Kindly tell your friends and neighbors who have bees, of time and place of this convention and the treat that awaits them, and urge them to come.

P. B. RAMER, Sec.

**Standard Italian Queens**

OF THE HIGHEST GRADE.

Bred in separate yards from superior stock of Golden and Leather-colored Strains. Selected from among the best stock of Long Tongue Clover and Honey-Queens in the world. Bred by us with the greatest care for business. No disease among our bees. Our elevated country, with its pure mountain air and pure sparkling spring water furnishes the ideal place of health for bees and man. See our circular for the rest.

Queens sent out last season by us arrived in the very best shape, except a few got chilled late in the season in the North. Our Queens have gone to California, Oregon, Canada, Colorado, Cuba, New Mexico, and many of the States. We rear all queens sent out by us from the egg or just-hatched larva; in full colonies. Our method is up-to-date. If you want to know what we have, and what we can do, in the way of fine, large, prolific QUEENS, and how quick we can send them, just give us a trial order.

Prices: Untested Queens, \$1.00; 6 for \$5.00; 12 for \$9.00. Tested, \$2.00; Select, \$3.00; Best, \$5.00.

Full Colonies, with Tested Queen, \$6.00. 3-frame Nuclei, wired Hoffman frames, no Queen, \$2.00; 2-frame, no Queen, \$1.50. (Add price of Queen wanted to price of Nuclei.)

Special rates on Queens by the 100. Safe arrival and satisfaction guaranteed. Shipping season begins in April. Write for circular. It is FREE.

T. S. HALL,  
134141 JASPER, PICKENS CO., GA.

**BEE-SUPPLIES!**

Everything used by bee-keepers. POUDER'S HONEY-JARS, Prompt service. Low Freight Rates. NEW CATALOG FREE.

**Found at Last!**

A place where I am rearing QUEENS for Business, Gentleness, Beauty, and For Sale. Prices:

Untested, each, 75c; doz., \$7.50. Tested, each, \$1.00; doz., \$10.

Either Golden or leather-colored strains warranted pure.

Remit by Postal **DANIEL WURTH,** Queen Specialist.

Money Orders.

17D41 KARNES CITY, KARNES CO., TEXAS.

**Tip-Top Glass Honey-Jars**

1-pound.

The pictures shown herewith represent the best Jars for honey that we know of. They are made of the clearest flint glass, and when filled with honey, and neat labels attached, they make as handsome packages as can be

1/2-pound.

7-ounce.

We can furnish these Jars, f.o.b. Chicago, at these prices:

	1 gross.	2 gr.	4 gr.
1-lb. Jars	\$8.00	\$9.50	\$18.00
3/4-lb. "	4.50	8.50	16.50
7-oz. "	4.00	7.50	14.50

If you try them once you will likely use no other kind of top or sealing arrangement for honey-jars.

**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

**Italian Queens, Bees and Nuclei.**

We have a strain of bees bred specially for honey-gathering and longevity, at the following prices:

One Untested Queen	..... \$1.00
One Tested Queen	..... 1.35
One Selected Tested Queen	..... 1.50
One Breeder Queen	..... 2.50
One Comb Nucleus (no Queen)	..... 1.40

Tested ready now; untested in May. Safe arrival guaranteed. For price on Doz. lots send for catalog.

**J. L. STRONG,**  
164141 204 E. Logan St., CLARINDA, IOWA

**HONEY AND BEESWAX MARKET QUOTATIONS.**

**CHICAGO, April 7.**—Choice to fancy white comb honey sells in a limited way at 15¢/16¢ per pound. There is no certain price for other grades, but they sell slowly at 3¢/6¢ less per pound. Extracted, 6¢/7¢ for white grades; ambers, 5¢/4¢. Beeswax, 32¢ per pound.

R. A. BURNETT & Co.

**ALBANY, N. Y., Mar. 14.**—Honey demand quiet; receipts and stock light. Comb selling, light, 15¢; mixed, 14¢/15¢; dark, 13¢/14¢. Extracted, dark, at 7¢/7¢. Beeswax firm, 30¢/32¢.

H. R. WRIGHT.

**KANSAS CITY, Apr. 2.**—Our market is almost bare of comb honey; the demand is good. We quote you as follows: Fancy white comb, 24 sections, \$3.50; No. 1, white, \$3.40; No. 2, white and amber, \$3.30; No. 3, white, 6¢/6¢; amber, 5¢/6¢. Beeswax \$8.10 per pound, 25¢.

C. C. CLIMONS & Co.

**CINCINNATI, March 11.**—The demand for extracted honey is good at the following prices: Amber, barrels, 5¢/4¢, according to quality; white clover, 8¢/9¢. Fancy comb honey, 15¢/16¢. Beeswax strong at 30¢.

THE FRED W. MUTH CO.

**NEW YORK, April 8.**—Comb honey is moving rather slowly of late and prices are somewhat declining. We quote fancy white at from 14¢/15¢; No. 1, white, 13¢; amber, 11¢/12¢. Extracted quiet and easy, with plenty of supply. We quote white at 6¢/7¢; light amber, 5¢/6¢; dark at 5¢. Beeswax steady at 30¢/31¢.

HILDBRETH & SPOELLEN.

**CINCINNATI, April 7.**—The comb honey market has weakened a little more; is freely offered at following prices: Fancy white, 14¢/15¢; no demand for ambers whatever. The market for extracted has not changed and prices are as follows: Amber in barrels, 5¢/6¢; in cans, 6¢/6¢; white clover, 8¢/8¢. Beeswax, 26¢/26¢.

C. H. W. WEBER.

**SAN FRANCISCO, Mar. 11.**—White comb honey, 12¢/13¢; amber, 9¢/11¢; dark, 7¢/7¢. Extracted, white, 6¢/7¢; light amber, 5¢/6¢; amber, 5¢/5¢; dark, 4¢/4¢. Beeswax, good to choice, light, 27¢/28¢; dark, 7.50. 14.50.

Demand is fair on local account for water-white, uncaned, but there is not much of this sort obtainable. Market for same is firm at ruling rates. Canded stock and common qualities are going at somewhat irregular and rather easy figures, holders as a rule being desirous of effecting an early clean-up.

WEEKLY

## The Foot-Path to Peace.

To be glad of life, because it gives you the chance to live and to work and to play and to look up at the stars; to be satisfied with your possessions, but not contented with yourself until you have made the best of them; to despise nothing in the world except falsehood and meanness, and to fear nothing except cowardice; to be governed by your admirations rather than by your disgusts; to covet nothing that is your neighbor's, except his kindness of heart and gentleness of manners; to think seldom of your enemies, often of your friends, and every day of Christ; and to spend as much time as you can with body and with spirit, in God's out-of-doors—these are little guide-posts on the foot-path to peace.

—Henry Van Dyke, D.D.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the *WEEKLY American Bee Journal* for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the *American Bee Journal* whose subscription is paid in advance, can have a copy of Dr. Miller's new book *free as a premium* for sending us **Two New Subscribers** to the *Bee Journal* for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old *American Bee Journal*, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

# Stanley Queen Incubator and Brooder

An Arrangement that Allows the Bees Access to the Cells and Queens at all Times.

(Patent Applied for.)

One of the greatest objections urged against a lamp-nursery, or any kind of a nursery where bees are hatched away from the bees, is that the cells and their inmates are robbed of the actual care of the bees. When the bees have access to a cell, and the time approaches for the queen to emerge, the wax over the point is pared, and, as the queen cuts an opening through the cell, and thrusts out her tongue, she is fed and cheered in her efforts to leave the cell. A queen hatched away from the bees loses all of this food, cheer, and comradeship; and, until introduced to a nucleus, or full colony, has not the natural food that she would secure were she among the bees.

All of these objections are overcome by an invention of Mr. Arthur Stanley, of Lee Co., Ills. Mr. Stanley makes the cell-cups according to the directions given in Mr. Doolittle's "Scientific Queen-Rearing," sticking the base of each cell to a No. 12 gun-wad. By the use of melted wax these wads, with the cell attached, are stuck, at proper intervals, to a strip of wood exactly the length of the inside width of a Langstroth brood-frame. Two

wire staples driven into the inside of each end-bar, slide into slots cut in the ends of the cell-bars, and hold them in position.

The process of transferring larvae to the cells, getting the cells built, etc., have all been described in the books and journals, and need not be repeated here. When the cells are sealed they may be picked off the bar (still attached to the gun-wad); and right here is where the special features of the Stanley process steps in. Each cell, as it is removed, is slipped into a little cylindrical cage, made of queen-excluding zinc, the cage being about two inches long, and of such a diameter that the gun-wad fits snugly, thus holding the cell in place and stopping up the end of the cage. The other end of the cage is plugged up with a gun-wad. Long rows of these cages, filled with sealed cells, are placed between two wooden strips that fit in between the end-bars of a Langstroth frame, are held in position by wire staples that fit into slots cut in the ends of the strips. To hold the cages in their places, holes, a trifle larger than the diameter of the cage, are bored, at proper intervals, through the upper strip, thus allowing the

cages to be slipped down through the upper bar, until their lower ends rest in corresponding holes bored part way through the lower bar.

A frame full of these cages, stocked with cells, may be hung in a queenless colony, and will require no attention whatever except to remove the queens as they are needed. The workers can freely pass into and through the cages, cluster upon the cells, care for them, and feed the queens after they hatch, exactly as well as though the queens were uncaged.

These cages are unsurpassed as introducing cages, either for fertile or for virgin queens. The bees are not inclined to attack a queen in a cage to which they can enter, yet they can surround, caress, and feed her. They can become acquainted with her, and give her the same scent as themselves. When desirable to release her, one end of the cage can be stopped with candy, and the bees allowed to liberate her by eating it out.

By putting food in one end of the cage, a queen may be kept caged, away from the bees, the same as in any other cage.

Price, \$5.00, by Express, Or with the *American Bee Journal*  
one year—both for \$5.50.

**AMERICAN**  
**BEE JOURNAL**  
THE OLDEST BEE-PAPER  
IN AMERICA

43d YEAR.

CHICAGO, ILL., APRIL 30, 1903.

No. 18.

\* **Editorial Comments.** \*

**General Manager N. E. France**, of Platteville, Wis., wishes us to say that he sent to each paid-up for 1903 member of the National Bee-keepers' Association, one copy of "Bees and Horticulture," one on legal rights of bee-keepers, and a sheet of 25 questions to be answered and returned to him; and to new members also a pin badge. Since then there have been two bags of mail containing a lot of the above lost in a train wreck, so if any paid-up member has not received his package, and will notify Mr. France, he will mail another.

**How to Treat a Balled Queen.**—At this time of the year the novice will sometimes find upon opening a hive that the queen is balled, although she has been in the hive for a year. He is puzzled to know why she is balled, and still more troubled to know what he shall do. The best thing he can do is to do nothing. The bees have balled their queen because disturbed by the opening of the hive—possibly they are balling her to protect her—and if the hive is immediately closed there is little danger that any harm will come to the queen.

But it is another matter when you find a stranger-queen balled. The probability is that the balling will continue till the queen is dead, and your business is to get her out of the ball. Two things *don't* do: Don't try to pull the ball apart; and don't blow hot smoke upon the ball. Either of these things will generally mean immediate death to the queen. You may blow cold smoke upon the ball, holding the smoker at a good distance, and at first it seems to have no effect; but keep steadily blowing for some time, and gradually the bees will loosen their hold and leave the ball, until the queen is left alone. Possibly the better way is to drop the ball into water; very soon each bee will be trying to save itself.

**Establishing Distant Out-Apiaries.**—The usual reason for establishing out-*apiaries* is that without them the home-field will be overstocked, and the nearer home the better so long as there is no overstocking, unless a better field can be reached by going to a greater distance. Of late there seems a tendency to favor the establishment of out-*apiaries* at great distances—a hundred miles or so from home—even when the field nearer home is not overstocked. It frequently happens that a certain location will give a fine harvest when a second location at a distance yields nothing, although the pasturage is the same in each, climatic differences accounting for the difference in the yield. Another year the second field may be the paying one while the bees are starting in the first. If *apiaries* be established in both places, one or the other will be likely to have its dish right side up, and so if *apiaries* be established at a sufficient distance apart, and at a sufficient number of points, there will be little danger of a total failure in any given year.

Possibly this establishment of *apiaries* at great distances may be a wise thing, but before acting upon it the question should be carefully considered from all sides. Of course, it will cost much more to run *apiaries* at greater distances, but if the total harvest be sufficiently increased that will overbalance the cost. Suppose we have a home-*apiary* and two out-*apiaries*, and suppose a field 50 miles north and another 50 miles south, each exactly like the home field, and that every third year there is a total failure in each field. The first year

the failure is in the north, the second in the south, and the third at home. Each *apiary* in a good year yields 10,000 pounds.

Now, suppose the three *apiaries* are planted in the home field, say five miles apart. The first year will give 30,000 pounds of honey, the second the same amount, and there will be nothing the third year—altogether 60,000 pounds in the three years. Suppose, again, that one of the out-*apiaries* is planted in the field 50 miles north and the other 50 miles south. The first year is a failure at the north, but the other two *apiaries* give 20,000 pounds. The second year gives 20,000 pounds from the north and home *apiary*, and the third year gives 20,000 pounds from the north and south *apiaries*—no total failure in any one year, but—we have no more in the three years by one plan than we do by the other, just the 60,000 in the three years by either plan.

Before deciding, the practical question is this: Will the advantage of having the crop equally distributed over each year without getting any greater total in the three years be sufficiently great to balance the greater inconvenience and expense of the greater distances?

**Statistics of Bees, Honey, and Beeswax**, in the Twelfth United States Census Reports, are as follows: 4,109,626 colonies of bees; with a value of \$10,186,516. The total production of honey in 1900 was 61,196,100 lbs.: of beeswax, 1,765,315 lbs., which, together, represented a value of \$6,664,904. A grand total of \$16,851,420.

Bee-keeping isn't quite so small an affair as some people might suppose.

And it is increasing every year.

**The Arthur C. Miller Hive-Cover.**—Within the past few years—indeed, within the past year or two—there has been unusual interest in the matter of improvement in hive-covers. Several new ones have been listed by manufacturers, and individual bee-keepers have done no little in discussing what constitutes a good cover, and in experimenting with regard to the matter. Among others, Arthur C. Miller, of Rhode Island, has been thinking to some purpose, and writes:

I have just made 25 new hive-covers. The top consists of four or more narrow boards  $\frac{1}{2}$  inch thick, tongued and grooved together. These fit into end-pieces or cleats  $1\frac{1}{2}$  wide and grooved. Before the grooved pieces are put on four or five thicknesses of newspaper are laid on top, and a piece of thin cotton cloth stretched over all, and held by three or four tacks. The paper goes only to the cleats, but the cloth goes over the ends of the top boards. After the cleats are on they are nailed from top to bottom, firmly fastening the upper and lower parts together and holding the boards firmly.

Next, the cloth is drawn tight at the edges, held by a few tacks and a cleat nailed on. This makes a pretty stiff cover, which, owing to the narrowness of the boards, can not "twist" much.

The next step is to give the cloth a good coat of thick flour-paste, and it is allowed to dry a day, when it receives a coat of thick paint, and later a second coat. This paste business is a trunk-maker's trick, and a good one. The cloth so sized shrinks tight and takes less paint. The paper makes a fine non-conductor, ahead of an air-space, and also keeps the cloth free from the boards, so that no shrinking or swelling wrinkles and cracks it.

The paper part and the paste part I have tried and know about. The only part I am not sure about is the "twist" element of the narrow boards. The covers cost me here (without paint) 11 cents.

ARTHUR C. MILLER.

Whether those 25 covers come up to expectations can perhaps be told only after they have been in use five, ten, or more years, but there certainly seem to be several good points worth considering in them.

The use of paste means an important saving of paint. Newspapers themselves have been considered good non-conductors, and several thicknesses of them with the air enclosed between them may, quite possibly, be equivalent to the 3 $\frac{1}{2}$  air-space in double covers.

Certainly the expense will be less. With half-inch lumber securely fastened at the ends there can be no warping.

Twisting is another matter. A large proportion of lumber will twist with sufficient age. Cast-iron cleats holding the ends rigidly will not prevent twisting. But to have the greatest amount of twisting in a hive-cover, it must be made of a single board. Suppose a cover made of a single board twists to that extent that at one corner there is a crack of a quarter of an inch. Now make a cover of two boards instead of a single board, and let one of them be of the aforementioned twisting board. The crack at the corner will now be only an eighth of an inch, and as it will also be decreased in length it will not let in half as much air as the first crack. The crack will be still further diminished by the fact that the cleat fastened to the other board will have a restraining influence.

When the cover is made up of four or more narrow boards cleated together, the chance for twisting is reduced to a minimum. Of course, if it should happen that the four boards were of the same relative twist as if made of a single board, the result would be precisely the same as if the single twisting board were used; but a little figuring will show that the chance of such a combination is one in several hundred.

**Formalin Gas as a Cure for Foul Brood** is the title of a pamphlet published by C. H. W. Weber. Mr. Weber is very positive that by means of formalin we can be saved the necessity of destroying frames and combs, and full instructions are given as to the use of the drug, with illustrations of the box and generator used. Price of pamphlet, 25 cents. It can be ordered of this office.

#### PICKLED BROOD—BLACK BROOD—FOUL BROOD.

A Member—If pickled brood is left in the cell what would be the condition?

Mr. France—Pickled brood is entirely different; it never gets this ribbed and backbone appearance, flattened down across the sides of the wall; it seems to hold a roundness, and will turn up, if you please, very much like foul brood; they are very hard; you may shake the comb and they will rattle; they are loose; if you will take a pair of tweezers and press one of those it will come out readily; not so, however, with black brood; I had some samples of black brood, and, to my surprise, I was taking such good care of them they were beginning to mold a little in transit, so I put it in the stove to avoid all danger of getting it in my apiary. The one question I want to bring up now is, How does it look? Is there a question on that point?

A Member—In pickled or black brood won't the capplings be sunken and broken the same as foul brood?

Mr. France—There is a difference in them; with old foul brood these sunken capplings frequently have a tendency to be a little bit darker, although you would have to have your eye trained to notice the comparative difference; usually pickled brood has not a great deal of capping on it.

A Member—How long does it take before those capplings will shrink?

Mr. France—About eight days; about the same time the bees would cap it over naturally. As soon as they get it capped over it begins to shrink, and very soon thereafter there will be broken holes, quite often to the side of the center.

Mr. Clarke—When they are perforated that way is that before the larva begins to sink? Is it in the gases?

Mr. France—Yes, I think it is the gases. This bee will somehow take nourishment and grow.

Referring again to the case mentioned before, the night I was there the bee-keeper was so intent upon it he went that night; he was so anxious to get a crop, but had not had one for four years, although he used to get good crops, but when he brought some bees from another locality he had but little honey; that night he put them in empty boxes without foundation, and to keep any of them from deserting he screened the entrance; 48 hours afterwards he gave them full sheets of foundation on five frames; he confined them to five frames; as fast as those were drawn out he put in other three.

A Member—Why do we starve them for 48 hours?

Mr. France—We all know that the bee goes in good condition from the hive to the flowers; it gathers nectar from the flowers and brings it home in its honey-sac; if you can get these bees in the hives without filling themselves with disease, they will not take it afterwards. I have sometimes set another new, clean hive in place of the old hive, boring a hole from the top, putting the diseased colony very quietly in the evening, on top without closing the entrance; you have not disturbed them; they have to go down and out at the bottom, and when they come back they can not return; the next day put the queen in, and in three or four days you can take the hive off and they are transferred; but if I should advocate that, some one would make a blunder of it.

A Member—This dried scale that you were speaking of—this turned-up part—suppose now that the colony was affected with foul brood in the fall and we didn't know it, and if that hive—if we happened to examine that hive in the spring—would we still find that scale in the bottom of the cell?

Mr. France—Yes, last fall, at one of the Farmers' Institutes, a man came to me and said: "I believe I have something I didn't know I had; I am afraid my bees have foul brood; I didn't notice any odor; I do know this: I have some brood-combs that have that little, black, turned-up something." He showed me some of the combs at his house—some of those dried-up things; I could not see the rosy stage; these bees did have foul brood last summer; if I should go through your hives now we would see nothing at those stages at this time of the year. You will not find the rosy stage in 90 times out of 100—only these little black scales. Last spring I wrote him, and he said: "It is just as you said; when breeding began the next spring, and they put honey or larva into those cells of dried-down scale—that is where the mischief begins and ruins it." As soon as he had brood begin this year it was diseased. I have never seen a case of foul brood that I have not been able to trace to carelessness on the part of the bee-keeper, in almost every case; we speak about it being contagious, and we are to blame; our neighbor allows the disease to be out and exposed; our bees, which we can not fence in like our farm stock, are exposed, and they go out and gather the disease and bring it back again.

Mr. Moore—What is the point about letting 48 hours elapse before putting them on full sheets? Is it to allow them to consume diseased honey?

Mr. France—That is it; the moment we disturb the colony of bee-workers they load themselves with honey, and we have no way to get these bees to rid themselves of that honey except to starve them, and put them in the hive with foundation or without; if we screen the entrance the queen sometimes becomes discouraged and will swarm.

A Member—Is 48 hours absolutely safe?

Mr. France—I never knew it to fail in the honey-flow season. As to my experience with black brood, I have had but very little; I found a case in our State and traced it from New York; I bought it at my own figure and disposed of it rather than to have any experimental work; there is this difference—black brood has somewhat of a turned-up appearance, but it relaxes; it has decidedly a different odor. I would liken it to a carpenter's glue-pot that has become spoiled; it has somewhat the odor of stale furniture glue. Black brood would have more of the odor peculiar to sour apples; if you have taken some apples and thrown them out in a little bunch and let them lay—it has somewhat the odor of those decayed apples. It also has somewhat the tendency to dissolve the wax of the side-walls of comb, but I have never known foul brood to injure the comb; that seems to remain perfect; again, these little, black, dried-down scales on the lower side-wall, which just the end would show looking in here [indicating], in that stage the comb looks apparently clean, and I fully believe, so long as that comb has not been subjected to heat sufficient to kill the germs of life, there it will remain dormant

and renew its power to destroy as soon as the bees put in their honey, pollen or larvæ.

In one of our counties just north I saw a peculiar instance. I was passing by with my liveryman—seeing some bee-hives, and it being noon-time, I said to him: "I would rather eat dinner with a farmer bee-keeper than to go to the hotel." We went in and I took dinner there, and he wanted to know my mission, and so on; he said to me: "My wife has a swarm of bees; I used to have a good many swarms and they all died." He was anxious to keep bees, and, being a mason by trade, he had sealed the entrances of those hives; eggs had been deposited there, and he had stored away those hives with those black scales in, in the granary; eight years afterwards a swarm of bees came over and alighted in an apple-tree back of the house. The wife, not knowing where those hives were, took a square cracker-box for a hive and put the bees into that, and they did fairly well, in a good, old-fashioned way; they filled up the box. She wandered off on missionary work one day to some of her neighbors, and being away the next time they swarmed her, coming down from the field, saw the bees out on the tree. "Now," he thought, "I have some hives, I will give them on a full set of clean combs;" and he did. He wanted me to examine the hive. I turned it up and got that peculiar odor. I said to him: "I want you to know to your satisfaction that I am right." I opened it up and took out the comb, and there were the sunken cappings, the rosy stage, and plenty of it; and over in the corner, where there was no brood at all, I found those black, dried-down scales of eight years ago. Then I went up to the granary and found many diseased combs there. I told him to make up a good fire in the big iron kettle and we would fix it.

A Member—Would you work on the McEvoy plan, or starve the brood?

Mr. France—Well, if I mistake not that is the McEvoy plan; we starve them just long enough to get out of that little bee the diseased honey.

A Member—I shook the bees off on starters and left them to go in and out as they pleased. The starving plan is closing the hive up with screenings, and the bees worried themselves to death; when I tried it I lost almost half of them.

Mr. France—If you screen them, and put them in a cool place and give them a little water they will be all right, otherwise they get annoyed; in almost all cases I leave the hive open, narrowed down to keep the robber-bees from coming in.

A Member—Providing a number of combs that had contained foul brood had been stored away, how long afterward might the odor of foul brood be detected—one, two, three, or four years?

Mr. France—I don't think you would get very much of it a year afterwards; it becomes so dried down and hard it would be hard to detect it.

A Member—What is the first stage by which it can be detected? If you don't know you have it in your yard how do you go to work to find it?

Mr. France—I question whether the naked eye could detect it; there would be no difference in the outward appearance.

A Member—In regard to the perforations—is it not a fact that you can not go to a healthy colony and find those perforations in the cells? Isn't it about 99 cases out of 100, you may say, that you do find those perforated cappings? It is just as if you had put a needle or pin in the cell. Is that not unmistakably foul brood?

Mr. France—Picked brood may have; it is a very good guide-board.

A Member—With the foul brood the cappings don't begin to sink until after the gases leave the larvæ, do they?

Mr. France—Just as they begin.

A Member—Directly the gases leave the larvæ, which causes pressure on the top of the cell, directly the gases are released by that perforation, you may say the cappings then recede and have that sunken appearance, don't they?

Mr. France—Yes.

(Continued next week.)

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

### Rearing Long-Lived Bees and Queens.

BY DR. E. GALLUP.

DEC. 16 and 17, our Southern California Bee-Keepers' Association had a meeting in Los Angeles. I dropped in on the 17th and was told they had drawn Gallup "over the coals" for condemning all our Eastern queen-breeders. Of course, I denied that point-blank. But I did, and do still, condemn the rearing of queens and having the cells built and cared for in small nuclei. It is positively the deterioration of our bees in the worst possible manner. So when I came home on the 20th, here was the American Bee Journal and C. P. Dadant's article. Now, can it be possible that I am such a dull writer that I cannot make myself understood, or what is the matter?

Now, Mr. Dadant, you say it would be a waste of time for anybody to tell you that your bees were inferior, etc. Did Gallup ever tell you that queens reared in the manner you speak of were inferior? Certainly not, for that is exactly what I have been teaching.

Mr. Dadant sums up finally, by saying, "In my opinion we must rear our queens in good, healthy colonies," and here again I do not disagree with him one particle. I have reared just as good queens as can be reared in this manner. Take my best colony in every respect, and I prefer the leather-colored queen instead of the light-colored one; make the colony extra strong in numbers, by filling the hives to overflowing with nursing bees from other colonies. Now I am so foolish as to think that I get more good cells built in a colony thus prepared, and am sure to get every cell with an extra-large amount of royal jelly to support the embryo. Every cell will contain a good queen, etc.

We do not have any poor cells and poor queens to destroy or discard; Mr. Alley says he does with his nucleus-reared queens. Now, my 36-frame hives were the small Gallup frame, not the Langstroth frame. I only spoke of one queen living 6 years, and her wing was clipped, so that I know. I received the queen from Adam Grimm as a present, and did not use her in my 36-frame hive, as it was before I even thought of getting up such a hive. I know that I have had a number of queens since that lived 4 or 5 years. I furthermore know that I have had quite a number of queens that would, and did, occupy 16 Langstroth combs with brood; I have had 3 within the past two seasons—tramp swarms—that I picked up, and naturally reared at that, and common black bees, no one had anything to do with their rearing.

When I took Mr. Kenny's bees, in Ventura county, I selected 2 leather-colored queens in 10-frame Langstroth hives to breed from. I commenced stimulating the first of February with diluted honey. I used the hives two stories high, both queens fully occupied 16 frames with eggs and brood, and I had 36 good queens from them by natural swarming, saving every one of them. I lived the 2 swarms when they came out, on ready-made worker-combs, and in 21 days each queen had its 16 combs filled with brood and eggs. I sold out to Mr. McIntyre, and he said in the convention the other day that that stock still leads all the apiaries in that section of the country for productiveness and profit. He is the Secretary of our Association—I say "our," because they unanimously elected Gallup an honorary member. He says there is not a queen in existence whose bees live from the first of May until the first of September. Well, I guess that is so.

Now, I must tell the circumstances, surroundings, etc.: When I moved to Iowa I purchased 65 acres of land in the edge of a body of heavy timber, and clean, rolling prairie, one mile out. I purchased the timber as a splendid location for bee-keeping, as I had lived on the open prairie in Wisconsin and did not like the locality for bee-keeping, as it was too windy, and not a good variety of flowers. Well, I cleared up 6 acres, and yarded my sheep on it; they killed all the sprouts, and in two years pretty thoroughly covered the land with rich sheep-manure, and then I sowed it to white clover and got a splendid stand. This was the first white clover in that part of the State. I cleared up a few acres more for orchard, vegetable garden, etc., on the east side of the house; the clearing was a strip of land, before

coming to the prairie, half a mile wide, covered with oak and wild plums, choke, black and red cherries, wild crab apple and thorn-apples, etc.—all one mass of bloom in their season. On the west side was heavy timber consisting of rock and white maple, three varieties of elm, willows on a small creek, lowland and upland basswood; so the blossoming was prolonged for four weeks; different kinds of oak, black walnuts, etc., four different kinds of goldenrod, all right in the timber, and no wind at all as the bee-forage was perfectly protected by the timber on all sides.

My white clover patch was so perfectly manured and protected that it produced large quantities of nectar. There was no forage of any kind to induce the bees on the open prairie. My hybrid colony swarmed some time the first week in May; I killed the queen in the swarm, and introduced a natural queen-cell, cut out 8 queen-cells from the old stand, examined everyone and found the umbilical cord attachment. After seeing the umbilical cord, the first one I ever saw from the basswood log, I had examined over 100 cells and found none, and began to think I must be mistaken when I saw my first one. In dividing colonies and compelling one-half to rear cells there is no cord; in rearing queens in nuclei there is none. But in natural swarming we find them, and in natural superseding.

Now comes a question, and I am like Dr. Miller, "don't know," because I never have examined to see. Is there an umbilical cord attached to the nymph or embryo where we take away the queen from a populous colony and compel them to rear a queen? That is the question before the house. Now, my observation goes to show that the cord is placed there for a purpose, and that purpose has something to do with the longevity of the queen. We may not be able to discover any material difference in the first two or three generations, where no other requirements are lacking for rearing first-class queens, but in the end it will tell. It tells at once to the observing person, where we divide our bees and compel one-half to rear queens.

Now, Mr. Dadant, as I have told you just where to look for that umbilical cord, look for yourself, and you will be a great sight better satisfied than you will be to have some professor to tell you. You will have no trouble in seeing or finding it at all; anyone can see it or find it when he looks in the right place, and at the right time, without a microscope or magnifying glass; and if you are as astonished as I was when I saw my first one, it will pay you to investigate.

Now I will get back to that hybrid colony. They were peculiarly marked, so that I could not possibly be mistaken in them; they were quite numerous up to the last half of August, and quite a number showed up on the first week in September, but they were very old looking, hair all gone, and almost coal-black. Remember, they were perfectly sheltered, and had no winds to contend with. The bees from Mr. Alley's two queens that he sent me were all gone by the first week in February. There was no disease about them, they simply died with old age. The queens were both alive, one had barely a few bees, but not enough to occupy two sides of a comb; the other had probably a trifle over a gill of bees, all gone in the winter in just three months. Here was short life with a vengeance. Those bees did not die in the hive but flew away themselves, to die.

Orange Co., Calif., Dec. 28.

## How Bees Feed Each Other—Stimulative Feeding.

BY ARTHUR C. MILLER.

MR. DADANT has an interesting article on stimulative feeding, on page 231, but unfortunately for the value of his deductions they are based on erroneous premises.

It is not pleasant to charge so careful and usually painstaking a man as is Mr. Dadant with ignorance of ordinary bee-life, but feeling that he is as anxious as anybody for the truth, and that he will accept my correction in the kindly spirit in which it is intended, I will without further apology show wherein he is wrong.

1st. He says being returning from the field instead of depositing the load in the cells often hand it over to a young bee so as to get off to the fields again.

Possibly bees sometimes do this, but I have never seen it, and I have watched bees pretty closely. Further, such an operation would delay rather than speed the bees' movements, because it is a very short operation for a bee to

empty the contents of her honey-sac into a cell, but it is a slow operation for another bee to suck up a load with her proboscis.

2d. Whenever one of the young bees with one of these transferred loads "meets a queen she respectfully and differentially holds out her proboscis towards her and offers her a taste."

Food is never given on or by the tongue of the giving bee, but is taken from that bee's mouth by the tongue of the receiving bee. The disgorging of food is done with the proboscis folded back. Further more, bees, except in feeding brood, never voluntarily give food; it always has to be asked for, and sometimes almost taken by force. Also, it is not fresh nectar which is given to the queen, but digested pollen and honey, *i. e.*, chyle. I have never seen food offered to a queen, the "show of tongues" when she is taking food merely being an attempt on the part of the bees to get a taste of the coveted "pap."

As to the bees' deferential treatment of the queen, it is all a mistaken idea. Except during a peculiar operation which I have termed "grooming," bees never show anything which approaches respect or deference for their mother. I know these things from my own oft-repeated observations, and have shown them to others.

3d. When bees are not harvesting they are quiet. "If the bees are fed sparingly and often, they are stirred up and create more heat." (My italics.)

That is a clue to the increase in the queen's laying, the increased activity with its resultant increase of heat. Having kept bees chiefly as a pastime I have probably devoted much more time to experimenting than persons who keep bees for a business. But as a hobby which pays its own way is always more pleasant to ride than one calling for cash, I have always tried to make the bees pay their way, and have succeeded. Among other experiments were many on stimulative feeding in the spring. All sorts of food, fed in all sorts of ways, and to all conditions of colonies, at last forced the conviction that "stimulative feeding" was always done at a loss; that the best time to feed the colonies was in the fall, and that colonies worth wintering when given sufficient food then were in the best of condition in the spring, and for the harvest.

4th. In the example cited by Mr. Dadant, where a colony kept up a business of slow robbing, he attributes its great increase to the acquisition of the food. If the results were the same in the majority of cases such a conclusion might be drawn, but I have not been able to obtain even a fair number of colonies that responded thus to slow feeding. But it should be noted that when the unintentional feeding was progressing, the weather was such that the bees could fly out daily, and that they, to all intents and purposes, were getting a natural supply of food. It is not possible thus to feed a whole apiary, nor can we pick out the needy and set them at sly feeding. Feeding in the hive or at the entrance is entirely different. If a colony at that season can double itself in a month we may be confident that there was behind that growth some far more potent cause than a "one bee at a time" food-supply.

Providence Co., R. I.

## No. 1.—Queen-Rearing—Are We Advancing or Retrograding?

BY G. M. DOOLITTLE.

A YEAR or two ago, much stress was laid on our rearing better queens than we had been doing during the past, and many new thoughts were expressed along this line, looking toward an advance. Then the matter seemed to wane somewhat, and lately I notice some thoughts expressed which seem quite contrary to those of two years ago. I find some arguing that a pint of bees, if of the right age, will start queen-cells and rear better queens, than will a large number of bees without any special reference to their age; and that "nearly every bee-keeper nowadays" starts his cells by taking a pint or so of young bees to do it with. This pint of bees is to be taken and caged in such a way as to cause them to be very sorrowful or like children having lost their parents, and that they have been kept thus till they mourn themselves almost to death, then these young bees, even if there is only a pint of them, will rear better queens than will a whole colony in a normal condition. Is this correct? Can this be an advancement?

It is claimed by some that the queen-breeders of the past did not know that "young bees were the chief essen-

tial to queen-rearing, and without them success is impossible." Such claims can only be made through a lack of being conversant with the literature of the past, for considerable was said on this subject during the latter seventies and eighties, in opposition to the claims then made, that all that was necessary to rear good queens was to put a frame of brood in a hive and set the same on the stand of a populous colony, after removing said colony to a new stand. Such a procedure was spoken against by many, on the ground of its not providing young bees for the work of queen-rearing. The author of "Scientific Queen-Rearing" plainly states in that book, that "Nature designed young bees to do this work," and that book was written during the year 1884, and the experiments leading up thereto were conducted during the previous five years. To be sure, these young bees were not caged, a pint at a time, for this work, for such would have been considered as a move in the wrong direction, as it undoubtedly is now. Why go to the extra work and expense of caging a pint of young bees when such are in the upper story of any populous colony by the thousands?

All careful observers know that very few but young bees, of the right age for queen-rearing, are in the upper stories of our hives during the working season of the year. Why cause the bees to "thrash and mourn at the loss of their queen and brood," and be thrown into an exceedingly abnormal condition, under which conditions no really good work at queen-rearing can be done, as is shown by the short life of queens so reared, and their workers, when all know, or should know, that the best, long-lived queens, giving long-lived workers, are reared only when a colony is in as nearly a normal condition as possible? It is far easier to set a frame of prepared cell-cups into an upper story of a colony, where there are thousands of young bees of the right age, in a perfect normal condition, than to adopt all the "fuss and feathers" of catching and caging a pint of bees, and then throwing them into a frenzy and an abnormal condition, only to get inferior queens in the end. And this has to be done every time a batch of cells is to be reared, while with the normal plan as given in "Scientific Queen-Rearing," that gives the best, long-lived queens, (as thousands who have used that plan can testify), one preparation of a single colony in early spring, will give a batch of perfected queen-cells, of the highest order, three times a week during the whole season.

Accepting and advocating a plan for rearing queens with only a pint of bees, can only prove a backward movement, with all desiring the best of queens, or the improvement of stock; and the only plea I can find for such a mode of procedure is that a person may be able to place a maximum number of queens on the market at a minimum cost. If the statement that, "Nearly every bee-keeper nowadays starts his cells by taking up a pint or so of bees," be true, the bee-keepers of "nowadays" are to be pitied, for to rear good queens the warmth of the cluster must be kept up to a temperature of from 95 to 98 degrees, as I have proven several times with a self-registering thermometer; and no pint of bees can maintain this temperature, except in very warm weather. With the advent of a cool day or a cold night, the embryo queens would be partially or wholly chilled, all of which would be very much against any good results.

But we are given to understand that the reason why this pint of young bees will do such good work, lies in the fact that they are all of the right age, without any old bees, for, say they, these "older bees are a detriment." I wonder how many believe such a statement as that. Can it be true that all of the good queens that have been reared from the time Samson found the colony in his lion's carcass, down to the nineteenth century—which brought to us the stock from which our own bees sprang in so nearly a perfect condition as we found them—were reared without these detrimental (?) old bees? No one can believe such a proposition. Old bees are as surely needed in the production of good queens as are the young ones, even if they are worthless at cell-building and supplying the royal larvæ with chyle for their growth. And the science that tells of no old bees for queen-rearing is wrong.

In order that the young bees may do their part, the old bees are needed to bring in forage from the fields, and keep up the proper temperature of the hive on cool days and cold nights; and especially to keep the colony in as nearly a normal condition as possible, without which no good queens can be reared, unless these conditions are kept up artificially by man, the latter two of which even man cannot supply in any other than an imperfect way.

In all the experiments I have made, trying to keep up the right temperature for queen-rearing with very small

colonies, I have failed. For the same has always resulted in a delayed development on account of the temperature falling too low during cold spells, or the thing has been an entire failure on account of the temperature running too high for a short period, which is sure to result in the death of the embryo queens.

From all the experiments that I have tried during the past 30 years of effort at improved queen-rearing, I am convinced that the best of queens can be reared only where a colony is strong in numbers, with bees of all ages, and the conditions the same, or very similar to, what they are during times of natural swarming, and in cases of the supercedure of queens; and I say this after having tried all of the plans of caging bees, etc., that have been put before the public.

I believe it to be of far more importance to us of the present, and to those who are to come after, as well, that we bend every effort to improve our bees as much as possible, using only the plans which give the best, rather than in trying short-cut plans that we may distance some others who are trying to see how cheaply they can produce queens and place them on the market. Onondaga Co., N. Y.

## A Plan to Prevent Swarming.

BY R. F. HILL.

**T**HE plan to prevent swarming practiced by the bee-keepers in this locality seems to be exceedingly simple and successful, and I give it as follows:

The hive in general use is the ordinary 8 frame. As soon as the bees appear to be crowded, or show disposition to throw off a swarm, a hive filled with combs or foundation is placed on the old stand. Two frames of brood and the queen are removed from the old hive and placed in the center of the new. If any queen-cells are discovered on the combs, they are destroyed. A queen-excluder is placed over the new hive, and the old one, after the combs have been carefully inspected, and royal cells destroyed, is placed on top. All ingress and exit from the old hive is down and through the new one, which the bees will immediately fill with honey and brood. As soon as the brood is hatched from the old combs, there being no further eggs laid, the bees clean out and fill with honey.

The process of placing new hives under old ones continues all season, in many cases as many as 4 or 5 hives being stacked one above the other, the queen-excluder being always kept next to the parent colony. If this plan is followed, there is little or no trouble about swarming, and less about queenless colonies.

This, of course, refers to the production of extracted honey, but it certainly produces a strain of bees that are little inclined to swarm.

My own experience and opinion about bees is that there is a whole lot of humbug about prolific and long-lived queens. The poorest queens appear to lay a great many more eggs than I have any use for, as it keeps entirely too large a proportion of the bees employed as nurses, and too small proportion as honey-gatherers.

The plan just outlined delays the egg-laying process, because the queen has to wait until the new cells are prepared.

If a colony becomes weakened the most practical way is to remove a few frames of brood from a strong colony, or else shake them out into a stronger colony.

Wormy frames, and queens that permit worms, I immediately get rid of. Ramsey Co., Minn.

---

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 10 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### A Wet Spring and the Bees.

Rain, rain, rain, how it has rained for three days, and how things are growing; the grass looks as if it might be the last of May instead of the 15th of April. If the bees survive the changeable weather it surely does look as if we ought to have a big crop of honey this year. But you never can tell; it is not safe to count on a honey crop before you get it.

The ground was so full of water last fall, and we have had so much rain this spring, that the bottom seems to have fallen out of the roads—not for years have we known anything like it, so that we have not taken our bees to the out-apiaries yet, but expect to haul them soon. I am always glad to get them located, then it seems as if business had fairly begun.

As I stood watching the bees the other day I was surprised to note the number of different kinds of pollen they were bringing in, and they were fairly tumbling over one another in their eagerness to get out.

In the spring we always close the entrances of our hives by means of an entrance-block, so that only a very small entrance is left—about an inch square. On very warm, pleasant days, it would seem as if it were almost too small, and the bees come tumbling out one over another, seemingly resenting such an arrangement; but when the thermometer takes a sudden drop, and the snow begins to drive, and the cold wind howls, then I am sure they appreciate it (at least we do), as I feel pretty certain it prevents brood from being chilled—something like putting an extra cover on the bed, you know.

### Watering the Bees—Sunflowers, Etc.

Some three years ago I read about spring dwindling of bees, that they go out to get water and many get chilled and do not get back; and that occurring every day was partly the cause of spring dwindling. I read about it in the American Bee Journal one evening, after I went to bed. Before I went to sleep I had them all watered (in my mind), and I soon put it in practice by having a little trough at the entrance of each hive, so all they have to do is to come out to the trough and get the water, and go back. The troughs have a little piece nailed on each side of one end that goes into the entrance; it fits up close against the hive. I have the entrance in the middle of the hive, so it is at one edge of it. The troughs are 9 inches long, 4 inches wide, and 1½ inches deep. I am going to make some more, but I will make them deeper, so they will hold more water; the ones I have hold only a pint. I will make the strips wider. I nail the strips on the side of the bottom part, making it the same length as the bottom piece, then the two end-pieces across the end of the bottom-piece and the ends of the pieces that I have nailed on the side. They have to be sawed true, so as to be water-tight, or they will leak all the water. I cut the stalks of my erianthus grass and lay it on top of the water so the bees will not get in and drown. Anything that will float will answer to keep them out of the water. Of course, this is for the sisters who are keeping bees in a small way like I am.

My bees had a flight Dec. 2, and three in February, so I think they will winter all right; they seem strong when flying.

Either I or some one else made a mistake in my last article about my age; it should have been 75 instead of 79.

Yes, I can use a plane and saw as well as a hammer. I can saw on a straight mark as good as any man. I can do fancy-work, and a good many other things that do not belong to the bee-business. I raised a good many sunflowers last summer, and the bees would work on them until they were as yellow as the flowers. I had 90 quarts of seed; my pigeons are very fond of them.

The article in the American Bee Journal about the spider-plant, and how to raise it, is worth half the price of the journal. I did not know why I could not get it to come up until I read that article. I have saved a lot for the bees,

and want to plant a lot more this summer for them, and have the seed to feed to the pigeons.

I can agree with your mother, Miss Wilson, about tea and coffee. I have not used either for over 50 years, and I seldom drink anything at meal-time, as I think it more healthy to eat without drinking. I use a good deal of fruit-juice put up as fruit.

## The Afterthought.

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### GROWING EXPERIENCE WITH INCREASE.

Neither novel nor ever likely to get out of date—is Dr. Gallup's advice to those desiring to start apiaries. Begin with very few, and make your colonies. You don't know so much about bees but that what you learn in the process will more than pay you for the time you lose. So doing, the purchase price of a lot of colonies is saved, and is a clear gain to you. Page 182.

### GROWING BASSWOOD TREES.

I can testify that basswood seedlings three inches high—neglected and not in their natural soil—do not always come to naught. But all the same, J. D. Gehring's advice to get a load of dirt from where basswoods naturally grow seems to be sound. But the dirt alone, possibly it may not entirely prevent the slaughter wrought by the scorching mid-summer sun of the first season—if that is the main trouble. Who knows? Page 183.

### DIVISION RATHER THAN SHAKEN SWARM.

It's a division rather than a shaken swarm that Geo. W. Stinebring tells us about on page 183. Good thing in its way—although with a colony at swarming strength, looking over the combs and setting aside the comb the queen is on, is not likely to float on as smoothly as the reading of it does.

### INFORMATION REGARDING BEE-CULTURE.

"Please send information regarding bee-culture," eh? Surely, there is latitude enough. Natural for innocent outsiders to suppose that we department folk must have some information on hand. Why not trot a sample of it out? Supposing it had been a man, and that he had fired his request point-blank at the whole staff, perhaps he might have got the maxims below:

Bee-culture is not designed for women-folk.

Bee culture is specially adapted to women—and children, and invalids.

Bee-culture is a plain bread-and-butter affair, and sentimentalism mustn't be allowed to get into it.

Bee-culture is a science, a fascinating science, and if incidentally some profit arises from it no right-minded beeculturist should be too much taken up with that.

Bee-culture is a boundless mint of money—"cause you go in and make your capital as you go along—and bees work for nothing and board themselves.

Nobody gets rich at bee-culture—and "off years" keep coming in which you do not make anything—and bad winters in which your capital disappears.

Bee-culture has nothing in it at all—unless you start a bee-paper and get rich at that.

Bee-culture is so nice and neat.

A leading objection to bee-culture is that it is so miserably dirty.

One of the most independent of all ways to live.

Too sadly dependent on the city commission man—"cause one's product is not a staple, and there's no reliable market for it.

The main objection to bee-culture is that you might get stung.

The getting stung part is too trifling to be thought of. So nice to be considered a higher order of being than plain farmers.

So "nice" to have everybody say, "He don't work for a living; he just fusses with bees." Page 184.

(You see by the above that this is house-cleaning time, and so the proper season to hang out musty samples of in-

formation on the line. Misery!! By the time this gets into print they'll say, "How late your house-cleaning comes!"

BLACKS AND ITALIANS IN BAD WEATHER.

An idea advanced by Geo. B. Whitcomb, page 187, may have something in it. Claimed that in very rainy localities black bees will be patient and stay in the hive whenever it is unprofitable to be out. Also claimed that Italians are pretty sure to be impatient and reduce themselves to ruinous weakness by going out in bad weather. Wonder if the sliding screen in front, which we had up a few weeks ago, could be made to help in this case.

# Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

## Management for Increase.

I have 28 strong colonies and want to increase to 50 if possible this season, and would like to do it artificially as I think it will save a lot of time. This is my second season with bees. How shall I proceed? Would it do to divide the frames just before they are ready to swarm? and is it best to put frames of foundation in the old colony where I take out the frames of brood? ONTARIO.

ANSWER.—Yes, one of the simplest way is to divide each colony into two parts before the bees swarm. Leave the old queen on the old stand, and put more than half the brood with adhering bees on a new stand, and they will rear a queen. Fill vacancies with frames having full sheets of foundation.

But that's far from the best way. Just what the best way is, depends upon circumstances, and it would take more room than the patient editor would allow us in this department to go fully into the whole subject of artificial increase. Study up general principles in your text-book, and you will be better prepared to judge what is best for you. If there's any special point in the text-book that needs further elucidation, ask all the questions you like—that's what this department is for. If the editor can't get it all in with the fine type he's using, he can put some of it in lead-pencil around the margin! Artificial increase is perhaps given more fully in "Forty Years Among the Bees" than in any other book.

## Light in Supers—After-Swarms.

1. Will light getting in between the supers and brood-chamber, or under the cover, have a tendency to keep the bees from working in the super? I have some supers that do not fit snugly, but I can use packing to exclude the light if it is necessary.

2. In case of after-swarms, what would you recommend doing with them? VIRGINIA.

ANSWERS.—1. Perhaps the light would do little or no harm, but on cool nights it isn't a good thing to have cracks admitting the cold.

2. Return them, or unite two or more of them, unless you want the increase. Better still, prevent them. Set the swarm on the old stand with the old hive close beside it, and a week later move the old hive to a new place.

## Questions on Wintering and Swarming.

1. Can I make a standard Langstroth or a Danz. hive a safe place for bees to reside in during the winter in northern Illinois? If so, how? Laying aside the loss of honey (salable), wouldn't you advise Jumbo or Dandant bives?

2. If I raise the coffee-sacking or burlap with cobs or sticks, the bees usually come up and cluster above the frames in cold weather (for me) in outdoor wintering. Is this as well as to keep them down on the frames? It seems to me that those bees that have to stay in those narrow spaces between the honey, near the top of frames, must need have sore throats—and they are the ones, perhaps, that have rheumatism in their shoulders and can't fly in spring-time.

3. Will the weight of honey in a 10-frame super sag the T tins in the center so as to make the  $\frac{1}{2}$  bee-space too narrow?

4. Are the side supports of the loose T tins set into the base of super? If not, is there not a vacant space left for the bees to propolize and to let in cold air? You need not answer this if you think I would better buy one and look for myself.

5. I have the most of my bees now that show three yellow or bronze bands. Their queens do not run excitedly, and the bees act, I think, in quite a proper manner, waiting, as a rule, on the comb near or over the young, and generally receiving with kindness if a lamb polite

in my calling; but these bees have mostly, or entirely, black or hybrid ancestors. Are they Italians? Of course, I have been choosing their mother and brothers from the better colored queens for several years, and there are now colonies in which I can seldom find a bee which does not show 3 lighter bands. Do you think that bees from Italy would be willing to "sit in the same pew" with them; and could they breast so strong a wind as those who helped tempt the Vandals to Rome?

6. I spent last evening reading "40 Years." Now, after I "put up the queen" and the bees below have started cells, (page 104), I give them the cell about ready to hatch, of my own choosing. After the queen from this cell begins to lay, I "put down" the old hive, having removed its queen 2 or 3 days prior, and unite the two. Will this hold the whole union from swarming? We could get a young queen and a good swarm this way, but would the "put down," not knowing that the "holdens" below had reared a young queen of the "current year," give the whole union the "fever"? or would the aborigines tell the prodigals that they had a current queen now, and that she was not going to move until next spring?

7. Would an inserted cell act, on swarming the same as a queen hatched from one of their own cubs?

I have good reason for believing that a young queen feels as you say about swarming. ILLINOIS.

ANSWERS.—1. You can make them safe by having a lot of extra combs of sealed honey, and using these fall and spring. But the larger hives are safer. I got as much honey from 10-frame hives as from smaller ones, but it was harder work handling them.

2. Being above the cluster, they ought not to suffer; but there is really no need of any more space for the bees than just enough for them to cross over the top-bars.

3. The upright part of the T tin does not allow the least sag.

4. There is no trouble whatever. If sheet-iron is used, the thickness is not enough to count. If bent plates are used, they are mashed clear into the wood, so not the slightest space is left.

5. In spite of the apparent prevalence of black blood in their ancestry, your selection seems to have been such that Italian blood prevails, and your bees can hold up their heads as high as any "to the manner born." The crossing is rather an element of strength than of weakness.

Let's get at the principle—if we can. Other things being equal, a young queen is less likely to swarm than the older one. But if the young queen is in the right surroundings, she'll swarm about as surely as an older one, for the condition of the brood is a very important factor. I think that the chief reason why a colony does not swarm with queen reared in the hive the current year, is because of the condition of the brood, there having been for some time no young brood to feed. So when you put down brood that has been queenless only two or three days, they have the stuff to swarm with, and they may swarm.

6. An inserted cell will result exactly the same as one of the same age built by the bees themselves, providing there's no change in the brood.

## Management at Swarming-Time.

I caught 10 colonies of bees in box-hives, and I would like to know if it will do in swarming-time to pick the box-hive up bodily and shake the bees out, put a new hive with the bees on the stand, and put the old hive in a new place?

My first experience with bees was last spring. I caught a colony in a box-hive, and they swarmed 4 times, and what remained I drummed out and divided them between the last two swarms. From the first swarm I got 72 sections well filled; from the second I got 48 sections. I don't want so much increase, for I have now 19, all told—10 in box-hives, and 9 in 9-frame hives, called the "3-Jones Combination Hive." ONTARIO.

ANSWER.—Yes, it will do to shake the bees out, if you can, and if you make sure to get the queen with them. You will probably find it easier to drum them out.

## Catnip.

1. Will catnip grow on sandy soil?
2. Does it prefer shade or sun?
3. Will it blossom the first year?

WISCONSIN.

ANSWERS.—1. Yes, if not too sandy.  
2. It seems to have a partiality for bedgerows, but that may be more because of the protection, for it grows well right in the full blaze of the sun.  
3. I think not.

## Forced Swarms—Wintering Bees.

1. In your comments on the "A B C of Bee-Culture" (No. 307, page 6). Do you put a super on the new swarm at once when hived? Do you use an excluder?

2. In the forced-swarm method do you use starters or full sheets of foundation? Do you put on a super at once, and do you use an excluder?

3. If one uses full sheets of foundation in the brood-frames, will the bees change worker-cells into drone-cells when they get ready? If so, how would it work in forced swarming to melt up the comb in the old hive after the second drive and replace with starters? If done every year would it keep down an excess of drone-comb?

4. The last two winters I have put on a super (filled with undin-

# YOU ARE TO BE THE JUDGE!

receiver can truthfully say that its use has done him or her more good than all the drugs and doses of quacks or good doctors or good medicines he or she has ever used. Read this over again carefully, and understand that we ask our pay only WHEN IT HAS DONE YOU GOOD, AND NOT BEFORE. We take all the risk; you have nothing to lose. If it does not benefit you, you pay us nothing. We do not offer to send you a free sample to last three or four days, nor to send you a medicine which will cure you with four or five drops, but we do offer to send you a regular \$1.00 package of the most powerful curative medicine known to the civilized world, without one cent of risk to you. We offer to give you thirty days to try the medicine, thirty days to see results before you need pay us one cent, AND YOU DO NOT PAY THE ONE CENT UNLESS YOU DO SEE THE RESULTS. Your are to be the judge! We know that when Vitae-Ore has put you on the road to a cure, you will be more than willing to pay.

## WHAT VITAE-ORE IS.

Vitae-Ore is a natural, hard, adamantine rock-like substance—mineral—ORE, mined from the ground like gold and silver in the neighborhood of a once powerful but now extinct MINERAL SPRING. It requires 20 years for oxidation by exposure to the air, when it slacks down like lime, and is then of medicinal value. It contains FREE IRON, FREE SULPHUR and FREE MAGNESIUM, three properties which are most essential for the retention of health in the human system, and one package—one ounce—of the ORE when mixed with a quart of water will equal in medicinal strength and curative value 800 gallons of the most powerful mineral water drunk fresh from the springs. It is a geological discovery, in which there is nothing added or taken from. It is the marvel of the century for curing such diseases as RHEUMATISM, BRIGHT'S DISEASE, BLOOD POISONING, HEART TROUBLE, DIPHTHERIA, CATARRH AND THROAT AFFECTIONS, LIVER, KIDNEY AND BLADDER AFFLICTIONS, STOMACH AND FEMALE DISORDERS, LA GRIPPE, MALARIAL FEVER, NERVOUS PROSTRATION AND GENERAL DEBILITY, as thousands testify, and as no one, answering this writing for a package, will deny after using.

MEDICAL SCIENCE has failed to improve upon or even equal the remedies found in a free state in HEALING MINERAL SPRINGS. Physicians, the oldest and best, the newest and learned, acknowledge this to be a fact when they encounter a disease which is not amenable to action of drugs; they pack the patient off to Carlsbad, Saratoga, Baden, there to drink the waters which contain the essential properties for the restoration of health, and the patient returns, fresh, healthy in mind and body. If the sufferer cannot afford the trip, and few but the wealthy can, they must continue to suffer, as the waters deteriorate rapidly, and when transported fail to procure the desired result.

A LETTER TO THE THEO. NOEL COMPANY, CHICAGO, will bring a healing mineral spring to your door, to the your own house, your chamber—will bring to you VITAE-ORE, a mineral spring condensed and concentrated, a natural God-made remedy for the relief and cure of the ills with which man is afflicted. Why continue to suffer when this natural curing and healing ORE, nature's remedy, can be had for the asking, when the poor as well as the rich can have benefit of healing springs?

This offer will challenge the attention and consideration and afterwards the gratitude of every living person who desires better health, or who suffers pains, ills and diseases which have defied the medical world and grown worse with age. We care not for your skepticism, but ask only your investigation, and at our expense, regardless of what ills you have, by sending to us for a package. In answering this address.

THEO. NOEL COMPANY, J. P. Dept., Vitae Ore Bldg., Chicago, Ill.

## A MINERAL SPRING AT YOUR DOOR.

ished sections) on several of my hives. These sections were filled with black honey, and the bees cleaned them out nicely. I used no packing over the frames, and the bees came through nicely. I wintered them out-of-doors in a winter-case, the ones I use holding 3 hives. The sides and ends are made of boards cleated together, lined with tarpaper, and can be taken down and put away for use again. There is plenty of honey below. The temperature went as low as 20 degrees below zero. Is there any harm in doing this way. P. R. BRIGGS.

ANSWERS.—1. Follow the rule that applies to giving supers to any swarm. If you give a super at once there is danger that the queen will go up and lay in it; so wait a day or more until the queen has begun laying in the brood-chamber, or else give the super at once over a queen-excluder.

2. Some prefer starters, and some say full sheets of foundation, or still better drawn combs. In my own practice I have never used shallow starters, for fear of drone-comb. But if you want to save on foundation, you will be pretty free from drone-comb by giving at first no more than four or five frames, having shallow starters in these, and then after the bees have filled these with comb fill up the hive with full sheets of foundation or drawn combs. The answer to your first question gives the answer as to super and excluder.

3. In the hundreds of combs that I have had built upon full sheets of worker foundation, I don't think I have ever seen two inches square changed into drone-cells. If from any cause small patches of drone-comb are found, cut them out and fill up the holes with patches of worker-comb.

4. Your success is good proof that the plan is all right. The only objection I think is the fear that the sections would be injured for future use. The same sections, however, might be used year after year.

## Extracted Honey Production and Marketing.

1. I guess you will think I am troubling you often, but I cannot help it, can you?

2. What would be best to put my extracted honey in, a barrel or a galvanized-iron tank?

3. If I put it in a barrel or tank should I not have a faucet near the bottom to draw the honey off?

4. Would a wooden faucet be as good as a metal one in a barrel?

5. If I have a metal tank made should I have a metal cover made for it, or would a piece of cloth do in place of it to keep out the dust, etc.?

6. About 8½ cents a pound is the most I can sell comb honey for. Now, can I sell a one-quart Mason fruit-jar full of honey, jar and all, for 40 cents, and make it pay? I can get the jars for 75 cents a dozen.

7. Is a one-quart fruit-jar a good package for extracted honey?

8. Must I put a rubber around the neck of the bottle, or would it make the honey taste of the rubber?

9. What kind of a label ought to be put on the jar? Do you think one like No. 17, in A. I. Root Co's catalog of honey-labels, is a good one? I do. OREGON.

ANSWERS.—1. No, neither do I want to help it. So long as I have on hand a stock of awasers from which I can select, to fit such questions as are not already answered in the text-books, I'm glad to have the questions come. When I can't find any other appropriate answers I still have a job lot of the "I don't know" brand.

2. Hard to tell. Perhaps a paraffined barrel. But if the honey doesn't stand in it a long time, there are advantages in the metal.

3. The faucet is a great convenience—almost a necessity.

4. You can have a poor one of either kind, but I suppose one of the best metal faucets is better than the best wooden one.

5. Use a circular cover of cotton sheeting, having a hem about the edge and a rubber cord through the hem.

6. With the conditions you name, you ought to make the extracted pay a good deal better than the comb.

7. Yes, one of the best; but in some markets it is too large. I may as well add that sometimes it is too small.

8. The rubber will do no harm, and it's safer to use it.

9. Yes, what you mention is good. It's all a matter of taste: find out what your customers like best.

## Indication of Presence of Queen—Rape.

My colony of bees which is upstairs in the barn was unpacked March 30, and to all appearances they are very much alive, but I could not find a single sealed cell. I did not give them anything to eat that day as I should have done, and the next day when I examined them I found nearly three-quarters of them dead. I suppose they must have been just on the verge of starvation when I first opened them. I filled a couple of combs with thick sugar syrup, and a day or two ago when I looked at them there were several cells sealed. I think they contain honey. As far as I could see there was no brood or eggs. They have carried in a little pollen and some syrup I put out for them. I have looked at them several times and even among so few bees I have in no case been able to see a queen. Would the sealed cells of honey and the pollen carried in indicate the lack, or the presence, of a queen, in your estimation? and if there were a queen should there not be eggs and brood by this time? Many soft maples and elms are in bloom already.

In answer to the question about rape, on page 234, I will say that there is a Farmer's Bulletin, free for the asking, on "Rape as a Forage Crop." There are two varieties of rape—the annual, which is no good for fodder and is grown simply for the seed from which a lubricating oil is expressed; and the biennial, which is used chiefly for fodder and does not bloom till the next year after planting. As the biennial variety does not live through the winter, and the annual is not grown here, should you care that rape would not cut a very important figure in the honey-pasture of this section. I think if rape were sown with alsike clover it would grow soon smoother the clover out on account of its more rapid growth. If I am not right I would gladly be corrected. MINNESOTA.

ANSWER.—The fact that you could not find a queen with only a handful of bees in the hive is not positive proof that no queen was present; neither is this casting any reproach on you as a queen-finder; many a time I have failed to find a queen in a hive with a mere handful of bees, and I don't know why. The sealed cells of pollen and honey indicate nothing one way or the other as to the presence of the queen, but the absence of brood and eggs when the bees are carrying in pollen and honey is pretty strong proof that there is no queen there.

The Premiums offered this week are well worth working for. Look at them.

**FROM MANY FIELDS**

**Wintered Well - Large Hives.**

Bees have wintered well in Ontario. I put into the cellar over 300 colonies, a few I bought only a few days before putting in, and lost 2 by starvation—no queens, and evidently drone-layers in the comb in the fall. This was the total cellar loss. At least half of the colonies are now occupying the brood-chamber in full 12 Langstroth combs. The last shadow of doubt has passed away about large hives for me. R. F. HOLTERMANN.  
- Ontario, Canada, April 15.

**Loss from Starvation.**

It appears now as if the honey crop in this locality would be a failure. There have been no swarms and little or no surplus stored, and the bee-keepers may be thankful if their colonies do not starve during the usual drouths in May and June. It appears to me that the loss from starvation of bees in this locality is much greater than ours from freezing in the North.

There is something curious about the blossoms; my strawberries blossomed white, but did not set fruit. On examining the bloom I ascertained that they had no pistils. Another grower told me the same thing, and added that his plums were the same—bloom destitute of pistils, and set but little fruit.

Last season a prolonged drouth was followed by almost constant rain, and this may have injured the formation of buds; and this may also have something to do with the loss of honey in the wild bloom.

Mrs. L. HARRISON.

Washington Co., Fla., April 26.

**Grease to Prevent Propolis on Fingers.**

An item lately appeared in the American Bee Journal stating that grease or butter would loosen the propolis off the hands. Why not put the grease on the hands first, and prevent the propolis sticking to them, which it does, as I know by many years experience? I carry along a little tin box with grease, and smear my finger occasionally, and have no propolis to laboriously unstick. LASALLE CO., Ill. A. MOTTAZ.

**Spring Dwindling.**

It has been very bad bee-weather here in the Ottawa Valley, so far this spring. The snow went off early in March, but now we are having hard frosts every night, and cold north and east winds every day. It is snowing today. Most of the bee-keepers around here have had their bees out for some weeks past. Stores are generally low, and spring dwindling is going on at a rapid rate. There will be a great loss of colonies if this weather continues much longer. Mine are safe in the cellar yet. I took them out about two weeks ago and let them have a good flight on a warm afternoon, and they have been as quiet since as in January. I have 10 colonies.

W. A. HANNA.

Ontario, Canada, April 23.

**North Texas Convention.**

The 25th annual session of the North Texas Bee-Keepers' Association was held in Greenville, April 1, 1903. The meeting was called to order by Vice-Pres. J. M. Hagood. Prayer was offered by Rev. J. N. Hunter. But few of the leading bee-men of the Association were present, and they have been as quiet since as in January. I have 10 colonies.

The usual program of apianian topics was discussed, to-wit: "Queen-Rearing and Introducing;" "Drones, Pure or Hybrid;" "Apiarian Supplies;" "Diseases of Bees—Foul Brood, etc.;" "Strains of Bees—Hybrids,

## A QUICK CALL

Many times a life depends on securing immediate aid from a physician or surgeon. With a Stromberg-Carlson telephone in the house you can call the doctor in a few seconds in case of accident or sudden illness. A rural telephone line saves time and puts you in close touch with your neighbors and the rest of the world. Gives earliest market news, alarms the whole neighborhood in case of fire and helps in hundreds of other ways. The Stromberg-Carlson telephones are the easiest to operate, most modern and most durable on the market. Once tried they supersede all others. All parts guaranteed five years. Send for our Farmers' book No. 4 telling all about rural telephones. It is an interesting story. Sent free to anyone interested.

Stromberg-Carlson Telephone Mfg. Co., Chicago, Ill.

etc.; "Honey-Plants for North Texas," and "Marketing Honey."

Texas leads all the States in bees and honey. Two years ago the Legislature appropriated \$750 for an experimental apiary at College Station. The present Legislature added \$1000 more.

The following officers were elected for the ensuing year: W. R. Graham, president; J. M. Hagood, vice-president; W. H. White, 2d vice-president; Rev. W. R. Lowrey, chaplain; and Rev. J. N. Hunter, secretary, of Wylie, Tex.

The usual vote of thanks was offered to W. R. Graham & Son for their hospitable entertainment; also a tender of sympathy to our venerable president, because of his affliction.

The convention adjourned to meet at Blossom, Tex., the first Wednesday in April, 1904.

J. N. HUNTER, Sec.

Collin Co., Tex., April 10.

## Report for 1902—"Missing Link."

Eighteen colonies averaged 100 sections each. Our leader, a hybrid, put up 200 nicely finished sections; they did not appear as strong as many others that did not reach one-third as many sections.

Will those who have had colonies making very large yields please report and say what kind of management, if any, contributed to the result? In this case nothing was done excepting placing on supers and removing them about dark. A stray young queen was found in one of the supers, but was allowed to escape. I regretted her loss later. I favor absconding swarms, and always try to secure them; they seem more vigorous than others. I have five such now that I secured last fall; one of them is a 3-banded Italian, and the strongest in a lot of 35 colonies.

We favor the Danz. frames, and find single bodies large enough. I tried double-deckers, but they are failures here for comb honey. Moving supers, bees and all, to assist weak colonies did not benefit the one, but injured the other.

I want to know about that "missing link." Does it only occur in natural-swarming cells, and not in any other methods? We do not care whether it is a tube, cord, rope, or sausage-link. I merely want to know if it occurs in one case and never in the other.

Bees wintered well out-of-doors here. I got a good start during the fine March weather, but April, to this date, is cold and wet. The wind is almost constantly in the northeast.

White clover has a strong start, but Yankee weather puts a big discount on the prospects.

I had some hybrids, as well as pure Italian bees, working on red clover, and if my memory serves me rightly I saw German bees working on it in this locality 45 years ago.

GUY HUNTSBERGER.

Northampton Co., Pa., April 6.

## Cold, Wet Weather—American Hive

I can not keep bees without the American Bee Journal, for sometimes one item is worth its price for a year.

I am starting the season with 20 colonies in fair shape, but the weather has been cold, and so much rain that they could not work or build up as they should have done. I use the American hives, and would have no other for this locality. The size of the hive is 15 inches square, brood-frames 12 1/2 x 11 1/2 inches, one and two stories high as they are needed. They beat any hive that I ever tried for building up nucleus colonies. I hope for a good year.

F. McBRIDE.

Hardin Co., Ohio, April 17.

## Management of Bees.

I noticed a number of inquiries about spring management of bees. I will give some of my experience dating back to 1876.

I started in with 2 colonies of bees, with the view of supplying my table with honey. I made a study of bees, with very little loss, and I soon had all I could care for. My business called for 24 hours a day—half day and half night. Along in the '80's I found I was over-taxing my strength, and I would have to

### Italian Queens, Bees and Nuclei.

We have a strain of bees bred specially for honey-gathering and longevity, at the following prices:

- One Untested Queen.....\$1.00
- One Tested Queen.....1.35
- One Select Tested Queen.....1.50
- One Breeder Queen.....2.50
- One - Comb Nucleus (no Queen.....1.40

Tested ready now; untested in May. Safe arrival guaranteed. For price on Doz. lots send for catalog. **J. L. STRONG,** 164 1/2 204 E. Logan St., CLARKINDA, IOWA.

drop either the bees or my other business. I made the mistake of dropping the bees, although I put them on shares and derived some income from them, but it was not long before I had no bees.

At the same time I dropped the bees I was getting about three tons of honey a year. I started with Langstroth hives, and being an admirer of Mr. Doolittle's writings, I decided to try the Gallup frame, and I was so well pleased with it that I adopted it, and I never have regretted the change. Perhaps if I had been in a warmer climate it might be different. When I became satisfied which frame I liked best, I made a part of the hives double-walled for outdoor wintering, and a part single-walled for cellar-wintering.

As soon as I got fairly started I commenced experimenting on spring management. The first warm days in March that bees could fly, and warm enough to open the hives, which is usually the first or second week of the month, I took part of them out of the cellar. I thoroughly clean the hives out and crowd the bees up so that they cover all of the combs, and see that they have sufficient feed. I use chaff division-boards, and keep them crowded so that I almost always find brood on the side of the outside combs, and make haste slowly in spreading the combs when set out the second time.

I forgot to say that as soon as the weather turned cold again, after cleaning them out and crowding, I put them back into the cellar again, and I found by experimenting that it was best in this locality to leave them in until settled weather avoiding dwindling.

I have taken up bees again in a small way, for it is a pleasure for me to handle them. I never could lay down any set rules to follow, but had to watch each individual colony, and try to supply their needs.

Perhaps I may some time give my experience in outdoor wintering in a cold climate. I have always found it a benefit to treat the bees as I have stated. **L. A. PENNOYER,** Blue Earth Co., Minn., April 2.

### Taking Bees Out Early.

Last Thursday was the only day fit for the bees to fly since they were "cellared" last fall, and as I was very anxious to know how "the land lay" with them, I took 15 to the summer stands, returning them the next day, with the exception of 6 colonies, for which I managed to "rake up" enough material to blanket them well. I shall watch the results very carefully to determine whether the setting out and returning them was a benefit or damage, and report later if I can determine any difference. In general they were in splendid condition, save a few that were in bad shape when I put them into the cellar last fall.

We have barely seen the sun since the day following the taking out of the bees, such heavy fogs nearly all the time, and perfect torrents of rain, with lots of thunder and lightning. We also had hail to the det of the day. On Tuesday, and some of it remaining in piles after all the rain which followed. I have heard of no serious damage on account of the storm. **F. W. HALL,** Sioux Co., Iowa, March 15.

### Cellar-Wintering—Basswood.

My bees have been out of the cellar about two weeks. I always take them out the first week in March, if we get a day warm enough, as I can not keep them in any longer as they get very restless, and I can not find any way to stop it. For two years I have tried A. I. Root's plan of leaving the windows and outside cellar-door open nights. Last year they wintered poorly, but this winter they have come through first-rate, and they were not in nearly so good a condition when they were put into the cellar as they were the year before. They were light in both bees and honey.

Yesterday my bees were getting plenty of pollen—23 days sooner than I ever saw them get it before; to-day it is cooler, and snowing. Everything seems to indicate a good season; basswood trees did not put forth their blossoms last season, therefore we expect full bloom this season.

Mortality among the bees was not as large

### Italian Queens, by Mail. Golden and Honey Queens

Untested.....	1	6	12
Tested.....	\$1.00	\$5.00	\$9.00
Breeder.....	1.25	7.00	13.00
2-frame Nucleus (no queen).....	4.00		
	2.00	11.00	21.00

Add price of any Queen wanted with Nucleus. Our bees are shipped in light shipping-cases. Purchaser pays express on Nuclei. Safe arrival guaranteed of all stock sent by mail.

**BATAVIA, ILL., Aug. 21, 1901.**  
Dear Sir:—I thought I would let you know as to results of the nucleus sent me. They were placed in 10-frame hives and now they are in fine condition. From one I removed 24 pounds of honey and had to give 6 of them more room, and were hanging out. They have more than reached my expectations.

Yours respectfully, **E. K. MEREDITH.**

**DAVENPORT, IOWA, Dec. 31, 1901.**  
Your queens are fully up to standard. The honey queen that you sent my brother takes the lead. She had a rousing colony when put up for winter. The goldens can be handled without smoke or veil. Very truly yours,

**JOHN THOEMING.**  
Notice.—No tested stock sent out before May 15. Send money by P. O. Money Order or Express Order. **D. J. BLOCHER,** 17A1t PEARL CITY, ILL. Please mention Bee Journal when writing

Take a Trip over the Nickel Plate Road and be convinced of its superior train service. Solid through daily express trains between Chicago, Ft. Wayne, Findlay, Fostoria, Erie, Buffalo, New York City and Boston. American Club Meals, ranging in price from 35c. to \$1.00, served in Nickel Plate dining-cars; also service a la carte. Rates always the lowest. No excess fare charged on any train on the Nickel Plate Road. Chicago depot: Harrison St. and Fifth Ave. City Ticket Offices 111 Adams St. and Auditorium Annex. John Y. Calahan, General Agent, 113 Adams St., Room 298, Chicago. 'Phone Central 2057. 2-17A5t

as expected; it seemed to take very little honey to winter them.

We have only three kinds of flowers that yield honey to any extent: Basswood takes the lead, blue thistle next, and raspberry third. We have a great many acres of buck-wheat, and the bees seem to work on it quite a good deal, but the hives will get lighter all the time—very seldom that we can find enough to get a taste. As to white clover, the bees will start to die in June with fields white with clover, in this section. About thirty years ago I lost over 30 colonies by starvation, with fields white. I don't know that I have had a taste of white clover honey in 40 years. You very seldom see a honey-bee on the blossom; if you chance to see one it will look to be about half the size of a good healthy bee, with a little bit of brown pollen on its legs. C. M. LINCOLN, Bennington Co., Vt., March 25.

### Wintered Well.

Our bees have come through the winter in very good condition, and prospects are good; but, of course, time will tell.

SANFORD HARTMAN,

Lincoln Co., Nebr., April 3.

### Sort of "Does Him Up Brown."

On page 180, there is an article that attracted my attention—"Bee-Keeping in North Ontario." I consider it a gross insult to many of our able apiarists, as Mr. Brown says if bees are properly handled foul brood and insects will not attack the colonies. How absurd, when many of the best apiarists have to fight just such things.

Mr. Brown says he has never met a man that knows how to handle bees. How sad! How lonesome Mr. Brown must be in his veritable land of milk and honey, as he terms it. I wonder where Mr. Brown got his bees, as he says no one else has anything like them.

Mr. Brown says: "As to the keeping qualities of my honey it is always as good the following June as when gathered the previous September." I wonder how long Mr. Brown has been in the bee-business, that he does not know that the quality of honey improves with age, if properly cared for. I surmise that Mr. Brown has been in the bee-business just long enough to think that all other bee-keepers are only "pebbles on the beach," while he is a towering mountain. C. H. HARLAN, Kanabec Co., Minn., March 21.

### Comments on Several Subjects.

On page 154 California says: "In lifting out a frame it tears great ugly patches in the comb." If his combs are not crooked it may be like it here. Some of my frames have thin top-bars; the bees will sometimes build comb solid from one to the other. If the frames are spaced very closely I can hardly get one out without breaking the comb. The way I do is to take a short knife and cut the comb loose on both sides of a frame, then I have no more trouble until the next time, when I have it all to do again.

Here is a hand-shake for G. B. Williamson, page 157, about forced swarms. If it is the best way to have a good queen by letting the bees rear them at swarming-time, how are we going to get any good ones if we don't let them swarm? In fact, it would not work well here to practice the shook-swarm plan, as our best flow is too short.

I think I very nearly have some of Dr. Miller's non-swarming bees. I have one colony that I lived in 1892 that have swarmed only one year, and one lived in 1895, and one in 1896, that have not swarmed at all. They are in box-hives, too.

I read with interest all that was said in the Bee Journal last year about bees being able to hear. I think Mr. Doolittle decided the question in what he said about his bees killing a singing queen. If they can't hear how did they know she was singing? Several have asked Dr. Miller about keeping queens a few days after receiving them through the mail. The good Doctor always says, keep them in a warm place; but I suppose he forgets to warn them about ants. If

### Standard Italian Queens

OF THE HIGHEST GRADE, Bred in Separate yards from superior stock of golden and Leather-colored Strains. Selected from among the best stock of Long-Tongue Clover and Honey-Queens in America. Bred by us with the greatest care for business. No disease among our bees. Our elevated country, with its pure mountain air and pure sparkling spring water furnishes the ideal place of health for bees and man. See our circular for the rest. Queens sent out season by us arrived in the very best shape, except a few got chilled late in the season in the North. Our Queens have gone to California, Oregon, Canada, Colorado, Cuba, New Mexico and many of the States. We rear all queens sent out by us from the egg or just-hatched larva; in full colonies. Our method is up-to-date. If you want to know what we have, and what we can do, in the way of fine, large, prolific QUEENS, and how quick we can send them, just give us a trial order. Prices: Untested Queens, \$1.00; 6 for \$5.00; 12 for \$9.00. Tested, \$2.00; Select, \$3.00; Best, \$5.00. Full Colonies, with Tested Queen, \$5.00. 3-frame Nuclei, wired Hoffman's frames, no Queen, \$2.00; 2-frame, no Queen, \$1.50. (Add price of Queen wanted to price of Nuclei.) Special rates on Queens by the 100. Safe arrival and satisfaction guaranteed. Shipping season begins in April. Write for circular. It is FREE. T. S. HALL, JASPER, PICKENS CO., GA.

**WALTER S. POWDER.** 512 WASS, AVE. - INDIANAPOLIS, IND.

I only want to keep one out an hour or so I get a saucer and put some water in it, then put a cup in the water and lay the cage on top. Mr. Ant can walk around and look as much as he wants to. They would make short work of a queen, bees, sugar and all, here if they had a chance.

On page 301, Arkansas wants to know if the Carolina bees will keep wax-moths out as well as Italians. I have had only one year's experience with them, but I think he will find them as good, or better, as a good queen will keep a strong colony all the time.

I have had some bee-paralysis among my bees this spring; I never saw any of it before. I have 4 colonies that have it badly; they are part Carniolan. I do not know whether this race of bees is more subject to it or not. I would be glad if some one could tell me. I am trying the sulphur cure described by Mr. Pierce, in Gleanings. I will report my success later.

This is a rather poor country for bees at least I feel it is going to be worse, as the saw-mills are sawing up the poplar timber in this part of the State. I believe that bee-keepers have a harder time trying to make an honest living than any other class of people. If there is only \$1.00 for the bee-keeper and the other fellow the other one stands up and says, "I am going to have 99 cents anyhow, and then we will run a foot-race for the other cent."

In some places the man who grows pears is after the bee-keeper about blight, when the truth is, I don't believe the bees have any more to do with it than they do with the planet Mars. The man who cultivates grapes says they eat the dollar out of his grapes. The alfalfa man says he will miss a whole cent if he waits a day or two to cut his hay. Now, here comes the saw-mill man in a hurry to get a cent or two out of poplar trees. The sad part of it is, the bee-keepers here think that they can kill the goose that laid the golden egg and eat her, and then have more geese laid, but they will find out, some time.

We had a late fall, and but very few cold days all the winter. The bees began to carry in pollen and rear young brood the first part of February. We have had no really cold weather since the middle of February. March, up to this time (29th), has been real warm. I have saved all my bees so far except 6 queenless colonies.

I have had to feed only a little, but if it turns cold now I will have to feed more. If not, I think I will have swarms by April 10. The most of my colonies are very strong with bees now. The most, if not all of the box-gum bee-keepers, have lost several colonies so far.

As far as I had known Messrs. Dadant, Mason, Martin and Newman a short time even in bee-literature, it made me sad to read about their deaths. We have too few such men in the world now. J. S. PATTON.

Hale Co., Ala., April 2.

CONVENTION NOTICES.

Illinois.—The spring meeting of the eastern part of the Northern Illinois Bee-keepers' Association will be held at the residence of James Taylor, in Harlem, Winnebago Co., Ill., on Tuesday, May 19, 1903. All interested in bees are cordially invited to attend. B. KENNEDY, Sec.

Catnip Seed Free!

We have some of the seed of that famous honey-producing plant—Catnip. It should be scattered in all waste-places for the bees. Price, postpaid, 15 cents per ounce; or 2 ounces mailed FREE to a regular subscriber for sending us one NEW subscriber to the Bee Journal for one year, with \$1.00; or for \$1.20 we will send the Bee Journal one year and 2 ounces of Catnip seed to any one.

GEORGE W. YORK & CO. 144 & 146 E. Erie St., CHICAGO, ILL.

QUEENS!

Golden and Leather-Colored Italian, warranted to give satisfaction—these are the kind reared by QUIRIN-DE-QUEEN-BREEDER. Our business was established in 1888. Our stock originated from the best and highest-priced long-tongued red clover breeders in the U. S. We rear as many and perhaps more queens than any other breeder in the North. Price of queens before July 1st: Large select, \$1; six for \$5; Tested Stock, \$1.50; six for \$8; Selected Tested, \$2 each; Breeders, \$4. Two-frames Nuclei (no queen) \$2.50 each.

Special low price on queens in lots of 25 to 100. All queens are mailed promptly, as we keep 300 to 500 on hand ready to ship.

We guarantee safe delivery to any State, Continental Island, or European Country. Our Circular will interest you; it's free. Address all orders to

Quirin-de-Queen-Breeder PARKERTOWN, OHIO.

Queen-Clipping Device Free!

The MONETTE Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings. It is used by many bee-keepers. Full printed directions sent with each one. We mail it free, if you order or will send us the less a premium for sending us One New subscriber to the Bee Journal for a year at \$1.00; or for \$1.10 we will mail the Bee Journal one year and the Clipping Device. Address, GEORGE W. YORK & CO., 144 & 146 E. Erie St., CHICAGO, ILL.

Split Hickory Buggies.—The opportunity to buy the celebrated Split Hickory Buggies direct from the factory is open to our readers. The season is here for using pleasure vehicles, and the longer their purchase is postponed the less opportunity one has for getting the full benefit of the season's enjoyment out of them.

The Split Hickory line of vehicles is sold only direct to the user at the wholesale price, not being on sale at any store, nor is it handled by any jubber or dealer.

The Ohio Carriage Mfg. Co., Sta. 6, of Cincinnati, Ohio, sole makers of Split Hickory vehicles, is a highly reputable firm with a record of years of honesty and success as makers and sellers of high-class vehicles at moderate prices. Their offer to sell their jobs on 30 days' free trial is a fine and certainly very liberal. It enables the intending purchaser to see and try just what he intends to buy. A postal card or letter addressed to them at Cincinnati will secure you a new catalogue, containing all the latest things on four wheels, for people who like stylish, long-wearing and well-built buggies and vehicles. Send for it before you forget it.

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, April 18.—Little change from last quotation, sales are few and prices out firm. No. 1 fancy white, 15@16c; other grades range from 10@14c. Extracted, white, 6@7c; amber, 5 3/4@6 1/4c. Beeswax, ranging on arrival at 32c. R. A. BURKETT & Co.

ALBANY, N. Y., Mar. 14.—Comb demand quiet, prices steady. Light, Honey selling, light, 15c; mixed, 14@15c; dark, 13@14c. Extracted, dark, at 7@7 1/4c. Beeswax firm, 30@32c. H. R. WRIGHT.

KANSAS CITY, April 20.—The supply of comb honey is about exhausted. The demand good. We quote you as follows: Fancy white comb, 4 sections, per case, \$3.50; No. 1 white comb, 24 sections, \$3.40; No. 2, white and amber, per case, \$3.00@3.25. Extracted, white, per pound, 6@6 1/4c; amber, 5@5 1/2c. Beeswax, 25@30c. C. C. CLEMONS & Co.

CINCINNATI, March 11.—The demand for extracted honey is good at the following prices: Amber, 6@6 1/2c; light, 5 1/2@6c; good to quality; white clover, @9c. Fancy comb honey, 15@16 1/2c. Beeswax strong at 30c. THE FRED W. MUTH CO.

NEW YORK, April 8.—Comb honey is moving rather slowly at late and prices are somewhat declining. We quote fancy white at 14@15c; No. 1, white, 13c; amber, 11@12c. Extracted quiet and easy, with plenty of supply. We quote white at 6 1/2@7c; light amber, 5 1/2@6c; dark at 5c. Beeswax steady at 30@31. H. DRETH & SEIGLEIN.

CINCINNATI, Apr. 18.—The comb honey market is a little better, as the big stock is almost exhausted; prices are better—fancy water-white brings 15@16c. The market for extracted has not changed whatever, and prices are as follows: Amber in barrels, 5 1/2@5 3/4c; in cans, 6@6 1/4c; white clover, 8@8 1/2c. C. H. W. WEBER.

SAN FRANCISCO, Mar. 11.—While comb honey, 12 1/2@13c; amber, @11c; dark, @7 1/2c. Extracted, white, 6 1/2@7c; light amber, 5 1/2@6c; amber, 5@5 1/2c; cork, 4@4 1/2c. Beeswax, good to choice, light, 27@28c; dark, 25@26c.

Demand is fair on local account for water-white, uncandied, but there is not much of this sort obtainable. Market for same is firm at ruling rates. Candied stock and common qualities are going at somewhat irregular and rather easy figures, holders as a rule being desirous of effecting an early clean-up.

WANTED WHITE CLOVER EXTRACTED HONEY! Send sample and best price delivered here; also Fancy Comb wanted in 50-drp cases.

W. M. GARRETT, Epping, N.H., carries a full line of our goods at catalog prices. Order of him and save the freight.

## A Few Cheap Smokers !

We find we have on hand a few slightly damaged Clark and Bingham Bee-Smokers, which got a little damp and soiled at the time of the fire in the building where we were about 2 years ago. They are all almost as good as new.

We have some of the Clark Cold Blast, which when new sell now at 55 cents each; some of the Large Bingham—new at 65 cents each; and some of the Little Wonder Bingham—new at 50 cents. But to close out those we have left that are slightly damaged, we will fill orders as long as they last at these prices:

Clark at 25 cents each; Little Wonder Bingham at 30 cents each; and Large Bingham at 40 cents each.

We do not mail any of these slightly damaged Smokers, but will put them in with other goods when ordered, or sell them here at our office when called for—at the above prices.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec03" on your label shows that it is paid to the end of December, 1903.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

Advertising Rates will be given upon application.

## Weekly Budget.

EDITOR ROOT is stirring up the Ohio bee-keepers to form a State organization, having for one of its objects the securing in Ohio of a good foul brood law. Success to him in his efforts.

W. Z. HUTCHINSON is not practicing migratory bee-keeping, but migratory editing. His duties as State Foul Brood Inspector keep him at present wandering over the State of Michigan, and he edits the Bee-Keepers' Review as he goes, so as to give more "go" to his editorials.

MRS. CHRISTIAN THEILMANN, of Wabasha Co., Minn., died April 13th, after a short illness, at the age of nearly 77 years. Her maiden name was Angela Schocke. She was born in Westphalia, Germany, June 11, 1826, and came to Minnesota in 1854. She was married to Christian Theilmann, Nov. 13, 1856. She leaves a husband, two daughters, and three sons, to mourn her departure. In a private letter Mr. Theilmann says his wife "was a true Christian, a loving mother, and a helpmate in the real sense of the word." She suffered with rheumatism more or less for the past 20 years, and was confined to her bed for over a year, when, at last, la grippe and bronchitis caused her death.

Mr. Theilmann is one of the oldest and most prominent bee-keepers in this country. He has been very successful in the business. A

local newspaper item says that Mrs. Theilmann "was a faithful type of the pioneer wife and mother. She came here with her husband, both poor, but not afraid to labor with head, and heart, and hand. They prospered to a marked degree, and have been eminently successful in every undertaking, their labors being rewarded with all of this world's goods they needed, and their home blessed with a large family of children, each of whom is doing his duty in life as a good citizen." Surely, this is a good record, and the bereaved family will have the sympathy not only of the friends who knew them intimately, but also of bee-keepers everywhere, all of whom are interested in the welfare as well as the sorrows and afflictions of those engaged in the same calling.

MR. THOMAS WM. COWAN made us a very pleasant call on April 29, when on his way through Chicago to England from his home in California. He seemed to be in splendid health, and looked forward with pleasure to a year and a half of travel. He has a very pleasant home at Pacific Grove, Calif., and when leaving recently the people of the town gave himself and Mrs. Cowan a farewell reception which included practically everybody that could go there. They evidently have endeared themselves to the people of that locality by their many deeds of kindness and genuine worth.

Mr. Cowan has practically retired from active work and business, and is able to devote himself to pursuits which yield no financial returns. We trust that Mr. and Mrs. Cowan will have a pleasant and safe journey, and return to their California home much benefited by their trip.

"FORMALIN GAS as a Cure for Foul Brood" is the name of a small pamphlet giving the result of persistent experiments made by C. H. W. Weber with this new drug, trying to accomplish what is very much desired in the apiary—a cure for foul brood. As a result of these experiments, Mr. Weber thinks he is now permitted to say, without a doubt, that the foul brood germ can be forever eradicated by formalin gas. It has been substantiated by leading bee-keepers in his community, and bacteriologists and chemists who have recently made some very severe tests, but who all unite in saying that formalin gas does the work. The booklet describes and illustrates plainly just how to proceed (including the treatment of the afflicted colony) in exterminating foul brood without destroying hives, frames, or combs. Price, postpaid, 25 cents. It can be had from the office of the American Bee Journal.

MR. J. T. CALVERT, of the A. I. Root & Co., passing through Chicago on a recent trip to the Northwest, spent an hour or so in our office. He is looking well and reports a rushing business, which latter, by the way, is what all the bee-supply manufacturers are having just now. But the prospects are that there will be a shortage in the supply of sections, as basswood timber is becoming very scarce. The probabilities are that, within a few years, it will be necessary for bee-keepers to use four-piece sections, as there is practically no other wood except basswood that makes a

satisfactory one-piece section. But as the tendency seems to be toward the production of extracted honey, perhaps later on there will not be so great a demand for sections. If such should be the case, the basswood supply will likely last a few years longer than seems to be the prospect just now. Still, there are many other uses for basswood, which will help to wipe out the visible supply.

DR. C. C. MILLER, whom all bee-keepers respect so highly, and many of whom know so well, called on us when in Chicago last week. With the exception of a cough, which has bothered him for a few weeks, he is in excellent health, and is able to do considerable work among the bees as well as much writing. He is one of the few remaining old-time bee-keepers, and rightly merits the title of "Father Miller." While there may be many Dr. Millers in the world, there is but one Dr. Miller known well to bee-keepers. Not only those who have a personal acquaintance with him, but all who have read his helpful writings on the subject of bees, hope that he may live yet many years to bless the world with his cheerful presence and excellent apian advice.

# AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., MAY 7, 1903.

No. 19.

## \* Editorial Comments. \*

**Valuable to Members of the National.**—General Manager France has been sending out to each member of the Association three pamphlets. The first contains a copy of the Constitution, and a brief history of the rise and progress of bee-keepers' associations in this country. The second is entitled, "Bees and Horticulture; their Relations Mutual." In this, much valuable information is compiled regarding pollination, cross-pollination, self-sterile fruits, with testimony from various quarters of the globe, spraying fruit-trees, etc. The third gives decisions of the courts—something of intense interest to any one at all likely to have trouble with his neighbors.

Every bee-keeper in the land, not now a member, would consult his best interest by sending his dollar at once to be enrolled in the National Bee-keepers' Association. The dollar can be sent to the office of the American Bee Journal, or to the General Manager, N. E. France, of Platteville, Wis.

**A Snarl About Co-operation.**—Some one objected to a national honey exchange, that in some cases a man would not want to be bound to confine his dealings within the exchange when he could do better outside. Referring to this in *Gleanings in Bee-Culture*, Dr. Miller said that a member of an exchange might sell outside the exchange so long as he did not cut under the exchange price. In a footnote, Editor Root replied:

"An effective organization, National in character, should be so complete and perfect in its workings that not a single buyer can get any honey except through the accredited organization through which bee-keepers are supposed to market."

The Progressive Bee-Keeper quotes this, and says: "The editor of *Gleanings* most certainly knows better than that," and accuses *Gleanings* of being opposed to co-operation. Now, will some one tell us how the matter stands? Will the general manager of the Colorado Exchange tell us whether a member is allowed to sell outside the exchange?

**Paper for Wintering.**—It may be remembered that Arthur C. Miller tried protecting hives in winter by tying tarred paper about them. He has also used newspapers in the construction of hive-covers made with thin boards, and now has gone a step farther, wintering a colony with nothing over it but burlap and paper. He writes:

"As a test of the efficacy of paper for protection, I, last fall, in lieu of a cover, put over a moderate colony a piece of burlap, six (I think) thicknesses of newspaper and a layer of tarred paper, the latter being tacked tightly down around the sides of the hive. The burlap was to prevent the bees gnawing the paper and sticking it to the frames. The colony came through splendidly, notwithstanding several long, cold spells, and several times 14 to 20 degrees below zero. They had an entrance 14x3/8 wide open all winter."

**Temperature of Bee-Cellars.**—S. T. Pettit says a wise thing when he says in *Gleanings in Bee-Culture*:

"I never could pronounce definitely upon the proper temperature of any given cellar without first consulting the bees in that cellar."

Cellars are not alike, hives are not alike, and thermometers especially are not alike. Find out at what temperature the bees enjoy the greatest quiet in your cellar by your thermometer, and then try to keep the temperature in that neighborhood.

**What Kills a "Balled Queen?"**—At present there is some little discussion regarding this. It seems impossible that it should be suffocation, for no matter how tightly the bees are crowded together the shape of a bee is such that plenty of passages for air will be left between the different bees. If the queen should be suffocated, there ought also to be a number of workers also suffocated at the same time, and yet when a ball of bees finally melts away from a dead queen, did you ever find a number of dead bees in the center of the cluster?

A balled queen is sometimes stung to death, but that is when the ball has been meddled with by the bee-keeper. If left to themselves, balling bees do not sting a queen, and when the central bees are held together in so tight a grip it does not seem possible that they could sting if they tried. Besides, if it was the intention of the bees to sting the queen, why should they not sting her the same as they sting a worker, without going through the preliminary work of balling her?

It seems more reasonable to believe that the balled queen is starved to death. A queen, especially when in full laying, needs a great deal of food, and can not go long without it. The balling continues for a number of hours, long enough for a queen to starve when not in a cluster, and the violent exertion that she may be supposed to make in trying to extricate herself would only hasten the starving. Does not starvation fully account for the death of the queen?

**Formalin for Foul Brood.**—There seems to be an interest awakened in this matter calling for light. For some reason there has obtained in this country a belief that no drug could be effectual in curing foul brood, although in Europe cures thereby have been reported for years. Now that formalin has come to the front, there seems to come along with some skepticism as to its efficiency a disposition to give it more credit than it deserves. The blunt truth may as well be told that formalin will not cure foul brood. The same means must be used that have been used without formalin, if a cure is to be effected. If formalin proves at all effectual—and there are certainly pretty strong grounds for believing that it will—the only thing it will accomplish will be to prevent the destruction of frames and combs. That of itself is a great thing.

Special apparatus is used to vaporize the drug. A dish containing the formalin is heated over a lamp, and the fumes are confined with the combs in them, much the same way as when sulphur fumes are used. It is a mistake to suppose that a comb containing healthy brood can be treated without the utter destruction of all the brood.

Experiments have shown that the fumes act with promptness and efficiency in proportion as the germs to be destroyed are near the surface—a thing naturally to be expected—and this gives room for some fear that without very long treatment there might still be left living spores at the bottom of sealed cells of honey. But let us hope for the best.

**Honey for Sick Domestic Animals.**—An article in *Gleanings in Bee-Culture* from the United States consul at Magdeburg, Germany, gives some rather remarkable cures by the use of honey. A cow with inflamed udders was cured in ten days by rubbing warm honey into the skin. A sick turkey had bits of candied honey put in its mouth, and afterward was fed pieces of brown bread dipped in fluid honey; rapid recovery followed. A sick hen with a swollen head was also cured by the administration of honey.

**Phacelia** is having a boom in Europe as a forage-plant. Some, however, speak disparagingly of it as a forage-plant, while admitting its great value as a honey-plant. *Phacelia tanacetifolia* is the plant in question, and whether it is of value or not as a forage-plant, it is worth while for a bee-keeper to have a bed of it for the sake of its beautiful blue flowers. It is certainly a great favorite with the bees.

## Convention Proceedings.

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 277.)

#### FOUL BROOD—ITS CAUSE AND CURE.

A Member—Is comb foundation made from diseased comb safe to use?

Mr. France—Yes, sir. Three years ago I experimented with 82 good colonies in 15 of the best apiaries I could find in the State of Wisconsin, where they had never seen foul brood. They took a good deal of coaxing to let me go into their apiaries, but with the confidence that I had gained with my brother and sister bee-keepers, one said, "Go ahead." I told him if there was a sign of disease I would pay him well for it. To this day they wish they had tried more of it, because those colonies experimented on were the best they had.

A Member—Would you recommend this for other people also?

Mr. France—I would in this way: That no one need be afraid of getting disease through comb foundation. Any process which will make comb foundation will kill the germs of disease in wax. I recommend the use of the foundation regardless of where it comes from.

A Member—Suppose you had diseased combs, would you melt them up and use the wax for foundation?

Mr. France—Most certainly, I would.

A Member—Would you not destroy the diseased combs?

Mr. France—No. About a year ago, in a certain apiary where there were 108 good, strong colonies of bees, I found disease in four of them, and he said he would do it. I then went on, and came back a year afterwards, and there were no live bees left, but there were 2500 combs in the cellar, all diseased. "Now, Mr. France, this is pretty hard; I am going to put a match under the whole thing and burn it up," he said. I told him not to get discouraged with that, because that beeswax, if nothing else, is worth saving; and I had him send for one of those German wax-presses to test its merits, and rather than to burn it up I ran 2000 combs through that wax-press the first day, and the balance the next day, and shipped the wax to one of our Wisconsin comb foundation men and he sent me a check for—well, for the wax, and said, "I want more."

Mr. France—If you have not got a good press you would better get a good wax-press.

A Member—What is a good one?

Mr. France—The German wax-press. That is the only one that I know of that is worth recommending at the present time, because you can do so much in such a short time with it. I have something at home that does about as well, that is, a large boiler that I had made. It holds about three barrels; put it down on a large stove and I can do about as well with it as a German press, but I can not take it with me, and this other I take free of charge, checking it as my baggage, and have melted combs here and there, and I can do it up in such a short time.

A Member—How many pounds of wax do you get out of 100 brood-frames?

Mr. France—It depends altogether on the age of those combs. One beauty of this wax-press is that you can get more wax in proportion than you can with any other. I think, on an average through our State, that we get about three or four pounds of wax to a set of 8 or 10 combs.

Dr. Miller—Mr. France, you are in a position to learn about that. I wish you would give close attention to that matter, and perhaps give us the exact figures as to the amount. I formerly had the impression that there was wax put there in the first place, and never any addition to that wax, but I find that across the ocean, by a careful examination, they tell us that there is a layer of cocoon then a fresh layer of wax, then more cocoon, then more wax. I have

lived a good many years thinking that there was never any wax added. I wish you would give us the exact figures. Take some very old comb and find out the percent of wax you get from that when you have squeezed it all out; then take some newer comb, not quite so old, and give us the proportion of that.

Mr. France—I have planned to try that about the first of April. I have about 500 old black combs that I am holding for that purpose. There are some improvements to be made on the German press.

Mr. Moore—Will you tell us what is necessary to make the hives themselves safe to use again?

Mr. France—In about nine-tenths of the cases nothing; in the other tenth, if there has been any honey dropped from the diseased combs in there, or there are combs on the side of the hive, scrape them off clean. I have boiled only three lots of hives in the State of Wisconsin in the last six years. The disease would not get into the honey until it has gotten into the diseased cells.

A Member—Is it not in the bee-bread?

Mr. France—Not unless the bee-bread has been put in the cell. I do not believe the bees carry disease with them from a hive back to the flowers. When they go back from the flowers they have a new lot; that is the reason why we want to try this during the honey-flow.

A Member—If the honey from that comb which contains foul brood was put under a microscope would it indicate foul brood so that you could observe it?

Mr. France—I think it would, although the chances are it may have become dried down so that at this stage of the season it would be so hard it would take some little time, heat and moisture to show it as plainly as in June. If you have a good glass you will see that those little germs of foul brood are rod-like in shape. They are longer in proportion to their thickness, and seem to have power similar to that of a fishworm. They become large, break off and spread out. You need a very powerful glass to detect the germs of foul brood. I have to use our State glass in the Normal School.

A Member—I would like to ask if the outside of the combs of the hive that is diseased that contain nothing but honey, never having brood in, would take the disease.

Mr. France—I think not, but you would take great chances.

A Member—Is there any danger of using the tools that have been used in the handling of these bees?

Mr. France—If they have in any way become soiled or stained by the honey from the diseased hive, yes.

A Member—Can you cure a diseased hive of bees in the fall?

Mr. France—If we have plenty of sealed honey in the healthy combs.

A Member—Would you starve the bees?

Mr. France—I do not think that it would be necessary at this time of the year.

A Member—What harm would there be if you made public the names of the places and owners of diseased apiaries? Have not the bee-keepers the right to know who has it, and where it is?

Mr. France—I think you ought to know if your bees have it. Suppose some one whose bees have foul brood is a breeder of bees, and I should say in my annual report A, B and C have foul brood, would you buy bees of them? Practically I would have cut their throat.

A Member—Would it be right for a breeder to sell such bees?

Mr. France—No, sir; and if you had legislation in the State you would stop him from doing such business.

A Member—How would you stop him if nobody knows it?

Mr. France—By inspectors going through the yards and finding it out. Some bee-keepers have asked me to go to them and give them a certificate for or against. But if you get a queen from any one abroad and you are not certain, if you will take the queen out of the cage she comes in and put her in a clean, healthy cage, I do not think there is one chance in a thousand in getting a disease. I do not think the queen herself is ever diseased enough to transmit it to a colony. It is in the food in the cage. One of our city girls, who was at the Normal School, thought that she would make a present of a box of comb honey to her mother. She sent the little box by mail; it came from the west in the mail-bag until it arrived at Madison. There it was transferred to the Northwestern train which came to my city, and right in Madison, in the making up of the mails, I received some queen-bees from a distance that I had paid a good price for. My queen-cages were thrown in the same mail-bag with this box of honey, and the surface of

them was covered with honey. The postmaster said to me, "I want to show you something. Here are a whole lot of pictures and letters in the mail all botched up with honey. I am going to hold you for damages." I never before got queen-cages with the surface of the cages covered with honey. I went up and took the queens out and put them into clean cages, and put the other cages into the stove. I went down next day and paid the bill, and the postmaster said, "What do you think I found stuck in the bottom of that mail-bag? A box of honey!" Being a trapper's son, I got onto the back-track right away. I went to where the letter was addressed, and asked, "Did you get a box of honey?" She replied, "I got a letter from Annie, saying that she had sent me a box." "Where is Annie?" "Over in Minnesota." "What town is she in?" I finally got her address, and found from whom she bought the honey, and his bees had foul brood, so I took no chance on introducing the queens. There was a chance of my healthy queen-bees becoming diseased through that honey put in the mail-bag.

Dr. Miller—It is suggested here that it is barely possible that some one might misunderstand you. You have emphasized very strongly the danger of using an old cage, but you have said nothing about the bees. Would you be careful to transfer the bees with the queen?

Mr. France—It has been practiced, but those bees have fulfilled their mission for which they were sent, being good escorts of the queen. They have safely delivered their queen, and there is a great deal of danger lying in the honey-sacs of those bees, and they might as well be put into the stove with the old cage.

A Member—Is it necessary to burn anything to cure foul brood?

Mr. France—No, but it is often desirable economy.

A Member—Is there any danger of buying or using combs from strangers?

Mr. France—There have been many cases in Wisconsin where that was the means of contracting disease.

A Member—Is there any danger of buying second-hand honey-cans, barrels, or other packages, that have once had honey in them?

Mr. France—Yes; and I want to say that second-hand goods of any kind are poor things to store honey in.

A Member—Supposing the honey-comb is filled with honey, and it has had disease in it, will those disease-germs propagate themselves in the honey?

Mr. France—No, not until that honey has been transferred in the comb.

A Member—Will pickled brood or black brood produce foul brood?

Mr. France—I have never known it to do so. They are distinct and separate germs. Small-pox will not produce diphtheria or scarlet fever.

Mr. Moore—What causes foul brood in the beginning?

Mr. France—I know of a case where we have no positive proof of its being contagious. As to the real cause of what produced it I am unable to say, because in almost every case under my own observation I could trace it back to something else. I know this much, foul brood was brought here from Europe, and here from one State to another until it is a wonder to me now there is any place that is not occupied with the disease.

A Member—Is there any authentication of foul brood coming from anything but foul brood?

Mr. France—Not that I know of; and yet I say there must be a cause?

Dr. Miller—I think it is an old theory. I certainly have been one who has held to it very strenuously that without the microbe there could be no foul brood. Have you at any time understood that without the microbe there will be no foul brood?

Mr. France—No, sir.

Dr. Miller—I have held that until the last week or so. I was very much surprised to find in one of the Belgian journals that a very careful examination was made by Dr. Lambotte, who is, as I understand it, a very able bacteriologist. He went to work and examined it, and I confess to you it is very hard for me to believe there is any truth in it, and yet I believe the investigations were thoroughly made. He found that the *Bacillus alvei* was nothing more nor less than another microbe. The first thing he noticed was its great similarity to another rather commonly known microbe, and then he made very careful tests and decided it was exactly the same thing; that under certain circumstances this microbe, the *bacillus vulgaris mesentericus*, would have such changes made in it as to produce foul brood; and that it was the same bacillus under a little different condition.

My own impression is that this is correct, although I don't like to believe that foul brood is in a healthy colony.

A Member—Is foul brood animal or vegetable life?

Mr. France—As far as we can decide that, we would call it vegetable in its nature, yet it has a power of motion similar to that of a worm, and in that way would much resemble life; but at the same time it is generally understood by scientists to be of vegetable matter.

Mr. France—I want you all to examine these samples of foul brood, and I want to get daylight for your inspection. Please handle these combs carefully, because you may gather the germs of disease; and when you look at them take the comb down to look into the bottom of the cell. That is the one thing I am trying to emphasize, and what we are looking for. Take it at an angle until the light strikes it just a little over the front end, when you will see that little black scale turned up in that way.

A Member—That will be to the front of the cell, won't it?

Mr. France—Yes, nearly to the front side.

(To be continued.)

### Osmosis and Atavism—"Umbilical Cord."

BY PROF. A. J. COOK.

I AM glad to respond to the Editor's suggestion called out by the inquiry of Geo. W. Adams, of Essex County, Mass., in his reference to the umbilical cord in bees. It is often strange how people are led into what seems very strange theories. Some years ago you will remember we had a great deal about the bees putting formic acid in the honey from their sting, which nonsense long ago passed into oblivion. Only a few years ago some one of apparently no mean ability thought to question the well-proved theory of Dzierzon. Now we have this theory of an umbilical cord. If I might use the expression, I should like to refer to these three as the trinity of errors. The last one seems to me strikingly without foundation. I have studied bees of all kinds in all stages, time and again, and I never saw anything that could be likened to an umbilical cord, and if I had, I should certainly have regarded that as a misnomer, for surely the developing bee has no use for any such organ. It lies immediately in its nutritious pabulum and has no need of any connection with any outside source of nutriment. Your correspondent has asked if osmosis does not fully explain the method of food-taking of the larval bees, and he might add either of worker, drone or queen. I think it is without doubt true that the bee-larva does take its food largely by this process of osmosis.

#### THE LAW OF OSMOSIS.

The word "osmosis" may be defined to mean the passage of a liquid or gas through an organic membrane, which membrane is made up of cells. It is one of the most important phenomena which take place in any plant or animal. The word "digestion" is often defined as liquefying the food. I would define it as rendering the food osmotic. That is, making it capable of passing through the inner part of cellular wall of the stomach into the blood. Some food that is already liquid, like serum or blood albumin, is yet non-osmotic. It can not pass from the stomach through to the blood until it is first digested. The same is true of the egg-albumin or white of an egg, and the casein or proteid of milk. This is the substance that makes cheese. It is liquid in the milk but is yet non-osmotic and must be digested before it can pass to the blood.

Osmosis, then, is found everywhere in the body. As the nutritious material passes from the blood to the tissues, or again to the glands, it is done through osmosis. As the waste of the body leaves the tissues, or is passed off by kidneys, skin, lungs or liver, it is done through this same principle of osmosis. All work of the body is attended with this osmosis, and without it life would not continue for an instant. The air passes from the lung-cells to the blood through osmosis, and the carbon-dioxide passes off in the same way. We even take in oxygen through our skin by

the same principle, and the fish and the tadpole get their air from water in the same way.

It is easy to illustrate osmosis by a very simple experiment. If we take an egg and break off a little of the shell without in the least rupturing the membrane just beneath the shell, and then place this portion of the egg in water, the water will at once begin to enter the egg through this membrane, and the elements of the egg will soon begin to pass out. That is, the cells pass these substances through them in both directions.

A better way to illustrate osmosis, or one that is more graphic, is to take a piece of stomach or bladder, and tie it over the large end of a funnel. We then fill the funnel with a saturated solution of salt, and place it in water colored with a little carmine or aniline dye. At once the salt solution will pass through the membrane to the water, and the colored water will begin to pass into the funnel. The osmosis is much more rapid from water to salt than from salt to water. Indeed it is found that the rapidity of osmosis varies very much with different liquids, the kinds of membrane used, with the extent of the membrane and with temperature, heat and pressure.

In the body, then, we have everything favorable for very rapid osmosis. The membranes were developed for the absorption of the liquids which bathe them, and so are fitted for rapid work. The extent of membrane is very great. The temperature of the body is most favorable, and the pressure throughout the body stimulates the process. It is found in the experiments with the funnel that as the liquids become more uniform osmosis is less rapid. In the body the liquids are so rapidly carried away by circulation that uniformity is never approximated, and so the osmosis is always great. The tapeworm, and many animals of like nature that are in the stomach or intestines of other animals, and so constantly bathed with osmotic material, are often without any stomach or alimentary canal at all. They do not have to digest their food and so need no digestive organ. All such simply absorb their nutriment from the rich digested material in which they lie. Many of our worst parasitic enemies like the porkworm or *Trachina spiralis* take all their food by osmosis. The latter lives in countless numbers in the muscles of man, hog, rat or mouse, and through osmosis absorbs the liquid portion of the muscle and thus snatches from their victims vitality, and very likely life. Nearly all parasites in the softer tissues take their food in this way.

We are not surprised, then, that the larva of bees, wasps and ants, often take their food in the same way. Their food is wholly digested for them by the nurses, and thus has only to be absorbed, and this will take place through the skin as readily as through any other membrane. As the larval bees do not need to digest their food, it having been done for them by the nurse-bees, they have no need to take it into their alimentary canal, but can the better receive it into their blood directly through the skin. As suggested, then, by your correspondent, these larval bees need no umbilical cord, or, for that matter, any alimentary canal, for they have enough in their skin to take all the needed nourishment for their development.

#### ATAVISM.

The law of atavism refers to the inheritance of characteristics not from the immediate parents but from more distant ancestors, perhaps very distant. Thus if a child resembles its great, great, great, great grandparent more than any other immediate ancestors, we say such a child illustrates atavism.

No doubt Cheshire was right in the quotation, referred to by your correspondent. We know that bees were late in developing. It was long after vegetables were created before we had flowering plants. Insects appeared as early as the carboniferous period, and even earlier. But there were no flowers until the cretaceous period of the later mesozoic times. There could have been then no nectar-loving insects until after the cretaceous period, and so our bees, wasps and nectar-sipping flies, were of necessity late development. They are not only of late development but of a higher development than most insects. We know that the larva of bees are practically footless, and functionally entirely so. Any foot-like appendages, then, would simply be vestigial remains of true feet which were not only present but functionally useful in their distant relatives.

I should then have no hesitation in giving atavism as the law through which such vestigial organs are to be accounted for. All animals show such evidence. A very remarkable one is in the gill slits of the pharynx of our own

very early embryonic development. These gill slits are what are functionally useful in fish, but in us are very temporary organs, illustrative of what were useful organs in a very distant ancestor. There are a great many evidences in our own physical make-up that illustrates this same principle. I think it was Agassiz who once formulated the law that all higher animals pass through stages in their development which are permanent in lower forms. This is only another way of stating that extreme atavism is often illustrated in all groups of organisms, both plant and animal. Los Angeles Co., Calif.

## An Experiment with Forced Swarming.

BY CHAS. W. CILLEY.

**I** SAW in the last Journal some questions in regard to forced swarms, and as I have had some experience in that kind of management of bees, perhaps I can write something that will help some one.

Now, I have used this plan of forced swarms for the past 4 years in my own apiary, and have not had a natural swarm during that time. I have also done lots of that kind of work for other people the past year, and it has been very satisfactory to all of them, so I think it is pretty good proof that the plan of forced swarming is all right.

I also tested the plan by putting a forced swarm by the side of a natural swarm that came out the same day the forced swarm was made, to see if there would be a difference in them in the fall, but I don't believe the best bee-keeper in the world could have told the natural from the forced swarm Oct. 1. It is a great saving of time and trouble where one has to be away from home a good deal, or has an out-apiary to look after. There are a number of ways to make forced swarms, but I will give the way that suits me best, and anyone can use it with safety:

I usually make the forced swarms about the last week in May, or the first week in June, but you cannot always go by the time of the year to divide them, but when they are strong enough in bees, or when they are about to swarm naturally, take a hive that has starters an inch or more wide in all the frames, with no supers on, and place it near the hive from which you want the forced swarm to be taken, then remove the old hive and set it back a few feet out of the way, and place the new hive on the old stand. It should be done in middle of the day, when the old bees are working in the field, then they will return to the new hive on the old stand, and you will not have to shake or brush them from the combs.

Then go to the old hive and blow in a few puffs of smoke at the bottom, raise the cover after a few minutes and blow a little smoke under, to drive the bees out of the way; then lift out the frames carefully, until you find the frame the queen is on, carry this frame, bees and all, to the new hive, lift the cover, and put the frame in the center of the hive; put on the cover, and you have the forced swarm with most of the old bees and the old queen, the same as a natural swarm, and also one frame of comb and brood, and most likely some empty cells for the queen, so she can keep right on laying.

Now quite a lot of old bees are still in the old hive, and will return to the new hive on the old stand, the first time they fly, or most of them will, so you will see the forced swarm will be about the same as a natural one.

Now you can place the hive anywhere you please, and the colony will probably not swarm that year, because so few of the old bees will be left that they will not get strong enough until the swarming season is over.

The advantage of this plan of forced swarms is in having only two good swarms, where you would get two or three, or perhaps more, if you let them swarm naturally.

Now I think I hear some one say: "What will the colony in the old hive do, as they have no queen?" If you do not divide them until they have some cells started they will soon have a queen from one of them; but if you divide them before they have cells started (queen-cells, I mean) then they will rear a queen from some of the small brood, or perhaps from eggs.

Now some will say: "I don't like queens reared that way." But I have seen as good queens reared that way as any I ever had. I have one now that will be four years old next spring, if she lives, and did fine work the past season. But queens can be reared so as to have them ready when you wish to make your forced swarms, and you can introduce one of them in the old hive, if that suits better.

I have never had a forced swarm leave or desert their hive. Merrimack Co., N. H.

## No. 2.—Queen-Rearing—Virtue Not in Cell-Cups; Only Convenience, Etc.

BY G. M. DOOLITTLE.

**A** CORRESPONDENT writes: "Do you claim that there is any virtue in the cell-cups you use in rearing queens, more than what there is in the cell-cups built by the bees during natural swarming or at other times when they rear queens? A neighbor tells me that all your claims are based upon the cell-cups you make. Please tell us something of this matter in the American Bee Journal."

Replying to this I would say, that some have been trying to make it appear that "Scientific Queen-Rearing" was written in the interest of "cell-cups," evidently desiring to divert attention from the plan as given in that book, by which thousands of bee-keepers are rearing queens of the highest order today, to where they were rearing poor or inferior queens before they came in possession of the knowledge given in the book spoken of above. If the desire was not to divert attention, no such claim could possibly be made, for there is no claim put forth for virtue being in the cell-cups, in "Scientific Queen-Rearing," other than that such cups are a convenience and a help by way of rearing queens, and in handling of the ripened product—queen-cells.

Away back in the early seventies, Elisha Gallup told the readers of the American Bee Journal that bees would store as much honey in a nail-keg or barrel, as they would in the best patent hive ever invented, or in the nicest honey-boxes ever put before the public. And no one ever attempted to contradict that statement. Surely, that nail-keg honey was just as sweet as any; none had a better flavor or gave off a nicer perfume, nor is that in section-boxes generally so well ripened or of so good a quality. What use have we then for honey-boxes, or the nice sections of the present, if no more or better honey can be obtained by their use? Why go to the expense of 20 sections and a shipping-case when one of the 20 boxes of our fathers would give as much and as good honey? I think I see a smile on many faces as they give answers by saying, "These boxes are convenient, and we use them for this very convenience;" "they enable us to put our honey on the market in an attractive and inviting shape;" "in this way we can accommodate the wants of the consuming public," etc. Just so. We use sections for the sole reason that they are a convenience for us in putting our honey on the market in the most attractive and marketable shape. They do not add to our crop one iota above what we could secure with the old boxes and barrels of the age of our forefathers.

And just so with the cell-cups. They are not for the purpose of giving us more or better queens, but for our convenience, in that they allow us to rear queens so that every maturing cell can be used in any spot and place, just as we may desire; caging the cells in cell-protectors, pushing them into the combs, put them into our inside shirt pockets to keep warm and carry to the out-apiary or elsewhere; never have two or more built together, etc.; in short, so that we can handle them as we would so many eggs which we were preparing for shipping to some distant customer, or to put under our old "hawk-colored" hen when she wanted to sit. In this way they are as much ahead of ordinary cells as section-boxes are of barrels and nail-kegs. And this convenient part pays well for the making of the cups, over any of the other plans given to the public. If it were the number of cells we could get built we could go back to the era of cutting holes in the comb, under just-hatched larvae, for by this plan I once obtained 157 perfected queen-cells from one comb given to a queenless colony.

No, it is not the virtue in the cell-cups that gives those extra-nice queens every time, when using the plan given in "Scientific Queen-Rearing," but in the preparation of the colony so that they wish to build queen-cells when the *old queen* is present with them, the same as in natural swarming; so that they are in that normal condition under which all good queens have been reared all down through the thousands of the years which have passed since God created the honey-bee, told it to go forth and replenish the earth, and pronounced the bee, with all else He had made, as "good."

Cells built from strips of comb by the Alley plan, give just as good queens, where the colony building them is in the above normal condition, but the completed cells are so fragile that the greatest care must be used in handling. If any do not wish to use a two-story hive as recommended in the book, all that is necessary to bring about the same results is to slip a queen-excluding division-board into a

populous colony, treated the same way as is recommended for the two-story hive, this division-board shutting the queen away from three or four combs of brood, when queen-cells will be reared equally good as are those reared in an upper story.

Hundreds and thousands of bee-keepers have proven that the bees behind or over a queen-excluding division-board are brought under just the right conditions to rear perfect queens, as letters all over the world tell me in language similar to that of a correspondent, whose letter came by the last mail, where he says:

"The best queens that we ever had were reared in that way. The crops harvested since I used the plan as given in 'Scientific Queen-Rearing' is the evidence in the matter. It would be a waste of time for any one to tell me that my crops of honey were no better than before I used this plan, for I know better. I wish to say to you that the plan you so freely gave to the world is the very best that has yet been devised, so far as my knowledge goes, and I have read everything I can find on the subject."

I am aware that the claim is now being put forth that the presence of old bees is a detriment where queen-cells are being built, but this can be no more than a fallacious idea, as the bringing of our bees down to us through the thousands of the years of the past, in the perfect condition in which they came, abundantly proves, for till within the past half-century, 999 queens out of every 1000 were reared where the colony was in a normal condition, and no colony can be in a normal condition where no old bees are present. Old bees are a *sine qua non* (without which nothing) to successful queen-rearing, unless that *sine qua non* is supplied by the bee-keeper in the shape of heat, food, etc.: and the old or field-bees are the cheapest of anything which can be used to supply these things.

Heat and food have as much to do with successful queen-rearing as have bees of the right age, and their being brought under the right conditions, and he or she who ignores any one of these things cannot meet with the best success, or produce perfect queens. The taking of one of the elements of success, and so magnifying it that it hides all of the others—or even one of the essential things—is something which is often done for the time being, only to find out after a lapse of years that the thing pursued was not, after all, the thing over which to shout, *Eureka!*

Onondaga Co., N. Y.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Important Spring Work in the Apiary.

One of the very important things to see to just now is that your bees have *plenty of stores*. Stores disappear rapidly if nothing is coming in. It sometimes happens that bees may be in danger of starving with plenty of bloom, as a cold or wet spell of weather may prevent their gathering anything for several days at a time, and again it does not always yield nectar even when the weather seems to be all right. Our bees would have starved more than once in June had we not fed them, and with abundance of white clover in bloom, too. Brood-rearing must be kept up if we are to have strong colonies ready for the harvest, and that uses up large supplies of honey, so if brood-rearing is to go on without interruption the bees must have a goodly supply of honey in sight. One might think that if they have enough on hand for one day's supply that would be sufficient; but they seem to have the wisdom to look ahead and plan for the future. Keep their larider well supplied. It pays.

Another item to be looked after sharply is the queens. See to it that all your colonies have good queens. A colony with a drone-laying queen, or a queenless colony, may just as well be broken up at once, unless you have a good queen to give them, for they will surely dwindle away if left to themselves, as they are in a hopeless condition, and the bees, if used to strengthen up some other colony, may be of use.

Don't fuss too much with your bees. A pretty good plan, after you have assured yourself that they have

a good queen and plenty to eat, is to tuck them up as warmly as you can and let them alone until the weather gets down to business. Yes, I know it is a big temptation to the beginner to want to see how they are progressing. You want to look them over about every day—better not. You would not enjoy being pulled out of bed in the cold, now would you?

### A Bee-Keeping Sister in Texas.

My bees are in better shape than they ever were at this time of year; they are storing honey and rearing brood, and preparing to swarm. We are hoping and looking for a great honey crop in dear, old Texas this year, and I trust it will come up to our expectations. We have had so many failures.

I have received Dr. Miller's book, and must say that I am delighted with it, and think every bee keeper should have a copy. I wish to tell Dr. Miller how much I think of his book; it is a little gem, full of good things. If he has any more that he is going to put on the market I want them. I can read his book and feel as if face to face with the writer. Bless him, what a struggle he had to get his college course. How many of the young men of to-day would go through such an experience for an education? Lots of them will not embrace the opportunity when everything is paid for in advance.

I am farming on a small scale, having about two acres under cultivation. I am planting everything I can get seed for. I get up at 4 o'clock in the morning, and am out with my bees by daylight. How I love to see them at work, and the hum of the little bee is the sweetest of music to me.

I have an acquaintance in Waxahachie who has about 15 colonies of bees, and I have tried so often to get him to take some bee-paper, but he says, "My father had bees, and he never read any bee-paper, and he was a good bee-man."

I am 54 years old, and regret that so much of my life had been spent before I went into the bee-business; but I am trying to get all the pleasure out of it I can.

Ellis Co., Tex., April 6.

Mrs. C. R. West.

Glad to hear from you again, Mrs. West. I hope and trust that you will not be disappointed, and that Texas will give you a booming crop this year. I would not feel badly if Illinois would do the same.

Just talk about Southern people being lazy, will you? If they all follow Mrs. West's energetic example they surely can never be accused of laziness. Up at 4 o'clock in the morning! Mrs. West, that's too early. You don't keep that up as a steady diet, do you?

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### DRONE-LAYING IN A QUEENLESS COLONY.

When an idea is once established it is natural (perhaps to some extent proper) that it should not disestablish itself right at the word. "Simon says, 'Thumbs down.'" Only a few years ago most of us thought that drone-laying in a queenless hive was done by one bee masquerading as a queen. Now, the opposite idea seems to be well supported—laying by many workers at once. But I see Gleanings still eats a grain of salt, to the effect that in some rare cases there may be only one. Still, I guess we should mildly repress and reprove the old language, and get rid of it in due time. Page 195.

### GETTING POLLEN OUT OF COMBS.

Soak it half a day  
And wash it out with spray—

To-wit, the surplus pollen encumbering combs. Presumably there would be lots of little kinks of detail to be mastered, but I guess the plan would work nicely when you got the aforesaid kinks—unless it was consolidated (as I think old pollen is very apt to be) by some organic growth working through it. As to partly damaged pollen, I guess one would have to find out for himself in each individual case whether it could be got out with spray fast enough to be practical. In time past repeated soakings and waitings in

warm weather, provoking the pollen to ferment and foam itself out, have been mentioned, if I remember aright. Page 196.

### UNITING A QUEENLESS COLONY WITH A WEAK ONE.

J. A. Green is a brother of the O. K. brigade, and when he says he learned long ago not to unite in spring a queenless colony with a weak colony having a queen, we wonder. He ought to tell us some more about it—as that is one of the things the books specially exhort us to do.

The observation of queenless bees that lived over winter and then on through nearly all that part of the year when life is usually short, is an interesting observation. Wonder what they did when Sept. 5 was passed—go off in a company, or go out one by one to die, or individually try to get themselves into some other colony and get killed? There is some possibility that this long life does not after all represent the extreme of which they might have been capable. Page 197.

### BUYING COMB HONEY TO GET THE PURE.

So there are people who buy comb honey to be sure of getting the real thing, and then melt it up to be rid of the wax. Effective performance. More cash than faith they seem to have. Still, if I was out of the business, longed for a little liquid honey, couldn't get at an actual producer of it—I believe I'm just fussy enough to do so, too, rather than eat the running-at-large article. Page 200.

### BEEES DOING THE OPPOSITE OF EXPECTATIONS.

Bees always doing the opposite of what the keeper wants them to do—and that's the reason Mr. Broderick views Cuban bee-keeping as a terrible nightmare he has just escaped from. Well, our bees swarm when we don't want them to, and refuse to swarm when we do want them to—and oft omit the little matter of storing surplus, concerning which our feelings are decidedly strenuous. "Spects the 'hoss' is of the same breed as here, only the pace a little more rapid. Page 204.

### BEEES HANGING OUT WHILE SWARMING.

Rather queer and exceptional for bees to hang on the front of their own hive and let a swarm come out from within without joining it. Usually the swarming rush is very communicable indeed. Likely they had been right there for days, had a queen with them, and were playing that they were an out-door colony in Java—and these things may partly account for their abstinence—terminated by the queen's refusing to play any longer, and going inside. Page 204.

### THE AIKIN "HONEY-BOLOGNA."

Yes, we must stand by Mr. Aikin's honors in the matter of the honey-bolognas. Whenever any new thing makes a stir in the world the fellow always turns up who invented all that and more, too long, long ago—but we'll turn him down. Of what use, pray, might a paper package of honey be in the dreamy brain of somebody? The man who works things out, and fights them out, and trots them out, he's the fellow. Presumably, hundreds of people before Fulton invented steamboats; but what good did their steamboats do? Page 211.

### ALFALFA AND BEEF PER ACRE.

Aha! It's not after all the most beef per ton, but the most beef per acre that the farmer wants to get out of the alfalfa. Quite an important turn in our favor. When the growth is cut in the first glint of bloom a lot of the beef is left down in the bowels of the earth yet. Hay nice, but too little of it. Page 211.

Honey as a Health-Food is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 10 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order.

The Premiums offered this week are well worth working for. Look at them.

## Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

### Removing Drone-Comb—Uniting Queenless Colonies.

1. On page 79, of "Forty Years Among the Bees," under the head of "Mending Combs," am I to understand that all drone-combs should be removed?

2. Under the title, "Queenless Colonies," page 115, you speak of uniting a queenless colony with another. Do you accomplish that by placing the brood-chamber of the queenless colony above or below the other brood-chamber?

3. In reducing a storied colony to one story (page 130), do you take the extra brood-frames to other colonies with the *athering bees*? Or do you brush off all the bees?

I have enjoyed reading the book, and gained much helpful information. It's valuable index makes every topic instantly accessible. It is a worthy companion to the "A B C of Bee-Culture," and with that invaluable thesaurus is kept constantly at hand. NEBRASKA.

ANSWER.—1. Yes, when you have tried your best to keep out all drone-comb, enough will still be left to rear all drones needed. But it's a good plan to leave some drone-comb in one or more of your best colonies. It is just as important to rear best drones as to rear best queens.

2. Either way. Generally put the queenless colony above; but if the queenless colony is strong and the other weak, put the queenless colony below. It is a good plan to put newspaper or thicker paper between the two, with a hole big enough for one bee to pass at a time.

3. All bees are brushed off, leaving the colony full strength.

I thank you for your kind words.

### Queen Killed—Feeding Bees.

What shall I do with one colony of bees that I have? To-day, as I was looking at my bees I saw one colony that were flying well, but were not carrying in as much pollen as they had been in the habit of doing. In front of the hive I saw a few bees, perhaps a half-dozen of them, and on looking closer I found that they had their queen out there; of course she was dead. They were "lapping" her, as I call it. What shall I do with this colony? I don't want to lose them, for I have now lost half of my bees.

I have been feeding them for some time (perhaps a week) from one pint to quart of syrup, one-half sugar and the same of water. They have taken it all right until to-day (April 20); they take some, but not as much as they did.

They commenced carrying pollen about the middle of March. Why did they kill their queen?

The bees are ugly, and when I go by the hive they will fly and strike at me more than ever before. NEW HAMPSHIRE.

ANSWER.—Some accident may have happened to the queen; or she may have died of old age. It is possible a young queen is present, or they may have a queen-cell more or less advanced. In any case, if the colony is strong, give them a frame of brood, the younger the better. If they start queen-cells, they may be allowed to continue them, or you may give them a laying queen. Possibly it may be better still to unite them with a colony having a laying queen.

### Sulphuric Acid for Purifying Beeswax.

What is used for purifying wax for making comb foundation? How is it applied, and in what quantities? OIHO.

ANSWER.—A large part of the impurities will be gotten out of the wax by slow cooling, or rather by keeping it hot a long time. If the melted wax is allowed to cool rapidly the impurities do not have time to settle. But foundation-makers use sulphuric acid to make a complete job of purifying, throwing a jet of steam into the wooden tank containing the wax and acidulated water. For common people like you and me, a different plan must be taken, using the acid, however, of some strength, about one part of acid to 100 of water. It may be more convenient, although more expensive, to follow G. M. Doolittle's suggestion, instead of sulphuric acid using a pint of strong vinegar in one quart of water, every ten pounds of wax.

To use the sulphuric acid on a small scale, the following directions are given in Root's A B C of Bee-keeping:

"Use a large earthenware kettle, for anything else would be apt to be affected by the acid. Into this put a small quantity of water, then a proportionate amount of acid. Allow it to come to a boil, and put in a cake of wax.

"If this is too slow and tedious a job, a large iron kettle that will hold seven or eight pails of water may be used. Fill this kettle about half full of water, slightly acidulated. Start a slow fire under it, and when the water gets to nearly boiling put in the cakes of dark-colored

wax that are to be brought to a bright yellow. Keep hot for a few minutes, and then allow the fire to die down. As soon as all the particles of dirt have settled in the water, with a dipper dip off the free wax on top, being very careful not to agitate or stir up the dirt in the water.

"While the iron in the kettle may be attacked slightly, yet it will do no particular harm. When, though with the kettle, clean it out with boiling water and rub it over with grease."

### Keeping Queens After Hatching.

I have read a great deal about queen-rearing in bee papers and also in books, but I have never been able to understand how the queens are kept after they are hatched, where so many are reared; also by what method the queens are mated. Please give me some information on these points. MICHIGAN.

ANSWER.—There is no way to keep young queens, or to have them fertilized, except to have them kept in separate hives, or at least in separate apartments, so that there can be no communication between any two nuclei in which the queens are kept. Some queen-rearers use small hives with small frames, but the general way is to use brood-frames of the regular size, with one to three frames for each nucleus. The young queens are left to themselves to be mated, flying out of the hives when a few days old to meet the drones in the open air.

### Colony with Laying Worker.

All my bees are in good shape excepting one colony; it is the same one I had so much trouble with last season and wrote about. In examining it this spring I find it is again without a queen, and laying workers are doing business, breeding is going on, and only drones are being hatched out. I never saw drones in a hive, in this part of the country, in the month of April. Eggs are attached to the sides of the cells and piled together 3 or 4 in a spot, like fly-blow.

What would I better do with this colony? Would I better try giving it a laying queen, or break it up and scatter them among the other hives? Of course I can do nothing with it until the weather becomes warmer and I have the bees put out. When would be the best time to do this, immediately on putting it out-of-doors, or wait till the honey-flow begins? The colony has plenty of stores. ONTARIO.

ANSWER.—Those bees are old and of no value as nurse-bees, but might do a little as field-bees. The only advisable thing is to break up the colony right away, and give the bees to colonies in good working order.

### Bisulphide of Carbon for Fumigating Honey—Putting on Sections.

1. Do bee-keepers use bisulphide of carbon in the place of sulphur for destroying moths in honey? If so, how is it used? and in what quantity?

When a swarm issues do you take the sections from the old hive and put on the new? If so, how long before you put sections on the old hive again. NEW YORK.

ANSWERS.—1. Probably most bee-keepers do not yet use bisulphide in preference to sulphur, but probably they will in the near future. Just how it is used depends upon what it is to be used upon, etc. One way is to use it upon brood-combs. Pile up several live-bodies filled with the combs to be treated, put an empty story on top, and in this set a saucer containing two or three tablespoonsful of the drug, and cover up close. Don't allow a light or fire to come anywhere near it unless you want an explosion.

2. Unless an excluder is used, don't put the sections on the swarm for a day or two—wait till the queen gets fairly started to laying below. Don't put sections on the mother colony till it becomes strong enough to store in the super, which may not be till next year.

### Spring Management of Bees.

We have had now over a week of fine weather, though the nights are cool. The fruit-trees are in full bloom, and the bees hustling.

I have 3 colonies (ideal) in full bloom, one of which I formed last year from a nucleus. This one is in a double-walled hive with burlap over the frames and a super filled with leaves, and cap over all. It seems to be the strongest colony now. This morning I found the bottom-board well sprinkled with wax-scales (white instead of yellow), and bees fanning about the entrance although it was quite cool. Thinking they might need room I removed the winter covering and gave them a few sections from last year; the most of this honey was not capped and was not candied; I kept it all winter in the attic, right up under the roof, wrapped in paper. No moth or mice disturbed them.

My question is: Did I do right to give them the super?

I did not look into the hive as it was too cold to expose the brood, this being at 6:15 a.m. I do not get a chance to examine my bees excepting on holidays, unless I do it Saturdays, which I prefer not to do unless absolutely necessary, which is not the case this year. Our next holiday is May 30. I would like to know whether or not they all have brood. The queens were reared last year, all young and prolific.

It seems to me a good many useless questions are asked you by

beginners, who ought to have books and papers which answer the most of their questions. This is my third year in the bee-business, but I have two papers and three text-books and will get your book this year, I hope. I can "eat" bee-lore as well as honey.

NEW YORK.

ANSWER.—I don't know whether it was wise or not to give the super. I could tell better by looking in the hive. The probability is that they had plenty of room without it, and that it gave them just so much more to keep warm. Still, it is possible that their combs were so filled up, and so much honey coming in, that they needed the room. Bees do not generally need surplus room till some time after fruit-bloom, but sometimes they need it during fruit-bloom.

Spring Feeding of Bees—Beet or Cane Sugar.

1. In regard to an article on page 231, "Why Feed Bees Sparingly and Often." by Mr. C. P. Daçant, please tell us how to do it in this section. March and April are usually cold and windy and not warm enough for the bees to fly very much, and so they could not leave the cluster to go to the top of the hive. Would it do to open the hive to feed every day? What is the best known way to feed when the bees

are out-of-doors wintering on the summer stands? How early should stimulating feeding begin?

2. I want to know if all sugar sold for granulated sugar is cane sugar or will answer for bee-feed. How can I tell cane sugar before the bees have been killed with poor or beet sugar? How can I procure cane sugar in rural sections like the hill towns of New England?

VERMONT.

ANSWERS.—1. It is impossible to give everything in one article, and however true may have been all that Mr. Daçant may have said, he would no doubt have told you that when it is too cold and windy for bees to fly the best way to feed them is not to feed at all, only to see that they have plenty of stores in the hive. When it is warm enough for profitable feeding, there will be no trouble about their leaving the cluster to take feed either above or below.

2. I think that only a small part of the granulated sugar is made from cane sugar, and although I have tried very hard to learn some way in which cane could be told from beet sugar I am still in ignorance on that point. The British Bee Journal stoutly insists that beet sugar should not be fed to bees, but authorities on this side the water insist just as strongly that there is no possible difference between beet and cane sugar when it is made into granulated sugar. Certain it is that thousands of pounds of granulated sugar made from beets have been fed with good results.

FROM MANY FIELDS

Looks for a Good Yield.

The prospects are good for a large yield of honey in this section. White clover is the best shape I have seen it for years, and we have lots of basswood around here.

I put 30 colonies of bees in the cellar, took out 29 on March 15; one was robbed out so I have 28 in good condition. Last year was a poor one, but I look for better results the coming summer. C. M. LAWRENCE. Blackhawk Co., Iowa, April 28.

Missouri Organized.

We had a very successful convention of bee-keepers at Moberly, April 22 and 23. Several parts of the State were represented by prominent men, and we effected a permanent organization, and listened to quite a number of splendid bee-talks. We fixed the initiation fee at 60 cents for new members who may desire to join between now and our next meeting, after which time it will be \$1.00. We now have 67 names enrolled. We expect to meet again some time in December, the date, place and program to be arranged by the Executive Board. W. T. CARY, Sec. Carroll Co., Mo., April 25.

Smoker-Fuel—Taking Bees Out for a Flight.

A few thoughts about smoker-fuel are suggested by reading James H. Wing's high commendations of cedar-bark as a smoker-fuel in a recent issue of the American Bee Journal. Cedar-bark for that purpose has one objection that should not be tolerated in smoker-fuel, and that is, the great amount of ashes produced from it.

I think if any one will take a given quantity of all the different kinds of smoker-fuel recommended, and burn them on a quiet day on a sheet of iron, or any other substance that will save all the ashes, each kind by itself, the conclusion will be that of all the different kinds none can approach cedar-bark as a producer of ashes.

So far as I have tested the list, apple-wood has the least ashes of any wood except pine; it holds fire well, and gives a good flow of smoke. It should be just rotten enough to break up pretty well when cut with a drawing knife.

On page 99 is a little talk about taking bees out of the cellar to give them a winter flight, and then returning them to the cellar. I wish to say that the condition of the bees, the condition of the cellar, and the kind of day, have much to do with after results.

Right here let me interject that if the bees are wintering fairly well, better not disturb them until set out to stay. If the bees are thirsty because the cellar is too dry, and if

Rumely Engines

both as traction and generating and supplying power, are typical of all that is best for threshermen. They are rear geared, gears are of steel, cross-heads and slides are protected from dust, they are free from all trappy devices. the day is warm, still and bright, they will carry in quite a lot of water, and no small amount of brood will result, which, I believe, is always injurious in the cellar, just in proportion to the amount started.

In the cellar, breeding is a hard pull upon the vitality of the queen, the bees and the food, without anything to show for it of value. I know, Mr. Editor, that all your readers will not agree with me in this. Let me say that the bees that remain quiet during their stay in the cellar, without breaking cluster, and without breeding, are the ones that eat the least food and do the best work the following season.

Let your experimenters give all the conditions.

On the same page I read about bees from time to time voiding the contents of their intestines. For many years I have held the belief that they do under favorable conditions, and, when they do, they always winter well. It is said, "Chief among these conditions are pure air and the proper temperature." Good food, should have been added.

Ontario, Canada. S. T. PETTIT.

**Fair Honey Crop Expected.**

The outlook for a good crop of honey has been greatly improved by the rains of April 16 and 17, which gave us a fall of an inch near the coast, and from 3 to 4 inches in the mountains.

The season is a little late, and the bees were a little weak in the early spring, owing to the short crop of last year, and in some instances scant stores, but they are building up fast, and in some localities extracting has already commenced. With a few more rains, which we expect, a fair crop will be secured in southern California.

F. C. WIGGINS.  
San Diego Co., Calif., April 20.

**Best Prospects in Years.**

It is dry here, but the best prospects for a honey crop in years, as we had rain during the winter. I had to feed my bees all winter; they are working on willow now.

S. M. WILKERSON.  
Wise Co., Tex., April 23.

**Bad Weather for Queen-Rearing.**

April weather stopped our queen-rearing business, as for three weeks it was so cold and rained so much that we could not do anything. Bees consumed all their stores, brood was chilled and died in the nuclei and many full colonies. We had to feed sugar syrup—a thing we never did before. Yesterday was the first day in April that seemed like settled weather. To-day the wind is from the east. Bees could get some honey now, I suppose, if they could fly, though the flowers may not have any honey in them. We are trying every way possible to have queen-cells built, but our cell-cups are rejected by the bees; one or two, and sometimes four in a batch, are all we can get, and many of them are inferior. Not looking for such unfavorable weather, we were wholly unprepared for it.

Pickens Co., Ga., April 28. T. S. HALL.

**Expects a Fair Crop.**

The weather is very backward for bees, but whenever it is warm enough they gather large quantities of pollen. My bees wintered fairly well, and I am consequently expecting a fair crop of honey.

A. C. F. BARTZ.  
Chippewa Co., Wis., April 23.

**A Beginner's Experience.**

April 17, 1902, I bought 7 colonies of bees and 16 empty hives. I brought them home and noticed the bees going and coming, but I did not know the reason. I soon found out that something was wrong. I got a smoker and examined them, and found what is called moth. I then sent for "A B C of Bee-Culture," and it was worth five times the price to me. I took a well, smoker and knife and cut out the moth, and cleaned the hives nicely. The millers still came around, and I

wanted to catch them. The black ants were very bad, so I got all the land tarpons I could find, and they crawled off; then I got hop-toads. They hopped off; but cleaned up the ants before they went. I then took a Bantam hen and chickens, and she cleaned up all pests.

This year I am going to hang a lantern over a tub of water; the miller is great for coming to the light.

I got 183 pounds of good honey and 6 swarms. I think that is doing well.  
Kent Co., Md., April 13. THOS. GORE.

### Foul Brood in Ontario.

**EDITOR YORK:**—In a recent number of the American Bee Journal I see a report as to the extermination of foul brood in Ontario. Without going into any details let me say that our good friend Mr. McEvoy is looking at things through rather rose-colored glasses. I can take him or you to more than one part of the Province where he has inspected and found foul brood, and for a whole year or more never went back to see that they were treated or cured; this does not speak well of its almost extermination. To my knowledge it is in the counties of Victoria, York, Peel, Norfolk and Simcoe; and several counties are moving to have county inspectors, so the work will be done more expeditiously.

I have been pressed to make these statements, and in justice to bee-keepers they should be made, as you have published the other side.  
R. F. HOLTERMANN.  
Ontario, Canada, April 24.

### Bees in British Columbia.

I send a few words from British Columbia, reporting the condition of my bees after a steady, cold winter, with no flight between November and March. They were wintered out-of-doors, with two or three inches of planer-shavings between the hives and an outer rough case. A gunny-sack, with planer-shavings placed in a super, formed the cushion.

I had 5 colonies, one in a 10-frame Langstroth hive, two 8-frame Langstroths, and two Danzenbaker hives. We had a light fall of snow just before they took their flight, about the middle of March, and the first and a lot of bees, for when they lit on this fluffy snow they sank in and soon met death in the icy meshes of that downy white mantle. Had the snow been packed the least they could have risen again, but, as it was, I lost a lot of my

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

**NOTE.**—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pic on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

### 3-Frame Nuclei For Sale

We are now booking orders for 3-frame Nuclei of Italian Bees, with queens, to be delivered between May 15 and June 1—first come first served. They will be shipped by express from Kankakee Co., about 50 miles south of Chicago. They are on Langstroth frames, and the number of Nuclei is limited. Prices are, f. o. b. starting point—One Nucleus, \$3.00; 5 or more at one time, \$2.75 each.

**GEORGE W. YORK & CO.**

bees that could not well be spared at that time. In March I fed about 30 pounds of honey, which a store-keeper had allowed to become filled with flies, etc., and which was of course unsalable. I thinned it down with hot water, and the bees carried it in with avidity, and, as a result, they are well supplied with food.

Now, for the result: I went through them yesterday and found them all alive, and all have some brood. The 3 colonies in Langstroth hives are much stronger than those in Danz. hives. The 10-frame Langstroth, and one of the 8-frame, are in fine condition. The latter has two frames of brood that are a pleasure to look at. It is a large, solid patch of brood without misses.

The weaker of the Danz. hive colonies has started two queen-cells, much to my surprise. In one of the hives I found a small patch of what looked like "laying worker" brood; they looked like small rifle cartridges, with the caps of the cells bulging out. Perhaps it is drone-brood from the queen. I hope it is.

How I wish I could have the advantage of a visit from an expert like Dr. Miller or Mr. Alley, or one of the bee-keepers. Being here alone I blunder along making many mistakes, and sadly feel my ignorance. I could not manage last year, but for the American Bee Journal. That dollar is my best investment, and pays me the largest returns for my money. But, oh, for the living voice and experienced hand of an expert in my apiary, if only for an hour!

My hives stand on a railway embankment, consisting of boulders, so I am afraid to clip my queens, lest they get away, when they should crawl under a stone and I be unable to find them. But this is one of the things I should like to have the advice of an expert on. Mine is a very poor location, but it is that or nothing.

My bees are gathering any quantity of pollen from the pussy-willows. After that they have nothing to get until white clover, and that is the only honey harvest they will have, as our bush is all coniferæ. The gardens furnish a few flowers, but nothing worth mentioning. However, there is any amount of white clover, while it lasts. **H. BEER.**  
British Columbia, Canada, April 22.

### Prospects Good.

I am somewhat interested in bees, having 25 strong colonies. I did not lose one during the winter; they wintered in better shape than for the past six years.

We have plenty of white clover, so the prospects are good for honey this season. I notice some of the bee-keepers report the same in other localities. Well, hurrah for a change, for we have had several years that have been almost failures here.

I have taken the Bee Journal only a short time, but I think it is a fine paper, and every one who keeps bees should have it every week. **L. W. ELMORE.**  
Jefferson Co., Iowa, April 27.

### A Lecture on Ants and Bees.

Last evening Rev. W. T. Elsing gave a lecture at the B. B. Memorial Presbyterian Church; he had a good, attentive audience, and he used stereopticon pictures, which were excellent; many of them I recognized as coming from various bee books and papers. Mr. Elsing's lecture showed that he had read the proper books. He did not soar away into flowery untruths, but gave a plain, lucid, understandable talk. His audience were charmed with the talk and illustrations. He is doing this work gratuitously as missionary work, to try to show the beautiful in Nature, and the loving kindness of God. I had never met him before, but before the lecture I formed his acquaintance, and told him about our National Bee-keepers' Association, of which I had not known anything. I gave him the last copy of the American Bee Journal, which he was glad to receive, having never seen one. I invited him to join the National Bee-keepers' Association, and to subscribe for the American Bee Journal. I told him about the work and objects of the National Bee-keepers' Association, and the audience of \$1,000 for manufactured comb honey, and several other points. He announced them all

### Tennessee Queens.

Daughters of Select Imported Italian, Select long-tongued (Moore's), and Select Straight 5-band Queens. Bred 3/4 miles apart, and mated to select drones. No bees owned within 2 1/2 miles; none imported within 3, and but few within 5 miles. No disease. 30 years' experience. **WARRANTED QUEENS**, in cages, each; **TESTED**, \$1.50 each. Discount on large orders. Contracts with dealers a specialty. Discount after July 1st.

10 colonies Italian Bees in good condition in dovetailed hives—painted.  
 Hoffman frames. Price, \$3.50 for 8 frame, and \$4.00 for 10-frame.  
 F. V. DAVIS,  
 19Atf 424 River St., Hanstee, Mich.

in his lecture, and most positively asserted that the people need never be afraid of purchasing comb honey; and also emphatically denied that the bees injured perfect fruit, but that other insects did, and that the bee naturally sucked the juice from the inviting hole.

This man is trying to lead the people aright, just on the subject of ants and bees.

CHAS. E. KEMP,  
 Baltimore Co., Md., April 23.

## Too Cool for Bees.

As it is too cool to-day for me to be out I will write about my bees. They came through the first part of the winter in very good condition, and were breeding up very fast, but now, April 23, it is unusually cold, and I cannot say how they will do. I hope it will turn warm soon. There are thousands of bloom out now, but so cold that the bees cannot fly.

A. J. McBRIDE,  
 Wautauga Co., N. C., April 24.

## Spring Robbing Among Bees.

I see that some one in Pennsylvania has trouble with his bees robbing back and forth in the spring. Now, it is a common thing, where bees are wintered in a cellar, and all come out with nearly the same scent, for some of them to get to plundering from each other, and keep it up until some of them are entirely used up. I am surprised that Dr. Miller, with his 40 years among the bees, has never had a case.

The sweetest remedy I have ever found is to feed each colony so engorged a quart or so of feed scented with something that will give each colony a different scent. To No. 1 I give feed scented with peppermint; to No. 2 wintergreen, and so on until all that are engaged in plundering carry a different scent. A few slices of onion put into one hive will fix that colony so they will meet with a warm reception wherever they go. Essences of all kinds are better than the oils, as the oils will not mix with the feed as well as essences.

I use quart fruit-jars, and put the feed in at night when all are at home. Use an extension-hit to make a hole in the top board, and set the bit so it will cut the hole just large enough to receive the mouth of the jar. Cut the jars full, then tie over a single thickness of cheese-cloth. Have the feed rather thin, so the bees can get it readily, turn the jars over with a quick motion, and it will not run out any faster than the bees draw it out through the cloth. The hole in the top-board should be directly over the bees, so that the feed is right with the mouth of the jar. Do not work at it at night and day as long as it lasts. The cap of the hive should be put over the jar when on, so that no bees can get a taste of the feed from the outside. Use enough of the scenting material to give the feed a perceptible flavor of the different kinds which you use, and that kind of plundering will soon cease after they get the feed.

The bees are in fine shape here, but the weather is cold; there is scarcely a day when they can fly safely. IRA BARBER,  
 St. Lawrence Co., N. Y., April 20.

## An Experience with Bees.

In the spring of 1901 I bought 2 colonies of bees in old-fashioned shallow hives, having room in each super for 40 sections. They cast 6 swarms. I kept 4 and gave away 2. I got 200 pounds of honey in the fall. The 6 colonies came through the winter all right, being buried in straw, all save the entrance or south side. They cast only 7 swarms last year, the most of them very late, as I will more fully explain later. I kept 5 and gave away 2. I got only about 40 pounds of honey from the 11 colonies, for as all know, last year was a very poor honey-yielder.

Having put the 5 new swarms in 8-frame dovetailed hives, and being desirous of having my little apiary uniform, I sold all of my old-fashioned hives, keeping only the 5 new ones. I bought 4 more colonies, from a neighbor, that had come off very late, and were put in the 8-frame hives, so if you are keeping up with me you will see that in the fall of 1902 I had 9 colonies of bees in 8-frame hives.

I have said all this to get to a place where I can relate what to me is the most interesting part of my experience, viz.:

August 9, 1902, I hived a large swarm of bees in one of the above hives; it was raining almost daily, and was cool. Knowing there had been no nectar in the bloom all summer, even if the bees could have flown, I reasoned that they could gather nothing since it had been so cold and wet. I concluded I would better look at them. Aug. 16, 1902, seven days after I had put them in the hive, was a nice, warm, sunny day, and although I had never done anything of the kind, I determined to look at them, especially as the bees were flying lustily from the other hives, and not a bee coming out of this one. I put on veil and gloves and removed the top from this hive, and there the bees were in a bunch, dispirited, lifeless, and seemingly in a starving condition. I grew bolder and lifted out all the frames. There was not a scintilla of comb made. I was so disappointed that I could not bear the idea of their starving, so I put on an empty super, and placed in it a pie-pan, laid some cobs in it, and filled with syrup. I made the syrup by filling a gallon bottle with granulated sugar and pouring in cold water and shaking until all was dissolved. The bees were ravenous, and soon emptied it. I continued to fill the pie-pan with sugar syrup for some days.

All of this time it was raining, when I thought I would see if they were simply eating syrup or were building comb. I again lifted the frames and found they were rapidly filling them with the most beautiful white comb. Matters were now becoming decidedly interesting to me, and knowing all my other colonies were in almost as bad a condition, I placed empty supers on them, with pie-pans in the supers, and fed all until I had fed \$15 worth of sugar to the 9 colonies. As 7 of them had to make their comb out of sugar, is it at all surprising they consumed 45 gallons of syrup, or 3 gallons for every dollar's worth of sugar?

Now, what of the result? About the middle of March I noticed an enormous amount of a wet, black stinking mass on the bottom-board, placed empty supers on them, with pie-pans in the supers, and fed all until I had fed \$15 worth of sugar to the 9 colonies. As 7 of them had to make their comb out of sugar, is it at all surprising they consumed 45 gallons of syrup, or 3 gallons for every dollar's worth of sugar?

Now, what of the result? About the middle of March I noticed an enormous amount of a wet, black stinking mass on the bottom-board, placed empty supers on them, with pie-pans in the supers, and fed all until I had fed \$15 worth of sugar to the 9 colonies. As 7 of them had to make their comb out of sugar, is it at all surprising they consumed 45 gallons of syrup, or 3 gallons for every dollar's worth of sugar?

Some of the colonies, especially the one coming off Aug. 9, 1902, are full of bees. Did they develop last fall? or are they the old bees that I put in there? The four colonies I bought I did not get until late in the fall; they were empty and starving. I fed them until cold weather. Surely, they could not have dropped young bees last fall during the winter, so the bees now must be new ones put in last fall. All 9 colonies came through, but one was so weak the others pounced upon it when I was gone one day, completely annihilating it. They punctured the comb and tore it up in a great way.

I may add that I immediately subscribed for the American Bee Journal on buying my first 2 colonies. I have since bought Prof. Cook's Manual of the Apiary. I am too busy with my profession to read much bee literature, but it is getting "mighty interesting." W. A. WISEMAN, M. D.  
Douglas Co., Ill., April 13.

[The freeze may and may not have killed the brood.

The bees present in the middle of March were mostly those reared after the swarm was hived Aug. 9, and the bees in the other colonies were, as you surmise, reared before winter. Generally no young bees leave the cells after October.—EDITOR.]

CONVENTION NOTICE.

Illinois.—The spring meeting of the eastern part of the Northern Illinois Bee-Keepers' Association will be held at the residence of James Taylor, in Harlem, Winnebago Co., Ill., on Tuesday, May 19, 1903. All interested in bees are cordially invited to attend.  
B. KENNEDY, Sec.

A Good Poultry Supply House.—A new advertisement of an old reliable poultry supply house comes into our columns this issue. It is that of W. J. Gibson & Co., of Chicago. Many of our readers have had satisfactory dealings with these people for years. There is hardly any necessity of the poultry business but what is carried by this concern, who make it a point to supply to their customers the best, and only the best, there is going. In the personnel of the house there is a good deal of poultry talent, certain of the members being actively engaged in the poultry business. At least one, Mr. H. M. Horton, is well known to poultrymen, and is at present a director in the National fanciers' Association. Naturally, they know what the poultryman's needs are, and what is best adapted to meet them. In the present of our readers we heartily commend the advertisement to their notice. Please mention the American Bee Journal when writing to them.

The Nickel Plate Road

is the short line to the East, and the service equal to the best. You will save time and money by traveling over this line. It has three through daily express trains, with through vestibuled sleeping-cars, and American Club Meals, ranging in price from 35c. to \$1.00, are served in Nickel Plate dining-cars; also a la carte service. Try a trip over the Nickel Plate Road, and you will find the service equal to any between Chicago and the East.

Chicago depot: Harrison St. and Fifth Ave. City Ticket Offices 111 Adams St. and Auditorium Annex. John Y. Calahan, General Agent, 113 Adams St., Room 298, Chicago. 'Phone Central 2057. 1—17A5t

Catnip Seed Free!

We have some of the seed of that famous honey-producing plant—Catnip. It should be scattered in all wasteplaces for the bees. Price, postpaid, 15 cents per ounce; or 2 ounces mailed FREE to a regular subscriber for sending us one NEW subscriber to the Bee Journal for one year, with \$1.00; or for \$1.20 we will send the Bee Journal one year and 2 ounces of Catnip seed to any one.

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, April 18.—Little change from last quotation, sales are few and prices not firm. No. 1 to fancy white, 15@16c; other grades range from 10@14c. Extracted, white, 6@7c; amber, 5½@6½c. Beeswax selling on arrival at 32c. R. A. BURNETT & Co.

ALBANY, N. Y., Mar. 14.—Honey demand quiet; receipts and stock light. Comb selling, 12½@15c; mixed, 11@14c; dark, 13@14c. Extracted, dark, at 7@7½c. Beeswax firm, 30@32c. H. R. WRIGHT.

KANSAS CITY, April 20.—The supply of comb honey is about exhausted. The demand good. We quote you as follows: Fancy white comb, 24 sections, per case, \$3.50; No. 1 white comb, 24 sections, \$3.40; No. 2, white and amber, per case, \$3.00@3.25. Extracted, white, per pound, 6@6½c; amber, 5½c. Beeswax, 25@30c. C. C. CLEMONS & Co.

CINCINNATI, Apr. 27.—Little demand for comb honey at present; fancy white sells at 15@16c in a small way. We quote amber extracted at 5½@6½c; white extracted, Sales not so lively as expected this season of year. Amber extracted is offered on all sides, and future prices are awaited with intense interest. Beeswax strong at 30c. THE FRED W. MUTH Co.

NEW YORK, April 8.—Comb honey is moving rather slowly at late and prices are somewhat declining. We quote fancy white at from 14@15c; No. 1, white, 13@14c; amber, 11@12c. Extracted quiet and easy, with plenty of supply. We quote white at 6½@7c; light amber, 5½@6c; dark at 5c. Beeswax steady at 30@31. HILDRETH & SIBBLEER.

CINCINNATI, Apr. 18.—The comb honey market is a little better, as the big stock is almost exhausted; prices are better—fancy water-white brings 15@16c. The market for extracted has not changed whatever, and prices are as follows: Amber in barrels, 5½@5¾c; white clover, 6@6½c; white clover, 8@8½c. Beeswax, 26@30c. C. H. W. WEBER.

SAN FRANCISCO, Mar. 11.—White comb honey, 12½@13½c; amber, 9@11c; dark, 7@7½c. Extracted, white, 6½@7½c; light amber, 5½@6c; amber, 5@5½c; J. dark, 4½@4¾c. Beeswax, good to choice, light, 27@29c; dark, 26@28c.

Demand is fair on local account for water-white, unacidified, but there is not much of this sort obtainable. Market for same is firm at prevailing rates. Canned stock and common quantities are going at somewhat irregular and rather easy figures, holders as a rule being desirous of effecting an early clean-up.

# The Best Bee-Goods in the World....

are no better than those we make, and the chances are that they are not so good. If you buy of us you will not be disappointed. We are undersold by no one. Send for new catalog and price-list and free copy of THE AMERICAN BEE-KEEPER; in its thirteenth year; 50 cents a year; especially for beginners.

THE  
**W. T. Falconer Mfg. Co.,**  
JAMESTOWN, N. Y.

W. M. GERRISH, Epping, N. H., carries a full line of our goods at catalog prices. Order of him and save the freight.

# A Few Cheap Smokers!

We find we have on hand a few slightly damaged Clark and Bingham Bee-Smokers, which got a little damp and soiled at the time of the fire in the building where we were about 2 years ago. They are all almost as good as new.

We have some of the Clark Cold Blast, which when new sell now at 55 cents each; some of the Large Bingham—new at 65 cents each; and some of the Little Wonder Bingham—new at 50 cents. But to close out those we have left that are slightly damaged, we will fill orders as long as they last at the prices:

Clark at 25 cents each; Little Wonder Bingham at 30 cents each; and Large Bingham at 40 cents each.

We do not mail any of these slightly damaged Smokers, but will put them in with other goods when ordered, or sell them here at our office when called for—at the above prices.

# WAX PROFITS.

Many bee-keepers allow old combs and scraps of beeswax to collect, which, for lack of time and the proper utensils, is scattered or eaten up by moth-worms. A big item would be added to

the year's profits by the timely rendering of said wax by an economical process. We believe the press illustrated herewith fills a long-felt want in rendering wax.

B. Walker, Clyde, Ill., says:

"Was inclined to believe at first that the German wax-press was a failure; but after a thorough trial was well pleased. I secured 30 pounds more wax from one day's use of the machine than I would have secured by the ordinary method of rendering."

N. E. France, of Platteville, Wisconsin, State Inspector of Apiaries, and Gen. Mgr. National Bee-Keepers' Association—says:

"The German wax-press is by far the best machine or process to save wax from old, black brood-combs."

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

## The Record

Began advertising experience as editor of Commercial Union.

Organized Western Agricultural Journals Associate List. "Leaders of the Great West and Star of the East."

Began Publication of Agricultural Advertising. Founded, named and edited it.

Organized and established The Frank B. White Company. Originated its policy formulated its methods and made it a success.

Increased capital stock of Frank B. White Company, enlarged its capacity and gave it a commanding position among the great advertising agencies.

Sold my interest in the Frank B. White Co. and began the publication of Class Advertising.

Organized WHITE'S CLASS ADVERTISING Co. under the laws of Illinois with a capital stock of \$100,000. Leased commodious offices in the Caxton Building and am prepared to originate, design and place class advertising and to do more business and do it better than ever before.

In the Light of  
the Past we go  
Forward

Will you use our  
Light

"I know no guide but the lamp of experience," said Patrick Henry.

The lamp of my experience which in 1886 was like the faint glimmer of a tallow dip light has after being at it 17 years become the search light that illuminates the whole field of class advertising. White's Class Advertising Co. has secured the front half of the ninth floor of the Caxton Building, 334 Dearborn Street, Chicago, with more than 2,000 square feet of floor space which is being equipped with the most modern conveniences for the transaction of a modern advertising business along class lines. I shall be glad to talk about my special service system which was originated and developed by me and has been successfully used in behalf of many advertisers.

**Frank B. White**

Councillor at Advertising

334 Dearborn St., Chicago

WHITE'S CLASS ADVERTISING Co. is the name of a new company recently organized here in Chicago, its object being that of placing advertisements in class papers—advertising agents in the agricultural line, principally. Mr. Frank B. White, who has had 17 years' experience in the business, is the president of the company; E. J. W. Dietz, vice-president; George W. York, treasurer; and W. C. Gray, secretary.

On the evening of April 30, the new company gave a banquet to some of its friends and stockholders, at the Union League Club of Chicago, there being nearly 80 present. Dr. C. C. Miller was there, to represent the bee-keepers. The above design, with reading enclosed in border, appeared at each plate. After the banquet board was cleared of its tempting viands, addresses were delivered

along the advertising line, with frequent very complimentary allusions to Pres. White, the host of the evening, whose high character and business ability among both advertisers and publishers are greatly appreciated. The Editor of the American Bee Journal has been closely associated with Mr. White for about 10 years, and is glad to be able to endorse all the good things said of Mr. White.

"Class Advertising" is the name of a handsome monthly magazine published by the Company. It is devoted to the advertising side of the business of manufacturing and putting on the market everything used by those engaged in rural industries. Every advertiser and every manufacturer of the goods indicated should read "Class Advertising" regularly.

The new Company starts out with excellent prospects of a bright and profitable business career. Any of our readers or advertisers who may need the services of such a concern will do well to consult them.

## \* Editorial Comments. \*

**Hastening the Granulation of Honey** is a thing that has hardly been desired in this country heretofore, the prevention of granulation having been the thing eagerly sought for. In Europe, however, the hastening of granulation has been more or less discussed for years. It is possible that in some cases it may be a matter of interest in this country. It is well understood that cold helps granulation. Occasional or frequent stirring is also a help, and it is said that frequent agitation gives a finer grain. Another thing that may be done to hasten granulation is to stir into clear honey a small portion of candied honey, the granules serving as so many centers from which granulation starts.

**Phacelia in Germany.**—A letter in Gleanings in Bee-Culture gives a glowing account of phacelia as a forage-plant in Germany; and many have praised it in the German bee-journals. It seems a little strange that no California bee-keeper has anything to say about it as a forage-plant, although it was introduced into Germany from California. The letter referred to is as follows:

Dr. C. C. Miller says, page 8, speaking of phacelia: "But no one has told us yet about its value as a forage-plant." A Mr. Karger, of Schreibendorf, writes: Mr. L., a practical farmer, sowed about the middle of May, phacelia on a piece of ground that had been in potatoes the previous year. Notwithstanding the cold and wet weather it grew luxuriantly, and reached an average height of 32 inches. While the phacelia was in bloom, although Mr. L. fed it to cattle that had been getting grass and green clover, yet they ate it voraciously. He also noted an increase of milk in quantity and quality.

A Mr. Haunschild, of Klein-Sagewitz, says that a farmer of his place had seven acres of phacelia; after the first cut of red clover had been fed, the phacelia was cut while the second week in bloom. The cows ate it with eagerness, and could hardly get enough. I think the above testimony ought to be sufficient to encourage all those to a trial who would like to have a bee-plant that might be grown in quantity to fill out a gap in the honey-flow, while its value as feed (green or hay) would pay the farmer for his trouble and expense, apart from its value as a honey-yielding plant. Phacelia begins to bloom about six weeks after sowing, and care should be taken not to sow it too thick.

**Giving Frames of Brood** from one colony to another is a matter that requires some judgment. If the object be to strengthen the colony to which the brood is given, then the more mature the brood the better, for giving a frame of brood about ready to emerge is much the same as giving the same quantity of young bees a few days later. It must be remembered, however, that it is also the same as taking bees from the colony that furnishes the comb, and it is generally very poor policy to strengthen a weak colony at the expense of a stronger one early in the season.

There are cases, however, in which, even early in the season, there may be a decided gain by giving brood from one colony to another. Sometimes a colony is found with a good force of bees, but without a queen, or having a young queen not yet laying, perhaps just emerged. Give to such a colony as many frames of brood as the bees can cover, but let the brood be as young as possible. If you take from a strong colony a comb of eggs or very young brood, and then put in the middle of the brood-nest an empty comb, or one containing honey, it will be promptly occupied by the queen, and thus you will have at the end of three weeks the bees produced from two combs instead of the one. So long as you may think it desirable for any reason to continue a colony that has not a laying queen, you will find it

policy to furnish it with brood from other colonies, always as young as possible. If a young queen not yet laying is present, it is believed that the presence of young brood will in many cases hasten her laying.

**Bees as Messengers.**—Perhaps two or more years ago accounts were given of experiments across the sea in which bees were used somewhat as carrier pigeons, and now a clipping from the Toledo Blade has been received which probably refers to the same experiments. M. Tagnac fastened pieces of paper to bees at a distance from their homes, and when they returned to their hives they could not enter because the entrance was made too small for them to pull the paper through. The success of the experiments was based on the ascertained fact that bees would find their homes at a distance of 4 miles.

The likelihood is that there has been nothing new in this line, and that the old item has simply been furnished up for the sake of filling up. A bee would hardly find its home at a distance of 2 miles, much less 4, unless it had previously been over the same ground, and encumbered with a weight the distance would be still shorter. It is not likely that bees will ever be regularly employed to carry messages.

**Hatching Eggs Over Bees.**—We have received the following on this subject, which was up several years ago:

Empson, York:—I enclose you a clipping to ascertain whether you can substantiate the statements therein made. As I keep poultry in connection with bees, it is quite a discovery, if true. W. F. BRAGG, Kitsap Co., Wash.

The clipping sent by Mr. Bragg reads as follows:

### HATCHING EGGS WITH BEES.

John Norton, of Illinois, has, for several years, been interested in bees, and has given them and their habits much study. It was this study that led Mr. Norton to devise one of the most interesting, and at the same time, most practical schemes of modern poultry culture. It is nothing more nor less than the hatching of thrifty and strong chickens in hives with the bees.

In watching the daily life of the busy insects, Mr. Norton noted that they laid and hatched eggs. It at once occurred to him that if bees' eggs would hatch, that the eggs of hens might also be quickened into life under the same conditions. He began experimenting, and with the final result of a practical, perfect, and cheap incubator. It is made as follows: A common hive is built with double walls, the dead space being filled with chaff in order that changes of temperature without may affect as little as possible the temperature within. Upon this hive is placed the common box cap that usually forms the second story of a hive, and which contains the honey of commerce. The main hive is filled with small boxes so familiar to all, and these contain the brood-comb and a supply of honey. Over these boxes is placed first a piece of oil-cloth and second a cloth blanket. Upon this blanket the eggs are placed, and above them two bags of chaff, filling the top, and so arranged that there is a slight cone of vacant space beneath the bags in the hive. The eggs, having been placed in the hive, are left to the care of the bees. The heat from the bees below, and from the brood-comb, keeps the eggs warm, and they hatch in exactly the same time as beneath a hen. No matter what the temperature without, that within never varies half a degree. If it grows cold the bees begin to devour the honey and give off heat. If it becomes warm without, the bees create a draft with their wings, and maintain an even temperature.

From 50 fertile eggs, at three different times placed in the hive, Mr. Norton has hatched 50 strong chicks, a record seldom equalled by hen or incubator. The eggs require no moistening as in an incubator. They need only to be placed there and allowed to remain till the period of incubation is passed. The chicks, as they hatch, crawl into the little cone-like space between and under the bags of chaff, and are found hungry and happy when the hive is opened. Mr. Norton is to be congratulated on the success of this experiment.

We sent the foregoing to Dr. C. C. Miller, who has this to say about it:

I read that clipping to a friend who is somewhat familiar with both bees and poultry, and after reading it I said, "What do you

think of it!" The answer came very promptly, "I don't believe it." I am strongly inclined to the same way of thinking. There have been reports of hens' eggs being hatched out over a bee-hive, but that a bee-hive could come into successful competition with a good incubator or a respectable biddy seems very doubtful. If eggs need turning in an incubator or under a hen, why should the turning not be needed over a colony of bees? The heat might be sufficient in a spell of very hot weather, but in a chilly night it is not very likely that the heat from a colony of bees would be sufficient to answer. Of course, I don't know; I'm only saying how it looks to me. One thing gives away the story as being written by some one not well versed in bee-matters: "The main hive is filled with small boxes so familiar to all, and these contain the brood-comb and a supply of honey." That is, the brood-chamber is filled with sections! C. C. MILLER.

And now comes Dr. G. P. Hachenberg, of Travis Co., Tex., who gives his experience as follows:

EDITOR YORK:—After carefully testing the temperature of a small colony of bees confined in one story, I placed a layer of fresh chicken eggs in the bottom of the second story, loosely wrapped in some woolen flannel. The eggs were separated from the bees with a newspaper, and carefully dated, so as to be sure to have them removed after the period of their incubation. They were set at large before the shells were fully broken, to guard them against the attack of the bees. The eggs required occasional turning, but no moisture.

In regard to the nursing of the little chicks, I had at the same date on the eggs set a hen with about 15 eggs with like date. These would come to maturity about the same time. After the chicks were hatched by the bees they were united to those of the hen, making in all a brood of 25 or 30 little chickens. These large broods are often seen in this climate, uniting the broods of one or more hens, and putting them under the care of one hen.

Some years ago I think I reported to you having a hen hatching eggs close to a bee-hive; the object was to prevent a valuable dog from eating the eggs. The dog had a great horror of bees, and he never went near those eggs, and the experiment proved a success. G. P. HACHENBERG.

When doctors disagree, who shall decide? We can't act as umpire in this game. Mr. Bragg would better try it for himself.

## Association Notes.

MR. WM. A. SELSER, of Philadelphia, Pa., has been appointed by the Executive Committee of the National, to succeed the late Thomas G. Newman, as member of the Board of Directors.

MR. UDO TOEPFERWEIN, of San Antonio, Tex., has been appointed by the Executive Committee of the National, to succeed Mr. A. I. Root, as member of the Board of Directors. Mr. Root resigned recently.

THE CHICAGO NORTHWESTERN CONVENTION REPORT will be resumed after publishing the proceedings of several other conventions which can be disposed of at the rate of about one a week. After that the Chicago-Northwestern will be continued until completed. We have copy of all the last day's proceedings, which are very interesting indeed. We regret that we have not the room to spare to finish up a lengthy report in a less number of issues. But sweetness long drawn out is best sometimes, we suppose.

HURRAH FOR ILLINOIS!—The State Legislature has passed the Bill in the interest of bee-keepers in this State. The last we heard it needed only the signature of the Governor to make it a law. The Illinois State Bee-Keepers' Association has full charge of the \$1,000 provided in the Bill, and also the expenditure of the same.

The provisions of the Bill are quite general, so that the funds can be used for various purposes for the benefit of bee-keeping in the State. We have no doubt that the officers of the State Association will see that it is expended wisely, and that much good will result from its use. We think the first thing needed is to provide one or more foul brood inspectors, who shall visit apiaries diseased, and thought to be diseased, and thus endeavor to rid the State of foul brood, or any other bee-disease as rapidly as possible.

We give herewith a copy of the Bill as passed:

### A BILL

For an Act making an appropriation for the Illinois State Bee-Keepers' Association.

WHEREAS, The members of the Illinois State Bee-Keepers' Association have for years given much time and labor without compensa-

tion in the endeavor to promote the interests of the bee-keepers of the State; and

WHEREAS, The importance of the industry to the farmers and fruit-growers of the State warrants the expenditure of a reasonable sum for the holding of annual meetings, the publication of reports and papers containing practical information concerning bee-keeping, therefore, to sustain the same and enable this organization to defray the expenses of annual meetings, publishing reports, suppressing foul brood among bees in the State, and promote this industry in Illinois:

SECTION 1.—*Be it enacted by the People of the State of Illinois represented in the General Assembly:* That there be and is hereby appropriated for the use of the Illinois State Bee-Keepers' Association the sum of one thousand dollars (\$1,000) per annum for the years 1903 and 1904, for the purpose of advancing the growth and developing the interests of the bee-keepers of Illinois, said sum to be expended under the direction of the Illinois State Bee-Keepers' Association, for the purpose of paying the expenses of holding annual meetings, publishing the proceedings of said meetings, suppressing foul brood among bees in Illinois, etc.

Provided, however, That no officer or officers of the Illinois State Bee-Keepers' Association shall be entitled to receive any money compensation whatever for any services rendered for same.

SEC. 2.—That on the order of the President, countersigned by the Secretary of the Illinois State Bee-Keepers' Association, and approved by the Governor, the Auditor of Public Accounts shall draw his warrant on the Treasurer of the State of Illinois in favor of the Treasurer of the Illinois State Bee-Keepers' Association for the sum herein appropriated.

SEC. 3.—It shall be the duty of the Treasurer of the Illinois State Bee-Keepers' Association to pay out of said appropriation, on itemized and receipted vouchers, such sums as may be authorized by vote of said organization on the order of the President, countersigned by the Secretary, and make annual report to the Governor of all such expenditures, as provided by law.

MR. N. E. FRANCE, General Manager of the National Bee-Keepers' Association, informs us that several members whose bees have become an annoyance to neighbors, have had legal proceedings begun against them to remove their bees. They now want the National to stand by them. Mr. France says that first he must know the whole history of each case before he can advise the best procedure. He says that too many have bees in cities that are an annoyance, and can and should be removed, or the public protected in some way. He is for peace and good neighbors, employing lawsuits to settle matters only as a last resort.

Several large bee-keepers' associations have lately sent in the dues of their members.

Mr. France is after a honey-adulterating firm. He says he has good evidence, and will soon "come down" on them.

Mr. France is doing all he can to push the work of the National. He is indeed a very busy man, as a good General Manager properly should be if he does all that needs to be done in order to make the Association effective in the interest of its members.

## \* The Weekly Budget. \*

MR. JOHN NEBEL, senior member of the firm of John Nebel & Son, of High Hill, Mo., died May 5, in his 70th year. The old bee-keepers seem to be fast passing away.

THE APIARY of A. J. KILGORE appears on the front page this week. When sending the photograph Mr. Kilgore wrote as follows:

I have 34 colonies in good condition. They are kept on the rear of my lot. The picture shows the rear end of the house; it shows also myself, but I am not particular about calling special attention to this part of the picture. The small trees shown are fruit-trees—cherry, apple, pear, plum, and apricot.

I have kept bees more or less for 40 years, and find great pleasure in working with them, and in the study of their habits. The summer of 1901 was good for honey-production; my bees then averaged 46 pounds of comb honey per colony; but the summer of 1902 was very unfavorable, the average being about 30 pounds of comb honey. The fall flow, however, was good, so they laid in sufficient supply for winter.

I winter the bees on the summer stands packed well in planer-shavings. I have had a few cases of foul brood, but I treated them very successfully by the McEvoy plan. I rear my own supply of queens, buying one only occasionally to get a little fresh blood. I keep no queens more than two years, exchanging them for young ones. This I consider a very important item in the profitable management of bees. A. J. KILGORE.

Mr. Kilgore certainly has a beautiful home. He looks happy and contented with his lovely surroundings.

## Convention Proceedings.

### Report of Vermont Bee-Keepers' Convention.

BY M. F. CRAM, SEC.

The meeting of the Vermont Bee-Keepers' Association was held at South Hero, Jan. 28, 1903. It was a joint meeting with the Horticultural Society, they holding their meeting the day before, and the last evening there was a joint discussion between the two societies.

The bee-keepers' meeting was opened with a song by Prof. W. N. Phelps, entitled, "Good Old Summertime?" prayer was offered by Mr. Story; the minutes of the last meeting were read and approved, and the following committees were then appointed:

On Nominations—V. V. Blackmer and R. H. Holmes.  
On Resolutions—M. F. Cram and H. L. Leonard.

#### REQUREERING AND OTHER MATTERS.

R. H. Holmes begged leave to digress from his subject a little at the beginning. Grand Isle County is a great place for fruit-growers and bee-keepers. The best bees are what we want for the fertilization of fruit. The islands are long enough for any bee, but not wide enough for large apiaries, but every fruit-grower should keep a few colonies of bees for the fertilization of fruit.

Some young man should keep on hand all the bee-supplies, so that any one can go there and get them.

Beginners should not buy high-priced bees, but should require later, if thought best. When a queen becomes worthless the apiarist should destroy it and give the colony another queen, or brood from which to rear one. The better way would be to buy a queen of some good, reliable breeder. Beginners should not get more than two colonies to start with, but should procure one or two standard books on apiculture.

Mr. Brodie, who is in the employ of the Canadian government, gave a talk on the "Spraying of Fruit-Trees." He said trees should be sprayed before the blossom is open, and again soon after the blossoms fall, but never while in bloom. The water would injure the fruit, even if there were no arsenoids in it.

#### VALUE OF BEES TO THE FRUIT-GROWER.

"Of what value are the bees to the fruit-grower?"

Mr. Leonard said that the bees carry pollen from one blossom to another, thereby causing the fruit to set. He also said that small bees helped some in this work, but honey-bees did the best of all. Trees have been covered, thereby excluding the bees, but such trees produce no perfect fruit.

Mr. Cram spoke of the value of bees in raising buckwheat. The more honey you get the more grain you get. One man in Virginia thought he could get rich raising pear-trees. He set out a large number of Bartlett pear-trees. He got no pears, for the reason that his pears were all of one variety. He sold out to another man who tried it, but with the same result. He sold to a man who set out another variety of pear-trees, thereby obtaining a cross-fertilization of the two kinds by means of the bees, and obtained an abundance of fruit. He said he had a plum-tree which had never borne any fruit, with the exception of a few scrubs. Last spring he broke a branch from another tree and hung it in that one, and obtained an abundance of fruit.

The Italian bees are the best fertilizers for clover, while the black bees are the best for buckwheat.

#### SHAKEN SWARMS—SAINFOIN—COMB FOUNDATION.

Mr. Blackmer said he preferred to let bees swarm naturally.

Prof. Shutt—On the Experimental Farm at Ottawa, Canada, John Fixter, the man who runs the station, said sainfoin was a very good plant for honey. Prof. Shutt said he had tried several experiments to see if bees would injure fruit, but he had never known bees to injure sound fruit.

In his remarks about foundation he said if we use very thin foundation the bees have to manufacture wax. If it is too thick it leaves a "fish-bone;" the medium-weight foundation being the best.

Unripe honey had done some damage to the market. Extracted honey had been known to absorb 15 to 20 percent

of water, and usually had 15 percent when taken from the bees. Honey should be kept dry and warm.

The afternoon session opened by two recitations from C. W. Scarff, one entitled, "His Uncle Hi's Sunshine Factory," and the other, "When I Get Rich," both of which were very entertaining.

The secretary's and treasurer's reports were read and approved.

#### THE PRESIDENT'S ADDRESS.

Another year has rolled around since last we met to talk over together our mutual interests as bee-keepers, our hopes and fears, our progress and our failures.

The past season in northern New England was quite unusual. Not since 1874 have we had such a rainy summer, and even that unusual summer was less cold than the past season, and yet, notwithstanding the cold and wet, the bees, as a rule in northern New England, have done well, having stored enough for winter, and surplus sufficient to repay their master for his timely care and attention.

We are in many respects highly favored here in Vermont, so far as concerns the health and vigor of our bees. While in most of our Northern States foul brood has been and is still doing great harm to bee-keeping interests, our State, so far as I know, is entirely free from this dread disease. It is true that what is known as "pickled brood" has made its appearance, but, so far, has done far less harm than was feared when it first appeared.

For the best grades of honey the price has ruled higher the past few months than for several years past. While this may be in part owing to light crops in other sections, there is reason to believe that the general prosperity of the country has much to do with it.

There is also a growing demand for honey as a wholesome and delicious article of food, in many families where it was in the not distant past unknown.

A few years ago it was almost unknown in the grocery trade. To-day no well-equipped grocery store is without it. There appears also to be an intelligent and growing demand for extracted honey, and I have noted with some satisfaction that our Vermont extracted honey sells higher than any other in our larger cities. We might perhaps have expected this while Vermont comb honey is preferred to any other brand.

There has been, I am sure, some advance the past year in the improvement of our stock. Recent study has shown very conclusively that there is as much difference in a given number of colonies of bees as regards their productiveness as there is in the same number of dairy cows. Our best apiarists are taking advantage of this fact, and breeding from their most productive stock. And while we can not, as yet, control the mating of our queens as with other domestic animals, I believe we can improve our bees quite as fast by rearing our queens from selected stock.

While we have no reason to complain or take a pessimistic view of the future, yet there are some things we may as well frankly admit as not altogether hopeful. The noble linden trees—the pride of our forests—are fast disappearing before the ax of the lumberman. We feel quite sure that the new growth does not nearly make good that cut down from year to year. Whether alsike clover, which has become fully naturalized in our Champlain valley, will make the loss of basswood good, it is yet too early to decide. I believe it will go a long way towards it. It winters much better than white clover, and, when sufficiently wet, comes up in old meadows, along the roadside, and in unlooked-for places, as well as in well-tilled fields where the seed has been sown by the hand of man. I have no doubt that during the past season there were several thousand acres of this clover within range of my bees, to say nothing of white clover and other honey-yielding plants.

Much may be done, however, to retain our basswood forests. I know one extensive bee-keeper who has purchased a large block of land near his home that he may control the growth of basswood now standing, as well as the young trees that come up freely and mature rapidly when protected by larger trees. This will furnish basswood bloom as well as wood and timber for untold time.

The production of alfalfa honey in more than a half dozen of our Western States, is a fact that must be reckoned with. In a recent business trip through Nebraska, Wyoming, Idaho, Utah and Colorado, I was surprised at the rapid strides that are being made in the cultivation of this valuable forage-plant.

The Rocky Mountains may be to-day considered as one vast cattle-pasture, while the valleys, where water can be had, are covered with alfalfa. More than this, east of this grand range of mountains, is a broad belt too dry for corn

or grain or Eastern grasses where this dry-weather clover seems to thrive most luxuriantly. And I hardly need to add that it furnishes food for bees as well as for cattle and sheep. Already alfalfa honey is more abundant than the far-famed white sage of California. The population of these alfalfa States is sparse, and most of the honey comes East in car-load lots. A few years since, I went to a large dealer in one of our New England cities, hoping to sell him my entire crop. Although early in the season, I found him stacking up a car-load of honey from Colorado, which he had bought. Suffice to say I did not sell my own.

Alfalfa honey, both comb and extracted, is beautiful to look at; as white or whiter than our best basswood honey, with a flavor, to my mind, much inferior to our clover or basswood. It granulates quickly, which may account for its being regarded with less favor than Eastern honey, and selling for a less price. I do not, therefore, believe it can compete with our comb honey. It may be different with extracted honey.

During the last two or three years a renewed interest has sprung up in bee-keeping in Cuba, and many bee-keepers have gone to that wonderful island to engage in their favorite pursuit, and are building up apiaries with marvelous productiveness. What the results will be no one can tell. The honey is probably not equal to our Northern honey. The great bulk of it is extracted or "strained," and finds a market on the other side of the broad Atlantic. But the Yankee bee-keeper in Cuba is not satisfied with two cents a pound for his honey, although produced in great abundance, and already he is shipping comb honey to New York.

Upon his success in this venture will depend in some measure the future price of honey during the latter part of winter, at least. How well we may be able to meet this influx of honey from Cuba and the far West, is a question for our consideration and most careful solution. One way I will at this time suggest, is the opening up of new markets, or increasing the demand where it is already known. In 1860 the New York market was broken down by what was then considered an enormous amount of honey—20,000 pounds. To-day that market will take hundreds of thousands of pounds of honey without a thought of being overstocked.

There is, I believe, a good and growing demand for extracted honey for table use, and this should be encouraged, as honey in this form is of almost as great value as food as butter at half its cost in the open markets.

During the past season I have made some experiments in securing white combs, or, rather, in preventing travel-stains, with fairly good success. The past season has been bad for the staining of combs, and yet, with a large number, I was able entirely to prevent it, or greatly reduce it, by the use of a properly constructed honey-board. I disliked to use or try even this remedy, fearing it would reduce the amount of surplus, but I have not found any serious objection.

My experience, the past year, with bleaching combs somewhat stained, has been quite satisfactory, thereby placing some six or seven thousand combs into the first grade, that otherwise would properly have been placed in a grade below.

I am also well pleased to state at this time that I am quite satisfied with the plain section and fences, giving bees free passage-ways around the edges of sections, as well as through the fences from one to another.

During the last few months some considerable space, in some of our bee-papers, has been given to the discussion of brushed swarms, or, more properly, forced swarms, for the purpose of preventing natural swarms. From my experience along this line I am led to believe that it at least promises well. Having practiced it to some extent for many years, I believe it is of much value in yards of bees that we can not visit more than once a week; that it will to a large extent control swarming, and at the same time give us a fair yield of honey.

J. E. CRANE.

Mr. Leonard wished to know whether sunshine would bleach combs without the use of sulphur. Mr. Crane said it could, but not as easily, nor is it as practical as with sulphur and common light.

#### A BEE-KEEPER'S TRADE-MARK—OTHER SUBJECTS.

Mr. Leonard said that a bee-keeper certainly should if he is an honest and practical man. The Government should make people mark their honey, and all other produce. Honey should not be faced, but should all be alike in the same case.

Mr. Crane would store honey in a chamber; high temperature is the best place in which to store.

How best to destroy queen-cells? Cut them out with a knife.

What is the cost of a queen-bee? From three to five dollars.

How shall we treat the new swarm so it will be less likely to start for Canada? Hive it in a clean hive, put in foundation or drawn comb, if you have it, or a frame of brood from some other swarm, and without queen-cells, is better still. Remove to a shady place as soon as hived; the farther from the place where they clustered the better.

A committee appointed one year ago to see if the bee-keepers and horticulturists would unite, reported it not practical.

V. V. Blackmer gave an interesting account of his six years' experience in bee-keeping in Florida. How the first winter he was there the big freeze came which wiped out thousands of acres of orange-groves, and killed nearly all of the honey-producing plants, and for the last eight years the bees have hardly made a living over the greater part of that State.

A vote of thanks was tendered the Canadian friends for their help in this convention.

Mr. Crane gave a talk on "Improving the Honey-Bee." The committee on nominations reported the following: President, O. J. Lowrey; Secretary, V. V. Blackmer, of Orwell; Treasurer, H. L. Leonard; Vice-Presidents: for Addison Co., G. C. Spencer; Orange Co., M. F. Cram; Rutland Co., V. N. Forbes; Lamoille Co., E. K. Seaver; and Chittenden Co., C. M. Rice.

The committee on resolutions made the following report: "We, the members of the Vermont Bee-Keepers' Association, do hereby tender our most sincere thanks to the people of South Hero for the very cordial reception they have given us, and for their bounteous provisions for the inner, as well as the spiritual and social, man.

"We would also thank our visitors from over the Canadian line for the insight they gave us into the doings of their Government—in our as well as kindred pursuits.

"Also to Prof. L. R. Jones for his address, and to the railroad companies who granted reduced rates to the convention."

M. F. CRAM,  
H. L. LEONARD, } Com.

## Contributed Articles.

### No. 3.—"Scientific Queen-Rearing" Book Combines All.

BY G. M. DOOLITTLE.

I HAVE waited since writing what I did on page 569 of the American Bee Journal for 1902, for the "smoke of battle" to clear a little on the queen-rearing subject, to see just what would be brought out in this matter. Many good things have been said, and many valuable ideas brought to light, the same being somewhat mixed with extravagant assertions, and, in some instances, rather immoderate language. For the good ideas and valuable things brought out, all ought to be extremely thankful. I believe that I, for one, have been much profited by this discussion, and wish here and now to thank those who have spent their time and talent in writing up this matter for the readers of the "oldest bee-paper in the world."

Then I see that some errors have crept into the minds of some, one of which is that Dr. Miller and others seem to think that Doolittle fully endorsed the "umbilical cord" idea, advanced by Dr. Gallup. This was not my intention, for I never claimed to know what the attachment was that I found holding the imago queen to the royal jelly. I had always supposed that it was Nature's means to keep the immature queen from resting on her head while she was being perfected in the cell, until I read the opinion of Dr. Gallup, and I am quite inclined to that opinion still. What I did intend to show was, that if there was any *virtue* in that "missing link" matter, such virtue was always present where queens were reared by the plan given in "Scientific Queen-Rearing;" and that Dr. Gallup was mistaken in

calling all queens reared by that plan among those he called worthless. And I think those who read aught else into what I said on page 569 (1902) will see their mistake by turning to that page and reading the matter over again.

In fact, I cannot see that all this write-up does little more than to emphasize the principles as laid down in the book above referred to, doing this by laying a little stronger claims to these principles than was done in the book. Gallup's whole claim is based on queens being reared in rousing colonies at a time when the bees are inclined to rear queens, either from the swarming impulse, or from superseding of queens. And this is just the ground taken by the writer of "Scientific Queen-Rearing." So my old teacher, and the author of "Scientific Queen-Rearing," agree exactly. All the author does is to show how queens can be reared by the Dr. Gallup way at the will of the apiarist.

Mr. Alley claims that the best queens can be reared by giving eggs or larvae to rightly "conditioned" nurse-bees which, with or without the help of other colonies, nurses and care for this brood so given, that the best of long-lived queens are produced. This point is also covered by "Scientific Queen-Rearing," in that it provides for these same nurse-bees, *rightly conditioned* to produce perfect success in their manipulation of the little larvae given them to mature into the best of long-lived queens; and does the same with less effort on the part of the apiarist than is necessary where the bees to build the cells must be sought out, "scientifically treated," confined in a box for a certain length of time, etc.

Then it exactly fills the bill of Mr. Riker, in that it provides for a laying mother being present at just the time when bees rear only queens which give those long-lived workers which hold out during the *whole* honey harvest, that enables the apiarist to secure the full results of the honey-flow, and which could not be obtained by queens giving bees with shortened lives.

In short, the plan given in "Scientific Queen-Rearing" combines the large hives with rousing colonies under the "swarming or superseding impulse," which "manufacture a large amount of electricity, heat or vitality," of Dr. Gallup; the "conditioned" nurse-bees, wanting a queen, of Mr. Alley; the rearing of queens when the "mother is present," of Mr. Riker; the selecting of those of the "proper age" for queen-rearing without interference of "older bees," of Messrs. Pratt and Simpson; and the "temperature and humidity," through plenty of nurse-bees and food in abundance, (from feeders when the same was not coming from the fields), of Mr. A. C. Miller; and is perfectly adapted to the wants of any bee-keeper, from the one having only two or three colonies, up to the one numbering his colonies by the hundreds or thousands. And there need be no limit as to size of colony used, in the large direction. Dr. Gallup's biggest colony can be used just as successfully as can one fully occupying a 10-frame hive, or one just ready to swarm in a two-story 8 frame hive. Just slip in a queen-excluding division-board, so as to enclose from three to five frames of young brood in the warmest part of the hive, thus shutting the queen away from them, and you are ready to proceed at once in rearing queens of the highest grade possible to obtain under any of the conditions named by any of the plans or theories advocated by any one during the past five years; and those which will be just as long-lived and give just as long-lived workers.

The principle is the same, whether we use upper stories with a queen-excluder between; a very strong colony with three or four frames of young brood shut away from the queen, by a queen-excluding partition being slipped down into the hive; or the same number of frames of young brood being shut away from the queen in the center of one of Dr. Gallup's big colonies in his 40 or 50 frame hives. And it would take quite a stretch of imagination for one who has *carefully* read "Scientific Queen-Rearing," to conceive the idea that the author claimed that the reason that perfect, long-lived queens were reared by that plan, "was just because cell-cups are used." Yet some are trying to prejudice against the plan on those very grounds. The cell-cups are only a *convenience*, not a necessity. I have reared just as good queens by this plan with strips of comb having eggs and young larvae in the cells, killing every other, or two out of every three larvae, *a la Alley*, and with larvae transferred into every other cell of a strip of drone-comb, as recommended by others; but, as a whole, neither of these are nearly so convenient as the cell-cups.

Some seem to think that nothing has been said or written about long-lived bees and queens till of late. This is not so. Dr. Gallup does not stand alone in this matter, neither is it a new thing. This part has been emphasized

during the past, by one of Canada's greatest honey-producers, Mr. J. B. Hall; also by Mr. Riker, Doolittle and others; but if I am right, Mr. Hall was the pioneer in calling attention to the matter. There is great advantage in such queens and bees, especially where the latter are reared with an eye on the coming harvest.

Regarding the many queens purchased by Messrs. Gallup and Alley being worthless, I take it they were speaking metaphorically. I cannot think they fully meant what their language would convey. As Dr. Gallup alludes to the matter of an exchange of queens between him and Dr. Hamlin's best and prolific queens proved in the other's hands to be the same worthless degenerates (?), which would not keep two or three frames filled with brood with all the cooing at these Doctors' command, these queens being similar after the exchange to those which have been so roundly and immoderately condemned, it would appear that such language conveyed more than was really intended.

And as proof of this I will say that I had one of those worthless (?) Hamlin queens sent me as a premium for securing the most subscribers to a certain bee-paper in a given time. The queen came in June, and as she was from one of the best breeders of the seventies, I thought to give her the best possible chance, which I did. Imagine my surprise to find that with all my extra care and coaxing, I could get her to put eggs in only three Gallup frames, and very scattering at that. I came very near pinching her head off in the fall, but finally concluded to give the colony frames of brood and honey from other colonies, and thus the colony was gotten through the winter. The next season she proved no better than she had the year before, and I have no doubt Dr. Gallup would have called her a "worthless degenerate," and Mr. Alley would have alluded to her as "worthless as a house-fly." Was she thus? Well, we shall see.

I had her in my hand one day, being just about to pinch the life out of her, when the thought arrested me, that Dr. Hamlin would not send me a worthless queen as a premium, and that I would rear a few queens from her, which thing I did, she dying soon afterward, of apparent old age. All of these young queens proved to be extra good ones, and one of them was the mother of the colony which gave me 566 pounds of honey in 1877, and was used in laying the foundation of my present apiary. 466 pounds of this honey sold at 20 cents-per pound, and 100 at 15 cents, the total cash resulting from that colony that year being \$108.20. Was her mother worthless? Quite a "house-fly," wasn't she? Stood way up by the side of the best of cows as to value! The honey sold from this colony during that year amounted to \$8 20 more than Mr. Alley prized his \$100 queen at, and lacked only \$91.80 of giving as much cash in a single year as the celebrated Root long tongued queen was ever valued at. And yet, if I do not misinterpret Dr. Gallup, he would no more have bred from that Hamlin queen than he would from those two imported, worthless (?), degenerate (?), house-fly (?) queens he got of A. I. Root, which he tells us about on page 423 of the American Bee Journal for 1902.

Right here is where many purchasing queens make a great mistake: If the purchased queen does not almost immediately outstrip anything they have in their apiary, she is condemned at once as a *breeder*, if her head is not pinched. I have had scores of letters telling of queens purchased from different queen-breeders which did not do well in the purchasers' hand, they condemning the breeders for sending out poor, worthless queens. I generally write asking if they have reared any young queens from them, and the reply generally is, "No, I killed the queen," or "She is not worth breeding from." A few have been persuaded to breed from these seemingly worthless purchased queens, and I have several letters in my possession thanking me for insisting on their breeding from these *apparently* poor queens, for thereby they have some of the finest queens they ever possessed.

Too much emphasis cannot be laid on the fact that it is the *daughters* of the purchased queen which tell of the value of the mother. And this is a subject which is also treated on in "Scientific Queen-Rearing." Had those parties who reported to Dr. Gallup that "Doolittle's queens did not turn out right," bred from them, it is barely possible that they might have found out that they had something similar to what I had in that Hamlin queen. My advice to all is not to condemn a purchased queen till you see what her daughters will do. If such daughters all appear to be poor, then it would be quite reasonable to decide that their mother was truly worthless.

And now, in closing this already too long article, allow me to repeat that I am in no financial way interested in

"Scientific Queen-Rearing." I have written what I have in favor of the book, because I fully believe that the bee-keeper who follows its teaching will be benefited thereby, in that he or she will be enabled to rear queens superior to those reared in any other way. Onondaga Co., N. Y.

[We mail "Scientific Queen-Rearing" for \$1.00, bound in cloth, or 60 cents in leatherette binding. The cloth-bound book we club with the American Bee Journal one year—both for \$1.60; or the leatherette-bound book and Bee Journal one year—both for \$1.40.]

## Putting Unfinished Section on the Hives.

BY ARTHUR C. MILLER.

RECENTLY, Miss Emma Wilson entered a protest against the use of sections containing combs in which honey of the previous season had been allowed to granulate. In the Journal for April 23, Mr. Doolittle combats the idea that the use of such sections is in any way harmful. When the doctors disagree the patient suffers. In this case I think the secret of the trouble has been missed by both.

It is, I believe, the usual practice to give such sections to the bees, in the supers, when the latter are put on for the surplus. It is Mr. D's practice to have them cleaned out in the spring at considerable pains and cost. Ordinarily the sections reach the bees when they are ready to add honey to that already in the combs, and of course such mixed honey is bound to granulate early. Sometimes, when the old honey has slightly soured, the whole of the new honey in that section is turned enough to spoil it. Also some of the neighboring sections are sometimes affected by the transfer to them of the acid honey, such transfer being more likely when the flow is intermittent on account of storms, cold, etc. Few bee-keepers realize how much bees move honey about in the hive. Mr. F. B. Simpson first called my attention to this, and it is a most valuable discovery—I mean the extent of the practice.

When honey is coming in with a rush such transferring is lessened, but if it is coming in fast enough to have any put into the sections, the bees will not remove and clean out the old even though they may move some of it about.

The foregoing, I think, will explain the why of the described combs causing trouble. Mr. Doolittle has his combs cleaned out thoroughly in the spring, others have it done in the fall. The results are the same.

Each bee-keeper must decide for himself, or herself, whether he or she will use the wholesale fall way, or the retail spring way; but either way, *don't* give the sections with the honey in them. Have them dry.

Providence Co., R. I.

## The Value of Breeding or Other Stock.

BY H. L. JEFFREY.

I HAVE read and reread the article by Henry Alley, on page 24, headed, "Can Good Queens be Reared by a Cupful of Bees?" There are two or three points in that article that interest me very much, and they are always left as they seem to be by Mr. Alley, without any backing up by facts or by comparison with the raw material proof from pure and unadulterated laws of Nature. The first one is the answers in Crude Nature to the heading question. That one I will pass now, and take up the point where he says, "How this statement will make Editor Hill of the American Bee-Keeper jump." There are thousands of people that not only jump, but they actually curse everything and everybody, whoever it may be, that places more than the butchers' price on anything, and the only reason for such discarding deduction of the valuation of perpetuating power always comes from the one idea of being cursed with the inability to produce superiority in anything. And the most galling thing to that class is, that in spite of their attempt to obliterate such superiorities, that very uncontrollable "Old Dame Nature," so tantalizingly just keeps poking one of her peculiar freaks just up into their sight, and just so far out of their reach that all they can do is to shake their fist and screech, "I wish the Devil had you!" But they forget to pay for a through ticket to his majesty, so it cannot be used.

But breeding-stock has a compounded compounding valuation. I will tell you why. A dairy-man I have known

for 40 years, has, within the past 30 years or less, actually increased the butter yield of his own cows more than double what it was years ago. About 30 years ago he noticed that the offspring from a certain cow, and the blood of a certain bull, always gave evidence of superior quality, and, very quietly, and unobserved, he went to work to intensify that power in the reproductive force and line. Close inbreeding was resorted to, to a considerable extent, and once that ball of imparting force became starting on its way, and its velocity increased its own force, that dairy more than doubled its butter yield from the same number of cows, and therefore decreased the actual cost of production, which in the actual sense not only gave double the profit, but was 4 to 1. Doubling the yield per cow, actually reduced the expense more than one-half; double the yield, made one less cow to keep for the same result. One less cow to keep for the same results made room to keep one more cow to produce double the result, which is actually twice 2 are 4, or an actual 3, profit against even cost and income; besides that, his intensifying the reproductive powers gave a like percentage value to all his neighbors that raised calves from their cows by his bull; and in dollars and cents added to the value of that man's breeding bull in ratio that his offspring became numerous.

This is not a fanciful sketch, but a solid, hard-pan, solid-rock, and past approvable fact, and one of those laws of the Old Dame, that cannot be drowned out of sight.

But some will say, "A breeding bull and a queen are not a particle alike." Well, just keep thinking so, and saying so, but suppose they both could speak and say, "You lie." Eh? They act it out; actions speak louder than words, or my eyes are without sight. But it is just the same with bees, only a less time required to produce the same results.

Only 12 years ago I saw 150 colonies of bees containing the daughters of one queen that produced more than double the quantity of honey that was produced by 200 colonies containing the hap-hazard, come-as-you-please queens. There was the close selection for quality followed up for seven generations to produce the superior qualities. The 150 queens were all reared in one season, the same persons owing the 200 other colonies owned the 150 queens, and their mother was worth just as much more than any other common queen as her progeny produced more pounds of honey than the common stock. Furthermore, if from that queen 10,000 queens had been reared, and each of their colonies produced only \$1.00 more in honey than the common, average queen, that identical queen is actually worth the small sum of \$10,000 to the bee-keepers at large; and then selecting from her daughters a very few breeders of like productive powers, that \$10,000 is again compounded. And deny it if you can; but remember that "Whoever speaketh the same, speaketh a lie, and the truth is not in him." Figures prove 1 from 2 but one remains; Nature proves 1 from 2, and 3 remain; or 8 from 2, and you have 10.

Litchfield Co., Conn.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Mr. Doolittle and the Sisters.

The kind words from Mr. Doolittle about the "Sisters Department" are thoroughly appreciated. Many thanks for the same.

### Unfinished Sections Used as Baits.

Mr. Doolittle asks the question, "Why would Miss Wilson consider bait-sections spoiled because honey had candied in them?"

I consider them spoiled because it is difficult, if not impossible, to get the granules entirely cleaned out, and because such granules present act as a center to start further granulation.

Mr. Doolittle asks: "Can't the bees clean sections or the cells of the honey-comb as clean in the spring as in the fall?"

Probably they can, if the honey is in the same condi-

tion one time as another; but it is more likely to be candied in the spring, and then the job of spring-cleaning is very different from fall-cleaning.

He asks: "Can't they clean them clean and free from honey, whether candied or otherwise, in the spring, summer, or fall?"

Yes, I think they can. But it doesn't matter whether they can or not, if they won't. As a matter of fact, our bees don't clean out candied honey the same as they do liquid honey, and this is not "a belief in an old assertion, taking it for granted it was true," but a fact that I have seen demonstrated many and many a time. Any one can probably see the same thing demonstrated in almost any case in which a colony has been robbed out in the spring. The liquid honey will be taken, but the candied honey will be left, every time. The granules seem to be to the bees no more than so many grains of sand, and they are only removed, apparently, just so far as it may be necessary to remove them in order to get at the liquid honey.

Even if the bees should clean out the candied honey as well as the liquid, there would be an objection to the waste, for the bees throw away all the granules they carry out of the cells.

Mr. Doolittle tells about using sections for stimulative feeding, and says:

"Opening hives a week after they have been so treated, I have found them with more than doubled brood, and thought I was doing a nice thing in this way. But Miss Wilson says not."

I hardly think Miss Wilson ever said anything about it. She thinks he would be doing not only a nice thing, but a very nice thing to have "more than doubled brood" in a week's time. But she would prefer that the feed should be given some other way than in sections of candied honey, and Mr. Doolittle will probably agree that for stimulation it would be better to have thinner feed, and that at least part sugar would be cheaper.

Mr. Doolittle asks if I have tried fall-cleaned and spring-cleaned sections side by side. No, I never made any exact comparison. I would do so this year if I could find any sections containing any candied honey. But our honey has kept too well for that. Nearly a hundred sections are on top of the kitchen safe, most of them having some unsealed cells, but I can not find a single cell that shows the least sign of granulation.

But I think several have reported in the past years (I can not name them now), that their sections have been spoiled when spring-cleaned ones were used. If Mr. Doolittle succeeds, others may not be so fortunate.

It is probably not necessary to say that the least granule left in a cell will serve as a starting-point for further granulation; all scientists are agreed upon that; the only question is whether the bees will clean out the granules. The fact that I have seen so many cases in which the liquid was all emptied out of the cells and the granules left is pretty good proof; but if any of the sisters, or indeed of the brothers, have any sections of candied honey, by all means let us have them tried. If Mr. Doolittle is right we ought to know it.

Rightly managed, there is no need of having our beautiful sections torn. We have had thousands of them so cleaned without being torn in the least. Wrongly managed, they will be torn either spring or fall.

### Lotion for Whitening the Skin.

The following is given in the "Health and Beauty Department" of the Chicago Daily News, as a good and harmless lotion for whitening the skin:

"Pure honey (extracted) four ounces; glycerine, one ounce; rose water, one ounce; citric acid, three drams; essence of ambergris or essence of rose, six drops.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

The Premiums offered this week are well worth working for. Look at them.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. H. HASTY, Sta. B Rural, Toledo, O.

### CHAFF HIVES IN DIFFERENT LOCALITIES.

So in Wisconsin they don't take to chaff hives at all. In New York's best bee country they don't want anything else. Down in Missouri, Manufacturer Leahy gave his away, because he wanted his hives all so as to carry into the cellar easily. What shall we say, therefore? I'll say, if you have chaff hives don't give them away. I have some, and you are not going to get them free gratis. Page 213.

### THE MICELESS HONEY-ROOM.

Happy Greiner! He has a shop and honey-room in which there are never any mice. I suppose hundreds of the brethren intended so; but, alas, the chasm between intention and realization! It's all just so as it ought to be—to put sections in the intended-to-be-mouse-proof box inside the intended-to-be-mouse-proof room. Honey-keeping by Double Entry better than honey-keeping by Single Entry. Page 214.

### THE "POOR SEASON" AND "POOR PIE."

Apparently the "poor season" of some bee-keepers is like the "piece of very poor pie" which your hostess blandly invites you to take. Page 214.

### ALFAFA-GROWING IN THE EAST.

I stand convicted, Mr. Johnson. I climb down. I had no right to speak of the tubercles of alfalfa as having "bugs" in them—and so throw the learners in natural science off the track. I guess my impression at the time was that the tubercle-dwelling germs were animal; and so my short-coming stands as a case of ignorance, and not as a frolicsome sort of perverse teaching.

Thanks to Prof. Hopkins for the information that clover bacteria will not serve the turn for alfalfa. And how well the pictures on page 212 tell the story—story of something lacking in the one case and of things all right in the other! It is quite reasonable for us to expect that alfalfa naturalized, and fully supplied with its own tubercle-dwelling bacteria, and flourishing like a green-bay tree, would yield honey here as well as elsewhere. Lack of nectar-flow seems to be a plant's usual method of protest—protest that although it can live and grow it is dissatisfied with some of the conditions. Present appearance seems to be that alfalfa is a coming crop; and with it we see a new light. Page 215.

### JERSEY MOSQUITO AND BEE-STINGS.

O the Mosquito, the Jersey Mosquito!  
In size, vim and venom she can not be beat, O!  
She martyrs the natives, spring, summer and fall,  
Until a mere bee-sting seems nothing at all.

### A HUMMING BIRD "OUTFIT."

Husband and I and Alice and Kate, eh? Who couldn't make the honey-business hum with such an outfit as that? Page 216.

### SPRING-WATER IN BEE CELLARS.

No, Mr. Callbreath, it isn't the warmth of the spring-water that makes a cellar with a running spring in it one of the best of all places to winter bees. Running water oxygenizes and ozoneizes the atmosphere, and also dissolves the carbonic acid gas and carries it away. Ventilation of very best sort without any cooling, and without any possibility of excess.

### THE NAME-ON-THE-SECTION CONTROVERSY.

Tell Alma Olson I am on his side (languidly) in the name-on-the-section controversy—and, lo, I come to give him an unbrotherly stab. He put his foot in it badly when he referred to the seedsman's name on the package of seeds. Many, if not most of the seed-packages, hold seeds raised by some specialist farmer and sold to the seedsman who takes the responsibility of them before the world. If I am right, the great seedsman raise a great many seeds, but still buy more than they raise. I think the farmer would not be allowed to have his address on the seeds—pretty surely would not ask for such a thing. Page 220.

### BEEES STINGING AT A MARK.

C. Stimson will probably get the assent of many when he says bees generally sting at a mark mouth, nose, eye or

ear. Is that really so, or do our imaginations get in their work there? I have sometimes thankfully wondered why a cantankerous bee kept away from my eyes so well. In regard to the ear perhaps I had better own up. (But then, consider the size of the territory in some of our cases!) As a hostile bee spends much of the time just behind one's head, the ear is the first exposed territory met with, on screwing up courage to the sticking point and coming to the front. Page 222.

## Questions and Answers.

CONDUCTED BY

DR. C. O. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Editor.)

### Questions on Queen-Rearing.

1. I am frank to confess that I am as green as grass on queen-rearing, and want to know more, and I do not understand some of the expressions used in the American Bee Journal, and also "A B C of Bee Culture." I take the American Bee Journal and Gleanings in Bee Culture, have also "A B C of Bee Culture," still I am thick-headed. In "A B C in Bee Culture," under queen-rearing, page 255, is a cut of a Doolittle cell-cup, and from the cut it looks as if the cells are put on the bottom of a stick to be put in a brood-frame, and cells appear to hang straight down. If so, what prevents eggs or larva from falling out when grafted?

2. What is meant under the same head, pages 260 and 261 of "A B C of Bee Culture," when it says, "When properly done the strips of comb will have cells slanting toward the bottom-board?" In other words, I want to know whether these artificial cell-cups and these strips of worker-comb cells point or hang perpendicular, or stand straight out like worker-comb as built by the bees in brood-frames, or point down at about an angle of 45 degrees. I know after bees take possession of the prepared queen-cells they build them out and down. But what is their position when man leaves them? From the cut, page 258, it looks as if man leaves them hanging straight down.

3. On pages 260 and 261, "A B C of Bee Culture," it says, "shave one side of strips of comb." What becomes of the other side, and how treated, by man and bees? If as per instructions under queen-rearing, I put 2 frames of brood in the upper story, is there any danger of bees leaving it uncareed for, and the brood and cell-cup dying from neglect?

5. Should cell-cups be put in the upper story when the frames of brood are put in, or wait a day or so to see if the bees are attending to and keeping the brood warm?

6. Will this queen-rearing in upper story in any way hinder storing? and should full sheets of foundation be furnished on either side of the brood for storing?

7. How soon after putting in these artificial queen-cells before I can tell whether the bees are working on them?

8. The Alley plan, as described on pages 260 and 261, would be less trouble, I think, to me. Do you think it as good, for one who knows nothing about queen-rearing, as the Doolittle cell-cup plan?

KENTUCKY.

ANSWERS.—1. Your supposition is correct; the cells are mouth down, just as the bees always build cells when preparing to swarm. Dip your finger in water, and a drop of water will be found hanging on the tip after your finger is taken out of the water—held there by cohesive attraction, the same that holds the contents of the cell in place.

2. In an edition of "A B C of Bee Culture" before me, I find, not "slanting toward bottom-board," but "pointing toward the bottom-

bar." The cells point straight down, first and last. The only time when you will find queen-cells any other way is when the bees build emergency-cells from worker-brood, or in a very few rare cases in which the place is too cramped for the cells to be built straight down.

3. The side shaved down is the one on which the cells are started; the other side, not cut, is dipped into melted wax and then glued on the bar.

4. If one or more frames of brood are put in an upper story over a strong colony, there is no danger that the brood will be uncareed for, but there is always some danger, anywhere and everywhere, that not all of the queen-cells will be properly cared for.

5. It will be generally safe to give the cells at the same time as the brood, although there may be an occasional case in which the bees are a little slow about occupying the brood.

6. It will not hinder storing, and foundation or drawn combs may fill out the story the same as if no queen-rearing were going on.

7. Generally within 24 hours.

8. An utter novice would probably find it easier to manage the Alley plan, and either plan produces good results.

### Prevention of Swarming—Uniting Colonies.

1. Please give a description of L. Stachelhausen's invention to prevent swarming.

2. In M. K. Kuehne's plan to prevent swarming, after the queen is laying, does he take out the entire brood or just the wire-cloth and let them unite? WEST VIRGINIA.

ANSWERS.—1. Mr. Stachelhausen prevents swarming by the shaken-warm plan. You will find that fully given in back numbers, with Mr. Stachelhausen's comments also on page 245.

2. Take out the entire board, I suppose.

### Colonies on Crooked or Bulged Combs.

1. I have about 20 colonies of bees, purchased last fall; they are in 10-frame (impl.) hives, and about 6 combs in each brood-chamber are bulged or crooked. I have sent 6 Hoffman self-spacing frames, and sufficient brood foundation for these hives, foundation to be wired in, in full sheets. I wish to run part of these hives for extracted and part for comb honey. How can I best change the old, bulged brood-frames to new brood-frames of foundation.

2. How would it do at about the beginning of the honey harvest to put a second story or brood-chamber (for extracted honey) with the frame, foundation, and a queen-excluder between; then every 3 or 4 days exchange a frame or two of brood for a new frame or two of foundation from the second story? Then when the brood has hatched out they will fill these combs with honey. Will this honey be damaged any by being stored in these old combs? and will these old combs make good beeswax?

3. What way would be better for extracted or comb honey in sections? Or would I better not try to produce honey in sections from any of these colonies this year? OHIO.

ANSWERS.—1. If I understand you correctly, there are about four straight combs in each hive. Lift out these four combs and put them in another hive-body, looking to see whether you get the queen. If you get the queen, leave her with the four combs, and fill up each hive with the new ones filled with foundation. Take the old hive off the stand and put the new hive in its place. Put an excluder over this, and set the old hive over the excluder. Twenty-one days later there will be no brood in the upper story unless it be some drone-brood. Then you can extract the crooked combs, melt them up, or do what you please with them. If you do not find the queen on the four combs, and if the other combs are so fastened together that you cannot lift them out, then after you have put the four frames in the new hive, set the old hive on top of it with an excluder between, and drum the bees up, so as to get the queen above. Then put the new hive, as before directed, on the stand with the old hive on top and an excluder between. The queen must be in the lower hive.

2. The honey and the wax will be all right, but you will make a quicker job of it as already directed.

3. Necessarily you will have the old hive-body filled with extracted honey, but afterward it is pretty well settled how many let the bees do the rest of their storing in sections by adding supers of sections under the upper story.

## FROM MANY FIELDS

### Wintering Bees.

The past winter was very favorable for bees. Colonies that had plenty of stores came through in almost perfect condition. We have lost 7 colonies, due to lack of stores and queenlessness.

In preparing for winter we used different plans: Packing above frames, sealed covers without packing, and sealed covers with super on. The conditions being the same, the result seemed to be in favor of the first two plans, and I believe I would use packing had

## ONLY A FEW DAYS

It takes only a few days to get our 128-page catalog of the celebrated SPLIT HICKORY VEHICLE and Harness which we sell direct at factory prices. You should send for it by all means before buying. It is full of bugs and harness surprises. This

the means to keep the outside moisture from getting on the packing.

Prospects are favorable for the present season. Bees are doing a fine business from apple-bloom, and should the present good weather keep up they will get considerable honey.

I am thinking of building a shed for the bees so as to keep them from getting wet. I would have it open in front and arranged at the back part so that a person could get at the hives. Should any of the readers have any experience with a shed of this kind, I would be glad to hear their opinion of it.

E. N. EVENSON.  
Jefferson Co., Ohio, April 22.

**A Dry and Cool Spring.**

The bees wintered well last winter, and clover came through also in fair condition, so that the prospects for honey were good here. But we have had a dry, cool spring and now we have just had a light rain followed by snow and a temperature of 24 degrees above zero. Plum and cherry bloom is about half out, and apple-buds about to open, so that the prospects for fruit-bloom are very slim.

A good season for fruit-bloom was needed on account of lack of good working-days for such other bees as we have had heretofore. So, while the loss of the fruit-bloom may not prevent a honey crop later on, it will very probably necessitate feeding.

I am thinking of making some troughs and feeding outside, as there are no other bees in the range.

Fortunately, the bees were almost all quite strong, so that they will probably be able to protect their brood.

E. S. MILES.  
Crawford Co., Iowa., April 30.

**All Colonies Wintered Well.**

Bees are doing nicely on dandelion, willow and cherries. All colonies came through the winter in fine condition. I winter them in the open air, having packed them with an extra covering. Fruit-bloom was killed by sleet and ice. The temperature went down to 16 below freezing.

GUSTAVS KOLLS.  
Hall Co., Nebr., May 2.

**Swarming Management.**

On page 264, Wm. McEvoy gives his method of preventing swarms getting mixed up. I can see the advantage of his method, but many of the small bee-keepers, like myself, find it difficult to follow. Many of those that keep bees in this vicinity are farmers, like myself, and keep only a few colonies of bees from a very few up to 40 or 50, just for the pleasure of keeping them and having a little honey to keep us sweet. According to the definition given in the Bee Journal, we are not apiarists, only bee-keepers, and of the work prevents us from giving that time and attention to our bees that is required of an apiarist. We do not have any help, but each one handles his bees alone, and it often happens that two or more swarms come out at the same time while the farmer is in the field at work, and before he can get to his bees they have all clustered together, and the only thing to do is to hive them in one hive. I know of two instances of this kind that happened in this vicinity, and so many swarms clustered together that they could not be hived in a common hive, but were hived in a dry-goods box, and they stored several hundred pounds of honey.

Last year I had a swarm come out, and, after being in the air for a time, they returned to the hive without clustering, and while they were returning I looked in front of the hive and saw a small bunch of bees; on examination, I found the queen, picked her up with my fingers and put her on the alighting-board. The next day they came out again, and at the same time another swarm from the hive came out and were all mixed up, but clustered in two clusters about ten feet apart, and before I could hive them they all went together. They were both prime swarms and filled the hive full, and I got more honey from them than any three swarms last season. A few days after this I had an after-swarm come out, and while I was hiving them an-

other after-swarm issued, and came to the hive where I was at work, and they went in without clustering. I considered this an advantage for it made a good, strong colony that has wintered well, and is one of my best.

Last year was a poor one for honey. I got only about 300 pounds of comb honey from 16 colonies, 300 counts. I lost a number of colonies from spring dwindling and being robbed. My bees have wintered very well. I lost two colonies in the cellar. I put the bees out the first day of April. A few days after being taken from the cellar two colonies went into other hives near by. I suppose they were queenless. I now have 18 colonies, strong and healthy, and working well when the winter admits. It has not been very cold since they were taken from the cellar, but there has been too much rain for the good of the bees. To-day (April 50th) is the coldest we have had. The ground is covered with snow and the temperature this morning was 24. Bees are in better condition and working better than they did last spring.

I approve of nearly all the modern methods of handling bees, yet I am plodding along in the same old rut. I have for years been letting my bees swarm naturally. I do not clip the wings of queens, yet I have lost only three queens by absconding during the last ten years. I would rather not have any after-swarms, yet I do not cut out queen-cells, and if after-swarms come out I put two together, if possible, and so far I have been quite successful in doing it.

If our large apiarists read this article they will smile at my methods, and say they are old and out-of-date. This is true, and so am I old an out-of-date. I am 79 years old to-day. The modern methods and improvements are all right, but, at my advanced age, I find it difficult to keep up and adopt all of them. I am an old soldier, and can't keep up with the army, but when night comes I will try and be in camp, and "When the Roll is Called Up Yonder," I'll be there.

Millelacs Co., Minn., May 4.

### Bad Weather for Bees.

It has been very bad bee-weather for the last two weeks, in this locality. It freezes nearly every night, and this morning a snow-storm visited us, covering the ground with nearly two inches of snow. We are having a great deal of rain, which I hope will make a good honey season. I wintered but 2 colonies out of 4, the 2 that died being molly. But each had nearly 30 lbs. of honey left. I sold some of it at 15 cents per pound, and used the rest to feed the other colonies, which are in good condition at present.

I watch for the American Bee Journal every Thursday; it is a welcome visitor here.

B. F. SCHMIDT.

Clayton Co., Iowa, May 1.

### Look for a Good Year.

Our bees came out of the winter in good shape, with no loss to speak of. We winter them here on the summer stands. We have had an immense fruit-bloom, but the weather has been so cold that the bees could not work more than half the time, but they have filled up their brood-chambers and are in excellent shape for white clover, which is abundant everywhere. We look for a good year. I found the first white clover blossom to-day, which is nearly one month early. Success to the American Bee Journal.

Fulton Co., Ill., May 2.

## The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

GEORGE W. YORK & CO.,  
144 & 146 Erie Street, CHICAGO ILL.

**Testing Honey-Barrels.**

To test honey-barrels before waxing, a beehive is suspended in a clean jar in a Bee-Culture, instead of blowing into the barrel with the breath—American Bee Journal. Blowing the breath into a barrel or can to test it for leaks, is very unreliable. A decidedly better way is to place the lips firmly in or against the aperture, draw into the lungs and exhale through the nose all the air possible, by repeated draughts, which necessarily become shorter as the air is pumped out of a tight receptacle. By this means much more power, with less effort, is exerted; and in case of a leak, in testing cans, the intruding air from outside, while the breath is momentarily held to listen, will re-inflate the partly collapsed tin, thereby keeping up a constant tickle and ring as the sides readjust themselves to the original position. In testing barrels, when a leak occurs, and while the bung is yet stopped by the human pump, the hissing of rushing air may be audible, or, if the leak be very small, the suction at the bung will be gradually reduced, and readily recognized by the pumper.—Editorial in the American Bee-keeper.

**Time for Cutting Alfalfa.**

I have just read Bulletin No. 114, issued from the experiment station at Manhattan, and it says, "Alfalfa should be cut when not more than one-tenth of the plants are in bloom. Early cutting invigorates the plant. The late cutting of the first crop seems to injure the plant more than at any other time." In September, 1901, I planted six acres to alfalfa, and got a splendid stand. In the last week of May, 1902, I concluded that one-tenth of the plants were in bloom, and the crop was ready for cutting, and I cut ten swaths around the field. It set in so rainy and cloudy that I stopped the mower and waited two weeks for fairer weather, lamenting all the time that I was injuring the hay crop by letting it stand so long without cutting. But I was surprised, when I came to cut the second crop, to find that the piece that I cut earlier did not turn off more than about one-half as much as the piece I cut later; and this was the case with the third and fourth cuttings. As a result, through the season I could distinguish the very line where the earlier cutting left off and the later cutting commenced. The ground and soil are all the same, rich bottom, about 30 feet above permanent water, no weeds, foxtail, or crab grass in the field. The hay from the earlier cutting did not contain on the average one-tenth of second crop. Please explain to me why my alfalfa acts so contrary.—J. M. CRAIG, of Anderson Co., Kans., in Gleanings in Bee-Culture.

**Hiving Swarms on Shallow Frames.**

When only a single story is used it is likely to result in the bees swarming out again. The editor of the Bee-Keepers' Review manages as follows:

When I began using the Heddon hive, putting a swarm into a single section, and putting on the sections, there was so much swarming-out that I came very nearly being discouraged. Finally, I began using both sections of the hive for a brood-nest, for the first three days. On the fourth day I set the upper section, and the supers, to one side (crosswise of an empty hive), then set the lower section off the bottom-board, returned the upper section and supers to the old stand, and shook down in front of them the few bees that were clustering in the lower section. I used starters only in the frames, and, at the time of removing the section, the combs in the upper section were usually one-third or one-half completed. Some of the combs in the lower section were just nicely started, and

# QUEENS!

Golden and Leather-Colored Queens, warranted to give satisfaction—those are the kind reared by QUIRIN-THE-QUEEN-BREEDER. Our business was established in 1888. Our stock originated from the best and highest-priced long-tongued red clover breeders in the U. S. We rear as many, and perhaps more, queens than any other breeder in the North. Price of queens before July 1st: Large select, \$1; six for \$5; Tested Stock, \$1.50; six for \$8; Selected Tested, \$2 each. Breeds, \$4. Two-frame Nuclei (no queen) \$2.50 each.

Special low price on queens in lots of 25 to 100. All queens are mailed promptly, as we keep 300 on hand ready to mail.

We guarantee safe delivery to any State, Continental Island, or European Country. Our Circular will interest you; it's free.

## THE FRED W. MUTH CO.

Front & Walnut Sts., CINCINNATI, OHIO.

Please mention Bee Journal when writing

I used this lower section as the upper section to the next hive in which I put a swarm. This management did away entirely with the swarming out after hiving. It gave the bees plenty of room until they had cooled off and settled down to work, when it mattered little how much they were squeezed, there was no swarming.

**Differences of Opinion About Time for Cutting Alfalfa.**

Experiment stations should be able to decide such questions right, so farmers could tell exactly what is best; that is what the stations exist for. Experimenters can bring chemistry to bear on the subject, and then prove or disprove the practical application of the conclusions thus obtained by feeding stock and carefully noting results. Then, why don't they agree? Different environments naturally bring different results. It would seem strange if the most successful mode of handling alfalfa on rich, sandy loam would necessarily be best on a thin limestone soil where the growing season is more than a third shorter. The best hay for horses may not be best for beef stock or milk production. If any one has advocated very early cutting of hay in this valley, when the hay is intended for horse feed, it has never reached my attention. Many claim that alfalfa should be in full bloom for some time to make best feed for the cattle, and many claim it should not stand so long. But when it comes to dairy stock, I do not know a man who has changed from late cutting to early, and then changed back to late cutting. As dairying is rapidly coming to the front, it is revolutionizing the alfalfa business. As farming is usually done on methods which are supposed to give the best average results, the alfalfa is all cut young where dairying is the main thing (and it generally is), and little thought is given to the small loss, if any, that is brought about by feeding the "wisy-wasy" feed to other stock.—W. A. H. GILSTRAP, in Gleanings in Bee-Culture.

**The Percent of Water in Honey.**

At the annual meeting of the Ontario Association, Prof. Frank T. Shutt, Chemist of the Experimental Farms, Ottawa, gave an exceedingly interesting address relating to the proportion of water in honey. The address occupies a number of pages in the Canadian Bee Journal, and a few of the points are here given:

I said we had no Canadian data on the subject, and as far as I was aware the European authorities differed widely, for I found some authorities stated 10 and 15 percent of water, whereas I found other chemists gave as much as 25 and 30 percent of water; and then, on the other hand, there were those who endeavored to bring together the two, and said the proportion of water in honey might vary very largely, and that we should not be surprised at finding a variation of as much as 10 and 15 percent.

A large amount of work was done in the attempt to settle the question, with regard to which Prof. Shutt said:

However, I must make this statement at the outset, so that there may be no misunderstanding: It is very greatly to my disappointment that I am not able to tell you today what is the normal percentage of water in genuine honey, either ripe or unripe. We have done, as I have said, an exceedingly large amount of most careful, thorough chemical work since Oct. 1, but still I am not in a position to say really what the percentage of water is. Now, the reasons for that I will explain to you as I give these results. You will see it has not been a matter of negligence at all, but the question involved is one relating to the accuracy of the process now in vogue.

Referring to the great discrepancy in the results obtained by chemists in England and on the continent, he said:

One authority, J. C. Brown, gives dextrose as 31.77 to 42.02 percent; and levulose 33.56

**Tennessee Queens.**

Daughters of Select Imported Italian. Select long-tongued (Moore's), and Select, Straight 5-band Queens. Bred 3/4 miles apart, and mated to select drones. Ad price of any Queen wanted with Nucleus. Our bees are shipped in light shipping-cases. Purchaser pays express on Nuclei. Safe arrival guaranteed of all stock sent out.

BATAVIA, ILL., Aug. 21, 1901.  
 Dear Sir:—I thought I would let you know as to results of my nucleus test. They were placed in 10-frame hives and now they are in fine condition. From one I removed 24 pounds of honey and had to give 6 of them more room, as they were hanging out. They were more than reached my expectations.  
 Yours respectfully, E. K. HERBERT.

DAVENPORT, IOWA, Dec. 31, 1901.  
 Your queens are fully up to standard. The honey queen that you sent my brother takes the lead. She had a rousing colony when put up for winter. The goldens can be handled without smoke or veil. Very truly yours,  
 JOHN THOMING.

Notice.—No tested stock sent out before May 15. Send money by P. O. Money Order or Express. Order. **D. J. BLOCHER,** PEALO, ILL. Please mention Bee Journal when writing.

to 40.43 percent. Another authority gives dextrose 22.23 to 44.71; levulose 32.15 to 46.89; water 16.28 to 24.95, and so on. On looking over those results carefully the one thing that will strike you is this, that there appears to be great variability in the analysis in the composition of various honeys. I say "appears to be," because I can scarcely believe that there is such a great variation, but, nevertheless, the results as they appear on record would give that indication, viz.: that there is great variability.

Now, all these analyses have been made by men of reputation, men endowed with skill and with honesty, but the difficulty has been in connection with the material itself and the process of analysis employed. And now I think I can tell you the reason for this apparent discrepancy. We understand that the two principal sugars of honey are dextrose and levulose. Let us consider their properties: Dextrose crystallizes; this is the material which you see in candied honey. Levulose, on the other hand, does not crystallize; it does not become solid, it assumes the form of a thick syrup; it is the sweetest constituent of honey; it is much sweeter than dextrose; further, we find by experiment and analyses that in the artificial drying of honey it is extremely subject to decomposition; consequently during the ordinary and usual method of analyses employed, as I hope to show you, decomposition of levulose takes place and its disappearance has been recorded by the analyst as water.

Farther on Prof. Shutt said:  
 Now, my contention is this, that what we have been supposing to be water, and water only, as passing off in the drying process, is really in part the decomposed products of the honey. The lower you heat the honey, the higher the temperature, the greater the amount of caramelization, decomposition, or, in other words, loss. We estimate the water by the loss in drying, and if part of that loss is due to the decomposition of levulose, we get too much moisture.

The longer the honey-tube is in the drying oven the greater the loss—and the higher the percentage of water—apparently. If there were no decomposition, the amount we are able to dry to a constant weight, but this we find impossible. This, in my opinion, furnishes the explanation of the results as they appear in this bulletin of the Inland Revenue. Some analysts have dried for 24 or 48 hours, and some have been attempting by still longer drying to get a constant weight. If there were no decomposition, the amount we should be obtainable. But the fact of the matter is that our experiments show you can go on drying these tubes for several days and still they lose weight. Day by day we weighed thosetubes and put them back in the water oven, and there was always a loss. From the first weighings we calculated the percentage of water in a number of hives in the neighborhood of 14, 15, 16; after 12 hours more we obtained 18, and then another 12 hours gave us 20 and 25 percent, and then continuing the percentages of loss went up to 28, 30, and 32. Evidently there was no stopping-place, and what we were calculating as water was really in large part due to the decomposition of the honey.

**Absconding of Shaken or Brushed Swarms.**

Fr. Greiner is afraid of absconding. He says 20 percent turn out to be failures. During more than 20 years he has formed over a hundred brushed swarms on the old stand as well as on new ones. Only one of them absconded, and settled like a natural swarm on a limb of a tree near by. It was a very strong colony, and I had given them one brood-comb and a very small space for brood-chamber, separated from the supers by a queen excluder. I removed the brood-comb, enlarged the brood-chamber, and hived the swarm again, and everything went all right. Some years I had trouble from absconding of natural swarms; but with brushed swarms I never had any difficulty. Gravenhorst recommended removing the brood-comb the first day after forming the swarm. This may be true in his locality. Here I do not do it, and

have no trouble. Of more importance, it seems to me, it is to have the bees filled with honey and to give to the swarm sufficient room. I give them so much room that the bees can form a cluster like a swarm.—L. STACHELHAUSEN, in *Gleanings in Bee-Culture*.

**Bulk Honey.**

Referring to the claims of H. H. Hyde for bulk honey, Sonnambulist says in the *Progressive Bee-Keeper*:

With one of his assertions, my experience leads me to disagree, namely, "When the consumer buys bulk comb honey he feels sure that he is getting a pure sweet, just as the bees made it."

Time after time have I been earnestly informed that the comb honey, so very attractive in itself, was surrounded by a mixture of glucose. Prospective buyers, and those not thinking of ever investing a penny in the alluring dainty, alike join forces against the innocent product, and equally innocent producer. Indeed, with this class of people, producer-honey is pronounced artificial honey, and consequently fraudulent.

**CONVENTION NOTICE.**

Illinois.—The spring meeting of the eastern part of the Northern Illinois Bee-Keepers' Association will be held at the residence of James Taylor, in Harlem, Winnebago Co., Ill., on Tuesday, May 19, 1903. All interested in bees are cordially invited to attend.

**Tip-Top Glass Honey-Jars**

1-pound.

7-ounce.

The pictures shown herewith represent the best jars for honey that we know of. They are made of the clearest flint glass, and when filled with honey, and neat labels attached, they make as handsome packages as can be

1/2-pound.

imagined. The glass top rests on a flat rubber ring, and is held in place by a flat steel spring across the top as shown. They are practically air-tight, thus permitting no leak, which is an important thing with honey-sellers.

We can furnish these jars, f.o.b. Chicago, at these prices:

	1 gross.	2 g.	4 gr.
1-lb. Jars	\$5.00	\$9.50	\$18.00
3/4-lb. "	4.50	8.50	16.50
7-oz. "	4.00	7.50	14.50

If you try them once you will likely use no other kind of top or sealing arrangement for honey-jars.

**HONEY AND BEESWAX MARKET QUOTATIONS.**

CHICAGO, May 7.—The past winter and present spring have been a disappointment to producers and dealers in honey; in the consumption has been away below the average of the past decade. Choice to fancy comb is held at 15@16c per pound, with off grades at 2@5c less per pound. Extracted, white, 6@7c; amber, 6@6 1/2c; dark, 5 1/2@6c. Beeswax in good demand at 32c. R. A. BURNETT & CO.

ALBANY, N. Y., Mar. 14.—Honey demand quiet; receipts and stock light. Comb selling, light, 15c; mixed, 14@15c; dark, 13@14c. Extracted, dark, at 7@7 1/2c. Beeswax firm, 30@32c. H. R. WRIGHT.

KANSAS CITY, April 20.—The supply of comb honey is about exhausted. The demand good. We quote you as follows: Fancy white comb, 24 sections, per case, \$3.50; No. 1 white comb, 24 sections, \$3.40; No. 2, white and amber, per case, \$3.00@3.25. Extracted, white, per pound, 6@6 1/2c; amber, 5 1/2c. Beeswax, 25@30c.

C. C. CLERMONS & CO.

CINCINNATI, Apr. 27.—Little demand for comb honey at present; fancy white sells at 15@16c in a small way. We quote amber extracted at 5 1/2@5 3/4c; white clover, 3@3c. Sales not as lively as expected this season of year. Cuban extracted is offered on all sides, and future prices are awaited with interest. Beeswax strong at 30c. THE FRED W. MUTH CO.

NEW YORK, May 8.—The market on honey is very quiet and very little doing, with more than sufficient supply on hand to meet the demand. Fancy stock of comb honey is well exhausted, while other grades are still plentiful and selling at 13c for No. 1, 12c for No. 2, and 11c for amber; no demand for buckwheat. Extracted remains quiet at unchanged prices. Beeswax firm at 31c.

HILDRETH & SORLEKEN.

CINCINNATI, May 8.—The demand for comb honey is nearly over, but as the stock is almost exhausted, prices keep up. Fancy water-white brings 15@16c. The demand for extracted has not changed watered, and prices are as follows: Amber in barrels, white for No. 2, and 11c for amber; no demand for buckwheat. Extracted, white clover, 5@5 1/4c. Beeswax, 28@30c. C. H. W. WEBER.

SAN FRANCISCO, Apr. 29.—White comb honey, 12@12 1/2c; amber, 9@10c; dark, 7@7 1/2c. Extracted, white, 5 1/2@7c; light amber, 5 1/2@6c; amber, 5@5 1/2c; dark, 4@4 1/2c. Beeswax, good to choice, light, 27@29c; dark, 25@26c.

Last year's product has been tolerably well cleaned up, particularly the desirable stock. Present offerings are largely odds and ends, including little of fine quality. Values for the time being are little more than nominal. A lower range of prices is looked for on coming crop.

**WANTED** WHITE CLOVER EXTRACTED HONEY. Send sample and best price delivered here; also Fancy Comb wanted in no-drip cases.

## WAX PROFITS.

Many bee-keepers allow old combs and scraps of beeswax to collect, which, for lack of time and the proper utensils, is scattered or eaten up by moth-worms. A big item would be added to the year's profits by the timely rendering of said wax by an economical process. We believe the press illustrated herewith fills a long-felt want in rendering wax.

B. Walker, Clyde, Ill., says:

"Was inclined to believe at first that the German wax-press was a failure; but after a thorough trial was well pleased. I secured 30 pounds more wax from one day's use of the machine than I would have secured by the ordinary method of rendering."

N. E. France, of Platteville, Wisconsin, State Inspector of Apiaries, and Gen. Mgr. National Bee-keepers' Association—says:

"The German wax-press is by far the best machine or process to save wax from old, black brood-combs."

PUBLISHED WEEKLY BY

**GEORGE W. YORK & COMPANY**

144 & 146 E. Erie St., Chicago, Ill.

Entered at the Post-Office at Chicago, as Second-Class Mail-Matter.

EDITOR,

**GEORGE W. YORK.**

DEPT. EDITORS,

DR. C. C. MILLER, E. E. HASTY, EMMA M. WILSON

## IMPORTANT NOTICES.

**The Subscription Price** of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

**The Wrapper-Label Date** of this paper indicates the end of the month to which your subscription is paid. For instance, "dec03" on your label shows that it is paid to the end of December, 1903.

**Subscription Receipts.**—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

**Advertising Rates** will be given upon application.

## National Bee-Keepers' Association

### Objects of the Association:

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

### ANNUAL MEMBERSHIP, \$1.00.

Send dues to Treasurer.

President—W. Z. HUTCHINSON, Flint, Mich.  
 Vice-President—J. U. HARRIS, Grand Junction, Colo.  
 Secretary—GEORGE W. YORK, 144 & 146 E. Erie St., Chicago, Ill.  
 General Manager and Treasurer—N. E. FRANCE, Plattville, Wis.

### BOARD OF DIRECTORS.

E. WHITCOMB, Friend, Neb.  
 W. Z. HUTCHINSON, Flint, Mich.  
 UDO TOPFERPERVIN, San Antonio, Tex.  
 R. C. ARLEN, Loveland, Colo.  
 P. H. ELWOOD, Starkville, N. Y.  
 E. R. ROOT, Medina, Ohio.  
 WM. A. SELSER, Philadelphia, Pa.  
 G. M. DOOLITTLE, Borodino, N. Y.  
 W. F. MARKS, Chapinville, N. Y.  
 J. M. HAMBAUGH, Escondido, Calif.  
 C. A. HATCH, Richland Ctr., Wis.  
 DR. C. C. MILLER, Marengo, Ill.

If more convenient, Dues may be sent to the Secretary, at the office of the American Bee Journal.

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, cents: two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S

"FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO.**

144 & 146 E. Erie Street, CHICAGO, ILL.

Please Mention the Bee Journal when writing Advertisers \*\*\*\*

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO.

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., MAY 21, 1903.

No. 21.

## Editorial Comments

**Beeswax in Cuba.**—A Cuban correspondent writes that 35 cents a pound for wax, as given on page 243, is rather high. He has been able to get only 31 cents for it, but that is in Spanish gold, and is equivalent to 28½ cents American money.

**A New Bee-Disease,** fairly wide spread, is reported in the Australasian Bee-Keeper. It has the appearance of foul brood except smell and a deficiency of ropiness. Mr. Gale, of the Agricultural College, reports that they have bred the new microbe by thousands, and are satisfied it is not foul brood.

**Introducing Without Making Queenless** is advised by the Modern Farmer and Busy Bee. That is, instead of first making the colony queenless, put the new queen caged in the hive, and then remove the old queen 48 hours later, when the eggs is to be so arranged that the bees can liberate the new queen by eating out the candy. Well worth trying.

**Emptying Barrels of Granulated Honey.**—Some bee-keepers make very hard work of emptying barrels of granulated honey. We used to suffer the same way before we tried a different method. To take the head out of the barrel and dig out the solid honey is no easy job. After emptying one barrel the digger is apt to wish there were no such thing as a barrel of honey.

Our present method is to lay on the floor a sheet of heavy wrapping-paper about 3 or 4 feet square. Then put the barrel on one end in the center of the paper. The next thing is to remove the hoops then the upper head of the barrel, after which all the staves can be taken away. The honey will then stand before the operator in an almost perfect cylinder in form. With a spade or shovel he can shovel it into a melting-tank, or into any other receptacle desired. A 200-pound barrel can thus be emptied in about 15 minutes, if quick movements are made.

Just try the above method and see if you ever want to dig honey out of a barrel again. As second-hand barrels are practically worthless, it does not pay to try to save them by spending much more time than the barrel is worth in digging out the honey.

The paper used on the floor can be cleaned off and used again, if desired. We have also used, instead of the paper, a large sheet of galvanized iron. Zinc would also be a good thing for the purpose. The edges of either zinc or galvanized iron could be turned up a little, so that if the honey were somewhat soft it would be held as in a pan.

**Colonies with Virgin Queens in Early Summer** need special treatment in some cases. Generally when an old queen is superseded by the bees she continues to lay until her successor is ready to take up that duty. In that case there is no need of interference on the part of the bee-keeper. But it sometimes happens that by some means a virgin queen is found in a hive with no brood present unless it be sealed brood, perhaps well advanced. In general, it is had policy to take from a strong colony early in the season to give to a weak one. Here is an exception. This colony with the young queen can just as well as not be taking care of some brood from elsewhere until its own queen is laying. Take from a strong colony one or two frames of brood—the youngest you can find—and give to the

broodless colony. In place of the brood taken away, put an empty comb, or combs, in the middle of the hive. A week later these will be filled with young brood and eggs, and may be given to any colony with a virgin queen.

Thus, young brood and eggs may be drawn each week so long as there is any colony with only a virgin queen, and in this way it will be seen that for any frame thus handled there will be three times as many bees as if the frame had been left untouched for its three weeks in its original place. If desired, a frame of sealed brood from the colony with the virgin may be exchanged for the frame of young brood, and in this way the strong colony will be stronger instead of weaker for the performance. In any case, the sum total of bees will be increased.

**Red Bees.**—Gleanings in Bee-Culture reports that Mr. Fowls found some red bees, and was nonplused to find them the next day of their original yellow color. A few days later they were again red, and it transpired that they were made red by being fed syrup from red candy that Mr. Fowls had bought at a bargain. And now Editor Root is scheming to have a show of bees of different colors, made so by feeding different colored syrups!

Would a "red nose" on a bee indicate anything stronger than red candy syrup?

**Shaken Swarms in the Arid Portions.**—What is best for one region may not be best for another. In some places the chief value of shaken swarms lies in the fact of their keeping apiaries free from the evil effects of foul brood, even though it may be raging all about. Of course, that does not in the least conflict with its value as a preventive of swarming, nor with its influence with respect to the whiteness of the cappings of comb honey. For those who are located in Colorado, or similar arid regions, the following specific directions, given by the Rocky Mountain Bee Journal, will be of value:

The honey-flora in the arid States is such as to afford a long, moderate and continuous flow, and this furnishes ideal conditions for the utilization of shook swarming in connection with the production of comb honey.

Passing the question of spring management, we will presuppose that the hives are crowded with bees and brood in all stages, and that the honey-flow has well started. Both interior and exterior conditions are favorable to swarming. In fact, having noted these conditions, now is the time to begin active operations. Examine each colony carefully for queen-cells containing eggs or larvae. Having found one that has thus given notice of its intention to swarm, proceed as follows:

1. Open the hive quietly and with as little smoke as possible. Find the comb containing the queen and set it at one side in a shady place and out of the wind.

2. Close the hive, and by drumming and smoking cause the bees to gorge themselves with honey.

3. Move the hive to the rear and place a new hive, containing only starters in the frames, on the old stand. The super, containing sections filled with full sheets of foundation, should also be in place, with a queen-excluder between it and the brood-chamber. The excluder should be removed in two or three days.

4. Shake three-fourths to seven-eighths of the bees, including the frame containing the queen, in front of the new hive, and run them in as you would a natural swarm. The queen should be caught and placed in the entrance after the bees have begun to run in. The right proportion of bees to leave with the brood depends upon the weather and must be determined by the judgment of the apiarist.

5. If increase is desired, remove the old hive containing the brood to a new stand several feet away, and insert a ripe cell, or give a laying queen. If no increase is desired, place the old hive by the new one, but at right angles to it. The next time the apiary is visited shake again, and move the old hive to the other side of the new one, but still at right angles. Repeat this process for three weeks, when all the brood will have hatched. The combs may then be disposed of to the best advantage of the apiarist, and any honey remaining in them may be extracted.

Whether or not it is an advantage to put a comb of unsealed

brood in the new hive is a much mooted question, upon which the "doctors" disagree. I have always done so, and without disastrous results. For me it prevents absconding, and makes sure that no pollen will be deposited in the sections.

The new hive should be contracted according to the size of the swarm, so as to force the bulk of the bees into the super at once. Contraction will also discourage building of drone-comb in the brood-chamber. The best hive to use in this connection is the Heddon hive, or some other hive employing the shallow brood-chamber principle. This admits of more rational contraction, and forcing the swarm above. Before the close of the flow, or as the queen needs more room, the hive should be gradually expanded to its normal size.

Each old colony should be examined for preparations for swarming every six days until the swarming season has passed, and when found should be promptly dealt with in accordance with the foregoing directions. This gives the apiarist almost perfect control of the swarming fever. Instead of becoming an evil and a loss it becomes a blessing and a profit, as it enables the apiarist to throw a preponderance of the bees into the supers at precisely the right time to secure a crop of handsomely finished section honey.

Foul-broody colonies should be shaken at the beginning of the flow, regardless of their strength or fitness for swarming. Weak colonies may be united until their force is sufficient for business purposes.

## Miscellaneous Items

HON. EUGENE SECOR, the former General Manager of the National, has gone into the greenhouse business as a side line, at his home in Winnebago Co., Iowa. We notice this from a column article in his local newspaper. It says that, about two years ago, Mr. Secor advertised for a partner to start a greenhouse, being desirous of carrying out a long-cherished idea. He finally found the right man—in Illinois, of course. His name is Stitz. The newspaper says he "was raised in a greenhouse," but judging from his success he does not seem to be as "green" as the house he was "raised" in.

Their greenhouse business has developed so that they now have two, one of which is devoted to the growing of carnations, the demand for this beautiful flower having increased so rapidly that it may be necessary to use two houses for their production alone. They have all the fashionable colors of this flower, including the famous "Mrs. Lawson." They also have the McKinley and Roosevelt varieties. No mention is made of the "Woolley," which will be the purest and most beautiful of all, when once secured.

Mr. Secor is to be congratulated on his success in the floral line. Not many are so well situated financially as to gratify their desires in this inspiring line. Few earthly things are so beautiful as flowers. Of course, to the bee-keeper, the white clover, basswood, sage, the buckwheat, and some other blooms, are more to be desired than carnations, and roses, and "sich." But all have their uses, and are beautiful to look upon—bright emblems of purity, and sweetness, and truth.

THE FARMERS' HANDY WAGON Co., of Saginaw, Mich., are anxious to obtain some farm views showing their Handy Wagon in use on the farm. They think that, among our thousands of readers, there must be a great many amateur photographers who would be only too glad to enter such a friendly contest. They offer \$75 in cash to the successful contestants. By addressing the advertising department of the Farmers' Handy Wagon Co., full information as to the conditions governing the contest can be obtained. When writing, kindly mention the American Bee Journal.

DELAYS IN MAILING QUEENS are very annoying, not only to the queen-breeder but to the customers as well. We had expected to be able to fill all our premium queen orders by May 15, but the weather has been so unfavorable that several of the best breeders who had agreed to furnish us queens could not do so. We regret the delay exceedingly, but of course we cannot help it. We will fill all our orders just as soon as we can possibly get the queens. We trust all who are entitled to receive queens from us will be patient.

THOUGHT IT WAS A BEE.—A guide in the Maine woods was bragging the other day about his indifference to the attacks of the black flies, from which those in his party were suffering greatly. A \$10 bet was made that he couldn't let the flies settle for five minutes on his bare back.

The guide stripped, and the insects came in good numbers and began to bite. He did not wince. Then one of the party got behind

him, took a burning glass out of his pocket and, the sun being out, focused it on the guide's shoulder. The guide screamed and wriggled. He stood it for some seconds, then he blurted out:

"I can stand all the black flies in Maine, but brush away that blasted bet!"

He won the bet.

## Association Notes

### How We Got Our Foul Brood Law.

First, we had Mr. N. E. France of Wisconsin, at the last meeting of the Chicago-Northwestern Convention, and he addressed the convention on the subject of Foul Brood and answered all questions raised by the members.

Then we said, "Let us have a foul brood law," and we went at it. We put ourselves in touch with the Illinois State Bee-Keepers' Association, which had formal charge of the matter, and corresponded with Messrs. J. A. Stone, J. Q. Smith, Chas. Becker, and others who were engineering the Bills before the House and Senate at Springfield. Then we subscribed money, and mailed a printed appeal for funds to all our membership, and to those on the mail-list of the American Bee Journal in Illinois, besides.

The writer has the honor of a personal acquaintance with several of the honorable members of the Legislature, and he used his influence with them where he could. We were fortunate enough to discover the Hon. Henry W. Austin, of Oak Park, through Mr. C. F. Kannenberg, one of our members, and a member of the foul brood committee. Mr. Austin is a new member, a banker, and a man of affairs. He made a personal matter of our Bill from the start. He consulted with the writer a number of times about it, and when he was in Springfield to appear before the House and Senate committees, Mr. Austin introduced him to a large number of the members. He did more for us than any one else, and should be tendered a vote of thanks by the entire bee-keeping fraternity.

Our hearing before the Appropriations Committees of the Senate and House was most interesting. Pres. Smith, Secretary Stone, and Treasurer Becker, of the Illinois State Association, and the writer from Chicago, made our representation. Mr. Stone brought a hive and super, and they were opened and explained to the Senate Committee, who took great interest in them, and gave us an hour's time and full opportunity to make our case. Pres. Smith got a frame of foul brood from the State museum, and it was also exhibited and explained at length. The Senate Committee took no action at the time, and we did not know for over a month whether they favored us or not.

After our hearing before the Senate Committee, we went before the Appropriations Committee of the House. They were overwhelmed with business, and our hearts failed us at this point. The University of Illinois and Judge Tuhill took up two hours, and (it seemed to us) appropriated everything in sight (\$800,000). However, our time came, and *they gave us five minutes*, and heard us, and *announced that the Committee report the Bill to the House, and recommend its passage.*

Then following the long, tedious wait of more than a month, during which time we knew nothing of our fate, and imagined the worst.

Messrs. Stone and Smith, who live near Springfield, arranged to call at the capital every week and see some of the members, and show them that our interest was unflagging. We sent out over 800 postal cards to bee-keepers all over Illinois, urging them to do what they could to help get a law. The officers of both Associations mailed personal letters to all the members of both Senate and House. This aggregated a total of about 700 letters from this source, making a total of nearly 1500 pieces of mail transmitted in the interest of our law. Added to this is the number of letters from bee-keepers all over the State, to the Senators and Representatives, of which we estimate could be made.

The writer entered into the plan for a law at first with lots of enthusiasm and confidence of success. But, as the magnitude of the undertaking opened up in front of us it seemed more and more a hopeless task to get a bee-keeper's law in Illinois—this stronghold of politics. But here we are at the goal, having run a successful race. Not one penny has been spent for anything but ordinary legitimate expenses. I believe the combination of two Associations made an impression on the Legislature. In our letters to them, we said 35,000 farmers in Illinois keeping bees are interested. These figures are from the United States Census Report. There is no doubt, in any State, if 25 bee-keepers unite their work, any needed laws can be secured.

We are under great obligations to the members of the Houses who have taken a personal interest in our Bills. We need our friends, and greatly appreciate their efforts in our behalf.

HERMAN F. MOORE,  
Chairman Foul Brood Committee,  
Chicago-Northwestern Bee-Keepers' Association.

LATER.—Since the above was written, the news says that the Governor has signed our Bill, so we have \$2000 to spend in Illinois the next two years for bee-keeping interests.

Let us so administer our trust that the entire industry will be benefited and *as a result so thoroughly that the Legislatures of Illinois will never fail to aid us.*

H. F. M.

# Convention Proceedings

## Report of the Wisconsin State Convention.

BY GUS DITTMER, SEC.

The Wisconsin State Bee-Keepers' Association met in convention at Madison, at 10 a.m., Feb. 4, and the morning was spent in social intercourse. At 2 p.m. Pres. N. E. France called the meeting to order. He stated that owing to the marriage and removal from the State of Miss Ada Pickard, there was a vacancy in the office of secretary. Gus Dittmer was nominated and elected to fill the vacancy.

### CO-OPERATION AMONG BEE-KEEPERS.

Pres. France, after a few introductory remarks, suggested that the subject of co-operation be taken up. Mr. Wilcox thought the subject too broad and general; that much had been said on the subject in the past, but not much accomplished, and had nothing to suggest at this time.

Pres. France stated the case of co-operation in Minnesota, and spoke particularly of the successful co-operation of the "Honey-Producers' Association" of Colorado. He thought that conditions were different here from Colorado. Many large bee-keepers there and mostly small ones here. He thought the outlook was the best in 20 years. He thinks it a very broad subject that should be taken up by the "National." However, local organizations might succeed. He called attention to the fact that Colorado and California glutted our markets before our crops were ready, and that co-operation might be the remedy. He also stated that large buyers and commission men preferred dealing with organizations for large lots rather than looking for small lots.

"Why not form a trust?"

Pres. France—We may be forced to it.

Mr. Wilcox—Educate the bee-keeper to grade his honey. Ignorance and carelessness in this is what makes low prices. The careless one would expect as much as the one who grades carefully. Co-operation would not benefit the careless ones.

Mr. Huffman asked, "How can you get around these little bee-keepers that spoil the market?" It was suggested to buy them out. "Suppose they won't sell?" They will soon find out they can't afford to stay out. Pres. France had given the subject thought, and thinks it will not come to anything within the year. The first thing necessary is education along the line of grading.

### PARALYSIS AMONG BEES.

"Is there any cure for paralysis in bees? and is it contagious?"

Mr. Pierce didn't think it contagious. He had a case that he thought to be paralysis. It seemed to dwindle, though the brood seemed all right. He cited a case where a colony had been cured with sulphur. He tried it himself by thoroughly sprinkling the bees with it, and could see no harm done, and in two weeks the disease disappeared.

Mr. Fox—My experience is that the disease disappeared by letting them alone.

Mr. Post thought that a change of queen would cure it. He found in his experience that while there were lots of brood there was a continual dwindling away until the colony "went up." He does not think it contagious, because none of the other colonies had it.

Some one, after waiting for the disease to disappear, used sulphur, and after two weeks it had all disappeared.

### CAUSE OF EXCESSIVE SWARMING.

"What was the cause of the excessive swarming last season?"

The late honey-flow.

Mr. Wilcox—The question should be, What is the principal cause of swarming? I think that certain conditions bring about certain results; that hatching brood is the strongest cause. Remove the cause by removing the brood.

Mr. Rice—I never before knew bees to swarm so much and so late, and to have the swarming increase with the season.

Mr. Fox—They swarmed the worst in the light of the honey-flow. I had 32 out in one day. Perhaps it was caused by limited room.

Mr. Rice—I had three top stories on most of mine, and all had lots of room, and still they swarmed.

Mr. Post—I had the best improved non-swarming queens, reared for honey-gathering. They swarmed with little or lots of room. I kept them in by caging the queen, but as soon as she was released they came out.

Mr. Van Ennick—I agree with Mr. Wilcox. Remove the brood and give them lots of room before the swarming season sets in. With this management you can keep down the swarming fever and have hardly a swarm.

Mr. Post—That is all right for strong colonies, but it will not work with weak ones.

Mr. Wilcox—Yes, I have seen such cases.

Mr. Gledge—That may be the case where the queen is superseded.

Mr. Fox—I had special reference to after-swarms with lots of room.

Mr. Huffman—Better kill the queen, or remove the brood and fill with empty combs. Pay special attention to queens that don't swarm, and work along the line of rearing from them. We may have different ways of working, but insure the same result.

Mr. Fox—Will killing the queen stop swarming, Mr. Huffman?

Mr. Huffman—Yes, that is the principle.

Some discussion took place in regard to spraying trees with poison, with the intention of killing the bees. It was the general opinion that such intention could not be proven.

At this stage Pres. France read the report of his work on foul brood throughout the State. This brought about a discussion on this subject.

Vice-Pres. Huffman took the chair.

### PREVENTION OF FOUL BROOD.

Mrs. Blakely—How would you prevent foul brood?

Mr. France—Keep clear of it; don't buy old comb, bees, hives, etc.

Mr. Perry—Root it out.

Mr. Huffman—Mr. Perry could root his own but not his neighbors'. Would foul brood start in an apiary without contact?

Mr. France—One in one thousand.

Mr. Pierce—Why will it not spread from yard to yard?

Mr. France thought it did spread. He cited a case where bees had been burned year after year, but still it kept appearing from neighbors' bees, not from trees where squirrels had destroyed old comb.

"Do you know that bee-trees contain foul brood?"

Mr. Fox—I think it could be carried from yard to yard, and from yard to tree and back again, by robbing. If they are not disturbed it might remain year after year, as I do not think it can be carried except by contact in robbing.

Mr. Danniher cited a case of a bee-tree where they had plenty of brood, and foul brood, and lived year after year.

Mr. Pierce—Did they live year after year in proper condition? Do you know what foul brood is?

Mr. Danniher—I do.

Others doubted it.

Mr. Huffman—Will they live and have foul brood?

Mr. France—Yes, I have known them to do so for three years.

### SEALED COVERS IN WINTER.

"Should the honey-board be left sealed down when putting bees in winter quarters?"

Mr. Pierce—No, by no means, as they are all stuck up with glue, and will collect moisture.

Mr. Fox—Do you leave the honey-board off altogether?

Mr. Huffman—I do. I don't know what others do.

Mr. Fox—I use the honey-board.

Mr. Pierce—Should the cover be removed?

Mr. Fox—Yes.

Mr. Wilcox—Yes, I should have ventilation.

Mr. Pierce—In a moist cellar it would be worse.

Some discussion took place as to the merits of oilcloth. It appeared that nine were in favor and seven against.

Mr. Wilcox raised the point that you must use the queen-excluder to keep the queen out of the super.

"Will you get more honey by using them?"

Mr. Wilcox—You will not get more honey, but you will get rid of all annoyance.

Do you use a bee-space between the brood-frames and honey-board? Yes, always.

Which do you prefer, wood and zinc, or all-zinc? I prefer the wood and zinc; all-zinc warps.

Are you ever troubled by the queen going through the zinc? I have had them go through the perforated zinc, but it happens very seldom.

Mr. Minnich said he preferred all-zinc, as the bees would close the perforations in wood-zinc, but would not do so in all-zinc.

Mr. Huffman—All-zinc is good enough for me. I put the zinc flat on top of the brood-frames, and have a bee-space on top.

Mr. Pierce—It is just as easy to keep the perforations in wood-zinc clear as in all-zinc. Keep them clear by scraping.

Mr. Wilcox—I use a piece of a sickle to scrape any part of the hive.

Mr. Fox—I use a painter's scraper; this is a very good tool for general purposes.

Mr. France, at this time, spoke of Mr. Danniher as the oldest member, and of his faithfulness in attending the conventions year after year. On motion of Mr. France, Mr. Danniher was declared a life member by a unanimous vote.

#### FEEDING BEES IN WINTER.

"What is the best way to feed for winter?"

Mr. Fox, in answer to the question, read the following clipping from a journal:

"To feed bees in winter, purchase about 5 pounds to the colony of the best granulated sugar, and pour just enough boiling water on it to dissolve all of it into a thick syrup. Boil the syrup, being careful not to let it burn, until it will harden by putting a drop into cold water; then pour it into a dish or bread-pan, stirring it as it cools, and moulding it into cakes, which will weigh 5 or 6 pounds each. Remove the cover and place one of these cakes directly over the cluster, first placing three or four sticks of about one-half inch thickness across the frames to rest on. Cover all up carefully with a heavy cloth—a grain-sack is good. Over this place four or five thicknesses of newspaper, tucked in closely, and your bees will need no further attention until spring, so far as feed is concerned. In the spring, if there are any of the sugar-cakes left, melt them up and feed in the form of thin syrup to stimulate brood-rearing. Do not be in too big a hurry about feeding them the syrup, but be sure spring is here and the bees can fly every day before you commence this."

Mr. Minnich said he had tried this without success, as the syrup granulated.

Mr. Pierce—It will not do so if it is fed early enough.

"Will it not disturb the bees?"

It will not disturb them much. I have good success in putting frames of honey under the quilt on top of the frames.

Mr. Fox—While I do not advocate disturbing bees in winter, I believe it necessary to do so if needful. Besides, I do not think it will hurt them as much as is generally supposed.

Mr. Fox spoke of moving bees in winter successfully.

Mr. Wilcox—You may hear a different story in the spring.

Mr. France spoke of a case of moving bees in the winter in which the result was fatal.

#### ALFALFA AS A HONEY-PLANT.

"How long after alfalfa has been sown on land which has not grown it before will it yield honey?"

Mr. Moe said he had tried it and it had never yielded.

Mr. Adair—I don't think it will yield this side of the Mississippi River.

Mr. Huffman—I don't think it ever succeeds except in the dry Western section of the country, and I believe that rain is detrimental to it as a honey-plant.

Mr. Pierce said that in Illinois it would not yield unless the soil was inoculated with soil from fields where alfalfa had been successfully raised. He found, from conversation with a Kansas bee-keeper, that in that State it blooms the first season, and that the bees work on it at any time when in bloom.

Mr. Huffman—It will not yield if cut for hay.

Mr. Danniher saw a field near Madison in bloom all through the season, and the bees worked on it all the time while in blossom.

Mr. France found that everything seemed to be favorable for alfalfa around Fond du Lac, and that conditions seemed to be equally favorable in other parts.

#### CONVENTION EXHIBITS—TRANSFERRING BEES.

"Why are the exhibits of honey so small at our conventions?"

Mr. France—A few years ago, when premiums were offered, the exhibits were plenty. Since the premiums were discontinued we have no exhibits.

Mr. Fox—The members should take a personal interest in the matter, and bring exhibits without pecuniary inducement.

Mr. Huffman—If we take enough personal interest in the matter there would be plenty of exhibits, but we don't. What we want to do is to catch members, and to catch fish you must use bait.

Mr. Fox—If it is policy to offer premiums we should offer them.

Mr. Moe—Did our vice-president mean what he said, or was he simply preaching? Why did he not bring an exhibit?

"What is the best, or a good method of forcing a colony from a box-hive?"

Mr. Fox—Knock off one side of the hive, and take out the bees, combs, etc. Fit the old combs into new frames, and put into the new hive; the bees will fasten them at once.

Mr. Huffman—Have you ever tried putting an empty hive on top of the old, and drive the bees into the new hive? It is quite a job to fasten the old combs into frames.

Mr. Fox—I have tried it, but without success. It is not difficult to fit the old comb into the frames, and in two or three days they are fastened.

Mr. Wilcox—My method is to place an empty box on top of the old hive, then hammer the old hive for about 15 minutes, when the swarm will be in the box on top. They are then given the same as a swarm. The drumming is repeated after 21 days, to get all the young bees out. I don't care for the old comb.

Mr. Danniher—I have tried both, and prefer drumming.

At 6 p.m., on motion, the convention adjourned until 8 a.m., Feb. 5.

(Concluded next week.)

### Management in Producing Extracted Honey.

BY C. P. DADANT.

MR. C. P. DADANT—I would like to ask a question or two, if it is not too presuming. I think I have read in some of the bee-papers that you leave your honey on the hive till fall, and then extract all of it at once. Now, I have plenty of foundation to give to the bees, and I could just as well give them plenty of room and not extract till fall. I wish to ask your advice on that. Would it not be better to extract the white clover and keep it separate? Does not the honey get so thick that it is hard to throw it out.

Another thing: I have been thinking, that when the honey-flow starts, and somewhere near swarming-time, I would go out to the apiary and take all the brood from the bees, and bring it home, and either made nuclei or give it to bees with a this-year's queen, to run for comb honey. Would it be advisable to take all their brood so as to prevent their swarming?

One thing more: Is it advisable to tier up 3 and 4 stories high in 8 and 10 frame hives, Langstroth size?  
A. L. DUPRAY.  
Clinton Co., Iowa.

We do not leave the honey on the hives till fall, but till the season is over. We proceed as follows:

Just as soon as the crop opens, we place our extracting supers on the hives, usually one super to each colony. If the outlook is very promising, and some colonies extra-strong, we give these two supers. Of course the combs are already built in these, and all that the bees have to do is to store the honey. If our supply of supers and combs proves insufficient before the crop is at an end, we often resort to equalizing. By this we mean that we take combs from supers that are full and exchange them for empty combs taken from the supers of the poorer colonies which have been unable to fill theirs; for the colonies are not equally productive, some colonies filling two or three supers while others only begin to carry honey into their super. By this equalizing we secure a greater amount of filled supers, and save handling any empty combs when the extracting is done.

Just as soon as the clover crop is fairly over, we begin extracting. We never leave the supers on with clover honey in them for the fall crop, unless the amount of honey harvested is so scanty as to make it unprofitable to extract. The mixing of two grades, clover and fall honey, is objectionable, unless the honey is very thoroughly mixed. When

it is extracted at the same time, it is apt to make streaks of different shades and is not so nice as if uniform. Yet we must say that a mixture of clover and fall honey—knottweed, heartsease and Spanish-needle—makes a very salable article, if the different grades are thoroughly mixed, and we have often made such a mixture to satisfy fastidious customers, but the honey must be heated and stirred to mix properly, and it requires great care not to spoil its flavor in heating.

As a rule it is much the best to harvest each grade separately, and so we aim to extract at least twice a year, once in July and the second time in September.

As to the honey getting too thick, there is but little danger of that, and we much prefer to have it a little too thick than too watery as it is sometimes, especially the first crop, when it contains any basswood. Basswood honey has always given us the greatest trouble to secure it sufficiently ripened, even if left on the hives quite a while after the end of the harvest.

We say that we always extract at the end of the crop, but there are no rules without exceptions. We have had seasons when it would have been out of the question to keep the bees supplied with sufficient room, had we not taken the honey off two, three, and even as many as five times during one crop. But such seasons are rare. Yet we must be prepared for them. The more scarce they are, the more important it is to take advantage of the good luck.

We have often tiered up three supers, one on top of another, and our supers are large, containing from 55 to 65 pounds each. We have rarely put more than three of them on top of one hive. We do not believe there is any objection to tiering up still more, only with a narrow hive like the 8-frame Langstroth, one must be very careful how they are placed. The least slant to one side or the other would perhaps cause the hive to tip, as the weight of the honey would increase the settling to the lower side. We have no use for the 8-frame hive, even for comb honey production. The 10-frame hive is small enough.

If the honey of the fall crop is left on the hive till November, it may become thick enough to be inconvenient to extract. As a rule it is much the best to extract the crop, just as the harvest ends. By this method we not only secure as ripe honey as can be had, but we also save a great deal of labor, by doing the work all at one time.

Some apiarists find it convenient to haul the supers home from an out-apiary to do the extracting at leisure. We do not like this method. We extract on the spot, and return the supers to the hives at once. Whatever may be said in favor of the method of taking the combs home, our method is more expeditious and more economical.

Regarding the removal of the brood to prevent swarming, we would not recommend it. This method at best would only prevent the issue of a part of the natural swarms, but the apiarist would have to make artificial increase with this brood, or cause swarming with the colonies to which it would be given. It would be a great deal of labor, would entail some risk, and would hardly answer its purpose.

If an apiary is properly conducted for extracted honey with large hives, and a plentiful supply of supers filled with combs, there will be very little swarming, and it will not prove necessary to take any measures to prevent it. Ordinarily such measures would be useless, or worse than useless. A colony which is at all times supplied with a large quantity of empty combs, will make no preparations for swarming, unless it is in an uncomfortable position, exposed to the sun, or with too little ventilation, or with too many drones. Neither will such a colony produce much wax. I have seen it often stated that the bees produce wax independently of their will. The quantity thus produced is very small. It is only when they are compelled to remain full of honey for hours and days that the small scales of wax are produced, seemingly owing to the prolonged holding of a surplus of honey within their sac. When the colony swarms, each bee takes a load, and as they find no combs in their new abode they are compelled to carry this load until a part of it has been changed to wax. The bee which finds room to unload her honey-sac as soon as she arrives home, produces only a minimum of wax. That is one reason why the production of extracted honey is so great when a full supply of combs is furnished to the colony.

Hancock Co., Ill.

The Premiums offered this week are well worth working for. Look at them.

## Putting Unfinished Comb Honey on the Market.

BY FRANK COVERDALE.

AS I was listening with interest to the discussion which took place at the Chicago convention, Pres. York said that he had received honey in the comb only half filled and half capped. This should never be. Is not a nice comb, that fills a section, after being extracted, worth at least 6 cents? And is not the honey, after being extracted, a lighter color, and also a first-class honey for table use?

Besides, those sections of nice combs, which are left over, are a power to get all the colonies into the supers at the earliest possible date—a thing of as much moment to every comb-honey producer as "money in the bank."

There surely ought to be no honey sent to market until it is finished; it not only hurts the trade in general, but he or she who ships it will suffer more or less in future dealings. When I sell to a firm once I want to sell to it again. And, by the way, all my shipments have gone to one firm for the last 5 or 6 years, at satisfactory prices. Such a state of affairs is very satisfactory to me, and should be to every producer of this most healthful sweet. I have seen a great deal of dissatisfaction come to light along this line.

I am sorry to say that it is very hard to get honey put up well enough so that it will do to stamp a good name on it. However, I never stamp my name on my cases, because I sell direct to the wholesale house, in car-lots, and the firm, somehow, never forgets me.

If I wished a greater number of little orders, I would put my name on every case. Suppose I should case with several half-filled, half-capped sections, which on reaching its destination would be sold at 20 cents per section, would it not be embarrassing for the grocer? Through that honey the grocer would either gain custom or lose it.

Let me emphasize in strongest terms that it does not pay to ship this kind of honey to any market, at any price. I have tried it, but never had a chance the second time, so I have come to the conclusion that it is better to extract all this kind of honey, except that which I sell at home.

Selling honey at home, at a lower price, will soon gain trade similar to that of extracted honey. Still, as the price is nearly up to finished combs, better extract them, selling to this trade only inferior-shaped combs, and at a lower price.

Jackson Co., Iowa.

## Growing Timber in Germany—Lumber for Hives and Other Supplies.

BY F. GREINER.

PERHAPS every observer is aware that the destruction of the pine forests is going on at a rapid rate. The gravity of the situation is not fully recognized by the general public, for no new tracts of timber are being planted.

In European countries a regular system of forestry is practiced. The large estates have their timberlands divided into a certain number of squares. When one is cleared off another is planted. The thinning-out process goes on from the time the pine seedlings are large enough to answer for bean-poles, till the trees have reached a diameter of one foot or more. Thus the country produces what timber is needed. We, in America, have not yet arrived at this point. We keep slashing into the timber, right and left, with no regard to consequences. It is not impossible or improbable that, in the future—how near, is a speculation—we may have to resort to other materials for hive-making. We are not entirely dependent upon pine lumber for our hives and supplies; if it should come to the worst, we could use clay, plaster of Paris, brick, straw or paper-pulp; but it would be well for us to look the matter squarely in the face, and be more economical with the material on hand. Quantities of good material are annually burned up, which might be saved.

Pine lumber is not the only kind suitable for our use. In fact, basswood timber has already taken the place wherever practicable, as, for instance, in manufacturing sections, shipping-cases, inside fixtures, etc.; but the supply of basswood will, in all probability, hold out no longer than the pine. Other timbers that come in for our consideration, are whitewood, chestnut, butternut, cedar, and probably other timber. Whitewood might be used for hive-bodies; it answers well, and could be used for all inside work except

perhaps for the top-bars of brood-frames. No other timber answers as well as white pine, although basswood is used by a few.

I have used a great deal of chestnut lumber, such as was cut from large trees and which was full of little pinholes. It can generally be bought for less than pine lumber, and may be used for hive-stands, shipping-cases, section-holders, frame-stuff, etc. It is, however, not suitable for hive-bodies on account of its tendency to warp. It is even worse than basswood in this respect. I believe hives that are not exposed to the weather, as those in house-aparies, may be made of basswood or any other kind of wood without giving any trouble. Bitternut answers all purposes where chestnut would. I have used these timbers largely for many years.

A few years ago I bought a large pile of slabs. It consisted mostly of chestnut. I bought it with a view of using it for the kitchen stove, and I enjoyed the fun, that winter, of reducing these slabs—there were 27 two-horse loads—to stovewood, with the help of a good, sharp buck-saw. Whenever I came to a nice, heavy piece of clear stuff three feet or more long, it was cut out and saved. I have not only used this material for honey-cases, frame-stuff, etc., but also for potato-crates, and I have still a supply left to draw on. It was the cheapest timber and wood I ever bought. The whole lot cost me but \$5.00. A great deal of such material could be saved and utilized by the bee-keepers, especially by those who make their own supplies.

Ontario Co., N. Y.

## Foul-Brood Legislation in California.

BY HON. J. M. HAMBAUGH.

**A**MONG the very first bills introduced into the California Legislature in January was one with the following title:

*An Act*—To amend an act entitled an act to promote the apicultural interests of the State of California by providing county inspectors of aparies, and defining their duties, and providing for their compensation, and repealing an Act entitled, "An act to authorize the board of supervisors of the several counties of this State to appoint inspectors of aparies, and provide for their compensation, and defining their duties, and for the further protection of bee-culture," approved March 13, 1883, said first-named act having been approved February 20, 1901, and adding five new sections, seven, eight, nine, ten and eleven, providing for making the violation of certain sections thereof a misdemeanor.

Senator Ward and Assemblyman Burgess, both of San Diego Co., introduced the bill simultaneously in both houses, and they made rapid headway, reaching the Governor among the very first, to claim his signature. All honor to them, and thanks to all in our legislative halls who so generously contributed to the needs of the suffering bee-keepers, with their influence and votes. Many thanks also, to those wide-awake officers and members of the California State Bee-Keepers' Association, University Farmers' Club Institute, California Central Bee-Keepers, etc., especially our good friend Prof. Cook, who so ably and generously championed the cause of the bee-keepers, and while, in our individual estimation, it does not meet every requirement, we believe we now have upon our statutes the best foul-brood law on the continent of America. It will be noticed the last five sections and the amendment to the fourth sections were enacted at this session of the Legislature.

### CALIFORNIA'S NEW FOUL BROOD LAW.

SEC. 1.—Whenever a petition is presented to the board of supervisors of any county, signed by ten or more persons, each of whom is a property-holder, resident of the county, and possessor of an apiary or place where bees are kept, stating that certain or all aparies within the county were affected with the disease known as foul brood, or any other disease which is infectious or contagious in its nature, and injurious to the bees, their eggs, or larvae, and praying that an inspector be appointed by them, whose duty it shall be to supervise the treatment of said bees and aparies as herein provided, the board of supervisors shall, within twenty days thereafter, appoint a suitable person, who shall be a skilled bee-keeper, inspector of aparies. Upon petition of ten persons, each of whom is a resident property-holder, and possessor of an apiary, the board of supervisors may remove said inspector for cause after a hearing of the petition.

SEC. 2.—It shall be the duty of the inspector of each county to cause an inspection to be made, when he deems it necessary, of any or every apiary or other place within his jurisdiction in which bees are kept; and, if found infected with foul brood, or any other infectious or contagious disease injurious to the bees, or their eggs or larvae, he shall notify the owner or owners, person or persons, in charge, or in possession of said aparies or places where bees are kept, that the same are infected with foul brood or any other disease infectious or conta-

gious in its nature, and injurious to bees, their eggs, or larvae, and he shall require such person or persons to eradicate and remove such disease or cause of contagion, within a certain time to be specified.

Said notice may be served upon the person or persons or either of them, owning or having charge or having possession of such infected aparies or places where bees are kept, by any inspector, or by any person deputized by the said inspector for that purpose, or they may be served in the same manner as a summons in a civil action. Any and all such aparies, or places where bees are kept, found infected with foul brood or any other infectious or contagious disease, are hereby adjudged and declared to be a public nuisance; and whenever any such nuisance shall exist at any place within his jurisdiction, or on the property of any non-resident or on any property the owner or owners of which can not be found by the inspector, or any diligent search, within the county or upon the property of any owner or owners, upon whom notice aforesaid has been served, and who shall refuse or neglect to abate the same within the time specified, it shall be the duty of the inspector to abate the nuisance—either by treating the disease or by destroying the infected hives, together with their combs and bees therein.

The expense thereof shall be a county charge, and the board of supervisors shall allow and pay the same out of the general fund of the county.

SEC. 3.—It shall be the duty of the county inspector of aparies to keep a record of his official acts and doing, and make a monthly report thereof to the board of supervisors; and the board of supervisors may withhold warrants for salary of said inspector until such time as said report is made.

SEC. 4.—The salary of the county inspector of aparies shall be four dollars per day when actually engaged in the performance of his duties, and itemized necessary traveling expenses incurred in the performance of his duties, as prescribed in this act.

SEC. 5.—The inspector of aparies may, in his discretion, order the owner or owners, or other persons in charge of bees kept in box or other immovable or stationary comb hives in aparies infected with foul brood or any other infectious or contagious disease, or within a radius of three miles of such diseased aparies, to transfer such bees to movable-frame hives within a reasonable time to be specified in such order or notice; and in default of such transfer by owner or owners, or other person in charge of such bees, the inspector may destroy or cause to be destroyed all such hives, together with their contents, and the expense thereof shall be a county charge, as provided in section two of this act.

SEC. 6.—Any person or persons who shall import bees into the State of California, which said bees are not accompanied with a certificate from a duly authorized inspector of aparies, or bee-inspector, certifying that such bees are free from foul brood and other infectious or contagious diseases, or who shall import bees from another county within this State not having a bee-inspector, into a county having a bee-inspector, shall immediately, upon receipt of such bees, cause them to be inspected by a duly authorized inspector of aparies; and if such bees are found to be infected with foul brood or other infectious or contagious disease, such inspector shall proceed to have such disease eradicated, as provided in section two of this act. Any person violating the provisions of this section shall be deemed guilty of a misdemeanor.

SEC. 7.—It shall be unlawful for any person owning or controlling bees within this State, which are known to be infected with foul brood, or other infectious or contagious disease, to remove said bees to a new location, without first giving ten days' notice to the county inspector of aparies, stating when and where he intends moving said bees. Any person violating the provisions of this section shall be deemed guilty of a misdemeanor.

SEC. 8.—Any person or persons whose apiary is infected with foul brood or any other infectious or contagious disease, and who sells or offers for sale from such infected apiary any bees, hives, bee-fixtures, or appurtenances, or who shall expose in his bee-yard or elsewhere any infected comb honey, beeswax, or other infected thing, or who conceals the fact that his apiary is so infected, shall be deemed guilty of a misdemeanor.

SEC. 9.—Any person or persons who shall resist, impede, or hinder in any way the inspection of aparies in this State, or who violates under the provisions of this act shall be deemed guilty of a misdemeanor.

SEC. 12.—This act shall take effect immediately.

**Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.**

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what your German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Death of Mrs. A. J. Barber.

Mrs. A. J. Barber died at her home in Montezuma Co., Colo., March 24. Her loss will be regretted not only by Colorado bee-keepers, but by thousands of others.

In its last issue, the Rocky Mountain Bee Journal had this to say of our departed sister:

"Mrs. Barber was well known to the bee-keeping fraternity, not only of her own State, but of the United States. In her experience as an apiarist, she had evolved some original ideas of great value to bee-keepers, which she freely imparted to the craft whenever the opportunity presented. She conducted several large apiaries, being the most extensive woman bee-keeper in Colorado, and, perhaps, in the world.

"She was a pioneer of the early days of southwestern Colorado—days when the gore-thirsty Ute was never off the war-path. Her first husband was killed many years ago in an unequal battle with that tribe. She is spoken of by those who knew her familiarly, as a remarkable woman—naturally refined, sympathetic, and kind, yet, when occasion demanded, could be as brave as any heroine of fiction. Notwithstanding nearly her whole life was lived amid the turmoil, hardships, and meager advantages of the Western frontier, she acquired a splendid education, and was always recognized for her superior intelligence and modest worth."

### Spring Feeding of Bees.

1. A colony has stood on the summer stand all winter, and is strong and apparently healthy. If, on opening the hive on a warm, pleasant day in early spring, it is found to be quite damp, drops of water standing thickly on the walls, what better thing could be done than to lift the cover and let the sun shine directly on the pad for an hour or so in the middle of the day?

2. In "Bees and Honey," by Newman, in reference to spring feeding, we find this: "If there are no other bees in the neighborhood, the food can be given in shallow pans and placed in the noonday sun, at some distance from the bees." Do you advise this as a safe way of feeding a small apiary, *provided* all colonies are reasonably strong, and no other bees nearer than a mile?

(Perhaps I can aid you to give a clearer answer in regard to this particular case, by stating that my bee-pasture lies principally north of my apiary, while to the south there is practically no bee-pasture for a mile; then there is an apiary at least twice as large as mine; then a little farther south there is fine pasture.)

3. If a safe plan, how far from the hives should the food be placed?

4. How much per colony should be given, and how often?

5. Would not a bowl or can inverted on a plate, or some such thing, be better than an open shallow pan for such feeding?

6. Bees began gathering pollen early in April, and bloom was coming rapidly, when, on April 28 and 29, we had a cold wave, ice and snow, so all bloom is destroyed and no more expected till about the last of May. All colonies are strong, but there is not much honey in the hives. Under these circumstances am I not obliged to feed in order to be ready for early June alfalfa bloom?

I am a beginner, and have the whole business to learn, and while I am at it I want to learn it *right*.

Decatur Co., Kans., May 2. AUNTIE BEE.

ANSWERS.—1. The condition you mention is one likely to arise with any strong colony, especially if the entrance be somewhat contracted, and need occasion no alarm; but your idea of drying it out with the sun is all right.

2. It depends upon circumstances whether the plan is good. It seems more like getting forage from the fields than feeding in the hive, but the strongest colonies get the most. If other bees are within a mile, some watching

would be needed to see whether they get a start. Even at a greater distance they might sometimes carry off some of the feed, for bees have been known to forage more than two or three miles from home.

3. The distance is not important. Five, ten, twenty, or more rods, just as it suits your convenience.

4. Half a pint to a pint daily would not be out of the way. But you should not give enough to have the combs clogged so the queen will not have room to lay, and it is not well to feed except when the weather is favorable for bees flying.

5. Yes, and no. Yes, if the can or bowl be large enough to give sufficient standing room for the bees; otherwise no.

6. Surely, if colonies are strong you should keep them strong, and in order to do that they must have plenty of honey to draw on. It takes *lots* of honey, more than most people suppose, to keep up the amount of brood-rearing that is needed for good, strong colonies; and anything that curtails the brood-rearing at this critical time is most disastrous to your future honey crop. By all means feed if they need it. I hope you may find yourself mistaken, and that all bloom may not be destroyed so that you will not have any until June; but if that is true, then frequent feeding to stimulate your colonies is what you need.

### Honey in Bread.

"What nice bread this is! Mr. John's baker's bread is it not?" "No, I make all my own bread." "What yeast do you use?" "A half-cupful of honey, a pinch of tartaric acid, a little flour, and some water. I prefer dark honey for it." "Well, I would not wish for better bread." In the dry weather bread made with honey yeast does not get so dry as bread made with other yeast. In the United States the large bakers are among the greatest honey-buyers.—Australian Bee-Bulletin.

The last sentence of the above would indicate that in the United States a large amount of honey was used in bread-making, which is rather doubtful. It is true that large amounts of honey are bought by bakers, but used chiefly, I think, in making honey-jumbles and things of like nature.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### LONGING FOR HUN.

O for the hum of some bees in the skies!  
O for some summer, O for some flies!

(Loud cries of, "Put him out!")

### CUBAN HONEY IN THE UNITED STATES.

Shall we let Cuban honey in cheaper because our brethren are there producing it? It was not with that expectation that they went to Cuba, I reckon. As people make their beds so they must lie on them, as a general thing. If they are true Americans they don't want to take the position of holding out hands for alms. Of localities capable of producing floods of cheap honey, 'spects we are carrying enough already. Page 227.

### FORMALDEHYDE, FORMALIN, ETC.

As to formaldehyde vapor, what we want now is not more chin-music on the rondo, "It's reliable—It's unreliable—Nobody knows yet," but answers to square questions, "How can I get it? How shall I use it? What does it cost? What sort of stuff is it, anyway?" Some simple inventions and pictures of them, are just nicely in order, that we may try it without bungling, and without that waste of time which we usually incur when getting into something totally new. And let some of the first users give us their actual adventures—not too briefly. A sort of clandestine article, formaldehyde is, I believe—more largely used in doing wrong than in doing right—and by users who don't want the fact of their using it known. Perchance that circumstance may make us more or less annoyance and bother.

We read of both formaldehyde and formalin; what's

the relation of those two things—or terms? Seems to me some writers simply say "formal," and let it go at that. We would be glad to see these confusing words "form a line." O for a chemist to give us a learned and earnest talk—at the end of which we comprehend less the matter than before! (More cries of, "Put him out!") Page 227.

#### DEATH OF DR. GALLUP.

I failed to notice the death of Dr. Gallup when the number containing it arrived, and it just comes to me as a sudden sadness. Had hoped that it was a false alarm when he wrote that he was sick and not expected to get well. Not he that is to write "A Hundred Years Among the Bees," alas! Still, the Book prophesies of a time when a *child* shall die a hundred years old. Page 259.

#### PICKLED BROOD NOT CONTAGIOUS.

I hope Mr. France was right at the Northwestern, in assuring us that pickled brood is not catching. Nevertheless, the man who looks a little out for it is still pardonable. Suppose we should say, "Communicable, but good colonies in favorable condition invulnerable to the contagion." Would not that agree with what we know of the matter at present? Page 228.

#### THE LONG-TONGUED BEE.

Surprised if the long-tongued bee has become a back number already. She was called for at the Northwestern, and no long-tongued advocate stood up for her. So quickly done for—what begun for? Page 238.

#### LARGE SPACE OVER THE SECTIONS.

And the staid and reliable Mr. Baldridge can be queer when he tries, it seems. Likes to have a two-inch space over his sections built full of higglety-pigglety comb and honey. Notices one that the bees need more room. Sure! But most of us would prefer to be notified in a less strenuous manner. Page 228.

#### BEES AND FRUIT-BLOOM POLLINATION.

Yes, the remark was loudly made that covering bloom prevented pollen being carried by currents of air. We still didn't know for *sure* whether lack of bees or lack of natural conditions caused the failure of fruit-setting. To some extent I guess we shall have to say so still; but Prof. Cook, on page 229, makes a vigorous foray into that idea. Bees admitted just momentarily, and marks put on the flowers they visit—just those blooms and no others developing fruit. Conclusive as to the excellence of bee-work; but even that does not quite cut off the idea that the sterility of the other blooms was caused by their being covered up. All the same, the seven items at the close constitute excellent "gospel" on the subject.

#### BEE-NURSES AND BEE-BABIES.

Hello! Here on page 230 a new question bobs up. Does each bee-nurse about supply one bee-baby, or more than one? Answered tentatively for more than one. May be it's all right; but, see here once: To rear even one bee-baby the nurse must in about six days provide an amount of food considerably exceeding her own weight. Isn't that doing pretty well—wonderfully well? Just at present I guess we had better make the question broader. Let it run: Does each nurse supply several babies, or does each baby employ several nurses?

LATER.—The mathematical state of the case is dead against me. If it took two nurses for one larva the whole nursing time of a bee (16 days) would suffice to rear less than two young bees, and the colony would never get ahead any. This is anent the excellent article of Arthur C. Miller.

Honey as a Health-Food is the name of a 16-page leaflet (3½ x 6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 10 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Rearing Queens.

I tried to rear some queens by the plan given by Mr. L. Stachelhausen, page 150, and failed.

I prepared the colony as he directed, and gave the strips about an hour after the separation—that was Tuesday about 1 p.m. Thursday noon I looked in and there was not a cell started, and every larva was gone. So I gave some more (two pieces about 8 inches long) and at the same time put in 5 cell-cups and grafted them (I had no royal jelly). Friday noon they had built out 4 of the cups and had started one cell on the strips. All the other larva in the strips are gone.

In shoving down the cells on the strips I think I cut a little more than half way, that is, cut off more than half the depth of the cell. What do you think is the reason they would not start cells on the strips? Would cutting off the comb too deep make any difference? I used larvae that were just hatched, and the cell-cup they did not accept was the youngest larva I transferred. Of course what I transferred was older.

I am going to try again, as I believe it is a good plan. Any information will be thankfully received.

TEXAS.

ANSWER.—It is very hard to tell just why it is that bees fail to do as we wish about starting queen-cells, especially when one has only a written description. The most experienced do not invariably make a success, and in most cases it is quite likely they do not know the exact cause of failure. Your greater success upon second trial is your warrant for believing that you will continue to improve. It is the common experience. Cutting down the cells a little more or a little less than half way would hardly be the cause of failure. "If at first you don't succeed, try, try again."

### Facing Hives—Old and Moldy Combs.

I had eight colonies of bees last fall and wintered them out-doors packed thoroughly in leaves, and roofed, 4 together, facing south and 4 facing east, each packed the same. Those facing south came out strong and fine, while of the 4 facing east 2 were queenless, and all had many dead bees and the combs more or less moldy, though with plenty of honey. I have combined three colonies and faced them south.

1. Was this in consequence of their facing east?

2. Can I use those or other old combs to hive swarms on, or would they be better melted down? They nearly all have some honey and some pollen and mold, but are good, straight combs, and I dislike melting them if the bees will take them.

ILLINOIS.

ANSWERS.—1. I don't know, but the facing east may have something to do with it. A day might come warm enough to start flying in the afternoon those facing south, without starting out those facing east. Quite likely, however, there were reasons for poor wintering aside from the facing east.

2. Don't for a minute think of melting up those combs. Put them in a low story under strong colonies for the bees to take care of, and then use them when wanted for new colonies or swarms.

### Weak or Perhaps Queenless.

What is the matter with one of my colonies? I caught it late last fall. It did not gather enough honey to keep it over winter, and so I had to feed it about the middle of March. It does not clean out the mold and dead bees since I put them out of the cellar this spring, and it does not gather pollen, as my other colonies do.

MINNESOTA.

ANSWER.—Hard to tell what is the trouble without looking in the hive. Very likely the only trouble is that they are weak. It is possible, however, that they may be queenless. Lift out the frames and see if they have any eggs or brood. If not, unite with other colonies.

### Trouble Over a Bee-Tree.

I want to write to you about a bee-tree which I have found, and the owner of it will not let me cut it. How can I get the bees, etc.?

1. Has he a right to the bees and honey which the tree contains?

2. I agreed to grub the tree, and work it from the land, and the owner to pay me so much a cord for the wood; the grubbing of the tree I would do for nothing. The owner said, "No, we will let it stand until fall and divide the honey, and then you can have the bees." I said, "Then you can have the bees, too." He laughed at me.

3. The tree is not worth 10 cents to either of us, if we wanted to buy it, as it is rotten from top to root. No, I would not give one copper cent for the tree as far as the wood is concerned. Why, they burn wood by the trainload in order to open land. Why not burn this one?

Simply because he wants to get the honey, when the law says he cannot touch the bees or the honey, as I am the finder and no one else.  
 Why not have a bee-tree law? IOWA.

ANSWER.—I don't know the law in your State; one of your justices or lawyers could tell you. I'm afraid, however, that your having no other claim than finding the tree will not entitle you to anything better than his offer to divide the honey in the fall. And if that is done any time in September you will still have time to feed up the bees.

**Queenless Colony.**

I have a queenless colony of bees. Which would be the better way to do, send for a queen, or wait and put a queen-cell from another colony with them? COLORADO.

ANSWER.—If you wait for a queen-cell, the colony would be much depleted before the young queen would lay. Better buy a queen, or else unite with a good colony.

**Swarming—Wire in Comb Honey.**

1. I do not want any increase, because my bees are black, and I want Italians, and I should like to know, if, when a swarm comes from the hive and I catch and kill the queen, the bees will go back into the old hive and stay until the new queen-cells are hatched. Our bees are in box-hives and I want to put the two swarms combined into a frame hive, thereby preventing increase of black bees and making a strong colony of blacks.

2. We have put wired frames of foundation in hives and the bees have filled them with honey. Will this wire, if cut and pulled through the honey, have any poisonous effects, or in any way injure this chunk honey, making it unfit for use? ILLINOIS.

ANSWERS.—1. Yes, if the queen is not with them the bees will return to the hive, but in a large apiary there will be some cases of their going to the wrong hive. Then a week or more later the swarm will issue with a young queen.

2. The wire will not in any way injure the honey beyond the tearing of the comb.

**Perhaps Bee-Paralysis or Robbing.**

I have two colonies of bees, which wintered in fine shape on the summer stands, and built up very rapidly this spring. But on the morning of April 29, I saw quite a lot of dead bees on the floor and in front of the hive. I watched some come out and they ran as if they were crippled, or rocked back and forth, and seemed to be unable to fly when they tried. They would spin around like a top on the alight-

ing board, and double up and die. The bees have plenty of honey. What do you think is the cause of this, and what is the remedy for it. WISCONSIN.

ANSWER.—I don't know. Looks just a little as if it might be robbing bees that were stung to death; in which case the usual care about robbing would be needed. Possibly, however, it is a case of bee-paralysis, for which I can offer no cure; but as far north as Wisconsin it does not generally amount to much, disappearing of itself.

**Maybe Queenless—Unpainted Hives—Stimulative Feeding.**

1. Five of my colonies have been out of the cellar since March 9. A couple of weeks ago they had lots of eggs and young brood, but today they had no eggs, but sealed queen-cells. What do you suppose this means? Everything has been all right for brood-rearing.

2. May I ask why you prefer unpainted hives?  
 3. What are the main harmful results of stimulative feeding, if not practiced rightly? MICHIGAN.

ANSWERS.—1. The probability is that they are now queenless.  
 2. I think the bees are a little better off in unpainted hives. It costs more to keep the hives painted, and by the time the unpainted hives give out it is just possible I may want to change to another style of hive. If not, I think I can get new bodies for no more than it would have cost to keep the old ones painted. I want covers painted, although I am trying some zinc covers without paint.

3. Bees are induced to fly out when the weather is such that many will be chilled and lost, resulting in loss that more than counterbalances all the gain.

**Managing Double Brood-Chambers.**

1. In using two brood-chambers for your bees in the spring, how do you handle the extra one when removed?

2. If an extra chamber is taken off full of brood, will this brood hatch, if the bees are left on the old stand?

3. How do you handle two brood-chambers for comb honey? WISCONSIN.

ANSWERS.—1. Leave the eight best frames of brood on the stand, and use the other eight where they will do the most good. Some of them will have brood in, and these may be used to strengthen weak colonies or to start new ones.

2. Some of the young bees will emerge, but great loss will generally result. Don't try it as far north as Wisconsin.

3. Simply take away one story as mentioned in 1, when it comes time to give supers. You will find the whole matter pretty fully treated in the book you have ordered, "Forty Years Among the Bees."

**Death of John Nebel.**  
 Another veteran has stepped off the stage of action. This time it is one that touches a tender place in my heart. Mr. John Nebel is dead. We had elected him President of our Missouri State Bee-Keepers' Association just a few days ago. It is sad indeed. J. W. Rouse, the vice-president will, no doubt, make us a good president, but cannot, of course, wholly take the place of the one who has gone from our midst. It is hard to understand how soon and how strange the fies of brotherhood become fixed between comparative strangers, when they unite in a common cause, but such is the case. I never saw Mr. Nebel until I met him at Moberly, at our recent convention. I have had business relations with him for about three years, and had become very much attached to him. I have been working hard for some time, trying to organize a state bee-keepers' association, and I had confided in Mr. Nebel. I suppose the good cause will go on just the same, but, somehow, a strange heaviness comes over me as I think of the departed. I believe a great

many of the bee-keepers of Missouri and elsewhere have the same feeling, and will mourn the loss of our friend and brother. Let it be a reminder of the mortality of our race. Especially, let us endeavor to imitate the good qualities of men like Mr. Nebel.

Carroll Co., Mo., May 8. W. T. CARY.

P. S.—The Missouri State Bee-Keepers' Association, which was recently organized at Moberly, elected the following officers:

President, John Nebel; Vice-President, J. W. Rouse; Secretary, W. T. Cary; Treasurer, F. K. Thompson.

As Mr. Nebel has recently died, Mr. Rouse will succeed him to the presidency until the next election. W. T. C.

## Wintered in a Bee-Shed.

We had 33 colonies of bees put up for the winter last fall, 2 being somewhat weak in bees. We had, even in September, which weakened our old colonies and were no good. Of the 33 we wintered all but 4, or, not counting the 2 weak colonies, we lost only 2 good ones.

This spring, we had very warm weather in March, and the latter part of March we overhauled them and found every queen was laying and some had sealed brood already.

I forgot to say that we wintered them on the summer stands in bee-sheds. The sheds have three closed sides and the one which the sun strikes most upon; 20 colonies in chaff-hives and the rest in single-walled hives. We lost only one in chaff-hives. Those in single-walled hives we supplied with henlock outer shells, but although they all had the same supply of stores last fall, those in the single-walled hives were almost out of stores in March, while the others had plenty left yet. We consider that bees wintered in chaff-hives need less winter stores.

April was cold and we had much rain, and May, so far, is cold. May 1st we had a hard frost, which killed almost all of the apple, strawberry, cherry and pear blossoms. There should have been warmer weather. Under one of our hives, I discovered a striped snake, that would poke its head from under the hive at the entrance, and I suppose lived on bees, although I did not see it take any. We killed it and that ended her snakeship.

Lehigh Co., Pa., May 8. GEO. T. REX.

## Bad Spring for Bees.

Our spring has been bad for bees since March 20. After the first three days in March it never even froze during the next three weeks. The 16th, 17th and 18th were so warm that I set about half of my bees out of the house cellar, and they brought in pollen plentifully from the elm and soft maple, which do not usually blossom till a month

later. With the 24th it turned colder, and was not sufficiently warm again so the rest of the bees could be set out till April 12th and 13th. On the 14th it turned cold again with a continuous north wind, so that the ground was frozen every morning for the next 12 days except one. Most of the days it was also too cold for the bees to fly.

On April 28th the mercury went up to 55; on the 29th to 77; and on the 30th to 87. The bees enjoyed this, but the night of the 30th the mercury sank to 28, and at noon of May 1st I was at our mill where they grind feed by water, and the spray from a little jet caused by a nail-hole in the "water trunk," was freezing and had frozen on to a little tree, so that it was all bowed down with ice; and there were icicles on it an inch in diameter and two feet long. And the sun was shining on this tree and spray all the time. Such freezing of water on a sunny day in May, at mid-day, was never known here before. On the morning of May 2, we had ice an inch thick on standing water, and 1/2 inch thick this morning, May 5.

There is very little brood in any of the hives, and the bees are not nearly so good as they were in March. They came out of the cellars in good shape, and would have been now, if we could have had a good spring. If it does not turn warm soon, to stay so, those colonies lightest in bees will perish.

G. M. DOOLITTLE.

Onondaga Co., N. Y., May 5.

Cold and Windy Weather.

Bees generally winter well here. The most of April, and so far this month, the weather has been bad for the bees. Fruit-trees have been in full bloom for over a week, but we have had very few days that the bees could improve the time, owing to the cold, cloudy and windy weather.

F. A. SNELL.

Carroll Co., Ill., May 4.

Bee-Keeping in Florida.

I see a communication from Mrs. L. Harrison, of Washington Co., Fla., in the Bee Journal. She seems to speak very discouragingly of bee-culture here. I wish to say that there have been some of the greatest yields of honey in our State ever known. Mr. W. S. Hart produced an average of over 250 pounds per colony from 100 colonies, and I have had some splendid yields in the pine woods of Columbia county. We have several up-to-date apiaries. My brother and I have over 100 colonies, and took the premium at the State fair last November for the greatest yields of honey and best honey; and Mr. George Van de Vord for bees. Besides there are several large apiarists in West Florida, who do a good business with their bees.

D. H. HERLONG. Columbia Co., Fla., May 3.

"Sweeter Than Honey."

GERMAN PRESBYTERIAN THEO. SEMINARY, DUBUQUE, IOWA, Sept. 20, 1903. MR. WEIGAND.

Dear Sir:—I was agreeably surprised in receiving by your son, some delicious honey, which you so thoughtfully forwarded us. Mrs. McClelland and I have feasted on it and enjoyed it not only because of its own excellent quality, but even more because of the kind thoughtfulness which prompted the gift. As for myself, I found my mind, no less than my mouth, absorbed in its enjoyment. I could not refrain from thinking on the words of the Psalmist, "Thy word is sweeter than the honey and the honey-comb." The more I thought, the more resemblances between the Bible and honey-comb. Permit me to name some of these resemblances between the Divine honey-comb and that of the bee. The most obvious is that of sweetness, as given by the Psalmist. Truly God's word is very sweet to the man of spiritual discernment. And of all the elements of sweetness none so pronounced and delicious as the wonderful love of God as set forth in Holy Scripture.

Again, as I examined the comb itself, I found each cell was a regular hexagon. How wonderful this! Surely, God is here. For, as each angle in such a cell is 108 degrees, it is

just that very angle whereby the greatest strength with the least material can be secured; so that every cell bespeaks the presence of God who alone could thus guide the bee unconsciously to the uniform making of such an angle. Yes, each cell tells of God.

I find the same in every book, chapter and verse, yes, word, of Holy Scripture, like the cell of the comb; there is the presence of the infinite mind even while employing men like so many bees in the formation of this Divine honey-comb of Holy Scripture. But, after all, the sweetness of the product of all these bees is the one quality most obvious. Surely, to the man of spiritual taste, there is and can be nothing so sweet as the Bible—God's great honey-comb. Nor could I fail to note that, although so many bees are engaged in the construction of the comb, there was no confusion in the process or in the result. Each did its own work in its own place. Just so was it with God's honey-comb—the Bible. Different writers, in different lands, and from different sources, gathered the materials for God's honey-comb, even as in the structure of this of the bees.

And we should I weary you with this line of thought suggested by your gift? Enough to state that to mind and palate your gift was enjoyable.

Again thanking you for your gift, I am,  
Very truly yours in the Lord,  
A. MCCLELLAND.

[The above was sent to a friend of ours (Mr. A. Weigand) who handed it to us for publication. Mr. McClelland is about 65 years of age, and has been blind since his 8th year. But his spiritual vision seems to be all right. —EDITOR.]

### Honey and Fried Bacon.

One of the boys in the Second Regiment tells me that, while encamped in southern Florida, he went out with a searching party for water. After finding a good spring in a ravine a mile or so from camp, he was about to return, when he discovered bees going in and out of a large dead palm-tree. With axes they felled it in such a manner as to split the shell wide open. Then they gathered many comb of beautiful honey in several large new handkerchiefs. Returning to camp, they squeezed or pressed (with the aid of sticks) the honey out of a lot of bacon just fried. The boys had the best meal since they had left home. I have developed a fondness for honey and bacon since hearing the story, and prefer it to any kind of steaks.

The fellow who picked up the honey had bees all over his sticky hands and was not stung, but the one who tried to run was stung many times.

F. H. DRAKE,  
Worcester Co., Mass.

### Lost Bees in Winter.

I had the misfortune to lose all my bees the past winter, with the exception of one red clover colony. This colony built up from a 2-frame nucleus to a very strong colony; in fact I took one of the frames of brood away to strengthen a weak colony. The colony, in all, starved, I think; in fact I know they either had foul brood or black brood. Mr. E. R. Root thinks it was foul brood, but this spring I cannot see any signs of disease, and shall try to build up some good colonies from this queen. Her hive is full of brood and bees at this writing, but the weather is bad for bees here. I have 52 fine colonies in the South; there was a day the past winter but what they were flying.

I don't believe I ever wrote to you about the queen I got from you when I subscribed for the American Bee Journal. She came all right and I made a nucleus and after 24 hours introduced her; she went right to laying, and in about 2 weeks after, I had a weak colony with a poor queen, and I thought it best to pull her head off, and that I would then put these 2 colonies together. I snoked both colonies, but the next day I found the queen dead in front of the hive, and they then reared a queen of their own, but all perished out last winter. I notice some queen-breeders complain of being imposed on; if they will take

W. M. GERRISH, Epping, N.H., carries a full line of our goods at catalog prices. Order of him and save the freight.

# A Few Cheap Smokers!

We find we have on hand a few slightly damaged Clark and Bingham Bee-Smokers, which got a little damp and soiled at the time of the fire in the building where we were about 2 years ago. They are all almost as good as new.

We have some of the Clark Cold Blast, which when new sell now at 55 cents each; some of the Large Bingham—new at 65 cents each; and some of the Little Wonder Bingham—new at 50 cents. But to close out those we have left that are slightly damaged, we will fill orders as long as they last at these prices:

Clark at 25 cents each; Little Wonder Bingham at 30 cents each; and Large Bingham at 40 cents each.

We do not mail any of these slightly damaged Smokers, but will put them in with other goods when ordered, or sell them here at our office when called for—at the above prices.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are introducing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 5 for 25 cents. Send all orders to the office of the American Bee Journal.

## Miscellaneous Items

### Some Pictures of Beedom.

Rev. H. A. Winter at Home.

Rev. H. A. Winter was ordained a minister Sept. 12, 1852, at Upper Sandusky, Ohio. Last September he celebrated his Golden Anniversary. The picture on the preceding page shows him as he appeared at the time of his celebration. We have had the pleasure of meeting Rev. Winter several times at the annual conventions of the Wisconsin State Bee-Keepers' Association held at Madison. Mr. Winter is also an old bee-keeper, and takes great interest not only in caring for the bees, but in everything connected with the business, especially the meeting of the bee-keepers. As he sits in his chair in front of his beautiful home he seems to be the very picture of contentment. He appears also to be the center of attraction, if we may judge from the pleasant faces which surround him. It is a great pleasure to meet Mr. Winter, as he is always joyful and entertaining. We wish him yet many years of happy life, full of opportunities to bless mankind.

### C. C. Chamberlin's Apiary.

In the spring of 1902 I sent a picture of my apiary in winter, and I then said I would send another picture when the outer cases were removed. The picture has been taken for a long time, but I have not been very prompt in sending it. I keep as near 50 colonies as I can by doubling up during swarming time and in the fall. My entire crop of honey last year was 500 pounds, the smallest crop since I have been in the bee-business, all from 53 colonies. The cause of such a poor crop was so much wet weather which lasted all through the season.

C. C. CHAMBERLIN.

### The Old Soldier's Apiary.

I enclose a picture of our friend, Thomas Carver, and a part of his apiary. "Tom," as we all know him, is an old soldier of the Wisconsin Volunteers, of Company B, 28th Regiment. He enlisted at East Troy, Walworth Co., Wis., and helped defend Old Glory for three years. He is still in Uncle Sam's employ as mail-carrier.

Tom contends that the black bees of Arkansas were a "holy terror" during the early 60's, and continues by adding that if he had known what he has since learned about bees at "York's School," he could have evaded a whole lot of swelled eyes after being on a honey-foraging expedition. We find him an apt student in apiculture. He laments that he waited until the evening of life before courting acquaintance with the bees, and acknowledges he must rush business in order to get anywhere near his portion of the fun.

Ye fishermen, you should see the old soldier feed the finny tribe. He thinks the "Ladies' Relief Corps" in the Bee Journal is about right. He boasts that he can handle Younson's remarks to a finish.

By the way, the old soldier got a good crop of honey in 1902, and contends it's easy if one will but pay attention to what the Bee Journal says.

There is another good old student farther up the river, one W. Irvin. I will "show him up" later on. He, too, is an expert with the rod. So, when the three fishermen go after the finny tribe, there is usually room made for fish-stories.

J. P. BLUNK (the other fisherman).  
 Webster Co., Iowa.

### Frank W. Atkins and Hat-Swarm.

It is with much interest I read the different methods of bee-keeping in the Bee Journal.

My father always kept bees in box-hives, and I helped him care for them. When he died, three years ago, and left me the bees to care for alone, I decided to transfer some of

them to frame hives; and now my apiary contains 75 colonies, all I find time to manage successfully.

Last August I subscribed for the American Bee Journal and also got an Italian queen. I introduced her according to the directions on the mailing-card, and now I have a fine colony of Italians.

I send a photograph. Mother took it with my kodak. This, however, does not show the apiary, but you will notice in the picture my hat hanging on a crow-bar with a swarm of bees on it. This swarm came out the last of February and flew out over the meadow. As there was nothing there for them to alight on I took the bar out, intending to make a hole to set a bush in, but as soon as I got in under them they began alighting on my hat, so I took it off and hung it there for them. I hived them in a log-live, intending to "take them up" last fall, but they did so well I put them into the cellar with the others. They nearly filled the old log-live. Besides, they have changed from blacks to hybrids, and are nearly as golden as Italians. The nearest Italian bees kept here at that time were two miles away.

I take great pleasure in the bees, and receive some profit from them; also lots of good information from the American Bee Journal. Clinton Co., N. Y. FRANK W. ATKINS.

DR. MILLER'S NEW BOOK is thus reviewed by Editor Emerson T. Abbott, of the Modern Farmer and Busy Bee:

"Forty Years Among the Bees" is the title of a new book which we have received from the author, Dr. C. C. Miller, of Marengo, Ill., with high compliments. One hardly knows where to begin to read such a book, much less to write about it. It is not arranged like other books, and is not like any other book any more than its author is like other men. Dr. Miller has a distinct and unique personality which is all his own, and his book is eminently like him. We find Dr. Miller on every page of the book, and we may say that it is none the worse for that. In fact, while the book is primarily about bees, and not about Dr. Miller, to take him out of it would be to destroy its value, largely. We not only find Dr. Miller in the book, but we find his mind Dr. Miller in the book, but we find his entire family, which is also perfectly natural, for Dr. Miller is his family, and his family is Dr. Miller, for they probably come as near being a unit in their home and in its work as any family on earth. The Doctor and his family follow bee-keeping for a living, but not for the money there is in it, for they could make more money at other things. They follow bee-keeping for the joy they find in living that kind of a life, as is clearly brought out by the biography which the Doctor has woven in his bestiary.

We do not know as the book can rightly be called a text-book on the industry, yet there is very little of what is known as modern bee-keeping which is not found in its pages and stated in a way which any one, be he expert or ignorant of the industry, can understand, and yet in so interesting a way that the reader is not likely to lay the book down after he has begun to read it, if he has the time, until he has read it through. It is just such a book as one who knows Dr. Miller would expect him to write, and is a fit heritage to leave behind one to mark the metes and bounds of a useful, helpful, and well-spent life.

Every bee-keeper should own and read a copy of "Forty Years Among the Bees," and every one who is anxious to learn of the ups and downs, as well as the intense fascination of this world-wide industry, should also read it.

We said above that Dr. Miller is on every page of the book, but it was his wish more in the evidence on one of its pages, and round out the one thing lacking in its compact and round out the book as it should be, is a first-class half-ton of the general Doctor, just as he looks at the end of 40 years of bee-keeping experience. We think no better recommendation of the value and helpfulness of the industry could be produced. The book, however, has a wealth of illustrations, which are both interesting and practical.

## Editorial Comments

**Get Rid of Vicious Bees.**—Sometimes it happens that cross bees attack you whenever you enter the apiary, and careful observation may show that the cross bees all come from one colony. Kill its queen, and replace her with one of gentler stock. If your bees seem generally cross, even when there is no occasion for it, as during a full flow of nectar, better introduce new and better-natured blood.

**Brace-Combs in Sections** are objectionable. Some bees are worse than others at such work, and when a colony shows itself particularly bad, care should be taken that at least there be no breeding from it. But be sure that you do not lay the blame on the bees when they are innocent. When bees are crowded for room, any bees may be forced to build unnecessary brace-combs, so be sure that they have plenty of super-room.

**The Correct Use of Bee-Terms,** at least of a few of them, is a matter of more or less perplexity to those not familiar with them. An egg in a cell hatches out into a *larva*. *Larva* is the singular, *larvae* the plural; one *larva*, two or more *larvae*. *Larval* is the adjective; as "bees in the larval state." *Nucleus* is the singular, *nuclei* the plural; one *nucleus*, two or more *nuclei*. When used as an adjective *nucleus* is the word; *nucleus* plan, not *nuclei* plan of increase, no matter if a hundred nuclei are used.

**Testing Barrels for Leaks.**—Some discussion upon this point has occurred in Gleanings in Bee-Culture and the American Bee-Keeper. It appears there are different ways. If you blow into a barrel, a leak may be located by a hissing sound. The use of a pump, such as cyclers use for inflating tires, makes the blowing easier and stronger. The same hissing sound occurs if the lips be applied to the bung-hole and the air drawn out instead of blown in, and, perhaps, greater force can be used in this way. N. E. France suggests a plan still easier, if you already know the particular point to be tested. Apply moisture to the spot, then blow into the barrel. If there be any hole, the slightest blowing will show it by means of the bubbles that appear.

**Transferring Larva into Queen-Cells** is a thing that any novice may undertake, and he is likely to be delighted to find what an easy thing it is to do. The only tool needed is a quill tooth-pick, or, perhaps better, a tooth-pick cut from a joint of timothy grass. When you find queen-cells started in any colony, after brushing the bees off the comb dip out the larva, and then be sure to wipe it off the end of your pick. Having obtained a comb of young brood from your best queen, dip out a small larva—one not more than a day or two old—and place it in the same place from which you have already removed the larva in the queen-cell.

It is not easy to dip a larva out of the bottom of a worker-cell of full depth, so break down the cell-walls sufficiently for that purpose. When you have transferred the larva, mark the cell by thrusting in above it a wire-nail  $\frac{1}{4}$ , or  $1\frac{1}{2}$  inches long. In this way proceed with all the queen-cells you find in the hive. Nine days later cut out the queen-cells and use them where wanted.

**Do Old Combs Affect Surplus Honey?**—There is no question, probably, that they may have some effect upon either comb or extracted honey. Whether they always do, and to what extent, are separate questions. For ordinary purposes, old combs do very well for extracted honey, although it is possible that the honey may be very slightly darkened when stored in cells that have been used for brood-rearing. But after having been once extracted from, if not again used for breeding purposes, they ought to be as good as if never used for breeding, with the advantage of being tougher.

As to comb honey, however, the influence of old, black combs *may* be emphatically bad. Let such a comb face a frame filled with sections, and you may confidently count that some of the cappings of the sections will be very dark, the black wax being apparently carried over from the brood-comb to the sections. If sections be placed over black combs, the bees may be relied on to carry up some of the black comb, if the distance be not too great. This explains the reason for whiter sections when a honey-board or excluder is used between the brood-chamber and sections. The same whiteness is claimed by the use of thick top-bars.

**Feeding Meal in Spring.**—Feeding some kind of meal in the spring as a substitute for pollen is perhaps more common in England than in this country. John M. Hooker, a man held in high esteem among British bee-keepers, who is now in this country, offers the following note of warning in the American Bee-Keeper:

I tried the feeding of pea-meal in England, where, at one time, its use was advocated by many, but only in exceptional districts it is now used, where little or no early pollen can be obtained in the natural way until much later in the season. It was found that many of the combs were half filled with this meal, honey being placed on the top of it and sealed over, having both the weight and appearance of being full of honey. Little honey, however, was obtained from them in the extractor, and the pollen-bound combs had to be melted down. Sometimes the bees will bite away the comb down to the midrib, and roll the hard masses of meal out at the entrance, and the labor and time occupied in doing this is considerable. I have seen this occur in my own apiary.

**Watery Sections of Honey,** or those whose cells are filled so full of honey that there is no air-space between the honey and the cappings, are very undesirable. The best way—perhaps the only way—to avoid them, is to avoid the bees that make them. Two colonies may stand side by side, working on the same flowers, and one will store honey of snowy whiteness, while the sections of the other will look so dark and watery as to bring two or three cents less in price. If you observe closely, you may find in the same apiary some colonies that make sections distinctly whiter than those made by any other colony in the apiary. Breeding from such a colony, if the bees are desirable in other respects, will whiten your future sections.

**Straining Foreign Particles Out of Wax.**—Some who use solar extractors may take advantage of a plan given in the British Bee Journal. Take the wax that has been extracted in the usual way and put in fine muslin and return to the extractor. As it melts the debris will remain in the cloth, while the pure wax will slowly ooze through.

**Introducing Queens at Swarming-Time** is recommended by the Modern Farmer and Busy Bee. A few days before a swarm issues, place the new queen, caged, in the hive, where the bees have free access to her; then, after the swarm has issued, arrange the cage so the bees can liberate the new queen by eating out the candy.

# Convention Proceedings

## Report of the Wisconsin State Convention.

BY GUS DITTMER, SEC.  
(Continued from page 326.)

### SECOND DAY—MORNING SESSION.

The convention was called to order at 9 a.m. by the President.

#### EXHIBITS AT CONVENTIONS.

Mr. Fox spoke of having exhibits at the annual conventions. To the members attending these meetings it would be no extra expense to speak of, which was not the case in making an exhibit at either a County or State fair.

Mr. France spoke of offering inducements in the way of premiums for the exhibits by manufacturers and supply-dealers. He spoke of a case where an exhibit had been made at considerable expense and no premiums given; and thought that unless premiums were offered there would be no premiums of the kind in the future.

Mr. Dittmer said that the advertising of the manufacturer and dealer in displaying his goods was enough, and that he was opposed to paying premiums for the privilege of advertising.

Mr. Wilcox—The exhibits should be in separate rooms, as it attracts the attention of the members from the discussions.

Mr. Huffman—The question is, Shall we offer premiums? Mr. Wilcox—We can't afford it.

Mr. Fox—I am willing to bring honey to exhibit without a premium.

Mr. Pierce—I suggest that we ascertain how many will bring an exhibit next year.

Mr. Fox—I move that we offer premiums if we can afford to do so. Carried.

#### QUILTS AND HONEY-BOARDS IN WINTERING.

"How early should the quilts be put on in the fall?"

Mr. Wilcox—No need to put them on at all unless you winter the bees outside.

Mr. Otto—I never use quilts, but honey-boards, and put the bees in late. Bees are always quiet, and I am never troubled with moisture in the hive.

Mr. Pierce had experience with honey-boards, oilcloth, and cushions. He had trouble with moisture dripping from honey-boards and oilcloths; the cushion is warm and absorbs the moisture, which is always at the top.

Mr. Otto—I don't think you can winter as well without the honey-board, as the bees need water.

Mr. Huffman—Do they use it to thin the honey?

Mr. Fox—The quantity of the moisture depends on the temperature in the cellar. The higher the temperature the more moisture.

Mr. Huffman—I abandoned the honey-board long ago and took to quilts. I am never troubled with moisture or bees needing water. My cellar is dry and all right. In a wet cellar the bees are liable to be moidy.

Mr. Pierce—I think that in a cold cellar there is liable to be too much moisture, and that in a warm one it will evaporate and pass off.

Mr. Adair—I find that they are liable to be wet with a honey-board, as the moisture accumulates on the board and drips on the bees.

Mr. Huffman—I found moisture frozen on the top of the honey-board, which shows that the moisture passes through the cushion and out of the hive.

#### CARRYING BEES IN AND OUT OF THE CELLAR.

"Is it the practice of all bee-keepers to close the entrance of hives in carrying bees into and out of the cellar?"

Mr. Fox—I don't believe it is.

Mr. Dittmer always carries them in and out without bottom-boards, on cold mornings, providing indications are that the bees can have a flight that day. He pays no attention to location.

Mr. Fox never closes the entrance, and pays no attention to location.

Mr. Pierce thinks it a mistake to put them out in the morning.

Mr. Gross always puts them in at night, when there is no trouble about bees flying about. He put them out once in the morning, and afterward had a snow-storm.

Mr. Otto finds a smoker very useful in taking bees out. He has taken them out when there was a snow-storm afterward, and there was no harm done.

Mr. Wilcox takes them out during the day so they can fly. He thinks it risky to take them out at night, as they can not get back, and cluster outside.

"Is it best to take them out in the morning or in the afternoon?"

Mr. Fox—That depends on the distance you have to carry them.

A vote was called for, and the majority voted in favor of taking them out in the morning.

Mr. Pierce—At home I prefer to take them out in the morning, and always put them on the old stand.

Mr. Wilcox—It is always advisable to put them on the old stand if convenient.

Mr. Otto—I always put them on the old stand.

An expression being called for, a majority voted in favor of putting the bees on the old stand.

Mr. Pierce thought that they should be looked over occasionally during the winter, even if most of them were all right.

Mr. Fox—If the entrance is kept open they should not be disturbed until after the first flight.

Mr. Wilcox—The proper way is to use a loose bottom-board.

"How do you keep the mice out?"

Mr. Wilcox—Keep the bees in and you will have no trouble to keep the mice out. I find a mouse in the hive occasionally, but have had no bad results.

"What do you have for a bottom-board?"

Mr. Wilcox—I place the hives six inches apart, and then lay boards across the top, on which I place the next row, and so on. These boards are the bottom on which the dead bees drop. This always keeps the hive clean. I have no trouble in taking them out, as we let it cool off first. If they bother us about coming out, we use smoke and drive them back.

"How far is your cellar from the yard?"

Mr. Wilcox—We have to carry them from 20 to 50 feet. Mr. Moe—Do you prefer to put them in late or early? In cold or moderate weather?

Mr. Wilcox—If they are out too late they will freeze. I put them out, say from the 15th to the 20th of November.

Mr. Fox—From the 15th to the 26th is my experience. Mr. Huffman—That depends on the condition of the weather. I would leave them out until after Christmas, if the weather was favorable.

Miss Bruce—That depends on the condition of the cellar. If it is wet leave them out; if it is dry it will be all right to put them in early.

Mr. Wilcox—That does not matter with me. Just leave the cellar door open until the weather is cold enough. That will keep the bees in, and give them plenty of fresh air to keep them quiet. If I am troubled about bees clustering on the bottom I raise the hive from the bottom-board and let them cool off. They will go up all right.

#### SOWING ALSIKE FOR HONEY.

"Is it profitable to sow alsike exclusively for honey?"

It seemed to be the general opinion that it did not pay, that it was worth several times more for hay than for honey, and that we could not afford to sow it for honey alone.

Mr. France raised the question if it would not pay to furnish the seed to the farmers?

If you do they will think you are getting all the profit and the best end of the bargain.

Mr. Huffman—You must induce farmers to sow alsike instead of red clover. Get them to understand that it is most profitable to them. I am satisfied that it is a mutual benefit.

This was followed by a discussion as to the merits and paying qualities of alsike for honey as compared with alsike for seed.

#### LAYING WORKERS.

"How can a laying worker be detected, and how prevented?"

Mr. Minnich—My method is to get rid of them by taking the hive off some distance, shake all the bees from all of the frames, and let them fly back to the old stand, where a new hive has been prepared, new frames and a queen.

Mr. Huffman—Put into the hive frames with hatching brood and they will kill the laying worker.

Mr. Wilcox—Put a new colony on the old stand, and let the bees go to this.

Mr. Gross had been successful with putting a ripe queen-cell into the colony.

Mr. France thought they would break it up, and that Wilcox's plan was the best. He said he had seen them, and by catching them had gotten rid of them.

"Is it advisable to give the bees a cleansing flight in winter?"

A majority thought it was not, but it was the opinion of some that it might be desirable in case of dysentery.

APPROPRIATION IN THE LEGISLATURE.

Mr. France reported on conference with Assembly Committee on Agriculture, that they were willing to recommend more than \$700, but that they did not think the Assembly would allow more.

Mr. Wilcox thought we ought to ask for an appropriation for an exhibit at St. Louis.

Mr. Gross—Preparation must be made now; if we don't ask for it now it can't be done later.

Mr. Moe moved that the President and Mr. Wilcox be authorized to ask for an appropriation of \$1000. Carried.

Mr. France—If the \$1000 is granted shall we commence preparations at once?

Mr. Wilcox—As the entries need not be made until August, 1904, we can exhibit fresh honey, and will have a chance to make the arrangements at our next annual meeting.

ELECTION OF OFFICERS.

The following were elected by unanimous vote: President, N. E. France; Vice-President, Jacob Huffman; Secretary, Gus Dittmer, of Augusta; and Treasurer, Harry Rathrop.

Mr. France was recommended to the Governor for the appointment as State inspector of apiaries.

Mr. Wilcox was recommended to the Agricultural Committee as judge of the honey exhibit at the State Fair.

A general discussion in regard to exhibits at State and County fairs took place. It was the general opinion that the inducements were not sufficient to warrant successful exhibits.

Mr. Wilcox—The inducement is to advertise yourself. Mr. France was always financially "out" on exhibits at County and State fairs, but always built up a trade by means of it. He stated that at some of the fairs one horse race paid more than all the agricultural premiums put together.

Mr. Rathrop—The best remedy for such a state of affairs is to stay away.

Mr. France—This will kill the fair. Some thought that it would be just as well to let it die, and perhaps better.

Pres. France read his report as General Manager of the National.

Adjourned to 1 p.m., when the convention was called to order by the President.

TAXING BEES.

"Is it right or lawful to tax bees in some localities and not in others?"

The general opinion seemed to be that it was not right, but that if legal they should be assessed everywhere alike.

Mr. Otto—The attorney says that all property must be assessed unless exempt.

Mr. Post always pays taxes on bees.

Mr. France—I always pay taxes on my bees, and make the assessor and treasurer specify it so. He cited a case where a common council tried to declare bees a public nuisance, but changed their minds on seeing a receipt of taxes specifying bees as property. It is not lawful to leave them out. Everything should be specified and enumerated.

Mr. Fox—It is lawful to assess, and the assessor is liable for neglect under the law. I do not think that chickens are assessed in my town.

USING A TENT WITH BEES.

"Has any one here had experience with the open-top tent? If so, with what result?"

Mr. Pierce—I have had experience to considerable extent, and find it all right. I know that it is argued that if left open long enough bees will find the way back through the opening in the top. I have left it open for a whole hour and had no trouble, as the bees seem to miss it. I use mosquito-bar in the home yard, and wire-screen at the out yard.

Mr. France—I don't see how any one with lots of bees can get along without it; it is indispensable to me.

When do you use it mostly?

Mr. France—In the spring, looking over the colonies and clipping queens; also in the fall after the honey-flow, when bees are robbing, you will need protection, and can not get along without it.

Mr. Gross—I do all this right along without a tent, and I am never troubled.

Mr. Fox—I am often troubled in the fall when extracting, but I go right along about my business, and pay no attention to them and get along all right.

Mr. Minnich never has any trouble clipping queens and in taking off honey; he uses escapes, and never has any trouble.

Mr. Gross also never has trouble taking off honey for extracting.

Mr. Pierce—There must be a difference in locality. I could not do it in mine. I think you would always use a tent if you would use it once.

Don't the bees follow you from hive to hive?

Mr. Pierce never has any trouble that way, as the bees follow the tent only.

Mr. France—Some of you claim you are not troubled when clipping queens. Supposing you clip early. Then the tent is valuable.

HIVE BOTTOM-BOARDS.

"Who has used a 3/4-inch entrance?"

Messrs. Pierce and Adair had used it.

Mr. Rathrop spoke of an idea mentioned in the new "A B C of Bee-Culture," that the bottom-board could be adjusted to any desired width.

WOMEN AT CONVENTIONS.

"Why don't we bring our wives and daughters to our conventions?"

Mr. France—The best part of the Northwestern convention was the attendance of the ladies. We should bring them.

Mr. Rice—At some of the meetings I have attended there were as many ladies as men. For my part, I think we should induce the ladies to come with us.

CELLAR-WINTERING—OTHER MATTERS.

In preparing colonies for cellar-wintering should the full combs of honey be put in the center of the hive?"

Most of the members said no.

Mr. Otto—Bees can not cluster on filled combs, but must have empty combs in the center to cluster in.

Mr. Huffman—It is the nature of the bees to cluster in the center, and if full combs are used they must be spread apart—about five combs to an 8-frame hive.

"What is the best way to repair broken ends of frames?"

Mr. Fox—Nail a piece on top of the broken end, or, if split, drive nails through.

Mr. France—Transfer the comb to a new frame.

"When should the bees be put out in the spring?"

Mr. Fox—I used to put them out late, but of late years I put them out early, so they can get the early pollen.

"Why does some honey granulate and others don't—all Wisconsin honey?"

Mr. Fox—My experience is that the difference is in the temperature.

Mr. Otto—My experience is that all honey will granulate.

Mr. Gross—I agree that this is the case with extracted, but not with comb honey. I know of a case of comb honey 10 years old that was not granulated.

Mr. France cited Mr. Ochsner, who claims that honey will not granulate if kept in a warm room.

"Gleanings says, 'The very meanest colony to get into the supers is the one with an inch or so of sealed honey under the top-bars.' Is this true with colonies run for extracted honey?"

Mr. Fox—I never have any difficulty when there is honey in the field.

Mr. Huffman—That is my experience.

SHAKEN SWARMS.

"Will some one tell us about the 'shook' or shaken swarms?"

Mr. Rathrop—I have practiced it for a number of years. I always clip the queens, and if I find a colony ready to swarm I set the hive away and put a new one in its place, and shake them from the old hive in front of the new, and let them crawl in.

Do you use old combs or foundation?

Mr. Rathrop—I use either.

Mr. Pierce—I shake all bees and the queen on empty

combs on the old stand, set the old hive aside until all bees are hatched out, shake off young bees in front of new hive, take all queen-cells out of the old colony except one, and remove them to a new location.

A Member—Shake all the young bees into the new hive, give them all the working force, and try to get all you can out of the new colony instead of making two. This is for comb honey; for extracting it is not necessary.

Do you shake them before they make preparation for swarming, or wait until they are ready to swarm?

A Member—I never do this unless they are ready to swarm, and I see no difference between this and natural swarming.

Mr. Gross—I have done this for several years, but never before knew the name of it.

Do you always put a new colony on the old stand?

Mr. Gross—If you want a good, strong colony leave them on the old stand.

Mr. Pierce—I don't agree that two weak colonies will store as much honey as one strong one. With the old practice the old colony is removed to a new location. With the new practice we get one strong colony and no increase.

Mr. Huffman—With this process you simply have the old colony in a new hive. If you keep them from swarming won't that be the same thing?

Mr. Pierce—That may be all right if you are always on hand, but you can't do it if you have to be away much.

Mr. Huffman—Put on three top stories.

As a committee on the St. Louis Fair, the executive officers and Mr. Wilcox were appointed.

At the request of the convention Mr. France entertained the members with a song.

#### WATERING-PLACES FOR BEES.

Considerable discussion was had about watering bees. It was insisted that this is a neglected but very important subject, especially for brood-rearing.

Provision should always be made for watering to keep them out of watering-troughs for cattle. Bees want clean and warm water. If they go to the mud-holes it is an accident of the temperature.

"Is it a disadvantage to be near large bodies of water?"

Mr. Thompson found that when bees had to cross a large body of water lots of them were lost, especially when the wind was contrary.

#### PLACE OF MEETING.

The President suggested a different place of meeting for the next annual convention instead of Madison.

Mr. Lathrop suggested the formation of local organizations to send delegates to the State convention, which was to be continued at Madison.

Mr. Gross thought that the place of meeting could not be changed without amending the constitution to that effect. The matter was left to a committee consisting of the officers.

#### FINANCIAL STATEMENT.

Balance in treasury Feb. 5, 1903.....	\$22 22
Dues to State Association, received during the session of convention Feb. 4th and 5th, from 53 members, 50 cents each.....	26 50
Received from former Secretary, Miss Ada Pickard, Dec. 4, 1902.....	7 50
	\$56 22
Paid Feb. 5th, expenses of N. E. France, as Secretary.....	2 25
Balance on hand.....	\$53 97

No further discussion or business appearing, the convention, on motion, adjourned. GUS DITTMER, Sec.

Honey as a Health-Food is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 10 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order. Send all orders to the Bee Journal office.

### The Hive Problem—Uniformity and System.

BY M. A. GILL.

I HAVE read Mr. Aikin's articles on the hive problem with considerable interest, and knowing his great influence among men, and knowing also how prone beginners are to keep changing from one thing to another, and that frequently when the new system is not as practical as the discarded one, I am constrained, at this time, to make a plea for at least uniformity of fixtures.

Periodically, for the past 30 years, men have started out to show by some ideas of their own that the Langstroth hive was not the natural home of bees, and have suggested and put into use other system always more complicated, and just as often has the apicultural lane been strewn with the wrecks of blasted hopes and disappointments.

I know there are many inventors who *think* they have been a boon, and have filled "a long felt want," but I defy any one to show any hive and system that will give control of the bees in a more simple manner, and still winter a larger percentage in so great a number—a system that will allow one person to care for a greater number of bees, and put any more honey on the market at the close of the season. I know there are many who will claim it (we will cut out Doolittle); then show us the man, the system and the honey.

Mr. Aikin wants a hive that is the *natural* home for a colony of bees, and by and through his varied and long experience, he thinks he has found it. Oh, how seductive these natural homes for bees are!

Two years ago a man at Fort Collins transferred a colony from under the bench his bees were on, and it was the strongest colony out of his 60. One would say, "Surely, that is the natural home for bees." But, you see, it is not practical.

Two years ago I took a colony from the top of a large air chimney on the Bank building here, and it was the most powerful colony out of my 600. The chimney was full for ten feet, and was much the same kind of hive, or system, as described by Mr. Aikin in one of his previous articles, and about as practical. I thought, when taking out that colony, Surely, this is the natural home for a colony of bees, but, then, it is not *practical*.

Again, we took a colony out of a coyote hole, that ran horizontally into a bank on the Union Pacific railroad, and it was stronger than any colony in the apiary, at the time we got it. This, you see, was the Langstroth, or more, perhaps, the "Long Ideal" system. We said, Surely it is the natural home for a colony of bees. But it is not practical. But in my opinion it was about as practical as a system that compels a man, who is running hundreds of colonies, to carry an extra number of hives to put on and take off for breeding purposes. Or a system that is made up of a lot of little bodies of hives filled up with sticks and spaces, that should be filled with great, solid spreads of brood. Surely, with such a system, a man is curtailed from accomplishing what he could with a uniform and simple system.

Mr. Aikin implies in his last article that he has as many as eight or ten different hives, and that he has had them for years. Surely, a man with Mr. Aikin's keen perception has decided long ago which was best. Then why not shake the whole outfit into one system, and then keep more bees, because he can, if everything is uniform? Otherwise his honey-house and store-rooms are more like a department store or museum. And, O the exasperating bother, if a man wants a super, and the first four or five he comes to belong in some certain place!

I want to mention a case to show what can be done with uniformity and system. A widow, who does not live so very far from Mr. Aikin, keeps bees in boxes nailed up out of boards the same size as an 8-frame Langstroth hive. Lath was nailed in for top-bars ¼ inch down from the top of the box. A bottom was nailed on, and a loose cover was improvised. She has no knowledge of bees, but she got a good supply of supers (standard 8-frame Langstroth) and put them on, and then took them off as soon as filled, and in the fall she put \$650 worth of honey on the car from 60 colonies. How did she do it? Simply because she had a uni-

form and simple system, an old box brim-full of bees in the early spring, and the bees were there because the box met their requirements, and was full of breeding space and honey, instead of sticks and spaces.

Honestly, Mr. Aikin, I don't believe she could have accomplished those results with any other system. It simplicity met her knowledge of the business.

The hive she used was much the same system as advised by that scholarly gentleman and prince among beekeepers, Moses Quinby, 50 years ago, for farmer beekeepers or, in fact, for any one who didn't care to handle combs.

You will, no doubt, say her success was because of the extra-good season. I think not, as she did just as well comparatively three years ago; also one year ago. I think it is because of those good, natural queens in a proper-sized brood-nest, neither too large nor too small, without any frames, sticks or spaces to interfere with rearing the greatest amount of bees in the least amount of space.

Another illustration: One year ago I bought 26 colonies within three miles from your home. They were in boxes like those described, excepting four in the Littleton hive, which is nothing more nor less than the Heddon system. One colony was dead, and two others weak; but the boxes were packed full of bees by April 15, and I am sure that neither you nor I had any colonies in frame hives to compare with them at that date.

Again, I am confident that these longitudinal boxes were just as strong as if they had been standing upright like the ideal hive you have described in a previous article. But your hive, 30 inches high, is not practical, and my ideal box lying down must have frames in it, as we must have control of the combs, and I will admit that when I put in a set of frames I lessen the possibilities of that colony, and I insist that when you put in two sets of frames and spaces you double the loss in the hive.

Again, my observation has led me to think, at least, that a divisible brood-chamber will not winter as well in northern Colorado as the regular Langstroth, in the open air. As you know, my preference is for the 8-frame, while you prefer the 10-frame, and you give notice that you may change to a 12-frame.

Let me suggest that just in proportion as you add frames above 8, or at least 9, just in that proportion will you lessen the amount of honey you ship.

If I were living where I wanted a great amount of bees for, say a 20 or 30 days' honey-flow, I should certainly run hives two stories high, for a queen can be rushed for a short time; but out of the thousands of queens I have owned, I have never owned one that could keep more than an 8-frame hive well stocked with brood for five months—the time that is required here to cover the season when bees must be strong. I know of 12-frame hives that have slabs of honey in them 5 years old. If they had been in 8-frame hives, and in a careful man's hands, that honey would have been on the market in sections years ago.

I want to say to beginners, and to all who are disposed to be imitators: Watch and wait; and when you see a man who is caring for more bees without help than you are, and is really shipping more honey than you are with your old, reliable Langstroth system, then change, and not till then. "Blessed be the name of Langstroth."

Boulder Co., Colo.

## Rearing Long-Lived Queens and Bees.

BY HENRY ALLEY.

DR. GALLUP is dead. We shall miss him—myself as much and perhaps more than any other reader of the American Bee Journal. I am sorry he passed away so suddenly, and so soon after he wrote his last article for this journal.

If he was still on earth, I could have more heart and more interest in replying to the parting dig the Doctor gave me. I feel obliged to reply to his oft-repeated story, as it appeared in his article on page 277. How often Dr. Gallup has told the same old story in this paper—no less than twice the past winter.

Dr. Gallup says he had two queens from me—that's so. The queens and none of the bees lived through the following month of February. Why not? Now, Dr. Gallup wants it understood by all the readers of the American Bee Journal that the cause of the queens' dying so soon was owing to the manner of rearing them. How many take stock in such an idea?

The two queens sent Dr. Gallup were two as fine queens

as were ever reared by any one. They were of the finest stock I ever owned. They were the same strain and reared in the same batch as a good many other queens, and for which I can show thousands of testimonials, many of which have been published in my catalogs. Now, what was the cause of the trouble?

Of course, I cannot say certainly the real cause of two such fine queens turning out as they did. But all the symptoms point to pretty bad management when they were introduced. Why did not other people, who received queens at the same time, do as much kicking as has Dr. Gallup? Perhaps I ought not to say more on this point, as Dr. Gallup is not here to defend himself. He continually harped about my rearing queens in nucleus hives, or nucleus colonies, rather. I have never reared any queens, for sale, by the nucleus system. All my queens are, and always were, reared by the same system that Dr. Gallup recommends, namely, by the strongest colonies to be found. I am quite sure that Dr. Gallup got his first idea on queen-rearing from my writings, as I wrote many articles on this subject before he appeared on the stage.

I notice that quite a number of bee-keepers are using many of my ideas on this subject and claiming them as their own. When I wrote my first book on queen-rearing, some twenty-years ago, an Italian reprinted it entire, except so far as the name of H. Alley was concerned. My name was not mentioned. Probably, being a foreigner, could not pronounce my name, and so it was undoubtedly left out.

I do not like to say to much about myself when replying to attacks in the papers, but the articles by Dr. Gallup and some others compel me to say certain things that appear like tooting my own horn. Isn't it wonderful that I have continued in the queen-rearing business so long, considering that I have reared such infernally worthless queens? Did Dr. Gallup really think that all the queens I have reared were as poor as the ones he has described?

I wish Dr. Gallup could have lived long enough to have visited my apiary. I wish that he or any other man, who took stock in the Gallup statement, could come into my yard just now and see some of the Adel colonies that have those worthless (?) queens. I have queens from one to three years old. The strongest and best colony in my yard, save one, has a queen three years old. Then there are colonies which have queens reared by a pint of bees. One colony in particular has a queen reared by less than a pint of bees, and late last September. This queen cannot be purchased, as she is the most promising young queen in my yard. Last August I gave a young man an Adel queen. She was introduced safely. This spring the young man was obliged to dispose of his bees, and I purchased them. I don't believe that a stronger colony of bees can be found in the United States. The hive has eight frames, and every-one of them is filled with brood. This queen, as well as some 40 others, was reared by my new process for rearing queens.

Now, I will give some of the people who know it all, a chance to "arise" and tell us what they know about something connected with bee-keeping.

Last fall I purchased a powerful colony of black bees in an old-fashioned 10-frame Langstroth hive. One of those hives has a cap large enough to hold a bushel, yes, 5 pecks, if anything. The hive contained but 4 frames and there was nothing above the frames but the cap. The bees had filled the entire thing, from top to bottom with comb and honey, and it all weighed 125 pounds. I managed to get the cap off, and all the bees out of it into the brood-chamber. I never saw a larger colony of bees. It cast a swarm last year and had a fine young queen reared by the swarming process. This, of course, would give the colony one of the very best queens it was possible to have. Well, now, let us see about that part of it. This colony wintered on the summer stand and lost no bees at all during the entire winter. It has always been strong in numbers.

Now comes the point I want to call your attention to. About a week ago I was passing by that hive, and found the bees greatly excited, the same as when a queen has died or has been removed. Sure enough, the queen—a large, fine specimen—had died, as I found her on the ground. She was a young queen, and I could see no reason why she had died so young and suddenly. Now, get right up gentlemen and explain why this swarm-reared, and naturally-reared, queen had died. When you have explained the above please try this one:

Two years ago, I took my team and went on a hunt for a few colonies of bees I much needed. I came across a man who had a few strong colonies in the first pattern Lang-

stroth hives. I bought one, and it was a good one, too. There was a glass in the rear of the hive and I could see that the brood-chamber was crowded with bees. I took a peep at the entrance to watch the bees going out and in, and observed the size of the pellets of pollen they had on their legs. All was satisfactory but one thing, and that was a great objection so far as I was concerned. Right in front of the hive on a board was a large, fine dead queen. I was satisfied that the queen came from the hive I purchased.

When I arrived home I soon found that the colony had very recently lost its queen. I had queens in plenty and I soon fixed the colony up all right. Now, what caused this queen to die, and exactly under the same circumstances as the queen in the other hive died? This colony, like the first one mentioned, had swarmed the previous year, and so the queens were young in both cases. Some one will say the queen was injured in removing the frames. There never was a frame removed from this latter hive till I removed it. And, in the case of the first hive, it is impossible to remove one, as the combs are built crosswise. In a few days I shall transfer the colony to another hive.

I cannot tell why those queens died. Who can tell?

Now, if natural-reared queens die in this way, is it anything strange that now and then a queen reared by artificial methods dies? Why, gentlemen, don't you know that where one queen is reared by natural methods, there are hundreds reared by forced methods?

It's unjust to condemn a queen-dealer and say he doesn't know how to rear queens, for no other reason than that now and then a queen turns out to be worthless or lives but a few months and then disappears, especially after such queens have been thousands of miles in a mail-bag. Bear in mind that the two queens above mentioned never went hundreds of miles by mail, hence it will be seen that they were not injured in that way. Now the two queens that I sent Dr. Gallup were confined in a mailing cage 7 days, and traveled 2500 miles.

As I have before stated, had some of the queens Dr. Gallup reared been sent from California to Massachusetts by mail, they would, most likely, have been as worthless and short-lived as queens that were sent him from Massachusetts.

I have never heard any one else say that Dr. Gallup's queens were wonderful, except Dr. Gallup. He, I am told, had never been largely engaged in bee-culture, and never had reared many queens. No doubt Mr. Doolittle and myself, whose queens Dr. Gallup has so strongly condemned, have reared thousands of queens where Dr. Gallup has reared one. I have spent my whole life in this branch of apiculture, and now, after 40 years' experience, if I cannot rear a queen that will live four months, I cannot help thinking that I have wasted lots of valuable time. Of the 20,000 customers to whom I have sent queens in the last 40 years, I am willing they should say whether Dr. Gallup is right or wrong in his statements.

As before stated, any one can rear hybrid queens such as Dr. Gallup reared, but few can rear hardy, strong queens that will produce beautiful bees and produce lots of honey. Every queen-breeder in the land will bear me out in this statement.

Essex Co., Mass.

## Spring Feeding of Bees—A Reply.

BY C. P. DADANT.

ON page 278, Mr. A. C. Miller finds fault with my method of spring feeding and says that stimulative feeding is "always done at a loss." This is not the first time that I find objections to my methods, and I, myself, often find objections to the method of others. But because one man has not succeeded in a certain direction, it is not at all an evidence that the method is bad, or that others cannot succeed in the same way. For instance, one of our most practical apiarists, Mr. R. C. Aikin, of Colorado, takes all his extracting combs home from his out-apiaries to extract the honey, and returns them after extracting. I would not for a minute think of doing such a thing, and told him, when I visited him, that in my practice this method would be too slow. But he has his reasons for doing it, and they are good. So we are each right, in our own sphere.

When we come to the matter of spring feeding, I want to insist on my methods being correct. The ideas I emit are not theories—untried ideas. The reader will bear in mind that I have worked with the bees since 1868, for years almost exclusively at this business, in from two to six api-

aries, and for a long time it seemed to me as if no one else could be trusted with the management of the bees that we possessed, and do it correctly. We have practiced spring and fall feeding in all sorts of ways, not only experimentally, but practically, and on a large scale. Under these conditions, I should be much to blame, if I gave to the readers of the American Bee Journal theories based on mistaken notions or false opinions concerning the habits of the bee.

The present season is a very good one to show the advantages of stimulative feeding in the spring, and when I read Mr. Miller's letter in the evening, we had just been feeding some 60 odd colonies. I say that the present season is a good one for feeding, because it is a very irregular one. In a season when the winter is long-protracted, and the bees are confined to the hive until late, and in which, the crop once begun; it continues uninterrupted, feeding will do harm if begun too soon, and will do no good after the bees have commenced harvesting honey. But when the colonies have been breeding as they have this season, a little early, and a change in the weather is causing them to stop, a little judicious feeding stirs them and causes them to continue breeding. If we fed colonies that were heavy with honey, we would make a mistake. If we fed when the days were so unpleasant that the bees that went out foraging would die of cold we would do the bees damage. But the colonies which discontinue their breeding because of a change in the weather, when the weather is so that they can still fly, but find nothing, will be benefitted by stimulative feeding. This is not a theory, it is experience.

Mr. Miller charges me with stating incorrect physiological facts. I am not infallible, neither am I a microscopist, but there are things which any of us can see.

Mr. Miller says, "Except during a peculiar operation which I have termed 'grooming,' bees never show anything which approaches respect or deference for their mother."

What! The very name "king-bee," "queen-bee," given to the queen by the observers of the bee-hives centuries ago, show that every one who had taken any pains to investigate had noticed the wonderful respect, yes, the "deferential treatment," of their mother. They had noticed that as the queen walked on the combs the bees *respectfully* backed out of her way, as soon as they perceived that it was she who was there. The bees do show deferential treatment for their mother, just as if she was a "queen" or a "king."

We are, all of us, too apt to make light of the knowledge and of the teachings of the old masters in our art. Only a few months ago, in *Gleanings*, a Mr. Wright wrote a very interesting article in which he gave, with microscopic studies, some arguments that seemed to overthrow the teachings of Leuckart, Siebold, and Cheshire, on the fertility of drones produced by virgin queens or drone-laying workers. His arguments seemed so irresistible, his ideas so plain, that I concluded at first that he had added some knowledge to the general information on the bee's anatomy. But a few weeks later Mr. Adrian Getaz, in a very short and pithy article, showed that the microscopic diagrams of Mr. Wright were only evidences of the age of the drone in question, and not at all of their greater or less fertility, and that Cheshire, Leuckart, and Siebold, were still standing on impregnable ground with their discoveries.

Our departed friend, Dr. Gallup, told us of an umbilical cord in some queens, as yet undiscovered by scientists. But the umbilical cord proves to be very probably nothing but a portion of the cocoon spun by the insect during its metamorphosis.

Again, a few months ago, a European scientist, Dr. Lambotte, came forward with the assertion that the famous bacillus alvei of foul brood was nothing but a very much scattered and very common microbe, existing all over the world, and we all became very much excited over the possibility of getting foul brood at any time, and without being able to protect ourselves, owing to its being so very common. But this also turns out to be very probably an incorrect observation. I see in the *Revue Internationale d'Apiculture* an article by F. C. Harrison, in which he establishes plainly some imperceptible differences between bacillus alvei, and bacillus mesentericus vulgaris of Lambotte, which he calls *Bacillus mesentericus vulgaris*, after its original discoverer, Flügge. It would appear that there are differences between those two microbes which, although small, would result in about the same conditions as the difference between a venomous snake like the rattle-snake, and the harmless water-snake.

Conducted by EMMA M. WILSON, Marengo, Ill.

### Using Unfinished Sections.

On page 312, Mr. Arthur C. Miller refers to the matter of using unfinished sections, and thinks the secret of the trouble is in putting on sections that still contain honey. Mr. Miller's views are sound on that point, but I think he is in error in supposing that either Mr. Doolittle or myself has missed that point, and I think that Mr. Miller seems himself to have missed the point in dispute between Mr. Doolittle and myself. We are both agreed that the honey should be cleaned out before the sections can be again used to store in; but I hold that it must be cleaned out *before* there has been any granulation; and Mr. Doolittle thinks it can be cleaned out as well after.

There is no disputing the fact that if bees are allowed to rob out the liquid honey in the fall they will make a clean job of it. The fact that I have seen so many cases in which plenty of granules were left in the cells when granulated honey was cleaned out, even when robbed, makes it seem doubtful that the granules can be all gotten out before the bees again store in the sections. If Mr. Doolittle succeeds in that respect, it does not follow that others will. The plain question is this: Can we, in general, rely upon getting the bees to clean out the last vestige of granulation in sections? If Mr. Miller can tell us whether yes or no is the right answer to this question, he will be helping.

### An Experience—White and Red Clover, Alfalfa and Buckwheat.

Myself and family are diligent readers of the American Bee Journal. It has been of great help to us in beginning the bee-business. I have often thought to write and tell how I started in the business, and how I came out after two years' experience.

I first bought a good, healthy colony of bees for \$5.00; then I let a man bring his bees (a small colony) from the city to our yard, for which he gave me one prime swarm and 24 pounds of honey—just for the rent of the ground. Then we (I mean my husband and I) bought five colonies at \$2.30 a colony, and got but two swarms last season. I also divided one colony that threw out a swarm, and, when I hived it it immediately went back to the old colony.

Last winter was not a hard one on bees in our locality, but we lost three colonies, two from mice destroying them. One smothered by the snow, while my husband was sick. But we have nine good colonies left.

My, what an experience I had with our first swarm. It settled very high in an old apple-tree, the limbs were very far from the body of the tree, and my husband was in town. What was I to do? I sent my "twin swarm-catcher" to the neighbor's, and he came, but what did he do? He said he was afraid of bees. I then, with the efficient aid of my 16-year-old daughter, fixed our new hive, climbed the tree, and with a saw, rope, and water, saved the limb off and let the bees down to my daughter, but they immediately went to a higher limb. I was all tired out. Just then a perfect stranger came to the house for dinner. I then asked him if he would help me get the bees down. He said he was afraid of bees. As I had no veil or bee-fixtures, I took one of my lace curtains to tie over his head, and he got them to the hive after I cut the limb off. We saved the swarm all right with not a sting.

The first of last September we had two swarms, and saved both, but the next day a swarm came out and left.

Bloom is heavy, and the bees are very busy this week. Last week was cold and wet. Last year one colony was prepared for comb honey, and I believe it stored 50 pounds, while some others had no surplus at all; and one was even entirely without honey, but we fed it till buckwheat came, when it stored nearly enough to winter on.

1. Why did bees not work on white clover last year?
2. The red clover was full of bees, but there was none on white clover.
3. We have a lot sowed to alfalfa, but there was no honey in it last year; we did not cut it.

4. Will buckwheat yield nectar if sowed now, the first of May?

MRS. MARY E. HOUSEK.  
Howard Co., Ind., April 29.

ANSWERS.—1. Probably because there was no nectar in it. An abundant bloom of white clover does not always mean a large honey crop, for sometimes it does not secrete nectar. Just why, it is difficult to say, but due perhaps to certain atmospheric conditions. A cold, wet season will very seldom give much nectar.

2. So your bees worked on red clover, did they? You must have some of the long-tongued strain of bees. I wonder if red clover will secrete nectar when white clover will not.

3. There has never been any report of alfalfa yielding any honey east of the Mississippi. In fact, there has been no general success in getting it to grow luxuriantly in the East. We are told by the experiment stations that alfalfa will succeed in the East if the land be inoculated with some of the soil from the regions where alfalfa is a success. Let us hope that when it gets to growing in the East as it does in the West—if it ever does—it will then be as good a honey-plant as it is in Colorado.

4. Buckwheat will probably not yield nectar as well if sown the first of May as later, but it is not always a dependable nectar-yielder, no matter when sown.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### IMPORTS OF HONEY AND BEESWAX.

When Uncle Sam talks about imports he speaks by the card, and we can trust his figures. He collected money on so many gallons of honey. (Under a corrupt service import figures are too small—importers striving to pay on less goods than they get in with; but I guess we can trust our service at present.) And so beeswax importation decreased quite a bit from 1901 to 1902. The official figures speak of gallons, while we mostly think of honey in pounds and tons. Translated into tons, just a thousand tons, came in in 1901 and only 920 tons in 1902—or say a hundred carloads declined to 92 carloads. Not only did the amount of wax double, but the official price went up from 26 cents a pound to 28. On the other hand, the official price of honey went down from 4 cents a pound in 1901 to 3 cents a pound in 1902. Page 243.

### HENRY ALLEY AND HIS PICTURE.

What a nice picture of Henry Alley! The smile seems to say, "Lots of queens on hand, and lots of orders coming in." No, I'll take that back for repairs. The smile seems to say, "There are things in the universe even more pleasant to think of than orders and queens." Page 243.

### FOUL BROOD BY MAIL.

My estimate of N. E. France had grown considerably by the time I got through the second paragraph of his paper on foul brood. Only a few rare persons can talk on an old, worn-out, and not very nice subject, and interest us at once. If Mr. France knows a case where five queens from a foul apiary infected all five of the colonies to which they were introduced, it is about time some of us awoke from our slumbers. Whether the disease traveled in cage, queen or candy, it came by mail—and came as a return for the unsuspecting apiarist's dollar. Page 244 and 261.

### THE PRESENCE OF DRONES IN A COLONY.

But, Mr. Dadant, it is not quite *always* that we can have the warning presence of drones answered by workers just as well. The first night after swarming finds workers reared in the drones place mostly all gone, while most of the drones are where they are needed. I will freely grant to you, however, that this is but a small item to the drone's credit—and that the drone's practical value as a heat-producer is liable to great exaggeration. There is, however, another little unsettled point which may yet prove of some importance. Will 50,000 bees in the flush of the season feel

quite satisfied in their own minds if no drones are among them? Page 246.

#### OVERSTOCKING A LOCALITY.

To Miss Wilson's excellent analysis of the rights and wrongs of overstocking I would add this: There might be five grocers in one little town and yet the public be so poorly served that it would be altogether right, proper and desirable for an honest, up-to-date, live man to come in and start a grocery there. A corresponding state of things in apiculture is hardly supposable. To get at the moral point, I suppose that in almost every case a crowding grocer saves his conscience with the belief that the public are going to be benefited. The crowding bee-man comes much nearer to being a hog, pure and simple. Page 247.

#### FEEDING BEES IN WINTER.

And here is a beginner who has five colonies on a shelf in a nice, warm cellar. He has found he can make them come down and take feed—has done so several times, and says he is going to do so more. This is because (or say partly because) the colony he is particularly monkeying with—he kind to think it may be a little short of food. Don't, Mr. A. M. Deitz! I hope you will tolerate me in saying this. If you really are apprehensive of starvation find out for sure; and then give them food once for all. I know its tough to ask a boy with the bee-fever to let bees alone; but their winter quirk should not be intruded on. Pretty sure to do them harm, and may kill them altogether. Page 254.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Wants Honey First, then Increase.

I have been feeding my bees all spring and have them pretty strong, so much so that I have had to put on the second story so they would have room to cluster on cold nights. Now, I want to get all the white clover section honey I can. I saw in the Bee Journal that to double the story is not a good plan as they will fill the upper story first and will not put it in the sections. What I should like to know is: How will it do to take the upper story off and make a colony out of them? As I desire to increase my colonies, what would you advise? I want all the honey I can get first; increase is a second consideration.

ILLINOIS.

ANSWER.—Making a swarm of one story will work well, but you may get a little more honey to work a little differently. When it comes time to put on a super, sort out the eight combs that have in them the most sealed brood, leaving these on the old stand. Take the other eight combs with only enough bees to care for the brood, and set on a new stand. On this same new stand you can also put the story that you take from one or two other colonies, giving a queen or queen-cell. You can get extracted honey from this colony, or two weeks later you can reduce it to one story and work for comb.

### Transferring Bees and Rearing a Queen.

I have a few colonies of bees in odd-sized hives which I wish to transfer to Hoffman frames. I want to increase all I can. How would this do? On a warm day about 10 o'clock, move the old hive and set a new hive in its place, with one-inch starters and a frame of young brood. Would there be enough bees from the old hive to care for the brood and rear a queen? NORTH CAROLINA.

ANSWER.—Better not try it. It would be a costly way of rearing a young queen, and you wouldn't be sure of a good queen then. You would get all the field-bees of the old colony, greatly crippling that, and old bees are not the right kind to rear queens.

### A Beginner's Questions.

1. I am a beginner in the bee-business. I have 2 colonies which wintered finely. They are hybrid bees and I should like to know if it would be right to get an Italian queen and kill the old queen and give them the Italian queen. I have heard that they often kill the new queen when doing that way.

2. Are all your Italian queens (that you sell, the tested and untested queens) fertile, i. e., have they been mated by Italian drones?

3. In one of our hives the combs are molded and we left them in thinking that the bees would clean them out, but they are gathering

honey now and the comb is the same. Had we better out the molded combs now or later?

4. When I put on supers ought I to put on two at one time?

5. Do bees get any honey, or only pollen, out of dandelion blossoms?

6. Are all Italian queens long-tongued, i. e., all genuine Italian queens.

7. What is the best way to get a swarm of bees that are flying? Will throwing sand on them bring them down?

8. If the queen has clipped wings when they swarm, will they crawl a little way from the entrance and then will all the bees cluster about her so that you can put them in a hive?

9. Are Italian bees much better than hybrid bees?

10. Do bees gather much honey from wild cherry blossoms?

MICHIGAN.

ANSWERS.—1. Yes, that would be all right. There are more or less cases of loss in introducing queens; by following the instructions that come with the queens you will generally succeed.

2. I am rearing queens only for my own use, but when you buy a queen of any kind, unless it is distinctly stated that she is a virgin queen, it is always understood that she is mated and laying. If untested, there is no agreement as to the kind of drone she has met. If tested or warranted, it is understood that she has met an Italian drone, unless stated to the contrary.

3. Unless the combs are very bad indeed, I think you will find that the bees will clean them before the brood-nest spreads to the moldy combs.

4. Only one.

5. Lots of honey.

6. They vary.

7. Let them alone and they will cluster of themselves.

8. No, if you let them alone, the queen will generally go back into the hive of her own accord. Catch the queen, put an empty hive in place of the old one, and then when the bees of the swarm come back and begin to run into new hive, let the queen run in with them.

9. Some hybrid bees are just as good as Italians, but when you breed from pure stock you are more sure of having the same blood continued than when you breed by hybrids.

10. I don't know, but I think likely they do.

### Preventing Ants—Fumigating Honey—How Many Swarms for One Hive.

1. I have my hives standing on elm blocks, 2 feet by 12 inches, two blocks under each hive, and lying down, with a couple of pieces of plank crosswise. Is there any danger of ants getting into the blocks and afterward bothering the bees? (The ground is low, and not sandy.) If so, how shall I prevent it?

2. How do you fumigate sections filled with comb already in the supers?

3. How many hives would you advise a person to run into a hive?

WISCONSIN.

ANSWERS.—1. In the South ants are very troublesome, but not often as far north as Wisconsin. I have, however, had bottom-boards completely honey-combed by large black ants, but only two or three cases. If you should fear any trouble of this kind, you could probably take it by painting with coal-tar. The probability, however, is that you will not need to take any precautions.

2. Pile up the supers, set on top a saucer with two or three tablespoonfuls of bisulphide of carbon, set an empty super over, and cover up 24 hours. But don't bring a light anywhere near or you may get blowed up.

3. One, if it's strong enough; three, if weak enough. Generally you will not double up prime swarms, but two or three second swarms may generally be united to advantage. It is better, however, not to allow second swarms.

### Feeding Burnt Honey.

1. I have some honey which is burnt a little. Will it be all right to feed it to the bees in spring? WISCONSIN.

ANSWER.—Yes, it will be all right to feed such honey when bees are having daily flights, but it would be death for wintering.

### Dividing for Increase.

I am keeping bees on a small scale, but have been at it about 12 years, and the most I have had was 34 colonies. I have read "ABC" and some others, and have read journals. Most of the time I run for comb honey in pound boxes. I have prevented swarming to a great extent, until I have almost a non-swarming class of bees. Now I want to increase, but I want to get honey, too. The flow is on hand now.

1. Can't I divide as soon as the flow is over, and build up by the next, which comes about June 15?

2. Can I introduce queens to the queenless parts safely any time I like?

3. When would I better divide to get ready for the basswood, which will be in about June 15? ARKANSAS.

ANSWERS.—1. Whether you can divide and build up in time for the June 15 flow depends largely on the length of time you will have between meals. You don't say how long before June 15 the first flow

ceases. If you have only a week to build up, you can hardly make it, but you might in three.

2. Yes.

3. I'm not sure I fully understand your question, but if you have only a short time to work between harvests, then act accordingly. If you have a long enough time, you can make a new colony from each old one. If there isn't time enough for that, then draw only enough brood to make one new colony out of each two old ones. If the time is too short for that, then draw only one or two combs of brood and bees from each old one, and make a new one out of several old ones.

Size of Hive—Shade—Best Bees.

1. In a country where the seasons are wet and dry—very wet in winter and very dry in summer—and where the temperature never goes below 27 above zero, and rarely higher than 95 in the shade in the summer, where sunstrokes are unknown, would you recommend deep, shallow, or medium hives?

2. Considering the above climatic conditions, would you recommend that a roof be placed over the hives on the ground for shelter?

3. Keeping our climate in mind, which strain of bees would you recommend—golden, red clover, leather-color, or Carniolan? I want the gentlest and best workers.

CALIFORNIA.

ANSWERS.—1. For extracted honey, perhaps little choice; but for comb the medium or shallow would be better.

2. Hardly, except for sake of sheltering the bee-keeper from the sun while at work at the hives; and for that purpose a covering of boughs or vines would be sufficient.

3. It isn't so much a difference between golden, red-clover, etc., as it is to have the best of either one that you do have. The best of

any one of them is better than the poorest of any other kind. Possibly you might find among the leather-colored something that would suit you as well as any, and there is nothing to hinder any one of the other three kinds from being red-clover bees. It will be no harm for you to try more than one kind.

Leveling Hives—Drone-Comb.

1. If the hives are not level would the brood reared be all the same size?

2. How can drone-comb be prevented best? Will cutting out and putting in worker foundation do?

3. When is the best time to cut out drone-comb to prevent more being built?

I have no spare worker-comb as I have just started keeping bees, with two colonies.

MANITOWA.

ANSWERS.—1. Yes.

2. The best way to prevent drone-comb is to fill the frames with worker foundation. If you have combs with patches of drone-comb in them, there is no better way than to cut out the drone-comb and put in its place patches of worker-comb. Foundation will do, but is more troublesome. It would be worth while to cut up a frame of good worker-comb for patching, and in its place get another comb built on foundation.

3. It doesn't matter when, if you fill the whole with worker-comb only it will be easier to do it in spring when the comb is empty. If you want to try to get the bees to build worker-comb where you have cut out the drone-comb; have the building done by a colony having a young queen, and the weaker the colony the more sure you will be not to have any drone-comb built.

Write for Catalog Today \$40 SPLIT HICKORY WINNER TOP BUGGY

Made of selected second growth split hickory throughout. Handsome and durable. This is a thoroughly high-grade vehicle at a low price and has heel braces on shafts, panel carpets, leather quarter top and panel spring back, open bottom spring cushion, boot on back of body, high leather dash, storm apron, side curtains, oil and lead paint (choice of colors), open hearth oil-tempered springs, Norway iron clips, bolts and forgings and a hundred other points of merit. Guaranteed for two years.

SENT ON 30 DAYS' FREE TRIAL. Hitch up to it and use it before you decide. It will pay anyone to borrow the money and pay interest on it to take advantage of the great saving contained in this buggy bargain. It is an investment for years. Secure our latest catalogue, sent free if you write, describing this and numerous other vehicles and harness at bargain prices. We lead the world in quality, style and price. Address: OHIO CARRIAGE MFG. CO., Station 6, Cincinnati, O. Please mention Bee Journal when writing.

Your old running gears made into a new wagon at same cost. Write for free descriptive catalog. ELECTRIC WHEEL CO. Box 16 Quincy, Ills. Please mention Bee Journal when writing

FROM MANY FIELDS

Wintered Well—Prospects Good.

Bees wintered well here in southern Wisconsin, coming out in good shape. They are as strong as I ever saw them at this time of the year, but the spring has been very bad for them so far, April being very wet and cold. They get about two days to work every week.

Last season was a bad one. There was too much rain during the spring and summer up to the middle of July. They worked well after that, storing 80 pounds of extracted honey to the colony. It now looks as if we would get twice as much this season. I never saw white clover as thick every place—in the fields, pastures and meadows—as it is now. Of course, we can not tell much about the honey part of it, but there is a good show for it. We will be able to tell more about it when we get it in barrels or shipping-cases.

It has been fine weather for four or five days. Plums are in full bloom, and the bees are working well. I have 22 colonies in good shape, and will have 6 or 8 more soon. Grant Co., Wis., May 11. U. S. BOYD.

Look for Fine Honey-Flow.

The first of May our bees began bringing in honey. They are doing well, and the flow in honey is heavy. No trouble to get queen-cells built. Rearing is going on finely. The weather is dry and fine; there has been considerable wind, but the bees brought in the honey just the same. Many colonies are preparing to swarm. We look for a fine flow of honey and rapid work from now on. Pickens Co., Ga., May 11. T. S. HALL.

A Dry and Silent Time.

Drouth. Nothing quite like it known here before in planting time. Seeds won't come up—and my apiary some of the time (bees in tolerable order, you understand) is strangely silent. Lucas Co., Ohio, May 20. E. E. HASTY.

Cold and Unfavorable.

The prospects are not very favorable for a good honey crop, as we are having a very long drouth. We have had no rain for almost four weeks. The bees are barely making a living. The weather is so cold—we have had but one warm night this spring. It was very

QUEENS!

Golden and Leather-Colored Italian, warranted to give satisfaction—those are the kind reared by QUIRIN-THE-QUEEN-BREEDER. Our business was established in 1888. Our stock originated from the best and highest-priced long-tongued red clover breeders in the U. S. We rear as many, and perhaps more, queens than any other breeder in the North. Price of queens before July 1st: Large set, \$1; six for \$5; Tested Stock, \$1.50; six for \$8; Selected Tested, \$2 each; Breeders, \$4. Two-frame Nuclei (no queen) \$2.50 each.

Special low price on queens in lots of 25 to 100. All queens are mailed promptly, as we keep 300 to 500 on hand ready to mail.

We guarantee safe delivery to any State, Continental Island, or European Country. Our Circular will interest you; it's free. Address all orders to

Quirin-the-Queen-Breeder PARKERTOWN, OHIO.

**30 cents Cash  
paid for Beeswax.**

low, upon its receipt, or 32 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

**GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.**

This is a good time  
to send in your Bees-  
wax. We are paying  
30 cents a pound—  
CASH—for best yel-

wet and cold the latter part of March up to  
the middle of April. The bees got very little  
good from the apple-bloom. We are looking  
for a good honey-flow when our crimson  
clover blooms. We have about 30 acres of it.  
It is looking fine, and will be out in full  
bloom in a week or ten days. There is not  
much other clover, as most of it froze during  
the winter. I have a few acres of alsike, and  
there may be some little white clover along the  
roads and fences. L. A. HAMMOND.  
Washington Co., Md., May 11.

### Feeding in Sauce-Dishes.

As I have not seen or read of anybody feed-  
ing my way, I will describe it. I got some  
sauce-dishes, ordinary size, at 50 cents per  
dozen, and put in them two small pieces of  
corn-cob, put a super on the hive, put in the  
dish, put in the syrup, and there you are.  
Mason Co., Ill. FRED TYLER.

### Working in the Third Super.

My bees are doing well. I have some colonies  
that are working in the third super. I  
hived a swarm two weeks ago, and they have  
filled two supers, and are now working in the  
third.

The *American Bee Journal* is a great help  
to me. F. THER PRESSWOOD.  
Folk Co., Tenn., May 11.

### Bee-Keeping in Texas.

I think the bee-business will soon be good  
in this part of Texas, for it is a good country  
to grow lots of alfalfa. This is the finest up-  
land country in the world, and cotton is the  
best nectar-yielding plant in the world. It  
secretes it at the base of the bolls and squares,  
and on the under side of the leaves and in the  
blooms. It, together with alfalfa, will make  
this a fine bee-country. I produced 4000  
pounds of honey last year. I have 72 colonies  
at present, but they are badly neglected on  
account of other business. I think I will  
have an exhibit at the World's Fair. I have  
collected the vessels for it. J. M. HAGOOD.  
Delta Co., Tex., Feb. 9.

### A Cold, Wet Spring.

We are having a foggy spell of weather just  
now, when the bees should be piling in the  
honey from black sage. Of course, the bees  
are storing some honey in the warm part of  
the day, but unless it clears up soon there  
will not be nearly as much black-sage honey  
as expected. Bees do better this year away  
back from the coast, above the fog. There is

## Phacelia (Tanacetifolia)

the great Honey and Forage Plant, can be  
planted any time, while there is moisture. It  
blooms six weeks after sowing. Seed, 1 ounce,  
25 cents, postpaid.

ing-car space and other information.  
\*Phone Central 2057. 8—22A5t

no telling how much honey they will store in June from white sage, silver sage, wild buck-wheat, and other flowers.

Black sage honey is water-white when gotten separate from that of other flowers. Other sages yield white honey, but it is not as clear as the black.

This is fine, growing weather, and we may make up for our present loss later on. We had a bad season to build up our bees, there being so much rain and cold weather.

The bees are using nearly every cell of old honey, thus lessening the danger from foul brood. We have some of it yet around in the rocks and trees waiting for a dry year to scatter it. Bee-keepers have to be on their guard all the year around in California, although the danger is less during the honey-flow. Many counties in the northern part of the State are in danger of the "old bear" (foul brood), nothing being done to keep it from spreading. Only counties having ten or more bee-keepers or property owners entered can have an inspector appointed under the law.

E. ARCHIBALD.

Los Angeles Co., Calif., May 11.

**Unfavorable Spring.**

So far this has been an unfavorable spring for the bees. It has been cold, windy, cloudy and wet, most of the time. There were only a few days that they could get anything outside the hives, and nearly all the colonies had to be fed to keep them alive. It rained heavy night before last. Creeks and Zumbro River are high to-day, and overflowing, doing much damage to crops. Clover looks fine.

C. THEILMANN.

Wabasha Co., Minn., May 13.

**Feeding Best-Sugar.**

Bees wintered well with only about 2 1/2 percent loss. I am feeding some now. In an article on page 298, there is something about cane-sugar. I have fed 400 pounds of best-sugar since last October. I get it at the factory and fed it with no results. There is no lime in it to give bad results. Beet-sugar has the appearance of being dirty, while cane-sugar has not.

W. O. DARNELL.

Weid Co., Colo., May 11.

**Cotton a Good Honey-Plant.**

My bees are doing well, storing honey right along. I fed them from Feb. 1 until May 1, and they are in better condition than is usual at this time of year. They cast large swarms, and look healthy. I have had 14 swarms, and they go right to work. I am looking for a big honey crop, and hope we will not be disappointed. Cotton is one of our best

honey-plants, and if the boll-weevil doesn't destroy the cotton we will come to the front this year. I want Texas to roll up one of the biggest honey crops this year that there has ever been. **Mrs. C. R. WEST.**  
 Ellis Co., Tex., May 15.

## Appreciates the Bee Journal.

I am very much interested in the American Bee Journal, as it has helped me along very much with my few bees. It has been as good as a text-book; in fact, I have had nothing else but the Bee Journal, and when I commenced bee-keeping two years ago I did not know the first thing about bees.  
 British Columbia, Canada. **J. E. CARR.**

## Bee-Keepers' Ups and Downs.

Since my report of March 15th, on page 285, bee-keepers have had a lot of "ups and downs," mostly "downs." Such weather, oh my! To say it has been bad would be putting it mildly. The mercury has rarely gotten above 50, and only once as low as 12 above zero. But it seemed to be inclined to want to stay not much above that, for the greater part of a week. On May 2, bushels of ice still remained along tree lines, where the broken limbs had fallen, borne down with the  $\frac{3}{4}$  inch of ice accumulated on them. Our town has been noted for its shade-trees, but the tornado of last June blew down everything that wind could break, and now this ice-storm has stripped the limbs of what remained, giving them the appearance of that starry-rooster trademark on the Aultman-Taylor threshing machine. Bees had worked some on the willow bloom, the day before the storm began, but all was brown after the ice had gone off.

Plums and cherries are now in full bloom, and bees did good work on them yesterday, but to-day it is wet, having rained all night and at it yet. Dandelions are giving some pasturage where the bees can get to them. Apple-bloom will be out this week. Red clover bloom gave the bees a picnic for a part of two days, which is about all they were able to get from the flowers, on account of the condition of the weather.

We have one "plant" here which flowers night and day, winter or summer, which they work on whenever the weather is warm enough, when nothing better is to be obtained. This plant is located about three hundred yards from my bee-yard and on a fine April afternoon I got out to bees working lively, and a glance told me they were at work on the flowers of this plant. I had no more than

noticed them when a little girl appeared and said her pa wanted to see me. (Her pa is the owner of this plant—the miller.) I expected to see an angry Dutchman, when I got over there, but I didn't. They were grinding barley and wheat-screensings, and running the "chop" into a wagon-box out-side the building, and the miller said bushels of decimated, and they benefitted his in the meal in loading, and sent for me out of sympathy for the bees. Rain and cold followed for several days, and they have not bothered them since.

I tried to make a test as to the benefit of giving bees a winter flight, and returning them again to the cellar. Sickness, bad weather, and a complication of other matters, and the benefits, if any, so far as can determine, made it impossible to be anything like sure about it. I put the balance (90 colonies) of my bees out the last two days of March, and had it not been for several colonies-need feeding, they would have been better off to have stayed in the cellar several weeks longer.

In general, my bees are in good condition, having lost 6 colonies out of 96, three of which were in poor shape on cellaring them. One was queenless, being a united colony, and two had drone-laying, old queens. Very few bees are left among those who did not feed last fall, or on taking them out this spring. One man near my place has two good colonies, and two weaklings left from a yard of 26, most of them starved during the last recent ice-storm. I bought most of his hives with combs, and on cleaning them up some had as many as six frames with brood in, three or four frames being nearly solid with capped brood.

**Apiary FOR SALE AT A SACRIFICE.**

During my travels as State Inspector of some bee-keeper to make an investment. Mr. Wm. Wray, of Ashley, Mich., died last fall and left an apiary of 100 colonies, nearly all Italians, in chaff hives, on American frame combs built on wired foundation. There are reasons why they will be sold at a sacrifice. There is no one to take care of them, and some of the colonies are slightly infected with foul brood. Of course these bees cannot be sold and shipped all over the country, but if some man could buy them and manage them right where they are, he could make some money. Each hive, a 2-frame hive with reversible extractor, besides other articles too numerous to mention.

Ten acres of land leased from the Grand Trunk R. R. Co., and a small dwelling-house of 6 rooms, and a honey-house will be sold. No reasonable offer will be refused, but it must be made **AT ONCE**. Write to **MRS. Wm. WRAY, Ashley, Mich.**

The above advertisement was written and vouched for by W. J. Hutchinson, State Inspector of Apiaries for Michigan. The location is fine.

Please mention Bee Journal when writing.

**HONEY AND BEESWAX**

MARKET QUOTATIONS

**CHICAGO, May 7.**—The past winter and present spring have been a disappointment to producers and dealers in honey, in that the consumption has been away below the average of the past decade. Choice fancy comb is held at 15@16c per pound, with off grades at 2@5c less per pound. Extracted, white, 6@7c; ambers, 6@6 1/2c; dark, 5 1/2@6c. Beeswax in good demand at 32c. **R. A. BURNETT & CO.**

**KANSAS CITY, May 28.**—The supply of comb honey is almost exhausted. The demand good. We quote you as follows: Fancy white comb, 24 sections, per case, \$3.50; No. 1 white comb, 24 sections, \$3.40; No. 2, white and amber, per case, \$3.00@3.25. Extracted, white, per pound, 6@6 1/2c; amber, 5 1/2c. **C. C. CLEMONS & CO.**

**ALBANY, N. Y., Mar. 14.**—Honey demand quiet; receipts and stock light. Comb selling, light, 15c; mixed, 14@15c; dark, 13@14c. Extracted, dark, at 7@7 1/2c. Beeswax firm, 30@32c. **H. R. WRIGHT.**

**CINCINNATI, Apr. 27.**—Little demand for comb honey at present; fancy white sells at 15@16c in a small way. We quote amber extracted at 5 1/2@5 3/4c; white clover, 8@9c. Sales not as lively as expected this season of year. Cuban extracted is held at 11@12c. Beeswax prices are awaited with intense interest. Beeswax strong at 30c. **THE FRED W. MUTH CO.**

**NEW YORK, May 21.**—Comb honey trade exceptionally quiet, very little doing. Fancy stock not plentiful and is sold at 14c. A large supply of other grades on hand, which we are quoting at from 11@13c, according to quality, and in large lots make concessions from these prices. Extracted, unusually quiet, and prices show a downward tendency all along the line. Beeswax, firm at from 30@32c.

**HILDRETH & SEORLEK.**

**CINCINNATI, May 19.**—The demand for comb honey is nearly over, but as the stock is almost exhausted, prices keep up. The demand for extracted has not changed whatever, and prices are as follows: Amber in barrels, 6 1/2@5 1/2c; in cans, 6@6 1/2c; white clover, 8@8 1/2c. Beeswax, 28@30c. **C. H. W. WEBER.**

**SAN FRANCISCO, Apr. 29.**—White comb honey, 12@12 1/2c; amber, 9@10c; dark, 7@7 1/2c. Extracted, white, 6 1/2@7c; light amber, 5 1/2@6c; amber, 5@5 1/2c; dark, 4 1/2@5c. Beeswax, good to choice, light, 27@29c; dark, 25@26c.

Last year's product has been tolerably well cleaned up, particularly the desirable stock. Present offerings are largely odd and ends, including little of fine quality. Values for the time being are little more than nominal. A lower range of prices is looked for on coming crop.

**WANTED WHITE CLOVER EXTRACTED HONEY!**

Send sample and best price delivered here; also Fancy Comb wanted in no-drip cases. **THE FRED W. MUTH CO.,** 321st Front and Walnut, CINCINNATI, OHIO.

W. M. GERRISH, Epping, N. H., carries a full line of our goods at catalog prices. Order of him and save the freight.

Please mention Bee Journal when writing.

## A Few Cheap Smokers!

We find we have on hand a few slightly damaged Clark and Bingham Bee Smokers, which got a little damp and soiled at the time of the fire in the building where we were about 2 years ago. They are all almost as good as new.

We have some of the Clark Cold Blast, which when new sell now at 55 cents each; and some of the Little Wonder Bingham—new at 50 cents. But to close out those we have left that are slightly damaged we will fill orders as long as they last at these prices:

Clark at 25 cents each; Little Wonder Bingham at 30 cents each.

We do not mail any of these slightly damaged Smokers, but will put them in with other goods when ordered, or sell them here at our office when called for—at the above prices.

## Root's Improved Gowan Ball-bearing Honey-Extractor

Since the introduction of these extractors some 14 years ago to the bee-keeping world, we have been experimenting with a view to eliminating the weak points, and perfecting the stronger ones.

**ALL SIZES.**—We manufacture all sizes of extractors from the small 2-frame to the 4 and 6 and 8-frame power-machines. The can part of these extractors is made of galvanized iron covered with blue japanning, and neatly lettered.

**GALVANIZED.**—The comb-baskets are galvanized wire, well braced; the hinges, hoops, cross-arms, and other metal parts, are galvanized after finishing, something you will get in no other on the market.

**BAND-BRAKE.**—All 4, 6, and 8-frame machines are provided with band-brake, which permits of the stopping of the machine instantly, without danger of breakage. These machines have large metal handles. Ball-bearings are used to make them very light running. The honey-gates are large, which does not require the stopping of work to allow the honey to run out.

For Sale by all large dealers in Bee-Supplies.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail 6 cents; two for 10c or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate-brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact reproduction of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us a NEW SUBSCRIBER to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

**GEORGE W. YORK & CO.**

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

# BEE JOURNAL

43d YEAR.

CHICAGO, ILL., JUNE 4, 1903.

No. 23,

## Editorial Comments

**A Very Early Season** is that of 1903 in northern Illinois, perhaps the earliest in the memory of any living bee-keeper. Swarming is reported as early as May 3, and white clover in bloom about 10 days later.

**A Lack of Rain** the first two-thirds of May was beginning to make bee-keepers somewhat anxious in this region. The ground is well covered with white clover, but it was so dry that the clover leaves were curling up in the sun. Abundance of rain since then.

**A Wonderful Honey-District** is what the Upper Glenelg district is well styled in the Australasian Bee-Keeper. A Mr. Bolton, an English engineer, was the pioneer in that region. His "spring count" in 1898 was 100 colonies, and in the following four years it was 223, 310, 329, and 384. During those five years the gross value of the honey and wax produced by him averaged for each year \$3280.

**Dividing an Apiary Between Two Localities.**—Under proper conditions there is great gain in establishing out-apiaries, but the enthusiast in that direction may magnify the advantages. The following from the Bee-Keepers' Review seems to be a case in point:

An illustration of how out-apiaries may help to make bee-keeping more profitable was given me recently while visiting at Mr. Bingham's in Clare County. He is located upon high, sandy soil, and the honey crop there last year was light—about 20 pounds per colony. Clare, only four miles away, is lower, and the soil is clay, and bee-keepers in that locality enjoyed an excellent harvest. This year it may be Mr. Bingham's locality will have a good crop. An apiary divided between the two localities would almost double the opportunities for success.

If each locality is the better in alternate years, then there would be a gain in migrating from one locality to the other; but it is hard to see how "an apiary divided between the two localities" would be a matter of gain, for while each half of the apiary would have the advantage of the good year when it came, it would also have the disadvantage of the bad year, the two balancing each other.

**Non-Hatching Eggs.**—Dr. C. C. Miller writes concerning this:

"I have a queen whose eggs do not hatch—the second one of the kind I have had during my bee-keeping career. The cells are well supplied with eggs, and I suspect that when an egg becomes stale the workers remove it to give room for a fresh one; for only one egg appears in a cell, and this continues week after week with never a grub to be seen. Don't you think you could find me a purchaser for this queen at a hundred dollars or so? New strain of bees, you know."

Some very evident advantages would be gained by having such a strain of bees. They would be proof against foul brood, for there would be no brood to be diseased. There would be a great saving of stores, since no brood would be fed. They would be non-swarming, and other advantages will be suggested. But with all these advantages there would be one little drawback: With no eggs hatching there would be some difficulty in rearing queens, and some danger that in the course of time the strain would run out!

**Old vs. New Hives.**—In a discussion reported in the British Bee Journal, Mr. Weston said that he thought it would be advantageous to give up using very old hives, which might become saturated with the unhealthy products of the bees. The keeping of these old wooden hives for the usual long period was against bee-keepers. The straw skeps were never retained like that. It was a point to be thought of as to whether a single-walled hive would not be more hygienic than the present double-walled one which harbored impurities that could not be got at and eradicated.

Mr. Carr said that without possessing any scientific knowledge, they knew that some of our oldest and best bee-keepers, who knew the importance of keeping their hives clean, were now using the same hives that they had 20 years ago, and saw no reason for destroying them at intervals.

In this country age has not been considered an objection to hives. Certainly it can not be claimed as an advantage, and the possibility of a difference between old and new hives, so far as it may have any weight, will be an additional item to strengthen the position of those who advocate using hives without paint.

**Tarred Paper for Wintering.**—Mr. A. C. Miller advises trying it about hives, and it has proved successful with him. Editor Root says:

I once had the idea that paper tied around a common hive would winter bees as well as a chaff-packed hive. We fixed up a number of hives in that manner, setting a close-fitting winter-case over the whole; but in nearly every one of the hives so prepared the bees died, while those in the chaff-packed hives came through in the usual good order.

To which Mr. Miller may reply that the two cases are not parallel, since in his case there was no winter-case outside the paper.

**When to Put On Sections** is one of the stock questions of beginners each year about this time. It is not well to put on sections too early, for it takes some of the heat of the colony to keep warm the empty space. The bees also may do some damage to the sections by crawling over them, and sometimes by gnawing the foundation; although damage of this kind is greater at the close than before the beginning of the honey-flow. But it is much better to put on sections a little too early than a little too late. Abundance of super-room is a factor that plays an important part in the prevention of swarming. Being crowded just one day too long may be the last straw to decide the bees to swarm.

If one could know just when the main flow is to begin, it would probably be well to put on sections two or three days in advance. An old rule is to put on supers when bits of white wax are found plastered on the upper parts of the combs and along the top-bars. The rule is not a bad one, for by close watching one can tell pretty certainly when this white wax appears, yet it is possible that this deposit of new wax is a result of being crowded, and so comes after the crowding; so it would be well to anticipate it a little.

Instead of watching the bees, watch the flowers. Where white clover, for instance, is the crop to be provided for, if you are closely on the watch you will see the first clover in bloom—just a single blossom or two—several days in advance of the general blooming. About ten days after you see that very first blossom it will be time to put on sections. Just how soon the bees will commence storing in them depends upon circumstances, but in any case it is well to have them on in time. Possibly no nectar will be secreted, and no sections needed, but you can hardly know that in advance, and if necessary you can

take the supers off again. If there are empty cells in the brood-chamber you need not expect any stinging in sections till after the brood-combs are filled.

## Sketches of Beedomites

### MORLEY PETTIT.

Mr. Morley Pettit, the youngest son of Mr. S. T. Pettit—one of Ontario's most successful veterans in bee-culture—was born amid apicultural surroundings, and reared, as it were, in the apiary. His earliest recollections do not include the time when he first "watched the bees" in the swarming season, nor when he got his first sting (only that neither was considered agreeable). But a day came when he was considered big enough to "blow smoke" while his father "operated on some hives," and when he could "get stung without crying."

The smoker of earliest memory was one made by A. I. Root, with short, upright barrel, and a tube in the center reaching nearly to the end of the nozzle. The bellows originally had a valve, but at that time the valve was not working, and the smoke was drawn into the bellows and blown out again through this tube. In the side of the barrel was a hole for lighting and giving air to the fire. Coals used occasionally to drop from this hole on the hands of the inattentive bellows-boy, and that, coupled with an occasional sting, and a constant desire to be at any but a useful occupation, did not fire him with enthusiasm to become a leader in apiculture.

After attending public school, and passing the High School Entrance Examination, Morley entered the St. Thomas Collegiate Institute, passed in succession all the annual examinations set for High School pupils by the Ontario Educational Department, and matriculated to Toronto University with First Class honors in mathematics. He next spent a couple of years teaching, then entered upon his University course, completing his second year with honors in Philosophy, in May, 1899.

During these years he had spent his summer vacations, with one exception, assisting in the apiary, forming a liking for the business and learning its possibilities. He also learned to contrast the confinement of professional life with the freedom and probably equal financial remuneration of bee-keeping. Accordingly, when in the fall of 1899, his father, being then 70 years of age, wished to retire from business, he assumed control of the apiary. Since then he has met with financial success which has quite warranted him in his choice. The one apiary has been increased only to two as yet, but there is prospect of more to follow.

While he has been almost as successful in producing fancy comb honey by the S. T. Pettit system as his father, present prices make it seem advisable to run almost exclusively for extracted honey. For this purpose a brood-chamber equivalent to the 10-frame Langstroth is used, and, at the beginning of the honey-flow, sufficient super-room is given to contain 80 to 100 pounds of honey. The brood-chamber may also be enlarged at that time, and this, in an ordinary season, reduces swarming to a minimum.

At the close of the white honey-flow screens are slipped into porticoes permanently attached to the hives, they are loaded, 40 at a time, on a specially constructed spring-wagon, and moved about 25 miles for buckwheat. They are afterward moved home and wintered, some in clamps, and some in a well-ventilated cellar. This year's loss was between 3 and 4 percent of the number of colonies, and prospects are bright for a good honey-flow.

It was our good fortune to meet Mr. Pettit at the last meeting of the Chicago-Northwestern convention. He is an excellent convention bee-keeper, ready at all times to contribute his part in discussions. Speaking of conventions, he finds them of great value, and attends every one he can reach, for the inspiration of them as much as for the many useful points which can be gleaned. As he heard Mr. Cogshall say once, "It spurs you on." He says about the Chicago convention, that which stands out most clearly in his mind, after the pleasure of meeting all the bee-keepers, is Mr. N. E. France's matchless description of the symptoms and treatment of foul brood.

Mr. Pettit is a contributor of no mean ability to the apicultural press. He is on the regular contributors' staff of the Farmers' Advo-

cate, of Ontario, now the third year out of the four since he left the University; he contributes at intervals to the Montreal Herald, and regularly reports every convention which he attends. He finds the reporting very helpful, as it allows no superficial attention to discussions, and by the time the good points are put in shape for publication, they are well fixed in mind.

It affords us pleasure to present to our readers, both in picture and in word, our young bee-keeping friend from across the northern border. We wish him all success in his chosen vocation, as well as long life and much happiness all along the way.

## Association Notes

**STEALING FROM A NATIONAL MEMBER.**—General Manager France reports having caught three persons guilty of stealing from an apiary of one of the members of the National, on Saturday, May 16. They were given until 6 p.m., May 25, to make satisfactory settlement, or take results of the enforcement of the law. Two of the three, before the day was gone, came and settled, and it was thought the third would do so very soon.

**OVER 1200 MEMBERS** of the National Bee-Keepers' Association are now reported by General Manager France. And still they are joining. There ought to be 2000 members within the next three months. Why not? You can send your dues of \$1.00 either to N. E. France, Platteville, Wis., or to the office of the American Bee Journal, as we are the Secretary of the Association, and it is one of our duties to receive membership dues from all who may send. We then forward them to the General Manager and Treasurer, Mr. France, who sends the receipts. We should like to have several thousand bee-keepers among the readers of the American Bee Journal send us their dues within the next 60 days.

**THE NATIONAL IN LOS ANGELES.**—Prof. Cook, of Los Angeles County, Calif., on May 16, wrote us as follows regarding the holding of the National Bee-Keepers' Convention in Los Angeles this year:

The bee-keepers of Southern California are greatly rejoiced that the National convention is to come to our Southern metropolis. Los Angeles is not only one of the most beautiful and prosperous cities of the country, but its hospitality is second to that of no other city of the Union. We have had a year of exceptional rain, and unless the weather is too cold (this has been one of the coldest seasons known up to date) we shall have an immense crop of honey. Thus, it is to be expected that our apiarists will be exceedingly good-natured the coming summer, and will do their best to entertain our visitors. It will certainly be a surprise to Eastern bee-keepers to find apiaries numbering hundreds of colonies, and each colony of bees securing hundreds of pounds of honey in one season.

I have been asked to present a paper to the convention. I will take the subject which seems to me by all odds the most important now before our bee-keepers, that of co-operation in marketing. This ball was set rolling at the last annual meeting. It is a matter which can not too generally engage the attention of our bee-keepers. We can never secure a just price for our honey until we have control of distribution in the markets. The fact that bee-keepers are so scattered will make it a long and tedious matter to secure general co-operation, but it must come, and it will be a good day for all labor when it arrives.

All kinds of business are united except manual-labor pursuits. It is a bright omen that there is so much thought and effort at present in the line of union in these last-named occupations. Until people become entirely unselfish—and that we fear is not very near—there can not be justice between man and man till all classes are equally organized and equally successful in securing fullest co-operation. The success, then, of labor unions and of co-operation among all producers is to be encouraged at all times and places. There may be some trouble, some wrong, some injustice, yet the trend is and should be in the way of more perfect—aye, most perfect—co-operation.

A. J. Cook.

We have no doubt that California's big-hearted bee-keepers will give the National the grandest—well, if they go ahead of Denver, or Buffalo, or Philadelphia, or—oh, Chicago—in their entertainment of the National, they'll have to get a Golden Gate hustle on themselves. But we have heard that California is a great State, that it has great bee-keepers—and lots of them; and we have been privately informed that they are going to give the National this year such a welcome, and such a grand, good time, that it won't be so long before it holds a meeting there again.

## Convention Proceedings

### The Northern Michigan Convention.

BY JAMES H. IRISH.

The Northern Michigan Bee-Keepers' Union met in its fourth annual convention at Bellaire, March 25 and 26, 1903.

The President being absent, the meeting was called to order by Vice-Pres. Elias E. Coveyou. James A. Dart, the Secretary, was present, but owing to business could remain only until the next train north. He was excused from acting, and James H. Irish was called to the secretary's desk. The meeting was enthusiastic from the beginning to its close.

Among those present from a distance were Mr. and Mrs. A. I. Root, W. Z. Hutchinson, Geo. E. Hilton, and A. G. Woodman. The country lying between Traverse City and Petoskey was well represented by a large number of bee-keepers, who are practical apiarists and honey-producers on a large scale, many of whom gave very flattering reports of honey produced last season. Geo. H. Kirkpatrick made the statement that he had attended a great many bee-keepers' conventions in Ohio, Indiana, Illinois, and in this State, and that he never knew a given number of bee-keepers to report so large a number of colonies and so great a yield of honey per colony as the bee-keepers gave at the Bellaire convention.

#### WINTERING BEES.

The discussion opened on wintering bees, and was discussed from various standpoints, as wintering on summer stands in chaff hives, and various methods of cellar-wintering, some holding that plenty of ventilation was needed, while others thought that practically no ventilation was needed. All wintered with good results; very few losses from any cause were reported.

Mr. S. D. Chapman wintered 236 colonies in the cellar without loss. He began last season with 150 colonies and took 15,000 to 16,000 pounds of well-ripened honey, mostly extracted, during the honey season.

Ira D. Bartlett took 13,000 pounds from 88 colonies, 1500 of which was comb honey.

A. I. Root gave an experience in Cuban bee-keeping, reporting one Cuban bee-keeper as saying he could produce extracted honey at 2 cents per pound and comb honey at 9 cents. The quality of Cuban honey varies greatly, but compares favorably with honey produced in the United States.

At this point of time a number of bee-keepers arrived on the train from the south, and a short recess was taken. When the convention was called to order Geo. E. Hilton was called to the chair, and the rest of the day was devoted to discussing various questions, such as,

How and when shall we requeen apiaries?

Has any one tried to increase the amount of wax produced?

How do you get the wax from old combs and cappings?

How to mold wax without having it crack?

How many colonies pay best in one locality?

After a recess for supper, A. I. Root was asked to address the convention on Cuba. He described the manners and customs of the people to the great pleasure of the audience.

The question-box was again opened, and these questions discussed:

When does the keeping of bees become a public nuisance?

What about the National Bee-Keepers' Association?

The morning session of March 26 was called to order at 9 o'clock by Pres. Hilton. A. I. Root was given the floor, and discussed "Bee-Keeping in Cuba," after which W. Z. Hutchinson read a paper written by T. F. Bingham, on "Wintering Bees."

The question, "Where shall we hold our next meeting?" was discussed, and Traverse City was selected, the time to be set by the officers.

This was followed by the election of officers for the ensuing year, which resulted as follows:

President, Geo. H. Kirkpatrick; vice-president, S. D. Chapman; secretary and treasurer, James H. Irish, of Rapid City.

On motion, the name of the Northern Michigan Bee-Keepers' Union was changed to the Northern Michigan Bee-Keepers' Association. JAMES H. IRISH, Sec.

### A District Bee-Keepers' Convention.

BY R. F. HOLTERMANN.

A convention of bee-keepers embracing Brant and adjoining counties was held at the Court House at Brantford, beginning the evening of March 3, at 7 p.m. James Armstrong was elected chairman. A question drawer was opened, the following being some of the questions and answers:

#### PLANTING FOR BEE-PASTURE.

"Does it pay to plant for bee-pasture?" Yes, if the sowing can be made to pay for a crop otherwise.

Speaking of alsike clover for seed, the chairman gave an illustration of the value of the honey-bees as fertilizers of blossoms. A man across the road from his bees had five bushels of alsike clover seed to the acre, when those out of the range of his bees had not enough seed set in the clover to make it worth threshing. Mr. Barber stated that he had \$35 worth of alsike clover seed to the acre during the past season. One person said they raised within a circle of two miles of him \$4000 worth of alsike clover seed. It was pointed out that in some districts of Ontario the farmers had been producing alsike clover seed for at least 30 years, and as evidence of its value farmers could not be induced to stop raising a crop of it. Similar recommendations were made for sowing buckwheat.

#### SOME RELIEQUIFIED HONEY FROTHER THAN OTHERS.

"Why in reliquifying honey is some more frothy than others?"

Jas. Armstrong—It may be slightly soured.

Jas. Shaver—It is partly the source from which the honey is taken.

Alex. Taylor—I extract and leave it in cans holding about 400 pounds, then run into 60-pound cans. The honey varies in these cans as to amount of froth on top, although drawn from the same tap.

R. F. Holtermann—The causes vary; one is a degree of ripeness, another the source from which gathered. I believe, as a rule, basswood honey has more froth on it. Third, the degree of heat applied to the honey makes it vary as to froth.

#### UNSCREWING CAPS ON HONEY-CANS.

"Is there any simple way to unscrew the cap of a honey-can?"

Mr. Shaver—if too tight to move by hand, wind a cord three times around the screw cap and pull steadily.

#### TEMPERATURE OF BEE-CELLARS.

"What temperature should a cellar be? What moisture should be used? And do the top colonies winter better than those at the bottom?"

Mr. Armstrong—I was in one a week ago, and the temperature was 43 degrees; when the bees were picked from the floor they appeared to be very dry. The first hive was raised 8 inches from the floor.

Mr. Shaver—I have a cellar pretty moist; in fact, I thought it was too much so. This winter it is being tested in a small way, and appears to be all right.

It was thought that temperature was very important, but that moisture or degree of humidity was also an important factor, about which at present but little is known among bee-keepers.

As to the height from the floor of cellar it was thought that where there was a proper system of ventilation the atmosphere never was sufficiently stagnant to allow impure air to settle to the bottom of the bee-cellar. Some had noticed a distinct difference between the bees in the upper and lower rows of hives in a cellar without a proper system of ventilation. One member, who had experience with both systematic and "any way or no way" of ventilating, experienced as above given. No one reported placing bees on a stand greater than 20 inches in height, or less than 6 inches.

#### "SHOOK" SWARMS—SIZE OF HIVES.

"Is the 'shook' swarm system a success?"

The general opinion was that it would be in a measure, but unless carefully carried out much harm might result.

"Are large hives desirable?"

Mr. Fisher—I have a hive with 17 Langstroth combs for

the brood-chamber, and I can place two 8-frame Langstroth supers on top. By turning it half around I can make a packing-case of it for an 8-frame Langstroth body.

He had filled by queens 16 Langstroth combs, the outside combs partially filled. He had received during the past season 30 Langstroth combs of buckwheat honey, and about 20 of clover, besides an increase of 2 colonies.

Mr. Holtermann—The 12-frame Langstroth suits me. Of course, I do not care if a man uses a 2-frame or a 20-frame hive, but I think Mr. Fisher is going too far in the direction of large hives.

Mr. Fisher—I calculate to give room in the brood-chamber only as required.

#### FEEDING BEES—EXTRACTING HONEY.

"If bees have lots of honey, should one feed?"

Mr. Shaver—Bruise some of the combs; that will answer.

"When should honey be extracted?"

Some thought when two-thirds capped; others when all capped. It was pointed out that dry or wet seasons made a difference, the dryer the season the sooner the honey could be extracted. If the honey glistened in the cells it was thought fit to extract. It was also pointed out that if the bees swarmed, the fresh previously stored honey might remain in the hive for quite a time and yet not be ripe.

#### ROBBING AND HOW TO PREVENT.

"How shall we prevent robbing, and how stop robbing when a colony is being robbed?"

Mr. Phelps—Close the hive; contract the entrance of weak colonies.

A Bee-Keeper—Be careful to allow no honey about during the robbing season.

Chairman Armstrong—Have all colonies strong.

Mr. Holtermann—Let me say if any one should be careless enough to allow a comb of honey to be exposed until the bees have robbing from it well in hand, to reduce the danger of robbing it is well to allow the comb to remain until they empty the comb, otherwise the bees will realize there was still some honey left, and, in hunting about, it may lead to the attack of weak colonies.

He had a portico with a movable screen, when present, and for any reason the colony was attacked, he simply stepped up to the hive and closed it from outside bees without any danger of smothering. If bees had obtained entrance they would speedily seek to get out, running up on the screen; there they could be let out until only bees from the hive remained, thus the colony could set a guard and pull themselves together for defense.

#### EXTRACTED HONEY AND EXTRACTING.

The care of extracted honey was taken up, the chairman pointing out that much good honey was injured by improper care upon taking. Storage in a warm, dry room was advised.

The question: "How can we best extract in the robbing season?" led to the suggestion that combs should be set out for the bees to clean. The danger of spreading foul brood was pointed out. Prof. Harrison's opinion being asked, he stated that he could not see how any one could be sure that the honey left in the combs did not contain the germs of foul brood, even if there was no diseased brood in the brood-chamber below such combs. He would defy any ordinary bee-keeper to be safe, and would advise extreme caution in setting out such combs; it would be safer not to do so. It would be desirable to disinfect extracting combs from season to season with formalin. The combs of from 200 to 300 colonies could be disinfected at an annual outlay of about 20 cents. The use of medicine was more in the direction of prevention of disease than a cure.

#### FOUL BROOD—HOW TO EXTERMINATE IT.

Prof. Harrison gave an address upon the subject of foul brood. He stated the dread of it in certain sections was preventing the expansion of the industry. From 1893 to 1898 the Inspector of Apiaries found 40 percent of the apiaries inspected infected. To what extent these apiaries had been cured was not known, owing to the lack of system in following up the treatment.

Any one reading the bee-literature of Europe and America found a great difference in the method of treatment. When in Switzerland, Germany and Italy he had tried to find out why this difference existed. Monsieur Bertrand, of Switzerland, had offered as a suggestion, that owing to exposure in Europe the bees had become immune to the dis-

ease; this, however, seemed to him (Harrison) doubtful, as the bees of this country were largely imported from there.

In Europe the methods adopted were these:

1. The stamping out method, destroying the colonies, combs, hives, etc. Mr. Cowan and the British Bee-Keepers' Association were inclined to adopt this method.

2. The starvation method introduced by Schirach, in 1769. It was to take away the combs from the bees, keep the bees fasting two days, after which they were fed and allowed to build other comb, which was again taken away in two days.

3. The drug cures are practiced in Europe, but not in America. The bees were fed a disinfectant, which acts on the spores and bacilli of foul brood. The antiseptic material employed destroyed the germ.

The best remedy had been naphthol beta, in England, and formic acid on the Continent. Both are disinfectants, formic acid being the better of the two, being Nature's remedy. This formic acid is found in honey in varying proportions, more being in buckwheat honey than in clover.

Prof. Harrison then gave the method of applying the fumes of formic acid, 10 percent formalin, 40 percent alcohol, 50 percent water, the mixture heated in a vessel, and by means of a tube the vapor passed into an air-tight box containing the combs. The fumes were to be left in the box 12 to 24 hours. Formalin is used to disinfect rooms, the fumes being very penetrating. Germs of diphtheria wrapped in paper, several thicknesses, this package being wrapped in a blanket, and all suspended in a room treated with formalin fumes, showed that the fumes had penetrated the wrappings and destroyed the germs.

Prof. Harrison was asked to read a letter from Gleanings of Feb. 15, by C. H. W. Weber, giving the result of the successful treatment of foul-broody combs. He advised extensive tests to be made with this method, and results obtained.

Wm. McEvoy, Inspector of Apiaries, gave a statement in which he said the disease was almost stamped out in Ontario, and that much good work had been done. There was a little in one or two counties, and this would be dealt with in the spring.

Mr. Holtermann stated that he had very strong evidence that there was still a great deal of foul brood in the Province. In a county adjoining Brant, it was so bad that the bee-keepers had given up; some would buy neither hives nor fixtures until they knew where they were. The inspector had been there during 1901, but had left their district unattended during 1902. Bee-keepers in Brant County did not know how they stood, and as far as inspection went there might be a good deal in the county. He read a letter from the President of the Ontario Bee-Keepers' Association for 1902, claiming it was not on the decrease; also one from J. C. Marrison, of Simcoe County, where they wanted county inspectors. The work could then be done at a more reasonable time, and for less money; he had nothing to say against Mr. McEvoy, it was simply the need of other methods.

After some discussion it was moved by R. F. Holtermann, seconded by D. Phelps, that we, as bee-keepers assembled, request the Hon. John Dryden, that the operations of the Foul Brood Act be so arranged that Prof. Harrison, of the Ontario Agricultural College, of Guelph, would be recognized as a Government official, who could investigate and test the results of treatment of foul-broody apiaries. Carried.

It was also moved by Mr. Holtermann, and seconded by Israel Overholt, that we as bee-keepers assembled, ask the Hon. John Dryden that the Foul Brood Act be amended so that wherever there is a county or district bee-keepers' association, that said association have the privilege of appointing a local inspector of apiaries, subject to the approval of the Minister of Agriculture, the terms of remuneration to be fixed by the Minister, said inspector to be paid out of the Provincial grant for the Inspector of Apiaries. Carried.

The question was asked, if it was thought desirable that Mr. G. C. Creelman, Superintendent of Farmers' Institutes and Secretary of Associations, should be made secretary of the Association.

After a brief discussion, in which the majority expressed themselves as thoroughly in favor of such a move, it was moved by J. Feather, seconded by D. Phelps, that we as bee-keepers, avail ourselves of the privilege of recommending Mr. G. C. Creelman, B. S. A., Secretary of Associations, Department of Agriculture, Toronto, as Secretary of the Ontario Bee-Keepers' Association, and that said resolution be forwarded to the director of this district, to present to

the Ontario Bee-Keepers' Association at their next annual meeting. Carried.

The Deputy Minister of Agriculture, Prof. C. C. James, attended the afternoon session of the meeting, and being called upon for an address, stated that he came to listen rather than to talk. In his address he said it was rather in the form of a confidential talk, and not for publication. He advised the bee-keepers to get more in touch with the Department, and make more advancement than they had been doing. The Government did not know much about them; they must make their work better known.

### Rearing Queens in Upper Stories.

BY L. STACHELHAUSEN.

ON page 248, Mr. Hasty says:—"So far as words and names go, Stachelhausen's method of starting queens in upper story is a sort of swindle." Mr. Hasty has surely not read my article on page 150 very carefully. Not anywhere did I claim that I start the queen-cells in upper stories. The described plan comes very near to it, but twice in my article I called this removed upper story a *queenless colony*. I said expressly that I used Alley's brood-strips, and that they must be given to queenless colonies for some hours to get queen-cells started, while Doolittle's cell-cups can be given in the upper story at once. I do not like to be estimated as any kind or sort of a swindler, and hope Mr. Hasty will correct this injustice and his bad opinion.

This preparing of a queenless colony of the right condition to start queen-cells causes considerable work, if Alley's directions are followed; so, for many years, I experimented to find a way for forming such colonies with less expenditure of time and labor. So, if anything is new or particular in my manipulation you may say: Stachelhausen's method of preparing a queenless colony for starting queen-cells.

This spring I use still an easier way with success: I prepare a bottom-board with an entrance closed by wire-cloth and place this anywhere in the shade near the hive, on which the upper story over the excluder was arranged a week before. About four o'clock in the afternoon I simply set the upper story on this bottom-board and close it with a cover, so that no bee can escape. This is all the work necessary to get the queenless colony. Soon the bees will get uneasy on account of queenlessness, and a large part of them would leave the hive if it were not closed by the wire-cloth. Two or three hours later I give the frame with the prepared brood-strips between two brood-frames. (This empty space should be prepared before the story is removed from the main colony.) During the night the bees have started queen-cells and early in the morning of the next day this story is set over the excluder on its old place again.

On pages 136 and 230, I read articles of Arthur C. Miller, in which the author lays the most weight on the fact that young bees are necessary to rear good queens. In my article (page 150) I said: "A large surplus of young bees compared with the open brood is the most important thing for rearing queens," and tried to explain why it is so. It is interesting that such men as A. C. Miller, Henry Alley and E. L. Pratt arrived at the same conclusion by practical tests, as we did by theory. To some extent it is a proof that our theory is correct.

In an upper story we can create this surplus of young bees, if we wait 8 or 10 days before we give the queen-cells to be cared for as, during this time, many young bees will have hatched and the young brood is all capped. The only question may arise, whether these young bees will stay in the upper story, or will go down into the brood-chamber, where they may find plenty of young brood to be fed. In fact, this may happen if in a large brood chamber is a comparatively weak colony. This, of course, should be avoided; only strong colonies, which occupy fully not only the brood-chamber, but the upper story, too, (even if no brood is in the latter) are fit for this purpose. Then we have to consider another fact, which is entirely overlooked by most bee-keepers. In the bee-hive a most remarkable order is prevalent. The queen lays eggs in the cells in a certain order,

going around on the comb in circles, and when a certain number of eggs is laid, she goes to the next comb, etc., so that the oldest brood is in the middle in the form of a globe, and the next oldest surrounding it, like the shells of an onion, etc.

If the young bee has hatched, she is not strolling around in the hive hunting for larva: to be fed, but remains just in the space between two combs, where she was born. Her duty, the first days, is to clean her own cradle. In due time the queen in her circling way arrives on this spot. In the meantime the young bees have accumulated chyle in their stomachs, and so where the queen finds empty cells she will find young bees, too, which are eager to feed their chyle to her, of which she needs and consumes so large a quantity.

With the young larva the nurse-bees grow older, and the food they prepare is exactly of the kind corresponding with the age of the larva; and the age of the nurse-bees. When the larva are capped the nurses have to keep them warm only, and are soon ready to do other work.

If such order would not rule the colony, but the bees would loaf in the hive, it would not only cause a continued uproar, but it would be hardly possible that every larva received just the proper food vital for its age. It is true, the bee-keeper sometimes mixes this wonderful order up considerably, and thinks he has done a great thing. The bees accommodate themselves to the altered condition as well as possible, but sometimes weeks may pass before everything is in order again, and sometimes a real damage is done to the colony.

In the upper stories, too, the young bees do not leave the combs as long as some brood is in them, except when they are forced to do so by the bee-keeper. Everybody can see this, if he gives Italian brood in the upper story of a black colony, and examines it 8 or 10 days later; if the honey-flow is not very good, he will find very few black bees on the 3 or 4 brood-combs; while the other combs containing some honey are occupied by black bees only. An upper story, if the colony is strong enough and the whole arranged correctly during a moderate honey and pollen flow, is in the same condition as a colony with the swarming-impulse, and will rear just as good queens.

### Queen-Clipping—Reasons For and Against.

BY J. D. GEHRING.

"REUBEN BOND," who took some practical lessons in bee-keeping in my apiary, as related in a series of articles published in the American Bee Journal about two years ago, came to see me one day, in the midst of the busy season, "to find out," he said, "how to clip queens, and why they should be clipped."

Replying, I reminded him that there were several things in the bee-keeping line of much greater importance to him just then than queen-clipping. "Besides," I said, "it is a long story in all its details; hence, I will at present merely tell why queens are clipped. And even that is not easy to explain briefly, because, while one bee-keeper has one set of good reasons for doing it, another has a quite different set for it, and yet another has an equally good set—in his opinion, of course—for not clipping his queens.

The one says he clips his queens because it is easier to control swarming when the queens are clipped. "That alone is enough reason for me," he says. The others say, "I believe in queen-clipping because it is easier to keep track of them afterwards, and because I believe they lay better and are less liable to sneak into the sections to lay, and because I don't have to climb trees and do many like undignified things, when my queens are clipped."

Ask the third—an equally well-informed bee-keeper—why he doesn't clip his queens, and he will probably answer about as follows:

"I don't clip my queens because I don't believe in depriving an intelligent, industrious and useful creature like a queen-bee of the divinely bestowed blessing of liberty. And I don't and won't do it, because I think it's a wicked thing to do to maim and mar for life a beautiful little creature like a queen-bee. Besides, I wouldn't clip my queens for practical reasons that I can mention." He continues:

"I am a very busy man and can't afford to stand around in my apiary on the watch during the swarming season for clipped queens when they come out with a swarm. If my queens were clipped, and a swarm issues when I'm attending to business somewhere else, she'll probably get lost in the grass, or get picked up by a bee-bird. I don't keep my hives

down near the ground," he explains, "so that a queen once out couldn't get back without help if she is clipped. Besides these and several other reasons, I oppose the practice of queen-clipping because I believe bee-keeping is being run away from the path of Nature marked out for bees by the Creator himself. In other words, I believe it's a violation of the law of Nature, and of bee-nature in particular, to deny them the right and the inborn inclination to swarm in their own way. Now," he concludes, "I don't want anybody to think I'm saying this because I am proprietor of the best, the tip-topest swarm-catcher in the world, but simply because I'm a friend of Nature, and of bee-nature in particular."

"Now, let me tell you, Mr. Bond," I continued, "there is more truth than poetry in at least one of the reasons given by the objector for not clipping his queens. I think myself, that, when bee-keeping—or the keeping of bees, rather—is only one of the many irons he keeps in the fire, for business reasons queen-clipping would hardly be the right thing for him. Especially not if he objects to spending reasonable wages for a reliable person to take his place at watching for clipped queens during the swarming season."

"But the matter really has its serious aspects. In your case, for instance, you have told me that you are a farmer for business, and a keeper of bees for what pleasure there may be in it, with all the honey you and family want to use. Very well, then I would advise you not to clip your queens as long as you limit yourself to two or three colonies. For it's just about as the objector says about clipped queens getting lost or devoured by birds when some one isn't promptly on hand to pick her up when she comes out with a swarm. In a case of that kind I think it would be best to let your bees swarm in their own way, and run the risk of losing your swarm, and take the labor and the sweat, and sometimes the stings, incident to the catching of it."

"This piece of advice is all the more sensible and practical in face of the fact that it is known to be extremely unusual for a swarm to issue and cut a bee-line for parts unknown (to the bee-keeper) without first clustering and waiting a while somewhere within your reach."

Douglas Co., Kans.

## Feeding Bees in the Spring.

BY A. C. F. BARTZ.

ON page 278 appears a criticism by Mr. Arthur C. Miller, of Mr. Dadant's article on page 231. In it he charges Mr. Dadant with ignorance of ordinary bee-life, but makes a much greater error when he says, in part, "All sorts of food, fed in all sorts of ways, and to all conditions of colonies." Now, this is a very sweeping statement which, if taken as it reads, leaves no room for any questions whatever, and, I suppose, is taken for granted by a good many who have had no further experience in feeding for stimulating purposes than Mr. Miller seems to have, for if he had gone through the experience I went through about seven years ago, and Mr. Dadant undoubtedly had a similar experience, Mr. Miller would not have made such a sweeping statement as he did. There are conditions here in which stimulative feeding is of great value and indispensable, and his own italics—"they are stirred up and create more heat"—are in question, because not only the welfare, but in some cases the existence of the colony depends upon them.

Now, for the benefit of the readers of the American Bee Journal, I will mention the conditions under which stimulative feeding is absolutely necessary, and I am pretty sure if Mr. Miller ever meets with those conditions, he will approve of my statement. The conditions are as follows:

The bees, having been out of the cellar in the spring for a month or more, have had some fine weather, and brood-rearing has been progressing. Four or more combs are being filled with brood. Young bees are hatching by the hundreds every minute. Thus, the unsealed honey is being consumed very rapidly within the brood-nest.

Now, at once, comes a cold spell—a spell like we are just having—which may last two weeks. During this time the bees are forced to contract into a solid winter cluster, to say nothing of their being able to leave the hive, for that would be altogether out of the question for a bee, leaving the hive at such spells, would never return.

The hatching bees within the cluster, on not finding enough honey to satisfy them, are just the first ones to feed upon the jelly fed to the larvae, and, after that is gone, drop

off from the comb; not yet upon the bottom-board, but within the cluster, and the bee-keeper does not know what is going on until the cluster breaks and the adult bees move slowly to combs containing honey.

The queen stops laying, and either part of the whole brood-nest is left unprotected. But if at such times a little food is given, the queen will keep on laying, the larvae are fed, the hatching bees will remain alive, and the colony suffers but little. The bee-keeper, upon the arrival of warm weather, is delighted on seeing so many young bees taking their first flight, and, on opening the hive, finds the brood-nest still full of brood, where, on the other hand, if he had not fed, would likely find the brood-nest empty, even if the bees had reached enough honey to sustain their own life.

I am not an advocate of early spring feeding, nor at any time when bees can fly. I never found it practical, nor did I see any gain in it. But I always feed in such cold spells after the bees have large quantities of brood, and have found it the best investment.

I also discovered a very practical way of feeding during such cold spells. Take some extracted honey, which is candied solid; stir it and punch it until it becomes soft like dough. Then take manila wrapping-paper or fibre, cut it into pieces about eight or ten inches square, take the honey-knife and on it paste or smear about half a pound of this extracted honey. Raise up the hive in front and push the paper under the cluster, or if the cluster does not reach the bottom-board, paste it right under the cluster on the frames. In this way you do not have to open the hive and let any heat escape, for it is done almost instantly, and the bees will take the feed up without breaking cluster.

## Bees and Cross-Pollination in Flowers.

BY H. D. SCHWEINHAGEN.

LITTLE was known about fertilization of plants before Darwin wrote his work on the fertilization of orchids, and his work on the origin of species. He wrote much on cross-pollination in flowers and gave us a universal knowledge on all living things, plants and animals. On his great work all scientific men and other observers base their investigations.

The unparalleled success of Charles Darwin is well known. It shows him at the close of his century, to have been, if not the greatest, at least the most effective of its distinguished scientists. The question of cross-pollination, I think, is well settled through his work and the observers of to-day. Under this class I feel that all successful bee-keepers must be classed.

But the question whether bees are beneficial to orchards is somewhat problematical. Bee-men, who usually are quite accurate observers, are positive about it, and are, of course, in favor of the bees' usefulness to horticulture. Fruit-growers on the other hand, often claim to find crops just as good, or even better, without the aid of the bees.

But if we observe how the plant is dependent upon the insects, the question becomes a very interesting one. Many of us, however, have never seen the actual process. Insects move so rapidly, and many of them are so very small that we are wont to despair of seeing this miracle performed.

There are many interesting things in Nature that we can observe in our daily life without bothering with the dry problems that confront scientists, and this is one: Flowers live by insects and insects live by the flowers. Nature's provision in flowers is wonderful. Their hoods contain nectar, which emits a strong odor, effectively advertising it. This odor is very pleasing to the bee's sense of smell and will attract her. The bee, clinging to the flower, as it gathers nectar, catches its foot in slits between the nectar-cups or hoods; as it leaves the flower a foot is released by drawing it up through the slit, dragging with it two club-shaped masses of pollen. It flies to another flower and, while continuing the process of gathering nectar, draws a pollen-mass into the same sort of slit that caught its foot before, whereby some of the pollen will break off and is left where it can effect cross-fertilization.

We can see from this observation that the plant was assisted, to a great extent, by the bee, but the plant uses Nature's gift, the nectar, to attract the bees. For, the bee, to get the nectar, alights on the flower and thrusts it proboscis down into the nectar-cup for a sip.

There are certain flowers that open at certain time of the day, and others open only at night. Now this is not the re-

sult of chance. Certain flowers depend upon certain insects for fertilization, and they open when those particular insects are on the wing. Flowers sometimes appear to act as if they were endowed with human intelligence. Cut some fine branches of a laurel (sweet bay) from the outside and put it into water in the house. Now, the flowers you have cut and taken into the house will last longer because they are waiting for the insect on which they depend for fertilization, and from which they have been separated by your bringing them into the house. It is also said that some tropical orchids last longer in hot-houses here than they do in their native state, for the same reason.

It may be well to bring up here this fact, which bee-keepers, no doubt, have observed, and that is, that bees visit but one species during each trip.

I saw an article in the Metropolitan and Rural Home from which these few lines are taken:

"We think there are years when the seasonal conditions make bees almost the entire dependence for fertilization. At other times, it seems that bees are not needed at all, because other insects and winds furnish satisfactory fertilizing agencies."

I would suggest that a wet season would require the bees' work. In that condition the flowers and pollen are moist, and therefore the pollen cannot be so well transferred to other flowers by winds. The bee is built for its work on business principles. Hair is situated on its hind legs and form a pocket in which pollen can be carried home, the ultimate use of which is for food for the young.

The bee is covered with pollen in passing from flower to flower, so that it can scarcely help passing the pollen to the stigma of the flower.

Henry Co., Ohio.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Letters from the Sisters Appreciated.

I have received so many nice letters regarding the "Sisters' Department" that I feel like writing a personal letter to each in reply, but for lack of time I must content myself by saying through the Bee Journal how much I appreciate them, and I want to express my sincere thanks to each of you for them. If you knew how much good your letters have done me, I am sure you would not hesitate to write again.

I feel sure the department will be improved for our becoming better acquainted.

E. M. W.

### Hiving Swarms on Tall Trees.

On page 232, Miss Wilson gives interesting experiences of hers in hiving a swarm of bees clustered upon the limb of a tall tree. And she calls upon the other sisters to tell how they do it. Now perhaps she may allow me—an admirer of the Sisters' Department in the Bee Journal—to tell the manner of my doing it in one particular case.

Surrounding my bee-house are many trees, most of them small with the exception of three, two of which are apple, one elm. Well do I remember, a few years since, upon a beautiful May morning, the voice of my wife calling out: "Bees are swarming, come, quick!" Of course, like all good and obedient husbands, I hastily donned my hat and obeyed the call, finding the air full of bees, which had just begun to cluster upon the tall elm on a large limb, fully 30 feet from the ground, and not over 4 feet from the body of the tree. I watched them all cluster, and then said to my wife: "I will never risk my life up there to have those bees."

Now, I was made happy in hearing her say: "I would not try to get them. Let them go."

(Of course, I could not but think my life was not insured for her benefit). But I rather wanted those bees, it being an extra large swarm, and an effort to save them could not meet with more than failure, although a wholly and untried one with me. So, getting a pole some 18 feet long, tying a brush upon the end, with a 20-foot ladder resting against the body of the tree, I ascended the ladder to

give them a brushing-off the limb, and start them for the woods or some other place. Of course, the air was full of mad bees, but I soon discovered they were clustering upon the top of the tall apple-tree. I went at them again before they had all clustered, and they went for me, too. But their next move was upon a small plum-tree in the garden, from which I secured them without further trouble.

Hampshire Co., Mass.

JOSEPH BLAKE.

"If at first you don't succeed, try, try again." You certainly did deserve being rewarded with success for your perseverance with that swarm. But say, while you were working so hard for those bees, didn't you wish you had clipped the wings of your queens? It would have been fun to sit in the shade and watch those bees come back. Now, wouldn't it?

### Drawn Comb for Swarms—Drone-Comb Withheld from the Brood-Chamber.

1. If you have a swarm on 10 frames of drawn comb will it not detain them longer than is desirable from going into the sections?

2. If drone-comb is withheld from the bees in the brood-chamber, will it not force the queen into the sections, where queen-excluders and full sheets of foundation are not used in the sections?

L. S. R.

ANSWERS—1. Yes, I should think it would; but why hive them on 10 combs? Why not give them only 4 or 5 combs at first, filling up the rest of the space with dummies, then after they have filled the ones they have, perhaps in 10 days, give them the rest. That would give better results far as the sections are concerned.

2. If there is little or no drone-comb allowed in the brood-chamber, there is a very strong inducement for the queen to go into the sections under said conditions, and she will be very apt to do it, if no excluder is used. Even with full sheets used in the sections a few drone-cells will sometimes be squeezed in the sections for the queen to lay in, and more than once I have found a queen-cell built in one corner of a section from which a young queen had emerged.

But with full sheets of foundation in the sections there will be so little trouble that it is not worth while to use excluders.

### Getting Langstroth Hives—Uniting Swarms.

I am glad to be remembered in regard to the bee-keeping sisters' department. I have no suggestions to make in regard to its improvement.

I have 19 colonies of bees. I have always helped my husband with the bees, but since I have lost my husband I will try to take care of them myself.

1. Can you tell me where I can get the Langstroth hive? If so, please let me know.

2. I would like to know if I could unite two or more swarms of bees in the swarming season. That is, if I should have one swarm to-day and another to-morrow, could I unite them?

MRS. A. W. TABOR.

Bremer Co., Iowa, May 19.

ANSWERS—1. In the fullest sense of the word, any movable-frame hive is a Langstroth hive, as Langstroth invented the movable frame. The one most commonly in use is probably the dovetailed hive, and can be had from almost any dealer in bee-keepers' supplies.

2. There is little trouble in uniting swarms that issue on the same day, and there may be no trouble in uniting them if they issue a day apart, or even several days apart. But you may have trouble trying to unite a prime swarm and an after-swarm that do not issue at the same time.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 10 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order. Send all orders to the Bee Journal office.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### SHADE OF MULBERRY-TREES.

Crossed his mulberry-trees with squash-vines—'pears like! They reach out in every direction and shade a whole apary with two trees. No use for the rest of us to hanker after them, seeing we have not California's stimulating climate to make them grow. The miniature forest of proprs needed to hold them up is an item on the undesirable side—but can be endured I reckon. In fact, we are not reasonable to ask for a shade that shall encumber the ground not at all, like the cloud over the Tabernacle. Page 258.

### CLEANING OUT UNFINISHED SECTIONS.

It's quite true that bees show surprising contempt for honey in granular form—kick it around here and there, and oft leave in the cells, for the time being, whatever granules gravity and inertia may keep there. While a cell is in that condition they don't put nectar in it, I reckon. What I would like to know is, What measure of cleaning and polishing do average bees on an average occasion give to their store-comb? Not the exquisite work they put on brood-comb, I fear. The rogues won't do such work in advance much. Whatever they do they do off-hand—in goes the honey, and then we cannot see, as we can in the cases where an egg is put in. I think they usually rub over all the territory at least once and remove debris. To a bee a honey granule is a small brickbat. Don't believe it is their habit to leave brickbats in their storage-space. Still, I'd give a yoke of my six-legged oxen to be sure of it. When every bee is loaded with nectar and nowhere to put it, and just then a super of baits is put on, perhaps, under the pressure, there may be much less cleaning done than usual. Wish I knew. More or less small debris is often worked into wax, and some fine granules may go the same way. How much harm would they do? My theory, you see, is inclining dangerously toward spring cleaning. My practice is worse yet—no cleaning at all. I have very few of these sections, comparatively. One or two to a hive is usually all I can muster when it comes time to put on sections. To that small extent I deliberately put them on, honey, granules and all. My June flow is very fickle; and I figure it that more than half the time they will be cleaned out in the best style of the art before any honey is put into them. Think it a good thing to familiarize the bees with the new space just given them. And in the cases where the baits are not entirely emptied they are worked upon considerably and at once. This is anent the Doolittle-Wilson talk, on pages 262 and 312.

### QUILTING SWARMS DOWN.

Yes, when the bees have actually swarmed, and you have stopped them for once by quilting them down, then's a good time to make your shaken swarm. 'Spects my bees would get out and into a tree, somehow, unless those quilts were manipulated with great vigor and adroitness. Page 264.

### THE TELEPHONE, CHRISTINA AND THE COOK.

"It don't was perfect yet"—the telephone where they gave him the colored cook when he asked for his Christina. Should say so. And bee-keeping, it's just that way, too, in forty different corners. We anticipate Christina, and the colored cook turns up. And that is where the genius of the thing comes in, in making the best of the cook, and letting Christina go. Order ham and eggs. Page 267.

### A RARE "BEER" AND HIS BEES.

Here's a rare kind of Beer (wish the other kind was as rare)—a man 13 miles from any other bees. His bees, seen two miles from home, and three miles from home, add new evidence to the old that bees don't mind a little distance. I note that it was, in one case, nothing more phenomenal than garden gooseberries that they were after. Page 270.

### "THE FOOT-PATH TO PEACE."

Thanks for the display paragraph that opens No. 18. No danger of our being too often reminded that neither honey nor cash are exchangeable for peace. Without re-

gard to "views" we all know that something to love, and something to hope for, and quiet satisfaction of heart, are what we want. However absurdly we may scramble away from it we want it still.

### SIZE OF THE TWIST OF A TWISTING BOARD.

On page 276 you're away off in your mathematics, dear Boss—at least so it seems to me. Halving a twisting board reduces the twist to much less than half. We see that the clearer if we look in the other direction. Suppose a 14-inch board twists one-quarter inch, how much should a 28-inch board twist? Correct answer should be one inch, not one-half inch merely. The added 14 inches has its own twist, and the benefit of the other one's also.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Forced Swarms—Separating Swarms.

1. Is it a good time to make forced swarms when the bees begin to hang out?

2. Should supers be given bees before such swarms are made? If so, which colony should have it? And about how soon, under favorable conditions, will the other colony need a super?

3. When several swarms go together, how is the best way to separate them so as to have a queen for each? New York.

ANSWERS.—1. You can't depend upon them hanging out. You can tell better by looking inside the strongest colonies to see whether they have started queen-cells.

2. Yes, give supers as soon as the harvest fairly commences, or a little before; give the super of course to the old colony, as there is yet no other; leave the supers with the swarm, and give the super to the old colony when it becomes strong enough, if it becomes strong while the harvest lasts.

3. One way is to use a tin dipper to measure out enough for each swarm.

### Perhaps Poisoning or Bee-Paralysis.

Enclosed find a few bees. What do you think about them. I have 18 colonies of bees, and among them there are quite a number of colonies that are, it seems to me, killing off lots of bees, as I can find a handful of dead bees in front of the hives. These enclosed are some that were strewn around. I have been watching them and trying to find out what was the trouble, but as yet cannot find any cause. Those enclosed have a red stripe around their body instead of a yellow one.

The bees seem to be at work carrying pollen, but all day I can find a lot of them in the grass, crawling around and waiting for death to come. ILLINOIS.

ANSWER.—Nothing can be told from appearance of the bees, but from what you say it is quite possible that it may be either a case of poisoning or of bee-paralysis. If poisoning, of course there is nothing to be done; and if paralysis, you will probably find the trouble disappear of itself, although farther south paralysis is a very serious matter. Unfortunately no reliable remedy for paralysis can be offered.

### German Bee-Paper.

What is the address of a German bee-paper that treats exclusively of bees? WASHINGTON.

ANSWER.—Praktischer Wegweiser, Oranienburg-Berlin, Germany. Bienenwirtschaftliches Centralblatt, 32 Georg strasse, Hannover, Germany.

Leipziger Bienenzeitung, Taubchen weg 19, Leipzig, Germany. Bienenzucht, Thuringia, Germany.

### Bees Lost in Winter and Spring.

Being a beginner in the bee-business I take the liberty of submitting the following facts for your consideration:

Last fall I had 7 colonies of bees in box-hives. One colony died early this spring, the bees being found dead on the bottom. Three more of the hives have but a handful in each box and are getting less every day. The hives contain plenty of honey and combs. The boxes were single-walled with no protection from cold, which was severe last winter. The top cover of the boxes was filled with chaff. Bee-keepers in general around here have lost about 75 percent of their bees during last winter and this spring under similar circumstances to those

mentioned. What can be the cause? and what the preventive of a similar occurrence?  
 UTAH.

ANSWER.—It is possible that there may have been some special reason about which I know nothing, and it is also possible that there may be nothing more than unusually trying weather. If the trouble was the unusually severe winter, then the remedy is better protection, or else cellaring. If there had been protection on three sides as well as on top, the result might have been different. A windbreak on the side or sides subject to severest winds might also help.

**Queenless Colony Uniting with a Neighbor's Different Kind of Bees.**

1. My bees wintered well with corn-fodder set up on the north and west sides. I lost two colonies this spring that were queenless. I had two colonies in box-hives, apparently strong in April. They were not more than six inches apart. They seemed to be very neighborly with each other. They would mix together and crawl from one hive to the other. Finally, I discovered robber-bees lurking around one of the hives, and so I examined the hive and there was not a bee in it. I tried it to pieces and got 20 pounds of honey out of it. Don't you think the bees deserted the hive and went with the other colony that was strong the first of April?

2. You will find four bees wrapped up in paper in this letter. They are honey-bees, but I do not know what species. Will you tell me what kind of bee it is? I caught them gathering honey from ground-ly. There are quite a good many. They are like our honey-bee, but they have long horns or smellers on their head, and they have no stingers. There are two which are smaller than the other two, but I

think they are the same kind. I have kept bees for 25 years and never saw any bees like them.

Since I started this letter I have caught some more of that new kind of bees, that have a white or yellow nose.  
 ILLINOIS.

ANSWER.—1. Your surmise is very reasonable. The colony probably was queenless, and when its near neighbor began appropriating its stores it joined in with the marauder. The only thing that seems strange about it is that you should have found any honey in the hive, but perhaps you came upon them too soon for it to be carried out.

2. I am sorry to say I'm not an entomologist, only a practical bee-keeper, and I don't know enough to be sure about different kinds of bees except hive-bees and bumble-bees.

**Transferring and Introducing.**

1. I bought a colony of bees in an old red hive, the frames running crosswise in the hive. I wish to transfer into a new 10-frame hive, painted white. To place it over the new hive so as to fit I will have to turn it one-fourth around. Will the change of position and color make any difference?

2. How soon shall I put the queen in the new hive?

MISSOURI.

ANSWER.—1. The white color and the quarter turn need not make any great trouble, but if you mean that you intend to put the new hive over the old one, with the view of having the bees work up into the new one, my advice would be, "Don't." Draw the bees up into the new hive so as to get the queen in it, then put the new hive with the queen below the other hive, with an excluder between, and the bees will start work below much better than if you put the new hive above.

**FROM MANY FIELDS**

**A Beginner's Experience.**

I bought two colonies of bees in box-hives in 1897, and had them put into frame hives with supers the same spring, and Italian queens introduced. The work, new hives and queens cost me \$5.00.

In 1898 we had two swarms; I lived one and gave the other for the hive we put the swarm in. These three colonies had but little attention, and did not swarm nor store much honey during 1899, 1900, and 1901. In the spring of 1902 I bought five frame hives and fixtures, moved my bees 7 miles to where I now live. The man who moved them could hardly understand it, that I was buying five frame hives and had only three colonies. I got him to help me transfer the three. We divided the brood from the 3 hives and made 4 colonies. They did well after the transfer, and I had 3 swarms. One came out while my wife and I were away, and we lost it. A few days after we came back another fine swarm came out. We housed them all right. I now had 5 colonies. They did well and stored considerable honey. When the winter began they had the supers about half full of nice honey, which I left with them. I looked at them twice during the winter.

About the last week in February I moved them some 20 yards out of the vineyard from the east side of the house to the south side, where I had provided a bench about 15 inches from the ground and 18 inches wide. When

Address,

**GEORGE W. YORK & CO.,**  
 144 & 146 E. Erie St., - CHICAGO, ILL.

I moved the bees I changed the supers and put the brood-chamber on top of the super. The bees, up to this time, had used but little of the honey they had in the supers.

I have just finished the work on them, and will tell what I did. As the brood-chamber was on top of the super, I commenced in the brood-chamber by taking each frame and shook the bees off of it down in front of the stand, and took off every queen-cell I could find. When I got down into the brood-chamber I smoked it from the bottom and set the super back on top of the brood. I then examined the supers very carefully, and found that the bees had used all the honey in them. I cut out all comb that was not in proper shape on the frames. I found in the brood-chamber every cell was sealed with honey or used for brood. I took from three to seven queen-cells out of each. In this operation I put seven brood-frames, and all the bees that were on them, into an empty hive and stopped them up until the next morning. This being done late in the evening, the next morning I opened the new hive at the top, gave them a few puffs of smoke, arranged the frames properly, put in the eighth frame with brood-foundation, and closed them up at the top and opened the entrance, and in a short time they seemed to be as quiet and well content as any colony on the bench.

I think my bees have done well, and I now have an abundance of bees; the hives are all very large. I have four colonies of black bees that I bought last fall, and which I worked in the same way as the above-mentioned five. I have been in business for 13 years, and so did not attend to my bees properly. I no longer have any business, and I watch the bees very frequently, and have taken a great interest in them. I now have 10 colonies, 6 Italian and 4 black. J. G. WHITE.

Crawford Co., Ark., May 8.

### Orange-Bloom Honey.

I mail you a sample of pure orange-bloom honey taken from a 6-ton tank full. I am running three apiaries this season, all for extracted honey, and have already extracted 14 tons of pure orange-bloom honey, with more of it in the supers; but as bees are commencing on sage, our next extracting will be orange and sage honey. F. McNAY.  
 Los Angeles Co., Calif., May 19.

[The sample was very fine. It looks as if some parts of California are getting some honey.—EDITOR.]

### Formalin or Formaldehyde.

I quite agree with Mr. Hasty's remarks on page 329, respecting the mix-up of the above, and as I am not a chemist perhaps I can the better tell laymen about it. My experience with it has been practical, and what I don't know about it might fill a volume, but I'll try not to go that far.

In the first place, so far as the laymen go, the two words mean the same. Formaldehyde bears the same relation to formalin that ammonia does to aqua-ammonia. Ammonia is a gas, and aqua-ammonia is water charged with the gas of varying strengths up to 26 percent, after which the water will absorb no more.

Formalin is water charged with the gas—formaldehyde—usually to about 40 percent. Commercially, all we ever have to do with is formalin, so we might as well drop the longer word.

It was discovered not many years ago by German chemists, and has been largely used as a germicide. It has a peculiarly sharp odor, and produces a stinging sensation in the nose some time after smelling it. To some it is more offensive than ammonia, and would better be approached with caution on first acquaintance. It is as harmless as ammonia, however, and is good for catarrh.

As it is an absolute preventive of mold and fermentation, it has been largely used for that purpose. A few drops in a quart of milk will keep it for days, or in a paste will preserve it indefinitely. (Try this.)

Being so good a preservative, the milk-men, brewers, and others, have gotten "all-out" it, and here is where the abuse of a good thing has come in. It has been found extremely

**Marshfield Manufacturing Company, Marshfield, Wis.**

dangerous, if not deadly, when taken into some stomachs, and is now condemned as a preservative of foods by various health departments.

It renders gelatine or glue insoluble in hot water, and is an antiseptic toughener of the skin. The German soldiers are made to bathe their feet in a weak solution of it, and to drop a little in their shoes to toughen them and prevent sweating.

As a germicide I believe it is now considered pre-eminent by the best authorities. Sheets saturated with it are now used almost universally for disinfection after contagious diseases, and it is regarded as sure death to all germs of disease.

I have had no experience with foul brood, and I hope I will not have, but if I should have, I think I'd atomize it with formalin for a venture, anyway.

With apologies to Mr. Hasty.

Dupage Co., Ill.

P. S.—It may be bought of any druggist, and costs about as much as ammonia.

R. D. C.

**Experience with Queens—A Reply.**

On page 198, Henry Alley starts off well, but he is like the bees I have in the grain region of the Willamette Valley I spoke about some time ago—he gathers poor stuff before he gets through. At least two statements in his article are not argument, and do not prove anything except that he is too set in his ways to live and learn anything new. But what does prove something is the fact that many subscribers of the "Old Reliable" and many other bee-papers are buying queens every year that never live through the first winter, and most of the colonies that receive them never yield any surplus. Then, again, in his own article he admits the Italian bee has become a tender lot and difficult to rear.

Now, Mr. Alley, I have not had the pleasure of testing any of your queens, but others that I know of have, and they didn't vary much from those I bought of a half dozen other breeders. Every queen I bought of all parties except one died the first winter, and that one spring dwindled and died the next spring, and they were all built up to strong colonies within 30 days of your queens, but no one did any of them ever yield any surplus, while those despised blacks were filling from two to three large-sized supers for each colony.

Now, then, what would you have done under the same circumstances, wanting section honey and not queens? Well, I will tell you. You would study cause and effect, which I did and am doing, and from the results you would have drawn down your conclusions.

Now, let me give you a little account of

**Italian Queens, by Mail.**

<b>Golden and Honey Queens</b>	before July 1	
1	6	12
Untested.....	\$1.00	\$5.00 \$9.00
Tested.....	1.25	7.00 13.00
Breeder.....	4.00	
2-Frame Nucleus (no queen)	2.00	11.00 21.00

Add price of any Queen wanted with Nucleus. Our bees are shipped in light shipping-cases. Purchaser pays express on Nuclei. Safe arrival guaranteed of all stock sent out.

BATAVIA, ILL., Aug. 21, 1901.

Dear Sir:—I thought I would let you know as to results of the nucleus sent me. They were placed in 10-frame hives and now they are in fine condition. From one I removed 24 pounds of honey and had to give 6 of them more room, as they were hanging out. They have more than reached my expectations.

Yours respectfully, E. K. MEREDITH.

DAVENPORT, IOWA, Dec. 31, 1901.

Your queens are fully up to standard. The honey queen that you sent my brother takes the lead. She had a rousing colony when put up for winter. The golden can be handled without smoke or veil. Very truly yours,

JOHN THROEMING.

Notice.—No tested stock sent out before May 15. Send money by P. O. Money Order or Express Order. D. J. BLOOMING, 1741st PEARL CITY, ILL.

some of the results, first stating that every year here is like the season you had there last year—more or less cold and rainy during the best honey-flow, and the nights are always cool here. Well, sir, I had 5 colonies enter the supers before apple was in, and now, May 10, with apple in full bloom, every colony in the home yard is working in the supers, and those first 3 have each 2 supers on an over half full, and they are all full-blooded blacks.

Say, Mr. Alley, don't you think I ought to be suppressed?

Now, to come back to the subject in hand, the queen you got in 1878, valued as she should be for what honey her bees would produce in surplus, was worth just that much more than the rest, as the crop from her colony, etc., considered, which might not have exceeded any of the rest, nothing more. Any other value you got out of her you created by advertising and beauty, not utility.

Now, Mr. Alley, I see by your remarks about black queens, yellow queens, dunghill fowls, and up-to-date fowls, you have an eye on coming to the rescue. But, look here, don't you know that the best breeds of chickens alive to-day for producing eggs are the selected descendants of those despised dunghill fowls? Well, I am just selecting the honey-producers from among my blacks.

I am very sorry to lose my mainstay and support on queens. "Dr. Gallup," but the loss is partly made up by "foxy grandpa" coming to the rescue. I say, burrah for G. M. Doolittle, and with such a man as he by my side I am ready to do battle with the world, as he uses nothing but high-pressure, smokeless powder, while Mr. Alley uses that horrible smoky stuff.

Well, I will close for this time, but will give you black-powder follows something to roar about when I get time to write an article on laying workers, worker queens, and queens proper.

GEO. B. WHITCOMB.

Linn Co., Oreg., May 13.

**Bees Stinging Bright Objects—Sowing for Bees.**

Tell C. Stimson to get one of the bright pendants that are used on the hanging lamps. They are of glass and cut with many faces, so that the rays of light strike them in all directions, making an attraction for all bees. I have to wear glasses to see well in clipping queens. I don't like to wear a veil, as it not only impedes sight, but interferes with breathing, and then, as I am one of the boys of '61, I contracted the tobacco habit when camp-life had few entertainments. The veil interferes with the use of the weed. The bees at a habit of flying for the glistening of my glasses, and generally would hit the mark, then crawl under them, and get in their work on or near my eyes. I have had as many as 100 shots a day, and while the sting doesn't swell my flesh it interferes with one's comfort. So I stuck a pin through one of these pendants, and making a hole of way to stick it in my hat. This made a prominent mark and good target, and keeps them wondering why things are thus.

I sowed five acres of alfalfa on high clay ridge this spring. If it doesn't do well I shall resow in two years, and thus gradually get the "bugs" in that soil. We were taught in our army life that the only way to succeed was to re-plant (which often occurred, as our friends in the Southland were of mighty good material), to spit on our hands and try again. We must adopt these tactics in our business and never say die, but try, try again, and success will crown our efforts.

I sowed half a bushel of catnip seed last fall, in waste-places, under hedges, and along river banks. It is coming up nicely. I got some carpet-grass seed from California, and have sowed that in sheltered spots, but do not expect much from it in this climate. I have some phacelia seed from Germany that I will sow in the garden. This is a prominent plant there, try. It is a fine herb and forager plant there, an old German says it informs me. I have also sowed a bush along low ground near river edge, and expect good returns. We can do much to improve our range if we will only keep at it.

Eight years ago I sowed a peck of sweet

**Tennessee Queens.**

clover seed in the gravel pit. The soil had been removed eight feet deep. It grew and flourished like a green-bay tree, but when the railroad got all the gravel the land reverted to this same old Dutchman, who got me the pacella seed, he fenced in that 20 acres and took in the town cows to pasture. They made short work of my sweet clover patch, at it so short that it scarcely bloomed, while over the fence, where the cows couldn't get at it, it grew 4 to 6 feet high. The cows would not touch the kind of feed and it yielded abundant feed, but I fear that it is all "up" with that part of my range, as they eat it so close, and no seed ripens, that time will call it hence to bloom no more on that spot for ever. But the investment in that peck of seed paid me well, as it furnished seed for several years, and in some way it got scattered so well by my "night" birds, and now grows in many waste spots and roadsides where ragweed, wild sunflowers and horseweeds once flourished. There's nothing succeeds like success, and the only way to wear away failure is to keep the water constantly dropping.

I have 98 colonies in good condition, with queens all clipped last week, and am awaiting the harvest. Last season was the worst I ever saw, wet, cold, and no surplus. I lost 40 colonies in wintering, some in the cellar, some packed in leaves. Some were queenless, and more short of stores. I was sick in the fall and did not feed enough. I never lost any before.

**HONEY AND BEESWAX**  
MARKET QUOTATIONS

**CHICAGO, May 7.**—The past winter and present spring have been a disappointing one to producers and dealers in honey, in that the consumption has been away below the average of the past decade. Choice to fancy comb is held at 15@16c per pound, with old grades at 2@3c less per pound. Extracted, white, 6@7c; ambers, 6@6½c; dark, 5½@6c. Beeswax in good demand at 32c. **R. A. BURNETT & Co.**

**KANSAS CITY, May 28.**—The supply of comb honey is about exhausted. The demand good. We quote you as follows: Fancy white comb, 24 sections, per case, \$3.50; No. 1 white comb, 24 sections, \$3.40; No. 2, white and amber, per case, \$3.00@3.25. Extracted, white, per pound, 6@6½c; amber, 5½c. Beeswax, 25@30c. **C. C. CLEMONS & Co.**

**ALBANY, N. Y., Mar. 14.**—Honey demand quiet; receipts and stock light. Comb extracted, light, 15c; mixed, 14@15c; dark, 13@14c. Extracted, dark, at 7@7½c. Beeswax firm, 30@32c. **H. R. WRIGHT.**

**CINCINNATI, Apr. 27.**—Little demand for comb honey at present; fancy white sells at 15@16c in a small way. We quote amber at 5½@5¾c; white clover, 5@9c. Sales not as lively as expected this season of year. Cuban extracted is offered on all sides, and future prices are awaited with interest. The Fed W. MUTH Co. strong at 30c. **THE FRED W. MUTH CO.**

**NEW YORK, May 21.**—Comb honey trade exceptionally quiet, very little doing. Fancy stock not plentiful and is sold at 14c. A large supply of other grades on hand, which we are quoting at from 11@12c, according to quality, and in large lots make concessions from these prices. Extracted, unusually quiet, and prices show a downward tendency all along the line. Beeswax, firm at from 28@30c. **HILDRETH & SEBELER.**

**CINCINNATI, May 19.**—The demand for comb honey is nearly over, but as the stock is almost exhausted, prices keep up. The demand for extracted has not changed whatever, and prices are as follows: Amber in barrels, 5½@5¾c; in cans, 6@6½c; white clover, 8@8½c. Beeswax, 28@30c. **C. H. W. WEBER.**

**SAN FRANCISCO, Apr. 29.**—White comb honey, 12@12½c; amber, 9@10c; dark, 7@7½c. Extracted, white, 6½@7c; light amber, 5½@6c; amber, 5@5½c; dark, 4@4½c. Beeswax, good to choice, light, 20@22c; dark, 25@26c. **DRAPER PUBLISHING CO., Chicago, Illa.**

Last year's product has been tolerably well cleaned up, particularly the desirable stock. Present offerings are largely odds and ends, including little of one quality. Values for the time being are little more than nominal. A lower range of prices is looked for on coming crop.

## A Few Cheap Smokers!

We find we have on hand a few slightly damaged Clark and Bingham Bee-Smokers, which got a little damp and soiled at the time of the fire in the building where we were about 2 years ago. They are all almost as good as new.

We have some of the Clark Cold Blast, which we now sell now at 55 cents each; and some of the Little Wonder Bingham—new at 50 cents. But to close out those we have left that are slightly damaged, we will fill orders as long as they last at these prices:

Clark at 25 cents each; Little Wonder Bingham at 30 cents each.

We do not mail any of these slightly damaged Smokers, but will put them in with other goods when ordered, or sell them here at our office when called for—at the above prices.

Hamilton, Hancock Co., Ill

# Swarming Season.

Save your prime swarms. They are worth many times the value of secondary swarms that issue during the middle, or late summer. The Flannum Swarm Catcher, as shown in the illustration, is the best for this purpose. The basket is of wire-cloth with lid, and hung so that it can not be upset while suspended in air. No climbing trees to cut off limbs, torn clothing, sprained wrists, etc. Shipping weight, 10 pounds. Price, \$1.10.

The Alley Queen and Drone-Trap will cage your queens at swarming-time, when you have difficulty in locating them, or where you have occasion to be absent during swarming season. They are indispensable to the queen-breeder for caging drones to be taken to another yard, or for disposing of undesirable drones. Made in 12 and 14 inch length. Price, by mail, 65 cents each; by freight or express, 50 cents each; ten, \$4.00.

A Good Veil is a necessity even with the most gentle bees. The apiarist can accomplish more work; there is no hesitancy on his part because of cross bees. Price, \$1.00, postpaid. We have others at 80, 50 and 40 cents, postpaid.

The clipping of queen's wings is another method for securing the prime swarms. For the purpose we have a small pair of scissors which we supply at 25 cents, postpaid. See modus operandi in May 15th Gleanings in Bee-Culture.

### IMPORTANT NOTICES.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec03" on your label shows that it is paid to the end of December, 1903.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

Advertising Rates will be given upon application.

### National Bee-Keepers' Association

#### Objects of the Association:

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

**ANNUAL MEMBERSHIP, \$1.00.**

Send dues to Treasurer.

- President—W. Z. HUTCHINSON, Flint, Mich.
- Vice-President—J. U. HARRIS, Grand Junction, Colo.
- Secretary—GEORGE W. YORK, 144 & 146 E. Erie St., Chicago, Ill.
- General Manager and Treasurer—N. E. FRANCE, Platteville, Wis.

#### BOARD OF DIRECTORS.

- E. WHITCOMB, Friend, Neb.
- W. Z. HUTCHINSON, Flint, Mich.
- UDD TOPFERWEIN, San Antonio, Tex.
- R. C. AIKIN, Loveland, Colo.
- P. H. ELWOOD, Starkville, N. Y.
- E. R. ROOT, Medina, Ohio.
- WM. A. SELSER, Philadelphia, Pa.
- G. M. DOOLITTLE, Borodino, N. Y.
- W. F. MARKS, Chantville, N. Y.
- J. M. HAMBAGH, Escandido, Calif.
- C. A. HATCH, Richland Ctr., Wis.
- DR. C. C. MILLER, Marengo, Ill.

If more convenient, Dues may be sent to the Secretary, at the office of the American Bee Journal.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

### HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to  
**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

## Please Mention the Bee Journal when writing Advertisers \*\*\*\*

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

**HOWARD M. MELBEE,**  
**HONEYVILLE, O.**

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.99). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

**GEORGE W. YORK & CO.** Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., JUNE 11, 1903.

No. 24.

## Editorial Comments

**Text-Books on Bee-Culture** are things of exceeding importance. Beginners are sometimes puzzled to know what is meant by a text-book. Well, a text-book on bee-culture is simply a book of instruction, telling something about bees and their habits, and giving advice as to the care of them. The beginner who is trying to keep bees without having a text-book, even if he has only a single colony, is making a great mistake. None of the text-books costs much more than a dollar, and the beginner in ignorance of the principles of bee-keeping may easily make a mistake that will cost him a good deal more than a dollar in a single season.

It is a serious mistake to think that for a time the beginner will get along all right with a bee-paper, and after he has had more experience it will be time to get a text-book, or, as some call it, a bee-book. A bee-paper comes in to supplement a text-book, not to take the place of it. If you can have only the one, by all means get the text-book, though no one should think of keeping up-to-date without a paper also. But the text-book is the thing of first importance, and should be faithfully studied from the first minute you come in possession of a colony of bees, or, still better, before you get any bees at all.

**Second Swarms Should Be Prevented**, as a rule. This item is for beginners, and older readers can skip it. If colonies are left to themselves, they will generally send out a second swarm, sometimes a third, and even a fifth or sixth, although the latest issues are likely to be very small indeed. The beginner may feel pleased at the thought of so much increase, but sooner or later his greatest desire will be to prevent all swarms after the first, if indeed he does not desire to prevent even the first issue.

It is not a very difficult thing to prevent after-swarms. When the prime swarm is hived, set it on the stand of the old colony, putting the old colony close beside it. A week later remove the old colony to a new stand. All the field-bees from the old colony when they return from foraging will now go straight to the old stand, joining the swarm. That will greatly weaken the old colony, and at the same time stop the carrying in of all nectar. Being weakened by the loss of bees, and discouraged at the apparent cessation of the harvest, the bees will give up all thought of further swarming, allowing all queens to be destroyed in their cells by the first one that emerges.

**Apple-Blossom Honey.**—Fruit-bloom is counted of much importance because it comes at a time to aid greatly in building up colonies in strength for the coming harvest, but probably few have thought of it as a source of any considerable surplus. G. M. Doolittle, however, has expressed the opinion that if colonies were strong enough at the time of fruit-bloom, it might be the source of considerable surplus. But a yield of 100 pounds a colony would seem surprising. J. A. Crane says in *Gleanings in Bee-Culture*:

This county (Wayne) stands fourth in the United States as an apple county, and we can "know it last fall" whether the orchards will blossom or not this year; and also that, if the weather is favorable, and our bees in shape, we shall get honey.

In 1901 I extracted from three hives (supers and brood-nest) three

times in ten days, taking from each, at each extracting, a 12-quart bucketful of honey. Ripe? Yes, it weighed 12 pounds and 3 ounces per gallon. It candied solid the next January, and was pure white—nearly 100 pounds per colony. My whole yard averaged over 50 pounds per colony. Now, don't think I mean to say that such a crop can be secured every year; but I have had four yields of apple-blossom honey to three of basswood, so I think it well worth working for, seeing that you need prepare for it only when the trees are going to blossom full.

Now about the quality. I retail all, or nearly all, of my honey; and when a customer has once had apple-blossom honey he will always call for it again, although I have several other kinds—raspberry, clover, basswood, and generally buckwheat.

**Danger of Easy Increase.**—That a colony of bees, or any part of a colony, when left without a queen will proceed at once to rear a queen from a worker-grub—if such a grub be present—makes it seem a very easy matter to increase the number of colonies with great rapidity. Therein lies a danger to beginners—a very great danger. If a beginner has a colony with six, eight, or more frames of brood, he thinks that all he needs to do is to put a frame of brood with adhering bees into each of six, eight, or more hives, and, presto! there he is, with six, eight, or more colonies. If he acts upon that thought he will be very sure to rue it. Let him study carefully in his text-book some of the principles that should govern in such matters, and then he may act with some intelligence. As a further help, some hints will be given in these columns in the present and subsequent numbers which it will be well for the novice to study carefully.

**To Provide Ventilation When Moving Bees**, a common way is to use a screen of wire-cloth covering the entire top, a wire-cloth screen also closing the entrance. *Gleanings in Bee-Culture* gives the following ingenious way to save trouble and expense:

Instead of using an ordinary wire-cloth screen, take some pieces of one-piece section,  $\frac{1}{2}$ -inch thick, and lay one piece at each of the four corners, on top of the hive-body. The cover is now set on top, and, as will be seen, there will be a  $\frac{1}{2}$ -inch crack on the sides, front, and rear, between the cover and the body, and just narrow enough to exclude bees. The knee is now placed on the cover, when a creastaple is driven in, spanning the body and cover just opposite or near one of these section-pieces. With wire-cloth nailed over the entrance, and the cover secured  $\frac{1}{2}$ -inch above the hive-bodies, we get sufficient ventilation, even on hot days, if the bees are not to be moved more than about two or three miles. But I would not move during the heat of the day. Let it be in the morning or evening.

Still easier, and perhaps just as good, is the plan of having a bottom-board two inches deep. The wire-cloth at the entrance is then large enough to give sufficient ventilation without any ventilation at the top.

**Control of Fertilization Not an Unmixed Good.**—In our chagrin at the thought of failure to be able to control fertilization, one item may give us a crumb of comfort. If we were able to select the individual drone to meet a certain queen, it would very likely be in most cases at a distinct loss. To a certain extent it is well to have the selection in the hands of the bee-keeper. He can suppress the rearing of drones in all but those colonies which have shown themselves superior. This he should do, although in most cases heavily handicapped by the fact that he has no control of the drones in neighboring colonies.

Having thus made a selection by suppression, is he competent to make the further selection of the individual drone? He can judge only by the looks. Can he tell by looking at two drones which is the

more active? which has the greater wing-power? It is perhaps fortunate that this selection is left to Nature, and that in the race after the queen in the upper air the feebler drones drop out of the race one after another, and finally the fittest—the one with the best wind and wing—remains as the successful suitor.

If the man can select the colonies in which drones are to be reared, is it really desirable that he should have any further control in the matter of selection?

**How to Hold a Bee-Smoker.**—"To my notion," says Editor Root, "there is only one way.....the thumb should be on the side of the bellows next to the stove. This lets the hand hang in the natural position without any twist at the wrist." It would be interesting to know how many have notions exactly the opposite.

**Dividing a Colony** into two equal parts and allowing the queenless part to rear its own queen is a plan that generally suggests itself to a beginner. The following, which has just been received, is a type of a good many questions sure to occur at this time of the year:

"Can I divide a colony of bees and put half the frames in a new hive? Would they rear a queen of their own if they had brood? and would I better put the queen in the new or the old hive?"

The plan as suggested may succeed after a fashion, but it is hardly the most advisable plan. It is, however, so easily carried out, that in spite of its disadvantages it will probably be more or less practiced. By a little added work, the plan may be greatly improved. Put half the frames with adhering bees and the queen in the new hive. Three or four days later, without opening the hive, make the two hives exchange places. The result will be better than to leave the queen permanently in either place.

## Association Notes

MR. A. I. ROOT AND DR. MILLER expect to travel together from Chicago to the Los Angeles convention. So there will be at least "two boys" at the great meeting.

**POISONING BEES.**—General Manager France reports that a Wisconsin bee-keeper, on May 10, seeing that his neighbors' bees were robbing his colonies, closed his hives and exposed some honey mixed thick with Paris green. The result was that several apiaries were badly poisoned, and possibly other serious troubles. Mr. France was to settle the case June 2.

OVER IN CANADA a noted case has been won by the National—damages from bees. We have not as yet learned the particulars. There should be more members of the National in Canada. And then there should be a member of the Board of Directors over there. We are in favor of having the next vacancy in the Board filled by some good Canadian bee-keeper.

THE SANTA FE ROUTE will be the one over which the majority of bee-keepers of the East will travel to Los Angeles. We are hoping to get together a large party of bee-keepers to start from Chicago over that route, and stop off one day at the Grand Canyon of the Colorado River in Arizona. Doubtless there will be a number of other bee-keepers who will join the party all along the way, so that by the time Arizona is reached it should be a large company. We will give full particulars later as to time of leaving Chicago, etc.

THE NATIONAL BEE-KEEPERS' CONVENTION, as all bee-keepers know who read the bee-papers, is to meet in Los Angeles, Calif., Aug. 18, 19 and 20 next. The meeting will be held in Blanchard's Music Hall, 233 South Broadway. Mr. Geo. W. Brodbeck, President of the California National Honey-Producers' Association, has in charge the local arrangements, and writes us that it will be less difficult to make provision in the way of hotel accommodations in Los Angeles than any other place that could be found. He says they have so many large rooming houses scattered all over the city, that thousands who go there every season are well provided for; and it seems to be

the rule for people to hire rooms and take their meals out, so that rooms in any quantity can always be had, and meals from 15 cents up to any price one may wish to pay. But a good meal can be had for 25 cents. Mr. Brodbeck says that the matter of lodging and meals will eventually be handled by a hotel committee, so that accommodations will be secured for every one who goes to the convention.

Mr. Brodbeck also writes that we can put them down for a "California Welcome" on the first evening of the convention, which is Tuesday, Aug. 18, in Blanchard's Music Hall, which Mr. Brodbeck says is an ideal one for holding meetings.

We trust that every bee-keeper who can possibly arrange to be present will attend this convention. Being held in the great honey State of California, and also in a part of the country which every one who has not yet visited it should desire so much to see, it seems to us that the temptation to go will be so great that it can not be resisted. On account of the exceedingly low railroad rates in August, we believe there will be a great representation from the East. Of course, the Western bee-keepers will simply swarm to Los Angeles. We should not be surprised if it would be the most largely attended convention the National has ever held. We hope it will be. Mr. Brodbeck writes that every one says, "I am coming."

HON. H. W. AUSTIN, whose portrait is presented herewith, is one of the new members of the Illinois Legislature, and was perhaps the

HON. H. W. AUSTIN.

one most instrumental in securing for bee-keepers the new law, which we published on page 308, and to which we have referred several times in these columns recently. Mr. Austin is a resident of Oak Park, one of the finest and most delightful residence suburbs of Chicago. His fidelity to the bee-keeping interests of this State, as well as his successful efforts in behalf of its bee-keepers, will be appreciated by all.

We are pleased to present to our readers Mr. Austin's picture, as well as an expression of appreciation of his services. He will have the satisfaction of knowing that he not only did his full duty, but invested his efforts in a cause which was entirely worthy, and well deserved the law which was secured through his efforts and that of others.

## Miscellaneous Items

MR. THOS. WM. COWAN'S RETURN to England is noted in the British Bee Journal for May 21, he having arrived with his wife on May 14. It had been about five years since they left England for California, where they have lived ever since. Several weeks ago we mentioned the fact of their returning to England, and that upon leaving their California home a grand demonstration was given in their honor. Mr. Cowan is Chairman of the British Bee-Keepers' Association, and has been ever since its organization. A very cordial reception was given him by the Association upon his return. All our readers will be pleased to learn of the safe voyage of Mr. and Mrs. Cowan to their homeland; but if they are not careful, the United States will be considered as their "homeland," although the British Bee Journal says it knows that Mr. and Mrs. Cowan will never cease to regard England as their "home," wherever they may be.

MR. N. E. FRANCE, of Wisconsin, reports that the upland basswood timber has very little blossom buds this season, but that in the valleys it is better. On May 30 Mr. France received his reappointment as State Inspector of Apiaries for two years, under the new law, which grants \$700 per year, including expenses. Mr. France expected to start out on his official duties June 1.

# Convention Proceedings

## Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 293.)

SECOND DAY—MORNING SESSION.

The convention was called to order by Pres. York, at 9:30 o'clock.

The first number on the program was the following address by Mr. W. Z. Hutchinson, on

### COMMERCIAL ORGANIZATION AMONG BEE-KEEPERS

Nothing is truer than the fact that times and conditions change. Regarding the conditions and peoples of this continent in ages past, we have little else than conjecture; but so far as the present race is concerned there came, first, discovery, then settlement—the clearing away of the forests and the building of homes. Nearly all that was accomplished was the result of individual effort; and mainly with the bare hands unaided by machinery. Next came labor-saving machinery, and the beginning of organization in the shape of factories. At first there was much opposition to machines—they robbed men of an opportunity to labor. But then, as now, opposition to progress is useless.

The wagon-maker who made wagons by hand, sawing out the felloes, and shaving out the spokes, found it simply impossible to compete with the factory with its system of speciality, organization and machinery. The individual wagon-makers may have protested against organization, just as some of us now protest against the great organizations called "Trusts," and it is probably true that it inconvenienced them temporarily, and caused them to seek other employment, but the great mass of people who use wagons were benefited; and so were the individual wagon-makers benefited by this same process being introduced into the production of nearly everything they were compelled to buy.

This country has now reached what might be called the age of organization, and the industry that fails to catch the spirit of the times, and act accordingly, will eventually find itself in the position of the man who would now attempt to make wagons by hand. Organization begets organization, in fact, compels it. When the mine owners organize, the laborers must do likewise or be crushed. There is more than one industry in this country that would have been crushed out of existence had not the men who were engaged in it organized.

The best illustration of which I ever heard regarding the effect and value of organization was the act of an old man whose large family of boys failed to live and work in harmony. He gathered up a handful of sticks equal in number to his number of boys, and tying them up in a bundle gathered the boys in a group, and said he would like to know if he had a son strong enough to break the bundle of sticks. Each in his turn put the bundle over his knee, and strained with all his might to break the united strength of the sticks. All to no purpose. The father then untied the bundle, and handed a stick to each boy, saying: "Let's see if any of you are stout enough to break one stick." One contemptuous jerk of the stick across his knee was the emphatic answer of each boy.

It is not necessary to repeat the sermon that the old man proceeded to preach to his sons, but it is well that we take the lesson to heart.

As we are now selling our product we are competing one with another. We don't exhibit the business sense of even that despised class of people—the saloon-keepers. They never cut prices. With them, so I have read and have been told, the price of a glass of beer is always 5 cents. With us the price of a pound of honey is that at which our poorest or most unfortunate member is compelled to sell, as he must have the money.

I doubt if there is a bee-keeper in this country—one who

has given the matter serious thought—who does not believe that the time has come for National commercial organization. It seems as though it were time wasted to discuss its desirability—that we are ready to talk about the *how*. On this point we should gather wisdom from the past. How have other organizations been born, grown, and brought up? Most of the great industrial organizations have resulted from the amalgamation of smaller organizations; and they in their turn were made up of individuals. First, there was the individual wagon-maker, then the individual factory, so to speak, then organization of the factories into one immense combination or trust.

Such organizations of life insurance companies begin with a strong central office from which agents or organizers are sent out to establish branches. One method is that of gathering together small organizations, and uniting them under one great head; the other is the opposite—that of a central society spreading out and starting branches.

Which plan is the most feasible for bee-keepers? Colorado has an organization. California is working to establish one. Canada has in contemplation a similar move. Shall California and Canada succeed, and New York and Texas follow suit, and then shall these already successful organizations be united, or shall some strong central society like our present National Association, reach out and establish branches?

Right here it might be well to say that our National Association, as now organized, is not fitted to take up the commercial feature of organization, but its influence and machinery can be used to assist in the starting and fostering of a commercial branch or organization.

Some have opposed organization on the ground that it would be a trust. If it is an "organization" or an "exchange," it is all right, but they want nothing to do with a trust. Let us not be deceived by a jugglery with names. An organization, or an exchange, or a trust—it matters not what it is called—is a combination, or joining together of individuals, or firms, or corporations, for the benefit of its members. It is not necessary, nor desirable, that such benefit shall work hardships or injuries to the public. It may lessen cost of supplies, prevent the lowering of prices from forced sales by poor men, save freight charges by gathering car-load lots, and prevent gluts by means of statistics and proper distribution. It can do all this without raising the retail price of honey.

The great question at present is: "How shall we do it?" Let us discuss it. W. Z. HUTCHINSON.

Pres. York—The paper is now before us for discussion—"Commercial Organization Among Bee-Keepers." What have we to say? This matter was touched on in the President's address yesterday, so it may as well be discussed this morning. Has any one any questions to ask, or anything to say on this subject?

Dr. Miller—Mr. Hutchinson spent a great deal of time going over the ground to try to make us believe that organization was a good thing, a desirable thing, and then he wound up at that part in saying that there was no use in wasting time doing just what he had been doing, and I feel a good deal of force in that, and at the same time I think it the part of wisdom, for we haven't as a body of bee-keepers gotten right down to having that fact put right down in our minds, that what we need is organization. The first thing is a demand for the thing before you get it, and he has helped some little in making that demand, and then he wound up just in the right place by saying that we don't know just how we are going to do it. No, I don't know how. Some of you that do, tell us.

Mr. Hutchinson—My idea is, that we will have to form a stock company and limit the shares to the number of colonies each individual owns. Form a large stock company and then have somebody handle the honey for us so as to get an equal price for our goods. Of course, money has to be on hand in order to do business. We can't do business without money. We would have to have shares of stock and get money in hand, and then get some good man.

A Member—We have bees here in Chicago. Mr. York has built up a great business in honey here. We have opposition here. I was out here a couple of months ago trying to sell honey, and I noticed he had some beautiful honey which he had raised from the bottom of the car into the wagon. It was his own honey—"York's Honey"—and selling all the way from 18 to 21 cents a section. It is beautiful honey, of course. Now, of course, the middle men, on an average, get the biggest profit. Sell to a commission

house—I haven't done it—but I hear from others that they don't get very good returns.

Dr. Miller—I believe in England that a stock company plan was tried. It didn't work first-rate. Perhaps the "locality" wasn't suited for it! It is possible, I think, in one of the West India Islands doing something of that kind, and, perhaps, making a better success of it.

Pres. York—I think those in the honey-business in Chicago are willing to go into it. You can get rid of York all right, if you want to.

Mr. Niver—I can say on that point, that the Honey Exchange would sell its honey to Mr. York. He would be the second man, not the first, and we would want to sell our honey to him. He has a method of working, and he has got to be paid for his work. He is practically a retailer—he is selling in smaller quantities than the Exchange would care to sell, and he won't be a competitor, but a customer, so that we would all get the same price for our honey. Here is the reply to that: You can't do it. There are four sections of honey. If honey was all alike, like pig-iron, you could get the same price, and there is the greatest difficulty. If we can teach the bee-keepers to get all fine honey, and make the bees and honey-flow to come at the same time, and get all one kind of honey—Mr. Baldrige said was it white or was it dark, he didn't care whether half filled or bulged out, if it was white. That's the only point he cared anything about. That's the only point Western people see or know. It isn't so in the East, but if we can get our supplies so we can produce honey practically alike in shape, then we can commence to talk about color. There is the greatest difficulty. We can't all of us get honey in shape as fine as some others, because we haven't the locality to do it in—the flowers that produce the same quality of honey—and then we are not all of us just as good as some others. There is Mr. Crane's honey, just flush with the edge of the section. This section here comes always bulged to the edge. Unless these sections are handled very carefully they will be broken, and there is going to be our greatest difficulty in our Exchange. If we have a Central Exchange, and everybody that belongs to it ships their honey there, one man with a fine lot of honey will put it through and he will get a cent or two a pound more than his neighbor in the same Exchange. He won't like that. What can we do about that? This honey is worth that much more because it is in that much finer shape. I think that is the thing that we are going to stumble on more than any other one thing.

Mr. Clarke—I think we could obviate that by the mark of the bee-keeper on the case, even though not on the boxes, and I think the Association would, of course, naturally have a better demand for those bee-keepers' honey who did attend to their business, case their honey properly, put it up uniformly, and I think that would obviate that one trouble. The man who is shipping in his honey in an improper way, both in casing and mixing, naturally his honey would stay on the market longer, and it would naturally cause a demand for the best honey, and the Association and buyers would prefer his honey to that of the man who didn't attend to his business.

(Continued next week.)

### Forced or Artificial Swarming.

BY C. DAVENPORT.

NOTICE that of late there is considerable interest in shook, brushed, or what is in my opinion, more properly speaking, artificial swarming. I think it was 8 or 9 years ago that I stated in this journal how I practiced artificial swarming by removing all the brood; and that this was the only method that would stop natural swarming, if the swarming fever had been contracted; or in other words, if a colony had started queen-cells with the intention of swarming. In such cases I found that if a single comb of brood was left, that they would often swarm just as soon as they could construct or start new cells.

I had practiced artificial swarming for some years before mentioning the matter in print, and, each year since, I have artificially "swarmed" from one to two hundred colo-

nies. I state this simply that it will be known that I have had a good deal of experience in the matter, and this method, that I have practiced so many years, is practical and identically the same so far as results are concerned as the brushed or shook method that is attracting attention of late. For, of course, it can make no difference, so far as results are concerned, whether the bees are shook, brushed or jarred off the combs. There are, however, a good many things about this method, and perhaps I should say about any method, of artificial swarming that do make a very big difference in results so far as the crop is concerned, and if there is anything about our pursuit that requires skill and judgment, as well as a thorough understanding of one's locality in respect to the time and length of its honey-flow, it is artificial swarming practiced in such a way that as good a crop will be secured as would be had if natural swarming were allowed.

One that practices artificial swarming should thoroughly understand queen-rearing, for, with artificial swarming artificial queen-rearing must be practiced; and unless good queens are reared, the apiary will very soon degenerate. I know that as many have described the method in print the whole matter of artificial swarming is so simple that it may be successfully practiced by a novice. But one who has had a large, actual and long-extended experience in the matter can see by reading between the lines of much that has been written on this subject, that the writers have had but limited experience in the matter. In saying this I do not wish to be understood as questioning the veracity of any one who has written about this. What I mean is, that they might practice the same method the next season with entirely different results.

I am also aware of the fact that many who have had a large experience in the matter have given us much that is of great value on the subject. I would like, though, to call attention to the very important fact that in this matter of artificial swarming, locality is one of, if not the most important, things to be considered. For instance, one prominent writer, some time ago, in one of our journals (I do not remember which) advocated giving the artificial swarms full sets of drawn combs instead of empty frames. Now, let me briefly describe how that works in my locality:

The first surplus flow here is from white clover. This usually commences to yield about the first of June, but, of course, more or less according to the season. Very few colonies swarm naturally or are strong enough to swarm artificially until the flow from clover commences. Now, from a great deal of experience in this matter, I know that if a swarm, either natural or artificial, is hived on a full set of drawn combs, that from 25 to 40 pounds of this white clover honey will be stored in these same combs, when, if frames with only starters are used, most of it would be in sections.

Another thing, a swarm that is hived on drawn combs will often swarm again when these combs are full, instead of going to work in sections. But if empty frames are used, and they get started to work in the supers soon after being hived, they seldom attempt to swarm again.

When supers are placed over drawn comb it is perhaps needless for me to say that no work will be done in the sections until the comb below is filled with either honey or brood.

One thing I might say against drawn comb for swarms is, that here at least, a swarm, natural or artificial, is more apt to desert when hived on them than when empty frames are used. There is, though, one great disadvantage about using empty frames, and this is the matter of drone-comb. In this locality a good deal of drone-comb, that a swarm either natural or artificial, builds will be used to rear at least one generation of drones in, that same season; and a swarm that has an old or failing queen will build a good deal more drone-comb than one with a good queen, for this reason.

It is very important, when hiving on empty frames, to have strong, vigorous queens. I have found that here it doesn't pay artificially to swarm a colony until they make preparation to swarm naturally, no matter how strong they may be. But if they are to be swarmed artificially, the sooner it is done after they begin to construct cells the better. If they are not swarmed until they are about ready to swarm naturally, especially if they have one or more sealed cells, they are, after being swarmed, almost certain to swarm out or desert the hive the next day, even if a frame of brood is left them. On the other hand, if they are swarmed before they begin to start cells, it seems to discourage them, or at least they do not work with as much vigor as they would if swarmed later.

I notice that great stress is laid upon the matter of getting all the bees to fill themselves thoroughly with honey at the time the swarm is made. But this makes no difference whatever so far as their staying in the hives or the way they work. In fact, with me they seem less inclined to desert the hive the next day if they are not made to fill themselves thoroughly when swarmed. This deserting of the hives the next day is one of the greatest drawbacks to artificial swarming I have to contend with.

If I get time, and the Editor will allow me space, there is more about artificial swarming that I should like to say. Southern Minnesota.

[The Editor says he will be glad to allow Mr. Davenport all the space he will have time to fill.—EDITOR.]

## Organization Among California Honey-Producers.

BY HON. J. M. HAMBAUGH.

TO be sure, we are away out here to the extreme limit of Uncle Sam's domain, upon the far-away Sunny Slope of the great Pacific; where lofty mountains crested with snow pierce the azure dome, and valleys that are re-dolent with sense-beguiling roses and semi-tropical plants every day in the year; where the rugged, chaotic mountains defy Civilization's plow-share; where the coyotes howl and the wild eagles shriek in their somber and secure retreats. It is in these remote, isolated places that the wide-awake and intelligent bee-keepers have penetrated, and that against many and divers obstacles. They have secured nectar in quantity and quality that has attracted the eyes of the nations. The name of the California honey has gone abroad in the land, and her water-white sage honey has tickled the palate and adorned the tables of the potentates of the world.

Every Californian should be proud of the name and fame of her California honey, and while our sturdy pioneers have been busy studying modes and methods whereby they could secure quantities, and that put up in packages to meet the demands of the markets and the times, there has been another class of people eagerly putting into operation methods and influences whereby they might secure the product of these toilers at the very lowest possible figures, for speculation or gambling purposes. In this race it has not been a case of the bulls and the bears.

The honey-producers in their environments, with but little machinery at hand, and that very slow-going, have been at the mercy of the bears, and have simply been fleeced, often being compelled to take less for their honey than the most of their production. And the worst feature of the business has been the grinding tendency to the smaller producer—he is the most needy, has, by the nature of circumstances, been ground the closest, while the large producers—and especially those who produced honey in car-load lots—could secure better price. These and divers other causes, to say nothing of the "fad of the times," has naturally enough brought about the idea of co-operation. Quite a number of methods have been presented, but it seems that the work was being reserved for those princes of good fellows—Messrs. Geo. W. Brodbeck and George L. Emerson—to start the ball rolling among us in earnest.

A meeting of the bee-keepers for the purpose of organization was advertised for Jan. 19, at Escondido, with Messrs. Brodbeck and Emerson to be in attendance. Their plans and methods were clearly presented, which were in part as follows:

- 1st. "In union there is strength."
- 2d. By joining together, freight-rates, supplies, and other expenses, are reduced to a minimum.
- 3d. By marking and sealing our honey we guarantee its purity, thus preventing the possibility of adulteration. The guarantee of purity will increase the demand.
- 4th. The establishment of uniform prices and grades will prevent individual competition and the consequent depression in prices.
- 5th. The combination of the small producer with the large one gives strength to the former and removes him from the clutches of the speculator.
- 6th. The entire management will be in hands of bee-keepers, with no other interests involved, assuring equal benefits to all. Facilities for storage will be provided. All honey will be graded and sealed by an official grader.
- 7th. Members will be permitted to retail in less than

car-load lots. Advances will also be made on consignments if desired.

They also read the By-laws of the California National Honey-Producers' Association, giving a clear analysis of the work from start to finish. When an opportunity was given for the bee-keepers to take stock and seek shelter under its banners, there seemed to be an almost unanimous sentiment in their favor, and Pres. Brodbeck and Sec. Emerson left Escondido with every feeling of encouragement and belief that their work is a sure go.

The bee-keepers of Escondido have come up almost as one voice, and taken stock, and we want to see this example followed all over our State. It is time we were "getting into the band-wagon." If not, brother bee-keeper, you can depend on a continuation of past experience, and even worse. San Diego Co., Calif.

## Rearing Queens Over an Excluder.

BY HENRY ALLEY.

MR. DOOLITTLE, in his "No. 2," on page 295, continues to assert strongly that good queens are produced in colonies having a fertile queen. This, he says, can either be done over an excluder or by putting a division-board in the body of the hive, shutting the queen from the cells the bees are working on rearing queens. The success of this plan depends on several conditions. One condition is a good flow of honey when the bees have the swarming-fever; another condition is, when bees are about to supersede an old queen. Under the above conditions fairly good queens can be reared in a colony having a fertile queen.

Now, if one tries to rear queens in the above way after the honey harvest is over, or in the spring before the harvest commences, only inferior queens will be produced. As the honey harvest or flow is on but a few weeks some plan must be used to produce queens equally as good as are reared at the season of swarming. I assert, in the strongest terms, that neither Mr. Doolittle, nor any other bee-keeper in the world, can rear good queens in a colony that has a queen. I have tried this experiment the last 40 years in one hundred different ways. I had success only when the bees were gathering honey, or in cases where an old queen was about to be superseded. But in none of the cases I have tested could I get queens equal to those reared by bees just made queenless. Bees that have been queenless a long time will not rear good queens. Such bees come under the head of *old bees*.

One of my experiments was to cover a frame with excluder zinc, and place cell-cups within, so that the queen in the colony could not destroy them. The results was good queens so long as there was any honey in the fields. The results of rearing queens by queenless bees is so satisfactory at all times that I use the system in preference to any other. I can always get good queens in this way, but by the process of rearing them in a hive above an excluder, or in the brood-nest on one side of an excluder, the results are very unsatisfactory. Why, 'tis natural for bees to rear queens when they have no queens; but very unnatural to rear them, except at swarming time, when there is a queen in the hive. Let those who contemplate rearing queens the present season, try the queenless bee-plan, as well as above the excluder. I'll stake my reputation on the results. All who try it will report good queens.

Mr. Doolittle and I do not differ greatly on cell-cups. He thinks it is much easier to rear queens by making cell-cups and transferring larvae. I think it much easier, in my case, to have the bees make their own cell-cups—a thing they readily do.

Mr. Doolittle thinks, in fact he says, the queen cells made as I have them made, are "so fragile that the greatest care must be used in handling." 'Tis not so, Mr. Doolittle; you make a wrong statement. The cells built as I compel bees to construct them are heavily waxed, and can be handled roughly and thrown about the same as peanuts. Just the contrary to what you say, Mr. Doolittle, is a fact.

"Hundreds and thousands of bee-keepers have proven that bees behind or over an queen-excluding division-board are brought under the right conditions to rear perfect queens, etc." All I can say in reply is, that hundreds and thousands of bee-keepers do not understand the right conditions for the production of perfect queen-bees. By the way, I do not believe thousands, nor even *hundreds*, of bee-keepers have ever tested the plan in any way.

There is no man in the world who can rear three good queens out of one hundred above or behind a queen-excluder

device, except at swarming-time. 'Tis contrary to Nature, in every respect.

A hen when she is brooding, will "set" and bring forth a fine lot of chicks. Try the old hen when not brooding and see how many chicks you can get. She will "set" standing up, as the Irishman said his hen did. Bees are broody, and ready to rear queens when they have become queenless, or are about to swarm. You can't make them rear a decent queen under any other circumstances or conditions.

The virtue is not in cell-cups, it's not in old bees, nor is it in anything else but the desire for a queen. That's where the virtue lies. Then if the conditions are all right, you'll get some good queens. Yes, Mr. Doolittle, heat, food, plenty bees of the right age, are the essential things needed in the production of good queens.

Mr. Doolittle was not the inventor of rearing queens above an excluder, even though it is in "Scientific Queen-Rearing." Dr. Tinker and myself got there as soon as any one. But I do claim that I am the first person to condemn the entire system. I tested the system to my entire satisfaction, and when I found it was all wrong I discarded it, and advised the public not to use it.

I used it one year through swarming time and had fine success. I had an idea that I would keep it the success all through the season by extracting, feeding liberally, and keeping the top hive well stocked with brood from the queen below. But I failed. The first lot of queen-cells built after the honey-flow closed were as fine, large cells as I ever saw. I thought the top-story system the most wonderful thing ever devised. When those fine cells began to hatch, the queens that came from them were no larger than common working bees. I at once discovered that I had lost about one month's time right in the height of the busy queen-season. I had no queen I could send out for nearly a month. I had to change my whole system of rearing queens, and went back to the queenless-bees method.

Here is another point that will give color to my claim, as showing the difference between the methods of rearing queens: When I first began to rear queens in top stories above an excluder, I had an idea that as soon as the cells were capped a swarm would issue, just the same as in natural swarming. Well, why not swarm as they always do, if they have reared such perfect queens in such a natural way? The fact is, the bees had no interest or heart in rearing such queens. They were unnatural queens, and that is why no swarm issued.

On the other hand, when I have taken brood from below and placed it in the top hive at the time cell-cups were given the bees to complete, the bee occasionally would start cells on the brood given them, and just as soon as the natural cells were capped a swarm would issue. Bear in mind that the cell-cups given the bees were capped several days before the natural cells were completed.

When any one compares my method of queen-rearing with his own, I earnestly desire to be quoted correctly, and I will take the consequences. Don't tell the readers of any paper that queen-cells built as I have them built are fragile. This is only a sample of how I am misquoted and misrepresented. Sing your own praises as much as you like, but don't do it at my expense. That's decidedly wrong. I am continually compelled to reply to people who persist in misquoting me, merely to boost up their own pet theories.

In an article I sent to a bee-paper on rearing queens over an excluder, I was told by the editor that Mr. Doolittle reared no queens in that way. If he does not, why on earth does he advise other people to do it?

I am of the opinion that Mr. Doolittle rears very few queens above or behind an excluder. He well knows that queenless bees do a much better job.

Disprove the fact that I cannot rear better queens by queenless bees than any one can rear above an excluder while there is a queen in the colony.

In all books I have written on the subject of queen-rearing, I am quite sure I have, in all cases, stated that queenless bees rear the most perfect queens; and it is the most natural way to rear queens, except when a colony swarms.

Essex Co., Mass.

*Amerikanische Bienenzucht*, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Busy with Her Bees—Asking Questions.

I received your letter just as I was having a swarm of unruly bees. I got most of them off the tree into the hive, when the rest suddenly left and went home again. The ones that went into the hive are there yet, and seem to be contented with their new home.

I think "Our Bee-Keeping Sisters" department a great improvement to the Bee Journal, and I hope it will be encouraged more. I think we women-folks will feel more like telling our successes and troubles if we have a department of our own, and also help others along. I have often wanted to ask a question, but thought probably it wouldn't be worth answering. I think we can make this department very interesting and useful, if each one tries to do her best, and help. I will try to do my share. I will write later about myself and bees. I am quite busy with them just at present, as it is swarming-time. ETHEL M. BURDETTE.  
Hunterdon Co., N. J., May 21.

Please get over the foolish notion that your questions are not worth answering. Where would our department be if every one felt that way? If each one waited for some one else, no questions would be asked at all. The answer to a question that you may think "not worth answering" will likely be of service to a number of others besides yourself. A good motto is, "If you don't see what you want, ask for it."

### It Pays to Keep a Few Bees.

I have had my bees about six years, and will say, for the few colonies I keep, that it pays to keep bees. I have only 5 colonies now, as that is as many as I can care for and do my other work, although I have had from 12 to 15 at a time, and have sold them. I find the work pleasant and profitable, and shall always try to keep a few bees. All I know about bees I learned in the American Bee Journal, and I have lost but 2 colonies. MRS. R. TARBON.  
Ford Co., Kans., May 15.

### Transferring Bees from Box-Hives.

Last year I had 15 colonies of bees given me in box-hives. As I knew nothing of their ways, and as they had plenty of stores and bees, I let them all winter in the box-hives, while I tried to learn all I could in my "A B C of Bee-Culture" and the American Bee Journal; and last but by no means least, from any "live" bee-keepers I met.

My bees wintered very well. I have lost only one colony, but their hives are all shapes and sizes, and the comb like huge sponges, so that I can not handle them in any way. I, therefore, bought new hives—dovetailed, with Hoffman frames—put in full sheets of foundation, and proceeded to transfer on the Heddon short method.

It is full fruit-bloom, and the bees have 36 acres of orchard to themselves (80 trees to an acre), so I thought the time good. Last Thursday, with the help of a hired-man, I transferred one colony, and I know I got the queen in. We both saw her, and I put her in myself on a bit of alfalfa. The next day, when I went to look at the hive, the queen and nearly all the bees were gone; about 50 young bees were huddled miserably together at the bottom of the hive, and there were a lot of dead bees around the next stand. I then put the old hive back on the old stand, hoping some might return, but the bees left were too weak to protect themselves, and, alas! robbers got in instead. I was at my wits' end to know what to do with them, when, fortunately, my last Bee Journal came that day, and I took the advice given "Nebraska," and put the weak colony over a good, strong one, and they seem all right so far; for which accept my thanks.

Now, will you kindly tell me—

1. Why do you think the bees left the hive? Of course, I don't like to lose the bees, anyway, but I dislike more to

think that in some way my stupid human blundering cost a really whole, busy, happy colony their lives.

2. What am I to do with the others, for I must transfer somehow?

3. Do you think it would be successful on the same plan, if I waited until 21 days after swarming? The alfalfa will then be in bloom.

4. How many colonies of bees will 425 acres of alfalfa support? Here there is very little honey from wild flowers; just the fruit-bloom, and then alfalfa.

Delta Co., Colo., May 14. (MISS) REBECCA HALLEY.

ANSWERS.—1. Your method of transferring was really making a forced swarm, and swarms will not always stay where they are put, and it is sometimes difficult to say why. One of the most common reasons is heat, or lack of ventilation. Bees are dainty in their habits, and dislike a dirty hive, but that could not have been the trouble in your case, as the hive was new. Sometimes they will leave for no apparent cause whatever.

2. Do just as you did—give plenty of ventilation, and, if you can, give one frame of brood from some movable-frame hive. They are not likely to desert the brood.

3. The plan is an excellent one to let the bees swarm naturally instead of making a forced swarm. Then 21 days later drive out all the bees.

4. I don't know, and I don't know any way that you can find out.

### Drone-Brood—Laying Workers or Drone-Laying Queen.

I think the "Bee-Keeping Sisters' Department" a fine and instructive one, indeed.

1. I have a colony of bees about which I wish to ask your advice. The first I noticed wrong about them was that they were not working as hard as the others. When I examined them I found they were not very strong in bees. That was about April 23. They haven't very much sealed honey, or unsealed either, and I didn't see any brood except a few cells that are pouched out a pretty good size. Isn't that drone-brood? The other colonies are doing well, and will need the second super soon.

2. Is that colony queenless, or isn't the queen prolific, or what is the trouble?

3. If I get a new queen and introduce her, could I do it without removing the old queen, if there is one? or would the new queen be killed?

4. Can this colony, in the condition it is in, rear a new queen? The hive is an old one, but the frames are removable. I don't think the frames have ever been removed, and consequently they are badly stuck together. Maybe I would not know the queen if I saw her, although I have seen a queen-bee. ILLINOIS.

Peoria Co., Ill., May 23.

ANSWERS.—1. Yes, it is drone-brood, although in worker-cells.

2. Your colony either has a drone-laying queen or laying workers.

3. The old queen must be removed before introducing a new queen. If you get a new queen you will receive with her instructions how to proceed. If it is laying workers perhaps the best thing to do is to unite them with another colony, as it is always a difficult matter to get a colony with laying workers to accept a queen, and unless quite a colony it may be the best thing to unite in either case.

4. No, it is in a hopeless condition.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 1.50 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order. Send all orders to the Bee Journal office.

The Premiums offered this week are well worth working for. Look at them.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### BEEs STORING—STIMULATIVE FEEDING.

Here's battle again. Returning field-bee gives the nectar to first convenient hive-bee, because that's the business of one section of the hive-bees. Don't do any such thing; chuck it into the first empty cell, because it can do so quicker. If this is true the bee-hunter's bees ought (at least sometimes) to return almost immediately. The way that thing stands in my mind is that they almost allow four or five minutes for time spent at the tree. And quite likely those "because" had better be left off till the exact observed facts are agreed on. And the unnatural conditions of an observatory hive must not be allowed too much weight. Sometimes a returning bee finds it difficult to get rid of a load anywhere. Sometimes (I think) she finds the folks at home rather greedy to take what is brought in—three or four friends at once saying, "You know me!" When honey comes in rapidly field-bees should be plenty in the super, if the second of the above views is correct. Generally almost entirely absent from the super, I believe.

And, Arthur C. Miller, this department thinks you are too free with your nevers, if you say bees never give food unless it is almost taken by force. Pretty mess of things that would make in the winter cluster! And when you deny all show of respect by workers toward queens—well, you're in for a general flight of brickbats on that point, and so just at this time I will not throw many.

As to stimulative feeding, your conclusion, as the result of many and various experiments, that it is always done at a loss, is about what some of the rest of us have been concluding; but its friends are not going to surrender on call. Page 278.

### MAY CAUSE INSTEAD OF PREVENT SWARMING.

R. F. Hill's report is interesting where he says, queen and two frames of brood below, and the rest of the brood put above usually prevents swarming. I rather think that sometimes it would do just the opposite thing—put the swarming idea right into little noddles which had not entertained it yet. Page 279.

### WATERING BEES AT THEIR DOORSTEP.

I'll request Mrs. Sarah Griffith to report later on as to the extent she succeeded in getting bees to take the water she provided at their door. The little "snipes" are inclined to wade right through water at their door, and go off to the old familiar watering-place, "whether-or-no." Page 280.

### GREASE ON FINGERS MAY BE A GREATER ILL THAN PROPOLIS.

On page 283, A. Mottaz gives us a plump question: Why not carry some grease along and keep our fingers greased as a defense against propolis? Think I tried that so many years ago that I do not remember as clearly as I would like. The grease and the continual fuss of putting it on, and renewing it every time we hold to an absorbent surface for a minute, is quite a serious nuisance of itself. And if we do not entirely prevent the sticking it's taking on an additional nuisance partly to abolish an old one. And, let me see, doesn't the propolis and the grease sometimes work up together on the finger tips—work up into a sort of paint that prints the clothes wherever fingers thoughtlessly touch? If so, part of us will continue to bear the ill we have.

### DOUBTFUL ON RED-CLOVER STORING.

To Guy Hunsberger, page 284, I don't mind saying that blacks, hybrids and Italians all of them work on red clover at times. But as to any of them (or any particular strain of any of them) being ready to store very much red clover honey just yet—well, I'm nicely ready to receive a whole lot of convincing before I write it down so.

### WHITE CLOVER AND BUCKWHEAT IN VERMONT.

Interesting to see that in Bennington Co., Vermont, white clover has a steady reputation of yielding no honey. Bees at work lively on buckwheat, and still no significant amount of buckwheat honey in the hives—that's a common

experience here as well as there. But as to some of the Vermont counties, I think they would make a fuss if you accused them of having no white clover honey.

#### THE ALABAMA "HOG" VS. THE OHIO.

So the Alabama human hog is captain and chief among biped porcines—takes 99 cents of a "divvy" at once, and then proposes to run a foot-race for the other cent. As you say, I'm not pushing the claims of the Ohio hog. Let him stand down the column half way to the foot. Page 287.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Queens Lost in Danz. Hives.

I have trouble with the Danzenbaker hive. I have two colonies in Danz. hives. In one the queen died. They started queen-cells and hatched out, but could find no queen, so I gave them a frame of brood with eggs and young brood. They did not start a queen-cell from this, so I just took them and placed them over my other Danz. hive, thus doubling them up.

At that time hive No. 2 had a rattling good queen. Yesterday I found some brood in the lower chamber just coming out, but there were no eggs or young brood, and I could not find a queen. So queen No. 2 must be dead, as well as No. 1. However, they have a sealed queen-cell, which will be out in a day or so, and perhaps this double colony may yet do well. I have had much trouble with queens dying in the Danz. hive. I fear the frames are too shallow, and I have about come to the resolution to put no more colonies in Danz. hives. I have 5 Danz. hives, and I propose using them as extracting supers over a 10-frame Langstroth.

What do you think of my opinion, that the queens die because the frames are too shallow? Certainly the queen is kept much closer to the entrance of the hive, and so, nearer the cold air. At present I am sorry I bought the Danz. hives, though when I got them first I thought them first-class, but experience shows me that they are not a success, at least with me.

I lost queens from both Danz. hives last year. I lost a queen from an S-frame Langstroth hive. I also pinch many bees in closing up the frames of the Danz. hive, and may have pinched the queen in each case: but that seems improbable, though not impossible.

BRITISH COLUMBIA.

ANSWER.—I do not at all believe that the shallowness of the frames had anything to do with the death of the queens. If you will compare the Danz. with a hive having deeper frames, I think you will find that the queen lays just as near the entrance in the deep frame as in the shallow one. There is some chance that the queen might be killed between the close-fitting frames, but it is not probable that you would happen to kill two so close together in that way. It is possible, indeed probable, that when you put hive No. 1 over hive No. 2, there was a young queen in No. 1, even though you did not find her, and that caused the death of the laying queen in No. 2. Then, it would be nothing strange for the young queen to be lost on her wedding-trip.

### Bee-Paralysis—Cross Bees—Dividing Colonies.

Dr. Miller, I have picked all the meat out of the nuts you cracked for me last year. I want you to crack a few more. This time it is paralysis. In the early spring six of my colonies began to die. They would crawl all around the hive, some on their backs, some black and shiny. All had a trembling motion. All except two colonies were not close together, having three or more colonies between. I read in *Gleanings* that sulphur sprinkled all over the combs would cure it. I tried it, and this is what happened: In about three weeks, which was the beginning of a good honey-flow, they quit dying. Four of them began to breed up a little. The other two had good queens; they kept three or four combs full of eggs, but only one now and then seemed to hatch. The ones that did hatch looked none like a parent than a bee-larva. I removed both queens and gave them sealed cells from full-blooded Italians. They have a lot of nice sealed brood now. This is what I want to know:

1. Was it real paralysis?
2. Did the sulphur do any good?
3. Was it the sulphur, disease in the combs, or disease in the queens, that kept the eggs from hatching?
4. If those colonies are not cured, when will I be likely to see more signs of the disease?
5. In 1901 I bought two queens from the same company. One was tested and the other untested. Both were Carniolan. The untested one is a fine layer; her bees are very gentle, while the tested was a poor layer; her bees are very cross. All her daughters that I reared last year are the same. Why was it that way, or you suppose?
6. The tested queen and all her daughters except one, and this

one's daughter, have the paralysis. They were all that did have it. Is there anything strange in this?

7. Is this race of bees more subject to paralysis than any other?
8. Sometimes you tell beginners that have cross colonies to kill the queen. If they do this and the bees rear one from her eggs, won't she be cross, too?
9. If a gentle queen is mated with one of these cross broods, won't her bees be cross, too? I reared a queen from a full-blooded Holy Land queen last year. She mated where there were some cross bees. Her bees are about the meanest bees I ever saw.
10. On page 281 you told Ontario to divide his bees and put the old queen on the old stand. Would it not be best to put her on the new stand as most of the bees will go back to the old stand?

11. If I take a frame of brood from a colony that has pickled brood, and give it to a healthy colony, will they take the disease, too?

ALABAMA.

ANSWERS.—1. From your description, I judge it was.

2. I don't know. I doubt it.

3. I don't know. It may have been neither, I confess it is a puzzling case.

4. You may see signs of the disease any time, and you may not see any more of it.

5. I don't know just why, but it is nothing unusual to find different dispositions in the same apiary, just as among folks.

6. It is at least a striking fact, and it looks a little as if the queens were to blame.

7. Not that I know of.

8. I think when I have advised killing the queen that I have advised giving another queen of gentler stock. Yet a queen of the same stock would likely be an improvement, as she would meet a drone of a different stock.

9. Yes, the progeny of a drone of cross stock ought to have at least part of the disposition of said drone.

10. Just because the field-bees will all go back to the old stand it is best to have the old queen there, making that a successful colony for storing. They ought not to waste time rearing a queen.

11. Sometimes, and sometimes not.

### A Neighbor's Bees Robbing—Buying Bees.

1. My neighbor's bees are robbing mine. What can I do to stop them? They have almost destroyed my bees. If I can't buy them, what can I do to get rid of them?

2. I must buy a few colonies. Where can I get them best?

PENNSYLVANIA.

ANSWERS.—1. Any wide-awake bee will rob when it gets a chance, and if A's bees rob C's bees, it is not A but C who is at fault. C should not allow his colonies to be weak and unprotected. It will not stop the robbing if you buy the robbers, unless you brimstone them. Sometimes you can stop robbing by closing the entrance so only one bee can pass at a time, then piling up hay or grass about the hive and keeping it soaked with water. If a colony is queenless, it may help to give it a queen. This is one of the cases in which an ounce of prevention is better than a pound of cure, and it is well to keep all colonies strong, and if you happen to have a weak colony keep the entrance so small that the robbers cannot get started at robbing.

2. I don't know. It is expensive to get them from a distance on account of heavy express charges, and you will perhaps be able, by inquiring, to get them close at hand. Watch the advertisements, and you may see something not far away. You might also succeed by advertising your wants in this journal. If obliged to get bees from a distance, it will be less expensive to buy nuclei, and then build them up.

**Maple Sugar and the Sugar Bush**, by Prof. A. J. Cook; 44 pages; price, postpaid, 30 cents. This is by the same author as "The Bee-Keepers' Guide," and is most valuable to all who are interested in the product of our sugar-maples. No one who makes maple sugar or syrup should be without it. Order from the office of the American Bee Journal.

**Our Wood Binder (or Holder)** is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

FROM MANY FIELDS

Honey-Flow Coming Fast.

I now have 40 colonies of bees ready for supering. I have fed them all spring. The honey-flow is coming fast. G. C. DURR. Jasper Co., Iowa, May 29.

White Clover Abundant.

If the weather proves favorable we will get honey this year, as everything is just covered with white clover—such a crop never known in these parts. L. HONBARGER. Ogile Co., Ill., May 29.

Bad Spring for Bees.

This spring has been bad for bees. April was cool and wet, and we had a snow-storm here the 30th; and May has been but little better. So far it has rained nearly every day, or mostly evenings, so the bees had a chance to fly a little during the day, but we are behind about two weeks, compared with other seasons. I have five colonies of bees. I lost one last winter. I like the American Bee Journal. A. E. JOHNSTON. Martin Co., Minn., May 27.

Favorable Spring for Bees.

So far this has been an unusually favorable spring for the bees, owing, I think, mostly to the large quantity of bloom on the soft maple, together with some fine weather. A colony on scales gained 13 pounds in three days, the 1st, 2nd, and 3rd of May. On April 15th it (two stories) weighed 61 pounds, and on May 3, 85 pounds—a gain of 24 pounds in 19 days. On April 28 there was brood and eggs on 9 frames—6 above and 3 below. The queen of that colony was one I received last summer. I had over 30 colonies early in the spring, but have lost several, owing to the queens being missing.

A neighbor had a swarm on the 10th of May, the earliest I have known here, but some of mine would have swarmed earlier had I confined them to one story. This has been a rather late spring; apple-blossom is only just out. W. FISHER. British Columbia, Canada, May 13.

Bee-Keepers' Rights.

My bees have built up well considering the cold and wet spring we have had. But now we have had no rain since April 28, and we need it badly. We will have no white clover if it remains as dry as it is. I see that Mr. France thinks that we city bee-keepers ought to take care of ourselves. I do, too, so far as right is concerned, but when a neighbor strikes one of your bees and the bee stings him, then he is ready to settle an old grudge by going to the town council and putting in a complaint for damages. But he says nothing about spraying his fruit-trees and killing my bees. That is "a horse of a different color." Nor does he consider that his chickens destroy one's garden. But a swarm of bees is a nuisance to ignorant people. It is one of the best industries on this earth. I believe in protecting bee-keepers' rights. Some years ago I lost all of my bees through just such business. I stood the loss myself, yet I was a paid member of the National Bee-Keepers' Association at the time. F. McBRIDE. Hardin Co., Ohio, May 18.

A Good Honey-Flow.

The most of the bees in this part of the country came through the winter in very good shape. I lost only one colony by starvation. I had to feed a few colonies. We had one of the best honey-flows I ever saw. It lasted about five weeks. There was plenty of honey in the woods all the time. We also had one of the worst Aprils I ever saw. It

was cool and windy nearly the whole month. A good part of the time was cloudy, too. We had a good swarming prospect till after Easter when it turned cold and they did not swarm much. I have had only 4 swarms so far, as I know. It doesn't look like swarming-time at all. Even the Carniolans did not swarm much. We may have a very good flow in a few days, and maybe a few more swarms. Then we will have to wait and hope we will live till next April, and that it will be a good time.  
 Hale Co., Ala., May 4. J. S. PATTON.

**Bees in Best Condition.**

My bees are in the very best condition, most of them having two sets of combs. The prospect for a honey crop was never better. White clover is in full bloom, the earliest known here for years. H. C. CLYMER.  
 Linn Co., Iowa, May 28.

**Right Kind of Weather Needed.**

The prospect is good for lots of white clover and basswood, if we have the right kind of weather. Clover is just beginning to get out enough for bees to work on, but it has been raining most of the time, and I have to feed to keep the bees from starving and losing their brood. I now have 180 colonies, and 100 pounds of sugar is only about enough for their supper and breakfast.  
 G. W. WILSON.

Richland Co., Wis., May 29.

**Bees Doing Well.**

Bees are doing well in this part of the country. The fields are white with clover blossom, and the bees are working on it freely. I have had three swarms this week. The first one is starting in the super. I have the second super on some of my colonies. The honey-loctus yielded more nectar this year than I ever noticed before.  
 P. H. HARBECK.

LaSalle Co., Ill., May 28.

**Cool and Backward Spring.**

The cool, backward spring has been hard on bees in this locality. The hard freeze of April 29 cut short the supply of nectar from fruit-bloom, and I had to feed some, but at present all are doing nicely. White clover promises a good yield. G. M. WHITFORD.  
 Washington Co., Nebr., May 19.

**Bees Did Poorly this Spring.**

Bees are doing poorly this spring. There were only a few days during fruit-bloom when they could work, and most of the hives are entirely bare of stores; I have had to feed the bees to keep them from starving. For the last few days they have been working on white clover, and if we don't get too much rain (it is raining to-day again) the bees may build up yet to gather surplus when sweet clover blooms.

The American Bee Journal is the only paper of those I subscribe for that I read from beginning to end. I always find something new and interesting. ROBT. A. HOLEKAMP.  
 St. Louis Co., Mo., May 17.

**Unfinished Sections—Wintered Well.**

I have read with interest the pros and cons on different subjects and in regard to unfinished sections. I settled that question for myself some years ago. Every section that does not weigh 10 ounces I uncap and extract in the fall. I then tier up five or six layers of those extracted sections on some of my weakest colonies, and let them clean them out, and they do it all right. I then pile them away so the mice can not get at them in the winter.

When I put on sections I usually put the front row of those old sections, and they are the first filled, then I slip them out and put in 7 new ones. I have no trouble about getting the bees to go into the sections.  
 The 15th of last November I put 47 colonies

of bees into the cellar. I took out 45 alive, and sold two for \$10. Three became queenless and dwindled away. I now have 40 good colonies. They are getting some honey from fruit and dandelion bloom. We will soon have white clover. I usually get most of my honey from basswood. I find that the way to get honey is to have lots of bees when the harvest comes, keep them together as much as possible, and decapitate the drones with an uncapping knife. I think that helps to keep down the swarming-fever. I lived one swarm last year. The bees weighed 3 pounds. It came the last of June and stored 75 pounds in sections, and is strong this spring. I will report again after harvest.

WM. CLEARY.

Kossuth Co., Iowa, May 17.

**Working on White Clover.**

Bees are working on white clover, which is in full bloom—about two weeks earlier than usual. If there is not too much rain the honey crop will be much larger than last year. The American Bee Journal is a great help to me in caring for my bees.

GEORGEY A. HUNT.

Tipton Co., Ind., May 26.

**Bees in Fine Condition.**

My bees are in fine condition. I never saw bees so uniformly strong as mine are this spring. The weather here now is all that could be desired for an abundant harvest of nectar.

A. J. KILGORE.

Wood Co., Ohio, May 25.

**Working on Clover.**

Well, this spring was a hard one for the bees. Frost killed all of the maple, elm, boxelder and peach bloom, and impaired the apple, cherry, plum, gooseberry and pear bloom. I had to feed the bees to keep them alive. They are doing nicely now. They had a fine time on the raspberry and blackberry, and are now working on white clover, of which there is a profuse bloom. They commenced work on it over a week ago.

D. C. McLEOD.

Christian Co., Ill., May 28.

**Loss in Wintering—Various Matters.**

My bees were put into the cellar Dec. 3 in pretty fair shape, but the loss was heavy, owing to not having my cellar completed. Out of 39 colonies I have 15 left, but they are doing well now, storing honey from willow, dandelion and fruit-bloom.

Some of my colonies have five frames of brood, which is good for this part of the country at this time. The colonies which seem strongest are five that have been out since March 9.

I think a cleansing flight does a good deal of good. All the colonies that I gave a flight this spring were quiet when I put them back, while before they were restless.

I notice in the "A B C of Bee-Culture," page 92, dandelion is said to come in bloom just after fruit-bloom. Mr. Doolittle, in his comments, says that in his locality it comes just with fruit-bloom. In our part of the country it comes just before fruit-bloom, and it seems to me it must be of importance in early brood-rearing.

On page 92 (1903), in my report, the types made me say in regard to ginseng, "It will be marketable in from 7 to 10 weeks for the seed to germinate." It should have been, "It takes 18 months for the seed to germinate."

I like the looks of that money in the treasury of the National Bee-Keepers' Association, and I expect to be a member very soon.

It is only about 45 miles northeast of here where A. I. Root has started his maple-sugar plant, and feeds the "chicks" of the neighborhood on "maple-cream." I hope he will visit my apiary some day this summer, if possible.

I think every bee-keeper should have a bee-keeper of some kind. A bee-keeper who does not read the bee-papers is bound to get behind the times.

B. L. BYER.

Benzie Co., Mich., May 16.

**QUEENS!**

Golden and Leather-Colored Italian, warranted to give satisfaction—those are the kind reared by **QUIRIN-THI-QUEEN-BREEDER**. Our business was established in 1888. Our stock originated from the best and highest-priced long-tongued red clover breeders in the U.S. We rear as many, and perhaps more, queens than any other breeder in the North. Price of queens before July 1st: Large select, \$1; six for \$5; Tested Stock, \$1.50; six for \$8; Selected Tested, \$2 each; Breeders, \$4. Two-queen Nuclei (no queen) \$3.50 each. Special low price on frames in lots of 25 to 100.

All queens are mailed promptly, as we keep 300 to 500 on hand ready to mail.

We guarantee safe delivery to any State, Continental Island, or European Country. Our Circular will interest you if it's free.

**The Chicago-Northwestern.**

"In any business it is a good plan for the different men engaged in it to get together for the purpose of talking over items of special interest, in order to become better acquainted. This seems to be very true in the bee-business, and can be best carried out, I believe, in a convention where a question-box is the principal program. Each one feels as if he is helping the other, and certainly all feel that they are helped.

Such a convention was the one held at Chicago, in December. . . . I wish simply to say that those who have never attended a convention of this kind do not know what they have missed. There is something to be gained which is not found in bee-books or bee-literature of any kind. Go and find out, and regret only that you never went before.—Editorial in Gleanings in Bee-Culture.

**A Kink in Making Wax-Cakes.**

A lining of damp paper put inside a vessel into which melted wax is to be poured will prevent the wax from coming in contact with the vessel, hence there will be no dish to clean up afterwards. Strange as it may seem, the paper will also peel off readily from the cake of wax. Neither will the cake crack while cooling, as it is not stuck fast to the walls of the dish. Mr. H. R. Miller, of Missouri, wrote me about this.—Bee-Keepers' Review.

**Postponing Alsike Bloom.**

Generally it would be better to have alsike bloom later than its usual time, so as to come when white clover is waning. G. M. Doolittle says in Gleanings in Bee-Culture:

"Alsike clover can be made to bloom very nearly when wanted, within reasonable limits, by turning stock on it, and letting them keep it eaten down short until about two weeks before you wish the bloom to commence, when it will give a good crop of blossoms and a fair crop of hay, though the hay crop will not be quite as large as it would if it could have had its own way."

**Four Requisites to Successful Wintering.**

Given a box through which no drafts can pass (no upward or lateral ventilation), a plentiful supply of honey to burn, plenty of bees to burn it, plenty of oxygen to burn it with, and you have a formula which spells Success.—A. C. MILLER, in Bee-Keepers' Review.

**Best Conditions for Queen-Rearing.**

Arthur C. Miller discusses the matter in the American Bee-Keeper in his usual vigorous style, putting special emphasis upon the matter of humidity, to which probably most of us have never given a thought. It is well known that the right amount of moisture makes all the difference between success and failure in hatching out a clutch of eggs; why should it not make a difference with regard to bees' eggs? Mr. Miller says:

I believe it is generally conceded that the best queens are ordinarily reared at that season of the year when increase (swarming) usually occurs, and certainly they are more easily reared then. There must be a reason for this, and if we can find it, it will materially assist us in so shaping our methods when rearing queens "out of season" as most nearly to approach the normal conditions. At "swarming time" colonies are overwintering with bees; young bees (nurses) are superabundant; combs are loaded with stores of honey and pollen; field-bees are busy bring-

# SWEET CLOVER

### And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

ing in more, and temperature and humidity are high. These two latter items should receive special attention, and I cannot do better than to quote from Cowart's "Honey-Bee." On page 80 quoting Newport, he says: "Temperature of the brood-nest in the swarming season averages 96 degrees, while in August it is seldom over 80 degrees, or perhaps 85 degrees, even in the middle of the day when outer temperature is often more than 78 degrees." He then proceeds to give the scientific reasons for this. At swarming time the air of the hive is saturated with moisture, a matter almost never alluded to as a requisite for successful queen-rearing, whereas it is one of the essentials.

It is due to such causes as above that Dr. Gallup's "rousing colonies" produce fine queens, not to any supposed "umbilical cord," the latter being merely the last "cast" of the larva with its silken attachments.

## Quality of Catnip Honey.

Last year, for the first time, J. A. Crane had some catnip honey. He says in "Gleanings in Bee Culture":

It being a very wet season, the stuff grew quite rank, and farmers were too busy, when it did not rain, to cut it; consequently, the bees made a drive on it, wet or dry, rain or shine. Whenever there was a bunch of catnip it would be covered with bees from morning till night. Well, just before buckwheat came I extracted the crop, and—when! I have it yet. I don't want any more. I can't sell it, can't eat it, wouldn't give it away—going to make bees of it. If all catnip is like this, every pound of it sold at the market will spoil the sale of five pounds of good honey.

Editor Root adds:

I tasted the honey at Dr. Grandy's that had a slight flavor of catnip. It was not unpleasant. But a pure-catnip honey might be strong, and totally unfit for market. I think we have had other reports to that effect. In the same way, horhound honey—the pure article—is vile stuff. But a very little of it mixed with some other good grade of honey gives it a nice flavor that is not unlike the horhound candy of our childhood days.

## The Carniolan-Italian Cross.

L. H. Perry says in the American Bee-keeper:

I have crossed them for several years, and with me the cross is a better bee than either race in its purity. The most satisfactory results have been from the use of a Carniolan queen—the drone being Italian. In most cases this gives me a bee that sticks right to business in a honey-flow, and also a prolific queen. They are trying constantly to swarm, and are quite as gentle as either of the races from which the cross originates, and are beautiful bees, as well.

I have kept Carniolans for many years, and with the exception of their two bad traits—excessive swarming and excessive brood-rearing after the close of the honey-flow—I find them superior to the Italians in every way. The use of the Carniolan queen with Italian drone, has given me the bee best suited to myself, and I have no doubt the experience of my brother bee-keepers would be the same. The colonies which gave me the most honey this year were all bred in this way, and I am well pleased with their actions. Best of all, they did not offer to swarm, but kept right at work, storing honey. It is my firm belief that the more Carniolan blood one can get

# Italian Queens, by Mail. Golden and Honey Queens.

Untested.....	1	6	12	before July 1
Tested.....	1.50	3.00	6.00	9.00
Breeder.....	1.25	2.50	5.00	7.50
2-frame Nucleus (no queen) 2.00	11.00	21.00		

Add price of any Queen wanted with Nucleus. Our bees are shipped in light shipping-cases. Purchaser pays express on Nucleus. Safe arrival guaranteed of all stock sent out.

**BATAVIA, ILL., Aug. 2, 1901.**  
Dear Sir—I thought I would let you know as to results of the nucleus sent me. They were placed in 10-frame hives and now they are in fine condition. From one I removed 24 pounds of honey and had to give them more room, as they were hanging out. They have more than reached my expectations.  
Yours respectfully, E. K. MEREDITH.

**DAVENPORT, IOWA, Dec. 31, 1901.**  
Your queens are fully up to standard. The honey queen that you sent my brother takes the lead. She had a rousing colony when put up for winter. The goldens can be handled without smoke or veil. Very truly yours,  
JOHN THOMING.

Notice.—No tested stock sent out before May 15. Send money by P. O. Money Order or Express Order. **D. J. BLOCHER,**

# Business Queens

Bred from best Italian honey-gathering stock, and reared in FULL COLONIES by best known method, and guaranteed to be good queens and free from disease. Untested, 75c each; 6, \$4.00. Tested, \$1.25 each. Untested ready July 1st. Tested about July 15th. Address: **W. H. SHAN,**  
Central Square, Oswego Co., N. Y.

Please mention Bee Journal when writing

into them, without retaining the disposition for excessive late brooding, the better bee he will have. I have the "red clover" strains of Italians, but they do not work as well on red clover as my Carniolans do. Though I have never measured their tongues I believe they can reach farther than Italians.

It should not be understood that all crosses of this kind are as satisfactory as those mentioned above, for about 33 percent proved to be determined swarms.

**Weed Foundation Not Inferior.**

I regret that, in the report of the Ontario Bee-Keepers' Association convention, page 37, of the American Bee Journal, through some one's slip, a decidedly wrong impression is given of what was said by me about the Weed foundation. I distinctly said that I had not found other section foundation more acceptable to the bees. In fact, so far the contrary is my experience, and I hope no one will use that incorrect statement as evidence of the superiority of other makes.

The Weed foundation has, for brood or sections, the advantage over any other I have so far used, of staying better where it is at the beginning; less sagging, or none at all. It is sturdier; less weight per sheet in the brood will answer—a great saving.—R. F. HOLTER-MANN, in *Gleanings in Bee-Culture*.

**Close Saturdays at 1 p.m.**—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

**Good Buggies Cheap for 30 Days.**—For one month from the date of this issue the Kalamazoo Carriage and Harness Mfg. Co. 101 Ransome St., Kalamazoo, Mich., are offering a regular \$80 buggy for \$45, and extending the privilege to the purchaser of trying it for 30 days, and then returning it for any reason it is not satisfactory.

They do not limit the number of buggies to be sold at this price, but the time limit is inexorable, the \$45 price expiring in 30 days from this date.

The Kalamazoo concern is the pioneer in selling buggies direct to the people on 30 days free trial plan, and have made a wonderful success of this method because of its liberality and fairness and because of the high quality, low price and good value of their goods.

They are the largest manufacturers of buggies and harness in the world who sell their output direct to the users and save the middlemen's profits. Their buggy book, with all the favorites and all the newest patterns and styles of vehicles will be sent the reader on request. Please mention the American Bee Journal when writing.

**THE AMERICAN INSTITUTE OF PHRENOLOGY** Incorporated 1888, 19th Session opens Sept. 2d. **HONEY AND BEESWAX**

**MARKET QUOTATIONS**

CHICAGO, June 5.—The market is lifeless, no movement except extracted at low prices. Best grades of white extracted at 56¢@57¢; amber, 56¢@57c. Comb honey is held at 15c for choice white, and anything not grading up to meet this requirement sold at 20c less per pound. Beeswax, 32c. R. A. BURNETT & Co.

KANSAS CITY, May 28.—The supply of comb honey is about exhausted. The demand good. We quote as follows: Fancy white comb, 24 sections, per case, \$3 50; No. 1 white comb, 24 sections, \$3 40; No. 2, white and amber, per case, \$3.00@3.25. Extracted, white, per pound, 66¢@67c; amber, 57c. Beeswax, 26@30c. C. C. CLEMONS & Co.

ALBANY, N. Y., Mar. 14.—Honey demand quiet; receipts and stock light. Comb selling, light, 15c; mixed, 14¢@15c; dark, 13¢@14c. Extracted, dark, at 7@7½c. Beeswax firm, 30¢@32c. H. R. WRIGHT.

CINCINNATI, June 1.—Very little change in market from last report. We quote amber extracted grades at 56¢@57c in barrels; white clover, 50¢; for fancy equal demand comb honey, 15¢@16c for equity. Beeswax, 30c. THE FRED W. MUTH CO.

NEW YORK, May 21.—Comb honey trade exceptionally quiet, very little doing. Fancy stock not plentiful and is sold at 14c. A large supply of other grades on hand, which we are quoting at from 13¢@15c, according to quality, and in large lots make concessions from these prices. Extracted, unusually quiet, and prices show a downward tendency all along the line. Beeswax, firm at from 30@31c.

CINCINNATI, May 19.—The demand for comb honey is nearly over, but as the stock is almost exhausted, prices keep up. The demand for extracted grades has not changed whatever, and prices are as follows: Amber in barrels, 54¢@55c in cans, 66¢@67c; white clover, 50¢@51c. Beeswax, 26@30c. C. H. W. WEBER.

SAN FRANCISCO, Apr. 29.—White comb honey, 12¢@12½c; amber, 9¢@10c; dark, 7¢@7½c. Extracted, white, 6½¢@7c; light amber, 5½¢@6c; amber, 50¢@52c; dark, 40¢@45c. Beeswax, good to choice, light 27@28c; dark, 26@28c.

Last year's product has been tolerably well cleaned up, particularly the desirable stock. Present offerings are largely odds and ends, including little of fine quality. Values for the time being are little more than nominal. A lower range of prices is looked for on coming crop.

**WANTED WHITE CLOVER EXTRACTED HONEY!**

Send sample and best price delivered here; also FANCY COMB wanted in no-drip cases.

## A Few Cheap Smokers!

We find we have on hand a few slightly damaged Clark and Bingham Bee-Smokers, which got a little damp and soiled at the time of the fire in the building where we were about 2 years ago. They are all almost as good as new. We have some of the Clark Cold Blast, which when new sell now at 55 cents each; and some of the Little Wonder Bingham—new at 50 cents. But to close out those we have left that are slightly damaged, we will fill orders as long as they last at these prices:

Clark at 25 cents each; Little Wonder Bingham at 30 cents each.

We do not mail any of these slightly damaged Smokers, but will put them in with other goods when ordered, or sell them here at our office when called for—at the above prices.

The classic in Bee-Culture—Price, \$1.20, by mail.

**BEEWAX WANTED**  
at all times.

**DADANT & SON,**  
Hamilton, Hancock Co., Ill

# Swarming Season.

Save your prime swarms. They are worth many times the value of secondary swarms that issue during the middle or late summer. The **Planum Swarm Catcher**, as shown in the illustration, is the best for this purpose. The basket is of wire-cloth with lid, and hung so that it can not be upset while suspended in air. No climbing trees to cut off limbs, torn clothing, sprained wrists, etc. Shipping weight, 10 pounds. Price, \$1.10.

The **Ailey Queen and Drone-Trap** will cage your queens at swarming-time, when you have difficulty in locating them, or where you have occasion to be absent during swarming season. They are indispensable to the queen-breeder for caging drones to be taken to another yard, or for disposing of undesirable drones. Made in 12 and 14 inch

length. Price, by mail, 65 cents each; by freight or express, 50 cents each; ten, \$4.00.

A **Good Veil** is a necessity even with the most gentle bees. The apiarist can accomplish more work; there is no hesitancy on his part because of cross bees. Price, \$1.00, postpaid. We have others at 80, 50 and 40 cents, postpaid.

The clipping of queen's wings is another method for securing the prime swarms. For the purpose we have a small pair of scissors which we supply at 25 cents, postpaid. See *modus operandi* in May 15th Gleanings in Bee-Culture.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto button series that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

**Dr. Miller's New Book**

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

**HOW TO GET A COPY OF DR. MILLER'S  
"FORTY YEARS AMONG THE BEES."**

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

Please Mention the Bee Journal when writing Advertisers.....

**The Novelty Pocket-Knife.**

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal [with \$3.00]. We will club the Novelty Knife and the Bee Journal for one year, both for \$1.50.

**GEORGE W. YORK & CO.**

**Chicago, Ill.**

Please allow about two weeks for your knife order to be filled.

## Editorial Comments

**Writing Up Honey in the Local Papers** is strongly urged by Wm. M. Whitney. He says in *Gleanings in Bee-Culture*:

Now, it seems to me that the surest and best way to create a demand for honey, and thus enhance the price, would be to get the local press interested; *i. e.*, publish through the local papers instruction or information regarding the uses and benefits of honey as a food, a medicine, etc. It is surprising how little is known by the majority of people, even in the country, of the value of honey in numberless ways in a family. If we who are interested in this matter (and all bee-keepers ought to be) would thus place before the people in a judicious manner the ways in which honey may be used to great advantage, many families that have considered it a luxury in which they could not indulge might be induced to try it.

For instance, here is a family fond of warm biscuit and honey, or pancakes and honey, but think they can not afford it, but would adopt it if they were told that a syrup of granulated sugar, costing about 3 cents per pound, mixed with good, thick, extracted honey, costing in bulk, say 12 cents per pound, made a very fine syrup for the purpose, with all the flavor of honey, and making the average cost only about 7 cents per pound. How much better this would be for the consumer than to buy the stuff put on the market by the trade generally, with nobody responsible for its manufacture, and composed principally of glucose or something worse! When mixed at home we know what we are using.

The above is simply an illustration of what might be done were we to turn our attention in the direction of the local papers. We may talk till doomsday through the bee-journals, that nobody sees but the bee-keepers (and but few of them, I'm sorry to say), and it will never create a demand for honey one iota. What would we think of the business sense of a manufacturing establishment that exploited its goods and wares through the medium of a publication that fell into the hands of its competitors only? That is substantially what bee-keepers are doing in their efforts to market their honey. They talk in the bee-journals; they talk in conventions, where there is no one to hear but themselves. Why, it almost seems like lying awake at night to talk to one's self.

Mr. Whitney, in the above, gives some very good suggestions about creating a larger demand for honey. We hardly favor, however, the idea of suggesting to consumers that they could mix granulated sugar syrup with honey. We do not see the necessity of it. Why not eat the pure honey alone, instead of adulterating it with sugar? Certainly, extracted honey is cheap enough now without mixing it with a cheaper article in order to dispose of more honey. We think that greater headway will be secured by urging people to use more honey alone. They will do this as they become better acquainted with its value as an article of food. If bee-keepers were producing sugar also in connection with keeping bees, it might do for them to urge the use of sugar. We really think that it is better for bee-keepers simply to urge a wider consumption of honey, and if people wish to use sugar let them do so without any suggestion on the part of bee-keepers.

Mr. Whitney certainly is correct in saying that it is poor policy for bee-keepers to try to increase the consumption of honey by writing about it in the bee-papers. But that is all right so far as it goes, as it helps the producers, in that it educates them on the use of honey, when they can in turn pass the information on to their neighbors and friends. Perhaps a good way would be to pay the publishers of local newspapers for a certain amount of space, and then use it in calling the attention of people generally to the value of honey as a food. It

can hardly be expected that the local newspapers are going to use a lot of their space for the benefit of bee-keepers who have honey for sale. It is not just to ask them to use their valuable space in that way, without offering to pay them something for it.

We have thought for some time that the National Association could not better invest a few dollars than in advertising in the leading daily papers of this country. Something like the National Biscuit Co. does with their *Unceda Biscuit* and other bakery goods that they turn out. It might be well for the bee-keepers to create an advertising fund, letting each one contribute something toward it, as such advertising would be for the benefit of all who produce honey. A National honey exchange could do something of this kind very profitably, we think, as it would create a demand for their honey, especially if they sold it under a certain brand or label.

Honey will not sell itself, any more than anything else. Everything these days has to be pushed, and pushed vigorously, in order to receive the attention of the masses. Witness the advertising of the various breakfast foods. One can scarcely pick up a newspaper or magazine of any kind that does not contain a number of breakfast-food advertisements. The persistency with which the manufacturers of these brands of food continue their advertising, shows that it must pay to do so. Nearly everybody eats some kind of breakfast food. Nearly everybody should also eat honey, and we believe they will do so if they ever have an opportunity to learn as much about honey as they now know about breakfast foods.

Honey has never been brought to the attention of the consuming public in a manner to recommend it for general use. Perhaps one reason is that it can not be produced in unlimited quantities, as can be done with breakfast goods and other food preparations that are manufactured. When the honey of the country is all cleaned up, there will not be any more until the next season, and when the crop is short the end is soon reached. A National honey exchange, with ample funds, could buy up a large quantity of honey and store it, so that it likely would be able to supply all its demands from year to year. And yet, we have always contended that there is not enough honey produced in the whole country to supply the demand that would arise if everybody was as familiar as they should be with honey as a daily table article.

We think this is a subject worthy the best thought of honey-producers everywhere. With the proper demand among the people for pure honey, we believe that the price would be much higher for all grades. Most people like to eat good things, and if they can be assured of purity at all times, they are willing to pay a good price.

**A Plan for Rearing Queens and Starting Nuclei.**—Nuclei may be started in different ways. A plan of getting nuclei started that is easy of accomplishment for the beginner, at the same time resulting in a laying young queen in each nucleus, is as follows:

Take from a strong colony of choice stock its queen and two frames of brood with adhering bees, putting them in another hive on a new stand. In place of the removed frames two empty combs may be given. The hive in which the queen has been put may also be filled up with empty combs, or with frames filled with foundation.

Nine days later take the old colony from its stand, and put in its place the hive with the queen. The field-bees, when they return from foraging, will join the latter, and it will soon be a good colony.

The contents of the old hive may now be divided up into nuclei. The bees being queenless, they will stay wherever put much better than will bees taken directly from a colony with a laying queen. Two

frames of brood with adhering bees will do 'for each nucleus, and it will be well to add a frame of honey to each. One of the nuclei should be placed on the stand which the queen occupied for nine days, and this need hardly be so strong as the others, for it will have the advantage of the field-bees that had been with the old queen.

The result may be unsatisfactory if no attention is paid to the position of the queen-cells. They will be mostly found on the edges of the combs, where they may be easily chilled in the nuclei. Cut out those that are not centrally located, and see that each nucleus has two or more cells fastened upon the combs where they will be sure to be kept warm.

Not all the cells will be good; for the bees have a habit of starting the last cells after the brood has become too cold; but if they have two or more to choose from they will choose the best.

**To Fasten Queen-Cells on Combs.**—One way is to cut a hole in the comb and fit the cell into it. Another way is to use a heavy pin or a light  $1\frac{1}{2}$ -inch wire-nail, thrusting the pin or nail through the bit of comb at the base of the cell, and nailing the cell to the comb. Perhaps a still better way is to use a staple such as is now used in fastening bottom-boards to hives ( $1\frac{1}{2}$  inches wide with legs  $\frac{3}{4}$  inch long), pressing one end into the comb and letting the other compass the cell. Of course, care must be taken that the cell is not crushed, and that its cavity is not thrust into.

## Association Notes

**COLLECTING HONEY-DEBTS.**—A member of the National Beekeepers' Association could not collect a long-standing honey-debt. At the request of the General Manager, he wrote and requested the person owing to settle, or it would be placed in the hands of the General Manager for collection. The money came at once. This is one of the ways in which the Association helps its members. Who would not join such an organization, when \$1.00 as membership dues will bring so much in return!

**ANOTHER THREATENED LAWSUIT PREVENTED.**—The following letter was sent by General Manager France:

MR. LEON KELLOGG, Village Clerk, Sparta, Mich.—

*Dear Sir:*—I received your letter April 28, stating the village of Sparta, Mich. had passed an ordinance relative to the keeping of bees in Sparta, etc. Soon after, I sent the President of the National Beekeepers' Association to investigate the case, which he did, and reported there was something back of the bees, etc. That at that time compromise would not satisfy those in authority, and that we should be prepared to defend our member if necessary. Whereupon we secured the best legal assistance. We have over \$1000 in our treasury, and with over 1200 members ready to furnish their dollars if necessary, we are prepared to defend a legal business in your village.

To-day I got a short letter, stating said village, after carefully investigating the case, has concluded to drop it. No city or village in America has in force any such ordinance.

In behalf of the National Beekeepers' Association, I want to thank the village officers of Sparta, Mich., for their consideration of this matter, and decision of indefinite postponement of the ordinance, declaring a nuisance and ordering removed from their jurisdiction an honorable and legal occupation.

All is well that ends well. I hope that harmony and good-will may prevail in your village evermore.

Yours truly,

N. E. FRANCE,

General Manager of National Beekeepers' Association.  
Platteville, Wis., May 23, 1903.

**THE SANTA FE ROUTE TO LOS ANGELES** is the one over which likely most of the bee-keepers will go who live east of Chicago. Of course, all who live along this route will also go by that road. In the advertisement of the Santa Fe in this issue are described two trips, one of which provides for a stop-over at the Grand Canyon in Colorado, while the other goes right through to Los Angeles without any extra stop-overs. Some of us have about decided to take the trip that has a stop-over at the Grand Canyon, and rest there over Sunday, arriving there Saturday evening and leaving Monday morning. It is a long journey from the East, or even from Chicago, to Los Angeles, so that a day's rest, especially on Sunday, would doubtless be much appreciated. By leaving Chicago Wednesday evening, at 10 o'clock,

we can stop at the Grand Canyon and still arrive in Los Angeles a full half day ahead of the first session of the convention, which meets on Tuesday evening, August 18. If we can get together a company of 15 to start from Chicago at the same time, we can have a tourist car to ourselves, which will not only take us to the Grand Canyon, but after visiting that wonderful place we can continue the journey in the same car. This, it seems to us, would be very desirable. We will be glad to make all necessary arrangements here in Chicago for any who wish to join the company starting from here on Wednesday evening, August 12.

Those who are unable to spend quite as much time on the way can leave Chicago on Friday evening and still get to the convention on time on Tuesday. But as this trip to Los Angeles may be the one of a life time, it seems to us that we all can arrange to spend two days more, and leave Chicago on Wednesday evening, August 12.

We will be glad to announce in the Bee Journal the names of all who expect to go to the convention, if they will let us know. It is just two months until the great meeting will be held in Los Angeles. This will be ample time for all who can go, to make every necessary arrangement for the trip.

## Miscellaneous Items

HOMER H. HYDE, of Wilson Co., Tex., is to be married to-day (June 18). The name of the young lady is Lizzie E. Adams. We wish them not only lots of "chunk-honey," but also big "chunks" of happiness all the way through life.

W. Z. HUTCHINSON has contributed to the June issue of "Country Life in America," an illustrated article on bee-keeping for pleasure and profit. This magazine is perhaps the most elegantly illustrated of any publication devoted to rural life issued in this or any other country. It is beautiful all the way through. It is a monthly publication, and contains about 50 pages  $10\frac{1}{2} \times 14\frac{1}{4}$  inches in size. Doubleday, Page & Co., of New York, N. Y., are its publishers. Twenty-five cents will secure a copy of the June issue referred to.

**THE BEE-KEEPERS' LAW** for Illinois does not go into effect until July 1. Those who have the matter in charge are casting about for a suitable bee-keeper for inspector of apiaries. As soon as he is selected and appointed we will announce it. As all know who have read the law, which we published on page 308, the Illinois State Beekeepers' Association is expected to do all the correspondence and be to the trouble of settling all the bills, etc., and yet gets nothing for it. It seems to us that the bee-keepers of this State can not help in any way more than to become members of the State Association. Illinois should have the largest State Beekeepers' Association of all. We believe now that it is about the smallest of any of the States that have beekeepers' associations at all. Why not send your dues of \$1.00 at once to the Secretary, Jas. A. Stone, Route 4, Springfield, Ill.?

MR. LOUIS H. SCHOLL succeeds Mr. Wilmon Newell as Assistant State Entomologist, and in charge of the Experimental Apiary at the A. & M. College, at College Station, Tex., who resigned to accept the position of Assistant State Entomologist of Georgia. Mr. Newell is well known to Texas bee-keepers for the good work he has done in establishing the apiary at the A. & M. College, and advancing the industry of bee-keeping throughout the State, to which industry his departure will be a distinct loss. Mr. Newell will have charge of orchard and nursery inspection work in Georgia, for which his previous experience in Ohio and Iowa well fits him, and he leaves the college with the best wishes of his many friends in Texas. We are glad to know that his position has been so well filled by the appointment of Mr. Louis H. Scholl, of Comal Co., Tex., Secretary of the Texas State Beekeepers' Association. He is a native of Comal County, and is known throughout Texas and nationally as an expert bee-keeper. Mr. Scholl will devote his time entirely to the experimental apiary, and building up bee-culture in Texas. We wish him every success in his new position.

## Convention Proceedings

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 374.)

Pres. York—For the benefit of those who just came in, I would say that we are discussing "Commercial Organization Among Bee-Keepers."

Mr. Moore—I think a whole lot of this material that we are going over, perhaps laboriously, is useless. Don't take what I say to heart. All these things will settle themselves. In case any disputes arise you can agree to have an arbitration. The thing to do is to get the 700,000 bee-keepers in the United States to know that they want anything. We have a thousand in the National, pretty near, and as I read over what Dr. Mason said, I find that even the Greater New York had only 150 at the outside, and this number inside and outside is more than in any other association in this country. Out of the total number there are only 2000 of them who know or realize that they need anything on that subject. It is the capital and the interest that you need. Any of these little details can be settled, or will settle themselves.

Dr. Miller—Mr. President, it isn't nice of Mr. Moore to get up and say what I was going to say. I was going to say pretty nearly the same thing. Mr. Hutchinson has been wasting time here, and I almost felt that he was wasting time in talking about the necessity of organization, and when he stopped you started to talk about the little things that would be met with to settle after you had become organized. How are you going to be organized? That is the important thing to talk about.

Mr. France—The great difficulty, so far as I see, as Mr. Moore remarked, is to get the bee-keepers interested, to feel that it is a financial benefit to them, that they can not afford to stay outside of it. The bee-keepers in Wisconsin felt that they must belong to the State and to the National Association. We were the first to join the National in a body, and its influence is wide-spread now. But as to how to go at this is the question. I am at a loss to know how we are going to get them interested; to feel they are going to get something for the investment. We know that by organization much and great good can be done, but we can not with our membership now in the National Association—why, we are in our infancy.

Mr. Abbott—I like to agree with everybody if I can, but if I should tell all I think about this idea of a great honey-trust, or whatever you are a mind to call it, I doubt if very many of you would agree with me. I fully realize that Mr. Moore has touched the central thought, that the main thing, the essential thing, is to get the bee-keepers of the country to understand that they need something of that kind—to get them to have that kind of feeling.

Now, most of us look at bee-keeping as a professional pursuit, as an industry, a few of us, I would better say, as an industry for men to devote their life work to. I never have believed that bee-keeping would be a success in the United States in that way. My ideas are not along that line. I am a believer in bee-keeping as an adjunct to a farm, and I think we should keep that in view, so that I would have a little different idea, of course, of organization, because I would look at it from that standpoint. I would have to go back and discuss the question of whether it was a good idea to have a middle man or not. I think it is. I think the middle man is a good man. I think the Almighty made the middle man. I don't think modern society or modern business methods made him. He grew out of a natural condition of things, having an adaptation, when God made him, to do certain things. Some people have adaptability to produce nice goods; other people have adaptability to sell goods, and the production and selling of goods are two widely different things. The fact that

"York's Honey" is every place, and that it is "York's Honey," is helpful to the bee-keepers who produce honey all over this country. If there was a Mr. York in every village of a thousand inhabitants all over the United States there wouldn't be any discussion as to the sale of honey. There isn't honey enough in the United States to-day to supply the demand, and there hasn't been enough to supply the demand in five years, much less the demand that can possibly be created. There isn't honey enough to be had in St. Joseph to eat the amount of honey they do, to supply the demand for two months. Now, there ought not to be any great question of disposing of the honey in that locality, but last week there came to me a shipment of honey, and more than half of it was mashed, the sections were broken and were in a dilapidated condition. I went down to the wholesale house the day before I went away, and I was told that they had a shipment of honey in there that was all mashed. I said, "You can sell it to me for 10 cents a pound, or else find some bigger fool and get 8 cents." He said, "I would rather sell it to you for 10 cents a pound." He didn't know what to do with it. I did. And I was glad to have it. Another shipment of honey came in from Washington, Kans., and every section was in nice shape. It was cased properly, and put into the cars properly, and looked after when it went out of the cars properly, because I looked after that myself, and of course that was done properly, and it got into my place of business in proper condition. I am holding it there for future use. I didn't have to bother any about that shipment of honey, it will take care of itself, but the letter that came from that man had something in it. He said he had learned how to handle his honey so he could sell for cash any place, and he wasn't dependent on any commission man or on anybody else for his honey. He wrote that to me after he had his check. I thought then he didn't require any special help to sell his goods, he seemed to think he had solved the problem for himself. He thought if he couldn't sell to me there would be another man he could sell to. There was York in Chicago. He could fire it up to York if he saw how nice it came in.

Pres. York—And you would probably never get any more of it!

Mr. Abbott—That's the reason I didn't tell the man's name, because York would probably try to get his honey next year! There are, of course, large honey-producers where it becomes a serious problem as to what they shall do with their honey. That's a business proposition, and it would take a business head to answer it. I am not built that way. I have too much vim or enthusiasm. I manage to get enough to live on, and when I get that I don't care about business anyway.

To be serious, I do believe that the secret of the sale of honey in the United States to-day is to teach the bee-keepers how to put up honey, and how to make it salable on the markets of the world. Why, they hire men to go from New York city, scour the country all through Colorado and Utah, all through that Western country, and pick up car-loads of honey, and they are anxious for it. Pay their expenses out there to get it. It ought not to be much of a question, or problem, as to where honey may be sold when men do that. If the majority of honey out there is in such condition that it can be packed in cars, and it is only the question of the honey being in proper shape, it seems to me that there is already a larger market for honey than can be supplied. Why are we saying so much about selling our honey? Is it so hard, after all, to sell it as it would seem to indicate by what we are saying about this organization? Is honey a kind of a drug on the market?

I have been looking all over the country trying to get honey in good condition, and to tell you the truth, that one shipment of honey is all I could get during the entire season that I could get and feel that it would be all right when it got there and meet the demands of that market. Now, there are so many people that have honey and don't know how to put it up, but there doesn't seem to be much honey in the market in the country. There hasn't been for years. That has been my experience. I may be wrong about it.

After all, is there so much trouble in the sale of honey? I am just asking a question. I don't pay so much attention to the financial side of it. I go out into the market to buy honey for my own little trade—a very small trade—and I find hard work to get good honey to supply that demand.

How will we organize? Now, I will tell you how I do business. I had to move not long ago, and the way I moved was this: I got my men, and I said, "I want you to get these goods to my place just as fast as you can." And when they didn't hustle fast enough I said this man go here, this

that way, and the stenographer must pack that, and the goods were all up there in a very few days. Now, that's the only way I know how to do anything. Just to have some fellow to go to it, and do it.

Mr. Moore—There is a word in Mr. Abbott's remarks that strikes me. It reminds me of Mrs. Moore. I said to Mrs. Moore, "Dear, I know how you make up your mind. You find out which side of the question I am on, and then you are against me." Now, Mr. Abbott speaks of the farmer bee-keeper. I think he will admit, and you all will, that this is a day of specialties, and that it is the farmer bee-keeper that produces the honey in this country. I have sold honey about 16 years, and no matter about the producing of it, the selling of the honey has to be a specialty in this day and age.

In the last year I spent a great deal of time calling on retail grocery stores. If the honey was distributed equally according to the demand of the people, without any education, there would not be half enough to go around; but at present honey has been a drug. It is two cents in Cuba, and 10 to 12 cents a pound in our country. There is never enough fine, white, comb honey in one-pound sections produced in this country. It always brings a larger price. Our bee-keepers are producing liquid honey, and how to get that into the hands of the people is the burning question to-day. Mr. Abbott is speaking of the comb-honey question. There will never be enough of it. The bee-keepers are producing two or three pounds of liquid to one of comb, they can do it, and they are going to continue to do it. You witness this condition. Of course, you know where the great honey-producers are, and a fancy article of white clover and basswood honey can be bought, and the consumer is paying 20 to 30 cents a pound retail. There is no controversy about that. We don't object to the middle man. What we do object to is three middle men—the commission man, the wholesale grocer, and the retail grocer—three middle men coming in between the producer and the consumer. I witnessed this myself in my travels over Indiana. Local bee-keepers were getting last year's price for comb honey. They were getting 12, and 12½, 13 and 14 cents a pound. At the same time in Toledo they were selling it for 20 cents a pound in one-pound sections.

Dr. Miller—I found one grocer selling it for 23 cents by the piece.

Mr. Moore—I examined that, and half was second-grade and half was under grade. I have given a great deal of thought to this subject. I have thought so much about it that I don't know about it at all. I don't know what is best. If we could get these 700,000 people to interest themselves, their minds and their money, it would be decided right. We haven't, with our best efforts, been able to do so. My thought is this, and I give it to you for what it is worth. Those who are intensely interested—the Roots, York, Weber—us will form a stock company. We will have the authorized capital \$50,000. We will incorporate under the laws of Illinois or New Jersey, whichever our lawyer says is best. We will establish at Chicago a headquarters. We will start that way and try it. We will do all the things that are necessary for success. Get the honey from the producer and pay him as much as you can, and make the expenses as little as you can, get as much as you can for the product, and make a success of it commercially. Suppose the first branch is in Chicago. You would have to have a reliable store. You would have to have some one competent. You would have to have a telephone, and say that every one of the 10,000 grocers can telephone in. "We want some honey." Have to have your wagons distribute it. Have to have an exhibit of live bees to show them that we weren't common, every-day Chicago sharpers shipping in honey; and you would have to locate somewhat centrally from Twelfth street. You would have the place jammed with people all the time.

This company should have a title that would stand to the people for its purity. A title that occurred to me was, "The Honey Company of the National Bee-Keepers' Association." Is that too long? The printer stamps it with one impression. The Honey Company of the National Bee-Keepers' Association, if you please, and actual bee-keepers. And, as far as limiting the amount of stock, you can't do that. You can limit a man only to the extent of his pocket-book.

Mr. Abbott—I knew I could make Mr. Moore make a speech. There was something I wanted to say, and it is this: The question of the sale of honey all hinges around the infernal adulteration that's going on in this land openly. That's the greatest monster that the bee-keeper has to tackle. If we can only wipe out the monster of glu-

cose honey. I believe in that advertising scheme. Now, you have struck my idea. One such store would do much more to advertise and sell honey than anything I have ever heard mentioned. That is a splendid scheme, and splendid idea. That has been my idea all the time, and with the National Bee-Keepers' Association, that it has not made itself known. Mr. Moore suggests advertising, and it takes brass bands to run political machinery, and hurrah. The trouble with bee-keepers is, they haven't advertised. They haven't let the country know that they were in the world.

A party on the train said to me, "Where are you going?" "Up to Chicago to attend a bee-keepers' meeting." "Do they hold meetings?" "What do they do when they have meetings? Can a fellow afford to ride on the cars 400 miles to attend that meeting?" He didn't seem to know about the bee-keepers. But everybody knows about the Live Stock Show, and that the people from everywhere are coming to attend it. They have advertised—made themselves known. And now, then, I like that idea, but then I go back to my original proposition, the way to do that is for somebody to go ahead and do it, and Mr. Moore seems to know how it ought to be done, and if that is what we need why can't something of the sort be started, and see if we have bee-keepers enough to take stock in it. A stock company to do a thing like that—it will take a lot of hard cash to do it. How much stock do you think would be subscribed? Suppose a proposition of that kind should be put. My father kept a hotel, and some people came through the town, and their horse died right in front of our hotel. An old fellow who used to be a show clown, a kind of hard fellow, the people thought, and we kept a hotel and it wasn't our business to ask what kind of a fellow he was. He stood around there, and they kept a saying how sorry they were. Then the old fellow said, "Jimminy, craminj, how much you sorry?" He put \$5.00 on the horse, and said, "I am sorry that much." It wasn't two minutes, that was the end of it. He solved it with pretty rough language, but his \$5.00 backed it up.

The question of the adulteration of extracted honey will largely solve the problem of the sale of extracted honey. I went to the National Manufacturing Company, of St. Joseph, and saw the gentleman who ought to be a good man, and he took me down and says, "Come down, I want to show you." He took me down where he had a car-load of extracted honey, and over in another part he had a great pile of comb honey. He had gotten some extra-fine honey for his work. It has a good flavor to it. He said he would get rid of this in a little while. He puts three parts of glucose and one part of that honey, and sends it into Oklahoma and sells it for pure honey!

Mr. Moore—Medina, Ohio?

Mr. Abbott—That's the Glycerine Refining Company, and when you write to them about it they tell you to go to a place that's hotter than Ohio! Wipe out a few of those fellows; but that's the way they talk to us down in Missouri. The whole market is full of it. I stepped into a leading grocery—all friends of mine—but I told them the plain truth. "Do you know what that is there?" "Yes, I know what it is." "Do you understand the nature of that?" "Yes, we know all about it." "I know what that is exactly, it is adulterated honey." "But I thought you said you wouldn't handle any more of that, and now you stick that up by the side of my honey, and you hand it out to them and they think it is Abbott's." "We never do that. We tell them this is Abbott's honey." "But," I said, "you are injuring the market." "We bought this very cheap, and there are some people who want the cheap." When I inquired the price I found there was only a slight difference. The whole secret is, they buy the pure goods for 20 cents and sell for 25, and the other they buy for half, and they make more on that than they do on the better goods. The man who runs the grocery professes to be a good man, still he hasn't come to realize that setting up that goods which is manufactured and selling it to the people, not guaranteeing its purity, but implying it is pure, that that is a crime against society, and a crime against the interests of his own soul, and something ought to be done to make the country feel that.

Mr. Moore—I am sorry I have to disagree with Mr. Abbott about a law matter. These glucose people—we must respect their glucose. They have trained these grocers up for ten years. They don't want honey with the producer's name on it. They don't know us. I went into a grocery store, made it a specialty, and told them that I had 300 colonies of bees. The grocer didn't care to go any further. "What is the price?" The trade we care for is all that way, and the grocer prefers to sell a cheap article

because he makes more profit on it. The thing to do is to brand our goods, and educate the consumer to ask for them, for just the moment they find out there is a bee-keeper's brand they won't have any other kind. My wife buys baking powder, and she wants either Dr. Price's or Royal, and she won't have any other kind. The people have been drilled into this.

Mr. Niver—I had a little experience. I was in Niagara Falls selling extracted honey to private houses, canvassing to see if I could raise the consumption in that way and I sold a big lot of honey, and the stores were full of glucose honey and nothing else, and there is a law in the State of New York which makes a possible fine of \$200 a day, and each day is a separate offense. I did not go for the grocery man. I am willing they should have that trade if they will leave me the honey-trade. That may be selfish, but that's the way I look at it. The people gave me their honey-trade, and it was a big one. As Mr. Moore says, the liquid honey trade for the grocer is nothing at all. Nobody bought any honey there, or pretended to, because they believed it adulterated, but they would buy it from me, and continued to buy it week after week. There is one way that we can increase the sale of liquid honey.

(Continued next week.)

### The Question of Foul Brood—Cause, Etc.

BY C. P. DADANT.

THE apprehension of bee-keepers has been very much increased lately, on both continents, by the assertions of Dr. Lambotte, concerning its identity with a common bacillus known as *Bacillus mesentericus vulgaris*, which it appears exists very plentifully everywhere. These assertions, however, are very likely to prove erroneous, as a number of microscopists have taken issue with Lambotte and affirm that in spite of the similarity, the bacilli are different. Prof. F. C. Harrison and Thos. W. Cowan both raise objections, and the former shows by comparative tables that slight differences exist. In a matter of this kind it is very much as if we were to compare two snakes, the one poisonous, the other inoffensive. Differences which in a snake are easily noticed become much more difficult to detect in a microscopic organism. But we find those differences between dangerous and harmless diseases all around us. Is there anything more dangerous than diphtheria, or less so than an ordinary sore throat?

We can not be too cautious as to the spread of foul brood, and it is better to mistrust all appearances of diseased brood than be over-confident, but I believe there are many instances when foul brood is suspected where it does not exist. We are not as yet sufficiently informed on those diseases commonly known as pickled brood and black brood.

I had never seen foul brood until my trip to Colorado last fall, when I was given an opportunity of seeing it in three different places. It is quite prevalent in some spots, probably owing to the great number of bees kept in limited areas on a large scale, and in many cases by incompetent farmers as well as by practical apiarists. In one apiary of a very large honey-producer I was shown a colony which had been treated, being the sole colony in which he had found the disease, and we saw only one solitary cell of the disease. In other places it was more perceptible. But in each case the diagnosis was the same, the dark coffee-colored appearance, the glue-pot smell, the ropiness, the settling of the mass to the bottom of the cell, deeper at the rear than at the front, owing to the slight slant of the cells towards the rear—those well diagnosed indications were in each case the same. In each case the disease was well under control, but they showed me also in the dried-up combs, the brown scales of dried foul-brood quite perceptible to a searching eye. I came home very much impressed with the necessity of severe measures against the disease.

Several times during the fall and once this spring I have been asked about instances of dead brood, and in three cases samples were mailed me by apiarists in different localities of Missouri and Illinois. In neither of these cases did I see symptoms similar to those mentioned above. There

was dead brood, dead larvae in different stages, sunken cappings, but neither the glue-pot smell nor the ropiness were to be detected. An occasional larva had dried up and shrunk so that it was loose from the cell-walls, and could be dropped out by inverting the comb; others were stuck fast to the walls. One man reported that the disease had appeared in two or three colonies. He said:

"After a few days I went to examine the hive that had the dead brood. To my surprise I did not find a sign of it, but I found others that had it. Might not the bad weather be the cause of this?"

I wrote this man again in April to find about the condition of those hives. He replied, a few days ago:

"I received your letter. I don't think it was foul-brood, as the colony that had it worst got completely over it before the end of the season and harvested some honey. I am unable to find any signs of decayed brood in the hives this spring."

I really do not believe that disease was caused by the chilling of the brood (although we have had more than usually cool weather both in the fall of 1902 and in the spring), because, if the brood had been chilled, whole patches of it would be dead. We had entire combs of chilled brood, years ago, when we were practicing the spreading of the brood to induce prompt breeding in the spring. In such cases the brood was all dead, and the one or two instances that we saw, cured us thoroughly of the practice of indiscriminate spreading of combs.

From the descriptions Mr. France gave of pickled brood at the Chicago meeting, I would be tempted to decide that all those instances brought to my knowledge were of that kind. Now, will this pickled brood cure itself, or pass away? I would like to have Mr. France to tell us what he knows. I remember that when I was in Paris, in 1900, an old bee-keeper who was in charge of the Luxembourg apiary, in the heart of Paris, told me, with a shrug of his shoulders, that they had had foul brood in that apiary, but that it had become cured without doing anything for it. From what I have seen and heard about foul brood, this seemed rather odd, and I acknowledge that it did not give me a very exalted opinion of the bee-knowledge of the man who said it. I do not believe that foul brood will cure, of itself, without treatment; and wherever a disease of the brood has disappeared of its own accord, I am very much tempted to put it among the benign diseases. Very probably in such cases the bacillus is different. Might it not be that *Bacillus Alvei* is the true disease, while *Mesentericus* is a milder form? There is room for further scientific research on those points.

Whatever may be the case, we feel the need of competent and lively action on this matter in Illinois as in other States. I see by the American Bee Journal that the appropriation of \$1,000 each year for two years in Illinois has become a law, and I believe it is time to act. It will be quite a relief to our bee-keepers to know that in case of diseases among their bees they can command the services of some one who will make these matters a constant study.

Hancock Co., Ill.

### Thirty Years Ago and Now—Historical.

BY DR. G. BOHRER.

AFTER an absence of 30 years from the field of practical bee-keeping, I again have become the owner of some bees, and have renewed my subscription to the American Bee Journal. Samuel Wagner was its editor and publisher at Washington, D. C., when I first began to read it and contribute to its columns.

In 1864 I purchased and introduced my first Italian queen, being then a resident of Indiana. I paid Rev. L. L. Langstroth \$10 for her, and was declared by some people as being mentally out of balance for having paid such a price for one "bug," and it a "hum-bug," at that, so they said. But I successfully introduced her to a large colony of black bees that I had transferred from a box-hive to one of Mr. Langstroth's 16-frame observing hives, which I constructed under instructions found in his book ("Langstroth on the Hive and Honey-Bee"). Inside of eight weeks after the introduction of the queen but few bees other than three-headed Italians could be seen. From this beginning I increased my stock to more than 100 colonies, all of which I sold in 1873 and located in Rice Co., Kan., where I still reside on a farm that I located upon, and I improved as a soldier's homestead. This country not being at all adapted

to bee-keeping at that time was the reason why I dropped out of the business.

My health had been injured and my constitution shattered while in the army during our ever-to-be-regretted Civil War. Health was one of my chief objects of search in coming here.

Now alfalfa has become a common crop here, and thousands of fruit-trees and other honey-yielding plants are common, and the bees are rapidly becoming a source of income and profit.

On re-entering the pursuit of bee-keeping I note several changes of great importance. The most prominent and noteworthy is the amount of knowledge that has been acquired by the masses of our people concerning the habits and management of honey-bees.

Forty years ago I sometimes found it out of the range of possibilities to purchase a colony of bees, it being regarded as decidedly a forerunner of bad luck to sell a colony of bees. Especially was it held as true that any one selling a colony of bees could never hope to keep bees with any sort of success again. That such superstitions have been superseded by a degree of knowledge and scientific advancement resulting in profit, pleasure and luxury, is most certainly a source of gratification to all our people, and especially to the bee-keepers who were active participators in this grand march of progress.

I have not on hand data that will enable me to present a tabulated statement as to the difference between the number of colonies of bees kept now and 40 years ago, together with the enormous increase in the amount of honey, wax and profit derived from the same annually; but to the most casual observer of the difference in the conditions then and now, the contrast will appear very great. In the meantime, many of our most prominent leaders have quit the stage of action. Among them, Mr. Langstroth—the greatest of them all—is no longer with us. Adam Grimm, Dr. Hamlin, Elisha Gallup, Samuel Wagner, Chas. Dadant, Thomas G. Newman, and others, have been cut down by the Scythe of Time. Prof. Cook, Alley, Baldrige, Root, and possibly a number other prominent bee-keepers, I am happy to know, are still with us. And I sincerely hope to meet most of them at Los Angeles, Calif., in August, at the National Bee-keepers' Convention.

During the early 70's, at the solicitation of Prof. A. J. Cook, I discussed what was then known as the "Drone Question," before the Michigan State Bee-keepers' Association. Mr. Langstroth, myself and others, took the position that the fertilization of the queen did not affect the purity of her drone progeny, which position drew the fire of several among the bee-keeping fraternity. I do not know whether this is any longer a question or not. But I note the fact that Elisha Gallup has drawn the fire of a number by assuming the ground that the maturing queen has an "umbilical cord." That there is a channel through which she receives the necessary nourishment to keep up the development process will not be questioned; but under the accepted definition of what is understood to be an umbilical cord, the term applied, as Mr. Gallup has used it, must be construed as largely figurative. An umbilical cord proper consists of an artery, a vein, a sheath and connecting tissues, and when performing its proper function is attached to a fetus at one end and a placenta at the other, which latter organ consists of two portions, viz., a maternal and a fetal portion; the former being attached to both the mother and the fetal portion, and when thus connected is the channel through which the fetus or prospective offspring receives its substance until the period of birth has arrived. That there is no such connection between the mother queen and the queen in process of development is of course well known. Hence, to use the term as Mr. Gallup used it, must either be done in a figurative sense, or an additional definition to the term umbilicus must be added.

In conclusion, Mr. Editor, please permit me to state that in re-entering the circle of bee-keepers I shall not again engage in breeding queens and bees for sale as I once did, but to keep them for honey-gathering, and to be among the fraternity of bee-keepers is my sole object. I have passed my 70th year, and have abandoned the practice of my profession (medicine), and farming as well, and do not care to give any pursuit the uncasing attention required in breeding queens and shipping them. Lyons Co., Kans., May 22.

**Queenie Jeanette** is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Bees Cleaning Out Comb.

When I was about 10 or 12 years old I had an uncle who kept bees in what is now a rather old-fashioned way, but I always enjoyed being around his bees, and some way (he thought it queer) they were never cross to me. Three years ago last fall I had quite a notion that I wanted honey for ourselves. I had a chance to buy one colony to bring home in the spring, so I bought it. They sent out a swarm the next season, but we got only about 30 pounds of surplus honey that year. We packed them for the winter in chaff hives, and they came out fine in the spring. Both colonies just doubled the next summer. We packed them as before, but out of the 4 colonies one died in the winter, so we put out but 3 colonies last spring. They doubled, and furnished us with all the honey we could eat, besides selling \$18 worth.

When I first bought the bees I subscribed for the American Bee Journal, and we have read it ever since. We also got a book, "A B C of Bee-Culture," and studied it until we thought we knew a little of the business. Last fall my husband made up his mind that he could care for bees better than do what he was doing (market gardening), and he let all his tillage land except a little garden, and bought 54 colonies, making 60 in all, so we are "beeing" now. This spring has been extremely hard on the bees, there being so much rain. There have not been over four or five days that they could work.

1. In the last Bee Journal I noticed that you said bees would clean out comb without making holes through it, if properly handled. Now, we have fed ours honey in the comb this spring, and the combs were cleaned without injuring them, so I infer that either we or the bees handled it right—perhaps both—and what I want to know is: What would be an improper way? The way we did was to put the comb on top of the frames, and put cloth over it, and let the bees do the rest.

2. You asked what *my* work is now. It is to put sections together, and put in foundation, and put foundation in frames (self-spacing Hoffman). I use full foundation in every place. Are we doing right?

My husband says that if this weather continues we shall have to put the stands on stilts, and feed the bees with a bottle before fall; and then he thinks we shall know about bees!

GRACE W. SAGER.

Benton Co., Minn., May 18.

ANSWERS.—1. From what you say I suppose you put brood-combs over a colony and let the bees take the honey. No danger of combs being torn in that way. The danger comes when you expose the combs away from the care of any colony. Even then old black combs will not be torn. But if you want to know "an improper way," just take a section of honey or a frame filled with new comb and put it where the bees can make a free-for-all attack upon it, and see if they do not chew a good part of it into bits.

2. Yes.

### Beginning With Bees.

1. I am "the mother" in a large family, and wishing to "go into bees" with the idea of providing honey for my own family only, I write to ask you if you think it practicable for me, with hands already full, to try it. I have the book "A B C of Bee-Culture," and am taking the American Bee Journal, but I can't find much for beginners. In your department some answers to the following might be very timely to others besides myself.

2. What examination is needed to know that bees are satisfactory? We bought two colonies that were *not*—worms, etc. We destroyed hives and all.

3. What ought one to pay, and what kind of hives?

4. When ought they to be moved to gather honey this season?

5. What supplies besides the bees will it be necessary to have at the start? Will you tell me what I should look up

in the "A B C of Bee-Culture?" I fail to interest myself to open at random. I am such a busy woman.

I hope I am not asking too much.

MRS. J. J. GARRISON.

Van Buren Co., Mich., March 27.

P. S.—I send this written nearly two months ago, but unmailed because the answers I'm afraid are too simple.

I enjoy our department, and wish I could contribute from my experience. I shall try to as data come. I do want to learn before I begin. You editors write for old hands, not for ignorant people, or I am mistaken.

J. J. G.

ANSWERS.—1. Yes, I surely think it practicable to provide honey for your own family. Honey is a delicious, healthy sweet for children—for grown people as well—but I think children nearly always crave sweets of some kind, and honey is good for them instead of being harmful as are candy and sweets of like nature. Even with hands already full, you can no doubt find time to care for two or three colonies of bees, and the time spent with them will be a restful change for you—perhaps just what you need, a blessing as well as a profit.

2. If in movable-frame hives, remove the cover and lift out the frames to examine them. Italian bees will usually protect themselves against the ravages of the worms. Black bees are not so good in that respect.

3. It is not easy to give a satisfactory answer to this question, so much depends upon circumstances, and prices vary so much in different localities. It may be well to find out what bees can be secured for in movable-frame hives near home, and compare prices with those who advertise bees for sale, then you may be able to decide which is best. Heavy express charges must be considered, however.

4. The sooner the better.

5. One of the first things you will need will be a smoker. You will need for each colony, in case of a swarm, a hive filled with frames, the frames to be supplied with starters or full sheets of foundation (better have full sheets). Also two or three supers for each colony to hold your sections, if you work for comb honey. If you work for extracted honey you will need hive-bodies and frames instead. If working for comb honey you will need sections and foundation for them. For me, a bee-veil and gloves would be indispensable, but every one does not use gloves. Even if the bees did not sting I should want the gloves to keep the bee-glue off my fingers.

6. If you have not the time to read the whole of your bee-book, I should advise you to look up, by means of the index, the points that you are especially interested in, and want information about, from time to time, such as swarming, clipping queens, putting foundation in sections, etc. I think as you get the bee-fever your interest will grow.

Now, if these answers are not perfectly plain, don't hesitate to write again. This department is certainly intended for the beginner as well as the old hands, and it is not the fault of the beginner herself if her needs are not met, so long as she has the fullest liberty to ask questions? If things are not made plain, just write again, and please don't worry about your questions being too simple. Others may be having the same trouble, and the answer to your question may be of benefit to many others besides yourself.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### OSMOSIS—HOW ABOUT IT?

When the human skin takes oxygen from the air it is not rather stretching the use of terms to call the process, "osmosis?" College man might say so, but if common "feller" said it some one would grin. A good rhetorician usually avoids pushing his extreme verbal rights. Otherwise he might get too often to the point where "No man understandeth him." "Osmosis much more rapid from water to salt than from salt to water." If I understand this correctly it is that more unsalted water will pass in through the membrane than salted water will pass out. Thanks to Prof. Cook for mentioning the fact. A Big mystery

may be hid somewhere in that vicinity. Here's a wild grape-vine in a tree. Cut it off 50 feet up and it drips copiously for many hours. Might almost compare it to an engine-hose. I suppose it is osmosis that does the thing; but scientists do not claim to tell us *all* the why of it, I believe. A mere plant, with no animal powers, where does it get the force, the energy, to throw fluid up that way? Page 293.

### MR. CILLEY'S FORCED SWARMING.

That's the way to talk it, Mr. Charles W. Cilley—no natural swarm for four years, and no case of a forced swarm deserting. When the rest can say so we will write the word "Success" on—well, the process. Was going to say on forced swarming, but the words stuck in my throat somehow. Premium of five cents for a better and more satisfactory term. Page 294.

### ELEMENTS OF SUCCESS—BEE-OLGY AND THEOLOGY.

Mr. Doolittle's last paragraph, page 295, is very suggestive, indeed. The elements of success are usually many. How prone we are to hobbyize and magnify one of them till it hides all the others. That won't do. Unless all the prime elements of success are put in, superfine and gilt-edged treatment of one of them will avail but little.

Alley cells fragile; Doolittle cells strong—seems to be the way that matter differentiates.

Can't find much of a flaw to criticize in Mr. Doolittle's bee-ology this time, but can criticize his theology—just a trifle. He says the Creator pronounced the bee good, when the text says he saw it to be good. Is this too awfully minute? I think not. Those of us who are trying to be scripturally devout, and trying to take in cordially the facts of modern science, too, have a big contract. Are we not all just scratching around, and sticking in our toe-nails, to accomplish the things we propose to ourselves? Trying to hold our devotion, our Scripture, and our science, all three, we think of the babe trying to hold three big oranges. We must keep our religious ideas linked into the best shape possible in order that holding on may be possible. A little misquotation, if it is in the direction of greater difficulty, is big enough to object to.

### FOUL BROOD IN ONTARIO.

And so when they tell us that foul brood is almost exterminated in Ontario, Mr. Holtermann feels it his duty to take the role of hold-up man. Almost too strong a word? All right, I suppose, to feel a little jubilant over complete victory somewhere in sight; but we mustn't jubilate ourselves out of reach of the truth. Page 300.

### PERFUMES TO STOP ROBBERING.

"Some she gave 'lasses, and some she gave bread,  
And some she gave —"

And Ira Barber followed suit, giving one peppermint, and one wintergreen, and one onion, etc. This to discriminate friends from foes among robbers. I would say to the too-eager beginner, Don't go into that sort of thing unless you are sure you need to. And don't expect it to cure ordinary, battle-of-Waterloo robbing. I guess it would be effective to stop quiet, sneak-robbing if you've got that. Page 302.

### KEEPING A FAMINE-SMITTEN SWARM.

Dr. Wiseman was very lucky to have his famine-smitten swarm stay seven days, and give him a chance to feed them. In case a swarm is beginning with nothing, and the weather is such as plainly prevents their gathering anything, they should be looked to within three days. The rations they carry along should not be counted on for more than that—in fact they sometimes seem to carry almost nothing. The second evening is the correct time to give them something. There is a choice, however, as to how much you will feed. A half-pound feed, repeated if weather keeps contrary, will hold them. Page 302.

### RIGHT MAN NEEDED IN ILLINOIS.

Illinois now seems to have public money available to suppress foul brood, but not in an act granting special powers to inspectors. All the more need to appoint just the right man if they must rely on "speaking gently" without any "big stick." Diseased apiary bad—diseased apiary owned by cranky, ignorant, unreasonable man several degrees more to the bad. Page 308.

### HE RAPPED ALFALFA HONEY.

I see Pres. Crane, of the Vermonters, raps alfalfa honey as of flavor decidedly inferior to clover and basswood. Carload of it got provokingly in his path. Might it not have

tasted just a little better had there been no crowding? I believe *some* persons, not having any self-interest to prejudice them either way, call alfalfa honey the best. Page 309.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Moving Bees a Long Distance.

I have decided to move 150 colonies of bees some 500 miles. Will you please advise me as to the best way to prepare them for shipment? They will go all the way by rail. Can they be moved all right now, or would I better wait until the weather gets some cooler? They will go in one car all the way.

ALABAMA.

ANSWER.—They may go all right now, having the car open enough for ventilation, and the hives sufficiently ventilated, but it will be safer to wait till cooler weather. If the frames are not of the fixed-distance kind, they must be fastened so they cannot move in the hive. The matter of ventilation is of the greatest importance, and just how to provide that depends somewhat on the kind used. The entire top may be covered with wire-cloth, and if one hive is piled on another, strips must be fastened on the lower hive so the air can get between. The hives must be placed in the car so that the frames run parallel with the railroad track.

### Queens Going Through Excluder-Zinc.

I had five very strong colonies of bees. I put two frames of brood with a queen in an 8-frame hive with starters on six frames and queen-excluder on the bottom hive. I left the old hive on top, and every queen went to the top, and they were large queens. VIRGINIA.

ANSWER.—For a time it was a somewhat unsettled matter as to the right size of perforations in excluder-zinc, and some was made with perforations too large. Possibly your excluder was faulty in that direction. The perforations should not be larger than one-sixth of an inch.

### Rheumatism from Bee-Stings.

I am just getting up from a bad spell of inflammatory rheumatism. The doctors said I had a close call ever to get well. The professional doctor of this country claims it was from bee-stings, saying that when a bee stings, the poison never comes out, and when enough of them sting it poisons the blood. But I have argued that it was

from hard work and exposure, for I have worked very hard for the last ten years trying to keep my work in good shape. Now, I will tell you what I have to do, and you can see whether it is enough to cause any man to break down. I have 200 colonies of bees, and have read bee-books and bee-papers, trying to do my work in an up-to-date way. I have also 15 acres of strawberries and 6 acres of blackberries and raspberries, and 1500 apple-trees. Do not understand me to say that I do all this myself. Of course, there are lots of good hands, but so many that do not do their work right that I have done too much myself. Of course, I did not wear a veil, and got thousands of stings, but they did not seem to hurt me, and I have been in the bee-business for a year.

My bees are rolling in honey, and it keeps my wife and little girls busy making foundation and putting on supers.

I still think the "Old Reliable" is worth its weight in gold.

ARKANSAS.

ANSWER.—There have been many cases reported in which rheumatism has been cured by bee-stings, while others suffering from the disease report no benefit from stings; but this is the first time I have seen any report of rheumatism *caused* by bee-stings. I think your doctor must be mistaken in the matter. With the work you have been doing there is no need to charge your rheumatism to the bees; hard work is all that is necessary, with no doubt some exposure mixed in.

### Queenless Colonies—Number of Bees in a Colony—King-Birds—Wild Bees.

I. On page 331, in Question No. 1, about queenless colonies, I guess I did not state plainly enough what I wanted to know. It was, What made them queenless? At this early date of March the old queen would not be likely to fly out, would she? Or might it have been superseded?

2. How many bees are estimated to be in a medium populous colony?

3. Do you consider that king-birds do any damage, and should they be killed?

4. I notice a number of different kinds of bees working on the flowers here besides the honey-bee and bumble-bee. Do you think any of these are very good honey-gatherers, and has anyone ever tried to domesticate them? Some of them work on very small flowers that honey-bees won't touch.

I found some white clover in bloom here on May 19, and some dandelion the middle of April. MICHIGAN.

ANSWERS.—1. No, the old queen would not be likely to fly out either late or early. I had an unusual number of colonies become queenless this spring, and I don't know for certain why. Your colony may have become queenless because of attempt at superseding, as you suggest, and some accident may have happened to the queen, but there seem to be cases hardly to be accounted for in either way, and I don't know how to account for them.

2. At a rough estimate, perhaps 30,000.

3. The weight of testimony seems to be against them.

4. I think they have none of them been domesticated, don't suppose they can be, and don't suppose they would be of any value if domesticated. When a boy, I tried domesticating bumble-bees, but the amount of honey obtained didn't amount to anything, and I don't suppose any of the others would do as well as bumble-bees.

## Catnip Seed Free!

We have some of the seed of that famous honey-producing plant—Catnip. It should be scattered in all waste-places for the bees. Price, postpaid, 15 cents per ounce; or 2 ounces mailed FREE to a regular subscriber for sending us one NEW subscriber to the Bee Journal for one year, with \$1.00; or for \$1.20 we will send the Bee Journal one year and 2 ounces of Catnip seed to any one.

## FROM MANY FIELDS

### Weather Conditions Better.

I had a fine swarm to-day, which I lived on the old stand and gave the brood to growing colonies. There is some sealed honey in one super. The prospect here is fine. White clover is everywhere. There is a decided change for the better so far as the weather conditions are concerned. R. B. McCARTIN.  
Grundy Co., Ill., June 8.

### The Division-Board Feeder.

I wintered my bees without loss. I have had a number of swarms, something not known here in May. I use the division-board feeder, and when beginners ask what kind of a feeder to use in the Bee Journal, I wonder that they are not told that it is the best for slow feeding—three pints to two quarts at a time; use it at night, and there will be no robbing.

When I packed my bees last fall I found a colony that cast a swarm in September and had been robbed, but had a young queen. I put in a division-board feeder, ran a tin tube through the oats chaff I use for packing on top of the hives, down into feeder, and when

## Prize = Winning Stock

Daughters of Moore's famous long-tongued red clover Italian Queen, which won the \$25.00 prize offered by The A. I. Root Co. for the longest-tongued bees, and also daughters of other famous long-tongued red-clover breeders whose bees "just roll in the honey," as Mr. Henry Schmidt, of Hutto, Tex., puts it, now ready to go by return mail. Untested Queens, \$1.00 each; six, \$5.00; dozen, \$9.00. Selected Untested, \$1.25 each; six, \$6.00; dozen, \$11.00. Safe arrival and satisfaction guaranteed. Circular free.

Untested.....	1.00	\$ 5.00	\$ 9.00
Tested.....	1.25	7.00	13.00
Breeder.....	4.00		
2-frame Nucleus (no queen)	2.00	11.00	21.00

before July 1

Add price of any Queen wanted with Nucleus. Our bees are shipped in light shipping-cases. Purchaser pays expense of Nucleus. Safe arrival guaranteed of all stock sent out.

BATAVIA, ILL., Aug. 21, 1901.  
Dear Sir:—I thought I would let you know as to results of the nucleus sent me. They were placed in 10 frame hives and now they are in fine condition. From one I removed 24 pounds of honey and had to give 6 of them more room, as they were hanging out. They have more than reached my expectations.  
Yours respectfully, E. K. MEREDITH.

DAVENPORT, IOWA, Dec. 31, 1901.  
Your queens are fully up to standard. The honey queen that you sent my brother takes the lead. She had a rousing colony when put up for winter. The goldens can be handled without smoke or veil. Very truly yours,  
JOHN THOMING.

Notice.—No tested stock sent out before May 15. Send money by P. O. Money Order or Express Order. D. J. BLOCHER, PEARL CITY, ILL.

we had a day the bees could fly I would go and take off the cover to the winter-case and run a stick down through the tin tube into the feeder, and if I found no feed I put in sugar syrup—three parts sugar, one part water—hot right from the stove. I did not expect they would live, but they did, and came out strong last spring. I had a very poor season last year. C. G. ASCHA. Berkshire Co., Mass., May 31.

### A Discouraging Outlook.

The big freeze of last April was followed by fairly warm weather through May, but it was quite windy a large part of the time. The bees did quite well, however, as there was an extra-fine dandelion bloom, and some colonies were nearly ready to swarm; in fact, I heard of one stray swarm a week ago. But the last week or 10 days it has been excessively rainy, and now it is cold and cloudy, with the bees getting very restless. Many of the best colonies are running on drones, while the ground is getting white with clover bloom. Truly, the prospects of no honey crop can "go glumming" more easily than that for honey, and yet "Hope springs eternal in the human heart," especially if it is a bee-keeper's heart. For let the present be never so barren, cheerless or dreary; the glorious prospects for "next year" still, still loom ahead. E. S. MILES.

Crawford Co., Iowa, May 31.

### Cause of Foul Brood.

Out of 90 healthy colonies on May 1, fully 60 are more or less affected with what I take to be foul brood, the first I have had in the yard. It appeared in the home yard and in the new yard at another place, where I have most of the bees. I watered the bees in a trough, and as a number of them got drowned in it, this made the water smell before I cleaned it and then out as the weather got warm. The dead brood and combs smell the same as the water did. Might this not be foul brood? I wish to know first the cause of foul brood, but the "Smart Set" are wholly ignorant of the cause. Root's "A B C of Bee-Culture" has "Foul Brood and Its Cause" indexed, but says not a word as to the cause. It doesn't even say that they do not know the cause. There is a good, big field for the discovery of the cause, and an important one, too.

Bees wintered well, and are in fair condition. Rain is much needed, with a higher temperature. D. C. BACON. Bradford Co., Pa., June 1.

### Too Rainy for Bees.

Bees are breeding up very well, but are quite short in stores, as the fruit-bloom is all frozen. We have had rainy weather here since May 10, with some very hard, washing rains, and it is still raining, so the bees can not fly much. White clover is blooming abundantly. D. E. EVERS. Oteo Co., Nebr., May 30.

### Alfalfa Honey in Wisconsin.

I saw in the last Bee Journal, in "Our Bee-Keeping Interest" department, the statement that there has never been any report of alfalfa yielding honey east of the Mississippi River. I believe Dr. Miller made the same statement. Now, I want to say to them that we have produced thousands of pounds of alfalfa honey right here in old Wisconsin. We have lots of alfalfa, and get lots of honey from it, as you state in your report, N. E. France, will testify. We have plenty of white clover and an abundance of sweet clover and basswood. But we get very little honey, as a rule, from the basswood. Alfalfa has been raised here for years, standing the winters well, and making the best of fodder for stock.

Now, don't say a word about this to any one except Dr. Miller's family, for this locality is already overstocked with bees. We (my boy and myself) will run over 200 colonies this year to extracted honey, which will be

marketed in our home town. We have been years educating the people to extracted honey, and can now dispose of our entire crop of A. No. 1 clover and alfalfa honey at tip-top prices. I have lately had occasion to travel over a large part of the State, and find that bees, on the average, have wintered well, and the prospect is good for the coming season.  
R. K. DYE.

Fond du Lac Co., Wis., June 2.

**Very Dry in the East.**

I wrote you some time ago how well my bees wintered. I write you again how they came through the spring. I have lost about 50 colonies, and have 100 now, with not over 100 quarts of bees in the lot, and very little brood. I have 75 very good colonies, but they are getting poorer every day. There are very few bees flying in the yard—nothing for them to get. My bees did not lack honey, but the wind has been in the north most of the time for 55 days. When the sun comes out warm bees leave the hive, and it will cloud over and leave the bees in the fields to perish. All the bees now in the hives are from eggs laid the warm spell we had in March. As near as I can figure, there is not anything they can gather from now. Basswood is not budded to bloom; blue thistle is dried up. We have had no rain to speak of in two months. The losses of bees so far this spring will be about 50 percent in this vicinity, with a fair prospect of losing the rest. But it is just as bad on the farmers. I know of several that keep from 30 to 40 cows, and it looks as if they would not be able to cut two tons of hay for each.  
C. M. LINCOLN.

Behnington Co., Vt., June 1.

**Beedom Boiled Down**

**Spreading Brood a Two-Edged Sword.**

Editor Hyde says in the Progressive Bee-Keeper:

For localities where the honey-flow comes late and the bees have a long season in which to get bred up, it certainly will not pay to spread brood, it will simply be a great loss. In the hands of experienced men and in the right localities and in the right seasons, there is nothing that the bee-keeper can do that will pay more than the scientific spreading of brood. In the hands of the inexperienced or in the wrong season there is nothing that will cause more loss than spreading brood. I am honest when I say that I believe there has been more loss by brood-spreading than there has been gained. But because there is loss with the wrong parties and in the wrong seasons, is no argument against it if done in the right way and at the right time.

**How Much Is a Good Queen Worth as a Starter?**

A. I. Root tells in *Gleanings in Bee-Culture* about a visit in Cuba to C. E. Woodward, who has been there three years, is now the active partner in 2000 colonies in seven apiaries, and was just filling an order for extracted honey to the amount of \$16,000 to be shipped to Germany. Mr. Root says:

Ernest has been pretty thoroughly criticised, not only in *Gleanings*, but in other bee-journals, for suggesting that our best queen was worth \$200. Now, mind you, I am not going to advertise our queens this time. Friend W. got his best queen of our veteran friend Doolittle. He paid \$10 for her, and then paid for a nucleus besides to ship her in, so as to have her come in good order ready for breeding. He has stocked the whole apiary I saw with queens from this Doolittle queen. The hives are two-story, and some of them three-story. The bees are nicely marked, gentle to handle, and good workers.  
"Friend Woodward, how much do you sup-

**FURNACE HEAT FOR FARM HOUSES**

**THE LEADER STEEL FURNACE** is especially adapted to heating farm and village houses. It is shipped direct from the factory to the user, all ready to set up. No trust or middleman gets a profit. Any handy man can set it up without trouble after reading our directions. We furnish every needed attachment and pay the freight. Hundreds have been sold within the last three years and these have given such good satisfaction that they are selling hundreds more. As many as eleven big rooms can be kept delightfully warm in any weather with the same fuel that two stoves would consume. The numbers sell to the buyers. Only one fire to look after. No dust, dirt, smoke or space filling stoves to bother with. Needs but little attention. You will be surprised to learn how cheaply your house can be fitted with a modern furnace. Estimates free. Send for free booklet No. 17 about this furnace.

pose that Doolittle queen has been worth to you—that is, how much money has this apyrid given you because of the fact that every queen is of that Doolittle strain instead of being of the hit-and-miss kind which most of the Cuban bee-keepers get along with. Have it. You actually saved \$200, the price Ernest put on our choice queen?

"Why, Mr. Root, that Doolittle queen has been worth five hundred dollars to me, counting the queens I have reared from her that have been used to stock others of our apiaries; and I am testing some of her daughters with the view of using them for breeders when she is gone."

Now, friend Woodward may have been a little extravagant in the above; but I will leave it to our veterans in bee-culture—is it not possible that a bee-keeper can be benefited to the extent of hundreds of dollars by starting business with a queen that is superior as a breeder?

### Strong Colonies for Wintering.

Kepler found that that the ratio of squares and cubes determined the distances of the planets and their periodic times, but long before Kepler's day the bees found that the very same ratio, *i. e.*, the proportion of volume to surface would enable them in cluster to survive the winter. They found that as they increased the size of their clusters the radiating and cooling surfaces proportionally diminished, and if they made their clusters large enough, and the cooling areas small enough, and they could find food to eat, they could

defy the "freezing, bitter sky." They found that the loss of heat from their clusters was inversely as their diameters, and that an eight-inch cluster had twice the advantage of a four-inch cluster in retaining its heat, and a four-inch cluster four times the advantage of a one-inch cluster, but for reasons to be advanced hereafter, the larger clusters will be shown to have a much greater advantage.

The old bee-keepers, with their straw-skeps, found out that two colonies united for wintering would consume less than even one colony. They did not understand this, but as they increased the size of the clusters by adding more bees, the loss of heat from the cluster must have been greatly diminished, and this, no doubt, is the true explanation.

It is certain that the more bees that can be safely wintered in a colony the more honey will that colony store in the coming season; and it is about equally certain that bee-keeping is about to advance in the direction of larger clusters.—A. W. SMYTH, M. D., in Irish Bee Journal.

### Time Needed for Pressing Out Wax.

In the experience I have had pressing wax, it has appeared to me that *time* is one of the most important factors—a factor that has not been sufficiently emphasized. If you double your pressure and cut your time in two, I think you'll not get as much wax. If you give half the pressure for twice as long, I think you will get an increase of wax.—[Right you are, Doctor. We have learned by experience that it is not tons of pressure, but a mild pressure exerted often or continuously, that does the work. The free wax must have time to disengage itself from the mass of foreign matter, and a high pressure in a short time will not accomplish as much as a low pressure applied intermittently; but each intermittent pressure should be a little harder than the one preceding; that is to say, the mass of slumgum should be reduced in size a little at a time. One may say it takes time to do all this. That is true; but at the present price of wax, it  *pays*  to take the time, especially if taken in bad weather or at night.—EDITOR.] —Stray Straw in Gleanings in Bee-Culture.

### Getting Pollen Out of Combs.

In Gleanings in Bee-Culture is given a conversation between G. M. Doolittle and a visitor who asks what to do with combs filled with pollen. Mr. Doolittle advises giving such combs to the bees, if the pollen be in good condition. The conversation then continues, the visitor leading:

"But a part of the combs containing pollen have been off the hives for three or four years, and it seems to have hardened in the cells, so I judge the bees can not remove it."

"I have had a few combs like these, and I place such in tepid water, and allow them to remain thus for a few days, when the pollen will all be soaked soft; and by putting them in the extractor after this, the most or all of it can be thrown out. I have so few that I do not wish to dirty up the extractor for them. I shake what I can out of the combs after the soaking process, when the combs are put in sweetened water for a few hours, and then given to the bees, which will clean them up as good as new. In fact, I think this the better way to work at all times, as it incites the

## Marshfield Manufacturing Company.

Our specialty is making SECTIONS, and they are the best in the market. Wisconsin BASSWOOD is the right kind for them. We have a full line of BEE-SUPPLIES. Write for free illustrated catalog and price-list.

Marshfield Manufacturing Company, Marshfield, Wis.

Please mention Bee Journal when writing.

bees to activity, cleans the combs, and produces more brood than would otherwise be reared."

"I thought of throwing these combs containing old pollen into the solar wax-extractor, and not trying to save them, even if I did preserve those having no pollen."

"I would not do this, even did I intend to melt these combs."

"Why? Is not that the best way to get the wax from them?"

"It is the best way to get no wax from them. I find that where there is much pollen in combs thus melted, said pollen will absorb all the wax to be found in them, and quite a little more from other combs which may be in with this. Since discovering this fact I am careful how any pollen is allowed to go into the solar wax-extractor, as pollen is a great absorbent of melted wax."

"How would you render such combs then?"

"If combs containing much pollen are to be rendered for wax it should be done by means of boiling water, as the water in agitation from boiling dissolves the pollen as well as to liquify the wax, thus allowing the wax to escape without being absorbed by the pollen."

The use of sweetened water to get the bees to clean up the combs is perhaps new, and seems an excellent idea.

**Close Saturdays at 1 p.m.**—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

### CONVENTION NOTICE.

**Texas.**—The Texas Bee-Keepers' Association meets in annual convention at the Agricultural and Mechanical College, at College Station, Texas, July 7 to 10, inclusive, during the Texas Farmers' Congress meetings. Cheap excursion rates. Large crowds. A good time. Learn a heap. Meet your fellow-men, and talk. Exhibits of all kinds of stuff. Premiums of all kinds awarded. Come, and bring what you have, and take home some of the premiums. You are invited. Be sure to be there, July 7 to 10, 1903, at the A. & M. C. of Texas, College Station, Hunter, Texas. **Louis H. SCHOLL, Sec.**

**\$5 TO START YOU IN BUSINESS**  
We will present you with the first \$5 you take in to start you in a good paying business. Send 10 cents for full line of samples and directions how to begin.  
**DRAPER PUBLISHING CO., Chicago, Ill.**

**\$19.00 from Chicago to Boston and Return \$19.00**

via Nickel Plate Road, account meeting of Christian Scientists, June 28th to July 1st. Tickets on sale June 25, 26 and 27, with open return limit of June 28. By depositing tickets with Joint Agent in Boston on July 1, 2, 3 or 4, and payment of fee of 50c., extended limit returning until Aug. 1st may be obtained. Stop-over at Niagara Falls, in either direction, without extra charge. No excess fare charged on any of our trains. Three trains daily. Through vestibuled sleeping-cars. American Club Meals served in dining-cars on Nickel Plate Road; also meals a la carte. Address John Y. Calahan, General Agent, 113 Adams St., room 298, Chicago, for reservation of sleeping-car space and other information. Phone Central 2057. 8—22A St

# BEE=BOOKS

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie St., - CHICAGO, ILL

**Forty Years Among the Bees**, by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Mer himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 285 illustrations. Bound in cloth. 19th thousand. Price, \$1.50.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. I. & E. R. Root.—An encyclopaedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey**, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment**, by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Foul Brood**, by A. R. Köhne.—Origin, Development and Cure. Price, 10 cents.

## HONEY AND BEESWAX

MARKET QUOTATIONS

**CHICAGO, June 5.**—The market is lifeless, no movement except extracted at low prices. Best grades of white extracted, 5¢@6c; amber, 5¢@5½c. Comb honey is held at 15c for choice white, and anything not grading up to meet this requirement sold at 20c/5c less per pound. Beeswax, 32c. **R. A. BURNETT & Co.**

**KANSAS CITY, June 9.**—No comb honey in our market. White or light amber would sell quickly at \$3.50 for 24-section cases. Demand light for extracted, at from 5¢@6½c. Beeswax in demand at 25¢@30c. **C. C. CLEMONS & Co.**

**ALBANY, N. Y., Mar. 14.**—Honey demand quiet; receipts and stock light. Comb selling, light, 15c; mixed, 14¢@15c; dark, 13¢@14c. Extracted, dark, at 7¢@7½c. Beeswax firm, 30¢@32c. **H. R. WRIGHT.**

**CINCINNATI, June 1.**—Very little change in market from last report. We quote amber extracted grades at 5¢@6¢ in barrels; white clover, 5¢@6c; supply equal to demand. Comb honey, 18¢@19c for fancy. **Beeswax, 30c.**  
**THE FRED W. MUTH CO.**

**NEW YORK, May 21.**—Comb honey trade exceptionally quiet, very little doing. Fancy stock not plentiful and is sold at 14c. A large supply of other grades on hand, which we are quoting at from 11¢@13c, according to quality, and in large lots make concessions from these prices. Extracted, unusually quiet, and prices show a downward tendency all along the line. Beeswax, firm at from 30¢@31c.

**HUBERT & SPOELKEN.**

**CINCINNATI, June 8.**—We have reached the time when there is no settled prices in the honey market. Everybody is waiting to learn how the crop will turn out, therefore we will sell or ask the old price; fancy water-white comb brings 15¢@16c. Extracted, amber, in barrels, 5¢@5½c; in cans, 6¢@6½c; white clover, 8¢@8½c. Beeswax, 30c. **C. H. W. WEBER.**

**SAN FRANCISCO, Apr. 29.**—White comb honey, 12¢@12½c; amber, 9¢@10c; dark, 7¢@7½c. Extracted, white, 6½¢@7c; light amber, 5½¢@6c; amber, 5¢@5½c; dark, 4¢@4½c. Beeswax, good to choice, light, 27¢@28c; dark, 25¢@26c.

Last year's product has been tolerably well cleaned up, particularly the desirable stock. Present offerings are largely odds and ends, including little of fine quality. Values for the time being are little more than nominal. A lower range of prices is looked for on coming crop.

**WANTED WHITE CLOVER EXTRACTED HONEY!**  
Send sample and best price delivered here; also Fancy Comb wanted in no-drip cases.

## No Well-Regulated Apiary

devoted to the production of comb honey should be without a HUBBARD SECTION-PRESS. A number of machines have been experimented with for years past, some of these were for the folding of the sections only, while some have endeavored to accomplish both the folding and attaching of the Comb Foundation in one operation. The general verdict is that this latter class are both cumbersome and do unsatisfactory work. The HUBBARD SECTION-PRESS was improved a short time ago so that now it is adjustable for all regular one-pound Sections both square and tall. The machine is built on the toggle-joint principle, one by which great power can be applied. One is not only, by the use of a Section-Press, enabled to put up Sections much more rapidly, but square joints are also secured without any effort on the part of the operator; and unless you have these square joints you are liable to break some of the sections in crowding them snugly into the supers. Price, \$2.50; weight, 25 pounds.

### Daisy Foundation Fastener

has recently been improved. A new and heavier plate, adjustable block for different widths of sections, as well as provision for different sizes of sections by changing the plates, have been added. We believe for the purpose, it is the very best machine sold. It is simple in construction, easily operated, and will last a lifetime. Price, \$1.00. Extra Plates for Danzenbaker, Ideal, and regular sections, 20 cents each.

Ask your dealer for these Machines.

If more convenient, Dues may be sent to the Secretary, at the office of the American Bee Journal.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown here with is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S

"FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact reproduction of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

**GEORGE W. YORK & CO.**

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

43d YEAR.

CHICAGO, ILL., JUNE 25, 1903.

No. 26.

## Editorial Comments

**Soap to Remove Propolis.**—Editor Hutchinson is enthusiastic over the discovery of a soap called Lava soap, that is very effective in removing propolis from the fingers.

**Formalin**, frequently spoken of nowadays as a disinfectant of combs affected with foul brood, is the name of a particular preparation of formaldehyde. The name *formalin* is the property of the Schering Chemical Works, of Berlin, Germany, protected by United States and foreign patents, and is applied to a guaranteed 40 percent solution of formaldehyde; so that when "formalin" is bought, one may feel sure of a reliable article of a given strength.

**Start Queen-Cells in Full Colonies.**—Although by proper management the experienced queen-breeder may be able to have good queen-cells started in miniature colonies, the average beginner will do well to make it a rule to have all queen-cells started in full colonies. A single frame of brood with enough bees to cover, or partially cover it, may succeed in rearing a queen, but such queens would not generally be accepted as a gift by the experienced bee-keeper. Cells started in a full colony are none too good for him.

**Young Queens and Swarming.**—It was formerly held that if a colony had a queen of the current year's rearing, there would be no danger of swarming that season. After the introduction of Italian bees, whether it was the difference in bees or difference in treatment, it was found that the rule was not reliable. It is true, however, that there is less tendency to swarming with young queens, and it has been held by many that a colony with a queen of the current year would not swarm if the young queen had been reared in that hive. Even to this, however, exceptions have been reported.

**A Case of Long Caging.**—M. A. Gill reports in the Bee-Keepers' Review a case in which a queen was caged in a nucleus from about the middle of July till the 10th of October. She was then released, found laying on the third day, and proved to be a prolific queen. A confinement of 12 weeks in which the queen did not lay is a pretty strong argument in opposition to those who say that a queen is seriously injured by ceasing to lay for a few days. It also militates against the view that it is important that a queen should be allowed to lay to the fullest possible extent during the first year of her life.

**Untwisting that Twist.**—A friend who is solicitous for the harmony of the force upon the Bee Journal, writes:

"There seems danger of the editors of the 'Old Reliable' getting twisted up into a snarl over that twisting of the hive-cover, as appears in the closing words of our sprightly Afterthinker, page 362. Why not submit the matter to arbitration, and let me be chairman of the arbitration committee? I should rule that both are right.

"On page 276 the suggestion is that a cleat is on the end of the board, that cleat so rigid that it does not in the least swerve from a straight line. Now, suppose that 28-inch board twists so that while one end of the cleat rests on the hive the other end is raised, making

at the middle a crack of a quarter of an inch. It is clear that the crack at the end of the cleat will be just twice as much, or  $\frac{1}{2}$  inch. But on page 362 no such rigid cleat is supposed. The end of the board is cleated so feebly that the end of the board is allowed to twist at its will, and instead of remaining in a straight line it will form a curve, and the quarter of an inch at the middle may become more than an inch at the end. See?"

There is no need of anxiety lest there be strained relations among the workers on this periodical. Rather than any hard feelings, either side would be willing to concede any kind of a cleat, or no cleat at all. But it appears quite clear that we may look from different standpoints.

**Don't Start Queen-Cells in a Time of Dearth.**—To get the best kind of queen-cells conditions should be as encouraging as possible. The fact of queenlessness is all the discouragement the bees ought to be called on to endure. When bees start preparations for swarming, if the weather turns bad so that no nectar can be gathered, the probability is that preparations for swarming will cease, and the incipient cells be torn down. Don't try to have cells reared at a time when bees would be discouraged from swarming. If, however, there be no nectar coming in, while the weather is at the same time favorable, the lack of forage may be helped by feeding thin syrup every night or every other night.

**Non-Swarming Chamber.**—The Simmins plan of preventing swarming by allowing constant opportunity for building comb below the brood-nest has been considerably in vogue in England, although for some reason no great success has been reported with it in this country. A non-swarming chamber is thus referred to by the British Bee Journal:

The non-swarming chamber is placed below the body-box primarily to give the bees room and occupation in comb-building, but when they have got started well at work the extra chamber, bees and all, is removed and placed above the brood-nest, when it becomes the surplus chamber for honey-storing; and by providing plenty of storage-room overhead in this way swarming is prevented.

**One Way of Starting Queen-Cells.**—The novice is likely to feel that the matter of rearing queens is so difficult that he dare not undertake it. Although other ways may be better for the professional queen-rearer, here is a way by which the veriest tyro may rear a few queens of particular stock and of good quality:

Look through your choice colony till you find the queen. Take the frame of brood on which you find her with its adhering bees, and put it, queen and all, in an empty hive, and add to it from the same colony another frame of brood and bees. That's all; the bees will do the rest. You have simply made the colony queenless, and the bees will proceed to rear a number of queen-cells that under proper conditions will be as good as the best. In nine days from the removal of the queen the cells may be cut out and used wherever desired.

**A Busy Bee-Keeper!**—The other day we received the following line from one of our subscribers:

"Please stop the American Bee Journal, as I can not get time to open them, let alone to read them."

We may be wrong about it, but we think that any bee-keeper who is too busy to read his bee-paper is altogether too busy to fool with bees any at all. We can not see how a bee-keeper can put an hour or two each week to any better advantage than reading a bee-paper—that is, if he cares anything about making a success with bees. Some-

times a single item or article in any of the bee-papers is worth more than the subscription price for 10 years. Of course, we mean it is worth that if it is put into use by any live, up-to-date bee-keeper.

The fact is, that nearly all of us can find time to do whatever we really want to do. And it is truly so of the busy man—no matter how busy he is, he can always find time to do one thing more. It is usually the lazy, poky fellow who never has time for anything; and he is generally not asked to do anything, because those who know him best know that he never gets anything done.

**Cure for Bee-Paralysis.**—Many cures for bee-paralysis have been given, their authors confident of their efficacy, but upon further trial success did not follow. One reason for confidence in cures that do not cure is that frequently the disease disappears of itself, and then whatever remedy was last tried has the credit for the cure. In the hope that something, some time, may prove successful, it is well to give new remedies as they are offered. Here is one given in *Gleanings in Bee-Culture*:

I dug a ditch six inches wide and three inches deep in front of this hive, the ditch extending around to the sides of the hive. It is necessary for the hive to stand very close to the ground. The healthy bees will dig the diseased ones out and fall into this ditch, and have to leave the sick bee there, for it can't fly out; and all the sick bees that crawl out of their own accord will fall into this pit and can't get out, so you have these diseased bees trapped. I go out every evening and take up these dead bees, and burn them, destroying the disease-germ, hence I effect a cure. I have tried this remedy several years, and have never failed yet to cure a colony thus treated; in fact, I would not be in the bee-business to-day if I had not discovered this remedy. It usually takes about ten days to effect a cure.

## Association Notes

Mr. J. Q. SMITH, of Lincoln, Ill., has been appointed as Inspector of Apiaries for Illinois, as will be seen by the following:

ROUTE 4, SPRINGFIELD, ILL., June 19, 1903.

EDITOR AMERICAN BEE JOURNAL.—The Illinois State Bee-Keepers' Association met yesterday (June 18) at the State House, for the purpose of naming a foul brood inspector for two years, to carry out the provisions of the late Act of the Legislature. Mr. J. Q. Smith, of Lincoln, Ill., was chosen as such inspector.

It was the voice of the meeting that while the Act was in favor of the State Bee-Keepers' Association, all bee-keepers whose bees are affected with foul brood should have the attention of the inspector free of charge to them, except his entertainment; but that those who become members of the State Association should have the preference.

It was also the voice of the members present, that those who became members by paying their fee of \$1.00 to the Secretary, would secure also a membership in the National Association for one year.

JAS. A. STONE, Sec.

Now, whose whose bees are diseased can call on Mr. Smith any time after July 1st, the date when the law goes into effect.

Every bee-keeper in Illinois should send his dollar to Secretary Stone at once, so as to get in line for the State Inspector in case he is needed. The same dollar will also pay a year's membership in the National. Better join at once, if not now a member of the State Association.

**THE NATIONAL CONVENTION IN CALIFORNIA.**—Editor Root is quite enthusiastic about the matter. Having been over the ground embraced in the trip, he knows what he is talking about. He says in *Gleanings in Bee-Culture*:

It was suggested that we make the Santa Fe route the semi-official one of the bee-keepers. A tourist sleeping-car could be made up largely of bee-keepers, to start from Chicago in time to give a day's stop-off at the Grand Canyon—probably the most remarkable scenery of the kind the world affords. The train is then to go on to Los Angeles, fully named the "City of the Angels," one of the most delightful cities I have ever visited. It is not delightful because of its architecture, but because of the surrounding scenery and its bracing climate. Cool evenings and warm days make living there most enjoyable.

Board and lodging can be secured at very reasonable rates. In one of the good hotels of the city I secured a room at 25 cents a night, and board at 25 cents a meal, and the very best. There were other places where I could have had accommodations still cheaper. The bee-keepers there are a most hospitable set of fellows, and I shall not forget some of the pleasant hours spent with some of them.

This is a good year for California; and if one desires to see the real extent of bee-keeping possibilities in one of the fairest climes the world affords, let him take this trip. Do not go simply because you may get enough at the convention to pay you, but because your horizon of life will be enlarged, and because, years afterward, you can live over again (in memory) one of the most delightful trips you ever took. Just think of it! You can take a car in the morning in Los Angeles, and go to the coast and take a sea-bath. You can then come back to Los Angeles and eat strawberries and pick roses. In the afternoon you can go to Pasadena, a little city that is even more beautiful and more perfectly laid out than Los Angeles, where the great wealth of the East has been poured. Indeed, it is almost a heaven on earth. An hour's ride will take you up into the mountains, where you can get above the clouds—yes, may take a sleighride and enjoy a good snow-balling. Just think of it! a sea-bath in the morning, strawberries and pick roses at noon, a sleighride above the clouds, and snow-balling, all in one day! Talk about going "from the sublime to the ridiculous!" This beats anything for a rapid change of season and scenery. While this is possible in the spring of the year, it may not be possible in August.

But one of the most thrilling trolley-rides (dangerously near precipices) that can be imagined is to take an electric car and actually glide above the clouds and look down upon the valley spread out like a panorama thousands of feet below. One can see the ocean, and the cities of Pasadena and Los Angeles, and all the small outlying towns, with their fine orange-groves and all the beautiful luxuriance of a tropical climate. In short, he can see typical Southern California.

Bee-keepers, if you fail to take in a trip of this kind (and it is the opportunity of a lifetime) you will be missing one of life's greatest pleasures.

**THE SPARTA, MICH., ordinance**, referred to last week, which declared bees in that city a nuisance, and that they must be removed on or before May 10, was finally dropped. As soon as Mr. France learned that the ordinance was to be passed, he sent the city authorities and others plenty of literature, and letters pleading for the members who were threatened. As soon as the ordinance was passed, Mr. France sent Pres. Hutchinson to investigate the case, and settle, if possible. He went, but could not then get settlement. A trial was arranged for, and when the city of Sparta went to Detroit to secure legal aid, they learned that the National Association had already engaged one of Michigan's best attorneys. The city officials of Sparta then returned and dropped the case, which was much to their credit. Another victory was thus gained for the National Association.

As reported before, there are now over 1200 members in the Association. In view of the excellent things (the above is an illustration) it is doing for its members and bee-keepers in general, the membership list should be doubled before fall. "In union there is strength."

Each bee-keeper should feel the necessity of standing by all other bee-keepers. Only by so doing can the rights of each and all be maintained.

## Sketches of Beedomites

RUFUS TOUCHTON.

Mr. Rufus Touchton was for many years a prominent bee-keeper of Ventura Co., Calif. He died Oct. 9, 1902, after a weary struggle against the grim destroyer, Death. The local newspaper, published where he lived, said that his was an upright, conscientious life, ever performing the duties set before him, in domestic and public relations, in a manner that won him hosts of friends and the admiration of all. As one of the Supervisors of the county he served his constituents in an efficient manner. He was always a strong temperance man, and in anti-saloon contentions he stood faithfully by his own convictions and the promises he had made to his people.

Mr. Touchton was a native of Maryland, having been born in Hayre de Grace in 1852. He went to California in 1875, and located near Santa Paula. He engaged in bee-keeping and honey-production, and was considered one of the best apiarists in that State.

In 1894 Mr. Touchton was elected Justice of the Peace in Santa Paula, and served four years. In 1898 he was chosen Supervisor from his district.

A large concourse of people attended the funeral services, thus showing their esteem for their departed friend and neighbor.

The foregoing biographical notes were furnished us by Jno. G. Corey, a venerable bee-keeper of the locality in which Mr. Touchton resided so long. This short sketch should have appeared long ago, but was not furnished us until early this year, and has been overlooked.

## Convention Proceedings

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 391.)

Pres. York—We have spent a good deal of time on this subject, and Mr. Moore has an article somewhat along this same line. After he has read it, we will take up the question-box. We will now listen to Mr. Moore:

#### THE FUTURE OF THE NATIONAL, AND THE DUTY OF AFFILIATED ASSOCIATIONS.

The future of the National Bee-Keepers' Association is a theme that is of interest to all of us. Two years ago we raised the war-cry of "1000 members for the National!" and now we have it. Let us, here and now, in this Great City, at the center of population and energy for the Great West, raise high the cry "10,000 members for the National!"

And shall we not have it? Is there any impossibility inherent in this high aim? Let us consider for awhile a few phases of the question.

The United States Department of Agriculture reported that in this country there are over 700,000 who are engaged in apiculture on a large or small scale.

The bee-hive factories and supply dealers are sending out their catalogs to from 150,000 to 200,000 different addresses.

The bee-periodicals have about 25,000 paid subscribers. Is there anything impossible or wonderful in an association of 10,000 members from this host of over half a million strong.

So it is settled that we are to have 10,000 members in our National organization in the near future. The Good Book says, "According to your faith be it unto you;" and our faith is more than equal to this height.

We shall proceed to mention a few of the steps up to the full realization of high ideals.

First, at the election for General Manager held this month, let us elect to this high office *the best man* in our ranks, regardless of location, controversies, or any other disturbing element that may seem to complicate the situation. The only one thing that should be considered is, Who will serve the National best, and lead her up to the highest points of success and influence? Then having recorded the will of the majority, let our whole 1000 officers and members go forward in the New Year, resolved to put petty differences and jealousies behind them, and work for great things for the bee-keeping world.

Publicity and promotion are, in any business enterprise, of first importance. At the World's Fair held in our city in 1893, Moses P. Handy was employed at a salary of about \$10,000 a year, and his sole function was to let the world in all languages know what we were doing and proposed to do at Chicago. No doubt the Great Fair would have been a failure without the Bureau of Publicity and Promotion.

We are now in the 20th Century, and 20th Century methods must prevail.

Our opportunities are great, our field of usefulness is large—wide as the Nation.

We must succeed grandly, or disgracefully fail; there is no middle ground.

We must have our "Bureau of Publicity and Promotion" if we are to achieve great things.

Let every bee-paper in the land run a column in every issue, headed, "What the National is Doing." Let the officers, especially the General Manager, be responsible for the supply of copy to every bee-paper in America, small and large.

In the opinion of the writer, hundreds are waiting to see the National *do* things, before putting in their dollars to help.

You can see by the quantity of material submitted in

the annual report what a large amount of readable copy could be made, and the skeptics would be speedily convinced that the National was *doing things*, and could also be trusted to *do more* in the future.

Therefore, let the National advertise, and advertise largely, and I venture to say that no bee-paper in the land would render a bill for space.

The National Association must in the future rise to a sense of its responsibilities and privileges as never before. It must look forward, and up, to plans and aims that may seem now out of reach.

In nearly every State in the Union laws are made to protect the interests of bee-keepers. It takes lots of money to influence legislation.

Look at Illinois. No foul brood law; no spraying-in-fruit-bloom law. It is distinctly one of the functions of a National organization to get laws that are needed by bee-keepers passed in all the States.

An Association of 5000 to 10,000 members, and having the power to levy assessments for proper objects, can raise all the funds necessary to put needed laws on the statute books in every State.

I am no prophet, nor even the son of one, but I venture that there will be no lack of members and money to accomplish any lawful end, when bee-keepers all over the land realize that the National is going to do things on a scale commensurate with the size and wealth of our beloved country.

One of the laws greatly needed is a law of Congress forbidding the use of the word "Honey" on anything except *real honey gathered by honey-bees*.

Right here I want to whisper that this is a land and an age of majorities, and if you wish to lead it is wise to take your hat in hand, and say to the great body of the plain people, who finally settle everything in this country, "Sirs, what are your wishes?"

I will pass along to my next head:

#### THE DUTY OF AFFILIATED ASSOCIATIONS.

This was one of the greatest and wisest laws ever passed by our governing body, allowing any association to join in a body at half price. This has helped to the 1000 mark. Our General Manager will confer a favor on us all by giving the total of members affiliated in this way since the law was passed.

Let us not think that our duty is done when we pay our dollar. Every member must have and feel a personal interest in the work of the National. Any General Manager will welcome letters from the members with suggestions as to any phase of our work.

Let us talk up the National to our bee-keeping friends. Urge them to send in their dollar right away. Tell them they never know when trouble may come, and then it is too late.

Suppose every one of our 1000 should be a committee of one to get new members, does any one doubt that we could average two new members for each old member? and lo, we have 3000 members! Next year we have 27,000 members.

How important it is to get the membership aroused to action. No one person can do it all, but "united we stand," and nothing is impossible for us. No argument is necessary to prove that all questions are safe in the hands of the people, and sure to be decided rightly, if the majority really speaks. Therefore, let all affiliated associations send in to the General Manager nominations for all offices in the gift of the Association.

I need hardly mention as one of our duties, to join promptly again on expiration of membership, and remit promptly for the same. For only with the "sinews of war" can we do battle for the right and the interests of bee-keepers.

HERMAN F. MOORE.

#### WINTERING BEES ON HONEY-DEW.

"Having nothing but a crop of honey-dew, how can I winter my bees on it?"

Dr. Miller—The first thing to know is whether that honey-dew is of the kind that kills bees. In some places they winter successfully on it. If the questioner has had experience with it he will know.

Pres. York—He can probably tell better next spring.

Dr. Miller—He may have tried in past years.

Mr. Willcox—I had a very little experience with it, but I am rather inclined to the opinion that something can be done toward helping it by feeding sugar syrup. When that brood hatches out, feed sugar enough until they care for themselves, and they will get through the winter.

Mr. Watts—Some seven or eight years ago this occurred

to me: I had 120 colonies of bees all in strong condition. That season they gathered nothing but honey-dew, the first I ever experienced. Not being experienced at that time I didn't know what to do. I couldn't sell the honey, and couldn't do anything with it, and I told my wife we were going to lose all our bees. She laughed at me; but winter came on; the bees were on the summer stands; I left a lot of the surplus on the hives, but it was no use, in the spring my bees were all dead except two colonies. I lost the whole apiary. About three years ago we got another honey-dew crop, of a mild form. I sold that honey and the bees all died. I am afraid something will occur again, and I have no remedy.

Dr. Miller—I believe I would give them some syrup with the idea that they will take that first, and what they put in last they are likely to use first, and you will at least stand a better chance by having them use part of the sugar syrup.

Mr. Watts—Isn't it too late now to give them sugar syrup?

Dr. Miller—I should say ordinarily yes, decidedly. No sane man ought to give sugar syrup now, but in case of their being filled up with poison, I would run the chance of keeping them on that food.

Dr. Nussle—I would use one-tenth part of honey with the sugar syrup, if I had to import it from a neighboring State.

Mr. Abbott—If you have honey-dew you needn't run any risk feeding sugar syrup. Get granulated sugar and make a cake, and put it over the cluster, and my word for it, the bees won't eat anything else until that sugar is all gone. There is no reason why any bee should be fed syrup this time of the year. It surprises me that more isn't made out of this idea of feeding a sugar-cake. Five pounds of sugar will run any colony of bees through the cold weather that we have in Missouri, and which lasts during January. It is perfectly safe, easily made, and easily fed.

Dr. Miller—I want to accept the amendment. I hadn't thought of that. Mr. Abbott always has the cake of sugar with him "in his head." I don't. I ought to have had it.

Pres. York—Will Mr. Abbott please explain how they make the cakes of sugar for bees in Missouri?

Mr. Abbott—We simply get the best grade of granulated sugar and put just as little water in it as we can to make a liquid out of it in stirring up, then boil carefully, being careful not to burn it. My wife does it. She is the cook at our house. I used to cook, but I quit since I got married. She takes a little of it and drops it in cold water, and when it grains it is time to pour it out. Pour it into broad pans and make it about 1½ inches thick; and as she pours it in she stirs it a little, and that leaves little crevices that the bees can work into. I like it in the sugar form a little better. Then I put some sticks right over the cluster in January, and lay the cake on that, and put a canvas or something like that—something so there is no upper draft—and I have wintered a good many colonies without any honey of any sort, or anything to eat except that sugar. They will eat right through it, and the inside out of it, and sometimes leave a little, thin rim around it.

Mr. Wilcox—If you use crushed sugar mixed with honey and knead it to get the right consistency, wouldn't that answer just as well?

Mr. Abbott—It would answer until it run down over the bees.

#### IMPROVING BEE-PASTURE.

"How can I improve my bee-pasture?"

Dr. Miller—Sow sweet clover and catnip.

Mr. Wilcox—We have improved our honey-pasture wonderfully by sowing alsike clover. The farmers sowed it for the seed and found it profitable, and it is equally profitable for the bees.

Dr. Miller—Will alfalfa yield honey where you live?

Mr. Abbott—Yes, sir.

Dr. Miller—It doesn't in this locality.

Mr. Abbott—This must be a funny country.

Dr. Miller—I have been making inquiries for several years about it. Which side of the Missouri River do you live?

Mr. Abbott—I live on this side.

Dr. Miller—It is the first case yet reported that I have heard that alfalfa was sown along the Missouri River. I have been looking for this. They are telling us now at the experiment stations that we can have alfalfa grow and succeed in the State of Illinois by inoculating some of the soil, and I have been looking for that time to come.

Mr. Johnson—This is the plan that I have formed for the coming season: I went around to the neighbors and

agreed to supply them with one to five pounds of alfalfa seed at 25 cents a pound, and supply a small amount of inoculated soil. I can get it from the West from an uncle of mine. They are anxious to have it, and I see no reason why it shouldn't grow. I sowed one alfalfa patch. It takes about three years before it does anything, but it finally did well. I think it developed the germs itself. I think any alfalfa would finally develop those tubercles. Alfalfa is a clover, and in the different seasons it will yield here as well as anywhere. Sweet clover was a failure on account of being too wet.

Dr. Miller—Did you have your bees working on it?

Mr. Johnson—No, I did not.

Mr. McQueen—I have a patch of the alfalfa about half way to Elgin, and the bees worked strong this year. They did nothing with it last year.

Mr. Green—I am afraid Dr. Miller has not been reading his bee-paper thoroughly. There was a report from South Carolina of bees working very heavily on alfalfa there, but it was said they did not work the first year it bloomed.

Mr. Hutchinson—Is your patch on high or low ground, Mr. Johnson?

Mr. Johnson—It is not on low ground. It is on the side of a hill.

A Member—Alfalfa has to have well-drained ground. It has to have ground where water doesn't stand, ground where the rain can penetrate. It doesn't do well on heavy clay. On clover ground it will give honey in this country. I am going to try it next year.

Mr. Johnson—Nobody has tried alfalfa in this part of the country long enough—haven't had it long enough to decide that it doesn't produce honey. It takes a long while. It is on account of the bacteria, and I believe it will develop bacteria itself, and then it will produce honey.

Dr. Miller—I shall be glad to believe that. What about wild cucumber as a honey-plant?

Mr. Hutchinson—Bees don't work on it in this part of the country. I haven't seen a single bee on it.

Mr. Green—I watched them two years and saw only a couple, and they were gathering pollen.

Mr. Hutchinson—Near Dr. Gandy, in Nebraska, they get large crops of cucumber honey.

Dr. Miller—Is that the same thing?

Mr. Hutchinson—I don't know.

Dr. Miller—As I understand it, the kind of wild cucumber we are talking about, the sack is about as large as a butternut. There is a plant that the bees work on that looks like wild cucumber. We may be talking about different things. This pod, the seed is not like this at all. It is larger a good deal than this, the kind of wild cucumber we are talking about. There are only two seeds inside the pod, and they drop out and the cucumber dries up. We are talking about two different things.

#### PREVENTING PROPOLIS ON THE HANDS.

"While extracting how can I prevent propolis on my hands?"

Pres. York—Some one might suggest wearing mittens!

Mr. Wheeler—Wash your hands in kerosene.

Pres. York—The question is, How can I prevent?

Mr. Wheeler—Let some one else do the work.

Mr. Moore—Don't keep bees.

Mr. Abbott—You can prevent that sticking to your hands by oiling with sweet-oil, or something of that kind. I always oiled my hands before I began work.

Dr. Nussle—Oil or glycerine will prevent it from sticking to the hands to a great extent.

Mr. Wheeler—You can take it off very quickly with kerosene.

(Continued next week.)

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 10 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order. Send all orders to the Bee Journal office.

### Shaken or Forced Swarms—Questions Answered.

BY ADRIAN GETAZ.

I SHOOK a few swarms several years ago. The object I had in view was not to make swarms but to prevent them. The plan was to take all the brood out, put it on a new stand, and return it to the parent hive in five or six days.

As to preventing swarming, it was a complete success. None of the colonies thus treated offered to swarm. But the plan is otherwise objectionable, viz.:

1st. To carry it out on a large scale, it would be necessary to have a number of extra hives, which would involve a considerable cost.

2d. During the five or six days that the brood was absent, the parent colonies did nothing, or very little in the sections, but worked vigorously in the brood-chambers. And when I went to return the brood, I found the brood-chambers about half full of crooked combs, mostly drone, hanging from the supers. As a matter of fact, I expected to find some comb built in the brood-chamber, but I thought that with plenty of foundation in the supers, the bulk of the work would surely be done there. The locality, or rather the strength of the honey-flow, may have something to do with the results.

3d. The queens will go in the sections unless prevented by a honey-board. A honey-board is a nuisance, anyway, and also an expense.

4th. Some pollen was carried in the sections. I don't know how it could be prevented. The locality may have some bearing on this point.

#### MODERATE INCREASE.

A plan that will prevent swarming and secure a moderate increase consists in taking one comb of brood out of each colony every few days and replacing it with a comb of foundation. If the object is merely the prevention of swarming, the operation should be repeated as often as necessary, so as to furnish the queen enough room to lay. That may be as often as every fifth day, or perhaps only every tenth day, according to the size of the brood-chamber, the prolificness of the queen, the honey-flow, and other conditions.

As long as the queen has enough empty comb to lay in, there will be no swarming unless the queen is failing, or unless the lack of shade and ventilation renders the situation intolerable.

It will not do to put in an already built comb; the bees would often fill it with honey before the queen could lay in it. The reverse takes place when the foundation is given. But it is necessary even then to replace but one comb at a time, otherwise a portion of them would be filled with honey, as the queen could not lay in them fast enough to occupy them before the cells would be long enough to hold honey. I suppose that an already built comb shied down would do as well as foundation, but I have not tried it.

Keeping in view the above experiments, I think I can answer some of the questions asked in a recent number of this paper.

#### WHEN TO SHAKE THE BEES.

Right here it must be remembered that a colony which will not attempt to swarm will do better if left undisturbed. The trouble is, we do not know in advance which will not swarm and which will. The plan suggests itself to watch the colonies and "shook" those that begin to prepare for swarming. The trouble is, that in order to carry out this plan, it would be necessary to inspect carefully each colony every fourth or fifth day. That is entirely too much work.

The only plans that remain are to treat all the colonies just before the swarming season, or put queen-traps on all (or clip the queen), and treat only those that actually swarm. If the locality and other conditions were such that the majority of the colonies were likely to swarm, I would advise the first plan, otherwise I would prefer the second.

#### COMB FOUNDATION OR WHAT?

What shall we put in the brood-chamber, foundation or drawn combs? In view of the experiments stated above, I

should say, emphatically, not drawn combs, by any means. The bees would fill them with honey at once. Starters will not do. Too many drone-combs would be built. Full sheets of foundation should be given.

#### CONTRACTION.

This is a point on which I have no experience and can only suggest. If other people's bees do like mine did, they would work nearly altogether in the brood-chamber, rebuild it, and nearly entirely neglect the supers.

I would suggest to contract the brood-chamber to three combs, so that the majority of bees would be compelled to work in the supers. Then as soon as three combs are occupied, add one or two more; and when these are occupied, add again, and so on. It would not do to leave the brood-chamber much contracted all the time, because the swarming fever might start again.

#### SHALL WE LEAVE A COMB OF BROOD?

No, unless it is sealed brood. After the bees have once begun to build queen-cells, they will keep it up as long as the circumstances are favorable, and there is unsealed brood. There must be a forced interruption of some sort, either to destroy the swarming fever, or rather the queen-cell-building fever.

#### SHALL WE "SHOOK" OR NOT?

In my opinion, no; decidedly, no. It is far better to keep the forces together than to divide. In shaking swarms, the swarm (on the new stand) cannot give any surplus. The parent colony loses the bees that are on the new stand; besides that, it has to rebuild its brood-nest. A double loss.

But can it be done? Can we keep the forces together? Certainly we can. Cage the queens or requeen. In my locality, and with my system of management, only a small portion of my colonies swarm. The most satisfactory process with me is to let those colonies swarm that want to, return the swarms, destroy the old queens, and let them requeen out of their own cells. It is very easily done by having queen-traps on all the colonies.

#### A CONVENTION OF TWO.

Last winter I had a visit from Mr. Daniel Wurth, one of our best queen-breeders. It is hardly necessary to say that queen-rearing in all its aspects and details was the subject of our conversation. Mr. Wurth does not sell his queens direct to the consumers; he furnishes them through the supply-dealers. He insisted on the necessity of controlling the drones, and having drones to be good stock. He says it is not enough to Italianize the neighborhood and take the chances. His method is to put one or more drone-combs in several of his best colonies, keep them fed, and therefore have an abundance of good drones in the apiary. He says that if there are enough drones in the apiary, only an insignificant number of queens will mate elsewhere.

Among other questions, I asked him if he had darker queens in the fall than in the summer? He said he had some occasionally, not only late in the fall but also early in the spring. He thinks that the darker color may be due to the queen-cells being exposed to a too low temperature.

Knox Co., Tenn.

### Rearing Queens—Methods Discussed.

BY HENRY ALLEY.

WELL, now that the umbilical-cord humbug has died a natural death, and expired just about as quickly as most people supposed it would, we can now discuss subjects of more importance to the readers of this paper.

Mr. Doolittle lays a good deal of stress upon the fact that certain things he refers to can be found in "Scientific Queen-rearing." Yes, they can. One thing he refers to is the matter of rearing queens over and behind an excluder—that is, a queen-excluder. That is in his book, no doubt; but it never got there till I published it in the columns of the American Bee Journal. Many other things may be found in "Scientific Queen-Rearing," but they did not get there until after they appeared in my first work on queen-rearing, in a book entitled "The Bee-Keepers' Handy-Book." This work, which had the largest sale of any book devoted to queen-rearing, and contained 180 pages, is now out of print.

A perusal of this work made it quite easy for several parties to write books on the subject of rearing queens.

The only difference, in the method of rearing queens, between Mr. Doolittle and myself, is that he makes artifi-

cial cell-cups, and I use only those built in the natural way by the bees themselves. Now, readers, which of the two methods, think you, is the best? In what respect do artificial cell-cups have any advantage over natural cells? Mr. Doolittle claims to follow natural laws and natural methods in rearing queens, yet he tells people to disregard natural ways and adopt unnatural principles, as they are better than the methods used by the bees themselves. What bosh!

I first gave to the world a way of having queen-cells completed above an excluder, and refer to back copies of the American Bee Journal in support of this claim. I first gave to the world a method of having queen-cells completed in the brood-nest, while a queen was present in the colony. In that latter case no excluder of any kind was used. Neither of the above systems is practical, for the simple reason that they cannot be used at all times. With the first system good work can be done while there is a good flow of honey. But even in this case, not as good queens can be reared as by another method, and that is why I discarded the entire arrangement.

If I could rear superior queens at all times, as Mr. Doolittle says he can by the excluder system, I surely would use it. I have tested the matter to my entire satisfaction.

Mr. Doolittle, if I remember correctly, made some adverse criticism on the fact that I reared good queens with a pint of bees. I had nothing whatever to do with rearing any queen with a pint of bees. The bees alone are responsible for the good work that was done. I merely took the queens from a very small hive of bees, and the queen that was introduced was destroyed, and this pint, or cupful, of bees reared a fine queen. To have been consistent with the ways some people do business, I ought to have destroyed that large, fine and beautiful queen because she was not reared in a 16-frame hive by a bushel of bees. Who says a cupful of bees won't rear a grand queen? Let's see:

In the American Bee Journal of May 4, Mr. Doolittle stated that he had a colony that built 174 queen-cells. Whew! Wasn't that a lot? Now let us dive into mathematics a little and see about how many bees by measure it took to rear those 174 queen-cells, or queens, as the case may have been. Now, at the rate of one pint of bees to a cell there would have been 87 quarts of bees. That is 2½ bushels and 7 quarts of bees in all. Did any one ever see a colony of bees that would measure 2½ bushels? Well, let's call it a cupful of bees and a queen. That would have made in measure a half pint of bees per cell. How many beekeepers ever saw a colony of bees that contained 87½ pints of bees. Now, why criticise my statement that a cupful of bees built a queen-cell and produced a superior queen? Does not Mr. Doolittle's statement fully confirm my claim that a cupful of bees will rear a good queen? But I do not believe there were three good, or fairly good queens produced in those 174 cells.

What does Nature do in rearing-queens? Do bees build half a hundred cells when they cast a swarm? No, not on an average over 12 cells, and hardly ever over 3 cells; that has been my experience.

Mr. Doolittle in a recent article shows where his bees did better than mine. I really think I could fill this entire volume of the American Bee Journal in showing that my bees did better than any other bees on earth. In all my catalogs, in which I gave testimonials of my bees in competition with others, I always omitted the names of the other dealer—never considered it fair to call names in such cases. I know there are always good reasons why some bees do better than others, and it is not always the fault of the bees, either. We all know that. Here is a case for the reader to consider:

A bee-man in Ayer, Mass., Italianized his apiary of 14 colonies. The bees bred up well, were very handsome and all the hives were full of bees. The dealer from whom those queens were obtained advertised the best strain of Italians on earth. But these bees never would work in the sections, and barely got a living. He sent for me to come for the bees. When I had looked them over, I said: How much do you want for the lot? His reply was: "Take them out of the yard." He said they were worthless and I could have them for nothing. Well, they were *worthless*, as honey-gatherers. But I destroyed the queens and bred the bees for forming nuclei.

Now, the fact that these queens were extra-prolific showed that the trouble was not in the breeding, but in the strain of bees.

Now, Mr. Doolittle and myself have sent out queens that were no better than the above, but in my case it was in the strain and not in breeding that caused the trouble. Mr. Doolittle is criticising me for the same things he is

guilty of himself. Sometimes a strain of bees does not prove to be what they gave promise of. But we all do the best we can. I always try to beat the other fellow in the production of the best bees and queens. The other fellow tries to beat me. We are all in the same boat.

Mr. Doolittle, why do you say your queens are better than mine? Dr. Gallup, your old teacher in queen-rearing, and a man in whom you take, or took, a good deal of stock, says your queens are no better than mine. He said it, didn't he, and no longer ago than last winter, in the American Bee Journal? Now, Mr. Doolittle, you would better go slow on this point, as I can show as many letters condemning your queens as you can against my queens.

A few words more and I am done this time. Mr. Doolittle has published to the world his method of rearing queens. I have done the same thing, antedating Mr. Doolittle a long time. I do not believe in hiding light under a bushel.

Now I will tell the readers of this journal how I rear queens, or rather how I produce queen-cells and have them completed. When I have eggs about ready to start queen-cell building, I select one of the strongest colonies of bees in my apiary to do the cell-cup building. This colony is taken into the bee-room, the combs all removed and the bees brushed from them into the cap of a bee-hive. I do this in such a way that the bees stay in the box till I find the queen, which is not long, I can assure you. When the queen is found the bees are then put into a box having a wire top and bottom. The top is the cover. The bees are right in this condition for a few hours. In the course of an hour they miss their queen, and a few hours later they are supplied with eggs and cell-building is at once commenced. The bees will construct as many cell-cups as eggs are given them.

In the course of 24 to 36 hours these cell-cups are divided among several of the strongest colonies in the yard. The queens from the full colonies are first removed say 12 hours before the cell-cups are placed in the hives. Now, I do not put these cell-cups behind nor over a queen-excluder. A comb is removed from the brood-nest and the cells placed between two frames of solid brood. Here they are left until completed, which is three days later. By this method there are two sets of bees working on each set or batch of cells. The cells built in this way produce queens superior to any I ever reared by any other system.

Does any reader of this paper know of a better system of rearing queen-bees? Do you, Mr. Doolittle, know of any that compares with it? If you rear good queens by your present method, you can rear much better ones by the one given above.

I have been accused of rearing queens by the nucleus system. Does any man who rears queens thus see any nucleus system in the above? The first year I reared queens, when I was not selling queens, I reared by the nucleus system. Bear in mind, I only reared queens in three days for amusement, and not for sale. I reared good queens, all the same. Essex Co., Mass., May 14.

## Winter Ventilation and Porous Coverings— Some "Whys" About Them.

BY ARTHUR C. MILLER.

ON page 137, Mr. Hasty hesitates to give Mr. Holtermann's theories on porous coverings full endorsement.

Mr. Hasty does well to qualify his support, and I hope to show that his doubt is well founded, and that Mr. Holtermann's theory is erroneous, not because it is his theory, for it is not his alone, but because the truth is otherwise.

During the winter, when bee-life is maintained at a minimum of exertion or visible activity, ventilation by fanning is unnecessary, and is not resorted to except under certain conditions, and then generally only at considerable intervals. But the air is steadily and constantly changing in the hive, whether the latter be a thin box or a thick chaff hive. This is due to two causes—the cooling of warmed air, and the development of carbonic-acid gas.

The normal temperature of the winter cluster of bees is 65 degrees F. The warmed air in and about this cluster slowly rises, spreads out over the top of the chamber, chills, settles and passes out the hive-entrance, other air drawing in to take its place.

Place a smoker containing a small and slow fire in an empty hive, replace the cover, and we have a visible

though crude illustration of the air-currents created by the bee-cluster.

Regarding the production and movement of carbonic-acid gas, I cannot do better than quote from Cheshire, condensing part and quoting part literally:

"During periods between visible feeding the bees are actually feeding upon the store of honey taken into the honey-sac, where it is held till appetite needs appeasing." The digested food passes into the circulation, is oxidized by the air breathed, and heat is involved. "A supply of fresh air to the cluster is clearly essential, for as the heat is in proportion to the honey consumed, so it is in proportion to the products of oxidation—the noxious gas (carbonic acid) and the water—as a reference to the following table will show, in which all but the main constituents of the honey have been disregarded for simplicity's sake.

24 oz. honey	{	9 oz. water—9 oz. water.
		6 oz. carbon—6 oz. carbon.
		8 oz. oxygen
		10 oz. hydrogen } =9 oz. water

"The 6 ounces of carbon being united with 16 ounces of oxygen from the air, we obtain 22 ounces of carbonic-acid gas, which, with the 18 ounce of water, are thrown into the air of the hive by the consumption of 24 ounces of honey."

"Let us trace the 22 ounces of carbonic-acid gas, occupying about 12 cubic feet at ordinary temperature. Dealing with a colony wintered on seven standard frames (the equivalent of 6 Langstroth frames), set 1 1/2 inches from center to center, we find:

Seven frames, each 8 1/2 cubic inches wood—	59 1/2 cubic inches.
20 lbs. honey, specific gravity 1.386	=400 " "
1 1/2 lbs. wax " " .965	= 48 " "
Pollen, estimated	= 30 " "
Bees	=100 " "
	622 1/2 " "

"Disregarding fractions, this, subtracted from 1,500 inches (the solid contents of the hive) gives 878 inches, i. e., an air-space which we may for simplicity's sake regard as half a cubic foot, or 864 cubic inches. Therefore 12 cubic feet of carbonic-acid gas produced from the consumption of 1 1/2 lbs. of honey, would fill the air-space in the hive twenty-four times. Nor is this all. Air is only one-fifth—by measure—oxygen, the other four-fifths being nitrogen; and carbonic acid occupies precisely the same space as the oxygen, which unites with the carbon to produce it. Therefore, if the whole of the oxygen introduced had been converted into carbonic acid, the air in the hive must have been entirely renewed 24x5=120 times; and further the presence of carbonic acid is so deleterious that 5 percent only of the oxygen could be utilized; the proportion being also limited by the laws of gaseous diffusion (interchange) in the breathing-tubes of the insect. Thus it is impossible to resist the conclusions that 1 1/2 lbs. of honey cannot be oxidized for heat-production without the air of the hive being changed 2400 times."

"Authorities, with unusual agreement, state that the loss in weight of a wintering colony, in which breeding is suspended, is less than 2 pounds per month. With ordinary protection, this is about accurate, but it may be rather less than 1 lb. per month, or about 1/2 ounce daily. The 1 1/2 lbs. would therefore represent 48 day's rations, and make the daily essential number of renewals of the air-volume of the hive to equal 2400 divided by 48 equals 50; i. e., the air of the hive, even during this very restricted food-consumption, would need to be changed completely during every 30 minutes.

To what extent such a change could take place through chaff packing or unpainted walls may readily be guessed.

As further evidence that no upward or lateral ventilation is necessary, either to rid the hive of its moisture or its foul air, I would cite the results of my experiments with hives so enclosed in tarred paper, that the only exit for air or moisture was the entrance. Colonies so protected winter perfectly. Furthermore, carbonic-acid gas is heavier than air, and settles. Providence Co., R. I.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## Our Bee-Keeping Sisters

Conducted by ENMA M. WILSON, Marengo, Ill.

### An Experience with Bees.

My father has always kept a few bees ever since I can remember. After he got too old to work he kept more bees, and I helped him. I made, or rather put together, the sections, put in the foundation or starters, and got them ready to put on the bees; helped him take off the honey, cleaned off the sections, and I finally cased it ready for market, etc. Since he left us, in April, 1892, in his 89th year, my sister and I have run the apiary. We did all the work ourselves till the last two or three years, when our brother has helped us some. (I have had the rheumatism so much that I can't do half the work I used to, so our brother has taken my place and does whatever I am unable to do.)

The spring of 1892, if you remember, everybody lost nearly all their bees. We were left with 18 queens and a handful of bees, perhaps a pint to each queen. We fed them, and built them up, and increased them to 35 colonies, and that fall we sold about \$100 worth of honey. That year was a good honey-year—if we had only had the bees to gather it. Since that time we have had some good and some poor honey-years—more poor than good, though—only two good ones. One of the years we got 5563 sections of nice honey, and the other 4432. Some years we would get pretty nearly 1000, and once a little over 1500, and the other years less. Last year was a failure. We had less than 500 sections of honey, but it was about all salable honey. We had 70 colonies of bees. There was fall honey enough for them to fill their hives, and they went into winter quarters in good condition.

We have 60 colonies now, 5 of them rather weak. This has been such a cold, bad spring for bees that I do not know whether they are as strong as they would have been if it had been a warm spring.

We have just taken the cushions off of them, and put the sections on last week. We winter them on the summer stands. White clover has begun to bloom. We are in hopes that it will be a good honey-year.

I do not see any way in which "Our Bee-Keeping Sisters" department could be improved. I nearly always turn to that department first. (MISS) L. C. KENNEDY.  
Sangamon Co., Ill.

### Does the Bee-Work Herself?

The "Sisters" department of the American Bee Journal has pleased me so much that it is the first thing looked for in every edition. I had five colonies last year, but because of the illness of my sister, who has been helping me for years in the housekeeping, I have been compelled to dispose of several, not being able to do justice to the bees, as they must be looked after continually here, because of the prevalence of foul brood in this vicinity. I had one colony attacked last year, and I got rid of it only through considerable work and some little worry. I had good "crops" of honey every one of the five years that I have had bees, and last year it was a remarkably fine one. I do practically all the work myself, unless there is a rush, or some heavy work to do, when I call upon Mr. V. for assistance.

Hamilton Co., Ohio.

MRS. M. VAUPEL.

### Transferring from Gums—Ants.

We have 3 colonies now. The boys and I do the work. We found a swarm in the corn-field, so we took a hive and put it in, and it is doing nicely at work. It is very rainy here, but when it isn't raining the bees are busy. The boys found 2 colonies in the timber last fall, so they sawed the tree and brought it home. We had to move them this spring, so they have not swarmed yet. One bee-keeper here told us they would not swarm for two or three months on account of moving them, but I believe they have gone down in the old gum. They are very busy. We have plenty of red

clover, and it is all in bloom. There is plenty of white clover here, too.

1. I should like to get them out of the old gums. How shall we do it, and at what time? One is about six feet long and the other four feet, and they seem to be almost full. We only want to keep enough for our own use, as the boys are farmers and do not have much time to spend on them. These are the first bees we had anything to do with.

2. The ants are bad here. How can we get rid of them? Bourbon Co., Kans., May 21. MARY J. HALL.

ANSWERS.—1. Saw off at either end the part of the gum not occupied with bees, so they can not fill up any more. Then as soon as they swarm, hive the swarm and set it in place of the gum. Three weeks later drum the remaining bees out of the gum, and add them to the swarm, unless you want to make a separate colony of them. Then you can split up the gum and dispose of the combs. If you wish you can let the bees rob the honey out of the gum before splitting it up.

2. Generally the ants do little harm, and the bees are able to take care of them. You can kill them by setting for them Paris green mixed with honey. Put this on a dish and cover over so the ants can get in, but no bees.

### Hiving a Swarm from a Tree-Trunk, Etc.

I think that the department of the Bee Journal, devoted to helping women bee-keepers, can be made very useful. I have kept bees for more than ten years, yet sometimes I find some work connected with it as difficult as at first, and also that we may still continue to be learners. I do all the work without help, except sometimes a friendly neighbor helps with a ladder. I use the Alley drone-trap to catch swarms, yet sometimes the queen gets out at a place not well guarded. Yet here is a difficulty connected with the use of the trap. When the trap is full of drones on a hot day, and I go to release them, the bees are so enraged that I get many a savage sting, as was my experience yesterday. You will, perhaps, advise leaving off the traps and clip the queens. Well, I have not done this, on account of the great difficulty of finding the queens, being very near-sighted. Yet, with all the difficulties and obstacles I do take pleasure in keeping bees, and find some profit also. I have 15 colonies; keep only Italians. I use some hives of the Falconer make, but during the past few years have had the Danzenbaker hive, and like it very well. It is the best for comb honey, and comb honey is all I produce. Last year I had as fine honey in appearance and taste as any I ever saw. I had a good crop, and have sold all at a good price here at the home market, selling for cash at groceries and private families.

My location is in the city. I keep the bees in our backyard, overlooked and criticised by many observers. I do not find this so very pleasant, to be so much under observation; I mean all friendly, of course.

I have had trouble in regard to having swarms situated in very inconvenient places. I have sometimes put a hive above them with a small board to lead them in. They have nearly all gone in, and then all march out, and then fly off. I appreciate the answers in the Bee Journal in the question department. They often help me.

1. What is the best way to hive a swarm of bees that settles on the trunk of a tree or on a fence, sometimes on both sides of the fence?

2. What is the best time of the day to work with bees, in the forenoon or towards evening?

3. Is it advisable to shake off bees from a cluster taken from a tree before another hive lacking in bees? I have seen it advised, and tried it, but all the bees so shaken off were killed. The greater part went into the hive in which they were intended to go—a small part of the cluster, I mean.

Dutchess Co., N. Y. S. E. WILEY.

ANSWERS.—1. Take the hive that you have ready for the swarm, and place the entrance close up to the swarm as possible. Gently smoke the bees to get them started to running into the hive, or you may brush a few of the bees into the entrance, either way will do; just as soon as a call is made they will all run in like a flock of sheep jumping over a fence. If the swarm is within reach it is an easy matter to hive them in this way. Just set the hive so the entrance will reach the bees.

2. Any time of day when the bees are gathering well. During the honey harvest bee-keepers that have many bees

usually work all day. If nectar is scarce, and bees gather only in the forenoon, then the forenoon is best.

3. Depends on circumstances. Better not try it unless you have had a good deal of experience with bees.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### BREEDING FROM INJURED QUEENS.

It is asking a good deal of us, and yet we cannot altogether blame the queen-breeders for asking it. You see, our faith gets low—and when it is clubbed till lower by what seems to be evidence of worthlessness, then to ask us to hold on, and breed one of those "house-flies" into a blessing! Ah, so! Yet a queen that *actually* does carry within herself valuable inheritances is not going to lose them by the personal injuries she gets going through the mail or otherwise. She herself may but poorly keep three frames full of brood, while her daughters could furnish the apiary with better bees than any it has ever had. But, then, there's the chap that would send us any old queen reared any old way from any old blood—perhaps we are watching out even too much for him. We won't *always* assume that a poor queen is valuable to breed from, Mr. Doolittle. We'll call on our smellers, and smell our way to the safe cases. Page 310.

### THE DAIRY AND THE APIARY.

But there's surely this difference between dairy and the apiary when we set out to improve the two: With efforts and cash enough behind it, the dairy has an unlimited food supply. Likely as not the apiary may be taking already pretty nearly all the supply in reach.—H. L. Jeffery, page 312.

### HIVING A BUNCH OF SWARMS IN A BOX.

Bad when three or four prime swarms mix. To hive the great mass in a dry-goods box, giving them room to store several pounds of honey—well, it is interesting to see that it succeeded twice. I should not expect it to succeed often. Page 315.

### A SWARM-BEATER.

Mr. Ford's record of 32 swarms in one day beats my time. And as they hummed they seemed to say, "Dance, tenderfoot, dance!" Page 325.

### ENAMELED CLOTH FAVORED.

Surprised as well as pleased to see that enameled cloth had a majority among Wisconsin's. It's so handy that I have always adhered to it, although sometimes I feared I was a loser by so doing. If nine out of sixteen practical men favor it, I can go on and feel "chipper." Page 325.

### ALFALFA THIS SIDE OF THE MISSISSIPPI.

Still feeding us with the old story of no alfalfa honey this side of the Mississippi, I see. Just wait till they get it vaccinated for hay and honey. These are times of progress, and five years ago must be no criterion for five years hence. Page 326.

### THAT MARBLE-CAKE HONEY.

And Mr. C. P. Dadant finds late-extracted honey streaked with white and amber. I was almost tempted to wonder if that was not a trouble thought out in advance instead of a trouble experienced—but I'll say, "Wonder, lie down! don't you wonder this time." Somebody take a fruit-pan and get up, marble-cake fashion, the streaked can of honey it is possible to get up. Keep it in a warm room a week and see whether the streaks persist or disappear. I don't claim to know what the result will be. Page 326.

### THE DOOM OF THE FORESTS.

F. Greiner, on page 327, strikes into a subject of great importance to the whole country, as well as to us bee-folks—the utter destruction of wood, lumber and timber. And yet almost every one manages to maintain in regard to the rather dire situation just in advance a sort of complete

thoughtlessness. Not so with me. Perhaps I am too far the other way—find my heart feeling deeply sorrowful about the matter again and again and again. One of my best friends got through last winter by cutting down shade trees he thought he could spare. A great area of once

“wooden country” immediately to the west of here is getting as bare as the back of Calamity’s hand. Few farmers seem to have started in to have a wood-lot; and those who did have, “massacred” it till it shows but here and there a forlorn-looking pole.

# Prize = Winning Stock

Daughters of Moore’s famous long-tongued red clover Italian Queen, which won the \$25,000 prize offered by The A. I. Root Co. for the longest-tongued bees; and also daughters of other famous long-tongued red-clover breeders whose bees “just roll in the honey,” as Mr. Henry Schmidt of Hutto, Tex., puts it, now ready to go by return mail. Untested Queens, \$1.00 each; six, \$5.00; dozen, \$9.00. Selected Untested, \$1.25 each; six, \$6.00; dozen, \$11.00. Safe arrival and satisfaction guaranteed. Circular free.

## FROM MANY FIELDS

### Good Weather Needed.

Bees are very populous, there being lots of brood. We have the finest crop of white clover we ever had, but no weather that the bees can use it. We are getting some honey from alskie, raspberries and honeylocust. We have had three weeks of rain. We ought to have nice weather soon, then we might have the largest white clover yield we ever had. I run for extracted and comb honey. In the fall I put comb honey supers under extracting supers when the flow commences.

N. A. KLICK,

Stephenson Co., Ill., June 5.

### Too Cold for Bees.

This part of the country was struck by a very heavy frost last night, freezing a large variety of plants. Clover and raspberries are in bloom, with plenty of nectar in them. It is too cold for bees to work. Basswood is loaded with buds, especially the younger trees.

A. C. F. BARTZ,

Chippewa Co., Wis., June 12.

### Prospects Very Slim.

Bee came through this spring in very bad shape. I think one-half are dead in this county. There has been no rain to speak of, and everything is dried up. The prospects for white honey are very slim this year.

Orleans Co., N. Y., June 5. W. H. HEY.

### Feeding Bees in the Spring.

In my article on feeding bees in the spring, page 360, at bottom of the first paragraph reads, “They are stirred up and create more heat.” should read, “are in accord with experience.” And the sixth paragraph begins: “The queen stops laying, and either part of the whole brood-nest is left unprotected,” should read, “and either part of the whole brood-nest is left unprotected.”

I have also experimented with feeding extracted honey, liquefied and made thin with water, in comparison with the candied extracted honey made soft by feeding the working it to see what effect it would have on brood-rearing as well as on making the bees excited and leaving the hives, and find that just as much brood is being reared when the thick honey is fed, as by the thin liquid. And that, while the thick honey is fed, no bees leave the hive in cold weather, and consequently see a decided gain by feeding the honey in its thick stage, in preference to the thin liquid, for the thin honey causes great excitement and the loss of many bees in cold weather. It also requires a feeder for each colony, which amount is a good deal in an apiary of several hundred colonies, and, if they are not attached to the hive permanently, are a regular nuisance, and many of them get lost and broken. But with the thick honey, we don’t need any feeder, and don’t even have to take away the paper on which the honey was spread, if we don’t want to, as the bees take care of it themselves.

Another thing I find practical in a large apiary for feeding, when the bees get short of stores in warm weather, is to thin the honey to the consistency of nectar by putting 20 parts into a large-sized wash-tub, throw a scotch-shovel full of planer shavings on top for a float. Put three or four such tubs in the yard and just watch the “honey-flow.” After 10 or 15 minutes, should any of the colonies not be working in the feed, open those

2-frame Nucleus (no queen)	2.00	11.00	21.00

Add price of any Queen wanted with Nucleus. Our bees are shipped in light shipping-cases. Purchaser pays express on Nucleus. Safe arrival guaranteed of all stock sent out.

BATAVIA, ILL., Aug. 21, 1901.

Dear Sir:—I thought I would let you know as to results of the nucleus sent me. They were placed in 10-frame hives and now they are in fine condition. From one I removed 24 pounds of honey and had to give 6 of them more room, as they were hanging out. They have more than reached my expectations.

Yours respectfully, E. K. MEREDITH.

DAVENPORT, IOWA, Dec. 31, 1901.

Your queens are fully up to standard. The honey queen that you sent my brother takes the lead. She had a rousing colony when put up for winter. The golden can be handled without smoke or veil. Very truly yours,

JOHN THOMING.

Notice.—No tested stock sent out before May 15. Send money by P. O. Money Order or Express Order. D. J. BLOCHER,  
1741f PEARL CITY, ILL.

Please mention Bee Journal when writing.

## Why RUMELY?

The thresherman has many reasons, too many to give here. Summed up, it means the modern threshing outfit, the best money can buy. You will find the latest catalog on Rumely’s Rear Coated Traction Engines and New Rumely Separator full of threshermen’s logic, argument that convinces. Write us for it. Mailed free.

M. RUMELY CO., LA PORTE, IND.

hives and pour about a spoonful of the feed right among them, and see how quickly it will give them a "send-off."

Of course, the larger ones get the "lion's share," and, should, too, because they are just the very ones which need it most, for if we have a few small ones, they can be looked after very easily and supplied. I shall endeavor to keep a couple of barrels of fall honey on hand for such emergencies, instead of putting them on the market at a small figure, as I found it very handy to have nearly two barrels of it on hand this spring, for now my bees are in rousing condition to take care of anything that comes along in the shape of a honey-flow, and that, too, in spite of the horriddest weather imaginable, so much so that I thought sometimes I would lose the whole of them. One of my near neighbors saved only 50 out of 800 colonies, and he claims those 50 are very weak.

A. C. F. BARTZ.

Chippewa Co., Wis., June 6.

### Cold, Bad Weather.

We are having very cold, bad weather here now. It is so cold that the bees can not work at all. The pastures are white with clover now. I hope it will warm up pretty soon.

Grant Co., Wis., May 30. U. S. BOYD.

### Doing a Rushing Business.

Bees are doing a rushing business. There is lots of white clover. I use double hives, and the queens have commenced to ramble in the upper stories, making themselves a nuisance in general.

WM. RIGGLES.

St. Joseph Co., Mich., June 12.

### Swarming—Handling the Smoker.

The pesky bees are driving me to "beat the band." I have tried to suppress swarming as much as possible, and thought I knew fairly well how to do it. Put on surplus cases very early, in fact, some time before fruit-bloom time, and then doubled them, which the bees occupied almost immediately, and have done splendidly in putting in surplus; hence, I flattered myself that I have little or no swarming. But, my, O my! They commenced the last of May to swarm, and have kept it up every pleasant day since. I have cut out queen-cells; moved the old hives to new stands; put on additional cases, which they occupy immediately, and apparently go to work; yet it's swarm, swarm. Is it the Gallup hive that causes all this trouble? or, is it because of very strong colonies? They are all very strong, which result I have aimed to bring about so as to be able to take advantage of the white clover and basswoods; but I am afraid I've been like the Methodist preacher who prayed for rain—overdid it!

Say, what's the matter with Mr. Root? I'm with Dr. Miller in the proper manner of holding the smoker. Is Mr. Root cross-eyed? or is his thumb where his little finger ought to be? Perhaps he works the smoker with the nozzle turned half round, and blows the smoke over the bellows. He is certainly "way off" on the proper manner of holding the Cornell smoker, and I feel like telling him so; but as you know him better than I do, rather have you do it.

WM. M. WHITNEY.

Lake Geneva, Wis., June 13.

[Here is what Editor Root says in *Gleanings in Bee-Culture*, about the proper way to handle a bee-smoker.—EDITOR.]

Within the last five or six years most of the modern hot-blast smokers have been made in such a way that, while in use, the barrel will stand perpendicularly, leaving the coals of fire or hot embers to lie on the grate while the fumes free from sparks or embers are blown out through a curved or deflecting snout. The position of the bellows likewise during the insertion mentioned has been reversed, putting the large end at the top instead of at the bottom, as heretofore.

I have been surprised many and many a time to see how awkwardly bee-keepers handle the modern smoker. To my notion there is only one way. The thumb should be on the

 (Successor to Chas. F. Muth and A. Muth.)

side of the bellows next to the stove. This lets the hand hang in the natural position without any twist at the wrist. To handle the smoker, proceed as follows:

Stand in front of the hive, with the entrance at the left and the smoker in the right hand. With the left, pry the cover loose, then with the other holding the smoker in a perpendicular position, or only slightly tilted, perhaps, blow a little smoke over the tops of the frames. After the cover is removed, and the bees have been sufficiently quieted, set the smoker down close to the *back end* (not the front) of the hive on the ground. In doing this the position of the wrist and hand does not have to be changed. Now, then, if the bees begin to act obstreperously, all one has to do is to reach down, grab the smoker in the most easy and natural way, and blow the smoke over the frames without twisting the wrist or the hand in an awkward, angular kink.

If one gets to using an implement wrongly, he will waste seconds, minutes, and hours of time as the weeks and months roll by. Every movement should be calculated to get the maximum results with the minimum of time and actual muscular force expended.

I have seen bee-keepers pick up the smoker in the left hand, hold it in an awkward way which I can hardly describe, and then when they were through lay the smoker down in front of the entrance, right in the height of the honey-flow. Or perhaps they will lay it on its side behind the hive; then when they want it for an emergency it can not be found.

### Outlook None Too Good.

The outlook in this part of the State is none too good. We have had no rain since March, and cold weather in April, and a very windy and dry May. I figure on a small average crop, and would be surprised to see prices go below the last year's, especially since Southern California is complaining, too.

SEBASTIAN JSELIN.

San Joaquin Co., Calif., June 8.

### A Terrible Season.

We are having a terrible season so far. It has been cold and stormy, and bees have done little or nothing. But we yet hope for the best. It looks pretty slim for a honey crop.

W. W. WHIPPLE.

Arapahoe Co., Colo., June 7.

### Working for Section Honey.

The way in which I find it necessary to work to get the best out of a colony is to work for section honey in a shallow hive (7½-inch frames). First, we will consider that our colony can figure on a small average main flow about June 12. Now, if all of my bees would swarm about 15 days before, I would be pleased; I should consider lack of nectar the only drawback. I have the swarm on the old stand with one-inch space under the frames, and in three days put on sections. The object in having a deep and large entrance is that it is a great step in having all worker-comb built. It is a well-known fact to bee-keepers that bees wish to store this treasure away from the entrance and light. Therefore, the deep entrance forces the honey to the sections above, and the bees have a desire to build only worker-comb below.

Now, the parent colony: I shake and brush all of the bees it has on the frames, 14 days after the first swarm issues, into a new hive on 7 or 8 frames, with one-inch starters, the same as I did the first swarm, putting the frames in the same hive I take them from. In seven days more I again complete the last brush from the frames to the colony, and now the old stock is as strong as the first swarm, and will take a super and a few more frames of starters in the brood-chamber. If you prefer (I do) to feed honey in the frames in place of sugar syrup, just place the frames, which now have no bees on them, over the parent colony in the frames to the height of the honey-flow, and with drawn comb the parent colony will store more honey than the first swarm will in sections. The comb of

honey may be given to the colony that needs feeding in the fall, or it may be extracted. This practice has never failed to give good results.

In regard to keeping down increase, a swarm may be divided and a part given to the parent colony, and as it is in the height of the flow you will receive benefit from the bees you added, and it gives a fine crop of honey from both the swarm and parent colony; or, in other words, the parent colony is furnishing honey to feed such colonies that may need it. With an improved strain of bees I, in my locality, challenge the world in like condition and locality.

R. J. COVY.  
Fairfield Co., Conn., June 13.

### Beddom Boiled Down

### Iron in Honey.

Prof. G. de Bunge says in Zeitschrift fuer Biologie that, among the hydrates of carbon which serve as foods, honey holds an exceptional place. Of all the sugar matters, honey is the only one containing iron; and strangely enough, almost exactly in the same quantity as found in white bread. Put this down as another point in favor of honey as food.—(E.)—Stray Straws in Gleanings in Bee-Culture.

### Are Balled Queens Suffocated?

Dr. W. G. Sawyer, replying to the remark that it "is not known whether a queen is killed by stinging or suffocation," says in the American Bee-Keeper:

Now, while I am not very well acquainted with the anatomy of the bee, it is reasonable to suppose that there is not very much difference in the suffocating qualities of the queen

# INVESTMENTS SOUTHERN LANDS.

Such investments are not speculative. The South is not a new country. Market and shipping facilities are adequate and first-class. The climate is mild and favorable. Notwithstanding these and other advantages, Southern lands are selling for prices far below their real value and at present prices net large returns on the investment. For a free set of circulars, Nos. 1 to 10, inclusive, concerning the possibilities of lands in Kentucky, West Tennessee, Mississippi and Louisiana, and near the Illinois Central Railroad, for homeseekers and investors, address the undersigned,

**A. H. HANSON, G. P. A., Chicago.**

To Boston and Return at One Fare for the round trip from Chicago via Nickel Plate Road, for Christian Scientists' meeting in June. Tickets on sale June 25th, 26th and 27th, with extended return limit of Aug. 1st. Stop-over at Niagara Falls, in either direction, without extra charge, and at New York, returning, on payment of fee of \$1.00. No excess fare charged on any of our trains. Write John Y. Calahan, General Agent, 113 Adams St., room 298, Chicago, for detailed information. Phone Central 2057. 6—22A5t

and the drone, and the drone will not suffocate when completely immersed in water for 15 minutes, and I have not found out how much longer. The first trapful of drones I submerged until they were quiet, then I emptied them out. The next day the drones were as thick as ever. I recaptured them, kept them under water 15 minutes and set them aside to "dry." About nine out of ten revived and were as lively as ever.

Is it not starvation that causes the death of a balled queen?

**"Bunched" Swarms.**

I frequently have in my out-yards what, for want of a better name, I call "bunched" swarms. During my absence of a week or more, several colonies may swarm on the same day, and go together; and their queens being clipped they can not go with them, and they will return and go into one or two hives, filling the inside and covering the outside, and spreading out on the ground in all directions—two or three bushels of them. There are quite too many bees in such hives or on them to do well; in fact, such will usually do nothing but loaf, and wait for a young queen to hatch. I have found it works well to take a peck or half a bushel of these bees and give them to a set of combs from which the bees have been shaken. With a dust-pan made with high sides and back I scoop up from such "bunched" swarms what bees I need to give to these beeloss combs, and thus form new colonies which seem to do as well as any. Of course, I do not always have these large swarms to go to for bees; but when I do find my bees badly mixed in this way I can straighten them out in this manner, and make them all work profitably.—J. E. CRANE, in *Gleanings in Bee-Culture*.

**Close Saturdays at 1 p.m.**—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

**CONVENTION NOTICE.**

**Texas.**—The Texas Bee-Keepers' Association meets its annual convention at the Agricultural and Mechanical College, at College Station, Texas, July 7 to 10, inclusive, during the Texas Farmers' Congress meetings. Cheap excursion rates, large crowds, a grand time, and a good heap. Meet your fellow-men, and talk. Exhibit all kinds of kinds of stuff. Premiums of all kinds awarded. Come, and bring what you have, and take home some of the premiums. You are invited. Be sure to be there. July 7 to 10, 1903, at the A. & M. C. of Texas, College Station, Hunter, Texas. **LOUIS H. SCIGILL, Sec.**

**Adel Queens and Bees.**

All my Queens are reared by the good old-fashioned way they were raised when all queens lived three years—the bees stored lots of honey and gave such great satisfaction. These Queens are large, hardy, and reared the best they could get straight from ever saw. Queens not coming up to above guarantee replaced or money returned.

One queen, \$1.00; 3 queens, \$2.75; 6 queens, \$5.00; 12 queens, \$9.00. My new book on Queen-Rearing is given to all who purchase three or more queens. Send for Catalog.

**The Low-Down Handy Wagon.**—The advantage of a low-down wagon on the farm is so well understood that we need not refer to it except in the briefest manner. They are widetired and can be taken into fields when the ground is too soft to use narrow-tired wagons. They can be used on mud-paths and pastures without injuring the sod, no matter how soft the ground is. They are handy in every sense of the word for hauling hay, grain, live stock, plow, and other similar work, and are used on the field. A big load can be put on without pitching or lifting the load to a great height.

The only question to decide is where to get a handy wagon and get the best. The Farmers' Handy Wagon Co., of Saginaw, Mich., make one of the best if not the very best one made. This wagon has a long, broad platform and is equipped with a tire that would not be spoiled. The wooden wheels are guaranteed in every way, being made of solid white oak, three thicknesses. The inner section presents the edge of the tire to the ground, while the two outer ones have the grain running crosswise of each other. The tire cannot be driven off with a sledge hammer nor can the wheel ever shrink so as to make the tire loose.

The metal wheels made by this company have the spokes wedged in instead of cast in. Spokes that are cast in come loose after a little use, and the tire wedges and rattles or rattles. The whole wagon is made on the same solid plan, and every part of it is guaranteed in every way. This company publishes a book about the Handy Wagon, which shows pictures and printed description. Just how it is made and what kind of a guarantee goes with it. The book will be sent free to any of our readers who will send for it and mail on this paper. Address, Farmers' Handy Wagon Co., Saginaw, Mich.

**HONEY AND BEESWAX**

MARKET QUOTATIONS

**CHICAGO, June 5.**—The market is lifeless, no movement except extracted at low prices. Best grades of white extracted, 54¢/60¢ cent; amber, 56¢5/4c. Comb honey is held at 15¢ for choice white, and anything not grading up to meet this requirement sold at 25¢ less per pound. Beeswax, 32c. **R. A. BURNETT & Co.**

**KANSAS CITY, June 9.**—No comb honey in our market. White or light amber would sell quickly at \$3.50 for 24-section cases. Demer and light for extracted, at from 54¢/60¢c. Beeswax in demand at 25¢/30c. **C. C. CLEMONS & Co.**

**ALBANY, N. Y., Mar. 14.**—Honey demand quiet; receipts and stock light. Comb selling, light, 15c; mixed, 14¢/15c; dark, 13¢/14c. Extracted, dark, at 76¢7/4c. Beeswax firm, 36¢/32c. **H. R. WRIGHT**

**CINCINNATI, June 1.**—Very little change in market from last report. We quote amber extracted grades at 54¢/60¢c in barrels; white clover, 8¢/9c; supply equal to demand. Comb honey, 15¢/16c for fancy. Beeswax, 30c. **THE FRED W. MUTH Co**

**NEW YORK, May 21.**—Comb honey trade exceptionally quiet, very little doing. Fancy stock not plentiful and is sold at 14c. A large supply of other grades on hand, which we are quoting at from 11¢/13c, according to quality, and in large lots make concessions from these prices. Extracted, unusually quiet, and prices show a downward tendency all along the line. Beeswax, firm at from 36¢/31c. **HILDRETH & SOBLENKIN.**

**CINCINNATI, June 8.**—We have reached the time when there is no settled prices in the honey market. Everybody is waiting to learn how the crop will turn out here; for we will sell or ask the old price; fancy water-white comb brings 15¢/16c. Extracted, amber, in barrels, 54¢/55¢; in cans, 60¢/61c; white clover, 80¢/81c. Beeswax, 30c. **C. H. W. WEBER.**

**WANTED WHITE CLOVER EXTRACTED HONEY!**  
Send sample and best price delivered here; also Fancy Comb wanted in no-drip cases.

If more convenient, Dues may be sent to the Secretary, at the office of the American Bee Journal.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The pictures herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

**HOW TO GET A COPY OF DR. MILLER'S**

**"FORTY YEARS AMONG THE BEES."**

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO.,**

## The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of the owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.00.

**GEORGE W. YORK & CO.**

**Chicago, Ill**

Please allow about two weeks for your order to be filled.

No. 27.

## Editorial Comments

**The Queen is the Soul of the Colony.**—If you are a beginner, one of the first truths you should learn is that it is of such great importance to have a good queen in a colony that too much pains can hardly be taken to have your queens of the best. If none of your colonies is up to the mark, then no better investment can be made than to buy a queen of good stock. If all your colonies are good, you may do well enough to leave the entire matter of queen-rearing to the bees, that is, if you prefer to allow the bees to swarm naturally. If any one colony is better than the others, then it will pay to be to the trouble of having your young queens mainly, if not entirely, reared from that superior stock. Even if it makes a good deal of extra work, it will pay well in the end.

**Quality of Queens Mailed.**—It is pleasant to find a man speaking of his competitors in a broad-minded way. G. M. Doolittle says in *Gleanings in Bee-Culture*:

I have not had the experience of some in receiving from queen-breeders queens of which 90 per cent turned out poor, or "as worthless as so many house-flies," as one writer puts it. I have rarely received anything but first-class queens in all I have purchased; and from these queens purchased, and from what I know of several of our queen-breeders, I have not a single doubt that thousands of the queens sent out by queen-breeders are every whit as good as those reared under natural swarming, for I am satisfied that the most of our queen-breeders to-day spare no pains to bring about an equally favorable condition to that under which natural swarming is conducted, while rearing their queens.

**Shall Section-Supers Be Added Under or Over?**—A series of articles on comb-honey production, "How to Get All the Sections No. 1 and Fancy," has appeared in *Gleanings in Bee-Culture*, written by Orel L. Hershiser. After directing to give the first super in the usual way, Mr. Hershiser proceeds:

If the flowers are secreting nectar in abundance it will be but a few days till capping of the combs in the super commences, which will indicate the time when a second super should be placed above the first. Capping will now progress in the first super. At the same time, the honey-laden bees returning from the fields, not all being able to dispose of their burdens in the first super, which is rapidly approaching completion, will commence storing in the second, and continue without interruption. The opportunities for work in the first super are rapidly diminishing, and day by day fewer bees can be employed there, till finally the super is finished, and its completion will have been accomplished under the most favorable circumstances for thorough and complete work. But there is no enforced idleness, for the upper super furnishes store-room for all the nectar that can not be stored in the first one. In due time capping will commence in the upper or second super, if the honey-flow continues, which indicates the time when the capping in the first is finished. The first super may now be removed from the hive; and the second one, which is now being capped, substituted in its place, and a third super placed above it. When capping has commenced in the third super, the second, or one next to the brood-body, will be finished, and may be removed; the third, or one over the second, substituted in place of the latter, and a fourth placed above the third; and so on to the end of the season.

The natural instinct of the bee is to store its food as near as possible to the brood. The apiarist should heed the teaching of Nature, and keep food and brood in as compact a space as possible, and not violate the rule so unerringly pointed out by the Creator, by lifting

the partly-filled super and placing beneath it one containing empty sections, according to the orthodox teaching. By practicing the orthodox method, much of the working force will be withdrawn from the upper super, and work will be distributed through that and the lower one in undesirable and unprofitable proportion, oftentimes resulting in none of the sections being properly filled.

It will be noted that the advice is to give the additional super on top at all times, and never allow more than two supers on at a time. This view, apparently endorsed by the editor of *Gleanings*, is at variance with the practice of many, probably of most, comb-honey producers who put the second super under the first, not waiting for any sealing in the first if there be a good flow, but adding supers under as fast as all are crowded with bees, only putting empty supers on top toward the close of the season.

The plan advocated by Mr. Hershiser will undoubtedly secure sections thoroughly filled out, and more promptly sealed, but the beginner should understand that it is not without objections. With an empty super on top, the bees must be crowded harder to make a beginning than when the empty super is under, and this harder crowding means just so much more inducement toward swarming. The crowding also means more superfluous work in the way of brace-combs and burr-combs, honey being stored between the two supers, fins built on separators, etc. The honey being sealed in the lower super, it will be more rapidly done, and rapid sealing tends toward whiteness of comb; but the very thing that tends toward whiteness in that direction has the drawback that it tends toward darkness in another direction. Bees have a trick of carrying bits of the old, black brood-comb to help finish up the sealing of sections if the sections are close enough to the brood-combs, so more of this objectionable work will be done when the finishing is done in the lower than when it is done in the upper super.

It is a bad thing to give too much room; it may be a worse thing to give too little. A very weak colony may never need more than a single super, there being plenty of room in that one super for all the bees that can be spared from the brood-nest. It does not require a very strong colony to fill two supers, there may be force enough to fill three, four, or more supers. When a powerful colony has four or five supers crowded with bees, the work going on at all points in all of the supers would there not result a serious loss to confine those bees to two supers?

While not questioning that with never more than two supers on at a time, the additional super always being added above, a greater proportion, possibly a greater number, of fancy sections may be obtained, there is room for serious question whether the total amount of money received for the crop will be as great as by following a different plan.

**Don't Use Old Bees for Rearing Queens.**—After worker-bees have attained the age of about 16 days, at this time of the year they begin field-work, and although they may be forced to do house-work, they are not so well fitted for it as when younger. So, when getting queen-cells started, do not depend upon old bees. The suggestion is likely to occur to the novice, "If I move a colony of bees from its stand, putting in its place a hive containing one or two frames of brood, the field-bees will naturally return to the old stand, and finding no queen there they ought to proceed at once to rear one, and that will be an easy way of making two colonies out of one." If there were no other objection to the plan, a sufficient objection would be that rearing queens is not in the line of business those field-bees have been following, and the queens they rear will be more or less inferior.

**Wagon vs. Wheelbarrow.**—Quite generally wheelbarrows rather than small wagons or carts are used by bee-keepers in their work about the apiary. G. A. Deadman, in the Canadian Bee Journal, makes a strong plea for something with more than one wheel. One of the advantages of a wheelbarrow is that a load is more easily dumped from it than a wagon, but one does not want to dump things used in an apiary, for the more easy a wheelbarrow is to dump the more easy it is to upset. One must be careful how a load is placed on a wheelbarrow, or over it goes. The wagon is stable, no matter how the load is placed.

An advantage that would not occur to every one is that the wagon takes up less room, making it convenient to have two at a time in the extracting-room, one with full combs, the other to receive the empty combs.

One trouble is that while a wheelbarrow is a staple article of sale, easily found in any town, and at a low price, the wagon is hardly to be found at any price, and it is expensive to make one.

**A New Section-Frame** is referred to in the British Bee Journal, although no description is given of it that is very definite. The nearest that comes to anything like a description is as follows:

I wonder how many bee-keepers have heard about the recently invented section-frames? With the exception of being close-ended, they are very similar to the ordinary shallow frame, and are equally suitable for extracting; but when intended to be sold as comb honey, by means of a simple arrangement which causes no obstruction to a free passage over the entire comb surface, the bees are made to store the honey in three separate divisions, any of which can be cut out without interfering with the others.

**Parthenogenesis and Its Unsolved Problems** are to have careful investigation at the hands of E. F. Phillips, a prominent graduate student of the University of Pennsylvania. He has gone to Medina to pursue his investigations, taking with him the best apparatus the University affords.

## Association Notes

Mrs. DR. A. B. MASON, the widow of the late Secretary of the National Association, has sent to Eugene Secor, the former General Manager, a check for \$81.08, which is supposed to be in full of the funds belonging to the Association in the hands of Dr. Mason at the time of his death. This amount likely includes what Mr. Abbott collected as dues during the month he served as General Manager, which amount he forwarded to Dr. Mason.

The above information we have from General Manager France, to whom Mr. Secor forwarded the check from Mrs. Mason.

THE LOS ANGELES CONVENTION is going to be well attended, if we may judge by the inquiries coming in. Here is a sample:

EDITOR BEE JOURNAL:—My wife and self are planning to go to the big convention at Los Angeles, and would like to go with the crowd from Chicago, Aug. 12:

1. How many stop-overs are allowed, and where?
2. Must we all go home together?
3. Does \$50 include the berth in the sleeping-car?
4. How much extra would it cost to see Grand Canyon?
5. How much do you think it will cost for a couple to make this trip from Chicago, including all expenses?
6. Would you advise us to go via Chicago, or try some route from the Twin Cities?

Any figures, advice, or particulars, regarding this matter will be greatly appreciated. LEO F. HANEGAN.  
St. Croix Co., Wis.

To the foregoing we may offer the following:

1. As we understand it, as many stop-overs as are desired will be allowed west of Colorado.
2. It is not necessary that all should make the return trip together. Neither is it necessary that any one should return over the same route as when going. Arrangements can be made to go one way and come back another at the same cost.
3. Fifty dollars for the round trip from Chicago does not include the cost of berth which, in a tourist car, is \$6.00 for one way.

4. The extra cost for seeing the Grand Canyon will be \$6.50 for car-fare and \$2.00 for berth, if taken.

5. It would be very hard to estimate the cost of the trip, as different people will have different views, and different sized pocket-books. However, it ought not be very hard for each one to estimate about what his expenses would be, when he knows the exact cost of the railroad and berth tickets. It would be well, though, to take plenty of money along, as there may be some side-trips that one would like to take out there. After going so far, it would seem too bad to deny one's self anything that really ought to be seen and enjoyed. We are looking forward to it as the one great trip of our lifetime, and although we can not be away from our office much more than ten days, we hope to take in everything possible during the trip.

6. Of course, we would advise all who can possibly do so to join the party going from Chicago, as it will be "the more merrier." We are anticipating about the best part of the trip on the going journey. There will be ample time for visiting, getting acquainted, enjoying the scenery, etc., as we go along. There is really no fun traveling or seeing things alone.

We have answered the questions of Mr. Hanegan in this way, as we suppose there are others who would like the information that we have tried to give. If there is anything else connected with the trip that any other reader would like to know we would be pleased to tell all about it, so far as we are able. We only hope that every bee-keeper, who can possibly do so, will arrange to go to the Los Angeles convention. California bee-keepers are going to do great things for those who attend, and we are anticipating the largest and best convention the National has ever held. Of course, every bee-keeper who has not yet been to California will want to go on this trip. It will be a memorable time and convention.

## Miscellaneous Items

J. A. GREEN, Foul Brood Inspector of Mesa Co., Colo., reported that on June 19 a splendid honey harvest was just drawing to a close, cut off by the mower. It was a sad day for Illinois bee-keeping when Mr. Green decided to go to Colorado. He is a bee-keeper of whom any State may well be proud. We shall hope to hear more from him as time goes on.

THE APIARY OF MR. A. H. KLICK appears on the first page this week. He wrote thus about it:

I send a picture of my apiary and farm-house. It shows also myself and two of my daughters, who are quite handy in the apiary. I have kept bees for about 14 years. Since 1896 I have had from 95 to 110 colonies. The past three years I have had good success in preventing swarming. I use the 8-frame Wisconsin hive, and run them entirely for comb honey.

We read the American Bee Journal, every issue of which is worth its weight in gold. A. H. KLICK.

A DONATION OF STRAWBERRIES was sent us by Dr. C. C. Miller last week. We had heard some pretty big stories about the Doctor's strawberries in other years, but this is the first time we have had a chance to sample them. We can say that the berries are actually as big as the stories told about them. The 30 boxes were all the finest we have ever seen. We do not know what connection the Doctor's strawberries have with the "Stray Straws" he furnishes to a certain bee-paper, but if the straws are appreciated by any who read this they will have some idea of the appreciation we have for the strawberries.

The Doctor said, when sending the strawberries, that they would have sent bigger ones but could not get them. We are sure that bigger berries would not be any better.

Dr. Miller and his family are what some people would call cranks on roses, and strawberries, and bees. But what finer trio could be found? Also, what happier trio can be found than Dr. Miller, Mrs. Miller, and Miss Wilson! "I don't know" would be a good answer.

**Queenie Jeanette** is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

# Convention Proceedings

## Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 406.)

### STARTING PEOPLE IN THE BEE-BUSINESS.

"Is it advisable for bee-keepers to sell bees to people who have no interest in the bees, but who, from reports of fabulous wealth obtained from the bee-industry, wish to go into the bee-business?"

Mr. Abbott—That depends upon whether they have the money to pay for them.

Mr. Pettit—Don't sell them any.

Mr. Whitney—If I refuse to sell to them they are all the more anxious to buy from somebody else, and if I sell them and then advise and assist them until they learn that there is something more to the business than they care to do, they give up in disgust, 97 out of every 100.

Dr. Miller—That's all true enough, but you are doing a lot for the money you get there. There are two things that you have to do for your money. They will come to you at your busiest times. "Now, I want you to go and see my bees," and think you have plenty of time to go and do it, and feel hurt if you don't do it, and just so far as they are successful they are taking that much from your crop of honey. They pull out pretty surely, but while they are pulling out they are pulling something out of you, and if they succeed with half a dozen colonies, that's just so much taken out of it. Perhaps if you refuse to sell them it will make them think there is a bonanza in it. I don't know which is the best way. I believe in my locality it is about safe not to sell them.

Mr. Abbott—I have given away about a half million dollars worth of advice to that kind to people, and I have got my living by doing it. I feel richer and better, and I have good honey now, and that's worth more than anything else.

### WARM WEATHER AND WINTERING OF BEES.

"Has this warm weather made the bees have less honey, and have they consumed more honey than usual on account of the warm weather?"

Dr. Miller—I should say that there is a wrong assumption in that question. I don't know the difference between my locality and Chicago. This winter is unusual in the great amount of stores that the bees have. I don't think I ever knew a year in my life when they were so fully supplied with winter stores.

Mr. Wilcox—There is a very important question arises in there, that I have never heard discussed. Is warm weather the early part of the winter detrimental in any manner to the wintering of the bees? Does it reduce their stores materially? I have never heard that discussed. I have often thought of it.

Mr. Arndt—I am the one that asked that question. About the first of October I examined the bees and found them in good condition. Last Saturday I was going over them, and a marked colony which had a lot of honey is apparently light now. I attribute it to the warmth; the bees were too active, and consumed the stores which they would not have consumed had it been cold so they couldn't get out.

Mr. Abbott—I want to ask if we should discuss that question and discover that the warmth felt wasn't a good thing for the bees, what could we do about it?

Pres. York—See the weather man!

Mr. Wilcox—They could be placed in a more shaded place where the temperature would be less. I usually have mine working more or less around the shop or neighborhood, and don't try to stop them, and I often wondered whether it was injurious or not. There are many things I could do to keep them more quiet during October and November.

Mr. Clarke—Is that to find the condition, the lightness of the bees at the present time around Chicago? I don't think that there has been any answer to that question at all.

Pres. York—What do you find?

Mr. Clarke—From what I have heard from bee-keepers, bees are light in stores, and more especially around Chicago locality, and those that take off their supers before the honey-flow are nothing more than in a condition to go through the winter. Those that left their supers on until the close of the honey-flow, from all I hear, their bees are in a very light condition.

Dr. Nussle—The same up in Wisconsin.

Dr. Miller—In answer to the question I should say: Yes, there has been more honey consumed this fall, because there has been warm weather.

Mr. Clarke—That is just one reason for there being a light honey crop, and that warm weather came at a time when it ought not to come, and the bees could go out and fly and not get anything. It is exactly the same way with a human being. If they work they have to have more food.

Mr. Horstmann—I don't think the warm weather had any effect on the bees in that respect. I think there was no honey for the bees to get. I had one hive on the scales, and the highest they got in one day was six pounds, and it ran down to one-half pound along during September, and then they held their own, got just about stores enough out in the field for their own consumption. The warm weather had no effect at all, I think. We had some flowers right along during the summer and fall, and there was very little honey to get. We had lots of white clover, but the bees didn't get any honey, and the field was full of blossoms, but I had to feed my bees.

Dr. Miller—You came to a point where your bees flew out at will, and gathered just what they used, and the next day they flew out and didn't get quite as much, and then you were losing.

Mr. Arndt—Yes, sir; in the month of November it seemed to be they didn't get anything at all.

Mr. Wheeler—Mine were working on dandelion until Thanksgiving Day.

Mr. Horstmann—One thing we must consider, the bees have been rearing brood, and it takes considerable honey to rear brood. If they had quit rearing brood earlier this fall, the chances are the colonies would have run down considerably more. My bees have now just about quit, and the hive I have on the scales, is just about holding its own.

Mr. Whitney—I bought an apiary late in the season at Lake Geneva, Wis., about 15 colonies. I took off the supers and they were well filled with honey for extracting. On taking them off and examining the brood-chambers I found them almost entirely empty, about the middle of October. Of course, I removed the empty ones and placed on the brood-chamber the surplus, and I was surprised to find that the brood-chamber had plenty of surplus in the second story. I removed that by placing the surplus in the other tier.

### NUMBER OF COLONIES FOR ONE MAN.

"How many colonies can one man care for properly when producing comb honey?"

Dr. Nussle—It depends upon who the man is. From one to 500 colonies.

Mr. Whitney—As many as can be profitably kept in one apiary.

Mr. Wheeler—I think I would have gone to the poor-house long before this if I had run only one apiary. I have five, and attend to these myself, as nearly as I can, and as it is we have hard work to make ends meet at the present time; but I believe that one man can manage more than one apiary, and I believe it is so considered. I know I can do it, and have no trouble at all.

Dr. Miller—How many colonies do you think you can run alone?

Mr. Wheeler—Five hundred.

Mr. Wilcox—I can't see that he has differed from me, only in the form of expression. As many as can be kept in one apiary anywhere, and I believe they can keep from 400 up. I have no doubt but that a man can run three apiaries for comb honey, but I think it will be safe to say that he can attend to as many as can be kept in one apiary.

Mr. Clarke—Is the question how many he can run by himself, or with assistance?

Pres. York—One man.

Mr. Clarke—And run them all for comb honey?

Pres. York—That is the question.

Mr. Clarke—It is a pretty hard question to answer, that's sure. It can be answered only by the man himself

who does it, and according to what time he gives to it previous to the honey-flow.

Dr. Miller—Give him a chance to spend a year on it and then report.

Mr. Wheeler—I understand we were talking about Chicago locality. I don't believe in over 100 colonies in Cook County in one place.

#### BLACK LIZARDS AND BEES.

"Do black lizards, such as are carried in the cellar with potatoes, eat or attack bees in the cellar or out-of-doors?"

Mr. Fluegge—I carried six or eight out of my bee-cellar. I put them on the scoop-shovel and threw them out. I think they eat insects. They are very common, and you are sure to find them in potatoes.

Mr. France—They are harmless as far as the bees are concerned.

#### SHALLOW OR DEEP BROOD-FRAMES.

"Which is the better, a shallow brood-frame or a deep frame?"

Dr. Miller—Yes, sir.

Pres. York—Dr. Miller says, "Yes, sir." Does anybody disagree?

Mr. Wilcox—I think that question should be amended so as to ask what depth of brood-frame is best.

Pres. York—I don't think we have a right to amend it.

Mr. Wilcox—We can not agree on what is shallow or deep.

#### HYBRID BEES OR ITALIANS.

"Is there any advantage in hybrid bees over the pure-blood Italians (hybrids meaning a cross between Italians and black bees)?"

Dr. Nussle—There is no advantage in hybrids over Italians.

Dr. Miller—Yes, sir, you are safer from the boys of the neighborhood troubling your bees.

Dr. Nussle—I never have any boys troubling mine.

Mr. Clarke—There is an advantage, but lots of disadvantages. Undoubtedly for comb honey they do a little whiter capping. They leave more of an air-space between the honey and the capping, which causes the honey to look whiter, but there are so many other qualities about them that are objectionable that it is pretty hard to tell.

Dr. Miller—That runs a good deal by standards. Take a standard of hybrids and they will cap particularly white, and there are many Italians that will cap whiter than the others. I hardly think it fair to take them as a whole, and say that hybrids will cap honey whiter than the others.

Mr. Clarke—Isn't it a fact the lighter-colored the bee the more the tendency to poor capping?

Dr. Miller—I should say hardly.

Mr. Clarke—It has been my experience. I have tried a great many breeds. For that reason, I must say five out of six queens I had to kill. For extracting, some of them I won't dispute but what they are good workers. As a general thing they run to poor capping. That has been my experience.

Mr. Stauley—It is all in the strain of the bee. I have had some of the yellow bees put up the whitest and some put up some of the dark. It is all in the strain of the bee, is my experience.

Dr. Nussle—I understand that is brought about by the capping being very close to the honey, making that appearance. The Italians have more tendency to do that than the Carniolans or black bees, or a cross between them.

#### TAKING BEES OUT OF THE CELLAR FOR A FLIGHT.

"Is it advisable to take bees out of the cellar for a flight any time before taking them out for good?"

Mr. Baldrige—No.

Dr. Miller—That is a rule that has been accepted, and we have all given up and felt it was settled, but down at Medina, Ohio, they have unsettled it. That is the trouble with our settling down on something. I know for sure that there is one of the things that can't be. If you take them out and put them back there will be damage. In spite of that they did it at Medina and got along nicely. I am going to try it and see whether they will be all dead the next spring. I am of the opinion that we settled on it prematurely. Those Medinaites have done it all right.

Mr. Whitney—Wasn't that an exception to the rule?

Dr. Miller—I don't know.

Dr. Nussle—I don't think you could ever do that successfully in Wisconsin. We have snow on the ground all winter, and along until it goes off in March or April. It would never do when it is ever so warm with snow on the ground.

Dr. Miller—Well, that might be true there. The conditions here and as far south as Ohio will give you plenty of times when there is no snow on the ground at all. This is perhaps a very important thing to find out about. If it is a fact that in the middle of winter they took them out and let them take a flight, and they are not the worse for that, then it is worth while for all to know it. It might be well for a number of us to try that thing this winter, particularly where the ground is not covered with snow.

Dr. Nussle—Ought it to be warm, about 60 degrees?

Dr. Miller—A day when it is about 60, and dry, and see whether they come out better or worse. Here is what we have done. I don't know just how much was tried in the first place, but it was given out as a law, and we all accepted it, that we must not take out any bees until we took them out for good, and for years we have acted upon it. Suppose we try that, and see if they come out as they did at Medina.

Mr. Horstmann—I moved out my bees early last spring, and we had a cold-spell and I put them back and set them out a second time, and it did them lots of good, and the small colonies came out splendidly in the spring, and built up good and strong. I believe the reason was that I put them back and got them out again when the weather was more settled. I think I have lost very few bees by doing that, and I would have lost a good deal more on account of unseasonableness. They seemed to be very quiet, and they remained quiet.

Mr. Wilcox—I have too many bees myself to carry them out and in. I have neighbors who, under my advice, have done it with two or three colonies and succeeded. I advised them not to carry them out until the first of March, but if it comes warm enough for them to fly early in March be sure and place on the stand early in the morning, and not let them out more than one day, and the next time out place again on the same stand, so as not to keep them continually mixing up. As soon as they get a flight, bees commence breeding. My own bees are not carried out until the first of April. It is true of my bees, after they commence breeding, I don't want them to remain in winter quarters for three or four weeks.

### Co-Operation Among Fruit-Growers, Etc.

BY PROF. A. J. COOK.

I HAVE kept the readers of the American Bee Journal informed regarding combination among citrus fruit-growers of California. It will be remembered that in 1893, with only a few thousand car-loads of fruit, the market had become demoralized, so that many orchardists found at the end of the season they had really lost on their fruit. The amount actually received for the sale of fruits was less than the expense of marketing. Many fruit-growers were entirely discouraged, and all felt that something radical must be done at once. This led to the organization of Southern California Fruit Exchange. A large number of the growers joined this Association, and I have previously explained its workings. It really saved the fruit industry of Southern California.

Since that time the Exchange has done better for its members than has any commission man or any other organization of citrus growers. Yet, strange as it may seem, hardly half of the fruit has ever been marketed by the Exchange. Indeed, the commission men, in the aggregate, have done just as much in the last few years as the Exchange, each doing about 44 percent of the marketing. The balance of the fruit was sold by individuals who were in no organization. These latter were usually very largely producers who had special advantage from a very wide business acquaintance in the East. Often these men had previously done business either in New York or Chicago, and thus had exceptional acquaintance and advantage.

The present season has been an unfavorable one. The weather has been very cool and thus the fruit was slow to ripen, and has not had the sweetness for which California fruit has previously been famed. The low prices and the fact that there was no single selling agency has been a

great disadvantage not only to the Exchange but to the commission man. While the Exchange has suffered less than the other selling agents, all have suffered greatly. It is stated that the commission men have lost much money, and one of our most prosperous orange-growers, who sells his own fruit, and who has usually received the largest prices, told me a few days since that he had hardly paid expenses this year. All this led all interested parties to consider seriously whether there was not a better way.

#### NEW SELLING AGENCY.

A few weeks ago the managers of the Fruit Exchange and several of the commission men—packers who have bought and sold much of the California citrus fruit—got together to consider the matter of a sort of trust—a combined selling agency. Previous to this time the Exchange knew nothing about where the commission men would sell their fruit, nor yet did any commission man know where the Exchange would ship its fruit, or where any other commission man would sell his. This lack of control and distribution was a serious menace, and all recognized that some scheme must be devised to remedy the evil. After many meetings and much consideration of the entire subject, the following plan was agreed upon:

All citrus fruit should be sold under one agent. This agency will consist of two factors here in California. One will be the old Exchange, which will carry on its business just as it has before, except now it will know where all fruit is being sold, and will be able to distribute its output to the very best advantage.

The other factor consists of what is called the citrus union, and will be made up of all the commission men or packers outside of the Exchange, as I think now nearly all have joined the organization. The manager of the old Exchange is the manager of the new selling agency.

We see, then, that this new selling agency will have absolute control of the distribution of the fruit, and thus there will always be an intelligent distribution. The new organization will always have its finger upon the pulse of the market and will know just where to sell the fruit, that no car-load will compete with any other car-load. In fact, all will be co-operation as far as marketing is concerned, and there will be no competition.

Of course, there will still be competition, as all the fruit will sell upon its merit, and only the best fruit will bring the best price. About 90 percent of the output is now controlled by this new selling agent. It remains to be seen what the individuals who have been selling their own fruit will do. Some of them have already joined this new organization. Others will probably do so; while a few may very likely remain outside. If they do, it will only be because of peculiar circumstances they can do better. The new selling agency will have their sympathy, and they will do nothing to antagonize it.

Of course, this new selling agency is in a sense a trust. It will not, however, do as many trusts do, try to lessen the output of fruit that they may thereby raise the price. They will, however, control distribution, and in a certain sense the market. This will result in preventing all glut of the markets, and will secure an even, fair distribution, and uniform prices for good fruit. It is not probable that it will raise the price to any extent to the consumer.

It is strange that the old Exchange did not get nearly all the fruit-growers. All acknowledged, so far as I know, that it was a good thing, and really came as the salvation of the fruit interest, while many believed, or hoped, that they could get better prices outside the Exchange, and thus they handicapped this latter association by preventing that control of distribution of the fruit which is so very necessary to the best success.

I believe the bee-keepers are wide awake in this matter of intelligent co-operation. It seems to me that any matter of history in this great movement, like that which I have given above, is of special interest and importance to them at this juncture. The Exchange in the citrus industry of Southern California not only saved the business, but also makes possible this new combination.

I neglected to say that in the new scheme the Exchange is not to exploit the fruit-growers who have previously sold to commission men. The outside packers have also promised not to take the fruit from any one who has previously been in the Exchange. Those owning orchards that are just coming into bearing are to be about equally divided between the Exchange and the Citrus Union. Our most intelligent fruit-men rejoice in the Exchange and its great success. They rejoice now still more in the belief that this new combination will remove the one obstacle in the way of

success with the Exchange in the past—that of controlling distribution—and are happy in the belief that more prosperous days are just at hand.

#### FOUL BROOD LAW.

I was interested in the fact that bee-keepers in Illinois had to raise money to secure legislation regarding a desirable foul brood law. California secured an excellent law with no expense and very little effort. Why was this? Because Southern California is very generally organized. There are many farmers' clubs. Thus they have tremendous influence. They considered as a whole the matter of legislation, and decided that they needed six laws, one of which was the foul brood law. They went solidly to the Legislature and secured every enactment that they desired.

Every State should have these clubs, and then our farmers could secure their rights, which they have so signally failed to get in the past.

Los Angeles Co., Calif., May 16.

## Apiculture in the United States vs. Europe.

BY C. P. DADANT.

I NOTICED and read with pleasure the article on this subject by J. A. Heberly, on page 104. The differences existing between bee-culture in Europe and this country are great indeed. The different opinions relating to hives are mainly based upon the greater or less ease that those hives give for manipulations. The hives in themselves, when of the same size, are equally serviceable in the production of honey, and the bees in a common box without frames will harvest just as much honey as those in the most expensive frame-hive. But the ease of manipulations tells on results, because when an apiarist can examine his bees and supply their wants without difficulty he is more likely to do it when manipulations are impossible or difficult.

The Berlepsch breech-loading hive, which we compare to a cupboard, has made no progress outside of Berlepsch's own country, evidently because its manipulation is more difficult than that of other frame hives. But Mr. Heberly is correct in his statement that in house-apiaries this hive has some advantages, because it opens from the rear. But our American apiarist has little use for the house-apary.

In Europe generally, Switzerland, France, Germany, the home is often surrounded with walls, often very high walls which were once built to protect the inmates against the depredations of brigands. Though the present conditions of civilization have made those walls unnecessary, yet the customs remain, and in my travels I often saw a new house built with a 12-foot wall around it, like a fortress. This seems natural to the European. To us it is abnormal. One may travel through the greater portion of the United States without being able to see a 10-foot wall. Such walls are exceptional. Here and there a board fence will hide the out-houses, but in most cases the home is left un-surrounded by any obstacle except such as may be necessary to mark the limits of the yard, a shallow picket fence, or, to keep out cattle, a barb-wire fence. So we naturally do not think of defending our bees against intruders.

The house-apary in Europe is most usually built against a wall, two sides of this wall making two of the walls of the apary. The expense is thus much less than if the entire structure had to be built purposely for the bees. The temperature of Europe being much more uniform than that of this country a closed house may be used in which the manipulations are conducted even in hot weather without suffering. A bee-house here would have to be adapted to the climate. It would have to be built more as a shed than as a house; most of the bee-handling has to be done when the weather is the hottest, and a closed house would be almost out of the question.

A bee-house with several stories, with openings for bees in every direction, is objectionable, both owing to the bad exposure that some hives would have with flight towards the north, and to the danger of stings from all sides, for it is well known that bees are more prone to become offended at movements of men or animals when directly in front of their entrance. I have seen several house-aparies discarded owing to these faults. The manipulations are also difficult unless the hives are placed on different floors and entirely isolated from one another. The best house-apary that I have seen was a shed high enough for a man to stand in, with the roof slanting backward, front to the south, and a tight wall on the north and on each end. The north was provided with two or three doors, so that one might get to

any part without having to pass all along the inside. But there was enough space behind the hives to work freely and even to pile some empty hives from place to place. The front was entirely removable at will. This front was in sections, like large shutters, and was entirely closed during the cold days. On warm winter days, and during the summer, these shutters were removed and allowed the air to circulate freely. This made the shed pleasant for work, in fact nearly as pleasant as the shade of trees. But there were drawbacks even in this apiary. The hives had to be placed in close proximity to one another, and this made trouble when the young queens went out for their bridal flight. It is well known that, not only the young queens, but the young bees as well, often make a mistake and enter the wrong hive when the hives are too numerous and alike in appearance, especially if they are crowded together. The mistake of a worker-bee, or even of a hundred workers, has but little importance, but the mistake made by a young queen is of vital importance to the colony, as they usually have no brood of proper age to replace a queen that has not returned from her bridal flight.

Then we have another objection to house-apiaries which is insuperable in many instances. It is when we establish out-apiaries. The bee-keeper who has many bees does not have several farms of his own. So he is compelled, when establishing out-apiaries, to place them on some other man's land, and he does not know how long his bees may remain there. He cannot go to the expense of building a house in such circumstances. We had the experience of this ourselves once. We had a very good friend on whose farm we had had bees for years, and we finally decided to build a bee-shed, feeling sure that we would never be compelled to remove the bees. Within two years, changes happened in that man's family which compelled him to leave the farm and go to live in the city. His home was rented to a tenant, and the management of that tenant was such that we very soon decided to remove our bees.

The European who keeps bees as a business is rare, while here, especially in Colorado, California, etc., he is met everywhere. Land in Europe is high and in great demand. The spot occupied by an apiary is necessarily confined, while in our land we pay but little attention to the amount of space needed. In fact we waste land, and will probably waste it for many years to come, our country being so large. What will do for us is not acceptable to them.

Hancock Co., Ill.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Work Done by the Sisters.

I am just beginning to find out what an amount of work is being done by our bee-keeping sisters. The energy, courage and fortitude displayed by so many of them is truly inspiring, and surely ought to meet with success. Some of the letters I have received were not meant for publication, but they are so interesting and helpful that I trust I will be forgiven for giving all the sisters the benefit of them.

### Price of Hives—Removing Honey, Etc.

My experience is very limited in bee-culture. I have seven colonies, and keep them only for home use. I lost two swarms this week, and had ordered hives and they came, but they were not set up, as I had no one who could do so.

The way I take my honey is to take the top of the hive off that holds the pound boxes, and carry it a short distance from the main hive. The bees will all leave and go to the hive again. Then we take the honey and replace new pound boxes in place of the old, and place the top on again. I have not been able to attend to my bees myself of late, having been sick for six months with sciatic rheumatism, and my right arm nearly disabled.

1. What are hives worth there all set up and crated, ready to be shipped, say six at a time?

2. I take my honey only as stated above. How do you take yours? and in what months?

I should like to know more about bees, for I think they deserve all we can do for them. S. M. PAYNE.

St. Mary's Co., Md., May 22.

ANSWERS.—1. An 8-frame hive, all complete, nailed and painted, and crated ready to ship, will cost you \$2.50 at Chicago. The 10-frame is \$2.65. These have one super for comb honey.

2. We use T supers to hold our sections, and take each super off any time from June to September, whenever finished.

I hope that troublesome rheumatism is better. A few bee-stings might be of benefit. While the treatment is rather heroic, some claim to have been greatly helped by it. You might try a few by way of experiment.

### A Busy Sister.

I like the American Bee Journal ever so much, and what little I know about bees I have learned from the Journal. I have nine colonies. Yes, I do my own work. My husband does not like to be among the bees, and we do our own farm work so far, but the work is too hard for us two. But I hope to have some help so that I can take care of more bees. I do like them, for they are as busy as myself, and the humming is so sweet and healthful.

I have not asked questions because I am so poor a writer, being German, and never having gone to the English school, so I listen to those who do write, and learn that way. There is no one here who likes to tell what he knows about bees. We built a new house last summer, and put a furnace in the cellar. It is nice and dry for bees. Mine came out in good shape this spring, and are working well.

Waupaca Co., Wis., May 24.

LOUISA THILKE.

Please don't hesitate to ask questions. This department is for you just as much as if you were a good English scholar. Some of us may envy you your knowledge of German.

### Again With the Bees.

When we sold our home in Virginia and came to California I was obliged to give up my bees, until about six weeks ago, when I happened on a tramp swarm, as they are termed here, near Arch Beach, in Orange County, where I was staying, and brought them home in a box, then transferred them successfully into a Langstroth hive.

California is a great country for honey, but the last month has been so cold and foggy that the poor bees have had rather hard work. But now the real California weather is here, warm and bright, and as the hills around about us are covered with black sage, followed by several other varieties, and wild buckwheat, there is splendid pasture for them, and I hope for great things from my small colony.

Los Angeles Co., Calif., June 4.

MARTHA WHITE.

### A Ranch Bee-Keeping Sister.

I am not much of a hand to ask questions, because if I wait quietly some one always asks just what I want to know, and the bee-keepers have all been very kind to tell me and help me in every way possible. I like the American Bee Journal, and have learned lots of good things from it. I am going to get Dr. Miller's book. I like the way he answers the questions, and I feel as if I were acquainted with him.

I have been keeping bees only a short while. My husband bought 5 colonies and let them out on shares two years ago this spring. Then I helped a little and learned a few things, and I thought that common-sense was a good thing to use. So last year I took them myself, increased them to 31 colonies, but got no honey, as there was no honey last year.

I fed three sacks of sugar, and brought them out nice and strong this spring, and have 64 colonies in good shape. When a swarm came out I went to the hive they came from and cut out all of the queen-cells but one good one, in order to keep down the increase and to keep them strong. I also sent back some small swarms by killing the queen.

Now I am getting ready to extract just as soon as my extractor gets here. I am a little late about it, but I could not get an extractor sooner. I have had to put on two and

three supers so as to keep the bees busy. I also tried putting an empty hive under for a new swarm, and they work all right. I have some of them piled up three high, and they are full of beautiful white honey. I expect to have five tons of extracted, and several hundred pounds of section honey, but I do not know exactly how many yet.

Yes, I do all the work and raise chickens, turkeys, pigs, calves, colts, and oversee the whole ranch. My husband is a carpenter by trade, and gets his \$3.50 per day. As we want to get ahead this year we thought I could do the work here and let him work at his trade this year. But next year he will stay at home I hope, as his help is needed very much. I am going to increase up to 150 colonies next year, and try to keep that many on hand all the time. I do not want any more than that.

We have a foot-hill ranch of 320 acres, 5 miles from town or neighbors. One small apiary is all there is near us, and that is over a mile. White sage is just beginning to bloom, and I do not think that there is any better honey than that produced.

I like to read the sister bee-keepers' letters and their experiences. I have three children, the oldest a boy of 16. He will help me extract, but the stock takes up most of his time, and my two girls will be lots of help now. Our school is just out, and I am not sorry. I stay alone most of the time, but I do not notice it, because I am so busy all the time. I make frames, get my hives in the knock down and put them together. I had Simplicity hives at first, but did not like them, so I got the Langstroth, and then I built a chicken-coop. Well, I do any kind of carpenter work for anything I need. I think a woman can just do anything she wants to. My husband says that when I get hold of anything I haven't sense enough to let go. But it is just pure stubbornness in me, nothing else. He said he was afraid to leave me with the ranch to run, and everything to do, as it was so hard for me. But I have made out, and now it is vacation, and things will work along fine. I will get everything done up in shape, and in September go to the coast for awhile.

I do not see how our corner in the Bee Journal can be improved, unless the sisters write oftener. I always read that corner first. What I know about bees does not amount to much, but I can learn, and I am going to try hatching eggs over bees, and will let you know about it. If I try it myself then I will know for certain.

Does Mr. York buy honey direct from the bee-keepers? I should like to avoid the middle man.

Riverside Co., Calif., May 22. MARY E. AVERA.

Well! you certainly do have your hands full. You certainly are a helpmeet, indeed. How nice to be able to have the help of your three children—nice for you, and for them, too. I think you are pretty brave to stay alone most of the time 5 miles from town or neighbors. I hope you may be able to take that well-earned trip to the coast in September, and that it may be a very enjoyable one.

I shall watch with interest to learn how those eggs turn out.

I think Mr. York has sometimes bought honey direct from the bee-keepers.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Transferred Colony Deserting or Swarming.

I am having some experience with the bees that is different from anything I have met with before. I am handling bees for some of my neighbors. Mr. H. called me to transfer a swarm from a box to a Langstroth hive. The next day he found them all back in the box, which had been standing a short distance away. I drove them into a small box and cut the comb out and tied it into the frames of the new hive. They appeared to be contented for eight days when they came out and left without settling or even halting. They built two pieces of new comb as large as my hand. Now, please tell me why these things are thus.

GEORGIA.

ANSWER.—It isn't entirely clear from what you say just how matters were. You say you transferred, and the next

day cut out the combs. From that I suppose that the first day you merely drummed out the bees into an empty hive, and it would be nothing very strange for them to desert that and return to their old home. I don't know about the swarming eight days later, but if they were transferred and put on their old combs it hardly seems possible they would totally desert, but it looks more like a case of genuine swarming.

### Laying Workers—Removing all Queen-Cells.

1. Will you kindly answer, through the American Bee Journal, what I am to do with a colony of bees that has a laying worker? The hive is full of drones, also quite a number of workers.

2. What will be the consequence of removing all queen-cells from a colony that eight days previous had cast a swarm? Will the colony have to be re-queened?

IOWA.

ANSWERS.—1. The hive being full of drones, there are probably not many workers, and the few that are left are quite old, so the best thing is to break up the colony, distributing the combs, bees and all, to other colonies.

2. Very likely the colony would be all right, for a young queen may have hatched already, but if no young queen has emerged the colony will be hopelessly queenless.

### Queen Mating Twice.

Thirty years ago I was a breeder of Italian queens in Indiana. I have seen many queens leave the hive on the bridal trip, but never knew nor heard of one leaving the hive on two days in succession, and in both cases leaving unmistakable evidence of a successful trip. Did you ever know of such a case?

The way I came to know this to be true was by seeing a queen in May, just past, leave the hive and return. The next day, about 2 p.m., I was taking the drones out of a trap that I had set at this particular hive, as I did not want it heavily stocked with drones now, that this young queen had made her bridal trip. While clearing out the trap this same queen flew down upon the landing of the front of the hive and went in and leaving, as on the previous day, positive evidence of a successful trip.

I call attention to this in order that if it is common persons should not destroy the drones until the queens begin to lay eggs.

KANSAS.

ANSWER.—No, I never had any such case come under my observation. I have read of one or more cases occurring across the ocean, but I think this is the first case I ever heard of in this country. The case is interesting for its rarity, but I think it is of such infrequent occurrence that it need not make any difference as to the keeping of drones. Possibly, however, it is of more frequent occurrence than I think.

### Keeping Bees—How, Why, and What For?

1. How do you keep bees?

2. Why do you keep bees?

3. Would you advise me to keep bees? If so, what for?

WASHINGTON.

ANSWERS.—1. Your question is such a comprehensive one that it is impossible to find room for a full answer in this department. Indeed, I have written a whole book in trying to answer the question, and it is none too fully answered then. Answering in the most general way, I keep bees in dovetailed hives and run for comb honey. If you will specify any particular point you want me to tell about, I'll be glad to answer further.

2. Partly for the enjoyment of it, partly for the money in it, and partly for the intense interest in unsolved problems all the time coming up in connection with the pursuit.

3. I don't know. I'd like to get pretty well acquainted with you before answering. You might invite me to spend a fortnight with you at your home when I have leisure, so as to learn something of your habits, tastes, and capabilities. But then I hardly expect to have the leisure short of twenty years, and you might not want to wait so long. Answering the last part of your question first, you might want to keep bees for the sake of your health, if you are kept indoors most of the time; if your taste runs strongly in that direction you might keep a few for pleasure; if you

are in a good locality for bees with no bee-keeper near, and are rightly built for business, you might go into it for profit; you might also go into it for the sake of having honey of your own producing constantly on the table. Taking your question as a whole, if the ground is already occupied by other bee-keepers located within a mile or two, it is hardly advisable for you to trespass on their preoccupied territory. If the way is clear, and you are impressed with the idea that you might be of the right material for a successful bee-keeper, try it on a small scale, beginning with not more than two or three colonies, and actual experience will tell better than the most experienced bee-keeper can tell by guessing at it, whether you can be successful or not.

**Shaken Swarm Without the Shaking.**

About two weeks before the white honey-flow was expected I placed under some of my strongest colonies hives containing full sheets of foundation and combs. Then a few days before the honey-flow I made some frames just the size of the hives, of "parting stop" (a strip of wood 1/2 x 7/8 inches), mitered at the corners, and covered these frames with galvanized-wire screening, all but one corner, where I put a piece of queen-excluder containing just one hole. Then where the queen had not commenced to lay in the lower hive I placed one of the frames from the upper hive containing the least brood, eggs, etc., and put the empty comb in the place of it. Then with little smoke I drove nearly all the bees below; put the wire-screen over the lower hive, and the upper hive above. I examined them in three days, and in every case found the queen was below and filling every frame full of eggs, just as she would do if it was a newly-hived swarm, and enough bees were going up through that one hole to care for the eggs and brood above. Then I placed a super on the lower hive, with either drawn comb or foundation in the boxes, and placed the upper hive and screen above the super. Now—

1. Isn't this practically a shaken swarm without the shaking?
2. Won't I avoid swarming?

3. Will they store surplus honey in the super, as it is nearest their brood-nest, or will they go to the trouble of taking it up through that one small hole, away back in one corner, and filling those old combs? They have shown no disposition to start queen-cells in the upper hive. I think it is because of the screen. If everything works right I intend to drive them all below in 21 days, and pile on the supers, of course watching them in the meantime and giving them plenty of super-room.

We, in this part of Iowa, look for a grand white clover honey harvest this year.

**ANSWERS.**—In this case I feel very much more like asking then answering questions, being very much interested in the outcome of your experiment, and would rather say I don't know, and ask you to tell us after you've been through the mill. But if you promise faithfully to report after the experiment is finished, I'll answer as well as I can.

1. It is certainly very much like it, but also like a plan given by G. W. Demaree years ago, only he used the ordinary queen-excluder instead of the wire-cloth or screening, and I suspect that makes a decided difference as to the promptness with which the bees begin work below. That is, I think they will begin work much more promptly with your plan than with the excluder. The Demaree plan is simply to give an empty story under the full one, with an excluder between, putting the queen in the lower story. The bees easily going up through the excluder, the queen does not lay in the lower story generally for two or three days, and Delos Wood reports that with him the plan is an utter failure, the queen not laying at all. In your plan, however, you have so little connection between the lower and the upper story that the bees which have been smoked below probably feel about the same as if there were no brood above, so that after all they are much like a shaken swarm.

2. I am inclined to think you will. Be sure to tell us when you know.
3. I don't know, and I want very much to learn about it from you.

**Bees Doing Well.**

Bees are doing well here this year. Some honey has already been taken off. There were very few swarms, and they were the earliest I ever saw, coming in April and the first of May; none after May 10. C. A. WOMACK, Meeklenburg Co., Va., June 16.

**Heavy Loss of Bees.**

Over 50 percent of our bees in this county have spring-killed, and the balance are very weak. The honey crop will be very small this year in this county. ANDREW NELSON, Emery Co., Utah, June 17.

**Prospect for a Good Crop.**

Bees are doing fine just now. There is every prospect for a good honey crop in this locality. P. H. DAVIS, Hennepin Co., Minn., June 16.

**Favorable Season—Drones—Laying Queens.**

The weather in eastern Ontario has not been favorable for a honey crop so far this season. Between April 4th and June 11th, we had practically no rain, only about 1/2 of an inch fell in all that time. However, there was an extraordinary crop of dandelions from which the bees got enough to keep up breeding. There was also a very good fruit-bloom for a few days. The bees have worked more on red clover here this season than I ever knew them to do before. I presume it is on account of the smallness and shortness of the clover blossoms, as the result of the dry weather which permitted them to reach the bottom of the nectar cell. They are also work-

ing largely on wild mustard, which grows among the grain on many farms in this section. I was not aware that the honey-bee worked to any extent on this plant.

On the 11th and 12th inst. we had a glorious rain, and the weather has been cool and moist since. White clover is appearing in considerable quantities, and if weather conditions now continue favorable we expect to be into the honey-flow about next week.

I put on my section supers last week. Three of the colonies are working like Trojans in the sections; the others seem a little lazy at starting.

Tell Dr. Miller that my colony with laying workers didn't have any laying workers, after all, but it had a drone-laying queen—a late arrival last fall, I suppose. When you wrote me that you could not supply me with a queen for some weeks, I simply pinched her head off and set the hive over another colony, which was not very strong in bees. The two together made a splendid colony, and the new arrivals did not molest the other queen; in fact, she has done far better work since I united them than before. W. A. HANNA.

Ontario, Canada, June 16.

## Not a Promising Season.

With us during fruit-bloom the weather was rainy, and the locust trees failed to bloom, therefore a considerable source for honey was a failure. Basswood is scarce, and white clover not abundant. W. R. YOUNG.

Frederick Co., Md., June 13.

## Italians vs. Blacks—Great Breeders.

On page 365, Geo. B. Whitcomb is prepared for, was, and is expecting, the support of G. M. Doolittle, but I will send him a shell or two, and after the smoke has cleared away he will see that "foxy old grandpa" is on the other side.

In the first place, Mr. Doolittle has Italian queens that are equal to any queens in America, and he would not exchange one of his Italians for a half-dozen blacks. Nor does he agree with Dr. Gallup on his umbilical-cord theory. In fact, the best authority gives it a black eye.

Now, as to Mr. Alley's queens, I have never seen any of them, but I am satisfied that the queens were all right when they were mailed, but nearly if not all queens are injured to some extent in shipping through the mails. I have never had a queen from a distance that was any good, but I use them as breeders only, and rear as good queens from them as can be found in America.

Now, Mr. Whitcomb, get yourself a pure Italian queen, and rear a lot of queens from her and requeen your apiary with them, and you will have no more use for blacks.

Now, while my gun is loaded, I will fire a shot at A. C. F.artz. On page 360, Mr.artz, in speaking of stimulating by rearing in spring, says the bees having been out of the cellar about a month or more, four or more combs are being filled by the hundreds every minute. Now, look here, hundreds of bees hatching every minute four or more combs—hundreds means at least 200, so 200 every minute means 288,000 bees in 24 hours, or 5,948,000 bees in 21 days. That's very good, Mr.artz, for a queen with four or more combs. A. S. ANDERSON.

Kendall Co., Tex., June 14.

## Transferring Bees—Saving Combs.

On page 376, Miss Rebecca Halley describes how she transferred a colony of bees. No comb or brood was transferred, but comb foundation was offered as a starter, and, of course, something of an inducement to the bees to occupy a new home.

I have transferred hundreds of colonies from all manner of cavities, such as trees in the forest, round log hives, board box-hives, etc. Oftentimes the comb was worthless, or about so, except such as contained brood often hatching in large numbers. To transfer this for the double purpose of saving the young bees and serving as an inducement to the bees to occupy their new home I deem good economy, even if the comb is too poor to

be of value in the hive after the young bees have hatched and the colony is permanently and satisfactorily established in their new quarters. For it can then be removed, and comb foundation can be substituted.

My method of fitting such old comb in the frames is to lay the frame on a board where the pieces of comb can be fitted in by straightening their edges with a knife, and I have used as many as a dozen pieces to fill one frame. To hold them in position I use splints not to exceed  $\frac{1}{4}$  of an inch in diameter, cut so as to extend about  $\frac{1}{4}$  of an inch above and below the top and bottom-bars. These splints are notched at each end and wired together. I have put on as many as six pairs of splints of one frame. The bees will weld the comb together in two or three days, and fasten it to the frame, after which the splints should be removed, if it is intended to let the combs remain after the brood has hatched.

But because comb is dark only it should not be condemned, as it is often valuable. I have frequently found good worker-comb all of brood in sheets that would fill a standard Langstroth frame, which would contain about 3,000 bees, and were well worth saving, even if the comb is discarded as soon as the brood has emerged.

The matter of first driving the bees out of the old hives of much importance, which can be readily accomplished by turning the old hives mouth up; putting a box or a nail-peg over the mouth of the hive will answer a good purpose to hold them until the comb is transferred to the new hive and placed on the new stand, where the bees can be hived as we have any natural swarm, and they will not desert it.

G. BOHRER, M. D.

## Beedom Boiled Down

### Brood-Rearing in Cuba.

A. I. Root, who is at present amusing himself watching his 500 colonies in Cuba, reports in *Gleanings in Bee Culture*:

We have found trouble so far in getting the bees to rear brood in the winter time. The weather is certainly warm enough, and pollen is coming in great plenty; but the brood-nest is apparently so filled with honey that the queen can not find a place to deposit eggs. I have been very reluctant to accept this as an explanation; but other bee-keepers assure me such is the case, and some of them say our red-clover strain is worse than any other in thus filling every empty space with honey. I have suggested getting hybrids, or, better still, some of the Syrian or Holy Land bees, that are such *persistent* rearers of brood in season and out of season; but the objection is made that they swarm so much the remedy is worse than the disease. All agree the red-clover bees are the fellows for honey if we could only keep up the population of the hives. Throwing out the honey with the extractor seems to be the only remedy, and some seem to think the great objection to producing comb honey here is the filling of the brood-nest with honey so no young bees can be reared.

### Dry Cellars and Lots of Pure Air.

These suit T. F. Bingham, the smoker man. He says in the *Bee-Keepers' Review*:

We are well pleased with our cellar experiments and believe (mind you, believe, not know) that in less than 20 years it will be demonstrated that the temperature of a bee-cellar (I mean a cement cellar, not a house-cellar) may go up and down, from frost to 50 degrees without injury to the bees if only the air is as pure and dry as it is out-of-doors. I have no cellars to sell, but I am aware that a cement bee-cellar, to be first-class, ought to be built just as soon as the snow goes off, and be sawdusted and dried all summer, so as to be absolutely seasoned before the bees are put into it.

It must be borne in mind that, at present,

# INVESTMENTS

## SOUTHERN LANDS.

Such investments are not speculative. The South is not a new country. Market and shipping facilities are adequate at first-class. The climate is mild and favorable. Notwithstanding these and other advantages, Southern lands are selling for prices far below their real value, and at present prices net large returns on the investment. For a free set of circulars, Nos. 1 to 10, inclusive, concerning the possibilities of lands in Kentucky, West Tennessee, Mississippi and Louisiana, on and near the Illinois Central Railroad, for homeseekers and investors, address the undersigned.

**A. H. HANSON, G. P. A., Chicago.**

**Saratoga Excursion**  
July 5th and 6th, at \$17.45 for the round trip, via Nickel Plate Road. Final return limit, July 20th. Three trains daily to New York City and Boston. City Ticket Office, 111 Adams St., Chicago. Phone Central 2057. 11—25A3t

comb is the only cheap material that will furnish the warmth of the earth without the moisture of the soil or water surrounding it. A dry room surrounded by the warm earth must be depended upon in order to allow the central upward ventilating flues. It is alone by them that dry, fresh air can at present be supplied in sufficient volume to meet the demand of the bees. My three flues are all wide open now; and the bees are not roaring because they have or have not a "sniff" of the spring air.

These three flues have a superficial area of 716 inches, equal to one flue about five feet wide by one foot thick, reaching up into the air sixteen feet.

## The Queen's Retinue.

That retinue surrounding the queen is something after this fashion in this locality: Under normal circumstances, when a queen is traveling over the comb, no worker accompanies her. If she runs against the hind end of a worker, the worker will pay no more attention to her than to another worker. If, however, the worker is in such position that she can recognize the presence of the queen, whether the queen touches her or not, the worker will invariably squarely face the queen; and if the queen stands still long enough there will be a circle of bees all facing centrally. As soon, however, as the queen moves on, the circle breaks up, never to be formed again of the same bees.—Gleanings in Bee-Culture.

## Uniting Weak Colonies.

The following discussion upon this topic at the Ontario convention is taken from the Canadian Bee Journal:

Mr. Chrysler—In August or the first of September, I simply set one on top of the other for a few days and get them all in one hive-body; if they needed feeding for the winter I would feed them then. I would pay no attention to the queens; they settle that themselves.

Mr. Dickenson—Unless you knew one queen was better than another?  
Mr. Chrysler—Oh, certainly.  
Mr. Byer—Wouldn't a number of bees go back to their old stand?

Mr. Chrysler—I wouldn't care very much for that.

Mr. McEvoy—Did I understand Mr. Chrysler to say he simply set one on top of the other and unite them?  
Mr. Chrysler—I would set them on top of one another and let them be likethat for a few days when I would come along again and dispose of the frames not occupied and get them all in one hive-body; they would be one colony then.

Mr. McEvoy—I would get the bees to fill themselves pretty thoroughly upon their own stand and do the work in the evenings as late as I could do it and then unite them at once. I would raise the hive 2 or 3 inches from the bottom and shake the bees down and let them run in and give them a fair smoking so as to knock all the light out of them.

Mr. Heise—I go to the hives I wish to unite and remove all the frames except just what the bees occupy; I do that one evening and the next evening I come along and generally lift three out of one hive and place them in the other, leaving space for one frame between; let them remain on those for three or four days or a week and then I put the rest of the frames in and I have never noticed any fight.

## Empty or Filled Frames for Forced Swarms?

J. F. Crane says, in Gleanings, in Bee-Culture:

If we shake our bees into an empty hive there we shall be a loss of ten days to two weeks (usually), unless they are very strong, and honey very abundant, before they will do much in the surplus apartment. Some writers say they can get more surplus honey when a swarm is compelled to build combs in the brood-chamber than when given founda-

# Prize = Winged Stock

Daughters of Moore's famous long-tongued red clover Italian Queen, which won the \$25.00 prize offered by The A. I. Root Co. for the longest-tongued bee; and also daughter of the famous long-tongued red-clover breeder whose bees "just roll in the honey," as Mr. Henry Schmidt of Hutto, Tex., puts it, now ready to go by registered mail. Untested Queens, 75c each; six, \$4.00; dozen, \$7.50. Selected Untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free.

Send for catalog.

**MOUNT UNION COLLEGE,**  
Alliance, Ohio.

**Rural Telephones**—Telephones are becoming very common in rural communities and the more they are used the greater their application. The low cost of maintaining a service of this kind makes it possible for those who are in even very moderate circumstances to have telephone communication on their own property with their neighbors and neighboring towns.  
It may safely be said that the telephone has solved more problems than any other invention of modern times. It has made farm-life more attractive and brought into close communication those who have formerly been widely separated. It is now a common thing

in the matter of business alone a farmer can well afford to pay the small cost of a telephone, for there will be dozens of times during the year when he can make or save money by being in almost instantaneous touch with his market town.

Putting in operation a telephone line is very simple. Any one can do it, and it requires no special skill to keep in repair and operate a line. There are numerous makes of telephones for rural lines on the market, but the ones made by the Stromberg-Carlson Telephone Mfg. Co., Chicago, Ill., is having the largest sale and is giving the best satisfaction. This is one of the oldest houses in this line in the country, and the telephones made by this Company have been found to be perfect in their adaptation to the uses of people in country places.  
The Company publishes a very interesting Catalog, and we would advise our readers to send for one and see for themselves how easy it is to "get on the line." Address, Stromberg-Carlson Telephone Mfg. Co., 4, Chicago, Ill., and do not forget to say we invited you to do so.

**Please mention Bee Journal when writing advertisers.**

tion or combs; but that is not my experience. In 1901 I gave six or eight shaken swarms, that were very strong, brood-frames having only starters or half an inch of foundation under the top-bar; but I found such did not store nearly as much surplus as those given full sheets of foundation or old combs; and out of all there were not half a dozen good brood-combs—nearly all was drone-comb. So I find it much better to "shake" on to full frames of foundation well wired to shaking into empty hives.

But foundation has its drawbacks or disadvantages, or is not wholly satisfactory as a preventive of swarming. During the present season I shook some fifty or sixty colonies into hives with foundation. Some eight or ten of these swarmed out a day or two later, some of them without touching the foundation, while others drew it out a little and then decamped.

As my queens' wings were all clipped, some of the queens returned with a few bees with them while other colonies remained silent. Where the bees are content to stay on foundation they usually do well, although, if the queen is old or poor, the bees will frequently start a little brood and a few queen-cells, and then swarm again.

I have had the best results from "shaken" swarms when shaken on to old combs carried over from the previous year, or from hives where the bees died during the winter or spring. If these combs contain considerable honey it does no harm. I think I should prefer to have them about half full of honey. Last year I gave one such forced swarm a hive full of combs that were nearly solid with honey, and they did nicely. But if the combs are quite free of honey, and if you have a good-sized swarm, and honey is plentiful in the fields, they will soon have enough.

### Spreading Brood.

This is practiced after the following fashion by the Texas editor of the Progressive Bee-Keeper:

We will take a normal colony at the opening of spring and as soon as we find that the queen has brood in two frames we will select two nice combs that are about one-third full of honey at the top and will set two of these combs one on each side of the two frames of brood; thus we will have two frames in the center of brood, the one next on each side partially empty, and beyond these the two combs of pollen.

In about two weeks we will return to this colony and we will find that the queen has extended her brood, and now has four frames filled. We will proceed as before and slip in two more combs next to the four containing

## Dittmer's Foundation!

This foundation is made by a process that produces the superior of any. It is the cleanest and purest. It has the brightest color and sweetest odor. It is the most transparent, because it has the thinnest base. It is tough and clear as crystal, and gives more sheets to the pound than any other make.

Working wax into Foundation for Cash a Specialty. Beeswax always wanted at highest price.

Catalog giving FULL LINE OF SUPPLIES with prices and samples, FREE on application. GUS, DITTMER, Augusta, Wis.

brood, always moving the pollen-combs towards the walls and finally making use of them for brood. Now, by the time the queen has the six frames full of brood we may expect that the two middle ones are about full of eggs again, the first eggs laid therein have hatched out. At this juncture, just as the queen begins filling them the second time, if we will insert, between the two middle combs, empty combs, they will be filled at once with eggs, and fuller than they would be filled if placed on the outside. There is one great truth to learn in spreading brood, and that is that we must not chop brood, and by this I mean placing empty combs in between combs of capped brood, or the giving of combs faster than the queens can fill or the bees keep warm.

### Hiving Extraordinary—A True Story.

The following novel plan was adopted by an oldskeppist, owning, at least, 170 colonies of bees:

One hot day at the end of June several swarms issued simultaneously, and the bee-man had only three empty skeps, which would not hold one-half the bees. So, feeling that many other swarms would turn out during the day, he emptied the second lot in question into a sack and tied them up. Later the same day, as expected, many others (he could not say how many) of his numerous skeps followed suit, and the swarms were treated in the same way. Then he sent for more skeps, and ordered a long stand. When these came home a few days after, he untied the sack and laded out the bees with a hand-bowl. In this way nine skeps were filled, all of which were placed on the stand. This done, he turned the sack inside out and shook it: "Now, guv'nor" (he said, when I called a few days ago), "how is it then bees wouldn't bid? Every blessed skep was empty within a week. I know there was £10 worth of bees went away." Then he added, "It's the worst season I ever known—stiffed 50 lots an' only got 7 cwt. of honey."—A COUNTRY PARSON, in the British Bee Journal.

### How Shall Bee-Statistics Be Gathered?

S. E. Miller thinks we should invoke the aid of the general government. He says in the Bee-Keeper's Review:

In regard to a honey crop report, I think we should direct our energy toward the Department of Agriculture. I think that if the importance of this matter were fully shown up to the Secretary of Agriculture he would not hesitate to incorporate a honey report along with the regular crop report, as now issued. The National Bee-Keeper's Association would have to furnish him the names of intelligent bee-keepers throughout the country who would be willing to report regularly each month. No doubt they would be ex-

pected to report on all agricultural crops at the same time. This would be very little additional expense to the department of Agriculture, compared to what it would cost the National Beekeepers' Association to gather it and print it for distribution, as the cost of postage alone would be a large item to the latter.

**Pear-Blight, Ants, and Bees.**

Editor Root makes a case against the ants as the carriers of pear-blight, exonerating the bees. He says:

The statement is made in American Gardening, referring to pear-blight, that the blighted twigs exude a milk-white liquid; that this fluid the bees are likely to get and spread to the flowers of healthy twigs which they may visit. The bees would have no occasion for sucking up the virus, and there is no use in laying the blame on them, where common ants (very numerous in California where the blight is the worst) crawl all through it and thence all over the trees. While the bees may spread the virus from a diseased twig to a healthy blossom, it is extremely improbable that they should seek out the poisonous sap from a diseased twig.

While I was in California looking through those great pear-orchards, so fearfully blighted, I saw ants in great numbers crawling all over the diseased and healthy twigs, and some of the twigs were covered with that deadly milky fluid. I believe the time will come when it will be proven that the bees are not the chief means of spreading the blight; that those ever-present ants, that are continually crawling over the trees from top to bottom, will be declared to be the real culprits.—Gleanings in Bee-Culture.

**Close Saturdays at 1 p.m.**—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

**CONVENTION NOTICE.**

Texas.—The Texas Bee-Keepers' Association meets in annual convention at the Agricultural and Mechanical College, at College Station, Texas, July 7 to 10, inclusive, during the Texas Farmers' Congress meetings. Cheap excursion rates. Large crowds. A good time. Learn a heap. Meet your fellow-men, and talk. Exhibits of all kinds of stuff. Premiums of all kinds awarded. Come, and bring what you have, and take home some of the premiums. You are invited. Be sure to be there. July 7 to 10, 1903, at the A. & M. C. of Texas, College Station, Hunter, Texas. LOUIS H. SCHOLL, Sec.

**The Emerson Binder**

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

GEORGE W. YORK & CO.,  
144 & 146 Erie Street, CHICAGO ILL.

**HONEY AND BEESWAX**  
MARKET QUOTATIONS

CHICAGO, June 5.—The market is lifeless, no movement except extracted at low prices. Best grades of white extracted, 54¢/60 cents; amber, 56¢/54¢. Comb honey is held at 15¢ for choice white, and anything not grading up to meet this requirement sold at 20¢/5¢ less per pound. Beeswax, 32¢. R. A. BURNETT & CO.

KANSAS CITY, June 9.—No comb honey in our market. White or light amber would sell quickly at \$3.50 for 24-section cases. Demand light for extracted, at from 54¢/60¢. Beeswax in demand at 29¢/30¢. C. C. CLEMONS & CO.

ALBANY, N. Y., June 30.—Honey market quiet here; prices nominal and light receipts. We quote light comb, 15¢/16¢; mixed, 14¢/15¢. Extracted, white, 64¢/75¢; amber, 60¢/65¢; dark 54¢/60¢. Beeswax, 31¢/32¢. H. R. WRIGHT.

CINCINNATI, June 1.—Very little change in market from last report. We quote amber extracted grades at 54¢/60¢ in barrels; white clover, 80¢; supply equal to demand. Comb honey, 15¢/16¢ for fancy. Beeswax, 30¢. THE FRED W. MUTH CO.

NEW YORK, May 21.—Comb honey trade exceptionally quiet, very little doing. Fancy stock not plentiful and is sold at 14¢. A large supply of other grades on hand, which we are quoting at from 11¢/15¢, according to quality and in large lots make concessions from these prices. Extracted, unusually quiet, and prices show a downward tendency all along the line. Beeswax, firm at from 30¢/31¢. HILDBRETH & SPOELKEN.

CINCINNATI, June 8.—We have reached the time when there is no settled prices in the honey market. Everybody is waiting to learn how the crop will turn out, therefore we will sell or ask the old price; fancy water-white comb brings 15¢/16¢. Extracted, amber, in barrels, 54¢/60¢; in cans, 60¢/64¢; white clover, 80¢/84¢. Beeswax, 30¢. C. H. W. WEBER.

## IMPORTANT NOTICES.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec03" on your label shows that it is paid to the end of December, 1903.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

Advertising Rates will be given upon application.

## National Bee-Keepers' Association

### Objects of the Association:

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

### ANNUAL MEMBERSHIP, \$1.00.

Send dues to Treasurer.

President—W. Z. HUTCHINSON, Flint, Mich.  
 Vice-President—J. U. HARRIS, Grand Junction, Colo.  
 Secretary—GEORGE W. YORK,  
 144 & 146 E. Erie St., Chicago, Ill.  
 General Manager and Treasurer—  
 N. E. FRANCE, Platteville, Wis.

### BOARD OF DIRECTORS.

E. WHITCOMB, Friend, Neb.  
 W. Z. HUTCHINSON, Flint, Mich.  
 UDO TOEPFERWEIN, San Antonio, Tex.  
 R. C. AYKEN, Grand, Colo.  
 P. H. ELWOOD, Starkville, N. Y.  
 E. R. ROOT, Medina, Ohio.  
 Wm. A. SELSER, Philadelphia, Pa.  
 G. M. DOOLITTLE, Borden, N. Y.  
 W. F. MARKS, Chapinville, N. Y.  
 J. M. HANBAUGH, Escondido, Calif.  
 C. A. HATCH, Richland Ctr., Wis.  
 DR. C. C. MILLER, Marengo, Ill.

If more convenient, Dues may be sent to the Secretary, at the office of the American Bee Journal.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The pictures shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S

"FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO,**  
 144 & 146 E. Erie Street, CHICAGO, ILL.

Please Mention the Bee Journal when writing Advertisers \*\*\*\*\*

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelities," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

**GEORGE W. YORK & CO.**

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

CHICAGO, ILL., JULY 9, 1903.

No. 28.

## Editorial Comments

**The Value of a Purchased Queen** is not a thing always readily determined. If you get a queen represented to be of the best stock, and you do not find her to do as good work at laying as your average colonies, do not be in haste to condemn her. Rear queens from her, and see what their worth will be. Sometimes it happens that a queen, which has been doing excellent work, turns out after a journey in the mails to be a very poor layer. That, however, may have no real bearing on her value as a breeder, and young queens reared from her may be as good as if she had never been in the mail-bags.

**Self-Spacing Frames** may and may not be a good thing. As in other things, something depends upon the purpose for which they are used, and the management. In the present number Leslie Burr enters an earnest protest against them for use in extracted-honey production. In his case the exception is well taken. Whether to be used in Cuba or further north, frames that are to be used part of the time at one distance and part of the time at another, should not be self-spacing. For the term "self-spacing" may be considered practically synonymous with "fixed-distance," and such frames are not desirable to be used except at the one distance suggested by the arrangement for automatic spacing. For those, however, who use the same spacing in the extracting-super as in the brood-chamber, or whose extracting frames are distinct from the brood-frames, as well as for comb-honey producers, fixed-distance frames offer advantages not lightly to be esteemed.

**Something About Average Yields Per Colony.**—There is no question that there is such a thing as overstocking, and that in general the yield per colony will be increased by decreasing the number of colonies kept. In a place where white clover is the chief pasturage, there might be enough to keep a hundred colonies busy while the white clover bloom lasted. Suppose each colony should store 100 pounds from white clover. Under the supposition that each colony had all it could do, the yield of white clover honey would not be at all increased per colony if any smaller number than 100 colonies were kept. Whether 100 colonies be kept, or only a single colony, the number of pounds of clover honey gathered by each colony would be the same, although the total crop would be decreased in proportion to the decrease of colonies.

But on the supposition that 100 colonies could keep all the clover nectar licked up, then 101 colonies could not average as many pounds as 100. Not only that, but there would be an actual falling off of the total crop, by the amount of honey used by the additional colony for its own consumption. If, now, we keep increasing the number of colonies, we will keep decreasing both the total yield and the yield per colony, until we reach that point where there will not be a drop of surplus, the bees requiring all they gather for their own consumption.

But another factor comes in to be considered—the scattering honey-plants aside from the clover. Under some conditions these will make so little difference as to be scarcely worth considering, while

under other conditions they may make such a notable difference as to mislead the novice greatly. Suppose these scattering plants give a continuous yield throughout the whole season—say five months—but suppose the yield so small that two colonies can take care of the whole of it. If these two colonies are all that are on the field, then instead of being limited to about five weeks on the clover, they will have five months in which to store, or four times as long. Each one ought then to store four times as much as if confined to the clover, or 400 pounds.

Right here is where the novice is misled, for he is pretty sure to figure that with ten times, or fifty times, as many colonies he will have ten or fifty times as much surplus. Whereas, as soon as his apiary of two colonies is increased to six, he will find his average yield per colony just cut in two, and constantly diminishing with further increase.

**Bees Poisoned by Yellow Jessamine.**—C. S. Harris has a location in Florida where this plant is abundant, in several places covering nearly an acre of ground, and he says in the American Bee-Keeper:

When I began keeping bees here and discovered, in the spring, great numbers of bees dying and dead in front of the hives, I supposed they were stricken with paralysis, and yet the symptoms did not appear exactly like those of that disease. Most of the affected were the just-hatched, downy ones, and they had no trembling motion, but seemed stupefied or intoxicated. The old bees affected had the distended, shiny appearance of bee-paralysis, it is true, but ordinarily they were few, except in queenless colonies, or where, for any reason, but little brood was being reared. Very fortunately the queens are seldom affected.

After a few seasons I found that this trouble made its appearance with the jessamine bloom, from which the bees stored some honey and considerable pollen, and disappeared entirely with the end of that bloom. One point that made this more noticeable was that the blossoming of this vine is a movable period, varying with the season from December to March, and even April, remaining in bloom from four to six weeks. I have discussed this trouble with several physicians, and all of them say it is undoubtedly jessamine poisoning, having almost the same action upon the bee as the poison extracted from the root of the vine has upon the human system.

**Formaldehyde.**—An al-de-hyde into an al-cohol *de*-hydrogenated, and, as a rule, an alcohol is transformed into aldehyde when it loses two atoms of its hydrogen. Methyl alcohol ( $\text{C}_2\text{H}_5\text{O}$ ) when deprived of H becomes  $\text{C}_2\text{H}_4\text{O}$ , called formic aldehyde, because it very readily changes to formic acid ( $\text{C}_2\text{H}_3\text{O}_2$ ). Shortening the term "formic aldehyde," we have *formaldehyde*. It is largely used under the name of formalin, which is a 40 percent preparation put up by the Schering Chemical Works. It is probably the most destructive germicide known, although having little effect upon animals or man, the fumes being breathed, it is claimed, with little inconvenience. Yet it can hardly be a wholesome article of diet, for the doctors of Chicago object bitterly to its use in milk to keep it from souring, saying that such milk is deadly, slow but sure, if continuously fed to babies.

It must not be understood that formalin is a cure for foul brood. All that is claimed for it is that by its use foul-broody combs may be disinfected so that they may be safely used in a healthy colony. Even this is a very important matter, as thousands of dollars have probably been heretofore lost by the burning of such diseased combs.

The combs are submitted to the effect of the gas, and the most convenient way to use it is probably by means of formalin pastils

2d. They are cooler during the summer heat.

3d. They do away with the necessity of summer shading.

4th. They will admit a 20x20 super, which contains 16 Langstroth frames.

5th. They are quite a protection against robbing.

6th. You will not find them carrying out brood during cold, rainy spells or frosty nights, as you see them do in thin-walled hives.

7th. You will be blessed more with large swarms.

8th. The bees will not leave the super for either comb or extracted honey every cold night, as they do in the thin-walled hives with the ordinary flat cover.

Lastly. They are less easily handled by thieves.

The little expense, the bulkiness, and the extra weight, should not be taken into consideration for its adoption.

The advantages of this hive will pay in a few days for the expense of remodeling by the results obtained.

With reference to a bee-cellar above ground, I will say that such a repository can be made suitable and bee-proof, which is a necessity; also ventilation accommodation, so that it can be increased toward spring. The ventilator must be screened from below, and a trap-door must be replaced by a screen. Water must also be given in sponges at the entrance of each hive to supply the necessary moisture required for brood-rearing, which begins to take place in all the hives at that time in a dry repository like the one I have just mentioned, and also to prevent restlessness and over-heating.

The outer casing of this hive practically does not cost any more than an ordinary hive, and the inner one can be made of much cheaper lumber and still be first-class.

#### KEEPING BEES IN THE CITY AND MOVING THEM SHORT DISTANCES.

I kept bees for several years practically in the heart of the city, from 30 to 70 colonies in the rear of my residence, between it and the stable, where I kept eight horses, one cow, and four setters. The buildings are situated on a corner lot opposite two stores, and the next door is a butcher-shop which does a large business, as also did the stores.

One block and a half away is the largest church, which has the largest congregation of any church in the city. Opposite the church is a school-house with 600 pupils, one-half of them passing our residence four times a day. Some of my hives were within two feet of the sidewalk.

I had Carniolans and Italians. If I had a cross colony I would supersede the queen. All of the queens were clipped.

I had poplars all around the yard, and some fruit-trees in the yard. By the way, it is on account of the fruit-trees I got the bees. The boys, as vandals, wouldn't only take the fruit before it ripened, but would even break the trees.

I bought some cross bees in the valley 10 blocks away. I moved them in the middle of the summer. My residence being 80 feet higher, I think the difference in altitude in the short distance kept my field-bees from returning to nuclei that were placed where the hives were taken.

I placed a colony on four stilts under every fruit-tree in the yard in a very flimsy way, thinking the boys would disturb them when they came after the fruit, but they have never disturbed fruit or bees since, so the bees could not give them a reception.

How it came about that the bees did not disturb the neighbors, or the daily pedestrians, was by the bees taking an upward flight as they left the yard, the same as if they came out of a kettle, and the same in descending on their return to the yard.

I would advise any one in like circumstances to provide for water in the yard proper from the very first day, as that is the only thing bees carry from the immediate neighborhood. I have seen them on a water-barrel as much as a swarm at a time in the next lot, the river being three blocks away, and a large creek four blocks from the residence.

E. E. NUSSLER.

Dr. Nussler—I have an entrance-gate that is an improvement on the former gates, preventing the air from getting into the hive in cold weather. It was simply a strip of wood under the front of the hive, and another gouged out of a block of wood which would be put in front of that so that the bees would have to go through a kind of a tunnel into the hive. A friend of mine has used that extensively, and he says he has never had a case of robbing since. He has used it more extensively than I. There is one advantage in it. It is very cheap, and any person can make it easily himself. It prevents cold wind entering the hive.

Mr. Pettit—I would like to hear the dead-air space dis-

cussed a little, as to how we can get dead-air space for the double-walled hive. I realize that the dead-air space is the best conductor, but the question is to get it air-tight. Take a piece of wood that is placed in front and behind the hive. A casing is around the hive, and the side-boards are placed at it afterwards, so by accurate work you can make a very good hive. It is all in accuracy and right lumber. They were air-tight, I am positive, because you could pull them up and the air would return just the same as out of a barrel. They were air-tight.

Pres. York—Is there anything else to be said on the paper, or on the air-space mentioned? If not, we will have the report of the Committee on Resolutions. Secretary Moore will read the report.

#### RESOLUTIONS OF RESPECT ON THE DEATH OF DR. A. B. MASON.

WHEREAS, To our Heavenly Father, for reasons which we can not now understand, it has seemed best to call to a higher duty our faithful friend and fellow-worker, Dr. A. B. Mason; therefore, be it

Resolved, That we, the members of the Chicago-Northwestern Bee-Keepers' Association, do hereby make an expression of our most sincere sorrow and grief over the loss of one of our truest stand-bys and supports; and be it also

Resolved, That we extend to his wife and to the other members of his family, our most earnest and heartfelt sympathy in their loss, which is greater than ours.

HUBER H. ROOT,  
W. Z. HUTCHINSON, } Com.  
F. WILCOX,

Mr. Hutchinson—There are so many things I suppose I might say that I hardly know where to commence. Dr. Mason was a jovial, genial, joking character. The first time I met him was at the State Fair, where he was to award the premiums and I was an exhibitor. He looked me over and says, "Are you Mr. Hutchinson?" "I am, sir." He says, "Well, I am sorry to meet you." And for some reason or other I got onto the trick of his nature, and I said, "You can't feel any worse about it than I do." That is a key to his joking nature. I have known him personally, and have been a close friend of his for 20 years, and I can say that there never was a man who was a truer friend to me than Dr. Mason. I think all who met him in the National conventions will say he was the life and soul of those meetings, and I think no man in our ranks will be more missed in these conventions than he will.

The resolution was adopted unanimously.

Emerson T. Abbott then addressed the convention on

#### BEE-KEEPERS AND PRINTERS' INK.

Mr. Moore asked me to select a subject. I was at a loss to know what to talk about. I said to myself, "A great many of these bee-keepers know more about bee-keeping than I do, and it would be folly for me to endeavor to tell them anything about how to manage their bees, so I will let the matter rest until I get there." I thought I would select a subject after I got here, and this one came to me: "Bee-Keepers and Printers' Ink."

You have probably seen on your fence, Sunny Jim, and I leave you to guess what fool raised him. That jingle was written by a woman. The woman has made a good competency out of it, and the company for whom she did the work have made a fortune, and Sunny Jim is found all over the world wherever people eat, and more people know about Sunny Jim and that jingle probably than they know about any other one food.

Now, then, this same printer's ink should be applied to bee-keeping and the work of bee-keepers. It has been my hobby that this principle of printers' ink should be applied to the National Association. You know people who publish papers all believe in advertising. That is, they believe in the other fellow advertising, and in other people paying the cash in advance. Every paper man here will tell you that is so. All of the Chicago daily papers, all of them believe in advertising, and they believe that it can be done perhaps better in their paper than in any other way. We will leave each individual to decide that for himself, as to where the advertising can be done to the best advantage, but we want to emphasize the fact that the advertising can be done to advantage.

Take the National Association for instance. There are over 300,000 bee-keepers in the United States, and I venture to say that there are not 25,000 bee-keepers of the United States, if we could assemble them all to-day, that could tell what the National Bee-Keepers' Association has ever done. There are about a thousand members in the Association.

and there are at least 300 of them, I should say, who have never seen a copy of the Constitution of the Association to which they belong. Now, doesn't that surprise you? But that is so. I am not making rambling statements that are not borne out by the facts. Three or four gentlemen said in my presence here, "Can I get a copy of the Constitution of the National Association?" I do not know where you would get it. They ought to be accessible, and you ought to have had one very long since. They hadn't been printed. Never but once in years have we seen anything credible in the form of advertising given out to the world, and that was the report of the Buffalo convention, which was published by Mr. York, and I have been watching and waiting anxiously to know whether we were to have a report of the same kind of our Denver meeting. What it stands for, what it proposes to do, and there isn't in existence to-day a single pamphlet, a single leaflet, a single scrap of printed matter on which a member can see—which will tell the story—and read it when you have time. And yet, we wonder why there are not ten thousand instead of one thousand members. I wonder why we haven't done more than we have.

Do you know whose goods are on the shelves of the merchants down in Iowa? I will tell you whose goods are there. The goods of the people who had a nature aggressive enough to send a smart and energetic traveling man there to show the goods to the best advantage, and make those people down there feel that it was to their advantage to do business with that house, and no other. The goods that are prominent in the United States to-day have been made prominent by aggressive men and women, and by the expenditure of printers' ink broadcast everywhere until the babe begins to lisp, as it were, the moment it says papa and mamma, Mellin's Food it knows next. Why? Because Mellin has used printers' ink. Because Mellin has used the agencies that are necessary. Now, there is Mr. Jones living over in a county in Illinois. He is a member of the National Bee-Keepers' Association. Is there any reason why Mr. Jones should not be a walking advertisement for the National Bee-Keepers' Association? He ought to be, and, if necessary, if Mr. Jones can not afford voluntarily to do the work for nothing, then he should be paid. There is no reason why we should not send out solicitors to entreat men to become members of our Association, than there is for life insurance men not to send out solicitors to get men to take out life insurance in their company. There is no reason why we might not be 50,000 strong in a little while actually, but we will never be 50,000 strong until we use the agencies of the Twentieth Century to make ourselves strong, and these agencies must be used by us if we ever expect to succeed, and one of the strongest and best of these is *printers' ink*, properly applied and properly distributed, backed up by the energy and enthusiasm of live men and women.

Now, it seems to me, that it is worth our while to think about this just a little. Suppose I could just stir up enough enthusiasm in you people here to send you out as walking advertisements in the interests of the National Association, or in the interests of this Chicago meeting. Why do you have a better meeting here than they have in any other place in the United States, aside from the National? It comes pretty nearly holding its own by some meetings of the National. Why is it? Printers' ink! And I hope you will excuse me if I ask another question. Why, instead of 300 or 400 members in the National is it 1000 strong? Printers' ink distributed by George W. York and others has done the work. Those are the sober facts. Those are stern realities.

Now, if we were all to distribute it, we would do that much more. We must have something to distribute. It costs money to get out neat circulars; it costs money to do anything. It costs money to print a journal like Mr. Hutchinson's, with fine illustrations, printed on good paper, but it all tells in the end, it all counts for something, and if we want to be a force and a power in the world we must let the world know that we are abreast of the times, and not a hundred years behind the age. A little peanut stand uses more advertising than we do, and we have no right to compete with the peanut stand unless we use some of their methods. I believe in advertising, in pushing matters.

As to the way to do these things, as to the special thing to be accomplished first, as to whether we had better try to build up a honey exchange—that's a business proposition. Whatever line of work we select, it must be along the lines I suggest—advertising—letting the world know that you are trying to do that thing. Let me say another thing: Perhaps you never thought of it. It is just as much news to find that there are bee-supplies for sale in Chicago as to read that they held a meeting here and I made a speech.

One thing is just as much news as the other. It is just as much news to know that there is a suit of clothes for sale at a certain store in Chicago as it is to know that a hotel burned up—deplorable!—and 21 people lost their lives. There are people wanting clothes, and needing supplies, and the thing that carries that news to them is just as much distributing information as one that carries gossip about Jennie Smith and her beau. We have said it is of value to advertise. That's part of the thing itself, and that's part of what we want to know. You might say that of the National Association. They are blowing their own horn. I notice that some blow their own horns a good deal in something that I was doing. We have the famous horn-blower with Sousa, you all heard him, he is a citizen of St. Joseph. How much do you suppose Mr. Sousa would pay Arthur Prior if he let somebody else blow the horn? He has a good horn, and he is a good blower, and he has a right to blow it. I believe in people who have a good horn blowing it. It will never be blown on earth if you don't blow it. The other fellow will never blow it for you. He is busy looking after his own horn. That's all there is to it. We can't build up a National Association. We can't do anything that bee-keepers want to do unless we blow our own horns sufficiently that they may be heard, and that the people may know that we have this thing, and that the people who want that are just as anxious to secure that which you have for sale. You don't want to think that you bore a man because you tell him a large story about your bees, for he is as pleased to hear it as you are to tell it. He is interested in hearing you, and it may do him some good. I have lived in St. Joseph 20 years, and, believe me, there isn't a week but somebody comes in and buys honey. It is some I produce myself with my money. A woman gets some of that honey and she says, "Mr. Abbott, I never had anything like it, I want your honey all my life!"

Dr. Miller—She never tried "York's Honey!" (Laughter.)

Mr. Abbott—And she says, "I never knew that there was any Abbott's honey before." Don't you see, if I had blown my horn a little sooner what an amount of honey I might have sold; and when she found it she was so delighted that she was in the fourth heaven. "York's Honey"—they find it that way. The more they take the better we can treat our wives, the more money it brings to us. I have said enough; I have taken enough of your time. I thank you.

EMERSON T. ABBOTT.

Pres. York—There are two little corrections I would like to make about the Constitution of the National Association. I think Mr. Abbott said not over 300.

Mr. Abbott—I was asking it.

Pres. York—The Constitution was mailed in the Buffalo report. You didn't think of that, perhaps.

Mr. Abbott—No, sir. Let me say another thing. That wasn't said by way of criticising anybody, because it wasn't anybody's duty to have that Constitution printed. All the Constitutions that have been printed—I think Mr. York put that in the Buffalo convention report without being told to do so by the National. I was chairman of the Board of Directors for a long time, and if they ever passed a vote directing Mr. Secor to print it, I didn't know it. Mr. York printed it of his own volition.

Pres. York—It seems to me that Mr. France ought to take part now, following Mr. Abbott, about building up the National Association in Wisconsin, and I think he can say something very interesting on increasing our own membership. We heard him on another subject, but he hasn't had a chance yet on this.

Mr. France—I fully agree with Mr. Abbott, that we haven't used very much printers' ink. We debated cheating the consumers in a box of comb honey—squeezing. We have been doing the same thing, cheating our National Association. We haven't given any encouragement to beekeepers, and the other subject of the National Association forming a honey exchange, if you please, will all correct itself as soon as you have members enough in the National. The first and foremost thing we want is to get strong enough to do some good, and although we have set our mark at 1000 and reached it, it looks small that a thousand members are all that we have when there are over 700,000 beekeepers in this land of ours. I was surprised over my own State what a few members were taking the bee-papers. Mr. Abbott said that we haven't encouraged others to become members. If it is advisable that we organize, and we know that it is—we have the National—and the thing to do is to get more members in it, even though we have to pay a man for soliciting members like the insurance companies do for

life insurance. We haven't even asked members to come in, or allowed them anything for soliciting new members. At our Association I was the first to introduce this thing of joining in a body. Join the National in a body; the more we have the more we can work. I do hope that the day isn't far off when the numbers in the National will increase rapidly. Then, again, this subject of foul-brood legislation, so many of our States need it, and the National Association, if it has any strength, can be a great help. Local legislation could not have much effect when it was transferred over from another State. It had a name, was doing business, and they had respect before the legislature, and so is the National, and I think the day is coming when we will all of us get our neighbor bee-keepers to join the National Association.

Pres. York—We have with us the president of the National Association; perhaps he would tell us some of the plans of the Association as to using printers' ink.

Mr. Hutchinson—I indorse all that Mr. Abbott has said. I believe in advertising my business in other papers. I don't know that there is anything to say in regard to the future of the Association. Mr. Moore had an excellent paper on that subject. We should go ahead and work, and advertise, and get members, and, possibly, as Mr. France says, if we get members enough this matter of organization will settle itself; but I don't know about that. I am sure we certainly need the members.

Pres. York—I believe the Board of Directors decided not to print the annual report this year, thinking they could use the money to better advantage in some other way. Of course, that is their own affair; it wasn't mine at all. I took the report, and we have the report in the American Bee Journal, anyway, whether it is in pamphlet form or not.

### Uniting Weak Colonies in Spring—Formalin.

BY J. A. GREEN.

MR. HASTY wishes me to explain (page 296) why I do not believe in uniting weak colonies in the spring, as stated in my article on page 197. I know very well that it is contrary to most of the teachings of the books, but experience has shown me that it is but very seldom anything is gained by uniting colonies early in the spring. Two weak colonies put together will usually, in a very short time, be no larger than either one would have been if they had been left alone. The reason of this is that a large proportion of each is old and nearly ready to die of old age. The excitement of uniting, and the sense of prosperity caused by the increased number of bees, induces the bees to fly more freely, and otherwise exert themselves unduly, so that not only these old veterans, but the young bees, are soon worn out and rapidly perish.

Now, if this is the case—and I can find plenty of company among practical apiarists in believing it to be true—it is still more certainly true when one of the colonies is queenless. The colony with a queen has been in a comparatively normal condition, which is not true of the queenless one in which a much larger proportion of the bees are old and nearly worn out.

Some may say that it would certainly have paid to have given a queen to the colony the bees of which lived so long. Perhaps it would. The unusual longevity of these bees might have enabled them to hold their own until they had reared successors to themselves. But this is by no means certain, and I feel morally certain that ordinarily if a queenless colony the size of this had been united early in the spring with an equally weak one having a queen, which would be the usual way of procedure, its bees, instead of living until September, would all have been dead before June, and perhaps much sooner.

Do not understand me as saying that it will never pay to unite a queenless colony with a weak one in the spring having a queen. If the colony has not been long queenless, or if it has still a large number of bees, it may work all right to give it a queen in any way.

What I want to make clear is, that it does not usually

pay the man whose time is of much value to fuss with weak, queenless colonies early in the spring.

FORMALIN OR FORMALDEHYDE.

We read a great deal lately about this new specific against foul brood. As to whether we should call it formalin or formaldehyde, those who are informed on the latest chemical developments in the line of medicine tell me that the active principle is formaldehyde, and that formalin is a preparation of formaldehyde (patented, I believe), with the object of fixing it in solid form. They say that formaldehyde, in its ordinary liquid form—which I believe consists of the gas dissolved in water—is not only cheaper, but for many purposes, and probably for ours, is better.

In the enthusiasm over the results that seem to have been obtained, let it not be forgotten that all that can be claimed for it is that it obviates the necessity of destroying infected combs. As the apparatus needed for effective work appears to be somewhat expensive, and as we can recover very nearly all the value of old combs by melting them up into wax, it would appear that the margin of profit is not sufficient to warrant the use of the method unless there are a great many cases to be disposed of, or unless it is to be used as a preventive measure. For instance, if a man has a large number of extracting-combs from which he has just extracted the honey, he learns that some of the combs have contained infected honey. He does not know which they are, and, even if he did, the progress of extracting has doubtless spread the seeds of the disease through a large number of the combs. Without some efficient system of disinfection, it would pay him better to destroy the whole lot than to try to use them again.

Here is where the value of the fumigating method comes in. It might pay the man who lives where foul brood is prevalent to make a tight room large enough to hold all his surplus combs, and fumigate them all at one operation as a precautionary measure. But to go to almost as much expense and trouble to disinfect a single hive full of combs at a time, looks to me like being "penny wise and pound foolish."

Mesa Co., Colo.

### Forced or Artificial Swarming.

BY M. D. ANDES.

I HAVE just read Mr. C. Davenport's article on page 374, on forced or artificial swarming. While I agree with him that locality has much to do with the method that would secure the best results, I believe Mr. Davenport is wrong on some points. Without going into details I will simply give my method, and the reader can see wherein we differ.

I do not profess to be a bee-master, and am a very poor writer, but I have had some experience outside of text-books that has been worth many dollars to me in surplus honey and time saved.

I keep from 35 to 40 colonies of bees in 10-frame dovetailed hives, with Danz. supers for comb honey.

My business requires my time at the office ten hours a day, so I have but little time to be with the bees. Ten years ago I commenced clipping the wings of my queens, and ever since bee-keeping has been a pleasure.

Now, when a swarm issues my wife or the hired girl cages the queen, and when the swarm returns (which it will be sure to do) the queen is run in with the bees, and the hive marked. The same evening, when I get home, I remove the colony to one side and put a new hive filled with drawn comb or full sheets of foundation on the old stand, shake and brush all the bees in front of this prepared hive on a sheet or table-cloth, and let them go in like a natural swarm.

With all my experience I have never had but one to swarm out treated in this way. By this method I do not disturb colonies that are not inclined to swarm, and they go on unmolested and store honey.

By the plan advocated by Mr. Davenport and others, one must be continually looking for queen-cells, thereby disturbing the bees, and, no doubt, at a loss in the surplus honey.

You may ask what I do with the brood. If I am treating a colony with a superior queen, I make nuclei and rear some fine queens, otherwise I destroy all queen-cells and place the brood on top of the weakest colony in the yard with a queen-excluder between; or, if this colony should have a poor queen or an old one, I save the best looking cell, kill the old queen, and leave out the excluder. This will usually give me a good, strong colony with a young

queen, which will seldom swarm that season, but store a good crop for extracting in the fall. This method will keep down increase or make increase, whichever preferred.

This plan is entirely original with me, brought about by circumstances, and which has given me the best results. Colonies treated in this way, taken as a whole, always store more honey for me in the supers than those that did not swarm.

This is not practical for out-apiaries.

Sullivan Co., Tenn.

## Queen-Rearing—Nucleus Queens—Other Topics Discussed.

BY HENRY ALLEY.

I DON'T think the subject of queen-rearing can ever be worn out. No end is in sight, so far as I can see.

I have been severely criticised in this Journal by several persons for statements I have made concerning queens reared in nuclei, and queens reared by a small number of bees. I have been criticised by people who merely guessed that I was wrong, not by those who had tried the experiment and noted the results. I stated in my articles that I could back up all that I claimed for nucleus-bred queens. I gave an account of one nucleus-bred queen that lived four years and two months, and could not have laid less than 100,000 eggs each year. Now, this queen was reared this way:

I fixed up a 3-frame nucleus merely for drones, as I had a few queens that I desired to have fertilized in another yard by a special strain of drones. One frame of worker-brood was put in and about three pints of bees. I did not open the hive for several weeks, and then only to see how many drones there might be left. I found the bees had provided themselves with a large, fine queen. She had such a promising appearance that I concluded to keep her in my own apiary. Now, that queen proved to be one of the finest queens I ever owned, or ever saw.

This brings the subject to another point: It has been claimed that queens reared from larvae three days old are short-lived and worthless. Does the experiment given above confirm any such claim? Mr. Aaron Benedict, who reared and sold queens some 25 years ago, claimed that the best queens were reared from 3-days-old larvae. I can not think so, yet I hardly know how to get over the fact that I did have one valuable queen reared from a three-day-old larva.

By the way, I am of the opinion that when a frame of brood is supplied queenless bees, an old larva is always selected by the bees from which to rear a queen.

Well, now I come down to nucleus-reared queens again: On the 19th of May (this year) I went into my apiary early in the morning (and the morning was a very warm one), and found no less than half a dozen colonies of bees clustered on the outside. All these hives had the winter-cases on, and several of them had a set of 24 sections on. I removed the out-cases to cool the bees as much as possible. I then looked for markings on the hives to see what kind of queens were in those colonies; I found marked on each of the hives "Nucleus queens," with the date of introduction. I was really surprised myself, as I had no idea I had introduced so many nucleus-reared queens.

Now, see here, my friends, I had nothing to do with rearing the above six queens. They were all reared in the small hives, such as I use to keep my queens until they become fertile. All these queens "came by chance," and they are good enough for me. Now, if bee-keepers who can do so well visit my yard, I will prove to them that nucleus-bred queens are as good as, if not superior to, natural-bred queens.

Unfortunately, we are in a bad fix for surplus honey this year. No rain has fallen here of any account since April. The grass and white clover are all dried up, and now, that the fruit-bloom is gone, there is nothing for bees to do but to eat what honey was stored from the fruit-blossoms. Many of my colonies were well under way in the sections, and some of the sections are full. All the brood-chambers are solid full of honey and no feeding will have to be done.

Last year bees did nothing in June. It was so cold and wet. Now it is dry and there is no honey. So you see we are in a "stew" all the time. Some will claim that it is owing to the breed of bees that they are gathering and storing no honey. Well, it may be so. I wish I could find

a strain of bees that would store honey in winter and in summer when the flow is all used up. My past experience, however, makes me think that if I had queens of that sort to sell, somebody could be found that would cry them down. And this reminds me of what Mr. Doolittle said of my queens in a recent article from his pen. He showed that queens from my "hundred-dollar" queen did not compare in honey-gathering in any way with those he reared. Well, they say that comparisons are odious, but I must say one word here about Mr. Doolittle's queens:

In a letter dated at Riddle, Oregon, May 10, the writer says: "I have a yard of 75 colonies mostly of Doolittle's strain, and I want to change them." It is presumed these bees stored more honey than the writer could take care of, and so a change to something else is needed.

Three years ago I found a man in Brockton, Mass., who had 20 colonies of bees for sale, as he would be away from home all summer and could not care for them. I took a look at them, and could have bought them at my own price, but I refused, as there was not a decent colony of bees in the lot, and I am sorry to say that he had a number of Mr. Doolittle's queens in the lot. I remarked that I wanted bees for business that year, and I could not afford to keep bees 12 months to build up.

Now, I don't propose to say anything more on this point. I give the above merely to show that Mr. Doolittle rears no better queens than other people do. Neither do I want it understood that I think the *strain* of bees, nor the method of rearing the queens, had anything to do with the inferiority of the queens mentioned above.

Better queens than the above can be reared by any system, and at any time of the year. Mr. Doolittle, like myself, had been unfortunate in selecting a queen-mother. I have reared queens from a mother whose royal progeny did not all prove first-class. The queens were sent out and fault found with them. I replaced all such queens when notified that they were worthless, or in any way inferior.

I reared queens 25 years in the good old-fashioned way, and no fault was found with them; but when I took up rearing queens over an excluder, then complaints began to come in.

Bee-keepers make a great mistake in purchasing the *beautiful yellow-banded* bees. Insist upon a darker strain, say bees that occasionally show but one band. A queen that produces such worker-bees is superior to any brilliant yellow-banded strain. I never saw a queen direct from Italy that produced all three-banded bees.

Where are those fellows who used to advertise 5-banded bees? That strain proved to be worthless, and so did the clover-queens, long-tongue queens, etc. Go back, gentlemen, to the old-fashioned Italians, say such as were bred and sold 30 years ago, when about half of the young queens were striped and others very dark. We can rear such queens as those, and send out good ones—queens whose bees will roll in lots of honey, and winter well any winter. If you purchase queens to please the eye, you can't please the pocket-book at the same time. There's money in what some people call "hybrid bees." There is money in some of the beautiful yellow-banded bees, but 'tis a difficult job to rear those beautiful queens and give perfect satisfaction in all cases.

I am not advising any one to purchase hybrid bees. The bees above-described are not hybrids, by any means. I am advising you to order a darker strain of bees only. Try them and you will see an improvement in your apiary.

I have found in my experience that *pure* Italians bees do not rear nearly as strong, hardy queens as do black bees. I am using black bees in all cases in queen-rearing.

Mr. Doolittle says the cells built by my method are "frail." How does he know? To show that they are not, I have sent a batch of empty queen-cells to Editor York for his inspection. Say what you think of them.

In my statements concerning rearing queens above an excluder, I will say that fair queens can be so reared. But I know, and Mr. Doolittle will find it so sooner or later, that *better* queens can be reared by just as simple process. I'll soon have Mr. Doolittle saying so, as will all others who rear queens, if they will try the process I have given to the public.

Essex Co., Mass., June 11.

[We have seen queen-cells reared from cell-cups, and in comparison with the samples sent by Mr. Alley we should say there was little if any difference in those we have seen.—EDITOR.]

The Premiums offered this week are well worth working for. Look at them.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Getting Ready for Alfalfa.

Our bees are doing fine, considering the cold spring and queenless colonies. I am putting sections together and fixing supers for the alfalfa flow the first of July.

MRS. G. W. KNOWLES.

Rio Blanco Co., Colo., June 24.

### Does All the Work Herself.

I have been keeping bees since 1895. I now have 17 colonies. I lost five during the winter and spring. I do all the work with the bees myself, and send and get the hives in the flat and put them together myself.

I like "Our Bee-Keeping Sisters" department very much. I turn to it the first thing when I get my Bee Journal. I have no suggestions to make regarding it.

St. Joseph Co., Mich., May 30. MRS. L. MACK.

### Watering Bees at their Doorstep.

I see in last week's Journal, June 11, that E. E. Hasty requests me to report later on, as to the extent I succeeded in getting the bees to take the water I provide at their doorsteps.

It is three years, I believe, since I first gave them water at the hive-entrance. I don't wait for them to have any other place to go. It is when the air is chilled and they need water, and they come out and find it handy; they don't feel like going far if they can get it near by. They take it and go back. I have the entrance the full width of the front of the hive, so I put it at one side of the hive. The pieces go under the hive in front, as I said in my description, and they take the water all summer unless I would forget to fill it through the day. As I said, they were not large enough, and I have some made after the directions in the "A B C of Bee-Culture," a small board with grooves in it, and use a 2-quart fruit-can for the water. Where the hives are in pairs one will answer for two hives. I put it on something so that it will be about as high as the bottom-board, and not more than half a foot from the hive. I don't know as my bees are any wiser than any others. I think they are pretty good-natured.

If this is not plain or satisfactory, E. E. Hasty will have to tell me where I have not made it plain.

Cumberland Co., N. J. MRS. SARAH J. GRIFFITH.

It is very true, as Mr. Hasty says, that bees will "wade right through water at their door, and go off to the old familiar watering-place." But he will notice that Mrs. Griffith does not wait for any other watering-place to become an "old familiar" one. Right in that is the secret of her success. She trains them to right habits in their youth, "and when they are old they will not depart from them." If care is taken to get the bees accustomed to a certain watering-place early in the spring, much trouble at the watering-troughs of horses and cattle may be prevented.

### A Bee-Keeping Sister on a Texas Ranch.

I bought 600 acres of land last June, and am now farming and running this big corn, cotton and truck farm myself. My home is in Chicago. I was a city-raised girl, and this is my first farming. They will eat tomatoes from five acres of my farm in Chicago. I began shipping June 1. I never saw one raised before, and raised the plants for the five acres in a hotbed planted Jan. 10; raised 25,000 plants myself with the aid of a hired man, who did the hard work at \$10 per month. And I have the best and earliest five acres of tomatoes in Cherokee County. I expect to get \$2000 for them, net. I could tell you more, but do not want to take you from your all-important subject—the bee.

I have always traveled, and while visiting my husband's

brother in Indiana, last year, I became interested in the bee. He takes the Bee Journal, and has a large apiary. I thought my farm would be incomplete without the bee. Besides, this is a great fruit country, and no bees. I have 75 acres in peaches; Elberta comes in next spring. And I knew the bee could do no harm, if it would not be a benefit, to fertilize the blossoms. I started to look for some bees and could find nothing but old-fashioned boxes of little black insects. So I bought two colonies of them, sent for the American Bee Journal, and my brother-in-law sent me some patent hives, some frames with starters, and some frames with comb, a smoker, knife, and cages to introduce new queens, and a hook to handle the frames with. I then picked up the Bee Journal to find out who sold queens, and found an advertisement and sent for two tested queens. The breeder has sent only one to date, but I introduced the "lady," and to-day I was delighted to see my fine Italians strong, and working side by side with their black sisters, which are waiting to receive the high-bred mother, and there is no comparison. They are not doing anything when compared with the Italians. They (the blacks) were stronger than the colony where I put the new queen, and now the Italians have more brood, more honey, and more bees, than the blacks. I will tell how I did it all.

The first warm day I transferred the bees to new homes, and went to feeding them, for they were very weak, being robbed close and full of moth, and no honey in the old gums. I took an ax and broke open the boxes, shook the bees in front of the new hive, took out what brood there was, put a frame in to keep the queen down-stairs, and put brood and what bees were on it in the upper section, and went to feeding them to build them up before the Italians came. When the "new lady" came my greed for bees got me into trouble. I found them doing so well that I wanted more, so I got another hive and three frames of brood, and the bees that were on it, and armed with small scissors I caught the "colored lady" and clipped her wing, and placed her in front of the hive so she could run in. I then got out a frame where there was some honey and pinned to it the cage my brother-in-law sent me. I put the queen and her escort in it, and covered it all up. Three days later I looked in and found all the escort dead and the queen running around the cage. Then I turned her loose and went away, hoping she would be received well, and to-day I have a strong colony of fine bees. A man just came with the other queen, so I will introduce her to-morrow.

The bees then started to rob my nucleus, and the dead bees showed me the struggle they were having. I shut them up and fed them, but every time I opened up the hive the robbing began. I fed the other colonies outside, and the nucleus inside, to see if I could find out where the robbers came from. Do not laugh. I could not find out, so I shut up the nucleus and found a lot of bees around trying to get in. I got a paper of starch, this fine patent starch, and dusted it on them, and marked them that way. They shook their wings as best they could and left after awhile for the woods. Not a quarter of a mile from here we found the tree, and a man claimed it. I did not jump his claim. I was glad to get rid of it, so he cut it down and thinks he started a colony, and I hope he has, for there are few if any bees here.

So this is the way a future apiary was started in Cherokee Co., Tex. There is only one man who pretends to keep bees here in this part, and he has the old style. I will try to meet him and get him to take the American Bee Journal and show him the difference in bees. I like to read the Journal, and especially the "Sisters" corner, as I think the work suits ladies. My husband is a kind man, but he has a railroad contract in Louisiana, and will not settle on the farm until this fall, then I will have some more bees. I am not afraid of being stung, and have only been stung twice, and that was an accident. The bees got in my dress and I crowded them.

I love the bees. They work for us and board themselves for nothing, and I will always try to divide honey with them. If ever I think I have learned anything that will benefit a bee-keeping sister I will let her know through the Journal.

GEORGIA MAYER.

Cherokee Co., Tex., May 25.

Well! I should think it was a pretty big undertaking for a city-raised girl to run a 600-acre farm, and there must be considerable pluck in your make-up. I am very anxious to learn how you succeed, how things foot up at the end of the year. Please don't forget to write us an account of your year's work. We may all want to move to Texas.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### MATERIAL FOR HIVE-MAKING.

Yes, if the lumber was so costly it could not be used for hives we could use clay and straw. Are you "gittin' in a hurry" for the time to come? As a half-way house before going to clay, quite small saplings can be sawed into lath, and lath make pretty good hives. Poles large enough to saw into lath can be raised in less than a lifetime, while big logs can not—that is, not as a general proposition—cottonwood and some other trees can be made to furnish a big log in a moderate number of years. I find my full-grown oaks between 200 and 300 in age. With an intensive sort of forestry that could be shortened greatly. And an immense majority of the States haven't even a forestry officer yet. Page 327.

### MAKING HONEY-BREAD.

If a man should undertake to make honey-bread, as per page 329, he would put the things named together and dump them into his flour directly, innocently expecting to knead up bread. I guess the ingredients named are to be fermented together first. If I'm wrong so much the better for the bread-makers.

### THE WEATHER AND SWARMING.

Mr. Doolittle makes a worse report on bee-weather than I can. Bad here, but some of the bees don't give up the swarming idea yet. Page 332.

### HONEY ON FRIED BACON.

Honey on fried bacon, eh? We can not put very much trust in the approval of soldiers in camp. Appetites too uproarious. But the combination is a striking one, not altogether incongruous, so if folks would only try it perhaps many would like it. Perhaps they won't try it. Some may say, "Why try to whiten the lily, or paint the rose?"

### SPRING-FEEDING EXPERIENCES.

The spring-feeding experience of Edwin Bevins will make some of the let-alone folks smile. Began early with some—got to feeding them all—has to keep at it now, weather is so bad. My usual May and June tactics is not to feed a colony unless it shows the outward signs of starvation—bees in stupid lumps by the door, or climbing feebly up the front, and dead ones beginning to scatter away. And when such a colony is fed I don't want to get them in the habit of expecting feed. Lots of mistakes made both ways in feeding tactics. Many dollars worth of sugar and honey are fed when the value of it never comes back again—bees would have done better left to their own resources. On the other hand, for want of some feeding just at the right time, often the harvesting generation is only half strength, and can gather less than half a harvest. Which set of risks it is the best to run is a matter of location—and man. You see, in a good location some loss from too generous feeding can be borne; while in a poor location the bees can easily be allowed to eat up more than they are ever known to gather. Page 335.

### QUEEN-EXCLUDERS UNDER SECTIONS.

I have been thinking all along that the "orthodox" way was not to use an excluder under sections. The consideration mentioned editorially, on page 339, is heavily the other way. Brood-combs will get black, and section cappings will partake more or less of near-by comb, if there is easy running back and forth. On the whole, wherever purchasers are extra-critical about whiteness the orthodoxy of excluders under sections must be conceded, I guess.

### HONEY SHOWS AND PREMIUMS AT CONVENTIONS.

Combined convention and mutual admiration honey show! Premiums to be given if the condition of the treasury admits, otherwise not. The above is what the Wisconsin are about to experiment in. I think the rest of us should look on with decided interest to see how the thing works. Might knock out of itself what little life a feeble convention has. Might revive decidedly the waning interest of the old members, and bring in lots of new ones.

Also might attract prospective customers to a valuable degree. Quite as legitimate to pay themselves premiums as to buy themselves buttons, one would say; although the consideration that every one can have a button is in the buttons favor. Permanent subdivision of the brethren into two classes, sharps who get the money and flats who pay it in—well, that's a very undesirable subdivision, and heedless management might easily bring it about. The brother who suspects he has been put in the flat division will soon make himself scarce—has already done so long since. Page 340.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Swarming—Bulk Honey—Building Worker-Combs.

1. I have a colony this spring with a last year's Italian queen in an 8-frame hive. They were strong, so I added eight empty combs below. Three weeks after that they swarmed without starting below at all. I examined the combs and found lots of worker-cells bulged out with drone-brood here and there all through the combs, but also considerable worker-brood. I hived them on five starters, and now (ten days after swarming), they have queen-cells nearly ready to seal again. What would I best do with them?

2. How is "bulk comb" honey managed to keep it from granulating, as it can not be heated and sealed?

3. I have had success getting worker-comb built from starters by putting all but four combs of brood above an excluder (queen below), and putting in a starter in the center of the brood. They build very fast, being so strong. Do you think it will always work? OHIO.

ANSWERS.—1. I suspect the queen was at fault, and you will probably do well to change her.

2. I don't know, and it seems strange that nothing has been said upon that point—at least I do not remember seeing anything about it. I should expect the liquid honey outside the comb to granulate, and then it would have to be eaten in that condition, unless the whole were melted and the wax removed. Perhaps Mr. Hyde will tell us about it.

3. No, you need hardly expect to have it always work, but there's no law against your continuing it so long as it does work.

### A Bee-Mix-Up that Mixed Up the Bee-Man.

I served three years as private of Company A, 36th Illinois Volunteer Infantry, and have been subject to the vicissitudes of a life in this world over 60 years; but during the three years' experience I have had with the "little busy bee" I have encountered more circumstances that I was unable to account for than during all my preceding life. Now here is what I met with in the last experience:

I had hive No. 1 filled with black bees with two dove-tailed hive-bodies and super. Beside it was No. 2, Italian bees in one body with super and clipped queen. No. 2 sent out a swarm about 10:30 o'clock. I caught the queen, but before I could get a hive in place the bees nearly all returned. I moved the old body away about 20 feet, placed a new hive with foundation on the old bottom with the old super and the bees in it on the new hive, and liberated the queen in it, expecting the field-bees to return to it, which would make a strong colony.

About 2 o'clock I was informed there was a swarm of bees about a block away that I could have for 25 cents. I arranged a 10-frame hive about four feet from No. 1 and No. 2, and went and cut down the swarm and brought it home. They were evidently a stray swarm of black bees. I felt that I was on the road to success until about 5 p.m., when I discovered that Nos. 1 and 2 were in great excitement, and that the Italians from No. 2 were migrating to No. 1 by running down to the ground and across the 18-inch space and up to No. 1; and that there were black bees taking possession of No. 2, and my 25-cent swarm was not in the hive I put them in.

Now, there is much said about *bee-paralysis* and its treatment, but never have I seen a word about *bee-keepers*

having it, but I went home that night *paralyzed*. I retained sense enough, though, to remove the upper body from No. 1 to a position on the ground in front and between the two hives, and the emigrants began to move into it. The next morning I moved it from the ground to a stand 22 feet away with a good supply of bees. But all three hives contain black and yellow bees in about equal proportions.

In the morning there was a cluster on the front of No. 1, and in it I found a black queen which I caged with a small number of bees, which appeared determined to hug her to death. I opened the cage to rescue her, and she darted out and over my *right* shoulder, and that is all I know of her. This caused me to have a spell of shaking *palsy* as well as *paralysis*. I have sufficiently recovered to conclude that the more I find out the less I know about bees. Now, what I wish to ask is:

1. What became of my 25-cent swarm?
2. Did I do the best thing in the matter?

GEORGIA.

ANSWERS.—1. If you're going to hold me responsible for the whereabouts of that swarm it might be better for me to pay the 25 cents and let it go, but in order to save the payment of so large a sum I'll make at least a guess in the case. Perhaps the safest guess is to say that it went into No. 2. There would be nothing very unusual in that, for it is a common thing for a swarm to enter wherever there is unusual excitement, and there seems to have been excitement at No. 2. Possibly you may say there was more excitement at No. 1, and ask why they did not enter No. 1 where there was as much or more excitement. I should have said they would, only for your testimony that black bees were taking possession of No. 2.

2. So far as I can see your course was all right except in the matter of the caged queen. It might have been better to have saved her in the cage till you were sure you didn't need her in either hive, and you might have taken more pains in caging her not to have allowed any workers in the cage. Likely that was not easy to do.

### Moving Bees to an Out-Yard—Dividing Colonies.

1. Does moving bees have any effect on them just before a honey-flow? I have moved some of mine ten miles. They seem to be in good condition, but they are storing all their honey in the brood-chamber, and do not seem to go into the super. Some of them were moved with a super on top of the brood-chamber, as the brood-chamber would not hold the bees.

2. I would like to increase my bees. When would be a good time to divide them? I do not want to interfere with the honey crop.

ALABAMA.

ANSWERS. 1. The moving would have no effect on them unless they were smothered or otherwise injured. Put a bait-section in the super, and see if that doesn't hurry them up.

2. It will probably interfere with the honey crop as little as any other way if you shake a swarm from each colony about the time of natural swarming, or a little before it. The shaken swarms would give you the crop, and the brood with a few bees would easily build up into a good colony.

### Rearing Queens—Putting on Supers—Red Clover Bees—Preventing Sugar Syrup from Granulating—Feeding the Queen.

1. As I wish to rear a number of good queens next season, I want to know whether I should purchase one of those high-priced queens for a breeder, or can as good ones be reared from common stock?

2. When a super has been filled with honey should an empty one be placed under or over it?

3. Do you know whether any strain of bees can work on red clover? and, if so, who has them?

4. How can we prevent sugar syrup from becoming hard and crusty in the cells? I fed my bees last year, and the sugar syrup became candy, or, what is worse, it became hard like rock-candy.

5. Can a queen eat as other bees, or do the bees have to feed her? It is said that the bees feed the queen.

KENTUCKY.

ANSWERS.—1. Queens reared from the best of stock are none too good. It is possible, however, to get good stock at

low prices by buying untested queens. A tested queen sold for a high price was at one time an untested queen, and if it had been sold at that time it would have been sold at the lower price of an untested queen. But in buying an untested queen you take the risk.

2. You will get your honey finished up sooner, and have it more fully sealed out to the wood if you put the empty super on top, and some say that there should never be more than two supers on at a time. I doubt, however, that you will get as much honey in this way. My own practice is to put the empty super under in all cases until it comes near the close of the harvest, when it is hard to decide whether another super should be given or not; in that case I put the empty super on top. Indeed, when a heavy flow is on and the bees have a good deal of room, I sometimes put an empty super on top for fear there may be a little crowding before I get around to them again.

3. Yes, there have been, one time and another, many bees that worked more or less on red clover; possibly some of your bees may do so. You will find advertisements of bees that are recommended for that purpose.

4. If you use an even teaspoonful of tartaric acid to every 20 pounds of sugar you will probably have no trouble. A better way, however, is to feed in such a way that the bees will have a chance to make it all right. Feed early, say in August or September, and give equal parts of sugar and water. Don't need to heat it—the bees will make it all right.

5. A queen can eat as other bees, as you can easily determine by caging one for a short time and then offering her a little honey. During the time of year when she is not laying she may help herself like other bees, but in the season of busy laying the bees feed her with food that is no longer undigested. If she were obliged to digest all the food she takes during heavy laying, I'm afraid the daily quota of eggs would decline very suddenly.

### What is a Good Honey Crop?—Rearing Queens for Next Season.

1. What do you consider a good crop of honey for three colonies of bees? Do you think 150 pounds in six weeks a good deal?

2. Do you think it would be a good plan to rear queens this summer and give them a few bees in a very small hive, and next spring give them to a strong nucleus?

MISSISSIPPI.

ANSWERS.—1. That's a little like asking the size of a piece of coal. All pieces of coal are not of the same size. Crops of honey vary much. There are seasons of utter failure, and there are seasons when honey seems to come in a flood. The character of the bees, as well as the management, has also a bearing. If I could average, one year with another, 50 pounds in six weeks to each colony, I should call it a good deal.

2. Yes, if you can winter them safely.

### Getting Rid of the Ant Nuisance.

1. I have been bothered with ants in my apiary. They will catch a bee when it falls to the ground and overpower and kill it, and also bother in the hives. Please tell me if there is any drug that will act on them as cobalt does on flies, and whether I could use it without danger of harming the bees. Coal-tar seems to do no good. CALIFORNIA.

ANSWER.—Find their nests, make a hole into it with a crowbar, pour bisulphide of carbon into it, and cover up the hole. But don't bring a light near, or you may get blown up. You may also poison them with poison such as Paris-green, strychnine, arsenic, etc. Mix the poison in honey or molasses, with enough flour or corn-meal mixed in so it will not run, and place it in convenient reach of the ants. Of course, it must be arranged so the bees cannot get it. It may be in plates covered with wire-cloth of such mesh as to keep the bees out but admit the ants, in which case it is not necessary to thicken with flour. It may be put on little boards. Take a board four to eight inches each way, and fasten on each corner a piece of section; put the thicken poison on the board, and then cover with a similar board. The thickness of the section is such that no bee can enter, but the ants can enter freely unless you have a giant breed of ants.

## FROM MANY FIELDS

### Summer Cold and Unfavorable.

The summer has been cold and unfavorable. Many days the bees could not work. They have hustled in the honey from white and alsike clover whenever the weather has been warm enough so that they could.

I have 25 colonies, some of them very strong, but I have not had a swarm yet. I moved my bees 30 miles last winter. I think it hurt them. Some of them were quite weak in the spring. C. H. BENSON.  
Barry Co., Mich., June 24.

### How to Hold the Smoker.

You say it would be interesting to know how many disagree with Editor Root as to manner of holding smoker. It depends upon what you wish to do. If you want to blow smoke among the bees from the top of the hive, hold the smoker with the fingers next to the stove, if the large end of the smoker is up. If you work without a veil, and want to smoke the bees out of your nose, as you most likely will, then hold the smoker as "Ernest" directs. Dr. Miller thinks he may be pigeon-toed in the hands, but he is mistaken. Root is a man with defective hands.

DELOS WOOD.

Santa Barbara Co., Calif.

### Common Motherwort.

You will find enclosed some kind of a honey-plant. Do you know the name of it? It blooms tolerably early, and the bees work on it a great deal. N. R. WHITE.

Saline Co., Mo., June 24.

I send a branch of a flower on which bees work so lovingly. It has been in bloom every since May 20, and will, from all appearances, still bloom by July 15. Please let us know what its right name is. B. W. HAYCK.  
Adams Co., Ill., June 22.

Please tell me the botanical and common name of the enclosed plant. We have a few stalks of it growing in our garden, and although it is a common weed, we are letting it alone on account of the bees being so fond of its flowers. The flowers of this plant are fairly alive with bees all day long.

KATE V. AUSTIN.

Wayne Co., Ind., June 24.

[The above inquiries are concerning the same flower—common motherwort, *Leonurus cardiaca*. It belongs to the mint family, and is in bloom several weeks during the summer. Prof. Cook, in his "Bee-Keepers' Guide," page 422 (17th edition), says of this flower, among others, that they "all furnish nice, white honey"—and "are thronged with bees during the season of bloom."—C. L. WALTON.]

### A Discouraging Outlook.

I enjoy reading the reports all over the country, and as I have seen none from this vicinity of late I will report. The outlook is quite discouraging for a honey crop in southwestern Wisconsin this year. We have plenty of white clover, but bees are working on it but little. We have some alsike, and bees are storing from this when the weather will permit. To-day we haven't seen the sun. It rained most of the afternoon, a little in the forenoon, just enough to stop bees working. A good many came out, got wet, chilled, and will never return. The temperature is quite low—about 55 degrees. Strong colonies in double extracting hives, i. e., two-story, are all capping just a little on the upper frames. There is nothing in the supers for comb to speak of, unless confined very closely below, and little then.

## A Good Wagon

begins with good wheels. Unless the wheels are good the wagon is a failure. IF YOU BUY THE ELECTRIC STEEL WHEEL muds to fit any wagon—your wagon will always have good wheels. Can't dry out or rot. No loose tires. Any height, any width tire—Catalog free. **ELECTRIC WHEEL CO., Box 16 QUINCY, ILL.**

about July 1, then we would be "in it," but there is no basswood to speak of. Bee-men report all over this southwestern part of the State about a quarter the usual amount of basswood budded. Around my apiary there is none. I bought buckwheat seed and sent out near town so as to have fall feed, and today I learned several farmers were going to sow buckwheat. For the past six years there hasn't been any of it raised around here.

Bees are swarming but little yet. It is getting quite dry. We need a good, soaking rain, some. We had too much in May.

Grant Co., Wis., June 19. L. G. BLAIR.

## Very Bad Spring for Bees.

This is a very bad spring for bees here. It rained every day for three weeks. I have 40 colonies, and have had but one swarm this spring. Bees are doing nothing in Hunterdon county, so far. We are looking for better weather.

A. DALRYMPLE.  
Hunterdon Co., N. J., June 24.

## What Ails the Bees?

I want to write to you on two or three subjects. Last summer I had 70 colonies of bees, and this spring I had 25. Some did not have more than one pint of bees. Last summer it looked as if some of the brood starved after it had been sealed over. After the bees had died I found nearly all more or less that way. This spring I still thought the brood had starved (chilled) to nearly all hives. But now there are honey and bees enough so that the brood would neither chill nor starve, and still I find lots of brood in the weak ones, and some in the stronger ones, in the same condition—some will be sealed over and dead, apparently. Sometimes as much as one-half the brood, and then their eggs and brood not sealed over. There is no odor or bad smell that I can tell. Some of the dead brood turns brown and dries up in the cell. Now, from this, can any one tell what is the trouble? Give me a minute description of foul brood, black brood, and pickled brood, or diseases that fits the symptoms.

R. R. STORESBERRY.  
Vermilion Co., Ind., June 24.

## Dwarf Essex Rape for Bees.

Bees are doing well here now, as there is one of the best crops of white clover this country ever produced.

I think I have made a little discovery in regard to Dwarf Essex rape for bee-pasture. Last year, after I had dug the early potatoes, I sowed the ground to rape for pig-pasture. One point of about 30 rods in area was not fenced in. The most of it wintered and began to blossom soon after fruit-bloom, and the bees have been working on it ever since—about five weeks now—and they still continue to work on the last flowers, as it is about gone. They have worked on it during the last two weeks with plenty of white clover all around it. I think they work it more for honey, as I never noticed them loading with pollen. I think of sowing two or three acres in August or the fore part of September for a bee-pasture next spring. It will be out of the way in time to sow a crop of buckwheat.

If any one has had any experience with rape for bee-pasture and can give any information in regard to its management, I would like to hear from him through the American Bee Journal.

P. B. RAMER.  
Fillmore Co., Minn., June 26.

## No Swarm in Eight Years.

So much has been said and written about the desirability of non-swarming bees that I thought perhaps a few words from me would be acceptable, as I have had some experience in that line, and I am convinced that I have got a non-swarming variety of bees. Why do I think so? Because they answer the description as given by nearly all the writers on the subject, viz., they do not swarm; but they do give me surplus honey every year. I can't take credit for better management, for I manage just as all prominent writers say we should manage. There is plenty of room in

the brood-chamber for the queen to lay, plenty of ventilation when weather is warm, and I extract whenever the bees begin to seal the honey in the super, so the management is nothing unusual. Yet I have not had a swarm issue in eight years.

I have five colonies back of my home, and my lot is 80 feet wide, with neighbors on both sides. So a swarm could not very well get out without being seen, and my queens' wings are clipped; that is, I clip one wing quite short.

The original queen was a gold-dust Italian, and the ones I now have are of her stock. I am not selling queens, but I do think I have a stock that won't swarm if given fairly good management. I have kept bees off and on for 15 years, but never very many colonies at a time. I use 8-frame dovetailed hives, and run for extracted honey altogether.

D. A. HARRAH.

Rock Island Co., Ill., June 24.

### Too Cold for Bees.

Bees are doing fairly well. It has been too cold. We had two frosts this month. Our bees are too far from good clover fields, which are abundant two to four miles away.

Rock Co., Wis. THEO. S. HURLEY.

### Too Much Cold Weather.

The honey crop will be fair, but not nearly so big as expected. We have had too much cold weather here. Besides, bees were weak on account of the drought last year.

JAS. HORNBACK.

Riverside Co., Calif., June 17.

### Self-Spacing Brood-Frames.

As there has been so much said about the Hoffman and other self-spaced (or fool-proof) frames, I will tell why they are not wanted. In Cuba, for instance, we have to extract from the brood-chamber regularly, so that the same frame is part of the time in the brood-chamber and part of the time in the super. Now, here is the point: Seven frames are used in a 10-frame super. Now, when you jerk the cover off from one of these supers all that you can see is honey. And when you uncap, one side or edge of the knife is dull for chopping the wax and honey off the topbar. Now, just tell me where your staples would be?

Now in Illinois I am using six frames in an 8-frame super, and I want a frame that can be used both above and below. So for extracted honey you or anybody else want a self-spaced frame.

Comb honey is a little different thing. I like a self-spaced frame for that myself. I have a few staple-spaced frames and about 50 hives with Hoffman frames, and every time I go over them a few of them get their legs broken. I was with Moe in Cuba last winter, and will probably return to the Island.

LESLIE BURR.

Grundy Co., Ill., June 15.

### Sainfoin or Esparecette.

Bees are doing well here considering the dry weather that we have had this spring. We expect a great quantity of bloom from white sweet clover, but the cattle are beginning to learn to eat it too freely this year. I planted some yellow sweet clover seed in a field where the cattle could get it to eat. Say! they put that yellow clover out of sight as readily as a small boy would a candy-stick.

But I have, I believe, struck luck in another direction. Some years ago Mr. Dadant gave a write-up of the sainfoin in some of the old European countries, and mentioned every thing, or esparecette, clover as a good honey-plant. Well, I have been scheming around ever since to get hold of it. My plants are now two years old, and the way those little bees bustle around on that sainfoin would make any one's heart glad. My clover has been in bloom three weeks now, and although we have had very little rain the bees have been working hard on my little plot of it every day. It is a good fodder-plant, making good

## Italian Queens, Bees and Nuclei.

We have a strain of bees bred specially for honey-gathering and longevity, at the following prices:

One Untested Queen.....	\$6.00
One Tested Queen.....	80
One Selected Tested Queen.....	1.00
One Breeder Queen.....	1.50
One - Comb Nucleus (no Queen).....	1.00

## Bee-dom Boiled Down

### Putting Name of Producer on Honey-Packages.

W. W. McNeal, who has figured both as a producer and a dealer, says in the American Bee-Keeper:

The producer who contends that he is robbed of his rights when he is denied the privilege of ornamenting small honey packages with his name and address, when such are not to be delivered to the consumer by himself, is certainly laboring under a mistaken idea of what constitutes justice in the art of trade. He may feel a pardonable pride in the excellence of his goods, but he should not insist on having all the glory and profits, too, when he reaps the benefits of a wholesale disposal of his crop to the dealer.

The dealer who caters to the retail trade has much to contend with and he should be given a clear title to his purchase, unencumbered by the name and address of the producer. When he has succeeded in creating a demand for honey in this more expensive way, his name is the one for lovers of honey to become familiar with. When he has paid for any given number of pounds of honey he should be accorded the right of his own name on his (then) own goods if he chooses to exercise that right just as truly as though he were to purchase any other of the farm products. This is only playing fair—only giving him a chance, and in no wise can it be said to be a slap at industry and a defeat of those principles of justice and right which inspire to a betterment of present conditions.

### Candy for Queen-Cages.

I have now been exporting queens to all parts of Australia for nearly 20 years, and I have found no sugar equal to "icing sugar" for making candy for provisioning queen-cages. To make I place the icing sugar on a large plate, and on top of it I pour a little honey of the best quality. This is then worked vigorously for almost half an hour, rolling it occasionally in the sugar with a glass-bottle roller, and then working it again in the hands until it becomes soft. To test its consistency I work it in the hands awhile without adding sugar, and if it does not stick it is right, and will successfully stand any weather, wet, dry, or hot.—H. L. JONES, in the Australian Bee-Keeper.

### Confining Bees for Shipment.

In the preparation of an apiary for a long move, there are innumerable details which develop to keep the manager thinking and conning. In order to avoid a loss of field-bees, it is necessary that they be confined after all have returned for the night. Considerable time and labor are required to affix proper entrance-screens; and time, under such circumstances, is usually at a premium. As a possible helpful suggestion to those who have such work to do, we shall endeavor to explain the ingenious plan adopted by our old friend Pat, when preparing for the Cuban trip.

Several days previous to the date upon which it was desired to make the start, Pat bestirred himself in quest of about a bushel of old corks of uniform size. Having ascertained the exact size of the stoppers at his command, he proceeded to bore a hole into which they would snugly fit in the front end of each hive, about centrally located. Wide entrance-screens were now adjusted to prevent the bees from using the ordinary entrance. These screens were supported by frames made of lath, and permitted the bees

to come out and move about upon the front of the hive across its full width and upward about four inches. The bees soon became accustomed to the new opening, and through it work proceeded as formerly, though the old entrance was stopped by the screen device.

On the evening of the departure, with car upon the side-track, and drays in waiting, Pat might have been seen peering into space and anxiously scanning the western horizon, while he held in his hand a cornucopian basket of corks. The exact moment for operation must have been very definitely decided by visible conditions, for when it arrived, a handful of corks was grabbed, and beginning at one corner of the apiary, with but a single step from hive to hive, they were inserted with mechanical regularity, and the whole 200 or more colonies were ready for loading in less time than it will take the reader to hear how he did it.—American Bee-Keeper.

**Close Saturdays at 1 p.m.**—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

## Prize = Winning Stock

Daughters of Moore's famous long-tongued red clover Italian Queen, which won the \$25.00 prize offered by the A. I. Root Co. for the longest-tongued bees; and also daughters of other famous long-tongued red-clover breeders whose bees "just roll in the honey", as Mr. Henry Schmidt, of Hutto, Tex., puts it, now ready to go by return mail. Untested Queens, 75c each; six, \$4.00; dozen, \$7.50. Selected Untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free.

J. P. MOORE,

25Atf Luck Box 1. MORGAN, KY.

**Hives, Sections, Foundation,** etc. We can save you money. Send list of goods wanted and let us quote you prices. ROOT'S GOOD ONLY. Send for Circular free.

M. H. HUNT & SON, Bell Branch, Mich.

## Tennessee Queens.

Daughters of Select Imported Italian, Select long-tongued (Moore's), and Select, Straight 5-band Queens. Bred 3/4 miles apart, and mated to select drones. No bees owned within 2 1/2 miles; none impure within 3, and but few within 5 miles. No disease, 30 years' experience. WARRANTED QUEENS, 75c cents each; 4 TESTED, \$1.50 each. Discount on large orders. Contracts with dealers specialty, Discount after July 1st

Send for circular.

## HONEY AND BEESWAX

MARKET QUOTATIONS

**CHICAGO, June 27.**—The market is very quiet, a little extracted sells for immediate use at prices ranging from 5 1/2c to 6c. Comb is plentiful with quite a quantity on the market. Beeswax, 30c/32c. R. A. BURNETT & Co.

**KANSAS CITY, June 30.**—No comb honey in this market. New white comb would sell for \$3.50 to \$3.75 for 24-section cases; amber, \$3.25 to \$3.50. There is considerable extracted honey on the market ranging from 5 1/2c to 6c. Comb is plentiful at 5 1/2c to 6c per pound. Beeswax in demand at 25c/30c. C. C. CLEMONS & Co.

**ALBANY, N. Y., June 20.**—Honey market quiet here; prices nominal and light receipts. We quote light comb, 15c/16c; mixed, 14c/15c. Extracted, white, 6 1/2c/7c; amber, 6c/6 1/2c; dark 5 1/2c/6c. Beeswax, 31c/32c. H. R. WRIGHT.

**CINCINNATI, June 1.**—Very little change in market from last report. We quote amber extracted grades at 5 1/2c to 6c in barrels; white clover, 8c/9c; supply equal to demand. Comb honey, 15c/16c for fancy. Beeswax, 30c. THE FRED W. MUTH CO.

**NEW YORK, May 21.**—Comb honey trade exceptionally quiet, very little doing. Fancy stock not plentiful and is sold at 14c. A large supply of other grades on hand, which we are quoting at from 11c/13c, according to quality, and in large lots make concessions from these prices. Extracted, unusually quiet, and prices show a downward trend along the line. Beeswax, firm at from 30c/31c.

HILDEBERT & SPOELLEN.

**CINCINNATI, June 27.**—The market for honey continues very uncertain, and there are no settled prices, if anything the price has a tendency downward. We quote same as follows: Fancy water-white bring 15c/16c. Extracted, amber, in barrels, 5c to 5 1/2c; in cans, 6c to 6 1/2c; white clover, 8c to 8 1/2c. Beeswax, 30c. H. W. WEBER.

**WANTED WHITE CLOVER EXTRACTED HONEY.** Send sample and best price delivered here; also Fancy Comb wanted in no-drip cases. THE FRED W. MUTH CO. 32Atf Front and Walnut, CINCINNATI, OHIO.

## Seasonable Suggestions.

### Use the Porter Spring Escape.

When taking off surplus this is the greatest saving device. It does away with the shaking of the heavy supers, the cruelty of excessive smoking which causes the bees to uncup their honey and

start robbing. Just tip the super to the angle of 45° and insert the board. In a few hours it is free of bees; then take off your super. No need of smoking. You can as well afford to be without a smoker as without the Porter Bee-Escape. Order to-day.

PRICE: 20c each; dozen, \$2.25; postpaid. With board, 35c each; \$3.20 per 10; by express or freight.

### Use Porter Honey-House Escape

over the doors and windows in the extracting-house, or any place you wish to clear of bees. The most persistent robber cannot return. Some bee-keepers make a practice of taking off the filled su-

pers and stacking seven or eight in a pile. The Porter Honey-house mounted on a board makes the best kind of escape. Don't wait till to-morrow before you get a supply. You can't afford to be without them longer.

PRICE: 25c each; \$2.75 per dozen, postpaid. Board without escape, 15c each; \$1.00 per 10. For sale by

in stock at all branch houses; also all our Agencies.

☞ If more convenient, Dues may be sent to the Secretary, at the office of the American Bee Journal.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to  
**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

Please Mention the Bee Journal when writing Advertisers \*\*\*\*

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it, but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact reproduction of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.00.

**GEORGE W. YORK & CO.**

Chicago, Ill

☞ Please allow about two weeks for your knife order to be filled.

No. 29.

## Editorial Comments

**The Growth of Clover** in northern Illinois this year is unprecedented. A correspondent sends a head of ordinary white clover measuring a full inch across, with a stem more than 15 inches in length.

**The Economy of Using Foundation**, says Adrian Getaz in *Gleanings in Bee-Culture*, is not so much in the saving of honey that would be used in secreting the wax as in the greater amount of standing room for the laborers. If a full sheet of foundation is given, work may be commenced at once over its entire surface, while if no foundation, or only a small starter be given, no work can be done on any part of the comb till all above is built down.

**An Improvement in Smokers** that will be appreciated by many is worth mentioning. It is a common thing for the nozzle of a smoker that has acquired some age to get to be something of a nuisance by becoming difficult to fasten on, and easy to tumble off. The A. I. Root Co. are now making the nozzle, lid, or cover, to the smoker something like the cover to the ordinary baking-powder can, the cover being hinged to the bellows-board.

This makes a much more secure covering than the ordinary flaring arrangement. Of course, however, it must be kept cleaned or there will be trouble about the fit; but no amount of cleaning will make the old flaring kind work to entire satisfaction.

**Young Queens and Swarming.**—It is agreed on all hands that a colony with an old queen is more likely to swarm than one with a young queen, other things being equal. Whether the mere presence of a young queen is sufficient entirely to prevent swarming is quite another question, and upon this point opinions are divided. Editor Hutchinson says:

"Year after year have I proved the truthfulness of the theory that the giving of a young queen before the swarming fever has developed, will prevent swarming."

On the other hand, Dr. Miller says that one year about the beginning of the honey harvest, and before the development of the swarming fever, he supplied all the colonies of one apiary with young queens, but they swarmed. Some of the highest European authorities hold that a colony will not swarm if it contains a young queen reared in the colony itself. This, probably, may be generally relied on, but some have reported exceptions. It would be interesting if one could know what conditions or circumstances make such differences in results.

**Forming Nuclei.**—H. L. Jones, the bright Australian queen-breeder, gives in the *Australasian Bee-Keeper* the following plan:

On the ninth day after preparing a batch of queen-cells I go to the colony I wish to divide and remove the queen along with a frame of bees and brood and make a nucleus of this. On the following day I go to my batch of ripe queen-cells and place each one in a West queen-cell protector, and then each cell-protector in a West spiral cage, first securely closing the opening at the bottom of the spiral cage with wax. Then I place say four of these in the queenless colony, one

cage to each frame of brood. The next day there will be four young queens in the hive, and all I have to do is to take away each frame of bees, brood, and queen, and a frame of honey placed in a nucleus, release queen, and practically every bee will stay there as contentedly as if they had swarmed there. I have made thousands of nuclei in this manner, and it is far more satisfactory to me than any other, I have ever tried.

The essential feature in the case seems to be that the bees, on being moved to a new location, are accompanied by their queen. Probably the same result would be obtained if the maturing cell were caged in any kind of a wire-cloth cage.

**Abdoutenless Bees** is the strange heading of an editorial in *Gleanings in Bee-Culture*. At first thought it would hardly seem possible that by its own act a bee would actually tear itself apart, but there seems no chance for mistake. The editor says:

About the first of May, when spraying was being carried on by some of our neighbors, I noticed hundreds and hundreds of our bees, which had lost their abdomens, dropping down on the sidewalks, or on bare spots of ground. In fact, such bees were scattered all over everywhere, but they showed up more plainly, of course, on the sidewalks. These wriggling creatures, without their hinder parts, crawling around, keeling over and over, were, of course, very much out of balance. They appeared greatly distressed. They would rush around in circles, or tug with their hind legs at their abdomens as if there were some pain or distress in that portion of their bodies. I was non-plused.

I watched the bees flying overhead, and noticed the fact that they were coming from the fruit-bloom, and I began to surmise that the trees off in that direction had been sprayed with poisonous mixtures, and that the trunkless victims on the sidewalk had come from them direct. After watching in the air for some time I saw a bee suddenly drop down, without its abdomen, and strike the sidewalk with a bound and a whirl. I looked up again, and finally saw a bee flying toward me suddenly drop, whirling over and over, and land on its back, without its abdomen. That this bee had been flying was very plain. When I first saw it it was rolling over and over in the air. From some cause or other it had lost its abdomen while on the wing; and at the precise moment of losing it, it went keeling heels over head until it landed at my feet.

I then called the attention of our apiarist to the matter, and we both got down on our hands and knees and watched. Finally, I saw a bee tug away at its hind quarters until it actually, by the power of its hind legs, tore its abdomen asunder at one of the segments or rings. But in this case the separation took place, not at the waist, but midway along the abdomen. A further search showed that other bees were tugging away at their bodies, and had torn them loose in the manner described.

My theory was, the bees that had just come from the field were suffering from poison, and that, while on the wing, they would tug away at their bodies with their legs, and finally effect the separation of the parts. We picked up a number of the victims with and without the abdomen, and all of them apparently suffering. These were sent to Prof. Frank Berton, Agricultural Expert at the United States Department of Agriculture, Washington.

Dr. Wiley, the government chemist, made an examination to see whether any trace of arsenic was present, as the presence of arsenic would confirm the suspicion that the bees were poisoned by Paris-green used in spraying fruit-trees when in bloom. Dr. Wiley reported that arsenic was not present, but small amounts of copper were. This points pretty plainly toward poisoning by Bordeaux mixture, the principal ingredient of which is copper sulphate, or blue vitriol. Bordeaux mixture is used very commonly in spraying, perhaps more generally than Paris-green.

The dying in such torture must have been a pitiable sight for one who loves the busy little creatures, and makes one feel that there should be a more determined effort than ever to have laws made in every State to prevent spraying fruit-trees when in bloom.

## Association Notes

Mr. D. H. WELCH, of Stafford Co., Kans., writes as follows in reference to attending the convention at Los Angeles:

Could one get a stop-over enroute to San Francisco and attend the convention and still not miss the G. A. R. meeting at the latter place? If so, could I take the same train you come on that stops one day at the Grand Canyon? What hour would it pass through our town? Would I need a special ticket to get these privileges?

D. H. WELCH.

We will have to refer Mr. Welch to his station agent, who likely can answer his questions. As we understand it, the train on the Santa Fe that will have the special car goes first to Los Angeles. The G. A. R. Encampment meets a little before the bee-keepers' convention, we believe, so that it would be necessary to go to San Francisco first.

We will not attempt to say anything further in answer to Mr. Welch's questions, as we really are not able to answer them. His station agent will likely be able to furnish him all the information needed.

A CAR-LOAD OF BEE-KEEPERS for the Los Angeles Convention would be a great thing. We suppose all have read what Prof. Cook said, in last week's Bee Journal, about the Grand Canyon and other scenes along the route to be taken to and from the convention. We are certain that the required number, which is only 18 persons, will easily be secured to make the trip together. Pres. Hutchinson, in referring to "the pleasures of a trip across the continent, and a visit to the Grand Canyon, of a company of bee-keepers who are sufficiently interested to cross the continent to attend a bee-convention," has this to say also:

"Four days and nights in such company will beat any convention all hollow. The fellow that does not go will regret it only once—but that will be for a lifetime."

Those who have already expressed themselves as expecting to go in the company referred to are the following: W. Z. Hutchinson, one or more of the Root Co., Dr. C. C. Miller, and the writer and his wife. So it will be seen that a good start has been made already. There are others who are thinking of going, and, no doubt, will decide to join the party. If all such will kindly write us we will be pleased to mention their names in this department. No doubt there will be several from New York State who will meet in Chicago and go in the car mentioned. It will be a great trip, and should be taken by every bee-keeper who possibly can get away long enough to go to Los Angeles and back.

## Miscellaneous Items

FATHER LANGSTROTH has credit in Gleanings in Bee-Culture for having given forced swarming, substantially as now practiced, more than 40 years ago.

Geo. W. BRODBECK, president of the California National Honey-Producers' Association, writing us June 20 from Los Angeles Co., said that he finds from observation and reports that had come in up to that date, that their honey season was nearly over, and that the crop is less than one-half in comparison with that of two years ago.

Mr. J. Q. SMITH, the new Inspector of Apiaries for Illinois, has begun his work. He says he has put in several days inspecting, and found foul brood in every apiary so far. Surely, an inspector is needed when such conditions exist. He wishes us to invite those wanting their bees inspected to write to him as soon as possible, so that he will know just where to go, and thus better arrange his work. He might go to one part of the State, and then the next call be almost back where he started. He wishes to save all the time he can for work, and not waste it in traveling. Address Mr. Smith at Lincoln, Logan Co., Ill.

## Convention Proceedings

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 439.)

Pres. York—We have a few more questions here, but before we take them up, I wish to call on Prof. Eaton, chemist of the State Food Commission, who is with us. He has always been in great sympathy with the bee-keepers, and especially pure honey. Dr. E. N. Eaton, of the Illinois State Food Commission.

#### ADDRESS BY STATE ANALYST EATON.

I am very sorry that I was not with you yesterday, as I understand you had the question of the adulteration of honey up for discussion. I am sure I would have been very much interested in your talk upon that subject, and perhaps I could have helped you in some way, at least by calling your attention to some of the facts concerning the adulteration of honey.

I have not missed a meeting of the Chicago Bee-Keepers' Association, and I did not want to miss this one, so, although the subject in which I am especially interested was discussed yesterday, I thought I would come and listen anyway, although I did not expect to say anything. I believe a chemist, especially one engaged in the crusade for pure food, can get a good deal of good from your meetings. I have noticed the lack of knowledge of many of my colleagues along the practical lines of bee-keeping, and you have noticed it yourselves, I am sure. Just this year there have been two State bulletins published in which the commissioners of pure food declared that comb honey was adulterated, that the comb was artificially manufactured. One of these was from North Carolina, and the other from South Dakota. It was also declared that there was a great deal of glucose-fed honey. Of course, South Dakota has not a chemist. Their chemical work is done at the Experiment Station. That probably accounts for the otherwise very efficient Commissioner making the statement he did; but if these people had attended bee-keepers' conventions they would not have made the mistakes which I am sure did a great deal of damage to the bee-keeping and honey industries.

I noticed with a good deal of pleasure the remarks of Mr. Abbott before the Denver convention, in which he said there was no adulterated honey in Illinois. I am not sure that he made it quite that strong, but almost as strong as that. I suppose you could find a little adulterated honey, but I believe that the markets of Illinois are very free from adulterated honey, at least in comparison with the condition in other States in the Union.

The Illinois Food Commission have six inspectors. They have special instructions to look at the honey on the shelves, to see whether it is labeled correctly; that the adulterated has the word "adulterated," and the name of the producer on it. They also have instructions to take up all suspicious samples and send them to the laboratory for analysis. I have examined a number of samples lately, but haven't found one adulterated; whereas, two or three years ago, over 33 1/3 percent of honey sold in Illinois proved to be adulterated.

Mr. Wilcox—I would like to ask Prof. Eaton if there is any danger of the chemist making the analysis being mistaken in his conclusions? Are we not in danger of being improperly judged, or our products? Can they tell to a reasonable certainty? and, if so, how does it happen that a chemist in South Dakota reported glucose-fed honey?

Prof. Eaton—This remark was not made by a chemist, but by a commissioner who is not a chemist, and probably did not seek the advice of his chemist before making the report. I don't know that a chemist could tell whether glucose was fed to bees. However, in case of cane-sugar, I think the chemist could tell in the analysis of the honey

whether the cane-sugar was added to the honey. In regard to glucose-fed honey, I believe there is no such article on the market. In regard to the detection of glucose in honey, it is one of the easiest things in chemistry when present in any commercial quantity.

Mr. Wilcox—I notice in the report of the commissioner of South Dakota that there is quite a variation. Now, what causes that difference in the degree of variation?

Prof. Eaton—The variation is caused in part by the varying amount of invert sugar in honey. Cane-sugar is present in small quantities in all honey, from less than 1 percent to as high as 7 percent.

Mr. Moore—Will you tell us what condition the market is in now as compared with before your commission began work—the percent of adulterated honey on the market?

Prof. Eaton—I can not, and I suppose it would be impossible to tell the exact percent of adulterated honey on the market now or at any other time. But before the Food Commission was in existence, the National Bee-Keepers' Association took up the subject of adulterated honey in Chicago, and bought a number of samples on the market indiscriminately, and gave them to me for analysis, and the result of that work showed that at least 33½ percent of the honey on the market was adulterated. The first year of the Food Commission we took a good many samples of honey, but, as a rule, we tried to get samples which we thought to be adulterated, which looked suspicious in character. The analysis proved that about a third of this also was adulterated, but I wouldn't want to say that that showed the actual condition of the market, on account of the discrimination exercised in purchasing. This year we haven't been able to find one sample of adulterated honey, but I suppose there are samples of adulterated honey on the market.

If any of the members of this Association have any suspicions as regards any particular honey, or where we may be able to get adulterated honey, I should be glad after the meeting is over, to have you give us the names and addresses of the persons we could get that honey from, and we will purchase a sample from them in the regular way by our inspectors. No name will be given, and it will give us some clue where to go to get adulterated honey.

Pres. York—We find in certain parts of Chicago there is adulterated honey, but it is labeled "adulterated."

Prof. Eaton—I mean honey put up contrary to the food laws.

Mr. Colburn—Let me suggest a point. I don't believe that there is any adulterated comb honey anywhere. We had some adulterated some months ago in Chicago, and a statement from some editor that you couldn't find a pound of pure comb honey—we should make a distinction between extracted and comb honey, so that the public will not be misled.

Dr. Miller—I think he said there wasn't a sample of any glucose-fed honey.

Prof. Eaton—I wouldn't want to say that there is no adulterated comb honey, because we regard the feeding of bees cane-sugar to be an adulteration, and we have found and proved in Illinois that from one apiary there was that kind of honey placed on the market. We bought the samples and proved them to be—and it was afterwards admitted to be—honey that was obtained by feeding bees cane-sugar.

#### FEEDING GLUCOSE TO BEES.

Mr. Wilcox—I would prefer to ask this question of the bee-keepers. It is the simple question referred to glucose-fed comb honey in Mr. Eaton's first remarks. I want to ask the bee-keepers if anybody knows whether the bees will store glucose. Can you make them store it, or can you make them store cane-sugar in the hives? I have been told by men who have fed barrels of it, and fed it for years, who positively declared that the bees didn't store it in the combs, and will not store it at all.

Pres. York—I am afraid you are expecting a great deal if you ask these bee-keepers to confess!

Mr. Niver—Mr. Hutchinson says they won't take it for him, and he says he would like to know if there is anybody else here who has tried it.

Mr. Abbott—They won't take it from anybody, only to keep from starving.

Mr. Armstrong—There is honey in the market labeled "adulterated" that has comb in it. What is the object in doing that? It is intended to deceive, is it not?

Dr. Miller—When they see the comb there they won't look so sharp at the printing on it.

Mr. France—In reply to Mr. Hutchinson I will say that I was considerably interested in the adulteration of honey, but decided to test it before spreading it about. I took a

colony, put them into a hive, and starved them for 48 hours; then I gave them pure glucose, and they continued to starve, and there was the same amount in the vessel that there was before. I added one-fourth honey to that liquid; still they continued to starve, until it was one-half honey before they touched it at all, and then only just enough to subsist or live.

(Continued next week.)

## Contributed Articles

### More About Forced or Artificial Swarming.

BY C. DAVENPORT.

**I**N my previous article upon artificial or forced swarming I treated the subject in a general way only, but as there are a great many who will no doubt try it for the first time this season, it may interest some for me to give some of my experience in the matter more in detail.

I have in the past said, and I am still of the opinion, that the amateur, or those without experience, can secure better results by allowing natural swarming. While quite a few have reported good results from forced swarming upon their first trial of the plan, there is no question in my mind but what to every one who has reported favorably, a dozen or more have tried it with unfavorable results, and said nothing about it. From this it will be seen that I do not believe with some that this method or control of swarming will greatly increase or revolutionize our business.

From careful reading of what has been written on this subject, I know that some localities are for some reason more favorable for forced swarming than my own is. For instance, one who has had a good deal of experience reports that with him these forced swarms very seldom, or never, attempt to swarm out or desert after being made. Now, here that is one of the main draw-backs about the plan, for from 40 to 80 percent of these swarms will swarm out within a day or two after being made, the number varying in different seasons. In fact, I do not know but what some seasons I would be safe in saying that over 100 percent will swarm out, for some will come out twice, and in a few instances I have had them come out half a dozen or more times, and sulk around for a week or so in the height of the white clover harvest, before settling down to work.

If it were not for this swarming out, I could produce much more honey each season than I do now. But as the matter now stands, I know from actual experience that I can, one year with another, make more money from one yard than I can by attempting to run one or more out-yards. I mean, of course, without hiring help; and if this is to be done it requires less skill to handle natural swarming than it does to make forced swarms so that good results will be secured.

The last two seasons all the bees I have personally handled were located in one yard. Last season there were 180 colonies, spring count, in this yard, and I secured about 13,000 pounds of honey which averaged me about 10 cents a pound net. I also sold about \$100 worth of bees and \$20 worth of wax. About a third of this honey was extracted and the rest comb in sections. I did nearly all the work myself, and I had more than I wanted to do, and more, I think, than any man should do.

I have given the results of last season to show that good results can be secured from forced swarming, but I had to be right there every day to attend to the forced swarms, and if I had been running around to out-yards but little in the way of surplus would have been secured from any of them. This matter of one handling a number of yards alone must depend upon locality, for no man that ever lived could do it profitably here. Through June, July, and August one large yard keeps a man moving lively in a fair season, if he does what should be done. Last season I let on shares a large out-yard to a man who has quite a family of children, a number of which are nearly grown up. He allowed natural swarming and also practiced forced swarming, and for awhile it took him, the hired man, and all the rest of the family to handle them. The forepart of the season, though, was the worst for swarming, and the swarms were the hardest to handle that I have ever known.

One of the many mysteries about our pursuit to me is,

group of colonies for some of which much honey was extracted in the fall, and some others which were left untouched:

"The colonies that had crooked combs, were left with all their stores—10 frames [Quincy frames.—A. C. M.], because we could not disturb them without breaking combs, and causing leakage and robbing, and it was not the proper season to transfer them. *These colonies did not have to be fed the following spring, became very strong, and yielded the largest crop.* [My italics.—A. C. M.] This untried result caused us to make further experiments, which proved that *there is a profit in leaving, to strong colonies, a large quantity of honey so that they will not limit their spring breeding.*" (Mr. Dadant's italics). Revised Langstroth, page 329.

Compare this paragraph with the other, and see which system Mr. Dadant found most profitable.

If we conduct any work so that it yields less profit than if conducted in another way, we are losing. Mr. Dadant says the fall-supplied colonies were the most profitable. As it is cheaper in time and labor to fill up the colonies in the fall than to dabble along food in the spring, and as the fall-filled colonies pay the most, I am justified in saying that spring stimulative feeding is conducted at a loss. I did not say, nor intend to imply, that colonies could not be built up by such feeding, but that it is not profitable.

Providence Co., R. I.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Feeding Syrup in the Spring.

The corner allotted to us is very nice. I hope it will grow and prosper in the future as it has in the past. I should like to ask through your department if I can feed bees in the spring with syrup, and how much I am to feed them at a time when they are short of stores?

Lake Co., Ill., June 8. NETTIE A. MUNSON.

ANSWER.—Yes, you can feed them in the spring with syrup. The amount depends somewhat upon how short of stores they are. If they are entirely out, 10 or 15 pounds is none too much.

### Managing Colonies that Store Watery Sections.

A few years ago we had a couple of colonies of Punics. They were hardy bees and good gatherers, but filled the sections so full of honey that they left no air-space, and when capped they looked black and greasy. We had concluded that we could not use them for comb honey, when one day a bright idea occurred to us to let them fill the sections full of honey ready to seal, then take them away and give to a colony that did extra-white work in sealing, and the result was very satisfactory, and we had a lot of beautiful white sections. If you have any trouble in that way, just try it and see how nicely it works.

### Keeping Bees With a Baby.

I do all of my house-work, not including washing, and have a young baby, and no help but my little 5-year-old son. I am one of the "sisters" "who paddles her own canoe" with the bees. My husband does not like to "fuss" with them, but sometimes I am just obliged to have him. For instance, I had a swarm in the top of a tree, and I told him if he didn't want to see me up that tree he would better go after them. Well, he went.

I had a letter partly written to you some time ago, but have been sick for a month, so it was not finished. Yes, there are questions I want to ask, and lots of things I want to discuss with some one who actually *knows* something. I am grass-green on bees, and my neighbor bee-keepers are even greener. I have only 10 colonies (3 new swarms), and haven't the chance to attend to them as I should. I rush out to them when the baby takes her long nap, and then

often have to stop in the "thick of the fight" if she chances to awaken. I love the bees though, and dearly love to attend to them. Our department is all right. I enjoy it much, and wish I could say something of value to some one else.

I have had some success, but it was not due to anything smart that I did, I don't believe. Failures? O yes, a plenty—scored another this forenoon, when I undertook to get ahead of the baby by getting up before day in order to get breakfast in line, and be ready to take off some honey by the time it was light enough to see. Not having enough supers, and not wishing the bees left without anything for supers, I thought to take out sections and refill at the hive, but those bees were all at home and made a bold stand for their ground, regardless of smoke. I was afraid to smoke them too much for fear they would uncap the honey (as a colony did last year). Therefore, I retreated in disorder, and resolved to renew the attack when the bees were busy in the field. We have kept bees for about five years, but paid them very little attention until recently I have taken them for my "hobby."

The American Bee Journal has been of great benefit. It comes to me on Saturday, and I sit up and read it through that night. I don't want to be tempted to read it on Sunday. I hope to add another "sister" to the subscribers' list soon. I received a nice queen from Editor York last year, and reared some queens from her. These bees are doing the best work this year. By another year I hope to have all Italians, and all queens clipped—that is, if the baby consents.

There is so much I want to say, but this is already so long; but I hope you will let me come again.

MRS. C. D. MEARS.

Princess Anne Co., Va., May 26.

That blessed baby will be helping you with the bees one of these days.

### A Poor Honey-Year.

This is a poor honey-year so far. We had a hail-storm that ruined the alfalfa bloom, so we get no honey from the first crop. Bees are working on white sweet clover. We have three acres in full bloom. We have a few bunches of the yellow also. It blooms two weeks earlier than the white sweet clover. I had to feed my bees until June 15 this year. Last summer two of five supers were filled nicely on June 14. This is the 29th, and the first sections are about half full.

MRS. BEN. FERGUSON.

Ford Co., Kans., June 29.

### Six Years' With the Bees.

I started bee-keeping six years ago with one colony of Italians, and at present I have 10 colonies, all in 8-frame, single-walled hives. I am running for comb honey, extracting the unfinished sections, and sometimes sell colonies on the frames. I do not have much time to spend with my bees, but I do all the work connected with them myself, unless a swarm clusters too high, when my father takes care of it.

I have been quite successful in wintering bees on the summer stands (provided they have plenty of stores in the fall), by placing an empty super on the hive and filling with oat-chaff, with, of course, the usual cloth and Hill's device under. And, by the way, I make my own "device" from barrel-hoops.

Last season the colonies that did not swarm stored some honey, and the others sent out their swarms so late that none gathered more than enough to winter on. I fed two or three in the fall.

I like to read the articles in the "Sisters" department, but wish there were more of it.

I aim to keep my bees strong rather than to increase in number.

EMMA A. LYON.

Fairfield Co., Conn., May 28.

Amerikanische Bienenzucht, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### PLACING COLONIES IN THE SPRING.

Unexpected to me that a majority of the Wisconsin farmers taking the care needed to return bees to the same stand as previous year, when taking them out of the cellar. Pleasant surprise, however. I think the greatest advantage of this is a personal and scientific one—get acquainted with the individualities of the individual colonies better if you always have them in the same place. Page 340.

### ODD FIXTURES IN THE APIARY.

A. M. Gill strikes well for uniformity of fixtures when he says: "O the exasperating bother, if a man wants a super, and the first four or five he comes to belong in some certain place! Still this would apply mainly to keeping hives that will not agree in numbers. Let the boys who hanker after that sort of experience experiment with odd ones, one or two of a kind. The odd fixture and no others might be kept in a corner wholly their own." Page 342.

### HIVING SWARMS FOR THE DEAR WOMEN.

Dire situation to be in—and all mankind except we'unns are liable to get into it! Nice lady with a nice daughter, and they beseech him to get down their swarm of bees from an ugly place and give it. Pause here, flippant bee-man, and consider once such a fellow mortal's feelings. He would rather participate in a battle; but there stand the ladies. Sweetly they stand in the unreason of womanhood. He knows they are thinking, "Men hive bees and consider it a mere trifle," and what man has done surely such a nice gentleman ought to be able to "can do." He is afraid, to the heart-sinking point; honestly has a right to be afraid, considering his ignorance, yet without any fault of his own he must be cat's-paw to get the chestnuts out of the fire—or say, get the little fiery, flying chestnuts down from the tree. Page 345.

### THE FLOUR-MILL A CURSE TO BEES.

And so the Mill-Flower which flours night and day, winters and all, is largely a curse when it flours neighbor to an apiary. Must be allied to the Venus' Fly-Trap botanically, seeing bees go into its flours and don't come out again. Page 350.

### THOSE NON-SWARMING, FOUL-BROOD-PROOF BEES.

Sad that Dr. Miller should have to lose his new strain of non-swarming, foul-brood-proof bees! When florists have a nice new thing that will not produce seed they propagate it from slips. Tell Dr. Miller to take those scissors (well accustomed to such work) and snip off one of the queen's legs. Plant the leg in a tiny pot of royal jelly, and try hard if influences can not be found stimulating enough to make it grow. Faith says that when one mode of propagation is denied another is supplied. Page 355.

### BEE-EXCRETIONS ON THE HIVE-WALLS.

I don't believe that poisonous excretions from bees accumulate from year to year in the wall of a hive. No more in a board that has been a hive side for ten years than in one only in use two years—my doctrine. However, the idea may not be so utterly absurd as at first it seems. Seems at first like the alarm of a non-practical, professional boggy-hunter, desperately hard up for a live boggy. Page 355.

### THE VARIOUS STAGES IN BEE KEEPING.

Yes, Mr. Morley Pettit, it's an era in the bee-boy's life when he can first get stung without crying. Who knows but we have seven eras, a la Shakespeare? First, the fool baby, escaped, and scooping bunches of bees into its mouth. Second, the fool boy, on warpath, throwing clubs, or heroically making a dash at the entrance with a shovel filled with dirt. Third, the wise boy—reclaimed savage—eager to help, puffing at the smoker, and taking stings with philosophy. Fourth, the youth, full of exploits, chasing runaway swarms, and bringing difficult ones down. Fifth, the fool man, inventing hives, and turning the bee-world upside down. Sixth, the enlightened man, planting out-

apiaries, and shipping his car-load of honey. Seventh—same as all the other "lean and slipped pantaloons" sevenths, except that in his whining he whines that the younger generation are using all his wise ways and inventions, and giving the credit all to somebody else. Page 356.

### VALUE OF REPORTING CONVENTIONS.

The habit of attending conventions and reporting the main points of value for some paper which may wish a report, is praiseworthy. Especially wise is the reason—get a clearer idea one's self what the really valuable things were—and remember them far better. Page 356.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Brood Cappings Gnawed Off.

In looking into a colony of bees to-day, I found a good many cells of sealed brood with caps gnawed off. Some of the brood was nearly ready to hatch, but a good deal of it was white. Fully half of the brood was thus gnawed. What was the cause? Can anything be done to stop it?

MINNESOTA.

ANSWER.—Hard to tell without seeing it. Possibly it is the work of the wax-worm. If so, the easiest way to prevent it is to have strong colonies of Italian bees, for they will keep the wax-worms out.

### Moving Bees 250 Miles on a Wagon.

Desiring to move about 50 colonies of bees some 250 miles by wagon, I would like to have you tell me whether, in your opinion, they would go through all right if moved in the month of October, when the weather is beginning to get cooler, and when they are properly prepared with wire-cloth over the entrances. At that time of the year the brood would be nearly all gone in this locality.

COLORADO.

ANSWER.—Yes, they ought to go all right. If just as convenient, the spring-time would be better, because the combs are lighter at that time, and spring is naturally a better time to recover from the journey. But if the combs are wired, or if they are old and tough, there ought to be no trouble about their breaking out when heavy with honey in October. Even in the cool weather of October, the shaking up of so long a journey may make it advisable to sprinkle a little water on them once or twice during the journey.

### Queenless Bees—Queen in Supers.

1. I have a colony that sent out a very small swarm May 17. A few days ago I noticed the parent colony did not seem very strong. I looked into the hive and found a small amount of bees, and I think nearly half were drones with no sealed brood or eggs. Do you think they are queenless? If so, what shall I do?

2. I have a colony that is strong and is working in the supers. It sent out a swarm June 22, and after the swarm went out I looked into the hive and found about one-half of the sections filled with honey and the rest with brood. Now, what was the cause of the queen going into the super? and what shall I do to prevent further trouble in that way? What can I do with the sections that have the brood?

MAINE.

ANSWERS.—1. They have been pretty certainly queenless five weeks or more, and having only a few workers, the best thing you can do is to break up the colony, giving the combs and bees to other colonies.

2. The queen may have been crowded for room to lay in the brood-chamber, or she may have gone into the super to lay in drone-cells, if drone-comb was scarce in the brood-chamber. A queen-excluder would prevent the queen from going up into the super, but that is hardly necessary. If

the sections are entirely filled with worker foundation it will make a great difference, for then there will be no drone-comb in the sections, and no temptation for the queen to go up into the sections to find such comb. I use no excluder, but the sections are filled with worker foundation, and not one section in a thousand has brood in. Perhaps the best thing you can do with the sections containing brood is to leave them on the hive till the brood hatches out and the bees fill them up with honey. They will not be of first quality, but will make good eating, and you will thus save the brood.

**Drone-Brood in Extracting-Supers.**

How do small patches of drone-brood get above the excluder in extracting supers over strong colonies, which seem to have a good queen? PENNSYLVANIA.

ANSWER.—I don't know. If your excluders are not all right, it is possible the queen gets up.

**Bees Carrying Queens Out.**

One year ago I commenced with 4 colonies and increased to 15 by natural swarming and dividing, then requeened 10. They went into winter quarters with plenty of stores until the first of March, when set out, and they had a nice flight for two days, and brought in some pollen. At that time one colony had died from lack of stores. They were then put back into the cellar and remained until the first week in April when they were removed to their summer stands. Then they began to dwindle and soon after five of them carried out their dead queens. They still persisted in carrying out their queens until I have but one left. In this locality some have lost 50 percent, and some 100 percent.

1. What caused the bees to lug their queen out?  
 2. After queens are successfully introduced that come from different localities, are the bees more liable to destroy them than those reared in the same apiary?

3. I bought 11 queens from different queen-breeders, and lost them all but one through the spring, that being one I introduced for a friend. What was the cause?

MAINE.

ANSWERS.—1. I don't know. Of course I know they lugged them out because they were dead, but I don't know the cause of their death. I have had some losses of queens in that way, but never in such a wholesale manner.

2. I think not. You seem to think that the bees killed the queens. I think hardly.

3. That comes under the same head as the first question, and of course I don't know. If any of the fraternity can throw any light on the matter it will be thankfully received.

**Returning After-Swarms.**

Can an after-swarm be returned to the parent hive? If so, how shall I proceed? MAINE.

ANSWER.—The easiest thing in the world. Just dump the swarm down in front of the hive and let them run in. It was the old-fashioned way of treating after-swarms, and there's no better way, if you don't mind the trouble. Just return the bees every time they swarm out, and when all the queens have emerged there will only be one left, and there will be no more swarming. Indeed, you may carry the plan still farther, returning the prime swarm and all after-swarms. That will give you no increase, but the largest yield of honey, especially if your harvest is early.

A STANDARD-BRED  
**QUEEN-BEE FREE**

To Our Regular Paid-in-Advance Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with **The Very Best Untested Italian Queens** that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription must be paid in advance. If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

**A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.**

Send us \$1.00 and the name (not your own) and address of **One NEW** subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows: One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We expect to fill the orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address.

## REVERSIBLE WALL MAP

—OF THE—

# UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

China, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. **Very useful in every Home and Office.**

**66 x 46 INCHES IN SIZE.**

## ELEVEN BEAUTIFUL COLORS.

Best and Most Necessary Map  
Ever Issued.

No Home or Business House  
should be without it.

### The **XXX** Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

### Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

### It has been pronounced a **XXX** Photograph of the World

One side shows a grand map of our great country, with **counties**, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

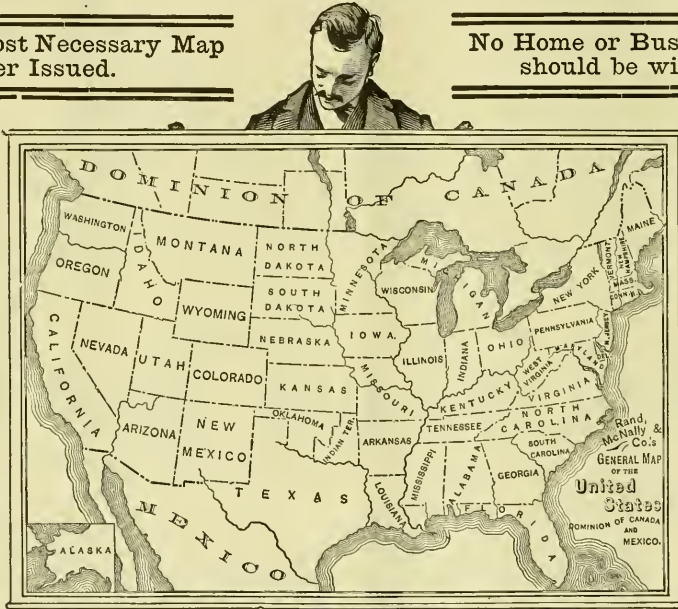

**1901 EDITION.**—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

**On the reverse side is the Library Map of the World.** The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. **The Inset Maps** are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps on one sheet, all for only \$1.50, sent by mail or prepaid express; or we will forward it free as a premium for sending us **Three New Subscribers** at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

## GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

### The 1900 Census **XXX** of the largest American Cities is given.

### A **XXX** Marginal Index

is one of the invaluable features.

It gives an alphabetical list of countries, their location on map, style of government, population, area, products, minerals, imports, exports, etc.

### FROM MANY FIELDS

#### Honey Crop All Right.

The honey crop in southern Wisconsin is immense—white and sweet clover and basswood now all yielding. H. LATROP.  
Green Co., Wis., July 6.

#### Less than an Average Season.

The bees seemingly are gathering honey from white and red clover, and have 48 to 72 one-pound sections on each hive, and if the weather holds favorable they will, no doubt, fill 75 percent. The season will be less than the average, I think. Not much swarming so far this summer. But I am holding in check the swarming impulse; letting only my high-grade superior queens make increase. Some of the best are not swarming; so I shall "swarm" them by moving the queen and nearly all the bees from their old combs to a hive with empty combs on the old stand, placing all supers on the hive on the old stand.

My bees wintered without loss, but April was very cold. I lost a few by starvation before I discovered their condition.

I never saw red clover so profuse as this year; such large, generous heads, while the white is no more abundant than ordinary years. CARSON VAN BLARICUM.  
Calhoun Co., Mich., June 24.

#### Variable Time for the Bee-Man.

The bee-man has had a variable time here this season. Right in fruit-bloom, when the bees were just getting to the front in big shape, we had a lot of snow and freezing weather. Then the last week in May the white clover began to bloom, and we had three weeks of rain and cold weather, so the bees could not fly. Now the weather is favorable and they are doing well, but we are wondering what will happen next.

J. M. LINSOTT.  
Gage Co., Nebr., July 4.

#### Getting Honey!

I've good news to tell you. We've been getting honey. Such nice honey, light-colored, and so very thick. White clover has been so rare of late years, but this year I never saw such a bloom of it. The great, large heads touch each other, and what delights us so much is that they secrete nectar. Aren't you glad?

The basswood is in full bloom to-day, but I do not believe the bees are profiting by it, for they are very cross and robbing hives containing comb. This bloom comes out all at once, and occasionally there is one great honey-day from this source. There is much sweet clover blooming, but the city fathers have ordered all weeds cut on vacant lots and elsewhere, as a health measure. What harm can there be in fragrant sweet clover? Cut it down and let it rot in piles, there may be.

It is hot and dry, and blue-grass is turning brown. We are wishing for rain.

Mrs. L. HARRISON.  
Peoria Co., Ill., July 1.

#### A Blacksmith Bee-Keeper.

I have seen nothing in the "Old Reliable" from this locality, so I will try to encourage my brother bee-keepers never to take fail for an answer. Bees are doing well. White clover is plentiful with an abundance of wild bloom. I have increased from 6 colonies to 16 this season. There was a swarm of bees come over on Sept. 20, 1902, and went into my neighbor's chimney, and I transferred them the same day to an 8-frame Langstroth hive, and they wintered on the summer stand and came through in good shape; sent out a swarm June 1, 1903, and I lived them; but there is the rub. I just got them in nicely,

# Stanley Queen Incubator and Brooder \*\*\*\*\*

### An Arrangement that Allows the Bees Access to the Cells and Queens at all Times.

(Patent Applied for.)

One of the greatest objections urged against a lamp-nursery, or any kind of a nursery where queens are hatched away from the bees, is that the cells and their inmates are robbed of the actual care of the bees. When the bees have access to a cell, and the time approaches for the queen to emerge, the wax over the point is pared, and, as the queen cuts an opening through the cell, and thrusts out her tongue, she is fed and cheered in her efforts to leave the cell. A queen hatched away from the bees loses all of this food, cheer, and comradeship; and, until introduced to a nucleus, or full colony, has not the natural food that she would secure were she among the bees.

All of these objections are overcome by an invention of Mr. Arthur Stanley of Lee Co., Ill. Mr. Stanley makes the cell-cups according to the directions given in Mr. Doolittle's "Scientific Queen-Rearing," sticking the base of each cell to a No. 12 gun-wad. By the use of melted wax these wads, with the cell attached, are stuck, at proper intervals, to a strip of wood exactly the length of the inside width of a Langstroth brood-frame. Two wire staples driven into the inside of each end-bar, slide into slots cut in the ends of the cell-bars, and hold them in position.

The process of transferring larvae to the cells, getting the cells built, etc., have all been described in the books and journals, and need not be repeated here. When the cells are sealed they may be picked off the bar (still attached to the gun-wads); and right here is where the special features of the Stanley process steps in. Each cell, as it is removed, is slipped into a little cylindrical cage, made of

queen-excluding zinc, the cage being about two inches long, and of such a diameter that the gun-wad fits snugly, thus holding the cell in place and stopping up the end of the cage. The other end of the cage is plugged up with a gun-wad. Long rows of these cages, filed with sealed cells, are placed between two wooden strips that fit in between the end-bars of a Langstroth frame are held in position by wire staples that fit into slots cut in the ends of the strips. To hold the cages in their places, holes, a trifle larger than the diameter of the cage, are bored, at proper intervals, through the upper strip, thus allowing the cages to be slipped down through the upper bar, until their lower ends rest in corresponding holes bored part way through the lower bar.

A frame full of these cages, stocked with cells, may be hung in a queenless colony, and will require no attention whatever except to remove the queens as they are needed. The workers can freely pass in and through the cages, cluster upon the cells, care for them, and feed the queens after they hatch, exactly as well as though the queens were uncaged.

These cages are unsurpassed as introducing cages, either for fertile or for virgin queens. The bees are not inclined to attack a queen in a cage to which they can enter, yet her can surround, harass, and feed her. They can become acquainted with her, and give her the same scent as themselves. When desirable to release her, one end of the cage can be stopped with candy, and the bees allowed to liberate her by eating it out.

By putting food in one end of the cage a queen may be kept caged, away from the bees, the same as any other cage.

and out came another from a box-hive. I covered live bees and all with bee-canvas, but of no avail. They covered the ground for 20 feet square on the grass, weeds and bushes, and they know how they united. I don't, for the canvas was held down tight by boards. Now, June 29, they have 70 pounds of comb honey by actual weight. I don't know whether that is the best or not, but it is good enough for me.

I would just as soon have a box-hive in June as a good swarm on a tree, only for extra labor. I smoke them at the entrance, then turn the hive upside down, place a box over them, put the new hive on canvas, and drum and smoke till the queen and majority of bees go up. Then empty them in front of the hive. Then I use an ax, take out the honey, and let the old brood and crooked combs go to the comb-box. I have transferred five with greatest success, queen always going up, and they go right to work. I used only starters one-half inch wide, but full foundation is better.

I am a blacksmith, and I go about my bees with sleeves rolled up, wide open collar, and no veil. I believe bees know a coward.

A. M. HOOVER.

Vermilion Co., Ill., June 29.

### Poor Season for Bees.

I don't know whether I will get honey enough to pay my subscription to the different bee-papers or not. Last year was a failure on account of wet, cold weather, and this is no better so far. I had two colonies to starve about two weeks ago. I did more feeding last fall and this spring than I have altogether for ten years. Two years ago I introduced 16 new queens. Some of them died the first winter, and last winter they all died but five, and only two of them are doing any good. I have bought a good many queens in my time, and I remember only two that lived over two summers.

If the weather continues cold and wet the balance of this season I will be looking up another winter, perhaps a heavier one.

Cleatfield Co., Pa., June 29. G. W. BELL.

### Best Season in 15 Years.

We are having the best honey season here that I remember for 15 years. Last year's all season's rain started the white clover, and the past spring rains have kept it growing so that our pastures, and even old meadows, are nearly knee-deep with it. It's a beautiful sight to us bee-keepers.

I have 15 acres of alsike clover which the bees seem to prefer to the white. The linden, or basswood, bloom is poor this year, but we do not need it.

My bees are doing quite well. I have mostly blacks. I find them best for comb honey. One of my black colonies had gathered over 100 pounds of fine comb honey about the middle of June, when they cast their first swarm. I have been fairly successful in preventing swarming. I increased from 20 colonies to 30. Most of them are working in two supers, a number in four and five supers. They will average 100 pounds, spring out.

Linn Co., Iowa, July 4. JAS. R. SMITH.

### Alfalfa in Michigan.

I am a new reader of the Bee Journal, and have become quite interested in some of the articles, especially the talk on alfalfa at the Chicago-Northwestern convention, as reported in the issue of June 25. I live in southeastern Michigan, about 40 miles north and west of Detroit. I have just started in with bees this spring, and hived my first swarm June 18. It was a pleasure to watch them adjust themselves so quickly to their new home and go to work. It was pretty cool and wet this spring up to about the middle of June, when it warmed up some, and now it is fine summer weather, and the busy little bee is now making up for lost time.

White clover and alsike are the present honey crop. There is a field of alfalfa a few rods west from me, but I can not discover any bees at work on it. I am sure it is not because there is no honey in it, for the nectar

is very much in evidence when you pluck the little blossom from the stem and draw it through your teeth, just as we used to do with the June clover to extract the sweet from that. My theory is, that the alsike and white clover, which blossom here the same time that the alfalfa does, being a regular and familiar plant, draws the entire attention and energy of the bees to them. These two plants yield more honey, too, I think, than the alfalfa contains. The piece of alfalfa I referred to substantiates the statement made by "A Member" in the convention discussion; for most of this field is made up of hill, side-hill, gully, and low spots. The heaviest plant yield is on the slopes in the lightest soil, mostly gravel. The heaviest soil (clay) and the low spots have very little of the plant-growth.

J. H. DAVIS,  
Livingston Co., Mich., June 30.

**Honey Crop a Total Failure.**

The honey crop is a total failure to date. It rains all the time, and bees can't get any honey, and the clover and raspberry bloom are nearly gone.

A. W. SMITH,  
Sullivan Co., N. Y., June 29.

**A Deaf Lad and the Bees.**

Some days ago a deaf friend of mine and his wife came to my house for dinner, as did several other deaf people. The friend told a story on himself, which is too good not to pass on.

When he was a lad of 12, up in Michigan, he saw a man selling bees by the pound, and having a crowd around him. The man, after "working his jaw" presumably on the in-

dusty and gentleness of the bees, would slyly dig his hand into the bees' nest, scoop up a handful and put them in his hat on his head, and then "work his jaw" some more, presumably, etc. After he paused the little deaf lad went up to him, and in the sign language, asked the seller to be allowed to try the trick himself. On the consent of the man the crowd widened out to a safe distance, laughing and winking. Upon the little boy to the box, goes the seller one better by dipping his hand in twice, not reckoning on the low crown of his hat. He put it on slowly, but pinched one bee, and she gave it to him on the very top of his head. With all the crowd before him he controlled his nerve, made obedience to the crowd, took his hat off and shook the bees out; then, as soon as he could, without attracting attention, he slunk off and put a cake of mud over the sting.

The story, to be appreciated, should be acted out in the graphic sign-language. The way he grimaced the moment of the sting brought convulsive laughter and tears.

CHAS. R. NEILLIE,  
Cuyahoga Co., Ohio.

## Honey from the Maples.

We are having very much rain and dampness. Basswood is yielding some honey. I took off of two hives about 65 pounds of maple honey. It looks amber, just like maple syrup, and also has a decided maple taste. It is extremely mild. This was taken off on June 13. The supers are full again. After I took them off I will let you know the results.

CHARLES E. KEMP,  
Baltimore Co., Md., June 26.

## Bees Did Well—Arizona.

Bees in this locality have been doing well this spring. One of my colonies stored over 100 pounds of extracted honey from raspberry and white clover during June.

Swarming, so far, has not been very extensive, but for swarms I am not so particular.

Basswood buds are nearly ready to burst. Then the bees will have a big time. Why is it that we do not hear from some of the fraternity in that "Land of Sunshine," the Salt River Valley, Ariz.? Possibly it is because they are too busy; if such is the case we can excuse them, but I believe if they tried they could spare a few minutes to let their friends know if they are still in the bee-business.

As far as I can see the only report for Salt River Valley during the past four or five years must be credited to A. J. Bridenstine.

Now, bee-keeping friends, I used to live in Arizona and keep bees. I am acquainted with a good many bee-keepers there who could give glowing reports of honey crops. Now, let us hear from you. I am still interested in my old home, and all the bee-keepers there.

The "Old Reliable" is a visitor at your place I am sure the editor will grant you a small portion of space for a report on bees once in a while, or often.

Enclosed please find a specimen of plant the name of which I would like to know. I do not know if it is of much consequence as a honey-plant, but the bees seem to be busy on it at times, but whether they gather honey or pollen I have not been able to ascertain.  
Benzie Co., Mich., July 2. B. L. BYER.

[Our botanist is on a vacation in Pennsylvania for two months. Doubtless Prof. A. J. Cook, of Claremont, Los Angeles Co., Calif., will name plants on receipt of specimens with postage stamps.—EDITOR.]

## An All-Around Bee-Keeper.

In our locality white clover was never finer and it is 17 years this summer since we have had near its equal. I am the bee-doctor of the neighborhood. This p.m., from 2 to 5 o'clock, I rode 10 miles on my wheel, chased a swarm from an old box to a frame hive, removed 56 pounds of honey, and examined 13 other colonies to see to their needs, visiting two separate yards for the work.

June 30, I went to the ridge of a two-story

## A Foster Stylographic PEN....

This pen consists of a **hard rubber holder**, tapering to a **round point**, and writes as smoothly as a lead-pencil. The **point and needle** of the pen are made of **platinum**, alloyed with **iridium**—substances of great durability which are not affected by the action of any kind of ink.

They hold sufficient ink to write 10,000 words, and do not **leak or blot**.

As they make a line of **uniform width** at all times, they are **unequaled for ruling purposes**.

Pens are furnished in neat paper boxes. Each pen is accompanied with full directions, filler and cleaner.

**BEST MANIFOLDING PEN ON THE MARKET.**

**19,000** Postmasters use this kind of a pen. The Editor of the American Bee Journal uses the "Foster." You should have one also.

## How to Get a "Foster" FREE.

Send two NEW SUBSCRIBERS to the American Bee Journal for one year, with \$2.00; or send \$1.90 for the Pen and your own subscription to the American Bee Journal for one year; or, for \$1.00 we will mail the pen alone. Address,

**GEORGE W. YORK & CO.**  
144 & 146 Erie St., Chicago, Ill.

Breeders, \$3.00 each, after June 1.		

Add price of any Queen wanted with Nucleus. Our bees are shipped in light shipping-cases. Purchaser pays express on Nuclei.

Safe arrival guaranteed on all stock sent out.

BATAVIA, ILL., Aug. 21, 1901.  
Dear Sir:—I thought I would let you know as to results of the nucleus sent me. They were placed in 10-frame hives and now they are in fine condition. From one I removed 24 pounds of honey and had to give 6 of them more room, as they were hanging out. They have more than reached my expectations.

Yours respectfully,  
K. MEREDITH.  
DAVENPORT, IOWA, Dec. 31, 1901.  
Your queens are fully up to standard. The honey queen that you sent my brother takes the lead. She had a rousing colony when put up for winter. The gatus can be handled without smoke or veil. Very truly yours,  
JOHN THORNING.

Notice.—No tested stock sent out before May 15. Send money by P. O. Money Order or Express Order. **D. J. BLOCHER,**  
17A11F PEARL CITY, ILL.  
Please mention Bee Journal when writing.

**\$300,000,000.00 A YEAR** and you may have part of it if you work for us. Uncle Sam's country product pays that much, send for samples and particulars. We furnish capital to start you in business. Draper Publishing Co., Chicago, Ill.

house and the top of the chimney and removed 8 to 10 pounds of new comb honey and sent the bees out. A board over the chimney-top and holes between the brick lower down made an attractive place. Who has gone higher!

I am caring for 21 colonies, and among them are two that are now ready for their fourth supers, each containing forty 3/4-inch sections, all from white clover. Neither have swarmed this year. Who can beat that record? Others run from 50 to 80 pounds each, according to strength and swarming fever. Swarms are generally numerous. While I work the bees I have a deputy working the office.

M. L. BREWER.  
Champaign Co., Ill., July 4.

**Good Prospects for a Crop.**

The prospects for a honey crop are good, with an abundance of white sweet clover and basswood all now in bloom.

D. L. DURHAM.  
Kankakee Co., Ill., July 3.

**Best Season for White Clover.**

This has been the best season so far for white clover I ever saw. The bees have about trebled themselves. I cannot make hives fast enough to supply the demand. I use 10-frame hives. I have some colonies that have filled two supers, and have two more nearly filled. I began with 13 colonies in the spring; 6 of them were in boxes and old American hives. Some of my first swarms have filled one super. I had a large swarm to-day from one of my first swarms one month old. I have tried to keep back swarming as much as I could.

ANDERSON YORK.  
Davis Co., Iowa, July 4.

Close Saturdays at 1 p.m.—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

**PAGE 12-BAR, 58-INCH FENCE**

**BEE=BOOKS**

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie St., CHICAGO, ILL.

**Forty Years Among the Bees.** by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide, or Manual of the Apiary,** by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full description of the anatomy and physiology of bees. 544 pages, 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee,** revised by Dadasnt.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**A B C of Bee-Culture,** by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing,** as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey, or Management of an Apiary for Pleasure and Profit,** by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture, Its Methods and Management,** by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur,** by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register,** by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood.**—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping,** by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment,** by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Foul Brood,** by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

**HONEY AND BEESWAX**

MARKET QUOTATIONS

CHICAGO, July 7.—At present there is little call for comb honey, some new is offered, and for fancy 14@15c per pound is asked. Extracted sells at 6@6 1/2c for best white; amber grades, 5@6c, depending upon flavor, body and package. Beeswax, 30c. R. A. BURNETT & CO.

KANSAS CITY, July 30.—No comb honey in this market. New white comb would sell for \$3.50 to \$3.75 for 24-section cases; amber, \$3.25 to \$3.50. There is considerable extracted honey on the market with scarcely any demand. Price nominal at 5 1/2 @ 6 1/2c per pound. Beeswax in demand at 25@30c. C. C. CLEMONS & CO.

ALBANY, N. Y., July 6.—Honey very quiet, but some call for new comb, which would sell for 15@16c for light, now. Extracted dull at 5 1/2 @ 6 1/2c. Beeswax, 30@32c. H. R. WRIGHT.

CINCINNATI, June 1.—Very little change in market from last report. We quote amber extracted grades at 5 1/2 @ 6 1/2c in barrels; white clover, 8@9c; super quality to standard. Comb honey, 15@16c for fancy. Beeswax, 30c. THE FRED W. MUTH CO.

NEW YORK, July 8.—Some new crop comb honey now arriving from Florida and the South, and fancy stock is in fair demand at 14c per pound, and 12@13c for No. 1, with no demand whatever for dark grades.

The market on extracted honey is in a very unsettled condition, with prices ranging from 5@5 1/2c for light amber, 3 1/2 @ 4c for white, and the common Southern at from 3@3 1/2c per gallon. Beeswax steady at from 30@31c.

MILWAUKEE & SEGELEKEN.  
CINCINNATI, July 7.—We have reached the time when there are no settled prices in the honey market. Everybody is waiting to learn how the new crop will price, therefore we will sell or ask the old price. Fancy water-white brings 15@16c. Extracted, amber, in barrels, 5 1/2 @ 6 1/2c; in cans, 6@6 1/2c; white clover, 8@9 1/2c. Beeswax, 30c. C. H. W. WEBER.

**WANTED! Extracted Honey.**

☞ If more convenient, Dues may be sent to the Secretary, at the office of the American Bee Journal.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to

fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S

"FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

**GEORGE W. YORK & CO.**

## Editorial Comments

**Do Things on Time.**—Promptness in doing everything at the right time is important in any calling; perhaps in none more so than in bee-keeping. The delay of a day in giving a super to a crowded colony may be the straw that decides the colony to swarm, materially interfering with the harvest.

A nucleus has its hive partly filled with frames. You fail to note its increasing strength till one day upon opening it you find a lot of crooked work. Comb has been built to the side of the frame and on the cover, and it takes you ten times as long to straighten it up as it would in the first place to have filled the hive with frames, to say nothing of the loss.

You are running short of sections in the harvest time. You thought you possibly had enough, and so kept postponing the matter of ordering till the last section was on the hive. Others have been like you, there has been a rush on the factory, so that it is behind orders, and the dealer can not possibly send you the sections without delay, and as a result you lose a part of your crop. The loss and the vexation might just as well have been avoided if you had sent your order early.

It is not necessary to cite further instances. Be on time, or ahead of time, and you will make more money, live longer, and be happier while you do live. If you're so built that you must be behind all the time, give up bee-keeping and go to shoving a wheelbarrow—you can shove better by being behind.

**Getting Bees Out of Sections** is a very simple thing with the white-clover flow that is now on in some places (July 4). All that is necessary is to take off the super—no need to drive out a single bee—after putting on the cover set the super on end on top, and leave it there till later in the day, when it will be found empty of bees. The bees will form a line of march down the side or front of the hive to the entrance, and after a little all will have joined the procession. If the sections be left thus exposed all day long, not a robber will touch them.

But wo betide you, oh inexperienced beginner! If you get it into your head that this is to be the unvarying program each year. Next year the flow may not be so good, and a very little exposure may start such a bad case of robbing that you will wish you had never seen a bee. Even in the best of years there will come a time when there will be a let-up in the flow, and then the least exposure must be avoided. So keep a sharp eye on your sections, and if at any time you see a bee flying with its head toward the sections, get them under protection immediately.

**Feeding and Caressing of Queens.**—In an article in the Bee-Keepers' Review, in which he pleads for fresh investigations on different points, Arthur C. Miller says:

But what can you expect of others when you write of "bees caressing the queen and offering her food when she pokes her tongue from the partly opened cell." That surely is a relic of the dark ages. The tongue is probably put out as a "feeler," for it is often used thus. Bees never offer food to the queen, or to each other, it always has to

be asked for, and, sometimes, almost taken by force. From long observation I am satisfied that it is never given on or by the tongue of the "giver," but is taken from the mouth of the "giver" by the tongue of the taker.

Mr. Miller has given evidence that his observations are entitled to consideration, but in the present case it need not be wondered at that some hesitation will be shown as to believing that bees never caress nor offer food to a queen. When bees are seen stroking and apparently dressing a queen, it is hard to believe that it is not meant somewhat in the nature of a caress. The tongue may be put out, as he says, as a feeler, but a feeler after what? Why not a feeler after food? If bees never offer food to a queen, and, as he says, it has always to be asked for, does not the queen ask for it by thrusting out the tongue? and if so when out of the cell, why not when in the cell?

**Brood for a Nucleus With a Virgin Queen.**—The practice of many is to give a frame with eggs and young brood to a nucleus having a virgin queen. This for more than one reason. If the young queen is lost, the bees will show the loss by starting a number of queen-cells. If no queen-cells are started it is safe to say a young queen is present, no matter if the most careful search fails to discover her. It is possible, however, that one or a few cells may be started even when a young queen is present, the cells not being destroyed till near maturity.

**Behavior of Queens at Different Ages.**—When a young queen has just emerged from the cell she is easily found, making no attempt to get out of the way. When a little older, a virgin queen is shy, scurrying with great rapidity from one part of the hive or comb to another, and makes such a success of hiding that the novice may be persuaded there is no queen in the hive. When about to assume the duties of egg-laying, she again becomes moderate in her movements, continuing thus through life, and in many cases continues depositing eggs in the cells when the comb is taken from the hive.

**The Scarcity of Basswood** is constantly becoming more pronounced. Lately in a private conversation a well-informed supply manufacturer said that the increasing difficulty of securing basswood lumber, and the constant advance in the price of the same was becoming a very serious matter. The amount used for sections is comparatively small, and if not a section were made, the great quantity used for so many other purposes would in not a great while use up the supply. He suggested the possibility that in the not very distant future it might become necessary to abandon the production of section honey, allowing extracted honey to take its place.

Such a result is not likely to occur. There is a demand for section honey that is separate from the demand for extracted honey, and consumers who prefer section honey are willing to pay several cents a pound more for the appearance, or whatever you may be pleased to call it. If basswood lumber should cost five times as much as it does now, it would not increase the cost of a section more than a cent, and the advance of a cent in the price of section honey would by no means kill the demand.

But even if basswood should entirely disappear, there would still be left the possibility of four-piece sections from any one of several different woods, some of them better in appearance than basswood. And it is just within the range of possibilities that the time may come when some will choose four-piece sections rather than to pay the increased price of one-piece sections made from basswood.

## Association Notes

EXHIBITS OF BEE-SUPPLIES at the coming Los Angeles convention is called for by a reader in San Bernardino Co., Calif. He thinks it would be a good idea to have the manufacturers bring samples of their hives, etc., so that bee-keepers can compare them.

THAT CAR-LOAD OF BEE-KEEPERS for the Los Angeles convention expects to leave Chicago on Wednesday evening, Aug. 14. Will those who expect to be in that company please let us know by Aug. 1, if possible, so that we can make all arrangements here with the railroad company, such as securing berths, and anything else that may be necessary to arrange for in advance? Of course, if it is impossible to let us know as early as Aug. 1, do so as soon as possible after that date. We want to have as many bee-keepers from the East to start in that special car as can possibly arrange to be here at the time mentioned. The round-trip fare from Chicago to Los Angeles is \$50; the berth \$6; and the trip to the Grand Canyon, where it is expected to spend Sunday, is \$6.50 more. By all going in one car the railroad company will allow the bee-keepers to take the same car to the Grand Canyon and sleep in it, and then afterward go on in it to Los Angeles.

In case any bee-keepers east of Chicago should purchase round-trip tickets, be sure to get them over the Santa Fe road from Chicago, as that is the route over which the car-load of bee-keepers will go.

We wish that 40 or 50 bee-keepers near Chicago and east of here could arrange to go in that special car. We would then have a continuous convention for several days. It will be a great trip.

AMENDMENTS TO THE NATIONAL'S CONSTITUTION.—The following amendments to the Constitution of the National Bee-keepers' Association have been approved by a majority of the Board of Directors and of the Executive Committee, but in advance of laying them before the coming convention at Los Angeles, it is desired that all shall have an opportunity to criticize and suggest, hence their publication. Suggestions and criticisms may be sent to Pres. W. Z. Hutchinson, of Flint, Mich., who will lay them before the committee having the matter in charge:

### ARTICLE III.—MEMBERSHIP.

Section 1 to be amended to read as follows:

SEC. 1.—Any person who is interested in bee-culture, and in accord with the purpose and aim of this Association, may become a member by the payment of \$1.00 annually to the General Manager or Secretary; and said membership shall expire at the end of one year from the time of said payment, except as provided in Section 10 of Article V of this Constitution. No member who is in arrears for dues, as shown by the books of the General Manager, shall be eligible to any office in this Association; if such disqualification occur during the term of any officer, the office shall at once become vacant.

Section 2 to be amended to read as follows:

SEC. 2.—Whoever a local bee-keepers' Association shall decide to unite with this Association as a body, it will be received upon payment by the local Secretary of 50 cents per member per annum.

### ARTICLE IV.—OFFICERS.

Section 1 to be amended to read as follows:

SEC. 1.—The officers of this Association shall be a General Manager, a President, a Vice-President, a Secretary, whose terms of office shall be for one year, and a board of twelve Directors, whose term of office shall be four years, or until their successors shall be elected.

Section 3 to be amended to read as follows:

SEC. 3.—The President, Vice-President, Secretary, and General Manager shall be elected by ballot during the month of December of each year, by a plurality vote of the members, and assume the duties of their respective offices on the first of January succeeding their election.

Section 4 to be amended to read as follows:

SEC. 4.—The President, Vice-President, Secretary, and General Manager, shall constitute the Executive Committee.

Section 5 to be amended to read as follows:

SEC. 5.—The Directors to succeed the three whose term of office expires each year shall be elected by ballot during the month of December of each year by a plurality vote of the members. The three candidates receiving the greatest number of votes shall be elected and assume the duties of their office on the first of January succeeding their election. The Board of Directors shall prescribe how all votes of the members shall be taken, and said Board may also prescribe equitable rules and regulations governing nominations for the several offices.

Article V, Section 3, to be amended to read as follows:

SEC. 3.—Secretary—It shall be the duty of the Secretary to keep a

record of the proceedings of the annual meeting; to receive membership fees; give a receipt for the same, and turn all moneys received over to the treasurer of the Association, together with the names and post-office addresses of those who become members; to make an annual report of all moneys received and paid over by him, which report shall be published with the annual report of the General Manager; and to perform such other duties as may be required of him by the Association; and he shall receive such sum for his services as may be granted him by the Directors.

### ARTICLE VII.—VACANCIES.

Amend by adding the following clause to the end thereof:

Any resignation of a member of the Board of Directors shall be tendered to the Executive Committee; any resignation of a member of the Executive Committee shall be tendered to the Board of Directors.

### ARTICLE IX.—AMENDMENTS.

This Constitution may be amended by a majority vote of all the members voting, providing such proposed amendment has been approved by a majority vote of the members present at the last annual meeting of the Association, and copies of the proposed amendment, printed or written, shall have been mailed to each member at least 45 days before the annual election.

GENERAL MANAGER N. E. FRANCE reports the following, which will be of interest to bee-keepers generally, but especially to the members of the National Bee-keepers' Association:

Riverside, Calif., has an ordinance, now enforced, forbidding the keeping of bees in certain parts of the city. Mr. France has written the authorities and bee-keepers there concerning the matter.

Another case is in a Michigan city where the ordinance is to take effect Nov. 1. Mr. Hutchinson has promised to wait on the officials of the city, and if possible make settlement.

There are several other localities in trouble, all of which Mr. France is helping. He is kept very busy in the work of the Association, and is doing lots of good.

MRS. C. M. GRAY, of Los Angeles Co., Calif., writing us July 4, had this to say:

We have had rather too cool weather until this month, but bees are now working in earnest on wild buckwheat, sage, etc., and we hope to have good results in extracted honey.

Southern California looks forward to a grand meeting of the American bee-keepers next month, and from all reports they will be tendered a royal welcome by those in and out of the fraternity.

MRS. C. M. GRAY.

## Miscellaneous Items

DR. F. L. PEIRO can now be found at Room 13, 52 Dearborn St., Chicago; hours, 10 to 3. He wrote July 2: "White mulberries coming on. Bees rejoicing."

G. M. DOOLITTLE, of Onondaga Co., N. Y., writing us July 10,

said: "Fearfully hot here. Bees doing very little. No basswood bloom this year on account of late frost. Thousands of acres of buckwheat sown, so we may get surplus later."

BEET-SINO REMEDY.—"There is no better remedy for a bee-sting than the juice of roasted onion. Roast the onion in the ashes if possible and squeeze the juice out, hot as can be borne, on the affected part. This simple remedy, applied in time, has been known to save life." So says a newspaper item.

HE HURT HIMSELF.—Little Byron, 3 years old, came in from his play crying and holding his foot.

"What is the matter with my boy?" asked his mother.

"I hurt me on a bee," replied Byron.

THOSE STRAWBERRIES, mentioned on page 430, have called out the following explanation:

MR. EDITOR:—Your remarks about strawberries from here make me feel as if sailing under false colors, for the majority of readers might understand that the fine berries you speak of were raised by myself. The only part I have in their production lies in the fact that they are raised on my ground. Years ago I produced strawberries by the acre, but I never could produce such berries as those I sent you. That remained for my good brother-in-law, Ghordis Stull, who is a genius in that direction, and seems to impart to his strawberries the ambition to excel in size and quality anything previously accomplished.

C. C. MILLER.

# Convention Proceedings

## Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 453.)

### FEEDING BACK TO PRODUCE COMB HONEY.

Mr. Craven—I would like to find out if any of the members of this Association, or any of the members of the National, who know and go to the National, have ever come across any other expert besides Prof. Eaton, who found the feeding back of cane-sugar for the whole apiary for the manufacture of honey, and whether it is profitable to do so to the men who do it. I have read, I believe, somewhere, that feeding back would take up, on an average, of about one-third or two-thirds less, and in that case if they should go to feeding back that would be at a loss instead of at a profit.

Mr. Hutchinson—It wouldn't make any difference whether sugar or honey, but whether it will be profitable or not you have to have the right kind of bees and management. I don't know whether any bee-keeper would make a success of it.

Mr. Moore—It may be that some one doesn't understand what a serious matter this is. I have told grocers and others that some bee-keepers are not too good to do anything if it will pay, but that there is a loss in feeding back honey, and I explained this very thing. I didn't mention his name. That they had tried all that was legitimate, and that it failed, that it could not be on the question, "Can you make dollars out of it?" So I say it can't be done. If anybody has a reason to show that I have been telling stories all these years, I want to know it.

Mr. Abbott—The strongest evidence that it can't be made to pay is, that it is not done, because there are, without a doubt, bees in the world in some shape to do anything. Now, when honey is bringing the price it is now, if this thing could be done at a profit in a warm room some fellow would be doing it, and Prof. Eaton wouldn't say they had found a single case in the great honey market like this. Now, we have just heard of one case. I knew a man who undertook it once, but the bees raised such a muss with him that he put right out-of-doors; it raised trouble with him and his neighbors, and when he got through he was out of his sugar and didn't have anything to do with it. The fact is, that they do not do it. As I said this morning, they are scouring the country to get honey—that's the clincher.

Mr. Niver—I asked Morton why we had so many unfinished sections, and couldn't get them finished. We have so many. Why not feed back extracted honey and get them finished? He said, "I have had my experience; you try it." I selected fine colonies, and fed back 30 pounds of good extracted honey. I got three pounds back. That was my experience; I never tried it since.

Pres. York—That's almost 16 to 1!

### BEE-WAY AND PLAIN SECTIONS.

"Discuss relative merits of, first, bee-way sections; second, half bee-way sections; and third, plain sections."

Mr. Pettit—I asked the question myself, and you have not interpreted it as I intended. What I mean by bee-way is, a quarter inch projection on two sides of the section; and a half way would be an eighth projection—the plain.

Dr. Miller—Perhaps Mr. Pettit will tell us about some experiments he may have made.

Mr. Pettit—With reference to the sections, I haven't had very much experience with any except the first-mentioned, those with the quarter-inch bee-way; but in my experience with them, and seeing how the honey is built out against the side of the section, I would be very much afraid of leakage from the plain section, and for general appearance I would prefer the section with the half bee-way. We have samples there that Mr. Niver showed me this morning.

Pres. York—How many use plain sections? Ten.

### FORCED OR SHAKEN SWARMS.

"Forced or shaken swarms—what should be done with the combs of brood?"

Mr. Horstmann—Pile them up as high as you can, and make good colonies of them.

Dr. Miller—That's one good way. I should say it would depend upon circumstances. If you have a lot of nuclei, take that first, and when you have no other use to make of them then pile them up. That is all right.

Mr. Wheeler—What about robbing?

Dr. Miller—That depends upon what you expect. You have reference to leaving the brood without any bees? I should not advise that. I know there are some that do that way, though. Some say, take all the bees off and hatch the brood; either make a pile or a single hive full of the brood and give it a queen-cell or queen, and then depend upon the young bees helping out to take care of the brood that is there. I should expect, in a good many cases, to have robbing going on. If there is a bountiful harvest there may not be any. The one thing I would expect, there would be some chilled brood, even if they have weather so hot that the brood will hatch out day and night. There will then be some starved brood. There will not be bees enough there within the first 24 hours to feed the brood that ought to be fed, and I think you would pretty surely have some starved brood; so those two things would make it unadvisable to use that brood without any queen. These men don't look into the matter closely enough. They would find that they had chilled brood, or starved brood.

Mr. Baldrige—I am acquainted with the person who prepared that question. I wish to answer my way. I don't believe it is policy to shake off all the bees, but to leave enough to take care of the brood properly; but I should place these shaken frames of brood in an empty hive by the side of the parent hive. I would close the entrance entirely so that no bee can get in or out, and attach to the front end of the hive a bee-escape, so that when the bees went out to work they would be excluded from the hive, and in the course of three weeks all the brood will be hatched, the majority of the bees will be in the other hive by the side of it. I should place this hive no more than one, or two or three inches away from the old stand, so that the bees will be excluded, and secured in the other hive.

Mr. Horstmann—This question of shaken swarms is done for two purposes. One purpose to cut down foul brood. Another purpose to get good, clean combs so you will have good, clean comb honey, and I think it is a mistake to shake frames too much. I give them one shake, and leave plenty of bees on that comb to take care of any brood they may hatch out. If you close up the bees as Mr. Baldrige says, and put the bee-escape on, they will go somewhere. There will be a great deal of trouble, I think. Leave it open so they can get in, but leave it smaller, and then by shaking off four or five colonies at one time you will have a splendid colony from the combs that you have piled on top of each. There will be a new colony, and that colony will give you plenty of honey if there is any flow at all, and you will not lose anything except the old comb; and if there is any foul brood in the neighborhood it will get rid of that. This is one thing I was expecting would come up. Foul brood can be cured sometimes by giving bees clean combs. I may be a little off of the subject. I had foul brood in one colony. I didn't know it at the time. I placed a hive under it, and let the bees build down, and after they got to work in the lower story I took the upper story off and put on some brood-chambers, and I found out that that colony was cured of foul brood simply by the bees storing in clean comb. It was all done over two years ago, and there is no foul brood there now. Foul brood was cured by letting them work in the new part of the hive and storing clean honey, and using that for brood when the queen went below. Shaken swarms are good for that one thing, and I don't think people should shake too many bees off of the frames. We have to look out for foul brood; the most of the bee-keepers in this convention belong around here, and I always think I should talk more to the interest of those near home. The others, of course, know their business better than we do here, and we know what we need.

Dr. Miller—Let me suggest one other variation. Take the plan Mr. Horstmann suggests, make a pile, shake, if you please, all of the bees off, shake what is convenient to shake off, depending upon the character of the bees—you may get all off, or not entirely all; make your pile of brood upon some weak colony. In that case the brood will be fed,

and there will not be the loss from starvation. Another reason, the other bees are not more likely to rob that pile than they are to have robbed the weak colony that was there before. If a new boy comes to school he has to run the gauntlet until he gets settled down. If there is a change made in the apiary, and there is any tendency to rob a colony, place it in a new place and it will be robbed. That's the case in my locality.

Mr. Horstmann—Did you ever have robbing during a good honey-flow?

Dr. Miller—I don't know.

Mr. Horstmann—I think it is very seldom.

Dr. Miller—I don't believe I did in a good honey-flow. I have had it in a honey-flow, though. You set a colony in a new place and the bees will try that, and if you pile this pile of brood upon a weak colony that has had its place there, they will not try it.

Mr. Wheeler—I have had quite a little experience along that line. I have been practicing that shaking process for more than ten years, and I find that even in a good honey-flow, honey coming in one day, we might have rain that night, and the next day the robbers would be out.

Dr. Miller—Still, that would be hardly called in a good honey-flow at that time.

Mr. Wheeler—My plan is to shake all the bees off, for fear you don't get the queen. If you don't get the queen it is too bad. You have to have the queen. After the bees are all off, I take the combs and hive and put them right where the old hive stood. I shake my bees all to one side, young bees and queen; I put the old comb on the old stand; the workers come in from the field and they take care of that comb. At night I carry that hive of old bees off anywhere I please. It takes from 28 to 48 hours for the old bees to go back to their old home where the hive is, and by that time there is brood enough in the hive to take care of itself.

Dr. Miller—Mr. Wheeler has a very bright way.

Mr. Abbott—Since I got to be a farmer I can't read everything on earth. I kind of get behind the Chicago swarm business. I supposed it was to get rid of swarming, but Mr. Horstmann says it is to get clean combs. When the bees are healthy, and there is no disease in a colony, does it ever pay to melt up a comb? I had an impression that a comb once made was worth more money as a comb. I have used combs for extracting that were 10, 12, and 15 years old. I don't know whether I got good honey or not. I always got the premium and 20 cents a pound for it. It seems to me if it is worth while to buy foundation, if one didn't want them, and there was no disease connected with them, they would sell for more as combs than they would in any other way. Maybe I misunderstood.

Dr. Miller—You haven't been reading!

Mr. Horstmann—I am going to experiment. One reason is to get rid of foul brood.

Mr. Abbott—Let me ask this question: Then you didn't mean to say that you destroyed the combs if your bees didn't have foul brood?

Mr. Horstmann—No. They are very handy to use for extracting honey.

Mr. Baldrige—The object of that question was not only to know what to do with the brood, but to secure all the bees in that hive, in the working hive. My plan secures all the bees in the original hive to store honey.

Mr. Wheeler—Doesn't mine?

Mr. Baldrige—I didn't say it didn't. No moth-miller can get in if the escape is on, or no robbers. You secure every bee in that hive without the loss of one on the original stand, on the parent stand working in the supers.

Dr. Miller—I think Mr. Wheeler's plan is taking a mean advantage of the bees. He takes everything away and sets empty comb in an empty hive, and the flight bees come back and occupy that, and they take care of them, and then he puts them on another place and they come out and go back to that same location again and join the swarm. I would like that you all get that idea of the two shifts that he makes, because these field-bees will hold to that one spot.

Mr. Niver—Do you all forget Doolittle's plan that he got up ten years ago? He made three swarms out of two normal colonies and a nucleus. There are certain things necessary to that plan. You must have as many nuclei as swarms, and, next, you must know within 10 days when the honey-flow will start. If you have ordered up your honey-flow and it gets there, and is delivered on time, you are all right; and if not, you are all wrong. We have tried that, because we can tell pretty near in New York State when our honey-flow is coming on, it varies but little. If it is bad weather, and the blossoms don't come, we have to feed.

To make these swarms that way is a ticklish piece of business to understand. I think I talked a day and a half to Dr. Nussle to make him see it. Mr. Doolittle proceeds as follows, as told in his "Scientific Queen-Rearing."

#### SWARMING.

After trying all the plans of non-swarming hives given, with no success, I settled down to the conclusion that such a thing did not exist when working for comb honey, and, even if it did, I doubt if as large a yield of honey could be obtained as by the use of swarming hives. Then, if we are to use swarming hives, the question coming next is, shall we make our swarms by dividing, or by letting them swarm naturally? Lately I have used both ways with what seemed to me the best results. It will be seen that the combs are all in readiness 15 days before the height of the white clover harvest, and where this is the main dependence for honey, all swarming should be done within the next five days. In this case swarming would have to be done largely by division, but as basswood is my main honey crop, coming about July 5, I do not practice artificial swarming, only so far as is necessary to have all swarming done 10 days before basswood opens. All swarms issuing previous to 15 days before basswood are hived on the best results. It will be seen that the combs are all in readiness the time of hiving, boxes are put on in the same manner as described before. Those issuing, the next five days, are hived two swarms in a hive, when convenient to do so, and the full complement of boxes put on at once. If not convenient, the swarm, after being hived, is set on the stand of another colony which has not swarmed, and such colony changed to a new location, thus securing to the swarm all the field-bees from the colony moved. Each swarm thus and all at once, thus, it will be seen all the swarms are in splendid condition to take advantage of the basswood harvest as soon as it commences.

Where I have two swarms together, the queen belonging to one parent colony is allowed to go back, when such hive is moved to a new location and the double swarm set in its place. The colonies losing their queens by their going with the swarms are allowed to rear their own queens, for (after thoroughly trying the plan) giving each colony a laying queen immediately after swarming, has not proved a success with me.

Eight days after a swarm has issued from a hive I open it, and, having ascertained that a queen has emerged from the cell, by finding one open at the end, I cut off all the rest and thus stop all second swarming. These cells, thus cut off, are placed in nucleus hives, if I wish more queens. By waiting until the first queen is hatched, I have a certain thing when the cells are all off, which is not the case where all but one cell is taken away four or five days after swarming; for the bees will often rear queens from the larvae still in the hive at that time, and also the cell thus left will often fail to hatch.

When I think basswood will open in about 10 days, I proceed to make the nucleus hives, and have ready to hand, swarmed, as follows: A hive is filled with frames of empty combs and placed upon the stand of one of these colonies which has not swarmed, and all the boxes are taken off and placed thereon, then all the bees are shaken and brushed off their combs of brood and honey in front of this prepared hive into which they will run as fast as shaken off. Thus, I have a colony that is ready for the honey harvest, as they have the queen, bees, and partly-filled boxes all in readiness for work. Previous to this, nuclei have been started, so that I have plenty of laying queens to use as I need them.

I next take all the combs of brood from which the bees were brushed except one, arranging them in the hive the bees were shaken out of, and carry them to the stand of another colony which has not swarmed. Next I take the comb of brood which was left out, and go to one of the nuclei, taking out the frame having the laying queen on it, and place the comb of brood in its place. Take the frame, bees, queen, and all and set it in the place left vacant for it when arranging the combs of brood. Now put on the boxes, and having all complete, I move the colony to a new stand, and set the prepared hive in its place. Thus, I have a laying queen and enough of her own bees to protect her, together with a hive filled with combs of brood and all the field-bees from the removed colony. In a very few days the colonies are ready for the boxes, and generally make the best colonies I have for storing honey. The loss of bees to the removed colony stops the swarming impulse, and in about a week they have so regained their loss that they are ready for the boxes again.

It will be seen my aim has been, in using these several plans, to get all my colonies strong enough to work in the boxes (during the best harvest to advantage, and still have none of them desire to swarm during the height of the best flow of honey. By adopting a plan called "nucleus swarming," I once had my bees (after an early division) nearly all swarming in the height of the honey harvest, by which I lost at least \$500; for swarm they would in spite of all I could do, and, while the swarming fever is on, but little work will be done in the sections, as all apiarists know. This taught me a lesson; I hope to profit by all such lessons, else why the use of leaving them?

That's the old Doolittle plan. As I said, it works finely, providing your "goods" are delivered that you order—a good honey-flow in ten days.

Dr. Miller—I think you will find pretty nearly the same thing in the American Bee Journal of 1861.

Dr. Nussle—I have a good many journals, but not that one.

Mr. Niver—I found that in the American Bee-Keeper; I think it was at least 10 years ago, and perhaps older.

(Continued next week.)

### Shaken Swarms, or Anticipating Natural Swarming.

BY DR. C. C. MILLER.

THERE are very varying views as to this matter. Some are very enthusiastic about it. Others find in it little to commend. It seems to me it is nothing more or less than anticipating natural swarming, and when the comparison is made between the two there are for some, if not for most, advantages in the shaking plan not to be ignored. The advantage of being able to have the swarms made at a time to suit the convenience of the bee-keeper rather than the whim of the bees, is enough to settle the case with very many.

But although I have practiced it more or less for years, I have not been as enthusiastic about it as some are, because I have indulged the hope that some plan might be discovered by which all swarming might be avoided, both natural and forced. One year after another I have had colonies that made no offer to swarm, and my record yields have always been from such colonies. I have made some attempt to encourage non-swarming by breeding from these colonies that devoted their time to storing rather than swarming, and not entirely without success. Yet I am sorry to say that this year the bees have seemed to forget all about their lineage, and preparations for swarming have been nearly universal. I don't know why.

Having such an antipathy to swarming, I can sympathize with my esteemed friend, Adrian Getaz, in some of his objections to forced swarming. Yet upon reading his article on page 407, I can not repress a feeling of interest for the under dog in the fight, and so will make some attempt at defense against some of his charges. Besides, the matter is of so much general interest that there is warrant for occupying room to have it fully viewed from all sides.

It is true that with forced swarming there must be a number of extra hives, but no more than would be necessary for natural swarming. Indeed, it is necessary only to have an extra-body for most of the colonies, for the shaken combs of four, five or six colonies can be piled in one pile, a single cover and bottom-board doing the service for the pile.

Mr. Getaz varied from the usual practice by returning the brood at the end of five or six days, and it was a success in preventing swarming. That's more favorable to shaken swarms, I am afraid, than results in general would warrant. I don't know that I ever tried—I think I never did try—exactly that plan, but I should expect my bees, in most cases, to swarm on return of the brood so soon. But I should expect them to work in the brood-chamber, just as his did. Ordinarily I think the brood is not returned at all, and if empty combs are given in the brood-chamber the work in the supers ceases and the combs in the brood-chamber are filled. But there is no real loss in this, for as fast as the queen needs the room for eggs, the honey is emptied out of the brood apartment into the super.

The queen will be likely to go into the sections just as she would with a natural swarm, but if combs are given in the brood-chamber she will not. Combs in the brood-chamber will also prevent pollen in the sections.

An inspection every fourth or fifth day is necessary, Mr. Getaz thinks, in order to anticipate natural swarming. I get along pretty well with an inspection every nine days.

Mr. Getaz thinks emphatically that drawn combs should not be given in the brood-chamber, because the bees will fill them with honey at once, and he prefers comb foundation. If the brood is to be returned in five or six days, no doubt foundation is best, but if there is to be no returning of brood, drawn combs work nicely. It is true that they will be filled with honey, but, as I have already said, the honey will afterward be emptied out into the sections. So I have no trouble in giving the full quota of drawn combs at the start.

I am with you, Mr. Getaz, in much preferring to keep the force of bees together, but I get into lots of trouble trying to do so, and I think we must admit that as between natural and forced swarms there is for most a decided advantage in the forced.

You say there is a double loss with shaken swarms:

"The parent colony loses the bees that are on the new stand; besides that, it has to rebuild its brood-nest." But the practice of many is to shake the bees back, or to make a double shake, once in ten days and again at the end of 21 days from the time the swarm was made. In that way nearly all the full force is kept in the hive.

Your plan of returning swarms, and killing the old queens and letting the bees rear young queens wouldn't suit some, especially those with out-apiaries not visited every day. Even if I had only the home apiary, I would rather not have young queens reared in the hive at harvest time. Too often the bees swarm out with the young queen.

I have fought hard against all swarming, natural or forced, but it is quite possible that I may never succeed to entire satisfaction in preventing swarming.

McHenry Co., Ill.

### Drones—Do They Keep the Hive Warm?

BY C. P. DADANT.

I NOTICE that Mr. Hasty criticizes my position on the drone question (page 345). He says: "It is not quite *al-drones* that we can have the warming presence of the drones answered by the workers just as well. The first night after swarming finds workers reared in the drones' place mostly all gone, while most of the drones are where they are needed." Then he added: "Will 50,000 bees in the flush of the season feel quite satisfied in their own minds if no drones are among them?"

There are no rules without exception, and I will grant that if a swarm happens to issue on a certain day, and the weather changes suddenly that same day from hot to cool, the drones, if they have not gone in part with the swarms, may prove a little help for a night. After the first night there are enough young bees hatched out to keep up all necessary heat.

But swarms rarely issue when the weather is cool, or when there are sudden atmospheric changes. Swarms are usually cast when the weather is hot and likely to remain hot. Drones pay no attention to the brood. They prefer to stay on the honey, so as to be able to help themselves without moving.

A colony which has cast a swarm has usually a sufficient number of worker-bees in the field at the time the swarm issues to keep the combs warm—the brood-combs at least—in a cool night, for those bees are all back to the hive for the night, though they were away when the swarm went off. Those drones not only do not care to keep the brood warm, but they do not care where they are, so they are warm themselves, and they are usually nested away in the upper part of the combs if the weather is cool. Then please bear in mind, it will be repeating, that those drones have all been reared at a time when the hive needed warmth to keep its brood warm, when it took valuable worker-bees to nurse and hatch all the brood.

Mr. Hasty thinks the bees will be satisfied in their own minds if there are no drones among them in the flush of the season. Well, I believe he is right, but I never have been able to keep a colony from rearing any drones at all. Only if we can keep the breeding of these drones down to a few hundred instead of a few thousand, I think we will have achieved a great saving, and will also have helped prevent the most promiscuous swarming, for I have repeatedly observed that the colonies which were allowed to rear the greatest number of drones were the ones which swarmed the most.

To me, natural swarming is a hindrance to success. I want to control it, and do in a great measure. If we want increase we can always make it artificially from choice queens and from colonies which would produce so little surplus that it is all gain to make the increase from them. In order to do this we must ascertain the best methods to avoid natural swarming, and the prevention of drone-rearing is one of the requisites.

But there will always be in any hive a few drone-cells—a corner, here and there, where the bees will find place for a few large cells, and there will be drones enough reared to let the bees know that they are there, for they are so noisy and clumsy that I imagine they are only *tolerated*, most of the time, just like a lot of noisy children in a busy place.

What I hold and want to impress on the beginner who reads the American Bee Journal is the advisability, in a state of domestication, to regulate the production of drones by removing the drone-comb and replacing it with worker-comb, just as much as possible, in every hive from which

we do not particularly care to get reproducers. I hold that in a state of absolute freedom, each colony of bees is induced by Nature to rear a large number of drones for the sake of the young queen that must meet one in her wedding-flight. In a state of domestication, when we congregate 50 colonies in one location, it is our place to regulate this overproduction of drones, for it becomes an overproduction when we gather the colonies in one spot, the drones of one or two colonies being amply sufficient to mate with the 50 young queens that may be reared.

In a state of entire freedom a colony of bees will not continue to store honey away till it amounts to tons. It will rear drones enough to eat its surplus, *at some time or other*. This in a general way. A colony that is ill-supplied with honey will kill its drones much sooner than one that is rich in stores, or "fat," as the French call it. The rich colony will also rear drones much earlier in spring, and will thus use up its surplus. But our domestication of the bees will not be thorough if we do not learn to save on the breeding of drones, and cause our bees to produce only enough of them for the absolute needs of the apiary.

If drones had been intended at all for warmth, they would have been kept when the weather is cold in the spring. But the reverse is the case. Let there be a few weeks of warm weather early drones will be reared, then let a cold spell come when the brood needs care and warmth, and at that very time you will see the workers persecuting the drones, driving them out, mercilessly, one by one, to tolerate them again when the heat returns.

Hancock Co., Ill.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### A "Sister" to Help in the Apiary.

I keep a few bees, and would like to build up a fair-sized apiary, but as I am the miller I do not have the time to give them the proper attention. With the opportunity there is for selling the honey here at home, I think this would be a good location.

Do you think it would be advisable to try to secure the help of one of the bee-keeping sisters, or one who wishes to learn? She might help with office-work, and I could help with the bees.

Washington Co., Pa.

M. DUSTY.

ANSWER.—It might be a good plan. You can tell better after giving it a trial. Very much depends upon the person. If you can secure the assistance of some relative who will take a personal interest in the work you may find it very advantageous.

### Bees Working on White Clover and Alfalfa.

I have kept bees for ten years. I do the work myself. I have 14 colonies now. White clover and alfalfa are in bloom, and bees are at work early and late.

Bokhara clover is seeding heavily this year.

Wabaussee Co., Kan.

MINNIE PERT.

### A Pennsylvania Sister's Experience.

I have been connected with bee-keeping for a number of years, and ought to know more about the business, but I have found that even what we "don't know" can be a help to others by starting investigation. To tell of my varied experiences in all these years would fill a volume. Successes and failures have followed all the way along. Losses have been in wintering. I have tried almost all ways. The most successful was under a part of our house not excavated as a cellar, but quite roomy and enclosed all around. It was such backaching work to get them under there, we gave it up for that reason.

My first venture, after having kept a few colonies, was to buy 25 colonies, giving a horse in exchange. I gained considerable experience in working with them. In 1896 my

son and I bought an apiary of 42 colonies, hives and fixtures, all in excellent condition, of a widow whose husband was a bee-keeper. She did not want to have anything to do with the bees, and so we got them at a bargain. We had about three excellent honey-years, and did well. Now, there have been three off years, and natural increase has not equaled winter loss. After selling some this spring, finds me with only 15 colonies and a lot of empty hives.

My son has the farm work to do and can not help much about the bees. My husband has been an invalid for more than two years with a nerve trouble. He never took kindly to the bees. I enjoy them as much as ever, and would like to increase this summer without spoiling my honey crop, which has been a much-needed source of revenue to us.

I have taken the Bee Journal a number of years, and like the new department very much. I am looking for a queen for a new subscriber. I can not always spend as much time, and give close attention to the bees as I would like, owing to other duties.

MRS. D. W. BROWN.  
Erie Co., Pa., May 18.

### Rearing Queens, Swarming, Etc.

MY DEAR MISS WILSON:—

I have 8 colonies of bees and wish to increase to 16, and Italianize. I want to buy a queen and rear young queens from her, but can't decide whether to get a "breeder" or "select tested." I am anxious to have the *very best* queens, and don't mind *any* trouble to produce them, but I am inexperienced, and am afraid I'll make some mistake, therefore I don't feel like paying a high price for a breeder when possibly a select tested would be almost as good, and less experience for one to "tinker" on.

1. Is there much difference between the two?

2. Now, I propose to put two stories of brood over a strong colony, confining the queen to the first floor. In eight or ten days take both upper stories with all the bees of each and place on a new stand, confining them for 24 hours, and give them young brood from my choice queen, and in nine or ten days break this colony up into nuclei. Will this method give me the *best* of queens? or would it be better to put both stories back over the excluder and queen after cells are started? I intend to put entrance-guards on hives containing black drones before my young queens take their flight. I am unable to watch my bees continually, as I have other work to do.

3. Will they store as much surplus if I use entrance-guards and queen and drone traps during the swarming season? My idea is to put an Alley queen and drone trap on the hive on which I find cells most advanced, so as to catch the queen and place among the cluster (also to prevent her getting lost, as she will be clipped). Then give her a plain box and return to the parent colony next day. (The trap will be shifted to other colonies when needed.)

4. Is there much danger of such a colony swarming again? I forced one colony April 14 (finding advanced queen-cells), and it swarmed June 8 just the same.

5. If you had had most of your hives to buy now, and were running for comb honey, which kind would you buy? I have a couple of Danz. hives, but I haven't tested them enough to know whether they are best or not. My other hives are for ten frames.

My bees have always wintered well, never having lost a colony, and they have had no extra attention, such as feeding, packing, etc., and wintered on the summer stands in quite an exposed position, too. I have read much about rearing bees six or eight weeks before the harvest, so I tried this spring by covering each hive with old rags, paper, straw, etc., and turning a large dry goods box, in the bottom of which was straw held in by paper and small sticks, over each colony.

6. Do you suppose it did any good? or would it have been better to have had them so packed all the winter? My bees swarmed earlier this year than ever before. The first swarm issued April 8. I thought perhaps it was because of their being wrapped up, though a few weeks later other swarms in the neighborhood were reported. I am anxious to know what kind of "locality" this is for bees. I have never made it a study, but I am trying to do so now.

Fruit blooms here through March, commencing about the first; white clover from the first of May through June, sourwood the last of June. I don't know what will be next, but I intend to "look out," nor do I know how much pasturage of any kind is accessible. White clover grows quite profusely along the roads and in the yards, but most of the

land is under cultivation. There are acres of strawberries, but they bloom so early. I don't know whether they are of much value or not.

7. What color is strawberry honey?

Locust and holly bloom in May, but my bees did not notice the locust, though bumble-bees were lively around it, but mine were equally as—I was going to say, boisterous, but hardly—around the tiny little holly blossoms.

8. Do you suppose my bees did not notice the locust because of white clover and other preferred blooms?

I have killed numbers of those little pests—the bee-martins. I have an idea they have a special taste for virgin queens, since I've lost several. Spare them for the sake of keeping away hawks? not I. I prefer to use that same shot-gun on the hawks.

I take the Bee Journal and have Dr. Miller's new book, both of which I thoroughly enjoy, and don't feel that I can do without. My! when I get started on bees it's hard to stop. "So it seems," I hear everybody say.

MRS. C. D. MEARS.

Princess Anne Co., Va., May 26.

ANSWERS.—1. Probably there is not much difference.

2. If all the combs are well covered with bees it will be all right, but be sure they have plenty of bees. Remember some of them will go back to the parent colony.

3. It will probably make very little difference.

4. Generally not, unless very early.

5. Most likely the eight or ten frame dovetailed.

6. The packing may have made some difference, but this has been an unusually early season in general.

7. I don't know, and I doubt if any one else knows.

8. Very likely.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Sumac as a Nectar-Yielder—Distance Bees Gather.

1. There is a bush that grows in this county known by the common name of sumac. It grows very abundantly in this section. There are two kinds of it, the red and the white. It is in bloom now, and the bees are working on it. It does not grow in the bottoms, but there is lots of it on the hills. What is the correct name for it?

2. Is there much honey in it? If so, is it of good quality?

3. My apiary is 1½ miles from the Red River bottom—a bottom about 8 miles wide, containing a very dense forest. It is about 5 miles to the river where there is a very extensive agricultural business carried on. I can see my bees going to the bottoms. How far do you think they will go in the bottoms? ARKANSAS.

ANSWERS.—1. Probably the plant is sumac. ☐

2. I don't know anything about sumac honey.

3. Bees have been known to go as much as 7 miles, but probably not with profit more than 2 or 3.

### A Swarm with Queen-Cells—White Clover Disappearing.

1. Five days ago I hived a moderately large swarm in a hive of usual size. The bees went right to work and have seemed perfectly contented from the first. Yesterday, five days after swarming, I opened the hive, found comb-building advancing nicely, some honey, and an abundance of eggs. The surprise that awaited me was the discovery of six queen-cells, all about half completed, and each containing an egg, or a larva with royal jelly. How do you account for queen-cells so soon after hiving?

2. Why does white clover disappear so completely after one year of luxuriant bloom? A vacant lot near my home last summer was a perfect snowbank of clover blossoms. The lot has not been plowed nor disturbed in any way whatever. But this summer it is impossible to discover a solitary clover plant. The entire lot has grown up to plantain. What is the reason for this? PENNSYLVANIA.

ANSWERS.—1. Very likely most bee-keepers would be, like you, surprised to find queen-cells so soon after the hiv-

ing of a swarm. Yet I doubt its being anything so very unusual. Remember that when left to themselves the bees will supersede a queen when she becomes old enough, and that supersedure will generally take place toward the close of the honey harvest. The queen has been doing her heaviest laying up to the time of swarming, and why should supersedure not take place immediately after swarming as well as later?

2. I don't know. Perhaps it winter-killed. Who can give a better answer?

### Two-Pound Sections—Coverless Colony Rained On.

1. A friend gave me some two-pound sections with supers. Are they all right for family use? I never saw any on the market and I can't remember ever seeing a two-pound cake of honey on the table.

2. The colony I started with this spring seemed good and strong, but during a heavy rain-storm the last of May the hive was uncovered. Would you think that the young brood would be chilled and thus destroyed by exposure? I found a few dead bees outside the next day. I put a super on during fruit-bloom, but they did nothing on it but filled it with bees. They are now storing some clover honey.

3. How would you remove a colony of bees from under the siding of a house?

4. I have found a bee-tree, and the owner of the tree objects to my cutting it. How would you get the bees out? SUBSCRIBER.

ANSWERS.—1. Yes, they are just as nice in every way as the smaller sections except as to matter of size. Formerly they were somewhat common on the market, but when the pound sections appeared the larger could only be sold at a lower price.

2. It is not likely that the brood was injured in the least. The bees pack themselves over it so as to make a "shingling" that will shed all rain from the brood. Still, it is not likely that a cold bath does the bees any great good.

3. Cut away the boarding so as to expose the combs, using the necessary smoke; cut out the combs and transfer them as directed in your book for transferring, arrange so as to have the hive close up where the bees were, and allow the bees all to settle on the combs, perhaps keeping the hive uncovered for that purpose. Toward the close of the day see that no bees have gone back to the old place, driving them out with smoke. When all have ceased flying in the evening, take the bees into a dark cellar and keep them there for two or three days, then set them on the stand where they are to remain.

4. Just what the law is with you I don't know, but if you do the work of taking down the tree and getting the honey you ought to be allowed at least half of it. The combs can be fastened in frames as in regular transferring. The work can be done almost any time during warm weather. If only the honey is to be secured, wait till the harvest is over.

### Keeping Swarming Colonies Strong—Using Queen-Excluders.

I am a beginner in bee-keeping and a subscriber to the American Bee Journal. The questions and answers have been a great help to me, but there are one or two that I would like to ask that I don't believe I have ever seen printed.

In the fall of 1901 I bought a colony of black bees in an 8-frame Langstroth hive. They were strong, and wintered nicely, and the 14th of the next May sent out a large swarm. I hived them as soon as clover began to blossom.

1. How can they be kept strong when they are swarming all the time?

2. I am greatly interested in the business, and wish to run for comb honey. Is it well to have them swarm so much? (I want the honey more than the increase!) If it is not well to have them swarm so much, what can I do to prevent it?

3. Is it as well to have queen-excluding zinc over the brood-frames? If so, where can I get it, and what would be the price? MAINE.

ANSWERS.—1. One way that is a good deal of trouble, although perhaps the surest way for one not very experienced, is to return each swarm that comes out. When a swarm issues take the cluster and dump it down in front of the hive from which it issued, letting the bees run back into

their old hive. If you cannot cut off the limb on which they are clustered, hive them in a hive or box, and then empty them in front of the hive. As often as they swarm return the swarm, and about two weeks after the first swarm issues you will be done with all swarming of that colony for the season.

2. No, it's decidedly a bad thing to have much swarming, and if you do not care for increase it would be better not to have any; but it is hard to convince the bees that they ought to respect your wishes. An easier way to manage than the one given in the preceding answer can be followed if you want one swarm from each colony and want no after-swarms. When the prime swarm issues, hive it and place the hive on the old stand, putting the old colony close beside it. A week later take away the old colony and put it on a new stand at some distance, and there will be little danger of any more swarming. You see that removal at about the time the young queens will be hatching out will so deplete the colony by taking away their field-force that they will have little heart for further swarming.

3. If you are working for comb honey and have your sections full of worker foundation, there is no need of a queen-excluder. If working for extracted honey it is better to have the excluder. Queen-excluding honey-boards may be had of any dealer in bee-supplies, and cost from 15 to 22 cents each, according to the kind.

### Getting the Foul Brood Inspector's Help.

How is the foul brood inspector's aid obtained to treat that disease. I think that my neighbor's bees have it, and he is like most farmer bee-keepers, very ignorant of the disease. It may mean much to my apiary if not gotten rid of.

ILLINOIS.

ANSWER.—I do not know of any foul brood law in Illinois that will prevent your neighbor from keeping diseased bees if he wants to; but if you will write to Mr. J. Q. Smith, Lincoln, Ill., the foul brood inspector appointed by the State Association, you can get all the help that is to be had.

### Transferring, Forming Nuclei, Etc.

1. How many pounds of comb honey will it take to make one gallon of extracted?

2. Will the bees store enough honey in the lower story of the hive to last them all the winter?

3. Would the first of June be too late to transfer, or to form nucleus colonies?

4. Which would you think to be the best, to sell honey at home at 10 cents per pound, or ship it North and sell it for 15 cents per pound?

5. Do bees gather much honey from the blossom of the cottonwood tree?

6. Is it the best plan to rear queen-cells in nucleus colonies?

7. I have some brood-frames full of honey. Would it be a good plan to give it to my nucleus colonies?

8. I have some colonies that haven't swarmed this year. Do you think it is cold weather that is preventing them from doing so, or is it something else?

9. If you would make nucleus colonies now, do you think it would be a good plan to commence feeding them now, so they would have plenty of stores for winter?

10. How soon after a virgin queen is introduced into a colony will she begin laying?

11. How many nuclei can I form from a 10-frame colony having plenty of brood?

12. Is it necessary to have a queen or a ripe queen-cell to introduce into a nucleus as soon as you form them, or can one wait a while?

MISSISSIPPI.

ANSWERS.—1. A good quality of extracted honey weighs something like 12 pounds to the gallon, and the difference in the weight of the wax is very little.

2. Yes, and no. If the hive is large enough, yes. If small enough, no. That's on general principles, but colonies differ, and some colonies in a very small hive will make sure of their winter's supply, while others will have the brood-chamber so fully occupied with brood till late in the season that there will be no room for stores.

3. Not at all.

4. I don't know. If it is comb honey, taking into account the chance of loss from breakage, besides freight and commission, perhaps the 10 cents in hand would be better.

5. I think not, if the cottonwood of Mississippi is like the cottonwood of Illinois.

6. I prefer to have them in strong colonies, at least until sealed.

7. Yes.

8. Not necessarily cold weather. I have colonies every year that make no attempt to swarm, and they are the very ones that give the largest crops.

9. It ought hardly to be necessary to feed unless there is a dearth.

10. That depends upon her age when introduced. She will generally begin laying when from 8 to 12 days old.

11. Probably about 4, for there will likely be about 8 frames of brood, and you will need 2 frames for each nucleus. If, however, you have two or more nuclei in one hive, so that they can have the advantage of mutual heat, and if your colony is very strong in bees, you may be able to make a nucleus for each frame of brood.

13. No, you can't suit your convenience in the matter, only it is a waste of time to have a nucleus long without a queen or cell.

## Prize = Winning Stock

Daughters of Moore's famous long-tongued red clover Italian Queen, which won the \$25.00 prize offered by The A. I. Root Co. for the longest-tongued bees; and also daughters of other famous long-tongued red-clover breeders whose bees "just roll in the honey," as Mr. Henry Schmidt, of Hutto, Tex., puts it, now ready to go by return mail. Untested Queens, 75c each; six, \$4.00; dozen, \$7.50. Selected Untested, 1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free.

## FROM MANY FIELDS

### Honey Crop All Right.

The honey crop in southern Wisconsin is immense—white and sweet clover and basswood now all ripening.

Green Co., Wis., July 6.

H. LATHROP.

### "Cheeky" People—Queenless Colony.

Everybody seems to think they can get along with the information they can pump out of another bee-keeper that is posted. So I have come to the conclusion that the best way to get rid of such parties is to charge for the information and see if it would have any effect. So the other day there was one came along. He had a swarm and no hive for it, and wanted me to show him how my hives were constructed, which I did. Well, he said there would be no use for him to undertake to make one, for he would make a complete failure of it, and he asked if I would make one for him. I said I would. So I put the swarm in a cracker-box and went to work on his hive and constructed an 8-frame body, frames with starters, one super complete with sections and starters; put the bees in, and

\* This is a good time to send in your Beeswax. We are paying 28 cents a pound—CASH—for best yellow.

low, upon its receipt, or 30 cents in trade. Impure wax not taken at any price. Address as follows, very plainly, **GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.**

charged him \$2.50, and he thought it was outrageous and said he would not pay it. Well, if he doesn't I shall levy on the bees this fall. That is a specimen of some of the people I have to contend with, and there are lots of them around here.

A sure cure for a queenless colony: Shake all the bees off in front of the hive and run a swarm in with them. At the same time give them a frame of brood in all stages, and the work is done. In eight days take out all queen-cells but one, and you have as good a colony as you have in the yard.

My bees are doing well this year. I started with 24 colonies, spring count, and swarming is over now and I have 36, and all good and strong except one, which has a poor queen, and I shall introduce a queen.

I am working hard to keep up with the bees, but as this is the first rush I have ever had it keeps me guessing, as I have to do all the work and can't get sections at any price half the time.

I wonder what Yon Yonson is doing. I have not heard from him for some time. I was amused at the way he did with his hidden Italians that would not work upstairs, as I had some that were that way. So I did the same as he did, divided them, and they are all right. I suppose that man that crossed his strawberries with milkwoods is having a fine time eating strawberries and cream.

By the way, I think that the best cross some of those big bee-men could make would be a cross with the golden Italian and the lightning-bug, so as to have a night force on in the busy season. Well, Yon Yonson, study over this and see what you think of it, and let us know. I am inclined to think that those big queen-breeders could do a big business if they could make a success at the cross.

J. M. BUTLER.

Mercer Co., Ill., July 10.

#### Big Swarming—Time to Read.

Prospects are good for a big honey crop here. I have had 100 percent swarming from 300 colonies. I have "shook" about 75, and an cutting cells out of the rest, as it is getting too late for shaking. Do you think I have been busy? I weigh only 120 pounds, and do nearly all my own work. I am not like the fellow that stopped taking the American Bee Journal because he didn't have time to read it. I read it and four more.

M. W. HARVEY.

Montrose Co., Colo., July 3.

#### Rearing Queens.

Now, I am going to use a little of that high pressure, smokeless powder (that we of the Pacific States believe in) at a few of those queen-breeders, while you have the pleasure of listening to those old-black-powder out-of-date things roar back at me. But that is all right. Let them roar. They will only get mixed up in their own smoke.

In the first place, please read over J. A. Green's article on page 197. Then read Mr. Alley's article, page 198, both in the issue of March 26. After reading those articles please bear in mind that Mr. Green's queenless colony became queenless at a time of year (according to my theory) when there would in no probability be a live bee in the colony reared from a fully-developed egg.

Now, then, before we go any further, it is just as well that I state my theory:

1st. A laying worker is a worker-bee that was fed and reared as a worker from a fully-developed egg, that on account of the queenless state of the colony is trying to set herself up for a queen, and at any time during the life of those bees after swarming-time a colony may possess them.

2nd. A worker-queen is a queen reared out of season at any time of year from an undeveloped egg, or the egg from any queen having plenty of empty combs in which to lay, and is not retarded in egg-laying. Such an egg will produce but two things. If fed as a worker it will produce a common worker, never a laying worker. Second, it will produce a worker-queen if all conditions are right for its development, but it will never produce a long-lived prolific queen proper.

3d. A queen proper is a queen reared from

an egg that has been fully developed by the mother queen being crowded for room, and egg-laying retarded until the eggs are developed more than normal; or from an old queen in which the formation of eggs is ceasing, and, in consequence, they being fewer in number, are better developed, as in supersession.

Now, I have been reading between the lines for some time, and the only queen-breeder that seems to be conforming to Nature, or nearly so, is G. M. Doolittle, hence his oft-repeated advice to the beginner to rear a few queens about swarming-time. But, on the other hand, while trying to conform with Nature he doesn't admit of a difference in worker-eggs. Now, right here I want to ask Mr. Doolittle how he can account for *laying workers* at one time of year and not at other times. I have noticed that worker-bees produced during the swarming period are always better developed in every respect, and partake more of the form of the queen, than during the roopty period in a hive.

Now, don't think that I argue against all the other good conditions necessary to produce a good queen, but I want one thing more, a fully-developed egg.

Let us take a peep into a hive of bees for the season and see what takes place, and we will see that Nature makes no mistakes. 1st Nature begins by giving the bees pollen along with a little honey, and there being plenty of empty cells early in the spring, it is the desire of both queen and bees to fill them as soon as possible, consequently eggs are laid as fast as produced and are developed into worker-bees; now, dear reader, just make one of these colonies hopelessly queenless after all the bees from the full-house time of last year are dead, and see if you don't have the same experience as J. A. Green reported.

We will go a little further, and we find a hive full of bees, drones, honey and pollen, to such an extent that the queen can not lay one-half the eggs she desires, consequently the eggs are better developed, and Nature steps in and creates a desire of reproducing herself. Now, with such a desire, and under such circumstances, would it be anything out of the ordinary run of things if the queen, by some means or other, was to do something in depositing the egg in a cell-cup that would

# REMARKABLE QUEENS do give...

I was showing my father yesterday how my bees, which I bought from you, were out working everything in my apiary. Send me 4 Buckeye Red Clover and 2 Muth Strain Golden Italians. I will order more after next extracting.

make a superior queen, and cell-cups started and eggs deposited therein;

Try the experiment again and make this colony hopelessly queenless in about three or four weeks after this period commences, and you will soon have all the laying workers you want, and as long as they live in that colony you can get a laying worker.

Now, then, the point I want to make is, if a worker-egg out of the swarming season will not produce a laying worker, and one during the swarming will produce a laying worker, why will there not be relatively the same difference in queens? I claim there will be, against all the evidence of text-books, professors and scientists, according to my practical experience.

One word more: The importance of having a large force of nurse-bees of the right age is all right and necessary, and plenty of field-bees to develop extra heat at night and bring in honey and pollen by day; and, above all, good stock to breed from. But don't think for one moment you can go on from one generation to another, taking eggs from your breeder during the time she has plenty of room, without at each consecutive generation getting a more tender, short-lived generation of bees, until you have a race of bees like Mr. Alley would have us to understand pure-bred Italians had become.

Linn Co., Oreg. Geo. B. WHITCOMB.

**Much Swarming.**

My bees swarmed some the latter part of April and the first of May. Honey was then coming in freely to the middle of May, and from then on to the last week in June bees would attempt to rob and sting anything they could catch hold of. At this date the bees are having a feast even late in the evenings. It is quite a thing to see them come in missing the hives. Those that swarmed in April swarmed again last week. In all my 18 years of keeping bees I never had a colony to swarm so early in the season, then later on to swarm again. I am now beginning to store honey in the attic of my dwelling-house.

E. B. KAUFFMAN.

Lebanon Co., Pa., July 13.

**Many Years a Bee-Keeper.**

I think the American Bee Journal worth its weight in gold to any bee-keeper, and I now would not be without it if it cost \$5 per year. I have 48 colonies in my apiary, and they are all doing fine work. I run an apiary in Wisconsin of 100 colonies, but I think my 48 colonies here are going to beat the 100 there.

I am now 35 years old, and I might say I have been practically brought up with the honey-bee, as my father kept bees every since I can remember. So you see they are as much pets to me as my wife's canary is to her, and I can truly say (if the bees) are her pets, too, for she thinks as much of them as I do.

WARREN GOTCHER.

Hubbard Co., Minn., July 11.

GEORGE W. YORK & CO., 144 & 146 Erie Street, CHICAGO, ILL.

**What Yon Yonson Thinks**

Vel, my ying, it is plenty bad for da N. B. K. A. to hole deris big convenshal vaf off in Cally forny. Ay don't see yv for dom haf to tag da G. A. R. fellera around. Ay don't lak Cally forny a toll, cause it is too far off. Ay never can go home on a ride ole Yim clear a Cally forny. Mebby da Ingins git ole Yim's call to hang in deirs belt, an den ay would be lak da feller vat vent up in a baloon, an ven dom git about 2 miles high somting broke an dom hav to talk back.

But, my goodness, ay seen feller vat sed dat Cally forny she is awful fine country, an he say dom rais awful fine fruit an punkins, an ery ting vat is nice; but he say, Yon Yonson, it's better you not vent to Cally forny, cause ven you see vat fine fruit dom rais, an get taste of das fine climate, den you vil be spoiled for das country, an yust hanker for das nice country and climate. An mebbly it don't was any som Swede mans in Cally forny. Vel, mebbly so, but ery body vat can, better go, cause dom get cheap tickert, and dom git to see plenty much fine country, an dom sure lurn a hole lot at da convenshal. Ay don't know yv for dom call da town Lost Angeles. Ay never hurd of any vat got lost in Cally forny. Course it was fellers dere vat got plenty much bees, but dom don't vas da whole sidevalk, caus Illenois got mor bee-keepers as Cally forny, but dom don't get quite so big patch of bee-hives. An Illenois got plenty good legislature, vat give us foul brood lak a money to back it. Ay rote to lots of dom law mane, an ask dom vil dom pleas be so good an vote for da bell, cause foul brood is vorser for bees dan hog colery is for dogs, an if da bees don't dan ven don't git any more hunny, an dat vil put an end to da hunny moon. Some of dom mak answar an say dom vote for it all rite ven dom git chance. An you bet dom did, too.

Vel, ay see it was som fellers vat give Mr. New York fits cause he by hunny and ven he sell it he put his name on it an call it "York's hunny." Vel, if he pay for it ours it is York's hunny.

Now, ay bean rais plenty strawberries, an ay bean selling strawberries for purdner four weeks, an ay sell more as 100 quarts a day, some days, an ay put Yon Yonson's name on every box, an dom go lak hot panikakes, cause it is youst som nice berries in da bottom of da boxes same as on da top. An ven dom peoples see Yon Yonson's name on da box dom know it was good fruit, cause Yon Yonson iss honest. You know ven he put his name on da boxes he haf to be, or you bet he ketch it on da phone in grate shape.

An ay tank Yon Yonson's name on fruit in das country means more as if York's name vas on dom. But in Chicago Yon Yonson's name on hunny is youst about so good som nutting, cause dom peoples in Chicago don't vas as cultivate Yon Yonson's acquaintance lak dom do York's. An if ay sen my hunny to Mr. New York, an he put his name on it, an den if it don't give good satisfaction den dom peoples vil com aroun an do York's trashing for nutting. An Yon Yonson he plenty lucky dat he don't vas York.

Now, if you want to sell hunny to York, den it is my busses to send him nise hunny, in nise shape, and packed honest; an den if it bring more mony ma York's name den mine, den he can give me more for da hunny. An he mak more, too. An ay tank ve bote be plenty big foolish if ve don't git so much ve can. An if Mr. New York ay pay me more for my hunny po das vas, den he iss welcome to put his fotograf on every box he is vant to. An yust so long he can take der hunny an pay vel for it, and sell it for good price, he help keep der price up.

YON YONSON.

**SHEEP MONEY IS GOOD MONEY** and good money if you work for us. We will start you in business and furnish the capital. Work light and easy. Send 10 cents for full time of samples and particulars. DRAPER PUBLISHING CO., Chicago, Ill.

## Beedom Boiled Down

### Treatment of Bee-Stings.

Do not rub the place when a sting is received; do not resort to medicines applied over the spot, as they can do little or no good; do not lose your temper. Do at once, if the sting appears to be a severe one, and you have time, scrape out the sting with the finger-nail; grasp, with the thumb and finger, the skin where the puncture is located, and raise from the flesh underneath, and pluck it hard, holding it firmly until, on letting loose, the pain no longer returns. Resume your work with the charitable thought toward the bees that they do not sting you in a spirit of malice, but in the legitimate defense of their home and property.—D. A. McLEANE, in *Gleanings in Bee-Culture*.

### Summer Dress for Bee-Keepers.

During the principal part of the honey-flow, a prominent element of bardship is the endurance of the heat. Sometimes the heat has really made me sick, so that in spite of a press of work, I have been obliged to give up work, and lie down for an hour or two. At such times you may be sure that I am not very warmly clad. One straw hat and veil, one cotton shirt, one pair of cotton overalls, one pair of cotton socks and one pair of shoes, comprise my entire wearing apparel. Before noon shirt and pants are both thoroughly wet with perspiration.

In this heated condition, I sponge myself

## Italian Queens, by Mail. Golden and Honey Queens.

	July and August.	6	12
Honey Queens (Untested)...	\$.75	\$4.00	\$7.00
" (Tested)....	1.25	7.00	13.00
Golden " (Untested)...	.75	4.00	7.00
" (Tested)....	1.25	7.00	13.00
2-frame Nucleus (no queen) 2.00		11.00	21.00

Breeders, \$3.00 each, after June 1.

Add price of any Queen wanted with Nucleus. Our bees are shipped in light shipping-cases. Purchaser pays express on Nucleus. Safe arrival guaranteed of all stock sent out.

BATAVIA, ILL., Aug. 21, 1901.

Dear Sir:—I thought I would let you know as to results of the nucleus sent me. They were placed in 10-frame hives and now they are in fine condition. From one I removed 25 pounds of honey and had to give 6 of them more room, as they were hanging out. They have more than reached my expectations.

Yours respectfully, E. K. MEREDITH.

DAVENPORT, IOWA, Dec. 31, 1901.

Your queens are fully up to standard. The honey queen that you sent my brother takes the lead. She had a rousing colony when put up for winter. The goldens can be handled without smoke or veil. Very truly yours,

JOHN THROEMING.

Notice.—No tested stock sent out before May 15. Send money by P. O. Money Order or Express Order. D. J. BLOCHER, PEARL CITY, ILL.

### If you want the Bee-Book

off with cold water before dinner, put on dry shirt and pants, and hang up the wet ones in the sun to be put on the next day. I am sure that by this refreshing change I am able to do more work.

It might be thought that applying cold water all over the body when every part is dripping with perspiration, might make me take cold. I have never found it so, even if followed up every day. The body is so thoroughly heated that it easily resists the shock, and a brisk rubbing leaves one in a fine glow.—Dr. MILLER, in "Forty Years Among the Bees."

### Changing or Replacing Queens.

I do not think that the question of age should be considered in the matter of changing queens, except so far as it may be taken as a sort of a rule to judge of when they will be apt to fail. I would not replace a queen so long as she lays up to her full average, especially at this time of the year, for during the month of June any queen that has even less than the average value can supply eggs which will turn out into bees at the right time for the honey harvest; while if a general change is made, many colonies are likely to lose thousands of eggs at best, and not only this, the young queen is often very liable to bring a lot of workers on the stage of action in time to become consumers rather than producers.

A change in early spring would have been worse yet, as it would have resulted in a loss of bees at just the time when each bee is of the greatest value to push forward the rearing of others for the honey harvest.

If queens must be changed I would advise waiting till the harvest of white honey is over, for the loss of eggs usually sustained through a change of queens will then be little

## A STANDARD-BRED

# QUEEN-FREE

To Our Regular Paid-in-Advance-Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with **The Very Best Untested Italian Queens** that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription **must be paid in advance**. If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

## A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.

Send us \$1.00 and the name (not your own) and address of **One NEW** subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows:

One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We expect to fill the orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

GEORGE W. YORK & CO., 144-146 E. ERIE ST., CHICAGO, ILL.

Please Mention the Bee Journal when writing Advertisers.

or no loss, as they generally hatch into larvae at a time when said larvae have to be fed out of the honey stored in the hive, while the natural bees generally consume more of the stores already laid aside than they add to them.—G. M. DOOLITTLE, in Gleanings in Bee-Culture.

**Umbilical-Cordless.**

"Two and a half summers have passed o'er my head,  
And I know I am failing fast,"  
A bright yellow queen quite mournfully said;  
"My usefulness soon will be past."  
"Just a few more eggs and my task will be done."  
And I shall call on the name of the Lord  
For a gift to my royal descendants each one,  
That new-fangled umbilical cord.

"Eggs in profusion I have laid in this comb,  
And a powerful colony results;  
Now I bid thee, my child, consume me out of home,  
I consider the chief of insults!"  
Then came a man with smoker in hand,  
Without any other excuse,  
Pinched off the head of that old Holy Land  
As he said, "You are now of no use."

Death like a dash took her from dependence,  
And without a whiff of reward  
Left each and all of her royal descendants  
No hope of an umbilical cord.

A. G. ANDERSON.

Kendall Co., Tex., July 6.

**National Convention Notice.**

The 34th Annual Convention of the National Bee-Keepers' Association will be held in Los Angeles, Calif., on August 18, 19, and 20, 1903, in Blanchard's Hall, at 235 S. Broadway. The headquarters of the Association during the convention will be at the Natick House, corner of First and Main Streets.

It is expected that this will be the largest and best convention ever held by the bee-keepers of America. Every one interested in the production of honey should be present, if at all possible. Besides the question-box, which will be one of the special features of the program, the following subjects will be discussed in papers by the prominent bee-keepers mentioned. Afterward a free and full discussion will be had by all in attendance who wish to participate. The subjects and men to introduce them are as follows:  
"Honey Exchanges and Co-operation Among Bee-Keepers" by Prof. A. J. Cook, Claremont, Calif.  
"How to Make Honey Producing Extracted Honey," by J. F. McIntyre, Sespe, Calif.  
Response by E. S. Lovey, Salt Lake City, Utah.  
"The Production and Sale of Church Honey," by Homer H. Hyde, Floresville, Texas.  
Response by C. P. Dadant, Hamilton, Ill.  
"The Eradication of Foul Brood," by N. E. France, Platteville, Wis.  
"Reminiscences of Bee-Keeping and Bee-keepers in the Early Days," by A. L. Root.  
There will be reports by the officers, which include Pres. Hutchinson, General Manager France, and Secretary York.

The California bee-keepers are planning to give all in attendance one of the grandest receptions imaginable on the first evening, Tuesday, Aug. 18. No one will want to miss this feature of the convention.  
It is an opportunity of a lifetime to take

the trip to California, as all convention members can avail themselves of the low railroad rates, as it comes at the time of the Grand Army meeting in San Francisco, and the same rates apply to Los Angeles.  
For further information or particulars that may be desired, address the Secretary, 144 E. Erie St., Chicago, Ill.

GEORGE W. YORK, Sec.  
W. Z. HUTCHINSON, Pres.

**Close Saturdays at 1 p.m.**—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

**CARTONS FOR HONEY** Wanted, to introduce the best, most practical, lowest-price Carton for honey, all things considered, costs nothing. We have wholesaled here in this city for 30 years. We have seen no honey-carton equal to this. Send us five two-cent stamps, and we will send you sample, together with explanation, and some practical suggestions regarding marketing honey to best advantage, also live poultry. We originated and introduced the now popular one-pound section. Established in 1870.

H. R. WRIGHT, Wholesale Commission,  
PROMPTNESS A SPECIALTY. ALBANY, N. Y.  
Please mention Bee Journal when writing.

**Catnip Seed Free!**

We have some of the seed of that famous honey-producing plant—Catnip. It should be scattered in all waste-places for the bees. Price, postpaid, 15 cents per ounce; or 2 ounces mailed FREE to a regular subscriber for sending us one NEW subscriber to the Bee Journal for one year, with \$1.00; or for \$1.20 we will send the Bee Journal one year and 2 ounces of Catnip seed to any one.

GEORGE W. YORK & CO.  
144 & 146 E. Erie St., CHICAGO, ILL.

**HONEY AND BEESWAX**  
MARKET QUOTATIONS

CHICAGO, July 7.—At present there is little call for comb honey, some new is offered, and for fancy 14@15c per pound is asked. Extracted sells at 6@6c for best white, amber grades, 5@6c, depending upon flavor, body and package. Beeswax, 30c. R. A. BURNETT & CO.

KANSAS CITY, June 30.—No comb honey in this market. New white comb would sell for \$3.50 to \$3.75 for 24-section cases; amber, \$3.25 to \$3.50. There is considerable extracted honey on the market with scarcely any demand. Price nominal at 5 1/2 @ 6 1/2 c per pound. Beeswax in demand at 25@30c. C. C. CLERMONS & CO.

ALBANY, N. Y., July 18.—We are receiving some shipments of new comb honey, mostly from the South; the demand light as yet; we are holding at 15@16c. Extracted slow at 6@7c. The crop of honey in this country very light, and we shall have to depend upon other sections more than ever for our supply of honey. Beeswax, 30@32c. H. R. WRIGHT.

CINCINNATI, June 1.—Very little change in market from last report. We quote amber extracted grades at 5@6@6c in barrels; white clover, 8@9c; supply equal to demand. Comb honey, 15@16c for fancy. Beeswax, 30c.  
THE FRED W. MUTH CO.

NEW YORK, July 8.—Some new crop comb honey now arriving from Florida and the South, and fancy stock is in fair demand at 14c per pound, and 12@13c for No. 1, with no demand whatever for dark grades.

The market on extracted honey is in a very unsettled condition, with prices ranging from 5@5 1/2 c for light amber, 5 1/2 @ 6 1/2 c for white, and the common Southern at from 5@5 1/2 c per gallon. Beeswax steady at from 30@31c.  
H. L. BERT & SIEGELKEN.

CINCINNATI, July 7.—We have reached the time when there are no settled prices in the honey market. Everybody is waiting to learn how the new crop will turn out, therefore we will sell or ask the old price. Fancy water-white brings 15@16c. Extracted, amber, in barrels, 5 1/2 @ 5 1/2 c; in cans, 6@6 1/2 c; white clover, 8@8 1/2 c. Beeswax, 30c. C. H. W. WEBER.

**WANTED! Extracted Honey.**

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a honey-queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 12c or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# A Tested Breeding-Queen worth \$2 will be GIVEN FREE

## Stanley Queen Incubator and Brooder

Until Sept. 1, 1903, with each

An Arrangement that Allows the Bees Access to the Cells and Queens at All Times.

(Patent Applied for.)

One of the greatest objections urged against a lanp-nursery, or any kind of a nursery where queens are hatched away from the bees, is that the cells and their inmates are robbed of the actual care of the bees. When the bees have access to a cell, and the time approaches for the queen to emerge, the wax over the point is pared, and, as the queen cuts an opening through the cell, and thrusts out her tongue, she is fed and cheered in her efforts to leave the cell. A queen hatched away from the bees loses all of this food, cheer, and comradeship; and, until introduced to a nucleus, or full colony, has not the natural food that she would secure were she among the bees.

All of these objections are overcome by an invention of Mr. Arthur Stanley, of Lee Co., Ill. Mr. Stanley makes the cell-cups according to the directions given in Mr. Doolittle's "Scientific Queen-Rearing," sticking the base of each cell to a No. 12 gun-wad. By the use of melted wax these wads, with the cell attached, are stuck, at proper intervals, to a strip of wood exactly the length of the inside width of a Langstroth brood-frame. Two wire staples driven into the inside of each end-bar, slide into slots cut in the ends of the cell-bars, and hold them in position.

The process of transferring larvae to the cells, getting the cells built, etc., have all been described in the books and journals, and need not be repeated here. When the cells are sealed they may be picked off the bar (still attached to the gun-wads); and right here is where the special features of the Stanley process steps in. Each cell, as it is removed, is slipped into a little cylindrical cage, made of

queen-excluding zinc, the cage being about two inches long, and of such a diameter that the gun-wad fits snugly, thus holding the cell in place and stopping up the end of the cage. The other end of the cage is plugged up with a gun-wad. Long rows of these cages, filled with sealed cells, are placed between two wooden strips that fit in between the end-bars of a Langstroth frame are held in position by wire staples that fit into slots cut in the ends of the strips. To hold the cages in their places, holes, a trifle larger than the diameter of the cage, are bored, at proper intervals, through the upper strip, thus allowing the cages to be slipped down through the upper bar, until their lower ends rest in corresponding holes bored part way through the lower bar.

A frame full of these cages, stocked with cells, may be hung in a queenless colony, and will require no attention whatever except to remove the queens as they are needed. The workers can freely pass into and through the cages, cluster upon the cells, care for them, and feed the queens after they hatch, exactly as well as though the queens were uncaged.

These cages are unsurpassed as introducing cages, either for fertile or for virgin queens. The bees are not inclined to attack a queen in a cage to which they can enter, yet they can surround, caress, and feed her. They can become acquainted with her, and give her the same scent as themselves. When desirable to release her, one end of the cage can be stopped with candy, and the bees allowed to liberate her by eating it out.

By putting food in one end of the cage a queen may be kept caged, away from the bees, the same as any other cage.

Price, \$5.00 by Express,

Or with the American Bee Journal one year—both for \$5.50.

Send all orders to **GEORGE W. YORK & CO.,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

## SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

Sweet Clover (white).....	5lb	10lb	25lb	50lb
.....	\$ 75	\$1.40	\$3.25	\$6.00
Sweet Clover (yellow)....	.90	1.70	4.00	7.50
Alsike Clover.....	1.00	1.80	4.25	8.00
White Clover.....	1.50	2.80	6.50	12.50
Alfalfa Clover.....	1.00	1.80	4.25	8.00

Prices subject to market changes.

Single pound 5 cents more than the 5-pound rate, and 10 cents extra for postage and sack.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

**GEORGE W. YORK & CO.**  
144 & 146 Erie Street, CHICAGO, ILL.

## The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; and we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

**GEORGE W. YORK & CO.,**  
144 & 146 Erie Street, CHICAGO, ILL.

Please mention Bee Journal when writing Advertisers.

# 28 cents Cash paid for Beeswax.

Address as follows, very plainly,  
**GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.**

This is a good time to send in your Beeswax. We are paying 28 cents a pound—CASH—for best yellow, upon its receipt, or 30 cents in trade. Impure wax not taken at any price.

BEE JOURNAL

43d YEAR.

CHICAGO, ILL., JULY 30, 1903.

No. 31.

Editorial Comments

**The Honey Crop of 1903. Prices, Etc.**—Editor Root, of Gleanings in Bee-Culture, sums up the honey prospects and prices, in the United States, as follows:

This has been a peculiar season; but taking all things into consideration, there will be more white-clover honey this year than last. The season has been exceptionally good in a great part of the white-clover region, particularly in Wisconsin, Minnesota, Illinois, Iowa, Indiana, and Ohio. In some of the Southern States the season has been poor. In the New England States there has been an almost complete failure; but recent rains have toned up the situation so that some honey will be secured. The yield of white honey has been light in many parts of New York; but as in the New England States, the recent rains have improved the conditions, but not quite enough to affect materially the crop of white honey, but sufficient to make, probably, a fair flow from buckwheat.

In Pennsylvania the season has been poor to fair. In Nevada and Utah the season has been good, and the honey is of first quality. In Arizona the flow has been less than the average. In Kansas and Nebraska the crops have been light in most sections. In Washington the season has been poor. Texas will not come up to the average. Idaho has had a severe loss of bees. In Colorado there may possibly be the usual crop, but the season was unfavorable in the early part of it. In Southern California, notwithstanding the early prospects were so flattering, there will be only about a third of a crop. In the central part of the State the season is little if any better.

As to the quality, the honey will be extra-fine this year; and even if there should be more of it this year than last, it will be so much better that the prices ought to hold the level of last year, especially if we take into consideration the general advance in other things during the past year. In the Eastern markets, where production has been light, there ought to be a general toning-up of prices. There will not be a large amount of California honey shipped east this year, probably; so what little honey is produced ought to bring good prices.

After writing the foregoing the weather turned cold, and this seems to be general over a great portion of the United States. If this cool weather continues it will chop the flow from white clover almost square off. That being the case, the expected crop will not be as large by considerable as seemed likely on the surface of things three days ago.

Our own contribution to the reports as published in the July 15th issue of that paper is this, dated July 1:

Our reports show that the far East has practically no honey, and the far West perhaps not more than half a crop. The central portions of the country seem to be having an enormous flow; especially is this true of the locality within, say, 500 miles of Chicago. The demand for bee-keepers' supplies has not been so great in ten years. It seems that everybody wants a lot of supplies, and wants them right away. There seems to have been a great deal of swarming, and a good yield of white clover. Personally, we have never seen such a perfect mat of white clover bloom as there is in this locality this season.

We doubt if it is necessary for the price of honey to be lowered very much, if any, from the price of last season. We think the people are ready to buy honey more freely than ever before. This, we think will be especially true as the bulk of the honey produced is of white clover, and that seems to be the kind preferred by the majority of the people; at least they think that is the kind they ought to have. The joke is usually on them, as they are apt to call nearly all kinds of honey clover honey. There is practically no new honey on this market as yet, but we suppose it will begin to come in very soon.

**A Robber-Cloth** is one of the things that costs so little and is so useful that no beginner should be without one or two. It is very

easily made. Here is what Dr. Miller, the inventor, says about it in his book, "Forty Years Among the Bees:"

I take a piece of stout cotton cloth (sheeting) large enough to cover a hive and hang down four inches or more at both sides and at each end. This must be weighted down at the side with lath, and for this purpose I take four pieces of lath about as long as the hive. I lay down one piece of lath with another piece on it, and one edge of the cloth between the two pieces of lath. I then nail the two together and clinch the nails. I use the other two pieces of lath for the opposite edge of the cloth. This makes a good robber-cloth just as it is, but it is better to have the ends also weighted down, especially on a windy day. For this purpose I made a hem in each end, and put in it shot, nails, pebbles, or something of the kind, stitching across the hem here and there so the weighting material will not all run together at one side or other.

In any case where one wants to cover up a hive quickly against robbers, as when opening and closing the same hive frequently for the sake of putting in or taking out combs, this robber-cloth will be found a great convenience. No careful adjustment is needed, as in putting on a regular hive-cover, but one can take hold of the lath with one hand, and with a single throw the hive is covered securely, with no killing of bees if any should happen to be in the way.

**Working for Beeswax as the Chief Crop**, with honey as a secondary product, is a matter often discussed, but seldom tried in real practice. It is not impossible, however, that in some localities it may yet prove practicable. The following upon the subject appears in the Australasian Bee-Keeper:

In connection with the production of beeswax in the West Indies, a suggestion has recently been made that—inasmuch as Muscovado sugar can now be purchased throughout the West Indies in wholesale quantities at from 3s. to 4s. per cwt., while beeswax is worth about 28 cwt., and taking into consideration the fact that the honey-flow does not exceed four months of the year in the most favorable localities—it would pay well to feed the bees nearly all the year round either with dry sugar, syrup or molasses, making the honey produced a by-product and the wax the main product. It is said that it takes about 10 pounds of sugar to make 1 pound of beeswax, therefore should the suggestion prove a practical one, it would be a great boon to West Indian bee-keepers, who would no doubt then import a species of bee from India which is especially suitable for wax-production.

**A Cure for Moths in Hives** is often asked for, and the usual answer is strong colonies and Italian bees. But such a cure cannot be applied in a minute, and in the meantime some help may be obtained with trifling cost and trouble by rolling into the entrance of the hive a mothball. This is recommended in the Australasian Bee-Keeper.

**Direct Introduction of Queens** is a desideratum worth working for, and the following letter from Dr. Miller seems to give promise that it may yet be reached:

MR. EDITOR:—I am sorry I cannot remember who it was that gave us the hint that introduction of queens was made more sure by wetting the queens. He certainly deserves thanks. I tried it in a considerable number of cases, and was successful in every case. But in each case the bees to which the queen was introduced has been queenless a longer or shorter time, and a flood of honey was on, so that I could not be certain there would have been a failure if the queens had not been wet.

I then determined to go a little farther, and drown the queen till apparently dead, and to put it to the severest test by giving a queen to a colony immediately upon the removal of its own queen. I took from a strong colony a queen that was in full laying, and gave it a laying queen from a nucleus, with no delay except the time spent in drowning the queen introduced—possibly three or four minutes. The queen was kept in water till she curled up as if dead. Then I laid her on the top-bar of the colony from which I had just removed the queen. The bees went to licking her just as they would their own queen, and

in a minute or two she revived, and the next time I looked in the hive she was laying all right. At the same time I thus introduced her, I also introduced in the same way into the nucleus the queen taken from the full colony, and with equal success.

I tried the same thing in two other cases. In one of them I used cold water right from the well, and the queen was so long in giving up that I put her in while still able to crawl. Success followed all the same. But I was not so successful with the queens taken from the full colonies and introduced into the nuclei—at least as to one of them, for unfortunately I lost track of the other. Whatever may have been the reason, the one queen was missing from the nucleus when next I looked for it.

It is possible that my success was exceptional in these cases, and that failures instead of successes would be the general rule. It is also just possible that if all the kinks were thoroughly understood there might be success in every case. I should prefer to say nothing about the matter till after time to give it a more thorough trial, but if there is any reliability in the plan it is better to know it as soon as possible, and I hope others may aid in testing it. C. C. MILLER.

**Some Useful Hints About Using the Smoker** are thus given by Arthur C. Miller in the *American Bee-Keeper*:

But there are a number of little kinks which go to make the use of any smoker more satisfactory, and the handling of bees more pleasant. The first of these is starting the fire. Salted paper rags will do it; kerosene will do it; pine shavings will do it, but a handful of charcoal (half-burnt twigs and chips from a bonfire) is by all odds the best thing to put in on top of the rags or shavings. A few puffs will kindle the coal, and then punk, chips, hard wood or almost anything that can burn will ignite and stay burning.

A maxim which every bee-keeper should paste in front of his beehive is: Never open a hive without a well-fired smoker right at hand. You may never need it, or life may depend on it. A really good, ever-ready smoker is cheap at several times present prices. Never take the lit smoker indoors unless you stay there with it. When throwing using it dump the fire and put it out, and if the smoker is hot, set it on something which cannot burn. Leave the top off and then you won't have to bang it to pieces to open it when you want to fire up again.

**Phacelia Tanacetifolia.**—The following has been received from Dr. Miller:

"I notice that the seed of phacelia is advertised in the *Bee Journal*. I heartily commend a trial, if it be only to cultivate phacelia as a flowering plant. Years ago, as well as the past winter, I cultivated it as a window-plant in winter with satisfaction. It has a beautiful blue flower, in appearance much like a heliotrope, and somewhat approaching heliotrope in fragrance, although I am not sure that it has any fragrance when grown in the open ground. A few plants that I had outdoors were busily visited by the bees."

The foregoing, while interesting to flower-lovers, throws no light whatever upon the important question as to the value of phacelia as a forage-plant. In Europe it is highly extolled as such, although the testimony is not all to the same effect. There is probably little question that it is one of the very best honey-plants, and if valuable for forage it is an undoubted acquisition. Much doubt is thrown upon this by the fact that California bee-keepers are silent as the grave with regard to its value for forage, although the plant was introduced into Europe from California. If any of the California people have any knowledge about it, whether good or bad, they would be conferring a favor to the fraternity in general by telling what they know.

**Yield From Different Cuttings of Alfalfa.**—To the question, "Which cutting of the alfalfa yields the most honey, the first, second, or third?" the *Rocky Mountain Journal* makes reply:

The first cutting. The second cutting, supplemented by sweet clover, is nearly as good, while the third cutting, coming so late as it does in September, furnishes very little bloom; at least, such is the case in northern Colorado.

## Association Notes

THE LOS ANGELES CONVENTION, if all signs do not fail, promises to be the greatest meeting the National has ever held. Here is what Geo. W. Brodbeck has to say, who is President of the California National Honey-Producers' Association, with headquarters in Los Angeles:

I am looking forward to a great meeting, and every one that I meet informs me they are coming. So do not be surprised if you witness the largest gathering of bee-keepers ever held in the United States.

Now, do not imagine that our summer weather is so oppressive as

you find it in the East, for it is not; and then there is not a night but that you will feel comfortable with a blanket as a cover. In fact, California is becoming famous as a summer resort as well as a winter resort. All who come should provide themselves with warm clothing, for newcomers are very careless about becoming acclimated, and as a result often suffer from colds, etc.

Advise all who come, to arrange their home and business affairs so that they can spend some time here on the Coast, for they will be sure to enjoy it, and should they fail to do this there will surely be occasion for regret.

Geo. W. Brodbeck.

The time is getting short now for preparation for attending the convention. As suggested last week, we hope all who expect to join the company of bee-keepers starting from Chicago the evening of August 12, will be sure to let us know by August 1, if possible, so that we can arrange for berths, etc., here in good time. The travel on the railroads at the time of the convention will likely be very heavy on account of the G. A. R. meeting at San Francisco, so that arrangements will have to be made a few days in advance in order to get the accommodations that may be wanted. We are willing to do all we can here in order to insure a comfortable journey for those who expect to go, if they will let us know in time. Of course, we can do nothing for any one after August 10, and, as mentioned before, all arrangements ought to be made at least a full week before starting from Chicago.

A car-load of bee-keepers going across the continent will in itself be great for those who can join in it. To spend several days together on a trip like that will be almost better than an ordinary convention, especially if the company is as congenial as anticipated. If you can get away at all it will pay you to go, as the trip is well worth taking, and one that will be enjoyed all the rest of your life.

In addition to those whom we have mentioned before as expecting to go, are these:

Mr. and Mrs. R. J. McColly, of Wood Co., Ohio.  
D. J. Price, of LaSalle Co., Ill.  
C. Best, of Lucas Co., Ohio.  
Mr. and Mrs. Leo F. Hangan, of St. Croix Co., Wis.  
L. Highbarger, of Ogle Co., Ill.

CONSTITUTION OF THE CHICAGO-NORTHWESTERN.—A request has come in for the publication of the Constitution of this Association. It is as follows:

### ARTICLE I.—NAME.

This organization shall be known as the Chicago-Northwestern Bee-Keepers' Association.

### ARTICLE II.—OBJECT.

Its object shall be to promote and protect the interests of its members.

### ARTICLE III.—MEMBERSHIP.

Any person interested in bees may become a member upon the payment of a membership fee of one dollar (\$1.00) annually to the Secretary.

### ARTICLE IV.—OFFICERS.

Sec. 1.—The officers of this Association shall be a President, Vice-President, and Secretary-Treasurer, who shall form the executive committee, and shall prepare a suitable program for each meeting.

Sec. 2.—The term of office of all officers shall be for one (1) year or until their successors are elected and qualified.

Sec. 3.—The election of officers shall be by ballot at the annual meeting, and a majority of votes cast shall elect.

Sec. 4.—Vacancies in office shall be filled by the Executive Committee.

Sec. 5.—The officers shall perform such duties as usually devolve on similar officers in other organizations of bee keepers.

Any other questions shall be decided according to "Roberts' Rules of Order."

### ARTICLE V.—PLACE AND TIME OF MEETING.

The place of meeting shall be in Chicago, Ill., the first (1st) Wednesday and Thursday of December, or such other days as may be selected by the Executive Committee, notice of which shall be mailed to each member ten (10) days before the meeting.

### ARTICLE VI.—ORDER OF BUSINESS.

The meeting of the Association shall be as far as practicable governed by the following:

Call to Order.  
Reading Minutes of Last Meeting.  
President's Address.  
Treasurer's Report.  
Reports of Committees.  
Unfinished Business.  
Reception of Members and Dues.  
Miscellaneous Business.  
Election and Installation of Officers.  
Papers on Assigned Subjects.  
Discussion.  
Adjournment.

### ARTICLE VII.—AMENDMENTS.

This Constitution may be amended by a two-thirds ( $\frac{2}{3}$ ) vote of the membership in attendance at any regular meeting, provided that

notice of such proposed amendment be mailed to the members by the Secretary not less than thirty (30) days before the next regular meeting.

A bee-keepers' association requires only the simplest form of constitution for its government. The above is probably sufficient for all ordinary purposes. It may not be as elaborate as some people would like, but in the five years that it has been used it has met every need that has arisen.

We are often asked for a copy of a model constitution for a local bee-keepers' association. The foregoing can be used at least as a start, and changes or additions can be made wherever it is thought desirable.

MR. N. A. KLUCK asks the following question about sleeping on the way to Los Angeles convention:

Does a "double-berth sleeper" mean that two can use it for \$6 to California, all the way, or till we get there from Chicago?

N. A. KLUCK.

Yes, two persons—if not too large—can occupy a double-berth all the way from Chicago to Los Angeles in a tourist sleeping-car for only \$6.00, excepting the extra stop-over and the trip to the Grand Canyon, which would be \$2.00 more for sleeper, and \$6.50 more for carfare.

## Sketches of Beedomites

MR. J. Q. SMITH.

John Quincy Smith was born April 14, 1846, in Berlin, Mahoning county, Ohio. When he was six years old his parents moved overland in a covered wagon and located on a farm in Darke county, Ohio. Here he attended the district school for several years. At the age of 14 he was apprenticed to learn tailoring at Greenville, Ohio, where he worked at his trade until 1864. Then he enlisted in the 152nd Ohio Volunteer Infantry. When the war closed, in 1865, he went to Springfield, Ill., and Oct. 21, 1866, married Miss Martha C. Busher of that city.

Immediately after his marriage Mr. Smith came to Lincoln, Ill., where he still resides and follows his trade, as well as bee-keeping.

In 1874 he became interested in bees, traded a double-barrelled shotgun for three colonies, and procured a copy of "Langstroth on the Honey-Bee" and other bee-literature, in order to understand apiculture thoroughly.

He soon had an apiary of 102 colonies, which he Italianized in 1882. During this year he found to his dismay that over 80 colonies were affected with foul brood, leaving only 17 live colonies. He traced the affection to the queens he had procured from a noted queen-breeder in southern Illinois.

In 1885 Mr. Smith organized the Central Illinois Bee-Keepers' Association under the charter of which he was president until 1892, when the Association joined the Illinois State Bee-Keepers' Organization, of which he has been president for the past six years.

Mr. Smith is a member of the Methodist church, and is also identified with a number of fraternal societies, and holds many responsible offices.

Mr. Smith has three children—Oliver, a merchant tailor in Iowa; Claudia, an accomplished young lady, who died at the age of 18, in 1894; and Walter E., who is at present engaged as junior member of the firm of J. Q. Smith & Son. All were graduates of the Lincoln High School and Lincoln Business College.

Mr. Smith made the first exhibit of section comb honey at the State Fair of Illinois, receiving the first premium of \$5.00 on the same.

Mr. Smith was recently appointed inspector of apiaries for the State of Illinois, beginning his work July 1. We have met him at the Illinois State Fairs and at meetings of the State Bee-Keepers' Association. He should make an ideal official in his work among the bees and bee-keepers of Illinois.

TO TEST SEED.—Chas. R. Neillie, of Cuyhoga Co., Ohio, sends us the following test for seed:

Lay two or more sticks on a bread-pan and fold a strip of woolen cloth down between the sticks. Put seed in the folds of the cloth and pour water in the pan till it just touches the folds. In a few days you will see what percent of the seed germinates.

## Convention Proceedings

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 470.)

REARING QUEENS IN CELL-CUPS.

"Can as good queen be reared from a small Doolittle cup as can be from one as large as can be used, say 11-32 of an inch in diameter?"

Mr. Stanley—That depends upon other conditions, I think. The cell has nothing to do with the queen, to my notion, so long as the queen is nursed and fed. The size of the cup has nothing to do with it.

Dr. Miller—I should say in answer to that question that there should be as good a queen reared if the larva is in a worker-cell, because the bees don't keep it in that. The authorities used to tell us that they turned three cells into one. They don't do anything of that kind, not in my locality! They simply fill out, enlarge the cell a little at the outside, and then fill them up, and the larva comes out to where it is larger, and they may be in as large a cell as they start in a queen-cell. I think Mr. Stanley is right, that the first part of the cell has very little to do with it.

Mr. Abbott—Is that in any bee-book in existence?

Dr. Miller—I don't know.

Mr. Abbott—I think that's brand new information. Every authority says they enlarge the cell.

Dr. Miller—That's true.

Mr. Abbott—They say they tear down—

Dr. Miller—They say they make three cells into one. They never do it. It's absolutely new.

Pres. York—This is the place to find out.

Dr. Miller—Any of them have eyes to see.

Mr. Abbott—They have had their eyes for years.

Mr. Colburn—If you will read Dr. Miller's answers to correspondents you will find it.

EIGHT-FRAME VS. TEN-FRAME HIVES FOR COMB HONEY.

"Why are 8-frame hives better than the 10-frame for comb honey?"

Dr. Miller—Are they?

Pres. York—How many think the 8-frame hive better for comb honey than the 10-frame? Two.

Pres. York—Why do you think so, Mr. Niver?

Mr. Niver—By trying 6, 8, 9 and 10. I got more honey out of the 8.

Pres. York—How many think 10 frames are the best? A lot more.

Pres. York—Mr. Duff, what makes you think so?

Mr. Duff—Why I think the 10 are better? I won't say that they are better for all localities, but they are better for Chicago. In fact, I proved that to my own satisfaction.

Mr. Colburn—If the 10-frame hive is better than the 8-frame, how much better is it? There are 25 percent more frames, and we ought to get 25 percent more honey. Do you get that much more comb honey?

Dr. Miller—I don't know.

Mr. Wilcox—I have tried on both sides of this question, but I think I can say that the hive which will give you the most bees at the time of your harvest will give you the most honey, and if your 8-frame is too small, then the larger hive will give you the most honey, but if you use your 8-frame two stories high it can be worked that way, and then remove one story when you put on the supers, you will get quite as much, and they are more convenient to handle. I don't know but what I prefer that way, especially as I produce both comb and extracted honey, and because then the combs are ready to remove and use for extracting purposes. At the present time I am using them, although I did get more honey when I used 10-frame hives than with 8.

Mr. Horstmann—I approve of 8-frame hives for comb honey, provided you have the time to attend to them. You

can see very easily that you will get more honey in proportion from an 8-frame than from a 10. You can rear all the bees you want in a 10-frame. No reason in the world. You can put a story under. You can make a 16-frame hive, and take one story out when the flow begins, then you will have all those bees to work in the super. I have run both 8 and 10-frame hives. I tested it, and I found out that my 8-frame hives gave me more honey than the 10-frame. I had several 10-frame hives that gave me no honey, and only one 8 that didn't give me any, because they swarmed a great deal. I let them swarm. I wanted some more swarms, but the experience I had taught me that the 8-frame hives are the best for comb honey. You have to produce 32 sections in 10-frame hives every time you produce 24 in an 8-frame hive; that would allow four sections to a frame. I say that if a bee-keeper has time to attend to 8-frame hives, give them the proper attention, that he will get more salvable honey from an 8-frame hive than from a 10-frame hive. We know the bees have to fill these two extra frames with either brood or stores before they will go into the supers. I noticed also that the bees filled up the supers on the 8 better than the 10, on account of their being a little bit crowded.

Mr. Abbott—You say the 8-frame hives are the best, yet you compare a 16-frame with a 10.

Mr. Horstmann—Now, you take an 8-frame and put a story under and that makes it 16; you take the extra 8 frames off when the honey-flow is gone.

Mr. Abbott—But the 10-frame man could add below, too. Mr. Horstmann—He would have just as much work if he wanted to handle dummies. You have a large super on a small brood-nest—that's the disadvantage.

Mr. Wheeler—I use a different hive, consequently I can't talk about 8 or 10 frames. When I want to enlarge my brood-nest I put on top. I gauge the amount of brood by my strength of bees. Very often in the spring I have some swarms in shallow brood-chambers. When the honey-flow comes I take off when I want to.

Mr. Horstmann—Before Mr. France goes away I wish to make a motion that a vote of thanks be given him for his presence and instructive address on foul brood.

Dr. Miller—I take pleasure in seconding that motion.

Mr. France—I will say that these samples of foul brood I have carefully selected; we have not had sufficient light to see the disease in its various stages. For those of you who will take care of them I will leave these samples; after thorough examination destroy it by fire. I want you to see the scale by daylight.

Mr. Horstmann's motion was carried unanimously, after which the convention adjourned to meet at the call of the Executive Committee.

### The Future of the National Association.

BY HERMAN F. MOORE.

**I**N view of the nearness of the annual meeting of our National Bee Keeper's Association, at Los Angeles, it may not be out of order for a private in the rear rank to make a few suggestions.

It seems to me that in view of the fact that there are 700,000 (or a few less) bee-keepers in one great country, that as a class having certain rights and interests in common, they are falling far short of wielding the power and exerting the influence to which they are entitled.

Notice a few of our commercial combinations to illustrate the fact that numbers, brains and money form a union impossible to beat.

I wish briefly to note a few of the means by which the objects of our National Association can be best carried out, said object being, Promoting the interests of bee-keepers; protecting and defending the members in their lawful rights; and enforcing laws against the adulteration of honey.

First let us amend Article 11 of the Constitution, "Objects," so as to read as follows, after the word "honey," "and to procure the enactment of new laws whenever and wherever necessary to protect the members."

☐ But some one may say, "Let each State look out for

itself in such matters." The answer is, there are very few States where the bee-keepers are prepared with either the knowledge or money necessary to place a new law on the statute books, about foul brood, or adulteration, or spraying fruit-bloom. Witness our own State of Illinois with no spraying law and until recently no foul brood law.

We as bee-keepers must stand or fall together, and only by the united action of all can such laws as are needed be speedily placed on the statute books of all the States.

Also let us amend Sec. 9 of Article V, last clause, so as to read "provided that not more than four assessments shall be made in any one year and no one to an amount exceeding the annual membership fee, without a majority vote of all the members of the Association." Money is more necessary than any one other thing, and no beeman, with his heart in the right spot would object to \$5.00 a year, if the Association opens a campaign of push, and goes to doing things.

The air of our beloved land is full of electricity. All know that great things are going on about us, and shall the bee-people fall behind the procession? No! let us raise up 500,000 strong, and march to victory.

But how to get the 500,000. Ah, there's the rub! Now, in strict confidence, I'll tell you.

First, do you know that the price-lists of our hive-dealers, great and small, go to nearly 200,000 who keeps bees, far and near?

Do you know that the bee-papers are read by nearly 40,000? What an army!

Several years ago, when the writer was corresponding with the General Manager regarding the prosecutions in Chicago, he used this expression, "And we can have 1,000 members of the National." I well remember that he feared he was guilty of unjustifiable exaggeration. And now we have over the thousand.

Oh my brothers and sisters in the sweetest, purest, cleanest business on earth, let us remember, "according to your faith be it unto you." Let us set our faces toward the rising sun, and throw our caps high in air, and shout, *10,000 members for the National!*

These are not idle vaporings. Let every bee-paper in America be furnished with a copy for every issue, every week or two weeks, or each month, for a column headed, "What the National is Doing." Let the General Manager be responsible for it, that everything of interest to the members, even down to the smallest details, be set down in this column. In our 50 States there can be no lack of material.

After seeing the National column appear for a few months the 40,000 readers would get it into their heads that there was a *real, live entity* bearing such a name. If these all knew the facts about the acts and aims of our National, as do you and I, they would all join, and we would have 40,000 members instead of 10,000.

I believe a mere request would give a page to the "National" in every price-list mailed to 200,000. Think of it, my friend! If the National should pay 1 cent postage on a circular to send to each one of these, and have a present of the envelopes, paper and printing, it would cost \$2,000. Is this not a field worth cultivating?

So much for publicity, or promotion, as they said about the World's Fair. How many of you know that they paid Major P. Handy \$15,000 a year for three years to do such work for the World's Fair, and \$100,000 expenses besides? (These figures are not accurate.)

There is unlimited room for growth of our local associations. We are somewhat abashed that our little Chicago-Northwestern, 5 years old, has only 77 members to send to the "National." But if each State had an association of 77 members to join in a body, the National would have 3750 members now. Cook Co., Ill.

### Honey Exhibits—Their Value and Advantages

(Read at the last Minnesota Bee-Keepers' Convention.)

BY WALTER R. ANSELL.

**T**HE title of my paper might suggest that I propose telling you how to prepare for and put up a honey exhibit, but such is not my intention. I should find myself up against too many conflicting methods in the former, and for the latter I possess no qualification. I wish to touch more on the general principles of exhibits and, with a view to discussion, to suggest to you some reasons in support of my belief that honey exhibits are helpful to bee-keepers and instructive to them as well as to the general public.

And I should like to invite your attention to some methods for facilitating and increasing such exhibits.

Exhibitions, besides their educational value, are very useful as advertisements, and I also want you to view them in this light. If honey could be produced as cheaply as sugar, it might sooner be classed amongst the necessities of life, and, as such, would require no special advertising; and even now it runs sugar so closely in price that, its superiority over the latter for many uses considered, it is conceivable that if placed prominently, attractively and frequently before the public eye, it would not be long in commanding itself more than at present to the public palate.

That is just what we want, and we must not neglect any of the means at our disposal for effecting this object. Of course we could all sell more honey if we could get it, but I want to see both the demand and the price improve; and one will assuredly follow the other.

Without organized exhibitions the public would be dependent upon the exhibits in their local grocers' stores, and I too often a sorry recommendation.

I want them to get to know what honey ought to be, both comb and extracted. I want them educated in a nice discrimination between clean honey and dirty honey; between thick and thin honey; between pure and adulterated honey, as you and I are educated. Then they will refuse the leaky or travel-stained combs, the thin, badly extracted or adulterated honey; a greater uniformity of excellence will result, because we shall all be on our mettle to send our honey to market in the best possible condition, and the adulterator will sooner be discovered. Then will the demand for good honey increase, and the slipshod bee-keeper or dishonest trader be left out in the cold or have to amend his ways; and then we may confidently speculate on higher and more uniform prices.

We can also ourselves learn a great deal from honey exhibits, and, alas for poor human nature, more especially from competitive exhibits. I have no doubt that if the number of honey exhibitors at State and County Fairs could be multiplied, it would conduce to far greater excellence in all kinds and grades of honey. This, as I have endeavored to show, would give us bee-keepers better times; and, as the prosperity of a people is made up of the prosperity of its units, so would the State be benefited.

And here I would touch on the encouragement which should be given to honey exhibits by the State. I am not competent to enter into a consideration of the objects and the means at the disposal of our State Agricultural Society. I only wish to throw out the suggestion that the more inducements they can offer honey exhibitors, the greater number of exhibitors will they attract; and, possibly, by an inconsiderably increased expense, an important advance in their objects might be achieved.

An exhibitor's expenses are not light, especially if he has to ship his honey from a distance. And when the value of his time is considered, I am not surprised that many shrink from the risk.

A fairly large exhibit can scarcely be put up by a country bee-keeper at about \$30 Fair under an outlay for freight, cartage and help of about \$30 to \$50, irrespective of the bee-keeper's own time; at least such is my own experience. Of course we must not expect a guarantee of indemnification; I only suggest that the State might help us a little more if we are willing to help ourselves.

To those of you who have not yet become exhibitors at the State Fair let me throw out the suggestion that you just try *once*. Not necessarily a large exhibit, but an excellent one. You could send up a case or two of different kinds of comb honey, or a box of extracted honey in glass at an expense of about a dollar; you need not come yourself, though of course we should all be glad to see you; and you might gain \$10 or \$20 in premiums. Then you would come next year yourself with a much larger show, and I can assure you of a great welcome from present exhibitors.

If there were more entries made, we should certainly receive greater recognition from the Fair Committee.

As I think there must be some here who are not well acquainted with the various classes of the products of the apiary in which they can compete for premiums at the State Fair, I have brought some of this year's premium lists which are here on the table and entirely at your disposal. Mr. Gordon, superintendent of our building, who I am glad to see is here, will, I am sure, with his usual good nature, answer any question for your guidance.

But there is another kind of exhibition which I feel sure we might try on our own account; and that is a permanent honey exhibit in the city. In fact, a honey exchange, where honey would be bought and sold, wholesale

and retail, at fixed prices for various grades of honey with the assurance of obtaining the best possible prices, and an advance if needed. There would be full security for his honey to the producer and to the buyer for the purity of the honey. I can assure you it is no infrequent thing to see a farmer bee-keeper bring up a load of excellent honey with his team, and, after applying at two or three grocers' stores, sell the lot to one of them at 20 percent less than he would get if he took it to a reputable commission firm.

Or our honey exchange might take the form of a honey department in connection with some large grocery concern; and in either case my proposition is distinctly a business one, and one that would be readily backed by a bank.

I feel sure that if this Association would appoint a really live committee we could have a honey exchange, a permanent honey exhibit, established in time to receive next year's Minnesota crop. Branches would of course be established at some of the larger provincial towns to receive the near-by crop, but in all cases exhibition would be our advertisement, combination our strength, and good management our salvation.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### She Lives With Her Bees.

I have enjoyed our department in the American Bee Journal so thoroughly as a "silent partner" that I had not thought you would care to hear from me. I always enjoy the "Reliable" reading. That is my way of attending the National Convention and other bee-keepers' conventions, and I feel almost a personal acquaintance with all the writers, and have often wished I could write as others can. I have not a faculty for expressing my thoughts in writing, and, besides, I have very weak nerves and am obliged to write with a pencil. Death has claimed so many of our old members this year, that it makes one feel sad. They were like old friends. Yes, dear sister, you are fortunate indeed to have Dr. Miller to advise and help you. May you keep him many years. I always enjoy his department.

I have kept bees about 13 years. My son started me in bee-keeping and I had everything to learn. I made a great many failures, but finally became reasonably successful. I have about 40 colonies this spring. They are in as good condition as can be expected. They have had plenty of dandelions to work on. The rain spoiled the "Hum of the bees in the apple-bloom," and now white clover is coming on, but it rains and the wind blows night and day.

I do all my work in my apiary, also scrape all the sections and pack all the honey in 12-pound cases, and what I don't sell here at home I ship West. Yes, I stamp my name on my cases, but not on the sections. I am the only bee-keeper within the city limits, and I very seldom see any of the farmers that keep bees. They have no use for a bee-paper. They understand the whole business and bring their honey to the stores just as it comes from the hives!

I put up my own shipping-cases and thought I was quite a bee-keeper until I read Sister Griffith's letter. It took all the conceit out of me, but it was grand. I am 60 years old. How happy I would be if I thought I could care for my bees till I am 75. It won't be long. Years go so rapidly. I live out-of-doors with my bees all summer.

Crawford Co., Wis.

MRS. PAUL BARRETTE.

If the others enjoy your letter as much as I have, you need not worry about not having the faculty for expressing your thoughts in writing.

### Bee-Keeping in Early Days—Clipping Queens.

The American Bee Journal has always been interesting to me, and for years of its youth I was a subscriber to it, but for some cause it was discontinued till I sent for it this year. I see it was established the year I was married, so it is of long-standing.

The Sisters' department is interesting. It is always the first I look for when the paper comes, and I hope it may continue. I can hardly remember the time when I did not

have something to do with the bees, as my father kept them when I was a child (but, of course, in the old style). When we wanted some honey to eat the sulphured sticks were called for and placed in a hole in the ground and set on fire, and a hive of bees placed over it and smothered, then the honey taken out. When I began keeping bees I got the movable frame and began reading bee-literature and have read some every year since, but I feel I have only made a beginning. I think the Sister's department might be improved by having a little more of it.

I have never kept over 40 colonies, and last fall I put into winter-quarters 33 colonies. Four died and three are weak. I have always wintered them out-doors, and sometimes the hives would be nearly covered with snow for weeks, and it would be more work for me to get them in and out of cellar, as I am alone and do all the work myself, since my dear husband left me for a better world than this, nine years ago.

I have not been so fortunate as to get the big yields that some we read of have, but they are not only beneficial in giving me a little "pin money" but in helping me to go without my crutches, as there is nothing better for rheumatism than the sting of bees (at least with me). I expect to keep bees as long as I am well enough to care for them.

Bees built up nicely this year on fruit-bloom, but our surplus is from white clover, and basswood has been thinned out very much.

Seeing many kinds of machines for clipping queens' wings I would say for the benefit of beginners, don't buy a machine but use what the good Lord has given every one of us, our two fingers and thumbs. My plan is to pick the queen off the comb with the thumb and finger of my right hand, and place her feet on my first finger of the left hand, and then fasten them with the thumb, when, with a small pair of scissors in the right hand, you can easily cut off one of the large wings. As there are four wings cut one each year till she is old enough to be replaced by a young one. I have never made a mistake but once, and that was my first experience. I cut off one leg with the wing, but she did her work just the same.

MRS. R. A. HUNTINGTON.

Genesee Co., N. Y., June 1.

So you think the Sister's department might be improved by having a little more of it. Well, if the sisters continue to increase in their contributions as they have been doing lately, we may have to petition the Editor for more room. [We have no objection to being petitioned.—EDITOR.]

### Bees Unusually Cross.

For those who have bees enough to occupy all their time, there are some unpleasant features connected with the work not realized by those who have only a few colonies. For instance, to-day (July 17) we went to the Wilson apiary. It was cloudy and chilly, not a fit day to work with bees, but the work must be done. I can't say that the bees were exactly glad to see us, but certainly gave us a warm reception, and they were all at home.

We are having a good honey-flow, but it seems to me that our bees are unusually cross. In taking off honey we have not used an escape of any kind so far this year. Simply set the supers of honey on the top of the hive and let bees run out when they please. An easy way to take off honey. They can sit there all day long and not a bee will touch them. Not a trace of robbers. Something we have not enjoyed in years. And yet, as I said, the bees are unusually cross. I can't account for it.

Honey as a Health-Food is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as a Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

The Premiums offered this week are well worth working for. Look at them.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

NOT AN OFFENSIVE SWINDLE—BEE-LARVAE.

To Mr. Stachelhausen: The word "swindle" was not used in its offensive sense. It shall be recalled—although it was not, I think, used in such a way as to lead to bad opinions, either of that method of rearing queens or of the practitioner. Page 356.

And so we're all growing older (no possible swindle about that) and as the bee-larva grows old the nurse grows old, too, and a suitable modification of the kind of food comes very naturally. Quite likely there is something in that, and a something most of us had not thought of. Would not apply so well when the nurse, after having reared one set of charges, begins again. Page 359.

FEEDING GRANULATED HONEY.

In feeding candied honey as directed by A. C. F. Bartz, on page 360, the greatly diverse character of candied honey must not be lost sight of. Some is sharply granular, and some has scarcely a trace of a granule—and all grades between. The granular sorts, bees are much inclined to kick around and waste. Presumably Bartz's method would go nicely with the non-granular sort of honey. Page 360.

BRILLIANTS FOR BRILLIANT BEE-FOLKS.

A lamp-pendant hung to one's hat for bees to aim their stings at! And sure the public will think we are chickens, and that the dingles are to scare hawks away! Still, let some of the boys and girls try it and report. Brilliants, I believe they call those things. If you happen to be more brilliant than the brilliant, why, then, we must conclude your experiment inconclusive. Page 366.

VENTILATING HIVES FOR MOVING.

Ventilating for journey by lifting the cover a little crack but not quite enough to let the bees out—how about that? Might do for a few hives, new and perfectly true. With such hives as a good many of us have the "critters" would get out at twists and blemish spots, I fear. Ventilation through wire, and every opening just as tight as you can possibly get it, is likely to remain the orthodox way. Page 371.

HABIT AND HOLDING THE SMOKER.

And Ernest says, "Thumbs up—next the fire." A burn on one of the fingers that writes this testifies that I am one of the t'other ways. That does not prove that the t'other way is the better way. Never gave the matter much thought. It would not be surprising if the exact best way depended on the make or shape of the individual smoker. And if I'm wrong with the advantage of being right pay for the trouble of breaking a settled habit which is likely to prove stubborn? Page 372.

ORGANIZING TO CONTROL SALES AND PRICES.

Mr. Hutchinson's reasoning, as to the necessity of organization to control sales and prices, seems to be crushing. Hardly feel like talking back to it. But still my independent heart within me pleads that I absolutely won't go in myself. 'Spects there's more of us. Page 373.

FORCIBLE WORDS ON REARING QUEENS.

Those are very strong and forcible words of Mr. Alley's on page 375. "Natural for bees to rear queens when they have no queen; but very unnatural to rear them (except at swarming-time) when there is a queen in the hive." And he gives us his testimony for what it is worth, that queens reared out of swarming season over an excluder are poor, with very rare exceptions.

DESERTION OF FORCED SWARMS.

The man who for eight years has made from 100 to 200 forced swarms every year is the one we want to hear from. And he finds desertion next day one of the greatest drawbacks. I note with interest that colonies intending to swarm next day or soon, desert much worse. That's kind

of an ugly point. The colony that inclines to swarm next day is just the one we need to attend to.

That 40 pounds of honey put below when a full set of drawn combs is used—Mr. Davenport speaks as if that was a crusher. Will it not go upstairs, the most of it, when the brood-nest expands? It seems to me that it will. Possibly the particular strain of bees one keeps makes a material difference at this important spot. Page 374.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### It Is Foul Brood?

I have had 2 colonies in my apiary in common boxes. About May they acted as if they had foul brood. Still, in June they both put out a good swarm. A great many bees may be found around on the ground. What can be the trouble?

ANSWERS.—It is impossible to tell from the data given. It may be paralysis, and it may be something else. It would be well for you to send to the American Bee Journal for Dr. Howard's book on foul brood, and inform yourself thoroughly so as to tell whether foul brood is present. They might swarm in spite of foul brood.

CALIFORNIA.

### Increasing and Improving Stock.

I am a small bee-keeper and want to increase and improve my stock. I bought some queens and made nuclei. I took three frames of bees with the frames  $\frac{1}{2}$  or  $\frac{2}{3}$  full of sealed brood and introduced the queens. I made it all right except they weakened down. I should like to know how to remedy this. I followed "A B C of Bee-Culture."

1. How can I keep them strong enough?
2. How shall I build up those I have made? I have my fine queens in them, but they are very weak.
3. I got one of the old queens in the new hive through mistake. Can I put her back, or will I have to introduce her back?

ARKANSAS.

ANSWERS.—1. If there were bees enough to care for the brood, you will probably find that as soon as the brood has time to hatch out they will be strong enough to build up. The trouble probably was that in starting the nuclei you took brood and bees from a colony having a laying queen, and took no precaution to make the bees stay, and so a large part went back to the old hive. You should fasten in the bees for a day or two, and then so many will not return. Neither will so many return if you make the colony queenless two or three days before taking away the bees.

2. Give them each a frame of sealed brood, and when enough bees hatch out to care for it, give more.

3. If there is no young queen yet reared in the hive, she can probably be put back with no other precaution but to destroy the queen-cells. If, however, a young queen has been reared, you must remove her and introduce the old queen.

## A STANDARD-BRED QUEEN-BEE FREE

To Our Regular Paid-in-Advance Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with **The Very Best Untested Italian Queens** that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

### A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription **must be paid at least 3 months in advance**. If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

Send us \$1.00 and the name (not your own) and address of **One NEW** subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due also.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows:

One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We are filling orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

**GEORGE W. YORK & CO., 144-146 E. ERIE ST., CHICAGO, ILL.**

REVERSIBLE WALL MAP

OF THE

UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

China, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. Very useful in every Home and Office. 66 x 46 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

Best and Most Necessary Map Ever Issued.

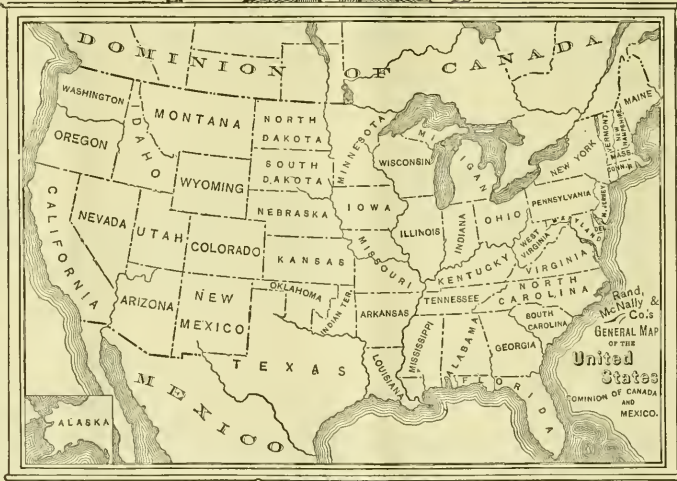

No Home or Business House should be without it.

The Plates are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

Marginal Index is one of the invaluable features. It gives an alphabetical list of countries, their location on map, style of government, population, a rea, products, minerals, imports, exports, etc.

It has been pronounced a Photograph of the World

The 1900 Census of the largest American Cities is given.

One side shows a grand map of our great country, with counties, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

1901 EDITION.—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Special attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

On the reverse side is the Library Map of the World. The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. The Inset Maps are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps on one sheet, all for only \$1.50, sent by mail or prepaid express; or we will forward it free as a premium for sending us Three New Subscribers at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

# Thousands of Hives = Millions of Sections

Ready for Prompt Shipment.

We are not selling goods on NAME ONLY, but on their quality. In addition to the many car-loads we are shipping to all parts of the United States, we have just made one shipment of five car-loads to England.

**G. B. LEWIS CO., Watertown, Wisconsin, U. S. A.**

## Natick House, LOS ANGELES.

Cor. First and Main Sts.,

HART BROS., Proprietors.

"The Popular Hotel," remodeled; 75 additional rooms, all newly furnished. Everything strictly first-class. Elevator. American plan, \$1.25 to \$3.00; latter includes suites with private baths. European plan, 50 cents up.

HEADQUARTERS of the NATIONAL BEE-KEEPERS' ASSOCIATION during the Convention, Aug. 18, 19 and 20.

Please mention Bee Journal when writing.

## Catnip Seed Free!

We have some of the seed of that famous honey-producing plant—Catnip. It should be scattered in all waste-places for the bees. Price, postpaid, 15 cents per ounce; or 2 ounces mailed FREE to a regular subscriber for sending us one NEW subscriber to the Bee Journal for one year, with \$1.00; or for \$1.20 we will send the Bee Journal one year and 2 ounces of Catnip seed to any one.

**GEORGE W. YORK & CO.**

144 & 146 E. Erie St., CHICAGO, ILL.

## Italian Queens, Bees and Nuclei.

We have a strain of bees bred specially for honey-gathering and longevity, at the following prices:

- One Untested Queen.....\$ .60
- One Tested Queen..... .80
- One Select Tested Queen..... 1.00
- One Breeder Queen..... 1.50
- Ose - Comb Nucleus (no Queen)..... 1.00

These prices are for the remainder of the season.

Queens sent by return mail.

Safe arrival guaranteed. For price on Doz. lots send for Catalog. **J. L. STRONG**  
164 1/2 204 E. Logan St., CLARINDA, IOWA.

## FROM MANY FIELDS

### White Clover a Big Crop.

My bees are doing well. White clover is a big crop here, and so is basswood bloom. I have 51 colonies, old and new, and it makes me a lot of work.

ELISHA BAILEY

Erie Co., N. Y., July 20.

### Working on Red Clover Leaves.

For about ten days my bees have been bringing in honey from the second crop of red clover; now this is nothing remarkable, for I have seen them doing so for more than 20 years past; but recently, passing through a field of clover in bloom, I stopped to watch them and to my surprise I found them working not on the blossoms but on the leaves. This, I confess, I had never seen before. On closer examination I found the clover leaves covered with small plant-lice, and the under leaves covered with honey-dew (so-called), very similar to that found frequently on the leaves of the hickory, oak and other trees, though the honey is not so dark colored as from the leaves of trees.

Now this is something new to me. Have any of the readers of the American Bee Journal observed the same? Not one bee was working on the blossoms, and will not, I suppose, as long as the secretion continues, as it is more abundant and more easily obtained.

E. T. FLANAGAN.

St. Clair Co., Ill., July 15.

### Relies on the Buckwheat.

The weather is, and has been, very unfavorable here throughout the season, and it is a wonder to me that our bees have done as well as they have. We will have a little honey, anyhow, but I rely more on the buckwheat than on anything else for surplus and winter stores.

FRIEDEMANN GREINER.

Ontario Co., N. Y., July 15.

### White Mulberries for Bees.

Having mentioned the subject of white mulberries in previous numbers of the American Bee Journal, I wish briefly to reiterate my confidence in the fruit as a remarkable honey-producing bee-food. My third year's practical observation more strongly convinces me of its great utility. Those who do not avail themselves of the hints before given regarding this very valuable tree stand greatly in their light. Suspicion of personal gain—that there must be a "colored artist" in the

melon-patch—has, no doubt, deterred worthy but timid bee-keepers from making the experiment. Again I would like to assure them I have no white mulberry trees to sell (or any other sort), and in this instance, at least, have not the least selfish scheme to promote. But, having stumbled on a really good thing I would like others to enjoy the certain benefits that cannot fail to result in planting a hundred or more trees as a sure honey-producing supply. Last year I sent out some cuttings to and some 50 applicants. I promised one and in each case sent three cuttings to make sure—simply on receipt of postage—with the expressed desire that the recipients write me results, that if not successful I might mail them a young rooted plant, which I was raising from the seeds purposely to present them. How many heeded my request? Not one! It has settled my enthusiasm; I offer nothing more—plants or cuttings.

I am glad to have had some bee-keepers come, talk and inspect the facts. A Mr. Owen and his son were over during the full fruition of the tree—the only bearing one I have.

My bees are doing splendidly. I am feeding them crushed white mulberries every day, besides their natural forage. I have taken off some fine honey and expect considerable more in early fall. The ripening berries will last another week or two—generally for five weeks during the season, in which time, if fed plentifully to the bees, tangible results are certain to follow.

Probably here endeth the last chapter of Peiro's Epistle to bee-keepers concerning the white mulberry as a honey-provender. Selah.  
F. L. PEIRO, M. D.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

# Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

## Alfalfa Honey

This is the famous  
White Extracted  
Honey gathered in  
the great Alfalfa  
regions of the Cen-  
tral West. It is a  
splendid honey, and  
nearly everybody  
who cares to eat  
honey at all can't  
get enough of the  
Alfalfa extracted.

## Basswood Honey

This is the well-  
known light-colored  
honey gathered from  
the rich, nectar-  
laden basswood  
blossoms. It has a  
stronger flavor than  
Alfalfa, and is pre-  
ferred by those who  
like a distinct flavor  
in their honey.

Write for Quantity Prices by Freight, if Interested.

A sample of either, by mail, 10 cents, to pay for package and postage.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 E. Erie St., Chicago, Ill.

## Queens Now Ready to Supply by Return Mail

Stock which cannot be excelled. Each variety bred in separate apiaries, from selected mothers; have proven their qualities as great honey-gatherers.

**Golden Italians** Have no superior, and few equals. Untested, 75 cents; 6 for \$4.00.

**Red Clover Queens,** which left all records behind in honey-gathering. Untested, \$1.00; 6 for \$5.00.

**Carniolans** —They are so highly recommended, being more gentle than all others. Untested, \$1.00.

ROOT'S GOODS AT ROOT'S FACTORY PRICES.

**C. H. W. WEBER,** 2146-2148 Central Avenue,  
CINCINNATI, OHIO.

(Successor to Chas. F. Muth and A. Muth.)

to give the sealed combs a darker appearance than that capped by the blacks, the latter leaving a little air-space between the capping and the honey, thus giving the combs a snowy-white appearance. The blacks are good workers when the harvest is abundant and near at hand, but lack the staying qualities of the Italians when nectar must be searched for far and wide. For the production of extracted honey (that thrown from the combs by centrifugal force, the combs being returned to be refilled) the Italians are the ideal bees, unless it may be in the warmer countries, as in Cuba, where the honey-flow comes in winter, and as the Italians are apt to slack up in breeding as the season advances, the approach of winter finds the colonies too weak in numbers to take advantage of the harvest.—W. Z. HUTCHINSON, in Country Life in America.

### Don't Invite Trouble.

Some bee-keepers imagine that because the National Association has always been triumphant when there has been an effort to drive some member, or his bees, outside the corporation, they can keep bees in almost any way in almost any situation. I am glad to see that Manager France does not propose to defend every member whose bees are declared a nuisance, regardless of whether they are a nuisance or not. All bee-keepers will know that a large apiary might be so managed as to become a terrible nuisance to near neighbors in a city or village. I investigated a case last year in which the bee-keeper was decidedly to blame. He even went so far as to stir up his hybrids purposely, on hot afternoons, that he might hoot and jeer at his neighbor when they had to "cut for the house." Then he boasted that he belonged to the National Association, a thousand strong, which would stand by him. It stood by him by advising him to move his bees out of the village. Of course, this is an extreme case; but we all know that, even with the best of management, bees will sometimes prove an annoyance, if not a nuisance.—Editorial in the Bee-Keepers' Review.

### Feeding Back Extracted Honey.

Feeding back extracted honey in order that comb honey may be obtained is something that has been tried by very many of our best apiarists, and still remains, if I am right, an unsolved problem with some of those who have tried it. Some have reported success and others a failure; but if I am right again, and I think I am from what I have read and heard, those who consider it a failure, to a greater or less extent, far outnumber those who consider it a success.

From my experience in the matter I feel like saying that, if any one must feed extracted honey to his bees in order that comb honey may be produced, it could be better fed in the spring, in order to hasten brood-rearing, thus securing multitudes of bees in time for the honey harvest; then by putting on the sections in the right time, a large crop of comb honey may be secured if the flowers do not fail to bloom or secrete nectar.

My experience led me to believe that it is better to secure the honey in the sections in the first place, rather than have it stored in frames of comb, and then thrown out with the extractor that we and the bees may go

through with much labor and stickiness to secure the same thing which might have been secured without all this trouble.

The practice of feeding back is on the principle of producing two crops in order to secure one, and it seems strange to me that any one would argue that such a course would pay in the long run. Even under the most favorable circumstances, such as having the bees finish nearly completed sections of honey, I could not make it more than barely pay, if I counted my time what it was worth to me in other ways. At the close of certain seasons, when I would have a large number of unfinished sections, many of which were so nearly finished that a few ounces of honey would apparently finish them, it seemed that it might pay to feed a little extracted honey to finish such; but after a careful trial of the matter, covering a period of some fifteen years, I finally gave it up as not being a paying investment, even in such cases, to say nothing about extracting with the view of feeding the honey for the bees to fill sections with from start to finish.

It is generally conceded that the best results can be obtained by feeding the extracted honey right at the close of the early white-honey harvest, so that the bees are kept active.

It is generally thought best, I believe, to take away all frames except those which are quite well filled with young brood, when preparing the colony for feeding back, using dummies in their places; but if all the combs are filled with sealed honey, except those which the brood occupies, these combs of honey will answer as well as dummies, so far as I can see. You might try both ways, and then you could tell which you like best, should the thing prove a success in your hands.

I think all agree that this honey should be thinned to the consistency of raw nectar, if not a little more, by adding the necessary amount of warm water.

Only the amount needed for feeding at one time should be thinned, or two feedings might possibly answer; for if the thinned honey is allowed to stand long in warm weather it is quite liable to sour and spoil.

Almost any way of feeding will do. I set an empty hive at the rear of the one being fed, making a communication between the two at the bottom so the bees could come in where the feed was. In this empty hive I placed division-board feeders to a sufficient number to hold 25 pounds of the thinned honey. This whole 25 pounds would be carried out of the feeders the first day, and usually nearly the same amount the second 24 hours, but later

## Long Tongues Valuable

South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

HETTO, TEX., Nov. 19, 1902.

J. P. MOORE,—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Fried E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fall. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00 dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00 dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

31A4t McDONALD, Bradley Co., TENN.

on they would not carry so fast, when only what they would nearly clean up each day would be fed, as the thinned feed is liable to sour in the feeders, if the bees are several days in taking it out.

This fed-back honey is far more likely to candy or become hard in the comb than that put in the comb at the time it is gathered from the fields.

When first taken from the hive it looks very nice and attractive; but when cool weather comes on in the fall it assumes a dull, unattractive appearance, thus showing that the honey has hardened in the cells; while comb honey produced in the ordinary way is still liquid, and will keep so from one to three months after the fed-back article has become so hard as to become almost unsalable.—G. M. Doolittle, in *Gleanings in Bee-Culture*.

**Close Saturdays at 1 p.m.**—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

## National Convention Notice.

The 34th Annual Convention of the National Bee-Keepers' Association will be held in Los Angeles, Calif., on August 18, 19, and 20, 1903, in Blanchard's Hall, at 235 S. Broadway. The headquarters of the Association during the convention will be at the Natick House, corner of First and Main Streets.

It is expected that this will be the largest and best convention ever held by the bee-keepers of America. Every one interested in the production of honey should be present, if at all possible. Besides the question-box, which will be one of the special features of the program, the following subjects will be discussed in papers by the prominent bee-keepers mentioned. Afterward a free and full discussion will be had by all in attendance who wish to participate. The subjects and men to introduce them are as follows:

"Honey Exchanges and Co-operation Among Bee-Keepers" by Prof. A. J. Cook, Claremont, Calif.

"How to Make Money Producing Extracted Honey" by J. F. McIntyre, Sespe, Calif.

"Response by E. S. Lovesey, Salt Lake City, Utah.

"The Production and Sale of Chunk Honey," by Homer H. Hyde, Floresville, Texas. Response by C. P. Dadant, Hamilton, Ill.

"The Eradication of Foul Brood," by N. E. France, Platteville, Wis.

"Reminiscences of Bee-Keeping and Bee-keepers in the Early Days," by A. I. Root.

There will be reports by the officers, which include Pres. Hutchinson, General Manager France, and Secretary York.

The California bee-keepers are planning to give all in attendance one of the grandest receptions imaginable on the first evening, Tuesday, Aug. 18. No one will want to miss this feature of the convention.

It is an opportunity of a lifetime to take the trip to California, as all convention members can avail themselves of the low railroad rates, as it comes at the time of the Grand Army meeting in San Francisco, and the same rates apply to Los Angeles.

For further information or particulars that may be desired, address the Secretary, 144 E. Erie St., Chicago, Ill.

## HONEY AND BEESWAX

### MARKET QUOTATIONS

CHICAGO, July 20.—Some consignments of the comb of 1903 are offered on this market, the comb in the majority of cases No. 1 to fancy, and the quality of the very best. It is many years since this neighborhood yielded in quality and quantity as now. Demand has not come for it at the present moment, but will within a short time, as it is being told that an abundant harvest of fancy honey is upon us. Prices asked are from 130¢/50¢ per pound. Extracted sells slowly at 67¢ for fancy white, 50¢ for amber. Beeswax, 30¢ per pound.

R. A. BURNETT & Co.

KANSAS CITY, June 30.—No comb honey in this market. New white comb would sell for \$3.50 to \$3.75 for 24-section cases; amber, \$3.25 to \$3.50. There is considerable extracted honey on the market with scarcely any demand. Price nominal at 54¢/65¢ per pound. Beeswax in demand at 30¢/30c. C. C. CLEMONS & Co.

ALBANY, N. Y., July 18.—We are receiving some shipments of new comb honey, mostly from the South; the demand light as yet; we are holding at 15¢/16c. Extracted slow at 67¢. The crop of honey in this vicinity is very light, and we shall have to depend upon other sections more than ever for our supply of honey. Beeswax, 30¢/32c. H. R. WRIGHT.

CINCINNATI, June 1.—Very little amber in market from last report. We quote amber extracted grades at 54¢/65¢ in barrels; white clover, 50¢/51c supply equal to demand. Comb honey, 15¢/16c for fancy. Beeswax, 30c.  
THE FRED W. MUTH Co.

NEW YORK, July 8.—Some new crop comb honey now arriving from Florida and the South, and fancy stock is in fair demand at 14c per pound, and 12¢/13c for No. 1, with no demand whatever for dark grades.

The market on extracted honey is in a very unsettled condition, with prices ranging from 50¢/55c for light amber, 36¢/40c for white, and the common Southern at from 50¢/55c per gallon. Beeswax steady at from 30¢/31c.

HILDRETH & SEIGELKEN.

CINCINNATI, July 20.—The demand for honey continues slow. New extracted and comb begins to be offered largely. Prices show a downward tendency. Extracted sells at the following prices: Amber in barrels, 50¢/55c; alfalfa, 64¢; white clover, 70¢/75c. Comb honey, fancy water-white, will bring 14¢/15c; no demand for lower grades. Beeswax, 27¢/30c.  
C. H. W. WEBER.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# 200 Nuclei with Red Clover Italian Queens

## Ready for Immediate Delivery.

We have arranged with a bee-keeper having a large apiary adjoining Chicago, to furnish us with Nuclei, each having a Red Clover Queen reared from one of Root's specially selected Red Clover Breeding Queens. They will be shipped direct from the apiary at these prices, cash with the order:

One 3-frame Nucleus with queen, \$3.50; 5 or more at \$3.00 each—on standard Langstroth frames in light shipping-boxes.

Or, we can furnish these Nuclei in 8-frame hives containing 3 extra brood-combs and 2 extra frames with foundation starters, at these prices:

One Nucleus for \$4.50; or 5 at \$4.00 each.

With a good fall honey-flow these Nuclei can easily be built up into good, strong colonies for wintering.

Address all orders to

**GEORGE W. YORK & CO.,**

144 &amp; 146 East Erie Street, CHICAGO, ILL.

# Dr. Miller's New Book

**SENT BY RETURN MAIL.**

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

**HOW TO GET A COPY OF DR. MILLER'S****"FORTY YEARS AMONG THE BEES."**

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

IN AMERICA

43d YEAR.

CHICAGO, ILL., AUG. 6, 1903.

No. 32.

## Editorial Comments

**The Los Angeles National Convention**—Aug. 18, 19 and 20. We suppose a great many bee-keepers, especially all over the Western part of the country, are getting ready to go. It will be a wonderful trip for those of us who live farther east. And those California folks are all ready to welcome the buzzing crowd.

It probably will be the regret of a lifetime to those who could go if they would try, and fail to make the effort. There is still room in the special bee-keepers' car going over the Santa Fe, and leaving Chicago the evening of Aug. 12. If you are going to join that company in the greatest trip a lot of bee-keepers ever took across the continent, let us know quick, and we will reserve a berth for you.

The round-trip rate from Chicago to Los Angeles is \$50, and \$6.00 extra for berth. For the Grand Canyon trip (where we will all spend Sunday, Aug. 16) the extra cost for carfare and berth is \$8.50.

Since our last issue, the following have notified us that they will join the party leaving Chicago on Aug. 12 for Los Angeles:

N. E. France, of Grant Co., Wis.  
Geo. S. Church, of Winnebago Co., Wis.  
Mr. and Mrs. H. D. Tallady, of Emmett Co., Mich.

**Time of Taking Off Sections.**—Just when it is best to take off a super of sections is not an easy thing for the novice to decide, and indeed one of considerable experience may sometimes be puzzled about it. If one waits till every section in the super is fully sealed, some of the central sections will be sure to have the cappings darkened, and it is a question between unsealed sections at the outsides and darkened sections at the center.

It is better to be too early than too late, for a few unsealed cells will not hurt the sale as much as the darkening. Take off the super when the four sections at the corners are still incomplete, or even when the entire row on each side lacks a little of being finished. Then fill up a super with these unfinished sections, and return them to the bees to be finished. Do not fill the super entirely with sections that are filled, lacking only the sealing of a few cells, but let the outside sections be such as are only half filled or less. Indeed, it may be well that the four corner sections shall have only foundation in them. Then there will be no temptation to leave the super on till the central sections are darkened, and the outside sections will give a chance for some storing, being returned again for finishing.

**Detecting Foul Brood.**—On another page of this number will be found a very practical article on foul brood by R. L. Taylor, copied from the Bee-Keepers' Review, which is especially instructive in the matter of detecting the presence of the disease. Read it, whether you have any present interest in such things or not. No telling how soon you may need knowledge about such things, and need it badly.

**A Good Cement** for fastening the handles of knives, forks, and other things that have become loose, is said in the Australasian Bee-keeper to be the following: Four parts of resin, one of beeswax, and one of brickdust, melted together.

**The Use of Smoke on Bees.**—A. J. Alden sends a clipping from Farm and Ranch containing this paragraph from Heddon's "Success in Bee Culture":

"Take the average colony of blacks or hybrids, have your smoker in good trim, blow smoke across the entrance, and if no honey-flow is on, into the entrance; then noiselessly pry up the cover and pour two or three good puffs of smoke into the top of the hive, when you can handle your frames rapidly. But half smoking such a colony will make perfect terrors. With the gentler bees less smoke is needed, but the method should be the same. This can be done quickly. Smoking the entrance starts the panic, and the smoke on top of the frames completes it, and also gains the complete surrender of the crossbred hybrids."

Mr. Alden's comments, "This is a little different from the accepted rule: 'Never be rough with bees nor fight them.'"

There is really no conflict between the rule and Mr. Heddon's instructions. It will be noticed that he has in mind gentleness of movement, even when dealing with cross bees, for he says to pry up the cover *noiselessly*. Giving smoke may or may not be considered fighting them. No more smoke than is absolutely necessary should ever be used, but with cross bees it is much better to give enough in advance to make sure of subduing them, for once thoroughly aroused, it will take more smoke to control them than if a sufficient amount had been given at the start.

Judgment and no little experience is needed in the use of smoke. Some bees need little or none when conditions are favorable, the weather hot and honey coming in a flood. If a queen is to be found, an overdose of smoke will prevent finding, for when the bees get to running like a flock of sheep you may as well close the hive till another time. In this regard there is no difference in individual colonies. A very little disturbance will set some colonies on a stampede, while others with more disturbance will remain quietly on the combs.

**Adding Supers Under or Over.**—The practice followed by a large number has been, when giving additional supers, to put the empty super of sections under the others next to the brood-nest, except near the close of the honey-flow, when the empty super is put on top. This practice will probably continue, in spite of the claim by some that better results can be obtained by giving the empty super always on top, and never allowing a colony to have more than two supers at a time.

But there seems to be some tendency to depart from what has been the general practice with regard to the arrangement of the supers tiered up other than the empty one. That practice has been to have the oldest super at the top of the pile, the next in age immediately below the upper. Instead of the continuance of that practice it is likely to be reversed, the empty super being next to the brood-nest, the one next above it being the one nearest completion and so on. This will sooner secure the finishing of the super earliest given, while at the same time the empty super under it will prevent the darkening of the comb in the nearly completed sections.

**Bee-Stings That We Do Not Like.**—The following is an editorial from Gleanings in Bee-Culture by the younger Root:

If there is any place over my whole body that I do not like to get a sting outside my face it is up my sleeve on my wrist. Ordinarily I never take any precaution about putting on cuffs or extra sleeves that are bee-tight; that is, fitting closely around the wrist. But last week when I went down to the yards (it was just after a rain) the bees were particularly cross. Two or three got up my sleeve and stung me on the wrist. I paid little attention to the matter, although I suffered

considerable pain. Examination showed that one of the stings was right in one of the blood-vessels, and another near one of the nerve-centers. The next day the arm seemed to be lame, and what was strange, there were sympathetic pains in the other arm in exactly the same place as in the other. Hereafter I shall wear tight-fitting sleeves, or, better still, long sleeve gloves with the fingers cut off at the ends; and this reminds me that they are used by a very large number of practical bee-keepers. It behooves us all to be careful not to get any more stings than is absolutely necessary, for the effect of the accumulated poison may be serious in its effects in after years, as it was in the case of Langstroth and some others.

And, by the way, should these sleeves be treated with any preparation like linseed oil, paint, or any other substance to render them more sting-proof? We have been sending out for a couple of years special bee gloves that were soaked in linseed oil, but it always seemed to me that the oil would make the sleeve warm, causing undue perspiration to the parts protected. My own notion is that a sleeve made of heavy ducking, not treated at all, would be better than having something that would make the fabric stiff and unwieldy. We should like to get the opinion of our subscribers, as we are thinking of getting up a special bee glove, or sleeve, with the fingers cut off, for a very large class of bee-keepers who are looking for something of just this kind.

The elder Root, unless he has changed his mind, rather scouts at the idea of even wearing a veil. It may be a question whether our good friend, the younger Root, would ever have gone so far away from the traditions of his father as to contemplate the wearing of gloves if he had not been so reckless as to wear such loose wristbands as to allow the entrance of bees. There is no need of that for any purpose, and the ordinary wristband large enough to let the hand through is nothing less than an urgent invitation for bees to enter. And they are not slow to accept the invitation.

Farther than close-fitting wristbands, however, many of the veterans would object to any protection for the hands. The discomfort of wearing gloves on a hot day would to them be greater than that from a few stings that might be received during the course of a day in working with bees of reasonably decent temper.

If gloves must be worn, they are much better to have the tips of the fingers cut off, thus taking away the chief clumsiness of working with gloves. Some, however, especially among the sisters, would object to having even the tips of the fingers bare, their object in wearing gloves being hardly so much to avoid stings as propolis.

**Automobiles for Out-Apiaries**, in preference to horse-flesh, seem now to be possibilities in the not distant future. There is no question as to their advantage in one respect—they will never get frightened, run away and break things because attacked by cross bees. With horses there is always some anxiety in that regard. The main objection to the use of automobiles at present has relation to expense. Editor Root views that part of the subject hopefully. He says:

Already the operating expense is far below that of a horse. We hear a great deal about expensive repairs, and they are expensive if one does not understand something of machinery. The process of simplifying the auto is going on all the time, and the repair item will grow less. Already there is a very good model offered at retail for \$275; quite a number kept in a little room, and sometimes during the winter operating a gasoline-vehicle is about a half a cent a mile, of the run-about type. Figure up the mileage of your horse, cost of keeping, including the labor every day, or two or three times a day, whether you use it or not, and see where the figures are. When the automobile stops, the only expense is the interest on the investment, and repairs, and these last may or may not be a large item. It can lie idle six months. My auto is kept in a little room, and sometimes during bad weather it stands for days without any one going near it; and yet it is ready for me almost instantly when I am ready for that.

The price of automobiles has dropped some \$200 or \$300, on run-about this year, already. Millions of money are being poured into the industry. It will not be long before Yankee genius will be able to turn out a machine so cheaply that every one can have one who can afford a horse and buggy and a barn. No, throw the barn out of the account. But whether the automobile will be able to go over any roads that a horse and buggy can is doubtful. Good roads and automobiles must go hand in hand. There is no use in buying an automobile unless you can have better roads than where the mud is half-axle-deep.

**"Queen-right Colonies"** is what F. Greiner, in the American Bee-keeper, calls colonies that are all right as to having a laying queen. This is a useful innovation from the German language. The word "queenless" is used with regard to a colony that has no queen, but heretofore we have had no word for its opposite. The new word "queen-right" means more than the opposite of queenless, for it merely means that it would include colonies with virgin queens or with drone-layers. But in one word it expresses the fact that a queen is present and that she is a normal laying queen.

**To Stop Robbing**, G. Small gives the following in the Australian Bee-keeper:

At night close up the robbed hive seeing that there is a queen and a good supply of food, then let it remain for three days, open it at night again to let the bees have some fresh air or to feed them, but closing the hive again before the other bees are on the move; by this you keep out all "robbers" which will be seen flying round in dozens, with the hive being closed they find they cannot get in to plunder and kill, and will leave the hive entirely master of the field.

This simple but effectual way has been tried by the writer with the robbing in all stages, and according to these stages the longer or shorter time you will require to keep the robbed hive shut up, in some cases three days, six days, or even ten or twelve days are required for treatment to prove successful.

Continued long enough, the plan ought to work well, with any colony having a good queen, but there would be sometimes danger of suffocation. It would be a good deal of trouble to open the hive every evening and then close it again for ten or twelve days, and it would for some be easier to put the colony for that length of time in a cool, dark cellar. But if the colony be thus moved, an empty hive should be put in its place, otherwise the robbers will make a severe assault upon a neighboring colony.

**The Honey-flow and Swarming** in Illinois and adjacent States are somewhat unusual. The general rule is that when the bees get to storing heavily they give up swarming, but this year the heavy flow seems only to make them worse. Can any one tell why?

**Swarms in Chimneys and Walls** of houses are not confined to California this year. Throughout the white clover region of Wisconsin, Illinois, and Indiana, they are unusually common. One correspondent reports five in his vicinity.

## Miscellaneous Items

A BEE-KEEPERS' PICNIC will be held by the Southeastern Minnesota Bee-keepers' Association at Homer, on Aug. 25, 1903. All beekeepers are invited to be present. It should be made a great day for all the bee-folks in that neighborhood.

THE SISTERS DEPARTMENT in this journal has the following kindly mention by Stenog in *Gleanings in Bee-Culture*:

From a very modest beginning, Miss Emma Wilson has made her department, "Our Bee-keeping Sisters," one of the best in the "Old Reliable." Miss Wilson's scholars ask a good many practical questions which are ably answered.

EUGENE SECOR, of Winnebago Co., Iowa, has an interesting article on "Some of the Benefits and Pleasures of Bee-keeping," in the July 15th number of the *Twentieth Century Farmer*. The illustrated original heading used in connection with the article is very attractive indeed. All together it is an attractive as well as instructive contribution, and will doubtless incite many a reader of that excellent farm paper to investigate the habits and work of the busy bees.

MR. WILLIAM McEVROY, foul brood inspector for Ontario, Canada, reports 220 colonies of bees, and hopes before long to increase his apiaries to 1000 colonies. He says he has secured the largest crop of honey this season he has ever had. The inspectorship has kept him from going as largely into bees as he would like to do. There are few as prominent bee-keepers in Canada as Mr. McEvroy. He certainly has done a great work for bee-keeping in the Province of Ontario.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

The Premiums offered this week are well worth working for. Look at them.

## Contributed Articles

### Finding Queens—Pollen in Extracting-Combs.

BY C. DAVENPORT.

THOSE who have read what I have written in the past know that for comb honey I use and prefer the black or German bee. And all who have handled black bees know that it is a hard and oftentimes impossible matter to find a queen in a populous colony without straining or running the whole force through zinc. I keep all laying queens clipped and generally go over the hives in the spring before the colonies get very strong. But last spring it was so very cold and unfavorable almost all the time that I disliked to open the hives or disturb the bees as much as would be necessary to find the queens. When I did start in at this work most of them were fairly strong, and as soon as I opened a hive and began to handle the frames the bees would begin to boil up over the sides of the hive or collect or hang in bunches on the bottom-bars of the frames, and it seemed impossible to find a queen without the use of zinc. I would attach entrance-guards to the hives, then shake all the bees on the ground in front, and after most of them had crawled through the zinc the queen could be found among the few outside. But for some reason this method did not work well this season. The bees seemed loth to crawl through the zinc and in some cases a large part of them would collect around or under the hives and stay there all night.

So I devised or studied up another plan by which a queen can be found so much quicker, that I am taking space to describe it. It may be old to some, but I do not remember ever seeing it described. And, no matter how strong a colony is, the queen can by this method be very quickly found; and the plan will, I have since found, work equally well with a swarm if it is for any reason desired to find their queen.

I took an empty hive-body and over the bottom tacked or nailed an all-zinc-queen-excluding honey-board. A tight bottom was nailed on another empty hive-body and the outfit was complete.

The empty hive with the tight bottom was placed on the ground in front of a colony and over it I would place the other body on which the zinc was nailed. Now, if I have made myself understood, it will be seen that we have two empty hive-bodies with a sheet of zinc between the two, placed in front or beside a colony whose queen it is desired to find.

Taking out the first frame it is looked over for the queen and if she is not found the frame and adhering bees are hung or placed in the empty hive-bodies. This is repeated with all the frames unless the queen is found before. We will suppose, which is usually the case with me, she is not. If the colony is very strong and becomes much excited, a large number of bees will be running around on the bottom-board of the now empty hive and collected on the inside. The hive is now quickly picked up and set over the one containing the frames, a sharp blow on each side rolls what bees are adhering to it down among the frames, and if there are so many bees on the bottom-board that the queen might be among them without being easily discovered it is held over the frames and the bees jarred off among them.

The bottom-board and hive are now placed back on their stand. With the left hand one of the outside frames is raised up two or three inches, then with the closed right hand the top-bar is struck a sharp, quick blow near its center. One blow of the right kind usually clears a frame so that a queen can be readily seen if she still adheres to it. As fast as the frames are cleared of bees they are placed back in the hive proper, on which the cover is now placed.

When I thought about this plan I was afraid that the bees would, instead of crawling down through the zinc, crawl up over the side. But in practice the most of them go right down through the zinc so that the queen is readily seen.

After the queen was clipped I would let her run in at the entrance, and then dump the bees down in front and they would go in sooner, for, of course, with this method, they have no zinc to go through at the entrance.

A neighbor bee-keeper near swarming-time offered to make quite a wager with me that I could not by this plan find the queen in one of his strong colonies in five minutes. In a trifle less than three I had found and clipped her, placed the frames back in the hive and dumped the bees down in front. But in this case I did not look the frames over to find her. Some might, and in fact I had some fear that it might, injure laying queens when jarred down on a sheet of zinc in this manner, but out of over 150 so treated not one was injured or lost, and they went right on laying at their usual rate. By the entrance-guard plan, when a queen stayed out over night before being found and clipped, it would in some cases be a number of days before she would resume laying as well as before.

#### POLLEN IN EXTRACTING-COMBS.

During the last few years I have produced considerable extracted honey, and one great drawback about this branch of our pursuit that I have to contend with is pollen in the extracting-combs. Last spring I had about 500 full-depth combs that were filled nearly solid full of pollen. The method that has been described, of soaking such combs in water until the pollen can be thrown out with the extractor, is an utter failure, so far as such pollen as is gathered here is concerned. I gave the plan a most thorough trial last spring in all kinds of variations. Some combs I soaked for a short time, some for a few days, and some for over two weeks, but in no case, where the cells were full or nearly so, did it soften or loosen enough so that it could be thrown out with the extractor. Where there was but a small amount in a cell it would work all right. Some of these combs I soaked in water and put them through the extractor three times. Of course this removed some of it, but the larger part still remained in the combs, and I found that combs soaked in water soured and molded badly in spite of all I could do to dry them.

The plan of giving these combs containing bee-bread to the bees in order to have them use it up will not do here, because, as a rule, there is too much of it gathered all through the season. The only way I know of to overcome or get rid of this, as it might be called, surplus pollen is to shave or cut it out of the comb. I lay a comb down on a board that just fits inside the frame. Then with the extracting knife I cut or shave the comb, pollen, and all down to  $\frac{1}{8}$  or  $\frac{1}{4}$  of its original thickness. These combs are then placed over strong colonies some time before the flow commences, and the bees will usually dig out and throw away what pollen is left before building out the comb again.

Southern Minnesota.

### A Protest Against Unripe Extracted Honey.

BY R. A. BURNETT.

IN a recent number Mr. A. I. Root, in one of his Home articles, spoke of a bee-keeper in Northern Michigan who sold her honey in a perfectly raw state to a confectioner, and that both the buyer and seller of said honey seemed to be well pleased with their operations. "The producer sold a much larger quantity of honey from each colony of bees by taking it out of the combs before it was sealed than if it had been sealed and allowed to ripen before extracting."

Now, if there is any one thing that is more injurious than another to the sale of extracted honey, it is unripe or improperly cured honey. I do not know that I have read anything in a long time which annoyed me more than the publicity given to that method of obtaining a large quantity of honey.

I have for many years sold honey to manufacturers; but where they got uncured honey it had the effect of reducing their consumption in the near future, as it did not give satisfaction in the product of which it was a component.

I will take the liberty of citing a most striking example of marketing honey in a green state. Certain bee-keepers in the main buckwheat sections of New York, in recent years, got immense returns from their bees by taking off the combs before the honey had been sealed, or very soon thereafter. Some of them were called "Lightning Operators." Their honey was sold on the reputation that buckwheat honey had made for itself, that of being a good article for baking purposes; but after two or three years of disappointment with buckwheat honey (that they got hold of) these manufacturers finally determined that they would use no more buckwheat honey, for of late it had been very unsatisfactory in many instances. The result is, that for the

past two or three years these largest of consumers will not have anything to do with honey that has any symptom of buckwheat about it; and as its use for other purposes is very limited we have great difficulty in disposing of it; and when we do it is at a low price.

I am firmly of the opinion that, had it not been for the greed of these bee-keepers, buckwheat honey to-day would be in as great demand as it was ten and twenty years ago; for at that time it was considered one of the best kinds of honey for baking purposes.

Some mention has been made of late concerning Cuban honey, or the honey of the West Indies, which honey has also been largely used for baking. If these tactics of marketing the unripe product are followed they will soon bring the product of that section into such disrepute that honey from the islands will be shunned just as buckwheat is in the United States at present writing. Cook Co., Ill.

[Mr. Burnett is entirely right, and we (A. I. R. and myself) wish to endorse his protest from beginning to end. Mr. Root senior only meant to refer to what had been done by one bee-keeper in Michigan; but it is apparent the practice should be condemned just as vigorously as actual adulterating, for the one leads almost to as serious consequences as the other. It is well known to the writer that some bee-keepers in York State have been careless about putting out unripe buckwheat honey; they supposed that so long as it was used for manufacturing purposes no harm would result; but if they could see some of the protests I have seen, they would let the honey fully ripen in the combs before extracting. It is true that the market for York State buckwheat extracted has been injured almost beyond repair. In saying this I do not mean to imply that all buckwheat from that section has been unripe.—Ed.]—Gleanings in Bee-Culture.

## Foul Brood—How to Detect It, Hold It in Check, and Finally Get Rid of It With Slight Loss.

BY R. L. TAYLOR.

"If you had an apiary of 200 colonies with cases of foul brood scattered through it, how would you manage throughout the entire season to get rid of the disease, or to keep it in check?" the editor asks me.

In the first place I would avoid, as far as possible, getting into a panic. Foul brood is bad enough, to be sure, and its cure entails considerable labor and loss, but it is, fortunately, not without a remedy. I should try to preserve my equanimity, and thoroughly mature plans for effecting a cure; for there must be no halting while taking any step in the operation.

### CHARACTERISTICS OF THE DISEASE.

The first point that claims serious attention is the distinguishing of the diseased colonies from the healthy ones. This is a matter that is attended with more or less difficulty, at any season of the year, but with more at some seasons than others, except in cases where the disease has made considerable progress. In these cases, even one with no experience, need have no hesitancy in coming to a correct decision. All the ear-marks of the malady are but too evident: the weakness of the colony, listlessness of the bees, the repellent odor, the ragged cappings of the brood, the shapeless dead brood, and the general unprosperous appearance of the combs and the honey, make the diagnosis easy.

But if the colony be yet strong, and but slightly affected with the malady, the case is quite different. If it be in the fall, after breeding has ceased, or in the spring before it has begun, the bees, owing to the strength of the colony, have almost, if not entirely, removed the cappings from the diseased cells, the odor is faint, if not practically absent, and the colony appears prosperous, so that even the adept, on a hasty examination, is liable to be deceived; and one without experience is sure to be. The diagnosis of those of this sort is the most difficult of all, and the difficulty increases with the slowness of the affection. How, then, may the disease be discovered in such cases? Let us go to one of the colonies badly diseased, and take from the center of the brood-nest a comb—the newer it is the better—in which there has been brood during the past breeding season. Now, we will hold it in a good light, so that the light falls upon the comb not quite perpendicularly, but at an angle of 70 or 80 degrees from the top of the comb; now we look down at an angle of about 40 degrees from the top of the comb into the cells, and what do

we see? In many of the uncapped cells on their lower sides—not bottoms—we see brownish, not grayish black, scales nearly as wide as the cells, and reaching nearly to the opening of the cells. These scales are the remains of brood destroyed by foul brood.

We will spend a little time in looking at them to fix in our minds the image of their forms; will examine the other side of the comb, and even take out one or two more to look at. If the colony is weak, many of the affected cells retain a fraction, or the whole, of their cappings, but, in any case, there are many with no capping. If the colony has been afflicted with bowel trouble, one, on a careless examination, might take the scales to be dried excrement, once half liquid, but we look carefully and see that they are always in the same position, and of the same size and shape, which would not be the case if they were excrement.

We will now return to the colony but little affected, and take out and examine, one after another, the combs in which brood has been reared during the past season. Now we see the scales at a glance. There may be but half a dozen in some of the combs, and in some none at all. It is safe for us to pronounce the colony diseased, and to treat it accordingly, but this test is not quite so certain as one we shall be able to apply when brood-rearing has been under way for some time, and settled warm weather has come. I say it is not quite as certain, for the sole reason that in one or two cases I have known the scales of brood dead from other causes than foul brood, though, in those cases, I think the scales were all finally removed by the bees.

We will now go forward to apple-bloom, or to the opening of white clover. If the colonies we visited earlier have been left undisturbed, we will examine them again in the same order as before. Providing ourselves with some toothpicks, or bits of straw, we go to the sicker colony of the two for its thorough examination, and proceed with the greatest deliberation, for we are trying to learn to distinguish foul brood with absolute certainty. Having an eye out continually for the appearance of robbers, which must be taken as a signal for closing the hive, and postponing further examination, we raise the cover. If we are on the leeward side of the hive we may catch a faint whiff of the ill odor that proceeds from the diseased brood, as the cover is raised, but we make sure of it by bending over the hive with face near the top of the combs, but we do not unnecessarily prolong this part of the examination, for the scent is by no means pleasant—nor worse than that of colonies badly affected with diarrhoea, perhaps; not so bad, but quite different—something like that of a poor quality of glue as it is warming for use, or like that of a dead animal after it has lain and decayed and dried for weeks in the open air. With a little practice we shall not be liable to mistake the odor, and we shall find it of considerable assistance in discovering the disease to the extent that often the necessity of lifting combs will be precluded.

Now, we will take out two or three combs from the center of the brood-nest, and look for the peculiarities in their appearance or contents. At the first glance, one who takes delight in seeing his bees prospering would have a feeling of depression come over him without realizing the reason for it. But we easily discover the reason. There is plainly a general appearance of shiftlessness, slovenliness and squalor. The combs are too dark, and without the natural, clean look. The bees do not cling well to the brood, but slink away; the cappings of the brood do not have the pretty, clean, slightly convex appearance, but some are flat, or even concave; many are perforated, some slightly, others in a greater degree, and are more or less ragged.

Now we will look into the cells. Some, not capped, contain larvae of a clear, pearly luster, others have nicely rounded cappings—all these are as yet healthy. In the cells with sunken, perforated and ragged cappings, and in many of those not capped at all, we see larvae of a brownish color of various shades from slightly yellow sometimes to the prevailing hue of a dark, dirty brown. These are all dead. Did they die of foul brood? We can surely tell by trying them with our toothpicks. We open some of the sunken and the perforated cells and insert the sharp end of the toothpick into the remains of the larvae the different cells contain. The skin of each one goes to pieces with a slight touch, and a slight turn converts it into a homogeneous, glue-like mass of the color of coffee when prepared with milk for drinking; and on withdrawing the toothpick the matter is drawn out in a string a half inch, more or less. It is foul brood, and the toothpick is the supreme test. There is no foul brood without viscosity, and no viscosity without foul brood.

### NECESSITY FOR CAUTION WHEN EXAMINING INFECTED COLONIES.

The toothpick, as used, we must dispose of with care to prevent the contamination of healthy bees. We may burn

them in the smoker; and it is an additional safeguard to have always at hand a dish containing a weak solution of carbolic acid in which to wash tools and hands before manipulating a colony that may prove to be healthy.

Now, we must go and examine the colony but slightly affected, for the detection of the disease in such a one requires some patience and care. On opening the hive, if we have a "good nose," we may, on applying it to the top of the combs just over the center of the brood-nest, possibly distinguish slightly the characteristic odor of foul brood, but very likely we may not be able to do so. We then remove combs from the center of the brood-nest. On a cursory view everything looks prosperous—the colony is strong, the brood is compact and abundant, and of a general normal appearance, and the bees are working energetically. But if we look carefully we may see here and there a cell the capping of which has lost its lively appearance. It is a little too dark, and is slightly flattened. We must have recourse to our toothpick. One breaks the suspicious capping. Yes, the larva is dead and discolored. The toothpick touches it with a slight turn and is withdrawn, bringing the stringy tell-tale matter with it. Other similar cells are found. There is no question but that it is foul brood.

#### HOW TO PREVENT THE DISSEMINATION OF THE DISEASE.

Now that it is established that foul brood has a foothold in the apiary we must make every effort to prevent its further dissemination. It might be asked, Why not do that by curing all the diseased colonies? The reply is that the periods of time when that can be done quickly and safely are limited, both in number and extent. The temperature must be warm enough for comb-building, and security against robber-bees must be had for the necessary operations, so that a time of waiting of greater or less length is pretty sure to intervene, hence the necessity for taking precautionary measures. And first, and most important, is the guarding against robbing. We must make a weak colony secure against the possibility of being attacked. The weak colonies are the ones by far the most likely to be diseased, so we will make sure not only that the entrances are small enough for successful defence, but also that the bees have sufficient spirit to make the defence. We will sacrifice, without hesitation, any infected colony that will not fight.

#### WHAT MAY BE DONE WITH MEDICATED SYRUP.

If the character of the time is such that the bees will take syrup, this may be taken advantage of by feeding diseased colonies a quart or two of medicated syrup made by mixing one ounce of salicylic acid in sufficient alcohol to dissolve it, in about 25 quarts of a not too thick syrup or honey. This will be found very helpful; and we will not omit to avail ourselves of it as fast as the diseased colonies are discovered. I have found that this medicated food stops the spread of the disease in the hive, and, no doubt, on stronger grounds, prevents the spread of the contagion to other hives. If the time be early spring, as we find colonies which were badly diseased the previous fall, before giving the food we will remove from each some of the combs which contain the dead larvae, and leave the bees only the ones which have few or none. These will prove sufficient until a cure can be effected; and the withdrawing of the combs with the greatest amount of affection will be a very decided advantage to the colony.

#### UNITING WEAK COLONIES.

We are now supposed to have critically examined the entire apiary, and distinguished each diseased colony by a prominent permanent mark, and to have given each a supply of medicated syrup. We will now keep each supplied with this syrup until the flowers yield fairly well. In attending to this we shall find some of the colonies that are taking but little or none of the food; these we will unite either with each other, or with others that are stronger, putting two or more together as rapidly as it can be safely done. I say safely done, because two colonies standing some distance apart among healthy colonies may not be brought close together at one movement, for that would be likely to send some of the bees into healthy colonies. They must be brought together gradually so that all the bees will be brought along. We will make the united colonies strong by putting a sufficient number together to make them so, for weak ones will prove to be of little if any value.

#### A CAUTION REGARDING THE USE OF COMBS FROM COLONIES THAT HAVE DIED.

There is one other preliminary matter that must be attended to, and that is the examination of the combs of colonies that have died during the winter. Diseased colonies are particularly liable to perish, and a larger proportion of the dead ones will no doubt be found to be of that class. The

status of each is to be determined in the same manner that we determined the condition of the colonies examined for foul brood early in the spring before brood-rearing had made much progress; that is, by looking for the scale-like remains of the larvae which perished the previous year.

It will be understood, of course, that all diseased combs, that is, all combs from diseased colonies, bits of comb and honey, must be kept at all times where no prying bee can by any chance get access to them. These are the readiest means of the spread of the disease. The honey may be extracted from combs, containing sufficient to make it worth while, boiled well for at least 15 minutes, then medicated and used for feeding; but unless one has conveniences for keeping all combs and honey safe, they should be burned up at once. However, with care, there is no good reason why the wax from the combs, and most of the honey, should not be saved. Every one must consider his own conditions to determine how he can best dispose of them without incurring risk.

#### GETTING RID OF THE DISEASE.

We now come to the final and indispensable operation for effecting a cure, and that consists simply in transferring the bees from their own combs to hives furnished with frames of foundation or frames with starters. I have not found it necessary to disinfect the hives containing diseased colonies, so, if found more convenient, the combs may be taken out, the bees brushed and shaken in front of the hive, and the hive furnished with frames of foundation.

#### AT WHAT SEASON TO DO THE WORK.

But at what time is this to be done, and what disposal is to be made of the brood?

The operation may be successfully performed at any time during warm weather, if only sufficient allowance of time is made to enable the bees to complete their combs before the cool weather of the fall comes on. May, June and July are the best months, and of these about the beginning of the white-clover flow would be the most favorable time of the year for beginning the work. This is so, both because it is the best time for the bees to build up without any care, as well as because it is the time when robber-bees are least likely to be troublesome.

At this timely season let us go into the apiary with the necessary hives, ready furnished, to undertake the work. We find many that were but slightly diseased strong and almost in condition to cast a natural swarm. Each one of this class is moved to a new hive and one of the prepared hives is put in the place of each. Now, from each one take out the combs with the bees and shake the bees off in front of the new hive, making sure that the queen goes with them, until we have a driven swarm, leaving sufficient in the old hive to care for the brood. Now we have a driven swarm from each one, and the old hives with the brood. Within a week or ten days we will see that each of the latter has given it a good young queen, or a good ripe queen-cell, and in 21 days we will take away all the old combs and replace them with frames containing foundation or starters. This disposes of this class, and will surely effect a cure. It would be more than useless to give them another set of frames and another shaking out.

#### THE TREATMENT OF WEAK COLONIES.

Now we go back to the weaker class. These we will take in pairs. We first select the first pair, set one of them aside and put a new hive in its place and shake out the bees as in the former case, only get about all of the bees and the queen out. Now we put the old hive with the brood in the place of the other one of the pair, and bring that other one and shake out the bees and queen in like manner in front of the new hive, then take back the old hive and unite it with the one already on its stand; thus getting from the pair one new one with the bees and the two queens, and one united old one with the brood, that will be wanting a queen in a few days, and a new set of frames in three weeks, as in the former case. The rest are to be treated in like manner.

A good part of the success of this plan is owing to the medicated food given during all the forepart of the season. Without that the colonies would have been in comparatively poor condition, which would have entailed an increase of care and labor.

The cure may be effected during any part of the three months mentioned, or even in August, but the giving of medicated food must be resorted to unless the field is yielding an abundance for comb-building.

Sometimes the brood from several colonies may be given to a single one, and that one treated later.

Without feeding during a dearth, absconding is pretty sure to take place.—Bee-Keepers' Review.

Lapeer Co., Mich.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Don't be "Caught Napping" on Supplies.

I trust that none of the bee-keeping sisters have been caught napping without sufficient supplies. I have really felt sorry for the number of bee-keepers who have come to us this summer for sections and foundation, and we could not help them out.

### An Experience with Bees.

I have been too busy to write. I have been cleaning out my hives and getting supers ready for use.

I commenced keeping bees four years ago. I bought 1 colony and hive, 2 supers, and sections enough to fill both supers twice, and got 48 sections capped and 10 partly filled. I cut out the queen-cells and did not let them swarm. In the fall I bought three colonies; one was weak and I had to feed it.

I put the four colonies in two small hives, and spread a piece of old carpet on each hive. They could go out and in when they chose.

When I went to take them out, in the spring, I found the weak colony dead, and one of the others almost dead. The weak one had frozen and the other had been too warm, as their hive was wet and mouldy.

I bought three colonies the next year, and I have let them increase two swarms in the three or four years, so I have 16 colonies now.

We have had a cold, wet spring, freezing fruit-blossoms, so I have had to feed the bees, but the alfalfa and sweet clover will soon be in bloom. I am keeping my bees strong by feeding, so they will be ready to work when there is a honey-flow.

I do most of the work with the bees, as my husband has enough to do on the farm. When I need help my husband or some of the children help me. I have six children, a boy 19, one 11, and one 8, one girl 17, one 15, and one 4.

We keep horses, cattle, hogs, turkeys and chickens, so there is always plenty of work for all. I have 70 chickens, and 30 young turkeys.

There has been a hail-storm that damaged the crops from 25 to 35 percent for about 10 or 15 miles square.

I subscribed for the Bee Journal when I bought my first colony. I could not get along without it.

I got 800 pounds of comb honey last year from 9 colonies, spring count. MRS. BEN FERGUSON.  
Ford Co., Kans., June 1.

### A Sister's Work in Colorado.

I think I might be called a bee-keeping sister, although on rather a small scale, as I have only 28 colonies of bees.

Eight years ago, on coming to this valley—Grand Valley, in western Colorado—my husband bought two colonies of bees and gave them to me to do as I might.

The first two or three years they increased very fast, but for the last three years they have nearly forgotten to swarm, and as I was very anxious to have more bees, last year (about the middle of May) I divided my colonies, making 37 out of 21, trusting to the bees to rear more queens, but only eight succeeded in rearing good queens.

My dividing them weakened them so much that they did not get built up so as to store any honey from the first cutting of alfalfa (and that was the strongest flow of honey for the season), but from about the middle of July until Sept. 20 they stored 59 cases of very nice honey.

I was very much discouraged about my bees building us so slowly after dividing them. I thought perhaps I had ruined the most of them. I made up my mind to inform myself a little better on bee-keeping so I asked one of my neighbors (an old bee-keeper), which bee-paper he thought would be the best for me to take. He recommended the American Bee Journal, which I subscribed for in October. I also got Cook's "Manual of the Apicary." I am very well

pleased with the paper every week. When I get it, the first thing I do is to turn to the "Sisters" department.

I do all the work with my bees, put together the hives, supers and shipping-cases. I often wish that I had a hundred colonies; I think I could care for them all. I enjoy working with them so much.

This has been a cold, backward spring.

Perhaps later on I will tell you how I dress to protect myself while working with the bees. ALMA TRAVIS.  
Mesa Co., Colo., May 27.

So your bees have almost forgotten how to swarm. My I almost feel like envying you. Our bees have surely not forgotten, for they seem to think of nothing else, judging from the way they persist in trying to swarm. Shaken swarms, natural swarms—every thing swarms. All treatment and rules fail to prevent swarming this year. But with it all we are getting lots of honey, so we must take the bitter with the sweet, and we are surely thankful for the sweet.

Don't forget to tell us about that bee-dress later on.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### MOIST HEAT IN QUEEN-REARING.

The matter of moist heat to rear queens in is one certainly worth grubbing over. Very likely queens reared in a dry atmosphere would fall short, as Arthur C. Miller intimates. But the humidity of the hive, although not entirely out of our control, is a little that way. Lots of bees, all carrying nectar, and lots of comb with nectar in the open cells, is the price of humidity. The humidity of a nucleus will be pretty sure to vary with the outside weather, it seems to me. Queen-breeder might step in, but I don't believe he actually will. Page 381.

### BEES MIXING VARIOUS NECTARS.

Sometimes—in hot, dry weather and very poor flow, basswood honey is almost too strong for even a lover of the basswood flavor to approve. As it is quite a blow to us to have to set catnip honey as unfit for any use, we kind o'want to hide in some similar refuge. Was not the yield poor at Mr. Crane's; and might not the honey be endurable another time? Slim outlook. Both the wet weather and the amount brought in seem to point right the other way. We'll play that those bees found something else much worse than catnip, and mixed the kinds. Anything that yields honey when the usual sources fail, and bees forage desperately everywhere, is liable to more or less of that kind of misjudgment. Page 382.

### SAW ONLY PICTURE-SNAKES.

Of course that's not what the Editor saw the morning after the Fourth—those snakes on the title of No. 25. I can see bees in 'most everything, but fail to see 'em just at that spot. Not kidding, however. A bee-paper that is mostly something else is rather disgusting, but an occasional digression entirely off the field, I rather like.

### GETTING PEOPLE TO USE HONEY.

Likely Mr. Whitney, as per page 287, and sound in the main. Mixing of syrups should be done at home, evidently. Interest in bees is not hard to stir up among people who have previously known nothing of them; and when stirred up it is a very lively interest, second cousin to bee-fer. At that point the local editor will publish things cheerfully—and sales will boom. But don't try to load down the latter fellow with matter manifestly of the free-advertising sort. If you hand him matter let it be instructive—just what the people, editor included, are wanting to hear. And, say! if you have worked this plan profitably, get a wedge in your own heart, and put in a small paid advertisement in the paper. Do this as a matter of right feelings all 'round, even if the ad can do no more than has already been done.

But common people won't buy a 12-cent sweet for their every-day pancake use. Either give that up or offer them extracted honey at 7 cents.

Shall Association money be used to advertise honey in

the leading papers? I'm thinking the supply of money would run out before much result had been realized.

Of course our Editor is right, that the supply of honey would fall short if the whole people were enlightened and gently stirred on the subject. We have heard that many times, to be sure, but still we don't travel on it as much as we might.

ALFALFA COMING EAST.

Honey from alfalfa at Fond du Lac. Not a little merely, but honey by the thousand pounds. That's surely well to the north, and at least not a-west the great river. It's coming. "Spring! spring! spring! soon be here!" is what the little bird would say. Page 395.

THE SOLAR WAX-EXTRACTOR.

Yes, indeed, Mr. Doolittle putting into the solar extractor material that will absorb all its own wax when melted, and a lot more from surrounding stuff—well, the boy who does that the second time should call himself one of the fias. Page 398.

A LONG-CAGED QUEEN.

Perhaps I'm wrong, but my idea of the thing is that injury (if any) by suddenly compelling a laying queen to cease laying would all come in the first week. Twelve weeks no worse than six so far as the laying matter is concerned. As to the wearing grind of improvement there would be a good deal of difference; and twelve weeks of caging with the queen still unharmed is quite a record. Page 403.

ANOTHER TWIST ON THAT TWISTING COVER.

I see our mutual friend wants to prevent domestic hair-pulling by arbitrating the laws of twisted cover.—Hardly looks right to arbitrate the laws of mathematics—but I guess we may thank him for the main thing he called attention to. If the wood has a twisty disposition in its soul a cover rigidly cleated at both ends will still manage to twist some. The mathematical laws pertaining to a circle and its tangent do not apply when the ends are kept straight lines. Page 403.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Combs of Honey from Diseased Colonies.

What shall I do with 30 frames filled with honey, pollen and brood, taken from colonies affected with disease, probably black brood? MASS.

ANSWER.—I think I should try treating them with formalin.

### Queen-Bees of the Brown or German Race.

Do you know where I can get a queen of the brown or German race, undoubtedly pure and purely mated?

ANSWER.—No, I don't. Fifty years ago they occupied the land as the common bee of the country, and in spite of all efforts to drive them out it is probably a hard thing to find a spot in all the country where traces of black blood may not be found in the vicinity now. But to find pure stock is another matter. Does any one know of any undoubtedly pure stock of the kind anywhere?

### Getting Rid of Flies and Mosquitoes.

1. Please tell me what effect cobalt has on flies, and how to use it?

2. Is it offensive or dangerous?

3. What preparation is best to use?

4. What kind of plant will be offensive to mosquitoes? and is there any drug which, placed in the room, will drive them away, or prevent them from coming in.

MARYLAND.

ANSWER.—The only way I have seen cobalt used for flies was to sprinkle it on a plate and wet it with sweetened

water. The flies would eat it and shortly die. It is a poison, and care should be taken not to allow children to get hold of it, but there is nothing offensive about it otherwise. I know of no particular preparation, just ask for cobalt.

I have some doubt whether there is any plant or drug that would keep the mosquitoes out without being offensive to the occupants of the room.

### Using a Division-Board or Not.

In my 8-frame hives, by crowding all together, there is a space at one side wide enough to put in a division-board. Now, in hot weather, would you keep in the board, or divide the distance up among the frames, with the board taken out? NEBRASKA.

ANSWER.—Keep the board there all the time. If you leave it out in hot weather, the bees will build out the combs so you cannot space them close again. Besides, there is no reason for given more space in summer, and that board or dummy is a good thing to make it easier for you to take out the frames. I wouldn't do without a dummy in each hive for a good deal of money.

### An Experience in Transferring—Feeding Bees.

I have an apiary of about 90 colonies and have been handling bees three or four years for the pleasure I found in it. I commenced with box-gums, hollow logs, etc., but principally soap-boxes of all shapes and sizes. After getting the "A B C of Bee-Culture," Prof. Cook's and Langstroth Revised, Miller's "A Year Among the Bees," and having had the American Bee Journal to read for the past three years, I came to the conclusion that there was but one right way to handle bees—and with movable frames was the way. So my enthusiasm led me on to get a suitable hive and frames. I at last settled upon the 8-frame hive. And then came the task of transferring. Without asking any questions through the Bee Journal, I scanned all the back numbers and found what Dr. Miller had to say to the beginners on that subject, and put that with my own common sense and went to work.

In the first place, Dr. Miller says the best time is during fruit-bloom, when the combs are lightest; but here it was in July (the 4th), I was to undertake this intricate task, when the combs were supposed to be full. However, I thought I would try one colony, anyway, and if I make a success of it I might try some more. So I got ready by lighting the smoker, got a lot of string, a good knife and a table to work on. I followed Dr. Miller's plan pretty nearly through. I smoked the bees all in this hive and then lifted it off the stand, and then instead of having a "decoy" box I took the super off and used it for a "decoy," to catch the flying bees. I had to pry the box-hive open, as the bottoms were nailed hard and fast to the hive. When I got the bottom loose I turned the hive upside down and placed the forcing box over it and commenced drumming. Very soon I had the greater part of the bees up into it. Then I took the forcing box off and ran the remaining bees out by smoke into the super, now on the old stand. When all were out I removed the super and put the forcing-box on the bottom-board on the old stand and placed the super on top. Then I closed the entrance to a very small space to prevent suspicious robber-bees investigating what was going on. When all was through, and ready, I took the old hive to the honey-house some distance away to make the transfer of the combs. The old box-gun had only top-slats for frames, without side or bottom-bars, which left the comb hanging to the top-bar and to the sides of the hive. Generally what I transferred had tolerably straight combs for box-hives. I found very little honey in them, and finding this the case, concluded that no better time could be to transfer than when the combs were the most free of honey.

So I then proceeded to cut out the combs, which were 12 inches long by 10 inches deep, and fastened them into standard Langstroth frames. The combs came very near fitting in width. I had to trim off a little of the bottom, which did not injure the combs in the least. After all were in I carried the hive carefully back to the old stand and lifted the old box and super off and put the new hive with the transferred combs on the stand, and right here my plan began to differ from Dr. Miller's. He says: Place the hive on the old stand and empty the bees out in front and let them run in. But I differ from him in this respect, for reasons which I shall give after I am through explaining my method of transferring. Instead of emptying them out in

front of the hives I gently raise up the box, with the bees in it, and place it over the hive, and then brush them down gently, or otherwise; being filled with honey, they would remain quiet up in this box, no telling how long, and robber-bees would take possession below and on the outside of the entrance.

After I get the bees all brushed down and in the hive I either put the super over them or run the bees out of it down in the hive and take it (the super) to the honey-house to have its combs cut out, as I did the brood-chamber. Where I found the honey in the old super frames (14 inches by 4½ inches) too thick and crooked, and too full of honey to stand by with strings, I just uncapped them and placed them above the brood-chamber with an empty super on and let the bees carry the honey down to the brood-chamber where it is needed. As I just remarked, I found but little. This placing these ugly super frames over the brood-chamber to be fed back to the bees can be done any time later on, and is better to be deferred for a few days in order to give the bees lately transferred time to stick their combs and get everything in good house-keeping shape.

Another reason for deferring it is, all this manipulating creates a great stir and excitement among the bees, and might cause robbing, and the more honey handled the greater the honey odor to attract their attention.

My reason for not emptying the bees out on a sheet to be run in as Dr. Miller directs is this: In their present condition, they being full of honey are sluggish, and already demoralized, and there being a great many young bees, many of them lately hatched out, this emptying them out would lose some of them, and other strange bees would be around investigating and secure a taste of honey, which would very soon start a first-class case of robbing.

The bees run in by Dr. Miller's plan would hardly resist the robber-bees, until they felt more at home, and had gotten more accustomed to the late changes of a new hive and a new bottom-board, and all the new house complete with their combs, all looking as if a cyclone had passed through them. But if gently brushed down they find themselves at home and seem to accept the change of things more readily.

My bees have gathered literally nothing since the first of June, as it has been raining every since, and I am preparing to go to feeding very soon; I shall have to give them back all the honey extracted up to the first of June.

I now wish to ask some questions that will not only in-

terest me but may be of great advantage to other beginners. In regard to feeding them crooked and unshapely combs of sealed honey by placing the frames or combs just over the brood-frames and placing an empty super over them—

1. Will the bees carry the honey down and store it in the brood-chamber?

2. In case a super with these transferred frames of comb being on, and old combs of honey are placed on top of the super frames, will the bees store the honey in the super, or carry it down to the brood-chamber?

3. In case a temporary flow of honey comes on any time soon, and the bees having plenty of comb on hand, would the flow cause them to undertake building new comb, or would they use the old comb all up first to deposit their gathered nectar or honey fed to them?

4. Which do you consider in my case the best plan to feed the colonies I have that are short of stores, in order to carry them through the winter coming on?

5. When is the best time to feed, and how much at one time? How much in the aggregate to carry an ordinary colony through?

6. If bees are fed after a spell of rest with no nectar coming in for some time, will the feeding cause the queen to lay more vigorously and the bees to prepare more comb for the bees to lay in? Or, in other words, what effect does feeding have during such a spell?

MISSISSIPPI.

ANSWERS.—1. Generally not at this time of the year; nor in general at any time unless the brood-chamber is quite empty of stores.

2. Most likely neither. If they move it at all, it will be into the brood-chamber.

3. They would first fill the old comb, unless too inconvenient of success.

4. and 5. Use Miller feeders or the crock-and-plate plan; feed granulated sugar and water, half and half, no need to heat it; feed large quantity as fast as the bees will take it till you have fed each about 25 pounds of sugar. Feeding such a large proportion of water gives the bees a chance to prepare the food more like their natural stores, but it must be fed early enough so they will have plenty of time to ripen it, perhaps in September in Mississippi. Of course you will figure a little on whether or not they will gather from any local sources.

6. If thin feed be given daily for some days, it will have a tendency to start laying, although late in the season it is difficult to start laying after it has stopped.

## QUEENS.

Golden and Leather-Colored Italian, warranted to give satisfaction—those are the kind reared by **QUIRIN-THE-QUEEN-BREEDER**. Our business was established in 1888. Our stock originated from the best and highest-priced long-tongued red clover breeders in the U. S. We rear as many, and perhaps more, queens than any other breeder in the North. Price of queens after July 1st: Large Select, 75c each; six for \$4; Tested Stock, \$1 each; six for \$5; Selected Tested, \$1.50 each; Breeders, \$3 each. Two-frame Nuclei (no queen) \$2 each. All Queens are warranted pure.

Special low price on queens in lots of 25 to 100. All queens are mailed promptly, as we keep 300 to 500 on hand ready to mail.

We guarantee safe delivery to any State, Continental Island, or European Country. Our Circular will interest you; it's free.

Address all orders to

**Quirin-the-Queen-Breeder**  
PARKERTOWN, OHIO.

(The above ad will appear twice per month only.) 16E13t

Please mention Bee Journal when writing.

**CARTONS FOR HONEY** Wanted, to introduce the best, most practical, lowest-price Carton for honey, all things considered; costs nothing. We have wholesale honey in this city for 20 years. We have no honey-carton equal to this. Send us five two-cent stamps, and we will send you sample, together with explanation, and some practical suggestions regarding marketing honey to best advantage; also live poultry. We originated and introduced the now popular one-pound section. Established in 1870.

H. R. WRIGHT, Wholesale Commission,  
PROMPTNESS A SPECIALTY. ALBANY, N. Y.

## FROM MANY FIELDS

### Good Flow—Not Swarming Much.

We are having a very good honey-flow. I have two supers about full on most of my colonies, and they are bustling in the honey at a good pace, but are not swarming much.

Otero Co., Colo., July 17. W. J. MARTIN.

### An Old Bee-Keeper.

I was born Oct. 20, 1833. I began to keep bees when I was 20 years old. I have seen queens go out and mate with drones two days following, and had drone-laying worker. I have bought Italian queens of Baldrige, R. P. Kidder, Qulnby, L. L. Langstroth, Flanders, and Aaron Benedict; and I have reared scores of queens, but not any to sell. E. TUCKER.  
Genesee Co., N. Y., July 20.

### Sweet Clover Honey—Foul Brood.

Yesterday I took off a few sections of my first sweet clover honey. It tastes simply delicious—beats white clover "all holler." There are also some linden trees in the neighborhood and some catnip plants, and the combination of the three makes a honey which is—well, you ought to taste some of it; it is very thick, too. I probably won't get very

**BUSHEL CRATES**  
Our vented bushel crates are better and cheaper than baskets—3 cents each—made of best material. Shipped ready to put together. Skip-let No. 10 full particulars free. Geneva Cooperage Co., Geneva, O.

# Thousands of Hives - Millions of Sections

Ready for Prompt Shipment.

We are not selling goods on NAME ONLY, but on their quality. In addition to the many car-loads we are shipping to all parts of the United States, we have just made one shipment of five car-loads to England.

G. B. LEWIS CO., Watertown, Wisconsin, U. S. A.

## Natick House, LOS ANGELES.

Cor. First and Main Sts.,

HART BROS., Proprietors.

"The Popular Hotel," remodeled; 75 additional rooms, all newly furnished. Everything strictly first-class. Elevator. American plan, \$1.25 to \$3.00; latter includes suites with private baths. European plan, 50 cents up.

HEADQUARTERS of the NATIONAL BEE-KEEPERS' ASSOCIATION during the Convention, Aug. 18, 19 and 20.

Please mention Bee Journal when writing.

## SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

Sweet Clover (white).....	5lb	10lb	25lb	50lb
Sweet Clover (yellow)....	.75	\$1.40	\$3.25	\$6.00
Alfalfa Clover.....	.90	1.70	4.00	7.50
White Clover.....	1.00	1.50	4.25	8.00
Alfalfa Clover.....	1.50	2.30	6.50	12.50
Alfalfa Clover.....	1.00	1.30	4.25	8.00

Prices subject to market changes.

Single pound 5 cents more than the 5-pound rate, and 10 cents extra for postage and sack.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

## Italian Queens, Bees and Nuclei.

We have a strain of bees bred specially for honey-gathering and longevity, at the following prices:

One Untested Queen.....	\$ .60
One Tested Queen.....	.80
One Select Tested Queen.....	1.00
One Breeder Queen.....	1.50
One Comb Nucleus (no Queen).....	1.00
One Comb Nucleus (with Queen).....	1.50

These prices are for the remainder of the season. Queen sent by return mail.

Safe arrival guaranteed. For price on Doz. lots send for Catalog. J. L. STRONG, 164 1/2 E. Logan St., CLARINDA, IOWA.

Please mention Bee Journal when writing.

much surplus honey this year, as I increased from 4 colonies to 16, and so my colonies are not very strong.

The other day I discovered foul brood in one of my colonies. It is not a very bad case as yet, and I hope it won't spread to the other colonies. I shall treat the colony next week. I also wrote to Mr. Smith, the foul brood inspector, to take a look at my bees when he comes up this way. CHAS. B. ACHARD, Dupage Co., Ill., July 25.

## Forced Swarms—Finding Queens.

I have been reading about forced swarming, by C. Davenport, on page 453, so I thought to give my experience.

I had 16 colonies, spring count, and not wanting to watch for swarms I undertook the shaking process. I waited till I found queen-cells started, then shook them on old combs in 8-frame hives. All but one of them stayed and went to work at once. The one that left I shook into a 10-frame hive on full sheets of foundation. Now, probably the reason that Mr. Davenport's bees left was they were shaken on foundation.

I wish to know if there is any sure way to find a queen. I have one colony that I want to change the queen. So I proceeded on a tour of inspection, took frames all out and looked them all over, and put them in another hive. No queen found. Well, not to be beaten, I went over them again very carefully. Still no queen. So I thought I could catch her by getting a queen-excluder, and proceeded to strain the bees through the excluder. Still my lady was invisible. Well, I put my thinking-cap on and thought a while.

## Marshfield Manufacturing Company.

Our specialty is making SECTIONS, and they are the best in the market. Wisconsin BASSWOOD is the right kind for them. We have a full line of BEE-SUPPLIES. Write for free illustrated catalog and price-list.

Marshfield Manufacturing Company, Marshfield, Wis.

Please mention Bee Journal when writing.

I got an Alley queen-trap, fixed it on the entrance to another hive, drove the bees all through the trap into another hive, but the queen was not to be found. So I put them all back into their own hive, put them back on the old stand, and 3 or 4 days later found fresh eggs. So I suppose she has resumed business on the old stand. FRED TYLER, Mason Co., Ill.

**No Nectar in White Clover.**

Mr. France must hustle, or white clover must secrete there. Here, with the greatest crop of white clover, bees do not touch it. Basswood is nothing. Alsike is all I received my honey from, till lately, sweet clover is coming on. The bees got just enough every day to build up well. The greatest year for swarming and the most runaway swarms in the history of the country. N. A. KLUCK, Stephenson Co., Ill., July 16.

**Producer's Name on Honey.**

I wish a word or two about the producer's name on honey-packages. I hold that the producer has a perfect right to put his name and address on every package of honey sent out by him. On page 447 W. W. McNeal says: "The producer who contends he is robbed of his rights when he is denied the privilege of ornamenting small honey-packages with his name and address, when such are not to

(Successor to Chas. F. Muth and A. Muth.)

be delivered to the consumer by himself, is laboring under a mistaken idea." I think Mr. McNeal, and Mr. York, and Mr. Anybody Else are wrong on that score. Did any of you ever know of a grocer who objected to the name and address of the manufacturer or producer of canned goods being on every can. Is not every barrel and can of syrup marked in this way? Is not all toilet soap marked with the name and address of the producer? Does not Mr. York advertise Root's goods? Why does he not advertise York's goods? Are they not as much his as the honey he buys? I sell all my honey direct to the consumer myself, with name and address on every package, and guarantee it to be O. K. in every respect.

I have 26 colonies of bees and run for both comb and extracted honey, and could sell a great deal more than I can produce. I got 10 cents per pound straight for it. Now, Mr. York, don't ask why I don't buy some of "York's Honey" and sell it. I expect it would have your name and address on it. But that is not the reason I don't buy. First, you don't have the same flavor and color of honey I produce. You know we Southern folks have foolish ideas. I can't sell light colored honey at any price, and I can't buy and pay freight charges, then sell for less than 15 cents per pound, which is out of the question here.

I hope Messrs. York and McNeal will not

## Long Tongues Valuable

South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

HUTTO, TEX., Nov. 19, 1902.

J. P. MOORE.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongued bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

J. P. MOORE, L. Box 1, Morgan, Ky.  
31Atf Pendleton Co.

Keep mentioning Bee Journal when writing advertisers.

take any exceptions to what I have said. It is only my opinion on the subject.

My 26 colonies of bees are all in 8-frame dovetail hives, painted white. It was so cold in the spring we didn't get any honey, but we hope to get some from fall flowers.

Henry Co., Tenn., July 20. J. R. ADEN.

[It is all right to put your name on the packages of honey when you are retailing it yourself direct to the consumers. But when you sell it in bulk to a commission man or dealer, it is better to omit the producer's name.

We have no quarrel with any one who insists on putting his name on his honey when he sells it. Only he can't sell it to us. If any body else wants to buy it, that's all right. We have worked up a demand in Chicago for "York's Honey," and not for Aden's honey. We have spent a great deal of money in advertising "York's Honey" here, and have pushed it in many expensive ways that we have never written about. After doing all that, we are not quite such a whopping fool as to allow some one else's name to appear on any honey that we put on the retail market here among grocers.

We are not talking about extracted honey sold in bulk, such as 50-pound cans of it. We are speaking of section comb honey, and of extracted honey that we bottle and then

# A STANDARD-BRED QUEEN-BEE FREE

To Our Regular Paid-in-Advance Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with **The Very Best Untested Italian Queens** that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

## A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription **must be paid at least 3 months in advance.** If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

Send us \$1.00 and the name (not your own) and address of **One NEW** subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due also.

We need to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows: One Queen, 75c.; 3 Queens, \$2.10; 6 Queens, for \$4.00.

We are filling orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

GEORGE W. YORK & CO., 144-146 E. ERIE ST., CHICAGO, ILL.

Please Mention the Bee Journal when writing Advertisers.

label. We simply know we are right in our position in this matter so far as we are concerned. Others can do as they please with the honey they produce or handle. But any honey we put on the retail market must be "York's Honey," as we propose to stand back of every pound we put out.—EDITOR.]

## Beedom Boiled Down

### Getting Swarms Down from Tree-Tops.

Elsewhere I speak of the fact that we have been shinning up trees to get swarms. You may wonder why we did not pursue the good old orthodox plan of having the queen's wings clipped, or why the colonies had not been shaken, to stop all of this unnecessary climbing and chasing. In the first place, some of our customers object to having their nice queens clipped—don't like the looks of them. In the second place, the swarming weather caught us by surprise. We had about given up having any honey-flow, and the problem had been to keep our bees from starving. But the season opened up and the bees swarmed, and how should we get them out of our tall basswoods? No way under the sun but to climb after them.

We used a jack-knife to cut off the limb on which the swarm hung, then by carefully dodging among the limbs we climbed down to the ground as best we could, handing the swarm to an attendant as soon as he could be reached. But the jack-knife in cutting jarred

**\$300,000,000.00 A Year** and you may have part of it if you work for us. Uncle Sam's poultry product pays that sum. Send the for samples and particulars. We furnish capital to start you in business. Draper Publishing Co., Chicago, Ill.

the limb. I finally took down a big pair of pruning-shears, two big potato-sacks, and some stout string, supplying the boy who did the "shinning" with all these before he went up the tree. The shears were handy for clearing out a space through which to let the bees down. After reaching the swarm, the boy would proceed to slide the bag around the limb, and with the pruning-shears clip it off. He could then with his rope let down bees, limb, bag, and all, or he could climb down without danger of jarring the bees off, or without fear of being stung.

In descending through the tree, holding a limb from which a big swarm is hanging, one is liable to bump it against the foliage, dislodging many of the bees, filling the air full of them. These will in all probability alight on the limb nearest where they were first clustered, with the result that another climbing is necessary to get all the bees. The coffee-sack or bag saves all this trouble.

The pruning-shears are a vast improvement over the jack-knife. When the bees swarmed we had to hack away with this ever-present and usually convenient tool, but which, on occasions of this kind, was any thing but convenient or suitable.

I have been wondering if it would not be a good thing for those who do not clip the wings of their queens to have a special belt gotten up in which could be fastened a small short saw, a pair of strong pruning-shears, a smoker, a rope, and perhaps some other tool that might be necessary to complete the equipment.

The majority of bee-keepers believe, and believe rightly, that the *only* way to handle swarms is to do so by the clipped-wing plan. But something will happen, on account of which they will not get at the job, or perchance some queens will be skipped. In either case a swarm or two is liable to get to the top of a tree, and nothing but climbing after it will bring it to the earth again. I have seen the day many and many a time when an outfit of tools, with a pair of climbers already hitched to a belt, and ready to strap on, would be worth a good deal. There is nothing like being prepared for an emergency; and when one is in a hurry, the more convenient and handy his tools are, the more effective will be the work.—Editorial in *Cleanings in Bee-Culture*.

## BARNES' FOOT POWER MACHINERY

Read what J. I. PARENT, of Charlton, N. Y., says: "We cut with one of our Combined Machines, last winter, 50 chaff-hives with 7-in. cap, 100 honey racks, 50 brood-frames, 2,000 honey boxes, and a great deal of other work. This winter we have double the amount of bee-hives, etc., to make, and we expect to do it with this Saw. It will do all that catalog at price-list free."

# BEE-BOOKS

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie St., CHICAGO, ILL

**Forty Years Among the Bees**, by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 235 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarist library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. L. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey**, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**. Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment**, by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Foul Brood**, by A. R. Kohrke.—Origin, Development and Cure. Price, 10 cents.

Close Saturdays a 1 p.m.—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

## National Convention Notice.

The 34th Annual Convention of the National Bee-Keepers' Association will be held in Los Angeles, Calif., on August 18, 19, and 20, 1903, in Blanchard's Hall, at 235 S. Broadway. The headquarters of the Association during the convention will be at the Natiek House, corner of First and Main Streets.

It is expected that this will be the largest and best convention ever held by the bee-keepers of America. Every one interested in the production of honey should be present, if at all possible. Besides the question-box, which will be one of the special features of the program, the following subjects will be discussed in papers by the prominent bee-keepers mentioned. Afterward a free and full discussion will be had by all in attendance who wish to participate. The subjects and men to introduce them are as follows:

"Honey Exchanges and Co-operation Among Bee-Keepers" by Prof. A. J. Cook, Claremont, Calif.

"How to Make Honey Producing Extracted Honey," by J. F. McIntire, Seape, Calif. Response by E. S. Lovess, Salt Lake City, Utah. "The Production and Sale of Chunk Honey," by Homer H. Hyde, Floresville, Texas. Response by C. P. Dadant, Hamilton, Ill.

"The Eradication of Foul Brood," by N. E. France, Prattville, Wis.

"Reminiscences of Bee-Keeping and Bee-keepers in the Early Days," by A. I. Root.

There will be reports by the officers, which include Pres. Hutchinson, General Manager France, and Secretary York.

The California bee-keepers are planning to give all in attendance one of the grandest receptions imaginable on the first evening, Tuesday, Aug. 18. No one will want to miss this feature of the convention.

It is an opportunity of a lifetime to take the trip to California, as all convention members can avail themselves of the low railroad rates, as it comes at the time of the Grand Army meeting in San Francisco, and the same rates apply to Los Angeles.

For further information or particulars that may be desired, address the Secretary, 144 E. Erie St., Chicago, Ill.

GEORGE W. YORK, Sec.

## HONEY AND BEESWAX MARKET QUOTATIONS

CHICAGO, July 20.—Some consignments of the crop of 1903 are offered on this market, the comb in the majority of cases No. 1, fancy, and the quality of the very best. It is many years since this neighborhood yielded in quality an equal quantity as now. Demand has not come for it at the present moment, but will within a short time, as it is being told that an abundant harvest of fancy honey is upon us. Prices asked are from 13@15c per pound. Extracted sells lowest at @7c for fancy white, @6c for amber. Beeswax, 30c per pound.

R. A. BURNETT & CO.

KANSAS CITY, July 28.—Some new comb honey in market, but on account of hot weather the demand is not heavy, but will be getting better every day. Fancy white comb, 24 sections, per case, \$3.50; white and amber, 24 sections, per case, \$3.25; No. 2 white and amber, 24 sections, per case, \$3.00. Extracted, white, per pound, @6@6c; amber, 5c. Beeswax, good demand, @2@3c.

C. C. CLEMONS & CO.

ALBANY, N. Y., July 18.—We are receiving some shipments of new comb honey, mostly from the South; the demand light as yet; we are holding at 15@16c. Extracted slow at @6@7c. The crop of honey in this vicinity is very light, and we shall have to depend upon other sections more than ever for our supply of honey. Beeswax, 30@32c. H. K. WRIGHT.

CINCINNATI, June 1.—Very little change in market from last report. We quote amber extracted grades at 54@56c in barrels; white clover, 36@2; supply equal to demand. Comb honey, 15@16c for fancy. Beeswax, 20c.

THE FRED W. MUTH CO.

NEW YORK, July 8.—Some new crop comb honey now arriving from Florida and the South, and fancy stock is in fair demand at 14c per pound, and 12@13c for No. 1, with an demand whatever for dark grades.

The market on extracted honey is in a very unsettled condition, with prices ranging from 5@5 1/2c for light amber, 5 1/2@6c for white, and the common Southern at from 5@5 1/2c per gallon. Beeswax steady at from 30@32c.

HILDEBETH & SEIGELKEN.

CINCINNATI, July 20.—The demand for honey continues slow. New extracted and comb bees to be offered largely. Prices show a downward tendency. Extracted sells at the following prices: Amber in barrels, 50 1/2c; alfalfa, 6c; white clover, 7 1/2c. Comb honey, fancy water-white, weighing 14@15c; no demand for lower grades. Beeswax, 27 1/2c.

C. H. W. WEBER.

SAN FRANCISCO, July 22.—White comb honey, 11 1/2@13 1/2c; amber, 8@10c. Extracted, white, 5 1/2@5c; light amber, 4 1/2@5c; amber, 4 1/2@4 3/4c; dark, 3 1/2@4c. Beeswax, good to choice, light, 27 1/2@28c; dark, 25@26c.

This season's crop is not only unusually late, but is proving much lighter than was generally expected. While the market is unfavorable to buyers, the demand at extreme current rates is not brisk and is mainly on local account.

## WANTED! Extracted Honey.

Send sample and best price delivered here; also Fancy Comb wanted in no-drip cases.

THE FRED W. MUTH CO.

324½ Front and Walnut, CINCINNATI, OHIO. Please mention Bee Journal when writing.

WANTED—Comb Honey in quantity lots. We are perhaps the only dealers in this article owning as much as 150,000 pounds at one time. Please state quantity, quality and price asked for your offering. Theas. C. Starnes, Esq., 24½t MANZANOLA, COLO., or FAIRFIELD, ILL. Please mention Bee Journal when writing.

## WANTED—Extracted Honey.

Mail sample and state lowest price delivered Cincinnati. Will buy FANCY WHITE COMB HONEY, any quantity, but must be put up in no-drip shipping-cases.

C. H. W. WEBER.

2146-48 Central Ave., CINCINNATI, OHIO. 24½t Please mention the Bee Journal.

## The Best Bee-Goods in the World...

are no better than those we make, and the chances are that they are not so good. If you buy of us you will not be disappointed. We are undersold by no one. Send for new catalog and price-list and free copy of THE AMERICAN BEE-KEEPER; in its thirteenth year; 50 cents a year; especially for beginners.

—THE—

**W. T. Falconer Mfg. Co.,**  
JAMESTOWN, N. Y.

W. M. GERRISH, Epping, N.H., carries a full line of our goods at catalog prices. Order of him and save the freight.

Please mention Bee Journal when writing.

## Queen-Clipping Device Free!

The MONETTE Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings. It is used by many bee-keepers. Full printed directions sent with each one. We mail it for 25 cents; or will send it FREE as a premium for sending us One New subscriber to the Bee Journal for a year at \$1.00; or for \$1.10 we will mail the Bee Journal one year and the Clipping Device. Address,

**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie St., - CHICAGO, ILL.

## INVESTMENTS —IN— SOUTHERN LANDS.

Such investments are not speculative. The South is not a new country. Market and shipping facilities are adequate and first-class. The climate is mild and favorable. Notwithstanding these and other advantages, Southern lands are selling for prices far below their real value, and at present prices net large returns on the investment. For a free set of circulars, Nos. 1 to 10, inclusive, concerning the possibilities of lands in Kentucky, West Tennessee, Mississippi and Louisiana, on and near the Illinois Central Railroad, for homeseekers and investors, address the undersigned,

**A. H. HANSON, G. P. A., Chicago.**  
26A12t Please mention the Bee Journal.

## Tennessee Queens.

Daughters of Select Imported Italian, Select long-tongued (Moore's), and Select Straight 5-band Queens. Bred 3/4 miles apart, and mated to select drones. No bees owned within 2 1/2 miles; none impure within 3, and but few within 5 miles. No disease. 30 years' experience. **WARRANTED QUEENS**, 60 cents each; **TESTED**, \$1.25 each. Discount on large orders. Contracts with dealers a specialty. Discount after July 1st

Send for circular.

**JOHN M. DAVIS,**  
SPRING HILL, TENN.

9A26t Please mention Bee Journal when writing

**BOYS WE WANT WORKERS**  
Boys, Girls, old and young alike, make money working for us. We furnish capital to start you to business. Send us 10c stamps or silver for full instructions and a line of samples to work with. **BRAPER PUBLISHING CO., Chicago, Ill.**  
Please mention Bee Journal when writing

## 26th Year Dadant's Foundation 26th Year

We guarantee Satisfaction. What more can anybody do? BEAUTY, PURITY, FIRMNESS, No SAGGING, No LOSS. PATENT WEED-PROCESS SHEETING.

Why does it sell so well? Because it has always given better satisfaction than any other. Because in 25 years there have not been any complaints, but thousands of compliments.

Send name for our Catalog, Samples of Foundation and Veil Material. We sell the best Veils, cotton or silk.

## Bee-Keepers' Supplies OF ALL KINDS \*\*\*\*\*

Very fine pure-bred BARRED PLYMOUTH ROCK Chickens and Eggs for sale at very low prices.

Langstroth on the Honey-Bee—Revised,  
The classic in Bee-Culture—Price, \$1.20, by mail.

**BEEWAX WANTED**  
at all times.

**DADANT & SON,**  
Hamilton, Hancock Co., Ill

Please mention Bee Journal when writing.

## A Group of the Gowan Family.

The sales of the Cowan Reversible Honey-Extractor are steadily increasing. Over 200 sold in July alone. You are sure to be pleased if you order one of these Extractors for we have no complaints of these machines. Be sure to specify **Root's Cowan**.

For sale by all leading dealers and the manufacturers.

## The A. I. Root Company, MEDINA, OHIO.

**GEORGE W. YORK & CO.** 144 & 146 Erie Street, CHICAGO, ILL., are headquarters for ROOT'S BEE-KEEPERS' SUPPLIES IN CHICAGO. Send to them for their free Catalog.

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# 200 Nuclei with Red Clover Italian Queens

## Ready for Immediate Delivery.

We have arranged with a bee-keeper having a large apiary adjoining Chicago, to furnish us with Nuclei, each having a Red Clover Queen reared from one of Root's specially selected Red Clover Breeding Queens. They will be shipped direct from the apiary at these prices, cash with the order:

One 3-frame Nucleus with queen, \$3.50; 5 or more at \$3.00 each—on standard Langstroth frames in light shipping-boxes.

Or, we can furnish these Nuclei in 8-frame hives containing 3 extra brood-combs and 2 extra frames with foundation starters, at these prices:

One Nucleus for \$4.50; or 5 at \$4.00 each.

With a good fall honey-flow these Nuclei can easily be built up into good, strong colonies for wintering.

Address all orders to

**GEORGE W. YORK & CO.,**

144 &amp; 146 East Erie Street, CHICAGO, ILL.

## Dr. Miller's New Book

**SENT BY RETURN MAIL.**

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

**HOW TO GET A COPY OF DR. MILLER'S****"FORTY YEARS AMONG THE BEES."**

The price of this new book is \$1.00, post-paid; or, if taken with the **WEEKLY American Bee Journal** for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the **American Bee Journal** whose subscription is paid in advance, can have a copy of Dr. Miller's new book *free as a premium* for sending us **Two New Subscribers** to the **Bee Journal** for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old **American Bee Journal**, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO.,**

## Editorial Comments

**Ordering Supplies in Time.**—It is not wise to wait to see what the harvest will be before ordering supplies needed to secure it. Some bee-keepers, who have followed that plan, have been badly caught this year. Their stock of sections has run out, and more could not at once be obtained, because they were not yet made, and the manufacturers were away behind orders.

The fall of the year is none too early to order for the next year. Count your fall number as wintering without loss, then figure the number of sections they will require should the season be the best you have ever known, and order accordingly.

"But," you say, "there will in that way generally be a lot of dead capital, for nine times out of ten so many sections will not be needed."

The loss from dead capital will be less in ten years than the annoyance and loss in one year of heavy flow, if you run out of sections and can not get any. It is better to make up your sections and get them all ready in the supers in winter-time or early spring, while not crowded with other bee-work. If you don't need them they will be all right for the following year. Even if not used for three or four years, they will take no hurt.

**Keeping Empty Combs.**—Instead of trying to keep combs in a moth-proof closet, G. C. Greiner, as he reports in *Gleanings in Bee-Culture*, keeps them in a light room, hung not too close together in racks. The light, together with the airy space between the combs, is sufficient to keep the moth away generally, and if perchance an occasional attack be made, a simple glance enables one to see what is going on.

**Old vs. Fresh Foundation.**—The question comes up every year from this or that beginner, "Can I use next year foundation left over from this year?" Some say: "Yes, it is just as good as new when a year old, or five years old." Others say: "No, I would melt up all left over from the previous year, and would much prefer to have it right fresh from the mill."

It is not likely that locality plays any important part in the affair, what is applicable in one place being equally applicable elsewhere, and such widely differing views are to be accounted for by the fact that too limited a view is taken in either case. The experienced bee-keeper, instead of answering the question by either monosyllable, yes or no, will answer, "That depends."

Beeswax in the form of foundation is but little affected by age when properly kept, although it may be much affected otherwise. Let it remain in the packing-box in which it is received, and years of keeping will have little effect upon it. Even if put into sections and piled up in supers in the house, it will be readily accepted by the bees when several years old. But keeping it on the hives when not being used by the bees is another matter. In the early part of the season it may be all right, and it may do no harm to put on sections a few days before they are needed, but sometimes a super of empty sections is put on about the time the flow ceases, and the bees will immediately begin to put a very thin—not so very thin if left long enough—a very thin

coating of bee-glue over the entire surface of the foundation. A section thus treated, when given to the bees the next year, will be accepted very slowly, often not at all. Put such a well-greased section in the middle of a super among sections filled with fresh foundation, and when all the other sections in the super are filled and finished, that particular section will be as empty as when given.

The moral of all this is, that you need not be afraid to keep foundation over from one year to another, either in or out of the sections, but you should not leave it in the care of the bees after the honey-flow has ceased, no matter whether it be partly filled with honey, merely drawn out, or yet untouched. Sometimes there is quite an interval between the early and the late flow. Better take off the sections at the close of the first, to be returned when needed.

**Sweet Clover and Farmers.**—A German friend sends a clipping from the *Green Co. (Wis.) Herold*, which quotes the advice to farmers of John Bauscher, Jr., with regard to sweet clover. That advice is to take vigorous measures for the destruction of sweet clover, for once introduced into fields it can be gotten out only with the greatest difficulty, if at all, as it spreads with extraordinary rapidity, completely overcoming other forage and grain plants.

It does seem a little strange that men, otherwise intelligent, should show such ignorance with regard to sweet clover. Mr. Bauscher need only to use his eyes to know that sweet clover spreads very slowly, if indeed it spreads at all, from the roadside into a field. Its sole means of propagation is by seed, and it dies root and branch the second winter, so if cut before going to seed it has no chance for continuance.

In a field of cultivated crops sweet clover is no more troublesome than red clover, and in certain places not so bad as white clover. Indeed, in some cases white clover is a troublesome weed, as in a strawberry bed, but no one on that account is likely to condemn white clover as deserving of annihilation.

In spite of the unreasonable prejudice against it, sweet clover is gaining ground as a forage-plant of value. More than one farmer, who formerly railed against it, is now putting it in his barn as good winter feed. But stock must learn to like it.

**Too Much Symmetry in an Apiary Undesirable.**—Editor Root says in *Gleanings in Bee-Culture*:

It is a mistake to have a queen-rearing yard laid out in straight rows, and have all the grass and weeds cut out. Hives should be located in groups of one, two, three, four, and five. Do not have any two groups of the same size and appearance near each other. If there is a group of five hives here, make the next group of two; another group of four. Make each group different from the adjoining one, and, if possible, put near some distinguishing object like a tree or a bush. One group can have a large tree, and another a small one. If tall weeds grow up near the entrance, all the better. While they obstruct the flight slightly, they help young queens in identifying their entrances.

And, by the way, we made a mistake in Cuba in cutting away all the grass in front of the hives, and in putting them in straight rows. The native Cuban bee-keeper lets the grass grow. His hives are laid out very irregularly, with the result there is much less robbing than there would be if they were all laid out with perfect regularity in rows, and entrances pointing in one direction. In an apiary of the last-mentioned kind, it is no wonder the bees become confused, and that robbers get a good start before the lumates of the hive realize what is going on.

There is another point: It takes a great deal of time to keep the grass and weeds down. If I were running for honey and money only I would keep the entrances, the paths, and roadways clear, and that is all.

You will ask why you would not find that condition of things at

our home yard in Medina. Simply because it would offend some of our visitor friends. They expect to see something like a park. But take a trip up to the Harrington yard, and you will find things as they are in Cuba.

What is true in this regard respecting a queen-rearing yard is just as true with regard to the ordinary apiary, although the consequences may not be so severe. If a worker-bee carries its load into the wrong hive, there may be no loss; its load of honey will be worth as much to the bee-keeper in one hive as in another. But if a young queen enters the wrong hive, it is quite another story. But even in an ordinary apiary there are young queens to take their wedding-trips, and entrance into wrong hives is disastrous.

One does not like, however, to have the hives in one's apiary arranged in such order as a cyclone might be expected to leave them. There is little danger from the straightest rows, provided there are objects of the right kind to help the little workers to locate their hives. A tree will help to locate a number of hives on all sides. Even a post will be a help.

**Granules of Honey in Bait-Sections.**—It might seem that a very little honey left in a bait-section, even if granulated, would be so thoroughly lost in the much larger quantity of fresh honey added, that no harm could result. But it is claimed that each little granule acts somewhat as a seed, rapidly increasing its kind, the smallest granule thus soon affecting the whole. Upon this point H. S. Shorthouse makes the following interesting remarks in the British Bee Journal:

The occasional crystallization of one jar of honey which granulates, while the others remain bright and liquid, is accounted for by the fact that the bottle either contains a small portion of grit, or is slightly rough or irregular in some particular part of the inside, which lends a starting point of crystallization to the sugars which are contained in the honey in what we will term a state of super-saturation.

An experiment (on crystallization), using sulphate of soda for the purpose, most beautifully illustrates this theory. If we take a quantity of sulphate of soda, dissolve it in a minimum quantity of hot water, and whilst warm tie over the neck of the vessel in which it is contained a parchment paper, and allow it to cool, we can at any moment cause the solution to crystallize by the puncturing of the paper with a needle, or by keeping the bottle air-tight we can retain it in solution form.

Again, we can make solutions of chemicals and can manipulate them without any signs of separation, but the introduction of a further small crystal of the same or some other substance will spontaneously cause the crystallization of the whole, and I feel assured that the granulation of honey can be accelerated by the addition of a very small crystal of the ordinary cane-sugar.

## Miscellaneous Items

THE LOS ANGELES CONVENTION will be held next week. Only a few days yet, and there will gather perhaps the largest concourse of bee-keepers ever gotten together on this continent. To be a member of that convention will be a treasured memory by all who can attend. It is the first meeting of the National Association in a Pacific Coast city. California bee-keepers will "lay themselves out" to see that all who are present have the best of entertainment and a good time generally.

We expect to publish in these columns a very full report of the proceedings. But such can not take the place of being present in person. All should go who can at all get away from their homes and business. Aside from the convention, the trip and social meetings and greetings will be a rare treat.

MR. THOS. WM. COWAN is a name well-known throughout the world of bee-dom. He is not only editor of the only other weekly bee-paper, but is also the author of a book on bees and bee-keeping, that has had an enormous sale in the Old World.

Mr. Cowan is a man most delightful to meet. He is the very essence of affability and courtesy, and his character and ability are of the highest possible. He is a member of many of the famous scientific societies in England, and has won for himself a deservedly conspicuous position in them.

Mr. Cowan has been residing in California for the past few years, but recently returning to England, with his good wife, for a stay of a year or so. It is unfortunate that he can not be at the Los Angeles

convention, for his presence and help would have contributed immensely to the success of that gathering of American bee-keepers.

We are pleased to present to our readers the excellent picture of Mr. Cowan, which is reproduced from his latest photograph.

**FRAME FOR EXTRACTING SECTIONS.**—The following is from John Trimberger, of Clark Co., Wis.:

I send a photograph of my frame to hold sections for extracting. I use four frames holding 32 sections for one operation. I have used it three or four years now, and find it very expeditious and convenient. The stand is essential. The little honey that drips down stays

PLAN FOR EXTRACTING SECTIONS.

inside the enclosure; the frames remain dry. How the sections are held together can be seen in the picture. To take the sections out, I hold the frame with sections about six inches above the table, then drop the farther end on the table, at the same time pull the shifting end-bar, held by rubbers, toward me, and, presto, out drop the sections.

To put the sections in: After the lower six are in the frame I stand the 7th and 8th against the upper bar, then lift it up and the two last sections drop back in place automatically.

One of the combs in the picture has been mutilated by those inspecting it during zero weather, before the photographer had a snap at it.

JOHN TRIMBERGER.

THAT CAR-LOAD OF BEE-KEEPERS for the Los Angeles convention was assured in good time. As is usually the case, many must decide at the last minute about going. There are so many things to be considered—so many other things to be arranged for leaving—that it is exceedingly difficult for some to go away from home at all, especially when it is necessary to be gone for two weeks or more, as in taking a California trip.

But the company in the special car travelling across the continent will be the best kind of a convention in itself. A car-load of bee-keepers! Who ever heard of such a thing before? And to ride 2000 miles with Dr. Miller, A. I. Root, Hutchinson, and others! That surely will be a memorable event. There should have been 40 or 50 in the company instead of 25 or 30. But to succeed in getting the required number and a few more is something to rejoice over.

You will likely hear more about that car-load of bee-people later on.

## Contributed Articles

### A Cool Season in California.

BY PROF. A. J. COOK.

WE often find that with the seasons and years we are forced to change some of our old and, as we supposed, well-grounded opinions. I commenced keeping bees in Michigan in 1870, and for more than a dozen years had good honey-production; so I came to the warranted conclusion, as one might suppose, that a fairly good honey crop could be counted on in that goodly State. I felt in those days that the only certain checks on certain or assured success were disastrous wintering, which I soon solved; and "foul brood," which, fortunately, never laid its fatal clutch on my pets of the hive.

Imagine my surprise, then, when three seasons of unprecedented drouths gave us no honey at all. We had to reformulate our opinions, and say with the proper rainfall we were sure of a honey crop. In Michigan, we rarely had a year so cool that it precluded, for the season through, all nectar-secretion.

In California it has been usually, I supposed always, true, that with sufficient rainfall we were sure of a good honey-year. I was told when I came here, nearly ten years ago, that with 15 inches of rainfall we were sure of a good honey-product. This led me to proclaim two valuable characteristics of our section for the bee-keeper: We could be sure of a phenomenal honey-product with a year of ample rainfall; and, second, we could know by early spring whether or not the crop was to be ours, and so could buy, or not buy, our supplies, and could arrange our business as the circumstance of rainfall dictated. If this were surely true, it would be no mean factor in our conclusions as to our standing as the leading honey State in our country, and probably one of the very best in the whole world.

The present season has changed our views, and we find we have to reckon not only with rainfall, but with the cold and damp of spring as well. Last winter gave us a generous rainfall, and we, from all former experience, so far as I knew, had a right to count on a large and sure honey-product. Indeed, for all the years that I have been here, we never have had such abundant and well-timed rains as were ours the past season. As we should expect, the herbage and flowers have been very rich and luxuriant. Yet I doubt if we can secure more than one-third of an average honey crop this year.

The reason is not far to seek. We have had an exceptionally cold and damp season. Many mornings of April and May, and on into June, were so cool that a little fire was agreeable nearly every morning. This cool of the morning held on through the entire day, and while the bees, true to their nature and habits of industry, were out early for the possible nectar, failed to store as we had been led to hope would be the case.

As just stated, I doubt if we will secure more than one-third of a crop in this section of the State. In the north the rainfall was also short, so I doubt if we make any mistake in giving this as the probability for the entire State for the season.

Unfortunately, this removes the ground for sure prophesy in the early season, and we must put a question-mark after the prospects, even in seasons of generous rainfall, for we must also have the genial warmth, for though a damp, cool season may secure ample vegetation, it will not give us the nectar in the flowers.

#### A PROMISING REGION.

There is being carved out of the very desert of Riverside County, Calif., a very promising region, agriculturally. I speak of the Indio or Coachella valley on the Southern Pacific railroad, about 15 miles east of Los Angeles. This was absolute desert, but, like most of California, the soil is a rich alluvium, and is also very deep and pliable, so that it needs only water to make it wondrously productive. Three years ago it was found that by boring artesian wells a copious supply of the finest water has been secured. These great artesian wells are a marvel to behold. They pour out with no pumping at all. While the country only awoke to man's attention three years ago, there are already

hundreds of these wells, and an area of richest verdure already makes this one of the most attractive agricultural regions to be seen anywhere.

The climate is warm the entire year, and very warm in the summer. Yet it is so dry, atmospherically, that people work, they say, comfortably all day in the hot sunshine, even roofing buildings.

This region is going to be a great alfalfa country. So great is the warmth that even ten crops of alfalfa are grown in a year, and in many cases 2½ tons to the acre are secured. This is sure to become a great alfalfa section. Even at present they are growing alfalfa and feeding hogs at a great profit. There is also a great natural growth of mesquite, which is also of the great Legume family, and, as we should expect, one of the best of honey-plants. I see no reason why this new region should not more than surpass the famous San Joaquin region, and should not equal the very best parts of Arizona. I look to see in the Coachella valley not only one of the best farming sections in the United States, but one of the best regions for honey-production in the world. This valley is so early that early June cantaloupes are sent to Chicago; and early July grapes can be produced in profusion. It will be the great place for early fruits and vegetables.

Los Angeles Co., Calif., July 17.

### Examining Apiaries and Curing Them of Foul Brood.

(Special Bulletin by the Ontario Department of Agriculture.)

BY WM. M'EVROY, INSPECTOR OF APIARIES.

BEFORE opening any colony, go from hive to hive and give each colony a little smoke at the entrance of their hive. This will check the bees for a time from coming from other colonies to bother you when you have a hive open and are examining the combs.

When you take out a comb to examine it, turn your back to the sun and hold the comb on a slant, so as to let the sun shine on the lower side and bottom of the cells, and there look for the dark scales left from the foul matter that glued itself fast when drying down; for where you find punctured cappings and ropy matter you will find plenty of cells with the dark stain-marks of foul brood on the lower side of the cells. Every bee-keeper should know the stain-mark of foul brood, as it is more important for him to learn to tell it at a glance than to have to use a pin and lift a little of the matter out of a cell by the head of a pin to see if it will stretch three-fourths of an inch. Dead brood of other kinds often have pin-hole cappings, and several cells in the same comb will be found with scales in them; and for this reason every bee-keeper should learn to tell the one class of dead brood from the other, because we often find both classes of dead brood in the same colony with very little foul brood in the same comb, that the bee-keeper did not notice; after testing the other kinds, and not finding any to stretch he felt sure that that colony was not diseased when it was, and in time it would get worse, and get robbed out by the bees from other colonies, and then the disease would be spread all through the apiary.

I have often been called to come at once by parties feeling sure that their colonies had foul brood, and when I got there I sometimes found that it was not. In some cases I found a very sudden loss of the most of the old bees, and nearly all the brood dead and decaying. This was the result of some foolish people spraying fruit-trees while in full bloom, and the bee-keeper, not knowing what caused the sudden loss of nearly all his old bees, and finding so much decaying brood, felt sure that his colonies had foul brood. The only sure way for those people that cannot tell foul brood at a glance, is to put the head of a pin into the matter in the cells and lift it out, and if it stretches they can depend upon it that it is foul brood; but, as I have often said, the most important thing to learn is to know the stain-mark of foul brood, and then it never will make much headway in any apiary or cause much loss, because the bee-keeper would spot the disease at a glance and head it off at once.

Honey, to become diseased, must first be stored in cells where foul-brood matter has been dried down, and it is the bees feeding their larvae from the honey stored in these diseased cells that spreads foul brood. More brood dies of foul brood at the ages of six, seven, eight and nine days than at any other age.

The disease is spread by bees robbing foul-broody colo-

nies, and they carry the disease just in proportion to the amount of diseased honey they convey to their own hives.

Every diseased apiary should be treated according to the exact condition in which it is found, so as not only to drive out the disease, but to make considerable increase in colonies, and end by having every colony in first-class condition. In the honey season, when the bees are gathering freely, is the only safe time to make increase in a diseased apiary, and I make this increase by tiering up two hives full of the best brood with about a quart of bees until the most of the brood is hatched. By that time I will have a very large colony of young bees just in the prime of life, and when these bees are all shaken into a single hive and treated I will have a first-class colony made out of them. In every apiary that I had treated in the honey season I always had increase made by having the best brood tiered up with about a quart of bees, and left until most of the brood was hatched, and then had these bees treated just the same as the old bees that I shook off the brood and treated first.

#### HOW TO CURE THE APIARIES OF FOUL BROOD.

In the honey season, when the bees are gathering freely, remove the combs in the evening and shake the bees into their own hives; give them frames with comb foundation starters on and let them build for four days, and store the diseased honey in them which they took with them from the old comb. Then, in the evening of the fourth day, take out the new combs and give them comb foundation to work out, and then the cure will be complete. By this method of treatment all the diseased honey is removed from the bees before the full sheet of foundation is worked out. Where you find a large quantity of nice brood with only a few cells of foul brood in the most of your colonies, and have shaken the bees off for treatment, fill two hives full with these combs of brood, and then place one hive of brood on the other, and shade this tiered-up brood from the sun until the most of it is hatched. Then, in the evening, shake these bees into a single hive and then give them frames with comb-foundation starters, and let them build comb for four days. Then, in the evening of the fourth day, take out the new comb and give them comb foundation to work out to complete the cure. After the brood is hatched out of the old combs they must be made into beeswax or burned, and all the new combs made out of the starters during the four days must be burned or made into beeswax, on account of the diseased honey that would be stored in them.

Where the diseased colonies are weak in bees, put the bees of two, three or four together, so as to get a good-sized colony to start the cure with, as it does not pay to spend time fussing with little weak colonies. All the curing or treating of diseased colonies should be done in the evening, so as not to have any robbing done, or cause any of the bees from the diseased colonies to mix and go in with the bees of sound colonies. By doing all the work in the evening it gives the bees a chance to settle down very nicely before morning, and then there is no confusion or trouble. When the bees are not gathering honey, any apiary can be cured of foul brood by removing the diseased combs in the evenings and giving the bees frames with comb-foundation starters. Then, also in the evenings feed the bees plenty of sugar syrup, and they will draw out the foundation and store the diseased honey which they took with them from the old combs. In the fourth evening remove the new combs made out of the starters, and give the bees full sheets of comb foundation, and feed plenty of sugar syrup each evening until every colony is in first-class order every way. Make the syrup out of granulated sugar, and put one pound of water to every two pounds of sugar, and then bring it to a boil.

Where you find the disease in a few good colonies after all honey-gathering is over, do not tinker or fuss with these in any way just then, but carefully leave them alone until an evening in October, and then go to the diseased colonies and take every comb out of these colonies and put six combs of all sealed or capped stores in their place, taken from sound colonies, and on each side of these all-capped combs place a division-board. This will put these colonies in first-class order for winter with little or no bother at all, and the disease crowded clean out at the same time.

But some may say that the disease cannot be driven out so simply in the fall by taking away the diseased combs and giving the bees six combs that are capped all over right down to the bottom of the frames. It can and does cure every time when properly done, and if you stop to think you will see quite plainly that the bees must keep the diseased honey they took out of the old combs until they consume it,

as they cannot find any place in all-capped combs to put it, and that will end the disease at once.

Many bee-keepers will no doubt say that this fall method of treatment will not work in their apiaries at all, because they would not have enough of the all-capped combs to spare from the sound colonies, even if they could find some all-sealed. Very true; but you can very easily secure abundance of all-capped combs by putting Miller feeders on your sound colonies in the evenings in September, and feeding these colonies all the sugar syrup you can get them to take; and then in October each of these fed colonies can spare the two outside combs, which will be nicely capped all over right down to the bottom of the frames, and with these all-capped combs you will be provided with plenty of good stores to carry out my fall method of treatment. I finished the curing of my own apiary in the fall of 1875 by this sealed-comb treatment, when I had foul brood in my own apiary. All of my methods of treatment are of my own working out, and none of them ever fail when properly carried out.

Empty hives that had foul brood in do not need any disinfecting in anyway.

In treating diseased colonies never starve any bees, because it unfits them for business and makes them thin, lean and poor, and is also hard on the queens. I never starved any bees, but always tried to see how fat I could make them while treating them by feeding plenty of sugar syrup when the bees were not gathering honey.

If you have nice, white combs that are clean and dry, and that never had any brood in them, do not destroy one of these, as they are perfectly safe to use on any colony of bees just as they are, and are very valuable to any beekeeper. I once got a bee-keeper in the State of Vermont to save over 2000 nice, white combs, when he wrote to me for advice, and the saving of this class of combs must have been worth fully \$300 to him. But I have always advised bee-keepers to convert into wax all old combs that ever had one cell of foul brood in them, and the only article that will take all the wax out of the old combs is a good wax-press; and as this will pay for itself many times over its cost, I urge the bee-keepers everywhere to buy one.

NOTE.—Any bee-keeper desiring to know whether his bees are affected with foul brood may send by mail a sample of the diseased comb, enclosed in a pasteboard box, to Wm. McEvoy, Woodburn, Ont., Canada. Please see that the sample is free from honey so that other mail matter will not be injured.

## Spring Feeding—Habits of Bees.

BY C. P. DADANT.

I BEG the reader to forgive me for referring to this subject once more, but I cannot leave Mr. A. C. Miller's criticisms unanswered. This will be my last article on this subject, for I realize that long controversies are tiresome to the readers.

Mr. Miller (page 454) accuses me of taking his remarks as a personal attack. I cannot see where he received this impression. I aimed to answer nothing but his arguments and assertions. But it is quite difficult, I will agree, for one to keep his temper when another asserts that the facts you advance are not true.

Mr. Miller takes me to task and criticises my arithmetic and my ignorance of the length of time it takes for a bee to hatch, because I said that the colony that had been self-feeding by slow robbing had almost doubled in a month or so. Mr. Miller, of course, takes the month from the first day of the feeding instead of from the last, as it serves his purpose better, leaving out two weeks of the increase caused by continued feeding. At the end of a month from the first day the increase caused would show but the result of nine days of feeding instead of two weeks. I am so well aware of the necessity of a lapse of time between the laying of the eggs and the harvest, that it is on that point that all my efforts are directed. I want my bees to rear their young at the time when they are likely to be useful for the harvest. If I induce breeding early I do like the poultry-raiser who induces his hens to lay eggs early, when they are valuable. If the harvest begins June 1st and lasts 4 weeks, the bulk of the breeding must be done early in May, and the bees that will hatch from eggs laid June 10th will help consume the honey instead of helping to harvest it. So I insisted, and still insist, on the necessity of encouraging breeding early before the honey crop.

Left to themselves the bees will, of course, breed all through the spring, and will breed more plentifully if they are wealthy than if they are poor, provided they are not so crowded with honey as to have no room for brood; but the breeding will be still more enhanced if the colony is encouraged by feeding when there is nothing in the field. I deprecate the feeding of a rich colony because there is danger of overcrowding their combs with honey, and for no other reason. We have often, in the case of a rich colony, practiced the uncapping of a few cells from time to time, to induce them to feed and consume the honey. That has about the same effect on a rich colony that a little feeding has on the one that is more scantily supplied.

Mr. Miller quotes my own words in Langstroth Revised on that subject. Let me in turn quote him, the master himself, in a previous edition:

"By judicious early feeding a whole apiary may not only be encouraged to breed much faster, but they will be inspired with such vigor and enterprise as to increase their stores with unusual rapidity."

Mr. A. C. Miller will, of course, take objection to this teaching. He has tried feeding in all sorts of ways, and "always at a loss." Ergo, no one can succeed, Langstroth and others to the contrary notwithstanding.

Because I said that we should not feed when feeding would induce bees to fly out in weather cool enough to chill them before their return, or when they found honey out-of-doors, Mr. Miller concludes that when we can feed, we should not, and when we should feed, we can not. This is hardly good faith. There are plenty of times when there is no honey in the fields and yet it is suitable weather for bees to fly. At such times feeding encourages breeding.

When I wrote the previous article, I stated that we were then feeding some 60 colonies. It was about the last of April, and we had been feeding already for some time. We do not practice feeding every year, because it requires a great deal of attention on the part of the apiarist, and I like to look after this myself, and do not always have the time. This year I had two reasons for doing it. The fields were promising an immense crop of clover, and the weather was so changeable, and the early blossoms so scanty, that the bees were very irregular in their breeding. According to Mr. Miller, I fed "at a loss." What of the results? Our apiary foreman is acquainted with a number of apiarists in the neighborhood, and he says: "There is not a single apiary in the immediate vicinity that has such a crop as your home apiary. Some colonies have yielded 400 pounds, and the entire average at this date (about the end of the clover crop) is about 300 pounds per colony."

There are a number of readers of the American Bee Journal in this place, and it is not difficult to verify this statement. Of course, Mr. Miller can say that we would have a still better crop if we had not fed the bees, or that the result is due to other causes. For my part, I am sure that stimulative feeding had much to do with the results.

Mr. Miller tells me that he is ahead of me on some of the habits of the bee; I'll grant this; that the bees never give food on the tongue. Whether this is so or not, it has very little to do with the present discussion. I have seen bees make a "show of tongues"—perhaps they were only kissing. Feeding enhances breeding, because the bees are stirred up by it and because the queen is offered food more plentifully whether it be royal jelly or honey.

Mr. Miller denies flatly the deference of bees for their queen, and asks me to "look again." And would looking again and failing to see it cancel the hundreds of instances where I have seen and shown to visitors, even on the comb held in the hands, the bees making an admiring circle around their queen and getting out of her way at the least move she makes? They realize that she is indispensable, and are ever ready to offer her food, if they have any to offer, which is of course often the case when some fresh supply is brought from the field or from the feeder.

Of course, there is no such thing as a "body-guard liable to instant banishment from neglect of duty," criticised by Cheshire, but this writer himself notices their attentions to her welfare, and backing out of the way not to impede her movements, with the constant offering of food by the neighboring nurses. It is nothing but deference or respect due to the knowledge of her importance in the hive, call it in whatever terms you like. Hancock Co., Ill.

The Premiums offered this week are well worth working for. Look at them.

## Bacillus Alvei and Mesentericus.

DR. LAMBOTTE awakened serious fears that the microbe of foul brood was nothing more nor less than one of the commonest bacilli, to be found everywhere, only awaiting sufficiently favorable conditions to start a case of foul brood. It is comforting to know that authorities whose opinions are entitled to respect do not accept as sufficient the proofs that Dr. Lambotte has given. Prof. Harrison, a man of whom our Kanuck friends ought to be proud, seems to have given the matter very careful consideration, and still thinks *B. alvei* distinct from *B. mesentericus*.

Now comes a man whose word always counts, Thos. Wm. Cowan, and after reading what he says, one hardly need lose sleep over Dr. Lambotte's investigations. Mr. Cowan says among other things, in the British Bee Journal:

An examination of Dr. Lambotte's paper will at once convince the unprejudiced mind that there is very little to be alarmed about. It is quite true that Dr. Lambotte says *Bacillus alvei* and *Bacillus mesentericus vulgaris* are one and the same, and that all previous investigators have made a mistake, but it is not necessarily true because he says so.

That the products of both have aropy and viscous character does not necessarily make them identical, and even if they were they might be produced by different bacilli. Much importance is given to an assumption that the harmless *B. mesentericus* can be, under certain conditions, made to produce disease, and upon this hypothesis—not generally accepted—Dr. Lambotte bases all his conclusions. He is unfortunate in his illustration, for he does not prove that "flacherie" in silkworms is not produced by a specific germ, but only thinks that "if the investigation were again taken up with the present knowledge it would be found that at least one of the forms of this malady would be traced to microbes of the mesentericus family." There is not a shadow of evidence in support of this theory, or that mesentericus has anything to do with the disease, and even if it did it would prove nothing in regard to foul brood. We certainly can not understand Dr. Lambotte trying to maintain his theory in the face of his experiments. He failed entirely to produce foul brood with a cultivation of *B. mesentericus* spread over the brood. Some of the larvae were killed and surrounded with infecting material, but after three days the bees had cleaned out the cells, and there was no further damage. Although this experiment was repeated a number of times, it failed in every instance to produce the disease. We know perfectly well from long experience that such an experiment with *B. alvei* would have produced foul brood in a virulent form in the strongest colony.

*Bacillus mesentericus* is found almost everywhere, and were it the cause of foul brood we should also hear of this disease wherever bees were kept, but there are many districts where foul brood has not been known to exist, and in every case of an outbreak where investigation has been made, it was found that it had existed there before, or had been by some means introduced.

Without going more deeply into the matter it need only be said that we can not accept Dr. Lambotte's explanation, knowing as we do how rapidly foul brood spreads even when colonies are in the best condition. On the other hand, we also know that when certain means are employed the disease can be got rid of, so that with the present knowledge available we need only follow out the practices usually advocated in order to obtain the best results.

Honey as a Health-Food is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### An Interested Sister.

I am much interested in our "corner" of the American Bee Journal. I am one of the admirers and readers of the Journal, to which I have subscribed for many years. I will be glad to be a "contributor." I have kept bees for about 14 years, with varied luck and experience. I will write more at length soon. MRS. E. G. BRADFORD.  
Newcastle Co., Del.

### How One Sister Dresses for Bee-Work.

I am not used to writing for publication, and it has seemed quite a task. I fear you will feel like I do myself, and will dump this in the waste-basket. However, I shall make the effort.

I think the Sisters department fine, and enjoy the contributions, particularly the *dressy* ones.

Lake Winnebago is less than a mile from us, and we have a fine view of it from the porch. There are about 1200 apple, cherry, and plum trees in the orchards, and my bees have an ideal home, as well as myself. I have 36 colonies. I moved 39 colonies 14 miles last December, and put them into the cellar without a flight, or even taking the screens off the top of the hives, and so many of them came out and died on the cellar-floor that I told my family I would be glad to find half a dozen alive in the spring; but they all lived through. I found a great many broken combs, and have had a great deal of work mending them, and clipping queens' wings.

I number my hives with a crayon, and keep a book with a short record of the condition of each colony, and then I have some idea which ones need looking after first. They are all strong, but none of them have swarmed, nor do I want them to do so. Several are, or have been, at work in the supers, and I have taken off a few nicely sealed sections of dandelion honey, but the last two days we have had a cold northeast wind, and to night it feels as if we might have snow.

I have kept a few bees for 20 years. We found our first colony clustered on an oak-tree. For a few years we thought we did well if we got honey enough for our own use. The men did not care for the bees as I thought they ought to, and for the past 15 years I have taken all care of them. I only have to have them carried into and out of the cellar.

I buy my hives in the flat and nail them myself. I find that if I care for 30 colonies I have enough to keep me busy. Last year I had 23 colonies, spring count, and increased to 41. I had nearly 3000 sections of very nice honey, and found two colonies had been robbed, and the worms had eaten the combs. I doubled up some of the weakest. Just as the blossoms were opening I carried the weakest colony, after catching their queen, and put them above the one I wished to unite them with, with a piece of strong paper between in which I had punched a hole large enough for one bee at a time to pass through at night, and in the morning I saw they were carrying out dead ones and having a general war. I used a spray on both hives, using sweetened water with violet perfume, and mixed them all up, putting the frames that had no brood in the upper hive, and I have had no more trouble since then. I have united two more without the loss of a bee, so far as I could see.

I wear a sailor-hat, with black lace stitched fast to the brim, and let it fall loose on my shoulders. If a bee gets in I just raise my veil and let it out. I like an extra hat-pin to pin my veil down in front if I am bending over a hive, and find it handy to pick out a worm if I should happen to see one.

I use a pair of asbestos gloves, such as firemen and engineers use. They do not get scorched on the smoker, and if I get them covered with honey, as I often do when cutting out drone-comb, I take a cloth and wash them off, and they are as soft as ever after they are dry. I clip off the ends of the fingers and thumbs. I like a clean, well-

starched cotton-dress, or, if cool, a shirt-waist and heavy skirt.

When cutting out drone-comb I crush all empty waste comb in my hand into a ball and throw it into a basket or bag with the scrapings and all waste, and after the season is over I take a day and melt it out in the oven. If I have pieces with brood in them I throw them out to the chickens; they are so fond of it, and they will come around the hives waiting for it while I am at work, until the bees get after them, when they soon forget what they were after.

Now, if this finds the way into the waste-basket I shall not be surprised, as I do not think I have given any new ideas, for I think I have seen it all in the American Bee Journal; but I should be delighted to give you a chance to become better acquainted with me, if you should ever come to this vicinity—right here at "The Orchards."

ELIZABETH M. SMITH.

Winnebago Co., Wis., May 31.

Indeed, your communication will not go into the waste-basket. It is extremely interesting, and I hope you will soon favor us with another.

You must have an ideal home. If you are any like me you will thoroughly enjoy the lake, especially fishing in it. I almost envy you that part of it.

I am glad you are sensible enough to use a record-book. How any one can keep bees and get along without one is a mystery to me; but you see we don't all think alike.

I wish you would tell us more about those asbestos gloves. Where can you get them? Do they wear well? Are they proof against stings, etc.? Your bees are not as cross as ours are this summer, or that loose veil would never answer. Too many bees would get under it at once, and when you were attempting to let them out a whole lot more would get in.

Thank you very much for that kind invitation to get better acquainted with you in that ideal home. I should thoroughly enjoy accepting it, but this is such a busy world I am afraid it won't be possible to do so very soon.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### When to Take Off Honey.

I have several supers of fine honey all capped over and finished. Would you advise me to take it off and put it in a well-ventilated room, or leave it in the hive? If the latter, how long? IOWA.

ANSWER.—Take it off as soon as finished. The honey will be as good or better if left on longer, but the comb will become dark.

### Brood-Chamber Crowded with Honey.

Upon examining one of my hives I found honey all through the brood-chamber, and, to my surprise, a dead queen. Shall I take about 4 of these frames and put them above in an extracting-super, or leave it to the new queen to which I was going to give 4 frames of full foundation? Just at present she has no place to lay. MINNESOTA.

ANSWER.—If you intend to extract the honey, you may as well extract it out of the brood-combs; but if you leave it in the brood-chamber the bees will empty out cells as fast as the queen needs them.

### Pumpkin Blossoms as Nectar-Yielders—Difference in Bees.

1. Do pumpkin blossoms, nettles, common mint, peppermint, snap-dragon, camomile and love-in-tangle produce honey or pollen for honey-bees?

2. I have five-banded Italians, the queens are large and fine looking, but do not seem to produce extra-good gatherers, as other bee-keepers about a mile distance, but in another valley, have nearly double the yield I have this sea-

son. I bought a late June swarm from one of them. Would you advise breeding from this swarm's queen, or introducing new stock by buying a new queen from some reliable breeder? and would you advise getting a red clover queen?

Although these other bee-men are in a different valley, they claim their bees come through a gap between the mountains into the valley mine are in.

My hives are 10-frame chaff, reduced to 8-frames by division-boards or dummies. PENNSYLVANIA.

ANSWERS.—1. Pumpkins and all kindred vines do, also the mints; I don't know about the others.

2. It is possible that your neighbor has better bees than yours; it is also just possible that his bees have the advantage of pasturage, even if they are only a mile away. Before deciding fully, you can compare the work of the new swarm with that of your other bees. As the expense would not be great, it might be well at the same time to get a queen of good stock—red clover queens may or may not be better than others—then when you see the work of the progeny of your new queen—that is, of colonies having queens reared from her—you can breed from the best.

### The Division-Board and Its Use.

In regard to the use of the division-boards, I would like to be informed. Is the board placed in the center of the brood-chamber or to one side, and for what purpose is it used, anyway? MINNESOTA.

ANSWER.—What you call a division-board is really a dummy. Its purpose is to fill up the extra space in the hive after all the frames are in. If the hive were just large enough to take in the frames it would be difficult to take out the first frame. The dummy is put in either side, and is easily taken out. When that is out there is plenty of room to take out the first frame. That gives the one and only use of the dummy.

### Swarming—Rearing Queens.

1. What is the matter with one of my colonies? It issued as a swarm June 14, that returned to the old colony; June 26, in the forenoon, they issued as a second swarm, which returned, and a third swarm came out in the afternoon, which I hived. Two days later a fourth swarm came out. I sent these back by killing the queen and cutting out all the queen-cells, for the old hive had a queen. They do not have any brood now.

2. How can I rear some queens when there are no queen-cells in any of my colonies?

3. What caused one of my colonies to cast two swarms that returned, and not any that stayed out?

4. Will an 8-frame dove-tailed hive hold enough honey to winter a 12-pound swarm? MINNESOTA.

ANSWERS.—1. June 14 the old queen issued with a prime swarm. Through defective wings, or for some other cause, she could not go with the swarm, and the bees returned. By June 26 a young queen had emerged, but she was also unable to go with the swarm, and you hived the swarm with a later queen. No brood would be in the hive till their young queen was old enough to lay.

2. Remove the queen from a strong colony and the bees will start queen-cells galore.

3. It may be that the queen could not fly. Then they tried it the second time with the same result. Then because of discouraging weather, or for some other reason, the bees gave up further swarming.

4. Yes, if the frames are full enough.

### Moths and Worms Destroying Bees.

How can I drive out the moths and worms that are destroying my bees? They kill the brood, and even get into the supers. How would it do to throw salt or lye into the hives? I fired one hive, but that was hard on the bees. ILLINOIS.

ANSWER.—There is no way you can drive the bee-moth without driving out the bees; but you can get the bees to do it for you. Keep your colonies strong, and they will look out for the moths, especially if you have Italian blood in your bees. You can, however, give the bees some help by disposing of the large worms in the combs. Take a wire-

nail and pick a hole in one end of a worm's web or gallery, then start at the other end, digging after the worm till it comes out for you to kill.

### Colonies Eating Eggs and Destroying Queen-Cells—Extracting from Brood-Combs, Etc.

1. Why do queenless colonies eat or destroy eggs given to them to rear a queen? One of my colonies destroyed a cell I gave them, and are queenless yet.

2. Can honey be extracted from comb having a small patch of brood in it, and not injure the brood?

3. How long can a queen be confined without injuring her future laying?

4. Why does a queen sometimes lay 2 or 3 eggs in one cell?

5. Why do bees swarm after filling the body of the hive and full size 8-frame body on top one-fourth full, as mine did yesterday, July 6? IDAHO.

ANSWERS.—1. Bees frequently eat or destroy eggs given them or left with them when queenless. I don't know why. They will also destroy queen-cells sometimes for no apparent reason.

2. Yes, if you don't turn rapidly enough to throw out the brood.

3. I don't know; probably a week or two; possibly longer.

4. Sometimes there seems to be something exceptional or wrong with the queen; she lays two or three eggs in a cell when other cells are empty.

5. Generally because crowded for room; in which case it's a sign of a good queen.

### Lazy Bees—Comb or Extracted Honey—Introducing Queens.

1. I have a colony of bees which seems lazy; they will not store honey in the super at all, while the others do. Would it be a good plan to requeen?

2. Which would be more profitable for this locality (northern Vermont) comb or extracted honey, both selling at the same price?

3. Which hive is the best to use for extracted honey, the 8 or the 10 frame Langstroth, or the Draper barn?

4. Do you think forced swarming could be successful here?

5. I have a new swarm in a Danz. hive which is too weak to work in a super. If I should have another swarm come out would it be all right to hive them in the same hive with the weak one?

6. What is the most successful way of introducing queens? VERMONT.

ANSWERS.—1. Probably; although without knowing more about the case it is hard to say.

2. Probably extracted.

3. One of the larger size.

4. Yes.

5. Yes, only you must look out for fighting if the added swarm has a virgin queen.

6. Hard to tell. The plans are legion, every plan heralded as the most successful, and each in turn failing at times. Lately I have been using the water plan with entire success, but whether it would always succeed so well is a question, for I have used it only during a honey-flow. Hold the queen in water till she is nearly, or entirely, drowned, then give her to the queenless colony by laying her on one of the top-bars.

Amerikanische Bienenzucht, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

## REVERSIBLE WALL MAP

—OF THE—

# UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

China, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. **Very useful in every Home and Office.**

**66 x 46 INCHES IN SIZE.**

## ELEVEN BEAUTIFUL COLORS.

**Best and Most Necessary Map  
Ever Issued.**

**No Home or Business House  
should be without it.**

### The **xxx** Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

### Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

### A **xxx**

### Marginal Index

is one of the invaluable features.

It gives an alphabetical list of countries, their location on map, style of government, population, area, products, minerals, imports, exports, etc.

It has been pronounced a **xxx**  
**Photograph of the World**

**The 1900 Census**  
of the largest American Cities is given.

One side shows a grand map of our great country, with **counties**, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

**1901 EDITION.—Every reader should consult it every day.** The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The Southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

**On the reverse side is the Library Map of the World.** The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. **The Inset Maps** are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps on one sheet, all for only \$1.50, sent by mail or prepaid express; or we will forward it free as a premium for sending us Three New Subscribers at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

**FROM MANY FIELDS**

**A Great Year for Bees.**

This has been a great year for bees here in Kansas. Some of the bees have swarmed again and again, and where they have had the proper care they have stored from 50 to 150 pounds of white clover honey per colony; and we still have the fall flow to come, which, at present, seems very promising.

I have the care of 60 colonies, some of them belonging to my neighbors, and I care for them on shares.  
J. M. CHRISTIE.

Coffey Co., Kan., Aug. 3.

**Brought Up Among Bees.**

If I live to see Aug. 4th, I shall be 67 years old. I was brought up among bees as a child, and was with them until I came to America, 23 years ago.

A friend of mine bought 7 colonies one year ago, and gave them to me to be run on shares. This year I have transferred all but 2, and increased to 24, and all are doing well. I put them in 8-frame hives with half sheets of foundation.

I was taught a good deal about bees and their nature and ways, yet I am glad that I

**A STANDARD-BRED  
QUEEN-BEE FREE**

To Our Regular Paid-in-Advance-Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with the Very Best Untested Italian Queens that can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

**A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.**

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription must be paid at least 3 months in advance. If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

Send us \$1.00 and the name (not your own) and address of One NEW subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due also.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows:

One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We are filling orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

**GEORGE W. YORK & CO., 144-146 E. ERIE ST., CHICAGO, ILL.**

**Please Mention the Bee Journal when writing Advertisers.**

can find so much help in the good old American Bee Journal. I can not do without it, and I am not like the poor fellow who wanted it stopped because he had no time to read it. Poor fellow; I pity the man.

I shall want to ask a question or two after a little if it is all right, as I am building a beehouse and want to go into extracting a little next year.

JOHN COATES.

Dunn Co., Wis., July 29.

[Send on your questions any time.—Ed.]

**Home-Made Grape-Nuts and Postum.**

In a late editorial there was an objection made to mixing honey with some cheaper food to increase the sale of honey. I wish to give an account of a little discovery that I lately made.

I was eating a slice of bread well saturated with honey when I was called away. I slipped the plate in the oven, and when I resumed my meal I had "Grape-Nuts." Further experimenting showed me that crusts of bread saturated with honey and dried in the oven gave me "Postum." I was using Postum and Grape-Nuts at the time, but I make my own now at a wonderful saving.

I wish that you would test this, and also discuss it at the coming convention.

Understand, the crusts of bread for Postum, and the inner loaf for Grape-Nuts—a "predigested" food—at a saving of 75 percent. What would it amount to if all the bee-keepers would use it?

S. TROWBRIDGE.

Clay Co., Fla., July 22.

**Not Satisfied with Honey-Prices.**

My 65 colonies of bees came through in good condition, although an exceptionally cold April was very hard on them. May, however, brought its fine weather, and we have done, I think, very well considering that we keep bees as a "side line."

We have increased, by swarming, to 88 colonies, and taken 3575 finished sections of honey.

I am not satisfied with the prices. For instance, the Kansas City quotations on the same grade of honey that I produce is \$3.50 and \$3.75 per case, while the Birmingham, Ala., price is \$3.00 a case, less freight, and 10 percent commission. When we remember what a city Birmingham is, and what a fine market it is for other produce, we can readily see the importance of asking more for our honey. And to ask more means to get more—I have tried it. We should get together and get 12½ cents at the apilary for our No. 1, and 16½ cents a pound for our fancy comb honey.

My wife enjoys the Sisters department, and if we did not have so many girl babies to look after she might sometimes write a line for it.

Register us as being in favor of black bees for comb honey; and the American Bee Journal for our guide.

R. V. GOSS.

Walker Co., Ala., Aug. 3.

**Fine White Clover Flow.**

The white clover honey-flow was fine, although a good deal of rain and bad weather have been sandwiched in. Had we gotten through the winter with strong colonies, or if we had even had fair weather to build up

## Long Tongues Valuable

South as well as North.

How Moore's strain of Italians roll in the honey land in Texas.

HUTTO, TEX., Nov. 19, 1902.  
J. P. MOORE.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly,  
HENRY SCHMIDT.  
The above is pretty strong evidence that red clover is not the only plant which requires long-tongued bees to secure the greatest quantity of nectar.  
Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Circle arrival and satisfaction guaranteed. Circular free. I am filling all orders by registered mail, and shall probably be able to do so till the close of the season.

from spring, we would have had a "bumper" crop. The quality is excellent.

I have been kept constantly "at the post" early and late. I feared overstocking my pasturage here at home, and took 25 colonies to another yard 6 miles away, but it would have been better to have kept them here until after the white clover flow weakened, which is about now. I have 110 colonies here, and will move some of them out to other yards to fill up for winter stores, in place of feeding them sugar, as I did last fall. T. W. HALL, Sioux Co., Iowa, Aug. 1.

### Exceptionally Good Season.

Last season I started with 5 colonies in box-hives, 2 of which I transferred to frame-hives before they swarmed. The 3 not transferred early in the spring gave me 8 good swarms, and the last one on June 10, 20 days after each box-hive colony cast the first swarm. I transferred them to standard or Simplicity hives, and now have 13 colonies, all in good condition. Some of the prime swarms are now working in the third super, and may need more room in a week or two, if the honey-flow continues. It has been exceptionally good this season.

H. A. SCHOPPENHORST.

Warren Co., Mo., July 27.

### Best Season In 10 Years.

This is the best honey season we have had in 10 years. My best colonies have given me 200 pounds each of extracted honey up to this date. I have tried for comb honey, averaging also 100 pounds each.

Although northern Michigan is better adapted to the production of extracted than comb honey, I have mastered this problem with the aid of more experienced apiarists.

GEORGE J. MOLONEY.

Cheboygan Co., Mich., July 22.

### A Theory on Queen-Rearing.

I have been much interested in the discussions in the American Bee Journal on queen-rearing. I have made a special study on that line for several years, and have had some experience in rearing queens artificially. Like Mr. Geo. B. Whitecomb, on page 475, I have a theory. Although he was loaded with smokeless powder, I think he missed the mark entirely. Now, I will not use any powder, but will just hand in my theory, and the readers of the "Old Reliable" can compare it with Mr. Whitecomb's.

We will suppose a colony of average strength; take them from their winter quarters the first of April; the bees begin gathering pollen, they have plenty of stores, and the queen quickly fills the comb within the cluster with brood. Now about this time the brood hatches. The weather being warmer, the bees gathering from fruit-bloom, the queen is soon laying at her full capacity, and soon has all the empty comb occupied, and now she must stop laying so rapidly there will not be so many larvae for the nurse-bees to feed. There is an over-supply of royal jelly, and the young bees are hatching by the thousands, with practically nothing to do, as there are several nurses for every larva. Now is the time, if the weather is favorable, that they will make preparation to swarm, and

## REMARKABLE

The Universal Satisfaction our QUEENS do give...

I was showing my father yesterday how my bees, which I bought from you, were out working everything in my apiary. Send me 4 Buckeye Red Clover and 2 Muth Strain Golden Italians. I will order more after next extracting.

Buckeye Strain Red Clover Queens. They roll in honey, while the ordinary starve. Muth Strain Golden Italians—NONE SUPERIOR. Carniolans—NONE BETTER.

**The Fred W. Muth Co.,**  
CINCINNATI, OHIO.  
Front and Walnut,

will rear good queens either naturally or artificially, for the reason that they have an over-supply of nurse-bees and royal food. It makes no difference about the size of the hive, so that it is full of bees in the above condition. If the weather is warm, and a good flow of honey, you will get good queens.

Now about the laying worker: I think any time when a colony has an over-supply of nurse-bees, that they sometimes feed some of the larvae more royal food, or feed for a longer time, than they should to develop a worker; and if the colony becomes hopelessly queenless one or more of these over-fed bees will try to perpetuate the colony, setting herself up as a queen, and laying eggs. I do not believe that there is any difference in the eggs of a queen, they are all fully developed eggs.

Now, we will suppose that we have a colony with the above conditions reversed, that is, the number of nurse-bees are too few to properly feed the young larvae, and some of them are stunted or weaned too soon. Now, what will be the consequences? I have a theory (but I am not very sure about it yet), that when those underfed bees hatch they will have paralysis. C. P. MCKINNON.  
Marshall Co., Iowa, Aug. 4.

### Single Blessedness Not Encouraged Longer.

With the help of my 13-year-old son I am looking after 235 colonies of bees. I do all of my own house-work. Strange for a man to talk so, isn't it? Well, I have done so for 11 years, and never until this summer have I so badly felt the need of a "queen" in the kitchen. Just imagine a man baking light bread, and it almost ready to go in the oven, and 115 swarms of bees out at one and the same time. Well, as a bee-keeper, I won't encourage single blessedness any longer.

This (Delta) county will have only a medium crop of honey, but it is of excellent quality. It has been the worst season for swarming in years, and it seemed almost out of the question to stop it.

Since reading the Bee Journal, this summer, I have come to the conclusion that a man can not be up-to-date who does not take one or more good bee-papers.

There are some questions I want to discuss with my brother bee-keepers when I get time in the near future, as it better prepares us for successful work. W. S. BEYERLIN.  
Delta Co., Colo., July 23.

### A Report from Nebraska.

In 1902 I increased from 9 to 22 colonies, because I did not know how to prevent it. After reading the "Old Reliable" I wintered the 22 colonies successfully, coming out last spring all strong excepting 2 colonies that were weak and queenless. I united them with 2 other colonies, leaving 20 colonies for 1903. I have not had a swarm, and hope to finish the season without increase.

I have kept bees eight years, and this is the first year I have studied their needs. I just begin to see what could have been stored by a few colonies well cared for had I taken a bee-paper and read it.

No farm should be without a few colonies of bees, even 2 or 3. Keep them contented with plenty of ventilation, some shade and foun-

## Tennessee Queens.

Daughters of Select Imported Italian, Select long-tongued (Moore's), and Select Straight 5-band Queens. Bred 3/4 miles apart, and mated to select drones. No bees owned within 200 miles, none imported within 3, and but few within 5 miles. No disease, 30 years' experience. WARRANTED QUEENS, 60 cents each; TESTED, \$1.25 each. Discount on large orders.

Contracts with dealers a specialty. Discount after July 1st

Send for circular.

(Successor to Chas. F. Muth and A. Muth.)

dition when needed, and you will have a pure sweet for the table.

Do not neglect to subscribe for some good bee-paper, then take time to read it, advertisements and all. The successful farmer reads one or more good farm papers. Why not the bee-keeper?

The bees have had one continual picnic since white clover commenced to bloom, and the second crop of alfalfa was left standing until the winter wheat and early oats were in the shock, much to the joy of the busy bee.

The honey crop in Platte county for 1903 will be a fair one. Extracted slow, and comb honey in quick demand.

Let us hear from more Nebraska bee-keepers.

S. P. DRINNIN.

Platte Co., Nebr., Aug. 1.

### Cause of Loss of Queens.

After reading the item on "Bees Carrying Queens Out," I think I can give the correct cause. I think they killed the queens.

Last spring I lost several queens, and will give the cause of their loss. Out of a house-apiry containing 19 Danz. hives I lost 5 colonies and 6 queens, 4 of the colonies dwindling after their queens were lost.

During the early rains the packing got wet, and I removed it. I then discovered that cleats nailed on the inside of the hive kept the covers from fitting on tightly, and the chaff cushions on top of the brood-nest got in a bad condition. I concluded to remove the cleats, and in doing so jarred the hives, causing some of the colonies to ball their queens. The cover of the hive was heavy, and in removing it and placing it back on caused considerable jarring.

A bee-keeping friend told me of an experiment he once tried. Going to a strong colony he struck the hive one blow with a hammer. Upon examining the colony a little later he found the queen had been killed.

Be very careful not to jar the hives during early spring, especially in removing them from the cellar, or in case it is necessary to handle the frames. With fixed frames special care must be exercised or else you will lose more or less of your queens.

A. G. YOUNG.

Cattaraugus Co., N. Y., July 30.

# BEE-BOOKS

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie St., - CHICAGO, ILL

**Forty Years Among the Bees,** by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeping Guide, or Manual of the Apiary,** by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 54th pages. 235 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee,** revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this work by Rev. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture,** by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bee. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20

**Scientific Queen-Rearing, as Practically Applied,** by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey, or Management of an Apiary for Pleasure and Profit,** by Thomas G. Newman.—It is nicely illustrated and contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture, its Methods and Management,** by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read it. Contains 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur,** by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register,** by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood.**—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping,** by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment,** by Prof. F. R. Cletcher.—Its Cause and Prevention. 10 cts.

**Foul Brood,** by A. R. Kohske.—Origin, Development and Cure. Price, 10 cents.

Close Saturdays a 1 p.m.—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply from 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

## National Convention Notice.

The 34th Annual Convention of the National Bee-Keepers' Association will be held in Los Angeles, Calif., on August 18, 19, and 20, 1903, in Blanchard's Hall, at 235 S. Broadway. The headquarters of the Association during the convention will be at the Natick House, corner of First and Main Streets.

It is expected that this will be the largest and best convention ever held by the bee-keepers of America. Every one interested in the production of honey should be present, if at all possible. Besides the question-box, which will be one of the special features of the program, the following subjects will be discussed in papers by the prominent bee-keepers mentioned, afterward a free and full discussion will be had by all in attendance who wish to participate. The subjects and men to introduce them are as follows:

"Honey Exchanges and Co-operation Among Bee-Keepers" by Prof. A. J. Cook, Claremont, Calif.

"How to Make Honey Producing Extracted Honey," by J. F. McIntyre, Sespe, Calif. Response by E. S. Lovess, Salt Lake City, Utah.

"The Production and Sale of Chunk Honey," by Homer H. Hyde, Floresville, Texas. Response by C. P. Dadant, Hamilton, Ill.

"The Eradication of Foul Brood," by N. E. France, Platteville, Wis.

"Reminiscences of Bee-Keeping and Bee-keepers in the Early Days," by A. I. Root.

There will be reports by the officers, which include Pres. Hutchinson, General Manager France, and Secretary York.

The California bee-keepers are planning to give all in attendance one of the grandest receptions imaginable on the first evening, Tuesday, Aug. 18. No one will want to miss this feature of the convention.

It is an opportunity of a lifetime to take the trip to California, as all convention members do avail themselves of the low railroad rates, as it comes at the time of the Grand Army meeting in San Francisco, and the same rates apply to Los Angeles.

For further information or particulars that may be desired, address the Secretary, 144 E. Erie St., Chicago, Ill.

GEORGE W. YORK, Sec.

## HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Aug. 7.—Consignments of the new crop are coming to commission houses that have not had honey for years past, and as there is not any consumptive demand they are finding difficulty in disposing of it. Under such conditions it is hardly possible to give accurate prices, as some merchants are selling honey that others hold at 15 cents. The prices given in our last quotations are asked, but feeling is unsettled. Beeswax steady at 30c.

KANSAS CITY, July 28.—Some new comb honey in market, but on account of hot weather the demand is not heavy, but will be getting better every day. Fancy white comb, 24 sections, per case, \$3.50; No. 1, white and amber, 24 sections, per case, \$3.25; No. 2, white and amber, 24 sections, per case, \$3.00. Extracted, white, per pound, 50c; amber, 50c. Beeswax, good demand, 25c/30c. C. C. CLEMONS & Co.

ALBANY, N. Y., July 18.—We are receiving some shipments of new comb honey, mostly from the South; the demand light as yet; we are holding at 15c/16c. Extracted slow at 60c/7c. The crop of honey in this vicinity very light, and we shall have to depend upon other sections more than ever for our supply of honey. Beeswax, 30c/32c. H. R. WRIGHT.

CINCINNATI, Aug. 6.—The supply about equals the demand for extracted honey. We are selling amber extracted in barrels, 54¢/60¢, according to quality. White clover, 40¢/45¢, and cans, 70¢/8¢, respectively. Comb honey, fancy, in no drip shipping cases, 16¢/16½¢. Beeswax, 30c. THE FRED W. MUTH CO.

NEW YORK, July 8.—Some new crop comb honey now arriving from Florida and the South, and fancy stock is in fair demand at 14c per pound, and 12¢/13c for No. 1, with no demand whatever for dark grades.

The market on extracted honey is in a very unsettled condition, with prices ranging from 50¢/55c for light amber, 54¢/60¢ for white, and the common Southern, at from 50¢/55¢ per gallon. Beeswax steady at 30c. HILDBRETH & SEGLEEN.

CINCINNATI, July 20.—The demand for honey continues slow. New extracted and comb begins to be offered largely. Prices show a downward tendency. Extracted sells at the following prices: Amber in barrels, 50¢/55¢; alfalfa, 45¢/50¢; white clover, 70¢/75¢. Comb honey, fancy water-white, will bring 14¢/15c; no demand for lower grades. Beeswax, 27¢/30c. E. H. W. WEBER.

SAN FRANCISCO, July 22.—White comb honey, 11¢/13¢/4c; amber, 8¢/10c. Extracted, white, 5¢/6¢; light amber, 4¢/5c; amber, 4¢/4½c; dark, 3¢/4¢c. Beeswax, good to choice, light, 27¢/29c; dark, 25¢/27c.

This season's crop is not only unusually late, but is proving much lighter than was generally expected. While the market is unfavorable to buyers, the demand at extreme current rates is not brisk and is mainly on local account.

**WANTED! Extracted Honey.**  
Send sample and best price delivered here; also Fancy Comb wanted in no-drip cases.  
THE FRED W. MUTH CO.

Hamilton, Hancock Co., Ill

Please mention Bee Journal when writing.

## RED CLOVER HONEY-QUEENS.

SPRING BLUFF, Wis., July 18, 1903.

Dear Sirs:—I thought I would write you a few lines in regard to the Red Clover Queen I got from you. They haven't swarmed yet this summer, but I have taken 48 sections from them and there is 24 more all ready to come off.

Just think, 72 nice sections of as nice honey as ever was made, and only July 18th. It seems as though they will surely fill 48 more.

I don't know whether their tongues are any longer than any of the others, or whether they entered it from Red Clover, but surely such bees are worth money.

I use the 8-frame Junco frame.

C. E. KELLOGG.

C. E. KELLOGG, Spring Bluff, Wis.

Dear Sir—We have yours of July 12th and would be glad to have you advise us by return mail with reference to the capping of the honey. Some parties say the capping from these bees is not white, and we would be glad to have you advise us how your honey is in this respect, and oblige,

Yours truly,

THE A. I. ROOT CO.

SPRING BLUFF, Wis., July 31, 1903.

THE A. I. ROOT CO., Medina, Ohio.

Dear Sirs:—Yours of July 24th at hand to-day. In regard to your question in reference to the capping of the honey from these bees I will say that it is simply perfect, beautiful snow-white and every box perfect, 56 one-pound sections now. I am quite sure they will fill two more supers, which will bring the number up to 144. I would like very much to have you see a few of those sections, and I will be glad to send you a few.

Now, I haven't told you ALL their good qualities yet. I am sure they are by far the most gentle bees to handle I have. I could take off the sections without smoke or veil without getting stung.

There are a few traits about them that don't seem to want to swarm. They will fill the 144 sections, which I am sure Respectfully,

C. E. KELLOGG.

seem to me are quite remarkable aside from their honey-gathering, and I will write you again in a few weeks and let you know if they fill the 144 sections, which I am sure they will.

### AGAIN READY FOR PROMPT DELIVERY.

We were snowed under with orders for a few weeks, but here we are again with good Queens and prompt service.

### Red Clover and Honey Queens.

Untested .....	Each.	\$1.00	\$1.25	Breeding .....	Each.	\$3.00
Tested .....	2.00	11.40	17.10	Select Breeding .....	7.50	
Select Tested .....	3.00	17.10		Extra Select Breeding .....	10.00	

With any of the last three we include one frame of bees and brood to insure safe arrival, for which we make no charge. These must be sent by express. Queen circular free.

**THE A. I. ROOT CO., Medina, Ohio.**

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# 200 Nuclei with Red Clover Italian Queens

## Ready for Immediate Delivery.

We have arranged with a bee-keeper having a large apiary adjoining Chicago, to furnish us with Nuclei, each having a Red Clover Queen reared from one of Root's specially selected Red Clover Breeding Queens. They will be shipped direct from the apiary at these prices, cash with the order:

One 3-frame Nucleus with queen, \$3.50; 5 or more at \$3.00 each—on standard Langstroth frames in light shipping-boxes.

Or, we can furnish these Nuclei in 8-frame hives containing 3 extra brood-combs and 2 extra frames with foundation starters, at these prices:

One Nucleus for \$4.50; or 5 at \$4.00 each.

With a good fall honey-flow these Nuclei can easily be built up into good, strong colonies for wintering.

Address all orders to

# Dr. Miller's New Book

## SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S

### "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

## Editorial Comments

**Queen-Nurseries for Honey-Producers.**—Queen-rearing is quite a business by itself, and the man who makes a business of rearing queens to sell can afford to use plans and appliances not generally used by one who rears queens only for his own use. Yet if the importance of having best queens were felt, as fully as it should be, the average honey-producer would in his plans and appliances probably come nearer the commercial queen-rearer than he now does. Probably few honey-producers use anything in the line of a queen-nursery, but it might be an advisable thing to do for any one with 50 or more colonies.

Queen-cells nearly mature are put in a queen-nursery where the young queens may emerge from their cells and still be confined separately, and then instead of a queen-cell, a virgin queen may be given to a nucleus or a colony. There are advantages in this. The cell may contain a dead larva, or it may contain a young queen with defective wings, making her worthless. No loss can occur from either of these causes if the young-queens be allowed to emerge in a nursery. A good cell is sometimes torn down by the bees, and as a young queen is not always easily found, days may be wasted by the bee-keeper awaiting the laying of the queen when no queen is present, for he can not always tell by the look of the cell whether a queen has emerged from it or not. It is a nice thing to have a few virgin queens on hand for emergencies, and with a nursery a number can be kept in one hive, but without the nursery only one can be thus kept.

A friend who rears queens only for his own use says he would use a nursery if he never used queen-cells except by taking them from colonies that had swarmed. He has used with satisfaction both the Pridgen and the Stanley. The Pridgen has the advantage that there is no possibility of the bees getting at the cells to destroy them, and a cell may have quite a hole in it and yet hatch out all right. Neither can a queen ever get out of its own compartment, as it sometimes does in the Stanley. The Stanley has the advantage that being made of excluder-zinc the bees can get to the cells as freely as if they were on the combs. A cartridge containing a young queen can also be taken out separately to be taken elsewhere, whereas with the Pridgen the young queen must be allowed to come out of its compartment before it can be taken elsewhere.

**Comb vs. Foundation.**—In a previous issue of this journal, Adrian Getaz suggests the prevention of swarming by taking out of each colony every few days a frame of brood, and replacing it with a frame of foundation, saying that empty comb will not answer the purpose, as "the bees would often fill it with honey before the queen could lay in it." In one of the two-men conventions held by Editor Hill and O. O. Poppleton, as reported in the American Bee-keeper, this matter came under discussion, and Mr. Hill says:

It will be noted that Mr. Getaz advocates the use of foundation in preference to a brood-comb because of the additional advantage thus secured by the queen. Here is where Mr. Getaz and Mr. Poppleton collide. According to the experience of the latter gentleman, either a sheet of foundation or a comb which had never been used for breeding purposes, are effectual barriers to the queen's progress—acting, in fact, somewhat as a division-board would do in dividing or

restraining the brood-nest, according to the position occupied by the said new combs or foundation; whereas, if given a brood-comb which has been formerly used for breeding purposes, she is quick to avail herself of the opportunity to extend her egg-laying operations. It is understood that during the height of the season, when brood-rearing is being pursued strenuously, the queen will quite readily take to "any old thing" in the way of combs, whether old or new, or whether full sheets or starters are used; but the point is, the queen's individual interests are greatly assisted by the use of old brood-combs, under all circumstances.

"When" two such "doctors disagree, who shall decide?" It is very certain that at least sometimes, when a frame or two frames of empty comb are given to the bees in the time of harvest, those combs will be filled with honey before the queen could have the time to fill them with eggs. That does not, however, leave it a foregone conclusion that in all cases this filling of honey into the combs would be an effectual bar to their use by the queen. The question is whether, when the combs are thus filled by honey, the bees will again empty it out as fast as needed by the queen.

Mr. Hill urges that the queen prefers old comb in which to lay; Mr. Getaz, that the bees prefer old combs in which to store honey; both are no doubt correct; the practical question remains, Will a frame of foundation or one of drawn comb do most toward the prevention of swarming? If a frame of drawn comb and one of foundation were given side by side, would that help to settle it?

**Bee-Paralysis Reconsidered.**—The following note has been received from Dr. Miller:

MR. EDITOR.—I take pleasure in forwarding to you a letter received from O. O. Poppleton, and although intended only as a private letter, it is of such general interest that I am sure my good friend, Mr. Poppleton, will forgive me for giving it entire to your readers.

I must thank Mr. Poppleton for calling attention anew to his method of cure, and ask his pardon that in the press of affairs it was not given the attention it fully deserved. Mr. Poppleton is a man of much and varied experience, whose word is entitled to thorough credit, and it is to be regretted that of late years we see so little from his pen.

C. C. MILLER.

The letter of Mr. Poppleton referred to reads as follows:

DADE CO., FLA., July 11, 1903.

DR. C. C. MILLER, Marengo, Ill.—

MY DEAR FRIEND:—Will you grant me the privilege of hinting at a change which ought to be made in some of the answers to questions you have made within the last few months? I refer to the idea that there is no cure known for bee-paralysis, etc. See your answers in the American Bee Journal for June 4 and June 11, 1903. E. R. Root makes the same statement in a still more positive manner. See Gleanings for Aug. 15, 1902, page 679; for Sept. 1, page 720; Feb. 15, 1903, page 100; and May 1, page 396.

There is a certain cure known for the disease—one described by myself several years ago in the Review, and a couple years ago in the American Bee-keeper. I enclose a copy of the latter, which you will see touches on all the points raised by inquirers and writers in the American Bee Journal and Gleanings within the last few weeks.

Please notice how extensive my experiments were—some 40 or 50 cases cured with considerably over a hundred untreated cases under observation; also the careful, thorough manner of conducting the experiments, by treating only a few cases at a time, and comparing them with other still untreated cases; then treating a few more at a time, and so on until all were cured. The result of this careful work was that every treated colony recovered in about the same number of days after treatment, while all the others remained diseased until treated. Handling as directed in the article prevents all loss of brood or brood-combs, and is a very important point.

If the condition of my eyes would allow, I would gladly write an article on this subject for either of the papers, which would fully answer all the inquiries lately made. In lieu of that I thought that perhaps calling your attention to what is already in print would give you a chance to help any future inquiries.

This is not written for publication, simply for your future use, if ever needed.

The coming meeting of our Association at Los Angeles, Calif., comes so early in the season that it is impossible for me to get away to attend it. I am much disappointed, but it can not be helped. We have three distinct flows of honey here in South Florida—winter, spring, and summer. The first and last are almost total failures this year, while the spring flow was extra good. The crop, as a whole, the poorest I have had in years—probably a little less than 100 pounds per colony.  
O. O. POPPLETON.

P. S.—I think the many failures reported in the use of sulphur is simply because it wasn't rightly applied. Everything, to succeed, has to be done rightly.

On another page of this number will be found an article written by Mr. Poppleton for the American Bee-Keeper of April, 1901, which gives in full his treatment of the disease.

One of the strange things about bee-paralysis is the very great difference of opinion as to its importance. Some view it as a much-dreaded scourge, while others think it scarcely deserving attention. And with reason. In the North it appears in a mild form, seldom affecting any considerable number of bees, always disappearing of itself, while in the South it is a very serious matter. Having lost from it "about 15,000 pounds of honey, and quite a number of colonies of bees," Mr. Poppleton can certainly not consider it a matter for light consideration in Florida, where he now lives.

For the benefit of the novice, it may be well to mention briefly the signs by which the disease may be recognized. Some of the bees of a colony will be found on the alighting-board trembling as with the shaking palsy. Then they become somewhat swollen, and are black and shining from the removal of their plumage, perhaps caused by the abuse of the other bees which drive them from the hive; and later they stagger off upon the ground to die. If you find this condition of affairs in the North, you need scarcely give the matter a second thought; it amounts to but little, and in all probability will disappear of itself, perhaps to return in a short time, perhaps not at all. But if in the South, it will be well to give it immediate attention, and it will be well to apply thoroughly Mr. Poppleton's plan of cure *exactly as he gives it*.

**Bees Feeding Each Other.**—On another page appears an article from Arthur C. Miller, referring to some remarks made on page 467. The bump of veneration seems to be poorly developed in Mr. Miller, if not entirely lacking. No matter how hoary with age may be any tradition of the fathers, before accepting it as truth he insists that it must have the endorsement of the bees, just as much as if it were a belief uttered only yesterday.

It will be noticed that some care was taken not to come into very violent conflict with Mr. Miller's statements, chiefly a few questions asked. And with the same continued caution some questions may be mentioned that might be asked by some one anxious to defend the traditions of the fathers. Mind you, it need not necessarily be understood that in this quarter any doubt is entertained as to the impregnability of Mr. Miller's position; just a suggestion of questioning that might arise in the mind of one accustomed to cherishing the old traditions. Some of those questions might be the following:

When bees appear to be caressing the queen, but are not caressing her, what are they doing?

When a queen pokes her tongue from the partly opened cell as a feeler, what is she feeling after?

If food always has to be asked for, how does the queen ask for it?

Having mentioned these possible questions, the American Bee Journal might take the responsibility of asking just one question on its own account. In the article in the present number emphasis is put upon the point that food is not given by the tongue, but by the mouth, and the opening sentence gives the impression that in this quarter the opposite view is held. Now the question is: What is there said on page 467 in any way hinting that food is given by the tongue rather than by the mouth?

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

The Premiums offered this week are well worth working for. Look at them.

## Miscellaneous Items

**THE APIARY OF R. H. JEURS**, of Australia, as shown on the first page, appears to be a model of neatness. The group of people also are a happy looking company. When sending the picture, Mr. Jeurs wrote as follows:

I have been a subscriber to the "Old Reliable" for about eight years. I have about 600 full colonies and nuclei. I go in for queen-rearing extensively, and all my queens are reared on the Doolittle plan.

This not being a first-class locality, I have not made a record for honey, but it is improving, and a few years ago I thought I was playing up, having gotten 3 tons of honey; later I reached 12 tons, and bid fair to go to 20 or 30 tons.

I have worked up a private demand for my honey, and have thus disposed of 5 tons in one year. By so doing I have made bees pay me.  
R. H. JEURS.

**NOTICE OF DISSOLUTION.**—By mutual agreement the partnership heretofore existing between Charles Mondeng and P. J. Doll, under the name of the Minnesota Bee-Keepers' Supply Manufacturing Co., of Minneapolis, Minn., has been dissolved, Charles Mondeng retiring from said firm. All accounts and bills receivable due the late firm are to be paid to said P. J. Doll, and all accounts and bills payable will be paid by said P. J. Doll. The business will be continued under the old name, and at the same stand.  
CHARLES MONDENG.  
P. J. DOLL.

**A CONVENTION OF TWO.**—Perhaps it might be called a series of conventions. That experienced veteran, O. O. Poppleton, each year takes his bees to the vicinity of the Florida home of Editor Hill, of the American Bee-Keeper. This year the bee-business in that region has not been very rushing, and it is only natural that Mr. Poppleton should occupy some of his leisure in making frequent visits to the editorial sanctum. As might be expected when two such men meet, each visit is a veritable bee-convention, and the first pages of the August number of the American Bee-Keeper is occupied with what the editor calls "A Medley," discussing various things apicultural suggested by the reading of this and other journals, making very interesting reading.

## Association Notes

### The Wilson Co. (Tex.) Association.

Pursuant to a call, the bee-keepers of Wilson, Karnes, Goliad, Atascosa and Bexar counties, Tex., met at the Court House in Floresville, and organized themselves into an association to be known as the Wilson County Bee-Keepers' Association. The following officers were elected: H. H. Hyde, president; J. B. Scott, vice-president; and M. C. West, secretary.

A committee was appointed to draft a constitution and by-laws for the association, and report at next meeting.

On motion, Mr. Homer H. Hyde was nominated and unanimously elected as a delegate to the convention of the National Bee-Keepers' Association at Los Angeles.

The following bee-keepers were present: Louis H. Scholl, L. Stachelhausen, H. Johnson, H. Piper, J. B. Treon, H. H. Hyde, M. C. West, G. F. Britton, J. M. Bell, J. D. Bell, J. B. Scott, W. W. Davidson, W. T. Brate, W. E. Crandall, W. H. Mathis, W. M. Wingard, J. T. Bell, M. M. Faust, L. Haynes, E. N. Smith, J. M. Forest, Jos. Robinson, and J. H. Kolmeyer.

The convention then adjourned to meet Sept. 3 and 4, 1903.

### Organized a Bee-Keepers' Business Association.

In convention at Floresville, Tex., Aug. 7, the bee-keepers of Wilson, Atascosa, Karnes, Goliad and Bexar counties voted to organize themselves into an association for the purpose of assisting the bee-keepers to a better market for their products, and for purchasing and distributing bee-keepers' supplies.

It was voted that the plan of association be modeled after that of the Colorado Honey-Producers' Association, an association of the bee-keepers of Colorado, which has been eminently successful in disposing of the product, and meeting the needs of the bee-keepers of that State.

Books were opened for the subscription of stock in the association, shares to be worth \$10 each.

The organization then proceeded to the election of officers, which resulted as follows: Dr. J. B. Treon, president; J. B. Scott, vice-president; and Will M. Wingard secretary.

Adjourned to meet Aug. 21, 1903.

## Convention Proceedings

Proceedings of the Texas Bee-Keepers' Convention Held at the A. & M. College, at College Station, July 8 to 10, 1903.

BY LOUIS H. SCHOLL, SEC.

The annual meeting of the Texas Bee-Keepers' Association was called to order by Pres. Udo Toepferwein, at 9 a.m. of July 8.

The first subject of discussion was that of the election of officers for the ensuing term. This, according to the printed program, was to be left toward the close of the meeting, but as some preferred to have the election of officers first, it was, after some discussion, put to a vote, resulting in that the election be proceeded with, and these were elected: President, W. O. Victor; Vice-President, J. K. Hill; and Secretary-Treasurer, Louis H. Scholl.

The following committees were then appointed by Pres. Victor:

A committee of three to revise the Constitution and By-Laws: J. B. Salyer, Louis H. Scholl, H. H. Hyde; and to which was added the name of Prof. E. Dwight Sanderson.

A committee to inspect and to report on the College Experimental Apiary: J. M. Hagood, F. L. Aten, and Udo Toepferwein.

A committee to judge the honey on exhibition: H. H. Hyde, J. F. Teel, and J. K. Hill.

A committee on resolutions: O. P. Hyde, W. H. White, and Z. S. Weaver.

A committee on program for the next meeting: O. P. Hyde.

The next annual meeting of the National Bee-Keepers' Association, to be held at Los Angeles, was discussed for some length, and also what had been done by several of the members of the Texas Association in trying to get that meeting to be held at San Antonio this year. Every effort was used to get the meeting, but as the factor of cheap railroad fare plays the greatest part in the selection of the place of meeting of that Association, and as the meeting of the G. A. R. at San Francisco this year offered such inducements, it was most natural that the National should follow them. That left Texas to come in second. And we are glad of that fact. What we now have for the National is a most urgent invitation to come to Texas with their next meeting—and if that can not be, then we want them to come the next, or the very first chance that they may get. The Texas Bee-Keepers' Association is quite a portion of their body, and we certainly have a right to have them come to meet with us one time, anyway. There are about 70 of us who are members of that great Association, and we are growing in numbers; and we would grow much faster if the Association would only come to Texas once, so that the bee-men of this great State could get better acquainted with it and its objects. We are hoping that we shall see them soon.

The Texas Association will send several delegates to the Los Angeles meeting, viz.: Udo Toepferwein, Louis H. Scholl, and W. O. Victor.

Then the subjects of the regular program were taken up, and Prof. E. Dwight Sanderson, the State Entomologist, addressed the bee-keepers on

### APICULTURAL WORK OF THE A. & M. COLLEGE.

First, let me extend you a cordial and hearty welcome as you again assemble here to discuss methods for the improvement of Texas bee-culture. Being charged with the direction of the experimental apiary here, it is with much pleasure that I meet this Association for the first time, to listen to your discussions, and to learn from you those lines of experimental work which will be of most immediate practical value.

The apicultural work of the A. & M. College falls naturally under three heads; viz.: (1) Investigation, (2) Police Work, and (3) Education.

(1) INVESTIGATION.—The experimental apiary, founded through the efforts of this Association and my predecessor, Prof. F. W. Mally, has been undergoing a steady process of development. In a little over a year it is impossible to fully

equip such an apiary and secure large results with but part of one man's time devoted to it. Furthermore, it requires time to become familiar with methods suited to the honey-flow of the locality. I feel, therefore, that my former assistant, Mr. Wilmon Newell, has done exceedingly well, in view of the fact that it was possible to devote but a part of his time to this work. We lost his services reluctantly, but were unable to meet the inducements offered elsewhere. Mr. Newell will present the results of his work to you so that any review by me is unnecessary.

It has been apparent for some time that for successful work the entire time of one man should be devoted to apiculture. We have, therefore, secured your secretary, Mr. L. H. Scholl, as assistant and apiculturist, who will give practically his entire time to apicultural work after the present summer.

We have also found that considerable additional equipment is needed at the bee-house. It is our purpose to add another room to the present house, with cellar beneath it, and to secure all necessary apparatus and supplies for the lines of investigation outlined below. For this purpose we have set aside \$900—almost double the amount available during the past year. College Station is by no means an ideal place for bee-keeping, and we have found the honey-flow insufficient to supply over 40 colonies at most. This, and other factors, have led us to arrange for two out-yards in the Brazos River bottom, some ten miles from the college, where experiments will be carried on under our direction, but without expense to us. Future lines of investigation proposed by Mr. Scholl and Mr. Newell, many of them already undertaken, may be briefly mentioned as follows:

Comparison of hives and construction of improved and special hives; comparison of races of bees; comparison of methods of management; methods of preventing swarming; methods of running out-yards; studies of the home manufacture and styles of comb foundation; methods and profit of manufacture of vinegar from cheap honey and honey-waste; methods of bottling honey; planting for honey; native honey-plants, etc. These, and other problems which may suggest themselves, will be taken up as fast as feasible. With the additions now contemplated we shall have the best apiary of any agricultural college or experiment station, and the only one, to our knowledge, with an apiculturist. We may, therefore, reasonably expect to secure results of value from these investigations during the next few years, which will be published upon completion.

(2) POLICE WORK.—Through the efforts of this Association, a bill for the suppression and control of foul brood and other diseases of bees was introduced in the 28th Legislature by Hon. Hal Sevier, of Sabinol, to whom we are under many obligations, and finally passed. The law covers the situation quite effectively, but most unfortunately provides no funds for its enforcement. The writer called the attention of the author of the bill and the officers of this Association to the necessity of providing funds for the enforcement of the law if it were to become effective, but without avail. This is to be much regretted, and I believe shows the necessity for further strengthening this Association, both as regards membership and organization, in order that the importance and size of the industry may receive better recognition. But though no funds for the inspection work contemplated by this law are available, its mere enactment is a distinct forward step, and funds for its enforcement can doubtless be provided by the next legislature. Meanwhile we shall endeavor to do all possible toward the enforcement of the law where foul brood is known to exist by correspondence, and will prevent any knowing violations of its provisions as far as possible. This Association can be of the greatest assistance in this work in creating public sentiment in favor of the most thorough treatment of diseased bees. It also seems to me that local or county associations or sections of county farmers' institutes could do much toward the discovery of diseased bees and securing their proper treatment.

(3) EDUCATION.—Two lines of educational work are in our charge—instruction of students at the college in apiculture, and the instruction of farmers and bee-keepers throughout the State by means of literature and talks at farmers' institutes and bee-keepers' conventions. Until the present year no provision was made for instruction in apiculture in the regular agricultural course. It is now an elective study through the senior year, so that all who wish may obtain a full course. Special courses will be given to suit individuals whenever possible. Considerable student labor is also employed at the bee-house, and a boy interested in bees can thus secure a deal of practical knowledge

of them. Our equipment for the instruction of students is undoubtedly the best of any institution in the country. It remains for the bee-keepers of the State to make this branch of our work a success. Send us your boys, and get your neighbors' boys to come to the college for a full agricultural course, or a short course in bee-keeping and special subjects. Perchance older heads may also find it profitable to spend a few months here in study; one of our most enthusiastic students, in the short course in agriculture last winter, had passed three score years and ten. Before many years go by we hope to send out from this institution some bee-keepers who will be a credit to the efforts of this Association, and will do much for bettering the status of Texas apiculture.

We are wont to be proud of the fact that Texas leads all the States in amount and value of bees and their products. I have been studying the statistics of apiculture in Texas and other States as given in the 12th United States Census, and have secured some facts on this subject which may be of interest to you. It seems that Texas bee-keeping is much like the live stock industry with the longhorn steer—large quantity and very little quality. We are proud to number some of the most successful and progressive bee-keepers of the country as Texans; but for every one of these there are a thousand devotees of the old "bee-gum" whose bees and their product vastly increase the quantity, but woefully lower the quality of the apary products.

First, let us compare the industry of Texas with that of the United States and other States and sections. Bee-keeping is more popular here than in many States. Seventeen percent of our farms have bees, while there are only 12.3 percent of those throughout the United States. But in nearly all other respects Texas stands near the bottom of the list.

The average amount of honey produced on farms reporting bees for the United States is 86.5 lbs.; for Texas 79.5 lbs.; slightly more than the average for the South Central, 66 lbs., and South Atlantic States, 62.4 lbs., but less than the North Central, 85.8 lbs., North Atlantic, 106.9 lbs., and far below the Western States with 304.4 lbs. per farm reporting. Likewise the average value of honey produced on farms reporting bees for the United States is \$9.42; for Texas, \$7.80; the South Central and South Atlantic being \$6.90 and \$6.78; while the values are greater in the North Central, \$10.07, North Atlantic, \$12.50, and Western, \$23.38. In the United States the honey product per colony of bees averaged 14.9 lbs.; for Texas, 12.2 lbs.; for the North Central States, 16.9 lbs.; for New York, 18 lbs.; for California, 28.3 lbs.; for Colorado, 29 lbs.; and for Arizona, 49 lbs. The average for Texas is slightly more than that for the Southern States, 11.3 lbs., but is exceeded by that of Arkansas, Kentucky, Virginia, West Virginia, and Florida. The average production of wax per colony for the United States was 43 lbs.; for Texas, 41 lbs.; for Arizona, 69 lbs.; and California, 89 lbs.

But the value of the product of the average colony is the best indication of the quality of our bees and status of bee-keeping in Texas. The average value of honey and wax produced per colony for the United States was \$1.62; for Texas, \$1.19; lower than the average for all the Southern States, \$1.20, and exceeded by all other sections of the country as follows: North Atlantic Division, \$1.94; North Central Division, \$1.98; Western Division, \$2.54; California, \$2.56; Colorado, \$2.87; and Arizona, \$3.55. In other words, whereas the Texas product was valued at \$468,527 in 1899, had the colonies been as productive as the average for the United States would have been worth \$637,363; and had they produced as much as those in the Northern divisions it would have brought \$770,972; while had they averaged as well as the Western division the value would have been more than doubled, and considerably over a million dollars.

The same point is brought out by a consideration of the average value of bees per colony. For the United States this is \$2.42; for Texas but \$1.91; there being only seven of the States (mostly southern) having a smaller value, while the average for all Southern States was \$1.95; for the North Central, \$2.95; Western, \$3.10; and North Atlantic, \$3.31. Thus the total value of Texas bees, \$749,483, though about 50 percent greater than that of any other State, would have been increased to \$973,090 had they been worth the average for the United States, and to about \$1,200,000 had they been worth the average value exclusive of the Southern States. Altogether, had Texas been of a quality of those of the average for the United States their total value, with value of their product, would have been about \$400,000 greater; and had they averaged with those of the Northern and Western States, they would have had about \$750,000

greater value, and been worth approximately one and a half million dollars.

But let us consider apiculture in Texas locally by counties, and we may possibly learn something which will throw light upon the above figures. I have compiled two maps, showing the local conditions of apiculture in Texas. The first gives the number of colonies in each county, and is colored according to the number of colonies per farm in each colony. The latter is secured by dividing the number of colonies by number of farms. It is to be regretted that the census does not give the number of farms reporting bees for each county. We see that 59 counties, mostly in the Panhandle country, have no bees. Of these, 40 have a considerable poultry product. Twenty-six counties have less than 100 colonies. East of Austin there is not over an average of one colony per farm. Twenty-eight counties, scattered through the central part of the State, have 2 to 4 colonies per farm. But 7 counties have 4 to 6 colonies per farm; five—Chambers, Dimmit, Frio, Kinney, and Kimble—have 6 to 10 per farm, while Uvalde has 23, and Zavalla 35 per farm. These figures show that the number of colonies are pretty evenly distributed throughout the humid portion of the State, but that there are relatively many more per farm in central and southwest Texas.

To appreciate the conditions, however, we must consult the second map, showing the pounds of honey produced per colony and value of bees per colony in each county. The map is colored according to the honey produced per colony. These figures show that the valuation placed upon colonies is very largely a local matter, and not related to the productiveness of the colonies, with the exception of Wharton, Dimmit and Uvalde counties, where the price has clearly been raised by the introduction of improved bees. In four counties less than five pounds of honey is produced per colony. In 56 counties from 5 to 10 pounds of honey per colony is produced; and in 41 counties between 10 and 12 pounds per colony.

Thus, in over half the honey-producing counties of the State (98 out of 180) less than the average of 12.2 pounds of honey per colony is produced. In 40 counties it is but little over the average, being 12 to 15 pounds. In 26 counties 15 to 20 pounds is secured. Six counties—Rains, Brazoria, Travis, Scurry, Winkler, and Presidio—produce 20 to 25 pounds, but there are only 45 colonies in the last three counties together, so they are not to be considered. Seven counties, including Starr and Midland, which have but 12 colonies, Wharton, Menard, Live Oak, Dimmit, and Uvalde produce over 25 pounds per colony. Thus, but five counties have a production equal to the average of the Western States.

Another map should show the total honey production for each county. It would reveal that the five counties of first rank as regards honey per colony produce 6 percent of the crop of the State; that the three of the class producing 20 to 25 pounds per colony (excluding three with but 45 colonies) produce 4 percent of the total; that the 21 (excluding those with but few colonies) producing 15 to 20 pounds per colony produce 19 percent of the total; and that all together these 29 counties, having an average production per colony greater than that for the United States, produce 29 percent of the total production of the State.

Of those counties producing 12 to 15 pounds per colony, over the average for the State, 35 (excluding five having less than 100 colonies) produce 27 percent of the crop of the State. Thus, the 64 counties, or 33 percent of the honey-producing counties of the State, produce 54 percent of the total crop. The remaining produce the other 46 percent. This points to the conclusion that the bulk of Texas honey comes from counties east of Austin, which produce about the same amount as the average per colony for the State, 12.2 pounds.

It is to be regretted that the value of honey for each county is not given, and that the value of honey and bees-wax is combined in the total for the State, as these figures would give us a better indication of the quality of the product of different sections of the State. I am aware that the census was subject to much error, and that it is now three years old. But in comparing it with figures secured from bee-keepers in different counties, we are inclined to believe that the census is fairly accurate as a whole, and more to be relied upon than private information. Though a large advance has been made in apiculture in Texas in the last three years, and some shifting in the areas of greatest production, still the general conditions are doubtless practically the same. Those of you who are familiar with local conditions can doubtless better and further interpret the above

statistics than can I, but one or two conclusions seem to me quite readily apparent:

- (1) The bulk of the bees and honey of Texas is of a low grade.
- (2) The honey is produced mostly east of the Colorado River.
- (3) In this area there might easily be supported five to ten times the present number of colonies.
- (4) By improvement of the bees, and by better methods of hiving and management, the average product per colony might readily be increased 50 percent.

It seems to me that these facts open up a large field for our apiculturist to do valuable missionary work in bettering apiculture in Texas. It seems to me that many a farm might support a number of colonies of bees, cared for largely by the women and children, which, like the poultry, would go far toward furnishing the comforts of home and happier living. In connection with the development of large fruit interests, there is also a chance for many moderate-sized apiaries, for fruit-men are coming to learn that they must have bees to produce many varieties of fruit in perfection. Nor does it seem to me that professional bee-keepers need have any apprehension of an increase in the number of colonies, and consequent product will have an undesirable effect upon the market for first-class honey.

The market for honey is practically undeveloped, and the supply is far from filling the demand. As long as the market is not glutted an increase in production, providing the quality is maintained, exercises but little influence on the price of the first-class product. It seems to me that by bettering the methods of bee-keeping throughout the State, this Association will be doing much toward securing better prices for the products of its members. Unfamiliar with the conditions of apiculture in the widely varying conditions of this great State, it is impossible for me to point out the local application of these statistics, but their significance will be readily appreciated by this audience, and as time goes on we trust that Mr. Scholl will further elaborate this preliminary survey of Texas apiculture. We trust that with your co-operation and support we may do much toward bettering and furthering this most interesting and profitable industry.

In closing, let me again welcome you here. Visit the bee house and yard. Mr. Scholl will be glad to explain all details to your satisfaction, and we will appreciate all suggestions or criticisms. Let me assure you that though not a practical bee-keeper by profession or training, it will be my constant endeavor to direct the apicultural work under our care to the best interests of the advancement of Texas apiculture. I trust that in a few years Texas may lead in the quality of her bees and their product as well as in the quantity, and that her experimental apiary and the organization of her bee-keepers may be the best possible. To these ends we shall devote our best efforts, and with the continued assistance and support of this Association we do not doubt their achievement. E. DWIGHT SANDERSON.

A unanimous vote of thanks and appreciation was extended to Prof. Sanderson for the interest he has taken in the pursuit of apiculture in Texas.

Some figures of Mr. Toepferwein were very interesting, as they showed to some extent the great amount of honey that was produced in Texas. He reported that 13,000 cases of cans, of 120 pounds each, had been already sold, besides 190,000 sections. Of honey already shipped he says there was 1,560,000 pounds, both comb and extracted. The Hyde Bee Co. report about twice that much more.

(Continued next week.)

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

### Bees Feeding Each Other—Apiarian Errors.

BY ARTHUR C. MILLER.

SO, Mr. Editor, you think Mr. Miller is guessing when he says that bees never offer food to the queens or to each other on or by the tongue.

Suppose I answer you Yankee fashion by asking if you, or any one of your acquaintance, ever saw food so given and can swear that it was so given. Don't answer hurriedly, but before you answer at all, let me ask you to go and look at the bees. Take a frame from the hive, hold it up before you, and when you see one bee getting food from another, just tip the comb over until you can look at the bees from the side—see them in profile—take a magnifying glass if you wish. You will find one bee has its tongue in the other's mouth, and that the tongue of the latter is folded back under her chin. Now, if the bee with the projected tongue is the giver, why is the other not taking it on her tongue as she should be to fulfill present theories, for you say the queen puts out her tongue to receive food? But if the bee is taking food, why is not the giver's tongue out giving it, if that is the way food is given?

Now, just consider the structure of a bee's tongue; is there anything about it to suggest the possibility of food passing from one tongue to another? Does it look possible or probable? Did you ever hear of any one seeing two bees holding the tips ("spoons") of their tongues together, or of one bee holding the "spoon" against the grooved face of the other's tongue, or of the grooves of two tongues being held together? Did you ever consider why several drones put out their tongues toward a brother drone when that brother is getting food? Offering him food, aren't they?

The bee-keepers may go on believing food is given on and by the tongue, and a whole lot of other errors if they choose, and I cannot stop them, and if it makes them happy far be it from me to take away their pleasure. But they must not expect others to take much stock in what they say on other matters relating to bee-life, when they are so blind to what any one may see if they will take the pains to look.

I don't ask any one to take my word for the manner in which bees get food, or take my word for other things about bee-life. I only describe them as I see them, and any one can go and see the same things in any colony.

Beedom is full of hoary-headed, fossilized errors which should either be buried or put into glass cases as curiosities, but it is high time they got out of the bee-press, and gave the room over to more progressive matter. I take a host of bee-papers, and month after month wade through a sea of rehashed topics that would have been settled long ago had the truth been allowed to prevail. Matters of practice in practical apiculture hinge on a knowledge of bee-life, and where this knowledge is lacking—or worse, where error is held in its stead—practice is pretty sure to be at fault.

It's theories, not conditions, which have been our guide; now let's reverse things and go ahead. Running around in a circle is nice fun for little children, but rather undignified and certainly unprofitable for older persons.

Providence Co., R. I.

### Bee-Paralysis—Sulphur Cure a Success.

BY O. O. POPPLETON.

I PROMISED some time ago that as soon as I knew the result of certain experiments not then finished, I would write out some of my experiences with bee-paralysis in my apiary.

The disease is more widespread and serious than most bee-keepers realize. Twice within the last 20 years it has lessened the season's receipts from my apiary over 25 percent, entailing a loss of about 15,000 pounds of honey and quite a number of colonies of bees. There is more or less of it every year.

The disease itself is exceedingly erratic—comes and

goes without any apparent cause, and without strictly following any rules. Colonies in perfect health will sometimes be attacked suddenly, and in a very short time be reduced to a nucleus. At other times a diseased colony will suddenly recover without any known cause. For this reason no rule can be made by experiments with any one or even a few colonies. And now, after a personal experience with over 200 diseased colonies, I more than ever realize how little we really know of the nature, causes, prevention, or of the disease. While I am satisfied that it is to a limited extent contagious, I do not know exactly how the contagion is communicated.

While in Washington, just after the Philadelphia convention, Mr. Benton introduced me to Dr. Howard, United States Entomologist, and I had a short talk with him about his Division making a scientific investigation of the disease. He asked me to call on him in his office and talk the matter over; but when I did so he was out. I was disappointed, as I hoped, through him, to get some real, definite knowledge of the disease and how to fight it. I still hope that some practical scientist will do this work for us.

I have not yet learned how the contagion, if any, is communicated, but I think through dead or diseased bees only. Last season I made some experiments to learn whether combs, honey or brood carried it, by taking away all the brood from what diseased colonies I had and giving them to certain nuclei. I built up six nuclei by giving them brood from diseased colonies, and so far (nearly a year afterwards) only one of these six colonies has shown any signs of the disease.

As several other colonies have taken the disease this spring, it is not very likely that this one took it because of these combs of brood and honey. That five out of six failed to take the disease after nearly a year has passed looks as if it will be safe to use all combs of either honey or brood. This simplifies the problem of what to do with diseased colonies, and save the loss of combs and brood, as in the cases of foul brood.

Several years ago nearly or quite one-third of my apiary was diseased, and the prospect was that I might have to abandon bee-keeping because of it, after nearly half of the diseased colonies had died. Experimenting with all the methods of cure I could hear of, and the use of sulphur proved the only method of any value. This I applied to three or four colonies at a time, then in a few days to a few more. Then, after an interval to more, and so on, until all had been treated. The result was the entire cure of each colony treated in the order of their treatment, while not a colony in the yard recovered until a certain time after treatment, showing conclusively that it was the treatment which affected the cure. I have used the same method more or less since then, but not to so great an extent. Out of some 40 or 50 altogether which I have treated, all were cured by one treatment except three, which required a second one each. As many have reported failures in treating diseased colonies with sulphur, it looks as if they must have misapplied the sulphur some way, and I think it will be best to give in detail the way I have used it.

For reasons I will give later on in this, I always go to the colony I am to treat during the day, and take away all the combs that contain brood; or, at least, unsealed brood or eggs, and give to some other colony; then in the evening, as soon as the bees have quit work and are all home, I proceed to dust sulphur over every comb in the hive and, if possible, on every bee in the hive. I never measure the exact amount of sulphur used, but suppose about a teaspoonful to every three or four combs in the hive.

I do the work by taking what sulphur I can hold between my thumb and first two fingers and dusting same over first one side and then the other of each comb, bees and all; also over any collection of bees there may be off the combs in any part of the hive. My aim is to have a thin dusting of the sulphur over every bee and every comb in the hive. The thinner the dusting the better, so it reaches everything in the hive. I tried using an insect powder gun, but couldn't do as good work as I could with my fingers. The next day, after doing this dusting, I carry back to the hives the same number of combs and brood as I had taken away.

The reason for taking away brood before dusting the combs, and returning again afterward, is because the dusting of combs not only kills all the unsealed brood in the combs, but ruins these same combs for brood-rearing. If such combs are left in the hive, all eggs deposited in them will hatch out all right, but the larvae will die as soon as hatched. By giving these same combs to strong colonies,

they will clean them out and use them all right, and no loss of combs or brood will result.

For a week after dusting a diseased colony with sulphur, fully as many or more bees will be dying as before the dusting; and this fact may lead some to think the "cure" is not a cure. It will take a couple of weeks before one can tell whether the treated colony is cured or not.

Diseased colonies are usually very weak in numbers after being cured, and are of very little, if any more, value than a good nucleus. I have doubts whether it really pays to cure them except such as can be treated very early in the season, before nuclei can be profitably made. For the last year I have adopted the plan of curing such colonies as needed it as early as the middle of February, or even earlier; after that I make as many nuclei as is needed for the purpose, and as soon as they have a young laying queen I take away the combs from the diseased colonies, giving the brood to these nuclei, thus building them up into good colonies and destroy all the diseased bees with sulphur fumes.

In changing combs from diseased to other colonies I am very particular to know that each comb is absolutely free from bees, especially of dead ones that may be in some empty cells. Diseased bees quite often crawl into empty cells to die.—American Bee-Keeper. Dade Co., Fla.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Some Feminine "Four O'clocks."

On page 296, Mrs. West says she gets up at 4 o'clock in the morning.

Well, Mrs. West, we are getting up at 4 o'clock in the morning, too. I still think it entirely too early, but those bees of ours are such hustlers that we have to do it in order to keep up with them. I hope Texas is fulfilling your expectations, and giving you as nice a crop of honey as the bees of Illinois are giving us.

### Lost Faith in Bee-Stings for Rheumatism.

I have lost faith in bee-stings as a cure for rheumatism. I never had as many stings in my life as I have had this summer, and I am having my first experience with rheumatism. It is all in my fingers, and is not a pleasant experience by any means, but I am never going to recommend bee-stings as a cure.

### How to Prevent Swarming.

I have been wanting to say a word to our bee-keeping sisters, but have been so busy, or, rather, I want a little information about bees. I take the Bee Journal, but I can not find just what I want.

We have been in the bee-business only two years, so we know very little about it. We have 65 colonies, and want to work for comb honey, but our bees don't seem inclined to do so, but want to swarm all the time. How can we prevent it? They have all swarmed once, and the most of them have swarmed the second time, and still some are casting off little swarms every week or ten days. Can we put them back in the parent hive? If so, shall we kill the queen? I put some swarms back with the queen, but they came out again the next day. We do not want to enlarge our apiary, so what I want to know is how to prevent swarming. Plenty of room does not seem to do our bees any good, as I put plenty of supers on.

My husband and I care for our bees, and we find it very pleasant as well as interesting. MRS. LOU O. KING.  
Garfield Co., Colo.

This has certainly been an unusual year in this locality for swarming. Bees have seemed to have a mania for it. So many absconding swarms are going into chimneys, porches, and siding of houses all over the country. I know one man that has had five swarms come into his house. Every few days some one telephones that they have had a

swarm of bees come to them, and would like to know what to do with them.

It is not an easy thing to prevent all swarming at best, and this year it has been much more difficult than usual. It is an exceeding difficult thing to prevent prime swarms, but these after-swarms that are so annoying can be almost certainly prevented. The old queen comes off with the first swarm, and she is not so flighty and hard to manage as a virgin—not so likely to abscond.

All after-swarms will have virgin queens. When your first swarm issues give it and set on the stand of the old colony. Set the old colony close up to the swarm, letting it stay there about seven days then remove it to a new place. The flying force, when they go to the fields, instead of returning to the hive from which they came, will go back to the old place, and join the swarm, and the old colony weakened by losing all its flying force, and having no honey coming in, will conclude it doesn't want to swarm, and you will have no further trouble with it.

Your plan of returning swarms was all right, but you will have to keep on returning them until the last queen emerges from the cell. You see, it is this way:

When an after-swarm issues, one or more queens that have been kept in the cells are allowed to emerge, and when the swarm is returned a battle royal takes place among the free queens, only one surviving. If all have been allowed to emerge from the cells, the one return of the swarm will be the end of it; but if any are left in the cells you have to return the swarm again, perhaps the next day. So you will have to keep on returning the swarm as often as it issues, which may be only once, or it may be several times.

You can prevent all increase by returning the first swarm, and all succeeding swarms, but it may make a good deal of work.

### A Beginning Sister—Honey for Stings.

I might say I am a beginner in the business. I started last year with one colony, and July 20 our first swarm issued, and as we had a clipped queen it was simply fun handling them, but when our second swarm came it was not so pleasant. We hived them, and after two days they left the hive and never waited to cluster, but went up over the tree-tops and out of sight, and we saw them no more. Our third swarm went back to the parent colony, so we had but two to winter, and they came out fairly well; only our clipped-queen colony is very weak, but it seems to be very industrious at present. We have not examined them yet, as the weather is too cool, and it might chill the brood, if there should be any, but I fear she has been hurt in the caging last summer, as the colony has simply dwindled ever since.

I am very fond of the bees, but I find they don't make very good pets; but I hope they will be more gentle this summer. They seem so busy now they have no time to sting.

I think the Bee-Keeping Sisters department of the Bee Journal the best corner in it, and that is the first I read when I get the paper. I would like to see many more letters every week.

Do any of the sisters ever get stings? If so, try honey on them. That is my cure. MRS. PETER CAMERON.  
Polk Co., Minn.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### THE DEBT OF ALL TO ALL.

He'll never see a word of it, but others may who are in danger of feeling like him a few years hence—that man who stops his bee-paper because he doesn't get the wrappers off it. I know right well the disagreeable feeling of having baskets full of unopened papers around; and so I am qualified to scold him considerably. I scold. Is it right to take a course which, if generally followed, would deprive us of bee-papers? His duty to the American Bee Journal may not forbid, but how about his duty to the rest of us? I'm

presuming that he's a good man all through, and wishing to meet all his just obligations. It is not only the journal that needs him; *we* need him. And we think that if he would hold on a bit there would come sooner or later a revival of interest ("Let thy first love"), and that that revival of interest would do him good, both personally and financially. Papers that I suspect of having something in on one of those topics in which I am intensely interested—they get their wrappers torn off "quick sticks." Probably so with him.

Somebody in the past has made apiculture into a vocation this man and others could make money at; and the bee-paper has had a notable share in the work. Shall it be killed off, therefore? Somebody *will* make the apiculture of the future different—better than it would be if left to itself; and the bee-paper will have a strong hand in that. Give it, then, its very moderate measure of support. Page 403.

### IMPORTANCE OF VENTILATION.

In case the reasoning of Arthur C. Miller proves to be rock-ribbed all around, and the air of the hive needs to be renewed 2,400 times for each 1½ pounds of honey eaten, it calls us (like the cardinals shut up at Rome) to a little personal interest in ventilation. Note how he tells us that this is a complete change every 30 minutes. Well, air is a nimble fluid, and will do a good deal of traveling in 30 minutes if we give it half a chance. But perhaps we must give it that half chance a little better than we have been doing in the past. One element of the situation most of us do not have in mind is how much air in 30 minutes can be made to go right through a board, a block of ice, a brick, a stone, almost anything. I have seen statistics on this point that were surprising. Wish I had them boiled down and in my memory so I could give them. Page 408.

### AN ERROR THAT PRODUCED A HASTY LAUGH.

A crooked mark prominently out of place on page 409 made me laugh. Eyes a little dim, I didn't notice the hyphen which gives the whole thing away, and read—

"Does the Bee Work Herself?"

—and this in the Sisters department, too. Hires an ant, perchance, or induces an aunt. Looks so supremely wretched over the task she is dawdling at that her "brothers" do most of it eventually, just to relieve their minds. Page 409.

### SEVERAL HUNDRED POUNDS OF HONEY.

In my department, page 410, in place of "several pounds of honey" read, *several hundred* pounds of honey. Kind o' hope the readers actually got the meaning by crediting me with an un contemplated dry joke.

### PREVENTION OF DRONE-COMB BUILDING.

Is it true that very deep entrances and much space below the frames prevent the building of drone-comb? According to the reasoning of R. J. Cory, page 413, it ought to be. May be suspected that a rousing colony, filling all the bottom and part of out-doors, will forget that the bottom is an exposed situation. But that would not usually be in a newly-hived swarm, however; and that's the case when we are most often and most earnestly desirous of having all worker-comb built. Need a collection of experiences on this point, I think. As queenless bees always build drone-comb it may be suspected that *distance* from the queen has something to do with it even when there is one.

### FOUND IRON IN HONEY.

And so the German savants have found iron to be a constituent of honey. Some of us knew pretty well all along that there were more things in honey than our professors would tell us of. Same proportion of iron as in good bread. Makes good blood and strong men. Page 414.

### BALLED QUEENS DIE FROM VARIOUS CAUSES.

We at once suspect that the suffocation theory would hardly suffice alone for the death of balled queens when we think what a lot of drowning all bees will endure. Pretty plainly she *may* starve if they keep at it long enough—and don't get violent enough to kill her some other way—and friendly bees don't feed her while hostile ones are mildly hanging on to her. There seems to be all grades of violence, from a mere gentle hug to the most spiteful, hissing, tearing rage—not only killing the queen, but a great lot of the bees also. Mental worry is an ample cause of death in so highly organized a creature as a queen. In fact, I believe a worker can be worried to death—or made to worry itself to death, in about an hour. Angry bees sometimes eject poison, as

our own sense of smell quickly tells us, and absorption of ejected poison at least don't do her any particular good. Better we say a balled queen dies from a variety of causes—not usually a sting, but sometimes. Page 414.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Italianizing in Louisiana.

1. When is the best time to Italianize bees in Louisiana?
2. How many queens would it take for 80 colonies to be Italianized by the next honey season?
3. Is there anything more modern upon the subject of rearing queens and Italianizing than the principles laid down in your text-book? If so, what is it?

LOUISIANA.

ANSWERS.—1. If you have no mishaps in introducing it does not make so very much difference when it is done. There is less danger of failure in introducing right in the harvest-time, but less interference with storing by introducing later in the season.

2. Possibly 85 or 90 to make a sure thing of it, if you have some losses in introducing. But you probably contemplate rearing queens, and in that case a single queen to rear from would do as well as more. Whether you can make a success of it in that way depends somewhat upon your season. With a good fall flow and vigorous action it ought not to be a very hard thing. Even if you have no fall flow, feeding will to some extent take its place.

3. There is perhaps nothing later than what you may find in "Forty Years Among the Bees," at least it is the latest of my knowledge and practice, yet that is limited only to my own practice. The excellent work of G. M. Doolittle on queen-rearing goes into the whole subject most fully. Nothing better can be found in print.

### Honey Extracted When Two-Thirds Capped.

Owing to the lack of supplies I extracted some honey when about two-thirds capped. Will it do to sell it that way?

ILLINOIS.

ANSWER.—If the honey is very thin, it is better to sell it in that condition, but the mere fact that a third of it is still uncapped does not condemn it. If it is good, thick honey it does not matter that it was partly unsealed. If thin, it may be brought to a better consistency by letting it stand uncovered where it will be heated to 100 degrees or 125 degrees.

### Bee-Keeping in Arkansas.

On page 473, "Pennsylvania" says he had a colony that had cells started in 5 days. I had a colony that cast a swarm in 14 days after being hived, and left the parent hive in good condition.

1. I have a small apiary that I run in connection with a farm. I live about 1½ miles from the Little Missouri river. Do you think the distance cuts much figure with the crop?

2. I have 28 colonies and 6 nuclei. Holly, linn, rattan, and various other plants and vines grow around that secrete nectar. Do you think it would pay better to increase the bees and put them near the bottom-land, or run a small yard with the farm out here in the hills? We have black-gum, rattan, blackberry, prickly ash, cotton, and sumac, all of them producing lots of honey. Do you think it would pay to neglect an ordinary farm to move the bees nearer to the bottom?

ARKANSAS.

ANSWERS.—1. Yes, distance cuts quite an important figure in many cases. But it is likely that a distance of 1½ miles is so little for the bees that there would be little gain in moving nearer.

2. I don't know, but I think it well to stick to the farm,

at least until the bee-business grew sufficiently to afford a good living. You might not find 100 colonies succeed so well as 28, and you might not find as much advantage as you expect from changing your location.

### Moving Bees in a Car—Yellow Sweet Clover Honey.

1. Would it be safe to move bees in a closed car with household goods, they to be covered with wire-netting only? The car would be a week on the road.

2. Is honey from yellow sweet clover darker in color than that from white sweet clover? ONTARIO.

ANSWERS.—1. Something would depend on the weather. If not very hot, and the whole top of the hive is covered with wire-netting, and the bees are supplied with water by sponge or otherwise, they ought to get through all right.

2. I don't know, but I think the color is the same.

### Untested Queen Questions—Bees Gnawing Foundation.

I have been trying to follow modern methods since last spring, and have this season been fairly successful. But the more I learn about bees the less I seem to understand about them, therefore I will venture to ask the following questions:

1. Are the "Standard Bred Queens" sent out by Editor York as premiums pure Italian?

2. Are they fertilized or virgin?

3. Is there any danger of getting foul brood with them as a free gift?

4. How soon should I be able to find eggs laid by one of those queens? I got one and introduced her Aug. 1, and found her all right this morning, Aug. 4.

5. Why do my bees gnaw some of the foundation out of the frames (both starters as well as full frame) and then build up again, but too much drone-comb? MISSOURI.

ANSWERS.—1. [Yes.—EDITOR.]

2. They are fertilized and already laying.

3. [No.—EDITOR.]

4. Sometimes within 24 hours after she is out of her cage, sometimes not for a week. The same is true of any queen introduced, even if she has not been through the mail.

5. I don't know. Possibly pure mischief when no honey is coming in.

### Late Introduction of Queens—Swarms Returning.

The honey-flow has been over here a long time, since about May 15.

1. Can I make any forced swarms at this time, or must I wait until spring?

2. Can I introduce new queens yet? and how will I have to proceed?

3. I have one colony of bees which swarmed about 6 or 7 times, and the swarm went back to the old hive every time immediately after hiving in a new hive on starters. I also gave new comb for brood, and did every other way I could think of. What was the matter with it? LOUISIANA.

ANSWERS.—1. You can, but not so successfully as when there is a flow of honey. You will have to feed, and it will be necessary to keep a very sharp lookout or you will start a bad case of robbing.

2. Yes, you can introduce queens any time so long as the weather is warm. The proceeding is the same as at any other time, but introducing is not always so successful in a dearth as when honey is coming in freely.

3. The queen may have had defective wings so that she could not go with the swarm; then when the bees found there was no queen with them they would return to the old hive.

### Foundation Starters or Full Sheets—Gathering from Corn-Tassels—Too Strong Colonies—Rearing Queens

1. In using foundation starters, if you cannot use full sheets would you use wide or narrow starters?

2. What do bees gather from corn-tassels? I see them working on them.

3. Can a colony of bees get too strong? By this, I mean can they be strengthened up to such an extent that they

will fail to store as much honey as a less populous colony, because the bees will consume more honey than the weaker colony.

4. Would a colony with bees and brood in three 8-frame dovetailed hives be too strong in your opinion?

5. In starting queen-cells, by fastening a strip of comb (with the cells scraped off of one side) to a frame, so the cells point downward, my trouble is to get the strip of cells fastened without spoiling the eggs. Have you reared any queens by this method? If so, how do you fasten them? If you do not rear them this way, what is the best way to start them? I do not have a great deal of time to spend with queens, anyway.

MICHIGAN.

ANSWERS.—1. Wide; as a rule the larger the starter the better.

2. Pollen, and perhaps honey, too.

3. Other things being equal, I think no matter how strong a colony might be it would always store more than a less populous colony. I do not believe that a colony which is all the progeny of one queen can ever become too strong for the best results. If several colonies were united into one giant colony, it would store more than any weaker col-

ony, but it might store less than the same bees would have done if not united.

4. No, it would not be too strong, but as mentioned in 3, it may be that the same bees would have stored more as two separate colonies—for I take it that you mean to unite two or three colonies to get the three stories filled. If a single queen would fill the three stories, I would say all right.

5. Yes, I have reared a good many queens by the Alley plan, and have found no difficulty in fastening the strip by dipping it in melted wax, and the eggs were not injured by it. The way I prefer to rear queens for my own use is given very fully in "Forty Years Among the Bees," and although it would take too much space to give it here, I may say in brief that my best queen is kept in a nucleus where fresh combs are constantly built and filled with brood and eggs, and when these tender combs partly filling the frames are given to queenless bees they suit them to a nicety for starting a lot of fine cells.

You say you haven't much time to spend with queens. Pardon me for saying that if you have time to spend with bees at all, you have time to spend a good share of it in rearing the very best queens, seeing that a queen is the very soul of the whole colony. Good queen, good colony; poor queen, poor colony.

## The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

## "What Happened to Ted"

BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton, the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—60 pages, 5x8 1/2 inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver.) Address,

ISABELLE HORTON,  
277 EAST OHIO STREET, CHICAGO, ILL.

# A STANDARD-BRED QUEEN-BEE FREE

To Our Regular Paid-in-Advance Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with **The Very Best Untested Italian Queens** that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

## A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription **must be paid at least 3 months in advance.** If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

Send us \$1.00 and the name (not your own) and address of **One NEW** subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due also.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows:  
One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We are filling orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

GEORGE W. YORK & CO., 144-146 F. ERIE ST., CHICAGO, ILL.

Please Mention the Bee Journal when writing Advertisers.

## FROM MANY FIELDS

## Two Brothers Go "A-Beeing."

I don't know whether letters are relished from tenderness or not. My brother, C. W., and myself, with our families, dogs, cats, parrots, and everything, moved to this beautiful spot from smoky Chicago last spring. We decided to take up bees as a side-line. I didn't know a queen-bee from a lightning-bug, and all my brother knew he had gleaned from a few random visits to a mutual friend, Stoughton Cooley. However, what he saw there got him interested, and we purchased five nuclei from a dealer.

Say, it would have made an old bee-man crack his ribs, I suspect, to have watched us manipulate bees! Later we picked up a snap in the shape of a couple of colonies from a "widdler" up in the country, whose son had died, or done something, I have forgotten what. Shortly afterward, Mr. Stoughton Cooley being out, he informed us that, in his judgment, both of our snap colonies had foul brood. Of course, our hair rose straight up, and we at once notified State Inspector Smith. While waiting for him we destroyed both colonies, but boxed up the comb for his inspection. He came last evening, and inspected us all over to-day.

Mr. Cooley was right; it was foul brood, but fortunately they had not infected the rest of the colonies, of which we now have 11. Mr. Smith gave us a clean bill of health, said there was not the slightest trace of foul brood, which information was thankfully received. Mr. Smith is a pleasant gentleman to meet, and is evidently "on to his job" with a big J. He submitted to being pumped gracefully, and gave us quite a batch of information on bee-lore.

In our study of bees so far we are undecided where to place them. Sometimes we think they should be classed with Mark Twain's ant in the Black Forest of Germany. Don't seem as if they knew enough to come in out of the wet. Then, again, it looks as if they were pretty level-headed. We will give you the ultimate verdict later on.

Inspector Smith informed us that he had 49 calls booked now from all over the State.

FRANK E. KELLOGG.

McHenry Co., Ill., Aug. 7.

## An Interesting Experience.

In 1901, I had 10 colonies of bees in old boxes, nail-kegs, etc., and I gave a bee-man half of the bees and honey to put my half in old Langstroth hives. That season we got more honey and money for our bees than we had in 10 years before.

In 1902, we had (I say *we*, because I am teaching my wife and children the bee-business, as I think it better to leave them that than an insurance policy, although I have one) 7 strong and 2 weak colonies. In June I bought 25 colonies that were 25 miles from home. There was plenty of black sage there so I left them, but they have done but little good, and I could not give them the care they needed, and I am afraid they have foul brood. We have no one here who knows what foul

## Thousands of Hives = Millions of Sections

Ready for Prompt Shipment.

We are not selling goods on NAME ONLY, but on their quality. In addition to the many car-loads we are shipping to all parts of the United States, we have just made one shipment of five car-loads to England.

(Successor to Chas. F. Muth and A. Muth.)

brood is, but from what I can read and see I am afraid it. I am going to treat soon with formaldehyde.

I now have 45 colonies. This has been a very poor year here, and a fruit-man near my out-apiary puts out poison—he says for the yellow jackets, but of course my bees get it, too, and I don't think there is any recourse but to move the bees. And this same man, who puts out poison, had 50 colonies of bees a year ago that he had bought. To hear him talk, he was a bee-man of the "first water." He commenced to tell me what to do, and what not to do, and finally I asked him what bee-paper he took, and he said, "None." I asked him what text-book he used; he said, "None." I asked him how he could get along, and he said, "Common sense. These fellows who write books and papers don't know any more about bees than I do."

Now listen, friends, and see what his success was. In July of that year he was trying to sell his bees, because he claimed they damaged his apricots in drying, and he would not be bothered with them. Well, he sold, and I understand that a third of them had foul brood in a short time afterward.

Now, my 25 colonies are in range of a man who has 80 acres of apricots, and he says his apricots have been better since my bees have been there (4 years) than ever before. And I asked him if they injured his drying apricots, and he said, "No, they do them good by taking out the water so they will dry sooner." So that is the result of a bee-man without a book on bees or a bee-paper, and so it will ever be.

When I started in I got "ABC in Bee-Culture," Gleanings, and last, but not least the great American Bee Journal. Now I am sent for here and there to take off honey, transfer bees, and give information. They say, "Go and see Wittner, he knows more about bees than any one I know of." (They don't know how little I do know, and I don't tell them, either). But such is the reputation of a man who tries to inform himself from what it has taken others years to learn. What could I do without my bee-literature? Why, what I did before I had it—nothing in the honey-business.

So, in closing, I say hurrah and three cheers for our bee-book, G. W. York, of the American Bee Journal, Gleanings, and Root, hog or die. C. H. WITTNER.

Santa Cruz Co., Calif.

P. S.—And add hurrah for the Chicago Queen.

**Italians and Unfinished Sections.**

I have been a constant and interested reader of the American Bee Journal for about 3 years, and will say that it's worth to me has been many times its cost. I am always interested in items "From Many Fields," as I belong to the same class of little fish that swim in that shallow pool.

I keep Italian bees, both 3 and 5 bands. I bought 3 colonies of blacks to test their great value in the production of fancy comb honey. After a test of two seasons in the same yard, and giving blacks advantages in the way of special care, also full sheets of foundation in sections, I was disappointed, or rather pleased, to find that my Italians could and did beat them both in number of sections and fancy capping. I tested them with  $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{4}$  and

**Cheap House Warming**

The Modern House

is warmed from a furnace. The very best furnace is the LEADER Steel Furnace.

We make it

to fit your house and send it freight prepaid to your station. Any carpenter or handy man can set it up. Anyone can operate it. Burns hard or soft coal, wood or coals. One furnace will heat the largest house in the coldest weather. Seven to eleven rooms heated with the fuel required by two stoves. If the weather is mild less fuel is used. Only one fire to take care of and that requires but a few minutes a day. No dust, smoke or ashes in the rooms. Even, delightful heat day or night in any kind of weather. Send to us for free estimate of the cost of fitting your house and ask us for our booklet telling all about these furnaces. We send estimates and information free. Buy of the makers and save the middleman's profits. Write for our catalogue No. 17.

**HESS WARMING AND VENTILATING CO. CHICAGO**

Please mention Bee Journal when writing advertisers.

Ideal sections—and it was with surprise that I read the article of Mr. Hutchinson, on pages 492 and 493, which is so at variance with my experience. Formerly I was bothered with greasy capping with my Italians, but by removing all finished sections as soon as the bees had completed them, I have failed to have a single greasy section from 50 colonies.

I have tried to breed from my best cappers, but hardly think that I overrated it in that way. Try removing finished sections within 5 days and see if greasy sections don't disappear—if you fail, I'll "holler" "Locality!" and then advertise in the American Bee Journal the best strain of bees in America. Sure thing, Mr. Alley will not be in it, and Mr. Doolittle will do less. For fear I will be swamped with orders, I will say that I have no queens for sale, but might sell You Yonson a queen over the 'phone.

I sold the black-bee sections @ for \$1.00, and sold the Italian Ideal sections, weighing 14 to 15 ounces, @ for \$1.10, giving the buyer choice of 16 to 18 ounces of bee-way section, or a light-weight plain. I sold to consumers.

I have tried hybrids, but none are equal to the pure Italians in this "locality."

During the height of the honey-flow I run out of foundation, and could not get it in time, so I was in quite a disagreeable condition. Luckily, I had quite a number of sections with comb in them, left over from last season. I cut the comb out of the sections, excepting a V-shaped piece which I left as a starter in the section. I then cut the comb taken out into 3-cornered pieces, about 2 inches to a side, with a hot bread-knife, which did the work in first-class condition. I then took the sections in the flat and laid them on the table; I held the pieces of comb for just a moment over a lighted lamp, and then placed them in the center of the section, the melted wax making them adhere tightly to the sections. I could not see but what I got as good results as though I had used foundation. So you see my unfinished sections were worth 65 cents a pound. I am so well pleased that I shall try it again. J. M. West.

Pike Co., Ohio, Aug. 1.

**Poor Crops in Louisiana.**

The honey crop in Louisiana is very poor this year, about 50 percent short, caused by the excessive rains which began in May. This, as a rule, is a great honey country, and we never have to take the bees in-doors to winter.

As I am intimate with Illinois and the other 8-months-winter States, I can proudly say Louisiana and California have them "skinned a Texas black." S. J. WEBER.

East Baton Rouge Co., La., Aug. 4.

**Wanted—A Honey-Wagon.**

I need a honey-wagon badly, and I know there are many thousands like me; in fact, everybody who handles honey needs a light, cheap honey-wagon that will hold 150 pounds of comb honey. It should have springs so the comb honey could be hauled over ordinary ground without breaking. We could haul the heavy combs to the extractor, and return them; we could haul comb honey to the honey-house, and many other things about the apiary. If I had one I would use it apart of the time in selling honey.

Now, don't say, "Use a wheelbarrow." It

breaks the honey, is hard to push, and sometimes it upsets.

I have kept bees for 30 years; I have never made millions out of them, but they have more than paid their way. We have a little more than half a crop this year, and the quality is very fine.

Let us hear from others—any person who wants a honey-wagon. We can generally get anything we want, if we talk right through the American Bee Journal. Oh, may it live while man remains on the earth.

D. G. PARKER.

Brown Co., Kans., Aug. 11.

[Here is a chance for bee-supply manufacturers. Bring on your honey-wagon!—EDITOR.]

Appreciative—Drowning Queens.

On page 483, appears a description of a robber-cloth by Dr. Miller, which, I think, is a very useful article, and for which I wish to return thanks. In fact, there are very many things I have seen in the American Bee Journal for which I intended to thank the writers many times. Hardly a day passes that I do not feel thankful to some one who has contributed to my knowledge in bee-keeping, and I think it would be a good thing for all of us to indorse a good thing when we receive it, thereby encouraging a more free contribution, as well as letting the writer know that his efforts are appreciated.

Right here I wish to thank Dr. Miller especially, for his method of arranging the brood-chamber, as regards the pollen-comb described by him in his "A Year Among the Bees" (now out of print). This seemingly little advise is of no small consequence to me, nor to any one whose locality furnishes an over-abundance of pollen, as it puts one in position to put his hand right on the bulk of pollen in a colony instantly.

Another seemingly small matter of no less importance, is the adjusting of the brood-nest in the spring with a division-board, a la Doolittle. Please accept my thanks, Mr. Doolittle. This adjusting is of great value to me in this cold climate, for with it I can fit up any size colony snugly, and not have them put brood in undesirable combs.

Another very important thing to me is to know how to use the most important hive-tool—a very strong jack-knife, a la Heddon. I have used many different hive-tools, such as a putty-knife, framing chisel, a screw-driver, etc., but to my notion there is nothing that can approach a "jack-knife" of the right kind for convenience and handiness. It is always ready for service, such as a chisel, screw-driver, crow-bar, queen-clipping device, drone-brood extinguisher, hive-scraper, tack-hammer, etc.

In this way I could go on mentioning implements, methods, and the names of their inventors and contributors, but space does not permit, as it would fill the columns of the American Bee Journal for weeks, so I will refrain from going into detail any further, but thank each and all who have been contributors to these columns, for even the smallest mite will help to make up a complete method.

Before I close I want to haul Dr. Miller over the coals for his putting those queens into the water. (See page 483.) He says he wets them so they may introduce easier, but

QUEENS!

Golden and Leather-Colored Italian, warranted to give satisfaction—those are the kind reared by QUIRIN-THE-QUEEN-BREEDER. Our business was established in 1888. Our stock originated from the best and highest-priced long-tongued red clover breeders in the U. S. We rear as many, and perhaps more, queens than any other breeder in the North. Prices of queens after July 1st: Large Select, 75c each; six for \$4; Tested Stock, \$1 each; six for \$5; Selected Tested, \$1.50 each; Breeders, \$3 each. Two-frame nuclei (no queen) \$2 each. All Queens are warranted pure.

Special low price on queens in lots of 25 to 100. All queens are mailed promptly, as we keep 300 to 500 on hand ready to mail.

We guarantee safe delivery to any State, Continental Island, or European Country. Our Circular will interest you; it's free. Address all orders to

when you read on you find he drowns them. Now, you just wait, Doctor, I am going to call the attention of Miss Wilson to you, and if you put any more queens into water to wet them, she'll tend to you, won't you, Miss Wilson? For he will say he just wets them, but afterward you see he drowns them. So don't let him put any more queens into water, for he will surely drown them. He thinks he can introduce them easier then. May be he can, but would they be worth any more than those half-dead ones we get through the mail? Well, we will wait and see what Hasty says. Most likely he is after him by this time, and the chances are he caught him.

Chippewa Co., Wis. A. C. F. BARTZ.

So. Dakota Prospects—Foul Brood.

As it has been some time since I have seen anything in the American Bee Journal in regard to the honey prospects of South Dakota, I thought I would write what they are.

Our bees wintered well, all those with plenty of stores. I winter them in the summer stands, and never lose a colony on account of the weather. If I lose any it is on account of the queens. This is the 15th year I have kept bees in this place, and I produce comb honey altogether, also allow natural swarming and

GEORGE W. YORK & CO. 144 & 146 Erie St., Chicago, Ill

no clipped queens. My average yield is from 50 to 60 pounds per colony, spring count, and I never rob my bees. I have had 10 new swarms so far this spring, and they were all very large; and I wish to state that every swarm could be hived sitting in a chair, and with perfect ease. Now, don't think I am jesting, for I am in earnest, as many of my bee-friends around here can testify. I will further say that during all these years only one swarm clustered over 4 feet high.

We have between 150 and 200 colonies of bees in this vicinity, and many have foul brood. I have it on all sides of me, from within a mile to 40 rods, and have never had a cell in any of my colonies, and you may guess how thankful I am. Our bee-keepers, whose bees have it, are getting rid of it as fast as they can, and when they all get it disposed of they will not invest in it again in this vicinity.

Right here, while on this very important subject to bee-men all over the United States, I wish to answer a question asked in the Chicago convention by Mr. Craven (see page 469). Question: Does it pay to feed sugar for the manufacture of honey with a view to profit? My answer is emphatically No. And I say also, and wish that I could be in the convention at Los Angeles, so that all bee-men could hear me, *Never feed sugar to bees unless you want to cut off the head of the hen that lays the golden egg.*

And now I want to be put on record as saying that there would never have been such a scourge as foul brood if all bee-keepers would deal honestly with their bees. Oh, that almighty dollar! Poor bees, those abundant winter stores taken away and adulterated sugar substituted, and still a little later, on close examination, oh, horrors, foul brood!

And now, my brother bee-keepers, I have not been joking. I know what I am saying, and later you will all know that I know, so get rid of foul brood, all you who have colonies so afflicted. If you feed, use nothing but pure honey, then foul brood will be no more.

J. M. HOBBS.

Yankton Co., S. Dak., July 27.

**Close Saturdays a 1 p.m.**—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

## Tennessee Queens.

Daughters of Select Imported Italian, Select Long-tongued (Moore's), and Select, Straight S-banded Queens. Bred 3/4 miles apart, and mated to select drones. No bees owned within 2 1/2 miles; none imported within 3, and but few within 5 miles. No disease, 30 years experience. **WARRANTED QUEENS**, 60 cents each; **TESTED**, \$1.25 each. Discount on large orders.

Contracts with dealers a specialty. Discount after July 1st

Send for circular. **JOHN M. DAVIS,**

## Long Tongues Valuable

South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

HUTTO, TEX., Nov. 19, 1902.  
J. P. MOORE.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friedl. E. K. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.  
The above is pretty strong evidence that red clover is not the only plant which requires long tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders. Untested, 75 cents each; six, \$4.00 dozen, \$7.50. Selected, unttested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

## HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Aug 7.—Consignments of the new crop are coming to commission houses that have not had honey for years past, and as there is not any consumptive demand they are finding difficulty in disposing of it. Under such conditions it is hardly possible to give accurate prices, as some merchants ask 10 cents for honey that others hold at 15 cents. The prices given in our last quotations are asked, but feeling is unsettled. Beeswax steady at 30c.

KANSAS CITY, July 28.—Some new comb honey in market, but on account of hot weather the demand is not heavy, but will be getting better every day. Fancy white comb, 24 sections, per case, \$3.50. No. 1, white and amber, 24 sections, per case, \$3.25. No. 2, white and amber, 24 sections, per case, \$3.00. Extracted white, per pound, 66¢; amber, 54¢. C. C. BEESWAX, good demand, 25¢ 30c. C. C. CLEMONS & CO.

ALBANY, N. Y., July 18.—We are receiving some shipments of new comb honey, mostly from the South; the demand light as yet; we are holding at 150¢ per lb. Extracted white, per pound, 66¢; amber, 54¢. Beeswax, good demand, 25¢ 30c. H. R. WRIGHT.

CINCINNATI, Aug. 6.—The supply about equals the demand for extracted honey. We are selling amber extracted in barrels from 5 1/2¢ to 6¢, according to quality. White clover, barrels and cans, 7 1/2¢ to 8¢, respectively. Comb honey, 14 1/2¢ to 15¢ per lb. Extracted white, per case, Beeswax, 30c. THE FRED W. MUTH CO.

NEW YORK, July 8.—Some new crop comb honey now arriving from Florida and the South, and fancy stock is in fair demand at 14c per pound, and 12 1/2c for No. 1, with no demand whatever for dark grades.

The market on extracted honey is in a very unsettled condition, with prices ranging from 50¢ to 54c for light amber, 54¢ to 60c for white, and 48¢ to 50¢ for Southern. Demand at 60¢ 7c. Beeswax steady at 30¢ to 31c. HILDRETH & SEGELKEN.

CINCINNATI, Aug. 8.—New honey is now offered very freely, particularly extracted. The demand for honey is about as usual at this time of the season. I make the sales at the following figures: Amber, 50¢ 5c; water-white, all-falfa, 6¢; fancy white clover honey, 7 1/2¢. Comb honey, fancy water-white, brings from 14 1/2c to 15c. Beeswax, 27¢ 30c. C. H. W. WEBER.

SAN FRANCISCO, July 22.—White comb honey, 14 1/2¢ to 15¢; amber, 13 1/2¢. Extracted white, 54¢ to 6c; light amber, 4 1/2¢ to 5c; amber, 4 1/2¢ to 4 3/4¢; dark, 3 1/2¢ to 4c. Beeswax, good to choice, light, 27 1/2¢ to 28c.  
This season's crop is not only unusually late, but is proving much lighter than was generally expected. While the market is unfavorable to buyers, the demand, at extreme current rates is not brisk and is mainly on local account.

**WANTED! Extracted Honey.**  
Send sample and best price delivered here; also Fancy Comb wanted in no-drip cases.  
THE FRED W. MUTH CO.

## RED CLOVER HONEY-QUEENS.

SPRING BLUFF, WIS. July 18, 1903.

THE A. I. ROOT CO., Medina, Ohio.  
Dear Sirs—I thought I would write you a few lines in regard to the Red Clover Queen I got from you. They haven't swarmed yet this summer, but I have taken 18 sections from them and there is 24 more all ready to come off.

Just think, 72 nice sections of as nice honey as ever was made, and only July 18th. It seems as though they will surely fill 48 more.

I don't know whether their tongues are any longer than any of the others, or whether they gathered it from Red Clover, but surely such bees are worth money.

I use the 8-frame Jumbo frame.  
Yours truly,  
C. E. KELLOGG.

C. E. KELLOGG, Spring Bluff, Wis.

Dear Sir—We have yours of July 18th and would be glad to have you advise us by return mail with reference to the capping of the honey. Some parties say the capping from these bees is not white, and we would be glad to have you advise us how your honey is in this respect, and oblige,  
THE A. I. ROOT CO.

SPRING BLUFF, WIS. July 31, 1903.

THE A. I. ROOT CO., Medina, Ohio.  
Dear Sirs—Yours of July 24th at hand today. In regard to your question in reference to the cappings of the honey from these bees I will say that it is simply perfect, beautiful snow-white and every box perfect. 96 one-pound sections now. I am quite sure they will fill two more supers, which will bring the number up to 144. I would like very much to have you see a few of those sections, and I will be glad to send you a few.

Now, I haven't told you ALL their good qualities yet. I am sure they are by far the most gentle bees to handle I have. I could take off the sections without smoke or veil without getting stung. There are a few traits about them that seem to me are quite remarkable aside from their honey-gathering:

1. I will write you again in a few weeks and let you know if they fill the 144 sections, which I am sure they will.  
Respectfully,  
C. E. KELLOGG.

## AGAIN READY FOR PROMPT DELIVERY.

We were snowed under with orders for a few weeks, but here we are again with good Queens and prompt service.

### Red Clover and Honey Queens.

Untested	Each.	Six.	Each.
Tested	\$1.00	\$ 5.70	\$ 5.40
Select	2.00	11.40	7.50
Selected Tested	3.00	17.10	10.00

With any of the last three we include one frame of bees and brood to insure safe arrival, for which we make no charge. These must be sent by express. Queen circular free.

— THE A. I. ROOT CO., Medina, Ohio.

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# 200 Nuclei with Red Clover Italian Queens

## Ready for Immediate Delivery.

We have arranged with a bee-keeper having a large apiary adjoining Chicago, to furnish us with Nuclei, each having a Red Clover Queen reared from one of Root's specially selected Red Clover Breeding Queens. They will be shipped direct from the apiary at these prices, cash with the order:

One 3-frame Nucleus with queen, \$3.50; 5 or more at \$3.00 each—on standard Langstroth frames in light shipping-boxes.

Or, we can furnish these Nuclei in 8-frame hives containing 3 extra brood-combs and 2 extra frames with foundation starters, at these prices:

One Nucleus for \$4.50; or 5 at \$4.00 each.

With a good fall honey-flow these Nuclei can easily be built up into good, strong colonies for wintering.

Address all orders to

### GEORGE W. YORK & CO.,

# Dr. Miller's New Book

## SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the **Weekly American Bee Journal** for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the **American Bee Journal** whose subscription is paid in advance, can have a copy of Dr. Miller's new book *free as a premium* for sending us **Two New Subscribers** to the **Bee Journal** for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old **American Bee Journal**, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

## Editorial Comments

**How to Avoid Killing Bees.**—There are some things that every bee-keeper naturally learns by experience that are not always found in text-books of instruction in bee-keeping. One of these relates to the matter of killing bees. In some apiaries hundreds, or thousands, of bees are killed in the course of a year simply by mashing them when covers or supers are put on hives. The case is unusually bad when a large amount of smoke has been used. The bees run out of the hive, boiling over all around, and by the time the operator is through with his manipulations there is a layer of them half an inch thick or more all around on the upper edge of the sides and ends of the hive. If now the cover be quickly placed over, a large portion of these bees will be killed. If the operator is touched with a feeling of pity for the little innocents, and slowly lets down the cover upon them, so as to give them time to get out of the way, the result is but little better. After their stampede the bees appear just a bit stupid, and make no move to get out of the way till the cover presses down uncomfortably upon them, and then it is too late, for they are held fast in spite of all efforts to get away while the cover is slowly crushing the life out of them.

The experienced operator will put on the cover without killing a bee. In the first place, he will seldom have so many bees in the way, for he does not find it necessary to use so much smoke. But if there should be a border of bees an inch thick all around, he is still master of the situation. A little smoke is puffed lightly upon the border of bees just to stir them up enough so that they will be inclined to "move on," and then the operator takes the cover in hand. Instead of holding the cover level over the place where it belongs, one end of the cover is raised 10 or 12 inches, and the other end is allowed to touch the hive. Neither does it touch the hive the whole width, but just the corner of the cover farthest from the operator is allowed to touch the nearest corner of the hive. Still holding the cover with one end raised, he slides it from him across the width of the hive. Then allowing this end of the cover to remain resting on the hive, he quickly drops the other end 3, 4, or more inches, and as quickly raises it again. The bees that were squeezed by the dropping of the cover will get out of the way when it is raised. Without waiting an instant, he rapidly moves the cover up and down, each time raising it not quite so high as it was raised before, and lowering it just a little more. At the last, when the cover is raised only an inca, or half an inch, a few rapid vibrations up and down gets the last bee out of the way, and he can tell pretty well by the feeling when the cover no longer strikes upon the bees but upon the solid hive, and the cover is then allowed to rest. All this is so rapidly done that it does not take so much time as seems in the telling, and it is well that each novice should in the start begin practicing to save the lives of his bees.

**Cages for Shipping Queens Abroad.**—J. P. Moore is reported in *Gleanings in Bee-Culture* to have succeeded in "sending about 95 percent of his queens through alive to foreign countries." For mailing queens to England he uses two Benton cages fastened together face to face without any wire-cloth. Besides the candy, two small tubes are contained, one filled with water, the other with honey.

The candy varies from the usual formula a little, and it is just possible that it might be a good thing for domestic as well as foreign mailing. He says:

The candy is made of powdered sugar and honey, with the addition of a little glycerine, to prevent it from drying out and becoming hard. It is made as follows:

To seven cups of powdered sugar add one cup of nice, well-ripened honey, knead thoroughly, and make into three or four balls. Let it stand a few days; then break the balls up and pour a little glycerine over the mass, and work in more powdered sugar. Make into balls as before, and let it stand a day or two, when it is ready for use, if you have added enough sugar and not too much. If the balls flatten down the candy is too soft, and must have more sugar; but if they retain their shape, and have a moist appearance, the candy is just right. When just right, it is soft and pliable, and retains its shape when made into balls.

### Are Queens Injured by Sudden Cessation of Laying?

—On page 505, Mr. Hasty says:

"My idea of the thing is that injury (if any) by suddenly compelling a laying queen to cease laying would all come in the first week. Twelve weeks no worse than six, so far as the laying matter is concerned."

Evidently he is not in accord with what is perhaps a commonly accepted view, that the *suddenness* of the cessation does mischief, as if violence were done to the queen by compelling her to retain eggs that she feels impelled to lay. Really, is there anything in that view? Is there any violence in the case whatever? A queen can continue—does continue to lay—when suddenly removed from the combs, provided by the eggs dropped on the floor-board of a swarm before any combs are built. Is there, then, such a great *suddenness* in the cessation?

### Destroying Queen-Cells to Prevent Swarming.

—When the beginner has reached that point where it seems desirable to him to prevent swarming, one of the first things that occur to him is to cut out queen-cells. As the building of queen-cells is a part of the regular program of swarming, if they be regularly destroyed every few days the rest of the program can not be carried out, and he thinks there will be no swarming. He is surprised, however, to be told that this can not at all be relied upon to prevent swarming. If constantly thwarted in their efforts by the destruction of queen-cells, the bees become desperate and swarm out just as soon as an egg is laid in a queen-cell—possibly not waiting for that. The inefficiency of destroying cells as a means of preventing swarming has been so emphasized that some seem to have the impression that it has no effect whatever.

It does, however, have an appreciable effect, indeed to such an extent that one with bees not especially given to swarming may go through the season with very little of it. If, upon examination, queen-cells be found in a colony, and they are destroyed, the bees *may* swarm the very next day. But this is not likely. They may at once start cells again, only to be destroyed again by the bee-keeper on his next round, and if he goes through his colonies for cells every 10 days or so he will find some colonies that will keep up this battle with him the entire season without swarming. In other cases he will find the bees not so constant in their attempts. On one of his rounds he destroys cells in a certain colony, and the next time he finds none. On subsequent visits he may find cells started, and he may not.

Without actually recommending the cutting out of queen-cells as a means of preventing swarming, it is only fair to say that it is possible that one, especially if he can be present with the bees only a short time each day, may go through the season quite satisfactorily, provided he has a number of nuclei with young queens, or is willing

to buy young queens. Suppose he has only a few colonies, and is present with them only an hour or so each morning; or suppose he has a number of colonies in an out-apiary that he visits only once in 10 days or so. He has all his queens clipped as an indispensable proviso. He regularly destroys queen-cells in all colonies every 10 days or so, and so long as there is no swarming all is clear sailing. On one of his visits, however, he finds a colony with sealed cells and no eggs or young brood. He knows then that this colony has swarmed. All the same he destroys all queen-cells, and the next time round he gives it a young laying queen, and counts pretty safely that no more foolishness in the way of swarming will be considered by that colony for the rest of the season.

That's the whole program; destroy cells every 10 days, and when a colony is found queenless give it a young laying queen at the next subsequent visit. It may not suit many, but the plan is not altogether to be despised.

The above program has been carried out in a good many cases in a certain locality this year as well as other years, and it gets the honey.

**Shall Swarms be Shaken Before Preparations for Swarming?**—Some think it better to anticipate any action on the part of the bees by shaking before the time comes for the bees to start queen-cells, while others prefer to postpone action till queen-cells are found in process of construction. What may be best in one locality, or for one person, may not be best for another.

Where one can forestall swarming, and feel sure that is the end of it for the season, there is quite a comfortable feeling of being master of the situation. Granted that the shaking may interfere to some extent with the crop, the question may be asked whether it interferes any more—whether it interferes as much—as would swarming. Even if a little less may be obtained from each colony, the total crop may be increased by the shaking, for with the swarming question out of the way one can take care of enough more bees to more than make up all loss that comes from shaking. For, after all, in most cases the amount of work involved is the important factor in the problem. Less work and more bees will result from getting the swarming nuisance out of the way in advance.

But all may not be able to clear the track thus in advance. Too early shaking will with them only make the swarming demon more troublesome right in the harvest time. There may be sufficient reason why for them it may be best to keep on the watch for swarming preparations, only taking action when queen-cells are found in the hive. It will require work to go through the hives at stated times looking for cells. Still, one accustomed to the work will do it rapidly, and the results may justify the expenditure of labor. There will, too, be always ahead the alluring prospect of some colonies that will make no preparation for swarming whatever throughout the whole season, and they will be the record-making colonies. If all were shaken in advance no discrimination could be made, for it would not be possible in advance to select those colonies which would be complaisant enough to refrain from swarming.

This whole matter of shaken swarms is yet more or less unsettled, and it is to be hoped that experience, careful observation, and liberal exchange of views will so increase our knowledge regarding it that in the near future each one may have some more definite idea as to what shall bring the best practical results in his own case.

ASHLEY VALLEY, UTAH, seems to be a veritable bee-keepers' paradise, according to E. S. Lovesy, who grows eloquent over it in the Rocky Mountain Bee Journal. Enormous records have been made, some of them exceeding 1000 pounds to the colony. About a hundred bee-keepers occupy the valley, some of them having five and six apiaries with from 150 to 200 colonies in each yard, "and all of them rushing in with their loads of beautiful white honey." Those who might think of moving to this paradise are warned off by Editor Morehouse, who says the valley is now fully stocked, and no new bee-keeper should crowd in on those already there.

But he awakens interest in the Utah Indian Reservation, which will be opened to settlement Oct. 1, 1904, saying:

The Utah Reservation is similar to the Ashley valley, and when settled its valleys will produce honey as lavishly as the celebrated country around Vernal. It is now far isolated from railroads, but the Denver, Northwestern & Pacific, now building, will cross its borders and open its magnificent resources to commerce and civilization.

The Prelumps offered this week are well worth working for. Look at them.

## Convention Proceedings

Proceedings of the Texas Bee-Keepers' Convention Held at the A. & M. College, at College Station, July 8 to 10, 1903.

BY LOUIS H. SCHOLL, SEC.

(Continued from page 535.)

The following paper was presented by Wilmon Newell, who had charge of the experimental work referred to by Prof. Sanderson:

### REPORT OF THE EXPERIMENTAL APIARY OF THE TEXAS A. & M. COLLEGE FOR 1902-3.

The Experimental Apiary was established in May, 1902, with an appropriation of \$500 for the first year's work, or until Sept. 1, 1902. The itemized account of how this money was expended, as well as the work accomplished up to Sept. 1, 1902, will be found in the "Report Upon the A. & M. College Apiary," which was published during the past winter. Of this report 1500 copies were printed, but owing to lack of funds, copies were mailed to only a few in response to most urgent requests. Several hundred inquiries were received at the office of the entomologist for this report, showing that the bee-keeping industry in Texas is rapidly growing, and the demand for information enormous. Copies of this report may be had free of charge by applying to the secretary of the Association, or to the State entomologist.

For the year 1902-3, the sum of \$250 was available. This sum was totally inadequate for the work proposed, especially as the first year's work and funds were insufficient to build up the apiary to the proper size and condition for careful experimental work. The sum of \$250 was exhausted by March 1, 1902, and since that time the experimental apiary has been run mostly by main strength—and donations from charitably inclined individuals. Running a private apiary purely for the commercial gain to be derived therefrom, and running an experimental apiary with no possible source of revenue, are two distinct and different propositions, which fact is not always taken into account by the outsider. A number of reasons, and chief among them the necessity of a large and varied equipment, make the conducting of an experimental apiary by far the more expensive of the two. The \$250 above mentioned was expended as follows:

Bees and queens.....	\$45 40
Hives and apparatus.....	64 59
Tools, fence, and accessories to bee-house.....	39 43
Books and magazines.....	16 30
Feeding in fall of 1902, made necessary by dry season.....	6 00
Seeds and plants for experiments with cultivated honey-plants.....	15 83
Improvement in main building office.....	6 00
Travel (foul brood inspection and assistance).....	21 10
Freight and express.....	15 31
Postage and telegrams.....	14 90
Incidentals.....	2 34
Total.....	\$250 00

Owing to the shortage of funds, some lines of experimental work undertaken in 1902 had to be entirely abandoned, while the results with many other experiments were neither satisfactory nor conclusive, owing to the small number of colonies engaged in them.

#### HONEY-PLANTS.

In the fall and winter of 1902 considerable attention was given in the current numbers of the bee-papers to a California plant designated as "carpet grass," very flattering reports being given as to its honey-producing qualities and resistance to drouth. We were unable to ascertain the species of this plant, and accordingly secured from Sutter Co., Calif., through the courtesy of Mr. J. H. Erich, of that county, living "carpet grass" plants. These were planted out immediately upon their arrival, and grew fairly well. Some time after securing these plants, its name of *Lippia nodiflora* was published in the bee-papers. When the plants at College Station began blooming in the latter part of May, they were not only found to be this species, but were also identical with the form of this species occurring in

central Texas. This plant can be found along the banks of streams, and on the sandy knolls adjoining stock tanks. As a honey-producer in central Texas, at least, it is absolutely worthless. The bees visit it but rarely, and only then in the absence of all other nectar-yielding plants.

A small field of alfalfa was planted on the upland at College Station in the fall of 1902, and in spite of the abundant winter rains following, died out completely by May 1. The seed germinated and came up well, but the soil was evidently too poor for its growth.

The writer has often noticed that California privet—which shrub is largely planted for ornamental hedges in many parts of Texas—when in bloom, is visited by many bees, and the nectar secured is evidently considerable. With a view to determining the value of this shrub as a honey-producer, a small grove was planted during the past winter. Here, again, the lack of help asserted itself, and the work had to be abandoned when about one acre had been planted out. It is proposed to continue this planting until the grove contains at least three acres, and this, in three or four years, should give a good indication of what may be expected from this plant.

In March, the seed of several plants, including catnip, teasel, milkweed and sweet clover (*Melilotus*), were planted in carefully prepared soil. None of them grew.

Of over 40 different plants tested during 1902 and 1903, only borage, mustard, mignonette, Japanese buckwheat, sweet-peas, cow-peas, and California privet promise to thrive under soil and weather conditions existing at College Station. Of these only borage, mignonette, Japanese buckwheat and privet offer any prospect of being profitable if grown on a commercial scale for honey alone.

#### "PELLONCILLOS."

This, an unrefined sugar manufactured in Mexico, is familiar to the great majority of Texas bee-keepers, and especially to those of the Southwest, who have often used it for feeding in "off" years.

With a view to testing its food-value for bees, and its cost as compared to sugar, we secured last autumn about 40 pounds of this sugar. The sugar, as ordinarily sold, is in small cones containing about 13 ounces each, wrapped with corn-husks. In December several of these cones were placed in an empty super over a strong colony in need of stores. The bees worked at it slowly but steadily, and at the end of a month over half the sugar still remained in the super.

On Feb. 10, 11 and 12, the weather being warm and sunny, out-door feeding was resorted to as many of the colonies were short of stores. About 100 yards from the apiary three feeders were placed. One containing dry pelloncillos, one syrup made from pelloncillos and cold water, and the other contained ordinary sugar syrup made from granulated sugar (in the proportion of one part granulated sugar to 1½ parts water). The bees showed a decided preference for the granulated-sugar syrup, and took it fully four times as rapidly as the "pelloncillic" syrup. The dry pelloncillos were visited by only an occasional bee.

The day following many dead bees were found in front of all the hives, and in the afternoon a full quart of bees, dead and dying, were found bunched together by the "pelloncillic" feeder. Analysis of the "pelloncillic" syrup was made by Prof. H. H. Harrington, State Chemist, and was found to contain a large percentage of acetic acid. The dry pelloncillos were then examined, and were also found to contain acetic acid. The large organic content, aside from sugar, is most favorable for acetic acid fermentation. The presence of a considerable amount of water, for this fermentation to take place, is not necessarily essential. For this reason we must conclude that the use of pelloncillos for feeding bees is a most dangerous practice, and in no case should be undertaken without first testing the sugar for acid, and even while being fed it should be tested with litmus paper every day to be certain that no fermentation is taking place.

#### FEEDING EXPERIMENTS.

An experiment in stimulative feeding was undertaken the past spring, but owing to the limited number of colonies the results obtained were not conclusive.

In the experiment six colonies, each having six frames of bees (practically 6-frame nuclei) were used. Colonies 8 and 9 (old series) were fed from Feb. 13 to April 13, with Doolittle (division-board) feeders, at the rate of one-half pint of syrup per day (granulated sugar one part, to water 1½ parts), the feeding being omitted on cool and rainy days, when the bees refused to take the syrup from the feeders.

Colonies 2 and 12 were fed in the same way from March 6 to April 13. Colonies 1 and 3, for comparison, received no feed. At the beginning of the experiment these colonies (6-frame nuclei) were, so far as could be determined, in the same condition. All were in 10-frame dovetailed hives, and all had 3-banded Italian queens.

Summing up the results: Nos. 1 and 3 together produced (up to June 1) 15 pounds of extracted honey. Colonies 8 and 9 were fed in all 8 26-100 pounds of sugar, which, at 6 cents per pound, cost 50 cents. These two colonies together produced a surplus of 23½ pounds, a gain of 8½ pounds over the unfed colonies. Honey of the same quality and kind sold in Bryan, Tex., at this time for 7 cents. The gain over the unfed colonies was therefore 59 cents, obtained at a cost of 50 cents; profit 9 cents.

Colonies 2 and 12 received in all 5.8 pounds of sugar, which cost 35 cents. These two colonies produced only 15 pounds of surplus, which was the amount produced by 1 and 3 without feed. Loss, 35 cents. The above results would indicate that the feeding commenced early (Feb. 13), was far more profitable than the feeding commenced later on (March 6). The above amounts of surplus seem very small, but the fact that only nuclei were used in the experiment readily explains that point. Had full colonies been used the total yields would have been much larger, and doubtless the benefit (or loss) have been more marked.

We are prone to believe from this experiment, as well as from previous observations, that whether or not stimulative feeding will prove profitable in the increased honey-production will depend largely upon the price paid for sugar, the selling price of the honey secured, and the length of time available for building up the colonies before the main honey-flow commences. For example, in the above instance it is seen that the colonies which were given from Feb. 13 to April 13 to build up not only paid for the sugar furnished them, but made a narrow margin of profit besides. On the other hand, the colonies which were given from March 6 to April 13 to build up, did not even pay for a part of the sugar fed them.

As an illustration of the bearing of the prices of sugar and honey upon the results, suppose that in the case of colonies 8 and 9, the sugar had been purchased at 5 cents and the honey sold for 8 cents. The profit would have been 27 cents instead of 9 cents. Again, as a somewhat extreme case, suppose that the honey obtained were of good quality and retailed direct by the bee-keeper at 10 cents. The profit due to feeding colonies 8 and 9 would have been (with sugar at 5 cents) 45 cents.

Two full colonies were also used in a similar experiment, one being fed and the other not fed. In this case the fed colony produced but 3 pounds more surplus than the unfed colony, with a resultant loss of 12 cents. In the case of these colonies, had the sugar been bought for 5 cents a pound, and the honey sold for 10 cents, the gain in honey would have exactly paid for the sugar fed. In other words, neither profit nor loss. The value of the time necessary to do such feeding is not taken into consideration. These results are not considered by any means as conclusive, but are presented as showing how a very small variation in the price of sugar, or in the selling price of honey, will determine whether stimulative feeding will return a profit or a loss.

#### SECTION HONEY VS. EXTRACTED.

The present season has but confirmed our former opinion, that the vicinity of the College is totally unadapted to the production of section honey. A slow honey flow, an abundance of propolis, and above all, a dark honey, are the main deterrent factors. This makes the use of hives, specially constructed for section-honey production—such, for example, as the Danzenbaker—inadvisable. An interesting observation was made the past spring in connection with the latter hive. 4x5 plain sections, with fences and foundation starters, were placed upon one Danzenbaker hive, and upon one 10-frame dovetailed hive. The colonies in both these hives were 3-banded Italian, and, as nearly as could be determined, of the same strength. Now, as to results: The colony in the Danzenbaker hive produced 11 sections that graded No. 2, and 13 partially filled sections that could not be graded other than culls. The colony in the 10-frame dovetailed hive produced 15 No. 1 sections and 14 No. 3 sections. We have no explanation to offer.

On account of the abundance of propolis the use of closed-end frames, in most parts of Texas, is not practicable, and their use by beginners is not to be recommended. Among extensive bee-keepers rapidity of manipulation is a most important consideration. With such a hive as the

Danzonbaker rapidity of manipulation—as that term is commonly understood in Texas—is impossible.

In some localities propolis is so abundant as to make even the Hoffman frame an undesirable one. This is notably the case in the Brazos bottom, but a few miles from the College. It has been the custom of many bee-keepers to overcome this difficulty by the use of the "all-wood" frame, which must be spaced "by guess." For many reasons a self-spacing frame is to be desired, and in localities where propolis is abundant we heartily endorse the metal-spaced frame. These frames may be seen in the Experimental Apiary.

### Shaken or Forced Swarms—Objections Answered.

BY E. F. ATWATER.

ADRIAN GETAZ, on page 407, relates an experience very different from my own.

"I shook a few swarms several years ago," says Mr. Getaz. Well, so did I, and with the passing years I have shaken more, until I can now safely say that I have made scores, if not hundreds, of such swarms in the last two years. Mr. Getaz says, "As to preventing swarming, it was a great success." My experience is the same, if shaken on comb foundation *starters only*. With full sheets it is not an invariable preventive; on full combs it is even less certain with queens of various ages.

Swarms shaken on combs of *sealed brood* often prepared for swarming again, unless given a ripe queen-cell, instead of their queen (Aikin), and this latter is a very practical plan, a complete success.

Now, for the objections raised by Mr. Getaz:

1. "To carry it out on a large scale, it would be necessary to have a number of extra hives, which would involve a considerable cost." That's very true, but if the profits more than compensate one for this extra cost, what matter?

2. His second objection, crooked comb and drone-comb built in the brood-nest, where, apparently, no frames were placed. Why, Mr. Getaz, how about the *age* of the queens? Also, if the bees were not at work in the sections before being shaken, you may be sure that they will *often* build comb in an empty brood-nest first, where there are no little section-boxes or separators to divide the cluster. If the supers had contained *drawn* comb, or had been taken from other colonies well at work in the sections, the results might have been very different, for to insure *slow work* in the brood-nest, and the building of mostly worker-comb from mere starters, the bees must be working vigorously in the sections, almost as soon as hived.

3. "The queens will go into the sections unless prevented by a honey-board." If they do, wait a few days before adding the supers, or give a comb below. *Here*, the honey-board is "an expense"—a blessing, not "a nuisance"—and so an expense gladly met.

4. "Some pollen.... in sections." Give them a comb of brood or an empty comb below, which will usually lessen or do away with that trouble.

"Moderate increase, taking one comb of brood out of each colony every few days and replacing it with a frame of foundation." Nice plan, that, for my ten out-yards, isn't it? And more, in a fine flow my bees (mostly Italians) will pull out that sheet of foundation and fill it with honey, so that it acts very much as a division-board, practically confining the queen to one side of the hive, and so inducing swarming.

Now, to go back to objection No. 2. If the shaken swarms "did nothing, or very little, in the sections," it would seem to me that the queen would have been lonesome there.

The colonies here do fine section-work when shaken on drawn combs, but are somewhat apt to swarm within two weeks. Starters *will* do, if you will keep in mind my directions for securing worker-comb, and use a brood-nest of not more than seven Langstroth frame capacity. *However*, I have no quarrel with those who prefer full sheets of founda-

tion, as excellent results are secured in either way, and I have these forced swarms on full sheets, when, for any reason, I desire to form such swarms late in the season.

"I would suggest to contract the brood-chamber to three combs, so that the majority of the bees would be compelled to work in the supers." Don't you do it, for pollen will be placed in the sections. I have found it unsafe to contract the brood-nest until a swarm has been hived several days, or they may desert. With a brood-chamber, either shallow or deep, of five Langstroth frame capacity, a little pollen may go into the sections, but with a brood-chamber of six or seven Langstroth frame capacity, I have very rarely had this trouble.

"Then, as soon as these three combs are occupied, add one or two more." Here, and in the quotation above, Mr. Getaz says "combs," but, as he said, "It will not do to put in already built comb." I suppose that he means *frames of foundation*. Well, just let me suggest that "this is entirely too much work."

"Shall we leave a comb of brood? No, unless it is sealed brood." I have left combs of brood of all ages, and no swarming out resulted therefrom, although my experience in this respect is very different from that of J. E. Crane and some few others.

"Shall we 'shook' or not? In my opinion, no, decidedly no. It is far better to keep the forces together than to divide." Why, to be sure, but shaking *does* not divide when properly done, unless increase is desired. After shaking, I put a piece of burlap over the topmost super on the forced swarm; on this place the brood-nest and combs of brood, and the cover on top of all. Bore a 1/2-inch hole in the front end of this brood-body containing the frames of brood, and over this nail a chute or runway, so that as the brood hatches the bees are automatically fed into the "shook" or forced swarm, until all the brood is hatched. Or the same result may be attained by using the Heddon method of preventing after-swarms.

The burlap under the brood-comb gives ventilation and prevents chilling of the combs of brood. By this plan the forces are kept together, avoiding, in my practice, any "double loss," giving a double gain, control of swarming, with comparatively little labor and a large yield of comb honey of fine quality; and the queens are laying almost all the time, which can not be said of Mr. Getaz's plan of unqueening, although unqueening is an excellent plan for localities having one short honey-flow.

This season I have tested several systems of management to be used in the production of comb honey, and, as a result of that experience, I shall in the future use the Aikin method of allowing unlimited breeding-room up to the opening of the flow, then shake on starters or combs of sealed brood, in the latter case, giving only a ripe queen-cell. By giving sufficient stores and breeding-room up to the opening of the flow, it will not be necessary to inspect the bees more than once or twice up to June 1, when, at the opening of the June flow, by shaking *all* we need not inspect brood-nests for several weeks, visiting the bees once in ten days to give more super-room, and to remove finished supers.

Make the swarms very strong at any cost, for the strong colonies are the ones that stack up the supers of No. 1 honey.

Ada Co., Idaho, June 30.

### Wetting Queens for Easy Handling.

BY ADRIAN GETAZ.

I AM the one to whom Dr. Miller refers in his letter (page 483) as to wetting the queens when introducing them. What I had in view was not the introduction, but rather the handling of queens. The queens that I buy are introduced as per directions printed on the cage-cards. I do not think that any better method can be found, notwithstanding all that has been written on the subject.

I wet the queens whenever I handle them, just for safety and easy handling. For instance, you want to catch a queen for some purpose or other. You find her on a comb with more or less bees around her. Well, you try to catch her. Perhaps in your hurry you mash her or injure her seriously. Or some bee intervenes and stings you. Or, for fear of hurting her, you fail to catch her firmly, and she begins to race around quite lively. In your attempt to catch her, you scare her worse and worse, and she finally takes wing, and then you feel very much like breaking the third commandment of the Decalogue.

Now, suppose that as soon as you see the queen you give her and the bees around her a good wetting. Then neither

bees nor queen can neither run nor fly—just barely crawl about. You can then take your own time and catch the queen tenderly and carefully, and just put her wherever you please.

In rearing queens, I invariably cage the cells as soon as the bees have thinned the ends. The cages are made of wire-cloth, and similar in shape to the West cages. I put the cage in the hive the queen is to occupy, if it is already queenless, or I leave it where the cell has been built. But it must be in the cluster of bees to make sure that the young queen will be fed. Anyway, the time will come when the queen (a virgin, of course) will have to be released. When I first began, I simply uncorked the cage and laid it on the frames, letting the queen come out and go down between the combs. After two or three went "up in the air" instead of "down between the combs," I decided to give cages and queens a good wetting before uncorking the cages.

During the last two or three years I have often introduced them directly. That is, taken the cage (and enclosed queen) from the colony where she had been reared, given her a bath, and turned her loose at the entrance of her new home. This method has been as successful as the other. It has the advantage of not needing to open the hive where the queen is introduced. That's a good deal in times of scarcity of nectar. Very often the meddling of robbers spoils the introduction of a queen. Knox Co., Tenn.

weaken the old colony that the bees will decide they can not afford to swarm any more, and only one queen will be left.

4. Two weeks after the issuing of a first swarm, if no brood nor eggs are to be found in the hive, you may decide you have a queenless colony. Give it a laying queen, or if you have none, a virgin queen or a queen-cell.

### Hiving Swarms from Tall Trees.

As Miss Wilson has asked the sisters to tell how they do it, and as Joseph Blake tells how he did it, in last week's Bee Journal, I will tell the sisters the way I did it last summer.

I have a tall, slim red-cedar tree in my yard, and a swarm came out and settled in the top of it. So I spread an old quilt on the ground and put the hive on that, where I supposed they would fall, when I palled the tree-top over and would shake them off.

I nailed two pieces together, and put a large nail in one end of the pole and tied the other end with a clothes-line, so my neighbor could pull on that while I had the pole. I went after him, and he came; of course, he kept away quite a little distance, as he is afraid of bees. The nail would slip off of the line; I spoke but got no answer, and looked behind me and he was gone. One got after him and he left. I thought if I could get the rope around near the top then I would pull it over. It did not take me long to think how to get it there. I tied the line to the end of the pole and put it up where I wanted the rope, and walked around the trees and pulled the rope along, so it would come down. I then tied both ends together to pull it down.

I had to go for my neighbor again (they live close to me). When he came he wanted to know how I got the rope up there. So we both pulled on the rope and bent the tree-top over so I could shake them off, but the bees did not go near where I expected they would; they took wing and settled in a high cedar, higher than they were before, and the limbs were so thick together that one could not get them. My neighbor thought they were a hopeless case. I said the only way I could see to do with them was to keep them stirred up until they would leave and go some place else. So, with the long pole we kept them stirred up, but they would cluster in the same place, so I told him he might as well go home, and I would keep stirring them up.

I have tall pine trees along the road, and the bees are on the south side of them, so the neighbor just below the other one saw me in the road and came up. He and I kept punching and stirring them. He said we ought to have some kind of smoke, so I left him working at them and came in to get some salt-peter rags to tie on the end of the pole to set fire to and put up among them. When I went back I heard a roaring in the apple-tree by the other one, and I saw they intended to make for the woods, but the queen was too tired. She settled on a low limb of an apple-tree right across the road, so I took the hive over there, and with a poker got them and poured them on the quilt in front of the hive, and they were very glad to march in as fast as they could. It was a prime swarm, and I did not want to lose it. You see, there is a good deal of the bulldog nature about me to hang on. When I got through I had been over an hour at them, but I got them.

I think the Sisters department a great improvement to the Bee Journal; it gives us a chance to know what each one is doing, as you say, Whenever a woman makes up her mind to do anything she will do it.

I will let you know about my bees before very long. Cumberland Co., N. J. MRS. SARAH J. GRIFFITH.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Cutting Out Queen-Cells—Swarming.

Will you please explain about taking out queen-cells?

1. When to commence taking them out?
2. How often?
3. How long after the first swarm to prevent a second? how long after a second to prevent a third?
3. How to tell if a colony is queenless after swarming, and what is best to do with them? MRS. S. HATCH, Washington Co., N. Y.

1. If your desire is to prevent or postpone a first swarm you must begin as soon as queen-cells are started, at least before they are sealed. If you have a number of colonies, begin looking through the strongest at or before the usual time of swarming, which will likely be in your location about the time the white clover begins to bloom. When you find cells started in these strong colonies, then it will be well to make a systematic search in the others.
