2. About once in nine or ten days.

3. If all but one cell are cut out about a week after the first swarm, there ought to be no second or third swarm. If you want a second swarm to issue, but nothing later, cut out all cells but one as soon as the second swarm has issued. This, however, is not entirely safe, for immediately upon the issuing of the second swarm another young queen may have issued from her cell, and if you leave one cell uncut while there is a free queen in the hive, there may be a third swarm.

On general principles it may be said that you will probably find upon sufficient experience that it is better to prevent all after-swarms. To do this by cutting out queen-cells, listen for the piping of the first young queen that emerges. That ought to be about eight days after the issuing of the first swarm. To be on the safe side you might begin to listen the seventh day. Go to the hive in the evening when it has become still, put your ear against the side of the hive, and if there is a young queen there piping, you will have no difficulty in recognizing her shrill voice at intervals, "p-e-e-e-p, p-e-e-p, peep," and then the next morning cut out all cells.

There is, however, a better way than to cut out cells, by getting the bees themselves to do the job. The bees will never miss a cell; you may. The plan is this: When the first swarm issues, set the swarm on the old stand, putting the old hive close beside it. A week later move the old hive to a new place. That will make the field-bees, on their return from the fields, instead of going back to the old hive go back to the old place, joining the swarm. This will so

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### MENDING THE WEATHER—SHADE-BOARDS.

Mr. Abbott must be allowed his joking question about what we are going to do to mend the weather—warm weather in winter—but that is a very misleading joke. If decided that bees really suffer serious loss from much and daily flying around, the flying can be greatly reduced. The main question is simply whether that much work and expense is called for—and whether our arrangements will not be left to do harm further on, when Winter really gets busy. The key to the situation lies in shade-boards mainly. A complete shade has great power in the winter. Page 421.

### THE OCTOPUS OF COMBINATION.

Curious variations, the Octopus is capable of taking on, it seems. The fruit combine of California now walks on two equal legs, one a company of producers and one a company of commission men—the same head and tentacles answering for both. Case of necessity again. Benificent. Curious to see how, in these present years, the beneficent whistling of combination is in the boys' pockets, and how it inclines to get to whistling itself. And if boys were saints how good a thing it would be! Page 422.

### A SISTER TO TRY HATCHING EGGS OVER BEES.

Now we are to know whether it is practical to hatch eggs over bees. A woman with "gumption" to do things, and who handles both fowls and bees, is going to try it. Page 424.

### REMOVING HONEY FOR BROOD.

May be. Must be—seeing good men say it—in Cuba, and perhaps in other places, too, sometimes—But still I feel pretty sure nectar will be taken out of the way of the queen *whenever both queen and workers eagerly want brood*. Instead of studying on some other kind of bee, brethren, can't you put the bee you have in a different frame of mind? Page 428.

### VENTILATION OF BEE CELLARS.

Surely, Bingham is strong on ventilation. He gives cellar three tall ventilators, each big enough for a chimney-sweep to crawl in. And when they take the temperature down he inclines to just "let her go down." Yet, popularly, the present drift of sentiment is toward no special ventilation at all. How perplexing! May it not be that these two things I name are *both* truths? With correct and even temperature extra-pure air is not mandatory. With perfectly pure air even temperature is not mandatory. Of course we know that everything is mandatory, and still the bees will die; if the food is bad. Page 428.

### SACKED SWARMS THAT DESERTED.

Ah! Nine swarms tied up in sacks because there were no hives for them, all deserted when hived. Worth heeding. Several days sacked. England. In Yankee land we do things better. Guess some would have staid if they had been fed properly. Page 430.

### IRONING UNEVEN COMBS.

Thick, uneven combs put into shape by ironing them with a sad-iron not quite melting hot. "Pears like it might answer. Page 436.

### SOLICITING ASSOCIATION MEMBERSHIPS.

Solicitors to get bee-folks to join the Association. I had not thought of that before. Guess it will work—that is, can be made to work—in those regions of country where bee-men "hang thick on the bushes." Page 438.

### UNITING WEAK COLONIES IN SPRING.

Yes, Mr. Green, I agreed with you at the time, but thought it well to have reasons more fully stated. Let each weak colony in spring paddle its own canoe the best it ever

can paddle it. Help them if you can, but don't muss them up. More and better ones will get through than by continued uniting. Still, we don't want the iron-clad proposition that weak bees are *never* to be united in spring. Page 439.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Best Hive—Gathering Honey.

What is the best kind of hive to use for bees? We have a colony in a box, and I am anxious to get a hive.

When shall I gather the honey, and how?

ILLINOIS.

ANSWER.—You will do well to adopt a movable-frame hive, the dovetailed being one of the most popular. It is now so late that perhaps it will be as well to leave the bees in the box till next season after the first swarm. Very likely, however, they may do more than to fill the box, and you may be able to obtain some nice surplus for the table. Make one or more holes in the top of the hive or box—no matter if you bore right down into the honey—set over this a box four or six inches deep, and large enough to cover the hive, or more than one smaller boxes of the same depth, and when filled remove. You can tell better when filled by having glass on one or more sides, darkening the glass.

If you are going in for bees, one of the first things to do is to get a book of instruction, telling you how to take care of them.

### Transferring Bees—Overstocking and Preventing Increase.

1. I wintered two colonies last winter. This spring they each swarmed three times, and one of those swarms swarming again. One (in an old Langstroth hive, the other in a Jones) has filled all of the eight frames and the spaces between, so I can not take out any frames without cutting the comb between and drowning a great many bees. I do not wish to leave this hive in the condition it is. How can I get the bees out of the hive and put them into a new hive, so I can save honey, comb and bees?

2. I have 15 colonies. There are about 60 or 70 other colonies in the village. What number could I safely work up to without the neighborhood being overstocked?

3. When I get to that number, how can I prevent increase?

PALERMO.

ANSWERS.—1. You need have little fear of drowning bees in honey, for the other bees will clean them up. But you can get the bees out by smoking and drumming them, as directed in your bee-book.

2. That depends altogether on the pasturage. It is possible that you have reached the limit already, with 75 or 85 in one locality. Many localities will bear 100 colonies, and some favored places 200, 300, or more.

3. There are various ways, one being to double in the fall or spring to the desired number.

### Queenless Colonies—Difference in Bees.

1. I have over 100 colonies of bees. At this time of the year the honey-flow is over, and I find many queenless colonies. I give them brood from other colonies, and still some fail to rear a queen, and finally dwindle away. There are plenty of drones about. Why do they not rear queens?

2. When going through the hive I find in some that many of the supers contain uncapped honey, while others are starving for lack of it. Does uncapped honey in the extracting super prove that the bees are still gathering honey? If so, why is it that while some colonies gathered sufficient to store some, that other colonies failed even to support themselves, both colonies being equally strong?

3. I bought some queens this spring from a breeder as Italian queens. One of them seems different from the others. They are quite a gray color, having a couple of rusty bands.

They are so cross that when the hive is opened they fly out at you as if they were shot out of a gun, stinging one all over. What kind or breed of bees do you think they are? The other Italians are gentle, and have more yellow on them.

CALIFORNIA.

ANSWERS.—1. I don't know. Possibly they have been queenless so long that the bees are all old, and old bees are not the best kind for rearing queens. As you have given brood, there will be young bees hatching out from that brood, and if you give them brood and eggs again after enough young bees have hatched out, it is possible they may be willing to start cells.

2. No, unsealed honey in the extracting super does not prove the bees are still gathering. Two colonies apparently equal in strength may vary greatly in industry; one storing while the other scarcely makes a living.

3. Hard to tell; there may be black or Carniolan blood in them.

### Keeping Wax-Worms Out of Honey.

I would like to know how to keep the wax-worms out of comb honey. I have a nice lot to ship, and would like it in first-class shape.

NEW YORK.

ANSWER.—You ask how to keep the wax-worms out. The best way is to have strong colonies with a large proportion of Italian blood in them. You probably, however, want to know how to destroy the worms already in your sections. Fumigate them with sulphur. Use about a pound of sulphur or brimstone for each thousand cubic feet of space. Take any old vessel and fill it partly with ashes. In this set the iron vessel to hold the brimstone. Put in rags, live coals, or a hot iron, and as soon as lighted hustle out so as not to breathe the fumes. Close up tight, and 12 to 24 hours later air out. That will destroy all but the eggs, and you must repeat the fumigation about two weeks later to catch those that hatched out from any eggs that might have been present.

If you can get it, it may be still better to use bisulphide of carbon, which is believed to destroy the eggs as well as the larvæ. The amount to be used depends upon the number of sections and the space. One way is to stack up the supers of sections 5 or 10 feet high, put an empty super on top, and cover up in this two or three tablespoonfuls of the drug in a saucer, leaving it to evaporate. Be sure not to bring a light near it, unless you want your friends to be troubled by a funeral.

### The Alfalfa Pest—Number of Colonies for One Man.

1. Please describe the insect that blights alfalfa. How often does it appear in such large quantities? I would like to know all about it.

2. How many bees are the most that one man can handle, where there is a long but slow honey-flow?

CALIFORNIA.

ANSWERS.—1. I don't know, and refer the question to some one of the constituency better informed.

2. From 100 to three or four times that number, according to the man and management.

### Did the Queen Pass Through Perforated Zinc?

I have just overhauled my five hives. I had queen-excluders on 2 hives. In each case I find brood in the upper chamber. I found the queen in one upper chamber, caught her and put her down below. I suppose in each case the queen must have passed through the perforated zinc. Do you think my supposition correct? Drones cannot pass through them, but I think the queen must have done so, or else I have queens above and below, for there is brood in both places. If there are two queens, then the one I caught and put below will either kill or be killed.

I have not had much swarming, and no great amount of honey. The bees are working, but I think the brood eats it all. There is lots of brood.

BRITISH COLUMBIA.

ANSWER.—It is just possible that the case may be explained by assuming that the queen went up through the excluder, but I would accept that explanation only as a last resort. A virgin queen will make frantic efforts to get through an excluder when she wants to go out on her wedding-trip, but I have never known that a laying queen

would try very hard to get through an excluder. Even if the perforations were just large enough for such a queen to squeeze through, I don't believe one queen in a hundred would make the effort. Still, if there is no possibility of a queen in each story, or of brood having been put in each story, it is just possible that there may have been perforations large enough, and that the queen passed through.

### Time to Rear a Queen—A Colony Killing Its Bees.

1. I divided 11 colonies this summer. I put the old queens on the old stands, and the new ones off by themselves. Now what I want to know is this: The "ABC of Bee-Culture" says that it takes 24 days for a queen to hatch, but 9 out of that 11 hatched in 12 days, and one of them swarmed. There were no queens in there when I divided them.

2. I have a colony of bees that kill many of their bees; they have done it two or three times this summer. They will kill about a pint and then stop for awhile. One colony did it last year, and I thought at first that another swarm had gone in, but I see that is not what is the matter with them.

COLORADO.

ANSWERS.—1. You must have misread the "ABC of Bee-Culture." I think no authority nowadays makes the time longer than 16 days from the time the egg is laid till the young queen emerges from the cell, and 15 days is perhaps nearer the truth in a strong colony. When the queen is removed, as in your case, queen-cells are started from young larvæ, and the first young queen generally emerges in about 12 days, so your bees followed the general rule.

2. I don't know what the trouble is that would make them kill off anything but drones. It might be, as you supposed, a small swarm entering, only it would hardly occur so often.

### Buying and Rearing Queens.

Would you advise buying a queen now, or wait until spring? I want to try rearing a few queens, and did not know whether to get a queen now or wait until spring, when it is not so warm for her to be sent through the mail.

MISSOURI.

ANSWER.—Better get the queen now. If you wait till next year it will be somewhat along in the season before the new queen gets settled in her place, and if you get her this year you can begin breeding from her as early as you like next year. In other words, you will be just so much farther on by getting her this year; perhaps even being able to rear some queens from her this year.

### Using the Drone-Trap—Introducing-Cages.

1. How can I trap drones without injuring the queen or her usefulness?

2. Does the old queen always issue with the first swarm of the season?

3. Will she at no time come out unless a swarm issues?

4. Can non-swarming be practiced by the use of the drone-trap without injury to the queen?

5. When the queens destroy one another, does the old queen always come out victorious?

6. What cages are the best for introducing queens? and what kind of candy is used in them?

7. Is it an established fact that the queen has to come out of the hive to be fertilized?

8. How can I successfully practice non-swarming with the use of the drone-trap, and destroy the surplus of drones at the same time and not injure the queen or her usefulness?

OHIO.

ANSWERS.—1. By using the Alley drone-trap.

2. Yes, unless some accident occurs to her.

3. Not after she has taken her bridal-trip.

4. Not satisfactorily.

5. No.

6. Merely for introducing without shipping, the Miller cage with Scholz or Good candy.

7. Yes.

8. I don't know.

You are quite right as to the importance of studying one's business, and you would find it a very great help to study a good bee-book.

REVERSIBLE WALL MAP

OF THE

UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

China, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. **Very useful in every Home and Office.**

66 x 46 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

Best and Most Necessary Map Ever Issued.

No Home or Business House should be without it.

The Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

Marginal Index

is one of the invaluable features. It gives an alphabetical list of countries, their location on map, style of government, population, area, products, minerals, imports, exports, etc.

It has been pronounced a Photograph of the World

The 1900 Census of the largest American Cities is given.

One side shows a grand map of our great country, with counties, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

**1901 EDITION.**—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The Southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

**On the reverse side is the Library Map of the World.** The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agriculture, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. **The Inset Maps** are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps on one sheet, all for only \$1.50, sent by mail or prepaid express; or we will forward it free as a premium for sending us Three New Subscribers at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

**GEORGE W. YORK & CO.,**  
144 & 146 Erie Street, CHICAGO, ILL.

# Adels \* HARD REGORD TO BEAT \* Adels

My father has an Adel colony that stored 75 pounds section honey. It cast a swarm that has filled nine 24-pound supers up to date—1903. I am ready to back up this statement.

F. R. KOZAK, Maquoketa, Iowa.

I got 210 1-pound sections from one Adel colony. Another has filled 8 supers, and I expect 2 more supers this year from same colony.

One Queen and "Improved Queen Rearing," \$1.50. Send for 16-page Catalog.

## FROM MANY FIELDS

### Fine Weather in California.

We are having fine weather here in central California. Bees are doing well. The Central California Bee-Keepers' Association had a special meeting to discuss and consider the subject of the California National Honey-Producers' Association of Los Angeles. Nearly all were in favor of joining, but it was laid over until after the meeting in Aug. 18 to 20, at Los Angeles, where some of us expect to be, if the Lord wills.

My folks live at PasaCena, the garden of Los Angeles County, which place the Santa Fe railroad runs through. Bee-keepers from the East should not fail to see it while in California.

B. P. SHIRK.

Kings Co., Calif., Aug. 3.

### Hiving Swarms—A Report.

I received a queen during that cold, wet weather and had bad luck introducing her, so I sent for another and introduced her with the tobacco-smoke system, and had success.

On page 473, dumping the swarms in front of the hive and letting them run in to keep them strong is recommended. It says in two weeks all swarming will be over. It seems to me a

# A STANDARD-BRED QUEEN=BEE FREE

### To Our Regular Paid-in-Advance Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with **The Very Best Untested Italian Queens** that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

## A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription **must be paid at least 3 months in advance**. If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

Send us \$1.00 and the name (not your own) and address of **One NEW** subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due also.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows:

One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We are filling orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

GEORGE W. YORK & CO., 144-146 E. ERIE ST., CHICAGO, ILL.

## Please Mention the Bee Journal when writing Advertisers.

long time to dump swarms in front of a hive. Now I will give my way, which works like a charm.

Take an empty hive, set it in front of the parent colony, and put an Alley queen-trap in front. Have a screen made of wire-cloth to fit the top of the hive. Dump the bees in the hive, put the screen on quick, and smoke them out through the trap. The bees will return to the parent hive; take off the trap, and you have all queens and drones at your disposal.

I started in with 18 colonies, spring count, and I now have 35, all in good condition. I have taken off about 500 pounds of clover honey so far. The first part of the season being too cold and wet, the bees only made a living, and got ready for furious swarming. At this time it is getting very dry, and the bees are almost on a strike.

I would like to attend that convention, but the distance is so great that it would spoil a \$100 bill for me to go, so I will have to stay at home and see what the "Old Reliable" will say about the convention.

The Sisters department is fine. Success to Miss Wilson and the American Bee Journal. F. McBRIDE.

Hardin Co., Ohio, July 17.

### Will Exhibit at St. Louis in 1904.

The bees did well until July 18, then the honey-flow was cut short, the nights being cool and the days warm, and very little honey coming in. Up to July 18 the flow was good, never better. I will send one ton of honey to the St. Louis Exposition in 1904.

I have 43 members for the National Beekeepers' Association. I sent in 32, and have 11 more to send in yet—43 from one county, and I still expect more.

I increased 1 colony of bees to 4 this season, and had taken from them 363 pounds of honey up to July 21. G. W. VANGUNDY.

Utah Co., Utah, Aug. 4.

### Gathering from Alfalfa in Wisconsin.

Bees have not been doing much in the way of storing surplus honey for two weeks past. Before they were doing well on alfalfa clover until that was cut. There is plenty of white clover, but it does not yield honey like alfalfa. On one side of the bee-yard is alfalfa and the other is white clover.

Last fall I put in the cellar 78 colonies, and did not lose one in wintering. I now have 102 colonies and 8 nuclei. I work my bees for section honey. They are the 5-banded Italians. A. McCLANATHAN.

Eau Claire Co., Wis., July 28.

### About Half A Crop of Honey.

About half a crop of honey is reported for our locality; west of Chatsworth it was a little better than most localities. Six hundred colonies, belonging to four bee-keepers, produced nearly 40 tons. Had the bees all been Italians, and in Langstroth hives, there is no doubt but what the crop would have been much better.

The most of our honey crop came in June, it being cold and foggy during the month of May.

As usual, the hot weather hurt the white sage in July.

I saw something in the American Bee Jour-

## Thousands of Hives - Millions of Sections

Ready for Prompt Shipment.

We are not selling goods on NAME ONLY, but on their quality. In addition to the many car-loads we are shipping to all parts of the United States, we have just made one shipment of five car-loads to England.

nal about sumac being a good honey-flower. The kind of sumac that grows on the dry hills of this section yields a little honey in July, and it is of a dark color. It is quite different from that which grows in the lowlands of Minnesota.

My father sells honey at one of the city markets at half a cent higher than that quoted by the California National Honey-Producers' Association. Of course, only merchants buying a few cases will buy. He also retails extracted honey.

No doubt the California National Honey-Producers' Association is all right for Eastern buyers, but honey may come up a little after the 15th of this month. E. ARCHIBALD, Los Angeles Co., Calif., Aug. 7.

**A Short Report.**

I have 38 colonies of bees, and doing well. I have taken off 800 pounds of honey, and have 1500 more in sight. JOHN DEGROFF, Peoria Co., Ill., Aug. 10.

**Beedom Boiled Down**

**Translated from the French.**

**INTRODUCING BEES.**—Mr. Fitzhob, (Journal de l'Abeille rhénane), says he put the caged queen in the hive. Next day, he takes the cage (queen included) puts it in a cup of cold water and then turns the wet queens loose. He says he has never lost a queen, even when introducing to colonies with laying workers. Though he does not say so, I suppose that the queen is alone in the cage, without candy or attendants.

**APIFUGE SUPER-CLEARER.**—In a quart of boiling water put one ounce of carbolic acid (crystals) and one ounce of glycerine. When needed, wet a cloth with the mixture and put on the supers to be cleared. A few minutes will empty them of all the bees.

**DO BEES MOVE EGGS?**—Mr. Gallet (Apiculteur) says yes. In July, 1889, he introduced a queen in a wire-cloth cage without attendants and without food (the usual process in Europe) to a colony having no unsealed brood. Some accident prevented him from releasing the queen until four days later. To his surprise, he found eggs in several of the cells around the cage. He supposes the queen dropped her eggs which fell through the meshes of the wire-cloth, and were carried by the bees into the cells.

**PARAFFINE AND WAX.**—The adulteration of wax with paraffine is not often practiced here, but it may be well to know how to ascertain the fact.

Heat the suspected wax in a porcelain vessel with a large quantity of concentrated sulphuric acid. There will be a considerable foaming. Keep the heat a few moments yet and let cool. The wax will be transformed into a semi-liquid black residue; while the paraffine will remain intact, come on the top solidly. The acid must be as concentrated as possible, otherwise it would act only very slowly and imperfectly on the wax. It must be in excess, otherwise the residue would be too thick and retain the paraffine. A portion of the paraffine remains in the residue even

then. A mixture of 50 percent of paraffine gave only 45 at the end, and a mixture of 75 percent only 68. (From Le Rucher Belge.)—ADRIAN GETAZ, in American Bee-Keeper.

**Bee-Stings for Rheumatism.**

Dr. Perc of Marburg, addressed a brilliant gathering of physicians the other day on the healing properties of bee-stings in cases of rheumatism of the joints and muscles. The professor pointed out that it has been known from time immemorial as a cure among the poorer classes of people who have no faith in medical science. He has tested it thoroughly and proved its efficiency in 500 cases.

If a patient is suffering with rheumatism the stung part does not swell at first, nor until the bee-poison is frequently introduced. Then the rheumatic pain gradually vanishes. Dr. Perc allows his patients to be stung at first by a few bees, and then gradually increases in numbers. In one sitting he allows 70 bees to sting the patient. He describes the case of a woman who suffered excruciating tortures from rheumatism. In the course of her cure she was stung 6,952 times, and this resulted in a complete cure.—Exchange, Berlin, May 24.

**Prevention of Swarming.**

An ordinary bee-keeper that has been in the business for a number of years will tell you that when a colony gets to a certain strength, that is, after the white clover has been in blossom some 12 or 14 days, every colony that was in good condition will have one super half to three-fourths full. But now comes the critical condition. After said super is nearly full, the colony will begin to loaf for a week before it swarms, and this same week is lost if we wait for a natural swarm; henceforth be wise and transfer when the super is half full.

Some apiarists will tell you that every colony will act different from others. Nonsense. The bees must be controlled and made to do that which you wish, *a la* Aikin. Providing you have bees, and there is any nectar in the field, "shook" swarms will work with the same vim as the natural swarm, and doubling that of a loafing old colony with a lot of worthless brood after the flow is over.

My method is as follows: The colonies are grouped in pairs to begin with in the spring. Colonies No. 1 and No. 2 stand side by side. Spread them about 18 inches, and place a bottom-board with a Heddon half-super or hive between the two hives, and place in it seven shallow frames with one-half inch starters.

Now go to colony No. 1 and pry off the super, but do not take the cover off the super. Use very little smoke; next find the queen and place her with the frame of brood she is on, in the newly formed hive, with three of the empty frames on one side and four on the other. Now take from the same colony two more frames that contain no brood and place one on each side of the empty frames, and the brood-chamber is complete. Place an empty super, containing only starters in the sections, on this newly formed colony. Take the cover off the other super and place the super on the empty super, and the super from colony No. 2 on top of these two supers. Now cover the newly formed hive with a thin board with a 3/4 inch rim to make it look like an escape-board, *a la* Porter. Cut an entrance

in this escape-board by cutting two inches out of the rim in the front end. Now bore an inch hole through the board, one inch from the two-inch rim entrance.

Kill the queen from colony No. 2 and set the colony on this board, bottom-board removed, and also the body with the brood and bees from colony No. 1 on top of this, cover up and you are finished. You will now have shot-tower hives, *a la* France. Work is now going on in the supers in double time; hip, hip, and the colony is gaining in strength daily.

Fifteen days later, in transferring, the two brood-stories should be taken off and placed beside the parent colony. Eight days later reduce down to 20 frames, give them a strip of eggs, *a la* Alley, and you will have a number of queens 25 percent superlative to those reared under the swarming impulse.

Two weeks after the eggs are given, kill the queen in the old colony, give half of the brood to the parent colony that has the capped cells, and, at the same time give the old colony two cells from this parent colony, protected, *a la* West. You will now have your whole apiary requeened, which is very essential in the "shook" swarm system.—Geo. ROCKENBACH, in *Progressive Bee-Keeping*.

### The Canadian Honey Harvest.

The white honey harvest is well-nigh over, and so far as we have been able to ascertain the crop will be a good average. Quebec and Eastern Ontario suffered for lack of rain in the early part of the season, and, as a result, only a light crop has been secured. Western and Southern Ontario have had a good yield from clover. Basswood is doing fairly well at this date of writing, although the unsettled weather is rather against the bees working on it to the best advantage. We have not yet heard from the Western and Maritime Provinces. The quality of the honey this season is excellent, both in color and body. Many have mentioned the fact of the thickness, making it unusually difficult to extract.

Some have feared a lowering of prices, but we see no necessity for this if an effort is made on the part of the larger producers to distribute the product. Some have already sold at figures bordering on last year's prices. The general advance in other things should certainly have an influence in at least maintaining prices. Local markets are usually crowded by small producers at this season, and the tendency is depressing. It is generally better to hold a little later.—Canadian Bee Journal.

### Excessive Swarming in Colorado.

It seems that excessive swarming this year is not confined to a very small area. In Illinois it is perhaps worse than in any previous year, and this is what is said about it in Colorado, by the Rocky Mountain Bee Journal:

"Usually bees do not swarm much in Colorado, normally casting not to exceed 40 percent of prime swarms, with a still smaller percentage of after-swarms. This year, however, has pulverized all previous records. Swarming began about May 20, and did not cease until after July 15. And just about everything swarmed. One subscriber, in renewing, facetiously remarked that, in his locality, 'even the drones swarmed.' This is the tenor

## Long Tongues Valuable South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

HUTTO, TEX., Nov. 19, 1902.  
J. P. Moore.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day at I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly,  
HENRY SCHMIDT.  
The above is pretty strong evidence that red clover is not the only plant which requires long-tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

J. P. Moore, L. Box 1, Morgan, Ky.

## SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with the order:

	5lb	10lb	25lb	50lb
Sweet Clover (white).....	\$.75	\$1.40	\$3.25	\$6.00
Sweet Clover (yellow).....	.80	1.70	3.60	7.50
Alsike Clover.....	1.00	1.80	4.25	8.00
White Clover.....	1.50	2.80	6.50	12.50
Half Clover.....	1.00	1.80	4.25	8.00

Prices subject to market changes.

Single pound 5 cents more than the 5-pound rate, and 10 cents extra for postage and sack.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

GEORGE W. YORK & CO.,  
144 & 146 Erie Street, - CHICAGO, ILL.

of reports we are receiving from nearly all localities of the State.

"This season was a peculiar one. The flow began slow and drizzling—just strong enough to maintain active brood-rearing, but not strong enough to settle the colonies down to gathering and storing in the supers. The result has been a very large increase of bees throughout the State. The heavy winter loss is recovered, and we believe it no exaggeration to say that there are more colonies of bees in Colorado to-day than ever before in her history."

### Across the Mediterranean.

A bee-keeper of Italy migrated with his 300 colonies across the Mediterranean Sea to Tunis, but failed to make a success of bee-keeping and producing honey. He succeeded, however, in selling out to the French Beekeepers' Association there and came home a richer man.—American Bee-Keeping.

### German and Bee-Keeping.

The German government is looking into the matter of bee-keeping and adulteration of honey at the present time. A government experiment station with 10 colonies of bees has been established near Berlin, and a bulletin has been issued of late, treating principally upon the adulteration of honey; it also tells of the number of colonies kept in Germany, etc. It appears there were kept in 1900, 2,605,350 colonies. Of these 1,151,771 were in frame hives and yielded 16,171,200 pounds of honey; the others—box-hives, straw-skeps, etc.—gave a yield of 13,729,000 pounds. The frame-hive colonies yielded three pounds to two of the others.—American Bee-Keeping.

### Packages for Bulk Comb Honey.

The packages used in putting up this article are now most largely 3, 6, and 12 pound tin friction-top pails, that are put up in crates holding 10 of the 12-pound cans, 10 of the 6-pound cans, and 20 of the 3-pound cans. There is also some demand for bulk comb in 60-pound cans, two in a case, the cans having 8-inch screw-tops. These are sometimes ordered where the buyer desires to put the honey into glass packages for a fancy trade.—H. H. HYDE, in *Progressive Bee-Keeping*.

### Brushed Swarms.

So much has been written in regard to brushed swarms, I determined to try the process without combs and use frames with starters or full sheets of wired foundation, and add a Doolittle feeder with three pounds of extracted honey. I place an empty hive in rear of a strong colony, removing the combs one by one, and brushing all the bees from them back into the old hive, and place the combs in the empty hive. Then remove the hives with brushed bees and feeder to another stand, and place the hive with combs of honey and brood in place of the old hive just removed. The returning bees with capped brood soon hatch out another queen, and the feeding of extracted honey enables the bees to build up combs rapidly and prevents a disposition to abscond. It would be a great advantage to introduce a young queen if you have one, but I am experimenting without. I have tried the plan on quite a number, and so

# BEE-BOOKS

SENT POSTPAID BY

GEORGE W. YORK & CO.,

144 & 146 E. Erie St., CHICAGO, ILL

**Forty Years Among the Bees**, by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bee. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey**, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment**, by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Foul Brood**, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

far have succeeded, and no absconding has occurred.—Dr. O. M. BLANTON, in American Bee-Keeper.

Close Saturdays a 1 p.m.—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

## QUEENS.

The best of Queens from the best strains of 3 and 5 banded bees. I make a specialty of Queen-Rearing. I have 700 Nuclei, and send Queens

**By Return Mail**

(Exact size of the Pen.) 144 & 146 Erie St., Chicago, Ill

## HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Aug. 7.—Consignments of the new crop are coming to commission houses that have not had honey for years past, and as there is not any consumptive demand they are finding difficulty in disposing of it. Under such conditions it is hardly possible to give accurate prices, as some merchants ask 10 cents for honey that others hold at 15 cents. The prices given in our last quotations are asked, but feeling is unsettled. Beeswax steady at 30c.

R. A. BERRYETT & Co.

KANSAS CITY, July 28.—Some new comb honey in market, but on account of hot weather the demand is not heavy, but will be getting better every day. Fancy white comb, 24 sections, per case, \$3.50; No. 1, white and amber, 24 sections, per case, \$3.25; No. 2, white and amber, 24 sections, per case, \$3.00. Extracted white per pound, 66¢; amber, 54¢. Beeswax, good demand, 25¢/30c. C. C. CLEMONS & Co.

ALBANY, N. Y., July 18.—We are receiving some shipments of new comb honey, mostly from the South. The demand is light as yet; we are holding at 15¢/16c. Extracted slow at 66¢. The crop of honey in this vicinity is very light, and we shall have to depend upon other sections more than ever for our supply of honey. Beeswax, 30¢/32c. H. WRIGHT.

CINCINNATI, Aug. 6.—The supply about equals the demand for extracted honey. We are selling amber extracted in barrels from 5¢/6¢, according to quality. White clover, barrels and cans, 7¢/8¢, respectively. Comb honey, fancy, in no drip shipping cases, 16¢/16½¢ per lb. Beeswax, 30c. THE FRED W. MUTH CO.

NEW YORK, July 8.—Some new crop comb honey now arriving from Florida and the South, and fancy stock is in fair demand at 14c per pound, and 14c for No. 1, with no demand whatever for dark grades.

The market on extracted honey is in a very unsettled condition, with prices ranging from 5¢/5½¢ for light amber, 5¢/6¢ for white, and the common Southern at from 50¢/55¢ per gallon. Beeswax steady at from 30¢/31c.

HILDRETH & SEGELKEN.

CINCINNATI, Aug. 8.—New honey is now offered very freely, particularly extracted. The demand for honey is about as usual at this time of the season. I made sales at the following figures: Amber, 5¢/5½¢; water-white alfalfa, 6¢; fancy white clover honey, 7¢/7½¢. Comb honey, fancy water-white, brings from 14¢/15¢. Beeswax, 27¢/30c. C. H. W. WEBER.

SAN FRANCISCO, July 22.—White comb honey, 11¢/12¢; amber, 8¢/10c. Extracted, white, 5¢/6c; light amber, 4¢/5c; amber, 4¢/4½¢; dark, 3¢/4c. Beeswax, good to choice, light, 27¢/29c; dark, 27¢/29c. C. H. W. WEBER.

This season's crop is not only unusually late, but is proving much lighter than was generally expected. While the market is unfavorable to buyers, the demand for extracted current rates is not brisk and is mainly on local account.

**WANTED! FANCY COMB HONEY** in no-drip shipping-cases. Also Amber Extracted in barrels or cans. Quote your best price delivered Cincinnati. The Fred W. Muth Co. 32A½ Front and Walnut CINCINNATI, OHIO.

**WANTED—Comb Honey** in quantity lots. We are perhaps the only dealers in this article owning as much as 150,000 pounds at one time. Please state quantity, quality and price asked for your offerings. Thos. C. Stanley & Son, 24A½ MANZANOLA, COLO., or FAIRFIELD, ILL.

**WANTED—Extracted Honey.** Mail sample and state lowest price delivered Cincinnati. Will buy FANCY WHITE COMB HONEY, any quantity, but must be put up in no-drip shipping-cases.

C. H. W. WEBER, 2146-48 Central Ave. CINCINNATI, OHIO. 24A½ Please mention the Bee Journal.

**WANTED!**

TO BUY—White Clover Comb and Extracted HONEY—also Beeswax Spot case. Address at once, C. M. SCOTT & CO. 33A½ 1004 E. WASH. ST., INDIANAPOLIS, IND. Please mention Bee Journal when writing.

## The Best Bee-Goods in the World...

are no better than those we make, and the chances are that they are not so good. If you buy of us you will not be disappointed. We are undersold by no one. ## RED CLOVER HONEY-QUEENS.

SPRING BLUFF, Wis., July 18, 1903.  
THE A. I. ROOT CO., Medina, Ohio.  
Dear Sirs:—I thought I would write you a few lines in regard to the Red Clover Queen I got from you. They haven't swarmed yet this summer, but have taken 48 sections from them and there is 24 more all ready to come off. Just think, 72 nice sections of as nice honey as ever was made, and only July 18th. It seems as though they will surely fill 48 more.

I don't know whether their tongues are any longer than any of the others, or whether they gathered it from Red Clover, but surely such bees are worth money.

I use the 8-frame Jumbo frame.  
C. E. KELLOGG.

C. E. KELLOGG, Spring Bluff, Wis.  
Dear Sir—We have yours of July 18th and would be glad to have you advise us by return mail with reference to the capping of the honey. Some parties say the capping from these bees is not white, and we would be glad to have you advise us how your honey is in this respect, and oblige,  
Yours truly,  
THE A. I. ROOT CO.

SPRING BLUFF, Wis., July 31, 1903.  
THE A. I. ROOT CO., Medina, Ohio.  
Dear Sirs:—Yours of July 24th at hand to-day. In regard to your question in reference to the cappings of the honey from these bees I will say that it is simply perfect, beautiful snow-white and every box perfect, 38 one-pound sections now. I am quite sure they will fill two more supers, which will bring the number up to 144. I would like very much to have you see a few of those sections, and I will be glad to send you a few.

Now, I haven't told you ALL their good qualities yet. I am sure they are by far the most gentle bees to handle I have. I could take off the sections without smoke or veil without getting stung. There are a few traits about them that they don't seem to want to swarm.

I will write you again in a few weeks and let you know if they fill the 144 sections, which I am sure they will.  
Respectfully,  
C. E. KELLOGG.

## AGAIN READY FOR PROMPT DELIVERY.

We were snowed under with orders for a few weeks, but here we are again with good Queens and prompt service.

### Red Clover and Honey Queens.

	Each.	Six.	Each.	
Untested	\$1.00	\$5.75	Breeding	\$5.50
Tested	2.00	11.50	Select Breeding	7.50
Select Tested	3.00	17.10	Extra Select Breeding	10.00

With any of the last three we include one frame of bees and brood to insure safe arrival, for which we make no charge. These must be sent by express. Queen circular free.

THE A. I. ROOT CO., Medina, Ohio.

# AMERICAN BEE JOURNAL

If more convenient, Dues may be sent to the Secretary, at the office of the American Bee Journal.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shows herewith is a reproduction of a model queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 11c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# 200 Nuclei with Red Clover Italian Queens

## Ready for Immediate Delivery.

We have arranged with a bee-keeper having a large apiary adjoining Chicago, to furnish us with Nuclei, each having a Red Clover Queen reared from one of Root's specially selected Red Clover Breeding Queens. They will be shipped direct from the apiary at these prices, cash with the order:

One 3-frame Nucleus with queen, \$3.50; 5 or more at \$3.00 each—on standard Langstroth frames in light shipping-boxes.

Or, we can furnish these Nuclei in 8-frame hives containing 3 extra brood-combs and 2 extra frames with foundation starters, at these prices:

One Nucleus for \$4.50; or 5 at \$4.00 each.

With a good fall honey-flow these Nuclei can easily be built up into good, strong colonies for wintering.

Address all orders to

**GEORGE W. YORK & CO.,**

144 & 146 East Erie Street, CHICAGO, ILL.

# Dr. Miller's New Book

## SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO.,**

No. 36.

## Editorial Comments

The Los Angeles Convention is now history. It was a large meeting of large bee-keepers. There were more colonies of bees represented, and more pounds of honey, than in any National convention of bee-keepers ever held before in this country. The following were elected as officers for 1904:

President—James U. Harris, of Colorado.  
Vice-President—C. P. Dadant, of Illinois.  
Secretary—Geo. W. Brodbeck, of California.

We expect to begin the publication of the report of the proceedings in full next week, and from time to time we will also give some notes and comments on the trip and the convention.

**How to Write Questions.**—An editorial in *Gleanings in Bee-Culture* gives rise to the suspicion that the urbane and usually patient editor of that paper has had his patience somewhat tried by the sort of letters he gets containing questions. He says in part:

"Now, I have something to do besides answering letters; but I am perfectly willing to respond to all inquiries. But our friends will save me a great deal of time if they will make their questions brief, write on only one side of the sheet, and number the pages. Long letters are apt to be delayed, and perhaps never answered. It takes time and brains to dig a question or two out of a long, rambling letter. Get down to the meat of your inquiry at once, leaving out all unimportant details."

Among the many letters sent in for "Dr. Miller's Answers," some are models of neatness and clearness, but some of them would hardly be placed in that category. It is well always to give in connection with the questions any information or explanations to give a clear understanding of the case; other matter should hardly be mixed up with the questions, but given in a separate part of the letter. Besides having pages numbered, as suggested in the clipping, it is a great help to have the questions numbered. The reasons for writing only on one side of the sheet are more than one, hardly necessary to be given here, but if you want to be good you'll not write on both sides.

It is a real pleasure to receive some letters containing questions, which show at a glance just where each question begins and ends, and require no great amount of study to tell just what the questions are about.

**"A Colony that Never Thinks of Swarming;" A Confession.**—Under this caption appears the following editorial in *Gleanings in Bee-Culture*:

Some little time ago Dr. Miller and I had a little tilt over the first part of this subject. I was taking the ground that the new shaker-swarm plan was going to do away with many of our difficulties. While Dr. Miller admitted that shaking was effective, and could be made very useful, yet he still expressed a hope that we might some day breed a race of bees that would go on storing honey without swarming, the same as poultry-men have bred several varieties of hens that are non-sitters. I argued that the gain would be only trifling, because a colony could be shaken at the convenience of the apiarist, and thus all desire to swarm be taken away from them in advance. Well, now, for that confession. The events of the last few days have completely converted me to Dr. Miller's view of the matter. While I still have as much faith in the shaken method as I ever had, and while not one of the swarms we shook this season has essayed to

go out again, yet a colony that will stay on its brood-combs in its old brood-nest, and allow all its brood to hatch, is to be preferred because of the saving in the labor.

At the Harrington yard we shook perhaps a third of our colonies—perhaps the strongest ones. The remainder we left just as they were. When the honey-flow came on it was apparent that the shaking had set them back a little. They had, temporarily, at least, been deprived of their brood, and it takes a day or so right in the honey-flow for the bees to recover themselves again to begin work. Then the brood, after it hatches, requires to be shaken again at the old entrance; and this causes another interruption, and possibly the loss of a queen. If the brood is not shaken back with the swarm after it hatches, then the shaken swarm will, before the season is entirely over, begin to feel the need of the young blood that would recuperate their fast-waning strength when it is most (if ever) needed in the whole season. But Dr. Miller's ideal colony that never thinks of swarming will at least keep right on working—keep all of its brood, save all the fuss and bother of shaking frames with starters in, the building of drone-comb, and with all its reserve strength will go on magnificently producing honey. But the never-think swarm I think is still largely a will-o'-the-wisp, and so we will have to content ourselves with shaking for the time being, and occasionally shining up trees to bring back runaway swarms.

The question whether it is worth while to work toward a non-swarming strain of bees is one that will receive different answers from different persons. Some will say that the results with shaken swarms are so satisfactory that nothing further need be desired. There has been, however, testimony to the effect that in some cases shaken swarms have not had all the swarming mischief shaken out of them. Even if entire reliance could be placed in the shaking as a sure cure against any further attempt to swarm, according to the observation of Editor Root and perhaps others, "a colony that never thinks of swarming" will give at least a little better result than if interrupted by shaking.

There is no question as to the fact that there is a notable difference in different strains of bees as to the matter of swarming. Some are so given to swarming as to impair their value greatly, while here and there are reported cases where there is little or no swarming. A man who has bees that are greatly given to swarming will gain to introduce queens of stock noted for little swarming. If now he breeds persistently from those colonies that show the least inclination to swarm, will not swarming in that apiary become a constantly diminishing factor? He may never reach absolute non-swarming, but he may approximate it; and approximation is worth something.

**What Kills a Queen in a Ball?**—A difference of opinion prevails. Some think the queen is stung to death, others that she is starved to death, others that she is suffocated. Proof that stinging is the mode of execution is offered by the fact that the stinging has been in more than one case actually found in her body. To this it is replied that these are exceptional cases brought about by the interference of the bee-keeper. If the effort be made to disengage the queen from the ball by pulling the ball apart, she will most likely be stung. If hot smoke be blown upon the ball, she will be stung. No one, however, has reported finding a queen stung in a ball when the smoker has been held from the ball at such a distance that no heat could be felt from it, the stream of cool, dense smoke being played continuously upon the bees until no longer endurable, when the bees of their own accord would separate from the queen. Neither has any one reported finding a queen stung in a ball if the ball is thrown into a dish of water. The water seems to dampen the heated fury of the ballers, and it is every fellow for himself (or herself) to escape a watery grave, leaving the queen, like the rest, struggling to escape. That does not prove, however, that the bees never sting a queen in a

ball. An argument of some weight is the fact that if a strange bee enters a hive, and the bees are left to their own devices, the queen will be found hours later still alive in the ball. If stinging is the mode of execution, the bees could sting just as well first as last, and why such delay?

There is considerable to enforce the belief that death is caused by starvation. In the case of a laying queen, the great burden of eggs produced requires an immense amount of nourishment, and it is well known that such a queen is being constantly fed by the workers. Being deprived of all food in the ball, small wonder that she should succumb within a few hours.

That suffocation causes death does not seem very probable. It is not likely that the bees can be so densely packed in a ball as to prevent the entrance of all air. There will still be plenty of spaces to allow its entrance. Moreover, if the queen should be suffocated, would not the bees in immediate contact with her be also suffocated?

Until some one finds a dead queen in the midst of a ball with a stinging in her body, the queen being already dead when the ball is first meddled with by the bee-keeper, it seems that the advocates of the starvation theory have the best of the argument.

**Artificial Cell-Cups.**—A correspondent of the British Bee Journal having had difficulty in getting the bees to accept larva in artificial cell-cups, sent a sample of the same to the editor, trying to find what the trouble was. The editor replies:

We rather think the fault lies in your "cell-cups," judging by samples sent. These are all right, and nicely made at the lower or open end of the "cup," and also with regard to size and capacity of same, but the base of the cup has a little pit or well—so to speak—formed by the flat point of the stick or "dipper," which is altogether unsuitable in shape for the proper development of the queen-larva, and, as such, is probably rejected by the bees. Had the base of the cell been simply concave in shape, so as to form a rounded base to the cell, it would be far more likely to be accepted by the bees for queen-rearing.

In this country cell-cups are used of both kinds, but those of the "little pit or well" are specially intended to have transferred into them the larva in a little cup of the cocoon of its own cell. The comb containing the larva is shaved down till a shallow cup of the cocoon can be picked out, and this little cup, larva and all, is pressed down with a special instrument into the "well" of the artificial cell-cup. The bees accept this very readily, for the larva is left in its natural condition surrounded by the same food the bees eat it.

Whether these artificial cell-cups with the depression in the bottom would work just as well with the larva placed in them without the cocoon has probably not been tried much. But should a cell-cup with the little pit or well be altogether unsuitable in shape for the proper development of the queen-larva? Thousands of good queens have been developed in emergency-cells, and these have a pit of the same diameter and a good deal deeper.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

The Premiums offered this week are well worth working for. Look at them.

## Convention Proceedings

Proceedings of the Texas Bee-Keepers' Convention Held at the A. & M. College, at College Station, July 8 to 10, 1903.

BY LOUIS H. SCHOLL, SEC.

(Continued from page 550.)

### BOTTLING HONEY.

It is a well-known fact that when honey is bottled at a temperature of 160° Fahr., or thereabouts, and sealed while still at that temperature, it will remain liquid indefinitely. It seems likely that the temperature at which granulation can be prevented will vary with honey from different sources. At the same time, too high a temperature when bottling will impair the flavor of the honey. To determine at what temperatures honey of different kinds could be bottled to best advantage, experiments were begun in February, 1903. Eysenhardtia honey, procured from Louis H. Scholl, of Comal Co., Tex., was bottled and sealed at the following temperatures: 150, 155, 158, 160, 163, 165, 168, 170, 173, 175, and 180 degrees. Six bottles of each temperature were corked and sealed with sealing wax, the intention being to open one bottle (each temperature) six months after bottling, one in a year, one in two years, one in two and a half years, and one in three years after bottling, and make comparisons of the flavor and keeping qualities. A bottle of the honey, corked but not sealed and without being heated, was also preserved.

Within three months the unsealed honey was thoroughly granulated. Up to June 1, none of the sealed honey had granulated. On June 17, the first series of bottles were opened and examined by Prof. Sanderson and Mr. Scholl, and upon these Mr. Scholl reports:

"The honey bottled at 150 degrees had retained its flavor, while the higher temperatures of heating had impaired the flavor. This was noticeable with only 5 to 8 degrees difference in heating, and that bottled at 180 degrees was very strong, and scratched the throat badly."

In this lies the suggestion of future experiments with honey of different kinds. Experiments could also be conducted to ascertain the most economical methods and mechanical arrangements for bottling, and the profit to be derived from placing honey on the market in this form. There is no doubt that honey in small, neat packages will bring a higher price than in bulk. Whether or not the increased price would be sufficient to make the increased work profitable, remains to be clearly demonstrated.

### WAX EXPERIMENTS.

A series of experiments were undertaken recently to determine the proportion of wax in comb of different ages, and the best methods of removing same. The intention was to make the tests both accurate and extensive, but the scheme was not entirely completed, and it is hoped that this work will be continued to an exhaustive degree at the Experimental Apiary. The details of these experiments would be somewhat cumbersome, and as they will be submitted for publication elsewhere, only a summary of the results thus far obtained will be given here.

Old brood-comb, the age of which was undoubtedly five years or more, was analyzed and found to contain 36.3 percent of wax, 17.3 percent of soluble (in condensing steam) matter other than wax, and 46.4 percent of solids (insoluble).

Brood-comb two years old was found to contain 47.2 percent of wax, 21.1 percent soluble matter, and 31.6 percent solids. One-year-old brood-comb contained 57.8 percent wax, 22.1 percent soluble matter, and 20 percent solids. "Slum-gum" (refuse from solar wax-extractor) contained 24 percent wax, 40 percent soluble matter, and 36 percent insoluble matter. New comb, built upon full sheets of thin super foundation the present season, and which had never contained brood, contained 88 percent wax, slightly over 11 percent solids, and less than 1 percent soluble matter.

In a test of the Root-German steam wax-press, this machine, under full head of steam and careful operation, removed from the old brood-comb (five years or more) 80 percent of the wax contained. From two-year-old brood-comb the machine removed 89.5 percent, and from new comb

98 percent of the wax contained therein. From slum-gum the steam wax-press removed 76.5 of the wax therein.

The solar wax-extractor was tested with brood-comb one year old and removed only 77 percent of the wax contained. It is also worthy of note that even from very old comb, bright yellow wax was secured by using the steam wax-press, especially if the melted wax as it comes from the press be allowed to drip into cold water. The results of these experiments, when tabulated, appear as follows:

TABLE I.

Description of Comb.	Percent Wax Contained.	Percent Soluble Matter.	Percent Solids.	Percent Wax Removed by Sicam Press.	Percent wax removed by Solar Extractor.	Percent Wax removed by pressure under hot water.
5-year old brood-comb.	36.3	17.3	46.4	80	Not determined.	Not det.
2-year old brood-comb.	47.2	21.1	31.6	89.5	Not det.	Not det.
1-year old brood-comb.	57.8	22.1	20	Not det.	77	Not det.
Slum-gum.	24	40	36	76.5	Not det.	Not det.
New comb built on this super foundation.	88	Less than 1 percent	11	98	Not det.	Not det.
Cappings.	Not det.	Not det.	Not det.	Not det.	Not det.	Not det.

The above table indicates also what points remain to be determined in order to make the series complete.

HIVE-COVERS.

Six different hive-covers were tested to determine their resistance to heat, when placed in direct sunlight. As the bees in any colony always attempt to maintain the normal temperature within the hive, a comparison of covers, made upon hives containing colonies, would not be accurate, accordingly six empty supers, each having upon it a different cover were exposed May 30 and June 1 to steady sunshine from 8 a.m. until 7 p.m. At no time during the day were they disturbed, nor was any circulation of air allowed inside of them. Each super contained a tested, self-registering thermometer which registered the highest temperature, that is, in direct sunlight; a similar thermometer was placed on top of one of the covers. The covers tested were as follows:

Excelsior cover; Excelsior cover with shade-board made of one-inch pine, 24x30 inches, raised 3 inches above cover by means of cleats, thus allowing a free circulation of air between cover and shade-board; Ventilated gable-cover; Double, paper-covered, with dead-air space between two portions of cover, designated as "flat cover." "Hill" cypress cover, made of a solid one-inch cypress board, with heavy end-cleats. "Lewis" cover, made of 1/4-inch pine, covered with tin, and allowing a contained space of about 2 inches above top-bars.

All the above were covered with two coats of white paint. The highest temperatures attained under these covers are given below:

TABLE II.

Cover.	Date.	Temperature in Sun.	Maximum attained under cover.
Excelsior.	May 30	102° F.	93.8 F.
Excelsior with shade-boards	May 30	102° F.	93.4
Ventilated gable.	May 30	102° F.	93.5
Double cover dead-air spaced.	May 30	102° F.	94.5
"Hill" Cypress.	May 30	102° F.	97
"Lewis" metal covered.	May 30	102° F.	94.2
Excelsior.	June 1	103.5	93.8
Excelsior with shade-board.	June 1	103.5	92
Ventilated gable.	June 1	103.5	92.5
Double cover dead air spaced.	June 1	103.5	94
"Hill" cypress.	June 1	103.5	96.9
"Lewis" metal-covered.	June 1	103.5	93.5

For the two days it will be seen that the temperature under each cover, averaged as follows: Excelsior with shade-board, 92.7 degrees; Ventilated gable cover, 93 degrees; Excelsior, 93.8 degrees; "Lewis" metal-covered, 93.85 degrees; flat (dead-air) cover, 94.25 degrees; "Hill" cypress, 96.95 degrees.

It is regretted that warmer weather was not immediately at hand for a more crucial test, and it is hoped the experiment will be repeated during the hottest weather.

NORMAL TEMPERATURE OF BROOD CHAMBER.

In order to determine the normal temperature of the brood-nest, for comparison with above results, a self-registering thermometer was placed in a 5-frame nucleus and left 24 hours. Another was placed in a full colony (crowded with bees forced down from the super into the brood-nest for the purpose) and left the same length of time. Both nucleus and full colony were protected from the sun. The maximum temperature attained in the nucleus during the 24 hours was 94 degrees, and the maximum in the crowded colony was 94.5 degrees. We conclude, therefore, that the normal temperature is between 94 and 94.5 degrees. Any cover that in the hottest weather will not allow an inside (of an empty hive) temperature of more than 94 degrees may be considered a safe cover. Any cover allowing a higher temperature than this, even if no more than one degree, is detrimental. It is much easier and more economical for the bees to raise the hive temperature to their normal of 94 degrees by heat production than it is for them to lower the temperature to 94 or 94.5 degrees by ventilation.

Any tight wooden cover, substantially made, with a good shade-board above it, is a better protection from heat than complicated or high-priced covers involving "new principles." We do not sanction such, as the latter for shade-boards are cheaply and easily made (where it is necessary to place colonies in the sun); and the ordinary cover and shade-board together usually cost less than the "special" covers designed for protection from the sun.

FUTURE INVESTIGATIONS.

Perhaps no industry can show more rapid progress and development within the past 30 years than apiculture. Indeed, present methods, making possible the profitable production of honey on an extensive scale, are the developments of recent years. The bee-keeping industry is peculiar in that the greater part of its development has been due to private enterprise and experimentation, rather than to scientific study by government experts or others employed especially for that purpose. The bee-keeper has received practically no assistance, aside from some very creditable work done by the United States Department of Agriculture, and a few insignificant spurts by several Experiment Stations. Several of the latter have started off in apicultural work with promise of attaining good results, but the majority of them have allowed the work to lapse—either from lack of funds or disinclination, or both—before they had really gathered together sufficient equipment for real investigation.

I think I stand without fear of contradiction when I say that to-day Texas has the best equipped experimental apiary in North America. The A. & M. College promises very liberal and material support for the future, and the management of this apiary is in most careful and competent hands. We are justified, therefore, in expecting most definite and profitable results in the future from our Experimental Apiary.

The problems which present themselves for investigation are both numerous and varied. I will not occupy more space than is necessary to call your attention to some of the more important ones.

RACES.—Prof. Frank Benton, of the United States Department of Agriculture, has made a careful study of the traits, characteristics and advantages of the principal races. His published works are familiar to all of you. However, much remains to be done along this line. It does not necessarily follow that a race adapted to Northern or Eastern States will be found well adapted to Texas conditions, and it is not likely, either, that a race giving the best results in one portion of Texas will prove the race best adapted to all portions of that State. There is a large field for experimental work in hybridizing these races and testing the crosses thus secured.

Taking the five races, Italian (for the present purpose the 3-banded Italians, Golden and Imported—or "leather"—Italians are considered as one race), Cyprian, Holy Land, Carniolan, and German (black), we have, by combinations, the following 10 possible crosses: □ Italian-Cyprian, Italian-

Holy Land, Italian-Carniolan, Italian-German, Cyprian-Holy Land, Cyprian-Carniolan, Cyprian-German, Holy Land-Carniolan, Holy Land-German, and Carniolan-German. However, in many forms of animal life the female is known to transmit to the offspring certain prominent characters or characteristics, and the male certain other characters. This is notably the case in the breeding of fancy poultry. The same principle is recognized by many bee-keepers in producing crosses between the races. If this be true—and we have no evidence that it does *not* hold true—each of the above crosses, or hybrids, is capable of producing two strains, in all probability distinct (more or less) from each other. As an illustration, the Italian-Cyprian cross could be produced in two ways: First, by mating Italian queens with Cyprian drones; and, secondly, by mating Cyprian queens to Italian drones. The same holds true of each of the above 10 crosses, making possible 20 strains.

But if it be true that queens transmit certain characteristics and drones certain other characteristics to the succeeding generation, then the above-mentioned 10 crosses are *not true hybrids*. A true hybrid could only be produced by the following procedure, taking the Italian and Cyprian races as an illustration: An Italian queen mated to a Cyprian drone will give a resultant strain, which, for convenience, we will designate as Italian-Cyprian. A Cyprian queen mated to an Italian drone will result in a strain which we will designate as Cyprian-Italian. If now an "Italian-Cyprian" queen be mated to a "Cyprian-Italian" drone (or *vice versa*), the resulting strain will be a *true* hybrid, possessing the "drone characteristics" and "queen characteristics" of both races. This gives us 10 more possible strains, or a total of 30 strains theoretically possible, from the five principal races. It is, of course, true, that owing to the close similarity to each other, of certain of the five races, many of the above-mentioned strains might be practically identical with each other. Theories are not always borne out in actual practice, however, and the above will give an indication of the possibilities along this line.

**QUEEN-MATING.**—Closely connected with the above is the problem of successfully controlling the mating of queens to such drones as may be desired. The Mannum giant mating-cage, and the use of the glass carboy, have come very near to a solution of the problem, but its ultimate solution will come, as will also a means of mating queens more rapidly than by the use of nucleus-boxes.

**HONEY-PLANTS.**—These were mentioned in some detail at the beginning of this report, and it is here sufficient to reiterate that many promising foreign and American plants remain to be tested, and the regions of Mexico, New Mexico, Arizona, and even parts of Texas, may possibly yield native honey-plants worthy of cultivation.

**HONEY-VINEGAR.**—It seems probable that the cheaper and darker grades of honey produced in several Texas localities, and which now rarely net the producer more than 3½ to 4 cents per pound, could be converted into a high-grade vinegar at a considerable profit, and this with but a small amount of labor. There is room for profitable development along this line.

The ideal bee-hive has not yet been constructed, but a careful study of conditions, and of the bees themselves, together with careful experiments, should result in much better equipment than is now used.

At every turn the experienced bee-keeper meets unsolved problems and questions which he can not answer. Most of these offer suggestion for experimental work, which the individual can not take up owing to lack of funds and time, but which can be considered at the Experimental Apiary.

It seems but pertinent, also, that we should call your attention to the advisability of this Association taking steps to disseminate among our farmers and fruit-growers reliable information on up-to-date methods of bee-keeping. Such measures could not but accrue to your individual benefit and to the benefit of the State as a whole. Judiciously managed, such steps would rapidly increase the membership of the Texas Bee-Keepers' Association, would tend to prevent the marketing (at low price) of "strained" and "log-gum" honey, and would make possible an annual output of honey at least four times as large as present crops, and that without the least fear of "glutting" the market.

WILSON NEWELL.

The convention tendered to Prof. Newell, who was the former assistant in the Department of Entomology and Apiarist in charge of the College Apiary, a vote of thanks for the good work he has done while at the College, and

they regret that he could not remain at his place at the apiary. The secretary of the Association was instructed to inform Mr. Newell of this resolution.

It was also the sentiment of the convention, and the bee-keepers at large, that they were well pleased to see the position now filled by one of their own State, and one of their own number, Louis H. Scholl, too well known to all the bee-keeping fraternity to need extended introduction.

(To be continued.)

## Contributed Articles

### Education of Apiarian Writers—The Hive Question—Wintering—Excrements of Bees.

BY F. GREINER.

OUR good and esteemed friend from Rhode Island—it is needless to speak his name—has given us a great many interesting articles in the bee-periodicals of late. I have read them with both pleasure and profit, and would like to have a little private talk with you, Mr. Editor, for the gentleman is becoming rather personal in his last article in the June Review. He seems to carry the idea it would be serving the interest of the bee-keeping fraternity if we poor, every-day bee-keepers were "choked off" from having anything to say in the future, and that only the highly educated gentlemen and scientific bee-keepers be allowed to utter their ideas in public. Will it work?

It is without doubt a desirable adjunct for a writer on any subject, apiculture included, to have a college education, and to be "away up" in the sciences, and I wish that I, and everybody else, could have had such a training; but there are probably many who do write, and have written, good things without being educated; it is quite evident that a great many good things would not have been said had these been shut out.

Our good friend, the Rhode Islander, claims the bee-periodical readers have so long been fed on methods that they have lost all taste for the whys and wherefores; he urges looking into the latter first, and when we fully understand them then talk method. I would not dispute the soundness of such advice, but unfortunately we do not all come to the same conclusions after ascertaining the correct whys and wherefores. In many cases our conclusions are nothing more than opinions. I am afraid it is so to some extent with our esteemed and scientific friend, Mr. Miller.

Let us see. He has come to the conclusion, after many scientific investigations, that the Heddon hive is the best hive, and meets the wants of bees and bee-keepers best of any; is the best compromise between bees and the keeper. Other not less thorough and careful investigators come to the conclusion that the many sticks and spaces, particularly in the center of the hive, as in the tiered-up Heddon, are only a hindrance to the bees and retard development. Mr. Reidenbach, editor of the Praelz-Bienenzeitung, discussed this matter at length in his paper. Dr. Dzierzon pronounces his twin-hive (a bar-hive) as the best hive. Many others in America, as well as elsewhere, are sure that better results are obtained with an unbroken brood-chamber.

Mr. Miller holds that a chaff cushion has no warmth of itself, which is correct. But a woolen blanket has no warmth of its own, and yet it gives us lots of comfort in a cold night. An inch board, even a two-inch plank, is not nearly as effectual. His claim that bees are not drawn to a chaff cushion any more than to an inch board is not valid, if I can understand the language of the bees correctly.

#### METHODS OF WINTERING BEES.

"As to what is the best method of wintering," again our opinions and experiences are at variance. Mr. Miller has not a very high opinion of the chaff-hive. He gives us his whys and wherefores, etc. His conclusion is that bees need no porous material around them. It is true that a strong colony with good queen and an abundance of good stores will winter in any sort of a hive without the least protection; but as colonies run, good results in wintering are not secured without a good deal of protection and fuss-

ing. For the first 10 years, when engaged in bee-keeping, I used to lose heavily, often losing as high as 50 percent. Since adopting the chaff-hive for out-door wintering my losses have been small, and might have been lessened still more by carefully looking after my bees. This is not saying that by wintering in chaff I have struck the best method, but that it is a safe way, giving uniformly good results. My strongest colonies are usually those which were well packed. The paper-covered colonies have not quite come up to them.

#### QUEEN-REARING—FEEDING QUEENS.

Mr. Miller has also investigated the matter of queen-rearing. He undoubtedly rears fine queens, and he has concluded that the Alley method is the best. In his whys and wherefores I fail to find convincing proof that the course he or Mr. Alley pursues is any better, or nearer to Nature's ways, than the course some others pursue. What can it matter what kind of cells we use, if we accomplish the same result, namely, have the young royal larvae fed abundantly from start to finish, etc.? Is it not a matter of opinion rather than of superiority of method? I think the time will hardly ever come when a method will be found by which Nature can be outdone in the matter of queen-rearing.

Speaking of a queen-bee being fed by workers, Mr. Miller says: "When a queen is free to roam at will, she can get such food as she needs." Is this any more than opinion? Perhaps she is able to help herself to such food as she wants, but does she? That is the point. It is true that one may see a queen dip into cells of honey sometimes, but this is not yet proof that she does help herself to all she needs, though undoubtedly it is within her reach. Why is it we so frequently notice the queen-bee, when at liberty in her hive, being fed by the workers?

#### EXCREMENTS OF BEES.

Mr. Miller also resurrects the old bone of contention. Are the excrements of bees liquid or solid? I guess he is right, claiming authorities, to say that they are liquid. He, himself, has come to a conclusion that feces, when voided by healthy bees, are *dry*. I doubt Mr. Miller means just what he says. I don't believe a bee could void dry matter any more than any other living being of the same or higher order. Would they not suffer from constipation in a most intensified degree? Caterpillars void, perhaps, as dry matter as any living thing, as far as we ordinary mortals can observe. We find their excrements sometimes of beautiful shape, apparently as being shaped under hydraulic pressure. We might call them dry, although they contain some moisture. But the feces of bees are not nearly as dry as these. They are somewhat soft and pliable, although thread-like. They do not break up, but naturally they soon become so dry as to become hard, when they may be broken up in little pellets.

Mr. Miller admits that the bees sometimes void watery excrements, and he lays it to the taking of watery honey, which is an opinion. There are probably other causes. For example, *fright* will produce the same effect, not only in bees, but also in other and more highly organized beings, even humans. It would seem that during the honey season, when conditions are as favorable for bees as they can well be, they ought always to discharge their excrements in the normal, healthy shape—dry—but they don't. Even at this time we sometimes notice watery excrements.

After bees have been confined a long time, as during the winter, their intestines usually become loaded, and the contents are frequently so watery as to be termed liquid. This condition, according to Mr. Miller and some others on this and the other side of the great pond, is pronounced a diseased one. But I hold again that it is a matter of opinion. For practical results the diseased condition really does not begin until the bees, while their confinement lasts, become unable to hold their excrements any longer, and discharge them in this liquid form inside of the hive. Is it not a fact that as soon as a colony can have a good, cleansing flight, and get relief by voiding their excrements, although they may be liquid, that colony may be termed healthy, and will develop normally afterward, if conditions otherwise are right?

#### ALL HAVE HOBBIES—EXPERIMENTING.

It is not my intention to go over the list of all Mr. Miller has said in the past. I only want to pick out a few things to show that even as well-informed men as he have their hobbies like others of us who are not so well educated. I appreciate fully what he has said. He is deserving of credit for trying to bring out the truth as it relates to the honey-bee and its management.

I agree with Mr. Miller, it is not safe to rely implicitly on text-books. We must go to the Bee and learn of her, and not take everything for unmistakable fact we find printed. It is my opinion that it is not only misleading, but really wrong, to proclaim this or that theory as true when really we have no proof. For example, "What reason have we to say that the queen-bee lays eggs in the worker-cells which she has knowingly fertilized with sperma from her spermatheca, and other eggs not so fertilized into the larger cells commonly called drone-cells?" What we do know is this:

"Eggs found in worker-cells usually develop into workers; eggs found in drone-cells usually develop into drones." It has not been proven beyond contradiction that a queen-bee lays any non-fertilized eggs, and *that she does so at will* is nothing more than assertion. That it is proclaimed as fact tends to hinder others from making further investigations. Is it so humiliating to admit that we don't know? The thinking mind rebels against the very idea of parthenogenesis. As such an eminent man as Prof. Leuckart has said: "To say that an unfertilized egg produces life is only admitting that we have no full conception of the things; in short, that we don't know enough." Scientific men have failed to find evidence that eggs taken from drone-cells were fertilized. This is admitted.

Mr. Miller says: "Let us go to the bee and learn of her." The American bee-keepers are leading the world in practical bee-keeping; they will also turn their attention to the scientific part of it and become a factor of importance here, also. I suggest to our scientific friends who can devote their time to matters of this kind, to make the following experiment:

Select a late after-swarm and hive it on all drone comb. Drone-comb foundation will not answer, as the bees will not build drone-comb from it, as I have tested. After the queen has become fertile, make frequent examinations, and when a uniform stand of brood in all ages has been secured—it will be worker-brood in drone-cells—remove the queen and note what will happen; particularly see whether any drones are being reared. Try the same experiment a number of times; also, early in the spring, say in March, before the drones are being reared by the best of colonies. The object is to prove whether or not drones are reared from what is termed unfertilized or fertilized eggs.

A second experiment would be this: Obtain perfectly fresh eggs from drone cells laid by a queen under normal conditions. To accomplish this, I suggest taking a drone-comb from an extracting super, one which has in part been left free from honey, evidently for the purpose of having it filled with eggs by the queen, but being hindered by the queen-excluder has not been able to reach this part of the hive. Such combs are frequently found, and are all ready for the reception of eggs, and will be quickly occupied. Insert this comb in the middle of the brood-nest of a colony desirous to rear drones. It may take but a few minutes before the queen will busy herself upon it. Remove the comb as soon as a few eggs have been deposited, and before the bees have had an opportunity to visit the cells containing them.

If fortunate enough to obtain these untouched queens, cut out the pieces of comb and give to a hopelessly queenless colony having no brood of any kind, for the purpose of rearing queens. The object of this experiment is to see whether the so-called unfertilized eggs will produce a queen. This experiment should be repeatedly made, as we may not be successful in obtaining absolutely fresh eggs. It requires a great deal more care in its execution than the other experiment. It should be borne in mind that after an egg, either in a queen-cell or drone-cell, has once been subjected to incubation, it cannot be made over into anything else. A worker-larva three days old may be built up into a queen; not so a queen-larva, if ever so young, could be made over into a worker. Its destiny has been shaped from the moment the first worker-bee visiting it left the cell serving it as its cradle.

By such and similar experiments some of the knotty questions may be settled without having to depend upon the microscope. It does not require a college education to make these experiments, but if such men as Prof. Cook, for instance, would make them, their conclusions would have more weight with the fraternity. Ontario Co., N. Y.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Succeeded Beyond Expectation.

I think likely there is much in my experience as a bee-keeper that might be encouraging and helpful to other women, but it takes time to write it, and I seem to have little of it to spare, and especially at this season of the year.

I have over 200 colonies of bees in two yards, one at home where the work is done by a young man who has made his home here for several years, and the other located 3½ miles north of us that I take care of myself, driving out there early mornings and returning at evening. I find the work interesting, profitable and pleasant.

My failures have been few, and my success far in advance of what I expected when I took up the work.

The basswood has no blossoms this year, but white clover is plentiful, and yesterday I hauled home eight supers of nice, white comb honey.

CLARA WEST EVANS.

Allamakee Co., Iowa, June 30.

### Kept Bees 8 Years—Honey-Cakes.

There are no bee-keepers around here, and I often wish I had bee-keeping friends here so I could visit and talk bees. I have not lived here quite two years, so I do not know for certain whether it is a good locality for bees. There are lots of dandelions, three kinds of clover, basswood, fireweed, and any amount of blueberries and wild flowers.

I have never had more than 50 colonies at one time; I have only 25 now. I sold some when I moved here.

My son and I work together. I think it is much nicer work than housework. I do not mind the stings at all, just a little pain, and I don't think any more about them. I always work with bare hands. I have kept bees eight years. Honey sells here for 15 cents a pound, and there is a good market at that price.

I enjoy reading the Sisters department very much; it is fine. I wish more would write for it. I will send a recipe you can use, if you wish; perhaps you have it now.

I want to tell you that I have "Forty Years Among the Bees," and it is the finest book of the kind that I ever read; I never get tired reading it.

White clover is just coming into bloom, and I have had but two swarms. It is raining all the time, and is likely to continue for weeks to come.

MRS. L. A. MOSHER.

Crow Wing Co., Minn., June 8.

The following is the recipe referred to:

#### FINE HONEY-CAKES.

One quart of honey; ½ pound white sugar; ½ pound of fresh butter; 1 teaspoonful soda; juice of 2 oranges. Warm this enough to melt the butter, stir hard, adding 1 nutmeg. Mix in 2 pounds of flour, mixing it hard enough to roll; cut out with the top of a tumbler. Bake well.

### Hiving Swarms from Tall Trees.

I take a great interest in the Sisters department in the American Bee Journal, especially so on the subjects of hiving swarms on tall trees. I could not help smiling at the different methods that were given, since you all seemed to aim to get the bees to the ground, which is not the most desirable. What we are after is to have the swarm, *i. e.*, to get it in the hive so that it will stay there. Now, if you wished to get two things together you would certainly not try to take the heaviest to the lightest, you would take the lightest and carry it to the heaviest.

Therefore, if we have a swarm on a tall tree and the hive on the ground, we can get the hive to the swarm easier than the swarm to the hive, which I do in the following way:

I procure a stone, tie it to a light cord and throw it over the limb on which the swarm is clustered. Now we have the cord over the limb, by which we can draw a heavier

rope over the limb. Having gotten the rope over, I tie the hive (which has a bottom-board with an entrance at each end) to one end of the rope and pull on the other end, thereby raising the hive up to the swarm. When the hive reaches the swarm the bees will at once enter, and before long they will all be hived, and the hive may be lowered. The hive should be as light as possible. The two entrances are used so as to be sure of getting one faced toward the swarm.

I clip all my queens, but occasionally one gets superseeded and swarms the same year.

I hope you will put this in the Bee Journal, as it will help a good many, and may save some doctor bills, since it is quite different when the hive falls and when the man falls. I have gotten several swarms for my neighbors in that manner, who would not risk their lives for a swarm, but they are "on to" the kink now.

Philadelphia Co., Pa.

LOUIS J. BERGDOLL.

### A Letter from a German Sister.

An interesting letter comes from Mrs. Lizzie Schmitt, a German woman who thinks she must write in German because she can not write English correctly enough. Neither she nor others need have any fear on that score. Any inaccuracies of language are easily corrected. At our house German print can be made out fairly well, but when it comes to German writing it is like some people's washing, it has to be sent out to be done.

Mrs. Schmitt has been keeping bees for some time, but since taking the American Bee Journal her progress is more satisfactory.

She had the misfortune to be visited by that dread scourge, foul brood, but got rid of it in one season, which speaks well for her activity. Last year, from 48 colonies, she secured 2500 to 2700 pounds of honey, and in spite of the unpropitious opening of the present season let us hope that she will beat that record this year.

Her husband has become interested in the work, and it is somewhat in contemplation to rent the farm and follow bee-keeping exclusively.

She thinks it would be a good thing if more women would embark in bee-keeping and add to the interest of this department.

We shall look with interest for further reports from our German sister.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Annual Amount of Honey—Drone Characteristic—Amount of Honey Gathered by a Worker-Bee.

1. What is the amount of honey produced in the United States annually?

2. What is the scientific name of the characteristic which allows the drone to enter any hive in the apiary?

3. What is the amount of honey a worker is supposed to carry in during its life? NEW HAMPSHIRE.

ANSWERS.—1. I don't know. The government has made some attempt in the matter, but its reports are known, at least in some cases, to be very unreliable. I am sorry to say that I do not now have at hand even the approximate estimate that has been made. I refer the question to the constituency at large, hoping that some one will help us out.

2. I have never heard any scientific name for it, although it is possible there may be one. In popular language they are called "free comblers."

3. I don't know. It is easy to understand that it is a very variable quantity. Estimating the average life of a worker through the working season at 6 weeks, and allowing it to commence field-work when 16 days old, we have left only 26 days in which it is a gatherer. There may be a death during the whole of that 26 days of such character

that it will gather almost nothing, and there may be a continuous flood of honey during the entire span of its life.

Although the question is of such character as not to admit of an absolute answer, there is no law against making some approximation at an estimate. Suppose a colony to have 30 000 fielders at a time when the honey stored and consumed during 26 days amounts to 60 pounds. Dividing that amount among the 30,000 gives about a thirtieth of an ounce for each. That is, it would be the life-work of 30 bees to gather an ounce of honey, and the gathering of a pound section would wear out the lives of 500 bees. Taking the whole season through, that is probably much above the average, and in very exceptional yields it might be doubled or trebled.

### Spring Demand for Bees—Preventing Increase—Piping of Queens.

1. Is there any demand for bees for shipment in the spring? I would advertise through the American Bee Journal at the proper time.

2. Please give one or more plans to prevent increase. My practice has been to clip queens' wings, and, when they swarm, remove the hive to one side and place an empty one in its place, and when the swarm returns let the queen run in with them; then in eight days (or when I hear the young queen piping) destroy all queen-cells.

3. How would it do to have them in a temporary hive, then kill the old queen and immediately go through the hive and destroy all queen-cells but one, then run the swarm back to their original place? Would they *then* be likely to swarm again?

4. At that stage the queen-cells have not progressed very far. Would they be likely to start others from eggs or larvae?

5. Does a young queen always pipe before a swarm issues? Mrs. Tupper said she never knew a swarm to issue that she did not hear the young queens piping. IOWA.

ANSWERS.—1. There is usually demand, and sometimes very great demand, for bees in spring.

2. If you don't care for the labor of hiving, here's a plan that will leave you with absolutely no increase: Simply return every swarm that issues. You might have to return the swarm once or more before the dispatching of the old queen, and then one or several times before the issuing of the last queen from its cell. After that there would be no more trouble. You can vary from that in a way that will probably suit you better. When you find sealed cells, remove or kill the old queen, or else wait for the first swarm, return it, and kill the old queen. Then wait till you hear piping, and destroy *all* cells.

3. That would do, only it isn't always safe to depend upon one cell. Sometimes a cell does not contain a good queen. Better wait till the first young queen issues. You may as well save the trouble of hiving in a temporary hive by returning at once to the old hive.

4. Yes, but there would be no advantage in it.

5. You may safely count on the piping.

### Feeding Bees—Rearing Queens—Queenless Bees.

1. On page 335, Edwin Bevins says that he feeds granulated sugar and water with the pepper-box feeder. Will not the food run too fast? I cannot feed sugar and water with the pepper-box on that account. How does he do it?

2. When you wish the bees to replenish the brood-chamber, how do you feed, and where do you place the food?

3. Should you desire the bees to carry the food to the supers, where do you place it?

4. Should you have an extra brood-chamber on that you wanted emptied so as to preserve the combs for next season, how would you get the bees to empty them?

5. What do the bees do with the honey they fill up on when disturbed? and what do they do with it when they rob?

6. Are they not compelled to disgorge themselves before they could or would go out foraging again?

7. What is the appearance of brood sufficiently young to give to a queenless colony to rear a queen from? and what is the limit of age?

8. When you find little patches of brood deposited here and there in the combs, what does it indicate?

9. Did you ever see a case where the combs had no brood, but it was in the first super above the brood-chamber (at the present date, July 23rd)?

10. Why do bees allow queen-cells to remain on their combs when they have already a laying queen? I refer to unsealed cells, of course.

11. Will queenless bees continue to build queen-cells as long as they are queenless, after you tear them away? and is that a sure sign they are queenless, together with having no brood?

12. Where a queenless colony is to be united with a colony that has a queen, is there any danger of the queenless bees killing the queen? and where you see they are disposed to unite peaceably, would they then respect the queen?

MISSISSIPPI.

ANSWERS.—1. He may have smaller holes for the passage of the liquid, or he may have a piece of cloth inside.

2. If feed is needed in the brood-chamber, you may count on the bees putting it there in preference to any other place, no matter how you feed nor where you place the food. I use Miller feeders, placing the food on top. The crock-and-plate plan is also good.

3. Please disabuse your mind entirely of all thoughts that by different placings you can get the bees to carry the feed to certain places. No matter where or how you feed, the bees will first fill vacancies in the brood-chamber, and then turn their attention to the super. But surely you don't want sugar syrup in the super.

4. Take it off the hive and let the bees rob it out.

5. When they fill up because disturbed, they may afterward return the honey to the cells, but I suspect they generally take pretty good toll for their own use. What they get by robbing will be generally deposited in the cells.

6. Possibly not compelled, but I think they always go out empty.

7. Three days from the time the grub hatches out of the egg is theoretically the limit of age; but I suspect that younger brood is better, because when left to their own choice the bees use younger. Be sure that they have at least some cells containing the smallest larvae. If you give them all kinds, from eggs to sealed brood, they'll make the proper selection.

8. Perhaps a failing queen.

9. No, but such a case might easily be, especially if a swarm should be hived in an empty hive and a super at once given in which the bees had already begun work.

10. I don't know, it's a way they have.

11. Occasionally queenless bees will not start cells, and sometimes they will have cells and no brood while a queen is in the hive.

12. The queenless bees will not disturb the queen if already fully conscious of their queenlessness, and a peaceable uniting means kindly treatment of the queen.

### Returning After-Swarms—Destroying Queens.

Last spring I bought 2 colonies of bees. I transferred 3 swarms from hollow trees and caught several "tramp" swarms. I caught one the 19th of May. It cast 3 swarms, and the first one cast a swarm to-day, so that I have had 25 swarms—too many, entirely.

On page 457, is an easy way to return after-swarms. Will they destroy the queen every time put back, or will they come out again with the same queen?

Do we have to destroy the queens? MISSOURI.

ANSWERS.—When an after-swarm issues, a young queen emerges with it, and one or more young queens are allowed to issue from their cells in the old hive. Then when you return the swarm there is a battle, and the victorious queen issues with the next swarm. This may go on so long as any young queens are left in the cells. When all are out of the cells there will be a fight to the finish, and only one queen left, and consequently no more swarming.

**Maple Sugar and the Sugar Bush**, by Prof. A. J. Cook: 44 pages; price, postpaid, 30 cents. This is by the same author as "The Bee Keepers' Guide," and is most valuable to all who are interested in the product of our sugar-maples. No one who makes maple sugar or syrup should be without it. Order from the office of the American Bee Journal.

**Our Wood Binder** (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

REVERSIBLE WALL MAP

OF THE

UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

China, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. Very useful in every Home and Office.

66 x 46 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

Best and Most Necessary Map Ever Issued.

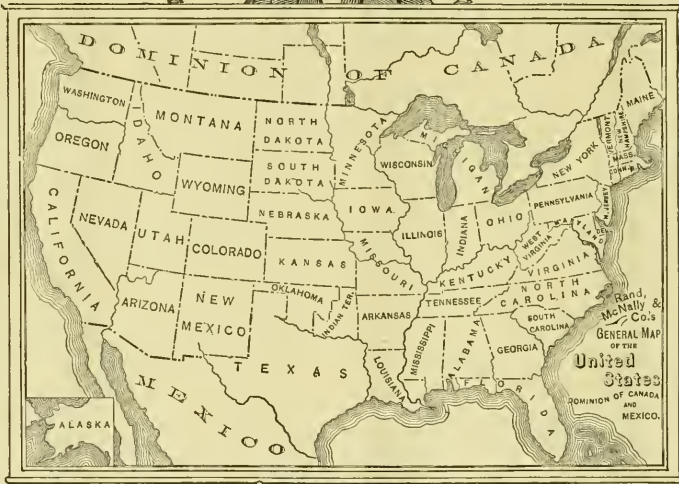

No Home or Business House should be without it.

The Plates are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

Marginal Index is one of the invaluable features. It gives an alphabetical list of countries, their location on map, style of government, population, a area, products, minerals, imports, exports, etc.

It has been pronounced a Photograph of the World

The 1900 Census of the largest American Cities is given.

One side shows a grand map of our great country, with counties, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape. 1901 EDITION.—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The Southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

On the reverse side is the Library Map of the World. The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. The Inset Maps are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps forward it free as a premium for sending us Three New Subscribers at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

HENRY ALLEY, WENHAM, MASS.

## Beedom Boiled Down

### Rearing One's Own Queens.

Is it advisable for the small bee-keeper to rear his own queens? Is answered by Wurtb, in Die Biene, with a decided no!

The great bee-master, Gravenhorst, is quoted as saying some years ago:

"We have neither found it practical nor paying, not even for the extensive bee-keeper, to enter into queen-rearing before the regular swarming season." Perhaps, adds Wurtb, he was as satisfied as we are of the changing of queens unbeknown to the bee-keeper."—American Bee-Keeper.

### Giving Empty Supers on Top or Below in a Heavy Flow.

The following Stray Straw from Gleanings in Bee-Culture shows that at least in a heavy flow it does not always seem best to give additional room by adding empty supers only on top:

"Every four or five days we overhaul the supers on the hives, taking off those that are finished, and giving empty sections where needed. The empty super is put below all the others; and as few have less than 4, and many 5 and 6 supers, it's a good deal of work

# A STANDARD-BRED QUEEN-BEE FREE

To Our Regular Paid-in-Advance Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with **The Very Best Untested Italian Queens** that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

## A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription **must be paid at least 3 months in advance.** If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

Send us \$1.00 and the name (not your own) and address of **One NEW** subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due also.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows: One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We are filling orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

GEORGE W. YORK & CO., 144-146 E. ERIE ST., CHICAGO, ILL.

Please Mention the Bee Journal when writing Advertisers.

to lift them all off for the sake of putting the empty one under. So, in one of the rounds a week or so ago, partly because it was easier and partly for the experiment, we lifted off no supers, but just put an empty super on top wherever the upper super appeared pretty full. That one experiment was enough. When we made the next round, four or five days later, we found work not pushed so very hard in the added super; but in the other supers wax and burr-combs plastered everywhere in wasteful profusion, built on to the separators and between the supers, spoiling the appearance of some of the sections, besides a waste of wax that might have paid for the extra work. If only two supers had been on the hive, so that the upper empty super would have been nearer the brood-nest, likely the bees would have begun work in it more promptly, but the burr-comb business would have been worse."

**Scissors for Queen-Clipping.**

Some time ago I ran across a peculiar pair of scissors that looked promising. The price seemed a trifle high, but as a venture I bought them, and now could I not get another pair I would not part with them for twenty times their cost. Clipping with them is a real pleasure, and one is half inclined to try fancy trimming of the workers' wings just for the fun of it. The handles three inches, blades one inch long, but their virtue lies in the shape of their blades, which are exceedingly slender, with finely rounded points, and all parts but the cutting edges are rounded and polished. They slip under the queen's wings almost of their own volition. There is no danger of impaling the queen on any sharp points, or of denting her abdomen with the sharp side of a wide blade. It is not even necessary to pick the queen from the combs, but just hold her still by pressing her thorax against the comb with one finger, and then snip the desired wing or wings.

Good tools pay, and he who works with poor tools is more than twice tired.—ARTHUR C. MILLER, in American Bee-Keeper.

**Reading Bee Books and Papers.**

For a beginner to take a bee-paper and not have a good text-book on the subject of bees is about like a child being started to learn to read in the third reader before he has learned his A B C's, for many of the questions that puzzle the beginner are fully answered in the text-books, but are seldom ever referred to in the bee-papers. Let it not be considered, however, that a single text-book and one bee-paper are sufficient for the progressive bee-keeper, for no author of any book is infallible, and while he may cover certain subjects thoroughly, another author may handle some other subject more ably, and the practical bee-keeper has no time to waste on any method that is not the shortest and best way of accomplishing the desired effect.

On the other hand, the bee-keeper should not make a book-worm of himself. In the long, winter evenings, he may profitably read nearly all that appears in the bee-papers, but in the busy time, when the bees are requiring his attention, and he has many other things to look after, when the time between dark and bed-time is short, he can not hope to read all, if he is taking several papers. He must be able to run through them and decide from the

letters and head-lines what will interest him the most. He will then probably miss much that would be of benefit to him, but better let it pass than to neglect the bees or some other important matter that requires attention.—S. E. MILLER, in Progressive Bee-Keeper.

### Arrangement of Supers on Hives.

I don't know what's the best arrangement of supers on hives; but at present we have settled upon this order: An empty super is put next the brood-nest; next above this the super nearest completion, and so on, the one least advanced being on top. If it seems possible that more room may be needed, an additional super is put above all. Next time around, this upper super generally has the foundation drawn, but no honey in it—sometimes a little honey, and sometimes the foundation not drawn at all.—A Stray Straw in Gleamings to Bee-Culture.

### Some German Uses of Honey.

From a honey leaflet sent out by P. Waetzel, Freiburg, I take the following recipes:

"Honey-water flavored with fruit-juice, lemon or berry, makes a good drink for fever-patients."

"Honey dissolved in hot water is good for hoarseness and coughs, beneficial in diphtheria, influenza and la grippe."

"Honey and unsalted butter made into a salve is excellent in case of scalds and burns."

"Apply a plaster or poultice of honey and flour on severe burns, also on boils."

"Sleeplessness yields to internal honey treatment."—American Bee-Keeper.

### The Carno-Italian Bees.

These are commended by Prof. Frank Benton, and are highly esteemed by the editor of the Rocky Mountain Bee Journal, who says of them:

"Their work in our own apiary this year amply justifies all we have said in their favor. For the locality of the Rocky Mountains they are superior to Italians in many respects, chief among which is the uniformity and high

## Long Tongues Valuable South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

**BURTO, TEX., Nov. 19, 1902.**  
J. P. MOORE.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or try to rob; and for gentleness of handling, I have never seen the like. Friend E. K. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, **HENRY SCHMIDT.**  
The above is pretty strong evidence that red clover is not the only plant which requires long tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Selected, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

### Italian Queens, Bees and Nuclei.

We have a strain of bees bred specially for honey-gathering and longevity, at the following prices:

One Untested Queen.....	\$.60
One Tested Queen.....	.80
One Selected Tested Queen.....	1.00
One Breeder Queen.....	1.50
One Comb Nucleus (no Queen).....	1.00

These prices are for the remainder of the season. Queens sent by return mail. Safe arrival guaranteed. For price on Doz. lots send for Catalog. **J. L. STRONG, 16A1f 204 E. Logan St., CLARINDA, IOWA.** Please mention Bee Journal when writing

quality of their work 'in the supers. They enter the sections readily, cap their combs as white as the snowy range, and use little propolis. The quality of the work of our Carno-Italians is distinctly superior to that of the various strains of Italians in the same yard, while the quantity of honey they have stored is fully equal to the best Italian colonies.

**A. I. Root on Depth of Frames.**

The senior editor of the *Gleanings in Bee-Culture*, asked his opinion with regard to the advantage of shallow frames over those most commonly in use, thus expresses himself:

"Friend H., if you want my personal opinion in regard to the matter, I would say, stick to the Langstroth frame. Since I began bee-keeping, every little while somebody gives his reason for thinking the Langstroth frame is not the best shape or size, and more or less follow him; but in due course of time the new kind is dropped, and we get back to the standard Langstroth. There are not only more bees in the world on this size of frames than all other sizes together, but I am not sure but there are *ten times* as many. Perhaps I am not posted, and up to the times; but I very much doubt whether there is advantage enough in a shallower frame to pay to use another than the Langstroth.

**The Future of Bee-Keeping.**

This is viewed very hopefully by Mr. G. C. Creelman, Superintendent of Farmers' Institutes for the province of Ontario. In the course of an address before the Ontario Beekeepers' Association, reported in the *Canadian Bee Journal*, he said:

"We are getting inquiries every day about bees; people want to branch out, and we find the younger people are growing up and asking for information concerning the common things that are about them. I don't know anything amongst Nature's studies better than to give a child a hive of bees; if the parents, if the older brothers, those of you who are here, could take those children and bring them along, and get the school teachers interested, and offer prizes for the best collection at the fall fairs, raised by the boys, of flowers, fruits, and so on, I believe we would have such an awakening in apiculture that the amount of honey produced would exceed the demand, and if at the same time we carried along a package of tracts, and kept the papers full of it from one meeting to the other, and kept talking honey, honey, in all our agricultural papers, a very great interest would be taken, and the demand would be increased. You have to keep these things before the people.

"As it is at present, there is so much lack of interest that the chopping down of a tree, or having to feed the pigs, will keep them away from the meeting; but if they have been thinking of that meeting for eight months or a year ahead, you would have a very much greater attendance. I think you men, who

**VENTILATED BUSHEL GRATES**

These crates are the most convenient things that can be used on the farm. Apples, potatoes and other fruits and vegetables can be gathered, stored and taken to market in them without re-handling. They allow air to circulate freely through them. Our crates cost 8 cents each ready to nail together. Made of best material and with decent care will last a lifetime. Can be "nested" together to store away. Our illustrated booklet No. 11 telling all about them free.

**"What Happened to Ted?"**  
BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton, the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—60 pages, 5x8 1/2 inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver.) Address, ISABELLE HORTON, 227 EAST OHIO STREET, CHICAGO, ILL.

are thinking along these lines, and using your brains to the very best advantage, are not doing enough; you are doing all this but you do not get a chance to tell the great number of people about it; you are to a large extent wasting time. A great many have heard these things before, and they are here for new inspirations, and to see if they can not increase along new lines."

**Using Starters in the Brood-Nest.**

It is a fact patent to all, I think, that a colony that is building a set of combs in the brood-nest, and that has at the same time ample storage room in the super, has all desire to swarm removed, and the necessity for rapid comb-building for storage purposes removed, and that the desire for workers in such a colony is paramount. Hence, nearly all the comb that is built by the bees, and immediately occupied by the queen, is built, worker size, whether the queen be one month old or three years old.

But to secure these conditions, everything must be normal. The colony must have a laying queen and an ample field force at the time they are hived, whether the swarm is forced or natural. Again, it is necessary to have a steady flow of honey; but these conditions nearly always prevail at such times in Colorado.

Any condition that will retard rapid comb-building, like an old queen with a good force of young bees and a small field-force, or a colony that has been given a frame or two of brood to help them, and has a small field-force, or a colony, let it be large or small, that is compelled to rear a queen, will invariably construct much drone-comb.

But I think it is still safe and advisable, here in Colorado, where our swarming season does not stagger along through the year, as in oriental countries, but is nearly all done in 20 days after the honey-flow begins, to continue the use of starters only in the brood-nest; and our reward will be a good crop of the most beautiful surplus honey that can be produced, and brood-chambers filled, with none too much drone-comb, as hundreds of my own, and others' hives will attest.—M. A. GILL, in *Gleanings in Bee-Culture*.

**Four Tons of Comb Honey from 70 Colonies.**

I promised you that I would tell you how I produced that four tons of honey from 70 colonies, spring count. In the first place, I had all young queens. I do not believe in keeping queens after they are two years old,

for my experience has been that it does not pay. My method is to keep the bees from swarming if I can. I believe in double-deckers. I find that it works the best to add the extra brood-chamber when they need it. When the queen gets her hive full of eggs and brood, and needs more room, I do not wait for them to get the swarming fever, but raise up the hive and put another under it with drawn combs. I find that drawn combs are far ahead of foundation to keep them from swarming. I do not claim that they will not swarm, nor are all queens good enough for double-deckers, so an apiarist would be foolish to try to use a double-decker with a poor queen. With Dr. Miller, I am still looking for a strain of non-swarming bees. To produce comb honey we must have strong colonies, and keep them so without a desire to swarm. Proper ventilation goes a long way toward this.

Last spring and early summer we had cold weather. I used to go down in the yard and close the entrance according to the strength of the colony, on cold nights. Sometimes it would keep so cold that I would not open them up for two or three days. I have found that those with large entrances, especially on cold nights, did not breed as rapidly. When they are storing comb honey in very hot weather they need a good deal of ventilation from the bottom. I have tried raising the hive in the heat of the day, and then lowering it toward evening as it begins to get cooler. I use shade-boards, and I never raise the cover to ventilate unless it is a powerful colony, as they can cap when there is a draft through the hive. If you do raise the cover, always lower it at night. Work with the bees, for they always want their ventilation at the bottom. Give them plenty of section room. As soon as they get one super well started I raise it up and give them another. I have found that they work all right in three supers; but when you get up to four or five they cap slowly in the upper supers.—GEORGE B. HOWE, in *Gleanings in Bee-Culture*.

**Close Saturdays a 1 p.m.**—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

**5¢ TO START YOU IN BUSINESS**  
We will present you with the first 5¢ you take in to orders here begin the Saturday afternoon. Send 10 cents for full line of samples and directions how to begin.

DRAPER PUBLISHING CO., Chicago, Ill.

# BEE=BOOKS

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie St., CHICAGO, ILL.

**Forty Years Among the Bees**, by Dr. C. C. Miller.—This book contains 320 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee**, revised by Dugast.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.50.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey**, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Biennen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy treatment, and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment**, by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Foul Brood**, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

## HONEY AND BEESWAX

MARKET QUOTATIONS

**CHICAGO, Aug. 7.**—Consignments of the new crop are coming to commission houses that have not had honey for years past, and as there is not any consumptive demand, they are finding difficulty in disposing of it. Under such conditions it is hardly possible to give accurate prices, as some merchants are asking 10 cents for honey that is other sold at 15 cents. The prices given in our last quotations are asked but feeling is unsettled. Beeswax steady at 30c.

R. A. BURNETT & Co.

**KANSAS CITY, Aug. 25.**—Receipts of comb honey more liberal; demand improving. We quote fancy white comb, 24-section case, \$3.25; No. 1, white amber comb, 24-section case, \$3.00; No. 2, white amber comb, 24-section case, \$2.75; Extracted, white, per lb., 6½c; amber 5½¢/6c. Beeswax, 25¢/30c. C. C. CLEMONS & Co.

**ALBANY, N.Y., Aug. 26.**—Demand increasing; receipts light as yet, and could sell more comb than coming. Light, 15c; mixed, 14¢/15c; dark, 13c. Extracted quiet; light, 7c; dark, 6c. Beeswax, 30c. H. R. WRIGHT.

**CINCINNATI, Aug. 6.**—The supply about equals the demand for extracted honey. We are selling amber extracted in barrels from 5½¢/6c, according to quality. White clover, barrels and cans, 7½¢/8c, respectively. Comb honey fancy, in no drip shipping cases, 16¢/16½ cents. Beeswax, 30c. THE FRED W. MUTH CO.

**NEW YORK, July 8.**—Some new crop comb honey now arriving from Florida and the South, and fancy stock is in fair demand at 14c per pound, and 12¢/13c for No. 1, with no demand whatever for dark grades.

The market on extracted honey is in a very unsettled condition, with prices ranging from 5½¢ for light amber, 5¢/6c for white, and 4½¢ for the common Southern at from 50¢/55¢ per gallon. Beeswax steady at from 30¢/31c. HILDRETH & SEIGELBEN.

**CINCINNATI, Aug. 8.**—New honey is now offered very freely, particularly extracted. The demand for light amber is about equal at this time of the season. I made sales at the following figures: Amber, 5¢/5½c; water-white alfalfa, 6½c; fancy white clover honey, 7¢/7½c. Comb honey, fancy water-white, brings from 14¢/15c. Beeswax, 27¢/30c. C. H. W. WEBER.

**SAN FRANCISCO, July 22.**—White comb honey, 11½¢/13¼c; amber, 8¢/10c. Extracted, white, 5½¢/5c; light amber, 4½¢/5c; amber, 4¢/4½c; dark, 3½¢/4½c. Beeswax, good to choice, light, 27½¢/28c; dark, 25¢/26c.

This season's crop is not only unusually late, but is proving much lighter than was generally expected. While the market is unfavorable to buyers, the demand at extreme cut rates is not brisk and is mainly on local account.

## WANTED! FANCY COMB HONEY

In no-drip shipping-cases. Also Amber Extracted in barrels or cans. Quote your best price delivered, Cincinnati, Ill. The Fred W. Muth Co., 324½ Front and Walnut, CINCINNATI, OHIO.

**WANTED—Comb Honey in quantity lots.** We are perhaps the only dealers in this article purchasing at such a low price at any time. Please state quantity, quality and price asked for your offerings, Thos. C. Stanley & Son, 244½ Main, ZANESVILLE, CO. OF FAIRFIELD, ILL.

## WANTED—Extracted Honey.

Mail sample and state lowest price delivered including freight at 15¢ per pound at any time. HONEY, any quantity, but must be put up in no-drip shipping-cases.

C. H. W. WEBER,

2146-43 Central Ave., CINCINNATI, OHIO.  
24½ Front and Walnut, CINCINNATI, OHIO.

## RED CLOVER HONEY-QUEENS.

SPRING BLUFF, WIS., July 18, 1903.  
THE A. I. ROOT (vs. Medina, Ohio).  
Dear Sirs:—I thought I would write you a few lines in regard to the Red Clover Queen I got from you. They haven't swarmed yet this summer, but I have taken 48 sections from them and there is 24 more all ready to come out. Just think, 72 nice sections of as nice honey as ever was made, and only July 18th. It seems as though they will surely fill 48 more.  
I don't know whether their tongues are any longer than any of the others, or whether they with-rod it from Red Clover, but surely such bees are worth money.  
I use the 8-frame Jumbo frame.  
C. E. KELLOGG.

C. E. KELLOGG, Spring Bluff, Wis.  
Dear Sir — We have yours of July 18th and would be glad to have you advise us by return mail with reference to the capping of the honey. Some articles say the capping from these bees is not white, and we would be glad to have you advise us how your honey is in this respect, and oblige, Yours truly,  
THE A. I. ROOT CO.

SPRING BLUFF, WIS., July 31, 1903.  
THE A. I. ROOT (vs. Medina, Ohio).  
Dear Sirs:—Yours of July 24th at hand today. In regard to your question in reference to the capping of the honey from these bees I will say that it is simply perfect, beautiful snow-white and every box perfect, 36 one-pound sections now. I am quite sure they will fill two more supers, which will bring the number up to 144. I would like very much to have you see a few of those sections, and I will glad to send you a few.  
Now, I haven't told you ALL their good qualities yet. I am sure they are by far the most gentle bees to handle I have. I can't take off the sections without smoke or veil without getting stung. There are a few traits about them that they don't seem to want to swarm.

see to me are quite remarkable aside from their honey-gathering. I will write you again in a few weeks and let you know if they fill the 144 sections, which I am sure they will.  
Respectfully,  
C. E. KELLOGG.

## AGAIN READY FOR PROMPT DELIVERY.

We were snowed under with orders for a few weeks, but here we are again with good Queens and prompt service.

### Red Clover and Honey Queens.

	Each.	\$1.00	\$1.75	
Untested .....	\$1.00	\$1.75	Breeding .....	\$2.00

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# 200 Nuclei with Red Clover Italian Queens

## Ready for Immediate Delivery.

We have arranged with a bee-keeper having a large apiary adjoining Chicago, to furnish us with Nuclei, each having a Red Clover Queen reared from one of Root's specially selected Red Clover Breeding Queens. They will be shipped direct from the apiary at these prices, cash with the order:

One 3-frame Nucleus with queen, \$3.50; 5 or more at \$3.00 each—on standard Langstroth frames in light shipping-boxes.

Or, we can furnish these Nuclei in 8-frame hives containing 3 extra brood-combs and 2 extra frames with foundation starters, at these prices:

One Nucleus in hive for \$4.50; or 5 at \$4.00 each.

Address all orders to

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S

"FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

## Editorial Comments

**Preparing Honey for Shipping.**—We are receiving many offers of honey, both comb and extracted, and also requests for shipping directions.

First, we may say that we are not in the market for any honey at present, and should we be later on, we will so announce.

Secondly, as to preparing honey for shipping—of course, most of our readers know that we prefer to have all extracted honey put up in the common 5-gallon or 60-pound square tin cans, two in a wooden box. And we would advise the following procedure for comb honey, when sent in less than car-load lots:

Only the very best and second best would we place on the distant market. We would put it into the ordinary 12, 20, or 24 pound non-drip shipping-cases, placing next to the glass a row of sections containing what would be a fair sample of the rest of the case. There should be no "facing" for deception.

Then, six or eight of these cases of honey should be put into a crate or box, but first putting in the bottom of the crate or box a layer of straw or hay several inches deep. This will serve as a cushion, and help to prevent the breaking down of the combs in handling when shipping.

After putting in the cases of honey, nail strips of boards across the top of the box or crate, and mark thereon, very plainly, "THIS SIDE UP. COMB HONEY. HANDLE WITH CARE."

Along each side of either box or crate, even with the top edge, should be nailed a board, say one inch thick, three or four inches wide, and about a foot longer than the length of box or crate, so that about six inches will extend beyond the ends of the box or crate, to serve as handles by which two men (one at either end) can carry it.

We would have each crate or box contain about 200 pounds of honey. Of course, 100 pounds each would do, but we think that the larger amount would be handled more safely, as it would be too heavy to tumble around, or to be easily overturned.

We have prepared comb honey for shipping as above described, and none was found broken after going hundreds of miles.

We once received a shipment of about 2000 pounds, sent to us from Minnesota in the ordinary 24-pound shipping-cases, each one being handled separately. The result was that at least a third of the honey was entirely broken out of the sections. And such a mess to clean up! Well, we don't want another like it for love or money. It was also a great loss to the shipper.

With proper care in preparation, comb honey can be shipped safely almost any distance.

**Choice of Location for Bee-Keeping.**—A young man just making a start, and intending to make bee-keeping the chief business of his life, will do well to look about and choose a place specially suited to that business. For that matter, so might one already engaged in the business. But he would be unwise, especially if already well planted, to go some distance to a new place, knowing nothing about it, but that some one had secured a very large yield of honey. Possibly that one year of great flow may be offset by two of failure.

Possibly the distance or inconvenience of access to a market may be so great as to counterbalance the greatness of the yield.

Then there are considerations outside of bee-keeping not lightly to be ignored. Climate, home, surroundings, are all of importance. Some of the Northern bee-keepers in attendance at the National convention at Los Angeles, who had cast longing looks toward that golden land, went home entirely satisfied to remain where they were, after seeing some of the California apiaries. Of course, all locations in California are not the same, but some of them are dreary enough. To get the advantage of pasturage an apiary is located in some canyon away from the haunts of men, the nearest neighbor half a mile or more away, outside of the sound of bell of church or school. With many it is a life of exile during the honey season, the rest of the year being passed elsewhere, but all would not like that sort of life.

On the whole, taking into account ties of friendship and old associations, as well as trouble and expense of making a change, the probability is that not one bee-keeper in ten will find himself better off anywhere in the world than right where he is now.

## Association Notes

MESSEURS. W. F. MARKS AND O. L. HERSHISER gave us a call when on their way home from the Los Angeles convention. They were the only representatives from the State of New York who attended the convention.

**NOTICE TO NATIONAL MEMBERS.**—General Manager N. E. France, of Platteville, Wis., desires us to say that if any member of the National Bee-Keepers' Association has not received from him a set of questions on a sheet to fill out and return, or has not received the badge-button or any of the leaflets he sent to members—if such will send him a postal card notice at once, he will see that they are supplied. He wants all reports in soon, so as to include all in the annual report, which he hopes to prepare so as to be of value to every member.

If members of the National will kindly heed the above notice, and act in accordance therewith, they will only be helping themselves.

**THE LOS ANGELES CONVENTION REPORT** we expect to begin next week. We thought we could get in the first installment this week, but we have not received a sufficient portion of the proceedings from the stenographer to start it in this number. Also, we have been so very busy since our return from the convention that we have not yet had time to prepare some notes on the trip and meeting that we expected to publish. Few can realize what it means for us to be away from our office for over two weeks. But we are sure all our readers will excuse us for any delays, under the circumstances.

And on top of all the extra pile of work, we have also been suffering from a severe cold, which we contracted upon our return from the sunny clime of California. It almost put us in bed, but we kept up by main force in order to get through the accumulated correspondence, so that now things are running about as usual in this office. On a weekly publication, in addition to all our other business, we need to be here about all the time. It is very difficult to get away for more than two or three days at a time.

## Convention Proceedings

Proceedings of the Texas Bee-Keepers' Convention Held at the A. & M. College, at College Station, July 8 to 10, 1903.

BY LOUIS H. SCHOLL, SEC.

(Continued from page 566.)

### BEE-KEEPING FOR WOMEN.

For years past women have taken an active part in nearly every branch of the commercial world, pressing out into almost every known occupation which tends to the well-being of our great and prosperous country, and to-day we have the pleasure, as honorary members, of meeting with the men in their association to discuss the feasibility of bee-keeping for women.

Now, we are well aware of the fact that each year there are many of our sex thrown upon their own resources and compelled to grasp the oars of life's frail bark and stem the ocean tide. Some, I say, are compelled by circumstances, others choose such a course rather than consent to be the heroine of a pure and peaceful home, as beyond a doubt was the Divine purpose.

When a woman realizes that she is dependent upon her own abilities, the first question that confronts her is, What can I do—what can I do to win a livelihood and thereby be independent? The first thought usually is, I'll teach, or clerk, or something just as confining, and, we may say, ruinous to health and usefulness. Why did she not think for a moment of the possibilities which lie before the American woman to-day in some out-door vocation, and especially bee-keeping?

One reason, if she did think of it, such an idea was immediately dismissed as being impossible for women. Yet it is by no means impossible, for there are many women bee-keepers just as successful as men, and more so than some men, but we'll not charge that to the man's incapacity, though it could be the case, for there is room for such argument in some instances. Surely, bee-keeping was not slighted on such a plea. The pleasure it affords, and the healthful influences, together with the monetary results, recommend it to the consideration of every energetic young woman.

What is more enjoyable than to walk into your cool, shady apiary with smoker in hand on some fine May day, and hear the happy hum of little bees, as they come tumbling and crowding into the hives, laden with their dainties from field, forest and glen? Such sweet peace and pleasure may be any woman's for just a little time, and patience, and trouble. And then it's not only pleasant but very profitable. Like poets, bee-keepers are born, not made, but almost any live, energetic person can in time become a successful bee-keeper.

Again, it may be truly said it is no lazy man's job. Many hesitate because they have no experience in the work. If you have none of your own, falter no longer but fall in line and appropriate some of your fellow worker's. You may be able to pay back some day. That is what we are here for to-day, to help one another. This is a men's association, but I am glad they have thought of us lady bee-keepers and consented to take us in as honorary members, at least.

Bee-keeping is becoming more and more scientific, though there are some "way back yonder" farmers who are contented to have a few log-gums. In a few years it will not be so. Ladies, take the matter in hand yourself. Mr. Farmer will be too busy and sleepy over the subject to object. Transfer the bees into nice, new hives, and some morning he will open his eyes to see those neat rows along the front walk, and hear the bees with renewed energy humming on the near-by clover. There are other things he will think of, too, when there are a few nice, clean sections of honey to market, and then next time more, and still more. He will doubtless remember that he was once owner of those bees, yet he would never know it from their appearance now. Then there was honey for Sunday only, and it was dark and thick—not the nice, clean sections that now grace the table almost daily.

Let us arouse some of the men, too, on the subject. I

suppose my father would never have thought of being a bee-keeper if his wife had not had a few patent hives when they were married.

The expenses of a beginner need not be great. Hives, frames, and other fixtures do not cost much now. A lady with a little help could make them herself. So, if one has not the means for securing these necessities, they can easily be made on the farm. Almost every farmer's wife or daughter raises some chickens for market each year, why not invest the proceeds in bees so that in time you may make more than mere "pin-money?"

True, not all localities are adapted to the production of honey. In such cases queen-rearing might be followed with success, since fine tested queens are in demand all the time. Then the production of wax is another feature not to be overlooked. I think if the ladies who have the time to canvass their neighborhood with tea-sets or patent medicine would establish an apiary they would find it more pleasant and far more remunerative.

There is here in connection with other studies an apiary for the boys who wish to study this branch of the course. Have you ever asked yourself why the boys should have advantages over the girls? Are not the girls equal to the task? If so, then in the Girls' Industrial School, at Denton, let there be an apiary. Yes, let the boys learn to care for the "Jersey," "Durham," "Hereford," etc., and the girls to keep bees, then will we truly possess "a land flowing with milk and honey."

There was a day when girls knew not the fret and worry of securing a livelihood. But then we saw "as through a glass darkly," now face to face, and we are brought to realize that institutions whereby young women may be equipped for the struggle are a real necessity, and as we are called the "weaker sex," why not help the weak? So let us think of getting an apiary at the Girls' School. Not only think of it, but get it.

We hope to hear of many ladies taking up bee-keeping not only to add to their "pin-money," but to become an auxiliary to the wealth and income of the farm, and we wish to see in this assembly room, at our annual meeting, many lady bee-keepers fully interested in this new calling to our girls.

MRS. BEN D. BURROW.

Grimes Co., Tex.

### PREVENTION OF SWARMING AND INCREASE.

Since different bee-keepers are running out-apiaries, the question arises how to manage them during swarming time. If we let the bees swarm, and hire a boy for watching and catching the swarms, we have considerable expense, and can be sure that this boy will sleep somewhere in the shade just when a swarm is coming out and going off.

Since I have kept bees, now for about 40 years, I have tried to avoid this watching for swarms by making them artificially, just a little earlier than the colonies would swarm naturally. Of all the different ways to make artificial swarms, I found that brushed swarms on the old or on a new stand are the best, because they are quite similar to natural swarms; in some respects even better. In this way I managed an out-apiary from 1882 to 1893 for comb and extracted honey, and lost very few swarms. At that time I increased the number of my colonies; when I did not want more colonies I united two of the weaker colonies after the honey-flow or in the fall. In some localities and some years I still think that it is the best plan; and right here I want to say that a great deal depends upon the locality and other circumstances as to which management is the best.

In my locality, for instance, the bees commence to breed early; at the end of March some of the colonies in 8 or 10 frame hives are swarming already, but the main honey-flow from horsemint commences generally at the end of May. During this flow we expect no swarms at all. In other localities the swarming time commences just before the honey-flow, and continues all through it. This makes a big difference in the management to prevent swarming.

Now, I will tell how I do it. I use very large hives in the spring, and they prevent swarming to a great extent. When you have used them five or six years you will find out that your bees will be less inclined to swarm. In some years, very favorable for brood-rearing in the spring, a large number of colonies would nevertheless swarm, but they will swarm at least a month later than those in small hives. Once in awhile I go over my colonies, and if I find one very strong I remove the shallow stories to see whether the colony has comparatively much brood. If I find brood that would fill more than two stories (an equivalent to about 10 Langstroth frames), this colony is swarmed or divided artificially.

Now, you will say, We want you to speak of a plan, or some plans, to prevent swarming and increase. Well, it is this way: The plan consists of two parts. At first a brushed swarm is made, and then the second part of the manipulation, all the bees which will afterwards hatch from the brood are given back to this swarm at the proper time; and this can be done in different ways. If we produce extracted or bulk comb honey the plan is more simple, and I will explain it first.

One thing I have to mention. If a brushed swarm is made, or a natural swarm is used just at the beginning of the main honey-flow for producing comb honey in sections, I always give starters only in the brood-frames, and full sheets of foundation in the sections. For extracted honey I prefer empty combs, or full sheets of foundation in the brood-chamber. I think you know the reason for this. Now to our management.

**FIRST PLAN.**—If a colony is ready to swarm, and the honey-flow will commence in about two or three weeks, and extracted honey is to be produced, I set a new brood-chamber on the old stand with one comb containing open brood and the queen; the balance full sheets of foundation, a queen-excluder on top, and over this all the stories of the colony in the old order. If I can't find the old queen I brush off the bees from the brood-combs into the hive, or in front of it, till I am sure the queen will be under the excluder. This manipulation keeps this colony from swarming for three or four weeks, and consequently it depends upon the locality whether it is sufficient or not.

**SECOND PLAN.**—We need a simple implement for this plan. It is a board, like a Porter escape-board, but in place of the bee-escape it contains two square holes about 2x4 inches, and wire-screens nailed on both sides of the board over these holes, so the bees can't feed through. On one end, about 2 inches of the rim is cut out for an alighting-hole. These double-wire screens can be used in the apiary for different purposes.

Now, we again make a brushed swarm on the old stand with the old queen, a double wire-screen on top, the alighting-hole in the front, and on top of this all the brood-frames with a sufficient number of bees for nourishing the brood. A queen-cell from selected stock can be given to this upper colony. When this queen is hatched and fertilized the wire-screen is removed, and which queen is selected, we allow it to be fought out by the queens themselves. In nearly all cases the young queen will kill the old one, and this colony will not swarm any more the same year. This plan is the invention of Mr. M. R. Kuehne, of California, which he described to me in a private letter.

**THIRD PLAN.**—If we wish to keep the old queen we can use another trick. We set the hive with the brood-combs on the side of the brushed swarm, and give a ripe queen-cell, if none is on the combs. This colony is weak, and the first young queen that hatches will destroy the other queen-cells. In a week after brushing she will have done this job, and we will see it, if any queen-cell is found with the side torn open by the bees. Now, in the evening, we simply change the places of the two colonies, and one hour afterwards, when the bees have ceased to fly, we change places again. What's that for? Well, in the evening many field-bees from the swarm will enter the hive with the virgin queen; they are used to a fertile queen, and will kill the young one during the night in nine cases out of ten. The next morning we set this hive on top of the swarm, and a wire-screen between the two, which can be removed about six hours afterwards.

These plans can be used for the production of extracted honey. The old brood-combs, which are now on top of the swarm, will be filled with honey, which can be extracted. For the production of section honey we can use similar plans, but we have to overcome some difficulties.

The forced-swarm method for section honey has a double purpose. First, to prevent swarming, and, second, to have the colony in the right condition to start to work in the supers at once. This is secured by the empty brood-chamber. There are no empty cells in which the honey could be stored, so it *must* go into the supers. For the first purpose we would not need any manipulation, because during the main honey-flow the bees will not swarm here. So it is plain the forced-swarm method must be used just at the beginning of the main honey-flow. Probably we can keep our bees from swarming before this time by using very large hives, and by spreading the brood once in a while, or, in some localities, where the bees swarm just at that time, we can use the plan I recommended about four or five years ago.

**FOURTH PLAN.**—A brushed swarm is made as before,

and the parent colony set at the side of it. The hatching bees are afterwards united to the swarm by using the well-known Heddon plan of preventing after-swarms or transferring. All this is old. If anything is new, it is that these old manipulations are used for another and new purpose.

**FIFTH PLAN.**—For this purpose, to add the bees hatching from the brood to the swarm, the bee-keepers in Colorado use another way. Over the top of the brushed swarm are set one or two section-supers, then the double-wire screen-board, and over this the brood-combs with some bees. Now, a canal is made out of three laths, which leads from the upper alighting-hole down near to the lower alighting-hole. The upper end of this canal is closed. The bees from the upper hive have to go down, and when they return to the hive they will mostly enter the lower hive. In three weeks all the bees have hatched, and can be united with the swarm, and the empty combs used elsewhere or melted into wax. I have some objections to this plan, but the Colorado bee-keepers say it works all right. Mr. F. L. Thompson described this way in the Progressive Bee-Keeper some time ago.

**SIXTH PLAN.**—Kuehne's plan, too, can be used for section honey, with a little variation.

**SEVENTH PLAN.**—Some of our Texas bee-keepers prefer smaller hives, and their bees commence to swarm one or two months before the main honey-flow. They have weaker colonies and weaker swarms. What would be the best plan for producing comb honey and avoid all increase?

I would use hive-stands on which I could place two hives close together. In the spring we have only one hive on every stand. The swarms, natural or artificial, are set close to a parent colony (not to that from which the swarm was made, but to one which was swarmed some days before this). When the main flow is beginning, and we have a single hive on a stand, it is a colony which has not swarmed. It can be manipulated according to one of the given plans. If we have a pair of hives on another stand it is a swarm and a parent colony. I would manipulate them in the following way:

We remove both colonies from the stand and set the brood-chamber of that colony, which has the young queen, in the middle of the stand, so it will catch the field-bees of both colonies. In this brood-chamber we will crowd the brood-combs which contain the most brood. If more brood-combs are in this colony we give it to the other colony with the old queen, but without bees. Now we put the section supers on, with or without a queen-excluding honey-board between them and the brood-chamber; on top of this a board with double wire-screens, as just described, and then the other hive with bees and all. The Colorado canal can be used or not. The field-bees of the upper hive will enter the lower hive. The next, or a few days afterwards, we kill or remove the old queen from the upper hive, and now the colonies are in the same condition as in the other plans, and the young bees are united with the main colony in one of the given ways.

**EIGHTH PLAN.**—Before I close I will mention the plan by which the bee-keepers of Colorado try to get rid of foul brood. When the honey-flow commences, the bees are shaken into an empty hive and treated on the McEvoy plan. All the brood-combs are given to another colony (a weak one will do), and here they are storified from several colonies as high as a man can reach. Twenty-one days afterwards all the brood has hatched, and now this colony, too, is brushed or shaken from the combs, the honey is extracted, and if the fumigating of these empty combs with formalin gas will prove to kill the spores of the foul-brood bacillus, we will have a true remedy for this pest. But do not forget that all the operations must be done very carefully.

**NINTH PLAN.**—If the colonies are in pairs close together when the honey-flow commences, we may unite them for comb-honey production and secure a good crop, even if they are not very strong. The queen of one colony is removed, killed or kept with one brood-frame and adhering bees in a nucleus. Now the bees of both colonies are brushed and shaken into an empty hive on the old stand, as described, and the brood-combs manipulated in the same way.

L. STACHELHAUSEN.

(To be continued.)

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

### Something of Benefit to Beginners in Bee-Keeping.

(Read at the Minnesota Bee-Keepers' Convention.)

BY A. E. HOOKER.

I HAVE been requested to contribute a paper on this occasion, and do so somewhat against my inclinations; for the reason that I am not a large bee-keeper, and certainly do not pretend to be a scientific one.

I have kept a few colonies of bees with moderate success for a number of years, and, of course, have had an opportunity to observe them more or less.

This brings me to the point that suggested these few remarks, namely, positive assertions pertaining to the habits of bees, and to the subject of bee-keeping in general. Assertions which have been handed down from the past, together with some of more recent origin, that are too often repeated in view of the fact that they can not be relied upon. In referring to some of these I do not expect to say anything that will be new to experienced bee-keepers, but possibly what I shall relate of my own experience may be of some use to beginners.

For instance, in reference to the swarming problem, we are told that the requisite conditions for swarming are a good honey-flow, brood in all stages, and plenty of young bees. Now, we doubt not these conditions are usually found in a hive from which a swarm is about to issue; but it is not always so. As a matter of fact, I have had swarms when there was little or no honey coming in, and when I feared they would starve if not fed.

I have practiced caging queens to some extent to prevent swarming; and after confining a queen for 10 or 12 days, taking care that no queen-cells were allowed to remain in the hive, I have not infrequently known colonies so treated to swarm within a very short time after the queen was released, and before it was possible for them to have brood in all stages; in fact, with little or no recent brood at all.

In verification of this I quote one of many similar examples from my record of the past season; "Colony No. 31, July 4, swarmed." I will say here, by way of explanation, that I use entrance-guards on all hives from which swarms are expected; thus confining the queen within the hive and inducing the bees to return. This return of the bees must be looked after, however, as I shall hereafter explain. But to proceed with our record: "July 5th, caged the queen and removed all the queen-cells. July 15th, liberated queen and removed all cells. On the following day, July 16th, they again swarmed." This shows that under some circumstances bees will swarm regardless of the condition of their brood.

Again, we are told, when bees swarm without their queen, she being detained by entrance-guards or otherwise, that they will soon return to their hive. But all experienced bee-keepers must know that they very often scatter, and many of them enter some other hive, unless they are prevented from doing so. To obviate this, I aim to cover with sheets of cotton-cloth, immediately, all hives from which swarms are seen to start, and throw a little water over them. If done promptly and well, very few bees will get into the air, and, in a few minutes, the cloth may be turned back, and the swarm will usually be found clustered on the hive.

But in case a swarm should get out, and on their return attempt to enter some other hive than their own, cover that hive at once and use the smoker, if necessary, until they cease their efforts to enter.

We are also told that when a colony has cast a first or prime swarm, if they elect to swarm again, the second swarm will issue in 8 or 9 days after the first swarm. This is quite an important matter to the beginner, who accepts it as truth; for it may result in the loss of unlooked-for swarms. I have found this to be wholly unreliable. My bees hold the entire matter in supreme contempt. Young bees often hatch almost immediately after the first swarm goes out, and they are therefore ready to swarm again.

I will once more quote from my record of a previous

year: "Colony No. 2, June 18th, swarmed; removed old queen; later in the day opened this hive and removed another queen, evidently a virgin. July 20th, swarmed, returned without clustering; young queen hatched; plenty of very recent brood." Here we have queens hatching on the same day the prime swarm issued. And, again, "Colony No. 8, June 13th, swarmed; removed the old queen; June 17th, young queen hatched."

I could quote from my records many similar instances, however it is not necessary to pursue the subject further. But, in passing, I wish to emphasize the necessity of subjecting all conclusions in reference to the conduct of bees to the severe test of a long and vigilant experience before publishing them as truths.

Bees are subject to such variable conditions that I think any affirmations in regard to their behavior should usually be qualified.

Again, beginners are sometimes disappointed by misleading statements concerning some of our modern inventions; as, for example, the case with which swarming may be controlled for a day or two by means of queen-traps or entrance-guards. Just put these on hives from which swarms are expected, and go away to town or where you please, perhaps leaving the children to look after the bees a little, and when you return home and have the time to spare, go around and see if there is anything to do. Just so.

But suppose, in the meantime, several swarms issue; some of them will be almost certain to cluster together, and, when they return, some hives will most likely get very few bees, and others will get more than their share. Possibly, too, to complicate matters further, a queen or two may be killed by the returning bees. And, again, it occasionally happens that a queen gets through the guard; or a colony may swarm that is not expected to do so, or a swarm from another apiary may come along and unite with your bees, and then off to the woods they all go together.

The serene bee-keeper, when he returns, may feel that the thing was a great success, being ignorant of what had transpired in his absence; but later, in all probability, he will come to the conclusion that bees do not pay.

Some time ago a very well known bee-keeper and contributor to bee-papers, wrote an article in which he set forth the merits of the Manum swarm-catcher, and expatiated upon the ease and certainty with which swarms could be managed by its use. I have not the article before me, but I recollect that the gist of it is: That with two or three poles, the longest being 20 feet—to meet, I suppose, extreme cases—any one could readily control the situation. Now, I had one of these catchers, but I had not used it very often. On reading the mentioned article, however, I resolved to try it again. This man must know what he is talking about, thought I; the fault must have been mine, if it had not always accomplished for me as much as he claimed for it.

An opportunity soon came. I do not intend to allow any swarms to cluster with their queens, but it sometimes happens, nevertheless. One day a swarm came out which I had reason to think might have a queen with them. They alighted on a limb of a tree, and I noticed that they chose a rather lofty location. But, nothing daunted, I went for my catcher, and with heroic confidence I raised the machine on high. But the swarm, for some inexplicable reason, did not deign to notice it. I raised it still higher; I held it at arm's length, still those unorthodox bees stubbornly refused to tumble into it. What could it mean? I paused to consider. I had confidence in my author; he said the thing would work, and I was bound to believe it.

After awhile I was aroused from my reflections by my neighbor across the street, calling to me and asking what I was trying to do there. I told him I was going to take down that swarm of bees. "Humph," said he, "pretty high up, aren't they? Look here, I have an extension ladder, better come and get it; I will help you; possibly by its aid you may be able to reach them."

"Reach them," I repeated to myself. Could it be possible that was the trouble? I stuck the end of the 20-foot pole in the ground and stepped to one side to take observations. Sure enough, the catcher did not appear to reach them. According to my view there appeared to be an interval of 25 feet or more between the catcher and the bees. Still I was not convinced. It is unwise to form opinions hastily. This might be another instance of "locality."

However, as a solution of the problem seemed hopeless at this time, and as I had some fears that the bees might become discouraged and fly away, I resolved to take my neighbor's advice and try the ladder. Accordingly I procured it. After drawing it out to its full length, and climb-

ing on to a limb above it, I managed to reach the cluster with the catcher.

When all was over, I sat down to meditate, and, as a result, I finally came to the conclusion that it is impossible to reach a swarm of bees 50 feet from the ground with a 20-foot pole, simply. And, I also concluded that the man who wrote that article either never saw a tree over 25 feet high or else ignored the fact that trees do sometimes grow higher.

Now, I wish to say right here, that I think the Manum swarm-catcher is an excellent device, and worth all it costs; but it will not reach swarms in the tops of high trees. And, as to the entrance-guards previously referred to, I hardly know what I should do without them. They do not, by any means, take the place of the bee-keeper's watchful eye, but I find them a great help.

No one appreciates useful inventions more than I do.

All goes to show how easy it is to make misleading statements, and how necessary it is, for those who aspire to the position of teachers, to weigh carefully everything they say; to look all around the subject, or else admit their view is only a partial one, and must not be expected to apply to all conditions. It is only natural that beginners should look to experienced writers for reliable information. And this very fact is apt, for the time, to dwarf their own natural resources, thus adding to their perplexity, in case the instruction is inaccurate.

But I do not wish to be misunderstood as underrating the excellent literature we have on the subject of bee-keeping. On the contrary, I advise all who expect to be successful with bees to read it. We owe much to our able writers, but they should not forget that they also owe something to their readers. And I think we have reason to complain that they, too, often speak without due consideration.

To sum up, I would advise beginners in bee-keeping to get a good book on the subject, but do not expect it to be infallible. You will get much from it, but you must have practical experience.

Do not invest in more than two or three colonies at first. You will have enough to do to handle them properly the first season. Keep a record of every colony. You must know what is going on in each hive from day to day, if you expect to make a success of bee-keeping.

To writers on the subject, I would respectfully suggest that it might be better to give their experience only, and not carelessly repeat what others have as carelessly said, and thus help to hand down palpable errors, which, from necessity, must be very confusing to beginners.

## Our Bee-Keeping Sisters

Conducted by ENMA M. WILSON, Marengo, Ill.

### Likes Bee-Work—Bee-Stings for Rheumatism.

I think the Sisters department is splendid. I had no idea so many women were doing as I have done. I have taken care of bees for seven years, and now have 40 colonies. In some years I have better success than others, but I am never without honey. I work only for comb honey. I started to take honey off the middle of June, and have taken several hundred pounds since then. I got 20 cents for the first, but only get 12½ cents now. I never saw honey come in so fast. White clover was full of bloom. I will have several hundred pounds to sell. I have hived 39 swarms, and have traded swarms for hives.

I love to take care of my bees. All the help I have is from my girls, aged 14 and 10 years. I lost my only boy last January. My, how I miss him! He was such a help. It seems hard to do without him.

I live on a small farm, and have to rent the ground out. I do not receive much from it. I manage to get along with the help of the bees and chickens. I would like to hear from those who have tried to get the eggs to hatch in the hives. I did not have faith in it, although I would like ever so well to have an incubator, as I raise several hundred chickens every year, and the bees would be a cheap kind, if it worked all right.

I noticed, in the last Bee Journal, something about bee-stings for rheumatism. It was crippled up real badly last

spring when I started to work with my bees, and I can say I feel it no more.

A lady from New York tells, on page 488, about how they used to take off the honey with the sulphur stick. I have heard my father tell about doing the same way.

I have written quite a good deal, and have not given any advice, nor asked any questions. There is lots for me to learn, and I find out something new quite often.

I think that a cake of sugar candy put over the frames in the fall keeps the bees from having dysentery in the spring. I winter my bees on the summer stands, putting leaves in the super. I have had good success in wintering them in that way. I wish I had things as convenient as I see they have in some of the pictures of apiaries given in the American Bee Journal. I need a honey-house very badly, and would like to have as many more bees as I have. I hope some day to have them.

I think the editor will have to give us more room. I enjoy reading the paper, especially the Sisters department. Page Co., Iowa, Aug. 4. INEZ J. HENRY.

### A Sister's Encouraging Word.

MY DEAR MISS WILSON:—I will now do what I have often felt like doing—tell you how much I appreciate your department in the American Bee Journal. I think it is well conducted, and when I recommend a bee-paper to a sister bee-keeper, I always add to my warm approval of the American Bee Journal the fact that it has a department especially for women, conducted by a woman whose experience and ability is unquestioned. Such a commend goes by this mail to Portland, Maine.

When I began bee-keeping, 19 years ago, Gleanings in Bee-Culture had a number of women correspondents, the best remembered being Mrs. Harrison, Mrs. Chaddock, and Mrs. Axtell. They were good, helpful writers, and I always felt an inspiration to go on with my work after reading their articles. Working entirely alone as I have always had to do, I did not have the comfort and pleasure of talking over my work with any one, so naturally the bee-papers were more to me than instructive—they were communications from friends with mutual interests, and I soon had my favorites, and felt as if I knew them; and, by the way, is not this one of the best things about conventions, that we meet these friends we have learned to admire?

I heartily wish you success, and a continuance of your work. S. M. STOW.

Cook Co., Ill., May 22.

### Trouble with Swarms Deserting.

I had some trouble with my bees, and would like some information. In July they swarmed, and I hived them, but the following day they left the hive and settled on an old barrel. I hived them again, but there is not a third of a colony in the hive now. July 7, the old colony sent out another swarm, which I hived without a bit of trouble, but to-day I looked in the hive and found only a handful of bees. Both hives were clean, and I can not understand why they leave, as they were both large swarms. I am very sorry, for I am anxious to get a start in bees.

I enjoy reading the American Bee Journal, and want to try to get some of my neighbors to subscribe for it.

I shall be very glad to receive advice from some one who has had more experience than I have. Cherokee Co., Kans., July 11. ANNA SHUPE.

ANSWER.—I think if you try giving them a frame of brood when you hive them you will have no further trouble. I never knew them to desert when given brood.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook; 44 pages; price, postpaid, 30 cents. This is by the same author as "The Bee-Keepers' Guide," and is most valuable to all who are interested in the product of our sugar-maples. No one who makes maple sugar or syrup should be without it. Order from the office of the American Bee Journal.

Amerikanische Bienenzucht, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### "NO END IN SIGHT" TO MANY QUESTIONS.

No end in sight to the subject of queen-rearing, says Mr. Alley. No end in sight to the silver question, says Mr. Bryan. No end in sight to the race question, says Mr. Washington. Good many things in the world not easy to get finished and filed away and ticketed. Page 440.

### THE FOOL-PROOF FRAME.

Here's one — "feller" who hardly knows how the fool-proof frame operates. To be impervious to the fool and keep him from getting into his hive might be one way — Box-hive under a higher title. If, on the other hand, it keeps its manipulators from becoming fools, that's a more important thing. Must have it, some of us. Page 446.

### HONEY-ADULTERATION DECREASING IN ILLINOIS.

It's cheerful and good speed in the right path for three years that they report in Illinois. Adulterated honey not easy to find now. Three years ago one-third of it was such. This is good of itself, and also good as a sermon. Those weak-hearted brethren elsewhere who always are saying, "You can't do anything about it," should listen to the sermon, and brace up to overthrow this evil and others. Page 452.

### FEEDING GLUCOSE NOT A SUCCESS.

As to the naughtiness of feeding bees glucose to make them fill sections, I suppose we have most of us been declaring that to be an impossible sin. Still, it's pleasant to have such strong support as Inspector France brings us on page 453. He finds that even famished bees will not take such feed until it is made nearly half honey, and then only enough for present use.

### GETTING BEES OFF COMBS—FORCED SWARMING.

Ah, Mr. C. Davenport is a hitter also in getting bees off from the combs. We have a tribe of the Hittites same as they had of old. Perhaps it's because we have seldom felt any need of anything beyond our own practice that has kept some of the rest of us from being hitters.

And forced swarming not likely to turn the bee-world upside down—is the prophecy of one of its chief prophets. —Page 453.

### LETTING BEST CAPPERS DO THE CAPPING.

Yes, here's a new kink that can be practiced to some small extent, contributed by Miss Wilson. If you have bees that gather honey well but cap it so as to look abominably, also bees that cap well, something has been done in the line of making the latter do the capping for the former. Page 455.

### RETURNING SWARMS.

I'm quite interested to see that Dr. Miller thinks that it's practical to return all swarms, prime and all, directly to the hive. I've done that way quite a bit, but only as a sort of dire extremity. More practical with few colonies than with many, I should say. Or, perhaps, many colonies and only a few actually swarming at any one time, would be the most hopeful; for then you'd expect to be on hand most of the time. You see, it takes so many operations, and the chances of escape become so numerous, that though generous of your time and labor you don't save the bees. If I ran 10 colonies that way, and had three of them actually unbroken at the end, I should think I had done tolerably well. Not that the seven have all sent bees to the woods, but they are not where they should be. Sometimes they'll omit swarming for one day; but infrequently they'll try you twice in a day. And when they fly 20 minutes before doing anything with themselves, it takes one's time in big slices. Page 457.

### THE OLD 4-PIECE A GOOD SECTION.

It would be a curious result if the 4-piece section should come back to us willy-nilly on account of the extermination of basswood. Could bear it without groaning, as the 4-piece section was a good section. Page 467.

### CAN'T SWALLOW THE ONION THEORY.

Is it exactly the thing for a bee-journal to print without protest that the juice of a roasted onion on a sting has been known to save life? Say rather that it did no harm, possibly a trifle of good—and the person lived. Perhaps I'm hard on onions. My doctrine is that, like the boy's pins, they save thousands of lives. Same method—by not eating them. Page 468.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### After Effects of Too Many Bee-Stings.

On page 500, the following is copied from Gleanings in Bee-Culture:

"It behooves us all to be careful not to get any more stings than is absolutely necessary, for the effect of the accumulated poison may be serious in its effects in after years, as it was in the case of Langstroth and some others."

Now, would like to know what were those after effects of which Mr. Root speaks.

When I began keeping bees, 13 years ago, a sting in one of my fingers would make my whole hand and arm swell, while now I can stand a dozen stings without much discomfort. I am working with my bees now without gloves, and have not tried particularly to avoid stings, as I have been desirous of becoming immune as much as possible; so if it should happen that I should get a large number of stings they would not affect me too much as I should have feared.

If there are possible effects, of which I had not heard before, then it would be better for me to be more careful to avoid stings than I have been.

It may be there are other bee-keepers who are as ignorant as I am of the after effects of bee-stings, and will be interested in your answer. MISSOURI.

ANSWER.—Mr. Langstroth was subject to fits of mental depression, when, for days, he would scarcely speak to any one, and didn't want to touch or even think of bees. My private opinion is, that bee-stings had nothing whatever to do with the case, and I don't believe you need feel unnecessarily alarmed. I've been accumulating stings for the past 42 years, and if the effect is ever to be serious it ought soon to be apparent. But except when I'm dead tired from overwork I'm yet about as cheerful a youth as you generally meet.

### Top and Bottom Section-Starters—Feeding for Winter.

1. Why do you use top and bottom starters? (See page 142 of your book). Would one that almost filled the section do just as well for home market? Time would be saved in cutting and putting in.

2. Will bees cap and finish supers any quicker if there are two on the hive instead of three? That is, if you had three on—two they had just started to cap, and one on top they had begun in? Now, if you take off the top one will they finish the others sooner?

3. Will bees put dark and light honey in the same cell? I have been told they would not. I mean, if they were working on white clover, and did not get enough to fill the cells, and buckwheat came on, would they put it on top of the clover honey?

4. In feeding for winter we are told (A B C of Bee-Culture) to find out how much the bees need, and feed them that amount of sugar and water. If I feed 20 pounds of sugar and water will it make 20 pounds of stores for winter? If a 10-frame hive were without any honey, how much sugar would it take to carry them through the winter?

5. I have one super that has a few cells of pollen in every section. What is the cause, and how can I prevent it?

6. Can a super (that is, on top of a hive) full of young bees be given to another colony without any fighting? Would it be a good idea to take from a strong one and give to a weak one?

7. How would it work to use the same depth of bottom-board under frames (¾) in winter, and close the entrance down to ¾ inch by a strip of wood for out-door wintering? What size entrance would you use here? MASSACHUSETTS.

ANSWERS.—1. Even for the home market I should prefer the bottom starter. It makes a nicer looking section. Unless a single starter to crowd the three, you may find bad work from crowding in the two, especially when honey is coming in slowly, will not be built down to the bottom. Although the bottom starter is original with me, I don't believe I'm sufficiently prejudiced in its favor to stand the extra trouble unless there were a sufficient gain to pay for it.

2. Yes, if you take off that top one they will be likely to cap the other two sooner. But if honey is yielding, and there are bees enough to crowd the three, you may find bad work from crowding in the two. I had some experience in that line this year, having only three or four supers on when these were so nearly filled that the bees had not room enough (although an empty super was on top, but they didn't get so

readily started on top as below), and they built burr-combs and built on the separators, making waste, and injuring the appearance of the sections.

3. Don't trust them. They'll put whatever they get in any cell that is not full.

4. No; 20 pounds of sugar and water, half and half, wouldn't make 20 pounds of stores, only about 14. Count 10 pounds of sugar to equal about 14 pounds of honey, no matter how much water is used.

5. That's one of the things I've never been able to find out, why one colony will have pollen in its sections when others exactly like it will have none. Shallow hives make a tendency to more pollen in sections, and if the queen lays in the super, that will make more pollen there, but there are still occasional cases which I don't know how to account for.

6. It can be safely done, but is not generally advisable.  
7. It would be all right. Deeper than  $\frac{3}{4}$  would be still better for the bottom-board, but I would not care to have the entrance more than  $\frac{3}{4}$ , and perhaps not more than 4 inches wide.

Don't be worried about troubling me with questions. Yours are so neatly and clearly given that it's a pleasure to answer them.

**Queen Questions—Putting on Supers—Tobacco-Smoke.**

1. Can queen-bees sting?
2. Do they always mate with a drone in the air?
3. If the virgin queen had her wings clipped would she be any good?
4. When is the best time to clip her wing?
5. Can workers lay?
6. Will the queen go up in the top part of the hive to lay?
7. When should supers be put on?
8. Will the bees store honey above while there is room below?
9. Are the brood and honey put in different combs below?
10. Where will I find the brood when I want to divide a colony?
11. Will tobacco-smoke kill bees?

NEBRASKA.

ANSWERS.—1. Yes, indeed, but they'll not sting you. One queen will sting another, and, as a very rare thing, a queen may sting a worker.

2. Yes.  
3. No, unless so little were taken off the wing that she could still fly.

4. The first time it is convenient to get hold of her after she begins to lay. In the spring make a general going over to clip any that came from superseding the previous fall.

5. Not as a rule; but when a colony has been queenless a long time they may undertake the business, and then we have the pest called laying workers.

6. Sometimes.  
7. When the harvest begins, or a little before it. Generally you will find bits of white wax on the top-bar and upper part of the combs at about the time to put on supers.

8. Generally not.  
9. No.  
10. In the brood-chamber.

11. No.  
A book of instruction about bees would be worth to you many times its cost.

**Building Up Weak Colonies—Removing Supers of Honey.**

1. Advise me how to make a weak colony strong. Is it a good plan to put two swarms together?
2. What is the best way to take supers of honey from the hive?

PENNSYLVANIA.

ANSWERS.—1. Early enough in the season there's no better plan than to let them build up and grow. Later they can be aided by frames of sealed brood from other colonies. It is also a good plan to unite two or more weak swarms, but it is better to prevent all swarms after the first.

2. To give full particulars as to the whole of taking off honey would go beyond the limits of this department, these being given in your book of instructions on bee-keeping; but if you will mention any particular point that is not clearly understood in your text-book, I'll be glad to answer in full.

**Crating and Shipping Comb Honey—Keeping Ants Away from Honey.**

1. Please give instructions how to crate and ship comb honey.
2. How do you keep ants from getting on it?

IOWA.

ANSWERS.—1. When you get the shipping-cases that are now furnished by supply-dealers you will hardly need instructions for using them, for you can hardly ease the sections wrong, they being so placed that the one row comes directly against the glass so as to show the face of the honey. It is of first importance that this row next the glass be a fair sample of the whole case, for the man who veneers by putting next the glass the best, and inferior honey back of it, will in the long run be the loser by it.

Unless there be so large a quantity of honey that it can be fastened solid in the car, it should be put in the crates sold by some supply-dealers, the crates so placed that the ends of the sections shall be towards the front and rear, so as to stand the bumping of the cars. On

the contrary, if the sections are hauled on a wagon, they should be placed crosswise.

2. While the honey is on the hives the bees will keep the ants away, but ants are sometimes very troublesome in the house. A small quantity of honey can be kept from them by having it placed on some kind of a platform with feet resting in cans or dishes kept filled with water or oil. That is not so convenient with large quantities, and aggressive rather than protective measures must be taken. Dishes may be set containing poison of some kind mixed in thinned honey. If you can trace them to their holes, pour gasoline or bisulphide of carbon into the holes, and cover up.

**Uniting Colonies—Care of Combs.**

I have 50 colonies of bees in dovetailed hives, and want to keep but 25, spring count. How and when can I double them up? What should I do with the frames of larvæ and honey? And how to keep the frames of comb during the winter?

TENNESSEE.

ANSWER.—Better wait until next spring to unite. If you unite this fall, there may be some casualties in winter, and you would not then have your 25 in spring. Even if you are sure of no winter losses in your mild climate, there are advantages in waiting till spring. There will be no question about care of combs through the winter, and by doubling 50 full colonies in the spring you are likely to have 25 stronger colonies than if the doubling were done in the fall; and 25 very strong colonies will take no more care than 25 weaker ones, and will store more surplus.

If there are any points not made entirely clear in your book about uniting in spring, send out all the questions you like, and I will cheerfully answer them—if I can.

**Extracting and then Feeding Sugar—Does Shaking a Queen Off the Comb Injure Her?**

1. Will it pay to extract from the brood-chamber and feed sugar worth 5 cents a pound, when honey is worth 10 cents?

2. Can I depend upon getting most of what is fed stored in the comb?

3. Would it kill a young queen that just started to lay, to shake her off the comb on the ground? I think I stopped one from laying in that way.

CANADA.

ANSWERS.—1. I don't know. In some cases it might, in others not.

2. I'm not sure that I get exactly the drift of your question. Of course, whatever is fed to the bees will be stored somewhere, with the exception of what the bees consume for their own use, and so it may be expected to be stored in the brood-chamber so long as there is room there. After cramming the brood-chamber, the bees would store any further surplus in the upper story, but, of course, you would not want sugar to be stored to sell as honey.

3. It is not likely that a queen would be at all injured by being shaken upon the ground from a comb held at the usual height. There may have been some other reason for the cessation of laying in the case you mentioned.

**Queenless and Queen-Right Colony.**

1. Will a queenless colony of bees carry in pollen in this State as late in the season as Aug. 17?

2. How can a person tell that bees are queenless if he can not look into the hive?

3. If a colony has a queen will there be brood and eggs in the comb at this time of year?

MAINE.

ANSWERS.—1. A queenless colony may carry in pollen at any time in the season when pollen is to be found. But after they have been queenless for some time, they accumulate a surplus of pollen, and are then likely to carry in little or no pollen.

2. If you find a colony carrying in little or no pollen when others are carrying in big loads, you may suspect queenlessness; but the sure way is to look into the hive.

3. In your region you may expect queens to continue laying throughout September, but in some cases they may cease before the month has advanced much.

**Does Returning Swarms Make Too Big Colonies for Wintering?**

I am keeping bees for the first time, and consequently I have very much to learn about them. I started last spring with 2 colonies, and have increased to 7, besides getting 140 pounds of surplus already, with the bees still hard at it.

What I want to ask is this: If I keep returning the swarms that are coming off now to their parent hives, instead of establishing new colonies, as I am advised by several writers in the American Bee Journal, will not such parent colonies become so populous that the 8-frame dovetailed hive cannot contain enough honey in order to insure sufficient stores for them for winter? If so, what would be best to do?

IOWA.

ANSWER.—No, you can never have more than the progeny of one queen in the hive, no matter how many times you return the swarm.

and those bees that you return will practically all die off before winter, so the number of bees in the hive in winter will be little affected by returning the swarms. All the same, it needs a sharp lookout, whether you return swarms or not, to see that bees in an 8-frame hive have plenty of stores for winter. Save up some frames of sealed honey to give needy colonies. If you don't need them this fall, you may be very glad of them next spring.

### English Standard Brood-Frame.

What is the size of the English standard brood-frame? and how many frames to a standard hive? MAINE.

ANSWER.—14x8½, and 10 or 11 are usually used in a hive.

### Keeping Comb Foundation—Vetch for Bees.

My questions may be foolish, but I am a foolish bee-keeper; I don't know much, but one thing I know is, that I have the bees and have to handle them. During the month of April we had a freeze that put my bees back, but they are coming out all right now. I have 6 colonies.

There are a few bee-keepers around here that use old boxes and logs for hives, but I can not make them hear when talking to them about subscribing for the American Bee Journal, or using good hives. I am going to study "Forty Years Among the Bees."

1. If I order more foundation than I use, how can I keep it from spoiling?

2. Do I have to have tools that are made for the purpose of fastening it in?

3. What about vetch for bees? I enclose a few seeds. Should it be sowed with rye, or what would be best? MISSOURI.

ANSWERS.—1. I hardly know what you can do with it that it will not keep, unless you put it in an oven where it will melt, or spread it out in the sun and rain for a year. Just keep it covered up wherever it is convenient. Even if you have it filled into sections, keep them where they will be dry and nice, and they will be all right. Although bees take hold of fresh foundation a *little* more readily than that which has been kept over, there isn't much difference. But if you leave it on the hives in the fall, when no honey is coming in, it may become so bad that bees will not touch it next year.

2. It will probably pay you to get a foundation fastener, although you can get along without one.

3. I know nothing about it from personal experience. I thank you for the seed.

### Returning Swarms.

Have I done right by my bees? I got tired of their swarming so much, so when the swarm came out I let them settle, and then went to the hive they came from and took all the queen-cells out, and took the swarm that was hanging on the tree and put it back in the old hive. That settled their swarming. Is there any danger of making them queenless? I do not clip my queens, as they are so hard to find. I keep from 50 to 70 colonies. WISCONSIN.

ANSWER.—You need not fear queenlessness, for the bees will not swarm without a queen, which would still be left when all cells were destroyed.

## Adels \* HARD REGORD TO BEAT \* Adels

My father has an Adel colony that stored 75 pounds section honey. It cast a swarm that has filled nine 24-pound supers up to date—1903. I am ready to back up this statement.

I got 210 1 pound sections from one Adel colony. Another has filled 8 supers, and I expect 2 more supers this year from same colony. P. R. KOZAK, Maquoketa, Iowa. J. C. OLDENBERG, Belleplaine, Minn.

One Queen and "Improved Queen-Rearing," \$1.50. Send for 16-page Catalog. HENRY ALLEY, WENHAM, MASS.

30Atf

## Position Wanted

By man of 20 years' experience, as APIARIST and POULTRYMAN. A 1 reference given. Address, American Bee Journal, 144 & 146 E. Erie St., CHICAGO, ILL.

**BOYS WE WANT WORKERS**  
Boys, Girls, old and young alike, make money working for us. We furnish capital to start you in business. Send us 10c stamps or silver for full instructions and a list of places to work with. DRAPER PUBLISHING CO., Chicago, Ill.

# A STANDARD-BRED QUEEN-BEE FREE

To Our Regular Paid-in-Advance Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with **The Very Best Untested Italian Queens** that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

## A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription **must be paid at least 3 months in advance**. If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

Send us \$1.00 and the name (not your own) and address of **One NEW** subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due also.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows: One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We are filling orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

GEORGE W. YORK & CO., 144-146 E. ERIE ST., CHICAGO, ILL.

Please Mention the Bee Journal when writing Advertisers.

REVERSIBLE WALL MAP

OF THE

UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

China, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. Very useful in every Home and Office.

66 x 46 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

Best and Most Necessary Map Ever Issued.

No Home or Business House should be without it.

The xx Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

A xxx Marginal Index

is one of the invaluable features.

It gives an alphabetical list of countries, their location on map, style of government, population, a re a, products, minerals, imports, exports, etc.

It has been pronounced a xxx Photograph of the World

The 1900 Census xxx of the largest American Cities is given.

One side shows a grand map of our great country, with counties, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

1901 EDITION.—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The Southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

On the reverse side is the Library Map of the World. The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. The Inset Maps are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps on one sheet, all for only \$1.50, sent by mail or prepaid express; or we will forward it free as a premium for sending us Three New Subscribers at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

GEORGE W. YORK & CO., 144 & 146 Erie Street, CHICAGO, ILL.

# Thousands of Hives - Millions of Sections

Ready for Prompt Shipment.

We are not selling goods on NAME ONLY, but on their quality. In addition to the many car-loads we are shipping to all parts of the United States, we have just made one shipment of five car-loads to England.

G. B. LEWIS CO., Watertown, Wisconsin, U. S. A.

## 28 cents Cash paid for Beeswax.

This is a good time to send in your Beeswax. We are paying 28 cents a pound—CASH—for best yellow, upon its receipt, or 30 cents in trade. Impure wax not taken at any price. Address as follows, very plainly,

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

## Dittmer's Foundation!

Retail and Wholesale.

This foundation is made by a process that produces the superior of any. It is the cleanest and purest. It has the brightest color and sweetest odor. It is the most transparent, because it has the thinnest base. It is tough and clear as crystal, and gives more sheets to the pound than any other make.

Working wax into Foundation for Cash a Specialty. Beeswax always wanted at highest price.

Catalog giving FULL LINE OF SUPPLIES with prices and samples, FREE on application. E. GRAINGER & Co., Toronto, Ont., Sole Agents for Canada. GUS. DITTMER, Augusta, Wis.

## Beedom Boiled Down

### Bee-Stealing at Denver.

In the past Denver bee-keepers have been occasionally annoyed by the theft of a hive of bees or its stores, but never before, to my knowledge, has any one undertaken to make an extensive start in bee-keeping by wholesale stealing of bees. Such, however, was the plan adopted by John S. Hayes and wife, a newly married couple living in Denver.

Suspicion was first aroused by the fact that his apiary, which consisted of one colony about March 1, increased at the rate of one colony every Sunday morning, until he had eight. All these were in bright red hives of his own manufacture. At this stage he purchased a few weak colonies and a lot of empty hives, which he placed in his yard to represent colonies, and lo, the red hives went for kindling. Then he began to increase much faster. He had a hive to set the stolen bees into. The stolen hives and frames that could be identified by their owner made an excellent fire.

On Saturday, June 6, I discovered five colonies missing at my out-apiary—the best in the lot. I immediately thought I knew where my bees had gone, and I resolved to use a little strategy to prove the truth of my suspicions and at the same time apprehend the thieves. I at once saw the bee-inspector of Denver county, arranged with him to inspect the suspected apiary early Monday morning. It was also arranged that after he got to work I would happen along on my wheel and drop in for a bee-chat, which I did, and the stratagem worked very nicely.

The woman had the audacity to ask me if I had had any bees stolen. I replied that I had seen mine the week before, and that they were all right at that time, which they were.

I could only identify one hive which stood on the stand. The inspector told them to look into the boxes and combs for foul brood, so we got to see that that were in sight. We had noticed a small room on the back of the lot, which was locked up.

The inspector asked, "What is in here?" "Oh, there isn't anything pertaining to bees in there."

"Well," the inspector said, "open it, I want to see." The man obeyed, and, behold, there were two of my hives, empty, along with a quantity of others. I made no claim to them, nor said anything in regard to what I had seen. I was just thinking how I could get a warrant before they got suspicious and burned up my evidence. I finally got a policeman to watch while we went for the warrant.

I had both man and wife arrested, and made them tell where the bees were that belonged in the two empty hives we found locked up. He had transferred them to his own hives, and he showed us which ones. The constable marked them as my property and let them set there, but nailed up the hive of bees that was standing outside, and took it and the empty hives right along to court with the prisoners.

While the policeman was watching them they thought something was going to happen. He took the ax and went to work with a will on hives and frames, and she carried the stuff in and fed the stove.

John Boucheneimer, also, had them both arrested the same afternoon for stealing two colonies from him. They both gave bonds that evening, and went to hang out hanging things in better shape for them. They moved five colonies away after dark, which were later located with a search warrant, and identified by a rancher who had only five colonies, and they were selfish enough to take them all. The ranchman finally got tired and dropped his suit. Others that lost one or two wouldn't prosecute, for they said the time they would lose would be worth more than the bees. The accused appeared the next morning for trial and asked for a continuance until Thursday morning to prepare their defense, which was granted. The case

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the bolsters are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO.

Chicago, Ill.

## The Fred W. Muth Co.,

Front and Walnut, CINCINNATI, OHIO.

was called Thursday morning and I put in my prosecuting evidence.

I took in a hive which was a duplicate of the stolen ones (a Root Colorado portico), and showed my markings. Under the band-hold was a number stenciled on which they had scraped and battered with a hammer, and then given a daub of paint and a new marking. But up under the top of the portico I had stenciled in inch letters F. H. H., which they evidently had not seen, for there it was and had been for many years. I also had the inspector for a witness, the constable as to the finding and where, the lady that lives on our ranch, where the bees were stolen from, showing that the prisoners were there looking the location over a few days before taking them, and some of the best bee-keepers we have as expert testimony as to the value of a picked number of colonies at that season.

They did not make any defense; did not go on the witness stand at all, but their attorney asked for a petit larceny charge. My attorneys asked to have them both bound over to the district court for grand larceny.

In my attorney's plea he said in part: "The fact that five colonies were stolen at the same time, although I could only identify three, showed without a doubt that they took five, and that it was unusual to find all the stolen property in a thief's possession when making a search." He said: "Look at them! They show plainly what they are. They won't work for a living like honest people, but steal they will. But stealing by their bent, why, O why, will they steal the busy bee?"

The justice took it under advisement for two days and then decided to discharge the wife and bind the husband over for grand larceny. The wife had an equity in some property where she lived, so she was accepted as bondsman for her husband's appearance. I then got back the three colonies that I had identified.

Aside from this, they were both under \$100 bonds on the Bouchenheimer charge. That case was called soon after, but they did not appear for trial, so the court declared the bond forfeited.

The district called my case for trial and they did not appear there, either, so that bond was declared forfeited, too.

As near as I can find out they did not have much reputation to lose, but what little they might have had is gone, the bees are gone, their equity in a home is gone, and they are fugitives from justice. Verily the way of the transgressor is hard.

Now, just a word as to organization, both local and national. It is pretty generally known that Colorado bee-keepers have a pretty strong State Association, and we also have the Denver Bee-keepers' Association, which is pretty strong, too. They stand together for the right and the protection of their interests. The encouragement it gives one to be backed by such a body of brother bee-keepers is worth many times the cost; besides, it was remarked a number of times that the effect of such a representation of interested bee-keepers certainly would have considerable influence with any judge. The court-room was packed every day with Denver bee-keepers, all interested and eager for justice to be meted out to very guilty persons. What can be accomplished locally by organization can more than be realized nationally.—F. H. HENT, in Rocky Mountain Bee Journal.

## FROM MANY FIELDS

### Best Season in 25 Years.

My bees are doing well this year. This is the best season we have had here in 25 years. I have 11 colonies, all strong and working finely. They are badly mixed, no full-bloods. I have not had one natural swarm this summer. I forced one, and that is all the increase I have had so far, and do not want any more swarming this year. J. L. BADER.  
Coffey Co., Kans., Aug. 18.

### Bad Weather for Honey.

The weather here has been so bad that our honey crop is a failure. The bees are getting some honey now from buckwheat, so we hope to get along without feeding very much sugar. J. I. CLARK.  
Addison Co., Vt., Aug. 24.

### A Good Record.

This has been the best season here for white honey for many years. I have taken from one to four supers of honey from all my colonies, and from one double swarm 183 pounds of comb honey. Bees are doing well at this date.

I think I have one experience that makes a new record.

On June 5, I received a 3-frame nucleus with queen. I put it in a 10-frame hive on old comb. On June 25, I found the hive filled. I gave them room by a super of 28 sections, and they went right to work in them. July 4 they cast a good swarm, which I hived on drawn comb. They have the hive well filled at this date. So I have no reason to complain of my red-clover queen. JOHN CLINE.  
LaFayette Co., Wis., Aug. 28.

### Plenty of Fall Flowers.

The bees are working nicely on the fall flow. I got about a ton of white honey. I have had less trouble this year than usual in loss of queens while mating. Bees are all in fine condition to gather nectar, if there will be a good flow. There are plenty of fall flowers, and I hope it will not get so hot as to dry them up. D. C. McLEOD.  
Kendall Co., Ill., Aug. 24.

### Cellar-Wintering of Bees.

My book shows that I stored 36 colonies of bees in the cellar Dec. 3, 1902, counting 6 three-frame nuclei as colonies. It is a large root-cellar built under the entrance or driveway into the barn. The temperature of cellar was 38 degrees, and the ground was covered with snow. I have the Langstroth-Simplicity hive, with loose bottoms. All hives are placed on rims 2 inches deep, with wire-screens so the bees were entirely confined all winter, running from 34 degrees to 38 degrees, but stood at 36 degrees the most of the time. The ventilation was a common stove-pipe running up through the roof, which was closed most of the time. The cellar was quite dry, and the bees real quiet up to March 19.

The same book shows that I put the bees out March 19, 20 and 22, 1903, all living, ex-

## Long Tongues Valuable South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

HUTTO, TEX., Nov. 19, 1902.  
J. P. MOORE.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-handed Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to roll, and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly,  
HENRY SCHMIDT.  
The above is pretty strong evidence that red clover is not the only plant which requires long-tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and return for samples and particulars free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

J. P. Moore, L. Box 1, Morgan, Ky.

## WE INVITE ALL readers of the AMERICAN BEE JOURNAL who seek a college for themselves or friends to investigate

### Mount Union College

Our motto in all departments is "Maximum efficiency at minimum cost."

Our scholastic training is equal to the best, our reputation first-class. All expenses for a year, aside from the clothing and traveling, less than \$200.00. Co-education, health conditions, moral and religious influence, superior.

Send for catalog.

MOUNT UNION COLLEGE,  
Alliance, Ohio.

cept two of the weakest nuclei were dead. The bees in a fair to poor condition, each colony having a very great percent of dead bees, due, I presume, to the low temperature in the cellar, causing a heavy consumption of honey, which, in turn, increased the death-rate.

I have increased to 64 colonies, with 3000 pounds of choice honey up to date, capped snow white, and good enough to take to the World's Fair.

I would just as soon think of farming 100 acres in small grain without a grain-binder as to attempt to manage 6 colonies of bees without reading an up-to-date bee-paper like the "old reliable" American Bee Journal. May it live long with a largely increased field of usefulness. J. W. JOHNSON.  
Stephenson Co., Ill., Aug. 17.

### A Good Report.

I had a good crop of honey this year, 60 gallons of extracted and 300 pounds of comb honey from 15 colonies, spring count, and increased to 43 colonies, with hives now full of honey, and good prospects for a fall crop. I have a good home market, and can sell it as fast as I take it from the hives.

D. E. ANDREWS.  
Monroe Co., Ind., Aug. 24.

### Shagbark Hickory Bark For Smoker-Fuel.

It may be worth while to inform your readers that the loose, dead bark of the shagbark hickory makes excellent smoker-fuel. I have used it the entire season, and find it more satisfactory than anything else I have ever tried. When well lighted it gives abundance of smoke, will not go out, is very lasting, and makes no sooty drip. R. L. TAYLOR.  
Lapeer Co., Mich.

### Honey-Flow Keeps Up.

The honey-flow keeps up, and we look for quite a fair yield of honey in spite of it being a backward season. Some of my colonies have filled 5 supers, but others have not done so well.

The price of honey started here at 10 cents to 12½ cents for comb, and 7 cents for extracted. W. J. MARTIN.  
Otero Co., Colo., Aug. 18.

### Results of the Season.

The bees have been doing very well in old Chautauqua County this season. I put 68 colonies into winter quarters, and came through the winter with 61 colonies good and strong. I winter them on summer stands. I will get about 50 pounds of nice, white comb honey per colony. EDWIN WARD.  
Chautauqua Co., N. Y., Aug. 18.

### Poorest Season in Years.

We have had the poorest season here that has been known for a good many years. It has been so very cold since early last spring that it has been impossible for the bees to fly much, only for a day or two at a time, except a part of June, and then it was so very dry, and the nights were so cold that the clover did not amount to much; and when basswood came on it was cold, bad weather again, so the bees stored but little from that

source. Since basswood stopped blooming there has been nothing, excepting the last few days some fall flowers, and the bees are slowly bringing in nectar. There are various fall flowers that grow in abundance in this locality, and unless we have a decided change very soon (and there is no prospect of it) we shall have to feed quite heavily to prepare them for the long winter that is before them.

We have an abundance of early spring pasture, so that all the feed they will require is what they consume during the winter, providing we can have good weather in the spring.

A. T. DOCKHAM.  
Todd Co., Minn., Aug. 27.

**A Good Honey Crop.**

The honey crop is good in this county. I wintered 20 colonies in the cellar, and did not lose one; they were all strong in the spring. I increased to 65, and have taken off 2000 pounds of clover and basswood honey.

FRED E. GRAHAM.

Wood Co., Wis., Aug. 24.

**First Year With Bees.**

This is my first year keeping bees. I bought 5 colonies and brought them to my place last spring; I now have 15 colonies, and they are doing well. One colony swarmed and filled a 12-frame brood-chamber, and I put on 18 sections, and will take them off filled on July 30. I think that is doing well for one colony. That same colony cut a place through an inch board to get into the hive, but we did not know but what there was plenty of room for them. As soon as I found they had cut the hole through I fixed them all right, but the place they cut is still there. That is the first I knew that bees were "wood-choppers." I like to work with my bees; they are Italians.

O. D. EDWARDS.  
Cooper Co., Mo., July 23.

Close Saturdays a 1 p.m.—Our customers and friends will kindly remember that beginning with July 1, for three months we will close our office and bee-supply store at 1 p.m. on Saturdays. This is our usual custom. Nearly all other firms here begin the Saturday afternoon closing with May 1st, but we keep open two months later on account of the local bee-keepers who find it more convenient to call Saturday afternoons for bee-supplies.

**SWEET CLOVER**

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with the order:

	5lb	10lb	25lb	50lb
Sweet Clover (white)....	\$.75	\$1.40	\$3.25	\$6.00
Sweet Clover (yellow)....	.90	1.70	4.00	7.50
Alfalfa Clover .....	1.00	1.80	4.25	8.00
White Clover .....	1.50	2.90	6.50	12.50
Alfalfa Clover .....	1.00	1.80	4.25	8.00

Prices subject to market changes.  
Single pound cents more than the 5-pound rate, and 10 cents extra for postage and sack.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

Please mention Bee Journal when writing advertisers.

**CONVENTION NOTICE.**

Ohio.—The first annual meeting of the Hamilton County (Ohio) Bee-Keepers' Association, will be held in room 1, Grand Hotel, Fourth St., Cincinnati, on Monday evening, Sept. 14, 1903, at 7:30 o'clock.

The annual election of officers for the ensuing year will take place, and the reports of the secretary and treasurer will be submitted. Interesting addresses will be given on organization and modern bee-keeping, by expert bee-keepers, and a discussion of subjects pertaining to the general welfare of the society.

Reports on the production of honey in various localities are expected to be furnished, and members are requested to bring specimens of comb and extracted honey for mutual exhibition at the meeting.

Several interesting specimens of foul brood will be shown, for the information of those present.

The executive committee would urge that it is the duty of bee-keepers, in this and adjoining counties, to become members of this Association, as it is only by means of a strong central organization that legislation in their interests and the further fostering of the industry can be accomplished, such as has lately been enacted in Illinois and many other States in the Union.

The annual dues are only 50 cents a year; each member is entitled to a copy of our new pamphlet, just published, entitled, "Instructions for the Successful Treatment of Foul Brood, as Adopted by This Society."

In the event of your inability to be present, you can have your name enrolled by sending your dues by mail to the Secretary, which will be duly acknowledged, and pamphlet forwarded.

The presence of ladies, either as members or as visitors, is respectfully solicited by the executive committee.

Silverton, Ohio. Wm. J. GILLILAND, Sec.

**HONEY AND BEESWAX**

MARKET QUOTATIONS

CHICAGO, Aug. 7.—Consignments of the new crop are coming. Consignation here that have not had honey for years past, and as there is not any consumptive demand they are finding difficulty in disposing of it. Under such conditions it is hardly possible to give accurate prices, as some merchants ask 10 cents for honey that others hold at 15 cents. The prices given in our last quotations are asked, but feeling is unsettled. Beeswax steady at 15.

R. A. BURNETT & Co.

KANSAS CITY, Aug. 25.—Receipts of comb honey more liberal; demand improving. We quote fancy white comb, 24 section case, \$3.25; No. 1, white amber comb, 24-section case, \$3.00; No. 2, white amber comb, 24-section case, \$2.75. Extracted, white, per lb., 6½¢; amber, 5½¢ @ 6¢. Beeswax, 25¢ @ 30¢. C. C. CLEMONS & Co.

ALBANY, N.Y., Sept. 4.—Demand for honey improving, at 150¢ @ 160¢ for fancy white comb; 145¢ @ 150¢ for No. 1; 130¢ @ 140¢ for No. 2. Production of honey in this vicinity is very light. This market will have to depend on other sections more this season than ever. Extracted honey, 70¢ @ 75¢ for white; 60¢ @ 65¢ for mixed and buckwheat. Beeswax, 28¢ @ 30¢. H. K. WRIGHT.

CINCINNATI, Aug. 6.—The supply about equals the demand for extracted honey. We are selling amber extracted in barrels from 5½¢ @ 6¢, according to quality. White clover, barrels and cans, 78¢ @ 80¢, respectively. Comb honey, fancy, in 40 lb shipping cases, at 20¢ @ 25¢ per lb. Beeswax, 30¢. THE FRED W. MUTH CO.

NEW YORK, July 8.—Some new crop comb honey now arriving from Florida and the South, and fancy stock is in fair demand at 14c per pound, and 120¢ @ 130¢ for No. 1, with no demand whatever for No. 2 grades.

The market on extracted honey is in a very unsettled condition, with prices ranging from 50¢ @ 55¢ for light amber, 55¢ @ 60¢ for white, and 40¢ @ 45¢ for moon Southern. At 20¢ @ 25¢ per gallon. Beeswax steady at 30¢ @ 31¢. HILDRETH & SEIGELKEN.

CINCINNATI, Aug. 8.—New honey is now offered very freely, particularly extracted. The demand for honey is about as usual at this time of the season. I made sales at the following figures: Amber, 50¢ @ 55¢; water-white alfa, 6½¢; fancy white clover honey, 70¢ @ 75¢. Comb honey, fancy white-amber, brings from 140¢ @ 150¢. Beeswax, 27¢ @ 30¢. H. W. WEBER.

SAN FRANCISCO, July 22.—White comb honey, 11½¢ @ 13¢; amber, 8¢ @ 9¢; extracted, white, 5½¢ @ 6¢; light amber, 4½¢ @ 5¢; 4½¢ @ 4½¢; dark, 3½¢ @ 4¢. Beeswax, good to choice, light, 2½¢ @ 2½¢; dark, 25¢ @ 26¢.

This season's crop is not only unusually late, but is proving much lighter than was generally expected. While the market is unfavorable to buyers, the demand at extreme current rates is not brisk and is mainly on local account.

**WANTED! FANCY COMB HONEY** in no-drip shipping-cases. Also Amber Extracted in barrels or cans. Quote your best price delivered Cincinnati. The Fred W. Muth Co. 324½ Front and Walnut, CINCINNATI, OHIO.

**WANTED—Comb Honey** in quantity lots. We are perhaps the only dealers in this article owning more stock at 150.00 per cwt. at one time. Please state quantity, quality and price asked for your offerings, Thos. C. Stanley & Son, 241½ MANZANOLA, COLO., OF FAIRFIELD, ILL.

**WANTED—Extracted Honey.** Mail sample and state lowest price delivered Cincinnati. Will buy FANCY WHITE COMB HONEY, any quantity, but must be put up in no-drip shipping-cases.

## Queen-Clipping Device Free!

The MONETTE Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings. It is used by many bee-keepers. Full printed directions sent with each one. We mail it for 25 cents; or send it FREE as a premium for sending us One New subscriber to the Bee Journal for a year at \$1.00; or for \$1.10 we will mail the Bee Journal one year and the Clipping Device. Address,

**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie St., - CHICAGO, ILL.

## INVESTMENTS —IN— SOUTHERN LANDS.

Such investments are not speculative. The South is not a new country. Market and shipping facilities are adequate and first-class. The climate is mild and favorable. Notwithstanding these and other advantages, Southern lands are selling for prices far below their real value, and at present prices net large returns on the investment. For a free set of circulars, Nos. 1 to 10, inclusive, concerning the possibilities of lands in Kentucky, West Tennessee, Mississippi and Louisiana, or and near the Illinois Central Railroad, for homeseekers and investors, address the undersigned,

**A. H. HANSON, G. P. A., Chicago.**  
26A12 Please mention the Bee Journal.

# TARISE

To say to the readers of the BEE JOURNAL that

## DOOLITTLE...

is now up with orders, so he can send Queens from his choice honey-gathering stock, by return mail, at the following prices:

- 1 Untested Queen ..... \$1.00
  - 3 Untested Queens ..... 2.25
  - 1 Tested Queen ..... 1.25
  - 3 Tested Queens ..... 3.00
  - 1 select tested queen 1.50
  - 3 " " Queens 4.00
- Extra selected breeding, the very best, \$5.00

Circular free, giving particulars regarding each class of Queens, conditions, etc. Address,

**G. M. DOOLITTLE,**

29D1f Borodino, Onondaga Co., N. Y.  
Please mention Bee Journal when writing

# 26th Year Dadant's Foundation 26th Year

**We guarantee Satisfaction.** What more can anybody do? BEAUTY, PURITY, FIRMNESS, NO SAGGING, NO LOSS. PATENT WEED-PROCESS SHEETING.

**Why does it sell so well?** Because it has always given better satisfaction than any other. Because in 25 years there have not been any complaints, but thousands of compliments.

Send name for our Catalog, Samples of Foundation and Veil Material. We sell the best Veils, cotton or silk.

## Bee-Keepers' Supplies OF ALL KINDS \*\*\*\*\*

Very fine pure-bred BARRED PLYMOUTH ROCK Chickens and Eggs for sale at very low prices.

**Langstroth on the Honey-Bee—Revised,**  
The classic in Bee-Culture—Price, \$1.20, by mail.

**BEEWAX WANTED** **DADANT & SON,**  
at all times. **Hamilton, Hancock Co., Ill**

## RED CLOVER HONEY-QUEENS.

SPRING BLUFF, WIS., July 18, 1903.  
THE A. I. ROOT CO., Medina, Ohio.  
Dear Sirs:—I thought I would write you a few lines in regard to the Red Clover Queens I got from you. They have a swarmed yet this summer, but I have taken 48 sections from them and there is 24 more all ready to come off. Just think, 72 nice sections of as nice honey as ever was made, and only July 18th. It seems as though they will surely fill 48 more.

I don't know whether their tongues are any longer than any of the others, or whether they gathered it from Red Clover, but surely such bees are worth money.

I use the 8-frame Jumbo frame.  
C. E. KELLOGG.

C. E. KELLOGG, Spring Bluff, Wis.  
Dear Sir—We have yours of July 15th and would be glad to have you advise us by return mail with reference to the capping of the honey. Some parties say the capping from these bees is not white, and we would be glad to have you advise us how your honey is in this respect, and oblige,  
Yours truly,  
THE A. I. ROOT CO.

SPRING BLUFF, WIS., July 31, 1903.  
THE A. I. ROOT CO., Medina, Ohio.  
Dear Sirs—You of July 24th at hand-to-day. In regard to your question in reference to the cappings of the honey from these bees I will say that it is simply perfect, beautiful snow-white and very box perfect. In one of the sections now, I am quite sure they will fill two more supers, which will bring the number up to 141. I would like very much to have you see a few of those sections, and I will be glad to send you a few.

Now, I haven't told you ALL their good qualities yet. I am sure they are by far the most gentle bees to handle I have. I could take off the sections without smoke or veil without getting stung. There are a few traits about them that they don't seem to want to swarm.

If you will write you again in a few weeks and let you know if they fill the 144 sections, which I am sure they will.  
Respectfully,  
C. E. KELLOGG.

## AGAIN READY FOR PROMPT DELIVERY.

We were snowed under with orders for a few weeks, but here we are again with good Queens and prompt service.

### Red Clover and Honey Queens.

Untested .....	Each.	50c.	Breeding .....	\$5.00
Tested .....	\$1.00	\$5.70	Select Breeding .....	7.50
Select Tested .....	3.00	17.10	Extra Select Breeding .....	10.00

With any of the last three we include one frame of bees and brood to insure safe arrival, for which we make no charge. These must be sent by express. Queen circular free.

**THE A. I. ROOT CO., Medina, Ohio.**

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to beekeepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

Something FOR OUR Bee-Keeping Sisters in the Winter Time.

We think all ladies will agree with us in saying that every man should at least understand some business, with which, in case of necessity, he could support himself and family. The wealthiest people frequently come to want, and wretched, indeed, is the man who cannot earn a living after his wealth is gone. He sometimes fills the grave of a suicide. And why, in this enlightened age of progression, should not woman, as well as man, be able to depend on her own resources? In case her husband dies in poverty, must she starve or depend on charity? In case her husband fails to provide and grossly mistreats the woman he has sworn to cherish, must she humbly submit? A THOUSAND TIMES, NO! Let every woman, before she marries, have some knowledge that can be used to make her a living. Every mother, rich or poor, should make her daughters, in a certain degree, independent, by giving them some kind of a trade, and teaching them to be self-reliant. Mothers should have their daughters learn to sew, and not neglect this important part of their domestic education. The

daughter so taught will not only make a better wife and mother, but will also be more likely to secure a better husband, and will always command his respect. He will not look upon her as a helpless "know-nothing," but will know that if he fails in his duties, she can live without him, and this can only strengthen the bond between them. A thorough knowledge of dress-making can always be turned into gold, and become the means of support for the mother and her little ones. She may never have to use this knowledge in this way, but she has a trade and can use it if necessary.

The outline cut shown herewith is a condensed copy of THE NEW LONDON LADIES' TAILOR SYSTEM for drafting and cutting ladies' and children's garments. For simplicity and accuracy it has no superior among the more expensive systems. Thousands of girls have learned more about drafting and cutting with this system than they knew about it after serving their apprenticeship in some of the dressmaking shops of the United States and Canada. Thousands of the best garment cutters have laid their complicated and expensive system aside, and are now using THE NEW LONDON TAILOR SYSTEM. Thousands have been sold at \$5.00 each, but we mail it free to a paid-in-advance subscriber to the American Bee Journal for sending us two new subscribers at \$1.00 each; or we will send it to any one with a year's subscription to the American Bee Journal, both for \$1.75; or, we will mail the Tailor System alone for \$1.00. Address all orders to

## Editorial Comments

**Marketing the Honey Crop** will be next in order. The tendency will be to rush it all off to the city. Don't do it. Do your best to sell nearer home.

Some bee-keepers seem to get scared if they have a thousand pounds or so of honey on hand. They think if they don't sell it within a month or two after taken off the hives they might have to carry it over winter, or perhaps be compelled to sit down and eat it all in their own family.

It is a great mistake to rush it off to the market, when, perhaps, a lot more have done the same way, and thus have shattered the prices.

In a wholesale way, the best comb honey should never sell for less than 15 cents a pound; and the best extracted should bring from 7 to 8 cents. Of course, in a season like the past, when there seems to have been a pretty fair crop, it may be necessary to shade prices a little. But don't do it unless you have a good reason for so doing.

**Queen-Cages Smashed in the Mails.**—We have had several instances where queens sent through the mails have been lost by reason of the cages becoming smashed. It seems in throwing the mail-sacks off the trains, books or other heavy articles come down on the cage edgewise, and of course it is crushed.

It seems to us the cages might be made a little stronger—left a little thicker by not boring out so much of the wood, which would leave a little stronger bottom to the cage, and thus prevent such easy crushing.

We suppose all queen-breeders have often been troubled in the same way. It certainly is very annoying, both to dealer and customer, to say nothing of the loss of the queens that have to be replaced.

**Formalin and Formaldehyde.**—The present possibility, if not probability, is that formalin, or formaldehyde, will be used to a considerable extent by bee-keepers. It certainly will if the claim is substantiated that thereby the combs of a foul-broody colony can be disinfected so as to kill both bacilli and spores, making it perfectly safe to use such combs in healthy colonies. It is, therefore, of some consequence that the readers of this journal be informed as to the best and most economical form in which to use the drug. So far, the advice given in these columns has been plainly in the direction of using formalin, that name being copyrighted and applied alone to the drug as prepared by a single firm. For some time it was difficult to get any information regarding the drug, and when such information was obtained through those who enjoy a monopoly of the term "formalin," it was placed in good faith before the readers of the American Bee Journal, notwithstanding the fact that it was a free advertisement.

There have been, however, intimations from more than one quarter that the information given in these columns was somewhat misleading, and now comes a letter from A. Richter, a pharmacist of New York State, who is also a bee-keeper, which is outspoken on the subject, and which bears evidence on its face that it comes from one who

knows what he is talking about. Mr. Richter is entitled to hearty thanks for his letter, which is as follows:

EDITOR AMERICAN BEE JOURNAL:—I should like to correct you on the article on Formalin. Formaldehyde can be purchased for 17 cents per pound. Formalin—a trade name—the product no better, but costs 45 cents a pound. Our business is full of these licensed ways of robbing, and I am sure it looks bad for a paper like yours to help along Shirling & Gatz, who know both to be the same—but charge more to pay for the advertising they must do. Pond's Extract and Witch Hazel, another example of this kind—antikamnia—costs \$1.00 per ounce, made up of acetated 17 cents a pound, bicarbonate of soda, 3 cents a pound.

I hope something will be done to keep the bee-men from any of these refined ways of cheating, for if some one does not step in they will be selling some secret food preparation to promote long-tongued or long-lived honey-bees at fabulous prices, and give the novice sugar-water colored up.

I have looked at the unselfishness of your paper and admired it, as I do the same quality in all the big bee-men, and I am quite sure you made the statement from want of knowledge, and not as a paid advertisement.

Truly yours,  
A. RICHTER.

In a nutshell, the situation is this: The American Bee Journal has been advising the use of a special preparation at a high price when something just as good can be had for less than half the money. The regret at having done this is only softened by the thought that it was done in good faith in the interests of bee-keepers, without any sort of pay, even by the use of space in the advertising columns.

## Association Notes

**AMENDMENTS TO THE NATIONAL CONSTITUTION.**—The following are the amendments as presented to the Los Angeles convention by the Committee on Amendments, and which will be sent to the membership of the National Bee-Keepers' Association in December, for their approval or disapproval:

### ARTICLE III.—MEMBERSHIP.

SEC. 1.—To be amended to read as follows:

SEC. 1.—Any person who is interested in bee-keeping, and in accord with the purpose and aim of this Association, may become a member by the payment of one dollar annually to the General Manager or Secretary; and said membership shall expire at the end of one year from the time of said payment, except as provided in Sec. 10 of Article V of this Constitution. Any person may become an Honorary Member by a two-thirds vote of all the members present at any annual meeting of this Association. No member who is in arrears for dues, as shown by the books of the General Manager, shall be eligible in any office in this Association; if such disqualification occur during the term of any officer, the office shall at once become vacant.

SEC. 2.—To be amended to read as follows:

SEC. 2.—Whenever a local bee-keepers' association shall decide to unite with this Association as a body, it will be received upon payment by the local secretary of fifty cents per member per annum to the General Manager.

### ARTICLE IV.—OFFICERS.

SEC. 1.—To be amended to read as follows:

SEC. 1.—The officers of this Association shall be a General Manager, a President, a Vice-President, and a Secretary, whose term of office shall be for one year; and a Board of twelve Directors, whose term of office shall be four years, or until their successors shall be elected.

SEC. 3.—To be amended to read as follows:

SEC. 3.—The President, Vice-President, Secretary, and General

Manager shall be elected by ballot during the month of November of each year, by a plurality vote of the members, and assume the duties of their respective offices on the first of January succeeding their election.

SEC. 4.—To be amended to read as follows:

SEC. 4.—The President, Vice-President, Secretary, and General Manager shall constitute the Executive Committee.

SEC. 5.—To be amended to read as follows:

\* SEC. 5.—The Directors to succeed the three whose term of office expire each year shall be elected by ballot during the month of November of each year, by a plurality vote of the members. The three candidates receiving the greatest number of votes shall be elected, and assume the duties of their office on the first of January succeeding their election. The Board of Directors shall prescribe how all votes of the members shall be taken, and said Board may also prescribe equitable rules and regulations governing nominations for the several offices.

#### ARTICLE V.—DUTIES OF SECRETARY.

SEC. 3.—To be amended to read as follows:

SEC. 3.—It shall be the duty of the Secretary to keep a record of the proceedings of the annual meetings; to receive membership fees; give a receipt for the same, and turn all moneys received over to the Treasurer of the Association with names and post-office addresses of those who become members; to make an annual report of all moneys received and paid over by him, which report shall be published with the annual report of the General Manager; and to perform such other duties as may be required of him by the Association; and he shall receive such sums for his services as may be granted by the Board of Directors.

#### ARTICLE VII.—VACANCIES.

Amended by adding the following clause to the end thereof:

Any resignation of a member of the Board of Directors shall be tendered to the Executive Committee. Any resignation of a member of the Executive Committee shall be tendered to the Board of Directors.

#### ARTICLE IX.—AMENDMENTS.

To be amended to read as follows:

This Constitution may be amended by a majority vote of all the members voting, providing such proposed amendments have been approved by a majority vote of the members present at the last annual meeting of the Association, and copies of the proposed amendment printed or written shall have been mailed to each member by the General Manager at least 45 days before the annual election.

JAMES U. HARRIS, W. F. MARKS,  
GEO. W. BRODBECK, UDO TOEPFERWEIN,  
C. P. DADANT, Committee.

J. F. MCINTYRE SMILES—so says the Ventura (Calif.) Free Press in its issue of Aug. 14. Here is the paragraph:

"A son and heir was born to the house of McIntyre, Thursday, and there is exceeding joy in the family. Five girls have come at previous times to bless the McIntyre home, and now as the sixth is a boy it is no wonder that Mr. McIntyre wears a beaming countenance."

Congratulations to that no longer boyless home.

OFF FOR THE LOS ANGELES CONVENTION!—Getting ready to attend the National convention in Los Angeles began in this office quite a while before the starting time arrived.

After it was decided just where the meeting was to be held, some thought that it would be a great thing to get up a car-load of beekeepers to meet in Chicago, and go the rest of the way together. The idea seemed to be a popular one. Soon applications began to come in for sleeping reservations in the tourist car that was to carry those who should finally be so fortunate as to be the favored party. They came from Michigan, Wisconsin, Ohio, and Illinois. Even a "youngster" down in Texas telegraphed us, desiring to know just when the beekeepers' car would arrive at Albuquerque, New Mexico, as he desired to join the party there. (That telegram was delivered at our home after we had retired for the night. Until it was opened and read we wondered who had died, or what other terrible calamity had befallen some one. Then to see that it was just a Lone Star chap that was crazy to go to a bee-meeting—well, it was rather trying to a recent wanderer in dreamland.)

But, Wednesday evening, Aug. 12, finally came—the night we were to start on the long journey—nearly 2500 miles. It was arranged to spend the following Sunday at the Grand Canyon, in Arizona—65 miles north of Williams, on the Santa Fe railroad.

Our train left Chicago at 10:30—a little late in starting. All went to rest just as soon as the ebony porter could make up the berths.

Those who started out from Chicago were these:

Dr. C. C. Miller,	A. I. Root,
W. Z. Hutchinson,	W. C. France,
Mrs. and George W. York,	H. H. Moe,
Mrs. and H. D. Tallady,	Chas. Schneider,
A. F. Morley,	J. J. Shearer,
M. Beet,	N. Brooks,

There were also two young men who we learned afterward were barbers. They were made good use of, as will be seen later on.

During the night there was an increase in the occupants of the car, for Messrs. E. D. Woods and D. J. Price, both of Illinois, got aboard the train. They were discovered the next morning, but no one tried to drive them out of the "hive." They were welcomed, and, like everybody else, helped to make the trip enjoyable all the way along.

The first morning found us in Kansas City, Mo., where Mr. and Mrs. Leo F. Ilanegan, with Miss Baby Hanegan, of Wisconsin, joined us. Also Mr. and Mrs. E. C. Wheeler, G. H. Van Slyke, and W. M. Pierson, all of Iowa.

At La Junta, Colo., Mr. and Mrs. N. A. Kluck, of Illinois, joined the company. And at Trinidad, Colo., that telegraphic Texan—H. H. Hyde—got aboard. He was the last bee-keeper to come into the company, and he seemed glad enough to find himself among friends, even if all of them were entire strangers, excepting as he had read of some of them in the bee-papers.

Dr. Miller and A. I. Root were the "boys" of the crowd! And didn't they just enjoy that long ride together! It gave them such an unlimited amount of time to swap bee-stories and reminiscences of the days when they first met and became interested in bees, as well as in each other.

We were agreeably surprised at the appearance of things in Kansas, as seen from the car window. It was our first trip into that State. We were delighted. Everything looked prosperous. And, then, to know there was not a legalized body and soul destroyer—saloon—in all the State! That was enough to rejoice over, had there been nothing else. We felt like hurrahing for Kansas. It is a great State in so many ways.

At Hutchinson, Kan., there was some talk of leaving Pres. W. Z. Hutchinson, when he got off to get something to eat in "his own town." By the way, there was a little joke on "W. Z." at that place. He went into the dining-room with a number of other people, including a young lady from one of the other cars of the train. As they were all stepping up to the table, the young lady drew a chair back, intending to seat herself thereon. But imagine what her surprise must have been, when "W. Z." sat his long self down upon that chair as deliberately and contentedly as is his usual manner! He absently thought she was simply a courteous waitress who was paid for doing just such little things among her other dining-room duties. He didn't realize what he had done until it was too late to offer an apology to the young lady. Let us hope they may both meet again some time in Hutchinson, Kan., and that "W. Z." can have the opportunity to do the same kindly, though unintentional, act for her.

That ride of a car-load of bee-keepers will live a long time in the memory of all who participated. What a splendid chance to visit! When one got tired talking with another, he could get up and walk to some other seat and tire out some one else. And so it went, day after day.

We will suppose now that it is Saturday, about 2 p.m., and we have all arrived at Williams, Ariz., and are ready to take the side-trip to the Grand Canyon to spend Sunday. Next week we will tell about it.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

**Why Not Help a Little**—both your neighbor beekeepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

## Convention Proceedings

### The Los Angeles Convention.

#### Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

The 34th annual convention of the National Bee-Keepers' Association met in Blanchard's Music Hall, Los Angeles, Calif., Aug. 18, 19 and 20, 1903, according to previous arrangement and announcement of the Executive Committee.

The first session was held Tuesday evening, Aug. 18, and consisted of a royal welcome extended on the part of the California State Bee-Keepers' Association. Pres. T. O. Andrews presided, and an elaborate program had been prepared for the occasion. The music was furnished by the excellent orchestra of the First Methodist Sunday-school of Los Angeles, under the direction of Prof. Valentine.

In the absence of the city's mayor, Hon. M. P. Snyder, Prof. A. J. Cook, of Pomona College, was called on to deliver an address of welcome, which he did in his usual happy way. Dr. D. W. Edwards, of the city, also helped to extend greetings to the convention.

The responses were given by President Hutchinson, Secretary York, A. I. Root, Frank Benton, and others.

It was an auspicious opening to the sessions of the convention which were to follow.

#### WEDNESDAY MORNING, AUG. 19.

The first business session was called to order at 10 a. m., with Pres. Hutchinson in the chair.

Prayer was offered by Prof. Cook.

It was moved and carried that the following committees be appointed by the chairman later, to report during the meetings: On Amendments, Memorials, Publicity, Resolutions.

Pres. Hutchinson—I have no address, for there was such an urgent call to go out among the bees and get rid of foul brood over in Michigan that there was no time and no place to write an address. There is plenty of other work of more importance, and we may as well commence with business and let the president's address go. The first thing on the program is an address by Prof. A. J. Cook, who will now speak on

#### HONEY EXCHANGES AND CO-OPERATION AMONG BEE-KEEPERS.

You may know the old story of the lord and the Irishman coming down the street, passing by the penitentiary, when the lord said, "Pat, if everybody was in that penitentiary that ought to be, where would you be?"

"Walking alone, your honor," answered Pat.

I am walking too much alone in this matter of co-operation, and I tell you I believe heartily in it, and I wish this morning that I could so enthrone you that you would go home and stir up the people so that it would be felt from Maine to Texas, and from Colorado to Washington. It seems to me there is nothing more important than this matter of co-operation—working together. I believe in it so much that three of us at our place own a cow together—four of us, I should say. I didn't get it big enough. My three nearest neighbors and myself own a cow together. Is that union? Why, if that cow gets out there is no fault-finding in that neighborhood. And I tell you, it would be a good thing if you owned chickens all together—a blessed good thing.

Again, it costs \$9.00 a year to take a daily paper. I could hardly afford that. If I were editor of a bee-journal I might, but, being a poor professor, my pocket-book is as flat as a cock-roach!

Now, three of us take a daily paper together, and we get along just as well. Don't you know it is a god thing—co-operation? We are working together. When I read my paper I know my neighbor has read the same thing. Perhaps when I meet him I will say to him, "What do you

think of the news in that paper to-day?" And he will say, "Why, I just thought of you when I read that." And if there happens to be a lady living alongside of you, you see this might become very pleasant.

I don't stop there. I can not afford to take eight or ten magazines. My wife and daughter like to have them; I am too busy to read all of them. So twelve of us take the magazines together. My friends, that is practical co-operation, and it works well. I would like you to consider something of that kind. It pays. Co-operation is in the air, and we want a great deal more of it than we have. It is strange how slow we are in this matter. If I were not so big a fool myself I would say the whole community are fools. But it is strange that you people are not more wide-awake in this matter of co-operation—getting together.

I have a friend, an old student of mine that I think a great deal of, and I am going to introduce him to you here. He says it is impossible to get the people to co-operate fully on the Citrus Fruit Exchange. Although nearly all believe it has saved the fruit industry in this section, yet about 40

Prof. A. J. Cook.

percent are all we can get into it—to the shame of our citrus fruit-growers be it said. It is strange that the people do not wake up to the importance of this great question. What is the great Standard Oil business? I tell you, they co-operate, and they get along, and that part of it is all right, and if they only got along by good and righteous methods, then we would all throw up our hats and say, "Go ahead!" And it is only because they are unrighteous in the way they do things that anybody complains.

Even livery stables co-operate. I went down to San Diego the other day, and it was too far for my wheel, and the rail cars had gone. Of course, I had to go to a livery. Well, I went to a livery stable, and they wanted \$6.00 to take me over. I said, "That is too much; and, besides, I am going for the State, and the State is poor, and of course I can't afford to pay that."

They said, "You have got to; you can not go with one horse, you have to have two horses, and that is what you will have to pay."

I said, "Is there another livery stable here?"

They said, "Oh, yes, there is one over there, and another one here, but it won't do any good—they will charge you just the same."

That is all right—they are all working together. Co-operation is in the air. I know the railroads are working together, and so do you. All these great business interests are working together, and we have got to work together. We want to go home and all begin to talk this.

Here in California we have this great Citrus Fruit Exchange, and it is a great success. There is no other co-operation of the kind which has ever had anything like the

success of our Citrus Fruit Growers' Exchange. You have read what I have to say about that in the American Bee Journal. So I have asked Mr. Reed if he would not come in here and tell us about it. He is right in touch with this Citrus Fruit Exchange; he knows what it has done, what it has accomplished, and why it has failed to do what he and others have hoped for it to do. Because the methods that will be used there, will be the methods the honey-men will want to use, I want Mr. Reed to come up here and talk to us on this subject, and afterwards answer such questions as may be asked. And before Mr. Reed comes, I want to say something Mr. Reed would not say.

This is a tremendous undertaking, because in Southern California (and what I said last night was not for nothing), I may be mistaken, but I do believe from the bottom of my heart that there is not so intelligent a population in the rural districts in the world as we have here in Southern California. I believe it. I do not say that carelessly. I have traveled pretty largely in the northern part of our country, and in the south and east, and I have never seen the equal for intelligence of the farming classes to Southern California. We have a club at Claremont, and of that club eight are college graduates—two from Harvard, one from Yale, three Cornell, and so on. So we have men who have had their college training. We used to laugh at "book-farmers." We don't laugh at them any more. We see these book-farmers going to the top, and we go to them and ask questions. You think about it.

So I say, here in Southern California we have the cream of the country so far as culture is concerned in these pursuits. If that is the case, what would be true in this section would be more difficult in others. In California, work as hard as they may, they have only about 40 percent of the citrus fruit-growers in this organization. Yet I have not seen a man who did not say it was the salvation of the citrus fruit industry. Yet only about 40 percent of them have joined. Haven't you got a load, then? Why, you have a backlog that your forefathers would hardly have carried, and you have got to carry it.

Sometimes I get like my friends Dr. Miller and Mr. Root—almost pessimistic. Sometimes I feel discouraged, and then see there was no need of discouragement. I am going to live a good many years yet, but I am a little afraid I won't live to see this general co-operation along all our industrial pursuits. I am afraid I won't live to see it, but we have got to have it. Why have we got to have it? We should not compete against each other. We should not compete. We should determine what is a reasonable profit, and then everybody should have it. That would never mean a good white sage extracted honey at 4 cents a pound. It would mean never less than 6 cents a pound. When we have this co-operation, when we get to that stage where we do not have this disastrous competition, we will get 6 cents for our honey.

We ought to be done with this matter of competition—this excessive competition which takes from us the profits—so that when the season is over our pocket-books look like cock-roaches.

Another thing that we find here very much to our detriment is the matter of railroad charges. You all know how exorbitant they are. It costs us \$1.20 to send a box of fruit to Boston. That is a great deal too much. I have not a doubt but it is twice too much, and that is why they can water their stock over and over again. We would do the same thing if we got the matter in our own hands. Most of us would charge just what we could get, just as the railroads do. I don't know that Dr. Miller would, but most of us would. How are we going to prevent it? Take California, Do you know, we could afford out of what we lose in three years' time to build, own, and equip a railroad from here to Boston, and have it all ourselves? It is computed that what we lose above a reasonable profit would do that in three years' time. Now, if that is the case, would not co-operation be worth something? We could do that if we were working together. "Ever the right gives promise, and ever is justice done."

I am just as sure we will have this co-operation as that we will get up to-morrow morning. Whether we get it soon or late will depend upon the energy we put into it. Another thing, our legislation is not right. If we were all together, working together, we could get almost all we wanted in the way of legislation. We have a little touch of that here in California. We have 40 or 50 farmers' clubs. The people are really getting interested. It took a long time to wake them up. Mr. Hambaugh, here, could tell you a great many things about that. He went right after them "with blood in his eye," and did not recognize any such word as "fail." He

said, "It is the right thing, and we will have it." And we all said, "Certainly, we will have it." And the first bill that got through the legislature was our foul brood law. We had these farmers' clubs, and they held a big meeting before the legislature met, and Mr. Hambaugh came down there, and he told us with reference to this foul brood law and inspectors (while he looked us right in the eye), "We want so and so"—and we all believed it. He said to these farmers' clubs, "Gentlemen, we want this; we need it, and we must have it." And they all said, "Amen," and they were all just Methodist enough to say right down inside, "Amen." And Mr. Hambaugh had the resolution passed, and we wanted that law, and that was the first law that was passed in the legislature without a single dissent. We didn't need any \$300, because we had the farmers back of us.

We want the bee-keepers organized so that when they go to the legislature and say what they want they will get it. So we want this matter of co-operation in the way of legislation.

Let me tell you one thing more: For a year we had men like Mr. Hambaugh studying these things that we wanted here in California. We had tried for 12 or 15 years to get certain bills through, but we failed because the moneyed interests were against us. Was it not queer that these men said, "No, sir; you don't get that." I was too well brought up to doubt a man's motive, but I wondered a good deal when these men came in and battled so hard for what was just and right. We would not impugn their motives. We devoted a whole year to studying this matter with three of our strongest men at work. One was Frank L. Palmer—a great, big, noble man. They spent a year studying, and they corresponded with people East. West Virginia is way up to the top, and we profited by their experience.

When we got that bill just as we wanted it, we went before the legislature, and we said, "That is the law we want without any amendments," and we had a strong committee up there, and we didn't have to pay them anything; they wanted to go up there anyway, and they said: "My friends, you must not touch these bills; they are just what we want, and we know a big sight more about these things than you can possibly know, and don't you amend them." And there was not a single bit of amending done on these bills.

Now, we have a good Governor. He is a good man. I wish I could say that of all our previous governors, but we have not always had that kind. The Governor wrote to me and said in regard to that fertilizer law: "I wish you could see the pile of letters and telegrams I have in regard to that." If anybody would read that law, they would see there was nothing in it but honest, fair dealing. Now, here was co-operation. We were working together, and I tell you when I get to talking about these things that so nearly concern our vital interests, I wish I were eloquent, that I might make you feel that we must have co-operation—that we must work together for what is right.

Now, Mr. Reed is here, and, by the way, you are to have a good-looking man talk to you. I am free to say that, for he is one of our "old boys." He will talk to us about the Citrus Fruit Exchange, what it has done, what it ought to have done, and what he hopes it will do in the future.

## Proceedings of the Texas Bee-Keepers' Convention Held at the A. & M. College, at College Station, July 8 to 10, 1903.

BY LOUIS H. SCHOLL, SEC.

(Continued from page 581.)

### BRUSHED SWARMS FOR SECTION-COMB HONEY.

It does not come within the scope of this paper to describe the many different plans and ways of making brushed or forced swarms, nor to trace out their origin, suffice it to say that my first knowledge of the method was derived from reading Mr. Stachelhausen's articles in *Gleanings*, some five years ago, though I had known, prior to that time, of its use in Germany. I will only try to explain in detail the two plans I most commonly use; nor do I always adhere rigidly to either of these plans in minor points, using altogether the shallow hive. Its ready adaptability to varied manipulations often tempt me to modify the process.

But I always try to keep in mind the three prime objects sought to be accomplished by brushing or shaking a colony of bees. Specifically stated they are, first, to secure a very

powerful field-force just in the nick of time. Second, so to contract and specialize their work that practically all of the honey will be forced into the sections. Third, to prevent swarming surely and effectually during the honey-flow.

In my practice it is not profitable nor practical to try to run a whole apiary for comb honey, but rather to select those colonies that have reached a stage of development where danger of swarming might be apprehended, using the weaker colonies for extracted honey, and to care for the combs and remaining brood. After the second brushing or shaking, experience having taught me not to hold these hatching bees until the close of the flow, in order to unite them with the colony from which they came, but rather to utilize them as quickly as possible. But when it is desirable to strengthen the comb-honey colonies after the sections are taken off, I do so by drawing combs of brood from these same extracting colonies.

Spring finds my colonies all in two, three, and four story hives. But the weakest are furnished room as fast as it is needed. The first of May my honey-flow begins, and lasts 24 or 25 days. Hives, sections, and all are gotten ready. Half sheets of foundation are used, except in the two outside frames, which are drawn combs, and full sheets in the sections. When all is ready I move the hives a little to one side and back from the old stands, having first filled them with smoke, and loosely closed the entrance with grass. I then take the cover off, and knock the bees in front of the new hive, which an assistant has placed on the old stand, as I moved the old hive. I then take up the combs by pairs, and with a quick upward and sudden downward movement, dislodge most of the bees, and immediately replace the combs in exactly the same order as they were before the operation. Going through the several bodies as rapidly as possible, on an average it takes five minutes for the two-story hives; seven for the three story, and ten for the four-story ones. When all the frames are in order I close up the hive, contract the entrance, and go on to another which the assistant has smoked, moved, and fixed exactly as the first one was prepared. This gives the bees ample time to load up and get in that stupid semi-torpid condition so necessary to successful and easy handling. In seven or eight days afterward, shake as many bees as are needed to reinforce the swarm, and then tier them up on the weaker extracting hives spoken of at the beginning of this paper.

The other way of making brushed swarms that I mentioned was this: Put all the colonies in pairs, and if they are arranged some five or six feet between pairs, it will cause less confusion and mixing of bees while under the excitement consequent on the change and loss of the old home and brood. Ten days before the main honey-flow begins put a super of sections on the strongest one in each pair, and put two or three partly-filled sections in the center of the super. At the same time put a shallow body on the other colony by its side. This should contain full sheets of foundation, except the two center ones, which should be drawn combs. Now, when the honey-flow begins in earnest, fill the two old hives with smoke and set them back a little. Take the body containing the partly-drawn sheets of foundation from the hive it is on, and put it on the half-way ground where the old hives formerly were. Put the partly-drawn case of sections on this new hive, shake all the bees from the combs of the strongest of the two colonies, and put the combs of brood on top of the one not shaken. Turn the entrance in an opposite direction, and leave it where it is for eight days. On the eighth day, in the morning, move it away to a new stand. All of the bees that have ever flown will return to where it was, and finally go into the swarm hive, that being the nearest one to their own former location.

These hives containing such powerful swarms should be propped up at the corners, leaving entrance-room all around. Also another super of sections should be given at this time. Great care has to be taken, and judgment exercised, as to whether or not it is best to try to get the combs and sections built out before the main flow or not, on account of its difficult features. I would not recommend it to any but the most expert and painstaking, though I regard it as a good one, and results have justified me in that belief.

Last year was only an average year for honey, but I took 2500 pounds of section honey from 35 colonies treated after these plans, and the same colonies were built up and gave a further yield of 35 pounds of extracted honey in the fall, or a total yield of 3725 pounds, 70 pounds of which was section honey to the colony.

Now, as to whether or not it is best to use full sheets of

foundation in the brood-chamber, my conclusions are, after numerous trials, that it is not best if the greatest amount of honey is the main desideratum; but if good combs are more or equally important, then it is perhaps best to use the full sheets, though I have known of flows where full sheets were of little value, for the bees simply would not waste the time necessary to draw them out, but merely added wax and built onto the foundation, not drawing it in the least. And if any man is so crazy as to think I don't know of what I am saying, I can show numbers of these combs yet.

Neither will full sheets secure all-worker combs with me, regardless as to who may say the contrary. In July last I prepared a number of colonies to brush as soon as the sumac flow started, which is usually about the 27th in this locality. From the best of these I secured 64 pounds in 14 days, and every one weighed an even pound, as they came off the hives. To those who have ever used the 4x5x1 $\frac{3}{4}$  section comment is unnecessary.

Now, I think this about illustrates the possibilities of the brushed or "shook" swarm method with me, the only trouble that I have ever found with it being that I could not command the honey-flow. J. E. CHAMBERS.

#### THE TEXAS BEE-KEEPERS' ASSOCIATION.

Along in September, 1895, if I mistake not, the Central Texas Bee-Keepers' Association was organized, and held semi-annual meetings until the summer of 1898, when it was decided to hold annual meetings. The Association met at different places until the last meeting it held, which was at Hutto, Tex. At that meeting it was decided to accept the offer of the Texas Farmers' Congress, to meet in 1901 at College Station, Tex. Accordingly, in July, 1901, all three of the bee-associations of Texas met in connection with the Central Texas Association. Officers elected were, J. B. Salyer, president; H. H. Hyde, vice-president; Louis H. Scholl, secretary.

Before the program was taken up I, myself, made known to the members a plan of organization which was adopted, and a committee on program appointed, of which I was a member. The committee reported that we disband the Central Texas Association and call ourselves the Texas Bee-Keepers' Association; and that we affiliate, as far as possible, with the Farmers' Congress of Texas. The Association was organized with the officers as previously elected. A resolution was offered and adopted, asking the State of Texas for an appropriation for an experimental apiary, and a legislative committee was appointed.

The special session of the Legislature made an appropriation for the establishment of an apiary, through the influence of the Association and Prof. Mally, of the A. & M. College.

At the meeting of the Association in July, 1902, a legislative committee was again, fortunately, appointed. During the summer several cases of foul brood developed in the State, thus making it necessary that we have a foul brood law. Accordingly, the Association and the A. & M. College went to work and secured a foul brood law for Texas. This law is now in force, but practically inoperative, from the fact that from some oversight no appropriation was made to get the law started. However, where the bee-men will get together and agree to foot the expense, their own and any other apiaries may be inspected and treated by the State entomologist or his assistants.

By an arrangement with the publishers, the members of the Texas Bee-Keepers' Association get reduced rates on all journals, and by paying one dollar they are members of both the Texas and the National Associations.

Such, in brief, is the record of the Texas Bee-Keepers' Association, and, in my opinion, it is a very worthy one, and one to be proud of. Every bee-keeper in Texas ought to be a member of the Association, and help fight the battles that it is fighting for the bee-keepers. One and all must admit that it has done a great work, and any bee-keeper ought to feel ashamed of himself to stay out, in view of the battles that have been fought and won with so few members.

I think the future is bright for the Association, and we have only to press on in the future as we have in the past, victoriously attacking any new problem that presents itself. We have an Association that we may well be proud of, and one that is doing a great work. Let us, one and all, rally around it.

I shall not attempt to forecast the future of the Association, as that would be impossible; however, I am sure it will be a bright future. HOMER H. HYDE.

### Carbolic Acid for Getting Swarms Down from Trees.

BY A. C. F. BARTZ.

THE instructions given in the item on page 510, are very good, as far as they go, but after having read the whole it makes me feel kind of sorry for those people who are too old to climb, and especially the bee-keeping sisters, for it is out of the question for a lady to strap on a pair of climbers, pruning shears, bucksaw, claw-hammer, or perhaps a whole carpenter shop, climb up a tree and saw off a limb, tie it to a rope, get tangled up in the rope herself, slip, and probably be fastened to the tree, and may be make it necessary for some one else to take down bee-keeper, swarm, and cabinet shop. And for these reasons I gave my experience of recent date to the bee-keeping world, and I am sure many of the readers, after trying it, will be satisfied, and never make an attempt to get a swarm out of a tree too tall to be conveniently reached from the ground by climbing it.

Then, too, how many swarms do not alight on a limb that can be cut off and carried down, but will string out on the trunk of a tree five or six feet or more? And it was one of those troublesome, hard-to-live ones which caused my noodle to get down to hard thinking.

It was a tremendously large swarm which plastered itself to a tall tree, about 20 feet above ground, and, I tell you, I dreaded to climb the tree, and even if I did I did not know how to get the swarm off unless I took the smoker and smoked them off, as I have done many times. But, then, I would have to climb the tree. When all at once the thought struck me, "Bees are afraid of carbolic acid." No sooner had I thought of it when I sent my ten-year-old boy to get a 2-ounce bottle of carbolic acid, while I got two poles, one 10 feet and the other 16 feet long, and nailed the two together, which made a pole about 24 feet long; but a fish-pole, or any other light pole, will do better.

I took a piece of cloth about 4 feet square, folded it up 4 times, so that it made a piece of cloth folded about a foot square. I tacked it on the pole in two places, top and bottom, as it might be in the center of the cloth, thus leaving the two sides of the cloth hanging loose, something like a stiff cloth hanging over a pole.

Then I poured the two ounces of carbolic acid on the cloth, raised the pole up and brought the now carbolized cloth over the swarm on the tree at its highest point, and gently passed it down the tree as the bees fled from the cloth, when, in less than 5 minutes, I had the swarm almost in a solid bunch.

But I was not satisfied. I proceeded to follow them up with the cloth, being careful not to kill any. But, my! how they got out of that tree. It made me laugh when they came down and lit on another tree, so I could easily have them standing on the ground.

Now, some one might object to this procedure for fear of losing the swarm by its going to the woods. But judging from the many swarms I have smoked out of trees, and never having lost one in this way, I feel safe to say that a swarm does not leave if disturbed shortly after alighting, but sticks to the first place it first settled on, or very near to it. And, furthermore, I do not handle swarms of this kind very gently, that is, swarms coming out of the regular order of management with virgin queens, which I should think would have a tendency to make them leave if that was their nature, on being driven off from the first place they settled on.

The next time I try the acid I shall use a large sponge instead of the cloth, but shall never climb another tree to take a swarm down.

I made another experiment with the acid on a swarm, out from which I wanted to take the virgin queens. I put the swarm into an empty hive with a queen-excluder above and below, and tried to smoke the bees out of the hive in order to find the queen; but the bees refused to leave the hive on being smoked, but would, if smoked from the top, go down to the bottom, and if smoked from the bottom would go to the top. Some of them of course flew, but enough of

them of course stuck to the hive to make the procedure a long, tiresome job, if not a total failure. Then I thought I would play a little trick on them, and took the acid cloth from the pole above mentioned, raised up the hive, zinc and all, and pushed the cloth spread out under the hive and let it down on it, when at once the bees started to the top away from the acid. But there I was with the smoker, and gave them no chance to cluster, but they left the hive as though a panic struck them, excepting the droues and queens, which could not escape.

The bees went to the hive from which they swarmed—just what I wanted—as I did not see them issue, and I intended to put them back again; and anyway it will be seen in this last procedure I "killed two birds with one stone"—I got the bees back to their home, and I had the queens and all the drones in the swarm also caged.

I now covered up the hive with the drones and queens in it, thinking that I would dispose of them at dusk, but had forgotten about it, and in the morning, when I found the hive still covered up in the yard, I opened it at once, and found everything dead in it. This, of course, was more than I expected or intended to do. I think that the fumes of the acid killed them very slowly, although it frightens them terribly. I would not advise the use of the drug for the purpose of killing drones, unless we learn from some of our professors that that drug makes short work of destroying bee-life.

Chippewa Co., Wis., Aug. 11.

### Getting Both Increase and Honey—Other Matters.

BY J. E. JOHNSON.

WHITE clover bloom was fine, and yielded well. Basswood was a failure, but we did not need it. There is a little white clover yet. Simpson honey-plant grows wild here, but it is not very valuable; also motherwort, but it does not attract bees as does catnip. My bees are still storing honey in shallow extracting-combs, but are not doing much in supers where they have to build comb; this is mostly from catnip and sweet clover, and smartweed just beginning to bloom.

Now, I see that the question is often asked of Dr. Miller. How can I increase my bees rapidly and still get lots of honey? As I started last spring with 12 colonies, and wanted both honey and increase, I formed a plan how to get both, which worked well. This is how I did it:

I found in early spring that my bees were nearly starving. I then fed them with candy, as per Abbott's plan, until it was warm enough to feed syrup. The most of the colonies were weak in bees, with little or no honey. I fed them every evening only about a half pint of syrup, some less than that. White clover promised to be abundant. By the time fruit-blossoms came out I had nearly all colonies ready for supers. I then put on one super with shallow extracting-frames containing for starters two-inch strips of foundation with quilt above to keep warm. During a cold spell in fruit-bloom I fed again every evening for nearly a week, increasing the feed as the bees became stronger, always above the brood-nest, and always just at dusk of evening. I also kept entrances contracted during cool weather. White clover and raspberry came in bloom about the same time, white clover being two weeks earlier than usual, and May 15 found me with a good honey-flow on, from both white clover and raspberry, and bees enough to fill two supers in nearly all 12 colonies.

I then soon began to slip an empty super under the top one. By June 1, the brood-chamber of the 8-frame Langstroth dovetailed hive was nearly filled with brood, and from one-half to three-fourths of the super of shallow frames. I then gave some another super next to the shallow frames. Everything worked well until a rainy spell struck us, and for eight days we had three or four warm showers every day; as usual, under such circumstances, the swarming-fever struck the bees. They would work for dear life between showers, and swarm.

By this time most of the colonies filled three or four supers with bees, and were capping the first supers. I then put another empty super on top, to give room, but the swarming still continued—nearly all swarmed three times, and I just let them swarm, but put back all fourth swarms. When two swarms would come out at once I would cover one hive up tight with a blanket, and, as Dr. Gandy says, they would immediately quit coming out, and would not

then swarm until afternoon or the next day. These first swarms were hived on starters in brood-frames, and a super containing sections, and they filled it chock-full of bees. In two or three days I would slip another super under the top one, which would prevent pollen in sections; this I did until they all had three or four supers.

Now, as the old colonies had so much brood hatching, the second swarms were large enough to work in two supers, and to the third swarms I would give the extracting or shallow-frame super. This, of course, left the old colony pretty weak, but as we had a good honey-flow on, several of these supers were capped, which I took off and put on the market at 15 cents for a 3 $\frac{3}{4}$  x 5 $\frac{1}{2}$  section, which sold as fast as I could get it to the home market. It was nice and white, and no other honey on the market. I ornamented every section with my business card, by stamping with rubber stamp.

Then I took some unfinished supers off the old colonies and placed on new swarms to finish until I had only one super left on an old colony. This contracted their room, and when the young queen began laying she found lots of empty cells in the brood-chamber and bees enough to rear brood, but not to gather any surplus; but they have now built up so as to be able to fill two supers of bees and are storing surplus again, and are ready for the smartweed flow.

Several of the first swarms swarmed the second time. I put back these second swarms, but they would not stay back, so I hived them in shallow extracting supers, and set them on the parent hive the next day after taking away the queen. In some of them I could not find the queen, but they settled their own disputes and quit swarming. I also made a few nuclei in the spring, which have built up.

I reared my own queens from a colony of long-tongued bees. That colony did not swarm, as I used so much of her comb-brood, and I believe I have taken off 30 sections of comb honey, and they are working slowly in 90 more sections, and will soon have them completed. Some of the first swarms have nearly finished 150 sections, and are working in four supers now. These shallow frames were moved up away from the queen, and as brood hatched out they were soon filled, extracted, and placed on the hives again.

So far this season I have taken off 1400 pounds of honey, all comb but about 200 pounds. I am taking off about three supers a day, using bee-escapes. I have about 1000 pounds ready, or nearly ready, to take off, and 50 colonies strong enough to fill from two to four supers with bees for the smartweed flow, which is just coming in.

Now, this plan would not work in some seasons, but this is a good year. I could have had much more increase, but I wanted honey also. Smartweed promises a fair crop. All queens seem to be prolific in a good season.

I have had a hard time to get hives and supplies, but I ordered an extra large supply early, so I managed to get along. I want to say right here that a certain bee-supply dealer beats the world to get a move on him, and can fill orders quick when he has the supplies; but when everybody wants a whole lot of all kinds of supplies, right away, quick, and he happens to be just out of almost everything, then he is liable to think him a slow poke. Let me give a little advice: get your supplies early; then if you have to send after a lot of supplies right in the busy rush, and don't get them right away, nor hear from the supply-dealer, and you get plum stuck, write the supply-dealer a real sassy letter, just give him fits, call him lazy, slow poke, and call him everything you can think of, only don't swear. Write about 24 pages; spend a good half day at it, even if you are busy; ask him if he got your order; tell him he is a thief and a rascal, and is probably off on a drunk, and not attending to his business. When you have it finished, read it over carefully; and if you see where you can make it a little stronger, add at least 10 more pages; then when it is ready to mail, go out and chop for your wife an armful of wood, make a good fire in the kitchen stove, and then open the lid and quietly drop the letter in the fire, and you will feel lots better. And so will the supply-dealer.

When your neighbors come three or four times a day to get you to go home with them and bring an empty hive with you, and climb up to a tree top and get a swarm of bees that came there, and then give them and give them supers with foundation, and show him what a queen looks like, and explain all about bee-keeping in general, then promise to help him cut all the bee-trees he can find this fall, and bring empty hives and transfer them for him, and lend him your smoker and bee-veil, and three or four bee-books, and its—"I'll hand you the money some time for the hives." Just say first, last, and at all time, that you are

sorry, but you just can't leave your own business, and can't help him at all right now; and that you have not even time to talk to him. Then hand him a copy of the American Bee Journal and a catalog of supplies, and bid him good-by—and it is "Come over when I am not so busy."

This has been a good honey season, and the bee-keeper that attended to his own bees all right will have lots of honey. But hundreds of bee-keepers that neglected their bees will not have any more honey than usual. I asked one bee-keeper how his bees were doing. "Oh, just fair," he said, "some have swarmed five or six times. I could not get hives, so they were put in boxes, some in barrels, and some were left." In fact, he got tired of hunting up boxes, and just let them go.

I asked him how much honey he had taken off, and he said, "Just a little bit; the old hives are full. I guess, or they would not have swarmed. They have had the supers on the upper story two or three years, so I guess they are full; they are so blamed cross I hate to do anything with them; I guess I will wait until cold weather. They tell me you are a good hand with bees. I wish you would take it off. I bet it is full of nice honey. I pried up the lid, but they got so cross I had to run, and did not get the lid down tight, and now they are so cross I don't dare go near them, and the bees are all over the hive. They say bees don't sting some people, but they just pop it to me."

I said I had all I could do with my own bees, and got all the stings I cared about at home.

My honey is selling for 15 cents per Ideal section. which is about 17 cents per pound. I get 12 $\frac{1}{2}$  per section, the dealer 2 $\frac{1}{2}$  cents. I advertise in different ways, and sell at home and near-by towns. People are better able to buy honey now than they were several years ago, and this locality, at least, will consume more than usual. Other eatables are high; butter is from 15 to 20 cents per pound to the consumer, and honey should not be less, nor will mine be. Honey is not a perishable article to be dumped on the market right away, and if honey is sold cheap it is the bee-keeper's own fault. We do not often get a good crop; let us not be foolish and sell it for a trifle.

Later I will give you my plan of selling honey.

Knox Co., Ill., Aug. 8.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Dividing Just Before Swarming.

Can I transfer a colony just before swarming, and let part of the bees rear the queen and brood and make another colony out of the bees in the old hive? MISSISSIPPI.

ANSWER.—Yes; put the largest part of the brood and bees on a new stand. Better not leave more than one frame of brood with the queen, and perhaps it may be well to take that away after a day or two.

### Removing Pollen from Combs—Shaking for Foul Brood—Rearing Queens in the Fall.

1. Will the bees remove pollen from the center combs in the brood-chamber so the queen can have a compact circle to lay in, the combs being filled by queenless bees, caused by the queen being in mating? The pollen is fresh, and the cells about half full.

2. Is one shake or two shakes right to cure foul brood? Mr. McEvoy says two, and Messrs. Root, Davenport, and others say one. When doctors disagree, what is a beginner to do?

3. Would a super that had been over a foul-broody colony be safe to use after being in an oven about an hour, the temperature about the same as that for baking bread, or a little below?

4. Can good queens be reared at this time of year, while the bees are still gathering considerable honey, by simply removing queens from reasonably strong colonies?

5. Would 20 drops of carbolic acid in  $\frac{1}{2}$  pint of water

disinfect hands and tools after handling a foul-broody colony?  
IOWA.

ANSWERS.—1. Yes, give them time enough and you will find the pollen all out of the middle of the brood-nest.

2. The decision of the question hinges upon the point as to whether the diseased honey will all be used up in the four days in comb-building. Mr. McEvoy thinks some of it will still be left, stored in the newly-built cells; the others think it will all be used up, making a second shaking unnecessary. I am not authority enough to decide.

3. Yes, and even without the baking it would be safe, for it is now generally agreed that the hive of a foul-broody colony does not need disinfecting, and the super would be as safe as the hive, if not safer.

4. Yes, "if considerable honey" means a flow sufficient to keep the bees busy, and at least a little on the gain. You can help matters by feeding. But it's wise to make your plans for another year so as to be all through with queen-rearing earlier in the season.

5. I don't know. Some one please tell us the right proportion.

### Uniting Colonies in the Fall.

I am a beginner and have 6 colonies of bees, spring count. I have increased to 9 this summer, two of which are quite weak and small, and I wish to unite them. Do you think it a good plan to smoke the strongest colony and put the weakest colony on top of the other, and drive them down with smoke, and after they are down, smoke them slightly more, and then cover them up? or is there a better plan?  
WASHINGTON.

ANSWER.—I think it would be better not to drive them down, but to leave them to themselves for a few days, setting the one hive quietly over the other at a time when bees are not flying—preferably on a cool day—then after the bees have got acquainted put the best combs of each into the one hive. It might be a little better, when the one hive is put over the other, to put paper between the two, leaving a hole in the paper large enough for one bee to pass through.

### Swarm Hanging on Tree Several Days.

If I am correct, a swarm in Wisconsin hangs on a limb over night in some cases, but never more than one or two nights. We recently had a swarm at one of our out-yards hang from Sunday until Friday morning, when they were hived and seemed perfectly contented. The weather was fair all this time. Is this an unusual occurrence, and can you account for it?  
WISCONSIN.

ANSWER.—It is unusual for a swarm to hang over night, still more unusual for it to remain two nights, and extremely unusual for it to remain five nights, as in your case. I don't know what should make the difference; possibly the rain or something else prevented their breaking cluster at first, and they began building comb and were reconciled to stay. Very likely if you had not hived them they would have hung there permanently.

### Hiving Swarms on the Old Stand.

On page 371, beginners are advised to hive new swarms on the old stand (to prevent second swarms), and a week later take away the old colony to a new stand. I tried this and it worked fine the first time. But the second time I tried it there was a second swarm came out of the old colony in four days. Will you kindly tell me what was the cause of this?

Would there be any harm in moving the old colony in less than a week to its new location?  
MASSACHUSETTS.

ANSWER.—As a rule, the prime swarm issues when the first queen-cell is sealed, and a second swarm issues shortly after the first virgin emerges, making the second swarm about eight days after the first. It may happen that on account of bad weather, or something else, the issuing of the first swarm is delayed, in which case there will not be as much as eight days between the two swarms—in your case it was four—in which case the wait of a week is of course too long. In that particular case it would have been all right to move the old hive in three days; but such cases are not frequent enough to make it advisable to move the

hive in so short a time. In ordinary cases the depletion would not be sufficient to discourage the bees always from swarming; for you will understand that the colony will be gaining strength rapidly every day from the hatching brood. Moving the hive earlier than a week might prevent swarming, but it would not be so sure.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### RUBBING THE PLACE STUNG.

The good maxim, "Do not rub the place where a sting is received," hardly applies to old chaps well inured to stings. Sometimes when I fear that a sting is going to give trouble, I purposely rub the place violently and at once. The idea is to dilute and spread the poison before trouble gets begun. The plan works well with me. Page 478.

### AFRAID OF MOTH-BALLS.

Bees are insects as well as moths; and I fear that any moth-ball strong enough to stand off the one would bring more or less injury to the other. Page 483.

### INTRODUCING LAME QUEENS.

In introducing a queen not able to walk, there is another danger in addition to danger of hostility from the bees. She tumbles, or gets tumbled to the bottom, to chill and starve and be neglected there, or possibly to get more tumbles out onto the ground. Page 483.

### THE "DOINGS" (?) OF THE NATIONAL.

A column entitled, "What the National is Doing," Mr. Herman F. Moore wants. Some pre-requirements. National must be doing something, and some one qualified must write it. We hardly need a column of well-looking nothings which busy readers would skip at sight as they skip most of the columns and pages of the 16-page daily. Page 486.

### UNAPPRECIATED GENEROSITY.

Dr. Peiro, I feel somewhat as I suppose a good mother must feel when she finds her children have been misbehaving themselves toward respectable passers-by. Fifty of our children received valuable time free, and cuttings presumably valuable, and not one heeded the request to write results! I don't blame you, Doctor! Still, it would please me best if you would rub the sore feelings into feeling better, run and play at something else for awhile—and then turn up again on the same subject. You're not alone. "Seven thousand in Israel do good for the sake of doing good, and get similar reward." It's only in the sweet "Thy Kingdom come" that the animal's, "Get all the good grabs you can and render nothing in return," will be found entirely absent.

Still, contra considerations are possible. Possibly a good many failed to make their cuttings grow, and didn't want to ride a free horse to death by asking for anything further. And I imagine that Uncle Sam is the leading villain in the case. He long has paid the bill for his politicians to shove free garden seeds under everybody's nose—request to write results printed on. Treating you as they treat Uncle Sam may be a little unpleasant, but is not doing you any dishonor. Page 492.

### REARING COMMERCIAL QUEENS.

George B. Whitcomb seems to have an idea that commercial queens are often deteriorated by being reared from No. 2 eggs. Has this idea reasonableness enough to call for a discussion, and for experiments later on, perhaps? Some mother-queen alleged to lay, or at least to be capable of laying, No. 1 eggs and No. 2 eggs. When in full tide of laying she finds that she has a whole empty comb ahead of her she gets a hustle on, and lets the eggs fly before they have had quite time to become No. 1. Feeble plants raised from half-grown seeds, feeble queens from such scant-timed eggs. This is surely one of the "important if true" matters. The opposite of this makes toward accounting for the excellence of natural swarm queens. Queen seldom laying

in natural cups except when crowded for room, and when the eggs have the last possible item of development. But how about the choice queen kept in the nucleus on purpose to keep her from shortening her life by profuse laying? If things in the nucleus are all right, and the breeder is so run as to lay only 200 eggs a day (instead of the 2000 she might otherwise lay), will there be any No. 2 eggs? From one point of view all the 200 should be at the best possible quality. From another point of view not so—whole machinery running too slow for best results. Too few workers engaged in giving her the wherewith, and those few too languid about it. Egg No. 1,500 at the close of a day when she would gladly have laid 2,000 is apparently the child of a stress and superabundance which cannot exist in the other case. Whole thing does not amount to a hill of beans, perhaps—and then, again, perhaps it does.

Hard to get the long Alley strips if one must not let a breeding queen have any large room ahead.

While we're at it I'll go somewhat further and say that I have suspected that *influences*—needed influences of development coming from the living bees—go right through the sealing of cells, and are needed by sealed cells, and missed when absent, and also missed when partially absent by the colony's being too weak. This is altogether beyond and apart from the danger of chilling. Where shall we get to, then? To the point where we must have a full, rousing colony all the time, and the queen-rearing nucleus abolished. Page 475.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### An Older Sister—Bee Hat and Gloves.

I'm one of "Our Bee-Keeping Sisters," for I've been handling bees for 33 years without a break. I'm in my 72d year, and I've taken care of my apiary almost alone this season, as my husband is an invalid.

My apiary has been growing smaller for about 13 years—no great losses, but gradually; the increase not being equal to winter loss.

The seasons have been poor, but the colonies have been well cared for. If I'm to blame it is because I neglected to introduce young queens, and there was so little swarming.

Last season was the first entire failure we ever experienced; the bees stored a winter supply, but no surplus. During fruit-bloom the bees built comb under the devices and then starved, as I found to my sorrow when I returned from Florida, May 2. I gave them syrup until they neglected the feeders. Honey came with a flood, and as soon as a bee left a cell it was filled with nectar, and the queens had no chance to lay. There has been very little swarming in our apiary. I would have preferred more.

#### A BEE-HAT OR MASK.

When I first began bee-keeping I purchased "Langstroth on the Hive and Honey-Bee," and I followed his directions in making a protector for my head, and I've never regretted it. I've tried veils galore, but they would catch on limbs of trees, and tear, or, while working, get close to my face or head, or where it was fastened about my neck, and I would be stung.

#### THE HAT AS I MAKE IT.

I measure from the top of the head to my shoulders, and cut this length from a web of fine wire-gauze, painted green, allowing a liberal amount for hems, bottom and top. I roll the hems, working all loose wire in, and bind with cloth; this is to prevent the ends of the wire from scratching when set over the head. Then roll it into a cylinder large enough to go over the head; roomy, but not too large. Sew a top to this cut from pasteboard, not round, but oblong. To the bottom a cape with an armhole on the right, and open on the left.

The front should be shorter than the back, and rounded out at the top. There should be a short piece over each shoulder, with a draw-string at the bottom.

I put the hat on with my right arm through the hole,

and tie at the left, and put on a linen vest, and button it up, and no bee can get at my head.

Bees do not sting through starched linen, and sometimes I wear a linen coat, as it has sleeves, and an apron tied around, so that no bees can creep under it.

#### BEE-GLOVES.

I prefer a small buckskin glove with a gauntlet of ticking or heavy drilling reaching to the elbow. I don't button the glove, but sew up the opening, having it loose so it can be drawn on easily. I've tried rubber gloves, but they are a delusion and a snare.

Clad in this armor I can work with confidence, knowing that no bee can possibly sting me.

Peoria Co., Ill., Aug. 10. MRS. L. HARRISON.

### A Nevada Sister's Report.

Our bees have done well. I had 45 colonies in the spring, and increased to 74, but did not receive any honey to speak of from the increase, but they are all filled up ready for the second crop of clover. From the old colonies I obtained 29 cases of comb honey, and 70 gallons of extracted—beautiful alfalfa honey. I have sold 60 gallons of extracted at 80 cents a gallon. We expect 11 cents a pound for our comb honey. The second crop of clover is beginning to bloom. I do all the work with the bees.

Washoe Co., Nev., Aug. 14. MRS. B. A. COOPER.

### Swarming—Rearing Queens—Using the Bee-Escape.

I am a reader of the American Bee Journal, and enjoy it beyond expression. Although my apiary is small I take pleasure in working in it. The season is fair; I will get three supers of comb honey to the hive. Some of this will be on exhibit at the Clark County Fair.

As I am a novice in bee-keeping I wish to ask a few questions:

1. Is natural swarming a hindrance to success?
2. Can as good or better queens be reared by artificial ways as by natural?
3. If the queen-cells are cut out of the parent hive eight days after the prime swarm issued, why do you prefer to put the prime swarm on the old stand? I like to give both swarms the same chance.
4. Will a bee-escape work under a super or hive having brood in them? MRS. DELLA E. STONE.

Clark Co., Wis., Aug. 6.

1. That depends. If you want increase it is all right to let the colonies swarm. But if it is honey you want, then I would try to have as little swarming as possible. It is not an easy thing to prevent all swarming, but all but prime swarms can be prevented without much trouble.

2. If you have only one colony you will get just as good queens from it by natural swarming as by any artificial process. But if you have a number of colonies it is not wise to trust entirely to natural swarming. Find out which is your best colony, and secure queens from that stock.

3. I don't cut out the cells when I make the change. I let the bees do that part of it. I believe you will get better results by throwing the flying force into the prime swarm, as that will give you one strong colony, and it is the strong colonies that give us the honey. If, however, you want to give each colony equal chance, hive the swarm on a new stand.

4. Not very satisfactorily. The bees are loth to leave the brood.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

The Premiums offered this week are well worth working for. Look at them.

**FROM MANY FIELDS**

**A Good Beginner's Report.**

I have had a good year, and the honey is still coming in. The weather is not the best just now. Turns cold so easily. But when they get a chance, the bees are working well. I started in March with two colonies, and increased to eight. My strongest colony has given me 300 pounds of honey. I drew on it for increase also, but used the other with which I started in the spring for increase. I sum it all up thus: 400 percent increase in colonies; 50 percent income on investment, plus all that a family of five can eat and what I have given away. And these last two items are of considerable importance. If I can do as well every year I think I would like to keep bees all the time.

But something tells me that it would be the part of wisdom to buy a barrel of sugar for next year with part of the proceeds of this.

R. B. McCain.

Grundy Co., Ill., Sept. 8.

**Nevada Bee-Notes.**

The past season has not been up to the average. The first crop from alfalfa was more than an average gathering, but the second bloom was light and we secured but little. Our crop will be about 150 pounds per colony, spring count.

This locality—the Big Meadow plain—will produce this season about ten or twelve carloads. The honey is water-white.

Foul brood is everywhere around the Big Meadow country, and we are now preparing to fight it.

Nevada has a good foul brood law, copied after the McEvoy plan, but as yet we have no inspectors appointed. NEVADA APIARIST.

Humboldt Co., Nevada, Sept. 2.

**Season's Report—"Shook" Swarms.**

The season being nearly closed I will report the results. I have 175 colonies, spring count, 2000 pounds of No. 1 comb honey, 300 pounds of No. 2, and 2800 pounds of extracted No. 1, all gathered after July 15 from blue thistle. It all came up and blossomed after the rains which followed our terrible drouth. Increase, none. Swarms cast, 10; 3 hived themselves in hives of combs stacked up beside the honey-house; seven hived on three frames and dummies, and the three frames given to other colonies last week. I did not divide any this season, as there was not over a quart of bees in the best colonies June 1.

I notice a great deal about "shook" swarms. That has been my practice ever since I commenced using frames, about 25 years ago. I mark all my hives, just what they produce; the next spring I take brood from those that did not do well, and build up those that were the best, unless they are very strong. When I see any inclination to swarm I get an empty hive and put it in place of the old one, find the frames with the queen, go to a colony that did not do well the previous year, draw out about four frames and put them in with the one frame and queen, and fill up the hive with frames of comb of the

STERLING, GA., June 29, 1903.

colony I draw from. I leave about three frames, and put on super; the rest of the hive filled with dummies. I intend to have a decrease instead of increase every fall, and buy enough in the spring and transfer them.

I used to buy a good many queens, but I found I had to get rid of about seven out of ten, as they were no good except to look at. One lot of queens I got, the drones all had red eyes; the bees would not gather honey enough to winter them. One other lot would swarm all the time, and not one drop would they have to winter on; they all died before time to put them in the cellar. The best lot I ever got came from Massachusetts, every one was leather-colored and good honey-gatherers, and I have bred from them for three years.

Two years ago I sent for a red clover queen; she came, and looked like a "dandy." I reared two queens from her, and have kept the three colonies two seasons, and not one section of honey have I got; No. 1 or No. 2 would have just a little chunk, about 1/3 of a pound, and as black as New Orleans molasses.

I have tried the "shook" plan on them, only I did not use an extra hive. I suppose if we had more red clover instead of alsike they would have been a real nice thing to have.

C. M. LINCOLN.

Bennington Co., Vt., Aug. 31.

**Bees Doing Pretty Well.**

Bees are doing pretty well here this season on cotton. This is about the only plant we get any surplus from in this locality. We usually have plenty of horsemanit, but we rarely get any surplus from it, and do not depend upon it as we do the cotton.

A few of the people here keep bees, but most of them have them in box-hives.

F. R. KNAUTH.

Williamson Co., Texas, Aug. 29.

**Dr. Gallup's Bees Good Ones.**

On page 344, Mr. H. Alley says he had never heard anyone else say that Dr. Gallup's queens were wonderful except Dr. Gallup. I am the owner of the last bees that Dr. Gallup reared—22 colonies. They did not need any doubling up to get honey. It is true that 3 colonies did not do well, and it was all they could do to take care of one super, but the other 19 colonies handled two supers all right, and the 22 colonies gave an average, per colony, of 23 1/2 pounds over the balance of my apiary of 138 colonies. These 138 colonies were doubled back to that number at the beginning of the main honey-flow from 172 colonies. About one-third of the 172 colonies were bought from Tom, Dick, and Harry. The balance were my own rearing; out of that whole outfit of 138 colonies only 23 could handle two supers each. All were on Langstroth frames, and all had the same show, one with another, to get there. Of course, any short of stores were fed until there was a living on the outside. Our foul brood inspector for this County said he never saw a more uniform lot of bees than the Gallup bees. It is true that the Gallup bees were not all handsome yellow ones; but how about those yellow dollars they put in the pocket over the other bees? They are handsome enough.

Again, Mr. Alley says, "I have spent my whole life in this branch of apiculture, and

now, after 40 years' experience, if I can not rear a queen that will live four months," etc. Now, I do not believe a close observer like Dr. Gallup was, had to rear thousands of queens to learn how to rear a good queen.

S. Q. CONKLE.

Orange Co., Calif., Sept. 3.

### A Good Report.

I started in the spring with one 3-frame nucleus, increased to 2 colonies, and have taken off 225 pounds of honey. I got 4 stray swarms, and have taken, all together, 463 pounds of honey, all extracted.

JOHN C. BULL.

Porter Co., Ind., Sept. 1.

### Poorest Year for Honey.

Yesterday I extracted 150 pounds of honey from 40 colonies. A year ago I had 2300 pounds from 35 colonies.

This has been the poorest year for honey we have had since I commenced keeping bees, 11 years ago.

HANS CHRISTENSEN.

Skagit Co., Wash., Aug. 25.

### A Beginner's Report.

Last winter I bought 13 colonies; the unlucky one died, leaving me 12. Seven of the 12 were in box-hives, and I transferred them into frame hives. I now have 28 strong colonies. In July I introduced 12 Italian queens, and all are doing nicely. I have something near 1500 pounds of comb honey.

Henry Co., Ill., Aug. 24. O. L. HATCH.

### Bees Have Done Well.

I have 14 colonies. I put 9 into the cellar last fall, and took out 8 last spring. I do not increase much, as I double them and put back most of the swarms, and in this way I get more honey.

My bees are doing finely so far. I have sold 60 pounds of honey at 20 cents per pound, and have about 12 supers that are about ready to take off.

I intend to make more of a business of bees and poultry.

I still want the "Old Reliable."

LUKE SIMMONS.

Pope Co., Minn., Aug. 7.

### The Season's Experience.

I have had bees the most of the time for the last 15 years. Sometimes I would have 1 or 2 colonies, sometimes none. I never had any luck until last summer, when the bees did well in storing honey but not in swarming. One colony swarmed, but after I had it hived a few hours they left, and I could not find them. The next day I found one swarm, but it was on July 4 and 5, too late for swarms; then I had two hives which I thought were full of bees, so I forced a swarm out of them. I took the frame with the queen and put it in a hive out of the old stand. That worked well; in a few days the new colony had nearly all the bees, but in a week or two the old were very strong. Now the trouble comes. I should have had a queen ready to put in the old hive, but I had none, and left that to the bees. Well, the one got its queen all right, but the others missed it somehow; the other one also had queen-cells, but very short.

After the cells were all opened I looked for

## Long Tongues Valuable

South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

HURTO, TEX., Nov. 19, 1902.

J. P. MOORE.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian Bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongued bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders, Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am filling all orders by registered mail, and shall probably be able to do so till the close of the season.

J. P. Moore, L. Box 1, Morgan, Ky.

31A1f Pendleton Co.

Expenses lower than other colleges of equal grade. Any young person with tact and energy can have an education. We invite correspondence. Send for catalog.

**Mount Union College,**  
Alliance, Ohio.

a queen, but no queen was to be seen. I looked again and again, but no queen. In about five or six weeks I looked again and found plenty of eggs, but they were scattered, so I thought it was not the work of a queen. In some of the cells were six, eight or ten eggs. By reading what others said I concluded they must have a laying worker, but the eggs hatched; they also have queen-cells. What will become of this thing? I have a queen on the frame in the box that came by mail. I will let her out soon, but I expect she will be killed.

I also had a colony which became queenless last spring, so I bought a queen that was a beauty; she is nearly as yellow as butter.

A. S. BEILER.

### Results of the Season.

My bees did very little good last year, and I lost several colonies, but saved 14 to begin with last spring, and they did very little this season. I now have 38, with what I caught in the woods. I think I will get about 1000 pounds of honey, possibly more.

I will just give a history of a swarm that came to me about the last of May. They have filled two supers and the third one nearly full, and cast two swarms. The first one has filled one super and has the second nearly full, and the second swarm has the first super just about ready to take off; so I will get about six supers of honey, or nearly 144 pounds. I think I can safely count on 130 pounds from one swarm. These were part blacks, but mixed with some as bright three-banded bees as you would wish to see, and they are very gentle.

GEORGE H. WELLS.

Johnson Co., Mo., Sept. 2.

### CONVENTION NOTICES.

**Illinois**—The annual meeting of the Northern Illinois Bee-Keepers' Association will be held in the Court House, in Rockford, Ill., Tuesday and Wednesday, Oct. 20 and 21, 1903. A good program is being prepared, and all interested in bees are invited to attend. B. KENNEDY, Sec.

**Utah**—The Utah Bee-Keepers' Association will meet in the City and County Building in Salt Lake City, Oct. 5, commencing at 4:30 o'clock p.m. Among the subjects discussed will be the winter problem and the best method to promote the interest of the State and National Associations. E. S. LOVESY, Pres.

The Geneva Bushel Crate.—Few improvements in the way of labor, time and money saving devices have been handed down to the farmer of late which embody so many really practical advantages, considering cost, as are found in the Geneva Bushel Crate for the handling of farm produce. Its adaptability, convenience, durability and saving features are so plainly evident that the wonder is it was not thought of long ago. Its usefulness is unlimited, serving as it does every purpose for which a basket can be used and every purpose for

which a basket cannot be used, at a much less cost. For storage purposes it is invaluable not only for convenience of handling, but because of the ventilating features it affords, reducing spoilage to the lowest limit, making it far preferable to barrels, bins, or the conventional pile in the corner of cellar or field.

Being made of a regulation size suited to fit the ordinary wagon-box, a good-sized load can be loaded with comfort and convenience. The saving in unloading is an item which alone will pay for its cost in a short time. In picking, gathering and marketing apples, potatoes, peaches, corn, onions and other fruits and vegetables, the Geneva Bushel Crate certainly commends itself to the eye of the practical farmer as an article of utility he cannot well afford to be without, especially when the low cost is considered and compared to that of the ordinary basket or crate.

These crates can be brought out to proper lengths, packed in bundles, ready for mailing together, and the farmer can do his own carter work during dull or rainy seasons, and thus save considerable money. Prices on various quantities can be had on request of the makers, and any further information desired. Address the Geneva Co-operative Co., Geneva, Ohio. We might add that in 100 lots the material costs about eight cents per crate! Please mention the Bee Journal when writing.

# BEE-BOOKS

SENT POSTPAID BY

GEORGE W. YORK & CO.,

144 & 146 E. Erie St., CHICAGO, ILL

**Forty Years Among the Bees.** by Dr. C. C. Miller.—This book contains 828 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide, or Manual of the Apiary.** by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 285 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee.** revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture.** by A. I. & E. R. Root.—A cyclopaedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20

**Scientific Queen-Rearing.** as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey, or Management of an Apiary for Pleasure and Profit.** by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture.** Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur.** by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register.** by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Poul Brood.**—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping.** by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Poul Brood Treatment.** by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Poul Brood.** by A. R. Kohne.—Origin, Development and Cure. Price, 10 cents.

## HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Sept. 8.—Honey is coming to market quite freely, and of first quality. This fact induces the trade to take an attitude of the opinion that it is going to be reasonable in price—two factors which go far toward making it the product. Best grades of white comb honey sell at about 14c per pound. Extracted honey sell at about 14c to 15c per pound; 6 1/2% to 7% for quality and package; amber grades, 5 1/2% to 6%. Beeswax, 30c.

R. A. BURNETT & Co.  
 KANSAS CITY, Aug. 25.—Receipts of comb honey more liberal; demand improving. We quote fancy white comb, 24 section case, \$25; No. 1, white amber comb, 24-section case, \$3.00; No. 2, white amber comb, 24-section case, \$2.75; Extracted, white, per lb., 6 1/2%; amber, 5 1/2% to 6%. Beeswax, 25 to 30c.

ALBANY, N. Y., Sept. 4.—Demand for honey improving, at 15 to 16c for fancy white comb; 14 1/2 to 15c for No. 1; 13 to 14c for No. 2. Production of honey in this vicinity is very light. This market will have to depend on other sections more this season than ever. Extracted honey, 7 to 7 1/2c for white; 6 to 6 1/2c for mixed and buck wheat. Beeswax, 28 to 30c. H. R. WRIGHT.

CINCINNATI, Aug. 6.—The supply about equals the demand for extracted honey. We are selling amber extracted in barrels from 5 1/2 to 6 1/2c according to quality. White clover barrels and cans, 7 to 8 1/2c, respectively. Comb honey, fancy, in no drip shipping cases, 10 to 16 1/2c cents. Beeswax, 30c. T. B. FRED W. MUTH Co.

NEW YORK, Sept. 8.—New crop comb honey is beginning to arrive more freely, and the demand is good for all grades. White clover, white at 14 to 14 1/2c, No. 1 at 13c, amber at 12 to 11 1/2c; no buckwheat on the market as yet.

Extracted is plentiful, and in fair demand at 7c for the white, 6 to 6 1/2c for the light amber, 5 1/2 to 6c for dark. Southern in barrels at all prices according to quality. Beeswax is declining, and nominal at 28 to 29c. HILDRETH & SEIGLEN.

CINCINNATI, Aug. 8.—New honey is now offered very freely, particularly extracted. The demand for honey is about as usual at this time of the season. I made sales at the following figures: Amber, 5 to 5 1/2c; water-white alfalfa, 6 1/2c; fancy white clover honey, 7 to 7 1/2c. Comb honey, fancy water-white, brings from 14 to 15c. Beeswax, 27 to 30c. C. H. W. WEBER.

SAN FRANCISCO, July 22.—White comb honey, 1 1/2 to 1 3/4c; amber, 80 to 85c. Extracted, white, 5 1/2 to 6c; light amber, 4 1/2 to 5c; amber, 4 1/2 to 5c; dark, 3 1/2 to 4 1/2c. Beeswax, good to choice, light, 2 1/2 to 2 3/4c; dark, 25 to 26c.

This season's crop is not only unusually late, but is proving much lighter than was generally expected. While the market is unfavorable to buyers, the demand at extreme current rates is not brisk and is mainly on local account.

**WANTED! FANCY COMB HONEY** in no-drip shipping-cases. Also Amber Extracted in barrels or cans. Quote your best price delivered Cincinnati. The Fred W. Muth Co. 324 1/2 Front and Walnut, CINCINNATI, OHIO.

**WANTED—Comb Honey** in quantity lots. We are perhaps the only dealers in this article owning as much as 150,000 pounds at one time. Please state quantity, quality and price asked for your offerings. Thos. C. Stanley & Son, 244 1/2 MANZANILLA, COLO., or FAIRFIELD, ILL.

**WANTED—Extracted Honey.** Mail sample and state best price delivered Cincinnati. Will buy FANCY WATER WHITE COMB HONEY, any quantity, but must be put up in no-drip shipping-cases.

C. H. W. WEBER,  
 2146-48 Central Ave., CINCINNATI, OHIO.

## RED CLOVER HONEY-QUEENS.

SPRING BLUFF, Wis., July 18, 1903.

THE A. I. ROOT CO., Medina, Ohio.  
Dear Sirs:—I thought I would write you a few lines in regard to the Red Clover Queen I got from you. They haven't swarmed yet this summer, but I there is 24 more all ready to come off. Just think, 72 nice sections of six nice honey as ever was made, and only July 18th. It seems as though they will surely swarm 48 more.

I don't know whether their tongues are any longer than any of the others, or whether they gathered it from Red Clover, but surely such bees are worth money.

I use the 8-frame Jumbo frame.

C. E. KELLOGG.

C. E. KELLOGG, Spring Bluff, Wis.  
Dear Sir:—We have yours of July 18th and would be glad to have you advise us by return mail with reference to the capping of the honey. Some parties say the capping from these bees is not white, and we would be glad to have you advise us how your honey is in this respect, and oblige,  
Yours truly,  
THE A. I. ROOT CO.

SPRING BLUFF, Wis., July 31, 1903.

THE A. I. ROOT CO., Medina, Ohio.  
Dear Sirs:—Yours of July 24th at hand to-day. In regard to your question in reference to the capping of the honey from these bees I will say that it is simply perfect, beautiful snow-white and every box perfect. 38 one-pound sections now. I am quite sure they will fill two more sumps, which will bring the number up to 144. I would like very much to have you see a few of those sections, and I will be glad to send you a few.

Now, I haven't told you ALL their good qualities yet. I am sure they are by far the most gentle bees to handle I have. I could take off the sections without smoke or veil without getting stung.

There are a few traits about them that I will write you again in a few weeks and let you know if they fill the 144 sections, which I am sure they will.  
Respectfully,  
C. E. KELLOGG.

seem to me are quite remarkable aside from their honey-gathering, they don't seem to want to swarm.

## AGAIN READY FOR PROMPT DELIVERY.

We were snowed under with orders for a few weeks, but here we are again with good Queens and prompt service.

## Red Clover and Honey Queens.

Untested .....	Each	\$4.00	\$ 5.75	Breeding .....	\$ 3.00
Tested .....	2.00	11.40	Select Breeding .....	7.50	
Select Tested .....	3.00	17.10	Extra Select Breeding .....	10.00	

With any of the last three we include one frame of bees and brood to insure safe arrival, for which we make no charge. These must be sent by express. Queen circular free.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

A STANDARD-BRED

# QUEEN-BEE FREE

To Our Regular Paid-in-Advance Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with The Very Best Untested Italian Queens that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

## A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription must be paid at least 3 months in advance. If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

Send us \$1.00 and the name (not your own) and address of One NEW subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due also.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows:

One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We are filling orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

**GEORGE W. YORK & CO., 144-146 E. ERIE ST., CHICAGO, ILL.**

40 Tested Italian Queens at \$1.00 each, as long as they last. Order quick.

# AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., SEPT. 24, 1903.

No. 39.

## Editorial Comments

**Don't Let Your Colonies Starve.**—The colonies that have given the largest amount of surplus may be the ones that have the smallest amount of honey for winter. To be sure, they may have an abundance, but the very fact that they have done so well in the supers suggests that they have put all above, and if they have kept the brood-chamber filled with brood till late, they are the very ones that may starve. After doing such good work for you in surplus, it would be too bad to let them starve, wouldn't it?

**Select Your Colonies to Breed From.**—No, it isn't the wrong time of the year to decide the matter for next year. The performance of each colony is more fresh in your mind now than it will be next spring. If you cellar your bees, there is some danger that they will be all mixed up, and that next spring you won't know which is which. If you are wise, however, each hive will be numbered, and you will have kept an exact account of the performance of each colony, making it not so very hard to decide which colony, all things considered, is the one that you want to rear queens from next year.

**Select Your Drone-Breeders.**—That may sound like strange advice to some whose chief thought with regard to drones has been the thought of entire suppression. To be sure, it is a good thing to discourage the production of a lot of useless consumers, but it may be well to suggest to you, oh, inexperienced beginner, that not all drones are useless consumers. A few are absolutely necessary, if you are to continue in the bee-business, and it is of highest importance that these be of the best stock. So, besides selecting the best colony from which to breed your queens, select one or more other colonies in which you will encourage the rearing of a considerable number of drones. Now is the time to make such selection.

**Foul Brood at the Chicago Convention.**—There appears in a German bee-journal the statement that at a bee-convention held in Chicago foul brood was much discussed, the sentiment prevailing that fire was the only safe remedy, one bee-keeper asserting that out of 667 infected colonies he had saved only three.

Our good German friends may be assured there is some mistake. Although fire might be the advisable thing where only one or two colonies were diseased, no one would advise it where a considerable number of colonies were attacked. Thousands of colonies have been successfully treated without resorting to such heroic measures as burning.

**An Extractor for Extracting Sections** has been often inquired for. So far as we know there is no special machine made for that purpose. But for a few cents any of the common honey-extractors can be fixed to extract honey from sections. Here is one way to do it:

Go to any tinner, and have him make a tin shelf, say  $1\frac{1}{2}$  inches wide and 6 inches long. Then have a wire hook about 6 inches long fastened to the center of each end of the tin shelf, so as to be able

to drop it into the comb-basket of the extractor, hooking the two wires over the outer edge. Then the sections can be put on this tin shelf, one at a time, after uncapping them, and the honey thrown out.

It would be well to have a tin shelf for each comb-basket of the extractor. Years ago, we believe these tin shelves (as we call them) were furnished with the extractors. At least that is where we got the idea. We do not claim any originality in the matter, but know it will work.

**A Severe Case of Stinging** is reported in *Praktischer Wegweiser*. In an unguarded moment a child of 18 months wandered into the apiary. Attracted by her cries, her father found her with her face, ears, neck, head, and hands covered with stings. In greatest haste he removed the stings, put the child in a bath-tub filled with cold water, and continuously, for half an hour, poured upon her cold water from the well. After the bath the stung parts were bathed with vinegar. Then the mother put the child in bed, and warmed the shivering body with the heat of her own body. Sleep soon ensued, and when the child awoke, a few hours later, it was quite lively. There was no swelling, and no evil after-effects from the intense cold of the bath.

It would not be difficult to try the same cure in less severe cases—continuous pouring of cold water followed by the application of vinegar. Possibly it would not always work so well.

**"The Queen-Bee and the Palace She Should Occupy"** is the title of a work of 75 pages, written by T. K. Massie, the said "palace" being the "Massie Ideal Hive," invented by the author. This hive, he announces, "is the only hive in existence which is complete in itself. It has more good principles, and fewer objectionable features, than any other." It is "decidedly the best hive ever made," and the "greatest labor-saving hive in existence."

At the outset the author declares himself in opposition to having anything as "standard," his book being dedicated to "that progressive spirit of American apiculture which recognizes no 'standard.'" Something like 20 pages are occupied with queen-rearing and kindred topics. The remainder of the work is devoted, in most part, to instruction in bee-keeping, as practiced by the author with his hive. Those who use "Massie's Twentieth Century Combined Ideal Bee-Hive" should secure this book.

**Screens for Apiaries.**—Those who wish to keep bees in towns or cities have a problem to meet that does not concern the man whose bees can be located at safe distances from any highway. Unless special precautions are taken, the bee-keeper with only a small city lot, and with neighbors close about him on all sides, is pretty sure to get into trouble on account of an occasional sting inflicted upon a passer-by. A board fence, 7 or 8 feet high, will put the flight of the bees above the danger-line. Such a fence, however, is not a very sightly affair. Mr. Wm. Duncan has solved the problem by means of a living screen.

It is not a very difficult matter to establish such a screen. For its basis a fence of poultry-netting; then vines to cover the netting, and your screen may be made a thing of beauty. Among the vines that may be used for immediate effect may be mentioned, morning-glory, nasturtium, wild cucumber, Madeira-vine, hop-vine, etc. At the same time, if desired, there are other vines that can be started for a more permanent effect, such as grape-vine, Virginia creeper, or American ivy, etc.

## Miscellaneous Items

MR. A. P. RAUGHT, of Lake Co., Ill., called on us Sept. 16, and reported the best season he has ever known. He started with 4 colonies last spring, increased to 10, besides losing one prime swarm, and had taken off 640 pounds of the finest white clover comb honey, which likely would be increased to 700 pounds by the end of the season. He was mostly smiles when we saw him.

TYLER BROS. (three of them) recently shipped to Paris, France, two car-loads of fine alfalfa honey in 60-pound cans, from their Nevada apiaries. The price received for the honey was 5½ cents a pound, f. o. b. starting point. This is \$110 a ton, or \$2640 for the two cars. America can easily help to sweeten the people across the seas. And when they once get a taste of that delicious alfalfa honey, they will want more of it. At least that is the way it works with this pencil-shower.

THE APIARY OF F. L. YOUNGMAN appears on the first page this week. It is located in an orchard, and consists of 120 colonies, all in the Hilton chaff hives, which, he thinks, is an ideal hive for a cold country. In fact, Mr. Youngman thinks they are better for the bees in the summer, as the chaff walls keep the hot sun from the brood-nest, thereby letting the bees work during the hot part of the day, instead of hanging on the outside, as they do on a single-walled hive.

Mr. Youngman used, for the first this year, the plain section and fence, and found them the finest thing in the shape of honey sections he had ever used. He says they are more easily cleaned, give the bees better access through the super, and make, when filled, a clean and neat looking piece of honey.

The honey-flow, in his locality, was better this season than it had been for years. The raspberries, white clover, basswood, buckwheat, and fall flowers gave a long honey-flow, and made the bee-keeping business one of profit as well as pleasure for him.

THE GRAND CANYON of the Colorado River, in Arizona, 65 miles north of Williams, we had been told, is a wonderful sight. In last week's issue we had just arrived at Williams, and were about to start on the side-trip to see the biggest hole in the ground, we suppose, there is anywhere in the world.

At Williams, Mr. S. W. Barnes, the genial Traveling Freight and Passenger Agent of the Santa Fe railroad, got aboard. It was his duty to answer questions and make everybody feel happy. He seemed to enjoy his work. At least he didn't act as if it disagreed with him. Of course, he knew everybody and everything all around the Grand Canyon. So he was a handy man to have on board. He talked as if he thought the Santa Fe was the greatest railroad going through the greatest part of the country in all the world. And Grand Canyon—well, that would have to be seen in order to be appreciated!

It was nearly 7 p. m. when we arrived at the Grand Canyon, early enough to get a good view of it before dark. We all walked up to its edge, or rim, and—looked. Well, there is no doubt about its being a big hole. It is wonderful. There is no use in any one trying to describe the Grand Canyon of the Colorado. One might as well attempt to tell all about the Rocky Mountains, or all about the United States, or all about bee-keeping, or any other impossible thing.

We were told that the Canyon, at that particular point, is 13¼ miles wide, and about one mile deep. But it didn't seem so. Some of us just knew it couldn't be possible. But it wouldn't do to get too contradictory, or one might get pushed off the edge of that almost bottomless pit, and then it would be good-bye forever.

It was Saturday night. And no barber-shop within 65 miles. What were the rough-bearded ones to do? No shave since the Wednesday before, when leaving Chicago. We were about to give up the idea of shaving, and thus be more in accord with the wild and dreary place in which we were stopping, when we were informed that the two city young men who had started out with the bee-keepers' car were barbers, and had their tools with them. One end of the tourist car was soon transformed into a barber-shop, and the car seats used as barbers' chairs. While one young man lathered the stubby faces, the other did the "scraping," and soon all were smoothly-shaven—at 25 cents each!

The young barbers made so much that they decided to leave the next forenoon instead of waiting until Monday. So that was the last we saw of our "jolly barber boys."

It was arranged amongst us to hold a religious service in the hotel parlor on Sunday morning, at 6:15 o'clock, where there were a good supply of comfortable chairs and a first-class piano. We had taken with us a couple song books, as well as some other special music. Mr. and Mrs. Tallady had also brought a Sunday-school singing book. Familiar songs were selected, so that few books were needed. Mrs. York played the piano, and her smaller half managed the program.

After singing one or two inspiring songs, Dr. Miller was called on to read the scriptures and offer prayer. Then another song, after which A. I. Root acted as preacher and talked to those present on, "In all thy ways acknowledge Him, and He shall direct thy paths." He didn't talk long, so no one went to sleep. It was really a helpful discourse, and made all feel better to start the day in that delightful way. After a duet by the pianist and program manager, and also a hymn by the "congregation," N. E. France closed the service with prayer.

Then all went to breakfast.

But after breakfast, what was to be done? Dr. Miller and the women-folks evidently decided to take things easy, and rest. But Mr. Root was as uneasy as a cat in a strange garret. He wanted to go down the trail into the Canyon. And yet he couldn't quite think it in exact accord with the command, "Remember the Sabbath day to keep it holy." But the more he thought about it the more he felt he ought to walk down into that Canyon, even if it was Sunday. Others were going, some on horseback, or muleback, and some a foot. It was too much. He simply *must* get down into that Canyon, and also be first to "get there." It seemed too bad, after coming so far, and spending so much good money! To reach only the *rim* of it, wouldn't do at all.

So off he started—down the trail—the liveliest boy of all. In fact, he led the party that walked. Among them were the writer, Tallady, Schneider, Moe, and Woods. And Mr. Hyde rode a horse, at \$4.00 for the round trip.

We wish we could tell our readers all about that trail or single-file path that zigzags down the Canyon. Just imagine walking down the edge of an almost straight-up-and-down hill for about four or five miles, in a dusty, much-traveled path, and you can have a little idea of what it meant. It took about two hours to reach the table-land below, which was still 1500 feet above the waters of the Colorado River. We all went only to the rocky bank of the river, which was 1000 feet almost directly above the water, which looked about a rod wide below, when, in reality, it was 500 feet! The water is muddy, and rushes along at a rapid rate.

About a 20-minute walk back from the place where we saw the river running through the deep gorge, are nine white tents, where people can remain all night if they wish. From the top of the Canyon all of these tents together look about the size of two ordinary handkerchiefs. One can also get a meal here if he so desires. Several of us did so, after taking a short nap. And then came the walk and climb back to the hotel at the top of the Canyon. It still makes us tired to think of it. It was a sultry Sunday afternoon. And down in that old hole—oh, how hot it was! Not a breath of air! And to climb several miles on a criss-cross, dusty, narrow mule-path—do you wonder that the effort was almost too much for some of us—especially for those who had been used to sitting at an office-desk? Several times we thought we would have to stop, and send for a horse or mule to take us up and out. Mr. Root, as well as several of the others of the party, were also winded pretty badly. But Mr. Woods and the writer pushed on, resting often, and finally got so far ahead of the others that we feared possibly Mr. Root had given out, or else some one else. We feared so much for Mr. Root that when we did finally reach the hotel we ordered a guide and horse to go and meet him at once. They did so, and soon came up with him and the rest of the party. (But Mr. Root said afterward that he could have made the trip all right without the aid of the horse.)

It would be utterly impossible for us to describe adequately the Grand Canyon. In fact, so far as we know no one has been equal to that task. But in a book called "The Titan of Chasms," the author has this to say:

"Stolid, indeed, is he who can front the awful scene and view its unearthly splendor of color and form without quaking knee or tremulous breath. An inferno, swathed in soft celestial fires; a whole chaotic under-world just emptied of primeval floods and waiting for a new creative word; eluding all sense of perspective or dimension, outstretching the faculty of measurement, overlapping the confines of

definite apprehension, a boding, terrible thing, unflinchingly real, yet spectral as a dream. The beholder is at first unimpressed by any detail, he is overwhelmed by the ensemble of a stupendous panorama, a thousand square miles in extent, that lies wholly beneath the eye, as if he stood upon a mountain peak instead of the level brink of a fearful chasm in the plateau, whose opposite shore is 13 miles away. A labyrinth of huge architectural forms, endlessly varied in design, fretted with ornamental devices, festooned with lace-like webs formed of talus from the upper cliffs, and painted with every color known to the palette in pure transparent tones of marvelous delicacy. Never was picture more harmonious, never flower more exquisitely beautiful. It flashes instant communication of all that architecture and painting and music for a thousand years have gropingly strived to express. It is the soul in Michael Angelo and of Beethoven.

"A canyon, truly, but not after the accepted type. An intricate system of canyons, rather, each subordinate to the river channel in the midst, which, in turn, is subordinate to the whole effect. That river channel, the profoundest depth, and actually more than 6000 feet below the point of view, is in seeming a rather insignificant trench, attracting the eye more by reason of its somber tone and mysterious suggestion than by an appreciable characteristic of a chasm. It is perhaps five miles distant in a straight line, and its uppermost rims are nearly 4000 feet beneath the observer, whose measuring capacity is entirely inadequate to the demand made by such magnitudes. One can not believe the distance to be more than a mile, as the crow flies, before descending the wall or attempting some other form of actual measurement.

"Here brain knowledge counts for little against the illusion under which the organ of vision is here doomed to labor. Your cliff darkening from white to gray, yellow, and brown as your glance descends, is taller than the Washington Monument. The Auditorium in Chicago would not cover one-half its perpendicular span. Yet it does not greatly impress you. You idly toss a pebble toward it, and are surprised to note how far the missile falls short. By and by you will learn that it is a good half mile distant, and when you go down the trail you will gain an abiding sense of its real proportions. Yet, relatively, it is an insignificant detail of the scene. Were Vulcan to cast it bodily into the chasm directly beneath your feet, it would pass for a bowlder, if, indeed, it were discoverable to the unaided eye.

"Yet the immediate chasm itself is only the first step of a long terrace that leads down to the innermost gorge and the river. Roll a heavy stone to the rim and let it go. It falls sheer the height of a church or an Eiffel Tower, according to the point selected for such pastime, and explodes like a bomb on a projecting ledge. If, happily, any considerable fragments remain, they bound on ward like elastic balls, leaping in wild parabola from point to point, snapping trees like straws; bursting, crashing, thundering down the declivities until they make a last plunge over the brink of a void; and then there comes anguilly up the cliff sides a faint, distant roar, and your boulder that had withstood the buffets of centuries lies scattered as wide as Wycliffe's ashes, although the final fragment has lodged only a little way, so to speak, below the rim. Such performances are frequently given in these amphitheatres without human aid, by the mere undermining of the rim, or perhaps it is here that Sisyphus rehearses his unending task. Often in the silence of night some tremendous fragment has been heard crashing from terrace to terrace with shocks like thunder-peal.

"The spectacle is so symmetrical, and so completely excludes the outside world and its accustomed standards, it is with difficulty one can acquire any notion of its immensity. Were it half as deep, half as broad, it would be no less bewildering, so utterly does it baffle human grasp."

Well, we had seen the Grand Canyon. And we will never forget it. Oh, how our legs ached! Why, for several days afterward we could scarcely walk. We preferred to sit down and take it easy. Even after getting to Los Angeles we could scarcely go up and down stairs. Mr. Root didn't complain any, but we knew from the way he walked—sort of softly like, as if fearing to step on a nest of eggs—he must be pretty stiff and sore.

It had been announced that in the evening there would be a praise service in the hotel parlor. So at about 7:30 a number gathered again and sang for an hour. And so closed a Sunday at the Grand Canyon.

But, hold on! It wasn't closed, either, for it was reported that one of our bee-keepers was missing! Think of it! He might have fallen over the precipice into the Canyon!

It was Mr. Kluck. Some one had seen him start down the trail at 5 p.m. It was now 9 o'clock, and no Mr. Kluck could be found. Mrs. Kluck was worrying about him greatly in the car. So we and some others began to consider starting a searching party down the Canyon.

By the way, there is a private telephone that connects with the tents down in the Canyon below. But after much vigorous ringing it was impossible to raise any one at the lower end, so we could not inquire whether or not Mr. Kluck had been there.

But in a little while who should come stomping in but Mr. Kluck himself? He had walked down to the tents and back since 5 o'clock! It must have been a very dangerous trip after dark.

We felt quite certain Mrs. Kluck would settle the matter with her re-discovered partner just as soon as she found a suitable time and place. He will hardly runaway again—not soon. He seemed quite willing to sit very still all the next day, evidently meditating—and resting his tired legs.

It was during a meal at the Grand Canyon hotel that Mr. Root turned to a young lady boarder, who had just seated herself beside him at the table, and said, "Can I have some pudding?" He evidently was in deep meditation, and thought it was a waitress who had just come his way. The young lady didn't get him any pudding!

During both nights at the Canyon we were awakened by the most unearthly sharp cries, or barks, we had ever heard. We at first thought it might be Indians, but discovered later that it was a bunch of coyotes holding a midnight "convention." Evidently one of their number was trying to introduce some amendments to the Constitution, and the rest of the crowd objected, and all spoke at once! We don't say that was really the cause of their trouble, but surely there was trouble, if we might judge from the coyotic sounds that pierced the midnight air.

On Monday morning, at 9:15, the car started back to Williams, arriving there about noon. Next week we will go on to Los Angeles.

## Convention Proceedings

### The Los Angeles Convention.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 598.)

Mr. J. A. Reed then spoke as follows, on

#### THE CITRUS FRUIT EXCHANGE—ITS WORK AND METHODS.

I will say, to begin with, that the citrus fruit industry dates back quite a number of years in Southern California. Some 12 or 15 years ago, when I first commenced to know something about this industry, there were, comparatively speaking, few oranges shipped from Southern California. The men who owned oranges in those days had little difficulty in selling them. It was the custom then to go out and examine a man's orchard, see about how many oranges he had, and then make him a lump offer for his orchard. There were a good many buyers in the field; they had money, and it was a speculative business. That was by the commission men, and these men paid them good returns.

It was not difficult at all to sell oranges in those days, because there were a good many buyers in the field, they were competing against each other, and there were, comparatively speaking, very few oranges. The demand was more than the supply. But on account of the prices they received for their oranges, there was no inducement for men who came here with money to set out orange groves.

In a few years, from shipping a few thousand cars, we had anywhere from 15,000 to 16,000, and after a few years we had 26,000 car-loads shipped out of Southern California. When the oranges began to increase, we found that the buyers were not nearly so anxious to buy. One reason was, that they could not make as good profits as they had been doing; another reason, they said, was that the orange growers were like all other growers all over the United States—they were not business men, were not capable of handling their own business. All they could do would be to organize to look after their products in the East.

There was an organization formed, the object of which was to do away with competition from the buyers, and they laid out certain districts, simply took and handled the fruit for us, and made the grower a good return as their conscience would allow them. Several years ago, the more oranges they grew the poorer the grower became at the end of the season. On man, of whom I can tell you, had a good crop, 12 car-loads, and when he got through the first year's business he owed the firm \$1800 for the privilege of growing and shipping. This is one instance.

In order to assert their rights, and get something for their labor, they realized they must organize, that they must get together, and co-operate, and the only way to co-operate was to get every grower who would join in with the

co-operation, and the question came up, How best to organize? In producing honey, I do not suppose there are near the difficulties that there are in the orange business, for this reason: All over Southern California we have different climates, different soils, and it does not make any difference where you go, which one of these localities, that was the one which was producing the best oranges that could be grown. A man would say, "I am not going to pool my fruit with any man down below Los Angeles, where they produce dirty, cheap trash." Another said, "I am not going to come in, for I have the finest fruit grown." Another said, "We have no black scale, our fruit don't need washing, don't need any cleaning." We found the best way to do was to organize them into localities, let each locality have its own organization, and let each organization be composed of the growers.

A great many organized on the basis of acreage, claiming that a man who had 100 acres had more right to say what the association should be than a man that had 10 acres. There were a number of the different local associations organized on the basis of acreage, and others on the number of boxes produced; it did not make much difference how they organized, so that they got together and organized and co-operated. The difficulties that came up were these:

"Why, you have got nobody connected with your organization that knows anything about selling fruit." But we did have men here who had business training, business sense, and they got together and said to the orange growers of Southern California, "We certainly have men who have business ability, and being orange growers they certainly can manage and run our business for us."

A great many said, "It never will succeed, because we did not go out and employ the so-called commission man, who had for years run this business, and get them to run it." But we said, "No; it was right that the orange growers should be the men to manage their own business."

We started with organizations in different places. There were many sections that did not organize. Many said we will just lay back and take advantage of these fellows who are going to do so many wonderful things; we will sell our fruit, and let them hold theirs, and see who is the loser. So, no completed organization was effected, and we thought best to do this: Make an organization in each locality; let that organization look after the local part of the work; let it be composed of the growers that are directly interested there. And that was done.

Local organizations came together and incorporated, and after they incorporated one said, "It is pretty hard to transact business." So we found it best to have the local organization responsible for the material which it bought, and also responsible to its individual growers (members). Then we found these organizations had to be bunched together in district exchanges. Each county was entitled to one. Wherever there was a large enough acreage in the county we allowed two or three in the county. A number of these local exchanges said: "We must have a head to us." Therefore they got together and selected one man from each one of them, and they elected one member a director in the Southern California Fruit Exchange. They got together, that is, and elected one man to represent that locality at the Exchange. Then the exchanges got together, and from their number, the directors selecting one to the Southern California Fruit Exchange. This was called the head of the institution, and that was made up of six different exchanges, comprising citrus fields from Taylor County on the north as far as San Diego County on the south, including Santa Barbara, Ventura, and all the different counties within that district.

We adopted a method that had been in vogue among the commission sellers, seeing that the only way to sell was to sell in the manner in which they sold heretofore. We followed them for a year, but found that it was not the thing to do. We then sold our oranges on what was called the f. o. b. plan, but we found that did not work successfully in the interests of the grower; therefore we abandoned that, and adopted a new plan and called it selling the fruit delivered. We ship our fruit, and have for some six years under that plan. The plan is this:

We get the local organization to say how many car-loads of fruit, when the fruit is ready to go, and when they want to ship it. The different localities vary in that, and we have to work and protect as far as possible each locality. The local association employs the labor that is necessary to put the fruit on board the cars. They then turn around and deliver the fruit to the local exchange, and the local exchange bills it to the Southern California Fruit Exchange, and they employ an agent in the East, and they look after

the general part of the selling. That makes the selling of it no difficulty, if it is all under one head. We found that the only way we could do, instead of hiring men in the East that were directly interested in the sale, was to hire men that were competent salesmen, pay them good salaries, put them under bond, and allow them to sell the fruit to the highest market price as fast as it was shipped to them. And we have been successful. For I say to you that there is no organization in the world composed of producers that has the reputation for doing anything like what the Southern California Fruit Exchange has done.

Not counting this year, but five years previous to this year, we transacted a business of \$25,000,000, and our financial losses were less than  $\frac{1}{4}$  of 1 percent—something. If you will ask your bankers East, or any place, to give you a record of anything of the kind, they can give you nothing, because it is a wonderful record.

The California Fruit Exchange is made up of producers that have been successful. There were always some growers that would not unite with the Southern California Fruit Exchange, and that would rather sell their fruit on board cars in California than to ship to Eastern markets and take their chances there. We issued a circular for years, showing that we could show better results than selling f. o. b. California, for this reason: In shipping East we did away with trying to encourage the producer to gamble on the future. No class of farmers make a greater mistake than those who are trying to speculate and gamble. Grow your product; put it on the market, and that is all the producer is entitled to. If he undertakes to hold it one year, or two years, or three years, he is gambling, and it spoils him if he once wins, generally speaking.

This exchange has done more towards helping the industry than anybody not familiar with the facts can realize. I remember in the bank where I was engaged, that it was almost always slow money on orange land. The first question asked was, "What did you realize for your crop last year?" and the majority had to acknowledge that they realized nothing out of their crop.

How can you expect to borrow when you can not show how you are going to pay interest? You can not do it. As soon as the organization was effected, the banks all over Southern California came to the association, and said: "If you have any growers who desire any money advanced to them on their crop, we are willing to advance any reasonable amount of money." Within two years it was altogether a different proposition to go to the bank and borrow money, from what it had been. I claim it was altogether on account of the organization, because it placed the industry on a sound basis.

Of course, there is always more or less trouble and dissatisfaction in any organization of this kind. Each man, whether a producer or a seller, has a part to perform, and unless he does his part, and does his part well, you can not expect good results; but, almost invariably, if you will give me any cause of dissatisfaction or trouble, I will show you that the trouble has been that some one has neglected to do what is right, and to do his duty. If the grower will grow his fruit, put it on the market, he has done what he can; then leave it to the selling agents.

I want to say that on account of a good many of the growers not coming into the Southern California Fruit Exchange, on account of about 50 percent of them always wanting to sell their fruit f. o. b. California, there is always a good deal of competition coming up. For instance, there was about 50 percent of the fruit acreage right in competition with the grower, and the growers themselves were the worst enemies that the organization had in competition, because the commission merchant found he could ship his next door neighbor's fruit and compete with us.

I will speak of the Exchange selling fruit in competition with the outside shipper. If he can get his money he has done his part, and the other fellow must take the chances and risk. Every man does that who goes into the market. We do, and, of course, if he can not sell it one way he will sell it another.

One of the easiest ways to sell fruit is to cut the price—that is, a great many people believe that, and almost as soon as our car strikes a market, there is another car on the track. We have a great many times met competition, and sometimes have cut the price. A proposition came to us last winter to do away with the cutting of prices. The outside shippers got together and formed what is now called the California Citrus Union. They came to the Exchange and said, "We do not want our growers to give up their idea of selling their fruit. We want to come with you and form

what is known as an agency, so that nearly all the product can be sold through one medium."

In April last we formed what is known as the California Fruit Agency, which was a combination of the two. The outside shippers forming themselves together and fixed the prices for packing and putting the fruit on board the cars, thereby becoming nothing but packers virtually, and the California Fruit Exchange retaining its membership and running its business as it had been doing.

This last year you may hear of as a disastrous year. I want to say to you it was largely due to two or three facts. We must all admit that sometimes climatic conditions are such that we do not grow as good fruits as others. I do not know whether that occurs in producing honey or not. I suppose it is all sweet, and sticky, and you never have any poor honey. But some years we have better fruit than others, and this last year we didn't have as good fruit by far as the average California fruit. This condition led the growers to believe if they would hold off they could get better prices. A great many growers held off, and all waited until late in the season. A great many were deceived in regard to the amount we had. Up to the first of May we had shipped less, but during the month of May we shipped a larger number of oranges out of California than we had ever shipped before in the history of the industry. It was a mistake to hold back. We missed out on the market, and the consequence was that all over the United States oranges sold lower than for years, and the fruit did not carry as well.

I will venture to say, if you will go over this entire country, you will find that those who have not received good returns can lay it to the fact that they held the fruit and shipped it late. A proper distribution is a wonderful thing for the producer, and if you can so arrange what you produce that you can put it out during the period it is consumed, you can get better results than to crowd it all into a short space of time.

I do not know that I can say anything more to the beemen, only this: That if the bee-men of this State, or of the United States, would get together on a plan of co-operation, I dare say you will have no trouble in getting good results and good prices for your honey. Without co-operation, I can only see how once in a while a man can get the results that he would get if all combined and worked together. A single individual may want to stand out. Do not stand out in the organizing because of one or two men that are not willing to come in. If they won't all work together, get together as many as you can, and, if you can, transact your own business, get fair results, and do it at a medium cost.

The old-line packers used to get 45 and 50 percent for putting it on board cars; they used to charge 10 percent commission for handling the fruit. Since the organization of the Southern California Fruit Exchange we have reduced the cost—the net cost. The cost of labor has advanced, material is reduced about 2½ cents a box, but we have reduced the entire cost 15 to 18 cents a box. That means a saving of hundreds of thousands of dollars to the growers. We have reduced the cost on an average to about 6 or 7 cents per box—the entire cost, I am speaking about; so you can see what we have accomplished by organization, and what we have saved the growers and producers.

If you will organize and select good men to transact your business, there is no reason in the world why the honey-producers of this country should not make as good a record as the orange growers have done in Southern California.

J. A. REED.

(Continued next week.)

**Proceedings of the Texas Bee-Keepers' Convention Held at the A. & M. College, at College Station, July 8 to 10, 1903.**

BY LOUIS H. SCHOLL, SEC.

(Continued from page 599.)

**TEXAS APICULTURE A PROFITABLE INDUSTRY.**

First, I wish to say that, according to the last census, Texas is now the leading State in the production of honey and the value of apianarian products. According to the census, Texas produced, in 1899, 4,780,204 pounds of honey and 159,690 pounds of beeswax, with a value of \$468,527. The number of farms reported keeping bees was 60,043, and the number of colonies kept was 392,644. Texas leads in the production of honey by over one million pounds. Bee-keepers from other States are learning of the vast honey-resources of Texas, and are coming every year, and soon I

expect to see all the territory covered by bee-keepers. Great numbers of bees are being brought into the State, and all bee-keepers are increasing their present stock, so that it is only a matter of a few years until the territory will be stocked.

The industry is also a profitable one. Colonies yielding from 50 to 150 pounds of honey a year, which sells at from 5 to 9 cents per pound, so that the income is considerable. The value of the yearly increase, and the value of the beeswax, ought to keep up the expenses of the apianary, so that the honey money may be considered as that much above expense.

The farmer who cultivates one hundred acres in cotton will make, perhaps, if everything is favorable, some 35 bales of cotton, worth about \$8.00 per bale profit, on an average, or \$280 gain for the year; the stockman, with his 1000 acres, may make \$1000 clear in some years. In other years, he has to feed, and low prices for beef cause him to make nothing. The physician may book \$3000, and perhaps may collect \$1500; the truck-grower may make from \$1000 to \$2000 in some years on his melons, beans, onions, and cabbage, and then a succession of droughts and he loses all he has made. The lawyer may get some good fees, and make a handsome amount of money. Then, again, in some other years the citizens are so law-abiding that he almost starves to death. But, gentlemen, the bee-man never has a failure, never knows any want, but with his 1000 colonies rarely ever clears less than \$5000.

In nearly all parts of Texas bee-keeping pays, yet it pays best in Southwest Texas, where the conditions are especially favorable, and where the flora is best adapted to the bees. Southwest Texas has never known an entire failure, something that can not be said of any other State, to my knowledge. There is always a crop of honey, more or less, so that the industry may be said to be a stable one, and one on which you may depend upon for a good living in Southwest Texas. I believe Southwest Texas to be the best bee-country in the world.

In Southwest Texas there are millions of acres of land on which there are no bees to cover it, and consequently there are millions of pounds of honey going to waste annually. There is plenty of unoccupied territory, and it only awaits the coming of the bee-man with his bees, to be indeed and in truth the greatest honey country on earth.

In coming to Southwest Texas, we would ask that you first come and look for yourself, and then pick an unoccupied location where there will be no kicks from the man who is already established. It is not only not right, but it is pound foolish, to put down bees near another man when there is so much unoccupied territory as there is in Southwest Texas.

In conclusion, I invite all who wish a pleasant and profitable business to come to Southwest Texas and engage in bee-keeping, starting in with a limited number and increasing your bees as you learn the business. We have good faith in the industry in our part of the country, and we invite all doubters to come and see for themselves.

O. P. HYDE.

**REPORT OF COMMITTEE ON RESOLUTIONS.**

*Resolved*, That we, the Texas Bee-Keepers' Association, in regular session assembled, extend our thanks to the retiring officers for the faithful way they have discharged their duties.

*Resolved*, That we request our Secretary to extend all aid possible to organize branch and local bee-keepers' associations, and assist those already organized.

*Resolved*, That we extend our thanks to Pres. J. H. Connell and Prof. B. C. Pittuck, Secretary, for the faithful way in which they have arranged the entire proceedings, and for their untiring effort to entertain all who attend the meetings of the Farmers' Congress.

*Resolved*, That we extend our thanks to our entomologist, Prof. E. D. Sanderson, and to his assistant, L. H. Scholl, for the great interest they have taken in our work, and assisting us in every way possible.

*Resolved*, That we extend our thanks to Prof. F. W. Mally, Prof. E. D. Sanderson, and Prof. Wilmon Newell, for their speeches on thorough organization, etc., and for assisting us in other ways.

*Resolved*, That every member of the Texas Bee-Keepers' Association feels that we are fully paid for our time and expenses for our visit to the bee-keepers' convention and the Farmers' Congress.

## Contributed Articles

### Stimulative Feeding of Bees in Spring.

BY ARTHUR C. MILLER.

ON page 518, Mr. Dadant says he will not write further on the subject. That is to be regretted, for if he will take the pains to go into details, I believe he can shed more light on an, at present, very obscure matter.

His recent articles on the subject give the impression that he is firmly convinced that there is a substantial profit to be derived from such stimulation. Unfortunately, he has failed to give sufficient data to enable the rest of us to go and do likewise, and, when criticised, has resorted to sophistry instead of giving facts and arguments. This may have been unintentional, but generally impresses the reader as being an attempt to save a lost case.

I write this article in the form of a reply to Mr. Dadant, because his articles voice a widely accepted belief, or beliefs, which I consider erroneous. It may be impossible to express myself so that no construction of personal antagonism will be inferred, but I desire solely to get at facts, not to irritate any one.

Frankly acknowledging that colonies may be stimulated to more rapid growth by feeding, I hold, in common with many others, that it is not profitable. Or, to state it differently, other systems of management produce greater gross returns and at a lesser cost.

Before discussing the economy of it, let me allude to what is assumed to be the effect of the food on the life and actions of the individuals comprising the colony.

In Mr. Dadant's article (page 518) I find this: "Feeding enhances breeding because the bees are stirred up by it, and because the queen is offered food more plentifully whether it be royal jelly or honey." (My italics). In a previous article, Mr. Dadant said it was nectar.

I assert that bees never offer food to the queen, and I know whereof I speak. The bees that show their tongues are seeking food, not offering it. The sooner bee-keepers learn this, the sooner they will solve several otherwise troublesome problems.

As I partly explained in my former article, the bees' attitude toward the queen is not one of deference, but one of obedience to two simple laws, *i. e.*, making way for deliberately moving bees, and desire for a particularly palatable food, the odor of which emanates from the queen's body. Mr. Dadant cites the circle about a queen on a comb held in his hand. Such a condition is not normal, and an exposed comb and the customary single-comb observation hive are very poor contrivances for the study of bee-life. If the curious bee-keeper would see the real attitude of workers toward the queen, let him watch her in the crowded clusters between the combs. The bees push her, scramble over her, and stand in her way until her steady movement forces them aside, and even then they won't always move. When she needs food she goes about with her antennae apparently more active than usual, acosting bee after bee, until at last one is found with the necessary "pap." Sometimes a long "talk" ensues, but when the bee is ready to yield her supply, the queen's tongue advances, and is placed directly in the other bee's mouth, the latter's tongue not having been unfolded at all. Then the "show of tongues" by surrounding bees occurs.

The assumption that the slow and steady supply of food to the colony causes the bees to offer to the queen more food, being found to be wrong, how are we to account for the increased laying? The stimulus which incites the queen to lay her first egg (after the winter resting spell) may never be determined, but certainly, as she has deposited an egg, her system calls for a restoration of tissue; this means hunger, slight, perhaps, but still existent. As soon as this hunger becomes great enough it forces her to seek food. At the time we are considering she may, and very probably does, have to apply to many bees before finding any that can supply her even a little "pap." As the number of bees having such supply increases, so the queen's laying increases, because she can more readily obtain the necessary food.

Generally, when bees are obtaining nectar we find breeding increasing in a ratio with the increase of young bees, not in a ratio with the inflow of food.

If it is not the direct action of the nectar-flow (or feeder-flow) on the queen via the feeding-bees which stimulates the queen, why does the accession of food stimulate brood-production?

It "stirs up the colony," which, explained, is: The bees consume more honey, and necessarily produce more heat, become less densely packed, and the queen, being but a part of the whole, also moves more, finds more food, is more often able to eat to satiety (the normal way of animal life), and therefore lays more eggs. As the young bees become more numerous, hence more quickly found; also increasing heat and open cells of pollen and of honey incite the young bees to full feeding, and the more they eat the more likely the queen is to get all she wants at each request. But even the well-fed queen is not constantly at egg-laying, even in the height of the season. Not infrequently she will retire to some obscure corner and stay perfectly still for ten or more minutes at a time, and during such rest the bees pass and repass as if she was but an ordinary worker. Perhaps she is waiting until they find some more "respect" or "deference."

Most apiarists are familiar with the slowness of brood increase in a colony composed of all old bees, no matter how good the supply of nectar and of the sudden acceleration of egg-production on giving the colony a frame of emerging brood.

Also, all apiarists are, I suppose, familiar with the usual almost total cessation of egg-laying before a swarm issues. Young bees are abundant then, and nectar and pollen fairly pour in. If, under such circumstances, the bees so assiduously offer food to the queen, how can she stop the egg-development? It will not do to argue that bees stop offering food to her and yet continue all their other functions.

A brief comparison of the differences in internal conditions between big colonies with superabundant stores (the kind Mr. Dadant said produces the most honey) and less populous colonies, with but moderate stores, may be appropriate here.

In colonies of the first type, when winter breeding begins (the latter part of December), food is plenty and readily accessible, bees are numerous, cluster temperature steady, and the brood-nest is soon surprisingly large for the time of year. Towards spring young bees form quite a respectable percent of the colony, and are steadily increasing. It is these young bees which make this type of colonies to breed so rapidly later on. Practically all of the winter-hatched bees must, as regards nursing ability, be regarded as "young" when early spring arrives, for a bee's age is measured by time elapsed plus work done.

With the smaller, or more scantily supplied colonies, everything is conducted on a more meager scale, and later, when stimulation is usually resorted to, they are away behind the first type of colonies, and it takes a ruinous amount of fussing to get them into shape for the harvest.

In other words, by putting into winter quarters big colonies with superabundant food, we conserve for next year much of this season's stored energy. By limiting stores, or by having smaller colonies (so as to economize (?) in food, some say), we lose much of such energy—an absolutely dead loss.

With the foregoing cursory explanation of the inner life of the colony, I will leave that part of the subject and turn to the economy of stimulative feeding. To be profitable it must enable us to get from the stimulated colonies enough more honey than from the normally big and unstimulated ones, to pay for the food, and the labor and time of the apiarist. Mr. Dadant, in "Revised Langstroth," says of his large, well-supplied colonies, "They did not have to be fed the following spring, became very strong, and yielded the largest crop." (My italics). Also, he states that further experiments proved "that there is a profit in leaving to strong colonies a large quantity of honey, so that they will not limit their spring breeding." (His italics.)

I cited these quotations in a former article, to which Mr. Dadant replied by quoting from an earlier edition of "Langstroth," that he (Langstroth) favored spring feeding. If this advice of the great master was so valuable, why did Mr. Dadant omit it from his revised edition, and, instead, put special emphasis (by italicizing) on the exact antithesis of it?

Mr. Dadant cited the feeding of 60 colonies last spring, and attributes much of his crop of 300 pounds per colony (average) to such feeding. Hath the fox lost his cunning? Has Mr. Dadant so soon forgotten the studious care and painstaking comparison which, I understand, his father exercised, and by which the son is supposed to have profited? Had he divided the apiary into two equal parts, had one-half well-supplied over winter, and stimulated the other

half in the spring, then had the fed half surpassed the other, the evidence would have been worthy our consideration.

Mr. Dadant quotes his foreman as saying that there is not another apiary in the vicinity with such a crop as his, and leaves us to infer that it is entirely due to stimulation. But that the excess over his neighbor's averages (which he does not give, so we cannot tell the percent of his gain) was due to such stimulation cannot be granted without more evidence than has yet been presented. The difference between his average and his neighbor's may have been 10 pounds or 200. The difference may have been due to feeding, to manipulation, to fall condition of colonies, to wintering, to strain of bees, or to locality.

Mr. Dadant has cited the difference fall condition produces, and we all know what manipulation may do, or undo; also the marked difference in various strains, and, as for locality, it is so disturbing an element of calculations as to be used as a general scapegoat.

I know of two apiaries, just one mile apart, both in the same river valley, both possessing apparently the same chance for forage, both managed the same way, and both in former years yielding closely similar averages. This year one of these apiaries has not yielded one pound of surplus, while the other will average, approximately, 40 pounds. I think Mr. Dadant will see he is asking a good deal when he expects us to concede that the evidence of his crop taken alone, and without the support of comparative tests made under the same conditions of locality, time, etc., is proof of the value of stimulative feeding, particularly when he has said repeated experiments in the past prove the fall plan the most profitable, *i. e.*, "such colonies produced the largest crops."

According to his own statement, the country covered by his apiaries (and presumably by his neighbors'), varies greatly in its yields in different parts in different years. We consider this when he talks of his excess over his neighbors being due to stimulation; he seems to have forgotten it. I would refer him to the "A B C of Bee-Culture," edition of 1901, page 239.

I can not find that he has ever given the cost of food and labor for stimulative feeding. He asserts that bees must be fed only at certain times. He also says, "We do not practice feeding every year, because it requires a great deal of attention on the part of the apiarist, and I like to look after this myself, and do not always have the time." (My Italics.) From this I deduce that his apiarist, and the rest of us ordinary bee-keepers, lack the time to succeed (I supposed he was advocating the practice for readers of the Journal), and also that the percentage of increase in the crop is not enough to pay him to take the necessary time annually; in other words, something else pays better.

That is my point exactly—other things pay better. I find the labor of preparing bees for successful wintering will simultaneously prepare them to reach the next harvest in prime shape. No extra labor at all, while spring stimulation is all extra labor, and at a season when time is very valuable. In other words, fall conservation is productive of better results than spring stimulation, and without the latter's cost in time, labor and risk. For it is a risk to limit the supply of food of big colonies, and it very decidedly does not pay to winter any but big ones, or to fuss with any small ones in the spring. In most localities the amount received for the extra honey taken from the colonies in the fall will not pay for the food and labor of giving it, necessary the following spring. Besides all this, stimulation does not always result very favorably; the common people can not always succeed, while the other way is *always safe*, and repeated experiments have proved it profitable.

Providence Co., R. I.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

The Premiums offered this week are well worth working for. Look at them.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Bee-Keeping Lessons By Mail.

A sister correspondent, who has a text-book on bee-culture, but evidently takes no bee-journal, writes thus:

"I am so anxious to learn I only wish I had some one to ask questions, who understands bees thoroughly. Would it be possible to give a few lessons by mail, for which I would be glad to pay?"

"Our Bee-Keeping Sisters" department, also "Dr. Miller's Answers," in the American Bee Journal, are intended to meet this very want, and the dollar a year paid for the Bee Journal would be much less than you could possibly get such information by private correspondence. Any question asked pertaining to bees will be cheerfully answered in these departments, free of all expense, as far as there is ability to answer.

### A Sister Wishes to Begin With Bees.

We have a hive near the house that has not been worked with or cared for, in four years, that I know of, and how much longer I do not know; but the parties said they never realized any good from them, and little wonder. I have made up my mind to give them some attention, which will not be much, and I don't know the first thing about them; still I sit and watch them work, and find it very interesting.

1. The bees are inclined to stay on the front part of the hive. What is the cause, and what shall I do?
2. Would I better put part of them into another hive, as there seems to be so many? or can such a thing be done? If so, how? and when is the best time?
3. Is it best to put in the one-pound boxes with the cells in or out?

LILLIAN M. MORGAN.

Washington Co., Nebr., Sept. 3.

1. It may be that they need more room. It may be that the hive is too close, and they need ventilation. Give them sufficient surplus room, and raise up the hive for ventilation. It is now so late in the season that you will probably not need to do it this year.
2. Don't think of dividing them now.
3. It is best to use comb foundation in sections, as that is probably what you mean by "cells."
4. A movable-frame hive, the dovetailed hive being one of the most popular.

### Report from a Blind Sister.

I wrote early in the spring of 1902, saying that my bees were all dead, and offering the hives for sale. From something I wrote some of my bee-keeping friends inferred that I was in needy circumstances. I had queries and offers of help from several dear people. I wish to thank them, and tell them how much I appreciate the kindly thoughts; but I wish to say that I have a good home and good children to care for their parents and the property. My object in selling the hives was to help some one else, as well as to keep good property from going to waste. I had several inquiries about the hives, but I discouraged their being sent for from distant points, thinking the freight would be greatly against the purchaser.

As the spring days grew warm I began to work with the empty hives. It was something I could do out-of-doors. I had been looking for some out-door work that I could do ever since blindness had come upon me. So day after day, as my feeble strength permitted, I felt my way about for the hives, cleaning them, sorting frames, and sorting those that needed an extra nail. I daily gained in strength. The walnut trees under which I worked began to throw a shade as their new leaves opened. When I had cleaned all except the 15 just taken from the cellar, I began on those. I had noticed a few bees flying about, and supposed they came from a colony half a mile away, belonging to a neighbor. But late in May, when the last hives were reached, I found

to my joy that there were living bees in two of them. I now have 8 strong colonies, 4 of them queened by the best red clover queens.

But to go back to my cleaning: As I continued to live out-doors, early in June I noticed that I could often see the outlines of things, and in some favorable light could see a moving object, and tell if it was a white cat or black chicken. Then, when I had cleaned all my hives, and sandpapered a few that were weather-beaten, I painted everything a cream white—hives, supers, and all.

The small amount of sight is only in one eye, but I can go to every hive in the bee-yard, and not much danger of falling over it, if I look carefully, as I can see nothing quickly, not even a bee-hive.

Although it has rained incessantly here, we have our first white clover honey harvest, some of the colonies yielding as much as 80 pounds of the beautiful product. So the dear daughters, who have so kindly loaned me their busy hands, and often tired eyes, to help care for my pets, feel well repaid for them.

MRS. B. J. LIVINGSTON.

Martin Co., Minn., Sept. 3.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### FEEDING BACK NOT GENERALLY PROFITABLE.

Producing two crops to secure one, is what Doolittle calls the feeding-back tactics. And he finds those who don't succeed at it greatly to outnumber those who do. Puts himself with those who can just barely succeed at finishing up sections nearly done. Candying in the comb is a bad trick, and the fed-back honey is much worse at it. Page 493.

### SURE METHOD OF FINDING QUEENS.

The Davaport method of finding a queen "whether or no"—shaking all the bees through a zinc-bottomed empty hive—is clearly one of the best methods in sight. Page 501.

### MARKETING UNRIPE HONEY.

We were mighty lucky that it was only buckwheat extracted honey that got killed. Had there been no chance to discriminate, I fear the big users that were bitten would have abandoned the use of all honey. And still the seller is going to continue to think that if he can make a sale he is all right. Far from being all right if he has killed off a future sale. This specially affects those who retail in their own fields. We must nurse our customers instead of poisoning them. Very little indeed do many of them know about honey, and we, if we understand where our bread is buttered, will post them honestly and truly. That there is a difference between ripe honey and unripe honey, and how that difference comes about—I suspect that even some of the big buyers need instruction solely on the point. Page 501.

### QUIRRE A DIFFERENCE.

In my Afterthink, page 505, it's not "improvement" but imprisonment that the long-caged queen would be getting.

### OUR OWN WAY THE BEST WAY.

"Twas ever thus. The Mississippi beginner knows it's better to put the bees gently in the top—his way—rather than run them in the entrance—Dr. Miller's way. Of our own way is the best for us, just because we put so much more of ourselves into it. Nice that there are in the language such words as "our own," and "mine," and "my way." Page 506.

### GETTING SWARMS FROM HIGH TREES.

Yes, Ernest Root, hurrah for that swarming-time belt to fasten sag and pruning-shears and coil of rope to—other tools *ad libitum!* But the smoker—you'll start with the wood of that next your precious hide, but when just in the most interesting part of the climb up that tall tree an earnest and fiery—Ouch! will tell to all below how that smoker contrived to whop around. I have some basswood trees to take swarms out of, too. The extreme and dangerous brittleness of basswood limbs decidedly increases the difficulty—cept

when the swarm itself snaps the limb clear off, and it falls to an easier location. Page 510.

### VARNISHING FOUNDATION WITH PROPOLIS.

An editorial, on page 515, says bees put a layer of bee-gine all over section foundation when put in too late and left. That's right—but possibly it might be "righter." Should we not learn to discriminate between what bees intentionally do and what they unintentionally do? (Granted that in the economy of Nature one class of doings may serve just as an important a purpose as the other.) Bees intentionally stop all cracks with propolis as fast as they can—round out corners—fill rabbits—and mix the propolis with the wax of bur-combs. Sometimes they put great dabs of it on the sides of the hive, apparently because they consider it precious, and still don't know what else to do with it. (In the tree, rotten wall and propolis makes sound lumber.) But varnishing, whether of foundation or of honey-cappings, I don't think they do intentionally. Nearly all hands, when the honey harvest is off and the propolis harvest is on, have their feet more or less dabbled, and the varnish of surfaces is simply the natural result of continually running over them. All the same, it improves matters from the bee's point of view.

### GOOD LOOKS AND CONVENIENCE COST.

I also feel constrained to confess that the symmetry, which is pleasing to the human eye, is, *per se*, more or less of bother and loss to the bee. We arrange for so much good looks, and so much convenience—but have to pay the regulation price for them—quite a bit cheapened to those who let the weeds grow. How disagreeable truth can be, sometimes! My apiary and entrances this summer were *too good* some of the time. Page 515.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Preparation for Wintering Bees.

I am young in the bee-business though not in years. Would it be a safe plan to set one hive on top of another, with say screening between in winter, when wintering in the bee-house? and, of course, packed the same as you would if only one hive were there. Would the moisture from the lower hive be detrimental to those in top hive? Iowa.

ANSWER.—I don't know; you've struck something I never heard of. I hardly believe the moisture from the lower colony would hurt the upper one. Of course, you would have an entrance above as well as below. If you try the plan, please report what success.

### Moving Bees Four Miles.

Can I move 9 colonies of bees four miles south? I expect to move about the last of September, and do not like to let them stand on account of robbing, as there will be no one left at this place when I leave. Some may go back and get lost, or they might not all be home when I move them. Perhaps I can take a cold morning to move them. I am afraid it might amount to a whole colony being left, or going back after being moved. Please advise me what to do about moving them. SUBSCRIBER.

ANSWER.—When bees are moved 4 miles there ought not to be the slightest trouble about any returning so far to the old place. Of course, if any are out in the fields when the hives are moved they would be lost. So, if you are going to move them in the middle of the day, close the hives the night before, or in the morning before bees are flying.

### Late Foul Brood Management.

Your postal card came duly to hand, and I note what you say in regard to our neighbors' bees, that you doubted its being foul brood. I am sorry to say that we have established the fact that it is foul brood, from microscopical examination, found all the symptoms in all the stages, from start to finish, as illustrated in "A B C of Bee-Culture," spores and all. The owner is getting some nice comb honey, and he does not want to disturb them (the bees).

Now, this man is not progressive enough to take "heroic" measures toward stamping out the disease, that is, to destroy his hives, bees and all. There are one or two others not far from here, I think,

whose bees have foul brood, as they have told me that they did not know what was the matter with the bees, as they have not swarmed for two years. I told him that he would most likely find them diseased.

1. Can those bees be transferred into new hives, on new frames of foundation, this fall, after the honey season closes?
2. Do you advise closing up the "suspect" on brood-frames, or can they go and come at will?
3. Will it be necessary to commence feeding at once the imprisoned bees, or can they still gather enough nectar to winter them?

PENNSYLVANIA.

ANSWERS.—1. Yes; but unless you have an excellent fall flow they will have to be fed to take them through the winter.

2. I believe it is not considered necessary to confine them.
3. I don't know what your fall yield is; but it is not likely it is enough for a sole dependence for wintering. At any rate, it will be safer to feed as soon as all diseased honey has been used up in comb-building.

### Kinds of Bees—Wintering.

1. What kind of bees are "Adels?" Are they something the same as Italians, or a distinct race?
2. Do you think they would be better, or as good, as Italians? Mr. Alley says they are not only the hardest and most gentle, but the greatest hustlers for honey. They are practically non-swarmer and non-stinging.
3. Would hybrid black bees rear any better queens than Italian bees? I have one colony that built very large queen-cells.
4. If the hives are contracted down to five or six frames with a division-board, would it be all right to leave frames of pollen on the outside through the winter?

CANADA.

ANSWERS.—1. If I understand it correctly, they are a strain of Italians so named by Henry Alley.

2. I have had no experience with them, so can not say.
3. I don't believe they would.
4. Yes.

### Changing Queens in the Fall.

I have 13 colonies of bees. I started in with 5 in the spring, and they have swarmed so that I had 15. One swarm went away, as I was not at home to attend to them. They have not stored much honey in the supers this season, but I think they have a good supply in the brood-chamber. I think of getting a strain of honey-queens for next season, as I am quite sure those I now have are breeding queens. I am thinking of trying two or three red clover queens, and the same of Italian honey-queens.

We had a good crop of white clover in this region this season, but the bees did not work on it to any extent, and I think there was very little nectar in the clover.

What would you advise one to do in such a case? Would it be advisable to introduce the class of queens I mention this fall, or wait until next spring? I am anxious to improve my stock, so as to procure more honey.

MICHIGAN.

ANSWER.—Don't be too sanguine as to improvement from new blood. Increasing from 5 to 15 is hardly compatible with a very large yield of honey, unless you have a late yield that is heavy. You ought not to have allowed more than one swarm from each colony, and then you would probably have done better in surplus. If there was no nectar in the clover, a difference in bees would not help the case any. It will, however, be a good plan to get one or two queens of different kinds and watch carefully for results, not so much to see what those queens will do as to see what colonies will do when have young queens reared from these new queens.

### Carrying Out Live Bees.

What is the reason that the bees carry out live bees and fly away with them? I am quite sure they are not robbers, as I have only 4 colonies.

PENNSYLVANIA.

ANSWER.—Sometimes a diseased bee is carried out alive, so also a young bee that has been made defective by the ravages of the bee-moth.

### Colonies Strong in Bees but Short in Stores.

I have 6 colonies of bees, two with Italian queens. The progeny of one of the latter seems no lighter in color than the other 4 colonies, what I supposed were black bees. The other Italian brood is pretty golden-colored, and good workers.

During the three of the black colonies were not doing much, I examined all the colonies 10-day, and found 3 of the black colonies with very little sealed brood, none with unsealed brood, one in particular had very little brood, and stores or surplus honey much less than at examination, two weeks ago. The other 2 colonies are also lighter in stores, but in a lesser degree. The two with Italian queens and the other black colony have plenty sealed and unsealed brood, but are not increasing in stores, in fact not quite holding their own. All the colonies I examined I saw only one queen during examination. Have they stopped brood-rearing, owing to being queenless or because there is no honey to gather? The three in question are, two in 8-frame hives, one in a 10-frame hive, and boiling over with bees. What bothers me is, if they cease brood-rearing thus early, would they not

be too weak to winter successfully even with feeding, as will have to be done with their present stock of stores, if a later honey-flow does not materialize.

ALABAMA.

ANSWER.—I don't know just how much difference between Alabama and Illinois, but in Illinois some colonies cease rearing brood quite early in September. The age of the queen has something to do with it; if a colony supersedes its queen late in the season, the young queen will continue laying later than would the old queen if she had not been superseded. If the honey-flow ceases early, that means an earlier cessation of brood-rearing. You needn't worry much about their being strong enough in bees to winter well. If there it no harvest to stir them up to brood-rearing, that means that the bees will keep pretty quiet, and bees don't grow old fast while keeping still. It isn't with bees as it is with you and me; when work stands still with them, age seems to stand still, too.

### Feeding Late Swarms for Winter.

I have four late swarms which are all working nicely; the frames of the hives I put them in had only starters, as that was all I had. If I have to give them a little feed, how much sugar will it take to about a quart of water, or possibly more, to make the syrup to feed the bees?

ILLINOIS.

ANSWER.—To make a syrup for feeding as late as this, it requires 5 pounds of granulated sugar to a quart of water.

### Loss of Bees—Foul Brood.

1. I have lost nearly all of my bees the past summer. Do you think it is the rainy weather or disease?

2. If it is foul brood will the hives be all right to use next year?

CONNECTICUT.

ANSWERS.—1. I don't know. If you mean that a number of colonies died since the first of June, I should be afraid of disease. Rainy weather might hinder the success of bees, but would hardly kill them outright.

2. The hives will be all right, but not the combs, unless, indeed, it turns out that the combs may be made safe to use again by using formaldehyde as a disinfectant.

### Best Kind of Bees.

I have 3 colonies of bees, 2 Italian and 1 black. They are in 8-frame Langstroth hives. I am a boy 11 years of age, and I just commenced keeping bees last spring, and like the work very much.

I am a subscriber of the American Bee Journal, and I like it. I wish you would tell me what kind of bees would be the best for me. I want a gentle kind, and that will store lots of honey. There is plenty of white clover in this neighborhood.

INDIANA.

ANSWER.—Probably Italian bees will suit you as well as any, and it may be that those you have are all right. You can, however, not be sure of that without being able to compare them with others, and it would be a good plan for you to get an Italian queen from some queen-breeder. After a year or so you can decide which bees suit you best, and then rear your queens from the best. Your father must be a very wise sort of a man to allow a boy of 11 to keep bees. I hope you will be very successful. I like boys.

### Caring for Honeyless Bees in the Fall.

1. How shall I care for colonies of bees where they are robbed of their honey after the fall-flow ceases? There are a number who caught bees in boxes and in the sides of houses, and one of my neighbors had a swarm take possession of their washing-machine, where it had been left to drain the water out. These parties expect to kill the bees as soon as they cease to gather honey; I can have them and their brood for taking them out. What I wish to know is: Can I successfully take them and winter them? If so, please give me a little instruction.

2. Is sugar better than honey to feed bees? I have 18 colonies run for comb honey. I put some frames where I took supers off for comb honey to feed the bees if necessary. provided sugar is not as good.

NEBRASKA.

ANSWER.—You will have to use your ingenuity to some extent, as each will probably differ from every other case, depending on how the bees are located. The main thing is to get the bees into the hive, upon their combs of brood, if they have any, the combs being transferred as you directed in your book for transferring. The probability is that you will not have enough combs, and it will be well to help out with frames filled with foundation. Then you will feed with the Miller or some other feeder, according to the general instructions in your book for fall feeding; trying to let each colony have the equivalent of about 30 pounds of honey. That will require about 23 pounds of dry granulated sugar, if you use sugar syrup.

2. There is no better food for bees than good honey, but granulated sugar makes a very good substitute.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

# NOEL SAYS:

If you are sick with any disease of the Circulation, the Stomach, Liver, Kidneys, Bladder or Throat, VITÆ-ORE WILL CURE YOU!

NOEL is the discoverer of Vitæ-Ore, has been familiar with its wonderful properties for two generations, has watched its remarkable action in thousands upon thousands of cases, and HE KNOWS.

NOEL SAYS he doesn't want your money unless Vitæ-Ore benefits you, and NOEL is old enough to know what he wants. NOEL says that the Theo. Noel Company has instructions to send in enclosed one Dollar package on thirty days' trial to every sick or ailing reader of THE AMERICAN BEE JOURNAL who requests it, the receiver to BE THE JUDGE, and not to pay ONE CENT unless satisfied, and NOEL is the President and principal stockholder of the Theo. Noel Company, and what HE says goes. Here is his SIGNATURE ON IT!

*Theo Noel*

## PERSONAL TO SUBSCRIBERS!

WE WILL SEND to every worthy sick and ailing person who writes us, mentioning THE AMERICAN BEE JOURNAL, a full-sized \$1.00 package of VITÆ-ORE by mail, POSTPAID, sufficient for one month's continuous treatment, to be paid for within one month's time after receipt. If the receiver can truthfully say that its use has done him or her more good than all the ointments and doses of quinine or other patent medicines he or she has ever used. Read this over again carefully, and understand that we ask our pay only when it has done you good, and not before. WE TAKE ALL THE RISK; YOU HAVE NOTHING TO LOSE. If it does not benefit you, you pay us nothing. We do not offer to send you a free sample to last three or four days, but we do offer to send you a regular \$1.00 package of the most successful curative medicine known to the civilized world, without one cent of risk to you. We offer to give you thirty days to try the medicine, thirty days to see results before you need pay us one cent, and you do not pay the one cent unless you do see the results. YOU ARE TO BE THE JUDGE! We know that when VITÆ-ORE has put you on the road to a cure you will be more than willing to pay. We are willing to take the risk.

**What Vitæ-Ore Is:** Vitæ-Ore is a natural, hard, adamantine rock-like substance—mineral—ORÉ—mined from the ground like gold and silver in the neighborhood of a once powerful but now extinct mineral spring. It requires twenty years for oxidation by exposure to the air, when it slacks down like lime and is then of medicinal value. It contains free iron, free sulphur and free magnesium, three properties which are most essential for the retention of health in the human system, and one package—one ounce—of the ORÉ, when mixed with a quart of water, will equal in medicinal strength and curative value the 8 or 9 gallons of the most powerful mineral water drunk fresh from the springs. It is a geological discovery, in which there is nothing added or taken from. It is the marvel of the century for curing

**Rheumatism, Bright's Disease, Blood Poisoning, Heart Trouble, Dropsy, Catarrh and Throat Affections, Liver, Kidney and Bladder Ailments, Stomach and Female Disorders, La Grippe, Malarial Fever, Nervous Prostration and General Debility.**

as thousands testify, and as no one, answering this, writing for a package, will deny after using. MEDICAL SCIENCE has failed to improve upon or even equal the remedies found in a free salt in healing mineral springs. Physicians, the oldest and the best, the newest and the poorest, acknowledge this to be a fact, when they encounter a disease which is not amenable to the action of drugs by packing the patient off to Carlsbad, Saratoga, Baden, there to drink the waters which contain the essential properties for the restoration of health, and the patient returns, fresh, healthy, in mind and body. If the sufferers cannot afford the trip—and few can—

A LETTER TO THE THEO. NOEL COMPANY, CHICAGO, will bring a healing mineral spring to your door, to your own house, your chamber—will bring to you VITÆ-ORE, a mineral spring condensed and concentrated, a natural God-made remedy for the relief and cure of the ills with which man is afflicted. Why continue to suffer when this NATURAL, CHEAP AND HEALING ORÉ, Nature's remedy, can be had for the asking, when the poor as well as the rich can have the benefit of healing springs?

Write for the attention and consideration afterwards the gratitude of every living person who desires better health, or who suffers pain, ills and diseases WHICH HAVE DEFIED THE MEDICAL WORLD AND GROWN WORTHIER WITH AGE. We care not for your skepticism, but ask only your investigation, and at our expense, regardless of what ills you have, by sending us for a package. In answer to this, address

**THEO. NOEL COMPANY, J. P. Dept., Vitæ-Ore Bldg., Chicago, Ill.**

## QUEENS!

Gold and Leather-Colored Italian, warranted to give satisfaction—those are the kind reared by **QUIRIN THE QUEEN-BREEDER**. Our business was established in 1888. Our stock originated from the best and highest-priced long-tongued red clover breeders in the U. S. We rear as many, and perhaps more, queens than any other breeder in the North. Price of queens after July 1st: Large Select, 75c each; six for \$4; Tested Stock, 61c each; six for \$5; Selected Tested, \$1.50 each; Broods, \$3 each. Two-Frame Nuclei (no queen) \$2 each. All Queens are warranted pure.

Special low price on queens in lots of 25 to 100. All queens are mailed promptly, as we keep 300 to 500 on hand ready to mail. We guarantee safe delivery to any State, Continental Island, or European Country. Our Circular will interest you; it's free. Address all orders to

## FROM MANY FIELDS

A Visit to Two Bee-Keepers.

During the middle of August I had a most delightful trip to Rhode Island and Massachusetts. I met Mr. Arthur C. Miller, and spent a very enjoyable afternoon with him at his apiary. Here I saw bees feeding each other, or one or two bees taking feed from a third which did not extend its tongue in giving it. I also saw evidence of the lack of respect which bees pay their queen. However these two things may be in other localities, in Mr. Miller's locality bees do just as he says they do.

From Mr. Miller's I went out to see Mr. Alley. I found him hard at work, with a red handkerchief over the back of his head and neck, and his smoking-pipe containing tobacco for introducing, between his teeth. He much prefers this handkerchief to a veil, as the latter is hard on his eyes. A few stings, and stinging bees about his eyes, do not seem to bother him in the least.

Mr. Alley had about 175 nuclei scattered about his yard. Of course, they were arranged any way to avoid the loss of queens from entering the wrong hives. He opened many of

## Wanted to Sell.

## The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no farther binding is necessary. **GEORGE W. YORK & CO.,** 144 & 146 Erie Street, CHICAGO ILL.

his nuclei for me to see the queens in different stages of growth. I saw queens laying, virgin queens in nuclei, and dozens together in nurseries; queens just fertilized, with the male organs still attached, and queens having filled the nucleus hive and ready to ship.

I saw Mr. Alley work his entire system from beginning to end, and for him it truly is simple, fast, and, from the appearance of his queens, productive of good results. In less than 10 minutes he removed eggs from the hive, cut the comb into strips, killed each alternate egg, fastened the strips to sticks, put the sticks in the frame, and gave all to a colony of bees prepared several hours before. He thus prepared eggs for about 60 cells.

Mr. Alley's method of introducing virgin queens to nuclei from nursery-cages is very easy and quick. He simply removes the plug from the cage, takes the feeder from the hive, plugs the entrance with a plantain leaf, smokes thoroughly with tobacco-smoke through the feeder-hole in the top, shakes the queen out of the cage into the feeder-hole, replaces the feeder, and the work is done. In a few days, if the weather is good, he has a laying queen. This introducing is done to-night, and by morning the entrance has been forced open, and all is well. He allows the queen to lay in the nucleus for nearly a week before shipping. This keeps his nuclei strong.

I do not know how a system could be more simple, rapid, and reliable, than this one of Mr. Alley's. RICHARD D. BARCLAY, 2d. Philadelphia Co., Pa., Sept. 10.

**Wettest Season in Many Years.**

It has been the wettest and coldest summer here for many years, being very wet all through June, July, August, and all but three days in September, so far.

I started with 3 colonies, increased to 6, and have taken about 150 pounds of honey, so far. But prospects are good for a good fall crop.

I get from 15 to 20 cents a pound for my honey (comb) per section, and I sell culls for a shilling apiece, but eat the most of them ourselves. D. M. LAUDENSLAYER. Clinton Co., Pa., Sept. 12.

**Introducing Queens.**

As I am so deeply interested in apiculture, and have so much to learn, and so many questions to ask, I am willing to give other beginners any little kink I have found out. So here is one:

I had two queenless colonies, as I supposed;

Address as follows, very plainly,  
**GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.**

**Please Mention the Bee Journal when writing Advertisers\*\*\*\***

I found no queen in either, nor any brood of any age, so I sent for two queens, which came all right, and near night the same day I examined both hives again, and found no queen in either, but queen-cells of several ages, so I cut them all out. Another thing, I found what looked like drone-cells at least  $\frac{3}{8}$  or  $\frac{1}{2}$  inch in diameter, the largest I ever saw. I let those queens remain in their cages inside of the hives for two days and one night, in order to get the scent of the hives.

Toward sunset of the second day I took an empty hive and placed it immediately in front of the old hive, say a foot or so, with a wide board forming a bridge from one hive to the other. I then took out each frame with the bees on and put them in this empty hive-body, which, when completed, I sprinkled with peppermint water, then sprinkled the queen to be introduced, and then brushed the bees all above from the frames, and placed the empty frames back in the old hive, dumped the bees out on this bridge, and let them run in as a swarm, and when about half in I turned the queen and escort bees loose, and saw them run in all right. I then placed a super of frames on top, that I had recently transferred from a box-hive, all tied with strings, and let them have this to occupy their attention for awhile, until they became well acquainted with the queen, and then I closed the hive.

The next morning, on visiting these hives, I found one queen dead and dragged out, and the other showed nothing wrong that I could see from the outside, but I would disturb only the one with the dead queen. I got my assistant and went carefully to work to examine to see if there was not some sort of a queen in this hive; although I had examined this particular hive a half-dozen or more times, I was going to make a more thorough thing of it. But on the third frame I lifted up, my assistant saw a queen, and on examining her she showed signs of something being wrong—seemed to be crippled in one leg, and got about very slowly and clumsily; still, there was not an egg of any kind or any brood to be seen, and I suppose this hive has been in this broodless condition no telling how long, as the colony had become reduced from a very large one to quite a small one, but had plenty of honey and no drones.

After writing the above I examined the other hives, and to my great satisfaction found my new process of introducing a queen to a colony that had been queenless ever since it was hived May 20, had proven a perfect success.

When I placed this queen in her cage inside the hive the bees clustered around her and clung to the wire, and held on with such a grip I could hardly force them loose. I thought that was an unfavorable sign—one that indicated they would ball her if they could get to her—and it was with the greatest fear, and with but little hope I had of successfully introducing a queen when the bees acted in this way; but, being a novice, I did not know whether it was a favorable or unfavorable sign.

My idea of this method of introducing a queen into a colony, was that by brushing them all off and running them in as a swarm, and spraying them, would so mix up things and so confuse them that they could not tell one bee from another; and through this freshly transferred super, with the combs tied

with strings and leaking with honey, was to divert their attention from the queen to the work of fastening in these combs and lapping up the running honey. JOHN KENNEDY.  
Adams Co., Miss.

**CONVENTION NOTICES.**

**Illinois.**—The annual meeting of the Northern Illinois Bee-Keepers' Association will be held in the Court House, in Rockford, Ill., Tuesday and Wednesday, Oct. 20 and 21, 1903. A good program is being prepared, and all interested in bees are invited to attend.  
Cherry Valley, Ill. E. KENNEDY, Sec.

**Utah.**—The Utah Bee-Keepers' Association will meet in the City and County Building in Salt Lake City, Oct. 5, commencing at 4:30 o'clock p.m. Among the subjects discussed will be the winter problem and the best method to promote the interest of the State and National Associations.  
E. S. LOVESY, Pres.

**Long Tongues Valuable**  
South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

**DUTTO, TEX., Nov. 19, 1902.**  
J. P. MOORE.—Dear Sir:—I wish to write you in regard to the purchase of you which I have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fall. I will express my thanks for such queens. I am very much pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders. Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circulars, foreign orders by return mail, and shall probably be able to do so till the close of the season.

**HONEY AND BEESWAX**  
MARKET QUOTATIONS

**CHICAGO, Sept. 18.**—Sales are not frequent enough to keep receipts cleaned up. They are made on a basis of 120¢ per comb for combs of the best grades. Extracted, white, 6¢/7¢ for clover and basswood, and 6¢/7¢ for other white honeys; amber, 5¢/6¢/7¢; according to flavor and package. Beeswax, 30¢. R. A. BURNETT & Co.

**KANSAS CITY, Aug. 25.**—Receipts of comb honey more liberal; demand improving. We quote fancy white comb, 24 section case, \$3.25; No. 1, white amber comb, 24-section case, \$3.00; No. 2, white amber comb, 24-section case, \$2.75; Extracted, white, per lb., 6½¢; amber, 5¢/6¢/6¢. Beeswax, 25¢/30¢. C. C. CLEMONS & Co.

**ALBANY, N.Y., Sept. 4.**—Demand for honey improving, at 15¢/16¢ for fancy white comb; 14¢/15¢ for No. 1; 13¢/14¢ for No. 2. Production of honey in this vicinity is very light. This market will have to depend on other sections more this season than ever. Extracted honey, 7¢/7½¢ for white; 6¢/6½¢ for mixed and buckwheat. Beeswax, 28¢/30¢. H. R. WRIGHT.

**CINCINNATI, Aug. 6.**—The supply about equals the demand for extracted honey. We are selling amber extracted in barrels from 5½¢/6¢, according to quality. White clover, barrels and cans, 7¢/8¢, respectively. Comb honey, fancy, in no-drip shipping cases, 16¢/16½¢ cents. Beeswax, 30¢. THE FRED W. MUTH CO.

**NEW YORK, Sept. 3.**—New crop comb honey is beginning to arrive more freely, and the demand is good for all grades. We quote fancy white at from 14¢/15¢, No. 1 at 13¢, amber at from 11¢/12¢; no buckwheat on the market as yet.

Extracted is plentiful, and in fair demand at 7¢ for the white, 6¢/6½¢ for the light amber, 5¢/5½¢ for dark. Southern in barrels at from 55¢/56¢ per gallon, according to quality. Beeswax is declining, and unbleached at from 28¢/29¢. HILDBRATH & SEEGLEN.

**CINCINNATI, Sept. 18.**—The extracted honey market has weakened a little as white clover is offered quite plentifully; prices of sales I made ruled as follows: Amber, in barrels, 5¢/5½¢; water-white alfalfa, 6¢/6½¢; fancy white clover, 6¢/7½¢. Comb honey, fancy water-white, 14¢/15¢. No sales for lower grades. Beeswax, 28¢. C. H. W. WEBER.

**SAN FRANCISCO, Sept. 2.**—White comb honey, 13¢/14¢; amber, 9¢/10¢. Extracted, best price delivered Cincinnati. The Fred W. Muth Co. light amber, 5½¢; amber, 4½¢/5¢; dark amber, 4¢/4½¢. Beeswax, good to choice, light, 27¢/28¢; dark, 25¢/26¢.

Most of the comb on the market is of small lots, and while being very steadily held, fails to move as readily or to as good advantage as would straight carload lots of uniform and high grade. Extracted in large request, with offerings of only moderate volume, and market firm at prevailing values.

**WANTED! FANCY HONEY**

In no-drip shipping-cases. Also Amber Extracted in bulk or cans. Quote your best price delivered Cincinnati. The Fred W. Muth Co. 32Atf Froot and Walnut, CINCINNATI, OHIO.

**WANTED—Comb Honey** in quantity lots. We are peripat in the only dealers in this article owning as much as 150,000 pounds of one time. Please state quantity, quality and price asked for your offerings. Thos. C. Stanley & Son. 24Atf MANZANOLA, COLO., or FAIRFIELD, ILL.

**WANTED—Extracted Honey.** Mail sample and state lowest price delivered Cincinnati. Will buy FANCY WHITE COMB HONEY, any quantity, but must be put up in no-drip shipping-cases.

## RED CLOVER HONEY=QUEENS.

SPRING BLUFF, Wis., July 19, 1903.  
THE A. I. ROOT CO., Medina, Ohio.  
Dear Sirs—I thought I would write you a few lines in regard to the Red Clover Queen I got from you. They haven't swarmed yet this summer, but I have taken 48 sections from them and there is 24 more all ready to come off. Just think, 72 nice sections of as nice honey as ever was made, and only July 19th. It seems as though they will surely fill 48 more.  
I don't know whether their tongues are any longer than any of the others, or whether they gathered it from Red Clover, but surely such bees are worth money.  
I use the S-frame Jumbo frame.  
C. E. KELLOGG.

C. E. KELLOGG, Spring Bluff, Wis.  
Dear Sir—We have yours of July 19th and would be glad to have you advise as by return mail with reference to the capping of the honey. Some parties say the capping from these bees is not white, and we would be glad to have you advise us how your honey is in this respect, and onlige. Yours truly,  
THE A. I. ROOT CO.

SPRING BLUFF, Wis., July 31, 1903.  
THE A. I. ROOT CO., Medina, Ohio.  
Dear Sirs—Yours of July 24th at hand to-day. In regard to your question in reference to the cappings of the honey from these bees I will say that it is simply perfect, beautiful snow-white and every box perfect. 98 one-pound sections now. I am quite sure they will fill 20 more supers, which will bring the number up to 114. I would like very much to have you see a few of those sections, and I will be glad to send you a few.

Now, I haven't told you ALL their good qualities yet. I am sure they are by far the most gentle bees to handle I have. I could take off the sections without smoke or veil without getting stung. There are a few traits about them that seem to me are quite remarkable aside from their honey-gathering; they don't seem to want to swarm.  
I will write you again in a few weeks and let you know if they fill the 114 sections, which I am sure is perfectly.

## AGAIN READY FOR PROMPT DELIVERY.

We were snowed under with orders for a few weeks, but here we are again with good Queens and prompt service.

### Red Clover and Honey Queens.

Untested .....	Each \$1.00	Six \$5.70	Breeding .....	\$3.00
Tested .....	2.00	11.40	Select Breeding .....	7.50
Select Fertilized .....	3.00	17.10	Extra Select Breeding .....	10.00

With any of the last three we include one frame of bees and brood to insure safe arrival, for which we make no charge. These must be sent by express. Queen circular free;

**THE A. I. ROOT CO., Medina, Ohio.**

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S

"FORTY-YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie Street, CHICAGO, ILL.

## A STANDARD-BRED

# QUEEN-BEE FREE

To Our Regular Paid-in-Advance Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with The Very Best Untested Italian Queens that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

## A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription must be paid at least 3 months in advance. If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

Send us \$1.00 and the name (not your own) and address of One NEW subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens anyway, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due also.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows: One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We are filling orders almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

**GEORGE W. YORK & CO., 144-146 E. ERIE ST., CHICAGO, ILL.**

40 Tested Italian Queens at \$1.00 each, as long as they last. Order quick.

## Editorial Comments

**Too Abundant Rains** is the cry of the agricultural papers in some parts. The bee-keeper, along with the farmer, will suffer from this, and producers of comb honey in one way that novices may not suspect. With continuous rains the atmosphere becomes saturated with moisture, and honey, having a strong affinity for moisture, behaves in this moisture-laden air much as it would in a damp cellar. The honey becomes thin in the cell, and increases so much in bulk that the air-space next the capping is filled with the liquid, giving the comb a water-soaked appearance. While nothing may be done to effect a cure, something may be done in the way of prevention, and even in warm weather it may pay to use fire to heat up the honey-room to the drying point.

**Standard Weight of Extracted Honey.**—At present there is no such standard. Is it desirable? Is it feasible? Good honey contains somewhere in the neighborhood of one-sixth of its weight of water; in a moisture-laden atmosphere it may attract to itself so much moisture as to be nearly half water. Taking these two extremes, there ought to be a material difference in price; is there? A grocer who has bought some of the thin honey at a certain price, when approached by one who has a fine article of extracted honey, will, in many cases, expect to buy it at the same price. In too many cases honey is honey, without regard to color, flavor, or body.

Suppose we take a case not extreme: A grocer buys honey that is a third water at 8 cents a pound, and afterwards buys some only a sixth water; if 8 cents is a fair price for the former, what is an equitable price for the latter? If we throw out the water as of no value, the 8 cents was paid for two-thirds of a pound of solid honey, if we may use that expression. That would make a pound of solid honey worth 12 cents. In the honey with one-sixth water there is five-sixths of a pound of solid honey; at 12 cents a pound it is worth 10 cents. So, if the one honey is worth 8 cents a pound, the other is worth 10 cents. That is on the supposition that one honey is just as good as the other except as to the matter of density. As a matter of fact it is not.

It is very clear that there is no fairness in having these two honeys sell at the same price; so it would seem desirable that there should be some standard by which the price could be established. Is it feasible to adopt and to use such a standard? That is another question.

**As to the Queen and Her Treatment.**—On page 532, some questions were asked of Arthur C. Miller with regard to some of the relations of queen and workers. Answers were promptly received, and, with apologies to Mr. Miller for delay, they are here given:

1. **CARESSING.**—I interpret it as curiosity, and searching for food. I also surmise the odor of a pregnant female, or, in the case of a queen-bee, whose structure is peculiar, we may have an odor comparable to that of animals "in heat," may be accountable for some of the attention the queen receives. Certainly, virgin queens, "exhausted" queens, and queens not laying, attract far less attention than does a queen in the full tide of laying.

"Grooming" is the only thing approaching "respect," and I should be pleased for an explanation of its purpose.

2. **TONGUE POKED FROM CELLS.**—I don't know what for. It may be for food, but I've never seen a queen get any then. And—

3. **HOW DOES A QUEEN ASK FOR FOOD?**—With her antennae. That is to say, they are always active when she is seeking food, and often a deal of "talk" takes place between the queen and the bee from which she is soon to obtain food.

If you will watch a queen-cell you will seldom see the antennae put through the cut except for an instant now and then. Cut them from a bee of any kind and note the result. Immediately the poor creature seems to become deaf, dumb and blind. Lubbock made extensive experiments in that line.

The management of queens in nurseries, in introducing theories of stimulating, etc., are all based on the assumption that bees offer food, "holding out their tongues to the queen, offering her food." I believe the individual bees to be utterly selfish. I think we must (for many purposes) regard the colony merely as an aggregation of individuals, each possessing many of the characteristics of "solitary" bees, which, I believe, is considered the original type from which the honey-bee sprung. ARTHUR C. MILLER.

If observation shows that bees never offer food with the tongue, and that food is never thus given, the food being given by the mouth and received by the tongue, it is well to be exact in our knowledge on that point, even at the expense of giving up cherished traditions. Whether all will be ready to accept the view that workers are without special affection for their reigning sovereign—the term "reigning sovereign" being used in a highly figurative sense as a sort of traditional habit—remains to be seen. So long as Mr. Miller is himself uncertain as to the purpose of "grooming," while admitting its approach to "respect," he may expect that some will believe it is respect; and the "admiring circle" so frequently seen formed about a queen, and the wail of the bees at her loss, will be offered as proofs not only of respect but affection.

In pulling up weeds in a flower-bed one is in danger of pulling up flowers at the same time. If, while the weeds are being pulled up, we find the roots of some of our flowers disturbed, let us thank the weeder for pulling up the weeds.

**May Supplant Sugar-Beet.**—Under this heading appears the following dispatch from Washington to the Chicago Daily News:

The Agricultural Department is inquiring into the statement of Consul General Richard Guenther, that a new plant has been discovered in South America, which promises to supplant the sugar-cane and the sugar-beet. Scientifically the plant is known as the *Eupatorium rebandiana*, and it contains a large amount of saccharine matter properties, which are easy to extract.

According to Mr. Guenther, a lump the size of a liver-pill will do the business in a cup of coffee, as the product made from the plant is from 20 to 30 times sweeter than cane or beet sugar. It is said to be easily cultivated in countries having climatic conditions similar to those of the southern portion of the United States.

Bee-keepers are not specially anxious as to how sugar-beet men may view this matter, but any new development in "sweets" can hardly fail to suggest the question, "What effect will it have on the honey market?"

The probability is that nothing will come of it, for at present it is only in the rumor stage, but suppose that what Mr. Guenther is reported to have said should turn out to be true, there is a possibility that the price of sugar may be materially reduced, in which case what about the price of honey?

It is not at all certain that cutting the price of sugar in two would have any material effect on the price of honey—certainly the price of honey would not be cut in two as a consequence. With the price of sugar and honey close together there is direct competition, for, to a large extent, one can take the place of the other as a mere sweetener.

When, however, a man pays for a section of honey an amount that would purchase three pounds of sugar, the two can hardly be said to be in competition, and the extra price paid for the honey is paid for the extra qualities it possesses, and with which sugar can in no way compete. A drop in the price of sugar to 3 cents a pound would not induce him to take the sugar in place of the honey any more than when sugar was 6 cents. So we need not worry whether or not *Eupatorium reboudianum* materializes as a formidable competitor of the sugar-beet.

## Sketches of Beedomites

### UDO TOEPPERWEIN.

Mr. Udo Toepperwein, whose portrait graces our first page this week, is a resident of Texas. He began the bee-business when a little boy, and decided, years before he was of age, that he would make bee-keeping a life study. He gradually worked his way up, and is now manager of the Texas branch of one of the largest bee-supply manufacturers in the world, and also has the exclusive sale in that State of honey-cans made by a large firm.

Mr. Toepperwein also has an extensive business in buying whole crops of honey from bee-keepers in and around the locality where he lives, and has himself apiaries at different places near, besides an apiary of 40 colonies right in the city.

Mr. T. was married only about a year ago, is a bright young business man, only 25 years of age, and seems to be able to take care of almost any amount of business with good judgment. Last spring he was appointed a member of the Board of Directors of the National Bee-Keepers' Association, to take the place of Mr. A. I. Root, who had recently resigned.

We have met Mr. Toepperwein on several occasions, and believe he is representative of the best in beedom in the State of Texas. He is quite a "convention trotter," though he seldom takes any part in discussions unless called out, when he speaks with a freedom and intelligence that evidently are born of experience. We believe he will prove an honor to Texas and a credit to himself as a member of the Board of Directors of the National Association.

## Miscellaneous Items

ON TO LOS ANGELES!—Having arrived at Williams again, about noon on Monday, Aug. 17, after visiting the Grand Canyon, our car was attached to the through train on the main line of the Santa Fe, bound for Los Angeles. It was a delightful ride for many miles, surrounded with mountains whose sides were covered with pines, and along the railroad acres of the beautiful oleome, or Rocky Mountain blue-plant, nodding in the breezes.

But towards evening we began to get into the New Mexico desert, and how hot it was! Nothing but heated sand all around us, and hot sunshine above us, with a suffocating breeze that one could imagine came from the lower regions.

We arrived at Needles about 9 p.m. This is called the hottest place along the line. We could easily believe it. The temperature must have been about 110 degrees above zero. It seemed to us the hottest night we ever passed through—and yet not as terrible as we expected from the way we had been previously warned.

At Needles, Indian squaws and maidens were offering long strings of beads of various colors, which were very pretty indeed. And they made many sales to the ladies of our train. The prettiest were \$1.00 per string, though in other places \$1.75 or \$2.00 are the prices asked for the same thing. They are worn by ladies as girdles, or around the neck, and are indeed quite attractive.

We omitted to say that at Williams, the Santa Fe railroad company put on our train a man known as a "Tourist Conductor." At least that was what it said on his cap. His name was Max Jenney. (Prob-

ably he has that same name yet, as he was a married man at the time!) Now, we have met men that we thought could talk—men that some would say had a double dose of "the gift of the gab." But here was a man that simply was "all talk." Why, he knew everything about everything that anybody possibly wanted to ask about California or anything else. He knew the flowers, the fruits, the mountains, the climate—well, we wouldn't have space to mention them all. He was good-natured, too. If the Santa Fe ever pays any of its employees for genuine talking ability, Max Jenney ought to get a big salary. He earns it. In fact, the State of California ought to pay him, too. If everybody he meets doesn't stay in California after once inside the State, it won't be Max Jenney's fault. We just got away from him as fast as possible. Why, he'd make you forget the old home and any business there (if you left any), and have you believe California is really the vestibule to Heaven.

Max Jenney!—the car of bee-keepers won't forget him soon. He's a good one. He's an actor, an enterprising story-teller—true (?) stories, of course—a "hale fellow, well met"—a "Tourist Conductor"! Ah, "Max," you're a dandy. Long may you live to "conduct" the "tourists" into your land of bloom, of sunshine, of climate—of heat and dust—gold, and the more common, earthy kind of dust.

The morning of Tuesday, Aug. 18, we began to get into the San Bernardino Mountains. We were at last in California! Could it be possible? Personally, we had longed, for years, to set eyes on that far-away land of gold. Finally, we were "right in it." There were the orange and lemon groves, the eucalyptus and pepper trees. Yes, and the yucca and cacti. But no grass! Oh, how dry and barren the ground looked! And everything covered with dust.

We reached Pasadena, which is some 10 miles this side of Los Angeles, about 9 a.m. Having relatives there, we stopped off until towards evening. We were at once driven in a carriage to one of the many lovely homes to be found there, and the very first thing we did was to take a good bath. Oh, wasn't it fine, after that long, dusty ride of nearly a week? How blessed it was to be clean once more! If we could only then have taken a long nap, we would have felt more natural again. But there was no time for that. We must soon take the street-car for Los Angeles, in order to be on hand for the reception to be tendered by the California bee-keepers in the evening.

Oh, yes, we forgot to say that as we stepped off the train at Pasadena who should we see but Geo. W. Brodbeck? He had come out from Los Angeles to meet the car-load of bee-keepers and ride in with them. We had never met Mr. Brodbeck before, though we had had a pleasant correspondence acquaintance with him for years. We are glad that so good a man is to succeed us in the secretaryship of the National Association next January. Mr. Brodbeck is a man that not only California bee-keepers, but all the rest in the whole country, may well be proud of.

We arrived at the Natick House about 6 p.m., and after supper went over to Blanchard's Hall, on Broadway, where the sessions of the convention were to be held. At the appointed hour the room was well filled, and "then the music began." The orchestra of the Sunday-school of the First M. E. Church of Los Angeles was present, and the music they rendered was surely inspiring. The superintendent of the school was seated near the rear of the room, and evidently enjoyed the program. By the way, this superintendent was none other than Dr. H. W. Brodbeck, a brother of Geo. W., and one of the most pushing (and doubtless "pulling," as well) dentists on the Pacific Coast. We will have more to say of Dr. Brodbeck later on.

As has been already announced in these columns, the evening session was presided over by Pres. T. O. Andrews, of the California Association. It was a very enjoyable evening. Everybody seemed happy, even if it was too awfully hot for comfort. It was an unusually heated spell for that locality—at least that's what those Californians said, and, of course, we had to believe them, as they ought to know. We didn't. All we knew was that if that was a fair sample of the glorious California climate we have heard so much about, we could find the same thing without going over 2000 miles away from home.

But after Prof. Cook and some others had given us all such a royal welcome, and after we had met a number of the extensive bee-keepers—extensive both as to bees and good-nature—that were present, we felt quite at home, and decided that we were going to have a good convention. What with Cook, and Harbison, and Corey, and Brodbeck, and Mercer, and Mellen, and Mendleson, and McIntyre,

and—and—well, so many other genial Californians, who couldn't have had a good and profitable time for a few days?

But as to what was done and said during the convention, that will be found in the regular published report which is now appearing in these columns. In some ways it was the greatest convention of bee-keepers ever held on this continent, or in the world. We were glad to be permitted to be present—to be one of that goodly company. We will never forget it. We will look back to it for years to come, and only wish that we could have remained several weeks after the meeting, instead of only two or three days. But a weekly paper requires constant attention, and lots of "copy," so it was necessary for us to hasten home instead of visiting, as we would so much have preferred to do. The next time we go out there, we hope to be able to stay a month or so.

Some after-convention experiences will be reserved for our next week's installment of these notes.

## Convention Proceedings

### THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 615.)

#### CO-OPERATIVE MARKETING.

Prof. Cook—If any of you would like to ask any questions, I am sure Mr. Reed will be glad to answer them.

Dr. Miller—It is now 10 minutes of 11; some of us have come a long way, and we have not struck any bee-talk. We don't know about oranges; we don't care about oranges, but I want to say to you that I feel like giving a very hearty vote of thanks to the citrus producers in general, and to Prof. Cook and Mr. Reed for talking to us about oranges. They have blazed the way that we ought to go. If we heard nothing else in this convention, and could go away feeling that something was going to be done as they have done, our coming would not have been in vain. I want to move a standing vote of thanks to Mr. Reed.

Motion carried.

Dr. Miller—I think there is a string of questions about that long [indicating by extended arms] that we would like to ask him, but I believe we are ignorant; we do not know what we want, and if there is anything in particular—I am all at sea—I do not know what is the right thing. If any of you know more than I do, and can ask questions, go ahead. I feel there is a great deal to be said on this subject.

Dr. D. W. Edward—At a number of meetings that I have had the pleasure and privilege of attending of the bee-keepers, I have heard this matter thoroughly discussed, and I respond heartily to the vote of thanks. However, this is the National Bee-Keepers' Association, not a citrus fruit convention. I am interested in both in a financial way, and I would say, that so far as my interest in the honey is concerned, the only interest I feel in this subject is in a lecture on the orange and lemon blossoms. It seems to me we are ignoring the fact that whatever this is, it has existed for years, and there is already an organization which is doing business to-day successfully operated by honey-producers exactly on the line that has been suggested, and which has been entirely ignored, so far as this discussion has gone. I would like to hear from these men of their organization, so that they are all converted to the idea of co-operation, or organization to carry out the same ideas advanced by Prof. Cook. And if that has been the beginning of the citrus fruit growers' association, why go back and rehash all that—why not go back to the bee-question?

Prof. Cook—I do not agree with the gentleman one bit. We have formed here a honey association, but it is just started. We want to form on something akin to that that has succeeded. In all essential respects they are just the same—it is the marketing of a product produced by people.

If these honey exchanges had been of long standing, we would not say a word about oranges. We have an organization that is in California. This is the United States! We want to touch questions that affect the whole country. One year ago this came up the first time in the National Association. It is a new thing, and we have nothing to refer to in bee-interests, and in this fruit exchange we have an example, and that is why I wanted Mr. Reed to come here this morning. These bee-men have a year or two at the most; they have just started. Our friend, Mr. Brown, went to Denver, last year, and stirred up the whole country. But it is very little we have done—hardly anything yet.

T. O. Andrews—Has your co-operation, the Citrus Fruit Exchange, worked much of a revolution in the freight rates? That is one of our difficulties.

Mr. Reed—No, we have not. We are practically owned by one railroad. We have done a good many things though that have aided and helped us at times in the rate business. There was one year we asked for a special rate to fight the foreign oranges. They gave it to us for four months, and that was the first time citrus oranges had been introduced to any extent. We went into the New York market and drove the foreign oranges out of it. Then the lemons. Without our fruit exchange we could never have accomplished what we did. I believe the citrus growers owe to the organization of the Southern California Fruit Exchange more than to anybody or all else together, the fact that they organized and could fight for a tariff and get it.

E. T. Abbott—I do not believe in anything he says—that is, in his theory. I want to talk about it later. I want to say, however, that in the five days travel it took me to get here, I have only traveled in a portion of the United States. I live in the center of the United States. The United States is a little portion of the territory covered by the territory of this National Association. This Association does not belong to the United States. It belongs to Canada, also. And to use illustrations by what has been done in a little patch of country that is not as big as a little neck of New York, is all fallacious.

F. E. Brown—I had not expected to say anything at this time; I have made no preparations whatever, but I am to have the opportunity of saying a few words along these lines. I am sure, as has been stated by Mr. Abbott, that this is a great question. It is one that has great magnitude. It reaches over a large space of territory, but at the same time there is not so much more business transacted by the honey-men than there is, perhaps, by the Fruit Exchange. But it is also true that the citrus fruit industry is centered in one locality, so to speak, while ours is spread out; but I do not see that this matters so much. I have been much interested this morning by the talk of Mr. Reed, because experience is a great teacher, and if we can profit by this experience, it will save us money; it will save us time, and a great deal of time, and a great deal of annoyance.

Now, I say to this assembly, we are inclined to believe that because we are producers of honey we are capable of transacting and carrying on our own business, regardless of the fruit-growers. This is a pride that we have of ourselves. This is all right. I am glad we have ambition along these lines. And while the fruit-man has organized, and while his organization has been a success, it has not been due to previous experience, as Mr. Reed has told us. But he said, "We have men of brains," and, ladies and gentlemen, we have men of brains in our ranks.

Now, while our honey interests are situated in localities from California to Maine, it is necessary for us to organize in localities. We believe this is so. Prof. Cook believes this is so, and he is writing along these lines. We are organized, and we will organize in localities. We will organize and transact business in localities. Then we will simply take hold of hands and march along to success. Is not that reasonable? Is not that so? Look at the association in Colorado. They are a strong organization that any bee-man should be proud of.

Look in other localities—Central California I should not pass, because I am from Central California. I have worked in that association from its beginning, and we have made a record that I am proud of, and I am glad to say it to my brethren here to-day. Look at Southern California—some 200 to 300 miles away from Central California. They have made a beginning that we bee-keepers of the Pacific Coast should be very proud of. It is a good thing. They are doing well. Look at their name—The California National Honey-Producers' Association!

Dr. Miller made this remark: "What is that word 'National' attached to the Honey-Producers' Association

of California?" The explanation given was that in California they do things in "big ways." The State is a world of its own. But that word "National" applied to the California Honey-Producers' Association means more than that. It is a handle to hold onto, it is a coupling to couple onto. When you start your association, start an association having a place by which it can be attached—coupled onto other associations, and we can be coupled together as one train.

I am not going to comment upon what Mr. Reed has said about this orange growers' association. They have worked a good work; they have succeeded splendidly. By local organization, local associations all united for a definite purpose and working together, they have wrought this result. There are matters of detail that we may incorporate into our association or not, as we please, but the thing is to organize, and have a place by which we expect to become a part of the National organization. The California National Honey-Producers' Association we expect will reach out into Arizona. Here is Mr. Ivy, he will have an association; and then we expect to reach out over to Mr. Harris, in Colorado, and I am sure he will be glad to couple on. Then there is Texas doing a noble work. We will go across the continent, spread out, and then we will take in all the honey-producers of this great land, but we can not stop there. We must reach out and take in Cuba. The Cuban question is one that we are "up against," and we must have that in our association. It does not matter about distance. Distance is nothing to-day with our rapid transportation and rapid communication. So, when we have these local organizations, and then means by which we can take care of the goods, there is no impossibility about it—not at all!

Now, regarding the selling agency, just a word. Any local associations to-day have to place their goods upon the market somewhere. They do not keep them. Now, my own experience lately: I have a crop of honey in Southern California to sell. We are holding it for better prices. We expect this, for the people around here who have not organized are selling to the commission men, and we, who have organized, will reap the benefit of the market. You, who are not organized, will see later on what you are losing, as you have in times past. But we have to market our honey. We have to sell it somewhere. We have a broker in Chicago, Boston, or New York. These brokers receive a commission for handling our goods. Now, the orange people may have salesmen, and their expenses will be about the same as that of the broker. What we want is a central selling agency that may direct the selling of these goods, and then a man in New York, who has been accustomed to sending to him, can simply place his order with the central selling agency for a car-load of Central California honey. We can deal with the selling agency, and then it is safe. We can not always tell what our brokers will do, but when we have our selling agency, there will be confidence established, so that any man will be willing to trust his goods to that selling agency.

Prof. Cook—I am glad that Mr. Abbott does disagree with me, because there wouldn't be any fun if we all saw these things alike. You have heard the old story: Tom and Bill both enlisted in the army. Tom said, "I always did like war; I was a single man, and so I enlisted." Bill said, "I was a married man, and I like peace, and so I enlisted." But we want to work together, and start right out. We have to convert the whole country—not like California and Colorado. We want to take in the whole country, and can do it. Another story: Two men leaped over the wharf to catch the fish. When the fish began to pull on the lines, one said, "I can't swim; I am drowning!" The other said, "I can't swim, and I am drowning, too; but I am not making such a blamed fuss about it." I hope you will all go home and make such a fuss that the whole country will hear it, and that we will have such an organization of the whole country as you have had in Colorado so successfully for the past three years, and such as the Citrus Fruit Exchange has had so successfully in Southern California for the past six years. This is going to be a great work, but I think the time of the real fun in life is getting under a big load and raising it—under a great problem and then make it move.

Mr. Abbott—This discussion seems to be drifting in the way of unionism. The unions always get things in their own hands, and then it means, "Go the way they do, or die!" This morning we seem to have been served notice that the other side can not be discussed. I want to say that I am first, last, and all the time opposed to turning over this National Bee-Keepers' Association to any kind of an association that simply means the dollar. The world is all stripped over with the dollar-mark. If there is not a dollar-

mark to measure the value of a thing, it has no value! I believe in keeping the National Association free from the dollar-mark. I do not believe in sending it out on a mission of money. It has a better mission in the world, and I hope to see it fulfill that mission. If you purpose to put it on a basis of commerce, you will simply go to the wall.

A few years ago, Mr. Root said I helped to make the National Association. At the first meeting we ever had this question was up, and it has been talked more or less ever since, that we would have a great Central Honey Exchange, and sell our honey at our price. All the citrus fruit is produced in a little space in California. You have about 50 percent of the citrus fruit-growers in this Citrus Fruit Exchange. When can you get 50 percent of the honey-producers into such an exchange? You can not get 50 percent of them into an organization in a thousand years! Then you and I will be dead and gone, and will not care so much for the Almighty Dollar as we do now.

This is a day when we try to minify the individual—a day of socialism, when men have nothing to do but theorize. The atmosphere is charged with it all through from Missouri up to where the waves surge against your shores. But there are high moral principles that lived before these things were, and they will live after these things are gone, and the only thing I have to suggest is that all these "isms" are self-destructive. If they were not, I believe all these combinations would force upon us the bloodiest war that ever has been known. We have had some of these combinations, which have called out every man in the town belonging to their union, simply because one man claimed the right to support his wife and little babies. What did the walking delegate say? "We have killed other towns, and we can kill this!" This is the other side of the question, and it is a serious side. It means danger to the people of this country, and it means serious danger. It is not a question of efficiency; it is not a question of ability; it is simply a question of compelling men to belong to the union whether inferior laborers or not, and when I employ a man to set up my paper, I dare not ask him whether he is a good printer or not. The only question is, "Do you belong to the union?" This is the spirit you are falling in with, and when you have gotten through you are just where you commenced. I do not want to disagree with all of you, but I want to say, Be careful; the Almighty Dollar is not all there is in it. We do not want a commercial organization, bound by commercial rules, said to be governed by honest men. Do you know, dishonest men sometimes get into strange places? Did you read about the minister that ran away with the missionary money—\$70,000—and went away to die in disrepute? They thought honest men were handling that money. All of these things are to be considered. This is the other side of it, and I just want to leave this word of warning: When you turn the National Bee-Keepers' Association over to an organization to sell honey, you will simply put it where it will lose its power in the world.

Jan. S. Harris—I see Mr. Abbott has to be "shown." I feel astounded to see that any man would come on the floor of this convention and try to throw anything in the way of the horny hand of toil. Everything that is brought forward in the way of wealth is done by the laboring man. The capitalist of this country is organized. You may have bad, you may have good, in all these organizations. You have bad, and you have good in your churches. But, for heaven's sake, when we go to work like the honey-producers of Colorado, and the fruit-producers of California, let each and every man put his shoulder to the wheel and help along. The time has come when the farmer, the merchant, the bee-man, and all others have to protect their babies and their homes on the lines that have been argued here this morning. Let me say that we are not going to turn this institution into any financial institution at all. The honey-producers' association of the United States will be distinct and separate from this organization. But it is a stepping-stone to help every person who engages in this industry to get what is right, and what is just for his product.

C. P. Dadant—I do not believe, when we organize, that it is possible to separate ourselves from the Almighty Dollar? Organization, association, is the order of mankind. There are very few not organized in some way or other. I belong to the National Bee-Keepers' Association. Most men belong to some secret association, some life insurance company. When a man insures his life, he insures it so his wife and little ones will have something when he dies. Is that wrong? But that is an organization with the Almighty Dollar in view. But I do not believe we can get our association in that shape yet.

Dr. Miller—I wrote a letter to my wife this morning.

That is nothing; I have written 15 others to her since I left home. And I put it in a box down here. By and by a man will come around and he will pick out that letter, and he will take it over to a big building that is here. He will put it in there, and he will put it in a certain place, and it will be taken on the cars and go from one man to another and be taken about 2000 miles and put it into a little office in the town of Marengo. I live in the country, and there will be a man there who will take that letter and put it in the box out where I live, and somebody will take it out of the box at my house. And what do you suppose I paid for that? I paid just 2 cents! [Laughter.] And that is co-operation!

Frank Benton—I wish to say that the foundation of this country is on co-operative principles. We are all together. It is a co-operative government, in our post-office facilities, and in all departments of the government. And why should we stand out as an organization? We are "up against" the railroad combine, the tin combine, and even the boxes that hold our honey. That being the case, is it not necessary for us to get together and buy in large quantities, and buy these things at the minimum cost? It does not necessarily increase the cost to the man who eats it. We minimize the cost of production all the way around, and sell the honey to the individual at the same price he is paying to-day. I believe it would be possible so to minimize the cost of producing, packing, and all expenses, as to realize more than three times the actual profit that we are making at the present time. Why should we not co-operate?

J. K. Williamson—There is one matter of co-operation we should have the benefit of right here at the convention. We are entitled to reduced railroad rates, and if each and every one had gotten a receipt for his ticket, what we could have saved in our railroad fare would almost have paid the expenses of the convention. And we want to impress upon all to take a receipt for their railroad tickets and bring them here. If we have over 50 members present, we are entitled to reduced rates.

A. F. Morley—I have given this matter a good deal of thought for a few years, from a remark I heard a speaker make, and I believe it is a fact, that we never get around in any shape only as we drift with the tide. And when one little company of five or six go to shift the other way, they will simply miss the track.

Albert B. Mellen—I agree heartily with Dr. Miller. I agree heartily with Mr. Abbott. Now, that is queer, isn't it? We are working to raise the price of honey to meet the raise in the price of everything else. That is exactly what the stock-brokers are doing in Wall Street. Up, up, up! Bound to fall! Dr. Miller says he can send a letter from here to Illinois for 2 cents. He can do more than that. If they can not find the party to deliver it to, they will bring it back and chase him around for two years to return it to him, and it will only cost him the original 2 cents. The fare from New York to San Francisco is about \$100. It has been demonstrated that passengers can be carried for \$2.50. Now, instead of working the price up, let us work the price down. When you get the price of honey too high, very few people will buy it—can not afford it. If we could sell honey at 5 cents a pound, and could ride from Los Angeles to New York for \$2.50, we would be making more money than we do now. It is not the amount of money that we get, but the amount we get for our money that tells the story. They are raising the price of everything, up, up, up. Now, if we are going to co-operate, let us be co-operated. I do not purpose to run this thing into politics, but let us run it into universal co-operation.

Pres. Hutchinson—I will announce the committees, and then we will take a recess:

ON AMENDMENTS—J. U. Harris, W. F. Marks, George W. Brodbeck, Udo Toepferwein, C. P. Dadant.

ON MEMORIALS—Dr. C. C. Miller, Prof. A. J. Cook, N. Levering, and M. H. Mendleson.

ON RESOLUTIONS—J. M. Hambaugh, A. I. Root, and H. H. Hyde.

ON PUBLICITY—Emerson T. Abbott, L. E. Mercer, and J. F. McIntyre.

An adjournment was then taken until 2 p.m.

(Continued next week.)

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

### Bulk Comb Honey—Eucalyptus Trees.

BY PROF. A. J. COOK.

**M**R. P. G. CARTTER, a subscriber to the American Bee Journal from California, keeps a few colonies of bees, and is also a dealer in honey. He asks me to express myself, through the Bee Journal, on two propositions. He sells much bulk comb honey. He puts this in pails and fills the pails with good extracted honey. He finds a ready sale at a good price. He asks why not put most of our comb honey in this way on the market, in lieu of the common sections. He also wishes to know if it is practicable, and, if so, desirable, to place nice glass jars right on the hives and have the honey stored in them all ready for market.

Years ago it was quite common to sell bulk honey in the fashion suggested above. The fact that such sales are now very rare, and very rarely attempted, shows that in the evolution of our present methods this one has become nearly extinct, while the sections have come to the front everywhere. This, alone, would prove that for the average and general market the sections are preferable. The reason for this is not far to seek. There is something exquisite in the neat, white sections as they are seen in the retail grocery. Their very looks are a bid for purchase. In the dining-room a dextrous cut removes them, and we have the immaculate, irresistible comb honey of just the right size right on the china, with no daub or untidiness, all ready for the most fastidious guest. Not so the bulk comb honey. It is taken from the pail all smeared with liquid honey that has surrounded it, which would not please any housewife, not to speak of her guests. More, it is not trim and neat in form, and certainly could never hope to compete on any table, or with any lover of such sweets, with the exquisite comb, clean and trim, just as it comes from the section.

Again, this bulk comb honey, with its old-time retainer, has an unsavory history. I think it originated with the Perrines, in Chicago. They put it in pails or jars and surrounded it, not with pure extracted honey, as our friend suggests, but with honey heavily adulterated with glucose. The Thurbers, of New York, who afterwards sold much of this kind of honey, defended the practice in the fact that such adulterated honey would not candy or granulate, and so would be preferred in the market, while the chunk of comb would push the fraud on the market and table. They did not say, however, that the far cheaper glucose sold as honey, and for the price of honey, secured a profit, which, though illicit, was no light weight as an argument in favor of the practice. A loud complaint was uttered, and the Thurbers consented to the abandonment of the practice. I fear that extracted honey is still largely adulterated with glucose, yet I think there is very little, if any, sold in this fashion. If it were, I should raise my pen and voice hard and loud against it. I am sure that two good counts can be made against such frauds—counts other than that adulteration is a fraud, and so the Devil's own business:

First, honey adulteration with glucose is not wholesome, else why is it fatal as a winter food for bees? and, why do bees refuse to take it, if they can get any other sweet? Although high chemical authority has defended the wholesome character of glucose as a food, the bees themselves refute the statement.

Secondly, the glucose, either of honey or candy adulteration, leaves a peculiar, brassy taste in the mouth, which will soon create a distaste for such honey, and thus a double thrust at the honest bee-keeper; it requires him to compete with an unwholesome, cheapened product, and with a product that is sure to "bear" his market. Let us all not only denounce this and all adulteration, but let us raise our most emphatic protest against it every time and place, and on every occasion. Let us continue to urge with renewed vigor until we have the best and wisest *National pure food law*.

As this form of honey adulteration is no longer practiced, so far as I know, I see no reason why any may not sell bulk comb honey in this form if their market warrants or suggests it, yet I feel sure that they must, perforce, keep the incomparable section-honey out of sight, or their sales will not be very heavy. Hard, manual labor, and the

keen appetite of youth, especially when coupled with a scant purse, may furnish a market for a limited supply.

#### BEES STORING IN GLASS JARS.

There are several reasons why it will never pay to secure our surplus in glass jars by the bees. The jars are too costly; the bees are not as ready to enter and store in them; and the stain on the glass as it is made a foot-path for beetravel, would make the jars uninviting. Cleaning would be far too difficult and laborious, in the nature of the case, to be practicable. For exhibition purpose at fair or exposition this may pay, for then we can afford the labor to make it neat and attractive, but as a general proposition it will never find favor, I am sure.

#### EUCALYPTUS.

Mr. H., of Corona, California, asks what eucalyptus I would suggest for honey. I am glad to answer this, as this beautiful tree should be planted far more extensively in our State than it is. There are fine blocks of it scattered here and there all about. There should be groves of it thickly set all about us, and the streets should be lined everywhere by these fine trees. Beauty, comfort and climatic influence all loudly favor such tree-planting. The blossoms are showy, persist for weeks, and can be had, by careful selection in every month of the year, and are all attractive to bees. I would suggest *Eucalyptus corynocalyx*. This grows rapidly, furnishes fine timber, and is known as the sugar-gum. *E. rostrata*, or red-gum, is very useful for timber. *E. Sideroxylon* is very handsome, graceful, has exquisite foliage, and may well be planted. This and *E. ficifolia* have beautiful-colored blossoms. *E. crebra*, *E. diversicolor*, *E. polyanthemos*, and *E. Gunni*, all are worthy a trial.

*E. diversicolor*, *E. rudis*, and *E. Gunni* stand much cold, the first enduring a temperature down to 8 degrees F., the others to 18 degrees F. *E. citrodora* is a fine honey-tree, one of the very best, and has a pleasant fragrance, but it will not stand much of a freeze, especially when young. We have fine trees at Claremont, but they killed down at first. They seem hardy now, for they stood a freeze down to 23 degrees F. last winter. I hope many will plant these trees.

Los Angeles Co., Calif., Aug. 14.

be put between the surplus and brood? What will make them build straight in the sections?

The help was threshing Bokhara seed to ship, so I thought I would send some beeswax, too, and came very nearly having a fire. I left the melting wax to get some corn to cook, and it boiled over, and burning lard is not equal to the blaze I had upon getting to the door. I seized a pitchfork and lifted the blazing can from the fire. A sun extractor would be far more safe. So you see what I don't know would fill a big book; but experience is a variety—some pleasant, and some otherwise.

After I got the honey and brood-combs out of those supers I put them into a tub of water and scraped them with a table-knife, sections and section-holders, and put on a duck coat and leather mittens, a bee-veil, straw hat (with a brim), took the smoker and went to put them back in the hives, as the bees are building four combs of honey under the alighting-board out-of-doors. I have tiered up three supers to the hive; I put them all on but the last one without a string; it was a big colony of Italians, and they were filling a super every two weeks; they covered me, so I started for the house, pulling off my bee-veil and leaving it on a bush as I went. I got to a tub of water and put my head right into it until I had drowned the bees, but my face, neck, ears and hands are twice the size they ought to be. One eye was closed one day. I bathed my face with cold water, and kept a folded towel, wet with cold water, on my head until the pain subsided; but it was awful for a short time. But I got the super on and the cover, too, later in the day. Now I think a large hive, and surplus room put on in the spring, and then leave the honey on until late in the fall, are better than small hives and to have to keep putting on supers.

MINNIE PERT.

Wabanssee Co., Kans., August, 1903.

If you find that your customers prefer to have their honey in combs with dark cappings, it will be all right to leave the honey on till late. The honey itself will be a little richer and riper. In general, however, the demand is for honey with cappings snow-white, and to secure such honey it should be taken off as soon as entirely sealed.

It is an unusual thing for the bees to change their brood-nest into the upper story, but in the case you mention, it would be just as well to take the honey from the lower story as surplus, providing, of course, that you desire the honey in such form as bulk honey, and providing that the comb was not too old. Otherwise the best thing would be to put the queen below, and make her stay there by means of an excluder. The honey might be extracted from the brood-combs, at least enough to give the queen room to lay, or, if you prefer, you might oblige the bees to carry the honey above, aiding them by uncapping the honey in the brood-combs. In any case see that there is plenty of surplus room above.

"Will additional supers prevent late swarms?" No amount of super room will make them safe from swarming, but it will help; for being crowded is one of the things that makes them want to swarm.

"Ought one always to put a queen-excluder between the surplus and brood?" When working for section-honey it is not needed; but when working either for bulk honey or extracted, use one.

"What will make them build straight in the sections?" Use comb foundation in the sections, either as starters or full sheets.

### An Ephesian Coin and Its Fable.

Various were the ways by which the site of certain cities were determined. For instance, the Palatine Hill became the original site of the Mistress of the World, because Romulus was so fortunate as to have seen a greater number of vultures than Remus had beheld. Cadmus, obeying the oracle, followed a cow, and on the plain where she stopped built the city of Thebes. Ilius also followed a dappled heifer, and on the "hill of Ate," where she layed down, he found his city of Ilium.

But it was once reserved to man whereon to build his comb foundation, as it were. A tradition preserved by Philostratus, relates that when the Athenians led their colony to found the city of Ephesus, the Muses in the form of bees flew before them, directing the course of the fleet.

Such is the fable explanatory of the figure of a bee executed on the ancient coins of Ephesus. Such is the story, appropriate and beautiful, woven about the coin of that

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Interesting Experiences of a Sister.

You want the experience of some of the sister bee-keepers. The last three days I have had considerable, but not pleasant. One of the tenants on one of my farms was taking surplus cases from his hives, and wanted to take part of mine off. Now I, for myself, like to take the honey from the hives late in the fall; it is cured better. And now I want to ask some questions:

1. We found the hive-body full of honey, and the queen gone into the supers and had reared a young swarm. If a queen-excluder was put on would it do to take part of the honey from below, or would it be better to add supers to make more room above?

2. I had two and three swarms in the air a day; Bokhara began to bloom, and then they filled the hive, but did not swarm. I wrapped up two supers and took them to a small town and called on a prominent attorney to sell honey. His wife was at a summer resort, and his boys did not like honey, but he concluded to take 4 pounds. We took the supers to a store to weigh the honey; when I saw the dark comb I felt as if 40 cents was a big price; but my next order was for \$10 worth; he was a farmer; it was for chunk honey. So I shall reverse and sell from below. Will additional supers prevent late swarms?

3. Bees are very busy now on goldenrod. I had some colonies in the supers last year, and they used up what honey there was above, and they would not go down for supplies, so the brood ought to be below; they had plenty, but seem to go up when in the cluster for winter, and when they got to the cover could go no farther. Should a queen-excluder

Ionian city once called "the light of Asia." The Ephesian coin engraved in Humphrey's "Coin Collector's Manual"—representing the stag on the obverse, and the bee on the reverse—belongs, we are told, "to the finest period of the monetary art as practiced at Ephesus, probably soon after the invasion of Alexander, when the Greek cities of Asia Minor were relieved from the thralldom of Persia."

How one's fancy pictures forth the progress of that Aegean fleet! What a dainty and delicate theme for poet and painter! A theme, indeed, to be expressed in the softest and most exquisite of touches! And then, too, how the mind pictures the end of that bright voyage, and fain would believe that—

"The melodies of birds and bees,  
The murmuring of summer seas,  
And pattering rain and breathing dew,  
And airs of evening,"—

voiced their welcome to that Athenian band, who were divinely led under the sweet guise of bees, by the daughters of Jupiter and Mnemosyne. KATE V. AUSTIN.

Wayne Co., Ind.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### LATE CURING OF FOUL BROOD.

McEvoy's assertion that foul brood can be cured in October by simple substitution of the combs, appears on page 517. It helps a bad situation to the extent of giving an alternative method. He thinks the new combs given should be entirely full and capped, lest the bees store somewhere a patch of brought-along honey, and omit to use it out again.

He sometimes succeeds in increasing the total number of colonies at the same time that he is effecting a cure. But, say, I guess he ought not to encourage hopes in that direction on the part of the ordinary bee-keeper. O. b. k. will damage his prospects of curing in his lust for increasing, if that flea is cultivated in his stocking.

### LAMBOTTE'S FOUL BROOD IDEA HIT HARD.

Thos. Wm. Cowan's knock-down argument to Dr. Lambotte will bear repeating. *Bacillus Mesentericus* is everywhere. If it were the cause of foul brood we should hear of foul brood wherever bees are kept. The fact is, that there are many regions and countries which are clear of it. Page 519.

### RIGHT DRESS FOR BEE-KEEPERS.

"Eyes right, right dress!" Somebody shout that same to some of the Brothers—considering the efforts the Sisters are making to arrive at right dress. Page 520.

### BURNING OUT THE MOTH-WORM.

"So 'Illinois' set fire to one of his hives in his vehemence to be rid of the moth-worm. Ruefully admits that it was hard on the bees, but seems not to consider that dosing the establishment with lye would be a little hard, also. When I hear of such strong measures I think it most probably a case which had got beyond all remedial measures. There is a time when the concern should be closed out. Shake the remnant of poor, old, queenless bees into an empty hive. Burn the rubbish in a fire, not in the hive, but near by. Put the salvage in tightly closed quarters—which must be looked over frequently, or it won't continue salvage long. Page 521.

### HOME-MADE GRAPE-NUTS AND POSTUM.

So bread soaked in honey and toasted brown in the oven is Grape-Nuts; and crust soaked in honey and toasted extra brown is Postum. No danger of the former being worse than the Grape-Nuts I tried to eat lately. I found Grape-Nuts good when it first came out; so I guess it spoils quickly with age (insoluble, and too hard), and that the grocer gave me some that was too old. If we can make it ourselves we can have it perfectly fresh; and, perchance, that's about the only way we can have it fresh in many cases. As I am a regular health-food fiend, I should enjoy reading lots of

actual experiences on this line. Guess the average reader would tolerate some. Thanks to Mr. S. Trowbridge for his lead-off in the matter. Page 524.

### THINKS ONE BACHELOR CAN'T COUNT.

Near relation to the boy who saw 500 cats in the backyard, is Brother Beverlin, if we read him correctly on page 526. His 115 swarms of bees at one time need counting by a man who didn't have his hands in the single-blessedness bread at the time. Thus, might we have a more cool, sober, and reliable census.

### SPRING KILLING AND BALLING QUEENS.

A. G. Young is right to caution about getting queens balled and killed in early spring. (This last queer spring seems to have cap-sheaf for such work.) We have most of us practiced and recommended an early looking over of the frames and a cleaning out of the bottoms. I don't know now whether that practice is to be recommended or reprobated. Page 526.

### REPRESSING THE SWARMING IMPULSE.

Will foundation or comb do the more to repress the swarming impulse? Which, indeed? We know that abundance of clean worker-comb right at hand is a strong repressive. Can we quite say that we know that thing of foundation? I kind o' guess that for a few hours after being put in foundation is *provocative*—to become a repressive later on when worked out. Half enough of either one thrust in the heart of the colony—'spects we don't quite know that that is repressive at all. Page 531.

### THE UNCERTAIN DOINGS OF BEES.

I've seen somewhere a vivid account of the interior of a hive when bees were fanning and roaring by night. Each beehive of nectar, and gently protruding a minute drop on the end of the ligula and then drawing it in again, and so on indefinitely. (May be it's romance I've picked up.) Suppose there could be, by novel-writer's device, a hungry lye in such a hive. Then, suppose the hungry bee should flourish her liquid and knock off one of those little protruding drops—and, in defiance of all new laws, appropriate it herself. That would be bad, Mr. Arthur C. Miller. Bees are so enterprising, so multiplex, so do-nothing-invariably, so sure to be breaking out in a new spot, that I, for one, decline to take the risk of saying they never do a thing when that thing is manifestly not impossible. Page 535.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Reducing Number of Colonies.

On page 573, Sept., 1902, you tell "Pennsylvania" how to reduce the number of colonies in the fall. When you place the queenless colony on its own bottom-board over the "breeder," do you close up the entrance of the top hive? Iowa.

ANSWER.—No; the idea was to leave the entrance so the old bees could go back to their old place, leaving the younger bees in the new place. If, however, you wanted to have the older bees also used for strengthening, it would be all right to shut up the entrance, of course guarding against suffocation.

### Slotted Sections—Bee-Keepers' Associations—Management for Extracted Honey.

1. Is there any advantage in the sections open four sides, or open top and bottom only, or only on bottom? If there is any, what is it? and how?  
2. Do you think a bee-keepers' association would help us any?

3. What do you think of putting the extra story under the main brood-hive to prevent swarming when running for extracted honey?  
4. Do you think they store any less honey? VIRGINIA.

ANSWERS.—1. I don't know whether sections open four sides are much used now, but at one time it was claimed that with the four sides open the bees would have more free communication, and would fill out the capping to the wood better. The few that I tried did not seem to have this advantage. A section open top and bottom is absolutely

necessary if you tier up. If you never use more than one super at a time the opening at the bottom would be enough.

2. There are many ways in which an association of bee-keepers is helpful, so many that there is no room to give them here. The National Association has helped to defend a number of bee-keepers who would otherwise have been obliged to give up bee-keeping, and it has helped to put down adulteration of honey. If it did nothing more, that is sufficient to make it the right thing for every bee-keeper in the land to send in his dollar to become a member.
3. Rightly managed, it may work very well.
4. No.

### Section-Cases Under the Hive, Etc.

1. I notice in the Bee-Keepers' Review an extract from your book, "Forty Years Among the Bees," where you advocate placing the section-cases under the hive. If pollen, travel-stains or propolis does not bother too much this would be a good thing for northern Michigan bee-keepers, as the cool nights are not conducive to comb-building.
2. Which hive do you like best for comb-building, the Heddon or the Danzenbaker?
3. Have you ever tried the Boomhower, Doolittle, or the J. P. Moore strain of bees?  
MICHIGAN.

ANSWERS.—1. There must be some misunderstanding. I think I never put supers of sections under the hive except to get the bees to empty the honey out of them, and that was not satisfactory, because the sections were badly dirtied. I should not think of putting sections under the hive to get the bees to store in them; most of all during cool nights.

2. Probably comb-building would proceed about the same in each.
3. I had some of the Doolittle golden, the most beautiful bees I ever saw.

### Horse-Chestnut or Basswood?

Will it pay me to plant horse-chestnut trees for the benefit of my bees? or would you advise basswood?  
MINNESOTA.

ANSWER.—Basswood, by all means. No other tree will give you so much honey. A horse-chestnut stands at my door, and when in bloom is visited by a good many bumble-bees, but by very few hive-bees.

### Getting Bees Out of a Cupola.

A swarm of bees have been in a cupola of a school-house near here for four or five years. They are mostly black bees; they have an unlimited amount of room, so that they never swarm, and there must be a bushel of them. Some say there are 500 pounds of honey up there. I have tried chloroform and sulphur on them, but can not kill them. I have a small hole out through the cupola, and can see all the combs. What would you do under the circumstances to get the honey? I dare not use fire or smoke up there. Is there not some chemical stronger, more penetrating and suffocating? If so, what would you recommend?  
WISCONSIN.

ANSWER.—It would be a good deal easier to tell just what to do if one were right on the ground. Sulphur fumes ought to kill them, and chloroform should, at least, lay them temporarily, but it may be that you did not get the fumes directly on the bees for a sufficiently long time. Blown directly on the bees from a smoker, they ought to prove effectual. Bisulphide of carbon is stronger, but it would be just as hard to confine it to the bees in a large place. From what you say I understand that what you want is to kill the bees, and then there is no trouble about getting at the combs of honey. That being the case, put on a bee-veil and go right at the combs as if no bees were there; only have a smoker to drive the bees out of the way; cut off the combs, and brush the bees off. There ought not to be danger of fire from a smoker carefully handled.

### Getting Rich in the Bee-Business.

Did you ever know any one to get rich in the bee-business? That is, if he made it his entire business, with nothing else to occupy his time?  
CALIFORNIA.

ANSWER.—Adam Grinnam made enough from bees alone to start a bank, and there are a few men living to-day who are making a good deal from their bees. But, as a rule, if a man is living for money alone, he will do well to go into some other than the bee-business.

### Preparing Bees for Shipping—Moving to a New Location.

1. If I ship I will probably ship 90 hives; the hives are 9-frame telescope, and we thought of putting an empty super on top, then a piece of thick, coarse cotton-cloth, the same as we use at home, then the cap, and nailing the cap on, and just as we are ready to load in the cars to put a piece of wire-screen cloth over the entrance. Will that be all right? Is that enough ventilation?
2. Will it be necessary to extract any honey? If so, how much?
3. How would you pack them? Would it be best to wad up coarse hay to pack between the hives, to act as a buffer to keep off the motion? But we expect to pack as solid as we can, anyway.
4. We thought of going somewhere in eastern Washington, per-

haps near Sunnyside, where the winters will not be severe, and it would be a good place to keep bees exclusively, for my four years in the army have told on me, and I can not stand cold winters. What part of the country do you think would be best?  
MINNESOTA.

ANSWERS.—1. I'm not sure about the ventilation. If your hive-entrances are as large as mine, 12 by 2 inches, it would be all right. With an entrance as shallow as some,  $\frac{3}{4}$  of an inch, it would not do so well. Something depends upon how close the cap fits. If that fits tight, so that no air can pass upward, then a small entrance will not be sufficient for ventilation. You might cut a hole in the side of each cap and cover it with wire-cloth.

2. If the combs are old and tough, or if they are well wired, there will be no need of extracting; otherwise it might be well to extract the lower half of combs heavily filled.
3. Hay packed in will be well, looking out that it does not interfere too much with the ventilation.
4. I have no knowledge of that country as to bee-pasturage.

### Arranging Hives for Certain Space.

My apiary is situated west of my dwelling about 60 feet; it is 30 feet wide by 100 feet north and south, with evergreen trees west of the yard.

What would be the most convenient way to arrange the hives so as to put 100 colonies in that space? or is there room enough? I have them in rows north and south, facing the east, but had thought of changing them and facing the south. How close could they be arranged and do well, and have room to work back of the hives?  
ILLINOIS.

ANSWER.—The best way I know of to give plenty of room between the hives and yet get them on a small space of ground, is to have them in groups of four, as given in "Forty Years Among the Bees," pages 93, 96. As I understand it, your ground is longest north and south; so let a row run north and south, facing east, two hives close together side by side, then a space, and then another pair, and so on. Then another row, back to back, close up against this row, will face west. That will make a double row on each side of the yard, with perhaps 15 feet between the two double rows, and with more space than is needed between the hives to work at the side of each hive; for I hardly think you will want to work at the end of a hive.

### Packing for Winter—Unpainted Hives.

1. When using outer cases and packing with some material for wintering, has sawdust been tried as packing?
2. If so, is it a success?
3. If not a good material, what are some of the objections?
4. Does a bee live long after it has stung and left the sting?
5. In answer to one of my former questions, you said you preferred unpainted hives, because you thought the bees better off in them, but you did not like the looks of them. Now, in what way do you think the bees better off in the unpainted hives?
6. If in unpainted hives they would produce more honey, ought not looks to be of secondary importance?  
MICHIGAN.

ANSWERS.—1. Yes.

2. Not in all cases.
3. Some complain of dampness.
4. I don't know just how long, but a considerable time. The injury does not seem alike in all cases. If my memory serves me, some one made the experiment of confining bees that had lost their stings with others uninjured, and there seemed no very great difference in the length of time the bees lived.
5. I don't know positively about the matter, but I think the hives have a better chance to dry out without the paint, and in a very limited experience I found that bees did not winter in a cellar so well in painted hives. Of course, it is possible that the paint was not at all the cause of the loss of the bees, which might not be an objection fault. Another objection would be the cost, which might not be an objection. There is one sure way would not want to change hives within 25 years. But I found I made a mistake when I did not paint wooden covers.
6. That depends. An amateur with a few hives on a well-kept lawn should keep hives neatly painted. A large apiary kept for the money that's in it, is another matter.

### Sour Honey—Keeping Honey—Swarming—Out-Door Wintering.

1. Herewith I send a sample of extracted honey which has lost its flavor; I have 150 pounds like it. It has been kept in a tank with a board over it. Do you think it soured because of insufficient ventilation?
2. I had a little comb honey in cases which had the same taste. Is it regular sour honey, or do the bees work in something to give it this taste?
3. How is the best way to keep comb and extracted honey? Can it be kept in a shop without fire ordinarily in this climate? This year has been cold and wet.
4. There is a locality, a few miles from here, where there are acres and acres of goldenrod, lots of heartsease, touch-me-not, and considerable buckwheat is raised; clover and basswood are nothing extra. Is there any practical way of keeping the bees from building up to swarm in June or July, and getting them up to their best about Aug.

23? If left to themselves I think they would be strongest just between clover and fall flow.

5. How do you think bees would winter out-of-doors with oil-cloth over the frames, sealed down at the sides, with a super of chaff on top? I use these all summer under the covers; they are very convenient. Would they do as well as a thin board sealed down, if covered with a chaff-packed super? Ohio.

ANSWERS.—1. I should hardly say the honey had lost its flavor, for it has a pretty strong flavor, although not the very best. Judging from the sample, it was probably extracted when hardly ripe enough, the ventilation having perhaps nothing to do with it. Very likely you can improve it if you subject it to a pretty high temperature, not covering it closely. Try setting it on the reservoir of a cook-stove. But don't put it there if it will be heated to more than 150 degrees. A mild heat applied for a number of days is the thing wanted.

2. What you probably object to is principally the flavor of the honey itself, perhaps accentuated by the lack of ripeness. There is very little souring in the case.

3. A hot, dry place—at least have the place dry, a place where salt will keep dry. It ought generally to be all right in Ohio, in a shop without fire.

4. It ought not to be a difficult matter to keep colonies weak till August. All that is needed is to start a sufficient number of nuclei, and then draw frames of brood to strengthen the nuclei and weaken the full colonies. But you had better try it on a small scale, for it is somewhat doubtful if you will like the results.

5. With a warm covering of chaff, you would likely find the oil-cloth all right, just about the same as a thin board.

Weight of Colony for Wintering.

How much should bees, hive and frames—an ordinary 8-frame dovetailed—weigh in order to be strong enough in bees and honey to winter on the summer stand? NEBRASKA.

ANSWER.—For wintering in the cellar, I aim to have each hive with its contents, its cover and its board, weigh as much as 50 pounds. For out-doors there should be 5 or 10 pounds more. If the combs are new, and if they do not contain much pollen, a smaller weight would do, but it is best to be on the safe side. A little too much honey in a hive for winter is just enough.

Queer Experiences with Swarming.

1. On June 14, colony No. III cast a prime swarm (it was hived in a new hive). June 21—the eighth day—just at evening I cut all queen-cells from the old colony, cut the caps from the most advanced cells, and let the queen run out into the hive. July 9—the 20th day after the first swarm, they swarmed again; the swarm was just an ordinary-sized second swarm, and wishing to examine the comb to ascertain if possible the cause of the unusual occurrence, I run the swarm into a box and overhauled the hive. I found a little capped brood in three combs, quite a little on one side of one of the frames, and a few seatterling cells of brood in two other combs and seven queen-cells, one of which had the whole side torn out of it by the bees. The cap showed no evidence of having been opened. One frame which a queen had lately emerged, two with dead inmates all turned black, and three with good, lively queens in just ready to come out, and five or six patches of drone-brood capped, but quite young yet. When I cut the queen-cells I had shaved the heads off all the drones, no eggs or uncapped brood in the combs. Can you explain the cause of the unusual occurrence?

2. What is the best method for handling swarms from the colonies three or four weeks old? I know you do not think such colonies swarm again in the same season, for a corresponding answer, you the latter part of the winter how to prevent new colonies from swarming again in about four weeks, and you said, Oh, but they don't. But, Doctor,

they do with me, and with others around here, if there is any honey coming in, and I have tried every way I know to prevent it.

To illustrate: I got my first swarm June 13, and June 14 I had 10, and hived them in six hives June 15. Six swarms hived in four hives July 1; one of those colonies swarmed just 18 days after being hived; left the hive full of brood and honey, one super full, and the other well under way. The next day, July 2, two more of them swarmed, and up to last night (July 8) nine of those new colonies had cast swarms. Of course, it is awful, right in the height of the honey-flow, to have them break up that way, and something has to be done to keep them together. I am using now two methods—one is to kill the old queen, return the swarm, and then cut out the queen-cells the eighth day; the other way, I take four frames of brood from the hive and replace with four frames filled with foundation. There are objections to both methods—one is not always sure, the other you lose a valuable queen (for I think it takes a pretty good queen to fill an 8-frame hive with brood and eggs in 18 days); and it is not sure, either, if you happen to miss a cell.

Can you suggest any better plan?

MINNESOTA.

ANSWERS.—1. When a queen is unsatisfactory, one of the first things is to rear a successor. A good many years ago I had a queen reared by a very weak nucleus. She laid just one egg, and that was in a queen-cell, and then she disappeared. Your colony swarmed 18 days after you let the queen out of the cell. That would hardly allow time for queens to mature from her eggs, and the only guess I can make is that eggs had been left from the old queen undeveloped until after the time of your overhauling. Dzierzon says that bees sometimes keep eggs in that way.

2. If I understand you rightly, a swarm was sent out by a colony which 18 days previously had been hived as a swarm. This, although not a very common occurrence, has been known from time immemorial, such a swarm being called a virgin swarm. That was not the thing I disputed, but I claimed that a colony would not swarm if it had a queen reared in the hive during the current year; and even in that it seems I was mistaken. The best suggestion I can make is to get into the hive a young queen after the harvest opens.

Swarms—Introducing Queens.

1. How can that man in Arkansas get a swarm of bees in 14 days from a new colony when it takes 21 days to mature a bee?

2. I saw in the Bee Journal the way Dr. Miller introduced queens, by drowning them. I don't approve of that. My way is to place the queen in a cage, fill the hole in the cage with sugar, then put the cage between the top frames, and by the time the bees get her out they will be acquainted with the new queen.

I have had some experience with bees. Last spring I did not have any bees at all, but I placed some empty hives out and 2 swarms came to me; then I cut down 3 bee-trees and now I have 5 colonies in good condition. IOWA.

ANSWER.—1. It is hard to understand how a swarm could be thrown off by a swarm hived only 14 days before, unless a frame of brood were given to the swarm, which is not an uncommon thing. It takes 21 days for a worker to mature from the time the egg is laid, but only 15 or 16 for a queen, and if a frame of brood were present and a queen were started from a grub, a young queen might emerge in 12 days or less.

2. Your way is the usual one, and is good. I don't know whether the drowning plan will always succeed, but if it does there is a saving of time over your plan.

GINSENG FOR SALE

My 1902 crop of fine Northern cultivated seed. Well germinated and ready to plant. Price, \$17 per thousand. A few thousand very fine cultivated one year old roots, at \$8 per hundred. Sold under written guarantee as to purity and quality.

Prices on older roots, wild or cult. on application.

FROM MANY FIELDS

Bee-Keeping in Kentucky.

This has been a very favorable year for the busy bee. White clover has been in bloom longer this year, in this section at least, than was ever known before—nearly four months; whereas the usual length of time to bloom is less than two months. The reason for the splendid honey-flow the present season is due to the fine rains which have continued every few days. There is an abundance of goldenrod, from which the bees are gathering considerable honey; this honey has a fine flavor.

Kentucky is far behind some of the other States in the matter of honey-production. There is no organization here, each "goes it" alone, and such a "go"!

The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

Please mention Bee Journal when writing.

As a rule, the bees are left to their own sweet will; what honey they collect is taken away from them and carried to the nearest grocery and sold for what it will bring, not having been cleaned from propolis or other matter that makes its appearance inviting.

A section of fancy comb honey, when placed with one of the class first-named, presents a strong contrast.

It is not necessary to say that this state of affairs very seriously cripples the price of a nice article of honey.

I have 22 colonies of bees, and they did well this year.

There is much being said about the swarming problem; each writer has this or that to suggest as to the best means to solve this problem. For this locality, I find that to prevent swarming in any form is to be preferred. One strong colony that does not swarm will store 25 percent more honey than one of equal strength and opportunity which has swarmed or been "swarmed."

Bees will, in every case, attend to the wants of the brood-nest before they go elsewhere. To prepare this requires considerable time and labor, drawing out comb foundation in the one case, or building new comb from starters, or filling old ones with honey. While the brushed, shaken, or "shook" swarm is thus employed, the other being provided with a brood-nest "laden with stores and teeming with bees of all ages," is crowding the sections and storing their collections there.

To prevent swarming is, for me, easy of accomplishment. My colonies are made strong by stimulative feeding early in the spring. When they are about to swarm, an empty hive is prepared; if they swarm out, which they very often do, the queen is caught in a Miller cage, and a hasty examination is made of the brood-nest, there being, comparatively, no bees in the way. If a good cell is found, the comb is put in the prepared hive with another. Their places in the old hive are replaced by empty combs or full sheets of foundation. By this time the swarm returns to the old hive, the queen is released at the entrance, and all is well. Not one in ten will swarm after this operation. We not only prevent swarming, but we secure a rational increase in the apiary at the same time.

I do not desire to "forage" on your very valuable space, Mr. Editor, but beg to say a word about "bee-papers."

No man can keep bees successfully unless he reads. He must consult the bee-paper if

## Bees and Apiary Stock at a Bargain!

We have for sale in Lee Co., Ill., (100 miles west of Chicago, on the Chicago & Northwestern and Illinois Central Railroads), the following list, some of which is new, and the balance as good as new:

10 10-frame Simplicity Nailed Hive-Bodies.....	20c each.
47 8-frame Hive-Bodies.....	20c each.
59 Wood-bound 10-frame Zinc Honey-Boards.....	15c each.
1200 New, Clean, Wired Extracting Combs (L. size).....	10c each.
560 New L. Brood-Frames with full sheets wired foundation.....	10c each.
400 Good L. Brood-Combs.....	12c each.
1 2 Frame Cowan Reversible Honey-Extractor.....	\$8.00.
1 Two-part Wooden Uncapping-Box.....	4.00.
1 "New Model" Solar Wax-Extractor (glass 26x60 in.).....	8.00.
1 Wooden Honey-Tank with galvanized-iron bottom (holds 1800 lbs.).....	10.00.
1 Bingham Honey-Knife.....	.50.
1 6-inch Comb Foundation Mill.....	15.00.
1 10-inch Comb Foundation Mill.....	25.00.
130 New Wired Staple-Spaced Brood-Frames—per 100.....	2.00.

Also 60 Full colonies Italian Bees in 10-fr. Langstroth hives, at these prices: 5 colonies at \$4.50 each; 10 or more at \$4.00 each. No disease.

All the above can be shipped promptly. First come, first served. What do YOU want out of the lot? or do you want it all? Of course the combs and frames of foundation could be filled into the empty hive-bodies and shipped safely in that way, if so desired. (No order filled for less than \$5.00 from the above list). he would know the bee and its habits. I attribute the slovenly manner in which bees are managed here to the lack of this knowledge. The American Bee Journal will call at my home as long as I can raise the price of its subscription. Its able editorials and articles contributed to it by some of the most able bee-experts of the age, and its general information pertaining to the bee-industry, make it one of the most useful, and at the same time interesting, publications of the day. If every man in Kentucky were to read the Journal, I believe her honey-production would, in a short, time be equal to that of many others of her sister States, for several of the honeypoints, especially white clover, flourish here as they do elsewhere. E. I. SMITH.

Warren Co., Ky., Sept. 4.

### An Acknowledgement and Mulberries.

I gratefully acknowledge Mr. Hasty's suggestion, on page 602. His counsel is always on the side of reason, and I am ready to admit that I may have been a little premature in my conclusion. I fear that I am not cut out for a good missionary, but even now I would so amend my previous decision as to send a small plant of the white mulberry, as long as they last, to any one really interested in the subject.

The cuttings were, however, sent on full letter postage, and must have reached each applicant. Under the circumstances, our Uncle Sam generally does the "square thing."

DR. PEIRO.

### Bees Did Well.

My bees did well this year. I got 1450 pounds of extracted honey from 18 colonies.

W. H. MOORE.

Smith Co., Tex., Sept. 19.

### Had a Good Season.

We are having a good season. I have one colony that has stored 224 pounds of honey up to this date, and white clover is still in blossom, and the bees are working on it. This colony is in a 10-frame hive. N. H. VOGR.

Nemaha Co., Kans., Sept. 21.

### Only a September Swarm.

Well, I was a sight to behold! My nearest friends were in a quandary whether I was Irish or Indian—and all due to that big swarm. No, it was so late we didn't expect them to swarm, did we? But they did, and the next morning, promptly at 9 a.m. There they were on that big cottonwood limb in my neighbor's yard—I was told of it after I left home, but couldn't leave the office to go catch a September swarm if it had been as big as a bushel basket—just what it looked.

But they waited for me, O yes, indeed; I energetically interviewed them a little while after 5 p.m. I first put an empty hive under that big limb for them to fall into, as it were; then I had that limb sawed off—and they did all the rest.

Now, I don't want to prevaricate, but if there wasn't a million bees all over me it certainly felt like it. After considerable investigation on their part, they found a hole in my vest just a little bit sooner than I did myself, and they weren't slow to get inside where I lived. Well, I'm not strong on English ex-

pressions, or I might enlarge on my feelings at that moment, and a good many moments after that, but suffice it to say I felt something as I imagine a toad with erysipelas must feel—hot and swollen. In looks I must have seemed a "peach"—a nice, fat Crawford, face round, full, not a wrinkle. The good wife, who afterward took a lot of stingers out of my neck, ears and protruding brow, intimated that I looked like a human pin-cushion. But I was too abstracted to resent the allusion; what I most desired just then was to get those hot stickers out of my hide. And all this for a September swarm.

But the real joke is, I never got that swarm. No, sir; they "riz," and went back to that same tree and hugged its trunk just above where the limb was, and there they remained just five days to the very hour—to see if I'd come back after them. Not much! At 9 a.m. on Labor Day, they took their flight, with the best wishes that occurred to me, and went West for tall timber.

Did you ever hear of a swarm locating in the manner mentioned? Cool weather, too, and nothing to eat. Those fool things have likely gone into some hole, and, owing to the late, inclement season! won't get stores, and

will die. But they'll die victorious, eh? Hang 'em!

But I say to their credit they did handsomely in putting in a big lot of honey in the brood-chamber, and a hundred pounds in the super, (mine is a double hive, you know). If they'd only had sense enough to stay and enjoy the fruit of their industry, I, too, would have been more contented.

Your punctuated uncle,  
Cook Co., Ill. FRANK.

### Partridge Pea.

I send a slip of a plant which grows here along hillsides and streams where there is plenty of yellow clay. I notice the bees work on it very hard in the fall. What is it?

FLOYD M. HEFFNER.

Webster Co., Iowa, Sept. 2.

[The enclosed plant is partridge pea, and belongs to the pulse family. Prof. Cook's Manual says it furnishes abundant nectar. The whole pulse family is a rather sweet one.—C. L. WALTON.]

### Not a Pound of Honey.

The honey crop is a failure here. It has been a poor crop the past four years, but there is not a pound of honey to take off this fall. It has been too wet and cold since the first of August for the bees to work and store surplus honey.

W. E. MEAD.

Newaygo Co., Mich., Sept. 15.

### The Hamilton Co., O., Association.

The Hamilton County Bee-Keepers' Association held their annual meeting in the Grand Hotel, Cincinnati, Ohio, on Monday evening, Sept. 14. A large number of prominent bee-keepers in the county were present, also from adjoining counties in Indiana and Kentucky. The reports of the Secretary and Treasurer for the past year bespoke a flourishing condition of affairs.

Having settled the question of foul brood treatment by adopting the McEvoy method, this society has issued a pamphlet (free to

## Long Tongues Valuable

### South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

HUTTO, TEX., Nov. 19, 1902.  
J. P. MOORE.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written you sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

144 & 146 Erie Street, CHICAGO, ILL.

members) containing full instructions as to symptoms and cure.

It was resolved that the society bend its energies during the ensuing year towards the enactment of laws in favor of the bee-keeping industry in the State of Ohio.

The election of officers for the ensuing year was then proceeded with, and the following resulted:

President, Henry Shafer; vice-president, J. C. Frohlinger; treasurer, C. H. W. Weber; executive committee, Fred W. Muth, A. E. Painter, E. P. Rogers, E. H. Chidlaw, R. S. Curry, Charles Kuck, Wm. M. Lennan, W. R. Gould, G. Greene, E. H. Vaupel, Mrs. J. C. Frohlinger, and Miss Carrie Boehm. Wm. J. Gilliland, of Silverton, was re-elected secretary.

A motion to amend the by-laws to increase the executive committee from six to twelve was carried unanimously.

Bee-keeping being a source of pleasure to the gentler sex, it was resolved, on the urgent appeal of the secretary, to give them representation on the executive committee. Two were elected, whose names appear above.

E. A. Painter, a prominent attorney and bee-keeper, gave an interesting address on organization, after which a hearty vote of thanks was tendered the proprietor and manager of the Grand Hotel, for the accommodation afforded the bee-keepers' association, free of charge, during the past year.

W. J. GILLILAND, Sec.

Hamilton Co., Ohio.

### CONVENTION NOTICES.

Wisconsin.—The annual meeting of the North-Eastern Wisconsin Bee-keepers' Association will be held in the Opera Hall, at Mishicot, Manitowish Co., Wis., on Wednesday, Oct. 7, 1903. Mr. N. E. France, the General Manager of the National Bee-keepers' Association, will be present and address the meeting. It is expected that this will be the largest best convention ever held by the bee-keepers of northern Wisconsin. Everyone interested in the production of honey should be present. An interesting program on many material subjects to each and every person interested in bees has been prepared, and such subjects will be discussed by the prominent and experienced bee-keepers, which will be followed by a free discussion by all in attendance who wish to participate. No one can help but profit by attending this convention. COMMITTEE.

Illinois.—The annual meeting of the Northern Illinois Bee-keepers' Association will be held in the Court House, in Rockford, Ill., Tuesday and Wednesday, Oct. 20 and 21, 1903. A good program is being prepared, and all interested in bees are invited to attend.  
Cherry Valley, Ill. B. KENNEDY, Sec.

Utah.—The Utah Bee-keepers' Association will meet in the City and County Building in Salt Lake City, Oct. 5, commencing at 4:30 o'clock, p.m. Among the topics a free discussion will be the winter problem and the best method to promote the interest of the State and National Associations. E. S. LOVENS, Pres.

# BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

## Alfalfa Honey

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

## Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

**Write for Quantity Prices by Freight, if Interested.**

A sample of either, by mail, 10 cents, to pay for package and postage.

**Order the Above Honey and then Sell It.**

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 E. Erie St., Chicago, Ill.

## DITTMER'S FOUNDATION RETAIL AND WHOLESALE

This foundation is made by a process that produces the superior of any. It is the cleanest and purest. It has the brightest color and sweetest odor. It is the most transparent, because it has the thinnest base. It is tough and clear as crystal, and gives more sheets to the pound than any other make.

**Working wax into Foundation for Cash a Specialty. Beeswax always wanted at highest price.**

Catalog giving FULL LINE OF SUPPLIES with prices and samples, FREE on application. E. GRAINGER & CO., Toronto, Ont., Sole Agents for Canada.

**GUS. DITTMER, Augusta, Wis.**

## BINGHAM'S PATENT 25 years the best. Send for Circular. Smokers

25ct

T. F. BINGHAM, Farwell, Mich.

**BEE-SUPPLIES!**  
ROOTS GOODS  
AT ROOT'S PRICES

Everything used by bee-keepers.  
POUNDER'S HONEY-JARS. Prompt service. Low Freight Rates.  
NEW CATALOG FREE.

**WALTER S. POWDER,**  
512 MASS. AVE. INDIANAPOLIS, IND.

## Italian Queens, Bees and Nuclei.

We have a strain of bees bred specially for honey-gathering and longevity, at the following prices:

One Untested Queen..... \$ .60  
One Tested Queen..... .80  
One Select Tested Queen. 1.00  
One Breeder Queen..... 1.50  
Ose - Comb Nucleus (no Queen)..... 1.00

These prices are for the remainder of the season.

Queen, sent by return mail.  
Safe arrival guaranteed. For price on Doz. lots send for Catalog. J. L. STRONG,  
1641st 204 E. Logan St., CLARINDA, IOWA

## REMARKABLE The Universal Satisfaction our QUEENS do Give...

I was showing my father yesterday how my bees, which I bought from you, were out working everything in my apiary. Send me 4 Buckeye Red Clover and 2 Muth Strain Golden Italians. I will order more after next extracting.

Buckeye Strain Red Clover Queens. They roll in honey, while the ordinary starve.  
Muth Strain Golden Italians—NONE SUPERIOR. Carniolans—NONE BETTER.

Untested, 75c each; 6 for..... \$ 4.00    Tested, 15c each; 6 for..... \$ 7.25  
Select Untested, \$1.00 each; 6 for..... 5.00    Best Tested, \$2.50 each; 6 for..... 12.00  
Best money can buy, \$3.50 each.

Send for Catalog of BEE-SUPPLIES; complete line at manufacturer's prices.

**The Fred W. Muth Co.,**  
Front and Walnut, CINCINNATI, OHIO.

## HONEY AND BEESWAX MARKET QUOTATIONS

CHICAGO, Sept. 18.—Sales are not frequent enough to keep receipts cleaned up. They are made on a basis of 12@14c for comb of the best grades. Extracted, white, 6½@7c for clover and basswood and 6@7c for other white honeys; amber, 5½@6½c; according to flavor and package. Beeswax, 30c. R. A. BURNETT & CO.

KANSAS CITY, Aug. 25.—Receipts of comb honey more liberal; demand improving. We quote fancy white comb, 24-section case, \$3.25; No. 1, white amber comb, 24-section case, \$3.00; No. 2, white amber comb, 24-section case, \$2.75; Extracted, white, per lb. 6½c; amber, 5½@6c. Beeswax, 25@30c. C. C. CLEMONS & CO.

ALBANY, N. Y., Sept. 19.—Honey market firm on light receipts so far and good demand. We quote: Fancy white, 16c; No. 1, white, 15c; No. 2, 14c; buckwheat, 12@14c. Extracted, good demand just now for Jewish holidays, for candied honey, at 6½@7c for dark; white clover, 7@7½c; mixed amber, 6½@7c. Beeswax, 30c. H. R. WRIGHT.

CINCINNATI, Aug. 6.—The supply about equals the demand for extracted honey. We are selling amber extracted in barrels from 5½@6½c, according to quality. White clover, barrels and cans, 7@8½c, respectively. Comb honey, fancy, in no drip shipping cases, 16@16½c. Beeswax, 30c. THE FRED W. MUTH CO.

NEW YORK, Sept. 8.—New crop comb honey is beginning to flow more freely, and the demand is good for all grades. We quote fancy white at from 14@15c, No. 1 at 13c, and from 11@12c; no buckwheat on the market as yet.

Extracted is plentiful, and in fair demand at 7c for the white, 6@6½c for the light amber, 5½@5¾c for dark. Southern in barrels at from 55@65c per gallon, according to quality. Beeswax is declining, and nominal at from 28@29c. HILDBRETH & SEIGELER.

CINCINNATI, Sept. 18.—The extracted honey market has weakened a little. White clover is offered quite plentiful; prices of sales 1 made ruled as follows: Amber, in barrels, 5@5½c; water-white alfalfa, 6@6½c; fancy white clover, 6½@7c. Comb honey, fancy water-white, 14@15½c. No sales for lower grades. Beeswax, 28c. C. H. W. WEBER.

SAN FRANCISCO, Sept. 2.—White comb honey, 12@14c; amber, 9@11c. Extracted, white, 5½@6c; light amber, 5¼@5c; amber, 4½@5c; dark amber, 4@4½c. Beeswax, good to choice, light, 27½@29c; dark, 25@26c.

Most of the comb on market is of small lots, and while being very steadily held, fails to move as readily as good advantage as would straight carload lots of uniform and high grade. Extracted is in high request, with offerings of only moderate volume, and market firm at prevailing values.

**WANTED! FANCY COMB HONEY**  
In no-drip shipping-cases. All Amber Extracted in barrels or cans. Quote your best price delivered Cincinnati. The Fred W. Muth Co.,  
3241st Front and Walnut, CINCINNATI, OHIO.

**WANTED—Comb Honey in quantity lots.**  
We are perhaps the only dealers in this article owning as much as 150,000 pounds at one time. Please state quantity, quality and price asked for your offerings. The C. W. Stacey & Son,  
241st MANZANOLA, COLO., or FAIRFIELD, ILL.

**WANTED—Extracted Honey.**  
Mail sample and state lowest price delivered Cincinnati. Will buy FANCY WHITE COMB HONEY, any quantity, but must be put up in no-drip shipping-cases.

C. H. W. WEBER,  
2146-48 Central Ave., CINCINNATI, OHIO,  
241st Please mention the Bee Journal.

# AMERICAN BEE JOURNAL

43d Year.

CHICAGO, ILL., OCT. 8, 1903.

No. 41.

WEEKLY

S. WOOD, (Aged 82 years,)  
Member of the Ontario Bee-Keepers' Association.

# THE AMERICAN BEE JOURNAL

PUBLISHED WEEKLY BY

**GEORGE W. YORK & COMPANY**

144 & 146 E. Erie St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

EDITOR,  
**GEORGE W. YORK.**

DEPT. EDITORS,  
DR. C. C. MILLER, E. E. HASTY, EMMA M. WILSON

## IMPORTANT NOTICES.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec03" on your label shows that it is paid to the end of December, 1903.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

Advertising Rates will be given upon application.

## National Bee-Keepers' Association

### Objects of the Association:

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

### ANNUAL MEMBERSHIP, \$1.00.

Send dues to Treasurer.

DR. C. C. MILLER, Marengo, Ill.

If more convenient, Dues may be sent to the Secretary, at the office of the American Bee Journal.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S

"FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will cost for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to  
**GEORGE W. YORK & CO,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise you try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

**GEORGE W. YORK & CO.**

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

Please Mention the Bee Journal when writing Advertisers.....

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

43d-YEAR.

CHICAGO, ILL., OCT. 8, 1903.

No. 41.

## Editorial Comments

**Scourene** removes propolis from the hands almost instantly, says Ralph D. Cleveland. We suppose all grocers have scourene for sale.

**Honey Crop Ruined by Insects.**—A Utah correspondent reports in the Rocky Mountain Bee Journal that "those little insects are in the alfalfa by the millions, and are in some of the bee-hives eating up the honey," resulting in only a fourth of a crop.

**Honey and Wax in France.**—Government reports show that in the ten years ending with 1901 the value of wax produced was nearly half as much as that of honey, or 44 percent. That looks like a large proportion of wax; but then the yield of honey was less than 11 pounds per colony.

**A Middle Bar in Place of Wiring,** is advised by the editor of the Australian Bee-Bulletin. He says:

We, ourselves, have not used wired foundation for several years, both on account of its stretching when the frame is full of comb and honey, and because the horizontal stick across the center of the frame is much better, and less trouble to put in. We know a number of good bee-keepers who are adopting the stick-plan instead of wires.

**Choice of Location.**—On page 579, an editorial ends with saying, "On the whole . . . the probability is that not one bee-keeper in ten will find himself better off anywhere in the world than right where he is now." This view is neatly confirmed by the first item in the editorial columns of the September Bee-Keepers' Review, where Editor Hutchinson says: "Michigan seems doubly desirable as a home, since taking my Western trip."

**Bees Embalming Mice.**—The question has been raised whether there is any truth in the statement that when some offending body as large as a dead mouse is found in a hive the bees seal it hermetically with propolis. Perhaps in the majority of cases, when a mouse dies in a hive, it will be found dried to a mummy, with no offensive smell, but with no coating of propolis. At least two cases, however, are reported in *Gleanings in Bee-Culture*, in which the dead mouse was entirely encased in bee-glue.

**A Variation of the Stanley Cartridge,** or queen-nursery, is given in *Gleanings in Bee-Culture*, as used by the A. I. Root Co. Instead of queen-excluding zinc being used, the perforations are smaller, so that workers can not get through. Instead of gun-wads, cylindrical wooden plugs are used. Through the upper one of these plugs a nail-point projects, the cartridge being fastened to the cellar by means of this cell-point. Through the lower plug a hole is bored and a smaller plug inserted. This smaller plug is hollowed to contain candy.

Some use leather instead of gun-wads for plugs, and claim they are better.

**Co-operative Advertising.**—In the discussions as to the advantages of organization among bee-keepers, very little has been said about the matter of calling the attention of the public to the great desirability of making honey a leading article of diet. Yet the gain possible in that direction is not one of the least to be expected from proper united action. Morley Pettit, in the *Farmers' Advocate*, uses these sensible words on the subject:

A matter which is at present sadly neglected is the advertising of honey. The very heavens resound with the names of food fads and medicines, while the most pleasant and nutritious of natural sweets is comparatively unknown in our Canadian homes. The reason is not far to seek. "Honey is honey," and, under existing conditions, if Smith advertised he would be increasing the sale of Brown's honey almost as much as his own. The only way out of it is for Smith, Brown, *et al.* to form a honey exchange and advertise the honey of the exchange. They would then agree upon a remunerative price, which would not become exorbitant, by the way, on account of the direct competition of fruit, syrups, and foreign honey. They would advertise extensively until "honey" would become a household word, learned along with "papa" and "mamma" by the lisping child.

**"C. O. D. by Mail"** is a somewhat novel thing mentioned by H. H. Charles, in *Class Advertising*. More than a thousand transactions of that kind were made by him with great satisfaction. A customer would want some part of an incubator and order it, perhaps without knowing the cost. If sent by express it would cost 25 cents, if by mail perhaps 3 or 4 cents. It was sent by mail with instructions to the postmaster to collect on delivery and remit, deducting his fee, which was never more than 10 cents. This might not be a bad plan with small orders in bee-supplies. But we wouldn't like to advise it until it is approved by the post-office department of our government.

**Commercial Organization** is up for discussion nowadays, and it is well that it should be carefully viewed from all sides. Not only should the advantages be shown, but the difficulties and objections as well. Some of these latter are considered by Hon. R. L. Taylor in the *Bee-Keepers' Review*. He shows the difficulty of making local organizations with the hope of uniting these into State organizations, and later uniting the State organizations into a single National organization. And yet, in the end, that is the very thing he advises, his views being summed up in the caption, "Commercial Organization Must Begin Locally." The only difference that appears between what is so hard to be done and what ought to be done is that action should only be taken in such localities as feel the need of it. He says:

"When several bee-keepers in the State of Michigan, or in any section of it, think they can dispose of their crop to better advantage by union, let them unite in such manner as seems best suited to their circumstances. If they are successful, their successes and mistakes will be a source of sound instruction to those of other communities who shall desire to take like action. Thus, each organization will be firmly cemented by a natural growth through experience, and, if need appear, its roots and branches will reach out until they meet and intertwine with those surrounding it, and all shall become one great growth, furnishing shade to all of the whole land who seek its shelter."

But if each organization is to intertwine with those surrounding it, will there not be necessity for some one to take the initiative to direct the intertwining? And if all are to become one great growth, who or what is to bring about the merging?

Probably the majority who urge unity of action advise the reverse course, beginning at the center and working outward, and they will be likely to ask why it may not be better to form the main organization at the start to foster the local growths, rather than to wait the years necessary for natural growth to blend all into one.

## Miscellaneous Items

IN LOS ANGELES AND ON CATALINA.—During the first day of the convention, Prof. Cook planned a trolley-car ride down to Long Beach, on the Pacific's sandy shore, about 30 miles from Los Angeles. It was found that if 100 could be pledged to go, the rate would be only 30 cents for the round-trip instead of 50 cents. The required number was easily secured, and so early Thursday morning all gathered at a certain point, and boarded the cars for Long Beach.

Electric cars get up some speed here in Chicago, but at times these Long Beach cars seemed almost to fly. Along the line was some of the best farming country we had seen in the West. There was one or two dense eucalyptus woods, alfalfa fields, one apiary, and other objects of interests.

Long Beach was soon reached, and we had about an hour to stay. Some of our crowd went in bathing in the Pacific, as well as in the large natatorium, where the water in a tank about 40x80 feet is kept at a certain temperature. The tank was about 4 feet deep at one end, and gradually became deeper toward the opposite end, where it was probably 7 feet deep.

Among those who "took their morning bath" in the tank, were: Prof. Cook, Messrs. Hyde, Hutchinson, Hershiser, Harris, Moe, Ivy (and Mrs. Ivy and child), and a number of others that now we can not recall. It was great sport. One would think that when such 200-pounders as Hershiser tumbled in there would be an overflow, and everything would be flooded, but evidently ample provision had been made for such emergency, so no one of the spectators at the edge of the "bath-tub" were drowned!

Mr. France went out on the pier, and with a fisherman's line that he borrowed, dropped a small empty bottle down to get a sample of the salty Pacific. He said he had a sample of Atlantic water, and now wanted some of the Pacific to take home.

The time to return to Los Angeles and the convention soon arrived, and all were rushed back in a very short time. It was a pleasant and refreshing trip.

At the close of the Wednesday afternoon session, Mr. L. E. Mercer, who had bought a \$1200 automobile with some of his honey crop, took Prof. Cook, Mr. Benton and us for a spin around Los Angeles. It was our first experience with that kind of a "horse and buggy." Mr. Mercer had had it about a month, and seemed to know how to manage it perfectly. He took us out on some of the finest streets, around parks, and where we could see the best parts of the city—where beautiful palms, waving pepper-trees, and the tall eucalyptus adorned the sides of the streets. It was a delightful ride, for which we were indebted to one of California's biggest bee-keepers.

The convention closed on Thursday afternoon. During the sessions a trip to Catalina Island was planned. So about a dozen started Friday morning at 8 o'clock for East San Pedro, about 20 miles away, to take the boat to cross the 28 miles of the Pacific to the Island. It was a bright morning, and promised to be a lovely day. But it is needless to say that, from May to November, they said no other kind of days happen there. We often found ourselves saying in the morning, "Well, we're going to have a bright day to-day," when we thought, "Why, you tenderfoot, they don't have any other kind out here, day after day!" So it was bright, glaring sunshine all the time. Rather hard on Eastern eyes.

We all finally got aboard the boat for Catalina—the famous outing place of Southern California. The boat hadn't gone far before some of the passengers seemed to feel as if they had had too much breakfast. So they began to "unload," and thus held the fish out with "a bite to eat." Dr. Miller concluded he'd better go into the cabin and sit down, and meditate on what he "didn't know." Mr. Hyde couldn't find a vacant seat or chair, or any place to hide, so he sprawled out on the carpeted floor, and tried to "enjoy" himself. He was a perfect picture of homesickness, lonesomeness, seasickness, and general gone-

ness and despair. He wasn't a bit sociable, and that is an unusual condition for him.

We really enjoyed the ride all the way, our stomach keeping right side up and in good shape all the time.

It took about two hours and a half to cross over to Avalon, the only town on the island of Catalina. It is situated on a beautiful, small bay, on the east shore. There seemed to be but very little shore to the island, but mostly steep rocks. Avalon is built in a little cozy depression almost under the high hills. At first one wonders how it is possible to get out of the town except by water, but there are stage roads through various parts of the island. There is also a ranch somewhere on it. A certain portion is set aside as a hunting park, where may be found wild mountain sheep and other animals. Sportsmen may "sport" there by paying for the privilege. We regretted not being able to stay longer and see more of Catalina.

Right here we wish to mention one of the most cordial and kindly bee-keepers we met in California. His name is Wm. Ross. He went to California some 13 years ago, from Ontario, Canada, on account of his health, which he has almost wholly regained in that "Land of the *Ultimate*," as we feel like calling it.

Well, Mr. Ross has a tent-cottage on Catalina Island, where he and Mrs. Ross and their youngest daughter, Bessie, spend a few weeks every summer.

We (with Mrs. York) at once engaged a room at one of the hotels.

MR. JULIAN AND HIS GLASS-BOTTOM BOAT "IOWA."

and then went out on one of the larger glass-bottom boats. There is a smaller row-boat (shown herewith) which also has a glass bottom. In this latter we took a ride on Saturday morning. It belongs to a man named "Julian," who has been there for about 40 years, and knows just the best route to row people so as to see through the glass bottom the greatest variety of shells, fishes, seaweed, etc. It is truly wonderful how much of interest can be seen through that window at the bottom of the boat. Why, one can see down from 50 to 100 feet, as the water is so clear. Never go to Avalon without taking a ride or two on the glass-bottom boat.

After the trip in the larger glass-bottom boat, Friday afternoon, on which trip Mr. Ross and Bessie also went, he invited us to come to their tent-home for tea, which should consist of some bread, milk, and California's best honey. It was a rare treat. "Mother" Ross just took us wanderers right in, and made us feel right at home. And such a meal! Well, the bread and honey and milk disappeared wonderfully fast, we can assure you. Such appetites as we did have at Catalina! It seemed that everything tasted so good.

During the evening there was a fine band concert for the summer resorters of the village, but we were tired, so sought our room and tried to "sleep the sleep of the just."

The next morning, we hired a row-boat, and with Mrs. York and Mr. Ross tried to do a little fishing in Old Pacific. We thought to catch a 30 or 40 pound yellowtail, or even a leaping tuna wouldn't have been despised! But we didn't get a bite!

About 11 a.m. we went to the bath-house and rented a suitable costume, then got into the Pacific with the rest of the bathers. Miss Bessie had a white cotton flannel suit in which she made a pretty picture. And she could swim in fine style, being quite at home in the water.

At 3:40 we were to take the boat for East San Pedro again, and

then the train to Los Angeles, and after that the electric car for Pasadena, where we were to stop over Sunday. We arrived at our destination about 9:30 p. m., two very tired travelers. Oh, how glad we were to get to rest.

On the return voyage on the Pacific, Mrs. York seemed to get wobbly on the boat, as it was a rather choppy sea. After giving up some of her dinner, she felt a little better. The ride on the water did not affect us unfavorably at all. Too tough and hardened, we suppose.

Before leaving lovely Avalon and Catalina, we wish to quote a little from a descriptive circular of the Island, which tells it so much better than we can. Here it is:

**SANTA CATALINA ISLAND.**—"A land where Winter hath fair Summer wed," a bit of world by itself, picturesquely located in the Pacific Ocean, 30 miles from Los Angeles.

Santa Catalina is truly a "Garden of the Gods in the land of the free." The island contains 47,000 acres of plains and valleys, and abounds in beautiful and lofty mountains, stupendous rock cliffs and precipices, and in climate, natural beauties and opportunities for outdoor pleasure comes as near perfection as one can find.

**THE MARINE GARDENS.**—The Ocean, along the entire coast of Catalina Island, is a wonderful natural aquarium. The water is still, tropically rich, and clear as a diamond; hence the famous glass-bottom boat, down through which visitors peer at the wonders of the deep, provide an entertainment found nowhere else in the world. Here one sees a perfect forest of seaweed, in all the colors of the rainbow, in the branches of which float beautiful fishes of rare and radiant tints, being the home of gold perch and schools of emerald fishes, while the black, long-spined echinus, star-fishes, sea cucumbers, abalones and octopi are seen clinging to the bottom of the ocean, and in the intervening water scores of rich jelly fishes of every form and shape captivate the eye. Nowhere so near a city of 100,000 inhabitants can such a strange and fascinating panorama be witnessed as that to be had from the window of the Santa Catalina glass-bottom boat.

**BATHING.**—The boating and fishing is superior to that of many California resorts. The perfect climate and sanitation, the smooth bays and facilities for safe boating and bathing, render it the ideal place for ladies and children. The little bays are crowded with fishing boats, steam launches and yachts, all providing for the public pleasure.

**FISHING.**—Fishing is a sport that can be better enjoyed here than any place in the world. Here may be caught fine fish monsters that weigh from one to 500 pounds, while yellowtail, barracuda, rock bass and albacore afford the fisherman all the sport he can ask for. The famous leaping tuna is caught nowhere else with rod and reel.

A novel sport confined to Catalina is flying fish shooting. The big tunas rush in, driving the flying fishes out of the water in flocks, like quail, and at this time the sportsman on a launch can pick them off with a shot-gun.

**CLIMATE.**—Catalina is a natural sanitarium, combining all that is best in the Madera Islands and the famous Riviera. Even in mid-winter the days are mild, frost being unknown; the Island is then a flower-garden. It has valuable sulphur springs, and the opportunities for salt baths and enjoying the remarkable varieties of climate, make it a most resort.

The days are never uncomfortably warm in summer, nor too cool in winter, presenting conditions which challenge comparison. The average temperature of July days at Avalon is 65 degrees. In August the highest mean temperature observed at 6 in the morning was 72 degrees.

We liked Avalon so much that we want to return some time when we can remain there a week or two. It is an ideal place to rest. The climate is simply perfect. There is just enough going on there to keep one from getting too stagnant and out of touch with the world. There is a daily paper published on the Island called "The Wireless." It is a great place to purchase curiosities and mementoes to carry home.

If you ever go to Los Angeles, don't fail to cross over to Catalina Island, and stay there a few days. You will never regret it. And if you can find Mr. and Mrs. Ross, and Bessie, you will have a much better time there than you can possibly have otherwise.

Next week we will tell how we and some of the other convention members spent Sunday in California.

**OUT OF THE BEE-SUPPLY BUSINESS.**—Again we find ourselves entirely out of the bee-supply business; and also the honey-business. The transfer was made to The A. I. Root Co., on Oct. 1, 1903. (See their ad.) For several years we have felt that we had entirely too many responsibilities, with publishing the American Bee Journal, looking after a bee-supply business, and handling a large retail and wholesale honey-trade. It was either drop some things or live a shorter time. We preferred to do the former, and have acted accordingly. It is, of course, with much regret that it seemed necessary for us to make this decision.

We hope now to have more time to devote to the American Bee Journal, with which we have been connected either as employee or editor for almost 30 years. We have always been in touch with it, and trust it will be the best of our best to our hosts of loyal readers and contributors we may in the future be able to make it a greater power for the advancement of the industry which it represents than it ever has been in all its past nearly 43 years. **GEORGE W. YORK & CO.,**

## Convention Proceedings

### THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 631.)

WEDNESDAY AFTERNOON SESSION.

After calling to order, J. F. McIntyre, of California, read a paper on

#### HOW TO MAKE MONEY PRODUCING EXTRACTED HONEY.

To make money producing extracted honey it is necessary—

First, to produce a large quantity of high-grade honey; and

Secondly, to sell it for a good price.

In starting out to accomplish these objects the first thing to be considered is the location, or locations, as it will be necessary to keep more than one apiary if you make very much money. If you can find a good field where you can keep a number of apiaries around your home apiary without overstocking or crowding out other bee-keepers, you are fortunate. I shall not attempt to tell you where to find this "Eldorado," because every field has some drawbacks, and you might not thank me when you find them out. I will, however, name some of the things to be taken into consideration in selecting a field.

The quantity and quality of the honey that can be produced, an open field, cost of transportation to market, society, healthfulness of climate, annoying insects, excessive heat in summer, or cold in winter.

Having found your "Eldorado," it is important to start with a hive that you will not regret. I have found nothing better than the 10-frame Langstroth, with an unbound zinc queen-excluder between the super and brood-chamber, and a painted duck-cloth under the cover. All combs in the brood-chamber should be built from full sheets of foundation.

It is also important to stock your hives with the very best stock of bees to be found in the world. I can only recommend that you buy some queens from every breeder who claims to have superior stock, and breed from that which is best.

A system of management should be adopted that will prevent excessive increase, and keep both the super and brood-chamber full of bees during the honey-flow.

Honey should not be extracted until it is ripe, otherwise it must be evaporated to prevent loss from fermentation. It requires experience to tell when honey is ripe enough to extract. In some seasons, and in damp locations, the nectar from the flowers is very thin, and the honey will often ferment after it is all sealed over; at other times, and in dry locations, it is sometimes thick enough to keep, when the bees commence to seal it over. In most locations it is about right when half sealed.

It is economy to have the best tools to work with. At my Sespe apiary, this season, my daughter Flora, 19 years old, extracted all the honey, 10 tons, as fast as a man could cart it in; but she had an 8-comb extractor driven by water-power to do it with. At an out-apiary it cost me \$3.00 per day to get the same amount of honey extracted with a 6-comb Cowan extractor. Two good honey-carts, carrying 4 supers, or 32 combs of honey, at a load, are necessary to bring the honey in from the apiary, one cart being loaded in the apiary while the other is extracted in the honey-house.

The capping-box should be large enough to hold all the cappings from one extracting, to give time for the cappings to drain dry before the apiary is ready to extract again. Bingham honey-knives, kept clean in cold water, are the best to uncup the honey until we get a power-driven machine that will uncup both sides at one operation.

I use smokers with 4-inch fire-tube.

Plenty of tank-room is necessary to give the honey

time to settle and become clear and sparkling before it is put into cans or barrels, and to prevent delay in extracting, by having to wait for cans or barrels to put the honey in.

Having a field and apiaries, with machinery to run them, and a good system of management, we will now consider the marketing of the crop.

If the cost of producing a pound of honey is 4 cents, it is easy to see that the man who is obliged to sell all of his honey at 4 cents will soon conclude that bees don't pay, and get out of the business. To make money, he must be able to hold his honey until the market price rises, for every cent he makes is in the difference between the cost of production and the price at which he sells. Organization undoubtedly helps to hold up prices. The organization of the California National Honey-Producers' Association, together with a medium crop instead of a full crop, as was expected early in the season, has kept the honey market from going to pieces in California this year; but organized weakness is not strength—it is only a bluff. The Steel Trust has been considered a pretty strong organization, and yet it has not been able to prevent a depreciation of its stock to the extent of over \$300,000,000 in the last few months. Why has this thing happened? Too many of its members had to have money, and steel stock had to be sacrificed to get it.

When the holders of any stock or commodity are financially weak, the price of that stock or commodity is bound to fall; but when they are all strong the price is equally sure to rise.

When a large crop of honey is harvested the bee-keepers, or a large majority of them, are financially weak, and while they are making sacrifices of their honey to get money the price is bound to rule low; but their honey, when sold, goes into the hands of strong men, and soon the price begins to rise. If you have money to live on, and no debts to pay, just wait until it gets to the highest price, then sell.

J. F. MCINTYRE.

Mr. York, in the absence of the writer, then read the following

#### RESPONSE BY E. S. LOVESY.

I fully agree with Mr. McIntyre in every point he advocates except queen-excluders. I can get more honey by giving the queen free range, as I run entirely on the division plan, giving the bees plenty of room; and if the queen should get into the surplus boxes, I can make good use of the brood, making new colonies or building up. I believe in building up strong colonies before I divide, as the results are often disastrous to divide and attempt to build up afterward.

I believe with Mr. McIntyre in the careful selection of a location, 10 frame hive, a liberal use of foundation or drawn comb, a good system of management that will keep the hive full of bees; and all honey should be properly extracted and ripened. If these conditions are complied with, as a rule it can be held for the highest possible price.

I also agree with Mr. McIntyre that the bee-keepers are in need of a stronger organization. We should not forget that "in union is strength;" a lack of which may cause our energy, at least, to be partly lost.

I regret that conditions are such that I can not be at the convention.

E. S. LOVESY.

L. L. Andrews—I would like to ask Mr. McIntyre what he thinks of the use of the hot knife as compared with the cold knife in extracting?

Mr. McIntyre—I am sorry to say that while I have seen it done I have never uncapped any honey in my life with a hot knife, but after putting the cold knife into the hands of others, and showing them how to use it, they would never use the hot knife again.

George M. Wood—I would like to ask Mr. McIntyre to explain his method of using the cold knife?

Mr. McIntyre—I have a little wooden keg usually, because it does not dull the knife when you throw it in. Three knives are about all you can handle. We take a knife out of the water all soaked, clean and sharp, run it to one side and the capping drops off, then up the other side of the comb. You can use it on several combs that way. Whenever a knife gets dirty—the least bit of wax on it—it goes right in to soak off, and when it comes out it is wet, clean, and free from honey, and, being sharp, it runs up the comb and cuts it right off, sleek as a razor would do it, and does it much quicker than a hot knife.

Mr. Wood—Do you use a long knife?

Mr. McIntyre—I would not use anything but a Bingham knife.

Mrs. D. A. Higgins—I would like to ask Mr. McIntyre whether he can uncup well-cured white or black sage honey with a cold knife?

Mr. McIntyre—We do not uncup any other kind—very little of any other kind. This is the honey (sample produced). You can turn it up for some time on a cold day before it will come out. It seems very queer that any one should run up against any difficulties. The hot knife, according to the way I have seen it used, will run half way up a comb or so, as far as it will go; but our cold knife will uncup several combs.

Mrs. Higgins—I find it will uncup one comb; that is all.

Mr. McIntyre—I always cut from the bottom up, because the comb is leaning a little that way, and as we run the knife up it drops right clean.

Frank Benton—Since Mr. McIntyre has had a great deal of experience in producing extracted honey on a large scale, I would like an expression from him as to how the different races of bees compared. He is not restricted in extracted honey to the kinds of bees that will produce white combs, since, of course, capping comes away anyway, and the honey from one is as good as the other.

Mr. McIntyre—I commenced bee-keeping in California with some stock I bought from Dr. Gallup. I brought his apiary here, and we had some very nice imported Italians. Later I got some Cyprian stock. I crossed these, and for extracted honey I find that I can get more honey with some Cyprian blood than with the Italians alone. They have really proved to be the strongest honey-gatherers I have had. I do not like the stinging qualities of the pure Cyprian. I have crossed them somewhat with Italian-hybrids. If I had crossed them with the Carniolans, which, I believe, is the favorite cross, they would be pure hybrids. These Italians crossed with Cyprians have proved to be the best bees in my hands.

J. F. Flory—Are they not crosser than the Italians?

Mr. McIntyre—Yes; I think you can not add Cyprian blood without adding a little temper. I think probably there is a little Cyprian blood in the queens. Those are selected from may be 10 to 20 generations bred in my own apiary, and I can not tell whether there is Cyprian blood in a queen, but I pick her for her business qualities. I would not take a queen that would sting me all to pieces; I would not breed from such a queen. I want them to be easy to handle, nice in color, and I want them to be great honey-gatherers. Those three points are about all I look to. I can not ask a queen whether she has any Cyprian blood in her or not, if she is easy to handle.

Geo. L. Emerson—I have not much to say, but I was interested in this cold-knife proposition, and thought perhaps we might get a little more information. Mr. McIntyre is a very large honey-producer. We have never been able to use a cold knife with any degree of satisfaction whatever. We seem to have a diversity of opinion here. There may be some that think they will have to change and use a cold knife instead of a hot knife. If they are going to do that they ought to know how to do it. If there is any way Mr. McIntyre can show me how to get away with that gasoline stove, I would like to have him do so; but we must have the same quality of work, even if we are a little warmer in doing it. I believe that is all.

T. O. Andrews—I was going to say if there was crossed blood in those queens Mr. McIntyre sent me, they are the most uniform I ever got together. So I thought they were pure Italians.

H. H. Hyde—I would like to know if Mr. McIntyre has ever used shallow frames for extracted honey, 5½ inches deep.

Mr. McIntyre—No, I have had some frames 7x17. They would do very nicely to extract from, but they did not suit me for brood-chambers, so I have only the 10-frame Langstroth. We usually manage to get them down near the super, which is so much heavier; get the combs out and extract them about from eight to ten days, according to the way the honey flows.

Mr. Hyde—We have used both shallow and Ideal supers, and we have concluded we can handle more conveniently, and quicker, by using the Ideal super for extracted honey; and, in extracting, we have a large extractor that takes two of the frames in each basket. When we come to uncup we can uncup one side, and do not go over it twice. But the principle is in not using the Porter escape at all. One man simply takes hold of the super, the first man smokes it freely. One man gives it a wobble. In a few minutes we take it in the house, and then can take off the super about as quick as one frame, and we consider it quite a gain also in uncapping.

Charles C. Schubert—I would like to ask whether Mr. McIntyre uses a bee-escape? also, whether he has an entrance to the super above the queen-excluder?

Mr. McIntyre—No, to both questions. I bought 50 Porter escapes and tried them to that extent, and the bees did not get out quick enough to suit me, so we went after them with wet brushes. We use a smoker and a wet brush—a brush made from manilla rope. I take a brush about five inches long. That does not hurt the bees any, and empties the supers quickly. I have tried different sized brood-chambers. I thought the 10-frame Langstroth was not big enough and tried 60 frames once, but when the colony swarms the swarm puts in too much time filling up the brood-chamber.

John F. Crowder—I would like to ask Mr. McIntyre where the apiaries are not diseased do you put the same combs back?

Mr. McIntyre—I always change combs. We take the empty ones and put on top of the hive. These empty ones are from some other hive.

A. Arthur Hansen—I would like to ask Mr. McIntyre how that cross is in regard to swarming—the cross between the Italian and Cyprian?

Mr. McIntyre—Well, I have some years thought I had a pretty fine non-swarmer lot of bees. They swarmed hardly any, but filled up their hives in grand shape. Then, in other years, when we have had lots of honey coming in, the apiary would just go wild, and nearly every colony would swarm. I think they are not as bad as pure bees. I can rear bees that never swarm, but they are very poor.

Mrs. J. B. Cherry—My experience with bees showed me for two seasons that our poorest hybrid black bees store more surplus honey. How do you account for this?

Mr. McIntyre—I have seen hybrid colonies that would probably excel other colonies in the apiary—may be any other colony in the apiary—and I suppose every bee-keeper has seen the same thing. But I never made a practice of breeding from that hybrid colony, for the simple reason that if one should send out such queens as that over the United States, they would soon get a bad reputation. If everybody were writing back, "The queens you sent me were hybrids," it would hardly do. I do not deny but what the black blood in some colonies seems to have no detrimental effect, and yet, in other colonies—I have seen, may be, 20 cases where hybrids were very poor compared with the strain of bees I have.

Mr. Andrews—I want to say in reference to that knife proposition, that I first got the idea of the cold knife from Mr. Wilder. I found by keeping the knife very sharp, and then cutting toward the top wall, I could always uncup two combs with the hot knife while I was uncapping one with the cold knife; so I went back to the hot.

A Member—I would like to ask if you raise the combs from underneath the queen-excluder, and place other empty combs and foundation below to give the queen more room? I find they swarm a great deal unless I do that, and that makes lots more work.

Mr. McIntyre—No, not as a rule. My practice is to leave the super full of honey on the hives in the fall, if possible, and in the spring these colonies will breed up lively without any assistance from me. I go over to see the queen, clip her wing, and they get very little more attention until somewhere along about the first of April. They will swarm, a good many of them, having the queen-excluder on. I catch the queen, set the hive back, and put the brood-chamber, filled up with comb foundation, in the place where the old one stood, and let the swarm go back. Then I have every queen in the brood-chamber. That is the main reason why I use queen-excluders. They hinder the brood some in going back into the supers, but I don't have second swarms. If I have some queen-cells ready to hatch I put one right in. The queen hatches and finds there are not enough bees to keep the brood warm, she tears the cells all down. A little later in the season, when I get my apiary full that way, I take the next lot, brush all the bees off of these brood-combs, and put one set of them with each one of these. I don't put it all on, mind you, because once in a while I find these have supers full of honey. Then I take the honey and put it above, and put the brood below. In that way every one of my colonies stores several supers full of honey every season. I do not have a lot of little, weak swarms where the bees do not get into the supers.

Mr. Gilstrap—I have worked with bees in Central California, Southern California, and in Colorado, and I find location and quality of honey produced has a great deal to do with the use of the hot or cold knife. Lacking 15 cans we took off 9 tons of honey last year, and never used any-

thing but a cold knife. I find keeping the knife sharp has a great deal to do with it. There are only two locations where I have worked with bees where I have found the hot knife necessary. Where the honey is not very stiff the cold knife can be used very satisfactorily.

J. A. Delano—My experience with the hot knife and cold has been during the last 15 years I have been in the bee-business. I started in with the idea that the cold knife was a good plan. It saves a fire in the honey-house, the heat, and bother. Another reason I thought it a good plan, was because several of the large bee-keepers were using the same plan. Mr. Charles Graham, one of the largest bee-keepers, used that plan himself, keeping the knife sharp, and running it on the same plan as Mr. McIntyre. But I found, after I had used it for about five years, that if we had boiling water to put our knives in, and kept them sharp, we could accomplish probably twice as much, and do the work a good deal easier. In this State we have different kinds of honey in different localities. With sage honey you can use a cold knife very well, as there is dust you have to wash off with a cloth; but I find in general practice the hot knife takes the lead in my experience. Mr. Graham has also done away with the cold knife, and taken up with the hot-water process. In extracting from an apiary where

J. F. McINTYRE.

the honey-flow is coming fast, in sage honey, and where a couple or three men have to handle so many combs in a day, a cold knife would be at a disadvantage. At least I think it would be with us. When we take off a ton, or ton and a half, with two or three men, we must use the easiest plan. Along this coast the cold knife works very successfully because the honey is thinner, and you will find it will cut easier, but you go inland, where it is drier, and it is harder to run a cold knife.

J. S. Harbison—I have inspected quite a large quantity of extracted honey, and I find one of the evils is the excessive use of smoke in handling the combs. Much very choice honey has been ruined in that way, so much so that a delicate taste would reject it on account of its bitter taste. You can not be too careful with reference to this matter. Honey is very sensitive to acquire a bad odor, as much so as butter. Another thing, there is too much honey extracted in an unripe state. It will never be the same honey as when ripened in the hives. These two things are something you must give more attention to, or else extracted honey will fall into disrepute. Carelessness in these matters is one thing that has prevented a more general use of honey. I have had much experience along these lines, and I caution you about using smoke, even on comb honey, because honey is always sensitive, and will acquire a bad taste. The importance of these matters seems to have been overlooked by a great many honey-producers. I warn you

in these particulars. You must have your honey in as nice shape as Nature produced it. Much fine honey has been ruined by carelessness in this direction, so much so that I would reject much sage honey because of its bitterness.

(Continued next week.)

### Disease-Germs—What They Are, and What Promotes or Hinders Their Propagation?

BY J. E. JOHNSON.

FIRST, let me quote from the works of Prof. George Mewman, M. D., F. R. S., Demonstrator of Bacteriology in Kings College, London:

"Latterly, bacteriologists have come to understand that it is not so much the presence of the organisms which are injurious to man or other animals, as it is their products which cause the mischief. These products are termed toxins."

Now, as I have said before, these bacteria are vegetable organisms, or little plants. Some bacteria are reproduced by budding, some from spores, and others by fission. In a favorable medium they increase very rapidly. The pear-blight bacillus, for instance, increases by fission, and one bacillus, in favorable media of proper temperature, and containing enough nutriment, would in 24 hours produce 17,000,000 similar organisms, or over 4,000,000,000 in three days. This organism is plainly visible when magnified 1000 diameters.

Dysentery among either animals or bees is caused by microbes which inhabit the soil near the surface, and are conveyed in dust form to the food eaten or the air inhaled. The three chief forms of the lower bacteria are thus: Round cell form are called coccus; rod form, or those that are longer than broad, are called bacillus; the blight bacterium is about the form of a grain of wheat, and is called bacillus. Those of thread form are called spirillum. The lower bacteria are flowerless, the higher forms of bacteria, however, have actual flowers. Anaerobic bacteria can only live in liquids, as the free oxygen kills them, or, rather, the crobes of the air are antagonistic to them. If the blight-germs could only live in liquid, then the crobes of the air would kill them on the bee's tongue. However, the blight-germs are not of anaerobic nature, although moisture is necessary to their propagation. A culture containing these germs, if merely smeared on the twigs of a pear-tree, will cause the tree to become diseased, if the tree is favorable to the propagation of the blight-germ.

But as I have written on the blight question before, and this is a bee-paper and not a fruit-paper, I will not tire those who are not interested in fruit; however, let me say that this year I had one limb that blighted during our rainy spell, but as it had turned dry when I found it, and a neighbor fruit-grower came over, we cut it out and examined it thoroughly; the blight had died out of itself. There is a good deal of blight near me this year, but not so much as last. Some pear-growers cut out their blight and some did not.

Prof. Burrill, of the Illinois Experimental Station, who was the first to discover blight-germs, in 1879, and announced it to the public in 1880, thinks it quite possible that they live in the soil, and if such be the case, blight-germs would travel in the air when the air was real moist, especially in fog.

Prof. Burrill is sending me cultures or artificial media; he agrees with me that when trees are properly fed they become more resistant to blight.

It is the foul-brood germ I wish to write about. As I have increased to over 50 colonies, and (nothing preventing) will make further increase; and as I find there is an apiary only 25 miles away badly affected with foul brood, which makes me fear it may be even closer, and if my bees get it I want to be able to fight it to a finish. And although this article may not establish any facts concerning the disease, it may draw out more substantial information.

I am not satisfied with the views of some, as very able

men, who have had much experience with foul brood, seem to differ greatly. Mr. France and Mr. McEvoy seem to give diseased honey the principal credit of spreading the disease, while, in Cuba, some say honey from a diseased colony will not give others the disease. (See Progressive Bee-Keeper for July, page 187). Now, there are such men as Pasteur and others who have spent nearly their whole lives in investigating the nature of the different pathogenic germs, and it is an established fact that nearly all, if not all, diseases of the animal kingdom are due to microbes; also, that there are some germs that are antagonistic to others, and that there is a constant struggle for the survival of the fittest, or strongest; especially is it so between the pathogenic and saprophytic germs. Two species will often not grow in the same culture together, as the product of one species is death to the other. Now, according to Dr. Germanno and others, some disease-germs or spores will survive drying much longer than others. Miguel has demonstrated by tests that some spores can remain alive in a dried state for at least 16 years, while others only a few hours. Now, the question I want to ask is, How long can the foul-brood spores survive drying?

At the Chicago convention, Mr. France related his experience with one case in which the bees contracted the disease from old, foul-broody combs that had been sealed up in hives for eight years. If I mistake not, it is a fact that bacteria must have their proper diet the same as other plants.

Let me further quote Mr. Mewman's works on Bacteria, page 12: "From what we have seen of the diet of micro-organisms, we shall conclude that in some form or other they contain nitrogen, carbon, and hydrogen." The reason I withhold nitrogen from my pear-trees is because I believe the blight-germs' diet to consist largely of nitrogen. Now that is the chief diet of the foul-brood bacteria (it is called bacillus, because of its shape). Is it in the honey, or only in the brood? and why does it thrive in the brood and not in the bee after it is out of the cell? I want to ask those who know.

Have you ever fed a healthy colony on honey from a diseased colony? and have they thereby become diseased? It seems that Mr. Rockenback has, and proved that it does not. (See Progressive Bee-Keeper for July). He seems to have had foul brood among his bees in the very worst form.

According to Mr. France's experience, the spores will survive drying for at least eight years. Now, according to the best authorities on bacteriology, the spores that survive drying a long time are frequently conveyed in the air in form of dust-particles only when dry, or might be when the air be moist, such as fog or when raining. No bacteria will leave a moist medium and travel in dry air; it must be dried first. The laws of gravity also affect all microbes in their travel in the air.

Now, one thing more: Do, or do not, any microbes originate spontaneously? As far back as 1862, Louis Pasteur, the world's greatest bacteriologist, arrayed against the world's greatest scientists of that day, proved by thorough tests that there was no such thing as spontaneous generation, or, at least, it seemed so, for M. Flourens, secretary of the Academy of Science, said: "There is, therefore, no such thing as spontaneous generation." To doubt still is not to understand the question. (See life and work of Pasteur, page 63.) Still, when we take into consideration that the germs of cholera can stand only drying for a few hours, and sometimes it will break out from seemingly no cause except filth and corruption, or overcrowding, lack of ventilation, or certain conditions may develop a new life of the vegetable of the lowest of all vegetable nature.

When Mr. France was asked at the Chicago convention if the disease would start of itself without inoculation, he answered, "Possibly once in a thousand times." I find that other scientists are not entirely satisfied on this question. It is well that we understand the important question more thoroughly. If there should be spontaneous generation once in a million times, then Pasteur's victory is all a mistake, and under favorable conditions they might originate much oftener.

Now, the bee-keepers owe a great deal to the efforts of McEvoy, France, Cook, and others, as it is no doubt they can cure foul brood—thanks to their untiring efforts—but it is not a fact that while it is being cured in one place it is being spread to others, and even possibly nearly every State has it more or less?

When once in a locality, even after cured, can we feel safe that there are not some dormant or dried spores waiting favorable opportunities to start the disease anew,

possibly in worse form than ever? Some say that in Cuba, where they probably have had the disease much longer than we, even the McEvoy plan does not cure. The old saying, that "an ounce of prevention is worth a pound of cure," is, no doubt, true in foul brood. If we can become more informed concerning the working of this disease, or the habits or diet of this germ, might we not be enabled to prevent wholly its introduction among our bees? Furthermore, might not the foul brood bacillus be propagated elsewhere except within a bee-hive?

The human mouth is a natural incubator for many germs; some are necessary to our health, digestion, etc. However virulent, microbes have been found in the human mouth, which, when injected under the skin of a rabbit, often resulted in death to the rabbit. (See page 176, Microbes, Ferments and Molds, Vol. No. 56, Industrial Scientific Series, by E. L. Troussart.) I do not think the bacillus alvei would be found in the human mouth, but mention this to show that some germs have different means of propagating.

The "A B C of Bee-Culture" says that the spores of bacillus alvei will withstand two hours boiling, and some be still alive. But scientific authority says that 60 minutes boiling at a temperature of 212 degrees F. will kill all kinds of spores. Now, no doubt many pounds of wax is annually rendered from combs thoroughly alive with spores, and probably even sent from Cuba, this being made up into foundation, distributed broadcast throughout the United States. What assurance have we that this wax has been subjected to 212 degrees F. for two hours? If it has not, can any one give us a truthful reason why foundation made from such wax would not start the disease?

If, as "A B C of Bee Culture" says, the spores will withstand two hours boiling, and live in a dried state eight years, as Mr. France has proven them, they surely can live in foundation unless boiled as stated. I am inclined to believe that since the McEvoy and France plan of treating foul brood began, the disease is being distributed in foundation. Formerly all diseased combs were burned. I hope, however, that I am mistaken.

I believe I understood Mr. France to say at the Chicago convention, that when he rids an apiary of foul brood he has a wax-press with him, and renders up the wax. I would like to ask Mr. France whether he boils the wax two hours or more, or even for 60 minutes. Also, what is done with this wax—is it sold on the market? I understand that Mr. France has tested this matter by taking wax so rendered to the manufacturer and using the foundation afterwards, and no disease resulted. I would like to ask Mr. France, in all kindness, do you firmly believe that all such wax, innocently bought on the market, would be treated as that was, or heated as that was, that is, by all United States wax-foundation manufacturers?

Conducted by EMMA M. WILSON, Marengo, Ill.

### Sulphur for Bee-Paralysis.

I agree with the bee-man, sulphur will cure bee-paralysis. I have used it for two years, when the bees were dying off with it. The way I did was, I took off the cover and sifted it down between the frames in the top box, but I did not spare the sulphur. I then covered them up, and went to the front and put a half cupful on the alighting-board and entrance way, so they would be obliged to go through the sulphur to get into the hive. I repeated the treatment three times. I did not disturb the brood-frames in the brood-chamber; the brood hatched out all right, and they were as strong as any in the apiary.

Merced Co., Calif., Sept. 3. MRS. ARTIE BOWEN.

This is confirmatory of the testimony of Mr. O. O. Poppleton (see page 535). Your plan of proceeding, however, is a little different. He sifted the sulphur with his fingers directly into the brood-chamber, while you put it in the surplus chamber. Of course, it would be likely to sift down into the brood-chamber from the super. Mr. Poppleton also took the precaution to remove unsealed brood or eggs, as these are injured by the sulphur. You do not say just how

you sifted in the sulphur. Mr. Poppleton tried an insect-powder gun, but found he could do better work with his fingers. Would not a pepper-box or flour-dredge work well? Possibly it should be specially made, with the perforated part long and narrow, so as to deliver the sulphur not on the top-bars, but in the space between them.

### Blue Vitriol to Kill Grass.

Alva Agee, in the National Stockman and Farmer, gives the following for driveways, walks, etc.:

"All grass and weeds can be exterminated in driveways, walks, etc., by a very strong solution of blue vitriol. I prefer to dissolve one pound of the bluestone to each one gallon of water, and enough of the solution is used to wet the surface of the ground slightly. It is far superior to salt. To dissolve as many pounds of the bluestone as there are gallons of water, it is necessary to suspend it in a bag at the surface of the water, as the strongest solution sinks to the bottom of the barrel. The solution eats through tin quickly."

Why would this not be a fine thing to use in the apiary to keep down the grass and weeds around the hives?

### Clipping Queen's Wings.

I enjoy reading the American Bee Journal very much, and especially our own department. I purchased 2 colonies a year ago last fall, and increased to 5, but lost one last spring. I know very little about handling them. My uncle advises me some, but he lives about 4 miles from me, so I have to blunder along most of the time.

I wanted to clip my queens this spring, but felt timid about it, as I have no text-book, and I never saw any one clip a queen. I had very little honey last year, but I am in hopes to have more this year. There is lots of white clover in blossom here. It seems favorable for a good crop.

NINA BURGETT.

I know just how nervous you feel about clipping those queens, but really it is not such a dreadful thing to do, after all. First catch the queen by the wings, then hold her by the head and thorax in the left hand, slip the scissors under the wings on one side, give a clip, and the thing is done.

Bee-Lore in the Public Schools seems to be on a par with a good deal of the bee-lore in general found outside of the bee-papers and bee-books. This view is confirmed by the receipt of a number of passages sent by Ella Anderson, who is very likely one of the "school ma'ams" of the great State of Texas. Concerning the passages quoted, she says: "The above is a specimen of the way in which bee-keeping is taught in our school-books. It has been copied 'word for word' from one of the most common books now in use." Amongst the information given is this:

"First of all we see some half-dozen bees around the door. . . . If we approach too near the front of the hive, one of these sentries will dash forward with an angry buzz; and if we do not wisely take the hint, the brave little soldier will soon return with help from the guard-room to enforce the command."

Fancy a cross bee letting up to go and get some other bee to do the stinging.

"The honey-gatherers and the wax-gatherers' carry their stores in their throats." Do they gather the wax from flowers, or where? and is so much wax in their throats a sure preventive of croup? Just one more precious bit:

"The honey-gatherers and wax-gatherers' draw in the sweet juices from flowers by their 'trunks.' The 'trunk' serves as a mouth and pump. The liquid passes through this into the throat, and is thus carried to the hive."

Isn't that richness for you?

Why Not Help a Little—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### TEXAS AND APICULTURE.

Texas the only State having an experimental apiary, and the apiary manned. Hardly thought it. Well, one out of Uncle Sam's family of forty-five is some better than that apiculture should be totally ignored. Credit to Texas!

Wonder what Texas legislature was thinking of when they supplied a foul-brood law, and no funds to enforce it. Well, now, maybe they thought apicultural public spirit needed a little cultivating—and that if a few hundred dollars of cash were appropriated it would kill off the desirable crop. Page 533.

### NUMBER OF BEE-FARMS—AN ERROR.

So taking the United States as a whole only one farm in eight has bees, but in Texas one farm in six. That, with the fact that Texas is a very big State, and comprising considerable extra-good bee-territory, has put them nominally at the head.

Who is responsible for this enormous Munchausenism, and what did the original author intend to say? "The average production of wax per colony for the United States was 43 lbs.; for Texas, 41 lbs.; for Arizona, 69 lbs.; and California, 89 lbs." Thus, in Texas an average colony yields 12 pounds of honey and 41 pounds of wax. Page 534.

### BEE-PARALYSIS AND ITS CURE.

I think Mr. O. O. Poppleton's article on paralysis to be a very instructive one. Tallies well with the general puzzlement on the subject. An erratic disease with no visible rules. Colonies in apparent health suddenly cut down to a remnant, and diseased colonies suddenly recovering without known cause. This last, if correct, may be relied on to furnish us with a large crop of worthless "sure cures." But we see Mr. Poppleton has a sure cure himself—dusting every bee with sulphur, after the brood is all taken away. But he doubts whether the cure is of much practical value because he finds the colony, when the cure is accomplished, to be so weak. If he's right, that the disease is wholly of the adult bees, and not at all in the brood, that will greatly help the apiarist in making his fight. New, healthy colonies can be built up, and all old diseased bees destroyed.

And an important riddle this is: "While I am satisfied that it is to a limited extent contagious, I do not know exactly how the contagion is communicated." Page 535.

### WHILE MAN REMAINS—AN APIARY CART.

While man remains on the earth, eh? Quite a benediction. Well, why not the American Bee Journal while man remains on earth? It will continue unless it stops; and why should it stop, Mr. Parker?

You're right to agitate for just the right kind of a honey-transporter about the apiary. I use a hand cart, which is much better than a wheelbarrow in some respects—worse, if anything, about getting tipped over; and the lifts are too high. Just comes to me that perhaps a four-wheeled hand-cart is the thing—a hand-cart with the body all in front of the wheels, and low down, and furnished in front with two light wheels no bigger than plow wheels—which same are to carry, or to be carried, according to load and circumstances. Must our vehicle have springs, or can we do without them? Page 541.

### BIG JACK-KNIFE A GOOD APIARY TOOL.

The apiary tool for most constant use might very well be a jack-knife if it was a big enough one. But where will one find a comfortable assortment of big jack-knives to choose from? Just glance over the stock of a big city house once. Disgustingly little things almost all of them—as if the world were peopled with dudes and babies. Perhaps there will not be one in the stock even half big enough for the purpose named. Fashion. Cowardice. Half mankind don't dare to carry a knife as big as they know they need. Years ago it got to be a sort of a test—country man carried a big knife, and the city man carried a little one—till callow young men everywhere wanted to be seen with the city man's kind of knife. The manufacturer would just as lief

make big knives; but he can't afford to make them unless some one will buy them. Page 542.

### DROWNING QUEENS FOR INTRODUCING.

Will the drowned-and-brought-to-life queen be any better than the ruined-in-the-mail queen, Dr. Miller? Important conundrum, which, I guess, we will credit to you, Mr. A. C. F. Bartz. Dr. Miller kind 'o' got away when I tried to catch him for cutting off the queen's legs; but we've got him this time for drowning her—on his own confession. Page 542.

### THE IDEA OF SUGAR CAUSING FOUL BROOD!

Quite an idea to go on the "important if true" list is suggested by Mr. J. M. Hobbs, on page 543. He is quite sure that the feeding of sugar greatly favors the development of foul brood. Barely possible that there may be something in this; but some of the folks will say, "Sugar!"

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Wintering a Small Colony—Buying Bees.

I am a beginner and am desirous of working with bees and having them, and would like a little information.

1. Have one colony of bees that I hired while swarming, July 10, in the railroad yards, and carried them 100 miles on my engine. I put them in a hive the next morning and they went to work at once, early and late. Now what I wish to know is this:

1. The hive is a 10-frame hive with foundation, frame 9x7 inches. How many of these frames full will it require to winter this colony, there being, as near as I could judge, about one or one and a half cupfuls of bees?

2. The honey-flow has been good, but it is a little slack now, while pollen is very good. I placed about one-half pound of good sugar syrup in front of a hive, which they carry in about four hours each day. Is this all right, in order to save feeding or disturbing the bees while in winter quarters?

3. Where can I procure a few good colonies stocked with queens, and at what time would you have them shipped? I wish the golden Italians already in the hives. MISSOURI.

ANSWERS.—1. If not more than 1½ cupfuls of bees are in the hive, they would not consume the honey in one full frame; but it is pretty safe to guarantee that so small a colony will not live till spring. Their chances may be better if you put them in a cellar for the winter.

2. Yes, that's all right, if they haven't enough stores. 3. It is now so late in the season that unless you have a specially good opportunity to obtain them conveniently near and at a bargain you will do well to wait till next spring. Look out for the advertisements in these pages about that time, and you may see what you want. By making inquiry it is possible you may be able to supply your wants from bee-keepers near you, for you will find it expensive business having full colonies sent from a distance. It would cost less to buy nuclei in the spring and build them up.

### Queen Questions and Some Others.

1. How should bees act when favorable to accepting a queen introduced to a colony that has been queenless perhaps ever since the colony was hived last May?

2. What do bees mean by one grabbing another, a strange bee and two or more run round the prisoner as if to examine it while the other bids to it? This looks to me like they were playing highway robbery—but only get back their own. Do they thus rob a bee?

3. What way do you account for my finding, in almost if not every hive examined, unsealed queen-cells? Certainly they can't contemplate superseding.

4. Should a young queen hatch out at this season (July 31) what chance would she have to become fertile when all the colonies have disposed of their drones?

5. Would she go infertile until next spring, when the drones appear, and then meet the drone? and would such a queen be of any value?

6. Would she lay drone-eggs between now and then, or remain as a dead-head in the hive?

7. You say it is easier to introduce a queen to a colony that has been queenless only two or three days. How would you count the time, from the time you remove the old queen, or should the old queen be removed for 48 hours before the queen to be introduced is placed in the hive? Or would you remove the old queen and immediately put in the other, enclosed in her cage, as it would require at best from 24 to 48 hours for the bees to release her?

8. Should a good queen lay eggs all through the winter in this

climate, or is there a time with all queens of every climate when they are fully at rest from laying? Would feeding a colony cause a queen to continue to lay?

9. Would frames put in crosswise, let them be brood or extracting shallow frames, make any difference with the bees accepting and filling them, and say the brood-chamber frames are lengthwise and the super frames crosswise? MISSISSIPPI.

ANSWERS.—1. It is easier to tell by looking at them whether they feel like accepting her than it is to tell how one tells. If the bees are hostile to her, they may be grasping the wires of the cage as if trying hard to get at the queen, while if they feel kindly toward her they sit quietly and loosely on the cage. That's not telling you very much, is it? Well, I may as well tell you that if the case were right here before me, I couldn't always tell for certain. They might appear to be looking as sweet as you please at the queen, with murder in their hearts all the while.

2. Yes, a strange bee appears often to be made to give up its honey voluntarily, saying, "See here, girls, if you'll just let me off I'll give you every bit of honey I have."

3. It must mean one of three things—swarming, supersedure, or queenlessness.

4. She would have no chance if all drones were absent, but there are generally at least a few drones at any time when bees are daily flying, even if you can't find any.

5. I don't know; I wouldn't give much for her chance. Some say they have had queens fertilized in the fall that did not lay till spring, and that they were all right. But a queen whose virginity extends from fall to spring might safely be warranted as worthless.

6. A virgin reared in the fall and not fertilized before winter would probably lay no eggs before spring; and if she then should lay any eggs they would produce only drones.

7. The time a colony is queenless should be counted from the time the queen is removed. A common way is to remove the old queen and put in the caged queen immediately, the arrangement being such that it takes about two days for bees to release the new queen. But that "about" is not very definite; sometimes a queen is released in less than a day, sometimes in three days or more. It is claimed that a still better way is to put the caged queen in the hive without disturbing the old queen, leaving no chance for the bees to release the caged queen; then 48 hours later to remove the old queen, and give the bees a chance to release the caged queen.

8. I don't know, but I think a queen takes at least a short lay-off from laying in any climate. Feeding continuously is likely to induce laying; but sometimes it's very hard to start laying. But continued feeding when the flow stops would be likely to keep the queen laying.

9. It wouldn't make any difference.

### Queenless Colonies Bailing the Queen.

1. About the first of this month (September), in looking over my bees I found Nos. 10, 12, 13, 17, 29 and 30 with no eggs, larva or brood of any kind, and being so early I took it for granted they were queenless. I had three or four laying queens in nuclei, so I just turned them loose in some of the queenless colonies and they were all ac-

cepted. I gave the others frames containing eggs in all stages, and ordered some queens, and was surprised to find none started. So I run them through the perforated zinc and found no queens, and introduced my queens and they were accepted all right. Why did they not start queen-cells?

2. As they must have been queenless at least 21 days, why did they not have a laying worker?

3. I left one nucleus to themselves, when I took their queen, and they started several cell-cups over cells of bee-bread but none on cells with eggs. Why did they do that?

4. By some unaccountable blunder I marked one hive queenless that had a laying queen with plenty of brood, and introduced a fine queen. Yesterday they had her nearly let out, and to-day she was out, and I opened the hive to see if she was all right, and discovered my blunder; and while hunting for my queen I found the old one balled in the bottom of the hive, but could not find my new one. I left no bees in the cage when I introduced the queen. Why did they ball their queen? IOWA.

ANSWERS.—Oh, dear! what makes you send so many hard ones all in one bunch? I don't like to use up my whole stock of "I don't know" answers, so must guess at some other answers the best I know how.

1. It is possible that so late in the season, and so near the time for the cessation of laying, the bees didn't think it worth while to bother about starting queen-cells. A better answer is that queenless bees have a trick of falling sometimes to start cells from brood given—not such a very uncommon occurrence, either—and no one seems ever to have given any reason for it. Just the way the bees have.

2. Better say "laying workers," for generally a lot of those nuisances are present. Laying workers don't always set up business in 21 days of the removal of the queen. In this case, too, there was less chance for it, because it was late in the season, and laying workers are not likely to start after the time when egg-laying ceases naturally in some colonies.

3. Can't make even a guess at an answer.

4. Perhaps for protection. It is not a very uncommon thing for bees to ball their own queen when alarmed in any way. The presence of a strange queen would suggest to them that their own queen needed protection. In one case, however, I had a queen protected to death because some strange queens were caged in the hive.

### Removing Supers from Hives.

1. When should all supers be removed from the hives?  
2. Will the bees feed on honey in the super now, or from the brood-chamber? ILLINOIS.

ANSWERS.—1. As soon as all storing is over for the season. In white-clover regions it is the best to take off supers at the close of the white-honey harvest, and then put them on again when needed for a fall flow, if a fall flow comes.

2. Both. As in brood-rearing slackens, and empty cells appear in the brood-chamber as a consequence, you may count on the bees carrying down honey out of the super to store in the brood-combs.

## Largest Book on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.  
144 & 146 Erie Street, CHICAGO, ILL.

### Queen-Clipping Device Free!

The MONETTE Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings. It is used by many beekeepers. Full printed directions sent with each one. We mail it for 25 cents; or will send it FREE as a premium for sending us One New subscriber to the Bee Journal for a year at \$1.00; or for \$1.10 we will mail the Bee Journal one year and the Clipping Device. Address,  
GEORGE W. YORK & CO.,  
144 & 146 E. Erie St., CHICAGO, ILL.

### "What Happened to Ted"

BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton, the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—60 pages, 5x8½ inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver). Address,

ISABELLE HORTON,

27 EAST OHIO STREET, CHICAGO, ILL.

## Beedom Boiled Down

### Whisk-Broom Bee-Brush.

There has been so much said in the journals relative to bee-brushes that I want to add just a few words. It seems to me that there has never been a first-class brush described; and it seems to me that, when we revert to a bunch of weeds, we are not making much advancement, aside from the untidiness of the apiary, in having weeds growing so plentifully that we can grab up a handful at every hive. We can all buy the best bee-brush at any store for 10 cents; and that is just an ordinary whisk-broom. Tack a sheet of sandpaper on your workbench or on a board and take hold of the handle of the whisk-broom with one hand, and with the other one press the end of the brush down flat on the sandpaper, and then pull it across it a few times, and you will have all the stiff points cut down so it will be pliable and soft, and no danger of mutilating the cappings. When brushing, hold the brush flat to the comb, or practically so; and if it gets daubed with honey, dip it in a dish of water, and it will be clean again, and the moistening makes it more pliable. I have one I have used for 15 years, and it is good for as many more. I always wet it before beginning my day's work.—ELIAS FOX, in Gleanings in Bee-Culture.

### Introducing Virgin Queens in Pairs.

This is the latest kink practiced by the A. I. Root Co., although the same thing seems to have been previously practiced by Swarthmore. The plan is thus given in Gleanings in Bee-Culture, as used by their apiarist, Geo. W. Phillips:

Here is a colony, we will say, that is queenless. Instead of giving it one caged virgin, to be released on the caged plan, he gives it *two* of flying age; but the loose slide protecting the candy is removed, exposing the food in one cage, leaving it in the other cage covered by the slide. The bees will release the queen of the first mentioned. In a day or so she will become fertilized, and go to laying. The other virgin is kept caged in the mean time. As soon as queen No. 1 is laying, she is taken out, and *at the same time* the slide covering the candy to the other cage is set back, the bees release queen No. 2. Before that is done, another virgin is put into the hive, caged with the candy protected. Queen No. 2 is accepted, and ere long begins to lay. She is removed, and the slide of cage No. 3 is slid back, and another virgin put in, and so on the cycle proceeds. The point is here: Both queens while in the hive acquire the scent of the bees and of the comb, so that when one queen is removed the other queen is already introduced except releasing, which the bees do in a few hours, and she again is in a fair way to become the mother of the flock. During the interim between the time the queen is released and when she becomes laying,

## Something FOR OUR Bee-Keeping Sisters in the Winter Time.

We think all ladies will agree with us in saying that every man should at least understand some business, with which, in case of necessity, he could support himself and family. The wealthiest people frequently come to want, and wretched, indeed, is the man who cannot earn a living after his wealth is gone. He sometimes fills the grave of a suicide. And why, in this enlightened age of progression, should not woman, as well as man, be able to depend on her own resources? In case her husband fails to provide and grossly mistreats the woman he has sworn to cherish, must she humbly submit? **A THOUSAND TIMES, NO!** Let every woman, before she marries, have some knowledge that can be used to make her a living. Every mother, rich or poor, should make her daughters, in a certain degree, independent, by giving them some kind of a trade, and teaching them to be self-reliant. Mothers should have their daughters learn to sew, and not neglect this important part of their domestic education. The

queen is acquiring the scent of the colony.

But Mr. Phillips goes one step further. Here is a colony that is not queenless, but we wish to sell the queen in 2 or 3 days. He accordingly cages the virgin in the hive, and 3 days after removes the laying queen, exposes the candy of the caged virgin so the bees can release her, when she is immediately accepted. There, don't you see, there is a lapse of only a few hours of actual queenlessness? We will say that, in 5 hours after the laying queen is removed, the virgin is stalking abroad over the combs, quite at home.

This thing is no experiment. We have been testing it for weeks to see if it would work under all conditions.

If the virgins are hatched in nurseries, and a supply of them is kept on hand, no colony need be queenless more than long enough for the bees to eat out the candy, which I should say would take about 5 hours as we provision the cages. By this plan one can get almost a double output of queens.

### Spraying Fruit-Bloom Proves to Be a Boomerang.

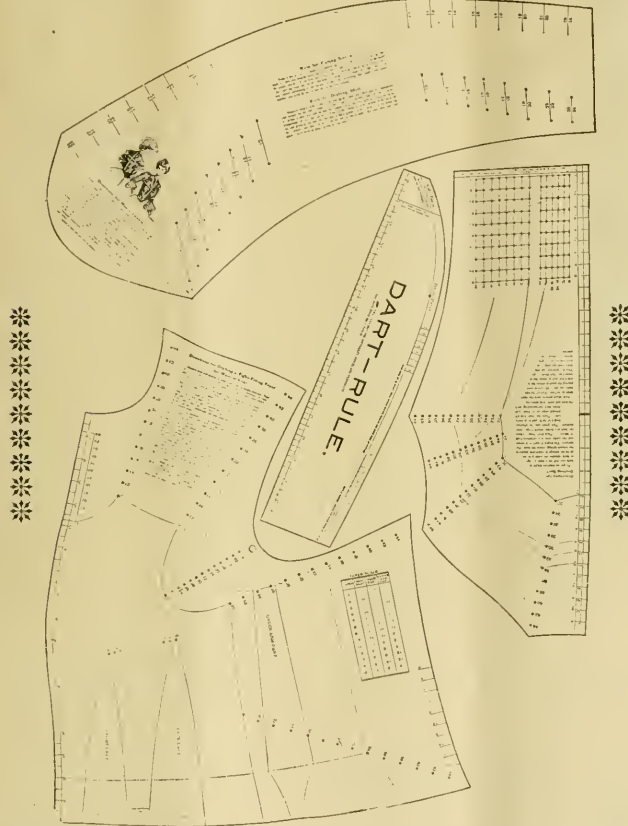

Last year I had my colonies very strong in order to get as much of the apple honey as possible, that being my favorite honey; and just when the bees began to store rapidly I noticed all at once thousands of them dropping around the house-apary and in my yard; and my colonies were depopulated a half, if not more, in 2 days' time. I was satisfied that poison had been used in spraying fruit-bloom, and immediately made inquiry. All parties denied spraying, yet I found that one had purchased a fruit-sprayer and had sprayed his trees at that time, even though he denied doing so. However, I made a public announcement that the party or parties who killed my bees by spraying his fruit during the time of bloom would also destroy his own fruit, and my prediction proved true: for the same party that had sprayed his trees at that time scarcely had any sound fruit, while an orchard within a stone's throw had hundreds of bushels of fine matured fruit, and no spraying whatever had been done; so I guess there will not be any more spraying done during full bloom in this section.—J. A. GOLDEN, in *Gleanings in Bee-Culture*.

### A Model Bee-Cellar in Northern Michigan.

The cellar is 14x24 inside. It is built 3 feet under ground and 4 feet above. The foundation is a stone wall 3 feet deep with 6 inch studding on the wall, boarded both sides, and filled in with sawdust. There are also inch cleats nailed on inside, and lathed and plastered, making a 1-inch dead-air space.

In building the stone wall we laid in 2x6 plank, letting them project 2 inches, and lathed and plastered on these, making a dead-air space on the stone wall, to do away with the dampness.

In one corner there is a tile drain, or intake, for fresh air, leading out 6 rods under ground, 3 feet deep. The cellar is built on higher ground, which makes it very convenient for underground ventilation. There is also a ventilator

daughter so taught will not only make a better wife and mother, but will also be more likely to secure a better husband, and will always command his respect. He will not look upon her as a helpless "know-nothing," but will know that if he fails in his duties, she can live without him, and this can only strengthen the bond between them. A thorough knowledge of dress-making can always be turned into gold, and become the means of support for the mother and her little ones. She may never have to use this knowledge in this way, but she has a trade and can use it if necessary.

The outline cut shown herewith is a condensed copy of **THE NEW LONDON LADIES' TAILOR SYSTEM** for drafting and cutting ladies' and children's garments. For simplicity and accuracy it has no superior among the more expensive systems. Thousands of girls have learned more about drafting and cutting with this system than they knew about it after serving their apprenticeship in some of the dressmaking shops of the United States and Canada. Thousands of the best garment cutters have laid their complicated and expensive system aside, and are now using **THE NEW LONDON TAILOR SYSTEM**. Thousands have been sold at \$5.00 each, but we mail it free to a paid-in-advance subscriber to the American Bee Journal for sending us two new subscribers at \$1.00 each; or we will send it to any one with a year's subscription to the American Bee Journal, both for \$1.75; or, we will mail the Tailor System alone for \$1.00. Address all orders to

**GEORGE W. YORK & CO.,**  
144 & 146 East Erie Street, CHICAGO, ILL.

leading out through the roof 12 inches square. This comes within 3 feet of the cellar bottom, and is arranged to shut off too much draft. The outside has been reinforced with a foot of sawdust coming above the cellar a foot, with tarred felt covering the whole. The floor above is made frost-proof by nailing on ceiling, filling in with sawdust between the ceiling and floor, and nailing inch strips to the ceiling, and then lathing and plastering. This cellar has never been cold enough to freeze, the temperature ranging from 41 to 45. I can put in 200 8-frame hives if necessary. I have wintered 150 in this cellar very nicely. It stays very dry and nice all winter. The upper part is used as a workroom and for extracting. The cost was about \$150.—JAMES HILBERT, in Gleanings in Bee-Culture.

#### Good Honey at 10 Cents Cheaper than Thin at 8.

I tested some well-ripened honey a few days ago, and it tested about 14½ pounds to the gallon. I figured out how much water it would take to make honey 13 pounds to the gallon. It takes about 28 percent of water. That is, take 100 pounds honey, 14½ pounds to the gallon, add 28 pounds of water to it, 10 pounds to the gallon, and you still have a honey 13 pounds to the gallon, and the manufacturer who buys the best honey at 10 cents a pound gets it cheaper than the one who buys the other at 8 cents.—MR. DARLING, in Canadian Bee Journal.

#### Our Sweet Tooth.

That Uncle Sam has a "sweet tooth" is demonstrated by the record of sugar importations for the year, which have increased to the largest total ever known. In addition to the sugar raised in this country more than 5,000,000,000 pounds have been imported, which with the domestic production, would give each man, woman and child in the United States about seventy-two pounds each per annum. As many persons do not eat anything like this amount and much sugar is introduced into the human body in other forms than the refined product, there must be many people who consume more than their own weight of sugar in a year. The quantity eaten in the form of confectionery is enormous, and, if sugar would do it, America would be a land of sweetness if not of light.—Boston Transcript.

To eat one's own weight of sugar in a year is a menace to health, if not to life. What a pity those enormous consumers of sugar could not be induced to consume their sugar in the more wholesome and delicious form of honey.

#### The California Sages.

White sage is perhaps generally thought by outsiders to be the principal one of the sages; but Californians say it cuts no great figure, the black and purple sages being away ahead, both in quality and quantity.—[Yes, the average Easterner gets the impression that the white sage is the main honey-plant of California, because all California honey from sage is named *white* sage. The black sage produces

a great deal more, and the purple or button sage comes in as a close second. But white *sage* honey is not misnamed, because it *is* white, and it is *sage*, but not necessarily *white-sage-plant* honey.—Ed.]—Stray Straws in Gleanings in Bee-Culture.

### FROM MANY FIELDS

#### Great Ragweed.

What is the enclosed weed? I think the local name here is "bull-weed." Bees are fond of it.

Knox Co., Tenn.

T. C. K.

[The plant is the Great Ragweed, and grows abundantly along moist river-banks. The bees may get considerable pollen from it, but not much honey. Botanists know the weed as *Ambrosia trifida*, and it belongs to the great Composite family.—C. L. WALTON.]

#### Amount of Honey One Bee Stores.

I saw in the American Bee Journal a question asked as to how much honey a bee can carry during its life. I am an old bee-butter, and have found a good many bee-trees in the woods. I have seen a bee lick up two thin drops of honey at one time and carry it home. If it can carry two drops of honey at a time, how many drops can it carry in one day? I will say it can carry three loads of honey in one hour. If so, it can carry 30 loads in 10 hours, or 60 drops, which make a teaspoonful of honey. So a bee can carry 26 teaspoonfuls of honey in 26 days, or the time of its active life. This makes about one-half of a small teaspoonful of honey.

Dr. Miller says the life of a worker-bee is 26 days, and I think so, too. I don't say that all the worker-bees will carry two drops of honey at a load, but when a bee sucks its fill of honey it can carry two drops.

I have watched bees for the last 30 years, and I am satisfied that my figures are right.

I don't say that a brown or black bee will carry two drops of honey at one time, but I do say an Italian bee will do it. So one-half a teaspoonful of honey is all that a bee will store during its life. That is my idea; and I think I am right.

F. E. WILSON.

Van Buren Co., Ark., Sept. 15.

[Even if it is admitted that a bee can store a half teaspoonful (or say ½ pound) of honey during its working life, it would not be safe

to estimate from that basis what an average colony of bees will produce during a season. Suppose there are only 40,000 bees in a colony during the 26 days, and only half of them do business, according to Mr. Wilson, they should carry in 5000 pounds. Perhaps 200 pounds of honey would be an exceptional yield, for 26 days; then what became of the other 4800 pounds?

The thing can not be figured out. It is all guess-work. And one man's guess is about as good as another's in such a case.

We "guess" we'll eat the honey and let the other fellow do the figuring.—EDITOR.]

**A Peculiar Year—Swarming.**

The last month and a half has been anything but favorable for honey-production in this locality. I think the crop will fall much below the estimate of many. And I fear many colonies, unless they are looked after and fed, will not go through the winter, if we should have a severe one.

I said this had been a peculiar year; well, it seems so to me. Let me tell you something—but, say nothing about it, for I feel almost ashamed of myself when I think of it. I have had 54 swarms from 31 colonies, and how many more there would have been no fellow can tell if I had not struggled continually to prevent swarming.

I have made a colony from a caged queen left on a table with a box over her to protect her from the sun. Bees came from all parts of the yard and clustered on the cage. They did not come at swarming-time, but one at a time, till there were 200 or 300 bees, which stayed day and night till the fourth day, when they swarmed as naturally as any swarm as you ever saw; but the queen being caged, they returned and clustered again. I made a nucleus colony for them; added a comb at a time as they needed, and now they are a good colony. Who says one cannot get a colony of bees if he has a queen? W. M. WHITNEY.

Walworth Co., Wis., Sept. 31.

**BEE-BOOKS**

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie St., CHICAGO, ILL

**Forty Years Among the Bees,** by Dr. C. G. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide, or Manual of the Apiary,** by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and useful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee,** revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture,** by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing,** as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey, or Management of an Apiary for Pleasure and Profit,** by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture, Its Methods and Management,** by V. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur,** by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register,** by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood.**—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping,** by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment,** by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Foul Brood,** by A. R. Kohnke.—Origins, Development and Cure. Price, 10 cents.

**HONEY AND BEESWAX**

MARKET QUOTATIONS

**CHICAGO, Sept. 13.**—Sales are not frequent enough to keep receipts cleaned up. They are made on a basis of 13@14c for comb of the best grades. Extracted, white, 6@6½c for clover and basswood and 6@7c for other white clovers; amber, 5½@5¾c; according to flavor and package. Beeswax, 30c. R. A. RUBINETT & Co.

**KANSAS CITY, Aug. 25.**—Receipts of comb honey more liberal; demand improving. We quote fancy white comb, 24-section case, \$3.25; No. 1, white amber comb, 24-section case, \$3.00; No. 2, white amber comb, 24-section case, \$2.75; Extracted, white, per lb., 6½c; amber, 5½@6c. Beeswax, 25@30c. C. C. CLEMONS & Co.

**ALBANY, N.Y., Sept. 19.**—Honey market firm on light receipts so far and good demand. We quote: Fancy white clover, No. 1, white, 15c; No. 2, 14c; buckwheat, 13@14c. Extracted, good demand just now for Jewish holidays, for candied honey, at 6@6½c for dark; white clover, 7@7½c; mixed amber, 6@6½c. Beeswax, 30c. H. R. WRIGHT.

**CINCINNATI, Oct. 1.**—Comb and extracted honey are coming in freely, and the demand is good with steady prices. We are making sales at the following prices: Amber extracted at 13@14½c; white clover, 6@7½c. Fancy comb honey, 15c. Beeswax, 30c. THE FRED W. MUTH Co.

**NEW YORK, Sept. 28.**—Comb honey is arriving quite freely now, and is finding ready sale at 15 cents per pound for fancy white, 13@14c for No. 1 white, and 12c for No. 2 white and amber. Very little buckwheat on the market as yet, and prices are hardly established. Extracted honey is ruling about the same as last with plenty of offerings of all grades. Beeswax is somewhat declining and selling at present at from 28@29c per pound. HILDRETH & SEGELKEN.

**CINCINNATI, Sept. 18.**—The extracted honey market has weakened a little as white clover is offered in quantities sufficient to be made ruled as follows: Amber, in barrels, 5@5½c; water-white alfalfa, 6@6½c; fancy white clover, 6½@7½c. Comb honey, fancy water-white, 14@15c. No sales for lower grades. Beeswax, 25c. C. H. W. WEBER.

**SAN FRANCISCO, Sept. 2.**—White comb honey, 13@14c; amber, 9@11c. Extracted, white, 5½@6c; light amber, 5@5½c; amber, 4½@5c; dark amber, 4@4½c. Beeswax, good to choice, 17½@21c; dark, 25@26c. C. H. W. WEBER.

Most of the comb on market is of small lots, and while being very steadily held, fails to move as readily or to as good advantage as would straight and good lots of uniform and high grade. Extracted is in high demand with offerings of only moderate volume, and market firm at prevailing values.

**WANTED! FANCY COMB HONEY**

In no-drip shipping-cases. Also Amber Extracted, in barrels or cans. Quote your best price for quantity lots. The W. H. WEBER Co. delivered Cincinnati, Ohio. Write at once. 324½ Front and Walnut, CINCINNATI, OHIO. Please mention Bee Journal when writing.

**WANTED—Comb Honey in quantity lots.**

## Long Tongues Valuable South as well as North.

How Moore's strain of Italian roll in the honey down in Texas.

HUTTO, TEX., Nov. 19, 1902.

J. P. MOORE—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is plain, strong evidence that red clover is not the only plant which requires long-tongued bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

## Root's Goods in Chicago.

The business for many years conducted by George W. York & Co., at 144 E. Erie St., as agent for The A. I. Root Company's Supplies, is this day transferred to The A. I. Root Company, to be conducted as a Branch Office. All outstanding accounts will be paid George W. York & Co.

The policy of Branch House will not be changed. We shall continue to serve the interests of bee-keepers to the best of our ability, and to increase our facilities whenever possible for such service. Mr. York will still be in the same office with us, and the benefit of his years' of experience with this trade will thus be available.

Please note change of name to avoid confusion in our work.

Oct. 1, 1903.

## THE A. I. ROOT COMPANY.

All orders, remittances, inquiries, etc., should be addressed to The A. I. Root Company, 144 E. Erie St., instead of George W. York & Co.

## STATEMENT BY GEORGE W. YORK & CO.

TO OUR CUSTOMERS AND FRIENDS:

In transferring back to The A. I. Root Company the bee-supply business which we took over from them some years ago, we do so with regret, as we have labored to build up a large and honorable trade in bee-appliances, and value beyond expression the generous patronage accorded us during the years. We trust the same will be continued to our successors in the business.

Please note that this transfer does not in any wise affect our publishing the American Bee Journal, or handling bee-books and queens. But we expect from now on to be able to devote more time to the Bee Journal, as for years we have had "too many irons in the fire" to give it the attention it requires.

GEORGE W. YORK & CO.

(See page 600.)

# LOOK AT YOUR WRAPPER-LABEL!

## Personal to Our Subscribers!

CHICAGO, ILL., Oct. 6, 1903.

We have just been informed by the Post-Office Department that **expired subscriptions** to a newspaper or magazine do not constitute legitimate subscriptions so as to maintain the second-class rate of postage, but if such are mailed with paid-in-advance subscriptions it places the whole edition under the third-class rate, which, in the case of the American Bee Journal, is about 14 times higher than the second-class rate. In other words, if the third-class rate of postage were enforced on the Bee Journal, we would have to raise the subscription price to \$1.50 a year at once. This we do not want to do. But we are compelled to show that every subscriber who gets the American Bee Journal is a **paid-in-advance subscriber**, in order that all may be mailed under the second-class rate. And the only way we can do that is for each one now in arrears to pay his or her subscription, not only what is past due, but also an advance subscription.

In order that **ALL** who are in arrears may put their subscription credit in advance **right away**, we wish to make the following offers:

We will credit any subscription sent us—1 year for \$1.00;

**2 Years for \$1.80; 3 Years for \$2.50; or 5 Years for \$4.00.**

Of course, these prices are not limited to those who are in arrears, but if any others wish to take advantage of them they may do so.

### Very Special Notice to those in Arrears.

In order to comply with the requirements of the Post-Office Department, we will be obliged to discontinue sending the Bee Journal to all who are now in arrears on their subscription. We know this is a very sudden notice, but it is not our fault, as this is the first chance we have had to say anything about it since we learned of it from the Post-Office Department.

But all who are in arrears can easily start a remittance to us in time so that it shall arrive at our office before the end of this month, and thus it will not be necessary to miss a single copy of the old American Bee Journal.

We are planning some great things for our readers for 1904, any one of which will well be worth the yearly subscription price of the Bee Journal. But by paying for 5 years at one time, it will cost you only 80 cents a year. That is only a trifle over 1½ cents per copy!

Let us have a prompt response from all who are in arrears, and also from those who will soon be in arrears, so that all our readers may continue right along without a single break.

It may be that some can also send along the names of one or more new subscribers with their own renewals, and thus help increase our list of readers. We are offering some handsome premiums for such work.

Trusting that all our readers had a good year with the bees, and hoping that we shall be favored with a general response by way of paid-in-advance subscriptions, we remain,

Yours for the best bee-literature,

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie Street, CHICAGO, ILL.

P. S.—If your wrapper-label reads "dec02" it means that your subscription expired with December, 1902; if it reads "jun02," it expired with the end of June, 1902. And so with any other month and year that may be shown on your wrapper-label.

## Editorial Comments

**Late Once in 20 Years.**—So far as we can recall, for the first time in 20 years the American Bee Journal was not mailed last week on time, or at the regular time. It was just two days late in leaving our office for the post-office. But it was no fault of ours. We sent the forms to press on Monday morning, Oct. 5, at the usual time, but just as it was all ready to be printed, the press-feeders went out on a strike. The firm who does our press-work then tried to get some other printing firm to print it, and finally succeeded; but that firm was also handicapped on account of the strike, so that it was almost impossible to finish it at all last week. However, on Saturday (instead of Wednesday) we got the last of the copies, and rushed them off to the post-office, after wrapping them.

We regretted the delay very much indeed, as we had made a fair record for promptness in getting out the American Bee Journal every week for many years. But our subscribers will now know the reason why it could not be mailed on time last week, and doubtless will hope, with us, that it may be another 20 years ere it need be late again.

**Peculiarities of the Past Season.**—Over a considerable scope of country there has been an abnormal amount of swarming, and that, too, with an unusual honey-flow. Hot days, and especially hot nights with prevalent sunshine, are considered the proper thing to accompany a heavy honey-flow; the best time for storing being just as farmers begin to complain of drouth; this year the flow seemed to go right along with cool, cloudy, and damp weather. One of the veterans, who had an unusually heavy harvest, reported:

"When bees are crazy over a big harvest you can do pretty much what you please with them without fear of being stung; but this year breaks the rule; I never had such cross bees in my life."

To the question whether he had not worked into a cross strain of bees, he replied:

"No, it happens that I have pretty clear evidence on that point. The crossiest colony of this year had a queen four years old; the blood in that colony ought to be the same as in the preceding two or three years, yet in those years that colony never distinguished itself for crossness."

**Foul Brood and Wild Bees.**—It has been a discouraging thought that no matter how careful one might be in one's own apiary, there was always the fear that foul brood might be lurking in trees occupied by wild bees in the vicinity. General Manager France speaks reassuring words with regard to this, saying that we need have little anxiety, for whenever a diseased wild colony dies out so as to leave its combs and remaining stores a center of infection, the squirrels, and perhaps other things, promptly clean out all that is left to do harm.

**National Bee-Keepers' Association—Its Province.**—Never in the history of the Association has there been such a rapid accession of members as at the present time. There is no good reason why this should not continue. Indeed, if bee-keepers were not blind to their own interests there would be a membership many times as large, for every bee-keeper in the land should become a member. It is not well, however, that there should be any misapprehension

on the part of recruits. There have been those who seem to have thought that they could wait outside till some trouble occurred, and then the Association would stand ready to receive them with open arms to take up their fight for them. A very little thought will show the absurdity of such a thing. It would be much like a man living without any fire insurance until his house was burning, and then expect to have the loss made good by a company in which he would insure after his house was in ashes.

Neither should it be understood that a member of the Association is at liberty to foment trouble, get into all sorts of quarrels with his neighbors, and then complacently folding his arms sit back and say to the Association: "There, now, I've stirred the thing up good and hot; you go ahead and finish the fight." It must be remembered that justice is not necessarily always on the side of the bee-keeper, and it would be a sorry thing to have a combination for the support of injustice.

Let each member do all in his power to keep in peace with the world "and the rest of mankind," and then if the attempt is made unjustly to oppress him, he may confidently rely upon aid from the Association to such an extent as seems right in the judgment of its officers.

**A Great Swarming Year** has been the year 1903, in certain portions at least. Many report excessive swarming, and stray swarms seem to have been flying through the air in all directions. It is well known that the Dadants have heretofore had very little swarming, not to exceed 5 percent. This year C. P. Dadant reports a perfect avalanche of swarming; and this with an exceptionally heavy yield of honey.

It has generally been understood that when bees begin to store heavily they give up all foolishness in the way of swarming, and devote all their energies to saving the precious flood of nectar. This year it seemed to work the other way—the more they gathered the more they swarmed.

Will we ever learn any definite laws by which bees are governed?

**Take Sections Off.**—Here and there will be probably still found supers of sections on the hives, where all storing has ceased. Perhaps a super was put on late, and the bees have not begun work in it at all. The bee-keeper thinks there is no immediate hurry, there is no honey in the sections, and so it goes on day after day, with the thought that so long as there is little or no honey in the sections they may as well be on the hives as elsewhere. A serious mistake, for in most places there will be propolis varnished over the comb or foundation to such an extent that the appearance is marred, and if the case is bad enough the bees will refuse to accept such sections the following year. If any beginner still has sections on the hives where the bees are not storing, let him lose no time in hurrying them off.

**Formaldehyde,** as a destroyer of the spores of foul brood, is still on trial. Cases are reported in which it has seemed effective, but so long as there are others in which growth of spores occurred after treatment, it will hardly do yet to place entire dependence on the drug. The question now is, whether the cases of failure were due to the inefficiency of the drug, or whether something different in manipulation might have produced different results. It is asking a good deal of any disinfecting agent to dig down into the bottom of a cell filled with pollen and honey, and there destroy a thing so tenacious of life as a spore of bacillus alvei. Can formaldehyde gas do it?

## Sketches of Beedomites

GEORGE B. LEWIS.

A short time ago we received the following notice from the G. B. Lewis Co., of Watertown, Wis.:

GEORGE W. YORK & CO., Chicago, Ill.—

Gentlemen:—We have just discovered that through an error you were not advised of the death of our president, Mr. G. B. Lewis, which occurred June 11, 1903. We herewith enclose newspaper clipping.

Yours truly,

G. B. LEWIS CO.

Per G. C. L.

The clipping referred to in the above reads thus:

George Burnham Lewis, a prominent manufacturer and business man, president of the G. B. Lewis Co., died at his home shortly after 9 o'clock last night. His death was not unexpected, as he had been in a dangerous condition several days. Hardening of the arteries was the primary cause of his death.

Mr. Lewis was born in Moreau, Saratoga Co., N. Y., July 5, 1832. He received an education in his native city, and when a young man of 21 came West, reaching this city in 1853, where he remained during the summer visiting with his brothers who had preceded him here. He returned to New York in the fall, and shortly after was married to Miss Sarah J. Ingalsbe. Mr. Lewis tried farming for awhile, but his thoughts reverted to Wisconsin, and in 1861 he removed to this city, and has lived here ever since. In company with his brother, R. E. Lewis, he purchased the water-power on the west bank of Rock river, then owned by a man named Salsey. The firm name was then R. E. & G. B. Lewis, and after sawing up the logs which were purchased with the mill and water-power, the firm engaged in the manufacture of sash, doors, and blinds. In 1870, R. E. Lewis retired and G. B. Lewis became sole owner, and conducted the business until 1878, when the firm of Lewis & Parks was formed, and upon the death of Mr. Parks, his son-in-law, the firm became known as the G. B. Lewis Co., one of the largest manufacturers of bee-keepers' supplies in this country.

From a small beginning, the business of the firm increased rapidly under his guidance and management, until it became one of the largest of its kind, with a manufactured product which sells all over the world.

Mr. Lewis possessed a quiet and amiable disposition, and was a man of integrity. In his business and social life he displayed those characteristics which are so much admired, and those who had occasion to have business or social intercourse with him always had a kind word to say in praise of his many good qualities. Mr. Lewis never aspired to political honors, preferring the quiet of his home. For the last 20 years he has passed the winter months in Duneedin, Fla., where he has large property interests, and it was while there, early this spring, that he was taken sick. He returned home in April, and has gradually failed in health until released from earthly suffering by the hand of Death. By his death Watertown loses one of its oldest and most progressive business men, and an honorable citizen who always took pride in his home city, and helped in its upbuilding. He will be sadly missed from the family and home circle, and by his many friends and acquaintances here and throughout the State.

His widow and two children, Mrs. L. L. Parks and George C. Lewis, of this city, survive.

Verily, the leaders among bee-keepers and bee-supply manufacturers are passing away. It was not our pleasure to have a personal acquaintance with Mr. Lewis, though, of course, we have had business relations with the firm of G. B. Lewis Co. for years. And it was always satisfactory in every way. That company has been represented in our advertising columns for over 20 years, we believe, and, so far as we know, their dealings with our readers have always been mutually pleasant and profitable.

The fact is, the G. B. Lewis Co. is one of the strong, clean, business-like bee-supply manufacturers and dealers of which all beedom should be proud. We understand all of that was characteristic of Mr. George B. Lewis. And that same honorable dealing is continued by his son, Mr. George C. Lewis, who has been manager of the business for years. We wish the firm continued success, although the honored President has been taken away permanently.

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

## Miscellaneous Items

**SUNDAY IN CALIFORNIA.**—In the first few paragraphs of the report of the Los Angeles convention, reference was made to the Sunday-school of the First M. E. church of that city. We had read and heard so much about that school previous to leaving Chicago, that we decided to visit it if we ever should be in or near Los Angeles on Sunday. So the coveted opportunity came on Aug. 23.

As mentioned last week, we spent Saturday night at Pasadena. So, we arose early Sunday morning and prepared to take the electric car ride of some 10 miles to the church mentioned in Los Angeles. As the Sunday-school begins at 9:30, it was necessary to move lively for a Sunday morning.

We arrived just a few minutes before the school was opened by Dr. H. W. Brodbeck, the dentist brother of George W. Brodbeck, of whom we have spoken before. He has been the superintendent of the school for 11 years. He has it well organized, and everything running perfectly. One of the assistant lady superintendents very courteously showed us, and about a dozen other visitors, around through the various departments of the school. This was appreciated by all thus favored.

The bee-keepers present were, Dr. C. C. Miller, A. I. Root, O. L. Hershiser, W. F. Marks, and F. E. Brown, besides the writer. If we mistake not, each of those mentioned attends the church of a different denomination excepting us, and yet all seemed perfectly at home in our Methodist school.

Dr. Brodbeck may well be proud of his excellent Sunday-school. It has an orchestra of about 30 instruments. Just think of what harmonies they can produce! It is an inspiration to any superintendent or school to have such an orchestra. It also has an efficient corps of officers and teachers—"each one an expert."

The school has enrolled about 1000 members. It has perhaps the best system of records known. Dr. Brodbeck got it up himself, so it ought to be a good one.

After the study of the lesson, Dr. Miller and A. I. Root were invited to speak to the main school, while we were asked to say a few words to the members of the young men's and young ladies' classes, which have their closing exercises together. There were probably 150 present on that occasion. How we wished we could have known enough to be equal to the opportunity. Who wouldn't give a great deal, if he had it, to be able to interest such an audience, even for a short time?

We believe both of these large classes were taught by ladies. Think what it means to hold the attention of a hundred or more young men every Sunday, and interest them profitably!

We can say we felt well repaid for making the effort to visit one of the greatest Sunday-schools in all the West.

After the close of the school, we bee-keeping visitors all went across the street to hear Robert J. Burdette preach. He has left the lecture platform, and is now the pastor of the Temple Baptist church in Los Angeles. He gave a splendid discourse. But we couldn't help feeling that the lecture-field needed him more than the pulpit.

By the way, we understand Mr. Burdette, several years ago, married a very wealthy lady, who resides, and owns a palace, in beautiful Pasadena. We passed by that lovely home with its gorgeous flowers and restful greenwoods, when "Seeing Pasadena" the following day.

On Sunday evening we attended the First M. E. church of Pasadena. The building and interior finishings and furnishings were simply superb. It is a Methodist cathedral. It cost something like \$100,000, we believe. Too much for any church. We believe in less pretentious church buildings, and more of them scattered throughout a city.

The organ and music in this particular Pasadena church was grand. The audience was large and attentive. The talk by the pastor was helpful. He stopped when he got through. Not every speaker can do that. Their "terminal facilities" are not always what they should be. But those Pasadena Methodists ought to be a happy and thoroughly good people. We suppose they are. We certainly saw no reason to be doubtful about it.

Judging from what we saw and heard on that one Sunday, in Los Angeles and Pasadena, we should say that not a few of their people attend church.

On returning to the home of our cousin, Mrs. Otto Freeman, after the evening service, we were quite ready to retire and get a good rest for the following day, which was to be the last of our stay in "Sunset Land."

Next week we will give the last installment of these rambling notes. It will be Pasadena and homeward bound. Both delightful to contemplate.

HERBERT CLUTE, a bee-keeper in Chippewa Co., Wis., reports a crop of 37,000 pounds of extracted honey taken from 333 colonies the past season.

HERMAN L. GLOEGE, of Green Co., Wis., called on us last week. He reported 112 colonies, and a harvest of about 4500 pounds of honey, mostly comb.

A "FOWL" BEE-MAN.—We notice that one of the foul-brood inspectors has envelopes and letterheads with "Fowl Brood Inspector" printed on them. That's pretty rich. First thing that inspector knows he'll be taken for a "chicken-lifter."

MR. HASTY has a very just complaint against the proof-reader. On page 633, he wrote about the bee flourishing her *ligula*, and we got it, "flourish her liquid." He wants to know what we think about that. Well, we think it was a bad break on the part of this paper. The promise is to try to do better in the future—if forgiven this time!

GENERAL MANAGER N. E. FRANCE reports as follows on the present membership of the National Bee-Keepers' Association:

990 members enrolled when he took hold less than a year ago. 569 new members enrolled during his term thus far, or an average increase of 57 members per month. 1559 was the total enrollment Oct. 5, 1903. 175 memberships at that time had expired, and should be renewed at once.

We consider the foregoing an excellent membership report. The increase has been very encouraging, indeed. But there should easily be enrolled a membership of 2000 before the next annual meeting of the National. Why not?

N. E. FRANCE, the well-known inspector of apiaries for Wisconsin, has lately been out on his inspection work, concerning which a local newspaper in Clark County had this to say:

N. E. France, who has been in this vicinity recently, reports that honey-producers in this part of the State are selling their extracted honey at a lower figure than they need to do, many of them letting it go at 6 cents, when they might have at least 7 cents. The crop in Wisconsin this year is estimated at 3,000,000 pounds, which would take 150 freight-cars to move it. Mr. France was here the last of July and found foul brood prevalent to a considerable extent. He gave instructions for treating these affected colonies, and in one instance tried the experiment which has been widely recommended in bee-papers, of using formalin gas. He found on this last visit that all colonies were free of disease except the ones treated with the formalin gas, some of the combs still being affected. This yard is quarantined until spring, when Mr. France will be back and personally treat the disease.

Mr. France writes us that the experiment mentioned above was with 200 combs, all being fumigated with formalin gas, using double Weber's amount of gas or formalin, Weber's lamp, etc. All were afterward put in clean hives, and bees put on them. Every colony became re-diseased.

WISCONSIN BEARS still like honey, if we may judge from the following taken from a recent copy of a Greenwood, Clark Co., newspaper:

Bears are getting rather numerous around bee-yards in this section. Nearly a couple of weeks ago a bear visited M. H. Wright's apiary on the Eau Claire river three different times, and was shot at by the owner without success, on account of the darkness. Finally, Mr. Wright got near enough to Mr. Bruin to see him cuff the tops from the hives and take out a section of honey, and when he stood up to eat it, he was enabled to get a line on him by lying on the ground, so as to get the bear between himself and the sky line.

At Severson's Popple river apiary a bear, or bears, have broken into a dozen or more hives, and some of them have been completely demolished. So far the mischief-makers are at large, they doing their work at night when it is hard to see them to get a shot at them.

So it seems that Wisconsin is still on the frontier, and wild game abounds. We supposed that Sir Bruin had passed on from Wisconsin, but he seems to get around in time to help unload the honey from the hives. But Mr. Wright got some of Mr. Bear's tenderloin, all right. Wonder how it tastes when made out of honey! Ought to be doubly sweet and palatable.

## Convention Proceedings

### THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

Continued from page 648.]

Dr. Miller—Before that question about the queens is entirely passed, I would like to ask a question. Suppose, Mr. McIntyre, that you had a hybrid queen and the colony gave you an exceptional yield, away beyond anything else in your apiary and you never expected to sell a queen in your life, would you breed from that queen?

Mr. McIntyre—That is a pretty hard one, Doctor. I can answer that in Dr. Miller's own language—"I don't know." [Laughter.]

Mr. Hyde—We have with us another extracted-honey producer, Mr. Dadant, and I am sure we would all like to hear from him.

C. P. Dadant—I feel like saying something in regard to the cold knife. We have tried both the cold and hot knife, and have stayed by the cold knife. There are times, however, when it is impossible to uncup honey with a cold knife. In the fall of the year, in our neighborhood, it is pretty cold at night, and after the honey is off the hive a little while it gets cold and thick, and the knife, instead of cutting, breaks the comb. Now, when it is fresh from the hive and warm, the cold knife will do splendidly. I think when combs are not off the hive too long, and are warm, the cold knife is all right; but you let them rest awhile, and the honey gets thicker, you will have to use a warm knife. I would not recommend extracting the honey when the combs are cold. It is much more difficult to uncup it, and much more difficult to extract the honey. We always extract the honey as soon as it is off the hive, for, when it gets cold, it is much more difficult to handle, and, of course, a man who extracts a good deal must consider all these things.

Prof. Cook—I would like to hear from Mr. Dadant on the question of the hybrid queen for breeding purposes.

Mr. Dadant—I think we have just as good queens among the Italians as among the hybrids.

Dr. Miller—But the condition is that you have one that is superior to anything else in the apiary.

Mr. Dadant—Well, in an impossible case we could have impossible results. [Laughter.]

Dr. Miller—More than once I have had hybrids that were superior to any of the pure ones.

Mr. Dadant—I have heard more comparison between Italian and Cyprian. I have had Cyprians, quite a good many. I have noticed one thing which perhaps some of you may not have noticed. There are exceptions to all the rules, however. The mating of a cross Cyprian queen with a drone from the quiet Italian colony will produce a mild and gentle type of bees, the moral qualities coming from the male, while the other qualities come from the female. These seem just as quiet to handle as pure Italians. But take the Italian queen and cross her with a black drone, and you have the crossiest bees, unless it is the Italian queen crossed with the Cyprian drone. I think, as a rule, it will prove to be so, that the mating of a quiet race on the drone side will produce quiet bees.

Albert B. Mellen—Will Dr. Miller please tell us what he would do about breeding from a hybrid queen that excels all others in *his* apiary?

Dr. Miller—To get even with Mr. McIntyre, I would better say, I won't tell. I will tell you what I have done. The colony that produces the largest yield of honey this year will be marked, and most likely be bred from next year without any regard to stripes or color.

Frank Benton—The question is, How to make money producing extracted honey? Now, of course, all of these points, as to the use of the hot or cold knife, the super with shallow combs, or deep combs, and so on, all come into consideration; also the question of bee-escapes. All these are

mechanical points, you may say, things that will settle themselves for each man. But I do not think Mr. McIntyre brought forward strong enough some large points—vital points—as compared with these. The question is how to get a large quantity of honey. Now, I believe we are losing tons and tons of honey by prejudice against certain strains or types of bees. A man that produces 20 tons of honey might produce 30 if he had the right kind of bees to gather it; and where he is producing 20 tons of honey he can increase that by half by care in the selection of his bees. The right bees for the locality, and the right queens, might enable him to gather an added 50 percent.

Now, I will come down to the particular point I wish to bring forward. The Cyprian bees possess more energy than any other race of bees I know of. I handled them for years in the Island of Cyprus, extensively there and also in other countries. They have a disagreeable stinging trait. Their tongues have been measured by a great many different people. I have done something in that direction which has been confirmed by others. Their tongues are the longest of any bees—at least, as long as any of the Eastern races, and longer than any other European types. They can fly farther, have greater wing-power in proportion to the size of the bodies. There is large wing-spread that has come through centuries of dwelling in the Island of Cyprus. I think it wrong to reject that type of bees, because they possess more power in transmitting their race or progeny than any other race I know of. With this element we should not ignore a strong-wing quality, and the fact that they are among the most prolific of European races, or beyond any type whatever. Of course, we want a bee that we can handle, and that brings the difficulty.

We have in Austria a type extremely gentle. Another type in southeastern Russia is an extremely gentle bee. Both of these bees are prolific; both of them good honey-gatherers.

Now, confining myself more particularly to the Carniolan—the bee of Europe—this is the hardiest bee that I know anything about. If we can eliminate some of its poor qualities and unite it with the Cyprians, we would have the ideal bee. I conceived that notion some 15 years ago, that we might, by crossing these bees, get the good qualities of each combined. While I was in Munich, Germany, I had sent a large number of Cyprian bees, that had been mated there, back to me. I tested them in that raw region, nearly 2000 feet above the sea-level, and I found them superior to any others we had there. I have printed the results of these experiments in some circulars which I have brought with me. Two years later I went to Austria and took with me a pure Cyprian queen, and had that mated to Carniolan drones. The same experience came to me, but not content with that, still I have followed down many and various crosses between these two races since then up to the present time, sometimes a large number and sometimes a small number. I have sent these bees into different regions of this country, where the winds are high, and where it is important to breed up rapidly in the spring, particularly. Where alfalfa, the first crop, would be an important item, people have told me that these bees with this blood increased their honey-yield, and increased their colonies at the same time very materially. Some have said they doubled their colonies. I am merely calling attention to what we are losing by rejecting these bees on account of their color, etc. Mr. McIntyre did not like to cross these bees; they would be rejected because they are hybrids, but would produce bees that would be acceptable on account of their color. Are they not just as much hybrids?

Now, it is just as easy to breed Carniolans that have yellow stripes on them. I have traveled all over Carniola, and have never seen a single colony there where there were not some yellow-banded bees, and I conceived the idea that a grey-colored bee with yellow queens would be very nice to have, and before my departure from that province I selected a set of yellow queens that would produce entirely grey workers, and the tendency was to have the yellow crop out on the workers. I tried to avoid that, but you see it would be to produce yellow Carniolans, and we would not have those hybrid bees, would we, because they are all yellow? Now, that cross-bred bee is not cross. It is amenable to smoke; it has the energy of the Cyprian, the prolificness of the Cyprian, and the hardness of the Carniolan. We have, therefore, all the really good qualities and important qualities of the Cyprian, including their great wing-power and their energy, their disposition to fly farther, their long tongues, and the hardness of the Carniolans. By continuing to mate pure Cyprians to the pure Carniolans, I think a constant type could be established, and I find that is pref-

erable to an unfixed type. I find in the spring, when the wind is cold, and many of the bees that leave the hives will drop down on the ground, these cross-bred bees, these hybrids, will actually get back into the colonies, and will fly strongly when others do not dare venture out, and they will gain something. The bees that do not get back into the hive will make a great difference in the honey produced. Coupled with all these other qualities, I am prepared to say that with all my experience of 11 years in foreign countries, and some 30 years since I began handling bees, I have not found anything to excel these bees. I believe the most important point in the production of honey is care in the selection of strains or types of bees.

Secondly, I requeen in the latter part of the year. I take pains to see that the new queens are bred from the very best queens I can produce. I select only large, prolific queens. I want those that will produce 20 to 25 queens to the brood. With these, I believe, we have gotten the two most important points in the production of extracted honey.

J. K. Williamson—Several years ago I put about 30 Carniolan queens into the apiary for Mr. Wheeler. My partner and I afterwards bought that apiary. The Carniolan queens, perhaps, were mostly superseded before we bought it, but the nearest Carniolans in the apiary after we got it were the bees that brought in the biggest amount of honey.

H. H. Moe—I would like to ask Mr. Benton how many queens he rears out of a good, strong colony—how many cells does he start?

Frank Benton—Well, I sometimes start 100 in a colony to get good, well-developed queens. I have seen in the hives of some of these Eastern races of bees, where they had prepared sometimes as high as 250 cells, nearly all producing well-developed queens. It is a mistaken idea to suppose a large number could not develop. Simply because our Italians and blacks do not produce a large number is no reason why we should not get them. I do not hesitate to rear anywhere from 50 to 100. I would not hesitate to rear 200 if I had a powerful colony.

Mr. Hyde—My views are the same. We have at present five or six different strains, and we try to find which are the best for all purposes. Cyprians are good bees for honey, but we can not stand the temper. Our men do not like to work where they are liable to be stung so often. We have decided to use nothing but Holy Land bees for our purposes.

Frank Benton—I may say I spent a good many days in apiaries in Palestine, and at the same time I had an apiary of over 200 colonies in Cyprus, and worked most of the time handling these bees with perfect impunity, while in Palestine I had to use clouds of smoke. Now, Syrian bees and bees of Palestine differ very much, and in the first importations brought to this country, in 1880, these two races were mixed, badly mixed, and the term "Holy Land" now covers them both. They differ considerably, and in temper are far inferior to the Cyprians. An occasional Cyprian colony shows as bad temper as a large number of bees of Palestine, but, all in all, the Cyprians are decidedly better tempered than these Holy Land bees. Where that does not hold good, the Cyprians have become hybridized, and likewise the Holy Lands, and this has brought in the gentle element. I have tested that.

Mr. Hyde—I would like to say that Mr. Benton must have gotten his from a different source than that from which we got ours. They are very gentle bees. I think they are as gentle as Italians; that is, pure Holy Land bees. I am not talking about something mixed up with Cyprians.

Mr. Benton—I think you got them from Mr. Baldensperger, in Jerusalem. That is where I established an apiary myself—that very apiary. Further, I have had constant experience with these bees for years, and I have been in his apiary and traveled near them, and moved all their colonies, some 600. They were supplied to me all the time I was in the East, afterwards when I was in Munich, Germany. It is just possible that you got a gentle type of that bee. By the side of it you may get fierce ones. The same thing may occur, perhaps, with the Cyprians, though, perhaps, in four cases out of five you will get rather easily managed ones, while, in the fifth, rather fierce ones.

Mr. Hyde—I would like to say that I got my stock of Cyprians from Mr. Benton! [Laughter.]

Mr. DeLano—I had 200 colonies in one location and decided to move half away. The 100 I moved away were so cross all that season that I could not go near them, nor any one else, unless fully prepared to do so, while the others in

another location were not cross. Why was it? These were all reared from the same queens. I think the blood has nothing to do with it.

Frank McNay—I think there is a good deal in location. I have had the same experience as Mr. Delano. We moved a portion of the apiary a number of miles away, and they were so cross all the time they were there it was almost impossible to handle them. On returning them to the same apiary they were as gentle as the others. I think the location has a great deal to do with it.

A Member—My question was, Is it not always the case that an apiary that is moved to a new location is generally cross for a while, or for the whole season?

Mr. McIntyre—Not always. If they are getting plenty of honey they will soon get over their crossness. Generally, when I move it is when they have plenty of honey, and they soon get over their crossness.

Mr. Andrews—That has been my experience, exactly. After the oranges gave out this year my son and I moved 150 right over to the buckwheat fields. They began working right away, and 82 we had in one place were moved twice, and they were better-natured than when working in the orange flow, only a few miles move. But if they are not getting much honey, and it is hard to get what little they do get, it is very likely they will become cross.

Mr. Corey—I don't think Mr. Mendleson's bees stay in one place long enough.

(Continued next week.)

### Putting Back Supers After Extracting.

BY C. P. DADANT.

Will you kindly pardon me for asking a question in regard to bees cleaning out the supers after extracting? I have read in your writings (if I think it was in the American Bee Journal) that you give the combs, after extracting, in the care of the bees until cool weather comes and the time of storing them away. I tried that way last fall, and when I took them off I found some honey in every frame, and a great many of the empty cells sealed over. I run the combs through the extractor again and gave them back to the bees, but they failed to empty them. They would store what honey they found right in those cells, and I had to store them as they were. Some of the honey granulated, and in spring some of the honey was sour. I had to use them as they were, and I fear that I will have honey that will not keep.—J. S. HAAG, of Iowa.

We have had one or two experiences of that kind—just enough to know that those things rarely happen. You have evidently extracted your honey before the crop was fully ended, and the hives must have been very full. If the colonies are supplied with all the combs that they can possibly fill, they will not put so much honey in the hive-body that they have no room for the very last few pounds that are harvested. A point may even be reached when it will be necessary to crowd them for space in order to get them to place enough honey in the body for an abundant winter supply. But if the crop is long protracted, and the weather is warm, the colony strong in bees, and heavy with stores, the bees will often ascend in those supers and stay there. It becomes necessary, when removing the supers for winter, to brush or drive almost the entire colony out of those supers. This may be avoided by extracting late, say a few days after the first frost.

Then, in putting the combs back, do not place the supers directly over the uncovered brood-chamber, but use the enamel cloth, if you use one, or a perforated honey-board, or a burlap cover, between the supers and the hive-body, leaving just enough space so that they may go back and forth. This partition will make them feel that the supers are too remote from their brood to stay on them, and they will carry the honey down, if there is any room at all to place it.

The amount of honey left in the supers after extracting, if it has been properly done, should be very insignificant, and ought to find a place in the hive-body without any difficulty.

As to the bees sealing empty cells, we have seen that also; it is a freak for which it is difficult to account. They may do it because they have an excess of broken fragments

of wax which they dislike to throw away, but in an experience of some 35 years, we have seen this but once or twice.

The fact that honey, which is left sticking to the combs after the extraction, is apt to sour is our reason for putting all the supers back on the hive at all times after extracting. There are many people who do not follow this practice, but who retain their supers, with the honey sticking to them just as they are after extracting, until the following spring. In a discussion of this matter in the *Revue Internationale*, of Geneva, it was found that the opinions were about equally divided on the subject, and those who did not return the supers to the hives held that the honey kept just as well in that condition as if it was gathered up by the bees. Perhaps there is a difference owing to the climate. In the Mississippi Valley we have very changeable temperature, and even late in the fall we may have weather favorable to the development of fermentation. Besides, during our damp weather the honey that is spread over the surface of those combs becomes watery, and much more liable to the effect of fermentation germs.

To remedy the trouble mentioned, I would recommend that you extract your honey after the first frost, and if the colony is strong, separate the brood-chamber from the upper story, as mentioned above. I would not under any consideration follow the methods of some apiarists, who put the combs out in the open air for the bees to clean. It teaches the bees to rob, and when the combs are not where all the bees can get at them, they tear them up mercilessly in their haste to get the honey away. Robbing bees are as unreasonable and merciless as human robbers.

If the extracting is done too late, and the bees have no warm weather to enable them to occupy the supers sufficiently, the conditions will be still more unfavorable. In this locality we are successful in getting our combs all nicely cleaned before cold weather, if the extracting is done early in October, and the supers returned the same evening. Usually within two days all will be in order. Yet we do not remove the supers until November, because we have once or twice noticed some moth-growth in combs that were too early taken away from the bees. If the combs are kept in a cold room—that is, a room without fire from November till May—there will be no moth in them. The cold weather evidently destroys the moth in whatever stage they may be.

#### A CROP-REPORT ERROR—TIME TO STOP.

A clerical error crept in my article on page 518. I reported a crop of 200 pounds per colony, and either the typewriter or the typesetter made it out 300 pounds. The crop was large enough with the true figures, and I only wish we could have such crops a little oftener.

In his three-column reply to me, Mr. Arthur C. Miller accuses me of resorting to "sophistry." When in an argument one of the contestants advances unpleasant epithets against his adversary, it is time to stop. Honey too much diluted changes to vinegar.

### Handling the Larvae and Royal Jelly in the Doolittle Method of Rearing Queens.

BY A. C. F. BARTZ.

MANY of the readers of this journal undoubtedly remember the fierce queen-rearing battle which took place in these columns between the queen-breeders and some of the contributors in general, and many and heavy were the shots fired from either direction, and some very important questions were settled for ever, if I am not mistaken.

But "not by a long shot" do I believe the queen-rearing question entirely settled. The umbilical-cord theory was pronounced nonsense, proved to be such, and disposed of. But there are other questions still unsettled, and it is for that reason I venture to take up the matter anew in these columns, if the editor permits me to do so, and I believe he will, for he himself is of the opinion that the queen-bee is in the "main spoke in the wheel," or, in other words, the foundation of a colony of bees.

Mr. Alley says, in part, let us have a quiet discussion on queen-rearing. All right, Mr. Alley, here we go!

I believe it is now accepted in general that naturally-reared queens are the best ones obtainable, but are believed to be too expensive, and the supply so inadequate to the demand, and consequently artificial means have been resorted to.

Now, there are two principal artificial queen-rearing methods before the bee-keeping public, viz.:—the Doolittle

and the Alley. Not knowing very much about the Alley method, I shall confine my discussion principally to the Doolittle plan now.

The practitioners of the Doolittle method know it is necessary to dip royal jelly from one queen-cell to another, also to transfer the larvae for the queens. And also knowing that some of the so-reared queens, or a good many of them, do not come up to the standard or expectations, I believe I found the cause of this short-coming the past season.

Last summer, in June (I do not exactly remember the date, but it matters not), I took some queen-cells and a piece of comb with larvae into the house, as the day was rather cool, and it being noontime there was a good fire in the kitchen. I thought I would rather transfer the larvae and fix all up there, for the temperature was high, at least 95 degrees F. I put the piece of brood to be used into my clothes, next to my body, to keep it warm, but the queen-cells containing the royal jelly I was not so careful with, but cut them out and carried them in my hands to the house, laid them on the table, and went to work at once dividing the jelly, and putting a portion into each respective cell-cup, *a la* Doolittle; when after I was done with the job, I took the piece of comb containing the larvae, that I had kept in my clothing until then, shaved the cells down as directed by Mr. Doolittle, picked up the spoon I had used in transferring the jelly (which I had made expressly for the purpose out of hard maple, one end of which I had made into a curved toothpick, for picking the larvae out of the bottom of the cells), when, for some reason I do not know, I touched my lips with the spoon I had previously used for transferring the jelly, and which was yet wet therefrom—why, it felt as cold as ice!

At once it dawned upon me why some of the queens reared by this method are inferior, for, if the temperature of the jelly sinks below that of the atmosphere surrounding it, which it surely does, it is no wonder that some of the little larvae produce poor queens after receiving such a "cold bath" as they would have had in this case had I not discovered the rapid cooling off of the jelly. But mind, it takes a lot of heating in order to raise the temperature of the jelly in the wax-cups to a normal one again. And, therefore, I would caution the beginner to be very careful, if using the method in question, lest he have some poor queens, although it may be a success in the hands of an expert.

I, for one, am in favor of having the queen put the eggs for the queens in the cell-cups having the queen touching them at all, as the experience I had last summer proves it is a very dangerous thing to do. It seems to me something like taking a half-hatched chicken out of its shell, holding it in my hand awhile, and then putting it back again and closing up the egg and allowing the chick to hatch. I wonder if it would be as strong as if I had never taken it out! I hear some one say, "Oh, well, a queen-larva is no chicken." I know it is not, but both are alike in some respects, at least, and that is in this: They both require the natural course for development, and experiments made show that the temperature of a colony of bees varies but little, however extreme the atmosphere surrounding it may be; consequently, it seems to me that a larva of such tenderness can scarcely stand the radical change of temperature to which it is subjected to in the transferring process. It also seems possible that by making some improvements and short cuts a much larger percentage of queens can be reared under the swarming impulse than has been done heretofore.

Some of the readers of the American Bee Journal undoubtedly remember me telling about cutting a brood-comb about half way through the middle and placing the same in a colony preparing to swarm, for the purpose of getting queen-cells built on the lower edge of the comb. Last summer I tried cutting only about two inches off the bottom of the comb, and inserted a stick with dipped cups, *a la* Doolittle, except dipping the entire stick into melted wax, and found the queens to lay promptly in them. But I believe if one would go to the trouble and take away the brood-combs from a colony intending to swarm, and insert several—say three or four combs with queen-cell cups—the queen would lay in them in such rapid succession that nearly all of them would hatch at the same time.

Now, in order that I may not use too much space, I will close and let the other folks have their say.

Chippewa Co., Wis.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Queen-Rearing—Feeding Bees—Other Questions

I launched my canoe into queen-rearing recently, and was utterly smashed on submarine snags not yet discovered. Help! help!

I have a "select-tested" queen from a well-known breeder, and her bees are a beautiful yellow, but so small (not more than three-fourths as large as my big, brown bees) that I hesitated to rear queens from her; but I tried, anyway.

I used two Danzenbaker hive-bodies with excluder between, the lower one containing the queen and her brood, the upper one 10 frames of brood from other colonies. I let this stand eight days, then removed the queen and all frames from below, but left almost all the bees. I put 3 frames of young brood and eggs from an Italian queen in the center of the upper story, putting below frames taken from there.

Ten days from removal of queen, just as I was about to go around and break up this colony into nuclei (after spending about a week sawing and nailing on nucleus hives), this colony swarmed. This was Aug. 24. On examining the 3 frames given, I found about 12 or 15 little sealed cells, the most insignificant I have ever seen, some indeed barely larger than drone-cells, varying to about an inch in length, and about the size of a lead-pencil around, not one of which I'd think of using. Now, several frames distant, in the same story, there were two splendid cells, out of which queens evidently had emerged. I put those on frames of brood from a black queen given over the excluder eight days before removal of queen.

So endeth effort No. 1.

The following is trial No. 2: I removed the Italian queen and shook nearly all bees from an upper story (which was the one containing brood) of another colony into the hive out of which she came, and the next day I shook nearly all the bees from another strong colony into this hive, for I did not feel sure I had enough young bees (of course, the queens were temporarily removed while shaking was in progress). Although goldenrod was still in bloom, on the third day I fed about three-fourths of a quart of extracted honey because the weather turned cool and cloudy, and continued so for several days.

Now, on the day for forming nuclei, on looking in the hive, I found the same kind of tiny little cells as before. Failure again!

Now for questions:

1. In my first attempt, do you think those bees started out with the idea of superseding their queen, and afterwards found themselves crowded, and decided to swarm?

2. What is the reason the bees would not make larger cells? Do you think the queen, whose bees are so small, is at fault, or have I simply "bungled"?? (Don't hesitate to say so—it is not the first time.)

3. Is extracted honey fed without thinning?

4. Why must feeding be done early? Can't the bees ripen honey if the weather is such that they can fly? In this locality there are not many weeks, or even days, in which they can not fly.

5. In wintering out-doors, would entrance-blocks be any advantage? My hives have an inch across the entire front.

6. Last fall I stupidly left a super containing 10 sections of drawn comb on a hive during fruit-bloom; these sections were filled (no other hive had supers then). Now, next spring, if I add supers underneath each colony would the bees store in them if there is any surplus? (If fruit blooms in March and April, and I don't care to disturb sealed covers.) Would it interfere in any way with brood-rearing?

7. Why should hives be exactly level if frames are not loose-hanging?

8. If brood in the same comb hatch into both yellow and dark bees, does it indicate the queen has been impurely mated?

9. Does not hanging out frames for bees to rob cause robbing when not desired?

10. Where does Miss Wilson get her buckskin gloves? and at what price?

I want to hear from the sister about those asbestos gloves, too.  
Princess Anne Co., Va.  
MRS. C. D. MEARS.

ANSWERS.—1. Those bees, no doubt, thought themselves queenless. When brood is placed over an excluder it is not an uncommon thing for bees to start cells. You should have examined the frames and killed all cells at the time you gave the brood from which you wished your queens reared.

2. Now about those small cells, they may, or may not, have been worthless. When queen-cells are started, not on the edge but in the center of the comb, they appear much smaller, often being so flat to the comb as almost to escape detection, and yet good queens may emerge from those same cells.

3. Not usually.

4. In Virginia it does not make so much difference as farther north, still it would be better to feed when the weather was warmer than just warm enough for bees to fly.

5. It is possible that a smaller opening might be better.

6. They would not be as likely to store in them as if they were placed over the brood-nest. But it would do no harm to try, unless it might be to soil your sections. It would not interfere with brood-rearing.

7. The hive should be level from side to side, not necessarily from front to rear. If not level from side to side the combs will not be built in the center of the frames, and there will be the same trouble in the sections.

8. Either there is impure blood in the queen or she has been impurely mated.

9. It may, if care is not used.

10. I got them at one of our stores in Marengo, but have never been able to get another pair like them. I paid \$1.00 for them.

I, too, am anxious to hear more about those asbestos gloves.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### QUEEN COMPELLED TO CEASE LAYING.

In the case of a queen compelled to cease laying, and the question whether there is any such compulsion—with its presumptive harms—the probabilities rather look on your side, dear Boss. Page 547.

### GLYCERINE CANDY FOR QUEENS.

Had I turned my guessing machine betimes on J. P. Moore's glycerine candy for queens, I should have guessed that it would poison every mother's daughter of them. Nevertheless, success is a very successful article; and after his experience I'll only demand a little verification. Don't go it too strong till others also have found glycerine harmless. Page 547.

### CELL-CUTTING TO CONTROL SWARMING.

My Afterthink on the plan of controlling swarming by persistent cell-cutting, is that sometimes it would be quite satisfactory, and sometimes quite unsatisfactory. But hunting cells in overcrowded hives is not pleasant work; and the amount of time required at it will, I think, cause the operator to quit it after a bit, wherever the number of hives involved is more than a dozen. Meekly ready to be informed and corrected by the man who has run 50 colonies through the season that way. Page 547.

### 1000 POUNDS TO ONE COLONY—PROVE IT!

And now, behold, so reputable a boy as E. S. Lovesy throws his hat into the charmed record ring of 1000 pounds to one colony! I believe a running-at-large impression afflicts a good many of us that 1000 pounds per colony has never been properly proved up yet. Page 548.

### TWO DIFFERENT APIARIES.

We will agree with Mr. Wilmon Newell, of the Texas experimental apiary, that running a private apiary for gain and running a public apiary for information are two very different propositions. Page 548.

### SHOWER-BATHING A QUEEN BEFORE INTRODUCING.

So it is for the purpose of catching the queen that Adrian Getaz wets her down. Shower-bath. Is it not true that man—bee-keeping man—has "sought out many inventions?" It makes two operations in place of one in catching a queen, and some of us would manage to bungle both of them—douse the water in such a way as to knock to unforeseen regions a bunch of bees, queen and all. Especially the wide-awake queen dodging back and forth around a bottom corner of the frame is likely to be a difficult subject for water-bath. Still, with all the rebates, the resource looks like a simple and useful one for some hands to use. Worth some trial from us all, perhaps. Page 550.

### CAPTURED BY A "SISTER."

He didn't know enough to take to the tall timber when the bees chased him home, and the "sister" came and captured him the second time for hiving purposes. For particulars, see page 551.

### BEES, UNLIKE DOCTORS, KILL THEIR PATIENTS SOONER.

That colony, page 553, which kills about a pint of its own bees every once in a while, I'll guess it is to cure some disease—paralysis, perhaps. The bee's infallible remedy for disease is to kill the patient and lug him out. Often, I think, they fail to live entirely up to their doctrine; but that is the ideal. Human doctors wouldn't like it—makes the case too short for an exemplary fee.

### INTRODUCING WETTED QUEENS IN FRANCE.

So wetting the queen when introducing her is well spoken by an apiarist over in France. Whatever of hostility the queen brings upon herself by impudent conduct, will evidently be obviated (or, at least, postponed) by a good wetting. I have oft suspected that the queen was to blame herself in very many cases. Page 557.

### CARBOLIC ACID AS AN APIFUGE.

"Powerful strong" an apifuge must be to drive the bees out of a super in a few minutes merely by the vapor from a wet rag, and no forced current of air. As it is no more surprising than some other things that are told of carbolic acid, we must not assume that it will not work until we have seen it tried. Page 557.

### TESTS FOR PREVENTION OF GRANULATION.

I feel quite interested in the Texas experiment of bottling honey at different temperatures, 150 degrees to 180 degrees, in comparison with a bottle neither heated nor sealed. But it will take three years to gather all the fruits. Already some fruit—the unheated granulated in less than three months while none of the other samples did so. The first examination at six months is past, and the two judges report the 150-degree sample much better than the high temperatures, and perceptibly better than those next to it. The 180 degrees was called quite objectionable. I should not have expected so pronounced results. Wonder if "personal equation," as the astronomers say, didn't have something to do with it. I would suggest that next time they capture some assistant judges who shall not be allowed to know "tother from which" as to the samples. Page 564.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Wintering Bees—Moving Bees in Summer.

1. I have 1 colony that I captured while swarming July 10. They are in a 10-frame box-hive, and are working early and late, having 6 frames full of something. What are my first and last duties to have these bees in working order for the next spring? I have the super with starters for the hive, but they are not on the hive.

2. Prof. Cook speaks about not allowing bees to breed after September. How do you prevent this?

3. During the busy season are all the bees supposed to be in the hive at night? If so, why would it not be safe to move a hive?

MISSOURI.

ANSWERS.—1. Perhaps your first duty is to see that there is no lack of stores for winter, for if only six frames have been filled there

may be a question as to winter supplies. Your next, and perhaps your last duty, is to study up carefully your bee-book, and then try to put in practice its teachings.

2. The matter is not much under your control, except that you should do nothing to encourage brood-rearing. If any feeding is necessary, let it be done rapidly, for slow daily feeding after the manner of a natural honey-flow has some tendency to start breeding.

3. With rare exceptions, like all virtuous maidens, worker-bees are expected to spend their nights at home. But that has nothing to do with the question of moving, for if you move them a short distance at night all the field-force will return to the old spot the very first time they return from the fields.

### Corn-Cobs for Smoker-Fuel.

I often see fuel for smokers mentioned, but never my favorite. Did you ever try it, corn-cobs broken up with a hammer? Try soft, pithy ones first. After a few trials you can select your fuel and break fine or coarse to suit your purpose.

PENNSYLVANIA.

ANSWER.—Yes, indeed; among the many things I have tried for smoker-fuel I have used quite a few corn-cobs. The matter of smoker-fuel is largely one of convenience. For some time the most convenient thing for me has been dry chips from the chip-fine, gathered on dry days and kept under shelter. It isn't at all certain, however, that something else may not take their place next year. The chips need no preparation, and make an excellent smoke.

### Position of the Winter Stores.

I am a beginner in bee-keeping. This is my first experience and season. I have 3 colonies in 8-frame chaff-hives, with shallow extracting-frames on them. The bees have the supers quite well filled, but very little in the brood-body. Will they carry it down before cold weather, or will they winter in the super where the honey is?

Don't the bees have to have their winter stores in their brood-nest to winter without loss? Is it best for me to get the honey down in the brood-nest? If so, how shall I proceed to do it?

I have looked all over my text-books and bee-papers, but so far I have been unable to find the information I want.

I want to winter the bees out-doors, and as they have little in the brood-nest, and honey above, it worries me as to whether they will winter this way.

MICHIGAN.

ANSWER.—The bees must winter where their stores are, and the great probability is that they will have stores all right in the brood-combs. It is quite possible that the bees have more in the brood-combs than you suppose, if you have not looked at them very lately, for when brood-rearing begins to cease all they gather will go into the brood-chamber. If vacant cells are still left below, the bees will carry down honey from the super. It occasionally happens that the colony may settle in the super for their winter quarters, but that is not likely to happen.

### The Use of Formaldehyde.

I read the interesting article by R. L. Taylor, on page 502; also another article by G. W. Haines, page 536, in *Gleanings in Bee-Culture*, on formaldehyde for curing black brood. Now, I would ask:

1. Can full, capped extracting combs be disinfected by the process of closing them up in an air-tight box or cupboard and fumigating them with formaldehyde?

2. Foundation also, when it gives suspicion of being infected, may it be disinfected then?

3. What do the bee-keepers in America think of formaldehyde as a cure for black brood?

4. I think by this time there may have been invented a machine by which formaldehyde is made directly by methyl alcohol (in Italian alcohol metilico).

ITALY.

ANSWERS.—1. I wish I might say to our good friend in Italy that there is no doubt as to the efficacy of formaldehyde. Tests have been made, seeming to show that formaldehyde fumes utterly destroy foul-brood spores in honey fully capped; yet a few have reported adversely. At present we do not really know yet whether to depend upon the drug or not in case of fully sealed combs.

2. There is probably little doubt as to success with foundation.

3. It is probably just as reliable with black brood as with foul brood.

4. That may be in the future. Possibly in Italy you may get ahead of us.

### Bees for Non-Swarming.

In your book, "Forty Years Among the Bees," you say that you work toward a non-swarming strain of bees. Why do you say nothing about black bees? The blacks are less inclined to swarm than Italians.

SWITZERLAND.

ANSWER.—The above comes from an esteemed German bee-keeper across the water, and it is quite possible that if I lived in Germany or Switzerland, I might pay close attention to black bees. There are good bee-keepers there who say the Italians are not so good as the natives, and I have wondered no little why there should be such a difference of opinion in the two countries. Is it possible that you have a better strain of blacks than we have in this country, or does

the climate make the difference? Answering your question directly, I may say that in this country the Italians are so superior to the blacks as honey-gatherers, that even if the Italians should be more inclined to swarming (I wish we had a single word in our language to express that, like the German word *schwarmig*), I should still prefer the Italians on account of their superiority in other respects.

### Loss of Queens in Introducing.

I have tried to introduce an Italian queen in one of my colonies, which they did not accept. I found the queen a day later in front of the hive dead, so I thought I would try again, and bought two more queens. I tried the second one; I left her in the cage three days, and then took off the pasteboard and let them eat out the candy, which took another 24 hours. I looked in 4 days afterwards, and there I found the dead queen in front of the hive, and also the third one the same way. What is the reason they do not accept the queens, as I had destroyed all the queen-cells? Will it be time enough yet for them to rear a queen if I put in a frame of brood, and they have no drones in the hives? or will they rear their own queen?

PENNSYLVANIA.

ANSWER.—It's hard to tell just what the trouble was. In almost any plan of introducing there will sometimes be failures; one case failing where a number succeed, and you can't tell that you've done a thing different in the one case—it just seems like pure contrariness on the part of the bees. Probably the best thing is to unite the bees with other colonies.

### Preparing Bees for Winter—Using the Bingham Honey-Knife.

1. I have 54 colonies of bees, and want to prepare them for winter. The hives have plain board covers, and some are old and may leak when the rainy season sets in. Would you advise me to put ducking under the cover to keep out the rain and cold? If so, what weight should I get? and would it be advisable to give it a coat of oil to make it waterproof?

2. Is there anything else I could use that would be better than ducking? You understand, I wish to keep the expense down as low as possible.

3. Would it hurt the bees if they should get wet, on account of the cover leaking?

4. In using the Bingham uncapping-knife, is it proper to use the beveled side or the smooth side of the blade next to the comb? I have seen it used both ways.

CALIFORNIA.

ANSWERS.—1. Don't do it; if the rain gets through the cover it will not help to have something inside to hold the moisture.

2. The cover of a hive is a poor place to economize. But the thing to do is not to have something inside, but outside the leaky cover. Perhaps shingles, shooks, or cheap boards.

3. Yes, indeed.

4. I don't know. I wish several would tell us their preference, or whether they use both ways. [Perhaps Mr. Bingham will give the right way to use his knife. We used the bevel edge on the comb.—Ertorr.]

### Honey-Plants for Louisiana—Red Clover Queens.

1. What is the best honey-plant that will grow in Louisiana?

2. When planted and how cultivated on high land?

3. Will California sage and catnip grow on Louisiana high lands?

4. By introducing red clover queens now in colonies that will work up to November 15, 1903 (as it never gets cold here before that time of the year), when will the queens begin laying, and when can I expect swarming from the same colonies?

5. Is cotton and *Lespedeza* (a species of clover) honey-plants of any consequence? There are miles of it around here.

LOUISIANA.

ANSWERS.—1 and 2. I don't know, and hopefully refer the question to some of our Louisiana friends.

3. I must also refer this question, venturing the guess that catnip would succeed, but not the wild sages.

4. If introduced at any time before colonies in general cease brood-rearing, you may expect her to begin laying within a week of introduction; and you may expect swarming next season at the usual time for other colonies to swarm. If it be your object to have the colony swarm as early as possible, you can hasten matters by exchanging combs of brood with other colonies, swapping sealed for unsealed brood.

Again I must refer this question. You can decide the question yourself by a little watching when the plants are in bloom.

### A Beginner's Questions.

I wish information on some points that I do not find in the books.

1. What stock of bees is the one I enclose you? I have one large colony of these.

2. What is the average life of a colony, or the worker-bee?

3. When the bees are quieted with cold is it all right to lift frames out to examine for the queen?

4. What make of hives is the best for a beginner to have?

5. Is it not best to have the hives set up on legs about 6 inches high, and to keep the legs saturated with kerosene so as to keep away

the moths, mice, ants, etc.? I have had my hive that way ever since the first of July, and cannot find a single pest in the hive.

9. For winter quarters would it be all right to put a dry-goods box over the hive, with a small opening?

The two bees I enclose you were dragged out of the hive and dropped on the ground.

ANSWERS.—1. It is not easy to identify specimens mashed in the mail, but I think they are what are called hybrid-Italians, a cross between Italians and blacks.

2. I don't know what the average life of a colony is. Badly managed it may not live a year; rightly managed it is a permanent insti-

tion. The life of a worker-bee averages something like six weeks in the busy season; during the idle time of the year several months.

3. No, don't disturb a colony if you can help it, unless it is worn enough for bees to fly.

4. The same make that he'll continue to use after he gets over being a beginner. Perhaps there's nothing better than the dovetailed, but tastes and opinions differ.

5. In some places that is worth while on account of ants; it wouldn't be worth while here. Legs don't keep moths out; hardly mice.

6. Yes.

### FROM MANY FIELDS

#### Hasty for Bee-Stings.

Mr. Hasty, page 584, "Can't swallow the onion." Perhaps if he would try a few doses he might not be so "hasty" to condemn it. I am confident that a raw onion sliced and rubbed freely on the sting has saved me the discomfort of a badly swollen face. If bee-stings do not swell on you, try it on some one where they do. WM. R. MARTIN, Washington Co., Pa.

#### An Aster—Hive Preferences.

I enclose a flower upon which the bees are working with great energy. Will you kindly give its name?

While we have a great abundance of golden-rod bloom I never see the bees or any honey-gathering insects working upon it; neither does heartsease yield honey in this locality.

I have the book "Forty Years Among the Bees," and have enjoyed it very much, and have been very much profited by its contents.

I winter my bees out-of-doors, using the Danzenbaker hives. I think our preferences for hives rests upon the same foundation as a mother's affection for her children—her own babies are always the best. This preference for "our own" seems very deeply embedded in Nature.

W. P. HOGARTY.

Wyandotte Co., Kans., Sept. 28.

[The plant referred to is an aster. The aster season includes September, October, and November, and during this period many varieties of this rather abundant and wide-spread honey-producing plant are in bloom. In many localities the entire winter supply is obtained from the asters and allied plants of the Composite family.—C. L. WALTON.]

#### Bee-Keeping in Arizona.

So far the honey crop is about the average; I have about 70 pounds per colony, but the bees are still storing from sunflower and alfalfa, and a kind of willow that grows along the river and irrigating ditches.

Sept. 10, we had a pleasant call from Mr. A. I. Root, who was on his way home from the Los Angeles convention, which call was very much appreciated by us bee-keepers; only he did not stay long enough to see all the bee-keepers of the Valley. I was just finishing up the third extracting the day he came, and he seemed surprised because I was extracting so late, but

#### CONVENTION NOTICES.

Illinois.—The annual meeting of the Northern Illinois Bee-Keepers' Association will be held in the Court House, in Rockford, Ill., Tuesday and Wednesday, Oct. 27 and 28, 1903. A good program is being prepared, and all interested in bees are invited to attend. Mrs. EDWIN E. SMITH, Sec. Cherry Valley, Ill.

Connecticut.—The Connecticut Bee-Keepers' Association will hold their fall meeting in the Capitol at Hartford, on Nov. 4. All bee-keepers are cordially invited to attend. For full information, write the Secretary.

Mrs. EDWIN E. SMITH, Sec. Watertown, Conn.

those same bees are ready to extract again. We have had a fine fall so far, and if it will only stay warm we will get considerable honey yet. We have run about 436 colonies for extracted honey this season, and 183 for comb honey. We have had the comb-honey bees in two apiaries, and the ones for extracted honey in four different yards.

Early in March we moved 180 colonies about 10 miles to a heavy mesquite timber, and they gathered about 700 gallons of nice honey from that source. The mesquite commences to bloom about June 20, and lasts until July 15. Then we moved the bees back to the Valley, and have had two good extractings from them, and will get one more extracting, which, I think, has paid us very well for our work, as that honey comes much earlier than the honey from alfalfa in the Valley. We got our extra extractings out of those we moved, and would have had a great deal more honey if it had not been for paralysis, which affected 81 colonies quite badly, and they did not gather very much honey from the mesquite. I have the bees now in apparently healthy condition, but of course it may return in the spring; if it does not, I will report my treatment.

W. D. JEFFERSON.

Graham Co., Ariz., Sept. 26.

## Beedom Boiled Down

### Honey for Rheumatism.

It is said that a certain lord found so much benefit from the use of the following mixture for rheumatism that he paid his physician £300 for the privilege of making it generally known, *pro bono publico*:

Recipe:—Sulphur, 1 oz.; cream of tartar, 1 oz.; rhubarb,  $\frac{1}{2}$  oz.; gum guaiacum, 1 drachm; honey, 16 oz. A tablespoonful night and morning in a tumblerful of white wine and hot water.

This mixture is called "Chelsea Pensioner," and a man of my acquaintance having tried the same has been benefited.—JOHN BROWNING, in British Bee Journal.

### Be Careful With Horses Around Bees.

Below is given a graphic account of the trouble one of our Canadian friends had through trying to make a combination of bees and horses. It will serve a good purpose if it warns some one of little experience in that line, so that they may avoid a like disaster. Some of us are looking forward hopefully to the time when we can have "horses" immune to bee-stings—in other words, when automobiles shall become so common and reduced in price that they will be cheaper than horses.

BEEES AND HORSES—A BAD COMBINATION AT TOO CLOSE QUARTERS.

A few days ago it became necessary to draw in some grain from along-side of the home apiary of some 160 colonies. The bees were working hard at

## Something FOR OUR Bee-Keeping Sisters in the Winter Time.

We think all ladies will agree with us in saying that every man should at least understand some business, with which, in case of necessity, he could support himself and family. The wealthiest people frequently come to want, and wretched, indeed, is the man who cannot earn a living after his wealth is gone. He sometimes fills the grave of a suicide. And why, in this enlightened age of progression, should not woman, as well as man, be able to depend on her own resources? In case her husband dies in poverty, must she starve or depend on charity? In case her husband fails to provide and grossly mistreats the woman he has sworn to cherish, must she humbly submit? **A THOUSAND TIMES, NO!** Let every woman, before she marries, have some knowledge that can be used to make her a living. Every mother, rich or poor, should make her daughters, in a certain degree, independent, by giving them some kind of a trade, and teaching them to be self-reliant. Mothers should have their daughters learn to sew, and not neglect this important part of their domestic education. The

daughter so taught will not only make a better wife and mother, but will also be more likely to secure a better husband, and will always command his respect. He will not look upon her as a helpless "know-nothing," but will know that if he fails in his duties, she can live without him, and this can only strengthen the bond between them. A thorough knowledge of dress-making can always be turned into gold, and become the means of support for the mother and her little ones. She may never have to use this knowledge in this way, but she has a trade and can use it if necessary.

The outline cut shown herewith is a condensed copy of **THE NEW LONDON LADIES' TAILOR SYSTEM** for drafting and cutting ladies' and children's garments. For simplicity and accuracy it has no superior among the more expensive systems. Thousands of girls have learned more about drafting and cutting with this system than they knew about it after serving their apprenticeship in some of the dressmaking shops of the United States and Canada. Thousands of the best garment cutters have laid their complicated and expensive system aside, and are now using **THE NEW LONDON TAILOR SYSTEM**. Thousands have been sold at \$5.00 each, but we mail it free to a paid-in-advance subscriber to the American Bee Journal for sending us two new subscribers at \$1.00 each; or we will send it to any one with a year's subscription to the American Bee Journal, both for \$1.75; or, we will mail the Tailor System alone for \$1.00. Address all orders to

**GEORGE W. YORK & CO.,**  
144 & 146 East Erie Street, CHICAGO, ILL.

the time on buckwheat just west of the yard. Through over confidence, the men in charge of the horses (a spirited team) were told to drive right up against the apiary where the bees were flying by the thousands against a strong wind. A few bees at once attacked the horses which could not be induced to move, one throwing itself in the harness. The bees then literally poured out on the horses by the thousands, and the men, after vainly trying to get the horses to go, and after receiving a lot of stings, concluded that "twas better to fight and run away, and live to fight another day," so accordingly took "leg bail" on double-quick time.

Being only a short distance away at the time, and hearing the noise, the writer arrived on the scene of action bare-headed and in his shirt-sleeves. Needless to say he met with a very warm reception. After with great difficulty unhitching the horses by the assistance of a brother, who had now arrived, and by the free use of the whip induced them to leave the place slowly, covered with swarms of angry bees.

The poor brutes were literally stung over every inch of their bodies, and it was thought that they would certainly die. Salt was given to them as soon as possible, but owing to the way they kicked and plunged after being put in the stable, hardly anything could be done by the way of removing the stings. However, they have pulled through, and to-day (a week after the stinging) they appear to be improving nicely, although their bodies are covered with lumps full of pus which are now discharging. While the writer received hundreds of stings on the head, face and neck, aside from a severe pain

## HONEY-JARS.

# Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

# BEE-BOOKS

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie St., - CHICAGO, ILL

**Forty Years Among the Bees**, by Dr. C. G. Miller.—This book contains 32 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey**, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment**, by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Foul Brood**, by A. R. Kohnke.—Original, Development and Cure. Price, 10 cents.

very powerful gas is still evolved. There is also a sediment which nearly all evaporates on further heating. The same thing takes place with formaldehyde without water, only the residuum left is black. I am quite aware that formaldehyde attacks iron and steel, but only to a limited extent, and when a layer of oxide is formed on the surface of the metal it ceases to attack the metal, owing to the oxide protecting the metal. With regard to the addition of water causing the gas to polymerise, that will not injure its properties as a disinfectant, even if it did so. Acetic acid and lactic acid are polymers, and water is added to these, but does not alter their uses, and so with formaldehyde. Mr. Saunders asks, "Have I fumed combs with diseased brood, pollen, and heavy stores, and given them back to the bees without a return of the disease?" Yes, I have done so. That is, I have so fumed combs, and have not so far seen any return of disease.

I have only been experimenting with formaldehyde last year and this, consequently I am not in a position to give any definite information as to results this autumn, but hope to do so some time next year.—BLACKWOOD, in British Bee Journal.

## HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Oct. 7.—The volume of sales are larger than at this time last year, and the supply more than corresponds with sales; but the prices and good quality of honey are expected to make a larger demand than we have had for several years. No. 1 to fancy sells at 13¢@14¢, white practically no sale for off grades, which are quoted at 12¢@13¢. Extracted, white, 6¢@6¢, amber, 5¢@6¢, according to quality and kind of package. Beeswax, 28¢@30¢.

R. A. BURNETT & CO.

BOSTON, Oct. 8.—Comb honey continues to be in good demand. Fancy white honey in cartons we quote at 18¢; No. 1, at 16¢; glass-front raises fancy white, at 10¢; No. 2, at 14¢. Extracted honey, Florida, 6¢@7¢, according to quality. BLAKE, SCOTT & LEE.

CINCINNATI, Oct. 7.—The demand for honey is a little better. The prices rule about the same. Extracted is sold as follows: Amber, in barrels, from 5¢@5½¢; in cans it brings about half cent more; water-white, alfalfa sells from 6¢@6½¢; white clover, from 6¢@7¢. The comb honey market is quite lively and same is sold: Fancy water-white from 14¢@15¢. Beeswax, good demand at 30¢. C. H. W. WEBER.

ALBANY, N. Y., Oct. 8.—Honey market firm with comb at good prices. We quote: Fancy white, 10¢; No. 1, 15¢; No. 2, 14¢. Seed for buckwheat, 13¢@14¢. Extracted seems to be more plenty throughout our correspondence than comb. We quote: White, 7¢@7½¢; mixed, 7½¢@7¢; dark, 6¢@6½¢. Beeswax, 28¢@30¢. H. R. WRIGHT.

KANSAS CITY, Oct. 6.—The demand for comb and extracted honey is good. We quote: Fancy white comb, 24 sections, per case, 43¢@45¢; No. 1, \$2.90; No. 2, and amber, \$2.75. Extracted, white, per pound, 7¢; amber, 5½¢@6¢. Beeswax, 25¢@30¢. C. C. CLEMONS & CO.

CINCINNATI, Oct. 1.—Comb and extracted honey are coming in freely, and the demand is good with steady prices. We are making sales at the following prices: Amber extracted at 5½¢@6½¢; white clover, 6½¢@7½¢. Fancy comb honey, 15¢. Beeswax, 30¢.

THE FRED W. MUTH CO.

NEW YORK, Sept. 28.—Comb honey is arriving quite freely now, and is finding ready sale at 15 cents per pound for fancy white, 13¢@14¢ for No. 1 white, and 12¢ for No. 2 white and amber. Very little buckwheat on the market as yet, and prices are hardly established.

Extracted honey is ruling about the same as last with plenty of offerings of all grades. Beeswax is somewhat declining and selling at present at from 28¢@29¢ per pound.

HILDRETH & SEGELKEN.

SAN FRANCISCO, Sept. 30.—White comb, 1-lb. frames, 13¢@14¢ cents; amber, 9¢@11¢. Extracted, white, 6½¢@7¢; light amber, 5½¢@6¢; amber, 5¢@5½¢; dark amber, 4½¢@5¢. Beeswax, good to choice, light, 27½¢@29¢; dark, 25¢@26¢.

There have been moderate receipts, mostly representing "firm arrival" purchases. The market continues to present a firm tone, but is not particularly active, buyers not caring to stock up very heavily at extreme current rates, and finding it exceedingly difficult to obtain noteworthy concessions in their favor.

## WANTED! FANCY COMB HONEY

In no-drip shipping-cases. Also Amber Extracted in barrels or cans. Quote your best price delivered Cincinnati. The Fred W. Muth Co. 32A1f Front and Walnut, CINCINNATI, OHIO. Please mention Bee Journal when writing.

WANTED—Comb Honey in quantity lots. We are perhaps the only dealers in this article owning as much as 150,000 pounds at one time. Please state quantity, quality and price asked for your offerings, The Fred W. Muth & Son 24A1f MANZANOLA, COLO., or FAIRFIELD, ILL.

## WANTED—Extracted Honey.

Mail sample and state lowest price delivered Cincinnati. Will buy FANCY WHITE COMB HONEY, any quantity, but must be put up in no-drip shipping-cases.

# Dr. Miller's New Book

Free as a Premium for Sending Two  
New Subscribers.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

## Long Tongues Valuable

South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

HUTTO, TEX., Nov. 19, 1902.

J. P. MOORE.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentle mess of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongued bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am billing all orders by return mail, and shall probably be able to do so till the close of the season.

## Root's Goods in Chicago.

The business for many years conducted by George W. York & Co., at 144 E. Erie St., as agent for The A. I. Root Company's Supplies, is this day transferred to The A. I. Root Company, to be conducted as a Branch Office. All outstanding accounts will be paid George W. York & Co.

The policy of Branch House will not be changed. We shall continue to serve the interests of bee-keepers to the best of our ability, and to increase our facilities whenever possible for such service. Mr. York will still be in the same office with us, and the benefit of his years of experience with this trade will thus be available.

Please note change of name to avoid confusion in our work.

Oct. 1, 1903.

## THE A. I. ROOT COMPANY.

All orders, remittances, inquiries, etc., should be addressed to The A. I. Root Company, 144 E. Erie St., instead of George W. York & Co.

## STATEMENT BY GEORGE W. YORK & CO.

TO OUR CUSTOMERS AND FRIENDS:

In transferring back to The A. I. Root Company the bee-supply business which we took over from them some years ago, we do so with regret, as we have labored to build up a large and honorable trade in bee-appliances, and value beyond expression the generous patronage accorded us during the years. We trust the same will be continued to our successors in the business.

Please note that this transfer does not in any wise affect our publishing the American Bee Journal, or handling bee-books and queens. But we expect from now on to be able to devote more time to the Bee Journal, as for years we have had "too many irons in the fire" to give it the attention it requires.

# LOOK AT YOUR WRAPPER-LABEL !

## Personal to Our Subscribers!

CHICAGO, ILL., Oct. 6, 1903.

We have just been informed by the Post-Office Department that **expired subscriptions** to a newspaper or magazine do not constitute legitimate subscriptions so as to maintain the second-class rate of postage, but if such are mailed with paid-in-advance subscriptions it places the whole edition under the third-class rate, which, in the case of the American Bee Journal, is about 14 times higher than the second-class rate. In other words, if the third-class rate of postage were enforced on the Bee Journal, we would have to raise the subscription price to \$1.50 a year at once. This we do not want to do. But we are compelled to show that every subscriber who gets the American Bee Journal is a **paid-in-advance subscriber**, in order that all may be mailed under the second-class rate. And the only way we can do that is for each one now in arrears to pay his or her subscription, not only what is past due, but also an advance subscription.

In order that **ALL** who are in arrears may put their subscription credit in advance **right away**, we wish to make the following offers:

We will credit any subscription sent us—1 year for \$1.00;

**2 Years for \$1.80; 3 Years for \$2.50; or 5 Years for \$4.00.**

Of course, these prices are not limited to those who are in arrears, but if any others wish to take advantage of them they may do so.

### Very Special Notice to those in Arrears.

In order to comply with the requirements of the Post-Office Department, we will be obliged to discontinue sending the Bee Journal to all who are now in arrears on their subscription. We know this is a very sudden notice, but it is not our fault, as this is the first chance we have had to say anything about it since we learned of it from the Post-Office Department.

But all who are in arrears can easily start a remittance to us in time so that it shall arrive at our office before the end of this month, and thus it will not be necessary to miss a single copy of the old American Bee Journal.

We are planning some great things for our readers for 1904, any one of which will be worth the yearly subscription price of the Bee Journal. But by paying for 5 years at one time, it will cost you only 80 cents a year. That is only a trifle over 1½ cents per copy!

Let us have a prompt response from all who are in arrears, and also from those who will soon be in arrears, so that all our readers may continue right along without a single break.

It may be that some can also send along the names of one or more new subscribers with their own renewals, and thus help increase our list of readers. We are offering some handsome premiums for such work.

Trusting that all our readers had a good year with the bees, and hoping that we shall be favored with a general response by way of paid-in-advance subscriptions, we remain,

Yours for the best bee-literature,

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie Street, CHICAGO, ILL.

P. S.—If your wrapper-label reads "dec02" it means that your subscription expired with December, 1902; if it reads "jun02," it expired with the end of June, 1902. And so with any other month and year that may be shown on your wrapper-label.

## Editorial Comments

**What Have You Learned** during the past season's experience? Who write out some of the things that have either puzzled you, or that you have solved, and send it in for publication. You have been helped by what others have written, why not help them by contributing from your experience during the past season, or previous thereto?

We will be glad to publish whatever we think will be interesting or helpful. Who knows but you may be practicing many "short cuts" in the apiary that would be new to other bee-keepers. Tell us about them, please.

**Photographs for Engravings.**—We are constantly wanting pictures of apiaries and other things of interest to bee-keepers in general, for use in the American Bee Journal. You, perhaps, have been interested in looking at the picture of some other bee-keeper's apiary, and doubtless others would be pleased to see yours. That is, if it is a nice, up-to-date one.

We can not, of course, promise to use all the pictures that may be sent to us, but we usually find a place for nearly all of them in time. Whatever pictures are sent in should be clear and bright, in order to make good engravings. A good way to do is to send us the photograph and let us report on it as to whether or not we can use it. If a favorable report is received, then you can send on a write-up to go with the picture in the American Bee Journal.

**The Hay and the Honey Crop.**—A subscriber sends the following clipped from the Lovelocks, Nev., Tribune:

"The cattlemen claim the bees are taking the nutriment out of the hay. They say that a ton of honey probably represents the essence from 200 tons of alfalfa, and that the hay is just that much poorer in saccharine matter. They say that it stands to reason that you can't take all this honey out of the hay and still have it as rich in saccharine matter. This belief goes far to portend action at the next legislature regulating bee-pasturage."

That probably gives the views of a good many of the cattlemen who are entirely honest in their opinions, but who are not well informed. The better informed can hardly hold such views. The paper from which the extract is made is to be commended for its fairness in giving both sides—a thing that can not always be credited to the weekly press. The clipping goes on:

"The apiarists ridicule these claims of the stockmen. They say the bees are a benefit to the alfalfa. They say that all this nectar that is made into honey would evaporate anyway and not be saved in the hay. They cite the old belief that the bees injured the orchards. Now, the orchardists of California give the free pasturage to the bee-men. The bees fertilize the bloom and make more fruit. They say that there is no complaint in California that the bees sterilize the alfalfa bloom. They say that all one has to do is to read up on scientific work, and see that bees are a benefit feeding on alfalfa bloom, and improve the hay."

Going back to the views of the cattlemen, if "it stands to reason that you can't take all this honey out of the hay and still have it as rich in saccharine matter," it ought not to be a difficult thing to show this very clearly and positively by actual experiment. Have any of

the experiment stations done this? Indeed, it is not necessary to refer the matter to the experiment stations. Any cattlemen who think the hay is the poorer for the bees can try the experiment for himself. Let him cover a plot of alfalfa with mosquito-netting so the bees can not get at it. He ought to find the ripened flowers sticky with honey. But if, on the contrary, he finds that the nectar has all evaporated into thin air, he may change his mind as to the mischief done by the bees.

The experiment might also show him that instead of being a damage the bees are a benefit; for in the covered plot, where the bees have no chance to fertilize the blossoms, he would find a failure in the seed crop. The case of red clover is in point. Every farmer knows that seed can be obtained from the second crop of red clover, but not from the first, but not every farmer has inquired why. The tubes of the red clover blossoms are too deep for the hive-bee to reach the nectar, and the bumble-bee does the fertilizing. But the bumble-bee does not start in the early summer with a full colony like the hive-bee; for some time there is only a single bee, and only when the second crop of red clover comes are bumble-bees in sufficient numbers to fertilize the blossoms.

The probability is that the counsels of the more intelligent cattlemen will prevail, and that no effort will be made to hinder the busy bee in its beneficent work.

**Phacelia** continues to be vaunted as a forage-plant in European journals, and there is no question as to its being a good honey-plant; but if any one has found it to be valuable as a forage-plant in this country he is keeping very mum about it.

**The Pronunciation of Propolis** is given in the British Bee Journal with all the vowels short, and to speak it otherwise is pronounced "a grievous classical blunder." That may be all right "in that locality," but the Standard dictionary gives the preference to long o in the first syllable. Still, if we were making a dictionary we would say prop-o-is, accenting the first syllable, with o short sound.

**Danger from Stray Swarms.**—In some regions the past year has been an unusual one for swarming, and some bee-keepers have rejoiced at the sudden increase of colonies by means of stray swarms coming to them. But such swarms sometimes bring bane instead of blessing. A case is reported in the British Bee Journal in which a stray swarm carried foul brood with it. It is well to give extra scrutiny to stray swarms—indeed, to a fresh accession of bees from any source.

**A Larger Opening for Honey-Cans.**—One of the most extensive users of extracted honey wrote us as follows, some time ago:

EDITOR AMERICAN BEE JOURNAL:—We take the liberty of recommending to the bee-keepers, who put up honey in 5-gallon cans, to endeavor to secure cans provided with a  $2\frac{3}{4}$  inch screw-top opening instead of the  $1\frac{1}{2}$ -inch which is now in use. The large opening has many advantages over the smaller one. The principal ones are that it is easier to remove the honey, and the empty can is more salable to dealers who use the second-hand cans for other purposes. We understand that a certain company that makes a large number of these honey-cans, would be perfectly willing to furnish cans with the larger opening, if so required by its customers. This change can be made without detriment to the cans now in existence with the smaller opening.

We have often thought that the screw-top opening on the ma-

jority of the 5-gallon cans used is entirely too small. The 4-inch screw-cap is much better, we think.

Of course, where a honey-gate is used, we suppose the smaller opening is better, and yet we do not see why a honey-gate suitable for the 4-inch opening could not be made for about the same price as the smaller one.

The larger, or 4-inch, opening is much better for cleaning and drying the can after emptying its contents.

We should like to hear from extensive bee-keepers who put up their honey for market in the 5-gallon cans, as to their opinion of a larger opening than is now generally used.

**Formalin of Variable Strength.**—Prof. F. C. Harrison says in the Canadian Bee Journal:

Formalin is not explosive, but I would caution you to be extremely careful to find out whether the formalin you supplied is of the correct strength, as it is a very adulterated article. For disinfecting bee-combs I advise the use of one-half more than is necessary in order to safeguard any weakness of the drug.

If this be true, the one great claim for formalin in preference to any other preparation of formaldehyde seems to be not well founded. It was claimed for formalin that it is guaranteed to be uniform in strength. It begins to look as if one pays an extra price merely for the name "formalin."

## Miscellaneous Items

**PASADENA AND HOMEWARD BOUND.**—The last day of our stay in California had come. The forenoon of Monday, Aug. 24, was spent in going from Pasadena to Los Angeles to get our tickets signed by the proper agent, so that we could start on our homeward trip in the evening. While in Los Angeles we called at the office of the California National Honey-Producers' Association, which is located in one of the finest buildings in the city. Pres. Geo. W. Brodbeck escorted us up to their office, and shortly thereafter we started back to Pasadena.

In the afternoon, our cousin, Mrs. Freeman, gave us (Mrs. York and the writer) a long carriage-ride over the beautiful city of Pasadena. While August is about the worst month in all the year to see the beauties of both man's work and that of Nature also, we saw enough to convince us that in March or April the sights in and about Pasadena must be simply entrancing. We certainly never saw so many palatial residences and surrounded with their immense grounds or lawns. We believe that some 40 millionaires live on one of the finest avenues. The driver seemed to know just who lived in each mansion during the winter, and where during the summer. Of course, it is well known that the majority of the wealthy owners spend the winters there, and during the rest of the year are in their regular places of business in Chicago, New York, or some other large city, making enough money to keep up their grand home in Sunset Land.

— We must have ridden 15 or 20 miles around Pasadena, and saw the best parts of that American Paradise. We think we could endure living there permanently if we had enough of the wherewithal to pay expenses. But we had to think of getting ready to start back for the smoky city of Chicago, and at about 8 p. m. we were at the station in Pasadena, waiting for the train to take us home.

We were only three of our former car-load of bee-keepers—Dr. Miller, Mrs. York, and her smaller half. But

it was an enjoyable return trip. We could see much that we had missed when going. Of course, there were none that we knew on the train except those mentioned, so it was a very quiet homeward journey. We visited with Dr. Miller until we both would get tired and sleepy in broad daylight. It was such a long ride—from Monday evening to Friday morning! Go to sleep at night with the train rushing on, and get up in the morning with the train still rushing on. Keeping that up for four nights and three days, and we had come from Los Angeles to Chicago.

It was a trip long to be remembered. Perhaps few of the number who went in that car-load of bee-keepers, over two-thirds of the way across the continent, will ever take so long a ride again. As we began this series of convention notes with an account of the car-load of bee-keepers, we close with giving a picture of the car and its "contents" as all appeared on Monday morning, Aug. 17, a few minutes before leaving Grand Canyon for Williams, on the main line of the Santa Fe railroad. Mr. and Mrs. Hanegan, with "Baby Joy," did not take the side-trip to Grand Canyon, so they do not appear in the picture; Mrs. E. C. Wheeler must have been inside the car; and as Mr. Hutchinson was managing the camera so the rest of us might be shown, he is absent from the picture.

So, with this explanation, we invite our readers to take another look at the front-page picture, and see if you don't all wish you could have been in that happy company—the first car-load of the kind ever known to go so far to attend a bee-keepers' convention where so many extensive bee-keepers were assembled, and who represented so many colonies of bees and so many pounds of honey—

No. of Colonies.	No. lbs. Comb Honey.	No. lbs. Ext'd Honey.
Over 45,000.	Over 300,000.	Over 2,000,000.

THE CHICAGO-NORTHWESTERN CONVENTION will be held Wednesday and Thursday, Dec. 2 and 3. The executive committee held a meeting Oct. 15, and will soon be able to announce the exact place of meeting in Chicago, and also give some particulars as to program. Look out for a great meeting. Plan to be present. It stands next to the National convention. Some have told us they thought it better than the National.

THREE FINE PHOTOGRAPHS were taken by W. Z. Hutchinson, when on the Los Angeles trip in August, for copies of which we are indebted to him. The first is of the Grand Canyon (and it is a grand picture); the second shows the bee-keepers' car, a reproduction appearing on the first page of this issue of the Bee Journal; and the third is a good group-picture of those attending the Los Angeles con-

ONE OF THE LOVELY CALIFORNIA HOMES.

# Convention Proceedings

## THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

Continued from page 663.

Mr. Moe—After listening to Mr. McIntyre's experience in hiving bees, I would like to ask if he has any difficulty with after-swarming, or secondary swarming; and, also, if he has had any experience with young queens reared in the same colony. If they have any disposition to swarm during that season, as well as introducing his queens.

Mr. McIntyre—I have very little difficulty with after-swarms. That is why I use the queen-excluder. By setting the brood-chamber out with a very few bees in it, and then introducing a cell ready to hatch, there is hardly ever an exception to this rule.

Mrs. D. A. Higgins—I always think the crossness depends a good deal upon who handles them, and how they are handled. We never have any trouble with cross bees. I think the way they are handled has a great deal to do with it.

J. K. Williamson—I wish to ask if there is any Cyprian blood in nearly all of the light-colored strains of bees. It always seems to me they are crosser and more vindictive than any of the dark strains that I get.

A. I. Root—In Cuba, last winter, they complained a great deal that when they had a long continued flow of honey the worker bees would fill all the cells with honey to the exclusion of brood, and the colonies would get depopulated. I laughed at the idea that that would stop queens from rearing brood. It seems as though the bees filled up everything with the honey. I said to them, We want some Holy Land bees. I used Holy Land bees years ago, and they would go to work at the approach of winter and fill up the cells with brood. I would like to ask if you have any trouble in California, when there is a very large flow of honey, with the bees filling the combs with honey to the exclusion of brood?

Frank Benton—I have shown this condition with any of these Eastern bees, and I ought, perhaps, to supply from the Cyprians and Holy Lands to a certain extent. I merely intend that, I think, as crossing material and breeding material, the Cyprians are to be preferred to the Holy Lands, and that rather gentle Cyprians can be found on the average. Now, when it comes down to the question, any of these Eastern races will introduce that element of prolificness, swift flight, strong wing-power, energy in collecting, and if we can only avoid that sharpness of disposition by the introduction of the gentle qualities from the male element, then we could meet all these conditions and get bees where there was an early flow, and we want them to go through the winter in powerful colonies; where the flow comes especially during the winter they would be especially valuable in keeping up the brood-rearing, storing their surplus in supers, and keeping the body of the hive well filled, whether the honey is coming in in that manner.

Another point, their continuous industry causes them, when other bees slack up and do nothing, to keep up enough to keep up the honey. That is not the case with the Italians. Then their lack of hardness causes them to dwindle easily, and we prevent this by combining with one of the Eastern races, whichever one of them may be preferred.

Now, just one word more. I mentioned the Caucasian race of bees. I have had very little experience with them, but I am very favorably impressed with them, and it is quite possible that we will have there a moral element that will be preferable even to the Carniolans.

T. O. Andrews—It seems to me that we are devoting a sight of time to questions that have been gone over time and time again. There are a thousand and one important questions relative to foul brood, treatment of foul brood, and things that are vitally important. As to this question

of Cyprian bees—"Holy Terrors," I call them—I was very glad when they decided they would not live in my climate. Every one to his notion in this, just as in the matter of the hot knife or cold knife. I move that we proceed to the election of officers, and then to the question-box.

The following officers were then chosen to serve for the year 1904:

President—J. U. Harris, of Grand Junction, Colo.  
Vice-President—C. P. Dadant, of Hamilton, Ill.  
Secretary—George W. Brodbeck, of Los Angeles, Calif.  
Proceeding to the question-box after a recess, with Mr. T. O. Andrews in the chair, the first question read was:

### METHODS OF RUNNING OUT-APIARIES.

"Which system is best for out-apiaries, hired help, or furnish bees and everything, and give a manager a percent of the net profits?"

E. T. Abbott—May I give my experience a little with hired help? On general principles, it is absolutely worthless. Once I turned over to a man 150 colonies of bees. I agreed to pay him \$30 a month and his board. I had no way of telling whether he earned his board or not, because I was away for about four weeks. On my return, I found that he did not know where a single colony in the yard was located. The colonies were all numbered, and for quite a little while I manipulated the bees from my location, saying, No. 3 would do so and so, and so on, and I told him that the colony of fine Carniolans should not be permitted to swarm, and that they were not to be divided until absolutely necessary. When I got home, my wife said that a swarm of bees was hanging on a tree outside, and I went out in the morning and put a swarm-catcher under them, when I discovered my \$10 queen had been hanging in a tree all night. When I asked him what had become of the colony of Carniolans, he said he did not know; and he was a very good young man and wanted to look after my interests. That is the reason I gave up manipulating bees. Whenever I have undertaken to hire a man to keep bees, I have become convinced that I could not hire it done. That has been my experience.

Mr. France—This subject, to those keeping a good many bees, is one of vital importance. As Mr. Abbott remarked this morning, it is getting to be everything on the union line. Labor is a big figure, and to get labor on the farm is not so difficult as in the bee-yards. I find I must either hire them at a definite stated price, they to do as I direct, or they must work upon a commission for a part of the product of the apiary—one of these two methods. In my own locality I am fortunately situated, having one of our State Normal Schools, and students, especially those in the third year, anxious to stay in the vicinity over the summer vacation, and the busy season comes just at a time when their summer vacation is on, and I take in these graduate boys as my assistants. But, generally speaking, I question if it is desirable to take the ordinary laborer, as we find him, on a commission basis. Their whole interest, then, is as to the number of pounds of honey they can produce, and they may over-reach, and you will be sorry for the experience. I think this is largely a matter of locality.

H. H. Hyde—I would rather have a man work on commission than on wages.

Mr. France—Yes, sir; rather than work for wages, because if I am not there things will go on in an indifferent, careless way. On the other hand, if it is his labor, he is willing to work more than six hours a day, and as a labor union dictates.

Mr. Williamson—In both systems, whether you hire the man or whether you rent the bees to him on a commission, the principle involved is the same. A man is trying to get all out of the bees he can. His interests and his employer's are antagonistic, and they can never be harmonized. The laboring man sells his labor and renders only so much as he must in order to hold his job. It is a business proposition with him; and, on the other hand, it is a business proposition to get all out of a man he can. There never will be harmony between employer and employee; it is impossible.

F. G. Corey—If you want to run an engine, you must have an engineer. A railroad company can trust a man a thousand miles away, if he understands his work. If a man has no taste for that kind of work he is not a bee-man. You can train men to work in the fields or the orchards, and they must be trained to be of real service in the bee-yards.

### BEST BEE FOR COMB HONEY.

"What is the best bee for the production of comb honey?"

Mr. Hyde—Either Italians or Carniolans.  
Dr. Miller—I say, *worker*-bees!  
-A. I. Root—Dr. Miller's hybrids!

#### BEST BEE-ESCAPE.

"What is the best bee-escape?"

Allen Barnett—I do not know whether my experience counts for more than others in that line or not. I work for comb honey, and I like to get the bees out of the supers pretty well, so I don't use any bee-escape, only one of my own, and that is a common tent, such as is used by campers. I have one about ten feet square, and I get a couple of poles and leave an opening at the top of it, and then I take common screen-wire and make a funnel, leaving one end of it large enough for one bee to get out. At the other end a cloth that will sit securely on the tent, so that the sides and ends will lie down on the ground a few inches, so that the bees can not get under. I use a little smoke, and carry the super with the combs in the sections, and stand it in the tent on end—not on the side, but on the end, so that the sections stand up and down. I place another one close to it, but not close enough so that the bees can get through. You can stand them in rows. In a tent ten feet square I can put as many as 50. All that you take off before noon will be out in a few hours, and I can work until 3 o'clock in the afternoon very well with that kind of bee-escape. As quick as you go in, close down your curtain, so that the bees can not come in. If you don't work later than 3 o'clock in the afternoon, the bees will come out and go to their homes. Sometimes bees will come from the outside and go down. In order to remedy that, I make another one of the same size and shape, allowing the space of 6 or 8 inches above it. They will then crawl out of the first and into the second, and they seem to become confused and go back out. This is the best bee-escape I have ever tried in connection with taking off comb honey. I have not used the Porter, but the old-fashioned ones. The bees do not have to crawl up through their supers by being stacked up.

Dr. Miller—The question as to the bee-escape depends upon the intention of the proprietor. If he wants to get his bees out of the super over night, or leave them as long as he has a mind to, I don't believe there is anything better than the Porter, because he can put it on and leave it, although it may be a question between the Porter and the Lareese. That has been used so little, perhaps of late, that not many would remember the name, but Mr. Reese combined the names of Larrabee and Reese in the name. But if the escape is meant to get the bees out of the super so that the proprietor may get them from the out-apiary and take them home, then the Porter or Lareese, either, is too slow, and the plan already mentioned is good. Let me give you one hint as to that. All that is required in that is to have a tent large enough to hold the supers. Pile them one upon top of the other crosswise, then that allows them to escape. Then the robbers, if it is a time when the robbers are troublesome, every time you go in there to take a fresh super, will try again. You will notice that the bees always attack your tent from the side where the wind blows. Have your door on the opposite side, and they will not come in. For a good many years I have used what I think is more convenient, and it is given in Root's "A B C of Bee-Culture" as the "Miller Tent Escape," and that is simply a combination of a robber-cloth and a cone. The robber-cloth is quickly thrown over the pile of supers. Throw the robber-cloth over them like a tent, and then when you are ready to go home you will find all the bees are out. That, I think, is the most convenient way of all.

#### YOUNG QUEEN LAYING IRREGULARLY.

"Is a young queen which starts out like a laying worker, scattering the eggs and mixing drone and worker eggs badly through worker-comb, worth keeping, or should she be killed at once?"

Dr. Miller—Try her again; give her another trial.

#### SELF-SPACING FRAMES FOR EXTRACTED HONEY.

"In producing extracted honey, has the self-spacing frame any advantage over the ordinary hanging frame? About what percentage of producers use self-spacing frames?"

N. A. Kluck—Self-spacing frames have a great many advantages. There is a great deal of difference.

J. M. Hambaugh—I think I am qualified to speak of the advantages and disadvantages of self-spacing frames. I have been in the business of inspecting everybody's apineries in San Diego county, and I think we have about as

great varieties as any State in the Union. If you could go with me and see the disadvantages of the different kinds of self-spacing frames, you would everlastingly place condemnation on them. If you want to examine rapidly, and get over a good deal of space in a day, you will almost curse the time you ever saw a self-spacing frame. And it is a great disadvantage when it comes to rapid handling and inspecting of frames throughout the country. If I had my way about it, I would everlastingly do away with self-spacing frames. That has been my experience, and I think that of a good many others. There may be some advantages for the time being, but wait until you want to take the frames out, and get at them rapidly. Then you will find they are a great disadvantage. With the other frames, you will find by placing your fingers right, you can lift them right out. But self-spacing frames you will have to pry out the first ones, until you can lift the frames up and get them out. Otherwise they are very hard to get out.

Mr. Abbott—How about the self-spacing hive, not a frame?

Mr. Hambaugh—I have never had any experience, if you mean hives.

Mr. Abbott—Yes, sir, I mean the body of the hives.

Mr. Williamson—All the experience I have had fails to apply when it comes to a movable frame. For rapid handling, you must have a loose-hanging frame.

Mr. Hyde—I am for a hanging frame, first, last, and all the time.

Dr. Miller—There are self-spacing frames and self-spacing frames, and it does not necessarily follow because you found a hive—and you will find them—where the frames are stuck fast, that all self-spacing frames act that way. The only thing is to have a sufficiently small point of contact. Generally you have that too large. I would like to ask Mr. Hambaugh the smallest point of contact he found between any of those frames.

Mr. Hambaugh—After they were in use a certain length of time I found all of them exceedingly hard to pry apart.

Dr. Miller—If we let any large amount of space come in contact that is bad. But did you find any of them touching at only a single point above and below?

Mr. Hambaugh—No; all touched about half way.

Dr. Miller—If there is only a single point at the top you will find those will be just a delight to handle. You will have no trouble in getting them out. The bees can not accumulate a lot of propolis there. We ought to have—I have tried hard to get that—we ought to have a spacing-nail that would automatically go in, with a head  $\frac{1}{4}$ -inch thick. I can not get them inside of that. I use a heavy common wire nail, and, with a gauge, drive it in so that it projects  $\frac{1}{4}$  inch. A staple would answer the same thing.

Mr. Hambaugh—To one side or another, enough so that they would go past each other.

Mr. Hershiser—Just as fast as I pull these frames out of the hive I go and get a claw-hammer and pull the nails or staples out.

Dr. Miller—Anybody that does not like them—there is no law against pulling them out.

Mr. Abbott—I might say I have been using a hive for more than ten years in which the hive spaces the frames. I pronounced the Hoffman frame a humbug; ten years ago, and I actually would not have me if I were manipulating it; but why one should suppose that a frame can not be spaced any other way when it can be accurately spaced with metal is beyond me. The "St. Joe" hive has frames which are spaced in that way, and you may nail your frames and not touch them for ten years, and you will have no trouble to lift any one of them out with ease. That hive has been sold for about 15 years, all over our Western country, and I have heard of no complaint of frames being stuck fast.

Mr. Hambaugh—I did run across a hive of that kind from which it was simply impossible to remove the frames. They had gotten so propolized, and we had so everlastingly much trouble trying to get those frames out and overhauling them, that the owner declared he would do away with them. If that is the "St. Joe" hive, I don't want anything to do with it.

Mr. Abbott—That is not the "St. Joe" hive.

Mr. Hyde—We once bought about 180 hives—I don't know whether they were the "St. Joe" hive or not, but when I wanted to get the frames out I had to move one at a time.

J. A. Delano—I think if we used tin right on the end of our hive where the frame is, so that we could slide our frames back and forth, then get a straight top-bar and a straight end-bar, it does not matter what width we take

(and not use any spaces of any kind), we will find it will suit all localities better. In our locality, I do not think of all the plans suggested in this discussion, that any of them would work. They will get gummed up.

The convention then adjourned until 7:30 p.m.

(Continued next week.)

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### A Sisterly Suggestion to a Brother.

I have been in the bee-business three years. I had 200 colonies last season, but lost some this spring. The honey crop is small with us this season, but of good quality.

I enjoy reading the Sisters' letters.

I take all the care of the bees and honey, making shipping-cases, etc.

I can sympathize with the brother from Delta Co., Colo., as I know what it is to do housework and care for bees at the same time. If he will send his full address to the American Bee Journal I will send him my address, and perhaps we can arrange it for one to take care of the bees while the other one looks after the bread, as I am a widow.

Bent Co., Colo., Sept. 22.

MRS. C. HENRY.

### Good Season—Changing Supers.

This has been a very good honey season, although the weather was not the most favorable—too cool to secrete the honey. Clovers blossomed well, but basswood blossoms lasted about 10 days.

I have sold \$91.16 worth of honey from 24 colonies, besides saving enough for ourselves and giving away quite a little.

I have kept bees many years, but I feel I know but little about them yet, and would like to ask: If a super is taken from one hive nearly full of honey and bees and placed on another, what becomes of the bees? Do they go down and out, or do they help finish filling the sections with honey?

I found a copy of the American Bee Journal of 1888, but it is quite inferior to the present paper of the same name. I find it very interesting and profitable to bee-keepers, especially the Sisters department, which I hope will continue to grow.

MRS. R. A. HUNTINGTON.

Genesee Co., N. Y., Sept. 30.

It depends upon the age of the bees. Most of them will stay where they are put, while field-bees that happen to be in the super will return to their own hive when they fly out, unless there has been several days of wet, cloudy weather so they could not fly. In that case most of them will, no doubt, begin to feel at home where they are.

### Sowing for Bees—An Elder Sister.

When I read Mary E. Avera's letter (page 424), I thought how much she was like me, only she is on a ranch farm and I am on a little Jersey farm. I do all my work, having no one to help me. She says she makes chicken-coops, so have I, and chicken yards. Her husband says when she gets hold of anything she don't know when to let go; that is my nature, too.

One sister says she makes her Hill's device, to go over the bees, out of barrel-hoops. I have made mine ever since I kept bees.

Thank you, Sister S. M. Payne, for telling how you take your honey off. I did not know of that way, and I have only one bee-escape.

I can sympathize with you Sister Payne, for I have not been able to get around without a cane for five weeks; have the same trouble. My bees do not seem to appreciate my hobbling among them with a cane. They have not had the attention they ought to have, and are not as good-natured as they were when I was with them more and talked with and to them.

I have undertaken too much. I planted an acre of corn, dropped and covered it myself, also quite a patch of sunflowers, and want to sow a patch of millet, too, and have seeded the pear-orchard to crimson clover, so that next summer the bees will have plenty. The first of March I planted the piece I am going to seed down, then I kept planting until the last of June, so they would have flowers to work on for a long time, and the pigeons and chickens will enjoy the seed this winter; but I notice since the spider-plant has commenced to bloom they do not seem to pay so much attention to the sunflowers, but are very busy on the spider-plant, especially in the forepart of the day. I never could succeed in getting it to grow before, until I read in the Bee Journal that it had to be sown in the fall. The patch looks pretty—it is so full of bloom.

The bees work on lima beans, too; I have a patch of them, and also of tomatoes for the canning factory, besides the things I am raising for myself. So you see I have undertaken a good deal for a woman alone, who will be 75 years old in December.

I always thought the Bee Journal very good, but since Mr. York has been so kind as to give the Sisters a corner to ourselves, it has added a great deal more to its interest. It seems natural, I suppose, for us to look at that part first; I am sure I always look there, and if our Editor had not given us a corner the bee-brethren would not know what we can do. I guess I am the only sister that has ever made hives, and I have a good many on hand, which is well, as I have lost the use of my right eye, and it is a great disadvantage in bee-work, as well as other work. Some other time I will have to tell about how my bees have worked and stored.

SARAH J. GRIFFITH.

Cumberland Co., N. J., Aug. 10.

### Bees on the Farm.

Our home is in a place that is comparatively new, having been settled only a few years, and the farms that we will consider have 20 or 30 acres, and many of them less, of plowland, and the rest is hay and pasture and woodland—just room for a good garden and orchard, for potatoes and corn, and a little grain; just what stock is necessary, 50 to 100 hens, and 2 to 40 colonies of bees. Of course, there are some big farms here, but we will let some one else talk about big farms.

Here, in northern Minnesota, we put our bees out in the spring, the last week in March or the first week in April, and we look them over, help the weak ones, feed the hungry before the rush of the spring work begins; and then again in two or three weeks, but they don't seem to need much care till they begin to swarm, the last of May. By that time the spring planting is well out of the way; chickens hatched, and almost able to take care of themselves. The busiest time with bees is right in hoeing time, but we find we can be leaving hoeing a little while at any time.

I should think there would be a conflict between bees and strawberries, but we have had only a few strawberries since we kept bees. We can manage the haying all right, and the raspberries and currants, and the worst trouble with the bees is over before the plums and apples are ripe.

The earliest blossoms our bees find are such as willow, tag-alder, soft-maple, and box-elder. There is an abundance of these trees, and they give the bees a good start. Soon after the tassel-flowers are gone, the plum blossoms appear, and wild cherry, and apple, and dandelions. We have the largest, finest dandelions in the world, and they blossom by spells all summer. We don't get much nice honey from the early blossoms, but we have had a little that was very fine. I should think the honey from the apple-blossoms would be very nice, and it may be when alone, but plum and cherry honey seems to taste more of the bark than of the blossoms.

We would like to get through swarming in time for white clover, but we don't, for they keep on swarming through June and July, and a few in August, and sometimes in September.

We have tried artificial swarming of bees only a few times, but have had very good success when we have tried it, and it might save a good deal of work.

One swarm came out August 6, 1900, and filled the new hive and stored 23 pounds of surplus. Once in a while a swarm comes out in September and builds up well, and goes into winter quarters in good shape.

White clover is very plentiful in our section, in the roadsides, pastures, and unused corners, but I suppose our very best honey-plant for rushing is the basswood.

About a week or ten days after our basswoods blossom, they begin to blossom on the shore of Mille Lacs, about a mile away. So, in a good year, we have a long basswood season. The bees work hard on the corn and catnip. There is not much buckwheat raised near our home, though I think it pays to have a few small patches near the hen-house. Then the bees can gather the honey, and the poultry will harvest the buckwheat. It would piece out nicely between basswood and goldenrod, for the alsike is uncertain, and blossoms only by spells.

There are lots of wild asters, and we get a great many pounds of bright goldenrod honey, and dandelions blossom till the bees are put away for winter.

We put our bees in the cellar about the last of November, and we have found that a swarm that goes into winter quarters in good shape is pretty sure to be all right in the spring; most of them are rearing brood and have young bees hatching when they leave the cellar.

We keep our bees in the cellar under the house, with the potatoes and other vegetables. We kept the temperature about 38 degrees last winter, and we have had better success at that temperature than warmer. We look at the thermometer every time we go down cellar, and open or close the ventilator to keep it right, and it does not take much time, while the better the cellar is for bees, the better it is for the vegetables and apples.

We got our first three swarms of bees four years ago; and we don't know of any in the county before that. Now we have 36 colonies, and about half of our neighbors have from two to five colonies.

We sell more than half of our honey at home, and the rest in Aitkin. I believe the extracted honey sells best, but it all sells readily at 12½ to 15 cents a pound. It is very seldom that a neighbor comes in without inquiring about the welfare of the bees, and the prospect for honey, even if there is not time to ask about the corn crop, or the melons or apples.

Whatever helps to make this world and humanity better and sweeter is always a blessing. We always love and appreciate anything that is sweet, and it seems to be the duty of the bee to search out and gather sweets that would otherwise be unnoticed and wasted, just as it is the duty of every human being to search out and remember the mercies and blessings so abundantly bestowed by our Heavenly Father. —Read at the Minnesota State Convention.

Aitkin Co., Minn.

ALICE HAZELTON.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### BEEWAX-EXPERIMENTS.

The Texas wax-experiments, page 564, told us what we already knew, for the main, that the percent of dirt in a comb increases with age. Like a spoiled child, I'm going to cry for what they didn't tell us. I want to know whether the *total amount* of wax in a comb doth with age increase, decrease, or remain stationary. If they had told us that it would have been something like. Until we find out that it isn't so, we naturally suppose virgin comb to be all wax. 'Spects that lots of the brethren still need to be informed. Texas finds that virgin comb has 88 percent of wax. But they used foundation in their virgin comb; and I incline to protest pretty loudly against such hybrid virginity.

### EXPERIMENTS WITH HIVE-COVERS.

That any well-made cover with a shade-board added protects better than a complicated cover alone, is a conclusion of value—and a conclusion that seems reasonable, also. They didn't find out exactly how much heat went through each individual cover in a *given time*. That's quite an important item. Perhaps you don't get my idea. Like this: Two tubs each has a small leak; but one small leak is only half as large as the other small leak. Sink these two tubs half down in water, for it to leak in, and *let them alone long enough*, and you'll fail to find out any difference in the leaks. Water will rise nearly to level in both. Similarly in these left-all-day empty hives, temperature finally got to

nearly the same level in most of them; but I fear the circumstance is misleading. Suppose they try next time how much ice melts in each chamber in one hour. Page 564.

### HYBRIDS OF PLANTS AND ANIMALS.

An incorrect statement, on page 566, needs spotting. Very true (and an important "very true"), that animals, and plants also, have two diverse kinds of hybrids, according to *which way* the cross is made. Not altogether unreasonable to say that neither is the true hybrid, if the lack could be remedied readily—as it can not. Mr. Newell's true hybrid is not a true hybrid, either. The same cause of diversity, only in much less degree, remains. C—I x I—C must not be expected to be exactly the same as I—C x C—I.

### NUMBER OF BEES USED UP IN A POUND OF HONEY.

Dr. Miller's estimate of 500 bees spent for a pound of honey is good as a starter—with the admission that they sometimes get much more. On similar lines I'll proceed to say, the bees of a summer may total 100,000. If all are spent, so as to average the rate named, it will be 200 pounds. A good many of us do not get so much as the surplus off a 200-pound income. Page 568.

### OUT-APIARIES AND BRUSHED SWARMS.

Stachelhausen, it seems, has run an out-apiary 11 years by brushing swarms a little in advance of Nature. Still thinks the method one of the best, but finds a great deal depends upon locality and circumstances.

And when he has a virgin queen in a hive and wants her killed, he can attain that, nine times out of ten, by a simple temporary shifting of hives near the close of the day—getting in a good lot of field-bees from a colony with a laying queen. The sweeping success of this, in Stachelhausen's hands, surprises me. Perhaps he only expects it of rather weak colonies. Page 580.

### SWARMING AND NECTAR-GATHERING.

A. E. Hooker, on page 582, seems to have my experiences pretty frequently. Not sure to escape swarming when the flowers fail for a spell to yield nectar. And the dictum of 8 or 9 days between prime swarm and after-swarm wholly unreliable. He finds more cases less than 8 days than I do. The average with my bees is more—in many individual cases much more.

In caging queens to prevent swarming, if the bees swarm precipitately when their queen is released, that looks to me like pretty good evidence that they were thinking about swarming more than about honey-storing before—*i. e.*, not doing their best.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### On the Mercy of the Court.

This is to be an apology, but I'd like to offer a prize for a form of words adequate to the occasion. Some of the questions answered in this number should have been answered long ago, but were buried under a mass of letters and papers where they slept until now resurrected to haunt me like accusing ghosts. To say I regret the delay doesn't at all meet the case. If I should burn the letters in hopes that the writers would think Uncle Sam had lost them, it would hardly help matters, for I'd rather stand all the reproaches that may be heaped upon me than to hear the lashings of a conscience constantly reminding me that I am a liar and a sneak. I'd like to promise that I'll never do it again; but I don't dare to. I don't know but I may. The trouble is, that I'm so crowded I don't do things as methodically as I should. I'm told I ought to give up some of the things I'm doing, but which? Some of them I hardly *can* give up, some of them I don't like to, and some of them I won't.

All I can do in the present case is to throw myself on the mercy of the court, and although not deserving it, still to ask forgiveness.

C. C. MILLER.

[We feel sure all who may have been unintentionally neglected will be glad to accept Dr. Miller's humble apology. We know he is a very busy man, and trying to keep up with his work as best he can. We can sympathize fully with him, as for years we have had altogether

too much to do in order to do some things in as good a manner as they should be done.—EDITOR.]

### Three or Five Banded Bees.

I want to Italianize all of my bees, and rear the most of the queens. Which would you buy to start with, those with three or with five bands? MISSOURI.

ANSWER.—Hard to tell. The best of either kind is better than the average of the other. Taking them as they average in general, very likely you will do as well with three-banders.

### Spider-Plant, Blue Thistle and Alfalfa.

I notice in reading "A B C of Bee-Culture" that there is a plant called spider-plant. Will it grow here? Where can I get some seed. What time in the year should it be planted?

Will the blue thistle grow here? Also alfalfa? Where can I get it? I have tried and failed. NORTH CAROLINA.

ANSWERS.—1. The spider-plant will probably grow with you if sown in the spring, but you will hardly find it worth the trouble. You can get seed from the A. I. Root Co.

Blue thistle will likely succeed with you, but not alfalfa.

### Keeping Bears Out of the Apiary.

I intend to start an out-apiary at a place infested by bears. As you have seen and spoken of California bee-keepers lately, perhaps you could inform me how they keep them out of the yards. OREGON.

ANSWER.—I don't remember to have seen any special means mentioned to prevent the encroachments of bears except in one case. If I remember correctly, in that case the hives were up in a tree, and a platform was built about the tree a few feet above the ground. Of course, a bear could not pass the platform; but such a plan would hardly be practicable on a large scale. If any of the constituency have any means of prevention to offer, I yield the floor.

### Cost of Bee-Supplies—Mating Queens—Starting with Bees.

1. What would be the expenses, per pound or per colony, for supplies for an apiary of say 100 colonies, producing 45 pounds of extracted honey or 30 pounds of comb honey per colony?

2. What is the average life of a dovetailed Langstroth hive, with reasonable care?

3. Can queen-bees be shipped by mail with safety across the continent? Are they so shipped?

4. How many colonies would you advise a man to start with who intends to devote his whole time to bee-keeping? CALIFORNIA.

ANSWERS.—1. If the extracted honey is put in 60-pound cans, it will cost for cans by the quantity about  $\frac{1}{8}$  of a cent for each pound of honey. For comb honey, sections and foundation will cost about a cent a pound.

2. Varies with climates and seasons. At a rough estimate, 25 years.

3. Yes.

4. As a general rule, a man will do well to begin the first year with 2 colonies, although special conditions might make it advisable to vary greatly from that.

### Fence Separators or Solid Ones.

Will the bees work better and quicker in sections with fence separators than the old-style solid ones? OHIO.

ANSWER.—It will make no difference.

### Uniting Bees—Wintering—Feeding Glucose.

I had a small swarm of bees to issue, which I decided to unite with a weak colony I had in my yard. I raised the cover and blew smoke over the frames and in at the hive-entrance of the weak colony. I then snook the bees of the swarm off the limb in front of the entrance. They entered the hive nicely, but the bees of the weak colony fought with such fury that they killed half of the bees of the swarm in a few minutes. Some of the bees of the swarm left the hive and entered the hive of a strong colony that stood near, and were welcomed by the bees of the strong colony.

1. Why did the bees of the weak colony fight those of the swarm? And why were they welcomed by the bees of the strong colony?

2. I notice yellow-jackets entering some of my hives. Do you think they are doing mischief? The bees do not seem to notice them. 3. I have been wintering my bees with a super filled with chaff next to the brood-chamber. Is this a good practice? Should there be a cloth placed over the brood-frames under the chaff super? 4. Is glucose fit to feed bees for winter stores? VIRGINIA.

ANSWERS.—1. I don't know, but I'll make something of a guess. A weak colony, as well as a strong one, may resent the intrusion of

strangers, the case being worse if the weak colony has a laying queen and the intruding swarm has a virgin. The manner of their entrance has something to do with their reception. When the swarm attempted to enter the hive of the weak colony, the bees probably marched in with a bold air, as who should say, "We have as good a right here as you, and we're coming in;" and the bees of the colony said, "We'll see about that." But the bees that went to the neighboring strong colony went as supplicants, and stood at the entrance fawning, as if to say, "Please let us in, we've lost our home, but if you'll let us in we'll work all the rest of our lives for you, just as if born here."

2. They're probably after honey, and are not likely to get off scot-free for long.

3. It's all right if the chaff doesn't sift down among the brood-combs; the cloth will prevent that.

4. No, no; glucose is not a fit thing to feed bees at any time or under any circumstances.

### "Rosemary Cure" for Foul Brood.

During the past year I have seen several articles in the American Bee Journal concerning the "rosemary cure" for foul brood. Is it a sure cure for the scourge? Do the fumes of it do the work? PENNSYLVANIA.

ANSWER.—I don't know, but I have no faith in it.

### Shallow Extracting-Frames—Cause of Balling Queens.

1. Do you use the shallow extracting frames, or don't you produce any extracted honey?

2. What do you think of frames  $5\frac{3}{8}$  inches deep for extracting?

3. On page 526, I notice an article which seems to explain the mystery of queenless colonies in the spring. Rough handling or jarring, he said, in early spring would cause the queen to be balled or killed. May this not be an explanation, or do you think there is anything in the idea? MICHIGAN.

ANSWERS.—1. I work only for comb honey.

2. The shallow frames are probably quite a little better for extracting; but the advantage is offset to some extent by the fact that frames can not be used interchangeably in either story. Yet the advantage of having clean frames that are used only for extracting turns the scales with some in favor of the shallow frames.

3. I have never supposed that loss of queens in my case could be traced to rough handling, but it is possible that there is more in it than I have supposed.

### Using Foul-Broody Hives.

Is it safe to use hives which had foul brood in them? These hives had foul brood in them three years ago; they were thoroughly cleaned and left on the stands ever since. How long is it known to stay in the frames in hives after it has once been there? WISCONSIN.

ANSWER.—Time can hardly be considered a factor in the problem, for foul-brood spores are very long-lived, lasting, no one knows, how long; but good authorities say that hives which have contained foul brood can be used at any time without disinfecting.

### Foul Brood Inspector—Introducing Queens.

1. Is there a foul brood inspector for Indiana? I had lots of dead brood in my hives last spring, and I do not know whether it is foul brood or chilled brood, or some thing else. I introduced several queens in May, and had to shake the bees from the combs to find the old queens, and may have chilled the brood while doing so.

I am a beginner, and my bees are blacks. I had 17 colonies and wanted to Italianize them, and bought 7 Italian queens; they are all dead but one.

2. How soon after introducing a queen is it safe to open the hive to see if she is all right? INDIANA.

ANSWERS.—1. I know of no foul brood inspector in Indiana.

2. It is a little safer not to disturb the colony for three or four days.

### Transferring Bees—Comb Honey or Extracted?

This has been a poor season for bees. I am trying to improve my stock all through. I have almost a non-swarming strain of bees, as I had only 4 swarms out of 25 colonies, and my bees have always stored honey. I have had from 50 to 205 pounds of comb honey in one-pound sections, but this year I have not had so much.

My hives are going down, and I will have to put the bees in new hives. I use the 8 framed dovetail live, but my old hives are hume-made; I bought them as they are, and the combs are so crooked and jammed up I can not get into the brood.

1. Would it be best to transfer in the spring, or wait until swarming-time and shake them and put a wire-cloth between the new and the old hives until the brood all hatches out, and then melt up the old combs?

2. Which would pay the best, to run for comb or extracted honey? We get 10 cents for comb and from 6 to 8 cents for extracted, and the

vessels cost a good deal to hold it. I have a home market for all I can get at these prices.

3. Which would pay the best to sell, comb at 10 cents here, or ship it to St. Louis and get 12 to 13 cents? The freight would be \$1.25 per 100 pounds, and then the breakage and commission are to come out.

ARKANSAS.

ANSWERS.—1. Better wait till swarming-time, but in putting the brood over wire-cloth, be sure to have at least a small entrance to the upper story, so the bees shall not be imprisoned there.

2. It is hardly wise for an outsider to attempt to answer questions of this kind. You see it isn't merely a matter of dollars and cents. Location has something to do with it, and the man has much to do with it. Taking the figures alone as you give them, it's a toss-up which is best.

3. Very likely there is more net money in the home market.

**FROM MANY FIELDS**

**Honey Crop Nearly all Sold.**

My honey crop is nearly all sold. I had 15 barrels, and have 2 left. It was sold at 8 cents a pound. I hope next year will be as good as this.

JAMES GROVER.

Brown Co., Ill., Oct. 8.

**From an Old Bee-Keeper.**

I have taken the American Bee Journal over 30 years, and have been handling bees for over 60 years, but I have been in the bee-business 40 years. I am just past 72 years old, and this year I have taken 13 tons of honey from 140 colonies, all extracted. The bees are all through and have gone to rest. I will begin to rear queens in January.

I have had bees near Lake Michigan, at South Haven. Perhaps you saw some of my specimens at the World's Fair, a bee-hive with a young ostrich on the top of it, and honey in ostrich egg-shells, and a good many other things.

I have had bees here for over 30 years, and a big lot of them at a time. Dr. J. ARCHER. Santa Barbara Co., Calif., Oct. 7.

**Report for the Season.**

My 40 colonies of bees stored 177 gallons of extracted honey and 499 sections of comb honey.

GEORGE S. CRONE.

Schuyler Co., Ill., Oct. 13.

**Bee-Keeping in Wisconsin.**

Last Tuesday, Oct. 6 I bought Mr. Albert Armes' bee-yard, apparatus and good-will. The yard is 9 miles north of Escobedo, and has 130 colonies of bees. I have 114 colonies in my apiary at home.

The past season Mr. Armes took off 16 barrels, of 350 pounds each, of extracted honey, starting in the spring with 100 colonies. I took off 12 barrels, starting the season with 60 colonies; I took honey from only 80 colonies, 10 were transferred and gave no surplus. There are 225 colonies of bees in our city—too many.

We look for a good season next year, if it is good weather. Our basswood bloom was killed by late freezing last spring.

Grant Co., Wis., Oct. 10. L. G. BLAIR.

**Amount of Water Absorbed by Honey.**

In "Editorial Comments," page 627, I find this: "Good honey contains in the neighborhood of 1-6 of its weight of water, in a moisture-laden atmosphere it may attract to itself so much moisture as to be nearly half water." Now we will take, for instance, a barrel of 1000 pounds of good honey with the bung-hole left open, said barrel being stored in a moisture-laden atmosphere. It would draw out itself the difference between  $\frac{1}{6}$  and 1-6, or which is  $\frac{5}{6}$ , of 1000 pounds is 833 $\frac{1}{3}$  pounds; the total honey and water in the barrel would then be 1333 $\frac{1}{3}$  pounds, would it? Of course,

**Sulphuric Acid for Cleansing Beeswax.**

What kind of acid is used to clean beeswax? I had about 20 pounds of nice wax, for which I have a local trade here, and I put it into a wash-boiler with clean water to clean it still further. After it wasn't clean I put it into a porcelain-lined kettle and cooked the water out, and now it is too dark for my trade. What can I do with it from the comb to the present state it has been in new vessels only, and no chance for coloring from vessels.

PENNSYLVANIA.

ANSWER.—The acid used is sulphuric, one part in 100 or 200—in severe cases one part in 50—being added to the heated mass. If that doesn't clear it probably nothing will. It is said by and cooked the water out, and now it is too dark for my trade. What can I do with it from the comb to the present state it has been in new vessels only, and no chance for coloring from vessels.

# Personal Testimonials

### We will send to every reader of the American Bee Journal

a full-sized ONE-DOLLAR package of VITÆ-ORE, by mail, POSTPAID, sufficient for one month's treatment, to be paid for within one month's time after receipt, if the receiver can truthfully say that its use has done him or her more good than all the drugs and doses of quacks or good doctors or patent medicines he or she has ever used. Read this over again carefully and understand that we ask our pay only when it has done you good, and not before. We take all the risk; you have nothing to lose. If it does not benefit you, you pay us nothing. VITÆ-ORE is a natural, hard, adamantine, rock-like substance—mineral—ORE—mined from the ground like gold and silver and requires about twenty years for oxidation. It contains FREE IRON, FREE SULPHUR AND MAGNESIUM, and one package will equal in medicinal strength and curative value 800 gallons of the most powerful, efficacious mineral water drunk fresh at the springs. It is a geological discovery, to which there is nothing added or taken from. It is the marvel of the century for curing such diseases as Rheumatism, Bright's Diseases, Dropsy, Blood Poisoning, Heart Trouble, Catarrh and Throat Affections, Liver, Kidney and Bladder Ailments, Stomach and Female Disorders, LaGrippe and Malarial Fever, Nervous Prostration and General Debility, as thousands testify, and as no one, answering this, writing for a package, will deny after using. VITÆ-ORE will do the same for you, as it has done for hundreds of other readers of this paper who have accepted this offer and MADE NATURE THEIR DOCTOR, if you will give it a trial, which none should hesitate to do on this liberal offer. SEND FOR A \$1.00 PACKAGE AT OUR RISK. You have nothing to lose if the medicine does not benefit you. WE WANT NO ONE'S MONEY WHOM VITÆ-ORE DOES NOT BENEFIT. Can anything be more fair? One package is usually sufficient to cure ordinary cases; two or three for chronic, obstinate cases. Investigation will hear out our statement that we MEAN JUST WHAT WE SAY in this announcement and will do just as we agree. Write TO-DAY for a package at our risk and expense, giving your age and ailments so we can give you special directions for treatment, if same be necessary, and mention this paper, so we may know that you are entitled to this liberal offer.

#### OWES HIS LIFE TO VITÆ-ORE.

Suffered for Years with Kidney, Heart, Stomach and Rheumatic Troubles — Made a Well Man Again by Vitæ-Ore.

COVINA, CAL.—I owe to Vitæ-Ore that I am alive to-day. For eight years I have suffered from KIDNEY TROUBLE, called by different names according to the whim of the doctor treating me, and I can honestly say that I never knew a well day. I became so bloated and fat that it was burdensome to me to make any exertion and a continual pain about my HEART never left me. It was impossible for me to lie on my left side, and sometimes I could not lie down at all. In addition to this I was tortured with RHEUMATIC PAINS, and even my DIGESTIVE ORGANS WERE

DISORDERED, acute attacks of cramps and neuralgic pains of the stomach being so severe as to threaten death. Four years ago I was attacked with typhoid fever and two doctors attended me. They broke the fever and treated me for other troubles, but I became weaker and weaker and every one thought I past recovery. My sister would not give up hope, but persuaded me to try VITÆ-ORE. She and my wife said if I would swallow a few doses I would find myself improved; if I did not they would cease trying me. I began taking it, and the result which they predicted came about. I began to improve at once and became in the course of a few weeks a well man and have continued so ever since. I am able to do the hardest kind of manual labor. My heart never gives me any uneasiness, and my cramps, pains and fat

are things of the past.

I could write as much more about the wonderful cure it effected, used as a gargle and swab in a case of VIRULENT DIPHTHERIA. The case was our only child and he is alive and well, while many others died who were treated by doctors. I cannot sufficiently praise VITÆ-ORE, and only wish I could reach all sufferers with a message of health and happiness. A. T. SIGMUND.

#### CURED OF SYSTEMATIC CATARRH.

E. B. Coleman, of Beecher City, Ill., Tells the Public of His Cure.

Every Organ Was Affected—Dortored for Three Years With No Benefit—Grew Worse from Day to Day—Better After One Week's Use of Vitæ-Ore and is Now Cured.

BEECHER CITY, ILL.—To the public, in general, I wish to say that I can not praise Vitæ-Ore enough, as I am positive that this remedy saved my life when all other medicines and doctors failed. For the last three years I have been a great sufferer from SYSTEMATIC CATARRH, so badly that it affected every organ within me and every one was expecting me to die. I had given up all hopes of ever seeing the spring-time come again. Though I had two of the best doctors here attending me I grew steadily worse.

I was confined to the house and my bed during all of last winter and during the month of February gave up all hope, as did my friends and relatives. Through the generosity of Mr. Theo. Noel, I began the use of Vitæ-Ore on the 1st of March, 1901, and BEGAN TO IMPROVE IMMEDIATELY DURING THE FIRST WEEK. As soon as I got it I dismissed the doctors, as I thought I had to die anyhow, not having much faith or hope for a cure. In a week's time I was out of bed and around the house and steadily improved from day to day. The enclosed picture was taken the first of May, but two months after I began the use of V-O.

I consider it a God-send to poor afflicted people if they only give it a fair trial and test its merits as I have done. Myself and young son cut and put up 300 shocks of corn during the fall, besides doing lots of hard work, and I am the same man that thought the spring of the year would find me in my grave. You can proclaim with me that it is the best remedy on earth for the afflicted, and I will be glad to tell all what Vitæ-Ore has done for me.

E. B. W. COLEMAN.

This offer will challenge the attention and consideration and afterward the gratitude, of every living person who desires better health or who suffers pains, ills and diseases which have defied the medical world and grown worse with age. We care not for your skepticism, but ask only your investigation and at our expense, regardless of what ills you have, by sending to us for a package on trial. In answer to this, address

THEO. NOEL COMPANY, J. P. Dept., Vitæ-Ore Building, Chicago, Ill.

**Please Mention the Bee Journal when writing Advertisers \*\*\*\*\***

you would have to stretch the barrel in order to hold it all; in fact, water being lighter than honey you would have very nearly two barrels, would you not? Could you not afford to sell it cheaper either by the barrel or by the pound? Did you ever try this? If so, did said honey absolutely refuse to take on any more water when this point was reached? Could this properly be called "watered stock" among bee-keepers? I have heard it said you could lead a horse to water, but you could not make it drink; but this seems as if you can make a barrel of honey drink without rolling it to water.

To-day it is raining. If this moist weather continues how many more barrels would it take to hold the out-put of extracted honey?

It is said there is no ill-wind but what blows some one good. The barrel manufacturers will be strictly "in it," won't they?  
**Knox Co., Ill., Oct. 10. J. E. JOHNSON.**

[It looks as if the experiment of watering that honey had been made in a dry time, and the water poured into the honey so slowly that some 300 pounds of it must have evaporated in the process. For if 1-6 of the 1000 pounds was water, and that 1-6 were taken out, there would be left 5-6 of the 1000 pounds, or 833 pounds of waterless honey. If now that 833 pounds becomes half water, it must take to itself 833 pounds of water, and thus become 1666 pounds of dilute honey, instead of 1333. Under such circumstances the honey might refuse to become more than half water, but under favorable circumstances there would be no such limit.—EDITOR.]

### Northeastern Wisconsin Convention.

The Northeastern Wisconsin Bee-keepers' Association met in convention in Mishicot, Oct. 8, 1903.

Owing to very unfavorable weather conditions, the meeting was not largely attended. The afternoon session, however, proved more successful and some important topics were quite extensively discussed; among which was, "The cause of miscellaneous laying of drone and worker eggs in the same comb," the subject being introduced by Mr. Coehms.

The date of the next meeting is Oct. 28, and as it is to be an important meeting, a large attendance is urged.

The election of officers will be held, and State Inspector France will address the meeting on the subject, "Advantages of Belonging to Bee-keepers' Associations, and Attending Their Conventions."

Measures will also be taken to unite the local society with the State and National Associations. **DR. J. B. RICK, Sec.**  
Manitowoc Co., Wis., Oct. 13.

### Honey Used in Cuba.

We find honey is used here for its remedial properties much more than it is in the United States, being sold in considerable quantities from all drug-stores, besides being employed in many home remedies for both man and beast. **GLEN E. MOR.**

Cuba, W. I.

### A Correction—Cost of Bee-Supplies.

Will you kindly correct the mistake in my letter in regard to the number of swarms cast on the same day. Instead of 115 it should have read 15; and from the fact I gave the number of colonies I was handling, it must have shown a mistake. (See page 526.)

I am much obliged to Mr. Hasty for bringing the same to my attention. Had I noticed the error I should have hastened to correct it, as I am not a descendent of the Baron Munchausen, who, most of our readers will remember, was the greatest pretentious liar of his time. If I had not been so fond of reading Mr. Hasty's Afterthoughts, I should never have known how I had committed myself. As Mr. Hasty seems to think my mistake may have been due to that single-blessedness bread, if

he will kindly assist us in removing the cause, we will try not to let the mistake occur again.

Will some brother tell us why, with the present price of honey, both comb and extracted, certain manufacturers see cause to advance the price of bee-supplies to the extent they have? I am a consumer of their goods, and find them of excellent quality, but when No. 2 sections at the factory get to be worth \$4.50, and No. 1 \$5.00, and there is always more or less waste of sections, it puts the consumer of bee-supplies to thinking.

W. S. BEVELLIN.

Delta Co., Colo., Oct. 12.

### An Appreciative Reader.

The instructions in the American Bee Journal are of great value to me. I take great interest in bees. I have made them a study and my business. I commenced to study about bees, and the work of obtaining the best possible results from them, when quite young.

When but 10 years of age my parents had bees, and I would often have to help with them; ever since then I have had bees and always loved to work with them, but I never had any literature on the subject, so when I came across the American Bee Journal, I was determined to have it, and would recommend it to each and every one interested in bees. After reading it a year, and also Prof. Cook's "Manual," I have learned to make bee-keeping a money-making business, to say nothing about the great pleasure obtained from the work.

I wish to express my thanks to each and every one connected with the American Bee Journal, for the information given to the lovers of bees; and also to "Our Bee-Keeping Sisters," for the good articles they furnish the Journal. They, with all our writers and lovers of bees, have my best wishes for success in the work.

Barry Co., Mo., Oct. 12. A. G. ERICKSON.

### Cutting Foundation with Electric Wire.

Did any of the brethren ever try to cut super foundation by electricity? I mean with a wire-embedding outfit. Tie a No. 30 tinned wire between two prongs; pile up the foundation from 2 to 20, or even 30, sheets in a pile; now switch on the current and saw the heated wire through the foundation. Of course, it is best to use a box with saw-kerfs the right distance apart for the wire to follow through the wax. It is true this way has its drawback, but I think it as good as any.

HANS CHRISTENSEN.

Skagit Co., Wash.

### CONVENTION NOTICES.

Connecticut.—The Connecticut Bee-Keepers' Association will hold their fall meeting in the Capitol at Hartford, on Nov. 4. All bee-keepers are cordially invited to attend. For full information, write the Secretary.

Mrs. S. EDWIN E. SMITH, Sec.  
Watertown, Conn.

Jeffersonian Simplicity.—Thos. Jefferson, third president of these United States, was skeptical of the science of medicine, believing in permitting nature to re-establish order in the system when any function was deranged, and discussed the subject frequently, with the same interest and earnestness that he did theology and politics.

"I believe," he said, "that there are certain substances by which, applied to the living body, either internally or externally or both, nature can be assisted, and by such assistance accomplish in a short time what nature otherwise would do slowly."

The Vitæ Ore remedy, with which the readers of this publication are largely familiar, is offered by its discoverer and proprietors as an aid to nature, to assist in the natural healing and recuperating processes. It is itself a product of nature, a geological discovery, mined from the ground as are gold and silver, different from anything which has ever been offered of a remedial character, and as such should commend itself to even those most prejudiced against the use of advertised treatments. It contains in its composition free iron, sulphur and magnesium, elements ideally calculated, to, as Jefferson says, "assist nature." The fair and liberal offer to send one month's treatment on trial, made in these columns by the proprietors (The Vitæ Ore Co., Chicago), is certainly most deserving of consideration. Please mention the American Bee Journal when writing.

## Langstroth on "The Honey-Bee"

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

### GEORGE W. YORK & CO.

### What Yon Yonson Thinks

As lak to tell Mister Buttlar det if any body shud want to ask you det da don't vos work to cross dom golden. Italians ma da lantern-bugs caus der quedes he vos fraid in da dark, an dom bugs don't vos can be found in da day time. But if he vil yust feed da lite colored bees ma 'lectric blitters, mebbey dom git 'lectric lights. But don't be surprised if you yake up some morning and find yours bees all vil yarmad and took der hives all vil dom. Den vat? My goodness, you don't vos be hav half da trouble to furnish yours nabors vil supplies lak Yon Yonson had.

Yon day ven ay vos so bissy to pick strawberries and svaru da bees, and put up boxes and foundation for da bees dat ay don't hardly hav time to rides, eat or sleep. It vas feller 7 miles away vat called me up on da fone, an he say he yust got a awful big svaru of bees, an he vont ay shal com and hive dom for hiiu, and be sure an bring von of dom patent hives.

"Ver you got dom?" ay say. "O dom is in da top of a big hedge fence," he say. "Dom is da big Italian bees, an dom is awful tame," he say.

"Vot color is dom?" ay say. "O dom is great, big black fellers," he say. "Vel," ay say, "ay don't got time to hive my own bees hardly, and ay don't got any extra hives to spare, an ay don't vos peddling bee hives now. So its better you send to Chicago for hives, lak Yon Yonson du, or put dom in a box."

An now he say dat his old friend Yon Yonson vent back on him. Vell, ay lak friends, but ay don't lak dom quivite so friendly.

Now, he vont ay shal transfer dom, but if he tank it is a pickenik to transfer dom big, bigk Italians, den I guess vil be lone at da pickenik; caus if ay help von, den ay half to help a dusen odder fellers.

As vont to say to Tom Carver and da odder fisherman, if dom vont to ketch lots of fish dom vont to git up early in da morning, yust vent da haycocks begin to crow. An to dat nice little girl vas is namo Miss Able, vot is com to usars, and in I keep bees so good, an lak to read da Merican Bee Journal: dat Dr. Miller don't vos sold der bunny vot bring der mummy vat buy der big grindstone, to grind der ax vot sharpens der sick vot kin ketch Yon Yonson yet. Ay got little boy vot is six years old, an he is a bee-keeper to. He keep yust so fur away from da bees som he can.

Vell, ay goan to tell you bow ay lak da Merican Bee Journal. First, Dr. Miller's department is vorr more as da hole paper cost. Dr. Miller is a plenty good feller, an he yust grind out all kinds of feed for da bee-keepers. Mr. Hasty's afterthot is plenty all right, caus if it is some ting I forgit or overlook he is sure to smell it out and explain. If his forethot is as good som his afterthot den me be purty smart feller; but don't tak any more hop, skip an jump.

It vont be som Big vor in camp if Miss Visson's Department should come up missing even for von veck. Ay tank it is good informing for da brudders as vell as da sisters; but since dat department begun, if Mlaw or da girls git da bee Journal first, den Yon Yonson he yust hav to valt ill dom read vot da sisters got to say. From now on, I will be good, an som times ay find bundles nuff to mak plenty big shock.

Beedom boiled down is all right, but ay guess Mr. New York git da fire little too hot some time, an da kittle go dry, caus some time it turn up missing. Better look out so da kittle don't bust.

On the page is da editorials. Dat is da cowketcher for da "old reliable"; it is good and strong, an can stand bar nocks; but now ay goan to give it som little bump.

On page 467, da editorlist he say dat dom fellers vat always order der supplies late and iss bevine, and don't be nuf supplies, its better dom git a veelborrow vat got handles on der side. Now, if da bee-keeper don't order nuf supplies early enuf, and da supply dealer don't order nuf early enuf, den ay lak

to know who is da behindest. But ay guess it is da bee-keeper, caus he iss da feller vot git left. Ay tank mebbey next year bote order so much dom git so fur ahead dom don't kin find da veelborrow nor hole shooting-nuff.

Vell, my ying, did you ever read vot Yon Yonson tank? You vil find it near da hind end of da Merican Bee Journal. Mr. New York some time put it in fur da engage. It is da bumping-board for da odder bee-papers vot is coming be hind da "old reliable." It iss da only soft spot da "old reliable" got, but da "old reliable" dont vas in any danger of any rear-end collision, caus it iss all ways on time.

Maw, she say if da fool killer should happen to com to our house it is better Yon Yonson run an hide rite strate.

Da Yon Yonson bumping-board is only temperary, an ven da readers git tired of it den it vil be laid in da shade for som new patent engage. YON YONSON.

### "What Happened to Ted"

BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton, the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—60 pages, 5x6 1/2 inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver). Address,

ISABELLE HORTON,  
227 EAST OHIO STREET, CHICAGO, ILL.

Please mention Bee Journal when writing advertisers.

## HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Oct. 7.—The volume of sales are larger than at this time last year, and the supply more than corresponds with sales; but the prices and good quality of honey are expected to make a larger demand than we have had for several years. No. 1 fancy sells at 13@14c, with practically no sale for off grades, which are quoted at 10@12c. Extracted, white, 6@7c; amber, 5@6c, according to quality and kind of package. Beeswax, 2@30c.

R. A. BURNETT & Co.

BUFFALO, N. Y., Oct. 11.—The demand for white comb honey is better than it was. The trade is particular and wants only very white, clean stock. If the wax is yellow from travestin it does not sell well, and price has to be cut. Fancy white comb, 14@15c; A No. 1, 13 1/2@14c; No. 1, 13@13 1/2c; No. 2, 12@12 1/2c; No. 3, 11@12c; No. 1 dark comb, 10@12c; No. 2, 10@11c; White extracted, 6 1/2@7c; amber, 6@6 1/2c; dark, 5 1/2@6c. Beeswax, 2@30c.

W. C. TOWNSEND.

BOSTON, Oct. 8.—Comb honey continues to be in good demand. Fancy white honey in cartons we quote at 18c; No. 1, at 16c; glass-front fancy white, at 17c; No. 1, at 15c. Extracted honey, Florida, 6 1/2@7 1/2c, according to quality. BLAKE, SCOTT & LEE.

CINCINNATI, Oct. 7.—The demand for honey is a little better. The prices rule about the same. Extracted is sold as follows: Amber, in barrels, from 5@5 1/2c; in cans it brings about half cent more; water-white, at 12c; No. 1, 10@11c; white clover, from 6 1/2@7 1/2c. The comb honey market is quite lively and same is sold; Fancy water-white from 14 1/2@15 1/2c. Beeswax, good demand at 30c. C. H. W. WEBER.

ALBANY, N. Y., Oct. 15.—Demand for honey good at 14@16c for white comb; 15c for No. 1; 14@15c for medium; No. 2, 13@14c; No. 3, 13 1/2@14c. Extracted more plenty; Amber, 6@7c; white; 6 1/2@7c for mixed amber; 6@6 1/2c for buckwheat and dark. Beeswax, 2@30c.

H. R. WRIGHT.

KANSAS CITY, Oct. 6.—The demand for comb and extracted honey is good. We quote: Fancy white comb, 24 sections, No. 1, case, 45@48c; 13 1/2@14c. Extracted more plenty; Amber, 6@7c; white; 6 1/2@7c for mixed amber; 6@6 1/2c for buckwheat and dark. Beeswax, 25@30c.

C. C. CLEMONS & Co.

CINCINNATI, Oct. 1.—Comb and extracted honey are coming in freely, and the demand is good with steady prices. We are making sales at the following prices: Amber extracted at 5 1/2@6 1/2c; white clover, 6 1/2@7 1/2c. Fancy comb honey, 15c. Beeswax, 30c.

THE FRED W. MUTH Co.

NEW YORK, Sept. 23.—Comb honey is arriving quite freely now, and is finding ready sale at 15 cents per pound for fancy white, 13@14c for No. 1, and 12c for No. 2 and 2 1/2c for No. 3 and amber. Very little buckwheat on the market as yet, and prices are hardly established.

Extracted honey is ruling about the same as last with plenty of offerings of all grades. Beeswax is somewhat declining and selling at present at from 28@29c per pound.

HILDBERT & SEGELKEN.

SAN FRANCISCO, Sept. 30.—White comb, 1-lb. frames, 13@14 cents; amber, 9@11c. Extracted, white, 6 1/2@7c; light amber, 5 1/2@6c; amber, 5@5 1/2c; dark amber, 4 1/2@5c. Beeswax, mostly to choice, light, 27 1/2@29c; dark, 25@26c.

There have been moderate receipts, mostly representing prior arrival purchases. The market continues to present a firm tone, but is not particularly active, buyers not caring to stock up very heavily at extreme current rates, and finding it exceedingly difficult to obtain noteworthy concessions in their favor.

### WANTED! FANCY COMB HONEY

In no-drip shipping-cases. Also Amber Extracted in barrels or cans. Write for price delivered Cincinnati. The Fred W. Muth Co. 32A1F Front and Walnut, CINCINNATI, OHIO.

## Long Tongues Valuable

South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

ETTO, TEX., Nov. 19, 1902.  
J. P. MOORE.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to roll; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

# Editorial Estimates of Dr. Miller's Book.

AN AUSTRALIAN ESTIMATE.

"Forty Years Among the Bees" is the title of a new bee-book written by Dr. C. C. Miller, in his usual chatty style. Dr. Miller has the knack of making all his writings readable, interesting, and instructive. He has had over 41 years' experience with bees, and sets out to tell the successes and failures he had during that time, special attention being given to failures. Such a book can not fail to interest both professional and novice. The book is illustrated with over 100 half-tone illustrations taken by the Doctor himself, and mostly in his own apiary. I look upon the book as a valuable addition to apicultural literature.

The writer, on looking over the pages, is reminded of the very pleasant and instructive day spent at the Doctor's home about 4½ years ago, when visiting the American States. Many of the illustrations include parts of the apiary and home surroundings which are familiar to him, and it is such pleasant recollections as these that create a desire again to visit the same spot. I would like Dr. Miller to visit our sunny land. He would be welcomed by all the bee-keepers, and especially by myself,—ERROR W. S. PENNER, in the Australian Bee-Keeper.

The American Bee-Keeper contains the following very complimentary paragraph:

Dr. C. C. Miller, the world-renowned apiculturist of Marengo, Ill., whose dominant traits are deep thinking and cheerfulness, has recently published another work on bee-keeping, entitled, "Forty Years Among the Bees." The new volume is a real gem of 328 pages,

beautifully bound in cloth, and handsomely embellished in gold. It is profusely illustrated with half-tone engravings reproduced entirely from photographs taken by the author, and the Doctor's concise style and cheerful vein is maintained throughout. We have to thank Dr. Miller for the privilege of perusing this splendid book, and can heartily commend it to our readers as a most entertaining and instructive treatise.

The Rocky Mountain Bee Journal refers to the book in this kindly manner:

"FORTY YEARS AMONG THE BEES."

This is the title of the latest addition to the book-love of bee-culture, and emanates from Marengo, Ill., bearing the insignia of our genial friend, Dr. C. C. Miller. Through the kindness of the good Doctor we are in possession of an autograph copy of the book.

The book is exactly what its name indicates—a narrative of experiences, the failures and successes of "forty years among the bees." It is a record of actual, daily work, and supplies what most of the text-books fall short of in detail—a description of the *modus operandi* of doing things about an apiary. The book is written in plain, simple language, and does not confuse the student with lights of rhetorical extravaganza. As an accompaniment to any of the standard text-books it will be found invaluable.

Every chapter is permeated with that incomparable philosophy of good cheer that has so distinguished Dr. Miller's life and work. Aside from the main issue we regard this as one of the chief charms of the book.

# Dr. Miller's New Book

Free as a Premium for Sending Two New Subscribers.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S

"FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

## Editorial Comments

### Ignorance About Honey.

An Illinois bee-keeper, several hundred miles from Chicago, shipped a large barrel of honey to one of the big retail grocers in Chicago.

On receipt of the honey, the grocer wrote the shipper that he could not use it; that "it is mixed with comb, and not the same as sample."

The bee-keeper wrote us about it, and asked us to call and see what could be done. We did so. And this is what we found:

The bee-keeper had sent the grocer an advance small sample of the honey in liquid form. He then shipped the barrel of it in granulated form. That was all there was to it.

The grocer told us they had no facilities for reliquefying the honey. He also thought the granulated honey was "mixed with comb!" It really was the very finest grade of white clover extracted honey, granulated. And he is one of the leading retail grocers in Chicago! We think, however, that we convinced him that he was mistaken about the honey being "mixed with comb." But he refused to keep the honey. He didn't buy granulated honey. The sample was liquid, and that was what he wanted! Wasn't it aggravating?

Well, what can be learned by such a transaction? At least this: When selling honey at a distance to anybody but a bee-keeper, ship honey *exactly like sample* shown in advance. Had the sample been granulated Mr. Grocer said he would not have ordered the barrel shipped.

### The Future of Sections.

When basswood becomes too scarce to use for one-piece sections, this will be under consideration. Editor Hutchinson thinks four-piece sections the solution of the problem. He likes four-piece sections, himself, better than one-piece sections, and thinks Editor Root would be surprised to learn how many bee-keepers there are in the country who really prefer them. To this Editor Root replies:

I am well aware that there are a few who prefer four-piece sections, but the number is very small. Although we sell about 15,000,000 one-piece sections annually, we have not had during the past year, and a heavy one at that, orders for more than 100,000 four-piece, and that is mostly for our Eastern trade. We understand the G. B. Lewis Co. has had but a light trade in them, while the W. T. Falconer Co. has a much larger demand than either of us. The four-piece goods seem to have been used quite largely at one time in New York; but the improvements that have been made in recent years in one-piece sections, and in the manner of making them, have almost driven the four-piece goods out of the market.

But for all that, we may have to go back to them, as we may not be able to get enough tough wood to make one-piece boxes to supply the present enormous demand. Between five and ten million feet of basswood is cut every year (this is only a drop in the bucket of the amount used by contractors and furniture-makers), and it would be hard to find any other timber as tough, in sufficient quantities, to take care of this enormous output.

It may be, therefore, that we shall be compelled in the future, say ten years hence, to use four-piece boxes made of some other wood. Or possibly we may have to get up some scheme whereby chunk or bulk honey can be divested of every suggestion of adulteration, so

that the general public in the cities will buy it the same as it would section honey.

However popular bulk honey may become, it will never take the place of section honey with some consumers. The question of four-piece or one-piece does not in the least interest the consumer, and so long as the section is demanded the small difference between the two kinds to the producer will probably make very little difference in the amount of section honey produced.

### Quoting the Honey Market.

From time to time we have received criticisms on the honey and beeswax market column of the American Bee Journal. It seems the quotations on honey are not satisfactory to some of our best and most extensive honey-producers. At least one bee-keeper has suggested that this paper was "in collusion with the commission men" who quote for its market column. But nothing could be further from the truth than that.

If any one has a better way to secure more trustworthy honey market quotations than that now used, we would be very glad to know what it is. We should think that those dealers in the large cities, who are in close touch with the supply and demand, would know best what the ruling prices of honey are, and so ought to be the best able to quote prices.

But it should be remembered that it is hardly possible to quote on honey as on wheat or corn. Honey is not yet a staple article, and so prices are likely to fluctuate more, or to be less stable. There may be a good demand for honey one day, and then practically no demand for several days.

We think we have had sufficient experience in the honey marketing business to have learned a few things—some things that the producers in general can not possibly understand except by having a similar experience. At least it seems some producers do not grasp the situation from printed statements. It is much like learning the management of an apiary—much of it can be secured only in the apiary itself, in actually doing the manipulating.

But, if any one can suggest a more practical way to get honey market quotations, let's hear it.

### Honey-Producers' Associations or Exchanges.

We think that such organizations, which are in the field for the purpose of buying and selling bee-keepers' supplies, honey, etc., should be considered on the same footing as other concerns which are out for business. We see no reason why a bee-paper should be expected to do a lot of free advertising for such associations, and then turn around and charge other concerns for the space they use, when both are simply dealers. We believe in treating all fairly and squarely, and expect to be accorded similar treatment in return. Bee-papers can not exist on air. It takes more than wind to pay for white paper, printers, office rent and office help.

So, if a honey-producers' association is out for business—out to make money for its members—and wants to trade with the readers of bee-papers, such organizations should be willing to use and pay for advertising space in the bee-papers, the same as do other legitimate dealers.

We are heartily in favor of the organization of co-operative honey-producers' associations. We have urged their formation. We have even tried to outline some methods by which we believed they could succeed. But it ought to be clearly understood that a bee-

paper is not a philanthropic institution. Nor is it usually published just for fun. We think most of the bee-paper publishers would like to make a fair profit out of their papers, just the same as the bee-keepers would like to make a little money out of their bees and honey.

We believe this is a subject that none of the existing honey-producers' associations has considered very much. We commend it to them as a fair and legitimate proposition. There may as well be co-operation between the bee-papers and such organizations as anywhere else. Why not? The American Bee Journal does not take a back seat to any apianian publication in its advocacy of co-operative honey-producers' associations, and in doing all it can to help them succeed. But it ought not to be expected to help them to get business and make money unless they are willing to pay their way the same as other firms who do business through advertising.

### Honey Prices Demoralized.

A prominent bee-keeper, not over 100 miles from Chicago, wrote us as follows, Oct. 19:

"I am going to try to get the bee-keepers in this locality to organize an association. Prices have been fearfully demoralized here this season, some bee-keepers rushing their comb honey off, even at 10 cents, when, if they had kept cool, and had done a little thinking, they could have had 14 to 15 cents for it. I have sold a good deal at \$3 75 a case, and made a sale of 35 cases to a firm in Chicago at 14 cents I. o. b. here. If I'm successful in getting the bee-keepers together, I shall try to get them to join the Chicago-Northwestern Association. Also, big money has been lost to them by not having the American Bee Journal to read."

All of which shows that it pays bee-keepers to have membership in an association, and also to subscribe for, and read regularly, at least one of the leading bee-papers. The difference between 10 cents and 14 cents a pound on say 500 pounds of honey, would pay membership dues and subscription for a good many years. Why is it so many bee-keepers can't see this?

It is not only foolish to sell comb honey at 10 cents a pound, but it is also ruinous to any market to do so. We know an Illinois bee-keeper who sold his entire crop of comb honey at 14½ cents a pound, delivered on the cars at his station. And his crop was over 15,000 pounds, too.

It pays to keep informed on the honey markets, and also to develop your own market, if possible, and keep it supplied from year to year.

## Miscellaneous Items

Rev. M. Mahin, of Henry Co., Ind., wrote us Oct. 22, that he was that day celebrating his 79th birthday anniversary, and the 60th of his ordination as a deacon in the Methodist Episcopal Church. On Oct. 31st he and his wife will celebrate the 60th anniversary of their marriage. And may they live yet many more years, and all of them filled with good health and abounding happiness.

Mr. A. I. Root's Convention Talk, on "Reminiscences of Bee-Keeping and Bee-Keepers in the Early Days," which appears in this issue, will be read with great interest and profit by all. Next week, J. S. Harbison, the pioneer bee-keeper of California, will continue on the same subject. These two talks, with a short one by Mr. Corey, occupied the principal part of the second evening session of the Los Angeles convention. They were listened to with rapt attention. We considered it the best session of the whole meeting. While it was mainly historical, it was something that likely could not have been had in any other way, especially the talks by Mr. Harbison and Mr. Corey.

Mr. Thos. Wm. Cowan, editor of the British Bee Journal, than whom there is no better known nor more highly respected bee-keeper in all the world, wrote us as follows, Oct. 6, 1903, from his home in England:

DEAR MR. YORK:—On my return to London I found the American Bee Journal of Aug. 13, last, with my portrait, and the few kind remarks you make. I think it a very good reproduction of the likeness, and thank you; also for your remarks. It is certainly pleasant to find that we have so many friends in different parts of the world. Since we have been in Europe it has been a constant visiting, and we have not yet got through all those visits we have to make. Of course,

some of the pleasantest have been with bee-keepers, both here and on the continent of Europe. It was quite touching to find so many who came long distances to see me again, and to find that an absence of nearly five years had only made the bond of friendship stronger. . . .

I hope you and Mrs. York are quite well. I am sorry that I was not able to attend the Conference at Los Angeles, and hope you had a pleasant time there.

Yours faithfully,

THOS. WM. COWAN.

Of course, Mr. Cowan did not intend that his cordial letter should be given to the public, but we are sure our readers will be glad to see it, and Mr. Cowan will not chide us. He belongs to the universal freedom, but more especially to English and American bee-keepers. He has been "one of us" for the past five years, when living in California, where, from what we have heard and read, he and his good wife simply captured the hearts of the people who came to know them best.

It was very unfortunate for the Los Angeles convention that Mr. Cowan could not have deferred his return to England until after that event. He would have contributed so much to the value and interest of the meeting could he have been present.

**Beeswax in the U. S. and Texas.**—We have received the following correction, which we are glad to publish:

COLLEGE STATION, TEX., Oct. 13, 1903.

EDITOR AMERICAN BEE JOURNAL:—My attention has been called to the comment by Mr. Hasty, on page 656 of the American Bee Journal of Oct. 8, regarding the pounds of wax produced per colony in Texas and the United States. I would say that the figures were taken from the Twelfth United States Census. You will find them on page CCXXXIV, Vol. 5. It is evident that a decimal point has been omitted, and that the figures should read .43 per colony for the United States, and .41 pounds per colony for Texas, etc. It, of course, does not change the relative yield, which was the point I wished to bring out. I prepared the article somewhat hurriedly, and consequently did not notice his rather ludicrous error.

Kindly make this explanation in your Journal, and oblige.

Very truly yours,

E. DWIGHT SANDERSON.

State Entomologist.

**The Illinois State Convention**, as announced on another page, is to be held at Springfield, Nov. 17 and 18. There ought to be a large attendance. Several important matters will come up for discussion and settlement. Now that the State Legislature has granted a fair appropriation to be expended in the interest of bee-keeping in Illinois, the Association should be so wise in its use that when called upon it can make a good report, and thus show the next session of the Legislature that the Association deserves at least a renewal of the appropriation, if not an increase.

Let many of the bee-keepers of Illinois be present at the coming convention. If nothing prevents, we expect to be there, and do what we can to help make it the best meeting of the Illinois State Bee-keepers' Association ever held. Why not every bee-keeper in the State plan to be present, so far as possible? Let there be a general rally of the bee-folks at Springfield, Nov. 17 and 18.

**Walter S. Ponder**, one of our regular advertisers, and an honorable bee-supply dealer in Indianapolis, wrote us Oct. 16:

"This has been the best year for supplies that I have ever known. I would not be surprised if next year would be a still better one."

If Mr. Ponder's prophecy should prove true, it might not be a bad idea for dealers to lay in a good stock of supplies in good time for the rush. We know how it is to be unable to get goods from the manufacturers in such a time. Nothing could be more aggravating to a dealer.

Permit another suggestion: Dealers should keep their advertisements constantly before the bee-keepers. It is a mistake to drop them out for a part of the year. It gives the impression that those who discontinue their advertisements have gone out of the business. And, there are always some bee-keepers who buy their supplies during the winter. Such are more likely to patronize the dealer who keeps his advertisement appearing constantly.

**A California Mountain Fire.**—W. A. Pryal, of Alameda Co., Calif., sends us the following newspaper clipping, dated Oct. 17, at Ventura:

A devastating mountain fire swept over the foothills of the Ojai Valley to-day. It is now raging along the mountain tops. The flames destroyed farm dwellings, irrigation systems, pumping plants, fruit-trees, bees, feed and timber.

All the Northhill stores were closed to-day to all the men to go to the foothills and fight the roaring blaze. Every able fire-fighter was brought into service. The conflagration soon spread in many directions, and the forces were divided.

The fire started near the Casa de Piedra school. It seems that

Miss Elizabeth Smith started a brush-fire near the school, and a strong wind scattered the sparks. Headmaster S. D. Thatcher called out the pupils to prevent damage. This was at 10 o'clock, and before noon Thatcher was compelled to telephone to Postmaster Smith at Northhoff for assistance.

This morning the wind carried the flames to the northwest. Within three hours' time the houses of C. E. Sackett, Edward Senior, and W. J. Davies were destroyed. The latter also lost his pumping plant, water-tanks and outhouses. The barn of James C. Leslie was burned and his house caught fire, but neighbors saved it. He lost many colonies of bees. They would have been saved, but the angry bees drove the firemen away. One man was badly stung.

The fire is still raging, and it is an inspiring spectacle as the flames leap from the timber and brush. The entire damage can not be estimated, but it will run into thousands of dollars.

We suppose those of us who live in a prairie country have no adequate idea of the conflagration that takes place during a mountain fire. It must be something terrible when everything is as dry as it was last August when we were in California. With a strong wind a fire at such a time, and in some places, would be simply irresistible, and would consume all things in its way.

## Convention Proceedings

### THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 680.)

#### SECOND DAY—EVENING SESSION.

After the opening of the evening session a telegram from Wm. A. Selser, of Philadelphia, was read, as follows:

"I send greetings. Wish you a prosperous session."  
WM. A. SELSER.

It was moved and carried that the secretary be instructed to write a recognition of this telegram to Mr. Selser.

Pres. Hutchinson—I have the extreme pleasure of bringing to your notice a name loved in every household throughout the land, Mr. A. I. Root, who will talk to us on

#### REMINISCENCES OF BEE-KEEPING AND BEE-KEEPERS IN THE EARLY DAYS.

It is a great pleasure to meet you all, friends, and it will be a great pleasure to me to tell you some of the things that happened in regard to bee-culture perhaps before many of you were born.

When I was a small boy I took a great notion to ants, bees, insects of all kinds. I wanted a hive of bees, but my good father objected. He said, in the first place, "They would sting the children." I was one of seven, half way between. He chased bees with dogs, guns, and some of those things that you trade for a brush-heap, and then set fire to the brush-heap and burn it up.

When I got married and was boss of a ranch, I said we were going to have some bees. And, by the way, I did not do much good anywhere in this world until I got married. The best investment, I think, I ever made—I don't know that it was my investment—the best investment Mrs. Root ever made, so far as I am concerned, was when she invested in my poor self.

Well, we got some bees, and I set them in a window in a hot day in summer, and the sun got so hot they flew away. Pretty soon I got a colony of an old farmer in a box-hive. Then I began ransacking agricultural papers, etc., to learn all I could about bees. I was a jeweler at that time, and my sister said that every old farmer that came into the store was pumped dry on the subject of bees. I kept that questioning up for about 40 years. I don't know that I have gotten entirely through yet.

Pretty soon I went down to the city of Cleveland and inquired for bee-books. There were only two then. I was very lucky in choosing L. L. Langstroth. I sat up that night

and read the book. I do not suppose any urchin ever read "Robinson Crusoe" with more pleasure and interest than I read that book. I sat up until after midnight, perhaps, and read it over and over again. I found that L. L. Langstroth was still living, and I started a correspondence with him. I found he had only one queen imported from Italy. He did not want to spare her, but would let me have her for \$20. Twenty dollars were not very plenty in those days, but I spent it for "the bug," as the neighbors said.

Of course, I had the colony removed to a frame hive, and went through that awful job of transferring. It made me sweat, you may be sure, but I got the combs into the hives, and I got my Italian queen introduced, but had to take her out four or five times a day to see that she was doing all right! I saw her lay her eggs; saw the larva grow in size. I think I saw the first bee that came out, and contrasted its color with that of the other ones.

You that have been through that know something about the wonderful interest and joy with which I watched the new bees. And the neighbors came around to see the little bees. I remember that our eldest boy, Ernest, whom some of you know, at the time these bees got out for a flight, was, perhaps, two years old. Of course, he was interested in everything that his papa was interested in. Mrs. Root missed him for a while one day. My Italian colony was all around him. She said when she found him the yellow bees were all through his yellow hair so that she could hardly tell which was which! So it was but natural that Ernest should be interested in bees.

I counted up just how many days until the bees should be flying. Then the problem came up, how far they could fly. It was an easy matter then to tell just how far they flew, because there was no such thing anywhere around as yellow bees.

Everything went on prosperously until winter came on. Then the old farmer said, "Mr. Root, there are not bees enough, not a quarter enough, to winter over." I tell you that was sad news. I thought it was a pretty good lot. "No," he said, "they would not winter." I finally bought a larger colony of bees, with which, very triumphantly, I united my colony and made a larger one.

The next spring, from my nucleus, I began rearing queens. I first got a lot of little hives—frames three or

A. I. ROOT.

four inches square. I had them in the garden under the currant bushes. At one time there was a little swarm of bees hanging on nearly every currant bush in the garden.

Pretty soon I learned that there had been a bee-journal published, and I hunted it up. This was the old American Bee Journal of 1861.

Then I commenced a correspondence with Samuel Wagner, which was kept up for several years. Mr. Wagner said the paper had not paid expenses. Then the war came on, and it was dropped. Through my influence, perhaps, as well as other influences, he re-commenced the publication of the American Bee Journal after the war.

There may be some in the room who remember the articles from "Novice" in regard to bee-culture. I think a good many of them were blunders, but gradually "Novice" began to get ahead. After I had had my bees two or three years, I decided to abandon them. I think my first failure was in using an extractor a little too severely, and they had little honey to winter on.

I concluded I would try it once more. I just bent my energies to getting them in good shape. I wintered every one that season. That was a reward for pains and care. Then I made quite a record. I do not remember how much it was.

About that time I heard that over in Germany they had a honey-extractor. I made the remark that an extractor should be made of metal instead of wood. The German machine was a wooden affair. In a little while I had an extractor constructed all of metal, and then put it on the market. I think this was about war times. I got a ton or more of honey, sent it to Cleveland, and obtained 25 cents a pound. Not quite as much as our friend Harbison got for his car-load of California honey. Of course, that made quite a stir.

Mr. Samuel Wagner sent me a piece of comb foundation made of beeswax. That was the first intimation I had of manufactured foundation. I said it should be made on rollers so that we could make it a mile long, if necessary. In due time Mr. Wagner made some rollers.

My jewelry business was very good at that time, if I attended to it, but I was off a good deal of the time experimenting with comb foundation, extractors, etc. I remember Mrs. Root said at one time she wished I would give up the bees. She was very patient and very kind, but we had no place except around the cooking stove, and if I dropped the wax, and happened to set my big foot on it, I tracked it on all of her nice carpets. I stewed and fretted, and things didn't work. Those who make it now perhaps wonder at my failures, but laying the foundation is not altogether plain.

One night I was so discouraged I was about to give it up. My wife begged of me and said, "If you will give it all up I will never say a word, and will never feel badly about it." I did not know but that was the best advice to take, but pretty soon I began to get ahead.

About that time I got hold of Quinby's book, "Mysteries of Bee-Keeping Explained." The first edition was written for the box-hive, and he presented his side of the box-hive so well that I almost thought I would rather be a box-hive bee-keeper.

Mr. Quinby described a tube with a plug at each end, for a smoker.

Then later our good friend Dr. Miller came on to visit me. He was a runner for a music store, or something of that kind. I tried to put him off, but you could not very well hold him off. He suggested to me that possibly rotten wood was a pretty good thing for smoker-fuel; but after I pretty nearly burned up a hive of bees, I did not know so well about it.

At the time of his visit I was interested in bee-hunting. I had hired an old veteran in the business to go along with me, and began excusing myself to the Doctor, and told him I was going bee-hunting. He said he would like to go along. I said, "You will get pretty tired." (He is short you know, and his legs are short.)

Out in the woods I was whistling something. I used to take singing lessons, and I happened to whistle one of my exercises. He said, "That is pretty, isn't it. I composed that." I thought to myself, "What a liar you are." The Doctor did not say anything, but talked it over pleasantly, because he was used to rough knocks. After we got home, he wanted to know if he might look at my curriculum—my music-book. He said, "You thought I was lying." I guess I was honest enough to say I had. He said, "There is the name—Dr. C. C. Miller. That's me." We had a very pleasant time. I have not time to tell you of all the good things about Dr. Miller, but it has been one of the pleasures of my life to count him as my friend. When we get tired talking bees, he can sing.

After that I paid him a visit, and what nice times we had talking of bees and bee-culture.

Before I get through I want to tell you a little story about Langstroth.

But about Samuel Wagner, the old originator of the American Bee Journal: Other journals were started up about this time, Phoenix-like. There was a clashing of journals of the same name, and Mr. Wagner bought out the others. Then H. A. King started the Bee-Keepers' Maga-

zine. Then I invested with him in a patent hive. I sold a few hives, and then went back to the Langstroth frame.

Perhaps I would better explain that I sent to Mr. Langstroth for a frame that was exactly right. I think the frame he sent me was not alike at both ends, or something of that kind.

About this time I began to tell the people that our honey ought to be put up in one-pound packages, and that the bees ought to put it up for us. They laughed at me, and said I had better make the bees do it. I said I would.

When I started out to make that one-pound section I was going to make it  $4\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{1}{2}$ . My first idea was to hang them in a frame that could be hung in the hive—a Langstroth frame, with a very little deviation, could hold four sections one way. Since that time they have been made in different dimensions. Some of the bee-keepers have plead with me to try to have the manufacturers of bee-hives get together, and if they could not do any more, make the frames of one dimension. We are trying very hard to have a system of gauges, to gauge the sizes of our frames and hives, and everything else, so that no matter whether you buy of The A. I. Root Co. or anybody else, every frame will go just right into every hive.

Well, after I burned up a bee-hive by using Dr. Miller's plan (I don't know whether he has ever paid me for that or not), Father Quinby came out with a bee-smoker with a little pair of bellows. Pretty soon afterward our good friend Bingham, of Michigan—quite an expert in bees, who has hives of his own—came out with his smoker, and I had gotten up a smoker about that time. Bingham got his smoker patented. I think one of my eccentric ideas was, about that time, that patents were a nuisance. Bingham thought my smoker an infringement on his, and it seemed a tangled-up matter to know whether he was the original inventor. Finally, I said to him, Mr. Bingham, before going into any suit at law (I never had time in my life for lawsuits very much, and what experience I have had in going to law makes me feel as though we ought to do almost anything else rather than quarrel in that kind of way)—I told Mr. Bingham I would give up; he might have the smoker. He said, "What are you going to do?" I said, "We will buy smokers of you, or do anything else that is right."

Mrs. Root criticised me very severely just then. She said, "You are selling smokers for 50 cents. What are you going to do?" I said, "The kind Father above will help me out." I was trying to do what is right and fair.

About that time John G. Corey invented a smoker on the cold-blast principle, and he mailed it to me with a letter something like this:

"I have gotten up a smoker better than the old one by far, but, after thinking it over, I have concluded I would rather give it to the bee-keepers of the world than to fuss and bother with anything of that kind, and I don't know but what the best thing to do would be to send it to friend A. I. Root."

And so I feel grateful to my friend Corey; as long as I live I shall feel grateful to my friends for their assistance.

Somehow or other I have been "dead set" against tobacco. Not against men that use it, because some men who use it are better men than I am. One day in the apiary one of them lighted a cigar to blow smoke on the bees. I said, "If you will throw that cigar away and promise not to use it any more, I will give you a bee-smoker." Others said, "And will you give me one, too?" and I said, "Yes; but you must promise to pay me for the smoker if you break your promise to quit smoking." I said, "You can have as many smokers as you please, but it must go into Gleanings in Bee-Culture, so that your wives and children will know whether you are keeping your promise or not."

Not long after that I had given away something like 1000 smokers. Ministers of the Gospel took the tobacco pledge and took a smoker. My friends said to me, "Why, you will get swamped! These things cost you so much, and if you keep on giving them away you will get swamped!" I answered, "The good Father above will see me out." Then the daily papers said something like this: "There is a Quaker chap down in Ohio who offers every man, woman, and child a bee-smoker if they will give up tobacco and take a tobacco pledge." That was quoted in a great many papers, and advertised our smokers until we sold 20,000 in one year at 50 cents each—\$10,000! Some said I was long-headed enough to see I was going to make a speculation out of it, but there was nothing of the sort. I am not long-headed at all.

Mr. Wagner died, and W. F. Clarke took hold of the American Bee Journal, and managed it quite ably for some

time. I think while he had it in charge we decided to start a little quarterly.

Our good friend, Thomas G. Newman, who has recently been called to his last home, succeeded Mr. Clarke, and managed the American Bee Journal very ably. We did not realize his value until he was gone. The sorrow that covers a man's grave is oftentimes the poultice that draws out his virtues.

About this time I got acquainted with Prof. Cook. I found him connected with an agricultural college, and while visiting him once we studied the plants and insects along the grounds. He took me over to a man who got up the first chaff-hive. You don't need them here, but they were a grand thing there. It has been my pleasure to have an automobile ride through Michigan, and they told me there that the very best thing to winter bees in is a chaff-hive.

About this time somebody (Mr. Alley, I think) started up queen-bees by mail, and that was getting to be quite a business when some of the boys got careless, and some bees got out and stung the post-office clerks, and Uncle Sam passed a law that no more bees could be sent by mail; but just at the crisis, when we did not know what we ought to do, our good friend, Prof. Cook here, went down to Washington, and succeeded in getting an audience with President Hayes, and the decision was reversed, and we bee-keepers were happy again.

There are lots of things I shall probably overlook which will come to mind after the meeting is over.

Of course, I began to be curious about bees in other parts of the world. We had the best honey-bees on the face of the earth. And then D. A. Jones, of Canada, got the money together to send Frank Benton across to the Old World, where he sometimes had hard work to find a place to stay all night, and had hard work to live in comfort. But we have had a chance to test these different bees. There was a good deal of experimenting about it, and whether the bees are superior or not, we are indebted to D. A. Jones and Frank Benton for giving us the opportunity to try these different bees.

I was going to say something about Italian bees. If our good friend Langstroth were alive he could tell you something about them. Just here I may mention how many things come up now-a-days that are called new inventions. Ernest will come to me and say, "Here is something new." "Why," I say, "that was published perhaps before you were born!" For instance, queen-cells with rows as regular as the teeth of a rake. I think that was given in *Gleanings* in 1878. There was a bee-keeper on a farm who had rows of queen-cells equal along the whole length, made in those wooden cell-cups, just the same thing they are selling now. In "Langstroth on the Honey-Bee" there is something about a bee-keeper attempting to get straight combs in the brood-chamber. I think he mentioned that as a good deal of bother. But he says straight combs, with bees on both sides, are better than money in the bank.

Worker-eggs by mail. A bee-keeper, I think in the old American Bee Journal perhaps, was the first who succeeded in sending worker-eggs by mail and having them hatch queens.

Our good friend Harbison, here, has given us quite a few items in regard to his work in getting the first car-load of bees to the Pacific Coast, and I would like to ask him now to tell us something about the first shipment of bees to California.

Mr. Harbison—My first shipment was 116 colonies.

Mr. Root—Those were Italian bees?

Mr. Harbison—No, native bees, such as we reared in western Pennsylvania at that time.

Mr. Root—And Mr. Harbison has told us that people said to him if he succeeded in getting the bees here there was nothing here for them to work on.

Mr. Harbison—Fortunately, I had been in California—was here in 1854. My first experience was the importation of fruit-trees, of which I imported the first varieties in the Sacramento Valley. That was in 1855 and 1856, and at that time I studied the flora of the country, and conceived the idea of preparing a shipment of bees; sold out my other interests and returned. That was in 1857, in the spring. I prepared the bees and shipped them in the fall of that year.

Mr. Root—Perhaps there are quite a number of other names I should have included in my list here. A long while ago Mr. R. Wilkin paid me a visit, and we had some long talks.

Langstroth and Quinby were pioneers in bee-culture. Mr. Quinby's attention was called to the fact that Lang-

stroth thought he was backward in giving his friend due credit. Langstroth, as perhaps many of you know, had periodic spells of mental depression. When I became acquainted with him he told me about those spells he had. He would go off by himself and would scarcely speak to his own family. Then he would come out of the attacks with a remarkably cool head, and gentle and genial manner.

He paid me a visit after one of those spells, and I had a good many talks with him about it. Sometimes he would get headstrong. One day he got pretty rough, and we pretty nearly had a quarrel. I felt quite sad about it. The next morning he came up to me and said, "Mr. Root, I want to beg your pardon for the way I treated you last night. That has something to do with my malady, and the next time I do that I wish you would come up, put your hand on my shoulder and say, 'There, there, old friend, I guess we had better change the subject.'" We had a good many talks after that, and among others about Quinby. He told me about his invention. "I did so and so, and Mr. Quinby did so and so, and Mr. Quinby was that or the other." It made a pretty long story, and after it was over I thought he was going home in a pretty bad frame of mind.

Mr. Langstroth, as many of you know, was not blessed financially during the latter part of his life, and it used to be customary for our bee-keepers' conventions to make him a donation. He thought the world had hardly given him what he ought to have had. I said to him, "Mr. Langstroth, you and Father Quinby have probably not a great while to live. I would advise you never to go over the matter again as you did with me here, and let it all pass. It is not worth while. Further, I wish you would go and visit Mr. Quinby and have a friendly talk, and let bygones be bygones."

He did not like that sort of logic. I urged the plan. Finally he went to bed. The next morning he did not get up, and I went into his room. He took his watch and handed it to me, saying, "Mr. Root, will you please listen to my watch." I said, "Isn't it all right?" It seems to me to tick regularly," for you know I was a jeweler by trade. He said, "So it says, 'tick, tick, tick' to you, but to me it has been saying, 'Quinby, Quinby, Quinby,' all night long, and I am afraid that watch will keep on saying 'Quinby' until I start down there and shake hands with Father Quinby, and we two make friends!" And he started off. I tell you I felt happy.

In due time he came back and said, "Mr. Root, I have had one of the pleasantest and best visits I ever had in my life. We talked things over, and he didn't find any fault with me, and I did not find any fault with him, and we are going to be friends as long as God lets us live. When I had that talk with him I gave it up without any discouragement. And it seemed to me there was not much use talking."

It is a pretty big job sometimes to make friends in matters of that kind. That lesson comes to me often. There may be some people here to night whose watches, if they do not say "Quinby," may be saying something else, and will continue to say it until they get up and go and do the right thing, as Mr. Langstroth did.

But there are other friends here, and I would be glad to hear from Mr. Harbison. Mr. Corey also is here, and we want to hear from him.

(Continued next week.)

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

**The Premiums** offered this week are well worth working for. Look at them.

## Contributed Articles

### L. L. Langstroth and Bee-Stings.

BY DR. G. BOHRER.

HAVING seen some statements in the American Bee Journal concerning what I infer to be injurious results having followed bee-stings, in Mr. Langstroth's case, I will state that I was well acquainted with Mr. Langstroth, and happened to visit at his home in Oxford, Ohio, when he was suffering from one of his attacks of mental depression, to which he was subject from an early period of his life.

He was in his apiary when I passed through his yard-gate, and seeing him there I went directly to him. It was not his custom to go outside of his house when under the influence of these attacks, so he and his family informed me, but he had done so on this occasion, hence our meeting was accidental, so Mrs. Langstroth told me, stating he would not have consented to see me, nor any one else, except as it occurred in this particular instance (by accident), and she expressed the hope that it might be the means of cutting short this particular attack.

I inquired of him if he attributed these attacks to any particular cause. "Yes," he said, "when I was young I received a lick on the head," at the same time placing the fingers of his right hand upon the right side of his head, near the top. Bee-stings were not mentioned as having anything to do with his case.

When he died, the papers reported that he died of apoplexy, having been attacked while in the pulpit preaching, or about to preach, a discourse. Knowing what I do about his case, I doubted the statement, but was then, as I am still, of the opinion that he died of a stroke of paralysis of the brain. But in this I may possibly be mistaken, but be this as it may, I never heard that his death was caused by the accumulation of poison from bee-stings.

I will further state that in all my study and practice of medicine, during a period of 47 years, I have never learned of or heard of bee-poison accumulating in the human system. Nor have I, after receiving thousands of bee-stings, with quite a sprinkle of yellow jackets, bumble-bees, and bald-hornet stings thrown in, been any the worse off, so far as I can detect. On the contrary, with time bee-stings seem to be, if anything, less painful.

When a boy I had one of my "windows" closed a time or two, once by a hornet, and another time by bumble-bees. Yellow jackets have peppered me pretty thickly upon my arms and other parts of my body, but not about the face. I am now past 70 years old, not as old as Mr. Langstroth was, but none the worse, as far as I know, as a result of stings.

### Foul Brood and Kindred Bee-Diseases.

BY C. P. DADANT.

I READ with interest the article of J. E. Johnson, on page 648. I think I can throw a little light on this subject.

I have been very much astonished to read, at different times, that boiling the honey did not destroy the germs of bacillus alvei, unless the boiling was kept up for several hours—three hours, I think. It had always seemed to me that boiling, if it was but for a minutes, would kill any germ of living organisms, whether animal or vegetable, and I yet wonder whether there might not have been some error in the experiments when it was reported that live germs were found after an hour of boiling.

The immunity of beeswax that has been once rendered seems to me well established. We have been manufacturing foundation for over 25 years, and during that entire time our bees have had access to the wax-receiving room. It is difficult to handle large packages of beewax, barrels, hogheads, sacks, etc., in a closed room, and our wax-weighing room would have been a trap for the bees, had we not arranged to let them go out of it of their own accord. Yet, with an apiary of 60 to 80 colonies close at hand, we have never yet seen a case of foul brood. So we are convinced that beeswax is absolutely safe after it has been once rendered at the ordinary temperature. Yet, if the scientists

are right in their experiments, the beeswax would have to be boiled three hours, at least, to destroy the germs.

I have thought of an explanation which would reconcile the necessity of long boiling with the fact that beeswax is immune, and that is: Is it not possible that the hot wax soaks the germs and embalms them—*mummifies* them—in such a way that further development is impossible? Our own experience, and that of Mr. France, are conclusive as far as wax and foundation are concerned as to their harmlessness.

It is true that foundation, when manufactured, has passed through several heating processes, both for refining the wax and for sheeting it. In many cases the wax remains hot for hours, but in some cases it is certainly not hot for three hours together. But dip anything you please into hot beeswax, and it at once becomes soaked with it, and when the wax cools, it becomes stiff. All bee-keepers who have had anything to do with rendering beeswax know how it soaks into everything, how it coats all sorts of utensils, or the insects, or particles of vegetable matter, wool, cotton, etc., that may happen to come in contact with it. It seems to me very plausible that the bacilli which come in contact with it would be so thoroughly soaked with wax as to become perfectly harmless, even if we have to grant that an hour's boiling would not kill them; though, with all due respect for the experiments made, it looks to me almost impossible that any life on our planet could be capable of resisting only a thorough soaking in boiling water, even.

If the surmise is right, it will explain how beeswax, even when only once rendered, would prove safe from the germs of brood diseases. It would not then require more than a very thorough heating and melting of it to soak all germs so as to make them harmless.

#### OIL OF EUCALYPTUS FOR DISEASED BROOD.

During the past year I have been asked a number of times about cases of diseased brood, and a number of samples have been sent to me. In each case but one I have concluded that the samples sent me were not foul brood. In the one case alone, a piece of brood-comb sent from Oregon, I recognized the well-described symptoms—the coffee color and glue-pot smell of the disease. I have treated two cases of dead-brood with entire success, by the use of oil of eucalyptus, which has been recommended by several writers in the *Revue Internationale D'Apiculture*; but I am satisfied that neither of these cases was foul brood. The manner in which the remedy was applied was as follows:

A small cardboard box, such as jewelers use for small articles of jewelry, was filled with cotton-batting, a small, round hole, a half inch or so, made into the end of the box, and as much oil of eucalyptus as the cotton would soak was poured in. This was placed just over the combs that were infested.

In the first case, the colony produced quite a crop of honey while undergoing treatment, and not only was the smell of eucalyptus strong enough to notice it when the wind was right, some 20 feet away, but the honey which was extracted from this colony had a distinct smell of the oil of eucalyptus, though not strong enough to make it objectionable.

The oil was applied for five weeks regularly, every four days, so that the colony was constantly kept under the influence of the drug. The bees did not seem to suffer from it in any way. According to our Swiss friends, the greatest objection to this drug is that it attracts robber-bees. I did not notice any trouble on this score. But it was used during a honey crop, this time.

The other case was in the apiary of a friend in Missouri. Two colonies were attacked, and he found a third just as he began applying the remedy. In less than four weeks all traces of dead brood had disappeared. This case was apparently what has been termed "black brood," for the sealed larva, or chrysalis, turned black in the cell.

I do not believe that it would be advisable to rely too much on this remedy in a case of true foul brood. All authors seem to agree in advising bee-keepers to avoid drugs. Yet it is to drugs that we all turn if we want to avoid the more radical means of fire. There is no doubt in my mind that eucalyptus will render great service in cases where the disease is not clearly foul brood, and I believe I would try it in very mild cases, and, by all means, would employ it when colonies are in danger of the disease, as a preventive. The fact that oil of eucalyptus is a strong antiseptic would indicate its usefulness in this respect. Its strong smell tainting the honey would lead one to think that it might even destroy germs existing in the honey.

At any rate, I would strongly recommend oil of eucalyptus.

tus for any diseased brood, where well-known symptoms of foul brood are not positive. I am of the opinion that if we could eliminate all the minor brood diseases, we would find the cases of actual foul brood less numerous than generally believed.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Illinois Strawberries in October.

Who wouldn't live in Illinois when you can have luscious, ripe strawberries for dinner, picked from your own vines the 12th of October. Good, big ones, too. Didn't I enjoy picking them, though, to say nothing of eating them?

[Just think of big strawberries, then a big lot of honey, then more strawberries again. That's the way Miss Wilson has had the good, sweet things of this life this year. And then tells the rest of us poor mortals about it in such a tantalizing paragraph as the one above! So it goes.—Ed.]

### A Well-Wishing Sister.

Though "up to my ears" in work, superintending about a dozen irons that I have in the fire, I am going to take time to wish you good-speed in this new department of the American Bee Journal.

In the winter is usually my leisure time, and all through the spring and summer my journals pile up unopened. Then, when everything is snug and tight "for a long winter's sleep," I get down my bundle, a smile of contentment spreads over my face as I smooth out the sheets, sort them out, and settle down for a good time. I've read your articles with much interest, and also some others, and many times the spirit has moved me to argue out some points, air my views, and relate some experiences; especially when the "old bachelor bee keeper" question waxed warm. After your kind invitation I shall certainly try to contribute some lines this winter worthy your columns. Till then, believe me with sincere sympathy,

Your friend and well wisher,  
Clinton Co., N. Y. FRANCES E. WHEELER,  
(Lecturer of the Chazy Grange.)

I am very sorry that you did not immediately act upon the good spirit that moved you, and let us have the benefit of your views at once. But we will hope to hear from you soon.

I am sorry to say I did not receive the "journal" containing your photo, though I looked for it.

### "Bay View Reading Club."

Will you please tell me, through the American Bee Journal, where information can be obtained about the Bay View Reading Course for literary clubs? It is frequently mentioned in the papers, and seems to be in much favor. If you could give some description of it I feel sure it would be, just at this time, a real favor to many others who may be looking for plans for a literary club.

Kane Co., Ill. ETTA MACFARLANE.

Without having any personal knowledge of the matter, I am glad to give you the following information that has been sent me:

THE BAY VIEW READING CLUB.

One of the popular educational institutions of to-day is the Bay View Reading Club. It has a thousand local clubs, and over 12,000 members. It is organized in nearly every State, and in other lands. In the past two years and a half over 500 woman's and other literary clubs have adopted its courses of study. The originator of the organization is John M. Hall, who is still at the head of it, aided by several assistants who are trained for the work. The Bay View courses endeavor to offer an intelligent plan for home study, and save the members from the confusion resulting from

the abundance of literature of the day. The courses are brief, simple in plan, and comparatively inexpensive. The courses are delightful reading journeys, wherein the country's history, literature, art and music are deftly combined in a study.

This fall the club begins the study of Germany, and will make side-trips into the delightfully interesting kingdoms of Belgium and Denmark. Circulars giving general information, and copies of the magazine, can always be obtained by addressing Mr. Hall, 165 Boston Boulevard, Detroit, Mich.

### Banana Sandwiches.

Select two large, very ripe bananas, peel and slice very thin and evenly. Sprinkle with two tablespoonfuls of lemon-juice. Add a little honey to white cream cheese and spread on dainty rounds of bread instead of butter; place a layer of the sliced bananas between the two slices. Nut-meats chopped fine, and maraschino, or any fine conserved cherries cut in halves, may be used for filling. Also preserved ginger and orange peel minced fine and mixed with a little thick, sweet cream.—Herald and Presbyter.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### SERENE BEE-MAN AND OUT APIARY.

It's a smiling picture Mr. Hooker calls up of the serene bee-man visiting his out-apiary. Nothing bad is going on just then, and if he's a person inclined to "fools' paradise," there is little in sight to keep him from constructing one right there. "So nice that my bees out here don't make me any trouble like other cases I read of." But then, if he actually harvests a good crop of honey, notwithstanding the miscellaneous fracas he didn't see, the situation may be somewhere near the saying: Ignorance is bliss—folly to be wise. Page 582.

### SHAKING OFF QUEENS.

I hope Dr. Miller is right about the harmlessness of shaking off queens, as per page 585. Perhaps I can go a little farther, and say I think he is; but an uneasy feeling about that persists in keeping a lodging in my mind. Sometimes the shake must send her down with quite a bit of violence. What are the consequences of throwing a big basket of eggs—and is not the queen about that?

### FUEL FOR BEE-SMOKER.

Just been trying the hickory-bark smoker-fuel, as per R. L. Taylor, page 590. Very fair—to use as a sort of adulterant. Don't put it in until the smoker is real hot, and not in preponderating quantities at any one time. I use another adulterant which may be worth recommending—news-paper wadded up in suitable sized wads. This is mainly for use when first starting up. After you get well along ashes and coals take up much of the fire space, and then it comes right to put in about what fuel there is room to put in. It's different when you begin. It doesn't seem nice to begin with fire-box only half full of fuel, tumbling about with every move. And to fill the yawning space entirely full of your choice fuel is a simple waste of half of it. I begin (Clark smoker) by crowding one side the chamber with newspaper wads. Then I fill the other side partly full of hard rotten wood, and finish off with soft rotten wood. The paper, besides being an innocent occupier of space, contributes considerable smoke. Also, it holds possession of the space longer than one would suppose. The smokers, with cylindrical fire-space, would call for a little different manipulation, but I guess it could be managed all right.

### CO-OPERATION AND INDIVIDUAL SELFISHNESS.

Interesting to see how Prof. Cook goes the whole—figure—in the matter of joint property. 'Specks that in that matter it will do to go the whole angel, but won't do to go the whole hog. Then, if human hogs should be found much plentier than human angels, it might wreck the scheme.

Three men could take the same daily paper, if their convenient hours for reading came differently, and exact hours were pretty rigidly enforced. Twelve families, each with a magazine for one week to read and pass on, looks a quite seductive economy on paper; but where the magazine would actually be when it ought to be at No. 12, I am not so sure. Worth trying. A grand, all-around, nation-wide fight against individual selfishness is needed. Not to be despaired of, either, if the proper amount of revival enthusiasm should get into it just right. And those manifestations of selfishness, which are so old and matter-of-course as to be considered as if they were natural laws, are just the ones to attack first. Anti-hog rival first, and then combination, eh? Page 597.

#### A SEDUCTIVE TEXAS WAY.

J. E. Chambers' Texas way seems to be, first, get an enormous colony of bees; second, brush it to prevent its swarming naturally; third, get a big lot of honey from it. Seductive. He that is able to follow, let him follow. Page 598.

#### GETTING DOWN LOFTY SWARMS.

It's a little hard to get rid of a semi-humorous feeling toward the scheme of "shooting" lofty swarms down by the smell of carbonic acid. We mustn't let our merriment deprive us of what may turn out to be a valuable addition to our resources. First trial resulted in the swarm taking wing and clustering on a lower place.

The other experience Mr. Bartz gives us is also interesting. Evidently a carbolized cloth can be made to serve somewhat the turn of an assistant, driving the bees in one direction while you with a smoker drive from another. A few queens and some drones without any workers, and all very badly frightened, might die in the course of a night without it's being exactly a case of poisoning. Howsoever, at present we had better consider it a poisoning case—and look a little out. Page 600.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Moving to Sweet Clover—Drone-Laying Queen.

1. By moving about 20 miles (on dirt road) I can get where there is black, waxy land, and a world of sweet clover. Would it be best to go there?

2. Will an old queen ever get so she will lay only drone-eggs?

ALABAMA.

ANSWERS.—1. It might pay well to move 20 miles for the sake of a better pasture; how well would depend upon how much better the pasturage. A good way would be to try part of your colonies in each place and compare results.

2. In many cases the contents of the spermatheca become exhausted, which will be shown by part of the brood hatching out of worker-cells as drones, finally there being only drones.

### Feeding Bees with the Miller Feeder.

I have tried making the original Miller feeder as near as I could from reading your book, but somehow I am not making a success in using it. If I leave room for the feed to run under the side it runs too fast down through the hive and out on to the ground; or sometimes it don't run at all. And if I leave room for the bees to come up over the side, they go down into the feed and get stuck in the feed and drown. I wish you would give us a good description of the feeder, and how to use it, in the American Bee Journal. I have your "Forty Years Among the Bees," but I am too dull to understand just what is the matter. Some of my bees—one colony—will not take feed when even put in a dish over the brood-nest. What is the matter with them?

NEBRASKA.

ANSWER.—There must have been something radically wrong in the construction of your feeder to allow the feed to run down through the hive, unless the feeder was filled so full that it ran over. As I use it, the feeder is hung in a common T super, just because I have plenty of T supers on hand, but it may be put in a box of any convenient size, the box being without top or bottom, and the inside of the box being about an inch wider and longer than the outside width and length of the feeder proper.

For the ends of the feeder, and the two inside partitions,  $\frac{1}{2}$ -inch stuff is used, and  $\frac{1}{4}$ -inch stuff for the other parts. This thin stuff is

less likely to split with age, I think, than heavier stuff. At any rate, mine are a good many years old and all right yet, most of them. By using small nails about half an inch apart, this thin stuff can be nailed together to make a very close joint. Suppose you use a T super for the outside box, or have a box of the same dimensions,  $17\frac{1}{2} \times 12\frac{1}{2}$ , inside measure, and  $4\frac{1}{2}$  inches deep, the material needed will be as follows:

- One bottom,  $16 \times 11 \times \frac{1}{4}$ .
- Two ends,  $10\frac{1}{2} \times 4\frac{1}{2} \times \frac{1}{4}$ .
- Two sides,  $16 \times 3\frac{1}{2} \times \frac{1}{4}$ .
- Two partitions,  $15 \times 4\frac{1}{2} \times \frac{1}{4}$ .
- Two top pieces at ends,  $13\frac{1}{2} \times 2 \times \frac{1}{4}$ .
- Two top pieces at sides,  $15 \times \frac{3}{4} \times \frac{1}{4}$ .

The two partitions are inside, leaving a space of about  $\frac{3}{4}$  inch between the partition and the side, the upper part of the partition coming flush with the upper part of the ends. That will leave a space of  $\frac{1}{2}$  inch under the partition for the feed to flow under—a space too small for a bee to pass through. The top pieces at the sides are nailed on the partitions, and the other top pieces on the ends, the end pieces on top supporting the feeder in the outside box or super. When the feeder is hung in the super, it is well to nail it on by a single very small nail at the middle of each side and each end. This will prevent the top pieces from curling up.

You will see that there is no place the bees can get to the feed except in the  $\frac{3}{4}$  space at the side, and bees never drown in so narrow a space.

I don't know just why that colony will not take the feed; they are quite capricious sometimes.

### Wants Lots of Increase—Foul Brood.

My bees have not done very well this season; I wish to increase as much as possible, and I am not particular about getting any honey next year, but I do want a lot of bees.

I have 2 colonies from which I have taken 200 pounds of extracted honey, and I do not care if I have to feed a lot of sugar next year. To how many colonies of bees can I multiply my 2 colonies?

My bees had foul brood early last spring, and by following the directions given in the books, I am glad to say I got rid of it very easily.

ILLINOIS.

ANSWER.—Your question is a hard one to answer. You will find it easier to increase if you have a long flow of natural stores than to depend on feeding; still, it will help the increase if you feed whenever the bees are not gathering anything, when it is warm enough for them to fly freely. Starting with two, you may close the season with anywhere from 10 to 20, depending upon the season and your skill and experience. Just between you and me, let me whisper a word in your ear: Don't try to increase too fast, especially late in the season. Better have 10 strong colonies at the close of the season than twice as many weaklings.

### Requeening Colonies—Color of Carniolans.

I have 10 colonies of bees which have not been requeened from any other stock of bees in the last 10 or 12 years, and would like to secure a few good queens, but would like to know:

1. How late in the season could I successfully introduce queens into my stock?

2. My colonies all have queens now, and would I better destroy the queens in the colonies into which I wish to introduce new queens before I order, or wait until I secure the new queens?

3. What is the color of Carniolan bees?

KANSAS.

ANSWERS.—1. Just as late as bees are flying, and perhaps later.

2. Wait till you get the queens.

3. Much the same as the blacks, with narrow, whitish bands.

### Peculiar Odor Around Hives—4x5 Sections—Comb or Extracted Honey?—Italanizing.

Last spring I purchased 5 hives and implements, known as a beginner's outfit, and started in the bee-business. I bought 2 colonies of black bees in common hives, and transferred them successfully to new hives, and have at present 4 colonies. I did not get much surplus honey in sections; the transferring and subsequent new comb-building seems to have given them a decided set-back, but I hope for a good crop next year. Now, I want to ask a few questions:

1. For about a week I have noticed a peculiar moldy or musty odor in the vicinity of my hives; it is noticeable 8 or 10 feet from the hives. A Mr. Neilsen, 3 miles west of me, noticed the same thing, also another bee-keeper a few miles west of town. I cannot find anything wrong in the hives; the bees seem to do well, and have stores and brood in all stages from eggs to sealed brood. The bees are working now on goldenrod and aster. Is it possible these flowers are the cause of this peculiar odor?

2. What is the opinion of leading apiarists on the 4x5 section? Some claim it to be the coming section. What do you think of the Danzenbaker hive?

3. Would a 10-frame hive be better than an 8-frame for the South? I want to make bee-culture a leading part of my work, and want to be up-to-date and have the best, and therefore want to be posted on the advantages or disadvantages of different styles of hives with Hoffman self-spacing frames; supers hold 24  $4\frac{1}{2} \times 4\frac{1}{2}$  bee-way sections with separators.

4. From a commercial point which pays the better, comb honey or extracted? and can I use the same style of hive for both kinds?

5. There are no Italian bees nearer to my place than 3 miles, while nearly every farmer around me has from 1 to 20 colonies of black bees, not to mention the wild bees, and, literally speaking, "the woods are full of them." Now, if I were to buy Italian queens I don't see how I could keep their offspring pure. It is almost a certainty that their young queens would mate with black drones, and if I would have to keep on buying Italian queens, and destroying all queens reared in my hives, it would be rather expensive so long as there does not seem to be a way to control the mating of queens with such drones as we would desire. I don't see how I can Italianize with profit. What is your advice in the matter?

ALABAMA.

ANSWERS.—1. The probability is that the odor comes from some plant upon which the bees are working. I have had the same thing occur here; an exceedingly offensive smell coming from the hives, with nothing apparently wrong otherwise, the disagreeable smell disappearing in a few days.

2. Hard to tell; those who try them and don't like them are not likely to say much about them, so that the testimony is rather one-sided. Some claim they can get a higher price for honey in tall sec-

tions, others say there is no difference. Much the same with the Danzenbaker hive; some are quite enthusiastic over it, while others do not approve. For my own use I prefer the dovetailed.

3. If you have any considerable number of 8-frame hives, and are working for comb honey, don't think of changing to the 10-frame without first trying them on a small scale. The difference in weight in handling the hives counts for a good deal with some; if you don't care for that I'm afraid the 10-frame would be better for you. But no one can decide the question for you so satisfactorily as you can decide it for yourself by trying the two kinds side by side.

4. That depends upon the quality of the honey, the market, and the man. I should lean toward the opinion that extracted might be better for you, but I may be entirely wrong. The same hive may be used for either, but if you work for extracted the probability is that you should have a larger hive than the 8-frame.

5. Most decidedly you can Italianize with profit, and most decidedly you'll find it an impossibility to keep pure Italians. The first cross between Italians and blacks, you will probably find, will give you as much honey as pure Italians. It will be a small expense to buy one Italian queen each year, and you can plan to have most of your young queens reared from her. In that way you can keep up your stock quite satisfactorily.

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.00.

GEORGE W. YORK & CO.

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

## FROM MANY FIELDS

### A Peculiar Year for Bees.

We have had a peculiar year. I started with 40 colonies, and some were very weak, as the spring was very unfavorable, and they were on the point of starving when the clover flow came, about June 15; but from then until Aug. 25 they improved all the shining hours, and I closed the season with 2700 sections of comb honey, and 500 pounds of extracted. I extracted all the half-filled sections, and will save them for next year for bait. I am getting 12½ cents for my comb honey and 10 cents for the extracted, here at home. WM. CLEARY.

Kossuth Co., Iowa, Oct. 18.

### How to Use Formaldehyde.

After reading many letters and items on the use of formaldehyde as a destroyer of foul brood, in the American Bee Journal and other journals, I fail to find sufficient insistence on the necessity of having the box into which the infected comb is placed absolutely airtight. Formaldehyde-gas is very diffusable, and unless it is confined by sealing up every crack or little hole the effect will be very disappointing. Perhaps that will explain some of the failures reported.

C. H. GRAENING, M. D.  
Bremer Co., Iowa, Oct. 15.

### A Wet, Cold Season.

It has been a very wet, cold season, still the bees did well the first part of the season. They commenced swarming the last of May, and the swarming fever ran high in the majority of apiaries until the first of August.

It is seldom that I have known bees to gather honey faster than they did the past season, from the middle of May until the first of August, when they stopped gathering any surplus honey in this vicinity.

I started in the spring with 15 colonies, nearly all Italians, but a few hybrids. They cast 27 swarms, but 10 of them clustered in 5 clusters, so at the close of the season I had 37 colonies and 700 pounds of comb honey, and if there had been a fall flow of honey I would have had several hun-

dred pounds more. I have a home market for all my honey, at 15 cents per pound, and besides this I was awarded \$7.00 premium on 100 pounds of honey at our County Fair. S. B. SMITH.  
Milledale Co., Minn., Oct. 19.

### A Poor Season.

This has been a poor season here, so much rain and cool weather. My 10 colonies of bees averaged only about 15 pounds per colony.

W. W. BOTSFORD.

Dickinson Co., Iowa, Oct. 18.

### Formalin Gas as a Germ-Killer.

The bee-papers have not got that right yet about formalin. Formalin is a gas from formaldehyde, and 40 percent water, and not necessarily a trade name. The gas does not kill germs, but when the gas comes in contact with the air it oxidizes into formic acid. It is the acid that kills germs.

When we kill bees with sulphur we also kill germs (almost as good as sulphur), but the bees are killed by suffocation, and the germs are killed by the acid that the fumes and air produce. The germs are plants; and the bees are animal life. Some things will kill one and not even injure the other. I am in hopes that some time we may get a cure that is sure death to germs, and will not cause the bees to miss a meal.

Prof. Lambotte is said to have made a big mistake, but I think he is not entirely wrong. *Bacillus alvei* is not the same as *Bacillus mesentericus*, but probably the former cannot become pathogenic without the aid of the latter.

J. E. JOHNSON.

Knox Co., Ill., Oct. 21.

### Difference in Storing—Queen Above Excluder.

On page 552, "California" wants to know why one colony will store and another starve. It may be the kind of flowers they are working on, as well as the kind of bees. Full blood, or nearly full blood, Italians and Carniolans will store a lot of cotton and bitterweed honey. The blacks will store very little cotton and hardly any bitterweed honey.

On page 553, "British Columbia" asks about the queen above an excluder. It is not an uncommon thing for queens to do that here; they get through somehow; I had 4 or 5 cases of that kind this year.

# TWO YEARS FOR \$1.00

After a man succeeds in publishing a good journal, the next step is that of getting it into the hands of the people, of getting them to reading it, and becoming acquainted with its merits. This can be done by advertising, sending out sample copies, circulars, etc. All this costs money. I think I am safe in saying that for every new subscriber I have received, I have paid out \$2.00 in advertising; hence I have often said that a publisher of a good journal could afford to send his paper one year free, for the sake of getting it into new hands. It would cost no more than other forms of advertising and would be very effective, but, for obvious reasons, this plan could not be put into practice, but I am going to come as near to it as I can. I have between 200 and 300 complete sets of back numbers for the present year, and as long as the supply holds out I will send a complete set, and the rest of this year free, to any one who will send me \$1.00 for the Review for 1904. For a few particulars regarding the numbers already published this year, read the following:

## Review for 1903

**JANUARY** illustrates and describes a Queen Incubator and Brooder which allows the bees access to the cells and queens at all times. It also contains several excellent articles on the subject of Commercial Organization among bee-keepers.

**FEBRUARY** contains a five-page article, perhaps the best ever published, on foul brood. It tells how to detect the disease with unerring certainty, to prevent its spread in the apiary, to keep it under control, build up the diseased colonies, secure a good crop of honey, and at the same time securely rid the apiary of the pest, all in one season, with almost no loss.

**MARCH** gives the portrait of a veteran bee-keeper of Michigan who manages out-aries 50 miles from home with only four visits a year, averaging a profit of \$150 each visit. He describes his methods in this issue of the Review.

**APRIL** has a frontispiece of bronze blue showing Mr. T. F. Bingham's apiary and wintering cellar, and Mr. Bingham describes the cellar and its very successful management. L. Stachelhausen tells how to prevent both natural swarming and increase in an out-ary, and secure a fine crop of honey.

**MAY** illustrates and describes a tank and method for fumigating foul broody combs with formalin. This is the largest tank and most extensive, successful experiment that has been made.

**JUNE** illustrates and describes the use of the cheapest power for hive-making, wood-sawing, feed-grinding, water-pumping, etc.—a power windmill.

**JULY** has articles from such men as R. L. Taylor and H. R. Boardman on "End of the Season problems," those problems that come up just as the honey harvest is closing and preparations for winter come on apace. Mr. McEvoy also tells how to treat foul brood after the honey harvest is over.

**SEPTEMBER** has an article from Mr. H. R. Boardman, in which he describes his wintering-cellar above ground, and tells how he succeeds in controlling the temperature and ventilation—sometimes using artificial heat. R. L. Taylor contributes an article on "Commercial Organization Among Bee-keepers," in which he states the case so clearly that no more argument is needed.

**OCTOBER** is pretty nearly taken up with only two articles. The first is by R. L. Taylor on "The Cellar-Wintering of Bees." It is an old subject, but Mr. Taylor has the faculty of saying new things on old subjects. He covers the ground very completely, and gives many a useful hint to the man who winters his bees in the cellar. The other article is by the Editor, in which he writes of California as a bee-keeping State, giving eight beautiful illustrations made from photos taken by himself when on his recent visit to California. Several of these are full-page.

**NOVEMBER** or December will be a special number in which the editor will describe that paradise for bee-keepers, Northern Michigan, using a large number of cuts made from photos that he took last summer while on an extended visit to that region.

Perhaps you may have intended subscribing at the beginning of the year—subscribe now and you will get the back numbers—wait until January and it is not likely you will get them.

## Superior Stock

The price of a queen alone is \$1.50, but I sell one queen and the Review one year for only \$2.00. Just at present, as explained above, as long as the supply of back numbers for 1903 holds out, all new subscribers for 1904 will receive them free. In other words, if you order soon, you can get the Review for 1903 and 1904 and a queen of the Superior Stock next spring, for only \$2.

W. Z. HUTCHINSON, Flint, Mich.

The time to advertise is whenever you need customers and are prepared to serve them.—Printers' Ink.

## 6 Percent Discount During October!

## Beedom Boiled Down

### Cross Bees and Light Clothing.

White clothing, says Mr. Hutchinson, saves the wearer some annoyance and stings. I have seen this stated before, but have been somewhat skeptical about it. Black buttons on a light coat, I am aware, will be attacked sometimes by bees because the buttons are suggestive of the eyes of an animal, and instinct seems to tell them these are vital. I imagine that a black hat on a person with white clothing might be the object of an onslaught of stings from bees enraged from any cause. My own notion is, if one were dressed in dark clothing, without any contrast of white or black spots in it, and all the surrounding objects were of about the same tint or darkness, cross bees would pay no more attention to it than they would to white clothing. But I am sure of this: That any thing black or dark-colored, surrounded by a white background, will attract their attention.—EDITOR ROOT, in Gleanings in Bee-Culture.

### Great Difference in Bee-Keepers.

What a difference there is in bee-keepers! Some are slipshod and slovenly, with hives standing in a row close together on a plank—and some of them box-hives at that. How encouraging it is for an inspector of apiaries to get into such an apiary as that when looking for foul brood! Then there are bee-keepers of a little higher grade. They have movable-comb hives, or hives that are intended to be such, but no foundation starters have been used, and many of the combs might as well be in real box-hives. Then there is another grade still higher, but it is not the highest. It is the man who aspires to be a pretty good bee-keeper, but has too many otherirons in the fire, and he neglects things. The frames are all stuck fast, and stuck together with brace-combs, and it is a task to get out a comb. Then there is the man who is a first-class bee-keeper. His hives are all made exactly alike. He uses foundation; he keeps the brace-combs scraped from the top-bars; his hives are level; the combs can be removed with the fingers with no prying from any knife or lever. Everything is orderly in his honey-house. He has

## HONEY-JARS.

I can sell you a White Glass Honey-Jar, holding 15 ounces of honey, at \$4.00 per gross. Also the standard square one-pound Jar at \$4.50 per gross. Sample of either Jar by mail on receipt of 10 cents for postage.

a place for everything, and everything is in it. The covers are always put on square and true. Reader, in which class do you belong?—Bee-Keepers' Review.

#### Stores Necessary for Wintering.

"We are constantly asked the question, 'How many pounds of stores are necessary for wintering?' A good deal depends on the strength of the colony, and very much on whether it is to be wintered outdoors or indoors. The average outdoor colony in this latitude requires anywhere from 20 to 25 pounds; for indoors, from 15 to 18 pounds will make a safe allowance. The indoor colony may not consume during its actual confinement, more than 4 or 5 pounds, while the outdoor colony, during the same period, may not require more than 10 pounds. If this is the case, why should not every one winter indoors? Because it is not positively proven yet that the extra amount of stores consumed outdoors does *not* give a more vigorous colony in the spring.—Cleanings in Bee-Culture.

#### Alfalfa and Sweet Clover.

Many intelligent farmers prize red clover highly on account of its ability to gather nitrogen from the atmosphere, and they are slowly learning the values of other clovers as well. An important point to know, is the fact that for the success of any one of the clover family, including sweet clover, red clover, and alfalfa, there must be in the soil the bacteria that belong to that one plant, and there is hope that when the soil of the East becomes inoculated with the bacteria of alfalfa, it may succeed just as well in the East as in the West. The following is from J. E. Johnson, of Knox Co., Ill., in the American Bee-Keeper:

Alfalfa has been tried in Illinois for many years by different ones but without success until Prof. Hopkins began growing it on infected soil, where he has found it to do well, producing as high as 10½ tons per acre in a single season. Prof. Hopkins, of the Illinois Experiment Station, has, this year, sent infected soil to something like 200 farmers in Illinois for alfalfa growing, so Illinois bids fair to become an alfalfa-growing State.

Now, one thing more. Of all the bacteria that inhabit the soil and cause the clover to live from the nitrogen of the air, sweet clover is probably the most powerful of all, which shows plainly for itself, as it will thrive and produce both seed and honey in abundance on soil so poor that the worst weeds will not grow at all, and even on alkali land, that is poison to nearly all other vegetation.

Why is this? Simply that sweet clover, when aided by its own bacteria, lives almost entirely from the nitrogen of the air (of course, getting a small amount of phosphates, etc., from the soil). Not only so, but these nitrogen-gathering bacteria are constantly and silently gathering nitrogen—the most precious element to plant-life—and placing it in the soil.

One sweet clover plant will furnish

## WEAK EYES CURED AT HOME.

Expenses lower than other colleges of equal grade. Any young person with tact and energy can have an education. We invite correspondence. Send for catalog.

MOUNT UNION COLLEGE,  
Alliance, Ohio.

### "What Happened to Ted"

BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton, the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—60 pages, 5x8½ inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver.) Address,

ISABELLE HORTON,

227 EAST OHIO STREET, CHICAGO, ILL.

a home in its tubercles for a thousand million bacteria, or even more. Now, in the far East are old farms which have become so deficient in nitrogen that they are considered worn out or worthless, and have been abandoned, notwithstanding these farms contain the other elements in abundance, or could be so with slight cost, as the other elements are cheap in price.

If sweet clover were sown on these same farms they could be made valuable and rich almost without cost. Infected soil would probably have to be also sown to get quick results, but when once set thickly to sweet clover, with their nitrogen-gathering bacteria, ten acres of the same would gather nitrogen from the air and fix it in the soil, when plowed under, faster than one man could haul it in a wagon from the nearest city in the form of barnyard manure. That despised sweet clover will some day be found to be the only hope of reclaiming many barren farms.

CONVENTION NOTICES.

**Chicago-Northwestern**—The regular annual meeting of the Chicago-Northwestern Beekeepers' Association will be held in the Revere House Club-Room, southeast corner of North Clark and Michigan Sts., on Wednesday and Thursday, Dec. 2 and 3, 1903. The Revere House has made a rate of 75 cents per person per night for lodging, when two occupy a room. Meals, 25 cents for on the American plan at \$2 per day. Owing to the Revere House furnishing FREE a place for holding our meeting, we feel that a plan which can do so should induce them during the Convention. Dr. C. C. Miller, Ernest R. Roy, W. Z. Hutchinson, Emerson T. Abbott, N. E. France, Inspector J. O. Smith, Jas. A. Stone and Hubert H. Root, all signified their intention to be present. Put this in your hat. There will be one of the best meetings ever held in Chicago. Everybody come.

HERMAN F. MOORE, Sec.

GEORGE W. YORK, Pres.

P. S.—It has been suggested that bee keepers bring with them samples of honey, and such little appliances as they have that are considered handy to work with in the apiary.

**Connecticut**—The Connecticut Bee-Keepers' Association will hold their fall meeting in the Capitol at Hartford, on Nov. 4. All beekeepers are cordially invited to attend. For full information, write the Secretary.

MRS. EDWIN E. SMITH, Sec.

Watertown, Conn.

**Missouri**—The Missouri State Bee-Keepers' Association will meet in Mexico, Mo., Dec. 15, 1903. J. W. Rouse will act as host to direct the attendants to the hall, which is free to all who desire to attend. Board may be had at the desired hotels at \$2 a day. Come, everybody, who is interested in bees and honey. Let us have a big meeting. We now have 51 paid members. Let us make it 100. Pocket certificates from your local railroad ticket agents will entitle you to these your tickets. It may be you can return for 1/2 fare.

J. W. ROUSE, Pres.

**Illinois**—The Illinois State Bee-Keepers' Association will meet at the State House, on Tuesday and Wednesday, Nov. 17 and 18, 1903. It has been so arranged that all who become members of the Illinois Association on payment of an annual fee of \$1.00 membership, will for the same be made a member of the National Association, and be entitled to all the combined reports of the State and Chicago Northwestern Associations. Efforts will be made at our coming meeting to give also a membership in the Chicago-Northwestern for the same \$1.00 fee, providing it can be so arranged.

Railroad fare has been promised on all the roads in the Central Division of one fare for the round trip, and a fare and a third on the others; but we still hope for one fare on the latter. Will announce later, as to iron road fare.

JAS. A. STONE, Sec.

Route 4, Springfield, Ill.

**WANTED—Extracted Honey.**

Mail sample and state lowest price delivered Cincinnati. Will buy FANCY WHITE COMB HONEY, any quantity, but must be put up in no-drip shipping cases.

C. H. W. WEBER,

**HONEY AND BEESWAX**

**MARKET QUOTATIONS**

**CHICAGO, Oct. 21.**—Sales are not frequent, with No. 1 fancy white comb honey bringing 136/14c per pound. To obtain 135/14c it will be to perfect and in sections it will not weigh over 146/100 ounces; sections that weigh 16 ounces and over have to be sold out from 1 to 3c less per pound. Extracted, white, sells at 67/10c in barrels; 64/7c in cans, according to quality. Beeswax, 286/30c. R. A. BURNETT & Co.

**BUFFALO, N. Y., Oct. 11.**—The demand for white comb honey is better than it was. The trade is particular and wants only very white, clean stock. If the wax is yellow from travel stain it does not sell well, and price has to rest. Fancy white comb, 14/1015c; A No. 1, 13 1/2/14c; No. 1, 136/13 1/2c; No. 2, 12 1/2/13c; No. 3, 11/12c; No. 1 dark comb, 11/12c; No. 2, 10/10 1/2c. White extracted, 6 1/2/7c; amber, 6/6 1/2c; dark, 5 1/2/6c. Beeswax, 28/30c. W. C. TOWNSEND.

**BOSTON, Oct. 8.**—Comb honey continues to be in good demand. Fancy white honey in cartons we quote at 18c; No. 1, 17c; No. 2, 16c; No. 3, fancy white, at 16c; No. 4, at 14c. Extracted honey, Florida, 6 1/2/7 1/2c, according to quality. BLAKE, SCOTT & LEE.

**CINCINNATI, Oct. 21.**—The demand for honey is a little better. The prices rule about the same. Extracted is sold as follows: Amber, in barrels, from 55c to 60c; white, in barrels, from 60c to 64c; white-alfalfa, 6 1/2/6 1/2c; white, 6 1/2/7c. The comb honey market is quite lively, and it sells as follows: Fancy water-white, 14/15c. Beeswax in good demand, at 30c delivered here. C. H. W. WEBER.

**ALBANY, N. Y., Oct. 18.**—Honey market still firm for honey lots and receipts not equal to demand; fancy white, 16c; No. 1, 14c; No. 2, 14 1/2/15c; buckwheat, 13 1/2/14 1/2c. Extracted, quiet; white, 7/7 1/2c; mixed, 6 1/2/7c; dark, 6/6 1/2c. Beeswax, 29/30c. H. R. WRIGHT.

**KANSAS CITY, Oct. 23.**—Receipts of comb honey good; demand good; market easier. Receipts of extracted light. We quote: Fancy white comb, 24 sections, per case \$1.00; white and amber, \$2.75; No. 2 \$2.50. Extracted, white, 7c; amber, 56/6c. Beeswax, 25 1/2/30c. C. C. CLEMONS & Co.

**CINCINNATI, Oct. 1.**—Comb and extracted honey are coming in freely, and the demand is good with steady prices. We are making sales at the following prices: Amber extracted, at 5 1/2/6 1/2c; white clover, 6 1/2/7c. Fancy comb honey, 15c. Beeswax 30c. THE FRED W. MUTH Co.

**NEW YORK, Sept. 28.**—Comb honey is arriving quite freely now, and is finding ready sale at 15 cents per pound for fancy white, 13 1/2/14c for No. 1 white, and 12c for No. 2 white and amber. Very little buckwheat on the market as yet, and prices are hardly established. Extracted honey is ruling about the same as last with plenty of offerings of all grades. Beeswax is somewhat declining and selling at present at from 28 1/2/29c per pound. HILDRETH & SEGELKEN.

**SAN FRANCISCO, Oct. 14.**—White comb, 1-lb. frames, 13 1/2/14c; No. 1, 12 1/2/13c; extracted, white, 6 1/2/6 1/2c; light amber, 5 1/2/6c; 55/56c; dark amber, 4 1/2/4 1/2c. Beeswax, good to choice, light, 2 1/2/2 1/2c; dark, 25/26c. The outward movement of honey is lively. Three sailing vessels clearing the past week for England took an aggregate of 87c cases extracted, making the shipments from this port by sea in the past few months the largest. There have been tolerably heavy receipts of the meantime and there is still considerable offering. Market is rather easy in tone, extreme current quotations are more liberal than with the views of holders than with the bids of wholesale operators.

**WANTED! FANCY COMB HONEY**

In no-drip shipping-cases. Also Amber Extracted in barrels or cans. We give your best price delivered Cincinnati. The Fred W. Muth Co. 3241 1/2 Front and Walnut, CINCINNATI, OHIO.

**WANTED—Comb Honey in quantity lots.** We are perhaps the only dealer in this article, purchasing as much as 150,000 pounds at one time. Please state quantity, quality and price asked for your offerings to Messrs. C. Stanley & Son, 2441 MANANZOLA, COLO., or FAIRFIELD, ILL.

THE "REVERE HOUSE," CHICAGO.

**Langstroth**  
**The Honey-Bee**

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**GEORGE W. YORK & CO.**

144 & 146 Erie Street, CHICAGO, ILL.

The Eye is more sensitive and subject to more diseases than any other part of the body. Ninety nine out of a hundred cases of poor or falling eyesight are due to simple little troubles that are easily cured; and most of the serious diseases of the eye that cause blindness begin with the simple little troubles. People usually rush to a spectacle dealer and buy glasses who never they find that they cannot see clearly, which is like getting crutches for some little sore on your foot, instead of treating the sore. There are about 40 diseases of the eye, but only a few of them are painful, and it is natural to most people to think that if there is no pain, there is no disease; hence the most serious of these diseases are often neglected until they are so far advanced that when one goes to a specialist, he insists upon an operation and a big fee, or a long, troublesome course of treatment at a big bill.

One of the most useful things ever published is a little book on "Diseases of the Eye," which describes and illustrates the most common of these diseases and explains a simple system of treatment by mail by which the trouble is easily diagnosed and treated by simple, harmless remedies. This book is sent free by the Chilian-Kennedy Co., Basingstoke, Ill. It shows how painful, dangerous and expensive operations can be avoided in the treatment of cataract and other eye diseases by using simple remedies discovered by one of the most famous eye specialists of the age, without using the knife or taking the chances of blindness, which often results from operations. Please mention the American Bee Journal when writing.

## Long Tongues Valuable

South as well as North.

How Moore's strain of Italians roll in the honey down in Texas.

HUTTO, TEX., Nov. 19, 1902.

J. P. MOORE.—Dear Sir:—I wish to write you in regard to queen purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly,  
HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner, and other choice breeders: Untested, 75 cents each; six, \$4.00; dozen, \$7.50. Select untested, \$1.00 each; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Circular free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shows here with is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

## Something About Our 1st-Page Pictures.

### No. 1—Apiary of S. T. Crim.

The preacher's boy came over, and he had a little box in his hand that looked like a toy canon. After he had opened it he said he would shoot. I told him to cut loose, and here we are. My wife and little niece pretended to be bee-keepers, and they got shot, too. Our cousin from Springfield was standing in the shade of a plum-tree, and you see she is still in the shade.

This is only a part of my apiary. I have 68 colonies, starting last spring with 26. My bees are doing well this season. I caught several stray swarms and doubled up the small swarms.

I am 63 years old, and have worked at the blacksmith trade since I was 17, but have retired from such labor. I have kept bees for 30 years in the old-fashioned way, and I never knew there was such a thing as a bee-paper published until three years ago. You see I have lost all these years whereby I might have been a rich man in the bee-business. Since I have been reading the American Bee Journal I have found out a way to make bee-keeping profitable. Two years ago I tore up all my box-hives, and now have my bees in 8-frame dovetailed hives. I do love the hum of the honey-bees. Oh, what music they make!

Well, this little niece of ours is named Miron Cooper; she goes among the bees and never gets stung. She is 5 years old. Some time ago a swarm came out and settled on a small cherry-tree. Little Miron said she would help me hive them. So she skipped out, and I got the hive ready and went out to the tree, and there she was up the tree above the bees helping herself to the cherries.

The last of June I run out of hives, and could not wait to get them from the dealer, so I resorted to nail-kegs. I got along very well until filled the third keg—I had too many bees, they could not all get in the keg, and in the evening they left it. I prepared another, and hived them as before; the next day they swarmed again, they crossed the street and settled on a plum tree in my neighbor's yard, so I prepared another keg and took it over and put the keg under the plum-tree, and set the ladder up to bring them down. They must have seen the keg, for they let go and departed across the cornfield to parts unknown. I said, "Good-by."

I was amused at my neighbor. The next day he said, "Your swarm of bees left you, and did not take their queen with them." I asked him how he knew the queen was left behind? He said: "Because his wife told him the queen got after her and ran her into the house." I told him it was a drone!

S. T. CRIM.

Sangamon Co., Ill., July 28, 1903.

### No. 2—Apiary of Louis N. Meyer.

Mr. Louis N. Meyer, Sr., passed away about a year ago. Louis, Jr., is shown in the picture with the rest of the family. Their bees are mostly Italians, in modern hives. The parents of Mr. Meyer, Sr., had kept bees in Germany.

Louis, Jr., reports that they had very few colonies until his father subscribed for the American Bee Journal, then the apiary increased to about 45 colonies. The father's desire was that Louis, Jr., stick to the bee-business, which he is faithfully doing.

### No. 3—Apiary of A. W. Swan.

I send a photograph of my apiary, or rather what is left of it, which was taken in July, 1902, there being at that time 70 colonies of bees, and at the present time there are 42 left. I lost 28 colonies through the winter and spring. We have had three very poor seasons here in Kansas, either too dry or too wet, mostly wet. For the last year it has rained nearly all the time during clover bloom, and it is still at it. It has rained every day except one since white clover commenced blooming, which was about May 20. I have been feeding up to the present time, and to-day the bees are booming on white clover, and yellow sweet clover, which is blooming well.

A. W. SWAN.

Nemaha Co., Kans., May 4, 1903.

### No. 4—Apiary of Peter Fleming.

It seems to be quite fashionable for bee-keepers to send to the Bee Journal pictures of their apiaries for publication, so I thought it might not come amiss to send a picture of a portion of one of my apiaries.

I am running for comb honey exclusively, not the so-called, but the genuine, and of the choicest quality. The picture was taken June 28, 1903, and shows that the bees are doing fair business for the time of year.

The apiary is under two apple-trees that are well laden with fruit, as one can judge by the number of props under the limbs, and "your humble servant" standing against one of them. They are past 50 years old, and still bear well, the bodies being 2 feet in diameter. The ladder seen standing between the hives is where we went after a swarm; they get the start of me and drive out an occasional swarm, and I have other duties and cannot give them proper attention, but I give them as good attention as a one-horse bee-keeper can.

PETER FLEMING.

Clinton Co., Iowa, July 22.

### No. 5—Apiary of S. A. Matson.

I send you a picture of my bee-yard, in which there were about 60 colonies when it was taken. The hives face east, and the picture was taken from the northwest. The two trees on the left are apple, and the others are peach trees. The picture was taken the latter part of September, just after the supers had been removed.

Last year (1902) was a poor one; the bees stored but little surplus, and that of very poor quality. Our main source is white clover, and it did not afford anything.

S. A. MATSON.

## Editorial Comments

### An Invitation to Subscribe.

This number of the American Bee Journal will go to several thousand bee-keepers who are not now getting it regularly. Will such please consider this an urgent invitation to subscribe? We want you on our list of regular weekly readers. A good time to begin to read the Bee Journal is now. Read during the coming winter, and thus get ready for (bee) business next spring.

### Get a Book About Bees.

In replying to a set of questions sent in by a subscriber, the British Bee Journal prefaces its answers by saying:

"The first advice we offer to beginners is to procure a 'Guide-Book' on bee-keeping, without the help of which it is like groping in the dark with bee-operations."

That bit of advice is one that holds good as well on this side the ocean, and applies to all localities. Whether you call it a "text-book," "bee-book," "guide-book," or what-not, a book of instruction in bee-keeping is indispensable, and the bee-keeper who tries to get along without one is penny-wise and pound-foolish.

### Smoking Hives at the Entrance.

This is condemned by some as seldom or never necessary. It is well to be considerate of the feelings of the bees, and drenching with a volume of smoke sufficient to drive them out of the hive is to be deplored; but if smoke is to be used at all, it should be used where it will do the most good, and where the least amount will suffice. Many of the veterans make a practice of giving a preliminary puff at the entrance, and they seem to have good reason for it. For the bees, whose special duty it is to guard against intruders—the ones that dart out to attack an approaching enemy—are not stationed in the innermost recesses of the hive, but at the entrance. The first jar caused by the opening of the cover is the signal for them to rush forth, and once out they are not easily pacified. A little smoke at the entrance, before the hive is touched, may prevent their issuing at all.

### Ventilation of Hives in Winter.

How much ventilation shall I give my bees for winter? is the question that will now be asked by many. If your bees are to be cleared, you can not give too much ventilation, and it matters little where it is given—this referring to the ventilation of the hive, not of the cellar. In the time of box-hives, the right thing to do was to turn the hive upside down, leaving it entirely open above. If the ventilation is given in the usual way—at the bottom—the bottom-board may be left off and the hive raised in some way so air will have free access. Or, the hive may be raised from the bottom-board by blocks at the corners. An excellent way is to have bottom-boards two inches deep, with the front entrance entirely open.

For out-door wintering, give strong colonies an entrance of 3 square inches—weaker colonies in proportion. That would mean an entrance  $\frac{3}{8}$  x  $\frac{3}{8}$ ,  $\frac{1}{2}$  x  $\frac{3}{8}$ , etc.

### The Bee-keepers' Convention Season.

This usually opens with the annual meeting of the National, which, this year, was held in Los Angeles. Then follow, a little later, the Illinois State, Chicago-Northwestern, Minnesota, Colorado, Ontario (in Canada), Michigan, California, Wisconsin, etc.

We notice that several other States are planning to hold conventions, notably Missouri, Ohio, Kansas, etc. Some day we hope there will be a bee-keepers' organization in every State.

Bee-keepers in this country have not begun to attend conventions as they do in Europe. We have all been too busy with other things to get away, it seems. At least it appears that such has been the case. But bee-keepers need to "turn over a new leaf" in this regard. Conventions are a wonderful incentive and inspiration. They are suggestive, too. One often hears things said on such occasions that, if remembered and practiced, are often worth several times over the expense involved in attending the convention.

And then the personal contact with others in conventions. How invaluable is that. We would not take a great deal for the pleasure and help it has been to us in meeting the leaders and experts of bee-dom at the conventions we have attended. The only time we ever saw Father Langstroth was at a convention—the last one he ever attended, for he died about a month thereafter.

Plan to attend just as many conventions of bee-keepers as you possibly can. You will not regret it, either in the present or after years.

### Keeping Ants Out of Hives.

In Gleanings in Bee-Culture, H. A. Higgins tells of beating the ants in the following manner:

Stakes are made  $\frac{7}{8}$  inches long, and made of 2x4 scantling; and instead of being sharpened and driven into the ground they are sawn flat, fastened on the ends of the 2x4, on the bottom-board, and the ends inserted into old (or new) quart fruit or tomato cans; and each morning the cans are filled with fresh water. The ground around the hives is sometimes alive with ants, but they never get into the hive. I have seen only one ant on the hive since I have used the cans, and that was caused by neglecting to fill the cans for two or three days. The only trouble to speak of is filling the cans, and that is not much when you take into consideration the good derived from it, as the bees will water at the cans, and will not have to go far for water. I have never seen a bee at my watering-trough, which stands about 20 steps from the hives. They all water from the stakes.

There is nothing particularly new in this, and in the North ants are seldom so troublesome as to warrant taking so much pains, but in the South they become a serious matter.

### Why Do Bees Ball Their Own Queen?

It is not an infrequent thing to find bees balling their own queen. Why? Some say they are roused to anger by being disturbed, and then attack the queen. Others say they cluster about the queen to protect her. There seems rather more reason for the latter view. The queen is the most important "personage" in the queen-dom, and why should they not be solicitous for her welfare? The outcome favors such a view, for when the queen is found balled by her own bees, if the hive is quietly closed at once, the queen will be found all right at the next visit. That, after all, is the important matter to know—that the thing to do to insure the safety of the queen is to close up the hive at once. If disturbance is continued, the bees may bug the queen long enough to starve her, even if they do think they are thereby saving her.

### Importance of Reading Bee-Papers.

This can hardly be over-estimated by any one who desires to make a real success of keeping bees. We do not say this because we have a bee-paper to sell, but because it is true. Read what Mr. W. L. Coggsball says on this subject, in a late number of *Gleanings in Bee-Culture*:

When I see a good labor-saving device it makes my heart glad; or when some bee-keeper writes an article that gives a shorter cut for doing anything, it pleases me, and I say to myself, "He is a benefactor." To be an up-to-date bee-keeper one must read everything between the covers of the bee-journals, advertisements and all. Don't skip a thing if you are starting in to make money out of bees.

Out of the 15 young men who have worked for me at bees, 12 are still doing so for a living. The most successful ones are farmers' boys who were willing to do any kind of work on the farm. The most successful ones are those who read the most, and talked bees at all times and places.

I wish to emphasize the fact that a desire to talk bees is important. It is better to have it as a hobby if one would succeed.

When it is remembered that Mr. Coggsball is one of the very largest bee-keepers in the world, his words should have some weight.

The fact is, a bee-keeper, like any other business man, can not know too much about his business. No one bee-paper, no more than any one man, contains all the information there is to be had. So it is best to read as much as possible, and from as many different sources as one can. And if you don't see what you want of practical information in the *American Bee Journal*, all you have to do is to ask for it—that is, if you are a regular paid subscriber to it. Of course, any bee-keepers who are not subscribers to this journal, have no right to its invitation to ask questions whenever they so desire. Not even a bee-paper can be run very long on air alone. It takes *cash* to pay for white paper, press-work, printers, etc. But every honest person is glad to pay for what he gets that is really valuable.

### The Literature of Bee-Keeping.

Did you ever think of the valuable and helpful literature that the industry of bee-keeping has developed in the past 50 years? Not only can those who seek information concerning bee-culture and honey-production find it in the large and complete volumes of bee-books, but the current publications, issued weekly, semi-monthly, and monthly, afford most lively and up-to-date reading. Current events, as related to bees and bee-keeping, are reported, and thus put in permanent and useful form.

How many present-day bee-keepers ever stop to think of the advantage they have over their predecessors of a half century ago? The growth of recorded information has been wonderful. Now, by getting one of the several excellent bee-books, and one or more of the bee-papers, any one with a little determination and application, can soon learn to handle bees profitably, and with much pleasure as well. But no one should think of starting with bees without first getting one of the best books on the subject. Even if one never does a thing with bees, such a book is well worth reading, simply for recreation and general information, if no higher motive.

Of course, the bee-papers will be found in the home of every bee-keeper who expects or desires to be successful with bees. It takes too long to discover everything by and for one's self. Life is too short, and competition too fierce now, to permit the ox-cart method of travel when the automobile method can be had. Read up in winter, and practice in summer, is a pretty good way to proceed. To be sure, some reading by way of current bee-papers should be done at all times of the year. Reading and practice. Both are needed.

### Horizontal Bar in the Brood-Frame.

Frauk McNay, of Los Angeles Co., Calif., writes as follows:

On page 643, is mentioned a horizontal bar instead of wires in brood-frames. Can you tell us how it is put in the frame, dimensions of stick, etc.? Also, is a full sheet of foundation used, or two half sheets?

The Australian journal, from which the clipping was taken, made no mention of particulars, but it is quite probable that the middle bar was simply a bar the same length as the inside length of the frame, two half sheets of foundation being used. Better not try it on too large a scale at first.

### Honey-Prices in England.

These seem better than on this side, so that the British bee-keeper may well be satisfied with a smaller yield. Twenty-five cents for comb, and 12 for extracted, are spoken of as prices not unusual.

## Miscellaneous Items

**Ohio Bee-Keepers** are at work trying to secure a foul-brood law. Success to them.

**Editor E. R. Root** announces in *Gleanings in Bee-Culture* that in the coming election for National Association directors, he is not a candidate for re-election. The office of director is no sinecure, and one can hardly blame Mr. Root for desiring to cut off some of the many demands upon his time, but his declining to serve longer will be a matter of regret to many, for he has been a most efficient officer. It will not be easy to find so faithful and conscientious a successor.

**Herman F. Moore**, of Park Ridge, Cook Co., Ill., has been appointed a deputy inspector of apiaries for northern Illinois. He is about 15 miles northwest of Chicago. Any bee-keepers who may desire his services at any time, should address him as above. Mr. Moore is the hustling secretary of the Chicago-Northwestern Bee-Keepers' Association, and to his untiring and faithful efforts, more than to any other one person, is due the success and prosperity of that organization.

**Buckwheat Cakes and Honey.**—Four-year-old Garland is devoted to his young and beautiful Aunt Louise. One morning, as she was talking to him from the second-story window while he gave her ecstatic answers from the brick sidewalk, he suddenly held up his chubby arms and called up to her:

"Throw yourself down in my arms, auntie! I'll catch you."

"Why, Garland, if I were to do that," his auntie said, laughing, "I might make a buckwheat cake of you."

"Well, then, auntie," said the gallant little lover, "I'd be the buckwheat cake and you'd be the honey!"—Selected.

**O. O. Poppleton**, of Dade Co., Fla., wrote us as follows Oct. 24, 1903:

**FRIEND YORK:**—I expect to leave in about a week for a six or eight weeks' cruise in my launch down the Florida Keys. We will visit both the coral and the sponge reefs while gone. We will be almost entirely away from mail facilities, getting letters only; no papers while gone. We will live in our boat, moving from place to place as the notion takes us. Such a life down here in the tropics will be a little different from the one you will be living with all the surroundings of a big city, with the cold and storms of the North.

With well wishes for Mrs. York and yourself,

Yours as ever,

O. O. POPPLETON.

What a nice time Mr. Poppleton will have in that delightful summerland—or summerwater—trip. It does seem that some people are more fortunate than others. But we are glad our good friend can have such an outing. It will do him good.

**Look at Your Wrapper-Label.**—According to the ruling of the Post-Office Department at Washington, as announced heretofore in the *Bee Journal*, unexpired subscriptions to any newspaper or magazine do not constitute legitimate subscriptions, so as to maintain the second-class rate of postage. In view of this, we are compelled to stop sending the *American Bee Journal* as soon as the subscription or time paid for expires.

Please look at your wrapper-label, and if it reads "NOV03," it means that your subscription ends with this month. If it is "DEC03," it will expire with the end of next month.

We trust that all those subscriptions expire will renew promptly, so as not to miss a single copy of the old *American Bee Journal*. Remember our liberal offers, which we will repeat here: Two years for \$1.80; 3 years for \$2.50; or 5 years for \$4.00.

Also, when sending in your own renewal, why not get a new reader for a year, to send with it? For securing two new subscribers (at \$1.00 each), we mail you free a copy of Dr. Miller's book, "Forty Years Among the Bees;" or for three new subscribers (at \$1.00 each) you can have your choice of either Prof. Cook's "Bee-Keepers' Guide," "Langstroth on the Honey-Bee," or "A BC of Bee-Culture." Surely, here is an opportunity to get some splendid bee-literature for a very little effort. Either of the last three books with the *Journal* a year, both for \$2.00.

But, above all, don't let your own subscription expire. There will soon be just one department that will be worth, several times over, the amount of a year's subscription. This will be announced later. But think of all the other helpful departments in the *Bee Journal* each week! The *American Bee Journal* will simply be invaluable the coming year. A good many say it is that now.

## Convention Proceedings

### THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 695.)

#### REMINISCENCES OF BEE-KEEPING AND BEE-KEEPERS IN THE EARLY DAYS.

J. S. Harbison—I did not expect to be called on here to make a speech. I have been a worker and not a speaker, and if I give you a rambling talk, it will be all you should expect.

I may as well start out a little on the lines my friend, Mr. Root, who has just preceded me, has suggested, and go back to the early trials and tribulations of bee-keeping in my experience.

My father kept bees from my earliest recollection, and I became the owner of bees at quite an early age, and did much of the work of taking care of my father's apiary, which consisted of probably 20, 30—50 hives at most.

I came to California in 1854, landed in San Francisco Nov. 20, which will be 49 years the coming November. My first experience was the importation of fruit-trees, which I carried on for two years, and laid the foundation for those great orchards on the Sacramento River, extending from Marysville to Lower Sacramento.

During those two years I studied the flora of California, and became satisfied that bee-keeping would succeed. After I had made a shipment and returned, I sold out my tree and nursery interests in the winter of '56, and returned, say in April, '57, with the intention of preparing a shipment of bees for California, and I made that shipment, as I did not know of there being any bees in California until after my getting the shipment to California.

When I returned to my home in Lawrence Co., Pa., and there prepared my bees, I took chosen lumber, had it sawed out about  $\frac{3}{8}$  of an inch thick, and made boxes of about a cubic foot capacity. I made them light, because we had to pay at the rate of about \$1.00 a pound freight from Newcastle, Pa., to Sacramento, hence it required economy in preparing the hives. When I was ready to ship them I added a chamber of about 3x8x13 inches, as a place for them to get off their combs and carry out their dead during the voyage, and that was ventilated by a wire net, giving some ten inches of wire ventilation.

I started with 116 of these colonies, and got all through except six. Six were entirely dead on arrival. Of course, they were all reduced in numbers. While I was preparing these bees at my old home, my old neighbors there thought that I must be a little "off." I never could get them to California, they said. My father tried to persuade me that it was not a good thing for me to do, and all that. They tried to persuade me, but it had no effect on me. I said, "Father, I am doing this with my own money, and if I succeed, well, and nobody will be the worse for it." Then he tried ridicule. He named them "the dollar hives," when our neighbors all joined in and said I was preparing dollar hives, but I went on just the same.

When I prepared these to ship in November, I had to take them on canal boats from Newcastle, Pa., to Rochester on the Ohio River, and from there on a steamer to Pittsburgh, and from there by rail. They were taken to the Union Depot in Pittsburgh, hauled in there, perhaps, about 1 or 2 o'clock in the afternoon, and the train did not go until evening. While they were being transferred by the express company, I was to have supervision and direction, so I staid pretty close to my bees during that time, and as people came into the train, as is usual preceding its departure, the hives sat there, very plainly marked "Sacramento, California." I heard many uncomplimentary remarks. Some of those people had been in California. There were no bees there; there was nothing for them to work on when

they got out there. There must be some fool; and some put it a little stronger than the simple word fool.

Very near train time, however, there came along an undersized gentleman, very nicely dressed, and he took in the situation, looked around, singled me out as the owner, and said, "Are you the owner of these bees?" I said, "Yes." I

"I see they are marked for shipment to California." I said, "Yes, I am going to take them to California."

He said, "Have you been there?" I replied, "Yes." "Have you ever been engaged in bee-keeping?" I said, "Yes."

"Do you know you can get them there?" "Yes," I said, "I have letters from the head agents of the steamship companies," naming them, that is, the steamship companies in New York, and the Panama railroad. "I have arrangements made by which I am assured of every facility at their disposal for getting them through."

These questions were so pertinent, and the people became so interested, that there was a great crowd around. Then the murmur started, what a great enterprise it was, what a great undertaking. This gentleman shook hands with me and said, "I hope you will get there safe. Indeed," he said, "I am very sure you will, for you understand the business." It made it a little bit trying for me. I was comparatively a young man, but very resolute and self-willed to do what I thought I could do, and which I did do.

I got them through. Every facility was afforded me. I went down with Capt. R. L. Whiting, of the Steamship "Golden Gate." I had made his acquaintance on my trip down to Panama, told him of my plan, and he said, "If you should be so fortunate as to connect with my ship in going out, I will take great pleasure in affording you every facility in my power."

When I reached Aspinwall with my bees, who should I meet on the gangway but Capt. R. L. Whiting? He recognized me at once, inquired if I had the bees, etc., and congratulated me that I was getting along all right, and gave me some information as to getting them across the Isthmus. And so with the kind assistance of those men who were willing to assist in the introduction of new enterprises into California, I got there, made a success of it, and it has given me great pleasure to know of the success that has attended bee-keeping here in California.

Then the bees sold readily for two years at \$100 a colony in Sacramento. My "dollar hives" increased somewhat in value when they were sold at \$100. I presume there are some of you bee-keepers here who probably paid something

J. S. HARBISON.

like that for bees. I knew colonies that I had sold at \$100 were resold by other parties at \$200, and then they made money out of them.

A Member—There is a Mr. Hale, that was alongside of me 12 years in Los Angeles, and he said he bought 15 colonies from you and paid you \$1500.

Mr. Harbison—I remember that. They located them in the city of Sacramento. That is correct.

That is my experience in the importation of bees into California. After I got them here I found about nine colonies had been imported before mine, but by a man who had no knowledge of the handling of bees. One man had to have some knowledge. I think his name was Howell, and he was killed by the blowing up of the Steamship Jenny Lind, in San Francisco Bay, or somewhere in those waters. I think he had brought out three colonies. So that defeated his establishing the business. Those bees were taken to San Jose, a place not so well adapted to bees as the Sacramento Valley, so, while I did not bring the first bees to the State, it was my experience and success in increasing and showing what could be done with them that started the business of bee-keeping in California.

Question—Did you get nice yields of honey right away?

Mr. Harbison—My first year was devoted to increase.

Question—You didn't work for honey?

Mr. Harbison—I worked for honey considerably in '58. I invented my hives, and invented section-boxes there in Sacramento in the winter of '57, after I got the bees out. I made the first exhibit of section-box honey at the California State Fair held in Marysville, September, 1858. I took the highest premiums that were given. There was a Mr. Appleton, I think, from San Jose, that took a little box of honey there to Marysville and set it out, but I was told by a friend that he went there in the morning before I got around, saw my exhibit, and then went and took his box of honey away, so that it did not appear again. I was threatened with competition, but it didn't pan out.

Mr. Root—What price did you get for honey in those times?

Mr. Harbison—I sold those sections at \$2.00 a section, two pounds in a section. That was \$1.00 a pound, and it sold readily. I made four observatory hives, and one or two oval hives of the same pattern, which I still use. There at Marysville it attracted a very great deal of attention. Then I think it was the next year there was a large Agricultural Hall built in Sacramento, and I exhibited there. I exhibited a full set of observatory hives, showing the queens in all stages of growth, and the conditions of the bee, illustrating them, and my exhibit was placed in the basement, where all agricultural products were placed. I had a very fine observatory hive, which I have yet, but it has not been used for a great many years, and the managers of the fair came to me and asked my permission to locate that hive according to their ideas. I, of course, granted it. It was a gratification to me, and they took it upstairs. There was a fountain in front of the speaker's stand, and they located it right in front of the fountain. During the evening they had to have a policeman there to keep the way clear so that the visitors could pass and see that hive. It was acknowledged to be the most attractive one item exhibit at that fair. Of course, I was awarded the highest premiums that their rules would allow, and those exhibits, and the success that I met with, started quite a furore in bee-keeping, and, unlike many other booms that have taken place in California, it has kept on. Of course, prices fell, but it has been a continuous growth ever since. It gives me great pleasure to be here and give you a little idea of what we have passed through in fetching about this industry.

Mr. Miller—Can you tell us how much it cost you to get those 110 colonies you brought from Pennsylvania by the time you set them up here?

Mr. Harbison—In the neighborhood of \$1800.

Mr. Root—When was your book published?

Mr. Harbison—In 1861. I wrote it in Sacramento. It is out of print, and there are very few copies to be had. They are scattered over California, a good many of them.

By the way, I sent the first case of comb honey that ever went across the continent. I put it in the first car of green fruit that was ever shipped from Sacramento, or from California. That car-load went to Chicago, and that case was the first case of California honey ever sold East.

Mr. Root—Tell us about your experience in sending car-loads across.

Mr. Harbison—We didn't send car-loads until we introduced bee-keeping down in San Diego. I had a friend down there, a Mr. Pardee, a relative, I suppose, of our present Governor. He had made some investigation down there as to the flora of San Diego, and he was satisfied that bees would do well. I had a friend, Mr. R. G. Clark, who lives in San Diego, whom many of you know. He was not engaged then in any enterprise, and his brother having bought bees, and having made a fine success of it, and hav-

ing learned from his brother, they conceived the idea of Mr. Clark going down there with his bees. We took 110 colonies and landed them in San Diego, Nov. 28, 1869. Those were the first bees landed in San Diego.

Question—When did you get Italians?

Mr. Harbison—In San Diego; I think from Mr. Quinby. Then I got others in '65. We landed those bees down there in San Diego in '69, and Mr. Clark and I were in partnership four years there, and in that time established four apiaries, and when our time expired he took two and I took two. He ran his two apiaries for the first season afterward, which was the year 1874, which was the best season we ever had. Then he sold out, and took the money, which was quite a considerable sum that he made during that time, and planted the first vineyard and eucalyptus grove ever planted in this valley, and to which is due the first raisins ever raised in San Diego County, a fact which, I think, may have been lost sight of. Others may have been credited with being the pioneer, but he is the pioneer raisin-grower in San Diego County.

Question—What is the greatest number of colonies you ever kept in one place?

Mr. Harbison—600 colonies.

Question—How much did they yield?

Mr. Harbison—They yielded an average of over 150 pounds of comb honey per colony, in 1864. That was the Honey Springs Apiary, near Lyons' Peak, in San Diego County. I had some apiaries there that had 400 or 500 colonies. I think I had as many as 500 colonies in this Sweet Water Apiary that I still own there, which is the last of my apiaries. I think the greatest number I had at any one time was about 3750 colonies, divided around in 12 apiaries.

Question—What was the largest crop in any one year?

Mr. Harbison—I can not give you the amount of the product, but it was considerably over 100,000 pounds.

Question—What was honey worth at that time?

Mr. Harbison—The first car-load was sold to C. O. Perrine, of Chicago. For 27 cents a pound, delivered in Chicago. I reserved, however, a few cases, perhaps 20, and placed in the hands of Graff & Co., to be sold as an experiment, and I think they realized 28 cents for me. The freight-rate, I think, was about 3 cents a pound gross on the car-load.

Question—That was extracted honey or comb?

Mr. Harbison—That was 2-pound sections. I have always produced 2-pound sections, and when I have ceased to do that, I shall have ceased to produce any honey. I have one apiary left which I want to sell. If I am spared to the 23th of September, I shall have passed the 77th landmark of my age, so it is time I had my apiary sold and somebody else was running it. It is for sale.

Question—In what year did you send those first cases of honey with the car-load of fruit to Chicago?

Mr. Harbison—It must have been exhibited at Marysville in '58, and Sacramento in '59. It was the first year after the railroad was completed. I think it must have been in '61 or '62, somewhere along there; anyhow, the first season after the railroad was opened overland. This car-load of honey that was shipped from San Diego—it must have been in '71 or '72 that we sold it to Perrine.

When we took the bees to San Diego, I had a little of the same experience in the way of comments that I had when I made my early shipments to California; that is, there was nothing for the bees to feed on in San Diego, hence it was a foolish enterprise to take bees there! But when we began to take our honey there, and going on board the steamer, they began to inquire how much we were getting a pound for it; they changed their minds, and were desirous of going into the business.

Now, to go back to the question that is affecting you all, I want to give you a little bit of history of the introduction of foul brood into California, and my experience with that.

In 1858, a man named Wheaton came to my place and visited me a number of times under pretense of buying bees, but, as I suspected at the time, and as was afterwards proved, simply to get the secrets of my success in the handling of bees. However, late in the fall of '58, he arrived at Sacramento with quite a large number of bees, somewhere from 80 to 100 colonies. I inquired where he got them. He said he got them from Quinby—out of Mr. Quinby's winter quarters.

He placed them within three-quarters of a mile of my apiary, a great many of them in bad condition. I did not know anything of foul brood then, for we did not have any in western Pennsylvania, and I supposed that foul brood was really chilled brood. He complained that my bees were robbing his. I went to make an examination, and remem-

bered what I had read of Mr. Quinby's writings about the disease, and recognized what was the matter. That disease was imparted to my apiary, and altogether I think I destroyed somewhere from 60 to 90 colonies, because I applied heroic treatment—burned them up, hives, honey and all. But even that failed to eradicate it, but I kept at it for two or three years, until I got it killed.

But, fortunately for me, I had established another apiary two or three miles from my home apiary, out of reach of these infected bees. I had sold 250 colonies, perhaps, to various parts of the country, and as soon as I discovered the presence of this disease in the State, I published an article in a San Francisco agricultural paper, warning my customers of what had transpired, and warning them to beware of these diseased bees, for it would prove disastrous to their interests. I did so to protect my customers, for I took pride in having men say, "You treated me fairly, and my purchases have been a success;" and I have met commendations.

The result was a paper controversy between Mr. Wheaton and myself, and some others joined in. They claimed I had no right to make public the fact of the presence of the disease. They did not deny that it was present, but claimed I had no right to injure their enterprise. I claimed I had a right. Mr. Wheaton finally brought his bees down to Los Angeles, and to him you are indebted for the trouble you have, and always will have with you. For you will never succeed in obliterating it, from the fact that the bees are in the rocks, in cavities, and every place else where the disease can be rooted. So you can only succeed in keeping it down as well as you can, only palliate what you can not cure.

I do not know that I can say anything more that will interest you. I do not know that what I have said gives you any interest, but I hope it is instructive, if nothing else.

Question—Mr. Harbison, did you have any friction with fruit-growers?

Mr. Harbison—They have made some complaints. I never got into any lawsuits on the question.

Question—An apiary belonging to one Steele Cannon, coming from Upper Sweet Water, with about 100 hives, I think, was burned. Can you tell us anything about that?

Mr. Harbison—I know of a number of apiaries burned. There were none of mine burned, however. There were some, probably, due to fruit-men starting the fire. I know there were threats made that apiaries would be burned, in case they were not moved. There were some people who moved their apiaries away, and gave them up. They never molested me. In one case where they complained, I went to the trouble of fixing the hives so they could be shut up during the day, but on visiting the vineyards about the same number of bees were found there as when they were not shut up, because the bees are in the rocks and trees, and wherever they can get a cavity to locate in. That can not be cured, and hence they will have to endure it. Whatever damage they may do to the raisins it is not so great as is generally imputed to them. Squirrels, and all that kind of thing, destroy more grapes and raisins than ever the bees do, or can do; but the fruit-men do not pay so much attention, and do not seem to care for them, because they are not supposed to be owned by anybody.

There is one more practice to which I should like to call your attention along the lines I have been experimenting on, and that is the matter of bee-pasture. I have demonstrated for myself, and those who care to investigate will discover, that very much can be done to improve the bee-ranges. The black sage that is found abundantly on the coast, in many places, does not grow in the mountains, or, if so, in very few locations. I gather the seed of it, and have planted a good deal of it on my ranch. I have, perhaps, 100 acres or so that is well kept, and it is adding to the value of my apiary, because it affords bloom when we have somewhat of a scarcity of other flowers, and we have a great deal of land there that I see no use that it could be put to that would be profitable for many years to come, at least, and I do not think there is anything that will pay better than producing bee-pasture.

There is a shrub that is found very extensively there on the mountain regions of California, that is worthless as bee-food. The bees gather some pollen from it, but no honey. The soil is good, and if you uproot the grass and weeds, the black sage and white sage take very freely. It is good land, suitable for these plants. You will have to confine yourself in improving your bee-ranges to the planting of our native shrubs. I know of no foreign honey-producing shrubs that will stand our dry season equal to our native plants. The eucalyptus family will be of great value.

It is a fine tree to grow, and resists drouth well, and will bloom at the time when our main dependence is gone. While eucalypti do not yield so much honey as our native plants, still the bees will increase, and it will subsidist your bees so that you can take off all the fine quality of honey, and you can depend upon the eucalyptus to carry your bees over the year.

Question—May I ask if you plow or cultivate the land where you sow the seed?

Mr. Harbison—It would be better to do so, but black sage does best where you have a plant over six feet square, better than if sown too close. When sown broadcast, it usually comes up too thick, and, while it produces well, it does not produce as well as those clusters where they cover a piece of ground two yards in diameter or more—a great, big mass of black sage—as you who are familiar with it know.

Question—Does black sage produce a water-white honey?

Mr. Harbison—Yes, there are three varieties of it here in these southern California counties. There is black and white sage. Up in Eldorado and Placer counties, where I kept bees and experimented, there is what might be termed "creeping sage." It grows on the ground, and runs, and I have seen a single plant cover more than a rod in every way, and shoots up bloom-stalks a foot or 18 inches. The bloom is almost identical with the garden sage, and I have seen as many as 25 bees working on an equivalent of a square foot. The honey is as white as your whitest, and has an aroma a little superior to these southern California plants.

Dr. Miller—Is that sometimes called the purple sage?

Mr. Harbison—I never heard it called that. I think the purple sage has a blue flower. What we term "black" is of a dark-green color in its foliage; the white is of a white color in its foliage. I discovered a plant on my place a perfect cross between the white and the black, that gives great promise of being an improvement on both of them. I saved some of the seed, intending to experiment and see whether I can produce all the varieties.

Question—Do you think the creeping sage would succeed in the Southern Counties?

Mr. Harbison—I have no doubt it would in some of the higher mountains. I have some growing, and while it is a partial success, I have not experimented in growing it in a number of places, but I think I could locate it in places more adapted to it than places where I have it, so I don't think it would be as profitable as our white and black sages would be for propagation.

To go back to the eucalyptus. What we call the red-gum is in bloom, and has been, for a couple of weeks. The bees work on it very largely to produce honey wholly. I think I have never seen the bees work on it gathering pollen. It comes along in sections, and will be in bloom for probably six or eight weeks, commencing early in August and running on into September. Then comes the blue-gum eucalyptus, which is the most rapid grower of the eucalyptus family, and that grows very rapidly. Some will be in bloom in October, and then others again along in September; another variety of trees will be in bloom along in March and April; then there is the *Robustia* that commences to bloom in January, February and March, and the red-flower gum that blooms at the same time. That is a very picturesque, fine tree. There are but few of them, I am sorry to say, growing in that country.

The planting of the eucalyptus would be a valuable investment as a fuel-producer, to say nothing of its value to bee-keepers. Groves of eucalypti would grow into money very rapidly. I had a few trees planted on my Sweet Water place 20 to 22 years ago, and some are now at least 100 feet high, and would make a cord or more of stovewood to the tree. I have not triangled them, but they are said to be 100 to 120 feet high.

(Continued next week.)

Why Not Help a Little—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

### How to Use a "Bingham" Honey-Knife.

BY T. F. BINGHAM.

I HAVE regarded this invention as a scientific discovery. The knife does what it does because so little of it rests in the honey to be uncapped. The honey is fixed, and comparatively rigid, yet plastic. Were the knife to lie flat in the honey the atmospheric pressure would be approximately 195 pounds upon its upper surface. The adhesiveness of

the honey does not readily admit the air to the underside from any usual cause, hence to move it is to move at least a part of 195 pounds pressure. No one will fail to see that by turning the knife in such a way as to allow a part, or all, of the 195 pounds atmospheric pressure to pass under it, it would not stick. I think the above explains why the  $\frac{1}{4}$ -inch bevel resting on the uncapped honey does not tear the cells—the only fixed matter in contact with it. The caps, as cut off, are movable, and do not hinder the free movement of the knife. The knife, as constructed, is simply less than  $\frac{1}{4}$  of an inch wide, merely a sharp edge which moves readily over the

T. F. BINGHAM.

honey and beneath the caps; the other  $\frac{1}{4}$ -inch blade is merely an apron to keep the caps from falling back upon the uncapped honey.

It will be readily seen that the bevel is the knife, and that this bevel depends upon the thickness of that part just back of the edge. That is why the knives are so thick. They should always be sharpened on the beveled side. I have been using to-day the first knife of the kind ever made. (It cost me \$2.00 in the edge-tool factory where all my knives are made). It is a perfect tool, and while a little wider than now made it can not be improved. A pound of steel makes about three blades.

I have often seen accounts of how to use an uncapping-knife, and while I don't know how they should be used, I will state briefly how I use mine.

I have a pail (wooden) so as not to dull the knife, or a shallow pan, filled with ordinarily cool water, into which I drop the knife whenever time will permit. The water removes the honey from the sharp edge, and is a great aid in starting the knife under the caps. It is at the starting point that the trouble begins. If it gets a clean start all goes well. Never use hot water; the wax will stick to the

BINGHAM HONEY-KNIFE.

(Showing lower side with beveled edges.)

knife, and, when it does, the knife might as well be iron as steel, as the edge will be thick with wax and will not cut—merely melt its way through the combs.

On this water question, I would just say that soap and cold water will remove bee-glue from your hands better than hot water; and if water and soap won't do it, a tablespoonful of clear alcohol will soften the wax, after which soap and water will do the rest.

Some might suppose that the water would rust and spoil the knife, but honey-sweetened water does not. It may lie in such water days without injury.

We are having great rains. Early honey was abundant and fine. Nothing but bees after July 5 I have just doubled up my colonies, and they have enough honey for

winter. I put 150 colonies into 75 to do it, and they are not short of bees or honey. It gave me a nice opportunity to weed out the hybrid queens, as 75 had to be removed. It took me from 5 to 7 hours per day, for 3 days, and not a single comb separately was changed in any of the hives. This feat could not have been performed in any other apiary in the United States or Canada, perhaps in the world.

Clare Co., Mich., Oct. 17.

### Bee-Keeping on a Poultry Farm.

BY VICTOR D. CANEDAW.

AS I have been asked to contribute a paper for this meeting, I will endeavor to give an outline of my experience in bee-keeping, and state why we chose to keep bees in connection with the breeding and rearing of our thoroughbred poultry.

About the middle of December, 1899, we bought 3 colonies of bees for \$6.00, the low price inducing us at that time to begin bee-keeping. We wintered them in our house-cellar, and the following summer, although a very poor year, and many around us had scarcely a swarm and no surplus honey, the 3 colonies increased to 7, and gave us 40 pounds of surplus honey.

During the season of 1901, the 7 colonies gave us nearly 800 pounds of surplus honey, and increased to 15 colonies. Our best colony that year gave us 105 pounds of surplus from the first swarm, and 65 pounds from the old colony itself, making a total yield of 170 pounds of comb honey. We sold 5 colonies, and began with 10 last spring, which increased to 18, and of that number we had 14 left, the others having been sold. The honey yield with us, this year, was only about half what it was in 1901, the 10 colonies of last spring's count giving us a yield of only about 600 pounds of surplus. So far, we have not lost a colony in any way, with the exception of two swarms which left for the woods without proper warning.

With the success we have had from the outset, you will not be surprised that we are quite favorably impressed with bee-keeping as an adjunct to poultry-raising and fruit-growing.

Perhaps the one thing which most strongly influences people to engage in bee-keeping is their liking for honey, and with us the supply of honey for our own table was the first consideration.

Bee-keeping is particularly adapted as an adjunct to poultry-farming, owing to the fact that the heaviest part of the work among the bees comes at a time when the poultry work is comparatively light. On most practical poultry farms the hatching season closes with May, and the work during the remainder of the season is comparatively light, while the work with the bees is most exacting from the last of May, through June and July. If the poultry-keeper chooses to bend most of his energies to obtaining fall and winter eggs, which are the most productive of profit, he is free to give them his entire attention, as the bees require but very little of his time at these seasons.

The labor of both bee-keeping and poultry-raising is comparatively light work, and to one not overly strong, and who feels the need of an open-air life, there are few occupations which are more attractive and fascinating, and certainly few which require so little capital to be invested, and yet are capable of furnishing one with a good living, if not something besides.

In keeping either bees or poultry, it is essential that one apply themselves closely to the work; although not heavy nor particularly taxing on one's strength, they require constant and systematic attention to insure best results.

Perhaps one very much disinclined to stay at home closely would not find them congenial employment, owing to this particular feature. This, however, would prove no objection to home life and rural surroundings. In fact, such would find it rather a pleasure to stay at home and give these interests the care and attention they require.

Our farm consists of only ten acres, and is devoted to the breeding and raising of pure-bred, white Plymouth Rocks for breeding purposes. Our busiest times are doing the fall and winter, with the selling and shipping of breeding fowls, and during the spring with the sales and shipments of eggs for hatching purposes. Thus, you will see our work with bees comes at a time when other work is not so pressing. We have quite an orchard of plum trees well started on the farm, to furnish shade for the chickens and incidentally fruit for our table, and for sale.

Bee-keeping has been taken up as a side-line, and has been found to interfere very little with our regular poultry-work. The chickens are allowed to run among the hives, to the mutual benefit, we believe, of both bees and chickens. From the fact that the poultry frequent the neighborhood of the bee-hives so much, and we seem to have so little trouble from the bee-moth, we judge they catch many of the millers, and I am quite sure they catch a great many drones, without manifesting a wholesome fear of the workers.

In many ways poultry and bees seem to be adapted to occupying the same ground.

The combination of poultry, fruit and bees seems to be a unique one, each contributing to the well-being of the other. Shade is one of the essentials on a poultry-farm, and nothing furnishes any more desirable shade for poultry than an orchard of plum or apple trees, while either makes a most desirable location for the apiary, especially a plum orchard. The trees being of low growth, prevent swarms clustering too far out of reach. In case of its being necessary to remove the branch on which the swarm clusters, plum trees are much less liable to injury from the unseasonable pruning.

It is generally known that fowls are of no small benefit to the fruit-trees, not only by consuming many insect enemies of the fruit, but by increasing the fertility of the soil over which they run.

Fruit-growers generally, I believe, recognize the value of bees for fertilizing the fruit-blossoms and increasing their chances of liberal yields of fruit, so it will be readily conceded that the production of honey, fruit and poultry products can be profitably and economically combined.

We had not care to engage in the culture of small fruits and bee-keeping together, especially the raising of strawberries, for the heaviest work of picking and marketing the strawberry crop comes just in the height of the swarming season, and both require prompt attention to be handled profitably.

Perhaps in the majority of cases where bee-keeping is carried on in connection with other pursuits, it would be found most convenient to run for extracted honey. One of the chief difficulties with us has been the tendency to excessive swarming when run for comb honey, and by working for extracted honey this tendency seems to be materially lessened; I believe this the experience of bee-keepers generally.

We had one colony, the past summer, which did not swarm at all, and otherwise than the presence of considerable drone-comb in the hive, we could not see anything to prevent them swarming. It was one of our best Italian colonies, and was used to supply breeding drones for our apiary. Other colonies swarmed more than usual, although the season has been unusually cool, but they were practically without any drone-comb.

By the use of modern hives and appliances, bee-keeping can most certainly be made a source of pleasure and profit on a poultry farm.—Read at the Minnesota State Convention, Chisago Co., Minn.

## The Value of Sweet Clover.

WHILE there are many who unqualifiedly condemn sweet clover (*melilotus alba*), also known as Bokhara clover, as a noxious weed that is not to be tolerated under any circumstances, there are others who claim for it some good points. Without doubt the conditions have much to do with the attitude of the observers. It is a very rapid and vigorous grower, produces an enormous quantity of seed, and is in other ways fitted to thrive under adverse circumstances. For these reasons it is quite persistent in remaining where it is not wanted when once it has maintained a foothold. This feature is, however, a strong point in its favor under certain conditions. It enables this plant to thrive where it is impossible to supply the conditions of soil and treatment necessary to the successful growing of other crops. As its name indicates, it is a legume, and like the other members of that family, it is a great improver of the soil. Prof. Duggar, of Alabama, says:

Fields that for two years have borne sweet clover have been known to produce the next year nearly twice as much corn as before being sown to this leguminous plant. At the Ohio Experiment Station, a number of years ago, a notable increase in the yield of wheat was obtained through the use of this plant as a green manure. The cane-brake Experiment Station at Uniontown, Ala., has demonstrated

not only the power of this plant to add nitrogen and vegetable matter, but also to assist in the drainage of the heavy calcareous clay soils of that part of the State, through the channels made when the large roots decay.

It should not be grown as a crop on soils where the other more common legumes will thrive; for while this plant is very easily grown, and an enormous yielder, it is not relished by stock either as pasture or hay. It is nutritious

*Courtesy Prairie Farmer.*

SWEET CLOVER IN POSSESSION.

when properly handled, and stock will do fairly well on it when they can get no other roughage, and become accustomed to it.

Its value as a honey-plant is quite generally recognized. Its chief redeeming feature, however, is its ability to flourish on soils that are in their present state almost barren. Where it once gets a start it will crowd out almost any other kind of vegetation.

The accompanying illustration represents a spot in a large area of idle land where the native grasses and weeds have been almost exterminated by the encroachment of sweet clover. Two fence-posts of ordinary height are in the center of this view, but are hidden by the clover, which will give an idea of its height. In the foreground is a patch of young clover just coming from the seed that ripened and shattered off last year.—*Prairie Farmer.*

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Cell-Cutting to Control Swarming.

I wonder if Mr. Hasty is "meekly ready to be informed and corrected by the" woman, as well as the man, "who has run 50 colonies through the season that way." Page 665.

I have run more than 50 colonies through more than one season that way. Yes, it is a good bit of work, and not always pleasant, *but* it gives the honey.

### A Sister's Impressions of the Los Angeles Convention.

Mrs. A. L. Amos, who was perhaps the sole representative of Nebraska bee-keepers at the Los Angeles convention, writes:

"I find that while I was holiday-making my bees were not. I have not yet removed all of the honey crop, but enough to make sure that I have every reason to be satisfied. Nebraska is not California, but to me it is literally 'a land flowing with milk and honey.'

"Being only a little fish rather than a whale among the bee-keepers, I don't often indulge in a convention, and

had not attended one since Lincoln, which I surely enjoyed much more than I did this last."

In a letter to the Custer Co., Beacon, Mrs. Amos gives her impressions of the Los Angeles convention, and among other things says:

"Certainly, it seemed to me, that there was more wrath than was desirable—in fact, the quibbling over trifles was not altogether creditable to the intelligence and forbearance of the craft, and suggested the idea that some of the irascibility of the Cyprian or the black bees, and the hybrids, with which some of the veterans are familiar, had, in some subtle way, communicated itself to them."

But, with the spirit of a philosopher, she concludes with the following wise words:

"Those of us who went to the convention, imbued with that spirit which carries malice toward none and charity for all, and a mind receptive to learn, will forget anything that might better be forgotten, and treasure only the wisdom of experience which was freely given; and will trust that 'the spirit that heals differences,' may descend upon some of the excited brethren, and bring them peace."

### Mrs. L. Harrison Afflicted.

I shall go to the hospital next Monday, to have an operation upon my eyes for cataract. I hope you will be able to read what I have written in dim light, the last I will be able to write for some time. My very busy life of three score and ten years are telling upon me.

Peoria Co., Ill., Oct. 22. MRS. L. HARRISON.

I am sure that Mrs. Harrison has the hearty sympathy of all the sisters in her affliction. We shall all be anxiously watching for the outcome, and earnestly hope that it may be successful.

Mrs. Harrison has been so long and favorably known among the bee-keepers that she may well be styled one of the veterans.

### Wants to Begin Bee-Keeping.

I have no bees yet, but I take the American Bee Journal in club with the Nebraska Farmer. One of my friends has some bees—Mrs. Hutflus—and she is going to send for an outfit. She does not know much about bees. I would like to go into the bee-business. I have a 40-acre farm, and I think she will let me have some; then I will tell you how we get along. I have plenty of flowers, catnip and clover. The trees are very large, and have plenty of fruit. I have had my homestead 23 years. I live alone, and have to work so hard. I have a good garden that I made myself. I do not think I can do so much work any more, but will have a different way for the future. I will have some bees if I can, and if the farmers do not attend to the crops they will have to leave them.

Pierce Co., Nebr., July 24.

RACHEL HUNTER.

Here is a woman that is up to date. She takes the Bee Journal before she has any bees. That is a good deal better than getting your bees a good while before you get the Journal.

### Have Your Bees Ready for Winter.

Are you sure that your bees have plenty of stores for the long winter? Not just enough, remember, but abundant stores. No harm to give them too much—they won't waste it.

Do you winter your bees out-of-doors? Then see to it that they are snugly packed for their long winter nap before it is too late.

If you winter them in the cellar, get your bees all ready to pick up and carry in whenever the weather gets cold enough. Don't put these things off until the last possible minute, for in that case they are apt to be done hurriedly, and so not very well done.

These delightful October days are likely to fool us into believing that there is plenty of time, but snapping cold weather may come with a jerk, and catch us napping.

The Premiums offered this week are well worth working for. Look at them.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### GETTING BOTH HONEY AND INCREASE.

To get both honey and increase in one season choose an exceptionally swarmy season (like the last), goad them on and see them get to swarming feverishly; then catch as catch can for all the honey you can get. J. E. Johnson's plan, page 600, doesn't differ very widely from this. But he went it "powerful strong," it must be confessed. Fifty colonies from 12, with 1400 pounds sure, and 1000 more heaving in sight, and the back county of Smartweed still to hear from—well, we don't blame him for bragging.

"All queens seem to be prolific in a good season." How's that for good aphorism to Mr. Johnson's credit?

There's another kind of season that favors both honey and increase—not quite surplus at all till very late, and then a good flow. Four colonies made out of one may, in such conditions, be expected to give more surplus than one would have done. Alack, comrade J., we are both teaching the children to play with fire! The safe road to surplus is to repress increase and keep all colonies as strong as possible. Not possible for us to know about the season's peculiarities before they arrive.

### SWARMS CLUSTERING OVER NIGHT.

I think Dr. Miller is right, on page 602. In good weather, if a swarm stays in a cluster longer than over night, it is with the intention to stay permanently. But, being nearly all women-folk, they may change their minds. We are not to be particularly astonished, therefore, if some one should report a cluster hanging four or five days, and then flying to parts unknown, in the usual style.

### A "GRANDMOTHER SISTER"—BEE-PROTECTION.

To say that our grandmother (or pronounce it grand-mother) is a Sister, hardly sounds right. Apiculture for 33 years seems to entitle Mrs. Harrison to some other title. Her style of bee-protection is somewhat unusual. I should call it a good style—only some of the younger sisters might whisper, "How do I look?"

I'm inclined to think it has not often been in print that bees take stiffly starched linen as a board or something, and don't try to sting through it. Guess that's perfectly correct. I can imagine that valuable use might be made of the fact sometimes. Page 603.

### IS IT A SURE THING IN TEXAS?

Mr. O. P. Hyde, of Texas, is putting it pretty strong when he says:

"Gentlemen, the bee-man never has a failure, never knows any want."

I thought at first it was comicalities he was at, but he seems to be in earnest. Page 615.

### THE QUEEN-BEE AND OTHER BEES.

Mr. Arthur C. Miller—after we have sufficiently rubbed him down with cobs and sharp curry-combs, we shall probably in the end come to thank him. Probably nearly all of us were crediting the bee's ligula with much more service than it actually performed; and it is desirable, very desirable, that the bee should stand right in our minds. Still, as for me, I am in no haste to say that the bee never does—well, anything it can do. Barely possible, perhaps, that by some queer arrangement it may be impossible to disgorge through the ligula.

He seems rather too anxious to reduce the queen to the ranks—don't appear to have the "judicial turn of mind" toward her—but no ultimate harm is likely to come of letting him trot out his theory of the queen's actions, and his theory of the actions of the workers toward her. Only he must not let his dander rise if we should say: "This is theory, brother, and we also have our theory." So, whenever the queen is fed something better than honey, the bees turn to like little boys and flourish a "Gimme some!" It's a valuable observation that the queen is seen to ask bee after bee and get nothing; also, that a delay or parley of some sort precedes actual feeding sometimes. Others must

verify until we know how general these things are. If bees never offer a queen anything, a caged queen would seem to be in dire straits. It is generally understood that whole apiaries are run for ten days or so with queens caged, to be fed by their own bees. I never did this, and don't, at this moment, know whether it is necessary to put food in the cages or not.

It's interesting to see that even during very rapid laying the queen takes rests of ten minutes or so. Guess the eggs are in strings (so to speak) and when one sting is ended the next may not be quite ready. But, then, we don't urgently need any theory other than the usual weariness and rest to account for this. Evenly told off through the day, 2000 eggs would be one each 46 seconds. Page 61b.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Storing Draw-Out Combs.

Where shall I store draw-out foundation combs to keep from getting moldy during the winter? MINNESOTA.

ANSWER.—Anywhere except in a damp, moldy cellar.

### Two-Piece Bottom-Bars—Bee-Quilt—White Clover.

1. Where can I get frames with the two-piece bottom-bars? How much more do they cost than the regular Hoffman frames? 3. Could the regular Hoffman frames be made that way? 4. What do you use over the frames for winter covering besides the cover?

5. Give a good description of a bee-quilt.  
6. I have some honey that I call white clover, but in the place of being clear white it is a kind of yellowish color, some cappings being white while others beside them have a yellowish appearance. What is the cause?

I have 34 colonies of bees. I had about a third of a crop this year, the weather being too wet and cold. WISCONSIN.

ANSWERS.—I. You can get them from the G. B. Lewis Co., by ordering Miller frames, and probably elsewhere.

2. I don't remember, but there's very little difference.  
3. If you mean with a two-piece bottom-bar, I think they might.  
4. Nothing whatever. They are taken into the cellar just as they stood on the summer stands.

5. I haven't seen anything of the kind for a number of years except in an apiary in California, and there a simple sheet of heavy material like denim or duck was laid over the frames. The last thing of the kind I used was a double layer of heavy sheeting with several layers of newspapers between.

6. Hard to tell without seeing it. I suspect you left it on pretty late and the bees gave it a slight varnishing with propolis.

### Wintering Bees.

As we are just starting in the bee-business, we would like to ask a few questions in regard to wintering bees.

1. We bought 4 colonies of Italians about 2 weeks ago (Oct. 1), and have had no experience heretofore, excepting what information we got by reading the "A B C of Bee-Culture," edition of 1887. Do you think it is too old for modern bee-keeping?

2. Two of the colonies have about 15 pounds of honey in the supers in sections. Would you advise taking this out?

3. If so, would it be best to remove the super or leave it on? If left on, would it be a good plan to fill same with shavings, or something like that?

4. Also, one hive has no cover, and there was a board laid on with a cloth or quilt, and the honey is stuck fast to it. As it is long and wide, and very unbandy, would you advise taking it off? If so, how? I do not think there is much honey below in it, as the hive is very light.

5. As we have no good cellar to put them in, would you advise building a shelter, or leave them out in the opening as in summer?

6. What kind of cloth or quilt do you recommend? and can they be bought of dealers in bee-supplies? IOWA.

ANSWERS.—1. Of course, there is constant progress being made in bee-keeping, but if you keep up with the teachings of 1887, you will be doing very well.

2. Supers are supposed to be taken off long before winter.

3. Either way. If left on by all means use planer-shavings or other packing.

4. I'm afraid if you muddle you may make bad work. The bees have probably settled their winter quarters up against that board, and

you better leave them as they are till spring. If the board is too much in the way by its length, saw it off.

5. Better give some kind of shelter, if it be only to pile corn-stalks about them.

6. Enamelled cloth may be used, or heavy sheeting, such as you will find at any store. But, nowadays, many use flat covers without any sheets or quilts. If you pack shavings in the super over the hive for wintering, you must have something under the shavings. Burlap, or almost any kind of cloth, will do.

### A Kind of Fly—Bees Fighting—Uniting Colonies.

1. I am a beginner in bee-keeping. I caught a fly or a bee, I don't know what to call the critter, so I send it to you alive in a tin box. I saw a couple of them enter one of my hives. I don't know what they are; I saw them several times during the warmest part of the day. What is it, a fly or a drone? Name it, and give its habits.

2. I opened a hive the first part of September, and set the frames in another hive-body and looked for the queen. I spent about half an hour, but could not find the queen; I wanted to kill her, as she was a hybrid. The bees filled themselves with honey, and when I put the frames back nearly all the bees went back, then some went fighting among themselves, and would take a bee that was rather late in getting back and would make her give up all the honey she had, then they would sting her to death, or bite her so she would die in a few minutes. They killed about a half pint of bees in this way. Bees from other hives did not fly on that morning, as it was a little cool, so it was their own bees they killed. Why did they kill their own bees in this way?

3. Is a Langstroth frame the same dimensions as the Hoffman frame? If it is not, what are the dimensions of the Langstroth frame?

4. If 2 colonies are united now (Oct. 15), will they fight very much if smoked some before setting one brood-body on another? MICHIGAN.

ANSWERS.—1. The insect is a kind of fly that is not very uncommon, but I'm not entomologist enough to give its name and habits.

2. I wonder if there can be no mistake about there being bees from other hives. If it were their own sisters they were killing, I can't give the reason why.

3. The same, 17 $\frac{1}{2}$  x 9 $\frac{1}{2}$ .

4. Possibly; put a paper between the hives with a hole big enough for one bee to pass at a time, and they will gnaw the paper away, gradually uniting.

### Winter Stores in Super.

I have some light colonies. I gave them supers with unfinished sections. Will they winter well if I leave them on for winter? I have a good 'bee-cellar.' I would like to leave them on. The bees do not take the honey below. WISCONSIN.

ANSWER.—Yes, it will be all right so far as the bees are concerned, but it will be rather rough on the sections.

### Managing Out-Apiaries—Swarming.

1. I have run an apiary of 100 colonies for the last 10 years, along with a farm, but I am thinking of giving up my farm to my son, and if I do I would start an out-yard. Could I manage the out-yard myself?

2. How would it do to put queen-excluding guards on the entrance in swarming-time, and keep all the queen-cells out? Would that work in the out-yard? or would it be better to remove all the brood to an upper story with the queen on starters below, with a queen-excluding board between the two?

I have been a reader of the American Bee Journal for a number of years, and owe all my success to it. May it live long, and die happy. ONTARIO.

ANSWERS.—1. You could manage the two yards yourself if you don't have too many bees in them, and your plan of management does not require too much work. The problem will be easier if you run for extracted than if you run for comb honey.

2. The guards will do if you follow up the right management afterward, but simply putting on guards and cutting out queen-cells will not be sufficient. The second plan you mention will work well for extracted, but not for comb honey. You have no doubt seen much lately about shaken swarms, and they might answer your purpose.

### Report for the Season—Wintering Bees in a House.

I started with 6 colonies last spring, and increased to 21 by capturing 3 stray swarms. I got 1824 pounds of comb honey, almost all in 1-pound sections.

I read the American Bee Journal and "Forty Years Among the Bees."

I make my own hives; I think they are what are called the Wisconsin portico hives, with 8-frames. I have weighed them to see if they had plenty of stores for winter. They weigh from 60 to 75 pounds each.

I have no cellar fit to winter bees in, so I will have to winter them out-of-doors, or in a house I built for chickens. The house is 10x18 feet and 7 feet high, with a good shingled roof, and boarded tight with

good pine boards. The side of the house is toward the south. I thought of making an opening along the bottom large enough so the portico of the hive would fit it, and set the hives on the inside, leaving the entrance to the outside of the building facing south. What I want to know is:

1. Would the house be any advantage over wintering on the summer stands?
2. Would it do to set the hives close up against each other, side by side?
3. Would it do to put two rows of hives, one above the other?
4. Would there be danger of the bees getting into the wrong hive when flying out on warm days?
5. Would it be advisable to pack the hives with straw inside the building?
6. If I put the bees in the house should I do so before, or wait until freezing weather?
7. Don't you think my bees did pretty well?

ANSWERS.—1. Yes, indeed; with the understanding that the bees are just as free to fly out as if the hives stood on their summer stands.  
2. Yes.  
3. Yes.

4. Yes, to some extent; but no great harm would come of it.
  5. Yes, if the building was somewhat open; if very close it would make little difference.
  6. A little better to put them in before severe weather.
  7. Very well, indeed; but don't expect them to average as well when the number of colonies runs up to 50 or more.
- (Don't send a stamp when you send questions; if any one gets them the Editor ought to have them; but he's not going to get this one.)

**Nuclei and their Management.**

What are nuclei? and how should they be taken care of?

ANSWER.—There is the same difference between a nucleus and a full colony that there is between a boy and a man. Usually a nucleus has not more than three frames covered with bees. To tell all that can be said about the care of nuclei would go beyond the limits of this department. A bee-book telling about this, and many other things, would be of great service to you.

INDIANA.

**Beedom Boiled Down**

**Growing Catnip for Bees.**

I have experimented a good deal with catnip. Besides sowing in waste places [in Knox Co., Ill.], I sowed one acre last fall. I find that it does best in very rich soil; in fact, in poor soil it did nothing. Where there is waste land containing leaf-mold, old brush-piles, or any decaying logs or wood, I believe catnip ahead of anything as a honey-plant; but for poor or only medium-rich soil I think sweet clover is far ahead of anything I have tried.—J. E. JOHNSON, in the American Bee-Keeper.

**Purifying Extracted Honey.**

This is a subject discussed in a symposium in the Australasian Bee-Keeper. In the leading article it is strongly advised to use artificial heat. The writer, James Lockett, says:

I say it can't be ripened satisfactorily by the natural heat alone. To purify by artificial heat we must get all our honey-tanks built with a compartment in the bottom of them to hold water, and have our steam-pipe going into it, also a short pipe going out of it with a valve attached, so if we over-heat or put the steam pressure on too strong, our escape pipe will soon let us know that we have too much pressure on.

Now, we want steam, and a good pressure with it. The right way is a small boiler, rather expensive for most bee-keepers, but the first cost is the only cost, and you have an article that will do its work properly and will last you a lifetime; and more, when you have your little boiler how handy it will be at the end of the season to clean out extractor, uncapping-can, honey-tanks, and any tins that need cleaning. I guess every time your little boiler is steamed up during the honey season you will be at work with the hose with a tap at the end where you are working so you can turn on or turn off steam when wanted, and when you do a half hour's work in about five minutes with the steam-pipe you will say, "Ah, can't beat the steam, boys."

Then, again, when you have a good flow of honey coming in, and you are extracting at the rate of one ton a day or more, and you will wind up with all

Please Mention Bee Journal when writing advertisers.

your tanks full and a snap of cold weather backing you up, what will follow? You will come along the fourth or fifth day and have a look at your tanks and find little or no scum on them. Why? The honey is too cold and thick to let the air-bubbles rise. Then you will come along again in about nine or ten days, and say, "Well, I must can up some of this honey to make room for more." What is the result? Some of your honey goes to market not properly ripened, carrying a scum on the top of it.

If we have an artificial system of purifying our honey similar to the above, we would avoid our honey going to market below standard, and it would only take a short time to heat your honey up to a certain temperature, independent of the weather.

In the same paper, Geo. Fackender says:

When honey is kept at a temperature from 122 degrees to 130 degrees F. for several hours, all impurities, everything foreign to pure honey, will come to the surface, which can easily be skimmed off, and its good qualities retained and clear, inviting appearance imparted. When the honey is purified it can easily be siphoned off into a lower tank to be packed for market.

The smaller bee-keeper—he who thinks the foregoing method too expensive, but at the same time wishes to obtain the highest prices for his honey—should utilize the heat of the sun to gain his end. He should place a shallow tank in a room with a low, flat roof, the tank to be connected with the extractor to get its supply of honey. It should have a cap on top, painted black, likewise the walls, to draw the heat. The roof should be constructed so that part of it could be removed easily to admit the rays of the sun. The sun striking the black surface of the tank for several days in the heat of summer, will soon bring all impurities to the top, which can easily be skimmed off. Such arrangement would be inexpensive and practicable, and honey thus treated will soon cast up all impurities, give off surplus moisture, present a clear appearance, and retard granulation.

## FROM MANY FIELDS

A Good Year for this Canadian.

This has been a good year for us. Bees were not in good shape in May, but white clover came in bloom earlier than ever before, and is still blooming, though, of course, not yielding honey. I have increased to 205 colonies, and expect to make that 300, at least, next season. This year my average was about 120 pounds per colony, mostly extracted honey.

MORLEY PETTIT,  
Ontario, Canada, Oct. 20.

Prevention of Swarming.

We keep the bees in 8 frame portico hives of a pattern similar to the Langstroth, but with middle bars in the frames, and a plain front hive, similar to the Simplicity hive; I like the por-

tico pattern much better for handling and hiving, and can put 28 of the regular 4 1/2 x 4 1/2 sections on them at a time.

This year I found No. 2 was weak in bees, while No. 3 was very strong, so just before swarming began I placed No. 3 where No. 2 had stood, and No. 2 in the space left vacant by moving No. 3. Neither of them swarmed, although both were fairly strong. I think I lost 25 pounds of honey by the operation, for neither was strong enough to gather much surplus in the short flow that we had. HOWARD H. HOUSE.

Oneida Co., N. Y., Oct. 23.

A Utah Report.

I took 620 gallons of extracted honey from 30 colonies, and increased, by dividing, to 45 colonies. No swarms. How is that? B. F. BARRUS.

Tooele Co., Utah, Oct. 17.

Good Wintering Advice.

I wish to call the attention of beekeepers to the fact that we should have more of our winter loss the previous autumn. Don't try to carry every colony through the winter that has a few bees in it. Remember that it is nearly always an indictment against a queen to find her always the mother of a weak colony. Don't let such colonies use up a lot of valuable stores, and then die, but weed out such and double up, saving the best queens, then feed in a way that will stimulate late breeding, and thus go into winter with bees whose life is before them instead of behind them. Have a standard of excellence that bees must come up to Nov.

Please mention Bee Journal when writing.

The Nickel Plate Road

will sell tickets within distances of 150 miles, Nov. 25 and 26, at rate of a fare and a third for the round-trip, account Thanksgiving Day. Return limit Nov. 30, 1903. 1st, and make them do it, and then we will have less winter loss and more honey for stimulative feeding the next spring.

Remember, there is many a slip 'twixt the queen-cell and a car-load of honey. Number of bees in the hives instead of colonies in the apiary, is a good motto.

I would like to have been there and made one more of that car-load of beekeepers, but I had to load two cars of honey during that 10 days, so I could not go. M. A. GILL.

Boulder Co., Colo., Oct. 24.

A Very Poor Year.

This has been a very poor year for bees in this part of Vermont. But we are not going to give up the American Bee Journal, just the same.

A. W. DARBY.

Grand Isle Co., Vt., Oct. 24.

Has a Home Demand for Honey.

This has been a poor year for bees. I had about 25 colonies the past season, and run for both comb and extracted honey. I have a home trade for all of it—comb at 15 cents, and extracted, 2 pounds for 25 cents. I put some of it in jelly, guarrantees, and put my label on it, thus guaranteeing its purity.

The American Bee Journal is a paper that every bee-keeper should take.

At a Lower Price.—We have arranged to have the Humphrey Poultry Book sent free to all of our readers who will drop a postal card asking for it. It isn't as big as an encyclopedia, and it doesn't pretend to tell everything about fowls, but it does contain a good many valuable pointers on feeding and brooding, which every one who owns chickens may ponder with profit. Of course it touches on the Humphrey products—the famous Humphrey Open-Hopper Bone-Cutter, the Humphrey Rapid Clover Cutter, the Humphrey Pure-Air Brooder and other supplies which poultry raisers will find useful and profitable. On the Bone Cutters the Company has made a general reduction in price for this season. Mr. Humphrey has an enviable reputation for fair dealing, and his goods are known far and wide as leaders in their classes. You ought to know about them. Send your name to-day to Humphrey, Kemp Street Factory, Joliet, Ill., and mention the American Bee Journal when writing.

CONVENTION NOTICES.

Chicago-Northwestern.—The regular annual meeting of the Chicago-Northwestern Bee-Keepers' Association will be held in the Revere House Club-Room, southeast corner of North Clark and Michigan Sts., on Wednesday and Thursday, Dec. 2 and 3, 1903. The Revere House has made a rate of 25 cents per person per night for lodging, when two occupy a room. Meals, 35 cents, or on the American plan at \$2 per day. Owing to the Revere House being a busy place or holding our meeting, we feel that all who can do so should patronize them during the Convention. Dr. C. C. Miller, Ernest R. Root, W. Z. Hutchinson, Emerson T. House, N. E. Rouse, Inspector J. O. Smith, Jas. A. Stone and Huber B. Root have signified their intention to be present. Pin this in your hat. There will be one of the best meetings ever held in Chicago. Everybody come.

HERMAN F. MOORE, Sec. GEORGE W. YORK, Pres.

P. S.—It has been suggested that bee-keepers bring with them samples of honey, and such little appliances as they have that are considered handy to work with in the apiary.

Missouri.—The Missouri State Bee-Keepers' Association will meet in Mexico, Mo., Dec. 15, 1903. J. W. Rouse will act as host to direct the attendants to the hall, which is free to all who desire to attend. Board meals will be had at the leading hotels at \$1 to \$2 a day. Come, everybody who is interested in bees and honey. Let us have a big meeting. We now have 51 paid-up members. Let us make it 100. Procure certificates from your local railroad ticket agents when you purchase your tickets. It may be you can return for 1/2 fare. J. W. ROUSE, Pres. W. F. CARV, Sec.

Illinois.—The Illinois State Bee-Keepers' Association will meet at the State House, on Tuesday and Wednesday, Nov. 17 and 18, 1903. It has been so arranged that all who become members of the State Association on payment of an annual fee of \$1.00 membership, will for the same be made a member of the National Association, and be entitled to all the combined reports of the State and Chicago-Northwestern Associations. Efforts will be made at our coming meeting to give also a membership in the Chicago-Northwestern for the same \$1.00 for providing. Plans are arranged.

Railroad fare has been promised on all the roads in the Central Division of one fare for the round trip, and a fare and a third on the others; but we still hope for one fare on the latter.

J. A. STONE, Sec. Route 4, Springfield, Ill.

WANTED—Extracted Honey.

BEE-BOOKS

SENT POSTPAID BY

GEORGE W. YORK & CO.,

114 & 146 E. Erie St., CHICAGO, ILL

Forty Years Among the Bees, by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutes in detail just how Dr. Miller does things with bees. Price, \$1.00.

Bee-Keeper's Guide, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive, but helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 541 pages. 255 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

ABC of Bee-Culture, by A. I. & E. R. Root.—A cyclopaedia of over 500 pages, describing everything pertaining to the care of the honey-bee. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 100 pages. Price, in cloth, 75 cents; in paper, 50 cents.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 100 pages, bound in paper, and illustrated. Price, 50 cents.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

Foul Brood Treatment, by Prof. F. R. Cleshire.—Its Cause and Prevention. 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Oct. 21.—Sales are not frequent, with No. 1 fancy white comb honey bringing 13 1/2@14c per pound. To obtain 13 1/2@14c it has to be perfect and in sections that will not weigh over 14@15 ounces; sections that weigh 16 ounces and over have to be sold at from 1 to 3c less per pound. Extracted, white, sells at 6@7c in barrels; 6 1/2@7 1/2c in cans, according to quality. Beeswax, 2@30c. R. A. BURNETT & Co.

BUFFALO, N. Y., Oct. 11.—The demand for white comb honey is better than it was. The trade is particular and wants only very white, clean stock. If the wax is yellow from travel-cleaning it does not sell well, and price has to be cut. Fancy white comb, 14@15c; A No. 1, 13 1/2@14c; No. 1, 13@13 1/2c; No. 2, 12@12 1/2c; No. 3, 11@12c; No. 4, 10@11c; No. 5, 9@10c. White extracted, 6 1/2@7c; amber, 6@6 1/2c; dark, 5 1/2@6c. Beeswax, 2@30c. W. C. TOWNSEND.

BOSTON, Oct. 8.—Comb honey continues to be in good demand. Fancy white honey in cartons we quote at 18c; No. 1, at 16c; glass-front cases fancy white, at 16c; No. 2, at 14c. Extracted honey, Florida, 6 1/2@7 1/2c according to quality. BLAKE, SCOTT & LEE.

CINCINNATI, Oct. 21.—The demand for honey is a little better. The prices rule about the same. Extracted is sold as follows: Amber, in barrels, from 5@5 1/2c; in cans about half cent more; water-white, at 14c; 6@6 1/2c; white clover, 6 1/2@7 1/2c. The comb, No. 1, 14@15c; No. 2, 13@14c; No. 3, 12@13c; No. 4, 11@12c. Beeswax in good demand, at 30c delivered here. C. H. W. WEBER.

ALBANY, N. Y., Oct. 18.—Honey market still firm for honey in comb and receipts not equal 1 1/2 demand; and white, 16c; No. 1, 15c; mixed, 14 1/2@15c; buckwheat, 12c; No. 2, 12c. Extracted, white, 7@7 1/2c; mixed, 6 1/2@7c; dark, 6@6 1/2c. Beeswax, 2@30c. H. R. WRIGHT.

KANSAS CITY, Oct. 23.—Receipts of comb honey good; demand good; market easier. Receipts of extracted light. We quote: Fancy white comb, 2 1/2 sections, per case \$3.00; No. 1, white and amber, \$2.75; No. 2, \$2.50. Extracted, white, 7c; amber, 6 1/2@7c. Beeswax, 25@30c. C. C. CLEMONS & Co.

CINCINNATI, Oct. 1.—Comb and extracted honey are coming in freely, and the demand is good with steady prices. We are making sales at the following prices: Amber extracted at 5 1/2@6c; white clover, 6 1/2@7 1/2c. Fancy comb honey, 15c. Beeswax, 30c.

THE FRED W. MUTH Co.

NEW YORK, Sept. 28.—Comb honey is arriving quite freely now, and is finding ready sale at 15 cents per pound for fancy white, 13 1/2@14c for No. 1 white, and 12c for No. 2 white and amber. Very little buckwheat on the market as yet, and prices are hardly established.

Extracted honey is ruling about the same as last week, in price, and in quality all grades. Beeswax is somewhat declining and selling at present at from 2@2 1/2c per pound.

HILDRETH & SEIGELING.

SAN FRANCISCO, Oct. 21.—White comb, 1-lb. frames, 13@14c; amber, 9@11c. Extracted, white, 5 1/2@6c; light amber, 5@5 1/2c; amber, 4 1/2@5c; dark, amber, 4@5c. Beeswax, good to choice, light, 27 1/2@29c; dark, 26@28c.

Market is more quiet than for several weeks preceding, but is fairly steady as to value. Spot stocks and offerings of both comb and extracted are mainly of amber grades, while most urgent inquiry is principally for water-white, the latter being the only kind meeting with some competition, and coming from buyers. Recent arrivals of honey in quantity, a lot of 12 cases from the Hawaiian Islands. The bees of the islands feed mainly on sugar.

WANTED! FANCY COMB HONEY

In no-drip shipping-cases. Also Amber Extracted in barrels or cans. Only best quality delivered Cincinnati. The Fred W. Muth Co. 32At Front and Walnut, CINCINNATI, OHIO.

## 5 Percent Discount DURING THE MONTH OF NOVEMBER.

There is every evidence that there will be a heavy demand for goods the coming season; and if you defer placing your order until next February or March, you will not only lose your discount, but may have to wait for the filling of your order some weeks. Indeed, you can afford to borrow money, and get your goods now, thus having them all ready for next season's use.

### Every Month You Wait, it will Cost You 1 Percent Per Month.

The styles of goods will be about the same for next season, so there is no use waiting for a new Catalog. But remember prices have advanced, owing to the increased price of material; but if you

### Take Advantage of Our Early-Order Discount

you will not be paying any more for your goods than last year. A word to the wise is sufficient.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Dr. Miller's New Book

Free as a Premium for Sending Two New Subscribers.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your Pocket-Knife will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.50.

**GEORGE W. YORK & CO.**

Chicago, Ill.

☞ Please allow about two weeks for your knife order to be filled.

No. 46.

## Editorial Comments

### Let Your Light Shine.

Bee-keepers read the pages of bee-papers to get light from them. Fortunately, bee-keepers as a class are exceedingly unselfish, and when one of them gets new light upon any point he is not only willing, but anxious, that others should have the same light. There are, however, many who seem in some way to have gotten the idea that unless they are very prominent as bee-keepers, or unless they have made some great discovery, their contributions will not be welcomed. Such is very far from the fact. The most obscure bee-keeper in the land may happen upon some improvement that the veterans will be glad to learn. So don't be afraid to add your light, even if you think it is a very little light. The stars don't refuse to shine because they are not as big as the sun. Tell us of your successes, and even of your failures. No matter how trifling it may be, if you have made a gain by any little improvement in management, let us know about it. It's the little things, when all put together, that help to make successful bee-keeping. Remember that "trifles make perfection, but perfection is no trifle."

### The Value of Drones.

This is still a matter in which opinions are divided, although the majority probably agree that it is well to suppress their production. There are, however, some who claim that drones are of value aside from the matter of fecundating the queens, it being claimed that they aid in keeping up the heat of the colony. There can be no disputing the fact that drones produce heat, but no one claims that a given weight of drones will produce more heat than the same weight of workers. Yet this seems the sort of reasoning that justifies the presence of drones:

"A pound of drones will produce as much heat as a pound of workers; therefore, a pound of drones to keep up heat in the hive will release a pound of workers to go afield, and the amount of honey stored by this pound of workers will be just so much added to the crop as a gain from the presence of drones."

It seems just a bit strange that men otherwise level-headed should accept such reasoning as conclusive. For a pound of workers in place of the pound of drones would release just as many other workers to go afield, these workers keeping up the heat while doing the work in the hive, and in their turn becoming storer, whereas the drones work neither in the hive nor afield.

### Honey-Exchange Advertising—Marketing Honey.

On Nov. 3rd we received the following, which will be read with interest:

EDITOR AMERICAN BEE JOURNAL:—Notwithstanding the fact that we are very busy helping producers find a market for their honey, packing our bees away for winter, etc., we must take time to say, Bravo, to your remarks regarding honey exchanges or associations, on page 691. We were laboring under the impression that all such were a free lance, and welcome to all the space they could use in our bee-publications. We have often thought that with that advantage, such organizations should be making much more progress than they really are making.

But now, "look a-here," you spoiled it all with that 14¢-cent honey article which followed close on the heels of it. The Illinois bee-keeper that got that for his honey had to get it on the market before the trade became posted. Our early sales were at 14 cents, but the large majority of our customers could not get their honey ready for them on account of the factories failing to furnish their shipping-cases in time.

Then we had to drop to 13 cents. At this price we got a considerable sprinkling of our sales filled, some car-lots, etc. But now, where is the market in which any considerable amount can be sold at more than 12 cents spot cash? And that is the only thing that counts now-a-days. We are in close touch with all markets, and ship to them all, and we know of none unless the "case" idea is worked.

Our hobby has been for several years, "Cash at the producer's depot." Counting the vicissitudes attending the shipment, sale, etc., of comb honey, we can not figure out much more than 10 cents for what remains unsold of the crop, unless it is offered in car-lots, which reduces the risk to a minimum, together with the freight and the trouble attending the sale of a car-lot, which is often no more than a 500 or 1000 pound lot.

We believe that the best work we can do is *not* to make honey hard to get, to raise the price, but make it more popular. And we would enjoy being assessed by the National for the purpose of advertising honey. The majority of people must be interested in eating honey before we will see the end of 10-cent honey, no matter how fine.

The honey is excellent this season, and will be a great help in advertising the sale of it for another season.

THOS. C. STANLEY & SON.

We are more than ever of the opinion that the National Bee-keepers' Association should in some way create a fund for the purpose of advertising honey. Such expenditure would aid every producer of honey in the country. Thos. C. Stanley & Son are dealers in honey, and of course they are willing to contribute to such a fund. We believe not only dealers in honey, but bee-keepers as well, would be glad to help swell the fund for such a purpose. All could well afford to do so, we think, for it would likely cause such a popular demand for honey as would increase the price not a little.

We have noticed a glucose concern lately advertising extensively an article of which they say, "Better than honey for less money." Not satisfied with filching the good name of honey, they even go so far as to use a picture of a straw hive with bees flying around it. What a pity that the National is not in position to follow that up with the advertising of the real honey! Were we still in the honey-business, we certainly would try to do something to counteract such evil effect upon the sale of genuine honey. Of course, we would not be financially able to do very much, but we certainly would make the attempt, and do all we could afford to do in that line.

We hope that either the National will take hold of this matter, or that the various honey-producers' associations or exchanges will get together and begin an advertising campaign that will result in such a big demand for genuine bees' honey that the bee-keepers will simply be unable to supply it even at a greatly advanced price. There is no time like the present for such action. We believe it would have a tremendous effect on the call for honey, not only for this year's crop, but for the future crops of honey.

### Room Required for Cellaring Bees.

This is a matter likely to be inquired about at this time of year by those who, for the first time, desire to cellar so many colonies that there may be fears as to sufficient room. Ten cubic feet for each colony has been given as the proper amount of room, and is probably not far out of the way. In the Bee-keepers' Review, R. L. Taylor says it would be well to allow two square feet of floor surface for each colony it is to accommodate at any one time, thus allowing a cellar 20x20

feet to accommodate 200 colonies. In this Mr. Taylor omits an important factor, the height of the cellar. A cellar 20x20 would need to be only 5 feet high to allow 10 cubic feet for each colony. That would be a very low cellar, although 6 feet is not an uncommon height. An additional foot or two in height would, of course, add much to the capacity of the cellar. Mr. Taylor very properly adds:

But it must not be overlooked that colonies are variable quantities. Two hundred colonies at the end of a favorable season might easily equal, in heat-evolving capacity, 400 colonies at the end of a very unfavorable season. The 200 colonies, in such a case, would be likely to overheat a cellar of the size suggested in the absence of extra care.

Still further it should be added that the low temperature of the cellar, and the consequent necessity for keeping it tightly closed, has a bearing on the number of colonies that may be accommodated in a given space. If conditions are such that for days at a time the cellar must be kept tightly closed for fear of its being too cold, then it may be that a larger allowance than 10 cubic feet for each colony would be advisable. On the contrary, toward the southern edge of the region for advisable wintering, or in severer climates, where the cellar is unusually warm by means of a furnace or for other reason, so that a door or window may be kept open generally, there might be no suffering with colonies packed so closely that each one would have considerably less than 10 cubic feet.

### "The Dairy Show."

In London, England, this is the annual occasion of the meeting of bee-men in October, for the purpose of witnessing or participating in the competition for prizes offered on honey and beeswax. Just why honey should appear at a dairy show may not appear on the surface, although butter and honey combine in a very friendly manner on bread, and "milk and honey" is a phrase frequently found in use, dating back to the time when the Israelites were in bondage in Egypt. Later on, the combination of "butter and honey" may be found in the Bible, where it is said, "Butter and honey shall be eaten, when he knoweth to refuse the evil, and choose the good." Isaiah 7:15.

### An Argument for Bulk Honey.

This is given by W. W. McNeal, in the American Bee-Keeper, based on the fact, or supposed fact, that section honey is so nice that the public doubts its genuineness. He says:

Chunk honey appeals to the people in general, because it is on a par with their education in things agricultural. It excites both the admiration and the appetite of the lover of honey, and when he has sampled it he is willing to concede the fact that it is "real bees" honey. If wrapped in a good quality of butter paper the honey is very presentable indeed, and will readily sell in any market.

### Migratory Bee-Keeping.

M. F. Reeve says, in the American Bee-Keeper, that this is practiced by bee-keepers of Philadelphia, Pa. In the fall they move their bees to the open country along the Delaware and Schuylkill rivers, and some seasons reap quite a harvest from the acres of goldenrod, asters, heartsease, and smartweed.

### Big Combs.

H. C. Sears, according to his report in Gleanings in Bee-Culture, accompanied by a half-tone illustration, seems to have bees that compete very successfully with Apis dorsata in the matter of building large combs. Two of the combs shown are 22 inches wide and 60 inches long! They were in the siding of a building.

### Wax-Moths.

Beginners should be reminded that wax-moths can do no injury in severe cold, and if unused combs are left out where they will freeze during the winter, both larvae and eggs will be destroyed.

But look out for the depredations of mice.

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

## Miscellaneous Items

**The Chicago-Northwestern Convention** on Dec. 2 and 3. Don't forget that. Try to be here. It will be held in the club-room of the Revere House, southeast corner of North Clark and Michigan Streets, Chicago. Rates for room and meals reasonable.

Remember the time—Wednesday and Thursday, Dec. 2 and 3.

**Mr. J. L. Strong**, of Page Co., Iowa, one of our advertisers during the queen-rearing season, recently sent several queens on an order from New Zealand, received on account of his advertising in the American Bee Journal. The local paper gave quite a write-up of the event, and also Mr. Strong's growing prominence as a queen-breeder.

**Dr. J. P. H. Brown**, of Richmond Co., Ga., wrote us as follows Nov. 2:

"I am still holding the fort. Enjoy good health. Sleep soundly at night. Relish my plain (nearly vegetarian) 'grub.' Mrs. B. is the only complainer—she frequently has attacks of rheumatism.

"Bees have done moderately well this season. The woodman's ax and the farmer's plowshare are gradually curtailing the area of bee-forestage. Bees, in our section, are dependent upon the natural flow, and this is being destroyed."

**Mr. Bingham, the Bee-Smoker Man**, recently sent us one of his latest smokers. It is the "Conqueror" size, but it is more than a conqueror. We used it when preparing our bees for winter, and such a deluge of smoke! Why, we were almost ashamed to turn such a tremendous volume of smoke on the bees. The movable nozzle fits into a sort of cup at the end of the fire-barrel instead of slipping over it, as is the usual form. This new smoker is exceedingly light in weight, and has a wonderfully strong blast. We should call it "Bingham's Best." It beats anything we have tried in bee-smokers.

**Mr. Geo. W. Brodbeck**, of Los Angeles Co., Calif., writing us Oct. 27, said:

"One of my out-aparies at Santa Monica had a narrow escape from fire several days ago, but the precaution I had taken in having the brush removed from the near surroundings saved the apiary. As it was, it burned all around it, destroying 200 tons of hay just adjoining. Several reports have come in recently of loss of aparies by these mountain fires, which often prevail during the dry season."

Mr. Brodbeck was very fortunate in his escape. A mountain fire, in such a dry time as they have out there, would be a pretty wild and direful affair.

**General Manager France** is a busy man now. He is getting out an elaborate report relative to the work of the Association during the past year. The large increase of membership (500) since he took hold of it is substantial encouragement and a splendid indorsement. Mr. France has several cases of adulteration on hand, and it certainly will not be his fault if he does not strike consternation in some quarters. The Association is doing splendidly, but it can do a great deal better if it has the moral support and dollars of more men who are interested in its welfare. Bee-suits of various kinds are becoming more frequent again; and if those of you who read this are not members before an action is begun against you, you can expect no aid from the Association after you get into trouble. The Association is a sort of life insurance, and the small fee or premium of \$1.00 entitles you to protection for a whole year, to say nothing of the other benefits you will get.—Gleanings in Bee-Culture.

**Once Late in 20 Years.**—A Stray Straw in Gleanings in Bee-Culture for Nov. 1, reads thus:

"The American Bee Journal for Oct. 15 was mailed two days behind time, the first time that paper was late for 20 years! A printers' strike made the delay. The 'Old Reliable' has been so regular that you could tell the day of the week by its arrival. George W. doesn't intend to have it late for another 20 years."

Editor Root then added this comment:

"The record up to the time of the strike was remarkable. Mr. York and his predecessor during the time are to be congratulated. May the 'Old Reliable' continue to break the record for another 20 years."

Our thanks are due, and hereby tendered, for the kind words and wishes expressed in the foregoing. We hope it will indeed be 20 years before the old American Bee Journal need be late again.

## Convention Proceedings

### THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 711.)

#### REMINISCENCES OF BEE-KEEPING AND BEE-KEEPERS IN THE EARLY DAYS.

J. G. Corey—After listening to the remarks of Mr. Harbison and Mr. Root, I do not know that I will be able to say anything that will interest you, but inasmuch as I am called on, I will give you the benefit of some of my early experiences in bee-keeping.

To begin at the beginning, where a man first becomes interested in the pursuit, would be to go back to the year 1836. We moved up from the center of the State of Illinois, near the line of the present Illinois Central Railroad. We did not make as good time as they make now, and we were two or three months going up that 200 miles. We landed on the east side of the river, a few miles below Rock Island, and they met us with the ferry boat and ferried us across Rock River. The boat was built by hewing down trees and hewing out the timber.

We continued our journey, my father not being satisfied with that country, and we located in Stephenson county, 14 miles north of Freeport, near the northern line of the State of Illinois. We arrived there, I think, about the middle of May, and after building a little cabin, the man that drove our team commenced cutting down the trees in the grove, and splitting up rails to fence our farm. In doing so, he very often came across bee-trees and marked them, and the mark was respected; and in the fall, when our pork-barrel was empty, we filled it up on chunk honey. We then had enough bee-trees for filling our pork-barrel of some 300 or 400 pounds. We cut them down below the entrance and above, and set them down on the south side of the fence. We fenced our dooryard in, and I was installed as bee-keeper, to watch those bees when they swarmed, and assist about hiving them. We made our hives out of sections of the basswood or linden tree, and called them "gums." We bored holes in them, and put cross-sticks in them, and split out lumber to make the tops, and sawed little notches for the bees to fly out. That was the primitive apiary in Stephenson county. I became interested in bees by watching these bees. Then, afterwards, I assisted a man by the name of Rowe, about 5 or 6 miles from us. He was a Pennsylvania German, who had been a bee-keeper in that primitive style. He maintained that no man could keep 100 colonies of bees. He said he had 99 once, but when he counted them over, some of them had decamped, and he had but 99 still, and he did not believe a man could keep 100 colonies.

Soon after that a pamphlet fell into my hands, which seemed to have been written by a man who was a little bit "light in the upper story." He claimed to have invented a bee-bellows which would keep the bees in; the bees would fly out, and all you had to do was to go in there and get out wagon-loads of honey. Not knowing, of course, whether that was so or not, it served to increase my interest in bee-keeping.

I had no opportunity to gratify my desires in that direction until 1859. I was then high up in Plumas county; the altitude is something a little less than 4000 feet above the sea-level. I picked up a paper and read an account of the invention of a movable-frame hive by Mr. Langstroth, and a review of his book. I soon obtained a copy of his book, and it cost me \$4.00 or \$5.00. I think it cost me \$1.00 express from San Francisco up. I read that book with a great deal of attention and care.

In December (I was then acting as County Treasurer of Plumas county), I went to Sacramento to settle with the State Treasurer. Of course, as I had become interested in bees, I was told of Mr. Harbison. I went out to his place,

but did not find him at home. I was told that a colony of bees would cost me something like \$200 to \$250. But that didn't make a difference.

After that I went down to San Francisco to have some books made for the county. As the facilities for book-binding were not very perfect, it took two or three weeks to get the books made up. Meantime I was looking around for bees. I picked up a paper and found an auction notice of some bees that had come across the Isthmus of Panama, and the owner had left them in the hands of the Wells-Fargo Express Company, and they were to be sold for the charges. I looked them over, and when they were put up for sale I bid in two colonies at \$35 apiece. When the auction was over a man came to me and told me he lived in Oakland, and that he had been buying some bees that had come across the Isthmus of Panama; that he had transferred them and built them up, and they were in good shape. He asked me what I proposed to do with them. He said, "You ship them over to Oakland, and we will see what there is to them." Well, I did so, and we found they were very weak, but both had queens.

He made a proposition to sell me a box about 12 inches square, with the combs fastened in so they would not move. The box was made of cracker-box lumber about  $\frac{3}{8}$  of an inch thick. It suited my notion on account of high altitude and heavy transportation. So I made a bargain with him, and paid him "boot money," and let him have mine at \$35 and took his colony at \$100.

I took that colony up on the steamer, and when we got to Marysville, a man told me the country was getting full of bees, and he didn't see why I wanted to pay such a price. He said there was a man named Kennedy out there who had, I think, 65 colonies. Perhaps he had divided or subdivided them until they did not seem very strong. But they were working very nicely. However, I took my colony on the stage, and went up to Bidwell's Bar. I owned an interest in a saddle-train connected with the Feather River Express. Our facilities for transportation were rather imperfect, and we went up to the nearest place called Buck Eye Ranch, and from there over, and the mountains was covered with a great deal of snow, in some places 25 to 30 feet deep. My partner was there with me, and we got ourselves across the mountains. I had my colony of bees, and he had some express matters.

I took along some honey, and mixed that up and dashed in a little honey once in a while, and let the colony rest on a window-sill where the bees could fly out into the yard. The choke-cherries soon blossomed there, I think about the latter part of February or the first of March. My bees built up very rapidly, and on June 6, 1860, my first swarm came out. Court was then in session. They flew out and up on a pine tree, and the man who went after them said the tree was 95 feet high, and he charged me \$5.00! He tied a cord around his waist, as he would lower a body on a rope. He would cut the limbs away below and let himself down. When court adjourned, we came out and saw this colony of bees hived. Then, having read Langstroth a little, I made a sub-division of this colony, and at the end of the season I had six colonies of bees in good shape. I was offered \$1.00 a pound for honey very often, but I wanted to build up the bees.

Soon after that I received notice of my father's death. I sold my six colonies of bees for \$600. The man is living there in that country now. It is said that bee-keepers are quite long-lived, but many of us are getting so old that we are not able to do very much in the business.

I located in Ventura county in 1874, and bought a half interest in about 100 colonies of bees, hived in Langstroth hives. We did not have any foundation then. He did not know what he could do, though. I bought a half interest in them, and paid him at the rate of \$3.00 a colony for them. I transferred them in the spring of 1875. I gathered up bees around there. Then I went to San Francisco on business and tried to get some of the Harbison section-boxes. They told me Mr. Harbison had moved to San Diego, and all he had were down there. But I found a man named Weatherby who made me some section-boxes, which he called the "Weatherby Modification," but they were virtually the Harbison section-boxes. I bought of him section-boxes and packing-cases, and produced 12 tons of honey in the Harbison boxes, and 8 tons of extracted honey. My extracted honey sold for 10 cents, and comb honey at 18 cents. I still own some bees there.

My success has been variable, sometimes very good, and at other times not so good. We have had a series of poor years, but still we stick to it, and the old bee-keepers, somehow or another, can not entirely shake it off so as to

get rid of the bees. The bees seem to stick by them. Perhaps if we did get out of it entirely a colony would come along and alight on our trees, and we would have to have them anyway. My neighbors come in to buy of me every few days during the season. They come down and are willing to give me a half dollar, or a dollar, for an old rejected hive, and so I sell them. I do not know that it would be possible or desirable to do so, to get rid of the bees.

My acquaintance with bee-keepers has been mostly through the bee-papers. I have been a very close reader of them all these years. I have the first copy of *Gleanings* ever issued, and the first copy of the *Bee Journal* that Mr. Wagner published. I have barrels and barrels of them, and my successors may some time read them. I have kept them very carefully.

I have attended a good many bee-keepers' meetings, and I believe I have joined about all of them. I have found

National Bee-Keepers' Association, beg to submit to this assembly the following:

Believing that it is the sense of all large producers of honey and local associations now organized in the West, as well as many smaller holders, that we, as members of the National Bee-Keepers' Association, use every available means afforded us to create a National Honey-Producers' Association upon a strictly commercial basis, for the handling of our product, that we may realize to ourselves, as producers, the full value of said product; and

WHEREAS, The Colorado Honey-Producers' Association and the California National Honey-Producers' Association, as well as many other smaller associations, are well on the road to success, that we encourage them in their good work. And that we recognize in the name and the formation of the California National Honey-Producers' Association the existence of the National Honey-Producers' Association,

APIARY OF W. J. MCCARROLL, OF LOS ANGELES CO., CALIF.

(Note the Extracting Tent, "Pipe Line," and Storage-Tank in the shade of the pepper-trees. The growth on the opposite hill is mostly black sage.)

it of benefit socially, and in getting items of people engaged in the pursuit. I never expected to be permitted to meet the men I have met here, whom I have been reading after so carefully for so many years, but I have finally met them. Perhaps the next time the National meets here at Los Angeles you may not see me here; but at the same time there will be some one, perhaps, to take my place.

I thank you very kindly.

Mr. Hyde spoke briefly, giving some reasons why, in his opinion, the meeting should be held in San Antonio next year.

Dr. Miller moved an adjournment, but the chairman called for the report of the committee on Honey-Producers' Association, and the motion was withdrawn. Thereupon Mr. F. E. Brown reported as follows:

#### REPORT OF COMMITTEE ON NATIONAL HONEY-PRODUCERS' ASSOCIATION.

We, the committee, appointed by the National Bee-Keepers' Association at the Denver convention, for the purpose of drafting plans for the commercial part of the

upon the conditions that their by-laws be amended to cover the necessary requirements for the broadening out and the uniting of other associations.

And we further recommend that the chairman appoint a committee of seven to draft plans by which this might be done; and when their report is submitted and accepted by this Association, as well as the California National Producers' Association, then it will become fully recognized as the commercial part of this Association, or the National Honey-Producers' Association.

W. Z. HUTCHINSON, }  
O. L. HERSHISER, } Com.  
F. E. BROWN, }

The chairman appointed the committee as follows: F. E. Brown, chairman; E. S. Lovesy, Herman Rauchfuss, H. H. Hyde, J. P. Ivy, C. P. Dadant, O. L. Hershiser.

A motion was carried that the report be approved.

Dr. Miller asked that five minutes be given to the Texas matter.

Judge Pascal, of San Antonio, was then introduced to

the convention, and in a somewhat lengthy speech invited the convention to that place next year.

The meeting then adjourned until Thursday morning.

(Continued next week.)

## Contributed Articles

### Prevention of Increase—Criticisms Explained.

BY ADRIAN GETAZ.

I DON'T think any of my past contributions have received as many comments as the one on page 407.

NORTH VERSUS SOUTH.

One first cause of misunderstanding is often the difference of "locality." In the Northern States, generally, the honey-flow (when there is any) opens suddenly, is very heavy, comparatively, and lasts, without interruption, perhaps about six weeks, as a general rule.

In the South, the conditions are altogether different. There is no continuous honey-flow as in the North.

There is a long-drawn honey season, during which the flow comes very irregularly—"by jerks," to use one of Rambler's expressions. That is, a few days of tolerably good flow, then a slack, then a week or two of flow, then, perhaps, a total intermission, and so on throughout the whole "honey season."

It is easy to understand that the methods of management must necessarily be different in two sections of the country. In the North it will do to build up the colonies as rapidly as possible early in the spring, and then let the brood-rearing diminish in order to increase the surplus. But in the South we must not only build up early, but maintain the full strength of the colonies during several months. This requires two conditions:

1. A large brood-nest, so the queen should be able to lay at her full capacity. As to what constitutes a large brood-nest, I found the size advised by the Dadants the best—10 Quinby frames.

2. No swarming, neither natural nor otherwise. The honey-flow, or rather the "jerks" that constitutes our honey season, are (except now and then) not strong enough to furnish anything like a surplus and rebuild a brood-nest. It is one or the other. Please bear in mind, that no swarming thus understood, means no increase, that it means keeping the bees, brood and combs together throughout the whole season. The mere issuing of the swarm is only a detail, as the swarm can be returned.

REMOVING THE BROOD.

The prevention of swarming thus understood, is what gave me the most trouble. I spent some five or six years in experiments. One of those were mentioned in my contribution of June 25, and consisted in taking out all the brood, putting it in another hive, and returning it after five or six days (cutting out the queen-cells, of course.) I also stated that the process was a success as far as swarming was concerned, but was objectionable, chiefly, by requiring an extra set of hives to hold the brood, and from the fact that the bees, during these few days, worked too much in the brood-nest and too little in the sections. One of my critics misunderstood me completely. He thought that by preventing I meant simply preventing the issuing of the swarm, and innocently remarked that the extra hives would be needed for natural swarms anyway. But that is not what I was after. What I wanted was, as stated in the beginning of this article, prevention of increase; keeping bees and brood together.

As to the building of too much comb in the brood-nest while the brood was out, another critic said I ought to have put on a super from another hive where bees were already at work. That's all right as far as it goes. But as a matter of fact, all the colonies thus treated were already well at work in the sections.

MODERATE INCREASE.

Another plan is to take out a comb every week or so and replace it with a comb of foundation. The combs taken

out can be used to form new colonies, or reinforce whatever weak ones may be in the apiary. The object is to provide room for the queen to lay. As long as there is plenty of young brood to feed, the nurse-bees will not undertake to rear queens.

The advisability of putting in a comb of foundation rather than an all-ready-built comb has been questioned. Let me say here, that I am writing exclusively from the comb-honey producer's standpoint. For an extracted-honey producer the problem is an easy one. All he has to do is to give enough empty combs to accommodate the brood and all honey brought in. If he gets in a pinch, he can extract some of the combs already full.

But the comb-honey producer is confronted by entirely different conditions. The empty combs are, by no means, plentiful. I have but six now, and would not have a single one if one of my colonies had not died last winter.

But a built comb will not do, anyway. Let us study the "conditions." When the flow comes the brood-nest is already full, or will be in a very few days. The secretion of wax and the building of comb in the sections are not started yet, so there is no room, or but very little, in the sections to put the honey in. Yet it is coming all the day. Having no other place the bees put it in the brood-nest as fast as the matured brood emerges, and crowd the queen out. Eventually, swarming follows if the apiarist does not remedy that state of affairs.

Now, suppose we give an empty comb. There is only one queen to lay eggs. There are thousands of bees ready to fill that comb with honey, and they will do it.

But give a frame of foundation and the "conditions" will be different. In the first place, it will take the bees some time to draw the foundation. Then, as soon as the cells are drawn, the queen can lay in them, while they can not hold honey until they are about an eighth of an inch longer. These two conditions enable the queen to follow the workers and lay as fast as the cells are ready. Result: a solid comb of brood.

Somebody said that a frame of foundation, or a fresh comb, prevents the queen from laying further, acting as a division-board. There is nothing in it. Queens are constantly passing from one comb to another, and when they do stop at a fresh comb it is because they have all the room they need on the side where they are.

One of the critics says that that plan involves too much work, and he prefers "shaking." Perhaps it does; I don't know. But, by the above plan, 2 or 3 combs are usually all that it would be necessary to take out. That is less work than shaking 8 or 10. It may be objected to, that these 2 or 3 combs are to be taken out at different times, and would necessitate opening the hives 2 or 3 times instead of once. That is true, but it is to be done at a time of the year when the hives have to be opened to see if the bees are ready for the supers; put on the first super, and later on the second. So, after all, the plan can be carried out with but little extra work.

"SHOOK" SWARMS.

Shall we "shook" or not? No, in my opinion, not in the South, and I believe not in the North, either. But don't misunderstand me again, and think I am advising natural swarming. I want to keep the bees, brood, and combs together. It has been said repeatedly, that by placing the old hive near, or above the swarm, or by shaking a second time, nearly all the bees can be secured in the swarm. But that's not all. The brood-nest has to be rebuilt. Did those who argue in favor of shaking, ever stop to think that a brood-nest of only 8 Langstroth frames contains enough wax to fill 64 sections? Would not 64 full sections be preferable to a new brood-nest, when the old one will do just as well?

CAGING QUEENS.

After trying everything in sight, and almost everything out of sight, so to speak, I came to the conclusion that caging the queens for 8 days, or requeening, are the only ways really practical. Both methods have their advantages and disadvantages. Requeening requires more work and more attention. Besides, some queens fail to mate, or are lost some way or other. On the other hand, a young queen will, in some way that I can not understand, induce the bees to carry the honey out of the brood-nest into the sections far better than an old one.

In my locality there is (with proper management) but little swarming, owing to cold spells of weather that come now and then, even until the middle of May or later. Only about 10 swarms out of every hundred colonies is the average percentage.

To manipulate 100 colonies in order to prevent 10 swarms

would be too much work. Furthermore, the 90 colonies, which would not have swarmed, will do better if left undisturbed.

So I let them swarm, if they want to, and treat only those that do swarm. Using queen-traps, I have no chasing of swarms to do (except in some occasional cases), and no queens to hunt, since I get them in traps. But if I had a large number of swarms to attend to, I would prefer caging, by a long way, and do whatever requeening I might need after the honey season. And if anything like a large portion of my colonies were to swarm, I would certainly forestall them, and cage throughout the whole apiary at the proper time to be effective.

There is a misprint in my contribution on page 407. The last part of the second paragraph in the second column should read: There must be a forced interruption of some sort or other to destroy the swarming fever, or, rather, queen-cell-building fever. Knox Co., Tenn.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Tomatoes and Honey—Origin of Propolis.

I have recently discovered a new use for honey, and hasten to place the recipe before the bee-keeping sisters:

Slice tomatoes, add a little honey to each slice. Try it and report.

We are amateurs as yet in bee-dom, but have already established some rules. One is, to be sure we have a plentiful supply of honey for our own use before selling any. Another is, that whoever gets a sting is entitled to an extra pound of honey to eat. One member of the family fears the bees, so does not go near them, and, consequently, does not get stung; but being a kind, sympathetic chap, offers to share the sting by eating half the honey.

Query: Can you explain how the bees make propolis? and what from? ALICE M. HOUSE, Oneida Co., N. Y.

They gather propolis from the gums to be found on the buds and branches of many trees. They may also often be seen collecting and packing upon their legs propolis that they find about the apiary on old frames, etc.

### Best Size of Hive for Women.

What size of hive is best for women, the 8 frame or the 10 frame?

There are some advantages in having a large hive. There is always abundance of room for stores, and you need not worry about the bees starving in winter. That scores one for the 10-frame, and one against the 8-frame hive, for there is always a little danger if you have only 8 frames, and a very prolific queen, that she may keep the frames so filled with brood late in the season that the honey will be mostly put into the sections, and when those are taken off in the fall it may leave the colony short of stores; so we will have to admit that the 8-frame hive will need careful watching on this point.

Then in reference to swarming: There will certainly be less tendency towards swarming with the 10-frame than with the 8-frame. That is the second item in favor of the 10-frame hive, and really those are the only two items that I can think of in its favor and against the smaller hive.

But with proper management we can use 8-frame hives without much trouble from starving or swarming, and they are oh! so much lighter and more pleasant to handle than the heavier hives. Just in the matter of supers alone it makes so much difference. Take, for instance, a super that fits an 8-frame hive holding 24 sections. When these sections are filled with honey, and the super also filled with bees, it is about all the average woman cares to lift, especially if she has to lift them nearly, if not quite, all day long. We will say that each colony will average 3 supers apiece during the honey harvest. Every time you open a colony those supers have to be lifted off and then on again, unless some of them are ready to come off for good—quite a

bit of lifting to do if you go through 50 or more colonies in a day.

Now, suppose we have to lift supers that fit a 10-frame hive; won't it be more than the average woman can do? It seems to me that this one item will bar out the 10-frame hive as far as women are concerned.

There are other things to be considered, such as hauling bees to out-apiaries, carrying them into the cellar, etc. Of course, it is possible to hire these things done, so I don't think they count so much as the things that have to be done every day.

Some one will say, "But you can have larger colonies with 10-frames than with 8, and it is the large colonies that give us the honey." It is true that the strong colonies give us the honey, but can we not have just as strong colonies with the smaller hives? "No," you say, "a good queen will fill more than an 8-frame hive." Of course she will, and for that matter more than a 10-frame hive, and if we are to be limited to a single story the 10-frame hive will, in many cases, be too small. But there is no law against using two stories, and I have known an extra queen to fill fairly well two stories of 8 frames each. That's for the early part of the season, before the harvest, and for that time 16 frames will, in many cases, be better than 10 frames, or than 20 frames.

When the time of harvest comes, the queen will need less room, and will get along very well with 8 frames. If we are working for comb honey we want the honey to go into the sections. We don't want the bees to have much room to store in the brood-frames, and even if there were no advantage in the lighter handling, it is likely we can get more section honey by having only 8 frames during the harvest.

For extracted honey the room needed can be gauged by the number of stories given.

But it should be said that any one who is not willing to give the proper attention, so that there shall be no danger from starving, will do well to use the larger hive.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### UNPROFITABLE COLONIES—BEE-HIVE EXPERIENCE.

Sister Morgan found a colony that has its duplicates in many places—no good to anybody, but getting along themselves nicely left entirely alone. Temptation to call them a worthless strain of bees; but in most of these cases we may presume the bees, queen included, just as good as the average. Often they lack any really convenient place to build, and that prevents any surplus. I remember how I used to keep bees when I was in box-hive heathenism, and I can almost wonder that they ever mounted to the tops of my great empty boxes and commenced building there. Then there's the too-big hive—full of comb, and with lots of surplus honey in the comb nearly every fall; but no one has the enterprise to break in and get it. Page 617.

### A BLIND BEE-SISTER'S CHEERFUL LETTER.

The leader of the blind bee-sister sounds in its very cheerfulness and matter-of-factness pathetic. Sitting there under the trees and putting frame by frame and hive by hive in order. Curious that the last two hives of a great lot, supposedly all dead, proved to have bees enough in to be salvable—and to make them into eight good colonies in one season was famous work. Page 617.

### CARNIOLANS AND ADELS.

Isn't it Carniolans instead of Italians that the Adels were to start with, Dr. Miller? Unselected bees brought from Carniola are of two different types, if I have the right of it, although the two types are pretty thoroughly mixed. There is the steel-gray type, and the type which is more or less yellow-banded. Pretty much everybody decided for the steel grays, and worked to eliminate the stripes. Mr. Alley, on the contrary, built up a real nice strain of striped fellows. 'Spects he doesn't care whether you call 'em Italians or not, so as you buy 'em. Page 619.

## NO DANGER YET FROM THAT NEW SWEET.

Saccharine was a reality, but it has not done all that was anticipated for it a few years ago. So about this wonderful South American plant, perchance. It's sweet can hardly be a sugar (providing the tales told of it are anything more than yarns), and a sweet chemical not a sugar at all would rather be a competitor of saccharine. Of course, it *might* prove much cheaper, better flavored, and less open to medical suspicion than saccharine. Hardly affect honey much unless it is very delicious, indeed. Page 627.

MAX JENNEY WAS ALL RIGHT.

A railroad man that is not trying to be a Trappist monk in the matter of spoken words, deserves the celebration you give him. Honors to Max Jenney! Even possible that if the train had come to a sudden and unexpected stop he would have told you why it was, if he could. Page 628.

THE "NATIONAL" IN CALIFORNIA'S ASSOCIATION.

The Californians got out nicely when blamed for the "National" in the title of a local honey organization—in invitation to all similar organizations to couple on and made it national. Page 630.

THE REAL FUN IN LIFE.

Big contract Prof. Cook blithely essays when he says, "We have to convert the whole country." He also gets in much of true philosophy, true Christianity, and true how to be happy in this life when he says, "The real fun in life is getting under a big load and raising it—under a great problem and then make it move." Page 630.

MORAL PRINCIPLES THAT ENDURE.

Noble sentence of Mr. Abbott's, ancient increased profits, decreased efforts—and renunciation of personal conscience. "There are high moral principles that lived before these things were, and they will live after these things are gone."

Honey is indeed one of the last things to be forced up artificially—or near enough that, that many sensible bee-folks feel shaky. Still, I think we should preserve the old maxim. Do not evil that good may come. When all things have their sales combinations, and all go up, up, up, and responsively and endlessly, some now and some next opportunity, it can only result in a general crash of some sort. Earth, and not moon, is where we belong. The further we get from terra-firma the more we put ourselves in the power of even a gentle financial gale. Make way for the *universal*—power of some sort—that adjusts *relatively* all prices, and says first of every product, *What ought this to be sold for?* Bureau at Washington, I think—with power to enforce. Page 630.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Swarming—Rearing Queens for Italianizing—Smoking Bees.

1. Would it be a good plan to place a colony that had just sent out a prime swarm in the place of one that was about ready to swarm, if I wish to keep down increase?
2. Would trapping off the drones make any considerable difference with the amount of surplus honey?
3. Should I attempt to rear Italian queens to change my stock at home, or buy enough? Can it be done with only one queen as a start?
4. What effect would a great deal of smoke have upon bees that are very cross?
5. Would smoke enough make them docile? NEW YORK.

ANSWERS.—1. No; it will increase the swarming. When you put a colony that has just swarmed in place of another about to swarm, you will have a swarm just as soon as the first virgin is ready for swarming, and the colony that you moved will probably be ready for swarming two or three weeks later.

2. The drones, no doubt, eat a considerable amount, and trapping them would make just so much more surplus. You would still be out as much surplus as the amount of honey necessary to rear the drone-brood; so it would be better to allow little or no drone-comb in the hive, and then you wouldn't need to kill off the drones.

3. Please make up your mind at the start that you can't change to

Italians and keep nothing else if other bees are all around you, even if they're two miles away. Yes, with one queen as a start you can manage very well, getting a new queen each year, if necessary.

4. I have seen them driven entirely out of the hive by too much smoke.

5. No, it may make them give up for the time, but their dispositions would remain the same. Some report that with certain kinds of bees heavy smoking only makes them worse.

### Producing Section Honey Over Deep Frames.

You say in your book that comb honey can be produced over Langstroth frames as successfully as over shallower frames. I have only Dadant-Blatt brood-frames in my hives, and these frames are still deeper than the Langstroth. I would like to produce over these frames section honey as well. Is that possible? There is room in my hives for 13 brood-frames, but in reality only 9 are used, with 4 dummies (2 on each side). GERMANY.

ANSWER.—I'm not sure. I do not now recall the exact depth of the Dadant-Blatt frame, but I think you could produce section-honey over them with fairly good success. But you can not successfully use a super the full size of your hive unless the hive be filled with frames, for the bees will not do good work in sections at the sides over the dummies. Your supers must be only large enough to cover the 9 frames. If, however, you want to have the super the full size of the hive, you might try having the four dummies between the frames instead of at the sides, putting a dummy between the 2d and 3d frames, another between the 4th and 5th, then between 6th and 7th, and between the 8th and 9th. You will find that a dummy between the frames will make less trouble than you might imagine. It is barely possible that conditions in Germany may make a difference, but I hardly think so.

### Questions on Bee-Management.

I am quite an enthusiast on the subject of bees, and am trying to learn all the different branches by detail. I carefully read all the textbooks—some things I don't understand, and if Dr. Miller will get his "One Year Among the Bees" before him while I ask a few questions, he will better comprehend my wants. Now, Doctor, turn to page 75, line 57 (last line)—

1. In working this change do I understand that there is a queen below and a honey-board between, or what keeps the queens apart?
2. Page 76, line 36. Do you mean the parent or the young swarm?
3. Page 77, line 21. What is meant by incipient queen-cells in this case?
4. Page 79, line 1. What is meant by a swarming colony in this instance.
5. Page 79, lines 17-18. Is there anything between the nuclei and colony below to prevent killing each other?
6. Page 81, line 2. Why did you give young brood if the queen was there?
7. Page 81, line 18. Placed frames, bees and all in a hive—what is to prevent killing in this case?
8. Page 81, line 24. What is meant by spreading the brood of these young colonies? What do you mean by saying also, on lines 25 and 26, they can be made to rear brood faster than *left to themselves*?
9. Why give the appearance of brood up to the time it becomes too old for queen-rearing?
10. Page 83, line 12. What paraphernalia for filling combs?
11. Page 86, line 3. When you unite two or more weak colonies in the fall, do they fight and kill each other, and what do you do with the queens?
12. In breaking up nuclei, generally in the fall, what is done with the queens?
13. Is it best to kill the escort bees in introducing queens, or will they interfere with the success in anyway?
14. Don't some colonies leave old queen-cells that have been once used, on their combs, or should all trace of them be removed after using them—by the bees?
15. What is meant by a single bee running around on the entrance-board, shaking itself, and cutting up as if for amusement of other bees? Porter bee-escape should be made—dimensions of material, etc., as mine, made the only way I could think of, failed.
17. It is frequently that when a colony swarms it is placed near the parent hive, and in six or eight days the latter is removed to a new stand and the young swarm occupies the old stand. Why not move the old colony away as soon as hived? Why wait six or eight days?
18. I have a colony in good condition every way, with an Italian queen, lately introduced, in which I see the bees are dragging out young brood, mostly drone-brood, I think, but some worker-brood. They have been fed, and have plenty of honey.
19. I am anxious to rear all the queens I can from 5 colonies I have Italianized with queens: these 5 colonies will be 100 yards at right angles from the main apiary, with some large trees and dwelling-house between them, with the natural flight of the apiary drones due east, and the 5 hives of Italian bees pure to mate with the young queens; and will the young queens be pure-blood if they mate with the drones of these Italian colonies?
20. In having two or more after-swarms in one hive, does either swarm ever come out with its queen and desert the others, or would they all go if any went?
21. I read of bee-men who speak of adding or changing supers on hives with bees and all. What prevents fighting?

Now, Doctor, this may seem quite a long list of questions to be

asked, but you invite the subscribers of the American Bee Journal to ask, and I have accepted the invitation. I am just crazy to learn all I can about bees, and am taking up the work one subject at a time, and am now on *queen-rearing and introducing*. MISSISSIPPI.

**ANSWERS.**—Allow me to premise that the book, "A Year Among the Bees," was written by a man who didn't know all about bees, and I wouldn't approve all the things he recommends. Between you and me, I don't count that an up-to-date book. Another book, "Forty Years Among the Bees," is not quite so bad.

1. In the case you ask about, the author is telling that he keeps the hive containing his breeding queen on top of another hive, or over the super of another colony, moving it occasionally to a new place, thus weakening it by making it lose its flying force at each change. Of course, there must be no connection between the upper and lower colonies whatever; the bottom-board of the upper hive stands on the cover of the lower hive. Instead of that plan, I prefer to keep my best queen in a nucleus standing permanently in its own place, drawing from it brood and bees if at any time it gets too strong.

2. A colony has swarmed, and the queen being clipped the swarm has returned. The queen is taken away from this colony, as well as all of its eggs and unsealed brood, so it will start queen-cells from the eggs or brood given.

3. Incipient queen-cells are those that are started but not very far advanced, as when started only a day or two.

4. The bees of a swarming colony are recommended as being good bees from which to start nuclei, because they will stay where they are put. A swarming colony is any colony in the humor of swarming, and in the present instance more particularly one that has swarmed and returned, because of having a clipped queen.

5. Yes, if a nucleus is set on top of another colony, the nucleus has its own bottom-board, so there is no communication with the hive below.

6. It is a common and a good practice to give a frame of young brood to a colony or a nucleus having a virgin queen. This helps to keep up the strength of the nucleus; it is supposed to have a stimulating effect in starting the young queen to laying, and, if one finds no queen-cells started on this young brood on a future visit, one can feel pretty sure the queen is still there.

7. When the frame of brood on which a queen is found is taken with its adhering bees from a nucleus and given to a queenless colony, the chances for friendly reception are better than if the queen were given alone, because the queen is not disturbed as when caught, and consequently does not act in a frightened manner; moreover, she is surrounded by a strong guard of her own bees to protect her.

8. By spreading brood is meant moving two frames of brood apart and putting between them a comb containing no eggs or brood. The queen will lay in this inserted comb very promptly, and thus the colonies will rear brood faster than if left to themselves—that is, faster than they would if the brood had not been spread. This refers to

building up nuclei into full colonies in hot weather, when there is no danger of chilling the brood by spreading it.

9. It appears just the same as it does immediately after becoming too old, only it is smaller. You can learn about the size of brood by taking eggs that you know were laid on a certain date, and then watching their size at different stages. A larva is too old for queen-rearing after three days old, and it is probably a good deal better when only a day or two old, for I find that when allowed their choice bees select for queen-rearing larvae only a day or two old. The safe way is to use the smallest larvae you can find.

10. The paraphernalia described in spring management at page 32. But it is a messy job to fill combs with syrup for feeding, and I'd much rather have a Miller feeder.

11. Turn to page 83, and you will see that one of the queens is removed two or three days before uniting. Generally, there is no fighting.

12. Generally part of the nuclei are queenless, so there are no queens to dispose of.

13. I don't know. It is more convenient to leave the escort bees with a queen, but it may be safer to have them out of the way. Then there is the remote chance of introducing foul brood by means of the escort bees.

14. In any hive, where queens have been reared, you are likely to find the remains of queen-cells—called cell-cups—perhaps a quarter of an inch deep.

15. I don't know.

16. I don't think I could give instruction sufficiently clear to enable you to make a Porter escape, and if you had the instruction it would be cheaper for you to buy one. Besides, you might be prosecuted for making and using a patented article.

17. In about 8 days after the first swarm, under ordinary circumstances, a second swarm may issue with a young queen. If the hive is moved a day or two before this, the colony is depleted of its field-bees (which go to the old stand and join the swarm), and is so weakened and discouraged thereby that the superfluous young queens are killed, and further swarming is given up. If the old colony were moved as soon as hived, it would be getting stronger every day, and on the eighth day would be strong enough to swarm.

18. It is a common thing for bees to destroy both the drones and the drone-brood when they no longer feel the need of drones, especially if there is a let-up in the honey-harvest.

19. A single colony will furnish enough drones for a whole apiary, and young queens from pure colonies mating with pure drones will be pure, but no matter how your colonies are placed you can not be sure that your young queens will not mate with drones from colonies a mile or more away.

20. They would not be likely to separate again.

21. Nothing—no need to prevent it. Put a super with its bees on a strange hive during the harvest, and you'll find there is no inclination to fighting.

**GRIGGS BROS.**

214 Jackson Avenue, - TOLEDO, OHIO.

## FROM MANY FIELDS

### From One of Our Old Friends.

I judge there are not many that read the American Bee-Journal now that read it in the days of its infancy, when it was published by Mr. Wagner, in Washington, D. C., in the days "Novice" used to give his experiences in it, and the first thing I looked for was what "Novice" had to say, for I was in the same boat, trying to winter bees in the house by supplying such feed as I thought they needed. Those days are long since past, but not forgotten; neither are many of the men that figured in those days in the bee-world. A few of them still survive, for I see their names occasionally. But a majority of them have passed over—to the Better Land, I hope. For two things the good Lord permits me yet to have love—for him and for his creatures—bees among the rest.

W. S. VAN METER.

Neosho Co., Kans.

### A Season of Failure—Plants.

Our honey crop here is like a man hunting God's country, it is always a mile (year) ahead.

We had three good flows this year. The first was ruined by cold, dry weather, the second by cold, wet weather, and the third by a severe drouth. The bees are in bad shape

# THE "1900" FAMILY WASHER FREE.

Greatest Invention of the Age. Labor and Expense of Washing Clothes Cut In Two.

No More Stoopng, Rubbing or Boiling of Clothes.

Every Household Needs One.

# THE "1900" BALL-BEARING FAMILY-WASHER SENT FREE

to any one answering this advertisement, without deposit or advance payment of any kind, freight paid, on 30 days' trial. The 1900 Ball-Bearing Washer is unquestionably the greatest labor-saving machine ever invented for family use. ENTIRELY NEW PRINCIPLE. It is simplicity itself. There are no wheels, paddles, rockers, cranks or complicated machinery. It revolves on BICYCLE BALL-BEARINGS, making it by far the easiest running washer on the market. No strength required, a child can operate it.

No more stooping, rubbing, boiling of clothes. Hot water and soap in all that is needed. It will wash LARGE QUANTITIES OF CLOTHES (no matter how soiled) PERFECTLY CLEAN IN 6 MINUTES. Impossible to injure the most delicate fabrics.

## 15 Machinets in 4 Hours.

Chicago, Ill.  
Last week I started to wash with your 1900 Ball-Bearing Washer. A neighbor saw me wash my little boys' waists (which were terribly dirty), and we were both surprised to see there was not a spot left. On Monday we did a big wash of 15 machinets and the work was done in 4 hours. It is the best machine I ever saw (and I have tried many). It works so easy that my little boy can run it.

MRS. A. H. CENTNER,  
636 Diversey Boulevard.

## Washing Easy at 87 Cents Old.

Chicago, Ill.  
I am more than pleased with the 1900 washer. Last week my mother, an old lady 81 years, helped me do my washing. She sat on a chair and did a large 2 weeks' wash with ease, and as she said, "without even perspiring and it was 90° in the shade."  
MRS. B. F. REYNOLDS.

## No Longer Prejudiced.

North Hudson, Wis.  
Enclosed please find P.O. order. My wife is very much pleased with the washer. This speaks volumes for it, owing to her being prejudiced against all washers. All who have seen it think it the best and easiest washing machine they have ever seen.  
C. WILLIAMS.

# Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

The white flower is tall thorough-wort, Eupatorium altissimum, and closely resembles the bonaset.

The third flower is a wormwood—*Artemisia candata*.—C. L. WALTON.]

#### A Long Swarming Season.

Some 30 years ago I kept a few bees. After moving to the city I had none until 3 years ago, when, about the first of July, I caught a stray swarm on a theater sign. I had increased them last spring to 5 colonies. They commenced to swarm about the first of May, and kept at it until Sept. 1, when the last swarm of the season, a very large one, came out. On Aug. 26, I had two out, both very large.

I have taken off only 24 small sections of honey from the whole lot. I doubled up, and returned to their old hives enough so I only increased from 5 to 16 colonies, which I now have. Several colonies have not enough to winter on, and I am feeding them sugar syrup.

If I had hived each swarm that came out I would now have 23 colonies.

This knocks all my former experiences endwise. Of course, there is no money in such business.

I would like to know if any other subscriber for the Bee Journal has ever had such an experience. Can it be because of my surroundings, or because of peculiarities of the season?

HENRY A. STONE.

Kings Co., N. Y., Oct. 10.

#### A Report—Paralysis—Crossing Bees.

From 56 colonies, spring count, I increased to 81, and took off 1200 pounds of comb honey and 300 pounds of extracted. My bees took the second swarming fit the last of August, and continued up to Sept. 10. I put most of them back, but it cut down my honey crop.

The first part of this season was very wet and cold, and it was June 20 before any of the bees worked in the supers. The white sumac was good, but the basswood was cut short by cold, wet weather; there were three days when it was too cold for bees to fly.

I had 2 colonies that had paralysis; they would throw out 1/2 pint of bees every night, and through the day the ground in front of the hives would be covered with live bees. They both swarmed, and I hived the swarms on full combs. One of them never showed any signs of disease after that, and the parent colonies were soon rid of the disease, but one of the swarms still continued to have the disease; they were so reduced by the middle of September that I gave them the sulphur cure, by closing the entrance almost tight and then putting a handful of sulphur in the lighted smoker. I think a wet season causes more paralysis than a dry one. I have tried the sulphur cure, as Mr. Poppletton directs, and thought I had them cured, but the next spring it would make its appearance again.

I notice by the American Bee Journal that Mr. Frank Benton says that a cross between the Carniolan and the Italian or Cyprian are the best honey-gatherers. I agree with him. I had a

## Something FOR OUR Bee-Keeping Sisters in the Winter Time.

We think all ladies will agree with us in saying that every man should at least understand some business, with which, in case of necessity, he could support himself and family. The wealthiest people frequently come to want, and wretched, indeed, is the man who cannot earn a living after his wealth is gone. He sometimes fills the grave of a suicide. And why, in this enlightened age of progression, should not woman, as well as man, be able to depend on her own resources? In case her husband dies in poverty, must she starve or depend on charity? In case her husband fails to provide and grossly mistreats the woman he has sworn to cherish, must she humbly submit? **A THOUSAND TIMES, NO!** Let every woman, before she marries, have some knowledge that can be used to make her a living. Every mother, rich or poor, should make her daughters, in a certain degree, independent, by giving them some kind of a trade, and teaching them to be self-reliant. Mothers should have their daughters learn to sew, and not neglect this important part of their domestic education. The

daughter so taught will not only make a better wife and mother, but will also be more likely to secure a better husband, and will always command his respect. He will not look upon her as a helpless "know-nothing," but will know that if he fails in his duties, she can live without him, and this can only strengthen the bond between them. A thorough knowledge of dress-making can always be turned into gold, and become the means of support for the mother and her little ones. She may never have to use this knowledge in this way, but she has a trade and can use it if necessary.

The outline out shown herewith is a condensed copy of **THE NEW LONDON LADIES' TAILOR SYSTEM** for drafting and cutting ladies' and children's garments. For simplicity and accuracy it has no superior among the more expensive systems. Thousands of girls have learned more about drafting and cutting with this system than they knew about it after serving their apprenticeship in some of the dressmaking shops of the United States and Canada. Thousands of the best garment cutters have laid their complicated and expensive system aside, and are now using **THE NEW LONDON TAILOR SYSTEM**. Thousands have been sold at \$5.00 each, but we mail it free to a paid-in-advance subscriber to the American Bee Journal for sending us two new subscribers at \$1.00 each; or we will send it to any one with a year's subscription to the American Bee Journal, both for \$1.75; or we will mail the Tailor System alone for \$1.00. Address all orders to

**GEORGE W. YORK & CO.,**  
144 & 146 East Erie Street, CHICAGO, ILL.

Carniolan that, after swarming, the young queen mated with an Italian, and it filled 5 supers every year for 3 years. I have 1 colony of Italians now, but I can not call them pure, that is 10 years old, and has never swarmed, and never stored less than from 50 to 100 pounds of surplus honey every year. I reared a queen from her, and it was the first to swarm the next year.

G. W. BELL.

Clearfield Co., Pa., Oct. 19.

### Past Season Bees all Records.

As the honey season is closed I can make my report. The past season has beaten all records for several years past, for honey and swarms. All the methods taught by bee-men to prevent swarming have failed; at the same time the bees stored a nice lot of fine honey. I started the season with 30 good colonies, which increased to 55, and produced over 3000 pounds of comb honey. The most of my new colonies are made up of 2 and 3 swarms, and all are almost too heavy, at this date, for one man to handle.

I want to put on record the performance of 3 colonies belonging to a friend of mine living 3½ miles distant. These 3 colonies produced 33 full supers of 24 sections each, being an average of 264 pounds to a colony, in 8-frame hives. This beats all records for this part of the country, unless it might be that Dr. Gallup, who kept bees in this county a good many years ago, did better with his large hives. The owner of these bees, Mr. Fred Zilk, is a young farmer, who, besides managing a large farm, keeps about 20 colonies of bees, and takes care of them, notwithstanding, until the present time, he never subscribed for a bee-paper.

The hardest problem to solve now is, what to do with so many bees. Our honey has sold readily in the home market, but the bees we cannot sell at any price, and 30 colonies are all that I want to keep.

A. F. FOOTE.

Mitchell Co., Iowa, Oct. 22.

### 4-Inch Screw-Caps for Cans.

By all means let us have those 4-inch screw-caps, and also a good wrench to remove them.

WM. RUSSELL.

Hennepin Co., Minn.

### A Lonesome Bee-Keeper.

The Bee Journal came to hand as promptly as usual; glad to see it, too. I did not find any answer to my questions yet, but did find Dr. Miller's humble apology, and it was accepted.

I found the cause of that peculiar odor, and am glad to say it was not foul brood, or any other of the many dreadful things I imagined, but pure and simple goldenrod or wild aster, or both.

I visited an apiary near Atlanta last week and found the same odor, but much stronger on account of larger number of hives in one place.

Commission merchants at Atlanta offered me 12½ to 13 cents for pound sections, and I felt very sorry I had 4 colonies instead of 400.

In reading the Bee Journal last night I got badly shocked, so much so that my heart went like a trip-hammer; it

was all about a "a sisterly suggestion to a brother." I don't know whether the Bee Journal is running a matrimonial department or not, but I think it would be a good thing if it did. I am another one of that unlucky tribe of bachelors, and have to look after housework, breadmaking, bees and all, and I am getting almost sick of it, so Mrs. Henry's sly suggestion hit me rather hard. This state of single blessedness does not suit me any better than the bees. If you can help us out I'll let you dance at the wedding.

C. H. KOENTZ,  
Cleburne Co., Ala., Oct. 24.

### Perhaps a Mustard—Poor Yield.

I send some seed-pods of a weed that grows by the roadside about 3 miles from my place; it grows about 3 or 4 feet high, much branched, and has yellow flowers. It is about out of bloom now, so I cannot send a good specimen of the flower. I have seen a few bees working on it, but I am not certain whether for honey or pollen.

1. What is the name of this weed?
2. Is it a good honey-plant?
3. If so, is the honey light or dark?
4. Would my bees be likely to get benefit from it, being 3 miles away?

We have had a poor yield of honey in this locality this year; too cold and windy during fruit-bloom, and too wet all through May, so that the colonies did not get strong enough to put up any surplus honey from the first crop of alfalfa bloom, and the second and third crops were ruined by the webworms, so that all the surplus I have is from the fall flowers, mostly heartsease, and not very much of that, only about 20 pounds per colony, in sections.

There are not many bees kept in this neighborhood; I have only 7 colonies; I am a beginner at the business, this being my second season.

E. S. WEBSTER,  
Reno Co., Kansas, Oct. 20.

[I believe the plant in question belongs to the Mustard family, and it is one that has been recently introduced from the old country. It goes by the name of Neslia. I know nothing about its honey-producing quality, but do not think it of much value, and, besides, three miles is a long distance for bees to go after nectar.—C. L. WALTON.]

### A Report—Queer Notions.

Last winter I had to feed my bees, and last spring I started with 18 colonies, which increased to 35, and gathered 1000 pounds of comb honey, all white clover. I sold it early, and averaged a little over 10 cents per pound.

This fall I have fed them 200 pounds of the best granulated sugar. I use the entrance feeders.

I like to take care of bees, the only trouble being that when they sting me they swell so.

I heard the other day that a number of farmers, living 6 and 7 miles north of here, and keeping from 2 to 12 colonies, have an idea that I have a peculiarly large strain of bees, twice the size of theirs, and very fierce; also that they fly away up there and rob

# BEE-BOOKS

SENT POSTPAID BY

GEORGE W. YORK & CO.,

144 & 146 E. Erie St., - CHICAGO, ILL.

**Forty Years Among the Bees**, by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work had been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide, or Manual of the Apilary**, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages, 235 illustrations. Bound in cloth. 16th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee**, revised by Dudaud.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apilary library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey, or Management of an Apilary for Pleasure and Profit**, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey," 100-page pamphlet. Price, 25 cents.

**Apilary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment**, by Prof. F. R. Cheshire.—Its Cause and Prevention, 10 ct.

**Foul Brood**, by A. R. Kohanke.—Origin, Development and Cure. Price, 10 cents.

their bees and carry home honey, bees and all.

My intention is to increase to 200 colonies. V. A. HANSON.

Polk Co., Wis., Oct. 25.

### A New Bee-Keeper's Song—

## "Buckwheat Cakes and Honey"

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

### "THE HUM OF THE BEES in the APPLE-TREE BLOOM"

Written by

EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 strictly in advance payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

GEORGE W. YORK & CO.

144 & 146 Erie St., - CHICAGO, ILL.

The man who thinks, grows. Hand-work is as essential to hand-work as it is to brain-work. No man's business or profession can rise higher than the thought he puts into it. Being up-to-date is good, but the man who thinks ahead of his competitors, gets the cream of the trade every time.—Jed Scarborough, in Printers' Ink.

### DRAPERYMEN ARE DELIGHTED

to meet those who work for us. Our keeper always have money. We start you in business. You make large profits. Easy work. We furnish capital—only 10 cents for full line of samples and particulars.

DRAPER PUBLISHING Co., Chicago, Ills.

Please mention Bee Journal when writing.

### The Nickel Plate Road

will sell tickets within distances of 150 miles, Nov. 25 and 26, at rate of a fare and a third for the round-trip, account Thanksgiving Day. Return limit Nov. 30, 1903. Three through trains daily to Ft. Wayne, Cleveland, Erie, Buffalo, New York, Boston and New England points, carrying vestibuled sleeping-cars. No excess fare charged on any train on Nickel Plate Road. Meals served in Nickel Plate dining-cars on American Club Plan, ranging in price from 35c to \$1.00; also a la carte. Chicago City Ticket Offices, 111 Adams St., and Auditorium Annex, Phone Central 2057. Depot, La Salle St. and Van Buren Sts., on the Elevated Loop.

### "What Happened to Ted"

BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton, the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—60 pages, 5x8 $\frac{1}{2}$  inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver.) Address,

ISABELLE HORTON.

227 EAST OHIO STREET, CHICAGO, ILL.

## The Best Bee-Goods in the World...

are no better than those we make, and the chances are that they are not so good. If you buy of us you will not be disappointed. We are undersold by no one. Send for new catalog and price-list and free copy of THE AMERICAN BEE-KEEPER; in its thirteenth year; 50 cents a year; especially for beginners.

### BEST

# Extracted Honey For Sale!

ALL IN 60-POUND TIN CANS.

**Alfalfa Honey**

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extract.

**Basswood Honey**

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Our honey is put up in tin cans holding 60 pounds of honey each. These cans are shipped in wooden-boxes, and should arrive safely. We have nothing but **PURE BEES' HONEY** to offer, and so guarantee it. **Cash must accompany each order.** All prices are f.o.b. Chicago.

### Prices of Alfalfa Honey:

One 60-lb. Can @ 8c.....\$ 4.80  
Two 60-lb. Cans (in 1 box) @ 7½c 9.00  
(Larger quantities at the 7½c price)

### Prices of Basswood Honey:

One 60-lb. Can @ 9c.....\$ 5.40  
Two 60-lb. Cans (in 1 box) @ 8c.... 9.60  
(Larger quantities at the 8c price.)

A sample of either Alfalfa or Basswood honey will be mailed on receipt of 10 cents; samples of both kinds for 16 cents. (Stamps accepted.)

**BEESWAX WANTED**—We are paying 28 cents cash or 30 cents in trade for pure average beeswax delivered in Chicago (or Medina, Ohio).

**HONEY-JARS**—Don't forget to get our prices on all sorts of honey-packages.

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Some Good Glubbing Offers.

As this is the time of year when most subscribers renew their subscriptions, we wish to call special attention to the following, which we are sure will commend themselves to all:

- No. 1—The Bee Journal and Dr. Miller's "Forty Years Among the Bees" (book alone, \$1.00).....**Both for \$1.75**
- No. 2—The Bee Journal a year and Prof. Cook's "Bee-Keeper's Guide," (book alone, \$1.20)..... **2.00**
- No. 3—The Bee Journal a year and Dadant's "Langstroth on the Honey-Bee," (book alone, \$1.20)..... **2.00**
- No. 4—The Bee Journal a year and Doolittle's "Scientific Queen-Rearing," (cloth bound) (book alone, \$1.00).... **1.75**
- No. 5—The Bee Journal a year and Doolittle's "Scientific Queen-Rearing," (leatherette bound) (book alone, 75c) **1.50**
- No. 6—Bee Journal a year and Standard Untested Italian Queen (mailed in May or June, 1904) (Queen alone 75c) **1.50**
- No. 7—The Bee Journal a year and a "Novelty Pocket-Knife" with your name and address on it (knife alone, \$1.25) **2.00**
- No. 8—The Bee Journal a year and a "Wood Binder," for holding a year's numbers (binder alone, 20c)..... **1.00**
- No. 9—The Bee Journal a year and an "Emerson Binder," (stiff board) (binder alone, 60c)..... **1.40**
- No. 10—The Bee Journal a year and a Monette "Queen-Clipping Device," (device alone, 25c)..... **1.00**
- No. 11—The Bee Journal a year and Newman's "Bees and Honey," (cloth bound) (book alone, 75c)..... **1.50**
- No. 12—The Bee Journal a year and Newman's "Bees and Honey," (paper bound)..... **1.10**
- No. 13—The Bee Journal a year and Root's "A B C of Bee-Culture," (book alone, \$1.20)..... **2.00**
- No. 14—The Bee Journal a year and a Foster Stylographic Pen (Pen alone, \$1.00)..... **1.75**

Send all orders to **GEORGE W. YORK & CO.,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

## The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

**Why Own the Novelty Knife?** In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

**How to Get this Valuable Knife.**—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$2.00.

**GEORGE W. YORK & CO.**

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

## Editorial Comments

### Don't Feed Syrup Now.

If you have been wise you will not be feeding anything now; the time for that was earlier; but if you have been improvident enough to leave some colonies till now with insufficient stores, let the deficiency be supplied with combs of sealed honey or with candy. Don't think of feeding syrup now.

### The Varying Value of Honey-Plants.

This is one of the curious things in bee-keeping. It is well known that alfalfa is one of the most valuable honey-plants in Colorado and other Western regions, while, until lately, there has been no report of honey gathered from alfalfa east of the Mississippi. Now hopes are entertained that by means of inoculating the soil with the proper bacteria, alfalfa may flourish in localities where hitherto it has been a failure, and that in such places it may become valuable as a honey-plant. But what will account for the widely differing values of the goldenrods and asters? Surely, there can hardly be lacking some bacterium in the soil of northern Illinois, where several varieties of these plants grow luxuriantly and abundantly, yet they are reported worthless as honey-plants. Why worthless here and excellent elsewhere?

### The Use of the Uncapping-Knife.

An old bee-keeper writes:

"What T. F. Bingham says, on page 712, about the use of the honey-knife, is worth all the long discussion about it in the Los Angeles report; but can it be possible that there is anything like 195 pounds pressure on the knife? It doesn't seem to need a strength of many pounds to move the knife."

Mr. Bingham is attributing to the pressure of the atmosphere what really should be attributed to the viscosity of the honey. The atmosphere is 15 pounds to the square inch, but that cuts no figure; the pressure is there on both sides alike, even if one side is immersed in honey. Try the flat side of the knife on a comb of very cold, thick honey, and then try it on one of warm, thin honey. The pressure of the atmosphere is the same in each case, but the knife will move with much greater difficulty in the case of the cold honey, because of its greater toughness.

This, however, does not take anything away from Mr. Bingham's argument in favor of having the  $\frac{1}{4}$ -inch bevel rather than the  $\frac{1}{2}$ -inch blade next the honey. For the blade being five times as wide as the bevel, it will take five times the force to overcome the friction, so to speak, of the honey.

### Selling Small Crops of Honey.

Recently we received an inquiry from a bee-keeper who had only about a ton of extracted honey, asking where he could sell it, and also what it was worth.

As to its value, of course we referred him to the market column the American Bee Journal. Any one who gets this journal regu-

larly would hardly need to write to us to know the market price of honey. That is what the honey quotations are published for.

Now, about where to sell honey. In the particular case referred to, we suggested that as he had only a small amount of honey to dispose of, we believed he could realize the most for it by working up a home market, or in near-by towns. If he should ship his honey to a large city market he would likely get about 6 cents per pound for it. If he put forth some effort, by offering it direct to families in say 6 or 8 pound pails or cans, he would doubtless get at least 10 cents a pound for it, if not more.

We would like to see bee-keepers get more for their fine honey, but in order to do so, a great many more of them will have to work up their own market. Of course, the bee-keeper who has a number of tons of honey can not usually dispose of it in a home market. Such will have to ship it to the larger city market. But there are thousands of small cities and towns that do not use a tenth of the honey they should use, and would use, if they were offered the honey direct by the producer.

We believe this matter will bear investigation and development. We would like to hear from those who have made a success of the home-marketing plan.

### Prices and Profits in Bee-Keeping.

The following is a sample of some of the correspondence that has come to this office lately and within the past few years:

MR. YORK.—I believe the common bee-keeper is the milk-cow of the big bee-supply factories, and the commission houses of the big cities. I can see no profit in bee-keeping. And it looks to me funny when factories advertise in the bee-papers that the bee-keeper should borrow money and send it to the factory to get the goods early. Those people like to get all the money out of the bee-keepers, and let the latter have only the bee-stings in the summer-time.

I believe there is a great, big humbug in comb foundation. It will stand the heat of an ice-box but not the heat of a hive full of bees. It must be more than half profit. Of course, there is more profit in that kind of foundation. I wouldn't use any foundation without wiring the frames.

BAPTIST BECK.

Being entirely out of the bee-supply business now, we feel that we can offer a few comments on Mr. Beck's letter without being accused of having "an ax to grind."

In the first place, we learned enough about the bee-supply business, while we were in it, to know that there is no fortune in it for any one, be he manufacturer or dealer. Why, if the profits in making and handling bee-supplies were equal to those in many other lines, bee-keepers would be compelled to pay about double the present retail prices for the supplies they use in their apiaries. We feel that we know something about this matter, for we are in a city where there is a great variety of business done, and we know that the profits in a number of other lines of trade are far in excess of those connected with handling bee-supplies and honey.

As to the intimation of Mr. Beck, that comb foundation is adulterated, we can only say that the bulk of the comb foundation sold to-day is made by the Weed process, and the fact is that the sheeting method of that process will not work adulterated wax. So that idea of Mr. Beck is entirely wrong. Almost any bee-keeper knows that on a very hot summer day, with a heavy swarm of bees in a hive not ventilated, any kind of comb foundation will likely melt down if not wired in the frames.

As to there being no profit in the bee-business at the present price of honey, we suppose that can also be said of any other farm products at different times during a series of years. But we venture to say that

there are a good many bee-keepers that would never complain at all, only guarantee them a fair crop of honey every year. They will take care of the price.

The fact is, there has never been a general oversupply of honey in this country. There may often be more produced in any one locality than can be used there during the year; but there are always many other places where not nearly enough has been produced to supply the demand. What should be done is to even up the surplus crop—distribute it more evenly throughout the country. Then a better price could be secured.

Honey will not usually sell itself, any more than it will take unto itself legs and walk off. The honey-producer must make some effort to dispose of his crop. But he must first see to it that it is put up in the best possible shape for market. Properly graded, neat and clean. He then needs to watch the markets—learn the supply and demand, as far as possible.

In our experience as a bee-supply dealer, we have not found the bright, pushing, up-to-date bee-keepers objecting to the ruling prices on bee-supplies. We have come in contact with a great variety of bee-keepers, too, in what was our bee-supply department. No one hears of a Coggeshall, a Dr. Miller, a France, a Brodbeck, or any other large bee-keepers complaining of high prices of bee-supplies. They have done business enough to know that when the expenses connected with manufacturing and handling bee-supplies are considered, the present prices are none too high. But, actually, there are a few bee-keepers who think \$1.00 is a high price for 52 copies of the American Bee Journal! But we doubt if any one can afford to keep bees at all, if he can not afford to pay a dollar for a bee-pair.

As to the suggestion that bee-keepers borrow money and buy supplies in the fall, that is all right. It would in some cases be a saving to the bee-keeper to do that. And for so doing, an early-order discount is offered by some manufacturers. But, of course, no one need borrow money or buy supplies in the fall just because some bee-supply manufacturer suggests that he do so.

In conclusion, we want to say that we don't know of any bee-supply dealer or honey-dealer who is getting rich in either business. Neither do we know of any honey-producer that is getting rich. Bee-keeping is not a get-rich-at-it business; neither is the bee-supply business, nor the bee-journal business. But all are businesses in which a fair, honest living can be made by hard work, and by "keeping everlastingly at it."

### Queens or Laying Workers.

A Kansas correspondent wrote inquiring as to the value of a queen which, upon beginning to lay, laid a number of eggs in a cell, only occasionally having a single egg in a cell; but within 24 hours another letter came, saying:

"I have looked into that hive again, and conclude that the queen is missing, and that laying workers are laying the eggs. What made me think at first that it was not laying workers, was that every cell contained one egg or more; that there were no vacant cells, but the eggs are fastened to the pollen in partly filled pollen-cells. It beats anything I have ever read about for laying workers; there must be many of them, or they are very prolific in egg-laying."

It may be said in general that a good queen will lay one egg in a cell, only duplicating the eggs when cramped for room. Yet there are rare exceptions, a good queen at first laying more than one egg in a cell, even when there are plenty of vacant cells. There is nothing strange about the large numbers of eggs laid by laying workers, for there is not, as some seem to think, only one laying worker in a hive, but a number, if not a majority, of the denizens of the hive are engaged at the miserable business.

There are cases in which it is impossible to diagnose certainly the presence of laying workers, at least until the brood is sealed, for the eggs will be laid just as regularly as if laid by the best queen. This, however, is probably never the case except where there is only worker-comb in the hive; for if drone-cells are present the laying workers prefer them, and will lay a large number of eggs in each drone-cell—sometimes a dozen in each—rather than to put up with the cramped quarters of a worker-cell. Generally, however, one or several queen-cells will be found well filled with eggs by laying workers. When eggs are found only in queen-cells, it is safe to say laying workers are the culprits.

It is also pretty safe to say there are laying workers if an egg is found laid on pollen, although, very rarely, a good queen may do such a foolish thing. When the brood is sealed, then all doubt as to the presence of a good queen is removed, for the sealing, instead of being

flat, looks like a lot of little marbles, showing that there are laying workers or a drone-laying queen.

### Automobiles for Bee-Keepers and Their Cost.

This is a matter concerning which there is some interest, and A. I. Root gives some figures in Gleanings in Bee-Culture. He copies the following from the Cleveland Leader:

"William Huston, who recently made an 8000-mile trip through the East in his automobile, to-day figured out the cost of keeping his machine in repair during such steady and hard service. He finds that the mere cost of operating his automobile was 10 cents a mile, divided as follows: Tire maintenance, 5 cents a mile; gasoline, 2 cents a mile; general repairs, 3 cents a mile."

This would be rather expensive for bee-keepers, but Mr. Root thinks it unnecessarily high, probably being for a large machine costing \$1500 or \$2000 instead of \$600 or \$700. His own experience makes him estimate: Tires, 1½; gasoline, ½; repairs, 1 cent a mile, or 2 cents a mile in all. Bee-keepers, who are dreaming of some day owning an automobile, will be anxious to put faith in the figures of Mr. Root, rather than in those of Mr. Huston.

Comparing this with the expense of using horse-flesh, Mr. Root bases his estimate on the charges made by liverymen, and thinks 10 cents a mile none too high for a horse and buggy. Some bee-keepers will smile at the thought of its costing them 10 cents a mile for old Dobbin and the wagon. Perhaps some one will give us an estimate of the actual cost for his team in visiting out-aparies.

### Smoking Bees at the Hive-Entrance.

Renewed attention is called to this matter by the wide variance of opinion expressed by two bee-keeping editors. The Editor of Gleanings says that even in the case of a very cross colony he seldom blows smoke in at the entrance. The Editor of Barnum's Midland Farmer says: "Smoke first, several minutes before taking the cover off; this will give them a chance to fill up with honey."

Is it locality, the character of the bees, or what is it that will justify such opposite treatment? Are none of Mr. Root's cross bees ever found near the entrance, and are Mr. Barnum's bees so savage that it is not safe to open a hive without first pouring smoke into the entrance for several minutes? In the case of the average bee-keeper, the choice between the two ways would probably be a choice between stings and loss of time. The amateur, with only one or two colonies, would probably prefer to lose the "several minutes" rather than to run the chance of the stings. The practical bee-keeper, with 50 or more colonies to open in a day, would hesitate at the loss of time. "Several minutes" would be at least three minutes to each colony, and for 50 colonies that would make two hours and a half, to say nothing of blowing the bees out of the hive with so much smoke. Perhaps the two gentlemen might get together and make some kind of a compromise.

## Miscellaneous Items

**General Manager France** wrote us Nov. 10, saying that the National Association had just won two more victories—one in San Antonio, Tex., where complaints were made against a bee-keeper by neighbors; and another in New Jersey, where honey-thieves were caught, plead guilty, and settled.

**Ohio Bee-Keepers to Organize.**—In Gleanings in Bee-Culture for Nov. 1, appeared the following editorial paragraphs:

There is to be a joint meeting of the Hamilton County Bee-Keepers' Association with the Ohio State Bee-Keepers' Association, at Cincinnati Nov. 25, in the convention hall of the Grand Hotel. The Hamilton County Bee-Keepers' Association, as I have already mentioned, is a very lively organization; indeed, I believe it is the most flourishing body of bee-keepers that ever existed in Ohio. It has regular monthly meetings, and the enthusiasm seems to keep up to the boiling-point. Well, its members are thoroughly aroused as to the necessity of having a foul-brood law in Ohio, and they desire to co-operate with their brethren all over the State in asking our next General Assembly to pass such a measure. The old Ohio State organization held its last meeting in Cleveland, if I mistake not. The secretary, Miss Dema Bennett, just before she died, turned over to me the

records and other properties of the old Ohio State organization. The time now seems to be ripe for reorganizing it, and holding a meeting in Cincinnati, for we are bound to have a good local attendance and an enthusiastic meeting. Bee-keepers all over the State are asked to lend their influence, for it is proposed to bombard the Ohio State Legislature with a goodly company of bee-keepers, possibly holding one meeting in Columbus while the legislature is in session. The date of the convention, Nov. 25, the day before Thanksgiving, will insure low railroad rates; and you may rest assured that the bee-keepers of Cincinnati will do the handsome thing in their part of the work.

It is highly important that every bee-keeper in the State should petition his own Senator and Representative. Soon after this journal is out the election will be over, and you will know who your next law-makers will be. Possibly you will know before. In any case, see them as soon as possible, and secure from them a pledge of support. *This is very important*, for it is essential that every member of the General Assembly be approached by one or more bee-keepers; for when our measure comes up they will feel that the law is urgently needed. We must make them feel the pressure. Put in your best efforts now before you forget it. If you can't see your man, write him.

The meeting at Cincinnati will not be devoted entirely to the discussion of foul brood. Other subjects will be discussed, and among other things will be a stereopticon talk in the evening.

LATER—I have just learned that D. R. Herrick, a Republican nominee for the legislature, and who has signified his willingness to father and support a foul-brood bill, will be present to address the convention. As he will probably be elected, this means much to us.

We hope that Ohio bee-keepers will turn out in goodly number at Cincinnati Nov. 25. Practically all will be able to get home again before the Thanksgiving dinner gets cold. Ohio needs a strong State organization of bee-keepers. Cincinnati is just the place to start it off. There are a lot of live, energetic bee-folks down there, that can do anything they really want to do. We shall expect great things from them. Being an "Ohio boy" we naturally look to our native State to be the foremost in all good movements.

**Bees in a Chicago Hotel.**—The following account of a hotel guest with bees appeared in the Chicago Tribune of Nov. 4:

Busy, buzzing bees stampeded guests and employees at the Palmer House yesterday afternoon. Escaping from a suit-case, in which they were being conveyed to Iowa, they flew through corridors and lobby, stinging a number of patrons.

Clerk Vier, at the counter, noticed two or three insects buzzing about his head.

"Shoo!" he exclaimed, slapping at them. Just then Edward Tiedt, of Indiana, appeared on the scene. He was excited.

"Have you seen any bees around here?" he asked, and then, as he perceived the insects, tried to round them up with a piece of gauze netting.

"They are high-priced bees," he declared. "I was taking them to my farm in Iowa. I'll give \$1.00 for every one that is captured."

Bell-boys became busy, but not busier than the bees, and guests fled from the rotunda. Some sought the bar, and the bees followed. Two made directly for a Scotch high-ball, and were killed with a towel.

A young woman telegraph operator sought refuge in a telephone booth, but she didn't stay long, for a bee had entered before her and resented the intrusion.

Mr. Tiedt had intended starting an apiary on his Iowa farm, and the bees were in a small box that was in his suit-case.

**A Large "Portico Hive."**—A. G. Erickson, of Barry Co., Mo., wrote us, Nov. 9, as follows:

EDITOR YORK:—I send you a newspaper clipping to show that bees can work as well in large places, or large hives, as they can in small ones. A. G. Erickson.

The clipping referred to in the foregoing is as follows:

BEES WERE GOOD TO THIS OAK GROVE MAN.

Two swarms of bees took possession of a cavity in a portico at the home of Dudley Owings, a farmer near Oak Grove, last summer. They were not molested until a few days ago, when Mr. Owings "robbed" them, and secured more than 200 pounds of the honey. This is a fine output for one season. As honey is worth 16 cents a pound, the two colonies of bees netted Mr. Owings \$32.

**Lizards and Insects that Fool Bees.**—"There is a kind of lizard which lives in the sandy deserts of Arabia," says the Sunday School Times. "Its body is so like the sand that it can not be distinguished from it at a little distance, but it has on each side of the mouth a fold of skin of a very light crimson color, which the creature can blow out into the form of a round blossom, and in this state it looks exactly like a little red flower which grows abundantly in the sand. Insects are attracted to this curious object, mistaking it for a

real flower that has honey in it for them, and they approach the mouth of the lizard without fear, when they are immediately snapped up.

"There is also an insect common in India which feeds upon other insects, and, in order to catch them, puts on the appearance of the flower of an orchid. Its legs are made flatter and broader than those of any other insect; they are colored a beautiful pink hue, and they ray out from the body of the insect exactly like the petals of a beautiful flower. Insects are deceived by this wonderful likeness to the blossoms which they frequent for the sake of their honey, and are immediately caught up by their treacherous foe."

## Sketches of Beedomites

### WALTER S. POWDER.

The subject of our "sketch" this week was born Dec. 2, 1860. He was reared on a fruit-farm in Hamilton Co., Ohio, and took a liking to the bee-business during his college days. He established a queen-rearing business, but after advertising for some years, succeeded in disposing of his entire product of queens to the late Chas. F. Muth.

Mr. Powder was one of the helpers in the factory of The A. I. Root Co. for a short time during 1883. He opened a small honey and supply house in Indianapolis, in 1889. With his nephew (now Dr. H. C. Cragg) for a helper, they made the business grow by being economical, both of them "batching." The stock of goods then consisted of a set of scales, a barrel of honey, and 20 colonies of bees!

Mr. Powder was the author of a pamphlet called "The Busy Bees and How to Manage Them," which helped many a beginner in bee-keeping.

To-day Mr. Powder has an immense stock of honey, beeswax and bee-supplies, without a single dollar of indebtedness.

He is unmarried, and for two years has been unfortunate about his bearing, thus debarring him from taking active part in social or church work.

Mr. Powder has been one of the American Bee Journal's continuous advertisers for years. And no one exceeds him in promptness in paying bills. He is one of the reliable kind of young business men that are succeeding because of their honorable dealing and energetic endeavors. We feel like giving such a boost whenever we can, though they are usually the kind that have already boosted themselves into success by their own efforts.

We believe we have not met Mr. Powder since the convention of the National which he refers to on another page—in 1886. And we have entirely forgotten that street-car remark, though we don't doubt that we said it. We had been married just a few weeks before that meeting. Sorry Mr. Powder has not as yet followed our good example in that line. But it isn't too late yet.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

**Our Wood Binder (or Holder)** is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

## Convention Proceedings

### THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 727.)

#### THIRD DAY—THURSDAY MORNING SESSION.

This session opened with Pres. Hutchinson in the chair. Prayer was offered by Dr. Miller.

Mr. N. E. France then addressed the convention on

#### THE ERADICATION OF FOUL BROOD.

This subject of foul brood is one that has been discussed through our papers over and over again, and the appearance of the disease, together with its serious effects, has been described repeatedly, until it seems almost useless to rehash

have some remedy by which we could legislate to make these movements all National in their character. I hope the day is coming when the helping hand of the National Association can reach out and help sister States to get this legislation. During the little time I have been acting as General Manager, I have realized the necessity of this important part of the work.

But to come to the individual work of foul brood, I find bee-keepers in my own State (I will not say this of others) who are readers of two, some of them of three, bee-papers, and who are practical bee-keepers, and are up to date; but when you come to converse upon the subject of foul brood with these parties, they say they have not had experience, they have not posted themselves upon this branch of the business. When it gets into their yard it gets a good foothold before they become interested. Then they begin to go over their literature and look up the subject, having failed, unfortunately, to put the information into their heads, in which case they would have recognized the disease when it made its first appearance, and the serious results which followed might have been avoided. To know it at the first glimpse is very important; to know what to do with it comes later on.

Foul brood has been described over and over again, and I hardly know whether it is worth while to take the valuable time of this convention to go into that here, whether it is desirable to describe it so as to know it without any guessing. I have been called 300 miles to see a case of pickled brood, when they insisted they had foul brood in the yard, and how glad I was to tell them there was no foul

N. E. FRANCE FUMIGATING DISEASED COMBS.

these conditions. But I do think the National Association could help to get legislation on this subject. It looks discouraging; I realize it, at least, in Wisconsin; Mr. Hutchinson realizes it in Michigan. Inspectors in other States realize that they should go into neighboring States to see that the disease is treated when the neighboring State has no legislation on the subject, but continues to propagate the disease and send it over to us. Therefore, we ought to

brood in the yard! But if they had read the literature on the subject there would have been no necessity for me to take such a trip. So I feel that one part of this subject needs to be impressed. To begin with, what causes foul brood? I will say, candidly, I do not know. Every case I come in contact with in my own State I back-track history, and, almost every time, it has been contagious through the bee-keeper's management in some way. There has

been a cause of it in that apiary, but what the original cause was I do not know. In certain cases it might have originated there, but that would not be a standard rule.

How do we spread it? Why, in as many ways as the bee-keeper knows of. I need not enumerate them. Sometimes by getting combs from somebody who has the misfortune to have the disease in his apiary. A man in my State bought, at a very cheap price, a lot of combs pretty well filled with honey from a neighboring apiary. He used

It will remain as found there, the larva continuing to draw down until it will turn up the head, Chinaman-shoe like. Just in that part pickled brood and black brood will do the same thing; that is, they will turn up, but they will not have that little thread running up there.

At that same stage is where it is brown, and has that ropy, stringy nature that I can not find in the case of pickled brood, and I have found it entirely different in black brood, so far as I have examined. Then, at the ropy stage,

C. A. HUFF'S TANK FOR FUMIGATING FOUL-BROODY COMBS WITH FORMALIN GAS.

these as feeders. In those colonies that needed spring feeding I cautioned him, saying, "My friend, do you know whether there has been disease in that apiary or not?" He said, "What is the difference?" I was out on my work, when I received a telegram to come immediately to this man's place. He could not wait for the dispatch to chase me around over the State, but he came overland 60 miles for me. He said, "I have got foul brood up there." I said, "Do you remember a young man who bought some combs with honey in?" He had shown me one comb as clean and white as you please, nearly full of honey, and in there I saw only three cells with foul brood. He had said that it "did not matter." Now, it was just those combs that he had fed. These all had foul brood, but no others. And, by the way, that bee-keeper was formerly of this county. He went back from California to Wisconsin, has had his experience in that, and is coming back to this county this winter to remain permanently with you.

Now, I will describe some of the symptoms of foul brood so that if any one here has not had experience, he may profit by it. Foul brood has some characteristics that are true to the nature of the disease; one would be the perforated or sunken cappings. That might also be true of some others, but it is always true at some stages of foul brood. If we would examine underneath this capping we would find a larval bee, according to its development. If we would take the early stages it would be of a coffee color, a brownish color, with a lightish streak in it, and the head end of that larval bee would be somewhat dry—a peculiar characteristic of that stage. The tongue of the bee seems to adhere to the upper wall of the comb. I never found that condition of affairs in pickled brood, black, chilled, or any other condition of brood, that the tongue stands against the upper side-walls; the larva on the lower side-walls, which is of a brownish color, and the bee is about one-half matured.

we get the peculiar odor of foul brood. Now, these are characteristics that are apparent to the eye. I might go into microscopic features, but do not care to take up these details here. I will say, however, this much: Here are specimens from 10 different bee-yards in my own State, samples of this foul brood. (Yes, I will keep them covered up! At your convenience, those of you who have not seen, and want to see the disease, will come up here and inspect these specimens. They are here for that purpose.)

Now, a little instruction as to what to look for:

First, I will ask the California bee-keepers to keep your hands off of the inside of the box, so that you may not carry the disease home. Handle it as you would any other poison. But what are you going to look at? I have marked on the box so you will know just the top end of the box. Looking straight down into the box, these cells seem to be fairly clean, but when you hold it in the sun (I would want to handle it with the sun coming into it in this direction over my shoulder, so that you can look angling down in there, at the lower side-wall, a little back from the front end of the cell). In some of these you will see that dried, black, thin scale, not quite as thick as the side-walls. That is the last stage. I have had men say, "Why is the comb in that condition? What does that amount to?" It amounts to just what I have illustrated with that comb; that brood was in those combs; it revived, and the disease starts again. In one of these combs there are eggs deposited right on top of these scales, and there is also pollen here, and there was some honey.

I was very much interested in the lecture last evening by your veteran bee-keeper, Mr. Harbison, especially in the close of his remarks in regard to foul brood in your district. You have a warmer climate than where I came from, and I do not know what would be possible if foul brood should be in the trees and in the rocks, where your bees have not

the troubles of winter as we have. But I do know in Wisconsin, and other Northern States, we need not fear bees, and we never have bees in rocks in our locality, so that from that source we are practically free in the Northern States.

I had the complaint brought that if we treated all the apiaries in the vicinity where we found it, there were bees there, and what was the use treating the disease when the bees from the trees would come in and inoculate everything? I had had some experience in hunting bee-trees, and I went out immediately and examined in regions badly infected with foul brood. In only one tree, where the swarm was not over a year old, did I find any disease, and that was in the last stages. But I did find trees where bees had gone from infected hives, and gone into the tree. I got permission to have those trees cut in my presence, that I might examine the brood, and in not one of them could I find a trace of foul brood. As an illustration, in this case where the bees had no comb foundation, and had to build comb for themselves, we found the bees had treated themselves. That tree I consider practically safe. The only way a bee-tree could become diseased would be where it had accumulated combs and then robbing diseased hives. In that way it might become infected. But in our Northern States we know that they can not stand the winters, and they soon perish, and the squirrels and bee-moth get rid of everything inside that hollow tree in a short time afterward. But in these localities it may be another subject.

Now the old treatment, the McEvoy plan, has come so near perfection, when followed in close detail, that I doubt if we can improve upon it at the present date. A little carelessness in any part of it, and we may spread the disease. Early this season there was considerable writing in our newspapers of the treatment of infected combs by the use of formaldehyde. Of course, I was interested immediately, and got material together, and as early as possible went at it to test that treatment. As a final result of that, treating a good many combs in various parts of my own State, I will say the results are simply this:

Where the cells are open, where the gas can penetrate into the open cells, where there was dry larvae, in every case where they were fumigated, the bees carried out the disease, and they continued to be free from infection. So much, I say, where the gas can reach it. But I have been unable to kill the germs of the disease under the capping. It doesn't seem to go through it. In fact, I have found, in capped brood-combs where there were bees apparently healthy, said combs fumigated, and the next day the little bees could crawl. If it would not kill the live bees it would not kill the germs of disease. It had the same ropiness, the same odor after fumigating. In one case I grafted some of that kind of comb into a colony, and had to treat it later.

I would recommend, if you have any doubtful combs, and have any cells capped over, before you use any formaldehyde treatment, that you uncap those cells, allowing the gas to get in there, because the walls of the capping are almost impervious to the gases. I do believe, instead of trying to save all black brood-combs by this formaldehyde treatment, that we would better make wax of it, and put in a new sheet of foundation. It is poor economy. Last year I became disheartened with the saving of old combs. There were parties whose bees seemed to lack energy, but when the old combs were taken away, and they had new ones, there was a new ambition. If, however, we do save the old combs, give them a double dose of formaldehyde treatment. I should be very cautious in trying to save these old combs.

At the Chicago convention, last December, the very best part of it was, after I had finished, those who had had experience, or were afraid they might have, asked questions, drawing out the vital parts. And to those that wanted questions answered, that was worth more to them than the cost of attending the meeting. This is your convention, and I feel I am encroaching upon your valuable time if I do not give you such an opportunity.

(Continued next week.)

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

## Contributed Articles

### An Improvement in Honey-Cans Needed.

GOOD, old, black Johnny Parker, when I was a boy, used to rattle off his prayers in boisterous eloquence, with the saliva spattering from his thick lips along with his earnest words, and he seldom failed to use one climax expression, "Oh, Lawd, speak wid a bois ob sebben peal; a bois like t'under." I don't know that I have recalled that expression before for 40 years, till this very evening, while reading the American Bee Journal, on the first moment of its arriving, about a larger opening for honey-cans; and then I felt like invoking Editor York (Johnny Parker fashion), to let his columns ring on the the subject till the improvement asked for is granted.

The retailers all over the country, who out-number the producers ten to one, if not a hundred to one, should have the first right to be considered in this question of convenience, for it is getting the honey out, and not putting it in, that is the matter. A producer can fill his cans, no doubt, through a small hole just as easily as he could through a large hole, and just as cheaply with the same honey-gate. Why should he care for the difference one way or another? For he is not the man who is to be tortured by this shortcoming in the honey-business, in getting that same honey out after it is candied down solid. While he, with a merry tune, can put the liquid honey in the cans, a hundred different men may have it to peck out—with occasion for tears, possibly. Now, whose happiness should be weighed in this case, the one man or the hundred?

In the last two years, on account of shortage with my bees to supply my home demand for honey, I have had, each year, to send for several shipments of honey from New York and Cincinnati, in which the 5-gallon can full of solid honey always figured largely. If the cans are not burst, or cut, or eaten through at the bottom by acidulated honey, or no nail-holes punched in them by the donkey that crates them—shame on him! I am not exaggerating a particle, for I have never yet received a shipment of honey without too many of the cans being exactly as I am describing. Then if they are sound, I like to set four or six of them into a liquefying tank a foot deep, and boil water around them till the honey is in a hot, liquid state.

And now comes the experience with the small-mouthed cans, which does not improve a man's happiness a single bit. No sooner is the honey hot than it begins to swell, and a scum rises thick upon it, and the cans, if they have been honestly filled, will refuse to hold their contents, and they will all be taken with the dyspepsia. Hurry up quick with a bowl and spoon! I grab a tablespoon, and behold it won't go into the mouth of the can, so I am compelled to putter away as fast as I can with a teaspoon to save some of the honey, while the cans are running over and some of the honey is wasting. A hole large enough to admit a cream-ladle 2½ or 3 inches wide would put an end to this waste, and with some men, no doubt, save hard words.

What did you say? "Dig a little out before melting it?" I have tried that, and it is impossible to do it successfully, because the hole is insufficient; and, even then, in some cases I have had them run over because I couldn't get out enough. And if I should take an inch auger, and bore it out in chunks to make room for the froth, that would not liquefy what I would take out.

What is that? "Cut the top out of the can?" Well, I have to do that in most cases now, but it spoils the can, you know; and, besides that, it is not a funny job to lift out of a boiling-hot liquefier a 60-pound can of honey, without handles, brimful, breast high, boiling hot, and burning one's fingers with a possible slop-over, with a woman standing by to say, "You must not use such language." We leave out the flowery language at our house; but I know human nature well enough to guess what most men would say; and I would not waste the gospel on those poor fellows, either, till I went first and secured the reformation of the honey-can makers, for to prevent an evil is much better than to cure. Here is a good chance for A. I. Root's evangelism.

If the narrow-mouthed men should try my liquefier a few times, and it did not put prayers in them for a bigger hole, and two handles to each can, I am mistaken. For I

have never yet seen a wire handle on a honey-can that was strong enough to be trusted in holding 60 pounds of hot honey without danger of breaking, for many of them break for me in lifting them out of the crate or box.

And last, but not least, a hole large enough for a cream-ladle would enable the buyer to inspect that honey more fully at first, so as to avoid taking from an unprincipled producer worthless stuff, as I have known to be the case from buying it myself in the present narrow-mouthed cans, which are not favorable for the dealer's inspection. But we fixed it up, for he was a manly man, and took it right back.

So I vote for a 60-pound honey-can with a hole in the corner of the top—as the most convenient place for pouring out hot honey—not less than 2½ or 3 inches large, and a strong wire handle on either side of the top; even if they cost more; for we consumers are the ones, in the end, who will have to pay for them.

Respectfully submitted by,  
COMMON-SENSE BEE-KEEPING.

## Sweet Clover—Is it Good or Bad?—And Some Other Things.

BY WALTER S. POWDER.

BACK in the seventies, when I first became interested in bee-literature, I was alarmed to learn that sweet clover was not looked on with favor by those who were planting for honey. I had established a small apiary at my father's home, on one of those beautiful hills just north of Cincinnati, and I felt rather badly when I discovered that I was in the midst of great fields of sweet clover. I gleaned from the bee-papers and text-books that bees would become intoxicated on sweet clover, and many a bee would never be able to return with its hard-earned morsel. On going to the clover-fields at twilight I soon learned that there was some truth in the statements that a few bees could be found numbed and dying on the bloom.

As time went on sentiment changed, and we have learned to look forward to having as much sweet clover produced in waste-places as possible. I have been guilty of carrying the seed in my pocket and scattering it in waste-places, and others have done likewise, till it has increased wonderfully. We have all wished for more sweet clover, and now we have it, but I am undecided whether it will ever prove the boon that we have looked for. I do not fear that it destroys bees to amount to anything, but, blooming as it does at the same time with our white clover, and being inferior in quality, it has greatly lessened the value of our white clover crop in central Indiana and southern Ohio this year. It is inferior in taste, in color, and in thickness; in color it has a greenish tinge. I have known the bees to refuse to work on its bloom, and again I have known but two seasons in 30 years when it yielded a surplus in this section of the country.

It yielded a surplus this year, the first since 25 or 30 years; I do not remember the exact year, but it was the same year the National Bee-Keepers' Association met at Indianapolis. [This was in 1886.—ED.] I remember this distinctly, because this was the first big convention of bee-keepers that I had ever attended. At this convention the late Chas. F. Muth exhibited a sample of sweet clover extracted honey, and I remember that Dr. Miller, in his good-natured way, suggested that its greenish color might be attributed to the coal-smoke around Cincinnati. I wanted to get up and say that I had some just like it that was produced where there was no coal-smoke, but I hesitated because I was too bashful.

### CONVENTION REMINISCENCES.

I shall always remember this convention in just the same way that a boy remembers his first circus. It was one of the events of my life to meet and shake hands with the men whose names were so familiar in the bee-papers. The late Thomas G. Newman was the principal orator. Dr. Miller was the funny man who kept the house in good cheer. W. Z. Hutchinson, a tall, handsome fellow, was taking items in shorthand for his "Notes from the Banner Apiary." I suppose I whispered to my nearest companion that he is the one I'd like to be. Mr. York was Mr. Newman's handy man, with a budget of books and copies of the American Bee Journal. Mr. York was about the only one who did not care to discuss bees during intermissions. He told some of us boys that those Indianapolis street-cars

would be too slow for Chicago, and I guess that I thought, "Well, he's the one I'd rather be."

Frank L. Dougherty was then the Indianapolis honey and bee-supply man. Dr. G. L. Tinker had sent samples of sections made of white-poplar, in four pieces, and I do not believe that I have ever seen their equal in fine workmanship. In fact, I was so favorably impressed with them that I ordered a lot of them as soon as I returned home, and I took them to a printer and had my card printed on them. I used them in a Betsinger case, with wire-cloth separators, and produced honey so fine that when I exhibited it half the observers would have said it was "machine-made," because it was too fine to have been made by the bees!

### CANS VS. BARRELS FOR HONEY.

I also wish to say a word about barrels for extracted honey. They are not popular in the Indianapolis honey market. There are several reasons for this. Usually the quantity is more than a customer wishes to purchase at once; but the worst objection is that they do not hold out in weight. I have tested the matter a number of times, and a 500-pound barrel will invariably show a loss of 60 to 80 pounds. How this loss occurs I am unable to explain.

The 5-gallon can is the proper article for shipping extracted honey, but there is room for one improvement. The boxes should be bound with hoop-iron to prevent the bottoms from coming off. It is not unusual to find loose bottoms; and an occasional nail plunged in the bottom of a can will do a lot of damage.

A thin layer of excelsior laid in the bottom of these boxes helps a whole lot to make matters safe.

Marion Co., Ind.

## The Texas Honey-Producers' Association.

THE bee-men of Southwest Texas, who held a series of meetings recently, are now well organized and incorporated under the laws of that State with \$5000 capital, divided into 500 shares and made assessable. The capital stock is all subscribed for, but when a bee-keeper wishes to become a member, certificates are transferred to him.

They began the conduct of business Sept. 1, and up to Oct. 1, when the charter was granted, they had disposed of nearly 15 tons of honey, and had control of nearly 5000 colonies of bees.

This association will give a new impetus to the bee-industry, because members get their supplies, including cans, at wholesale prices, and receive retail prices for their honey. Extensive plans are being inaugurated for a betterment of the condition of the bee-keeper, and the placing of the honey market on a firmer basis by guaranteed full-weight and purity, together with a price that will bring it in direct competition with other sweets. At present the producers are experiencing not only a greater production than demand, but a demoralized market, on the account of much honey being packed in the past with utter disregard to rules of grading, or neatness or care in packing.

The board of directors, consisting of Dr. J. B. Treon, president; L. Stachelhausen, vice-president; M. M. Faust, G. F. Davidson, W. E. Crandall and E. E. Longenecker, are formulating rules for grading, packing and marketing, which will at once place the product of the association in demand, because the dealers will at once know upon what to depend. Samples are required at least three times a year from all members, and as often as the honey seems to take a decided change in flavor and quality.

Promptness in the delivery of honey by railroad is another thing the association is watching with much interest, and are now collecting data. At present, it takes from 6 to 12 weeks to get a local shipment into North Texas and the Territories.

Commission men and others, who, at the outset, looked upon the association with contempt, are now upon a tottering fence, or have fallen entirely on the favorable side, owing to the quiet but determined policy now pursued. Agents of trusts are now placing bids with them, and making desperate efforts to make prices that will defy competition for the present, when, according to the golden rule of the trusts, the producer, or, rather consumer in this instance, must suffer. With the efficient anti-trust laws of Texas, and the indignant determination of the bee-keepers, it is safe to say they will live together, or die in the attempt.

Next year considerable comb honey will be produced,

and an effort to open the market of our larger cities will be pushed with vigor.

Protection of the producers has also been carried out within the association, by the heavy bonding of the secretary and manager, Lafayette Haines, and treasurer, J. H. Brown.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Introducing Queens—A Bee-House.

Our bees wintered all right last winter. We increased from 7 to 8 colonies, and our bees are getting along fine.

I would like to ask a few questions, the first about introducing queens. What time is the best?

The next is about a bee-house. My papa made a bee-house 50 feet long, 7 feet high, and 7 feet wide; that makes a space in front of 7 feet, and that makes two shelves. We would like to know if we could put the hives one above the other, or if we would have to put them on one shelf. We live in a town, and our lot is not very large, so we must keep our bees as close together as we can.

I like to read what the bee-keeping sisters have to say about their bees. We make our own hives, and I helped to put up the frames, and wire them, and put in the foundation.

Northampton Co., Pa. Oct. 25.

HOPE H. ABEL.

1. The best time in the season to introduce queens is when the bees are gathering honey most freely. The best time in the day is toward evening, when the bees have about ceased to fly.

2. Certainly, you can put them on two shelves, one above the other.

So, Miss Hope, you help make hives and frames, and put in the foundation? I imagine papa thinks you are a big help to him. Wish you had told us how old you are.

### Arizona Bachelor Bee-Keepers Want Wives.

The following clipping has been received:

WANTS CAR-LOAD OF WIVES.

RICHMOND, VA., Oct. 21.—J. Few Brown, cashier of the Valley National bank at Winchester, is asked to send a car-load of Virginia wives to the bachelor bee-farmers of Arizona.

Mr. Brown is a member of the National Bee-Keepers' Association, and the letter is from B. A. Hodsell, an Arizona bee-keeper, also a member. He says he knows of 30 prominent young men in that section who are greatly in need of wives, and who will make faithful and acceptable husbands. He asks that a car-load of girls eligible for wives be sent.

Mr. Hodsell was in Winchester a year ago, and was favorably impressed with the girls in the valley of Virginia.

It's all right for bachelor bee-keepers to desire good wives, but there may be some question whether the best sort of material will be willing to be peddled out in that sort of style. Some inquiries sent in to this department go to show that there is a desire for women bee-keepers as wives, but it may as well be understood first as last, that this department is not a matrimonial bureau.

### A Bee-Keeping Sister Too Successful.

Mr. A. I. Root, relating in Gleanings in Bee-Culture his travels in Michigan, tells of his surprise at finding that Mrs. Charles Shuncman was going to give up bee-keeping because of too great success! Many of the sisters would gladly share her bee-keeping burden with her, at least the burden of harvesting a big crop of honey. But here is Mr. Root's story:

"I don't know that I ever before in my life found a bee-keeper (or bee-keepers) who was going to quit the business because of being too successful. Mrs. S. says she greatly enjoyed bees until this season. She had enjoyed studying them and building up colonies; and this present

year all that marred her enjoyment was the fact that she had secured a tremendous honey crop! The honey was beautiful in quality and great in quantity; but she said it was too hard work for any woman, and her husband was in other business, so he could not give her any assistance; so she wanted to sell out and give it up. If the crop had been more moderate, or possibly none at all, she might have gone on keeping bees. There are very queer things in this world of ours, and there are some funny people in it. Perhaps Mrs. S. may conclude that, with the help of the bright boys and girls around her, she may, after a winter's rest, go on with the bee-business."

### Honey-Plant Seed—Wintering Weak Colonies.

1. Will you please inform me where seed of the following honey-plants can be obtained: Blue vervain, partridge pea, phacelia tanacetifolia, and cleome?

2. Is it not better to contract the space of hives with weak colonies to save the queens for early spring work, than to unite the colonies? They have plenty of stores to keep them over.

Monroe Co., N. Y.

MRS. L. M. RUSSELL.

1. Any leading seedsman ought to be able to furnish them. Perhaps the A. I. Root Co. can do so.

2. Contracting the space will help, but not a great deal, after all. It is safer to unite than to risk wintering a weak colony. But they can be safely wintered by putting two weak colonies in one hive, as described in "Forty Years Among the Bees."

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

BEES PROTRUDING SMALL DROPS OF NECTAR.

I have begun to be ashamed of it already—and instead of getting well I shall probably get "wuss and wuss"—my last "Afterthink," on page 633. Mr. Arthur C. Miller says it's all right about bees protruding small drops of nectar when roaring at night; but they do it with their mouths, not with the ligula. Not much doubt that he is entirely right in the matter.

THAT SWARM IN A TREE FIVE DAYS.

Uncle Frank's September swarm, which staid five days while nobody dared to meddle with them any more, were quite interesting eccentrics for our instruction. Went west finally. Page 637.

THE C. O. D. MAIL BUSINESS.

A tremendous hint to Uncle Sam is given by the chap who makes the mail do C. O. D. business for him. That the plan should succeed a thousand times is a matter of pleasant interest. No postmaster charged more than ten cents, it seems. No record of what some of them may have said about non-required business when they were too busy already. Should the thing spread till postmasters were very often asked to make such collections, there might be a concert of refusal.

Queens by mail C. O. D. Is there anything in that? Established breeder wouldn't like it, I ween. New breeder might offer it to get custom—and then the old chaps might have to fall in. Customers could dance with glee, thinking of the poetic justice (perhaps more than justice) it would give him—means of compelling promptness. "Give you one week, and then if she isn't here this transaction's off"—in place of the sickening wait, wait, wait from month to month. Page 643.

NO HONEY-TRUST RIGHT AWAY.

If we don't have a honey-trust till little, small, local trusts first succeed and then gradually unite, we uns the "skeery" folks can give our trembling thoughts to several other bogies first. Not during A. D. 1904, will the sweet octopus make us feel how bitter it can be—not quite sure about A. D. 2904.

Half the electricity about this subject, which we feel in

the atmosphere, is caused by chaps who are thinking of themselves as prominent officers of the Grand Universal Besweetener—very fellows least qualified, perchance. Page 643.

#### "YORK'S HONEY" AND THE EDITOR'S TIME.

But those good folks who can't eat anything else than "York's Honey," what ever will they do now? Poor fellows! But their poverty is our riches, I reckon. Apiculture is proud enough to think that its leading journal, or journals, deserve pretty much the full time of an editor. Don't expect her servants to live on air, or even on faith; but she decidedly does like the prospect of having them live, and give her full service, too. Page 644.

#### DIFFERENCE IN HONEY STORED BY DIFFERENT BEES.

Was Benton bethinking himself, or did he speak thoughtlessly, when he said the honey of one kind of bees was as good as that from another? There is great difference in different species of honey-storing bees as to the quality of the honey they store, why not some difference between different varieties inside the species? Page 646.

#### HOT KNIFE OR COLD KNIFE FOR EXTRACTING.

Ah! it's the cold knife that is one approved California style instead of the hot knife! A little wooden keg of cold water and three knives, two to soak while one is being used. Also, some think it can't be done, while some don't think it, but just do it—do it right along in the biggest kind of work. See, also, on page 712, how the knife-man himself, Bingham, says, cold knife, and decidedly reprobates the hot one. Extracting in small way, I always use the cold knife, without even the cold water, excepting to mop off with a rag once in awhile. If I should try the hot water once (which I never fairly did), perhaps I should flop over. Wonder if cold water would really soak off those small granules of wax that oft stick on the edge. In my practice, they call for the thumb-nail to be carefully drawn along. Tiny lumps of wax allow a keen blade to pass half way through them, and then hang on with great pertinacity. Oft they are so small that two or three are hardly noticed; but, anon, a lot of them get on until something remedial must be done. I find the temperature of the air in which one works makes a great difference. The hotter the day the worse the knife behaves. Have just been doing some extracting a good deal too cold. Bad for the extracting proper, but the knife does its part well—goes right along without any thumb-nailing or soaking. But get down much colder and the honey itself will hug the knife so you can not proceed with any comfort. Page 645.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Transferring—A Colony Half Drones.

1. How can I transfer a swarm of bees from a grocery box into a hive?
2. I have one colony of bees that has about as many drones as worker-bees. What can I do with them? and what is the cause of there being so many drones?
3. How much honey can bees store from one pound of granulated sugar dissolved in water? IOWA.

ANSWERS.—1. The same as your bee-book directs for transferring from a box-hive. But you would probably better not transfer so late in the season as now. One of the best ways is to wait till the bees swarm next year, and three weeks after swarming you can cut out all the combs with no danger of destroying brood.

2. It is either a case of laying workers or a drone-laying queen. In either case, the best thing is to break up the colony. The bees are probably so old that they are of little or no value to unite with other colonies, and this is one case in which, at this time of year, it may be advisable to kill the bees, as they will soon die anyway, and there is no use in allowing them to consume any more stores.

3. None that you could sell as honey. But if you feed a pound of sugar for wintering, it will probably be equivalent to about 21 ounces of honey.

### Buckwheat—Raspberries—Hive-Stands—Fall Covering for Hives.

1. What is buckwheat usually worth per bushel?
2. Would it pay me to furnish my neighbor enough for five acres?
3. How much seed is required per acre?
4. Do bees gather much from raspberries?
5. What does the average bee-keeper use as stands for placing the hives on during the summer?
6. Is there any need of covering the hives with anything during the fall? WISCONSIN.

ANSWERS.—1. Varies with locality; about \$1.00 here.

2. If no other plant is yielding nectar at the time, it would pay you big.

3. About three pecks per acre.

4. Yes, the raspberry is a very important honey-plant. In some localities, notably in northern Michigan, it yields a handsome surplus.

5. Generally pine boards in some form, the simplest being two pieces of fence-board nailed on the ends of two other pieces.

6. There should be provision made in some way for bees wintered on the summer stands to be covered warmer in winter than in summer, and this may as well be on in the fall.

### Keeping Comb Honey in Winter.

I have read your "Forty Years Among the Bees," and note what you say, on page 310, but here goes for a question—not of bees, but of honey:

We have a closet in our living room close to the stove, and I have filled it with honey, in small no-drip cases, with 15 sections in each. My wife thinks the honey will sour and spoil. I want to keep it from freezing. Will the heat from the stove spoil my honey? OHIO.

ANSWER.—Tell your wife that for once she will probably have to give up in the wrong. That closet, close by the stove, ought to be an ideal place for keeping honey, and would be all the better if it would keep not far from 100 degrees. Even a good bit above that would do no hurt. See page 271 of the book you have mentioned.

### Late-Reared Queen.

I received a queen all right, and put her into a new hive with a frame of brood. I looked for and could not find her, but found five queen-cells capped, and the rest of the brood hatched. I suppose that indicated that she was killed, and they will rear another, but it will be too late to be fertilized this fall. Will she be any good? And will the bees work in a cucumber-house this winter? The other queen did very well. MASSACHUSETTS.

ANSWER.—She may and she may not be worth something next spring—chances not greatly in favor. A colony will work in a cucumber-house, and will help the cucumbers, but it will not help the bees.

### Carniolans and Italians.

Please describe through the American Bee Journal, in a strictly "Truthful James kind of way," the Carniolan bees, and compare them with the Italians. In what respect is the one superior, or inferior, to the other? IOWA.

ANSWER.—I don't know enough to do as you desire, having had no personal experience with Carniolans. Even if I had, you might not have the same experience, for testimony concerning them is very contradictory. Probably Carniolans are not all alike. They are much more given to swarming than Italians, and the general testimony is that they are gentler. A cross between Carniolans and Italians is highly spoken of by some.

Amerikanische Bienenzucht, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## FROM MANY FIELDS

### A Good Honey-Year.

After a very poor outlook last spring, it turned out to be a good honey-year in this locality. I had 75 colonies of half-starved bees, spring count, and they increased to 100, and brought me over 3000 pounds of salable white comb honey.

WM. HARTWIG.

St. Croix Co., Wis., Oct. 31.

### Bees Nearly a Failure This Year.

The bee-business was nearly a failure here this year. It has been too wet and cold. From 80 colonies I got about 1000 pounds of honey, the most of it being comb honey.

Well, if I live another year I will try my luck with bees once more. We may get a crop of honey some time, if we only bang on and do not give up.

FRANK E. KNAPP.

Wadena Co., Minn., Oct. 30.

### Good Season—Bee-Paralysis.

I started in last spring with 10 colonies, increased by natural swarming to 16, and harvested 250 pounds of white clover honey and 1000 pounds of fall honey, about 175 pounds of this being comb honey, and the balance extracted. My best colony gave me 325 pounds; they were a good grade of Italians. I had 3 young colonies that gave me 125 pounds each, besides filling up all right for winter. This has been a good season for honey here.

I have introduced four queens with good success this year. One queen I got from Texas, and introduced her to a small queenless colony in May; they gave me 125 pounds of honey. This reminds me about introducing young queens to colonies that are affected with paralysis. I have changed the queen in 3 different colonies and the disease has disappeared entirely. I think the cure is all right, at any rate in my case. I had 2 cases last spring where the disease was so bad that the colony nearly died out, and yet the young queen saved all, and they gave me a nice lot of surplus honey.

I had a colony that lost their queen early in the spring, and they reared 42 perfect queens in their hive. The weather was bad, and they could not swarm, so they just killed them and kicked them out at the entrance, and I picked them up.

A. J. FREEMAN.

Neosho Co., Kans., Oct. 30.

### Report for the Season.

I cannot refrain from writing once a year at least, because I never took a paper that I thought was conducted quite as well as the American Bee Journal has been conducted. For my part, I can not see how some men can handle bees without it or some other paper; where they do, I surely think that the bees handle them the greater part of the time.

Three years ago I wintered 5 colonies, two years ago 9, and one year ago 20, and two of those died or dwindled away during a long, cold, wet spell we had last April. One of my neighbors had 2 colonies, and wishing to dispose of them, I traded him a hog for the bees, so this made my number good again. I have 35 this fall to put into winter quarters, nearly all being in very good condition. I think we had too much rain this season for a good crop of honey, or else I have too many bees for the of honey, or else I have not know which, as I got only about 600 pounds—30 pounds to the colony, spring count. I had one colony that stored 80 pounds of comb honey; they swarmed once, but I returned them and clipped their queen.

I would like to keep my number about 10, I would like to reduce it some if I can, and I have read of so many ways that I hardly know which to adopt. This season I practiced cutting out queen-cells while the swarm was out, and then return them, but I am quite sure this would not work where one person had a very great number of colonies. Toward

2146-48 Central Ave., CINCINNATI, OHIO.

Please mention Bee Journal when writing.

the close of the swarming season I got to clipping the queens, which I thought a better plan. As this has been a great season for swarming, the same method may work better another year.

I have read the editor's writings about the trip to California to attend the National Beekeepers' convention at Los Angeles, until, well, until I imagine I have been there myself. His description and explanation of things are so plain and perfect that I prize the writings very highly indeed, and hope to have the privilege of reading of many trips of like nature; also that Dr. Miller and our family namesake may be to attend many more of those meetings for without them how would the editor's writings be complete?

W. H. ROOT.

Wayne Co., Nebr., Nov. 3.

**Results of the Past Season.**

My bees did very well, considering the season. I had 18 colonies in the spring, increased to 30, and got 2680 pounds of honey, mostly white clover. One colony gave 234 4/5 sections, all salable. I use the Danzenbacher hive exclusively. I know my locality, understand its flora, and have a method of handling swarms that has made bee-keeping successful as well as profitable with me.

C. E. AURICH.

Troquois Co., Ill., Nov. 4.

[We would be pleased to publish your method of handling swarms.—EDITOR.]

**In Justice to California.**

I was somewhat amused and surprised at the articles written by different ones about California. Now, I do not want to criticise any one, but it is no more than fair to all Californians and prospective settlers that a wrong impression should be corrected.

Now, one impression is that we have a honey crop only once in 4 or 5 years. I have lived in the State since 1834, and have worked with bees nearly every season, and have an apiary at the present time. If my memory serves me rightly, the only total failure was in 1838; that season the bees in certain localities actually starved. It is true we have had more failures in grain-growing districts (I mean the grain crop), but because of a grain failure it is not always necessarily a failure in honey-production. In the season of 1837, and others which were very dry, the bees did remarkably well, the soil retaining its moisture from the previous season; neither does a very wet year always insure a large honey-yield.

In regard to honey-plants, a person not familiar with this country would suppose from the articles that the sages were the only natural honey-producing plants growing here. Should this be the case, I believe two years from now would see no more bees in this part of the State.

Let me name some of our honey-plants; I will enumerate them as they come in the season (from March to September): Alderlee,

wilows, horesmit, and numerous other wild flowers; then come black sage, white sage, wild alfalfa, wild buckwheat, and last, tarweeds. And we also have quite a few tame honey-producing plants, alfalfa, deciduous fruit-bloom, eucalyptus bloom, etc. Now, this applies to Southern California, and not to Los Angeles and vicinity alone. Remember this is no small territory—from Los Angeles to the Mexican border to the south is somewhere about 150 miles. I believe it is about the same distance to Sao Luis Obispo county to the north; and the distance between the large mountain ranges and the sea coast is about 100 miles, on an average. Now, is it reasonable to expect a person to collect bees of the country unless he sees more than can be seen from the trolley line that runs between Los Angeles and Pasadena? A person should be here at least during the honey season, say April or May, to gain some knowledge of the country.

Now, Mr. Editor, come out about next May, and I will be glad to take you over some bee-ranges in Riverside or San Bernardino counties.

A. F. WAGNER.  
Riverside Co., Calif., Oct. 24.

[We are glad Mr. Wagner wrote the foregoing. We certainly do not want to misrepresent any part of our great country.]

We hope to have the privilege some time of spending a few weeks in California, as we are fully convinced that going there in the dry season for only a few days one can not possibly get a correct idea of things in the apicultural line.

If any other erroneous impressions have been given in these columns, we will be glad to have them pointed out.—EDITOR.]

**Season Too Wet for Bees.**

The season here was too wet, and so many cloudy days. My bees, in the "Happy Home Hive" have sought to enter well, and some surplus, but not enough to bring about. Many colonies still have drones, notwithstanding they stopped breeding about Sept. 20.

Carroll Co., Md., Oct. 30. H. H. FLICK.

**Bees Did Fairly Well.**

The bees did fairly well here. I started last spring with 41 colonies, increased to 73, and put back about 30 swarms. I secured about 1500 pounds of fine comb honey.

W. R. M. COYLE.  
Vernon Co., Mo., Oct. 24.

**Poor Seasons in Succession.**

We have gone through six poor seasons here now in succession, which makes it pretty tough. We had hoped this would be a good one, but May was very dry, and May and June were both cold, with north winds blowing. It seems strange there was such a good honey harvest in Illinois; the weather must have been cold there, too. The only way that I can account for it, is that they had rain a little sooner than we did, and that saved the clover. I never saw a good season that was dry through April and May, while the clover is growing. It can be dry when the clover has matured, and it will do no harm, but not while it is growing.

GEORGE M. STINEBRING.  
Wayne Co., Ohio, Nov. 5.

**Transferring Bees from Box-Hives.**

This is my way of transferring bees from old hives without frames: If it is a gum I lay it on its side, with the comb standing on edge; nail a board on the bottom, leaving a hole large enough for the bees to enter the hive, and bore a number of holes in the top side of the hive. Prepare an 8-frame super with foundation in it, and place a queen-excluder between the hive and super, which keeps the queen out of the super, and no young bees will bother you. When I want to extract from it I will get a lot of honey from it that season, as it will not be checked from increasing in the latter part of the season. Quit extracting in time for

**R. H. SCHMIDT CO., Sheboygan, Wis.**

them to fill their extracting frames for winter; remove the queen-excluder so the queen can go above to lay, which she will do almost invariably; if she does not, blow a little smoke into the entrance which will drive her up. When you find that she is up, put the excluder on again, and after the required time to hatch the brood has expired, place a new hive where the old one stands, and remove the old one, putting in the frames that are in the super with the bees that adhere to them. The old hive will have but little honey in it, as they have put it into the extracting-frames. The combs can be rendered into wax, as it is generally cracked and old, and probably some of it filled up with pollen.

I want to do this work in the first part of the season. I have always had the best results from transferring as I have stated. The whole strength of the colony is used to produce heat, so the changes in the weather do not interfere with brood-rearing; in fact, they transfer themselves—they hardly know they have made a change. J. G. CREIGHTON.  
Hamilton Co., Ohio, Nov. 5.

### The Season in South Carolina.

Our honey crop was a failure here this year in the spring and summer, and our bees were about ready to starve Aug. 1, but the cotton commenced to give some honey, and then they gradually built up, so that by Sept. 15 they were in good shape and we had a good flood from Oct. 1st to the 20th, so the bees are in fine shape for winter. I have 70 colonies at home, and 15 at an out-yard, and they all have plenty of winter stores, and some of them could spare some, as the two-story hives have from 50 to 75 pounds each.

W. M. BAILEY.  
Spartanburg Co., S. C., Nov. 7.

### Bees as a Side Issue.

We had a bad summer. As it was so rainy and cold all through the early part the bees nearly starved in June, but by careful management I got a little surplus—all fancy—and I sold it at from 17 to 20 cents per section. I am now ready to commence the winter with 28 colonies, all in fair condition.

I found a bee-tree in May, cut it down and hived the bees; they had a fine leather-colored queen, and built up nicely, and are in good shape. I am a farmer, and keep a few colonies of bees as a side-issue, to help pay taxes. IRA SHOCKEY.  
Randolph Co., W. Va., Nov. 6.

### Late Queen-Introduction—Rearing Queens.

I received a queen this afternoon, and notwithstanding the cold, she and her attendants were in first-class condition. It required great care to hunt out a queen in a strong colony of bees, as they covered all over with flaming war-paint, but I did it, and got only one sting. The temperature at the time was 40 degrees above zero.

I can not sympathize with those who make so much complaint of getting poor queens from queen-breeders. I have bought queens from many persons for more than 30 years, and I can not recall more than one really inferior. I got one a few years ago that, for a time, laid comparatively few eggs, but later she kept her hive full of very fine bees, and the queens reared from her were among the very best I ever had.

Late last season I reared a queen in a small nucleus, which had lost its queen on her excursion to meet a drone; I gave it a bit of comb, only large enough for one cell, so the bees had but one larva to feed. I think there was no queen in a few days after that. The young queen seemed well developed, and became fertile, and began to lay a little in advance of the usual time. She pleased me so much that I introduced her to a full colony, and she has proved one of the very best queens in my apiary. She has done so well the past season that I want to try a first of another year, at least. From this experience, and from some others, I am satisfied that good queens can be reared in nuclei as well as in full colonies. Yet I would

# Langstroth on The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**GEORGE W. YORK & CO.**  
144 & 146 Erie Street, CHICAGO, ILL.

The good advertiser is ever ambitious to do better advertising.—Printers' Ink.

prefer to have cells built in full colonies and under the swarming impulse. I get nearly all of my queens in that way. M. MAHIN.  
Henry Co., Ind., Nov. 6.

### Box-Hives vs. Modern Hives.

I see that many disparaging remarks and many sarcastic comments appear from time to time concerning "box-hives" and all who use them. And while not in any way an admirer or advocate of them, I would like to point out one reason why many such despised hives are still used, and always will be. That overwhelming reason is the expense connected with a good, modern hive, no matter which you select. And remember that the despised "box-hive" is always perfectly satisfactory to the bee.

To illustrate the expense connected with the change from box-hives to modern hives, I give my own experience:

I have had box-hives to 15 colonies of common black bees in box-hives for the last three years, from 1900 to 1902, and this year I transferred them to 8-frame dovetailed hives, using the combined stand and bottom-board, and gable covers. Last spring I had 11 box-hives, with all colonies strong. I bought 20 hives, 1½ stories, and 5 extra supers, sections enough to fill all the frames with this foundation to put full sheets in all sections, and light brood to fill all enclosures with full sheets; bee-escapes, veil, smoker, foundation fastener, brook, paint, etc., making a total expense of \$50.30.

Later on I purchased 16 Italian queens for \$13.00; making a total of \$63.30 for the first year. Expenses for the next season will be \$51.00; for 1903, \$92.74; for 1904, \$80.39; and from that on, when I shall have an apiary of 50 3-story hives, the annual expense for supplies of all kinds will be about \$85.00. Therefore, my apiary of 50 hives complete will cost me \$257.43. All these expense items are based on the A. I. Root Co.'s latest price-list. If prices continue to rise, as seems probable, the expense will be more.

There is one other item of expense that I

Please mention Bee Journal when writing

have not mentioned. Nine of the box-hives that I had were "on shares," and the owner got scared at the expense and risk of transferring, and sold out to me. So 820 more must be added, making \$88.30 for 1903, and \$270.33 for the apary complete.

Also, there arises another item of expense in the loss of honey entailed by transferring, and the loss of 3 colonies in the same operation. Thus, I started with 11 colonies and got 9 swarms, so would have 20 colonies in box-hives. I have averaged about 50 pounds surplus honey per colony for the past 3 years, and have ready sale for all the chunk honey I can produce at 12½ cents per pound. So that even if none of the swarms had given any surplus, I would have 550 pounds of honey, or \$68.75. Instead of which I have 16 colonies, and 2 of the transferred colonies had to feed 25 pounds of syrup for winter supplies, and I got only \$10 worth of surplus honey; thereby losing \$58.75, making the total expense for apary, \$88.30. I am continued to use box-hives the expense would have been nil.

Thus, you will readily see that not many farmers (and they are the people that will be generally found using box-hives) can contemplate the expense of buying modern hives and all the many necessary appliances they entail with any degree of equanimity. You will understand that I expect it to pay me well (notwithstanding the expense), or I should not have entered on the necessary expense for the next 3 years. But most users of the box-hive couldn't, and wouldn't, stand the expense, even if they knew that they would double or treble their honey crop.

So as I began so must I end—the expense entailed in using modern hives and appliances is responsible for the continued use of the despised "box."

#### CONVENTION NOTICES.

**Chicago-Northwestern**—The regular annual meeting of the Chicago-Northwestern Bee-keepers' Association will be held at the Revere House Club-Room, southeast corner of North Clark and Michigan Sts., on Wednesday and Thursday, Dec. 2 and 3, 1903. The Revere House will accommodate 1000 persons, 50¢ per night for lodging, when two occupy a room. Meals, 25 cents, or on the American plan at \$2 per day. Owing to the Revere House furnishing tables and chairs, and holding our meeting, we feel that all who can do so should patronize them during the Convention. Dr. C. C. Miller, Ernest R. Root, W. Z. Hutchison, Emerson T. Deane, and J. A. Stone, Inspectors, J. A. Stone, Jas. A. Stone and Huber H. Root have signified their intention to be present. Pin this in your hat. There will be one of the best meetings ever held in Chicago. Entered as second-class matter, Sept. 15, 1902. HERMAN F. MOORE, Sec.

GEORGE W. YORK, Pres.

P. S.—It has been suggested that bee-keepers bring with them samples of honey, and such little appliances as they have that are considered handy to work with in the apary.

**Colorado**—The 24th annual meeting of the Colorado State Bee-keepers' Association will be held in the Chamber of Commerce Hall, Denver, Colo., Nov. 23, 24 and 25, 1903. An unusually fine program has been prepared. One of the features will be a display of hives, cups and frames manufactured in Colorado. The attendance of all Colorado bee-keepers is earnestly solicited. Write for program to Boulder, Colo. H. C. MOREHOUSE, Sec.

**Minnesota**—The Minnesota Bee-keepers' Association will hold its annual meeting at Minneapolis, Minn., Wednesday and Thursday, Dec. 2 and 3, at the First Unitarian Church, on the corner of Hennepin and Marquette streets, between Hennepin and Nicolet Aves. Go in on the Mary Place side. Procure certificates from your local railroad agents when you purchase tickets, and those living in Minnesota can return for one third fare, and we hope to secure the same for those living in Wisconsin, Iowa, and the Dakotas. DR. L. D. LEONARD, Sec. Wm. RUSSELL, Pres.

**Missouri**—The Missouri State Bee-keepers' Association will meet in Mexico, Mo., Dec. 15, 1903. J. W. Rouse will act as host to direct the attendants to the hall, which is free to all who desire to attend. Board rates for the leading hotels at \$1 to \$2 a day. Come, everybody who is interested in bees and honey. Let us have a big meeting. We now have 51 paid-up members. Let us make it 100. Procure certificates from your local railroad ticket agents when you purchase your tickets. It may be you can return for ½ fare. W. F. CARY, Sec. J. W. ROUSE, Pres.

**Canada**—The annual meeting of the Ontario Bee-keepers' Association will be held in the Town Hall of Trenton, Ont., Tuesday, Wednesday and Thursday, Dec. 1, 2 and 3, 1903, beginning at 2 p.m. on Tuesday. On the program are the following:

"The Advantages of Out-Apiaries; How, When and Where to Move Them," by B. O. Lott; "Spook Swarms," by Morley Pettit; "The Bees of Ontario and Their Importance in the Markets," by F. W. Hudson, of the Agricultural Department; "On the Storing of Comb Honey," and "Experiments in the Preparation of Winter Food for Honey Bees," by Frank B. Shutt; "Address on Experiments," by John Fixter, of the Experimental Farm. There will also be an address by Prof. James, Deputy Minister of Agriculture, of the Department of the Ontario Honey Exchange, which will be given and discussed. Messrs. Morley Pettit and C. W. Post will have charge of the Question Drawer. The evening of Dec. 2d will occur the annual banquet.

Persons having any new or practical inventions are invited to bring them to the convention, and place them on exhibit, and give their practical uses. There will be a place for showing these articles.

All persons going to the convention should purchase a full-fare single ticket from the agent at starting point, and give a standard certificate, and if efficient attend and hold these certificates, the return fare will be one-third, according to the arrangements made with the different railway companies, or, if under 50, two-thirds single fare.

The leading hotels—the Bleeker House, St. Lawrence Hall, and the Hotel Aberdeen—will give a rate of one dollar per day.

A very cordial invitation is extended to all persons interested in bee-keeping to attend and take part in the discussions. W. COUSE, Sec. Streetsville, Ont.

## HONEY AND BEESWAX

MARKET QUOTATIONS

**CHICAGO, Nov. 7.**—The supply of comb honey is large, and sales are being forced, so that it is a little difficult to give accurate figures. Sales are not easily made of fancy at anything over 15c per pound, with less desirable grades selling lower. Extracted, white, brings 6½¢ to 6¢, according to kind, flavor and package; amber, 5½¢ to 4½¢. Beeswax, 2½¢ 30c.

R. A. BURNETT & Co.

**PHILADELPHIA, Nov. 9.**—Honey arriving very freely the last week and prices little easier. This month is best month in the year for demand of comb honey. We quote fancy white 16¢ to 17¢; No. 1, 14¢ to 15¢; buckwheat, fancy, 15c. Extracted, white, 7½¢ to 8¢; amber, 6½¢ to 7¢. Bright yellow beeswax, 32c. We do not handle on commission. Wm. A. SEELER.

**ALBANY, N. Y., Nov. 7.**—Honey demand and price keeps up remarkably well. Fancy white, 16c; A. No. 1, white, 15c; No. 1, 14½¢ to 15c; mixed, 13¢ to 14c; buckwheat, 13½¢ to 14c. Extracted, dark, 6½¢; mixed, 6¼¢ to 7¢; white, 7½¢ to 8¢; not as active as comb. Beeswax, 30c. H. R. WRIGHT.

**CINCINNATI, Nov. 7.**—The demand for honey is a little better. The prices rule about the same. Extracted is sold as follows: Amber, in barrels, from 5½¢ to 5c; in cans about ½ cent more; water-white alfalfa, 6½¢ to 6c; white clover, 6½¢ to 6c; the comb honey market is quite lively, and it sells as follows: Fancy water-white, 14¢ to 15c. Beeswax in good demand, at 30c delivered here. C. H. W. WEBER.

**BUFFALO, N. Y., Oct. 11.**—The demand for white comb honey is better than it was. The trade is particular and wants only very white, clean stock. If the wax is yellow from travel it does not sell well, and price has to be cut. Fancy white comb, 14¢ to 15c; A. No. 1, 13½¢ to 14c; No. 1, 13¢ to 13½¢; No. 1, 12½¢ to 13c; No. 3, 11¢ to 12c; No. 4, 10¢ to 11c. Beeswax, 30c. White extracted, 6½¢ to 7c; amber, 6½¢ to 6c; dark, 5½¢ to 6c. Beeswax, 28¢ to 30c. W. C. TOWNSEND.

**BOSTON, Oct. 8.**—Comb honey continues to be in good demand. Fancy white honey in cartons we quote at 18c; No. 1, 16c; No. 2, 15c; No. 3, fancy white, at 16c; No. 2, at 14c. Extracted honey, Florida, 6½¢ to 7c, according to quality. BLAKE, SCOTT & LEE.

**KANSAS CITY, Oct. 23.**—Receipts of comb honey good; demand good; market easier. Receipts of extracted light. We quote: Fancy white comb, 24 sections, per case, \$2.00; No. 1, white and amber, \$2.75; No. 2, \$2.50. Extracted, white, 7c; amber, 5½¢ to 6c. Beeswax, 25¢ to 30c. C. C. CLEMONS & Co.

**CINCINNATI, Oct. 1.**—Comb and extracted honey are coming in freely, and the demand is good with steady prices. We are making sales at the following prices: Amber extracted at 5½¢ to 6c; white clover, 6½¢ to 7c. Fancy comb honey, 15c. Beeswax, 30c. FRED W. MUTH CO.

**NEW YORK, Sept. 23.**—Comb honey is arriving quite freely now, and is being readily sold at 15 cents per pound for fancy white, 13¢ to 14c for No. 1 white, and 12c for No. 2 white and amber. Very little buckwheat on the market as yet, and it is being sold hardly at 10c per pound. Extracted honey is ruling about the same as last with plenty of offerings of all grades. Beeswax is somewhat declining and selling at present at from 28¢ to 30c per pound.

HILDRETH & SEEGLER.

**SAN FRANCISCO, Oct. 21.**—White comb, 1-lb. frames, 13¢ to 14c; amber, 9¢ to 11c. Extracted, white, 5½¢ to 6c; light amber, 5¢ to 5½¢; amber, 4½¢ to 5c; dark amber, 4¢ to 4½¢. Beeswax, good to choice, light, 27¢ to 28c; dark, 25¢ to 26c. Market is more quiet than for several weeks preceding, but is fairly steady as to value. Spot stocks and offerings of both comb and extracted honey are mainly white. Our very recent inquiry is principally for water-white, the latter being the only kind meeting with much competitive bidding from buyers. Recent arrivals of bees from Hawaii, and other cases from the Hawaiian Islands. The bees of the Islands feed mainly on sugar.

#### WANTED FANCY COMB HONEY

In no-drip shipping-cases. Also Amber Extracted in barrels or cans. Our very best price delivered Cincinnati. The Fred W. Muth Co. 32A1F Front and Walnut, CINCINNATI, OHIO.

# Extracted Honey For Sale!

ALL IN 60-POUND TIN CANS.

## Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

## Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Our honey is put up in tin cans holding 60 pounds of honey each. These cans are shipped in wooden-boxes, and should arrive safely. We have nothing but **PURE BEES' HONEY** to offer, and so guarantee it. **Cash must accompany each order.** All prices are f.o.b. Chicago.

### Prices of Alfalfa Honey:

One 60-lb. Can @8c.....\$ 8.00  
Two 60-lb. Cans (in 1 box) @7½c 9.00  
(Larger quantities at the 7½c price.)

### Prices of Basswood Honey:

One 60-lb. Can @9c.....\$ 5.40  
Two 60-lb. Cans (in 1 box) @8c.... 9.60  
(Larger quantities at the 8c price.)

A sample of either Alfalfa or Basswood honey will be mailed on receipt of 10 cents; samples of both kinds for 16 cents. (Stamps accepted.)

**BEEWAX WANTED**—We are paying 28 cents cash or 30 cents in trade for pure average beeswax delivered in Chicago (or Medina, Ohio).

**HONEY-JARS**—Don't forget to get our prices on all sorts of honey-packages.

## IMPORTANT NOTICES.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec03" on your label shows that it is paid to the end of December, 1903.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

Advertising Rates will be given upon application.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and very frequently leads to a sale.

The picture shown here with is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

## The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" so further binding is unnecessary.

**GEORGE W. YORK & CO.,**  
144 & 146 Erie Street, CHICAGO ILL.

## 20,000 Pounds

White Extracted Alfalfa HONEY FOR SALE.  
Address,  
DR. GEO. D. MITCHELL & Co., Orden, Utah.  
464ft Please mention the Bee Journal.

## WANTED—Extracted Honey.

Mail sample and state lowest price delivered Cincinnati. Will buy FANCY WHITE COMB HONEY, any quantity, but must be put up in no-drip shipping-cases.

**C. H. W. WEBER,**  
2146-48 Central Ave., CINCINNATI, OHIO.  
24ft Please mention the Bee Journal.

WANTED—Comb Honey in quantity lots. We are perhaps the only dealers in this article owning as much as 150,000 pounds at one time. Please state quantity, quality and price asked for your offerings. Thos. C. Stanley & Son, 241ft MANZANOLA, COLO., or FAIRFIELD, ILL. Please mention Bee Journal when writing.

## HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Nov. 7.—The supply of comb honey is large, and sales are being forced, so that it is a little difficult to give accurate figures. Sales are not easily made of fancy or anything over 13c per pound, with less desirable grades selling lower. Extracted, white, brings 60 $\frac{1}{2}$ ¢, according to kind, flavor and package; amber, 54 $\frac{1}{2}$ ¢. Beeswax, 28 $\frac{1}{2}$ ¢.

R. A. BURNETT & Co.

PHILADELPHIA, Nov. 9.—Honey arriving very freely the last week and prices little easier. This month is best month in the year for demand of comb honey. We quote fancy white, 14 $\frac{1}{2}$ ¢; No. 1, 14 $\frac{1}{2}$ ¢; buckwheat, fancy, 15¢. Extracted, white, 70 $\frac{1}{2}$ ¢; amber, 67 $\frac{1}{2}$ ¢. Bright yellow beeswax, 32¢. We do not handle on commission.

WM. A. SELSER.

ALBANY, N. Y., Nov. 7.—Honey demand and price keeps up remarkably well yet. Fancy white, 16¢; A No. 1, white, 15¢; No. 1, 14 $\frac{1}{2}$ ¢; mixed, 13 $\frac{1}{2}$ ¢; buckwheat, 13 $\frac{1}{2}$ ¢. Extracted, dark, 6 $\frac{1}{2}$ ¢; mixed, 6 $\frac{1}{2}$ ¢; white, 7 $\frac{1}{2}$ ¢; but not as active as comb. Beeswax, 30¢.

H. R. WRIGHT.

CINCINNATI, Nov. 20.—The demand for comb honey is shown by the fact that it has sold six weeks ago at the enormous quantity of 100,000 lbs. on both sides. Fancy comb is sold in single case lots at 14¢. The supply of extracted honey is big, although the demand is good. We are selling amber extracted in barrels at 5 $\frac{1}{2}$ ¢@6¢. White clover, in barrels and cans, 7 $\frac{1}{2}$ ¢@8 $\frac{1}{2}$ ¢, according to quality. Beeswax, 30¢.

THE FRED W. MUTH Co.

BUFFALO, N. Y., Oct. 11.—The demand for white comb honey is better than it was. The trade is particular and wants only very white, clean stock. If the wax is yellow from travel-stain it does not sell well, and price has to be cut. Fancy white comb, 14 $\frac{1}{2}$ ¢; A No. 1, 13 $\frac{1}{2}$ ¢; No. 1, 13 $\frac{1}{2}$ ¢; No. 1, 12 $\frac{1}{2}$ ¢; No. 1, 11 $\frac{1}{2}$ ¢; No. 1 dark comb, 11 $\frac{1}{2}$ ¢; No. 2, 10 $\frac{1}{2}$ ¢; 11 $\frac{1}{2}$ ¢. White extracted, 6 $\frac{1}{2}$ ¢@7¢; amber, 6 $\frac{1}{2}$ ¢@7¢; dark, 5 $\frac{1}{2}$ ¢@6¢. Beeswax, 28 $\frac{1}{2}$ ¢.

W. C. TOWNSEND.

BOSTON, Oct. 8.—Comb honey continues to be in good demand. Fancy white honey in cartons we quote at 18¢; No. 1, at 16¢; glass-front cases fancy white, at 16¢; No. 2, at 14¢. Extracted honey, Florida, 6 $\frac{1}{2}$ ¢@7 $\frac{1}{2}$ ¢, according to quality.

BLAKE SCOTT & LEE.

KANSAS CITY, Oct. 23.—Receipts of comb honey good; demand good; market easier. Receipts of extracted light. We quote: Fancy white comb, 24 sections, per case \$3.00; No. 1, white and amber, \$2.75; No. 2, 12.50. Extracted, white, 7¢; amber, 5 $\frac{1}{2}$ ¢. Beeswax, 25 $\frac{1}{2}$ ¢.

C. C. CLEMONS & Co.

CINCINNATI, Nov. 7.—The demand for honey is a little better. The prices rule about the same. Extracted is sold as follows: Amber, in barrels, from 5 $\frac{1}{2}$ ¢@6¢; in cans about 5¢ cent more. Water-white alfalfa, 6 $\frac{1}{2}$ ¢@7¢; white clover 6 $\frac{1}{2}$ ¢@7 $\frac{1}{2}$ ¢. The comb honey market is quite lively, and it sells as follows: Fancy water-white, in barrels, in boxes in 30¢ delivered here.

C. H. W. WEBER.

NEW YORK, Sept. 23.—Comb honey is arriving quite freely now, and is finding ready sale at 15 cents per pound for fancy white, 13 $\frac{1}{2}$ ¢@14¢ for No. 1 white, and 12¢ for No. 2 white and amber. Very little demand on the market as yet, and prices are hardly established.

Extracted honey is ruling about the same as last with plenty of offerings of all grades. Beeswax is somewhat declining and selling at present at from 28 $\frac{1}{2}$ ¢ per pound.

HILDRETH & SEEGLEN.

SAN FRANCISCO, Oct. 21.—White comb, 1-lb. frames, 13 $\frac{1}{2}$ ¢@14¢; amber, 9 $\frac{1}{2}$ ¢. Extracted, white, 5 $\frac{1}{2}$ ¢@6¢; light amber, 5 $\frac{1}{2}$ ¢@5 $\frac{1}{2}$ ¢; amber, 4 $\frac{1}{2}$ ¢@5¢; dark amber, 4 $\frac{1}{2}$ ¢@5¢. Beeswax, good to choice, light, 27 $\frac{1}{2}$ ¢@28 $\frac{1}{2}$ ¢.

Market is more quiet than for several weeks preceding, but is fairly steady as to value. Spot stocks and offerings of both comb and extracted are mainly of amber grades, while most urgent inquiry is principally for water-white, the latter being the only kind meeting with much competitive bidding from buyers. Receipts of honey include about 12 cases from the Hawaiian Islands. The bees of the islands feed mainly on sugar.

## WANTED! FANCY COMB HONEY

In no-drip shipping-cases. Also Amber Extracted in barrels or cans. Quote your best price delivered Cincinnati. The Bee Journal, 241ft Front and Walnut, CINCINNATI, OHIO.

## CONVENTION NOTICES.

Chicago-Northwestern.—The regular annual meeting of the Chicago-Northwestern Beekeepers' Association will be held at the Revere House Club-Room, southeast corner of North Clark and Michigan Sts., on Wednesday and Thursday, Dec. 2 and 3, 1903. The Revere House has made a rate of \$1.00 per person per night for lodging, when two occupy a room. Meals, 35 cents, or on the American plan at \$2 per day. Owing to the Revere House furnishing 3000 lbs. of honey, we are offering it to all who can do so should patronize them during the Convention. Dr. C. C. Miller, Ernest R. Root, W. Z. Hutchinson, Emerson T. Appleton, N. E. France, Inspector L. O. Smith, Jas. A. Stone and Huber H. Root have signified their intention to be present. Pin this in your hat. There will be one of the best meetings ever held in Chicago.

HERMAN F. MOORE, Sec.  
GEORGE W. YORK, Pres.

P. S.—It has been suggested that bee-keepers bring with them samples of honey, and such little appliances as they have that are considered handy to work with in the apiary.

New York.—The Fulton and Montgomery Counties Bee-Keepers' Society will meet at the Central Hotel, Market Street, Amsterdam, N. Y., on Tuesday, Dec. 22, 1903, at 10 a. m. This will be the regular business meeting of the society for electing officers, payment of annual dues, and any other business which may come before this meeting. Annual dues, \$1.00, which also includes a membership card, and a National Association's. T. I. DUGDALE, Sec.  
F. P. JANSEN, Pres.

Minnesota.—The Minnesota Bee-Keepers' Association will hold its annual meeting at Minneapolis, Minn., on Tuesday and Thursday, Dec. 2 and 3, at the First Unitarian Church, on the corner of 8th St. and Mary Place (midway between Hennepin and Nicollet Aves.) Go in on the Mary Place side. Procure certificates from your local railroad agents when you purchase tickets, and those living in Minnesota can return for one-third fare, and we hope to secure the same for those living in Wisconsin, Iowa, and the Dakotas. DR. L. D. LEONARD, Sec.  
WM. RUSSELL, Pres.

Missouri.—The Missouri State Bee-Keepers' Association will meet in Mexico, Mo., Dec. 1903. J. W. Rouse will act as host to direct the attendants to the hall, which is free to all who desire to attend. Board may be had at the leading hotels at \$1.00 per day in Iowa, and at the Dakotas. DR. L. D. LEONARD, Sec.  
W. F. CARY, Sec. J. W. ROUSE, Pres.

Canada.—The annual meeting of the Ontario Bee-Keepers' Association will be held at the Town Hall of Trenton, Ont., Tuesday, Wednesday and Thursday, Dec. 1, 2 and 3, 1903, beginning at 2 p. m. on Tuesday. On the program are the following:

"The Advantages of Out-Apiaries; How, When and Where to Move Them," by E. O. Lott; "Shook Swarms," by Morley Pettit; "The Benefits of Organization and the Extension of the Ontario Honey Exchange," by the Agricultural Department; "On the Storing of Comb Honey," and "Experiments in the Preparation of Vinegar from Honey," by Prof. Frank S. Shattuck. Addresses on "The Future of the Experimental Farm," will also be an address by Prof. James, Deputy Minister of Agriculture of Ontario. A report of the Ontario Honey Exchange will be given and discussed. Messrs. Morley Pettit and W. Post will have charge of the Question Drawer. The evening of Dec. 2d will occur the annual banquet.

Persons having any new or practical inventions are invited to bring them to the convention and place them on exhibition to show their practical use. There will be a place for showing these articles.

All persons going to the convention should purchase a full-fare single ticket from the agent at starting point, and get a standard certificate, and if sufficient certificates are procured, the return fare will be one-third according to the arrangements made with the different railway companies, or, if under 50, two-fifths of the fare.

The leading hotels—the Bleecker House, St. Lawrence Hall, and the Hotel Aberdeen—will give a rate of one dollar per day.

A very cordial invitation is extended to all persons interested in bee-keeping to attend and take part in the sessions.  
Streetsville, Ont. W. COURSE, Sec.

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER  
IN AMERICA

43d YEAR.

CHICAGO, ILL., NOV. 26, 1903.

No. 48.

## Editorial Comments

### The National Bee-Keepers' Association.

General Manager France, we learn, is preparing a very elaborate Annual Report, which will be mailed to members early in December. He has done an immense amount of work in the interest of bee-keeping and bee-keepers all over our country. Already there is a membership of over 1600. This ought to be made 2000 by Jan 1. Why not? Surely, there ought to be 400 among the readers of the American Bee Journal alone that would join during the next month! We will be glad to receive and forward the dues (\$1.00) for any who wish to send to us when renewing subscriptions. Mr. France reports that "members are joining fast now." Two joined in Texas at the close of a lawsuit in which the Association won—as it usually does.

The forthcoming Annual Report of the General Manager will tell all about the work done by the Association during 1903. It will be mailed only to members. So, if you want a copy, and also desire to cast your vote in the election held in December (next month), you will need to send your dollar in *at once*, if not now a member. If you prefer, send dues to N. E. France, Platteville, Wis.

There are in the neighborhood of 30,000 bee-keepers who are subscribers to bee-papers in America. And yet only about 1 in 20 of them is a member of the National Bee-Keepers' Association. If it were 1 in 10 the membership would be 3,000. It seems to us that it ought to be an easy matter to get 1 in 10 to become members, especially when the Association is doing such good work in the interest of all bee-keepers. In view of such work, does it look right—is it right—that 1600 should bear all the expense for 700,000, which is the number of bee-keepers reported by the last census?

We wish that every reader of the American Bee Journal were a member of the National Bee-Keepers' Association. We are not asking anything in this for ourselves. Only that the bee-keepers might more generally help themselves, and the whole bee-keeping industry, by becoming members of their National Association.

### How to Drive Hive Staples.

When driving staples to fasten a hive-bottom to a hive, one can do it in a right way or a wrong way. The object is to have the hive so fastened to the body that there shall not be the least chance for the hive to slide back and forth on the bottom. If the staples are driven in straight up and down, unless there be an exceedingly tight fit there will be at least a little chance for the hive to slide back and forth. Four staples should be used, driven into the sides, near the ends, and the two staples on one side should be slanted in opposite directions, with the same amount of slant. Then there will be no chance for the hive to slide on the bottom.

### Salt and Lime for Bees.

"Salt and air-slaked lime should be put convenient to bees," says the Australian Bee-Bulletin. The partiality of bees for salt is well known, but isn't the lime a new suggestion? What do the bees do with it, Mr. Tipper?

### Don't Neglect Your Drone-Breeders.

Too many bee-keepers pay little or no attention to the improvement of their stock, allowing the bees to swarm pretty much at their own will, the swarming settling the matter of the new queens that are reared. Of those that make some effort at selecting, probably the majority look out for the queens alone, paying no attention whatever to the matter of drones. It should be remembered that it is just as important to have a good father as to have a good mother. Decide now a certain proportion of your colonies which are best, breed queens from the best one, and rear drones from the others.

### Late Flights Before Cellaring Bees.

The rule sometimes given as to the time of putting bees in cellar—a rule perfect in theory, but not always easily put in practice—is to put them in immediately after the last flight they will have before winter sets in for good. Speaking of this, Editor Hutchinson says in the Bee-Keepers' Review:

While I would leave them as long as I thought there was a *reasonable* chance for having another flight, I don't attach so very much importance to these extra-late flights. After the bees have settled down for their winter nap, they are consuming very little honey. The matter of two weeks does not use up much honey.

True, the matter of two weeks does not use up much honey, but if bees consume twice as much on the summer stands as in the cellar, that two weeks is equivalent to four weeks' consumption in the cellar. It may also be said that bees in the cellar do not consume an enormous amount in four weeks; but there is another way to look at it. The trying time of confinement comes in early spring; not because it is spring, but because of the length of confinement. The bees have been confined so long that two weeks more will mean disease, four weeks more disaster. It is the last end of the confinement that tells—the last straw that breaks the camel's back. Now, please remember that two weeks more on the summer stands without an after flight practically adds two to four more weeks' confinement *at the last end*, and that two weeks will seem no trifling matter.

### The Weeds of Ontario.

This is the title of Bulletin No. 94, issued by the Ontario Agricultural College, at Toronto, Ont. It contains about 100 pages, written by Prof. F. C. Harrison, and revised by Prof. Wm. Lockhead. In the introduction to this revised edition, we find these words:

"On account of the increasing demand for information regarding *weed-seeds*, it was deemed advisable to incorporate into this revised bulletin some information regarding the identification of the common weed-seed impurities which are found in commercial clover and timothy seed. A few additional weeds are described, and the *methods of eradication* are in many cases given in greater detail."

It is a very interesting pamphlet, and should be of immense value to the farmers of Ontario.

It says: "A weed has been defined as any plant out of place; and in that sense, a wheat-plant in a field of turnips is a weed." From this view, we suppose, the following is said concerning one of the best home-plants in the world:

**SWEET CLOVER** (*Melilotus alba*).—The white sweet clover is a very common plant in vacant grounds and neglected fields about cities and along roadsides. It is a tall, rank-growing plant, and thrives best on heavy clay soils. It may be classed among the weeds, inasmuch as it grows where it is not wanted, but it can not be considered a noxious weed. As a soil-former, sweet clover is a valuable plant. It roots deeply, and is a nitrate producer. With the aid of the rains and

frosts it gradually mellows the soil of unproductive clay, and makes it fit for cultivation.

It is a biennial. The shoots of the first year's growth are tender, and are valued in the South as fodder for stock, but those of the second year are tough, fibrous, and branching, and bear the flowers which are very attractive to honey-bees. In some districts sweet clover is grown extensively by apiculturists. The number of seeds produced every year by each plant is very large. Experience shows that sweet clover is not difficult to control. It grows altogether from the seed. If seeding is prevented by cutting down the plants at blossoming time, very few plants will make their appearance the following season.

Although a fodder-plant in the South, sweet clover is not relished by stock in Ontario. On account of the tough, fibrous nature of the second year's growth, there is a possibility that the plant may in a few years be grown for the manufacture of binder-twine, etc.

Should it be proven that sweet clover can be profitably used for making twine, surely here will be something that has long been looked for by bee-keepers—a plant that has value aside from the nectar which it yields.

If we remember correctly, sweet clover seed is valuable for certain purposes.

Who knows but the much-despised sweet clover will yet win its way to power and fame?

### Pick Out Your Breeders Now.

"Breed from the best" is a pretty safe motto, and it may be better now than later to decide which the best are. If you have made no definite record of the performance of each colony, by the time you want to start queen-rearing next year you may have only a hazy remembrance of it. So it is better to defer your decision no longer, and after having made the decision you should put it down in black and white, or else mark in some way the hive that contains your best queen. Also mark several others of the next best. Something may happen to your best queen, so that you will want to use the next best, and in any case you will want to know several of your best colonies which are to be encouraged to rear drones, drone-rearing being discouraged in other colonies.

### Weighing Colonies.

If you want to weigh your colonies before leaving them to their winter's repose, you can do it by means of a platform scale, but it is a quicker job to use a spring balance. Suppose you have decided that before going into the cellar each S-frame hive with its contents, cover, and bottom-board must weigh at least 40 pounds. A rope is slipped over the hive in some way—if you have cleats on the ends an endless rope is passed under each cleat—the hook of the spring balance supports the rope, and a tough stick used as a lever supports the spring balance, the short arm of the lever resting on a light frame-work of sufficient elevation.

It may not be necessary to weigh all the hives. Hefting may answer for most of them. Practice will help to decide by hefting when a hive weighs considerably more than 40 pounds, and such a hive does not need to be weighed.

The use of a little more strength, however, will enable one actually to weigh all and do it expeditiously. Have the spring balance supported by a broad strap about the neck, and you can lift the hive by the spring balance just about as easily as you can heft it. Have an assistant to call off the weight. Lift slowly, and whenever the index of the balance passes the 40-pound mark, the assistant calls out "Stop," thus saving unnecessary lifting. Of course, the same principles will apply if some other weight than 40 be the limit. When thus weighing, it may be convenient to use a long staff or stick to help balance or support one.

### Selecting Colonies for Next Year's Breeding.

Not a colony, but colonies; for it is not safe to depend upon a single queen—she may die—and several colonies are wanted for drone-rearing. At first thought it may seem a very simple thing to make the selection: Suppose No. 17 stored the past season the most surplus, 200 pounds; No. 23 stored 180 pounds; Nos. 85, 64, 94 stored, respectively, 176, 173, and 160 pounds; these being the best in the apiary, so why not rear queens next year from No. 17, and drones from the others? Well, it isn't so simple a matter as that. In spite of the superior yield of No. 17, it may be that it would be better to rear queens from either of the other four. It may be that No. 17 superseded its queen late in the season, and that the new queen has met a very inferior drone, so that next year the colony may do only mediocre work. You may as well take some time to the matter. Sit down one

of these long evenings with your memoranda before you, and give the matter the attention which its importance merits.

First, make a list of colonies giving the largest yields, putting them in the order of their superiority. If one of them has changed queens during the season, that throws it out of the count, although if the change was made very early in the season the colony may be entitled to some consideration. It may be that one giving an extra yield had in some way an extra chance, as by having brood or bees given to it. It may be that brood or bees were taken from it, for which allowance should be made. The record of previous years should be noted. A colony with a good record for two seasons is better than one with a record for only one season, always supposing that the same queen has run through the two seasons.

If comb honey is the object, it is worth while to note whether a colony has done good work in finishing up sections that are nice and white in every respect.

All these things should be carefully considered along with gentleness, inclination to swarm, etc., and the choice made accordingly; and it is better to make that choice now than later.

### Zinc for Hive-Covers.

This is favored by some. More expensive at the start, but it lasts, and there is no question as to its being rain-proof. If it will last a goodly number of years without paint; it may in the long run be the cheapest thing that can be satisfactorily used.

## Miscellaneous Items

Mrs. Morrill Dunn, of Chicago, read a short paper on bees at her residence on Nov. 5, to a group of young women who had formed a literary and social club. Through the kindness of Mr. Whitney (of Brookside Apiary, in Wisconsin), and a Chicago friend, she was enabled to show a complete hive, several combs, and a queen-bee with attendant workers. The properties were very interesting, and helped those who had read Maeterlinck's book to place things; and awoke great interest in those who had not a faint understanding of the wonderful system belonging to the most marvelous little creatures the world has to show.

The Minnesota Convention, which meets Dec. 2 and 3, in the First Unitarian Church, cor. 8th St. and Mary Place, Minneapolis, has a most excellent program. Every bee-keeper of that great State should "get there," if at all possible. Among the papers and subjects to be read and discussed are these:

Wintering Bees Outdoors in Manitoba—Dr. C. M. Vanstone.  
What is the Best Way of Extracting to Prevent Increase and to Get the Largest Amount of Comb Honey?—N. P. Aspinwall.  
Pickling with Honey-Vinegar and Honey—Miss Mary Moeser.  
Out-Apiaries and "Shook" Swarms—F. A. Gray.  
Co-operation Among Bee-Keepers—Walter R. Ansell and S. Lindersmith.

A Ramble on the Pacific Coast with a Little About Bees and Bee-keepers' Conventions—Mrs. H. G. Acklin.  
Some Reminiscences in Bee-Keeping—J. P. West.  
Bee-Keeping from a Woman's Standpoint—Mrs. W. S. Wingate.  
Queen-Rearing—G. R. Frye and F. A. Crowell.  
Honey Exhibit at the Minnesota State Fair—N. S. Gordon, Supt.  
How to Produce a Fancy Grade of Comb Honey—Dr. E. K. Jaques.  
Anatomy of the Honey-Bee, and Bee and Fire Blight (Pear Blight)—F. L. Washburn, State Entomologist.  
Bee-Keeping as a Side-Line—Geo. A. Forgerson.  
Transferring Bees from Logs to Modern Hives, and Getting Rid of Robber-Bees—Wm. Cairncross.

Four-Piece Sections are advocated by Editor Hutchinson, and he thinks the time now ripe for some one to make a specialty of their manufacture, and push them.

California Bee-Keeping is thus commented upon by our good friend, Mr. W. A. Pryal, of San Francisco Co., Calif., in a letter dated Nov. 11:

DEAR MR. YORK:—The reports of the Los Angeles convention, as given in the American Bee Journal, have been interesting me of late. Last week I read that part devoted to the talk by "Uncle Amos," and this week I was an attentive reader of the reminiscences of Mr. Harbi-

son. Of a good deal of the latter's work with bees in this State I have been familiar, as I, some time ago, collected all the information I could about the early history of bees into this State. I had had he "drawn out," as he had heretofore kept his "light hidden under a bushel." Little has been given to bee-keepers since he published his book, the "Bee-Keepers' Directory." He has been a great bee-keeper, and it is too bad for the fraternity that he did not do more writing, especially for the bee-papers. His book was a good one. While it is out of print, I have seen a few copies of it around some of the second-hand book-shops. That is where I procured my copy, as well as one for a friend.

W. A. PRYAL.

I notice that Mr. Harrison came to this State in 1854, the year my father came, I believe. Both were engaged in the same business, my father being located at first in San Francisco, and afterward in Alameda County, then what were portions of Contra Costa or Santa Clara counties. Mr. H.'s remarks about getting \$1.00 a pound for honey reminds me of some of the early settlers telling me that they saw a single peach sold for \$1.00. My father told me that he sold ordinary varieties of roses in the '50's, in this city, for \$10 the plant. Strawberries sold for more than \$1 a pound in the early days. All this seems strange to us Californians of the present day, when fruit is about the most common product of the soil we have, and can, at times, be had for almost nothing. And here honey has sold for less than it does in any portion of the world, in all probability.

Mr. Harrison voiced splendid advice when he called for the planting of honey-secreting plants. I have contended for a quarter of a century—it begins to make me feel old when I speak of such a long period of time—for the planting of honey-producing trees and plants. It was in 1877, I believe, I drew attention to the fact that the eucalyptus was a great honey-producing tree. This fact may have been noted by others before I mentioned it in the bee-papers. I am glad that the tree is now fully recognized as a boon to apiarists.

I firmly believe that alfalfa will be one of our great honey-plants scattered all over the State. I find that it is now growing in all manner of out-of-the-way places. Birds and other animals are sowing the seed far and near. In time it will be found growing wild on the highest hill-tops, as well as in the valleys. I find it growing in the most unlooked-for places in Alameda and San Francisco counties. It behaves bee-keepers to scatter the seed by roadsides and other places, which will then become distributing centers, so to speak. A good place to sow the seed is well up in the hills and mountains near a stream. In this way the seed from the plants that will thus come into existence, will work their way downward and downward, until the garland of alfalfa for the bees to revel in—first, away up on the hill-side (if it is a sunny exposure), and later in the valley below.

There is no doubt in my mind but the whole of California is a big bee-garden. The central and northern portions of the State have the advantage, owing to the fact that they are better supplied with rain-falls. While as much water-white honey may not be produced northward at present, I believe the time is not far off when color in honey will not cut much of a figure so long as the article is of good flavor. To my notion, some of the amber-colored honey I have tasted surpassed any of the so-called white honeys.

We are having nice rains. They came late this season. The grass on the hills and valleys is shooting up rapidly. If you were here now you would not find things as parched as they were when you were here in August—in the middle of our dry season. Mind you, when you saw some of the lower counties you saw but a very small portion of our great State. Just remember there are some valleys that are green the year around. There is the Pajaro valley, about 100 miles south of here, in Santa Cruz and Monterey counties, that is as verdant the year around as the Emerald Isle, and where the fine apples that tickle the palates of Londoners are shipped from, to a great extent. Then its strawberries and other small fruits are favorites in the San Francisco markets. 'Tis a great producer of sugar-beets, butter, cheese, etc. Then portions of Humboldt county has its rich valleys that never fail of crops. While the rainfall of the south end of the State may be five inches, the precipitation in that County may, as it often does, amount up to 80 or 90 inches. Wonderful things happen in California.

Then along the Sacramento and San Joaquin rivers there are vast tracts of land where wonderful crop-yields are harvested annually. In these valleys bees are not known to die of starvation, so I have been told. But once in a while they have been drowned by overflows.

In mentioning the eucalyptus I may say, in passing, that I found

the inclosed clipping in the editorial columns of this morning's San Francisco Call.

Yours very sincerely,  
W. A. PRYAL.

The clipping mentioned by Mr. Pryal reads as follows:

TIMBER AND BEE-FEED.

The Pacific Fruit World turns to the varieties of eucalyptus tree to assure in California the amount of bloom necessary for bee-feed. The honey-industry is a large one. Sometimes the fields do not suffice to make what is considered a full crop. How is this defect to be remedied? The Fruit World says simply that the planting of a proper number of eucalyptus trees is all that is requisite.

There is something novel in the proposition to cover the land with trees of the size of the lofty eucalyptus to serve the minute, buzzing honey-makers. It does not follow from this suggestion, that because the idea is new, it is not practicable. Indeed, the Fruit World cites facts that are at least interesting in support of its scheme.

There are a sufficient number of varieties of eucalyptus known to California to provide bloom during every season in greater or less quantity. When the flower-bearing plants and shrubs fail to contribute their full quota of nectar, the eucalyptus would be invaluable, so writes the Fruit World. "It is possible," says the editor of the journal, "to make such planting of eucalyptus trees as to secure from them a succession of bloom which will, in addition to their use as fuel, give ranges for the honey-gatherers."

The Eucalyptus calophylla and the Eucalyptus acemenoides are in flower from July to October. The first-named is the bearer of white blossoms. The Eucalyptus cornuta, which is well known by its allusion of yellow flowers, follows closely after the calophylla in time of blossoming. The Eucalyptus corymbosa has the same season practically. The Eucalyptus eximia, a low-growing tree, begins to flower from September to December. The Eucalyptus punctata, famed for withstanding drouth, is an October bloomer. The most brilliant of the eucalyptus family is the ficifolia, but its season is short. On the adobe hills the rudis thrives. At all seasons the occidentalis proclaims its name through its crimson adornments. Then there are the Leli mellidiora, that is rich in honey; the lehmani, the paniculata.

Seeds and trees, it is said, are available to start all the plantations that may be required. The eucalyptus has retained its popularity variously in this State during many years.

Tall groves make wind-breaks to shield orchards of deciduous and citrus fruits in many localities. Long avenues of shade attest its desirability in another use. Stout cord-wood it makes to enhance the joys of home, and is consigned to the open grate. Medicinal qualities inhere in it, and many men bleed oil. It has been employed to furnish material for cleansing the interiors of steam-boilers. Now, humming through the ambrosial air of California, the nectar-gathering bee may add its note of cheerful praise for the boquets of flowers raised high above arid lands by the eucalyptus' aspiring and mast-like trunk as a source of a table dainty.

The above is right in line with Prof. Cook's article on another page. Wherever the famous eucalyptus will grow, we should think that bee-keepers would aid in planting it. Its honey is delicious, of excellent flavor, thick in body, though rather dark in color. But as Mr. Pryal well says, color in honey will be of less importance as time goes on. Color in honey is now, and has been, a fad which we are certain will pass away like many another senseless fad.

A California Trip Correction comes from Wisconsin, in the following:

DEAR BROTHER YORX:—Didn't that coyote "convention," the altitude, heat, "Max Jenney's talk," or something, get you a little "mixed" when you announced in the American Bee Journal of Oct. 1st, that you traveled through the New Mexico Desert after leaving Williams, Ariz., through the Arizona desert after leaving the Needles on your way to Los Angeles? Have traveled over the Santa Fe route four times, and never found it thus. Perhaps there has been a big earthquake since I was there. It used to be Arizona from Williams to Needles, and California the rest of the way to the coast. Don't wonder "Max" failed to tell you that that 250 miles of the worst deserty kind of desert, from Needles to San Bernardino, was all California—beautiful, "blooming" California—or that you failed to discover it for yourself. Why I lived in a Bernardino County more than three years before I discovered it, or even knew that it was all San Bernardino County from Needles to Los Angeles! There are some big things in California besides trees and liars.

Your description of "Max" was particularly good. Did you happen (?) to meet his twin brother, "The Real Estate Agent?" Of course you did; the deserts are full of him. You were not there long enough to see and learn everything. Still I have known people to stay there less than a week and know it all, or think they did, when, in fact, the amount they did not know would have made a large encyclopedia.

There are some curious things growing in those deserts besides yucca, cacti, horsetails, etc. I am going to send you something I "grow" there, without any irrigating. I call it "A California Welcome." I hope you will excuse me for calling you "Brother," but, the fact is, my husband is a bee-keeper, as was his father before him, and bee-keeping seems to "run" in the family.

An Ex-Californiaian, with a big X, MARY B. HALL

Yes, Mrs. Hall, you are right in your correction. See page 762 for that "Welcome."

# Convention Proceedings

## THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 744.)

### FOUL BROOD, BLACK BROOD, PICKLED BROOD.

Question—What is the difference in the symptoms of foul brood and black brood in the appearance and development of the diseases? Are they two distinct diseases, or but one?

Mr. France—A comparison of foul brood and black brood shows that foul brood always has that brown color, a little darker than in healthy brood, the dead larvae of a light color, and, as it is termed, ropy. At this stage, if you run a match or toothpick into it, this dead larva will draw out with an elasticity like glue. And, by the way, it smells like a furniture glue-pot. It has that old, disagreeable foul-brood odor. If it were black brood it would be very much darker, and the odor would be like a rotten, sour apple in an old cider-mill. It is somewhat more of that nature. It attacks the larvae earlier in the life of the bee, and those affected turn a very dark brown, almost black, and die. Now, I never knew foul brood to have that peculiar characteristic, but when you go into it in the finer details, under the magnifying glass, the germs of the diseases have a very strong resemblance. They are each of them rod-like, and each of them throws out spores, and thus propagates. In that particular feature they seem to be alike. It seems to be a little harder in treatment. I believe I was the first to go beyond Mr. McEvoy in the treatment of foul brood, caging the queen while making the treatment. I did have a few cases where the colony was so dissatisfied that they deserted their home and went into neighboring hives, queens and all. They were fed liberally, and they stayed away. I avoided that trouble by caging the queens. New York bee-keepers have followed in the same line, treating black brood as foul brood, and caging the queen, and have even gone further and caged the queen for two days longer. All that is necessary is to get the diseased honey out of the hive into clean quarters.

Question—What is the cause of pickled or black brood? Is it contagious?

Mr. France—I feel that this subject of pickled brood is one of vital importance, because it has created in my own State a great deal of anxiety, and it has been quite serious. As to the cause of pickled brood, I have fully convinced myself what it is, and what causes it. In a little leaflet that I issued for Wisconsin bee-keepers, I described black brood and pickled brood. I do not know but I might as well read this as to try to give it in any other form. Your season here is earlier, so these dates would not correspond with conditions here:

"The larval bees (in Wisconsin the last of May and through June) show light-brown spots; a little later the cappings have small holes, they are not sunken or dark-colored as in foul brood. The dead bee will be at first swollen, with a black head, dried to a hard bunch, and often turned up Chinaman-shoe like. The skin of the dead bee is quite tough, and, if punctured, the thin, watery fluid of the body will flow as freely as water, often a little yellow or brownish colored from the dissolved pollen from the abdomen of the bee. It has very little or no smell, does not at any time stick to the walls of the comb, is easily pulled out of the cell, is never ropy or sticky, and, if the colony is properly cared for, the bees will take care of themselves. Plenty of liquid unsealed honey and pollen near the brood, and hives so protected as to keep bees and brood comfortable on cold days and nights."

So much for pickled brood. Now, what causes it? Cold, backward spring weather, when the bees can not get out and fly, causing a shortage of food, is the cause of nine-tenths of it in the State of Wisconsin. For instance, in

this State, last spring, you probably had some cold, backward weather. Then came on beautiful weather, and brood-rearing commenced, the honey-flow came on about the time of the honey-flow, and pickled brood would appear. That pickled brood may have started before you saw it. It is lack of nourishment and care of the larval bees. Just as we people first look out for our own stomachs, then those of our neighbors', so these bees, if they can not get out to work, will subsist upon the honey in the hive. There may be lots of solid honey in the hive, but the brood may be starved or chilled, and these conditions may produce a case of foul brood, or, under these circumstances, pickled brood. I do not believe a case of pickled brood ever produced a case of foul brood, any more than diphtheria produces small-pox.

What shall we do to get rid of it? Strengthen the bees so that they will have an abundance of honey. That is all there is to it. In one apiary where there were 80 colonies, and they had foul brood in a colony, I took every other hive, and simply gave those colonies an abundance of feed, and let the others go as they were. In ten days time, the colonies that were given the extra honey had carried out the dead, but the others were dwindling down, and there was more and more pickled brood. Then, in the same yard, I cautioned the owner, just during the time between fruit-bloom and clover, about ten days there that the bees do not get any honey; I said, "Don't you let them know anything about that famine time. You feed them those ten days, so that from the time there is no fruit-bloom there is something for them until the clover comes on." What was the result in that apiary? There is not a case of pickled brood there.

I don't believe foul brood and pickled brood are alike. Nor do I believe that black brood and pickled brood are one and the same. But there is another condition of affairs that seems to corroborate it. I have had several samples, and there is one here in this box. There is a condition that is rather serious, and it has a similar appearance to foul brood at some stage, but, owing to climatic conditions, or something, I have been unable to have an analysis that is to my satisfaction, to know what you would call it. We must take these conditions locally, and I would want to understand your conditions here before I could do it satisfactorily, but I believe you Western people will go after it and correct it.

How does it differ? Not so much brown, but more nearly black. It bears down loosely, and you can touch the comb up with a little pair of tweezers without any trouble.

Do the bees carry it out? In some localities they do. They say in Washington and Oregon the bees seem to carry out a good deal of it.

A Member—We have a modification of foul brood here; the color is darker, but the substance is not very elastic, but I have been thoroughly convinced that it is simply a modification. It is quite common here the last few years.

Prof. Cook—I have been very much interested in what has been said here in regard to pickled brood. We had a great deal of brood dying here in this way. I did not call it pickled brood; we called it a new bee-disease. We did not have much of it. You have diagnosed it exactly, Mr. France. I believe it was a case of starvation, or, any way, malnutrition.

Question—I would like to ask, where Mr. France says "contagious," if he means that it can be carried like cholera or yellow fever, or does he mean infectious, like carrying some of the spores from an infected hive? I would give them, and they would set along in a row near my barn; as I had no particular use of that I would allow them to remain them. I had a colony nearly perish with foul brood before I discovered its presence, but had hives within 6 inches of it where foul brood never appeared; but as I arrested the progress of the disease by removing and burning up the others, I concluded "contagious" did not apply, but that it is infectious. I want to know whether he does mean infectious.

Mr. France—His question was, "Do I think the germs of foul brood float in the air, and in that way would infect another colony?" No, I do not. In that case, why would not every cell in that comb be infected? I very seldom find a comb where all the cells in the comb are infected, even though some will have it in the last stages of the disease. I have taken the stand where a good many have called me down, but I am just as willing to be called down when I can be proven to be in the wrong.

How fast, and what will spread the disease? I contend that the comb having the disease in certain cells, when honey, larva, pollen, or anything the bees deposit is put into those cells, that material becomes infected. The next cell may never have had foul brood in. It is contagious

only when it comes in contact with the disease. And brood-combs are safe to use from a diseased colony where they have gone up and stored their honey, and there has been no brood reared in those combs. I believe there is no danger. I will tell you what I did a few days before I left home to come here. An apiary of 68 colonies, all of them with the disease; the hives were three or four stories high, extracting combs above. It did seem a shame to destroy all those combs. I said, "Don't do it. We will fumigate all of these." But the ones below, where there was disease, I said, "This is worth much more for beeswax, and we will use some new sheets of foundation."

By the way, with a German wax-press, you can take your combs and render out almost enough wax to pay for the new foundation.

Question—Would you hesitate to use a hive that had had the disease in it?

Mr. France—No, not unless that hive had had foul-broody honey daubed upon its bottom. In that case, I would want to scrape or boil it thoroughly. Seven years ago I disinfected hives, scraped and boiled, and even took kerosene and burned them out. But I would not want to live in a house with the walls all charred and black, and I do not believe the bees do. Now, I put the bees back in the same hive, simply scraping it. Those cells were clean, and I do not believe there is any danger.

Question—What amount of boiling would you give them?

Mr. France—I simply immersed the hive in the boiling water sufficient to melt the wax.

Question—I would like to ask how the foul brood is usually conveyed? also, if it would eradicate the disease to cut out certain parts of it and have the combs resealed, simply cutting out those portions of the comb that contained foul brood?

Mr. France—I have agreed in some cases, where there seemed to be but little of it, only one or two cells of foul brood in the comb, or perhaps eight or ten in the entire hive, to cut out and remove the diseased parts, keeping track of the hive, and in a majority of cases that has been all right; where it was not, I fear there was something covering up some that I did not see. It is a risk, however, for we can not see what is covered up.

Question—I would like to ask how it is conveyed from one apiary to another, usually.

Mr. France—It is conveyed largely by robber-bees, and the bee-keeper's manipulating.

Question—Is it not a fact that it has been conveyed from one apiary to another several miles outstanding, at a time of the year when robber-bees do not work?

Mr. France—I would have to get after back-track history there before I would want to admit all that.

Mr. Corey—We used to boil the hives, but it was very bad on the hives, because when they got dry they would get loose. We abandoned that plan a long time ago. We had a very eminent chemist with us at one time, and he recommended the use of bisulphide of carbon, and told me to buy a can of gasoline and put 25 percent of bisulphide of carbon with it, and take a brush and go over the inside of the hive and give a thorough treatment to the cover, and we would save our hives, our nails would all be intact, and our beautiful white painted hives, and he said it would be impossible for any spores, no matter what kind, to exist in that bisulphide.

Question—Would comb honey on top of the hive, produced from diseased bees, be safe to use or feed to other bees?

Mr. France—I think it would.

Question—Two years ago we had a case of foul brood. The lady asked me if she could feed the bees with that comb honey that she had; I told her I thought she could; we fed that back again, and the next year, or rather last spring, they moved away and sold their hives to some one else, and they were just literally grown up with foul brood. I think, unless they got it from some one else, it came from that comb honey.

Mr. France—I would get after back-track history again. In Wisconsin a man bought an apiary because he got it cheap; in due time it was united with his other apiary, and that yard dwindled down until it was half gone with foul brood. He treated it with the McEvoy plan. The next spring, as soon as brood-rearing got nicely started, he treated it again; altogether he treated that apiary seven times, and the disease would re-appear. He said, "I guess I had better quit the business." He tried to get legislation to help him, but he could not. He stood alone. He went before the legislature, and was ridiculed and laughed at.

Then, through the State Bee-Keepers' Association we got legislation. Otherwise we never would have gotten it. So much for the State Association. How much quicker we would have gotten it had we had a National one! I went to this apiary, and there were about four car-loads of empty hives. I went inside of the apiary in a neighboring yard, and there was foul brood and no attempt to get rid of it. What was the use of treating when his neighbor would not treat?

Question—What is the difference in the symptoms of foul brood and black brood, in the appearance and development of the diseases? and are they two distinct diseases, or but one?

Mr. France—I intended to bring some samples of enlarged cells of black brood, foul brood, and pickled brood. But black brood is always black, and head under, sharp-pointed, a little turned up, and quite hard. Pickled brood, the lower end light brown, thick skin, and the bottom end apparently a water-bag, as you would take hold and pull it out, which is easily done, as it is never ropy or sticky, and you puncture that skin and the fluid will run as freely as water. If it is black brood, that little bee would cover up about half to two-thirds of the bottom of the cell; it turns brown, or nearly black, with white streaks running near the center. It doesn't come out and get this sharp end to it like pickled brood at all.

Question—Do you think it is safe to feed bees comb honey from hives that have been treated for pickled brood, or black brood?

Mr. France—I would not use it for that purpose, unless I had heated it.

B. S. Taylor—I own three apiaries in part. One apiary had foul brood; in every case, where they fed this honey, it produced foul brood, for all of these had foul brood the next year. In regard to cutting out combs, one man, five years ago, had 240 colonies. Wherever he found a symptom of foul brood, he cut it out or burned it. Last year he got down to 56, and I found 28 that had foul brood. Now he has 11. Another man has been cutting down 100 colonies, and has been cutting out and burning them." I said, "In my opinion you will find 20 cases next spring."

Question—Is black brood as contagious as foul brood?

Mr. France—Yes; even worse.

Question—Will it cure itself?

Mr. France—Not until the bees are dead.

C. J. Davidson—To what heat would you subject honey in order to make it safe in feeding bees—honey that you are suspicious of—simply bring it to a boil to eradicate the germs?

Mr. France—Many have misunderstood that term "boil." I have had considerable correspondence in regard to Dr. Howard's treatment of that. He used dry heat. In boiling, I invariably stir so as to bring the center of the can to the boiling surface, so that it all gets heated. You may take an ordinary-top milk-can, which is common upon the farm, set it on the stove, and if you do not stir the contents you will find the center of the can has hardly been heated through, while it is apparently at the boiling point. One man said, "Any man can see that is boiling." I said, "You haven't killed the foul brood in that." I put my hand down deep in that and it didn't burn. I believe in thorough stirring. When it has all been boiled, and all brought to the surface, it will be safe to use to feed the bees. The germs will then all be killed.

Mr. Corey—You don't believe it is necessary to cook it two or three hours, do you?

Mr. France—No.

(Continued next week.)

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

The Premiums we offer are all well worth working for. Look at them.

### Roadside Tree-Planting and Reforesting.

BY PROF. A. J. COOK.

**M**UCH has been said in the past in the "Old Reliable" on this important subject. However, too much cannot be said, for there are very few topics discussed in our journals that are more important, or that more deeply concern our entire people than this.

It is a well-known fact that our climate, both as to temperature and rainfall, has greatly changed since our country was first settled. The extremes of climate are much more marked, and we all know that with extremes, either of heat or cold, often comes disaster. Extremes of rainfall are also of startling frequency during late years. The drouth dries up the crops, and brings distress often to a wide range of our farming population. The terrible floods that come with the frequent down-pours are even more distressing. Millions of dollars worth of property are swept away, and human sacrifice often brings wide-spread sorrow. There must be some common cause for these unwelcome changes. Whatever cause it is, it must be something that is very profound and far-reaching. We can hardly conceive that the cultivation of the soil is enough in itself to have effected this change.

The only other thing that we can suggest is the wide-spread and unfortunate depletion of our forests. If this can effect or bring about this change, then, surely, we have an easy explanation, for the denudation of our forest areas is something tremendous. The destruction of our forests during the last generation has been great, beyond compare. It is easy to believe that the presence of great forests in holding the rainfall, in moderating wind, in staying heat radiation from the earth, may have just the effect to moderate temperature and equalize moisture. I believe it is the consensus of the best educated men along the lines of meteorology, that the cutting away of our forests has brought these disturbances, and brought upon us these terrible extremes.

If the suggestion made above is correct, then certainly it is none too soon to begin the work of restitution, by commencing the wide-spread and wholesale tree-planting. I believe it is safe to assert that nothing that we can do will give so much hope in way of climatic improvement as general reforestation of much of our land area. Surely, it is none too soon for every one who owns any land, whether it be farm, or city lot, to begin the work of setting out trees. If we could all become sufficiently impressed with the importance of such action, we would all become at once tree-planters, and I believe we would perform a patriotic work, for which we would rightly receive the blessing of all the coming generations.

There is another argument, hardly less persuasive, which favors immediate action in this direction. How beautiful is a country or city where trees are much in evidence along street or roadside. Cambridge, in Massachusetts, New Haven, in Connecticut, and Riverside, in California, are illustrations of the value of tree-planting as a matter of aesthetics. The country, too, where all roadsides are adorned with trees is always sought by the would-be farmer. The advanced value which city or village lot or country farm attain upon the presence of trees, is sure evidence that beauty has a hold upon our people. It should be so. Anything that develops taste or love of the beautiful advances civilization and fosters good fellowship. Here again, then, we should all take a lesson and become enthusiastic supporters of any action which tends to increase the trees along our streets and roadsides.

The bee-keeper is also very greatly interested in the planting of trees. We all remember the great reputation which the famous Mohawk Valley of New York, and the great linden regions of Wisconsin, secured in bygone years because of the immense honey crop. This great yield of honey came almost as surely as the season, and a maximum crop was usually expected. With the change of climate, and the disappearance of the trees, the honey product is not only greatly diminished, but is far more precarious. It is hardly to be hoped that we can ever bring back anything like the old-time basswood forest, but if every one would inform

himself as to the necessity of reforesting our country as far as possible, and urge action to secure it, in season and out of season, we certainly should do very much, not only to improve the climate of our country, the beauty of our landscape, but also to effect a great increase in the honey-product of the land.

Without doubt there is going to be a great impetus in this direction of more extensive setting of trees. It behooves the bee-keeper to have his ear to the ground, and use every influence in his power to direct this work, so that he may gain to the utmost by this increase of roadside

BLUE-GUM (EUCALYPTUS) FLOWERS.

trees. There is no more beautiful trees for roadside planting than the American linden. There are no trees more valuable for other purpose than beauty. There is certainly no trees, or even plant, that secretes more or better nectar. Every bee-keeper should see to it that in the great work of tree-planting the grand old basswood is not neglected.

Hardly second to the linden in beauty or value, as affording economic products, or as a honey-producer, is the tulip, often called whitewood, and in the South incorrectly called the poplar. The bee-keeper will certainly use his influence that the tulip may have a fair consideration, as our country is being beautified by these gems of the landscape. The maples—both the sugar maple and the soft maple—take rank among the very first of our trees for beauty. The wood of these trees is also of great value in the market. While the maple blossoms a little too early to give it chief value as a honey-producer, yet it does furnish no little honey, and is no small importance in stimulating the bees to greater industry in the early spring months. For variety's sake, the bee-keeper may well urge that the maples share with the incomparable linden, the magnificent tulip, a place in city street and along country roadside.

California is as much interested in this matter of tree-planting as is any State in the Union. Indeed, I think it is more so. Water is the great desideratum in California. Too scant and too infrequent rains are a chief source of anxiety among the residents of this delightful region. Here, trees should not only be planted along the roadside and city streets, but if our people are wise, great blocks of trees will be set out on areas not otherwise occupied; and certainly more and more attention will be given to the reforesting, of our mountains, where, through inexcusable carelessness,

great areas of timber have been burned to the ground. I fully believe that could our people be made to realize the importance of this matter of a greatly increased forest area in our State, we should have a general movement all along the line towards wise and extensive planting of trees.

Among the trees most desirable in California, stands pre-eminent the various species of eucalypts. There are said to be 150 species of this genus of tree. They come from Australia, a region very similar to California. In such arid regions trees must become deep-rooted to live at all, and because of this deep rooting they will of necessity grow very rapidly, and will be fortified against the drouth that is sure to come with each year. For safety's sake, then, no tree should take precedence in such regions as California, Arizona and Nevada, of these fine, rapid-growing eucalypts. I am happy to say that our people are realizing the truth of this statement, as is shown by the rapid increase in the planting of these trees. The trees are not only attractive in form, foliage and blossom, but they are, I think, without exception, valuable for honey.

There is an interesting fact about the blossoming of these trees. Of course, in their native Australia, they blossom in the spring, which is our autumn. As they are transplanted to our State, on the opposite side of the equator, they are much perplexed. It is a struggle which shall most influence—their old habit and heredity, or their new environment. Thus, their time of bloom is very varied, and the time of bloom will change with the years. At present we can find eucalypts in bloom during several months of the year. It is wise, then, in selecting eucalypts for tree-planting to plant a variety, that we may extend the time of bloom as much as may be. It is also wise, at the same time, to secure such trees as are valuable for timber, posts, piles, etc.; such trees as grow rapidly and will stand greatest extremes of heat and cold, and also trees that are desirable for beauty. I will proceed to give a few trees that are to be heartily recommended:

*Eucalyptus citriodora* is a tree that is specially commended as a honey-tree. It is a profuse bloomer, and very attractive to the bees. The leaves are very fragrant. It is very graceful, and thus is to be recommended for its beauty. It has the one objection of being rather impatient of frost. It kills down here at Claremont when young, but when well started seems hardy. The wood is like hickory, and thus will always have a value in the market.

*E. rostrata* is the well-known red-gum. It is graceful, grows rapidly, and makes a fine roadside tree. It is said to be the best money-getter in Australia of any of the eucalypts. It attains a height of a hundred feet. It grows well under quite a variety of climate, enduring a climate of from 15 degrees F. to 115 degrees F. The timber is valuable for many purposes, being hard and strong. It is used in our States extensively for fuel and posts. It ranks high as a honey-producer both in America and Australia. I doubt if any tree is more desirable for roadside planting in California and Arizona.

*E. rudis* is a favorite in the Fresno region. It also will stand a wide range of climate. The timber of this tree is also first-class, and it stands among the best for honey.

*E. corycolyx* is the well-known sugar-gum. This reaches one hundred feet, and in Australia is said to attain a diameter of six feet. The bark is smooth and a buffy white, though the twigs are quite red. It stands our California temperature well, and, like the other trees mentioned above, resists the drouth to a surprising degree. It is more valuable for many purposes than is the common blue-gum, as the timber is very durable, and lasts a long time when set for posts. It blooms profusely, and is excellent as a honey-tree.

*E. tereticornis* is very similar to the rostrata, and is often known as redwood. I hardly know which is the more desirable for planting, and can cheerfully recommend both.

*E. sideroxylon* is very attractive to me. It has the grace of the American elm, while the narrow leaves make it especially beautiful. It is called, in Australia, the "red iron-bark." It stands our Claremont climate well. Its colored blossoms make it peculiarly attractive, and for this alone I should plant this tree, as also the still more beautiful and showy *E. ficifolia*, which has very showy red blossoms. The timber, while not as valuable, perhaps, as that of some others, is also much used for posts and in the arts—anywhere where strength and durability is required.

The other eucalypts that are specially valuable for honey are: *E. calophylla*, *E. hemiphloia*, *E. leucoxylon*, *E. longifolia*, *E. melliodora*, *E. ptilularis*, and *E. polyanthemus*. All of these are worthy a trial in many parts of the warmer regions of California. I have often been asked by the beekeepers of California to give a list of the eucalypts desirable

for roadside planting, and for more extensive planting, with honey especially in view. I believe the foregoing may be of service, and I am sure can be relied upon.

Los Angeles Co., Calif.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### GETTING BEES OUT OF SUPERS AND OFF COMBS.

McIntyre seems to be a mine of wisdom on several points of interest besides the cold knife. A dash of Cyprian blood makes 'em a trifle hot, but it does 'em good, and he grins and bears it. Disinclined to so much waiting as bees-escapes require; so he goes at 'em in the older orthodox ways—smoker and wet manila brush. (At my yard I would sooner completely take the combs with brush and smoker than put the escape in place—say nothing about the waiting.) If his brush was not wet, I suppose his "Cyps" would be hanging on one to each fiber. Giving each colony its own comb back, too much fuss. Same here. Late in the season I think an important gain in giving alien combs. They consider them plunder, and go at them sharper to clean them up. But that makes too much rumpus in the yard—and I get some fussing in another way—hold the supers empty till eventide, and then put the combs in. As to brush, I use a hen's wing, dry. Bees hang on sometimes, but not often. I'm disinclined to use two brushes on the same comb; and the wholesale "sweep-em" seems hardly adapted to get the bees out that cling a-top the bottom-bar. Possibly those who use it make it do so, after a fashion. Page 647.

### BREEDING NON-SWARMERS.

And McIntyre thinks he could breed bees that would be non-swarmers—but they would be poor bees on the main question. Rather unique idea. But he's in line with the rest of us when he finds his bees fair non-swarmers one season, and terrors to swarm another season. Page 647.

### HONEY SENSITIVE TO ODORS.

J. S. Harbison says honey is sensitive to bad odors as butter, lots and lots of it half ruined by smoke. If he's right, the shallow super and get-the-bees-all-out-with-smoke folks have a severe backset. Rather seems to me that he is giving us "the truth, and more than the truth." You see an inspector *might* lay to smoke a purely floral bitter he succeeded in tasting in the honey. Page 647.

### FLORAL BACTERIA—ORIGIN OF MICROBES.

J. E. Johnson says some of the higher forms of bacteria have actual flowers. Surprising! News to some of us—but not necessarily false on that account. But his question, whether any microbes originate spontaneously—well, at present I fear that must stand as a "fool-question." Present scientific feeling is, I believe, that a new bacterium *might* come to us from the planetary spaces, but not originate chemically. Interesting to see that Prof. Burrill, original discoverer of the pear-blight germ, thinks it possible that it might travel in fog. Page 648.

### SULPHUR AND PARALYSIS.

Make every bee wade through sulphur to get into the hive—there's an easy and simple remedial method for you—providing sulphur will actually cure paralysis. Credit to Mrs. Artie Bowen. Page 649.

### CROSS BEES GETTING HELP.

Sister Wilson, you say, "Fancy a cross bee letting up to go and get some other bee to do the stinging." Quite sure I have seen just that—and you will, if you watch out carefully enough. And when she succeeds in getting several to come, sometimes all together they will make a wild dash for reinforcements. Has happened (apparently) in case of a horse or cow tied several rods away, that this repeated rush for reinforcements has worked until half the colony went out and actually killed the poor beast. If you experiment, choose a hot day when bees are idle, somewhat cross, but not very. Put on your veil and take a hoe, and begin hoe-

ing and thumping about say twenty feet from one side of the apiary—a little closer if you don't get a "bite" presently. Page 649.

#### QUEEN SCHEME FOR QUEEN-BREEDERS.

Great scheme for the queen-breeders. Have a caged virgin queen getting acquainted three days before the old queen is sold, then a second one getting acquainted while the first is getting to laying. Wonder if the latter might not feel so jealous and disturbed in mind as to develop more slowly, wasting in one direction as much time as was saved in the other. Page 652.

swarm, but be it said to the credit of the good honey-gatherers, that almost without exception they are the ones that have made very little or no attempt to swarm. Perhaps it might be put the other way—the colonies that make little or no attempt to swarm are the ones that store the most.

If, during all the years of our bee-keeping, we had made the effort to improve our bees as honey-gatherers, that we have made for the past few years, I don't know where we might not be now, if the bees had continued to improve at the same ratio. It pays, and pays well, to look sharp as to the record of each queen.

When any colony fails to do good work, the head of their queen is in danger.

Our best queen, this year, gave us 300 finished sections, and quite a number of others came very close to that number. If nothing happens to that queen you may be pretty sure she will be used to rear queens from next year.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### "A California Welcome."

This week the sisters will read with pleasure the bright, breezy poem, entitled, "A California Welcome," which comes as one of the echoes from the Los Angeles convention. The writer evidently knows what she is talking about, having formerly lived in California for some time, where she may have figured as one of the "Welcomers" herself.

## A CALIFORNIA WELCOME.

O we love the gentle tourist,  
With his pocket full of gold,  
When he comes across the mountains  
To escape the mighty cold,  
And the blizzards, and the cyclones,  
And the many Eastern ills;  
And we meet him at the station—  
Yes, we meet him without fail—  
And we meet him, and we greet him  
With—"A Ranch For Sale!"

And we shoulder his umbrella,  
And his traveling-bag and "grip;"  
And we give him hearty welcome—  
Hope he's had a pleasant trip;  
Doubtless found it rather tiresome;  
Say he's looking somewhat ill;  
But our glorious California  
Soon will cure him, without fail.  
Then we call his kind attention  
To—"A Ranch For Sale!"

We escort him to the street-car;  
As he walks across the street,  
He seems to be disgusted  
With the dust upon his feet;  
And the cushions of the street-car  
Almost seem to make him ill;  
But he soon forgets his grievance,

For before him, on a rail,  
Is this California legend—  
"Orange Grove For Sale!"

Then we take him to our bosoms;  
Make him very welcome, too;  
Call his wondering attention  
To the glorious mountain view!  
Of the oranges and lemons—  
Tell him just to take his fill.  
But he seems to look askance  
At the "spider" and the "scale,"  
Till we hasten to inform him  
That—"This Grove's For Sale!"

Then we ask him just to notice  
The greenness of the trees  
(They are doubtless blue, back East!)  
But we never mention "freeze;"  
And of earthquakes, heat, and "northers,"  
Our tongues are very still.  
But the sun is beating down,  
And the sea-breeze makes him quail,  
Till he scarcely seems to notice  
That—"This Grove's For Sale!"

And we take him to the mountains,  
And we take him to the sea;  
And we bid him use the water  
Just as if the "stuff" were free.

But he doesn't like its fragrance,  
Nor approve its lack of chill;  
And he seems to feel quite "retched,"  
And his countenance is pale;  
And we scarcely dare to tell him  
That—"This Ranch's For Sale!"

But he seems to be distracted,  
(He's been bitten by a flea!)  
But we hasten his attention  
To the azure sky and sea.  
But a whooping old tarantula  
Has given him quite a chill;  
And a rattler, close at hand,  
Is making music with its tail;  
Till we quite forget to tell him  
That—"This Grove's For Sale!"

And we follow him about,  
And "boom" the country, day and night;  
And we think it rather shabby  
If that "sucker" doesn't "bite;"  
If that "tenderfoot" doesn't swallow  
Our small, sugar-coated pill.  
Then we chase him to the station;  
As he rides off, on the rail,  
We yell, to beat the engine—  
"I've a Ranch For Sale!"

Waushara Co., Wis. MARY B. HALL.

### About Queens—Breed from the Best.

We have been blessed with the largest crop of comb honey this year that we have ever had, and this with a very much smaller number of colonies than we usually have, as we began the season with only 124 colonies. Much of this success was due to the phenomenal season, but I believe also that much was due to the superior quality of our queens.

For a number of years we have selected our best queen from which to rear queens. Not the best tested queen, as that term is generally understood, for that means only how many golden bands her bees have; but our best queen, as shown by the record of her bees as honey-gatherers. That one fact, pure and simple, decides her worth without regard to her color, although we are very glad when our best queen gives us beautiful, golden-banded bees.

I think I must modify the statement that honey-gathering alone decides her worth, for there is one other element that enters largely into the matter when making the decision, and that is swarming. A good many points will be given in favor of the queen that has made no attempt to

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Starting an Apiary—Buckwheat for Bees—Shade, Etc.

1. I have just rented a 4-acre home in the suburbs of a city, and intend starting an apiary with the red clover Italian stock only. Now, as bees are too high-priced here, it is my plan to obtain frames of nuclei. Is this a good plan for a hasty increase, putting one frame and queen in a hive? How soon in March would you order stock? and would about 5 frames be enough to start with?

2. I will sow about 2 acres in buckwheat. How much seed shall I sow to the acre broadcast, and at what time, at the very earliest, in the spring?

3. On the above plan, would each colony produce any queens? If so, what time next summer would you go through them to find queens? and how many queens would I expect to find to a hive? I expect to clip all queens' wings, as ground-pests are not bad here, and I will aim to have all hives down low.

4. I have no shade on my ground, excepting close to the public highway, and it being rented property I can not put out grape-vines, but will try a quick-growth vine of some kind at each hive, on an arbor. What seed would you sow that is of quick-growth and makes a good shade?

5. About how many bees would you allow to a one-story 8 or 10 frame hive, calculating measurement by the pint or quart?

6. Is it necessary to put supers on before brood-chamber is filled up?

7. About how far will the Italians go to work on a good clover-field in honey-flow time?

8. If a colony brings on one or more queens, would you retain them and destroy the old one? and what is the best way, and feed, to care for and keep extra queens in reserve for emergency? I will want to renew about every 2 years?

I love to work among the bees better than running my pet engine. I use Prof. Cook's Manual, and I am a subscriber to the American Bee Journal, and all information about bees is well digested; and if I live long enough I expect to be a member of the National Bee-Keepers' Association.

MISSOURI.

ANSWERS.—1. If I understand you rightly, your plan is to get 5 frames of brood and bees and put these in 5 hives, one frame in each hive. A 1-frame nucleus in June or July would be a pretty weak affair to set up housekeeping, and in March would be likely to give up the ghost. Your safer plan will be to let your five frames stay in one hive as one colony till the colony becomes very strong before dividing; perhaps making your first nucleus in May. But, first of all, you should study thoroughly your bee-book, so as to have a good knowledge of the general principles of bee-keeping, and you will thereby be saved from many a serious mistake.

2. Sow about three pecks to the acre. Buckwheat is not a thing for spring planting, the time of sowing for best results being from the middle of June to the first of July. Still, if there is nothing else the bees can work on, I suppose it might be sown toward the last of April.

3. If you follow the plan outlined, you are not likely to find any extra queens in the hives any time through the season. Such queens are reared when a colony becomes strong enough to cast a swarm, and about eight days after the first swarm the young queen will begin to emerge.

4. Wild cucumber, morning-glory, nasturtium, and hops would answer. The women of your neighborhood can probably tell you of some others.

5. If they mean the amount of bees in a fair colony, 5 or 6 quarts.

6. No, nor is it advisable.

7. If they can find nothing nearer, they might go five or six miles, but would hardly work profitably more than a third of that distance.

8. I don't understand your question, but I don't believe a case will often occur in which it is advisable to kill the old queen. Reserve queens are kept in nuclei, one in each nucleus.

### Basswood for Making Hives.

Does basswood make good hives, or would it get too damp in the winter?

MISSOURI.

ANSWER.—My, no! Basswood shrinks and swells, and warps and twists to such an extent that it's not fit for a hive, or anything about a hive.

### Uniting Colonies and Saving Queens.

1. If I unite and double up my colonies in the spring, reducing my 35 colonies to 17 or 18, or one-half, when would I better do it? And how will I proceed? Or, can you tell me of some better plan to keep my number down around 25?

2. Can I save queens from the united colonies, and how? Would it be better to let them rear a young queen when they swarm again? You will see by my questions that I don't know it all yet.

NEBRASKA.

ANSWERS.—1. Unite in the spring any time after bees get to flying. It will be as well not to unite directly two

colonies of equal strength. The weakest colonies may be united with those considerably stronger, and you will probably find no fighting if you merely set in the frames of brood, bees and all. Then to unite those nearly equal in strength, first unite half the colony, and four or five days later add the rest. It will be well to have the colonies sitting close together that are to be united. Then when you have finished uniting take away the empty hive, and the field-bees will all remain with the united colony.

2. The only way you can keep the queens will be in nuclei, and perhaps it will be just as well to depend on new queens at swarming.

### White Pine for Hives.

Is white pine good material of which to make hives? Will the bees accept it as a home equal to poplar?

INDIANA.

ANSWER.—White pine is probably the sole material used by manufacturers of bee-supplies, unless it be in California, for making hives, and bees accept it without protest.

### Sowing White Clover Seed—Bee-Eggs Hatching.

1. When should white clover seed be sown?

2. What is the longest time an egg was ever known to remain in the hive without being hatched?

ANSWERS.—1. It may be sown at different times, perhaps no better time than when vegetation first starts in the spring.

2. I don't know. If I remember rightly, Dzierzon tells of eggs being held about two weeks and than hatching.

### Feeding Bees for Winter.

— I have 2 colonies of bees that came here last spring. From the largest we got about 40 pounds of honey; the other hive we did not open. We put them down into the cellar and covered them with a blanket. I think we destroyed one colony, as they did not gather any honey all through September, and there was plenty of clover around. There are only a few bees in the hive. Will I have to feed them? If so, what is the best to give them? ILLINOIS.

ANSWER.—Bees do not generally gather from clover in September, even though blossoms are seen. The small number of bees in a colony left to itself through the summer, makes it doubtful whether they have a queen. If queenless, it is only a waste to feed them. The best thing for feed is combs of sealed honey, and the next best for this time of year, candy made according to the instructions given in your bee-book.

### Wintering Bees in a House—Late Drones.

1. I am thinking how to winter my bees, and have a mind to put them in a small, dark, warm house, shut each hive with screen, and not let them out until in the spring. Will this do?

2. Do bees need more air in winter than in summer.

3. Is oilcloth good to put on top of the frames, or is it too cold?

4. Would paper folded and laid on top of the frames be warmer, and absorb the dampness better than oilcloth?

5. Two of my hives have some drones yet. Why is it? NEBRASKA.

ANSWERS.—1. Not very well. I'm afraid. By no means should they be fastened in the hive with wire-screen. It will only make them worry the more to get out. Unless you can keep the temperature pretty evenly at about 45 degrees, any kind of a house above ground will not be likely to work very well.

2. No, not so much; but they do need some, and it should be pure as possible.

3. It will do if covered over warmly with something else.

4. Paper is warmer than oilcloth alone. But if you use paper, you must have burlap or some other cloth under it to keep the bees from tearing it to pieces.

5. I'm afraid they're queenless; yet it sometimes happens that drones are suffered late where there is a good queen.

## FROM MANY FIELDS

### Doubling Up Colonies—Entrance-Closer.

On page 712, Mr. Bingham says he doubled up his colonies, putting 150 into 75. Why not have him and other veterans tell the best way to do it!

By the way, why don't some experts get up an entrance-closer that will save lifting a heavy hive to turn over the bottom-boards? I use them, and like them very much, but I would like to buy them when I buy my hives.

F. P. BRIGGS,

Middlesex Co., Mass., Nov. 16.

[Mr. Bingham is hereby requested to tell us how he doubles up colonies.

A good entrance-closer was illustrated and described about three months ago in these columns.—EDITOR.]

### A Big Catnip Experiment.

I promised, some time ago, to furnish an article for publication relating my experience the past season with catnip, so here goes:

"Ten acres of wild catnip; ten thousand pounds of choice comb honey; \$3,000 worth of seed in one short season; and how I did it."

It was about sundown, a little later or a little sooner, may be, I don't know (borrowing the language of Josiah Allen's wife), a real thought came to me that a reality of the above paragraph, although somewhat extravagant, would not be impossible. So one bright October morning I ventured out with team and wagon, with a new triple box and a hand-scythe. I gathered catnip enough in one day to thrash out 40 pounds of choice seed.

March 31, 1902, those 40 pounds of catnip seed were scattered over ten acres of good ground, where a good crop of corn had been raised the previous year. The corn-stalks were still standing tall and thick, so I cut them down with a disk harrow to level the top surface, leaning the teeth well back so as to scatter the stalks as much as possible, forming a mulch for this much-treasured seed.

Abundance of rain soon brought forth a nice crop of catnip plants, but as soon as we had a dry spell, of say two weeks, those catnip plants withered away like the morning dew before the hot sun. One-half acre of the above-mentioned lot produced a crop of potatoes last year. The ground was rich and clean. Here the catnip did not come up until the ground was shaded by growing weeds. When the weeds were from 6 to 8 inches high

the catnip presented a most admirable, luxuriant growth. Yes, here among the weeds a fortune was smiling in my face!

About June 10, I cut the weeds with a mower, leaving them lay where they dropped nearly every catnip plant had withered away, and withered away to stay dead for good, as the whole 10 acres has only a few isolated plants here and there.

In the latter part of October, 1902, I sowed a strip of land 2 rods wide by 10 rods long, with some of the same catnip seed. This ground had no protection but had a good uniform stand that measured more than 2 feet high July 1, 1903, when it began to blossom, and has blossomed continuously until quite recently. Bees will not only work on it from early morning until dark, but they will work on it immediately after a heavy, continued rain, while the water is yet dripping from the blossoms. It is perhaps the greatest nectar-yielding plant in this State.

Such is the story, in short, of perhaps the most extravagant experiment of its kind up to the present time; and while it was a failure, and the hope of ambition not realized, lessons of value may be deducted as follows:

First, that catnip will grow in the open.

Second, that the ground must be rich.

Third, that it must be sowed in the fall.

Fourth, 2 1/2 pounds of seed per acre is a great plenty.

I will conclude by saying that I did not gather any catnip seed this fall. Would you like to know why? J. W. JOHNSON.

Stephenson Co., Ill., Nov. 9.

Queens Laying in Queen-Cells.

On page 663, there is an article on queen-rearing, etc., by A. C. F. Bartz. I wish to question his assertion in the closing paragraph, in which he says:

"But I believe if one would go to the trouble and take away the brood-combs from a colony intending to swarm, and insert several, say three or four combs with queen-cell cups, the queen would lay in them in such rapid succession that nearly all of them would hatch at the same time."

I wish to say to Mr. Bartz, or any one who intends trying this plan, I very much doubt his getting a single queen-cell started for some time; not until the queen has filled all the vacant cells in the combs, and then the queen will not lay in the cell-cups.

It is not an uncommon thing to see a queen lay in worker and drone cells, but I do not hesitate to say that a queen will not lay in a queen-cell. If Mr. Bartz, or any other person, ever saw one do so, let him hold up his hand.

I think if Dr. Miller was asked if a queen would lay in a queen-cell, he would say, "I don't know;" and he is one of our closest observers of the bee's habits.

I know that worker-bees can, and do, move eggs from one comb to another, and I believe they always put the eggs in the queen-cells.

DELOS WOOD.

Santa Barbara Co., Calif., Nov. 5.

Bee-Keeping in Alabama.

I moved to this State last spring, with the intention of turning my attention to fruit-growing, but the dryness of the summer and fall was much against young trees and plants, owing to its being a mountainous country with sandy soil. On finding much of the land poor and greatly impoverished by raising cotton, and washing, I said, "Clover is what this land needs;" but with one accord they urged me not to waste any time and money by sowing it, as it was too dry. This did not convince me, so I ordered red, crimson, sweet, alsike and white clovers, and sowed a little of each last spring, and, true enough, what came up mostly before the first rains came. That was the last of October, but I found a few roots of white and a few of red, in a place where a horse had been fed (they tell me on imported hay), that lived and did well, and made seed. I concluded that spring was not the time to sow it, so I am sowing it now.

Last spring I found a colony of bees that were queenless, so I sent for an Italian queen;

THE "1900" FAMILY WASHER FREE.

Greatest Invention of the Age. Labor and Expense of Washing Clothes Cut in Two.

No More Stopping, Rubbing or Boiling of Clothes. Every Household Needs One.

THE "1900" BALL-BEARING FAMILY-WASHER SENT FREE

to any one answering this advertisement, without deposit or advance payment of any kind, freight paid, on 10 day trial. The 1900 Ball-Bearing Washer is unquestionably the greatest labor-saving machine ever invented for family use. ENTIRELY NEW PRINCIPLE. It is simplicity itself. There are no wheels, paddles, rockers, cranks or complicated machinery. It revolves on BICYCLE BALL-BEARINGS, making it by far the easiest running washer on the market. No strength required, a child can operate it.

No more stopping, rubbing, boiling of clothes. Hot water and soap is all that is needed. It will wash LARGE QUANTITIES OF CLOTHES (no matter how soiled) PERFECTLY CLEAN IN 6 MINUTES. Impossible to injure the most delicate fabrics.

15 Machinefuls in 4 Hours.

CHICAGO, ILL. Last week I started to wash with my 1900 Ball-Bearing Washer. A neighbor saw me wash my little boys' waists (which were terribly dirty), and we were both surprised to see there was not a spot left. On Monday we did a big wash of 15 machinefuls and the work was done in 4 hours. It is the best machine I ever saw (and I have tried many). It works so easy that my little boy can run it.

Mrs. A. H. CENTER, 636 Diversey Boulevard.

Washing Easy at 81 Years Old.

WHEELER, S. DAK. I am more than pleased with the 1900 washer. Last week my mother, an old lady 81 years helped me do my washing. She sat on a chair and did a large 2 weeks' wash with ease, and as she said, without even perspiring and it was 90° in the shade. Mrs. E. F. ENGLANDS.

No Longer Prejudiced.

NORTH HUDSON, WIS. Enclosed please find P. O. order. My wife is very much pleased with the washer. This speaks volumes for it, owing to her being prejudiced against all washers. All who have seen it think it the best and easiest washing machine they have ever seen. C. WILLIAMS. WRITE AT ONCE FOR CATALOG AND FULL PARTICULARS.

she did her part well, but the fall was dry, and so far as I could see nothing to make honey of. My sweet clover never came up, and the only thing in the clover line is what is called here "Japan clover" and I am very doubtful if it is a clover at all; at any rate, it yields no nectar. In September I found the bees would starve if I did not feed, so I fed sugar out of jelly-glass feeders, with perforated tops, which is the handiest feeder I have ever tried. Fill the glass full, then invert, and the bees will get every drop, and not a dead bee. It is so easy to handle, too. E. B. ELLIS. Cullman Co., Ala., Nov. 11.

Building Outside the Hive—Separators—Growing Alsike.

The Editor asks for "experiences" of bee-keepers. As I had experiences the past season, differing in some respects from any I have had before in more than 20 years of bee-keeping, I will try to relate some of them, though whether other bee-keepers will be benefited thereby is a question. My wish is that I may gain some knowledge, if some one will tell where I made mistakes, if mistakes were made by myself, or was it the bees?

In the first place, my colonies were nearly all very strong, probably caused by good feeding in the spring, before the honey-flow began. In nearly every case the space between the brood-frames and the bottom super was filled with honey before the super was half full or ready to have another put under it, and burr-combs and honey were crowded into every space available—under the honey-boards, and

in the covers if there was a hole big enough for the bees to get past the honey-board. They even built comb outside under the porch, on a number of hives, and all the time I thought I was giving them plenty of super-room. Wonder I did.

Another thing bothered me a good deal: For the first time in my experience I used separators between the sections, the "plain, sawed" separators, and to make them as nearly like the "fences" as I could, I punched 4 holes in each piece, opposite the middle of the section with a 16-gauge wa-d-cutter, for a passage-way. Now as to the results: I found about 5 percent of the sections fastened to the separators more or less firmly, and in several cases the combs were joined together right through the holes in the separators. Of course this made quite a mess when cut loose, and I had to sell these damaged sections at quite a sacrifice in price. The balance were in fine shape, and averaged about 14 ounces to the section; but this was no advantage to me, as I always sell by the pound. Now I am wondering if it pays to use separators, any way, and if I made a mistake in punching the holes in them.

When I came to remove the sections from the supers I was not a little surprised to find the bees had gnawed a large part of the separators, both and top bottom, some of them a good half inch in depth the whole four inches inside the section. I was never bitten by the front end of a bee, but don't tell me a bee has no teeth when they can gnaw a bass-wood board like that. It appears as though the busy little bodies tried to remove those objectionable obstructions entirely out of their way.

I want to digress a little here and take up more space. In "Forty Years Among the Bees," Dr. Miller complains of poor success with alkis clover. Allow me to suggest that he try sowing it without a nurse-crop. Select the lowest ground he has—the richer it is the better—plow and prepare a good seed-bed in the fall, then in the spring (late March or early in April) scatter the seed on a good coating of snow, if possible, when it will require no other cultivation to make it germinate. In the absence of snow, cultivate very lightly after sowing the seed. In the summer, if the weeds get too high, mow with the sickle-bar raised above the clover-plants, though if some are cut off it will do no harm. If the season should prove a very dry one, I would leave the weeds for a shade to the young clover, and protection in the winter. In the 12 years of my experience with alkis clover, I have never known it to fail in producing nectar, while some years it has been our only source of a honey crop.

## Extracted Honey For Sale!

ALL IN 60-POUND TIN CANS.

### Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

### Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Our honey is put up in tin cans holding 60 pounds of honey each. These cans are shipped in wooden-boxes, and should arrive safely. We have nothing but **PURE BEES' HONEY** to offer, and so guarantee it. **Cash must accompany each order.** All prices are f.o.b. Chicago.

#### Prices of Alfalfa Honey:

One 60-lb. Can @8c.....\$ 4.80  
Two 60-lb. Cans (in 1 box) @7½c 9.00  
(Larger quantities at the 7½c price.)

#### Prices of Basswood Honey:

One 60-lb. Can @9c.....\$ 5.40  
Two 60-lb. Cans (in 1 box) @8c.... 9.60  
(Larger quantities at the 8c price.)

A sample of either Alfalfa or Basswood honey will be mailed on receipt of 10 cents; samples of both kinds for 16 cents. (Stamps accepted.)

**BEEWAX WANTED**—We are paying 28 cents cash or 30 cents in trade for pure average beeswax delivered in Chicago (or Medina, Ohio).

**HONEY-JARS**—Don't forget to get our prices on all sorts of honey-packages.

## Some Expert Opinion

"In the multitude of counsellors there is safety."—BIBLE.

### Best Dimensions of Brood-Frame.

If for some reason you were to start in anew to keep bees, and were obliged to get an entirely new outfit—

**Ques. 1.—**What would be the dimensions of the brood-frame? Why?

**N. E. FRANCE (Wis.)**—Standard Langstroth. Only size salable on the market.

**EUGENE SECOR (Iowa)**—Langstroth size. Because, on the whole, I have never seen a better one.

**R. L. TAYLOR (Mich.)**—18 inches by 5½ inches. Because it gives me a divisible brood-chamber, and an elastic one to some extent.

**MRS. L. HARRISON (Ills.)**—The Langstroth frame. It is the only one I've had experience with, and the inventor made no mistakes.

**DR. C. C. MILLER (Ills.)**—17¾x9½. For two reasons: It is most nearly standard, and it is perhaps the best size when working for comb honey.

**C. P. DADANT (Ills.)**—Langstroth top-bar with 2 inches more depth. Because the hive would be larger, the frame would be better for wintering, and general results more satisfactory.

**JAS. A. STONE (Ills.)**—Regular Langstroth size. Most convenient to handle, and for the reason that two supers, or a double story, makes just the size needed for the frame for extracting.

**E. WHITCOMB (Nehr.)**—S-frame. This size is large enough to furnish the colony an ample brood-nest, and which should be set apart entirely for that purpose. We never go into the brood-chamber for honey.

**WM. ROHRIG (Ariz.)**—I would use the standard Langstroth frame, 17¾x9½. Just as much honey can be produced by its use as by any other; it is convenient to handle, and more easily obtained when wanted.

**C. DAVENPORT (Minn.)**—For single-brood-story hives I believe what I now have. The Langstroth size suits me as well as anything I know of. For double-brood-chamber hives I prefer a frame the same length, and about 5 inches deep.

**DR. J. P. H. BROWN (Ga.)**—I would use a frame 17¾x9½; top-bar 19 inches. Because this size of frame is the best suited to accommodate my section-cases. Were I living in a higher latitude, I might use a deeper frame so as to economize heat.

**C. H. DIBBERN (Ills.)**—Well, I would use about such a frame as I have used for the past 20 years—7x20 inches, close ends. Such a frame needs no wiring, if foundation is rightly used; and it is a very easy matter to remove and handle the frames.

**E. E. HASTY (Ohio)**—The common Langstroth, 17¾x9½. Good frame on its own merits. Bees on it will sell for more. Also, supplies for it can be more conveniently had. I used to argue against the Langstroth, and it has kind of floored me in the course of years of use.

**G. M. DOOLITTLE (N. Y.)**—Perhaps the regular Langstroth frame is as good as any, and has the advantage of being more largely in use than any other, so that in any exchange made with others, or in getting new frames from the manufacturers, little if any delay is experienced.

**J. M. HAMBUGH (Calif.)**—Locality has a great deal to do with this question. In this State I do not see how the regular Langstroth size can be bettered. But where the wintering problem is a factor in consideration, I think I would adopt a larger frame, and one more square in dimensions.

**J. A. GREEN (Colo.)**—I am very well satisfied with the frame which I am using, which is 5¾x12¾, used in a double brood-chamber; but if I were starting anew, I would make it only 5½, deep, in order that the brood-chamber and a super that would take a section 5 inches deep would be exactly alike.

**P. H. ELWOOD (N. Y.)**—Our frame is about 10x16 inches, inside. For section honey a somewhat shallower frame might be better, but for winter a still deeper frame would be better. Also, the shallow frames are not so good for spring building up. Any change would be toward a deeper and shorter frame.

**S. T. PETTIT (Ont.)**—I am not quite sure, but to be in line with the majority, with the advantages that are carried with it, I would be drawn to the Langstroth. But I like better a frame 9x16 inches, 12 to the hive, because a wide, short hive gives better ventilation, and a short frame is more rigid than a long one; and more, such a hive gives room for dividers, and 36 sections to each super.

**PROF. A. J. COOK (Calif.)**—Regular Langstroth. I give the reasons in my "Bee-Keeper's Guide." It is good, if not the best. Most bee-keepers use it. It is desirable to have hives that are like those of most bee-keepers. It is easier to sell bees. Every bee-keeper should produce both kinds of honey, so as to meet all demands. The Langstroth is as good a hive as any for this general work, in my opinion.

**L. STAEBELBAUSEN (Tex.)**—I prefer a frame as long as the Langstroth, and 5¾ inches high. Two, and sometimes three, stories are used for the brood-chamber. To explain why I would not use the space in the American Bee Journal for one or two articles. The main reason is, that shallow frames save nearly one-half of the time necessary for extracting; and that I want all frames in the apiary alike and interchangeable.

**O. O. POPPLETON (Fla.)**—12 inches deep by 14 long, inside measure. I produce extracted honey only, and use the single-story system, or what is known as the "Long Ideal hive." All colonies should be in as compact a form as possible, and to use shallower frames in this form of hive, would spread them out too much for best results. The size 12x14 gives about the right medium between too shallow and too large a frame, for this method of management.

**REV. M. MAHIN (Ind.)**—The frame I use is 12 inches long and 10½ inches deep, and I am very well satisfied with it. If I were going to make any change in it, I would add two inches to its length, and ½ inch to its depth. I would then use 10 frames to the hive. This would make the brood-chamber nearly square, and give ample room for brood-rearing and winter stores. The frames would be very easily manipulated. There is advantage in having the brood-chamber compact.

**G. W. DEMAREE (Ky.)**—In deciding a question of this kind no doubt but the important matters of locality, climate, etc., should be taken into consideration. In my locality, I would not change the original Langstroth dimensions of brood-frame. Why? Because I have, in the past 27 years, experimented with a great many sizes of frames, and have never found any size or shape of frame that is so well adapted to proper size and form of the brood department of the hive.

**E. S. LOVESY (Utah)**—I believe with the long and varied experience that I have had with many styles and sizes of hives, if I were starting anew I would use a frame about 13 inches deep and 13½ inches long, and the top-bar 15 inches long. Because it is the best shape and size frame for wintering. And, while you don't ask for dimensions of hive, if I lived in a cold climate I would make a double-walled hive with loose bottom-board—a hive that is simple, cheap, and easy to make; but I have not space here to describe it.

**MRS. J. M. NULL (Mo.)**—Standard Langstroth size. I have most success with this size, and for the sake of uniformity of fixtures; more of this size being used than any other one size, and possibly more than all others put together throughout my territory. A well-known bee-keeper is quite frequently offered bargains in small lots of bees, and it is his wish, if it is uniform size, to buy them, but he does not buy only because of its being "more in the pocket," but because these little "side-shows" (in more than one sense) prove a "thorn in the flesh" of the specialist.

**ABRIAN GETAZ (Tenn.)**—As to length, such as will admit the length of the hive to be the same as the supers. These (if using 4¼x4¼ sections) should be 17½ inches long inside, giving room for four rows of sections and ¼ inch play for facility of handling. As to depth, such as will give a brood-nest of full size, using only 9 frames. With more than 9 frames the supers are too large, as they must cover the brood-nest. As to what constitutes a full-size brood-nest, see "Langstroth Revised." It is the equivalent of something more than 12 ordinary Langstroth frames. The tall frames are much better for wintering outdoors. The honey being above the bees it can always be reached. The cold coming in at the entrance does not strike the bees as hard as it will when the cluster is barely above the entrance.

**R. C. ATKIN (Colo.)**—Starting anew, I would have my frame 5 inches deep and 16 long, outside measure, used in divisible-brood-chamber hive. The reasons are that I can handle hives most of the time instead of frames; can contract or enlarge at will without changing width or length, and in a way that is, by all odds, the least objectionable, and least annoying, and out of harmony with the bee-nature; can get the largest amount of brood with a minimum of swarming-fever; can tell more quickly if swarming preparations have begun; can have the brood-nest in better shape for winter, and better wintering; can get stronger colonies in spring; all together, I can accomplish much more with the same labor and time. I will be laughed at, but I am probably nearer on the road to control of swarming than those who use the old-style frame and hive—the Langstroth hive.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

## Editorial Comments

### Some Expert Opinion.

This is the heading of a new department in the American Bee Journal, or rather an old department which is revived this week. It ran before for 10 or 15 years, and was very popular, but for several good reasons it was allowed to drop out a few years ago. We now bring it forward again with practically the same corps of experts who for years so kindly and acceptably answered the questions that we sent to them.

It is not intended that this department shall in any way overlap or interfere with "Dr. Miller's Answers," but that certain questions, upon which there may be a great diversity of opinion, are to be referred to the "multitude of counsellors."

We feel very certain that it will be read with much interest and profit by all, not excepting those who contribute their answers to the questions propounded from time to time.

Of course, we reserve the right to decide as to what particular questions shall be referred to this honorable board of experts. Dr. Miller's prestige and patronage in this line is not to be lessened in any degree by this resurrected department.

### "In this Locality."

This is a phrase that has been more or less a subject for merriment, yet when you are right down to it there is no disputing that there is a lot in locality. Mr. A. says a certain thing is so and so; B. says it is just the opposite; and each wonders how the other can be so lacking in good judgment. For example, one man says he wants nothing better than closed-end frames; another says that rapidity of manipulation with frames having ends half-closed, to say nothing of closed-ends, is a thing impossible. Each man is right for his own locality, for the abundance of bee-glue in the one locality and its absence in the other makes all the difference in the world.

The thing needed is charity, and a view broad enough that when any one disagrees with us, to think that if we could change places with him we might also change views.

### Apicultural Education.

In this country the young man or the young woman who starts out to get an education in bee-keeping must, in most cases, be self-taught, with no aid beyond what he can get from bee-books and bee-papers. It is true, that in a few agricultural schools bee-keeping is taught, and some fleeting instruction given in a few farmers' institutes, but that is about all. Other countries do better. In Europe a start has been made in the establishment of regular apicultural schools, and in England a fairly successful attempt has been made to have instruction given every where.

The British Bee-Keepers' Association was founded in 1874, its avowed object being "to teach by means of duly qualified lecturers and experts the modern methods of bee-keeping. The Council, composed of practical bee-keepers, appoints examiners and issues certificates of proficiency in bee-keeping." First-class, second-class, and

third-class certificates are given. At a recent conference of the Council of the Association with representatives of County Associations, the chairman, Mr. Thos. Wm. Cowan, "endorsed Mr. Reid's statement to the effect that English methods were equal to any on the Continent, although probably no Government in the world did so little for the industry as our own. Germany had about 30 associations, nearly all of which published their own papers, the cost being borne by the Government, and this was sent gratuitously to all members. In Normal Schools bee-keeping was one of the branches of instruction which the future schoolmaster was required to teach.

"Mr. Scattergood was quite right in saying it was the children they wanted to secure, or, at least, create in them an intelligent appreciation of apiculture. On the Continent it was taught in schools, so that those who wished could continue the study of bee-keeping later on, while all gained more or less knowledge of the pursuit."

Our good friend, Mr. Cowan, was hardly correct when he said that probably no other Government did so little for bee-keeping; at least it will probably be difficult to find in this country as many counties as in England, which give an annual grant of \$150 to \$250 for the furtherance of apicultural interests. But it is comforting to know that in this land of ours the outlook is growing brighter.

### Making Dark Honey Light.

In the British Bee Journal it is reported that dark honey subjected for about three hours to ozone from an electrical machine became light in color, and that the expense per hundredweight would be trifling. Important if the cost be not too much, and yet—and yet. Would there be any benefit in the long run in having buckwheat honey look the same as clover, supposing all the time that there was no change in flavor? It would take away one of the easiest means of distinguishing one honey from the other. And would it not make consumers constantly suspicious that all light honey might be buckwheat or honey-dew?

### Do Bees Injure Sound Fruit?

Tests sufficiently numerous have been made so that it does not seem necessary that any fresh test should be made. Yet fresh accusations persistently made leave fresh tests by no means without value, especially if those tests be made as much in the interest of the fruit-men as the bee-men. Our Canadian friends have been making some experiments that might be considered exhaustive at the Ottawa Experimental Farm, and these are reported in the Canadian Bee Journal. First, strawberries were tried, then raspberries, neither of which were injured by the bees. The fruit was placed inside the bee-hive, also in other places easy of access to the bees. Inside the hives the fruit was exposed in three different conditions:

- (1) Whole fruit without any treatment.
- (2) Whole fruit that had been dipped in honey in one-half of the super.
- (3) Whole sound specimens in the other half of the super.

A second test of the same kind was made with peaches, pears, plums, and grapes, some of the fruit being punctured.

"The bees began to work at once, both upon the dipped and punctured fruit. The former was cleaned thoroughly of honey during the first night; upon the punctured fruit the bees clustered thickly, sucking the juice through the punctures as long as they could obtain any liquid. At the end of six days all the fruit was carefully examined. The sound fruit was still uninjured in any way. The dipped

fruit was in a like condition, quite sound, but every vestige of honey had disappeared. The punctured fruit was badly mutilated and worthless, beneath each puncture was a cavity, and in many instances decay had set in. The experiment was continued during the following week, the undipped sound fruit being left in the brood-chamber; the dipped fruit was given a new coating of honey and replaced in the super, and a fresh supply of punctured fruit was substituted for that which had been destroyed.

"At the end of the second week the fruit that was sound at the end of the first week that had been dipped in honey, and also in the brood-chamber as well as the punctured fruit, was considerably decayed, and where any openings appeared showed signs of being worked on, but to no very great extent.

"For the third week, fresh samples of fruit of all the above kinds were used. The results of this test was very similar to that of the first week, and being later in the season the fruit that had been put in sound, some of it had begun to decay.

"After the third week the bees belonging to the two hives which had been deprived of all their honey, appeared to be very sluggish, and there were many dead bees about the hives; the weather being cool and damp was very much against those colonies. These colonies had lived for the first three weeks on the punctured fruit, and on the honey off the fruit which had been dipped; as there were at that season few plants in flower from which they could gather nectar, these bees had died of starvation, notwithstanding the proximity of the ripe, juicy fruit. This supply of food, which they were urgently in need of, was only separated from them by the thin skin of the fruit, which, however, this evidence seems to prove they could not puncture, as they did not do so."

### The "Sweet Tooth" Should Have Honey.

The following has been sent in by Walter Martin, of Colorado, who says he "believes it worthy of copying, as it possesses some really good common-sense, and is told in a very brief manner:"

The best way of curing children of the injurious candy habit is to make pure honey fresh from the hive, or properly extracted from the comb, a regular feature of their diet. Not only candy, but lumps of sugar, sweet-cakes and too much jam are bad. Pure honey is good. Honey is more easily assimilated than many "predigested" foods. It is a concentrated food, and furnishes the same elements of nutrition as starch and sugar, imparting warmth and energy.

Honey is a valuable medicine, and has many uses. It is excellent in most lung and throat affections, and is often used with great benefit in place of cod-liver oil. Occasionally there is a person with whom it does not agree, but most people can learn to use it with beneficial results.

Children who have natural appetites generally prefer it to butter. Honey is a laxative and sedative, and in diseases of the bladder and kidneys it is an excellent remedy.

Such items can not be given too wide a circulation. It would be a good thing if bee-keepers everywhere could get their local newspapers to publish it.

We have several times urged that the National Association should do some advertising in the daily papers, in the interest of a more general use of honey. Such items as the above would be just the thing to put into such advertisements. We believe that nothing else would so increase the demand for honey among all the people as just the kind of advertising we have mentioned. It ought to be done. And the National Association is the concern that should do it. Why not?

### Box-Hives or Straw Skeps.

These are still used in large numbers in many parts of the world. In some parts of Germany they are used almost exclusively. "What an ignorant lot they must be," do you say? No, box-hives are preferred by intelligent men thoroughly versed in bee-keeping, who say that for the prevailing conditions box-hives are to be preferred. It is hard for us, in this country, to understand how that can be, but when men of bright parts, familiar with bee-literature and modern methods say it is so, we should have charity enough to say that we are not the custodians of all the bee-wisdom in the world.

### A Novel Kind of Insurance.

At least different from anything in this country, is that in England, whereby a bee-keeper is insured against damage done by bees. That is, if Jones keeps bees, and his bees sting Brown's horse, the insurance association will take the place of Jones to pay all damage up to a certain limit. To insure his bees thus, it will cost Jones two cents per colony.

## Miscellaneous Items

**Mr. Thos. Dougherty**, of Bureau Co., Ills., has been a bee-keeper for nearly 40 years. Last spring he began with 21 colonies, increased to 44, and harvested 2100 pounds of extracted honey, and 2000 pounds of comb honey.

**Mr. E. Kretchmer**, of the Kretchmer Mfg. Co., of Montgomery Co., Iowa, returned recently from a trip to Europe. He was absent about 14 weeks. Bee-keepers are getting to be great travelers—at least some of them. Perhaps Mr. Kretchmer will tell the readers of the American Bee Journal something about his trip across the water.

**The Illinois State Convention**, which was held at Springfield Nov. 17 and 18, arranged it so that the annual dues of \$1.00 would pay membership in both State and National Associations. A list of 23 names was sent to the National, with others to follow. The following were elected as officers:

President, J. Q. Smith Vice-presidents: 1st, John S. Dowdy; 2d, J. W. Prinnan; 3d, Aaron Coppin; 4th, Jas. Poindexter; 5th, S. N. Black. Secretary, Jas. A. Stone, Route 4, Springfield, Ills. Treasurer, Chas. Becker.

**Mr. W. A. Pryal**, writing us Nov. 21, from San Francisco Co., Calif., had this to say about the glorious rains they are having:

**DEAR MR. YORK:**—For the past week we have been having rain galore in this and the northern portion of the State. I understand the storm has been doing some good in the south land; it is in the northern and north central sections that the greatest precipitation has taken place. Just think, in the county just north of this (Marion), the great dairy or cow county—the rainfall has been as much as three inches a day. The rains have come late, which, according to long observation, means a wet winter. 'Rah for next year agriculturally—also bee-culturally.

W. A. PRYAL.

**Mr. James C. Harris**, of Grand Junction, Colo., president-elect for 1904, of the National Bee-Keepers' Association, in referring in a private letter to the place of meeting next year, wrote us Nov. 14:

"I should be pleased to have an expression through the bee-papers as to what the National members would think the best meeting-place for next year."

It might be a good idea for the members, when voting soon, also to say where they would prefer to have the meeting of next year. While such a vote would not be binding at all on the new executive committee, it would perhaps help them in making their decision.

As we understand it now, the following cities have been mentioned: St. Louis, San Antonio, Cincinnati and Salt Lake City. Our preference is for the cities in the order here given, though, of course, what we would choose has nothing to do with what other members prefer. We would not attempt to influence a single vote on this matter.

**Bee-Exhibit in the Public School.**—Mr. Thos. Chantry, of South Dakota, wrote us as follows, Nov. 19:

**DEAR MR. YORK:**—I surely get lots of comfort and good out of the American Bee Journal. I send some clippings from papers here which explain themselves. By a chain of circumstances I exhibited an observatory hive with no thought of anything more than my interest in pleasing and benefitting the children. There are many grown-up people in Dakota who have never seen a honey-bee. I also thought it might help to show how impossible it is to manufacture comb honey, etc. And the awakened interest in the homes all over the city caused indirectly a much larger use of honey, and made many friends. It seems now to show promise of a lasting advertisement.

THOS. CHANTRY.

The clippings referred to by Mr. Chantry, consist of compositions by pupils in the public school where Mr. Chantry made the exhibit and gave his talk on nature study as it relates to bees.

We did the same thing as Mr. Chantry mentions on two occasions, several years ago, in one of the Chicago public schools. It seemed to create a good deal of interest among the school pupils. We think it was in the 6th and 8th grades. Such object lessons always pay well, as it adds to the fund of useful information of the pupils, and also creates an interest in bees and honey.

## Sketches of Beedomites

### FRED W. MUTH.

Fred W. Muth, whose picture appears on the first page this week, is President and General Manager of The Fred W. Muth Co., of Cincinnati, Ohio.

Mr. Muth was born in 1869, and the first 20 years of his life he assisted his father and brother in the honey-business. The next nine years he was connected with a wholesale grocery business, in which concern he filled almost every position, and obtained a thorough business training. His old employer, Mr. Robt. J. Sultth, manager of the concern, now retired, was, and is to-day, one of his best friends. When Mr. Muth entered the honey-business on his own account, he and his good wife were the only ones who seemed to realize his ability. They cheered him on, and from the beginning he was determined to be successful, for he felt that he was the right man in the right place. His friend, Mr. Smith, pointed out to him exactly how hard it is for a young man to gain a firm foothold in this world. He did not discourage him, however, for he knew his qualifications exactly from a business standpoint. The result is that the business of the Muth firm to-day is far beyond his expectations.

The American Bee-Keeper recently said this of Mr. Muth:

Mr. Muth has traveled during the present year over 11,000 miles to buy and sell honey. As the representative of the firm which bears his name, Mr. Muth is known everywhere among manufacturers where honey enters into the composition of their product. The fact that Muth has, during the past ten weeks, sold upwards of 500 barrels of honey, is convincing evidence of the young man's ability to perpetuate the record of his lamented father, the late Chas. F. Muth, who, for years, we believe, bore the reputation of being the most extensive dealer in honey in the United States.

Mr. Muth has grown from infancy among the bees and barrels of honey, and while it has been stated publicly that adulteration of honey could not be detected in many instances, Mr. Muth assures us that though the adulteration be but 5 percent he can positively detect it, and in all his transactions "Purity" is his watchword.

Mr. Muth seems to take especial delight in introducing the use of honey with manufacturers who have formerly had no knowledge of its superior qualities along their lines of business, and to this fact, doubtless, his extensive sales are largely attributable, with a consequent benefit to the producer by extending the consumption.

Mr. Muth is a member of the executive committee of the recently organized bee-keepers' association of Hamilton county, Ohio, in which organization his expert skill and progressiveness are generally recognized.

We are pleased to present Mr. Muth to our readers through his picture, which is an excellent one. It was our pleasure to know his sturdy father before him, and we have also met the energetic son. Mr. Muth is, and has been for several years, one of our regular advertisers, and we are glad to know that he is building up a honorable and profitable business, both in bee-keepers' supplies and honey.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

♦♦♦♦♦  
**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort. ☐

## Convention Proceedings

### THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 759.)

FOUL BROOD.—FORMALIN, ETC.

Delos Wood—Is it possible by spraying live bees in the hive with formalin, to cure foul brood, and then let it alone?

Mr. France—Well, we are in our infancy yet on that: what little I have tried of that, some 40 cases, I have lost some 30 of them.

Mr. Wood—The reason I asked the question, a friend of mine has been discussing it, and he takes the position that it would kill the germs, but not the brood.

Mr. France—One thing in this little pamphlet: One man says: "I got foul brood from supply-dealers. How do we know where they get their foundation?" Now, here is an experiment to test that: A prominent Wisconsin bee-keeper, some years ago, had foul brood among his bees so bad that he lost 200 colonies before the disease was checked. Having a honey-extractor and comb-foundation machine he first boiled the hives in a large sorghum pan, then in a kettle. All combs were melted; after the honey was extracted the honey was boiled, and also the extractor and implements used. The bees were returned to their hives on comb foundation he made from the wax from the melted combs, then fed the boiled honey. Several years have passed, and there has been no signs of disease in his apiary since.

Question—How long was it boiled?

Mr. France—Just long enough to get the honey out of the comb. Here is another one: I took out of 11 of the worst infested apiaries in my State, old, black brood-combs full of foul brood, rendered them into wax, took that wax myself to the comb-foundation factory, and had them make it into comb foundation. Then I had the check to go right into 20 of the best bee-yards in Wisconsin, where no disease had ever been known, had the same placed in 62 of their best colonies, and in every case no signs of disease have appeared. Those same colonies continue to be the best in the various apiaries.

Say, can you get the other fellow to do that? I would like to know the results, though. For six years I have been trying to see what I could do. Now, if it develops in your yard, I will take the hive out the day it appears, and put your price on it. There were all together 62 colonies that I put that foundation in, and the 62 colonies in those yards were the best in those yards. Now, you throw away that idea of comb foundation from supply-dealers carrying the germs of these diseases.

C. B. Denison—Do you ever boil the combs? One thing, we never would kill foul brood with the sun-extractor.

Question—Upper combs from an infested hive that had some honey in—could we use those combs another season, in case there should be a little foul brood up there, cut out that piece, and use the comb in that shape?

Mr. France—First, if I had combs, bright and nice brood-combs, I would extract those combs, give them an extra heating, if you please, and get them as dry as possible; then I would give those combs a good fumigating, and then an airing, and I think they would be safe. To make a positive assurance of it, I would make them into wax.

Question—What would you fumigate with?

Mr. France—Formaldehyde gas; spraying does not seem to have very good effect.

Question—Don't you think we are temporizing with disease when we are trying to save the comb?

Mr. France—Yes, I think we are.

Frank E. Atmore—What do you do with the frames?

Mr. France—I usually burn them. In a lot the other day, where I was, we had two wagon-loads, two-tiers deep of combs that we were going to render up into wax, and

they were black enough! They had been used for years, but the frames the owner wanted to save. Adjoining there was a sawmill. I went down to the mill, found a vat where we could attach a steam-pipe to. I made arrangements there to have that vat and all the exhaust steam we wanted from the boiler. (I have been so accustomed to getting everybody around to help me.) I got up into the wagon, where I could superintend it, and handed those frames, one at a time, to a man who dropped them into the tank, where a man on the other side with a stick would stir them around, and the wax was almost immediately melted, and then he would throw those frames out into a pile. Those frames we put foundation in, and put them back into the hives.

Grenville J. Lynn—Twelve years ago this last winter I bought an apiary, and in the spring, when I went to look at it, I found a number of cases of foul brood. I was like some of these bee-keepers seem to be. I did not want to destroy the nice, white combs. I had a little correspondence with Prof. Cook, and he cautioned me against using any of it in the hives, or the hives either, until they were thoroughly cleansed. At that time Prof. Cook thought the best way to purify the hive was to air it. I did so. However, I found some very white combs that had been used for rearing brood. My father prevailed upon me to put three of these combs in separate hives and mark them. Just about the time the brood was being capped up, in each one of these frames or combs, the foul brood developed. I would like to ask, Why was that? Was that some outside condition? This was after I had cleaned out all the foul brood in the apiary, and I had taken pains to carry every hive into my extracting-house. I would not open a hive in the yard—took them all into the house; shook them out according to Prof. Cook's plan, and now the 37 colonies that I transferred I do not know of a single one to go back to foul brood except those three that I put those three white combs into; the foul brood appeared in those combs, and those only. Now, then, where did it come from, if it was not in those dry, white combs? There was not a particle of honey, nor brood, nor anything on that comb that I put in—just simply the dry comb. Since then I have had a good deal of experience.

Mr. France—Did you first put those bees on the starvation plan before they had those dry combs?

Mr. Lynn—No, sir, I did not. I was working under Prof. Cook's instructions, and I was going to "give him fits" if I failed. So I simply carried my hive into the extracting-house. If I found foul brood in that hive I shook the bees out about two feet from the ground. If I found the queen I caged her because I didn't have any bees to lose. Then, if there was any muss made there I would brush that away, and let them crawl right in on that clean foundation. I dipped the hive in boiling water for about two minutes; I found that was long enough to melt all the honey, and I was careful, very careful, never to touch the inside of the hive, or touch the frame in any way at all, from the fact that I had to handle them when I knew they were infected with foul brood. I would take them out with a stick, and then go into the house and wash my hands thoroughly with soap. Prof. Cook says wash them with something stronger. So I put them out on the old hive on the comb foundation. I want to say this: I kept one colony that I had kept for ten, yes, eleven years, and there was no foul brood ever developed in those hives I ever treated at all.

Mr. France—When did you get those foul combs—that colony that you have treated—when did you give them the new combs?

Mr. Lynn—They had filled them the season before?

Mr. France—What was in the hive when those bees went in?

Mr. Lynn—The comb foundation. Let me explain this: The hives that I put those three combs into were colonies that I had shaken out, and the bees had crawled in on the full sheets of comb foundation. They had built up their combs. In each case, I marked them so I could make no mistake. Then, as soon as the comb was capped, foul brood appeared, and it did not appear in any of the other hives. I was convinced, from information I had secured from Prof. Cook, that I was treading on dangerous ground if I used any combs in the apiary from infected hives. And these were the only ones I did use, except where I found them in the supers from healthy brood. If I found a hive where the bees had died out, no matter how white the combs were, I melted them up and got new foundation.

Prof. Cook—I do not like this discussion. It reminds me of the old coachmen's story. When asked how near he could drive to a precipice and not go over, one answered, "Six inches;" another said, "Three inches;" but the one

who said he would keep as far away from danger as possible was the one who was engaged. Now, in dealing with foul brood, I would keep just as far away from danger as I could. When you are "monkeying" with anything like this disease, I think you are making a great blunder. If we have diphtheria in our homes, we have learned to be very careful to prevent its spreading. We know of these bacterial diseases, and do not fool with them. Suppose you can save a few combs. I do not like these questions. I would say, "Don't take any chances at all!" [Applause.] From my own experience and observation that is what I feel like saying. I think I have written thousands of letters in which I have taken this ground.

Dr. Miller—There is sometimes a little danger that hastily you may go too far to one side or the other. That is perfectly safe advice as far as the disease is concerned. If I find a colony afflicted with foul brood, to destroy the whole thing. Would you save the bees, Professor?

Prof. Cook—Yes, I think I can save the bees without taking any chances.

Dr. Miller—I would not take any chances on the bees if I had only one colony. I would burn the whole thing, root and branch. It is an easy thing with me, when I have only one colony, to burn up bees and everything; all my tools and my assistant—but I don't know where I would get another! But when it comes to having a whole apiary, that is a different matter.

Prof. Cook says I can safely save the bees. Thank you for that concession. Here is another man, McEvoy, who says I can save the hives. Somebody else says I can save the frames. I would like to save all I can when it comes to the large numbers. Now, we are not certain yet whether we can save the combs or not. If I can feel as safe in saving the combs as I can the bees, I would like to. Mind you, I don't know! I would like to, if I can. There is pretty good authority. Prof. Harrison, of the Ontario Agricultural College, says that he has tried fumigating the germs of bacteria in the combs for that, and there has been no development. Now, I don't know whether that can be entirely relied upon without some further trial. It does not look to me very reasonable. Mr. France says he would hardly feel safe in assuming that the germs would be killed under the pollen. I believe the formalin would work through pollen quicker than through the honey. But yet, he says under the pollen the germs have not been killed. It is just possible, is it not, that he may be right? If he is right about that, thousands and thousands of dollars may be saved in the combs. Let us find out first whether there may be any safety in that. Why not? Prof. Cook has given you the safe thing, but if you carry the thing to the extreme, you will not even save the bees. Let us find out how far we can go in safety. If you take that ground too solidly, you would never make any progress. Let us try if there is something further that we can save.

George M. Wood—I wish to say something on cleaning out frames. I think you will all find it a very correct and true process. It is a home process, and one that will never fail. Hot water, and anything you may put in it is all right. Fire alone will save them better. I put one or two frames on a pile, and I have some old timber ready to burn. I hold the frames over the fire, and the wax will boil like oil. When they commence to singe the frame, wait just a little and swing it out, the air will put out the flame. Now, when this wax ceases to boil, and the wood begins to burn, the germ is killed, and it will never revive. Then throw them off. But first, never touch them until you are sure your hands are clean; and your frames are as good as new. If hot water will save them in two or three minutes boiling, this heating in a flame of fire is far superior. It does not cost anything; it does not destroy your frames.

B. S. Taylor—I believe this is a vital question to Southern California, and I am a good deal like the superintendent of the plant was two years ago. I was building a house for an electric plant; I was afraid, and I asked him if there was any possible danger. "Not a particle," he said; "but I advise you to be extremely cautious." I have seen this foul brood spreading so much through carelessness. I have burned up a number of colonies; I believe we want to be very cautious.

Mr. Harbison—I fully agree with Prof. Cook in the matter of heroic treatment. As I stated to you last night, I had a bitter experience in '59 and '60 with foul brood, and since that time I have had no further experience in that line, because I wiped it out. Save your hives and your frames by thoroughly boiling from five minutes to half an hour. Be sure your water is thoroughly boiling. You can

easily and safely save your frames and hives, but do not fool away your time by trying to save comb.

### THIRD DAY—AFTERNOON SESSION.

This session was called to order at 1:30 o'clock, with Pres. Hutchinson in the chair.

The Committee on Memorials then reported as follows:

#### REPORT OF COMMITTEE ON MEMORIALS.

The Committee on Memorials recommends the adoption of the following minute:

*Resolved*, That we recognize the loss to our calling in the departure of such bee-keepers as Chas. Dadant, Dr. E. Gallup, Dr. A. B. Mason, R. Touchton, R. Wilkin, J. H. Martin, Thomas G. Newman, Mrs. A. J. Barber, and others. We shall miss their kindly co-operation, and their generous contributions, from their long experience, to the general fund of apicultural knowledge. Long may their memories remain green in our hearts in the years to come.

C. C. MILLER, *Chm. Com.*

On motion, the foregoing was unanimously adopted.

#### APIARIAN EXHIBITS AT ST. LOUIS.

Mr. O. L. Hershiser presented the following:

**WHEREAS**, It is desirable that the bee-keeping interests be properly recognized at the Louisiana Purchase Exposition, by apiarian exhibits from the several States of the Union and by foreign States; and,

**WHEREAS**, The apiarian interests may receive the recognition to which they are entitled, it becomes necessary to bring the matter to the attention of the proper authorities in the most weighty manner possible; therefore, be it

*Resolved*, That our efficient and energetic General Manager act for this Association in all matters looking to the bringing out of a representative apiarian exhibit at said Exposition; and especially that he correspond with the Boards of General Managers appointed to represent the several States, urging them to make an allotment out of their appropriations for the State exhibits at said Exposition, for State apiarian exhibits.

On motion, the above was adopted.

Mr. E. J. Oatman, once an extensive bee-keeper in Kane Co., Ill., was present, and introduced to the convention. He also made a few remarks.

The Committee on Resolutions reported as follows:

#### REPORT OF COMMITTEE ON RESOLUTIONS.

*Resolved*, That we extend thanks to the members of the National Association for their liberal attendance from other States. We trust that your stay with us may be both pleasant and profitable. We heartily welcome you, and trust that in the near future you will meet with us again.

*Resolved*, That we extend our thanks to the press of Los Angeles, and all committees that contributed to the success of this meeting, especially to Geo. W. Brodbeck.

*Resolved*, That we extend heartfelt thanks to the citizens of Los Angeles for their kind and hospitable treatment of the members of our Association during our stay among you. We shall long remember you, and look back with pleasure to this meeting with you.

*Resolved*, That a copy of this resolution be transmitted to the mayor of the city of Los Angeles.

*Resolved*, That we extend thanks to the California bee-keepers for their hospitable treatment of our members from abroad. We also thank you for the kind reception given in our honor Tuesday night last, and for the nice music, and above all else for the fine and comfortable Hall that you have placed at our disposal. Our stay with you will be long remembered, and will be looked back to as one of the greatest pleasures of our lives.

*Resolved*, That we extend thanks to the retiring officers of our Association, for the efficient manner in which they have conducted the affairs of their offices during the past year.

J. M. HANBAUGH, }  
A. I. ROOT, } *Com.*  
H. H. HYDE, }

On motion, the foregoing resolutions were unanimously adopted.

(Continued next week.)

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Sisters Joining in Co-operation and the National.

The bees are going into winter quarters in good shape, and did well the past season. Honey is too low in price, so all have gone into the Central California National Honey-Producers' Association, and we can wait until it will bring enough to pay the producers to put it on the market.

Merced Co., Calif., Nov. 6. MRS. ARTIE BOWEN.

Sure enough, why shouldn't the sisters have the benefit of co-operation as well as the brothers? Is there any reason why the sisters should not be members of the "National," and have the benefits that the brothers enjoy there? To be sure, you may think, "Oh, I have only a few bees, and it won't pay." But, remember, if you do get into trouble and need help you can't send in your dollar and become a member after you are in trouble and expect the Association to help you out then. Better send in your dollar right away, and become a member now.

Besides, if you never need help personally, the grand work that the Association is doing in suppression of adulteration, etc., and in looking after the interests of the bee-keeper in general, entitles them to your support. Perhaps you have never looked at it in that way, but when you come to think it all over, should not the sisters as well as the brothers have a part in the grand work?

To tell the plain truth, the thing never appeared to me in just that light before. In fact, I never thought much about it. But I am sending in my dollar. I want to give my mite to help the good work along.

### Newspaper Bee-Lore.

The following, clipped from the London Chronicle, was written by some one (let us hope it was not a woman) who seems to have been trying to see how many errors he could get into a single paragraph:

"Robber-bees are always a source of anxiety to bee-keepers, and at this time of year the marauders seem particularly active.

"Having gathered no honey, or, at any rate, an insufficient supply for themselves, they will descend upon a hive, kill its industrious occupants, and carry off the golden treasure in an astonishingly short space of time. We know of a recent instance in which the attack was developed and the home bees killed in a couple of hours. Sometimes a hive will attack a neighboring hive. In such cases the old straw 'skip' was better than the modern arrangement, for a knife thrust through the top would break the comb and set the honey free, at which the thieves would instantly return to seal up their own store."

### Sugar Candy for Winter Stores.

1. Can bees fed on candy made of sugar, live through the winter?

2. Can they liquefy it without water, when the sugar is boiled sufficiently to make it into a solid cake?

I have several colonies that have no honey, and will have to be wintered on sugar, if at all. I have fed them sugar and water until now.

I consider the American Bee Journal one of the best papers published, and the Sisters' department very helpful. Morgan Co., Colo. MRS. J. H. GILMAN.

Yes, bees fed on any preparation of granulated sugar will live on it through the winter, unless it be in some form that prevents their using it. Taken all in all, there is probably nothing quite so good for bees to live on as sealed combs of honey, yet some think they winter better on sugar syrup or candy. Very likely the sugar is better than some samples of honey, and most surely better than some samples of honey-dew.

2. You will find that the bees will liquefy the candy

without trouble. There is generally no trouble about sufficient moisture in a hive in winter. Keep close watch of a strong colony toward spring, and you may often see a little stream of water running out of the hive-entrance. Look into a hive in the cellar, and you will see drops of water often standing on the back wall. Whether it be that moisture settles upon the candy, or the bees furnish the moisture through their tongues, or both, the fact is that experience shows that candy answers a very satisfactory purpose in winter, and after cold weather sets in it is much to be preferred to winter-fed syrup.

### Honey Cough-Medicine.

The following is clipped from a newspaper:

"For a cough, boil an ounce of whole flaxseed in a pint of water, strain and add a little honey, the juice of two lemons, and an ounce of rock candy. Stir together and boil a few minutes. Drink hot."

## Contributed Articles

### Propagation of Foul-Brood Germs.

BY J. E. JOHNSON.

ON page 696, Mr. C. P. Dadant, I think, threw considerable light on the subject of why wax is immune and does not spread the disease of foul brood. Begging his pardon, however, I am entirely confident that he is wrong in regard to the power of spores to resist heat in boiling water. It has for many years been an established fact that spores (not bacilli) of some species can withstand three, or nearly three, hours of dry heat at a temperature of 284 degrees, and nearly 60 minutes of 212 degrees F. in boiling water. The non-sporulating bacteria are, as a rule, much more easily destroyed.

At the present time there is something like 1200 different bacteria known (those not known may be even more numerous); all, or nearly all, medical colleges have the different bacteria in cultures, and have experimented with them, so that it is no longer guess-work as to how much heat they will withstand, or how much of this or that it will take to destroy them; but the question in medical practice is, if the germs of disease have found lodgment in our systems, what will destroy them and not injure the system? In fact, in treating disease it is as yet not generally on the plan of killing the germs so much as it is on the plan of aiding the system to throw off the pathogenic effect of the germs. In many cases the germs would still be present in the system, but made non-pathogenic when the remedy had effected a cure. I see in the daily papers remedies advertised and guaranteed to kill every germ in existence, to be taken internally; if such should be the case we would soon die if we took the remedy, even though we did not become poisoned, as even the digestion of our food is more or less the result of certain germs belonging to the bacterium family.

It is not so much that the life of a spore can resist such severe treatment as boiling, but it is because the capsule or shell of the spore is endowed with such resisting qualities. If we could take a spore and crack the shell open, even the sunlight would soon be fatal to it; but when we consider that spores are so small that 1000 would have ample room on the point of a pin or a cambric needle, it would take quite a while to crack the shells of a bushel or two.

The standard disinfectant at present is saturated steam at a temperature of 100 degrees C. (which is equal to about 245 degrees F.) for about 15 minutes; dry steam, although equally hot, would take a much longer time to kill spores.

Yes, it is strange that any form of life will stand so severe treatment, but it is true, nevertheless. In fact, the whole great subject of bacteriology is strange, but it is a science now well established and quite accurate, as far as established. I think Mr. Dadant is probably right about the spores becoming mummified or coated with melted wax so as to be harmless.

I do not know, but let me offer an explanation: That the brood will not become diseased by coming in contact

with the spores, but only when taken as food; also, that when spores are soaked in hot wax, or even if not very hot, it may penetrate the shell of the spores so as to prevent any future development, and so be rendered forever harmless, though not dead.

Bacillus alvei being reproduced from spores, it would be among the hardest to destroy; but it may be possible that even though the spores of bacillus alvei can withstand two hours ordinary boiling, they may become coated and harmless in melted wax even though not boiled. If such be the case, it must be because the disease cannot be contracted except through food.

I think it very doubtful if oil of eucalyptus would kill spores, but any antiseptic that can be used in the hive without harm to the bees would kill bacilli, and prevent the spores from propagating, to some extent at least. An antiseptic is next in power to a disinfectant, and if oil of eucalyptus can be used in a hive of bees without injury to the bees, it would have many advantages, as the temperature of the brood would be such that the spores would be in active reproduction, hence much more easily destroyed; or, in other words, the antiseptic properties of the oil of eucalyptus, if pretty strong, would kill the bacilli, and, as the spores would develop, the antiseptic properties would kill them before they could again sporulate. At least this mode of treatment would be worthy of thorough trial.

Although there is no spontaneous generation of germs, there is some strange behavior of germs. For instance, people may carry the germs of the genuine diphtheria in their throat all their lives, and they would grow and propagate there, but would be non-pathogenic and harmless; but such germs can at any time, under favorable conditions (probably by the aid of other germs), take on a pathogenic state and develop a case of genuine virulent diphtheria, and when once started it would be contagious. When the disease could be stamped out or cured the patient would still harbor and propagate the same species of germs, but they would then be non-pathogenic and harmless. The disease of blood-poison is the result of a combination of germs.

I wish to correct some mistakes I have made on page 700. Through carelessness I said that formalin was gas from formaldehyde and 40 percent water. It should have been from 40 percent formaldehyde and water. On page 648 occur some typographical errors, and some on account of my careless writing. The name Mewman should have been Newman. I asked the question, "What was the diet of the foul bacteria?" and was made to say "that the diet was nitrogen;" the word "that" should have been "what." Also by omitting a line, I was made to say there may be spontaneous generation of vegetable life. In reality there is no more spontaneous generation of germs than there would be of people. I know we should be very careful when writing for publication, and hope I may do better in the future. I may not be able to do much good, but I certainly hope to do no harm.

Knox Co., Ill.

### Care With Foul Brood—Eucalyptus Oil Treatment.

BY C. P. DADANT.

MR. C. P. DADANT:—I just now read your article on page 696, and take the liberty to write to you and ask you to give me a little advice.

I have about 80 colonies of bees which I have worked for extracting. I have had two and three extracting supers on the hives, and have secured a good crop of honey.

About two or three weeks ago I discovered in one colony that I had brought last fall, and which I had transferred last spring in a new 8-frame hive (I brought 10 colonies from the same party, the others are all right), in the hive-body next above the brood-chamber, a good deal of dead brood, what seems to me foul brood. Several days before I discovered this I had taken off an upper super of honey, had extracted it, and mixed the combs with the other extracting-combs, which I intended to put back on the hives. Maybe I did put these frames on the hives, or I may have them in my extracting-room; and maybe they were amongst a lot of supers which were set outside to make room and the bees began to clean them out. On Sept. 19 I had also taken combs off to extract, and they may have been put on other hives. What I wish to say is, maybe my other bees have had access to the combs of the infected colony.

The colony with the dead brood I closed up when I discovered the difficulty, and moved it about 10 miles away to a place where I do not think there are any bees.

Now I would like to ask you this: I have perhaps 150 or more extracting supers which need cleaning. By the bees? Would you pile them outside, and let the bees clean them out?

I have read your article about leaving the enameled sheets on the hives and putting supers back on hives, and have done that, but look-

ing, these cool mornings, in the top super, where I had three extract ing supers piled over the enamelled cloth, I found a cluster of bees in the super, right under the cover, which shows that they don't travel back into the brood-chamber. Other hives where I had empty supers piled on, had some honey in all frames again, and some cells capped. It is getting late in the season, and I have to run all these frames through the extractor again, and I would like to pile the supers out and let the bees clean them up, but I am a little afraid to do so. Would it be advisable to treat these frames with oil of eucalyptus before I give them to the bees?

I have never had any foul brood in my apiary, and I don't know whether I have it now, but it looks suspicious, and I would like to avoid its spreading if I could do it. I have looked through all my other hives and have found no other colony affected. The colony that has the dead brood stored considerable honey this season.

St. Louis, Mo., Oct. 30.

I do not count it any trouble to answer enquirers on the subject of foul brood. It is a matter of most vital importance to all of us, and the only way to bring about success in eradicating it is to enquire and report after trials of means of treatment. That is the only method by which we can get to some positive conclusion. We must bear in mind that not a single one of the remedies advocated by different persons has proven efficacious in all instances. It is either because the remedy was not tried with enough care, or because the disease was more virulent in some cases than in others. We see the same thing in diseases of the human race. The remedy that has saved some lives turns out inefficient in others.

But let us make sure, first, whether it is real foul brood that your bees have. The most of us are apt to get badly frightened when we see any dead brood at all. The party mentioned in my article previously was very much worried, when the disease appeared, and he tells me now that he had already destroyed one colony by fire, when he wrote me about the disease. He seemed so anxious about it that I took the train at the first opportunity and went to see for myself. Yet the cure was effected in so short a time that he now jokes about his fears. After the publication of my article he wrote me that he had used the eucalyptus just 22 days.

But dead brood, in any case, should be very much mistrusted. I kept bees for 30 years or more before I saw anything in the way of dead larvæ, except patches that had been chilled by exposure, and it is noticeable that chilled brood is usually in patches, every larva being dead, with a very plain odor of carrion when it has had time to decay, while other diseases show a dead larva or chrysalis here and there. At the first sight of a dead larva in a brood-comb, I should have pronounced the disease foul brood, had I not been informed better by men who had seen different forms of disease. The authority of these men is positive. Foul brood in all cases at a sufficiently advanced stage shows plainly ropiness and coffee color, and looks as if it might be liquefied brown rubber, though it does not string out much more than half an inch or so. Any other form of dead brood is less dangerous.

Whether in the present instance it is true foul brood or some other disease of a milder nature, it is best in your case to try the disinfectant recommended by Weber, with formaldehyde, on all supers that have been emptied, without exception. There is evidently much doubt of the efficacy of this remedy in disinfecting combs containing dead larvæ, and especially sealed brood, but I believe that, judging from the testimonials given, combs that contain neither brood nor honey can be successfully treated with this drug. Those super-combs are empty and in good shape to be thoroughly disinfected by a careful treatment. If they are all treated at one time, in a very tightly closed room, it will make a short job, and they ought to be sufficiently disinfected to run no risk of carrying the disease with them to the bees in the spring.

The greatest advantage of eucalyptus, if it should prove of value in true foul brood, as has been claimed by several European apiarists, is that it would not require the removal of the combs from the bees. On empty combs, away from the hive, it seems as if formaldehyde would be a much stronger remedy. It might not be a bad plan to try both. If formaldehyde proves sufficient, it does the work at one or two times at least, while eucalyptus must be renewed from time to time for a few weeks. A treatment of bees by eucalyptus, at this season of the year, would not be conclusive, because there is not enough brood reared to make sure of the disappearance of the disease. So the colony or colonies ought to be treated again in the spring.

Judging from your statement, it is quite possible that you have spread the disease by giving the combs of the diseased-hive back to others. I would by all means avoid the

risk of spreading it any further, and therefore would not give any of the supers to the bees, either on the hives or in open air, until they are thoroughly disinfected. I would not under any consideration expose the combs to be cleaned out in the open air. Besides the risk of attracting bees from other apiaries, you would excite your bees and give them bad habits. The habit of robbing, and lurking about buildings and empty hives or weak colonies, is contracted easily in that way.

Another fault of giving the combs to the bees in the open, is that they do not clean them or repair them, but simply rob the honey out with the greatest possible haste. In their hurry, they will damage them still more if they find it necessary or convenient, in order to get at the honey more readily. Many of us have seen combs open through the septum or foundation by the bees, to get at the honey on the opposite side, instead of taking off the cappings, just because it happened to be easier to do it that way. So the combs which you would expose in the open would be robbed of their honey without being cleansed or repaired.

If supers are put upon a hive, one at a time, the bees, if the colony is of fair strength, ought to clean it up within 48 hours in mild weather. It may then be removed and another put on, and if this is done during the evening there will be no trouble from robbing. The supers, which are piled on the hives two or three tiers high, and in which the bees have clustered, should be removed in the ordinary way, by shaking or brushing the bees out or by using the escape. Sometimes the removal of all the dry combs, leaving only those on which there are bees, will induce the bees to carry the remainder of the honey down to the brood-combs. It is only when the queen has moved up with the bulk of the colony that it becomes difficult to drive them down.

If your super-combs contain much honey, it is evident that you have extracted too soon, before the end of the harvest, and it may be advisable to extract once more. When the supers have once been cleaned they are all right for keeping over, even if they contain a little honey, for this is not in a shape to sour or attract robber-bees.

Hancock Co., Ill.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### BEEES GOING UPSTAIRS.

A remark is made on page 632 that it is rare for bees to move upstairs. Quite likely it is in the experience of some apiarists; but my extracting colonies provokingly often vex me with just that trick. The supers have excluders, but not very perfect ones. 'Spect the queen goes up Paul Pry fashion, and then founds a new llium there because it is not very easy to go back. The workers evidently don't know why the queen cannot come above, and often save for her, in a state of polished emptiness, the bottom of several combs.

### IS DISPOSITION FROM THE DRONE SIDE?

Concerning hybrids, does the disposition, as to being cross or otherwise, come from the drone side? That idea is strongly advanced on pages 661 and 602. Now let us watch out for evidences for and against.

### THAT CAGED QUEEN OUT-DOORS.

Wm. M. Whitney's colony, on page 655, is unique, and interests me very much. Caged queen out-doors on a table, shaded with a box, and individual bees come at their own option one at a time till several hundreds are around the cage. The number of bees we see bobbing around the entrances of totally empty hives show us that the bees of an apiary often get lost. I guess the Whitney swarm was composed of these lost bees. The "our crowd" spirit seemed to come to them easily. And the attempt to get the queen out of the cage by going through the process of swarming was beautifully in line with the notions evidently pervading bee-noddles. It was all right to build them up into a good colony; but had he devoted them and some of his own time more purely to the interests of science it would have been still better. How far can this volunteer

ing of individual bees be carried, we should be glad to know? Next time let him shift the queen into a larger cage made of a bait-section of comb. Put half the bees inside with the queen and leave half outside—to stool-pigeon for more. Perhaps a piece of very young brood as big as the end of one's thumb given to the outsiders would help on. A little feed every evening, of course.

#### CYPRIAN AND CARNIOLAN BEES.

So Frank Benton still mourns that the general verdict was adverse to the Cyprians—and still sees gentleness in them. Put it strong when he thinks a man whose crop is 20 tons might have had 30 tons with just the right kind of Cyprian hybrids.

Mr. Benton is good authority on Carniolans, and he finds, it seems, that not occasional colonies, but all colonies, in their native home, have some yellow-banded individuals mixed in with them. Page 662.

#### EFFECT OF LOCATION ON TEMPER OF BEES.

That the same bees should be cross or gentle according to location is so queer that we are inclined to have a good laugh at it and then dismiss the idea. "Location," run into the pictures. There seems, however, to be valid evidence of just that state of things. Granting the truth of it, there must be a reason—and digging after such hidden reasons is one of the proper and profitable things for us to do. Sometimes, I reckon, the reason is just one word—skunks. Peace at night in one locality and midnight worries in the other. I think some nectars are faintly poisonous—not enough to do serious harm, but enough to make the bees feel viciously on nettles. Change the location and you change, in part at least, the source of supply. When one locality is well shaded and one of unmitigated heat—partly melting things down occasionally—a foundation for a difference in temper can come in there. And it's a well-known general principle that the bees are less inclined to attack when they see human beings every day moving about near by. Lonely out-yards ought to be some crasser than the home yard. Are there other reasons?

Mrs. Higgins, on page 676, says it depends largely upon who handles them. Yes, that's so. Changed location may get them handled in an idiotic and provocative way in which bees never ought to be handled. Page 662.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Feeding Light Colonies Now for Winter.

The bees are lighter in stores this season than they have ever been before. If I had known they were as light as they are I would have fed them early in the fall. They have always weighed from 60 to 80 pounds, but this season they weigh only from 38 to 54 pounds.

1. Will a colony in an 8-frame hive weighing from 38 to 40 pounds have stores enough to last until April 1, wintering in the cellar?

2. Is there any way that I could feed them now so they will have stores enough to last until April? I have them in the cellar now. I have about 8 colonies that are very light. How would it do to set them out some good, warm day for a flight, then fill some of the empty combs with sugar syrup.

WISCONSIN.

ANSWERS.—1. When you ask about a colony in an 8-frame hive weighing 38 pounds, I suppose you mean the hive with bottom-board and cover. Wintered in the cellar under favorable conditions, you hardly need to worry much about its pulling through till April 1. At a rough guess, I should say that about 8 colonies out of 10 would make it. Two colonies may each weigh the same, and yet there may be several pounds difference in the amount of honey they have; one may have older and heavier combs than the other, and it may have a larger store of pollen. Two colonies under the same conditions, apparently just alike, and having the same amount of stores, may consume unequal quantities—I don't know why—possibly because one is of a more quiet disposition, and so consumes less. Although I

should set 38 as the limit, and would much rather have a greater weight, yet if a colony in the cellar had that weight I think I'd let it take its chances rather than to trouble it before the first of April.

2. Don't try setting them out to give syrup after any sort of fashion. Syrup belongs to flying weather, and if you have no sealed combs now, feed candy after the instructions given in your bee-book. It might pay to buy section-honey to feed rather than to give syrup now.

### Preventing Honey from Candying.

What do dealers in honey put in it to prevent it from candying? There is honey on the market here, put up in Chicago, that never candies, and they warrant its purity. I put mine up in pint cans, and after it candies many do not like to buy it. I believe tartaric acid will prevent it. How much dare I put in it without impairing the taste?

IOWA.

ANSWER.—I somewhat doubt whether any honest dealer puts anything into honey to keep it from candying. I am afraid enough of any acid to prevent granulation would be an injury to the honey. Can you not educate your customers to reliquify their candied honey?

### Drone-Excluding Zinc—Crosses of Bees—Prolific Bees.

1. Is there any drone-excluding zinc that will not exclude the queen? If so, what is its cost?

2. Is a cross between Carniolans and Italians as good, or better than either crossed with the blacks?

3. Which is the most prolific bee? VIRGINIA.

ANSWERS.—1. Yes; or at least there was; the perforations barring the drones, but passing the queens.

2. Yes, probably.

3. The queen. Amongst queens the Carniolans are noted for prolificness.

### Directions for Arranging a House-Apiary.

Is there any book published that gives definite directions for the inside arrangements of a house-apiary. If there is none, perhaps some contributors would favor us with the same in the Bee Journal. WASHINGTON.

ANSWER.—Perhaps Root's "A B C of Bee-Culture" has as much as you will find in any book. I suppose the chief thing as to inside arrangement is to have places for the lower tier of hives (the hives being the same as those used on the summer stands), shelves to support those above the lower tier, and passageways from each hive to the outer air so arranged that no bee can get out into the inside until when a hive is opened. I yield the floor to any one who will tell the best way to do this.

### Hive for Comb Honey—Wintering Bees—Shade, Etc.

1. You have invited your readers to ask questions, and as I am a tender foot in the bee-business I accept your invitation, as I am anxious to get started right. I started one year ago last spring with one colony, and I now have 8. I am using the alternating hive, which is a 2-story hive containing 8 Hoffman frames, 16½ by 5½ to each story. Now, I want to know if this is a good hive for one who works for comb honey.

2. I could not get my bees to work in the super, and there was an abundance of alfalfa, buckwheat and other plants to work on. What was the trouble? Are my hives too large?

3. Would it do to use a queen-excluder between the two stories of the hive? or would it be detrimental to the workers?

4. Where is the best place to winter bees in this locality, on the summer stands or in the cellar?

5. Should the hives be set in the shade during the hot weather?

6. How much honey should a good, strong colony have to winter well?

7. What is the advantage of a two-story hive over a one-story?

8. What hive do you think is the best where one wants the honey in supers or comb honey?

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

## FROM MANY FIELDS

### A Good Wisconsin Report.

I summered in Clark Co., Wis., last year, but not liking the country, I moved back to Grant Co., Wis., last January. I went back in March after my bees, and brought down 26 colonies, but when I came to look at them 4 were queenless, and some of the rest were very light, so in May I bought 5 more colonies, making 26 in all. From 4 of them I did not get much honey, but from 22 colonies I got 4000 pounds of extracted honey, and 350 pounds of comb honey. Pretty fair, I think, for Wisconsin.

I paid \$17 for the 5 colonies I bought, and sold \$64.00 worth of honey from them. From one colony that did not swarm at all I extracted 336 pounds of honey. I had 2 top stories on them; I had only 1 top story on all the rest of my hives. If I had had 2 or 3 stories I believe I would have had 300 pounds of honey to a colony. I let them swarm just as they wanted to, then let the new colonies store comb honey. I had one colony that stored 255 pounds of extracted honey, and swarmed twice. Only about half of my bees swarmed at all.

I have 41 colonies in fine condition for winter, none weighing less than 60 pounds, hive and all. I hope next year will be half as good as this year was. U. S. BOYD.  
Grant Co., Wis., Nov. 19.

### Bees Did Fairly Well.

My bees did fairly well last season. I had 5 colonies; from 4 I got about 130 pounds of comb honey; from the remaining one a swarm, but very little honey. A neighbor about 1/2 mile away, who has kept bees for many years, says that it was a poor year; he got almost no surplus at all; so I think I made a success, and hope to do better next year.

WM. R. MARTIN.  
Washington Co., Pa., Nov. 23.

### Results of the Past Season.

We started with 54 colonies of bees last spring; they swarmed and increased to 112 colonies, and we got 2363 pounds of comb honey, and 801 pounds of extracted honey. We have sold \$330 worth, and have some on hand yet. MARION F. ANDREWS.  
Des Moines Co., Iowa, Nov. 16.

### Light Crop of Honey.

I have just put my 230 colonies of bees into the cellar for their winter sleep. We had a light crop of honey this year. I. A. TRAVIS.

Wood Co., Wis., Nov. 16.

### Report for the Season of 1903.

As the bees will not store any more honey this season, and it is cold enough to put them into the cellar, I will make a short report.

I started in the spring with 70 colonies; 2 were queenless, so I lost them. The rest built up quite fast, and commenced to swarm May 12, and I was going to guess at the number of times they swarmed I would put it at about 50,000; but there was not that many, but I increased to 130. I returned as many swarms as I could make stay in the hive, and more than 20 went to the woods. After June 1 I could be with them awhile only in the afternoons, and I had a specialty of strawberries, and strawberries and bees are in season about the same time.

I use only the S-frame dovetail hive, with shallow super for both comb and extracting. I got a little over 13,000 pounds of honey, counting the salable sections each 1 pound, of which 3500—I sold them at wholesale at 10 cents a piece; retail at 12 1/2 cents; the rest was extracted, all white, except 1200 pounds was white and amber mixed. I use the 3 3/8

sections; they will hardly average 14 ounces each, but they look better than the 4¼ sections.

I had several colonies each of which stored over 400 pounds of extracted honey. I think if I could have been with them more during June and part of July they would all have averaged 200 pounds to the colony, spring count. (GEO. A. OHMERT, Dubuque Co., Iowa, Nov. 19.)

### Wet Season for Bees.

The past season was very wet for the bees. All the honey they got was from white clover, in June and July; later they did not gather enough to live on. I sold several pounds of honey at 12 cents a pound, just loose from the frame, not in sections; I could have sold several pounds more, but I want my bees to have plenty of stores for winter.

I had only 2 colonies last spring; one swarmed once, and the other twice. This fall I took off an 8-frame hive-body which had been put on the hive of one of the old colonies in June, and I found it plump full of white honey, no bee-bread at all. I took out 4 frames, and one of them weighed 6 pounds, which I thought was good weight; and the other 4 frames full I left in, and ran a swarm in, which I had brought from the woods. So I have 6 colonies with plenty of stores for winter. I have cut down 7 bee-trees, but there wasn't 10 pounds of honey in the 7; they had combs 5 feet long, but nearly all was brood-comb.

I use the 8-frame dovetailed hive, and run for comb honey only. I winter my bees with supers on top filled with leaves, which I think will keep them dry and warm.

B. F. SCHMIDT.

Clayton Co., Iowa, Nov. 18.

### A Season's Experience.

In accord with the editorial of last issue to "let our light shine," I am going to let my darkness shine (for I am only a beginner) for a few minutes, if you will.

I began the year with 3 colonies, Nos. 1, 2 and 3. I worked for extracted honey, for which I get 20 cents a pound, or one part jar for 50 cents, the jar to be returned.

Having read several items in the bee-papers stating that it is not necessary to have a queen-excluder under an extracting super, that the queen would not go up there to lay, I did not put any on. A week later I went

through the hive and found to my disgust all vacant cells in the supers occupied by eggs, a great many of them drone-cells. After a careful search I found only one of the queens in the supers, and placed her below; this was No. 3. Then I put on the excluders, and closed up the hives.

The following Saturday (I can examine my hives only on Saturdays) I found the same condition of things in Nos. 1 and 2, and the brood-nest getting empty. Another careful search for the queens resulted in my finding No. 1, but not No. 2. For the following three Saturdays we had rain so I was unable to open the hives, but on the following Sunday I was called from church by a neighbor; my bees were swarming. I took the hive all to pieces looking for the queen again without success, cut out 8 fine queen-cells from one comb, and destroyed all others that I could find, and closed up the hive again.

Well, this colony swarmed every day from that Sunday for about a week, and I stayed at home two or three times to take care of them. I knew they would not go away, as the queens were clipped, but I wanted to stop their fooling and find the queen. Finally, despairing of finding her, I took queen No. 1 with the comb and bees on which she was, and placed it in the middle of the brood-nest of No. 2; took out all the old empty combs from another hive, shut it all up, and was about to go, when I found a group of bees on the ground, and on examining it I found my long lost queen! What was I to do, open hive No. 2 again and look for the queen I had just put in? Not much! I had enough of that. I simply ran No. 2 queen in at the entrance of No. 1 with a puff of smoke and went about my business. Very simple introduction, was it not? Notwithstanding all this fussing I got 119 pounds of comb and extracted (mostly extracted) honey from the 3 colonies, and made a new colony with one of the queen-cells from No. 2.

I had a good crop for this section. With this year's experience I hope to do better next.

A. C. JACOB.

Richmond Co., N. Y., Nov. 17.

## BEST

# Extracted Honey For Sale!

ALL IN 60-POUND TIN CANS.

**Alfalfa Honey** ❧

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

**Basswood Honey** ❧

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Our honey is put up in tin cans holding 60 pounds of honey each. These cans are shipped in wooden-boxes, and should arrive safely. We have nothing but **PURE BEES' HONEY** to offer, and so guarantee it. **Cash must accompany each order.** All prices are f.o.b. Chicago.

**Prices of Alfalfa Honey:**  
One 60-lb. Can @8c..... \$ 4.80  
Two 60-lb. Cans (in 1 box) @7½c 9.00  
(Larger quantities at the 7½c price.)

**Prices of Basswood Honey:**  
One 60-lb. Can @9c..... \$ 5.40  
Two 60-lb. Cans (in 1 box) @8c... 9.60  
(Larger quantities at the 8c price.)

A sample of either Alfalfa or Basswood honey will be mailed on receipt of 10 cents; samples of both kinds for 16 cents. (Stamps accepted.)

**BEEWAX WANTED**—We are paying 28 cents cash or 30 cents in trade for pure average beeswax delivered in Chicago (or Medina, Ohio).

**HONEY-JARS**—Don't forget to get our prices on all sorts of honey-packages.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shows herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Some Good Glubbing Offers.

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a long time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$2.00.

**GEORGE W. YORK & CO.**

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

No. 50.

## Editorial Comments

### The National Election this Month.

During this month the members of the National Bee-Keepers' Association will be called upon to vote for several directors and a general manager, whose terms of office expire with the end of this year.

We believe it is a good thing to have the directors scattered over the country as widely as possible. It would be better, we think, if there were only one director in a State, no matter what the membership of any State is, as the Association is National, not only in name, but in influence and in extent.

Canada should be represented on the Board of Directors by one member, at least. Mr. Wm. McEvoy has been prominently mentioned. We hope he will be elected.

But each voter should remember that he has the right to vote for any member he pleases, regardless of what anybody else may say.

### Honey Superior to Sugar as a Food.

Dr. J. H. Kellogg, the well known medical authority, has given honey a strong endorsement in Gleanings in Bee-Culture. For the sake of the health of the public at large, it would be a fine thing if it could be copied by all the papers in the land. He says:

I consider honey much preferable to cane-sugar as a food. It is practically a fruit sugar, and is ready for absorption. Eaten in moderate quantities it ought to tax the digestive organs much less than cane-sugar, and is to be commended.

Many persons ought to be able to utilize honey who can not use cane-sugar. Adults often lack the power to digest cane-sugar. Cane-sugar is chiefly obtained from grasses and roots. It is a sugar adapted to herbivorous animals. One of the four stomachs of the cow secretes a ferment which is capable of digesting cane-sugar. Digestion of cane-sugar converts it into honey, so honey is practically cane-sugar already digested.

Malt sugars are best of all, as they are adapted to the human digestive apparatus, being the natural result of the action of saliva on starch. I think maltose is preferable to all sugars; but honey comes next, and I frequently recommend my patients to use it when they do not find it convenient to use malt sugars. So I consider that you and your busy bees are engaged in good missionary work, and you have my hearty sympathy. Knowledge in health-lines is increasing at a very rapid rate these latter days.

### What is a Bee-Scout?

Some readers may wonder why such a question is asked, because they are familiar with the word, and have never heard it used with any other meaning than that of a bee going out in advance to select a place for the future home of a swarm. The dictionary confirms this view.

It appears, however, that in England the name is applied to those bees which are on the lookout against intruders, as described by a writer in the British Bee Journal in these words:

There seems no reasonable doubt that the duties of the scouting bee are as clearly defined and deliberately assumed as are those of the sentinel, though the elusiveness of her movements, owing to the fact that they have to be performed on the wing, may lead to the notion that she is nothing more than a chance member of the community

whose temper has become upset, and habits of industry in consequence temporarily diverted from their usual peaceful course. In spring and early summer it is true her numbers are insignificant, and her special duties can then scarcely be said to have been taken up in earnest; but as the season advances the ranks of the bee-scout become recruited, and their attitude towards supposed intruders more aggressive. This remark may not wholly apply to cases where undue irritation has been brought about by accident or awkward handling, but in a well-managed apiary it is interesting to note the strictly limited area within which the aggressive attentions of the bee-scout are observable. Her function is to circle around within a few yards of the hive, and, unless actually following up an attack, her threatening attitude is scarcely exhibited beyond the prescribed limits. To the writer it appears that the zone of the scout's greatest activity lies within a distance of perhaps from two to seven or eight yards of home, and what is more striking, she seems, as a rule, to pay little attention to any one standing close against the hive, as, for instance, in an act of manipulation.

It will be seen that a class of bees is spoken of entirely different from those called scout-bees in this country. Indeed, it is a question whether heretofore the bees spoken of by the British writer have ever been considered as a separate class; and yet he may be right in thus speaking of them. Any experienced bee-keeper will recall one or several cross bees following him persistently about the apiary, perhaps all day long. Are not such bees detailed specially for that duty? But it will hardly do to call them scout-bees, so long as that term is already in use for another purpose. Shall they be called *pickets*? or is there some better name?

### Sense of Location in Bees.

This has attracted a good deal of attention. Some have thought them possessed of a special sense that allows them to return with unerring certainty from any point of the compass directly to their own home. In finding their home they are most assuredly not entirely guided by the appearance of that home itself, for if a hive in an apiary be removed ten feet from its location, the returning field-bees will never find it, although its appearance be exactly the same as before removal. C. Krab, in *Praktischer Wegweiser*, argues that there is no special sense in the case, that it is a matter of memory pure and simple. Observation and reflection help to establish this view.

Note the careful manner in which a bee marks its location when it takes its first flight, as also when it voluntarily changes location at swarming, or when changed a considerable distance to a new location. At first thought it might appear that it is merely noting the appearance of its hive, but its constantly widening circles favor the belief that it is taking an inventory of a wider circle of objects, with its hive as a central point. After the winter's confinement, or after a considerable confinement at any other time, a fresh marking takes place as if to refresh the memory. Then, after the marking is carefully done, no time is wasted in reconnoitering to find the right place on subsequent flights, but depending upon its memory for the appearance of surrounding objects, perhaps for a great distance in all directions, it goes in a bee-line direct to the central point of the objects previously noted.

### Improvement of Stock.

Under this heading, in the American Bee-Keeper, with no comment unless it be the sub-head, "A New Idea as to Means of Facilitating this Desirable Result," appears the following in an article by G. B. Cram:

I have combs built part way down and give these to queenless colonies to start dummy cells on the lower edge, which I use by putting in larvae, changing them again in from 12 to 20 hours; that is, taking

out those first inserted and substituting a new batch. "Oh, that's nothing new," you say. Now hold your tongue and wait until I am through.

My cell-building colonies are broodless—composed of bees not one of which is under ten days old. You say, "Why go contrary to all orthodox rules?" Because young bees like "pap" better than old ones. To satisfy yourself upon this point, just give a frame of eggs to a colony with no bees under ten days old, and another to a colony which has just been deprived of all brood and eggs. You will find that the former are much better fed than the latter.

Now, for my plan of selecting queen mothers: I select a queen that has just begun laying, regardless of what she may prove afterwards, as to color, etc. I closely follow up this method from generation to generation, from April to October. Thus, it will be seen, it is possible to get ten generations in one year—40 generations in four years—which is about the extreme limit of a queen's life, which is used as a drone-mother. Now, observe that it is thus possible for a queen to be a half-sister to her fortieth grandmother. You inquire, "Well, what do you gain by all this?" Well, I gain a long stride ahead of Nature, and, I believe, a queen whose workers have few equals and no superiors.

This is interesting, if for nothing else, for its audacity in going square against all established precedent. Bees under ten days old are chosen to rear queen-cells because "young bees like 'pap' better than old ones." Are we to understand that "pap" is prepared by the older bees and fed to those under ten days old? Is there any proof for this new doctrine? Mr. Crum says that by taking queen-mothers at random, only so they are young, he gains a long stride ahead of Nature. One would be better satisfied to have something beyond the mere assertion that there is great gain. Is there any gain beyond that of rearing from young queens? and is that a gain at all?

### Taking the Candying Notion Out of Honey.

H. G. Quirin gives, in *Gleanings in Bee-Culture*, an account of some June, in the matter a dozen of years ago. He says:

"In June, or when the first white-clover honey came in, we extracted a gallon, which we wished to use for making queen-candy. As the honey was rather thin, we placed the jar on the reservoir of the kitchen stove, with the injunction that it was to stay there till we removed it. Well, it stayed there for perhaps two months, the temperature varying all this way from 75 to 150 degrees, or perhaps a little higher at times. This honey was kept for two years, and part of the time in winter, when it went as low as zero, but it never candied. At present we keep our honey in five or six 60-pound cans blocked up back of the kitchen stove for several weeks before bottling. We believe this will keep it from going to candy until the grocer sells it. We find alfalfa honey quite stubborn. You can melt this honey in the oven, and it's ready to sugar the next day or two."

This is interesting, not because new, but because it corroborates the view that honey kept for a sufficient length of time at a high temperature, whether it be comb or extracted, will remain free from granulating. Not only that, but comb honey thus treated will stand zero freezing without cracking across the face of the comb, as honey generally does.

If you have a garret up against the roof, where the heat is suffocating on warm days in summer, try putting some honey there, leaving it throughout the summer, and then see how much better it will stand the cold of the following winter.

### A Peculiarity of Eucalyptus Trees.

At least of some of the characteristics of eucalyptus trees can not fail to impress those who see them for the first time. The leaves of the lower part of the tree differ in size and color from those on the rest of the tree. There is not merely a little difference, but the difference is striking. Neither is there a gradual shading from one kind to the other, but an abrupt change, so that one seeing a tree of the kind for the first time is likely to think some small bush with larger leaves is growing at the foot of the large tree.

### Cold Water Introduction of Queens.

The Australian Bee-Bulletin says: "A Frenchman, in introducing queens, puts the caged queen in the hive. Next day he takes the cage (queen included), puts it in a cup of cold water, and then turns the wet queen loose. He says he never lost a queen in this way." However French may be the man who introduced that custom, he is none other than our own Adrian Getaz, down in Tennessee.

The Premiums we offer are all well worth working for. Look at them.

## Miscellaneous Items

Clipping Queens has become quite the fashion in this country, but the British Bee Journal says it has never found favor in England.

Math. W. Krudwig, an Iowa bee-keeper, while working around his bees the past season, was stung on the tongue by a bee. His tongue swelled up terribly, and was unable to talk for several hours. He was obliged to seek medical aid to relieve the pain and swelling.

Mr. Wm. Ross, of Ventura Co., Calif., passed through Chicago recently on his way home, after spending a week or two in Canada, where he used to live before going to a sunnier clime. Mr. Ross is the bee-keeper who had a summer tent-cottage on Catalina Island. He helped make our short stay there pleasanter.

The Chicago-Northwestern Convention was held last Wednesday and Thursday as announced. It was a "great meeting"—so "they say." About 100 bee-keepers were in attendance, and from beginning to end it was one continuous stream of good bee-talk. We believe it will make one of the very best reports that was ever published. It was all taken in shorthand by and for the American Bee Journal. So look out for the report in these columns later on.

Secretary H. C. Morehouse, of the Colorado Bee-Keepers' Association, writing us Nov. 28, said this concerning their annual meeting held in Denver last month:

"The meeting was the best one ever held in the name of the Colorado Association, and the subjects presented were of great interest to bee-keepers throughout the West. The spirit of absolute harmony prevailed at all of the sessions."

We expect to publish a report of the Colorado convention soon. It is always one of the best of the whole year. Those Colorado bee-keepers are great folks.

Little Miss Hope H. Able, of Northampton Co., Pa., wrote recently, and her letter appeared on page 746. Referring to it, she writes again:

MY DEAR EDITOR:—I was glad to see my letter in the American Bee Journal, but very sorry to see that you had a mistake in it. You said we increased from 7 to 8 colonies. It should have been from 7 to 18 colonies.

I am 9½ years old.

From your friend,

HOPE H. ABEL.

We are glad to make the correction, for increasing from 7 colonies to 8 is quite different from 7 to 18.

Mr. Gus Dittmer, who is a Wisconsin bee-supply dealer and comb foundation maker, thinks that in referring to the Weed process of sheeting wax, as we did on page 739, we may possibly have done him an injustice. We simply said that "the bulk of the comb foundation sold to-day is made by the Weed process," which "will not work adulterated wax." We understand that while Mr. Dittmer's process may be different, nothing but pure wax goes through his sheeting machines also.

Mr. Dittmer is an honorable manufacturer and dealer, as his increasing trade easily testifies.

Mr. H. H. Chase, a bee-keeper of Manistee Co., Mich., sent us the following clipping from a local newspaper, dated Nov. 23, which is interesting even if not "all about bees":

"H. H. Chase has recently found two mounds on the north side of Bear Lake from which he obtained two skeletons, a beveled stone instrument, two pieces of ancient pottery, about 30 bone beads, and a few clippings of black flint. One bone of the arm had evidently been broken and healed. The shape and size of the skulls varied, one having double teeth all around.

"These specimens are unmistakably of a prehistoric race, as the manner of burial indicates, by an upright kneeling position facing the water and the west, and they have, in all probability, been buried from 500 to 1000 years. These findings, added to other tools, axes, arrowheads, etc., make a choice collection, which will doubtless find its way to a museum later."

## Sketches of Beedomites

### HOMER H. HYDE.

Homer H. Hyde, whose picture with that of his bride adorns the first page of this number of the American Bee Journal, was born in Dawsonville, Ga., May 7, 1881. At the age of three years, his father went to Texas, following his trade of a carpenter, and also farming for some years.

At the age of about 10 years, through his good mother's influence, his father bought his first colony of bees, and from that day to this, "Homer" has not ceased to have an active interest in bees, which seems to grow stronger as the years go by.

Mr. Hyde has read about all there is published on the subject of bees, taking all the apian papers regularly, besides spending a large part of his time the last ten years right in the apiary with the bees. The past season, however, he was kept pretty well closed in on account of the demands of the office-work, but he hopes to arrange matters so that another season he will be able to spend more time with the bees again.

Mr. Hyde secured his education in the common schools of Texas, and also took one course in Taylor University, at Waco, Tex. He was married June 18, 1903. His wife was born in Conway, Ark., Aug. 12, 1883. She is a lineal descendant of John Adams. Mrs. Hyde received her education in the high school of Floresville, Tex., and a little later was won "for better or for worse" by H. H. H. Mrs. Hyde is very much interested in her husband's work, and in the bee-industry, though it is said she is very much afraid of the bees themselves. However, Mr. Hyde thinks if she succeeds in holding the reins on him, she will have done her part. And that's so!

Both Mr. and Mrs. Hyde are members of the Missionary Baptist church, and are active in its services.

Mr. Hyde was one of the car-load of bee-keepers that crossed the continent recently to attend the Los Angeles convention of the National Bee-Keepers' Association, of which he is a member. We thus had opportunity to get acquainted with him. If all the other Texas bee-keepers are as energetic and enthusiastic as he is, we wouldn't object to forming the acquaintance of some more of them. We don't know what the middle initial "H." stands for in his name, but it might very appropriately be Homer *Huster* Hyde.

Referring to three of the pictures shown on the first page, Mr. Hyde wrote us as follows:

MR. YORK:—Enclosed are some partial views of two of our apiaries. In No. 3 you will notice that the apiary is situated in a grove of mesquite trees. However, this ground was a great mass of prickly pear and other growth, so that the open space is literally hewn out. In the lower part of the picture you will see some of the pear, showing its outline. The men in the apiary are helpers, and constitute our force, with the exception of myself. The men are, from left to right, O. P. Hyde, L. B. Wiseman (visitor), Wm. Sedding, Milton West, Emmett Hyde, and Chas. Wurth. We have 100 colonies of bees in this apiary.

No. 4 is a view of another yard taken some rods from the bees. This is taken to show the profusion of wild spring flowers that cover the pastures everywhere at that season of the year. In this yard we had neglected to use the syringe for about three weeks, and you observe the results. The shrubs in the picture are mesquites. We have 90 colonies in this yard.

No. 2 is a picture taken in our Holy-Land apiary, showing our men working with a full colony of pure-bloods without veil or smoke. These men are, from left to right, E. J. Carlton (foreman of apiaries), Emmett Hyde, and Chas. Wurth.

These three pictures were snapped by myself, and are among my first efforts in amateur photography.

We have about 1100 colonies of bees, located in 10 apiaries, from 1 to 9 miles from home. Each location will stand easily 200 colonies, and we expect to increase to that number at each yard. Our cold, late spring knocked us out on catclaw honey this year, giving us a frost on April 28, coming at just the time the catclaw was beginning to yield.

An average crop of honey for this locality is 100 pounds of bulk comb honey. We have the largest number of bees kept by any one company in the State. We are expansionists, and expect to increase our bees as fast as possible. Our methods of management will be given later on, when the writer has the time to write them up.

H. H. HYDE.

## Convention Proceedings

### THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 775.)

The next on the program was a paper by Homer H. Hyde, of Texas, on the

#### PRODUCTION AND SALE OF BULK COMB HONEY.

A few years ago bulk comb was practically unknown, but to-day there is scarcely a bee-keeper in the United States that has not heard of it, and how it is produced. It is now the principal product of the southwestern Texas bee-keepers. Its production is rapidly gaining ground not only all over Texas, but is gaining a footing in Nebraska, Colorado, Utah and California.

Since the publication of my articles in the bee-papers, inquiries have come from all over the country, and many of them state that they have already commenced the production of bulk comb honey. The production of the article will soon be universal.

The demand from the consumers for this article is rapidly growing, and is keeping far ahead of its production, and to this fact the bee-keepers are rapidly catching on. There are many reasons why it is gaining a hold with both the consumer and the producer, especially the former. When he buys a can of bulk comb honey he feels sure that he is getting a pure sweet, just as the bees made it; he feels that he is getting full weight; and he knows he has bought it at a less price per pound than he could have bought section honey. Then he has his honey in a nice bucket where it can not break or lose out when cut in two; and when he has eaten out the honey he has a useful pail left.

These are some of the reasons why the consumer prefers bulk comb honey to section honey. I am talking of the majority of the people. Of course, there are the wealthy who will always buy a limited quantity of section honey because it is high in price, and has to them a fancy look.

Now, let me quote Editor Root's foot-note to one of my articles:

"In my southwestern trip of a year and a half ago, I was fully convinced that bulk honey, or chunk honey, was getting to be more and more in vogue, both among progressive bee-keepers and the consumers themselves. Still, I found some bee-keepers who thought it would be better to educate the consumer to the use of section honey, believing there would be more money in the production of such an article. But I must admit that Mr. Hyde has advanced some very strong arguments in favor of chunk honey; and why should we bee-keepers not cater to the various demands? One locality will use large quantities of candied extracted honey; another will use nothing but crystalline liquid extracted; still another, fancy comb honey; still others dark honey, almost as black as blackstrap itself. Cater to what the locality calls for."

Yes, friends, let's give people what they want, and if they want bulk comb honey give it to them. Simply produce some of the article and take it around to your customers and give them a choice of the two honeys—section or bulk comb honey—and your customers will soon all call for the latter. Now, gentlemen, if this can be done, why not do it? We are sure it is the most profitable, as all will admit.

Bulk comb honey is produced in either full bodies or shallow Ideal supers. If the former is used it is hardly practical to fasten in full sheets of foundation, as the frames can not be wired, because we expect to cut the honey out; but with the Ideal frames we can use full sheets if we so prefer. Ideal supers and frames are preferred generally because they are not so large, are not so heavy to handle, they are nearer the right amount of room to give a colony

at one time, and they can be freed of bees much quicker than can full bodies. To free them of bees we simply smoke down between the frames well, and then pry the super loose and jounce it, when it will be found that most of the bees will fall out. They can then be stacked up and a hole left at the top, when, in two or three hours time, the last bee will have left the supers.

Then, again, the supers and frames are nice for extracted honey, should the bee-keeper in any event desire to use them, and, in fact, in putting up bulk comb honey it requires about one-third extracted honey with which to put the comb up.

In packing bulk comb we cut out the comb nicely and place it in the cans, and afterwards pour in extracted honey to cover the comb and to fill up the crevices, and, in this way, about one-third extracted honey goes in, and it must be remembered that this extracted honey goes in at the comb-honey price. It has been found both practical and profitable to produce both comb and extracted honey in the same apiary, and, in fact, on the same hives at the same time, for many have found that it pays them to have one super of combs on top of the regular brood nest, so that the queen may fill it with brood before the honey-flow, if she likes, and when the flow comes these supers catch the first nectar, and as soon as the flow is on, and the bees have commenced to secrete wax, this super of combs is lifted and the empty frames of foundation placed between them and the brood, which is the most effectual way of baiting bees into the supers; and then it will be found that where colonies are so worked swarming is kept in check, if not entirely prevented, the queen is left in entire possession of the regular brood-nest, and by the time the flow is over the brood will have hatched from the shallow super of combs, and the bees will have filled it with extracted honey, and this is just what we will want in putting up our comb honey, as we have already shown that at least one-third the honey must be extracted with which to pack the comb. It has been demonstrated, time and again, that bees will store all the way from 50 percent to 100 percent more honey when worked for section honey, and many believe (the writer included) that where the bees are worked as outlined above, nearly, if not quite, as much bulk comb honey can be produced as could be produced of extracted honey alone, and especially does this hold good where the localities have fast flows of honey, in which a great amount of wax is always secreted whether there are any combs to build or not.

This year's experience confirms all the above, and more, and we are more than ever convinced of the advantages of producing bulk comb honey. In addition I will say that we would advise all to use full sheets of foundation in the supers at all times, and we more than ever recommend the Ideal, or 5/8, super for the production of bulk comb honey.

We will now show the relative cost of bulk comb to-section honey. When we buy bulk comb supers and frames we have bought them to use for years. When we buy sections they are for only one season's use, whether they be filled with honey or not. Then we have to have costly separators, followers, etc., that soon give out, to be replaced. When we go to ship we have to have costly glass-front shipping-cases, and these cases in turn packed in crates for shipment. When we pack section honey we have to take lots of time and patience to scrape the sections. When we pack bulk comb honey we buy cases of cans and cut the honey out into them. When we get ready to ship we have to pay a high rate of freight on section honey, and more, run the risk of having a good part of it badly damaged or destroyed all together. When we ship bulk comb we get a low extracted-honey rate, and have the assurance that it will go through as safely as if it were extracted honey. When we go to prepare supers for the harvest, all we have to do to our bulk comb supers is to scrape the top bars a little and fasten in the foundation; but with section honey we have to make up shipping-cases and sections, and spend a long time putting the foundation in just right.

Again, you will find that there is much less work attached to the production of bulk comb honey than there would be if producing section honey. I believe that the spring and summer work is reduced about one-half.

For fastening in the foundation in the shallow frames, we use a machine that always puts the foundation in right and true, and securely. The machine works on the hot-plate principle, said plate being kept at the right temperature by a gasoline burner. This machine is also adapted for use in putting foundation in any kind or sized frame having the Langstroth length. However, the majority do not have these machines, but they can put the foundation on the top-

bars with melted wax. Simply keep a can of wax hot, and then use a spoon with which to pour a small quantity along the edge of the foundation, which is first placed squarely in the center of the top-bar.

When the supers are put on, the bees go to work in the bulk comb supers at once, and in a big cluster, and thereby forgetting to swarm; but with section supers the bees have to be carefully baited and coaxed into the supers, and when they get there they are cut off into 24 or more small compartments, which they have to try to keep warm, and to get them sealed out to the wood we have to crowd the bees, and thereby losing honey. By crowding we lose equally as much honey as we do when the supers are first put up, by reason of the bees being slow to enter the sections. Just how much honey is lost by the bees being slow to enter the sections, how much is lost by crowding, and how much is lost by swarming, I am unable to say, but it is considerable.

You may take the items in the production of the two honeys from beginning to end, and there is not an item that is not in favor of bulk comb honey, except solely in the matter of price received; but, friends, where unbiased men have tried the production of the two honeys side by side, and carefully taken into consideration every factor, they have invariably found that they can make at least 60 percent more money producing bulk comb, and many have placed the percent much higher.

There is another fact: Not one of the men who once quit section honey has gone back to it. We were ourselves large section-honey producers several years ago, but have been converted, and have disposed of most of our section-honey supers, and to-day have a large pile of them awaiting a purchaser.

You may say, I have no trade or demand for bulk comb honey. I will say that all you have to do is to produce it and offer it for sale, and you will soon have a trade that nothing but bulk comb will satisfy. You may say, I will have to ship my honey, and, what then? There is no market for this new product. I will say, take your honey to the cities and offer it yourself, and you will find a ready and appreciative market, and one that will next year demand more bulk comb, and the grocermen will have to order their supplies from you. There is no question but that a market can be found. The bee-keepers of Texas have found a market for more than they can produce, and I take it that the bee-men of other States have the same intelligence and the same get-up-and-get that the Texas bee-men have.

The packages used in putting up in this locality are now most largely 3, 6, and 12 pound tin friction-top pails that are put up in crates holding 10 of the 12-pound cans, 10 of the 6-pound cans, and 20 of the 3-pound cans. There is also some demand for bulk comb in 60 pound cans, two in a case, the cans having 8 inch screw-tops. These are sometimes ordered where the buyer desires to put the honey into glass packages for a fancy trade.

The question has been asked me, "How about it when the extracted part candies?" Well, you will either have to dispose of the honey before it candies, or teach your customers that there is no finer dish on earth than a fine grade of candied bulk comb honey. Our Texas trade does not object to candied honey in the least, as it has learned that honey is really better in its candied state. I fully realize, however, that this propensity to candy will be one of the drawbacks to its production in the North, and so would advise all to go slowly until they have a ready market for it before cold weather, or until they can teach their customers that it is really better candied.

We have lately "caught onto" a plan to prevent the candying of bulk comb honey, and that is to put up the comb in extracted honey that has been well heated, and seal up the cans with paraffine while the honey is yet hot, and we believe that it will not granulate under one year, and that is the opinion of Mr. Boyden, also. However, Mr. Boardman, of Ohio, has been drawn to the bulk comb idea, and has gone to work to find a way to keep it, and keep it just as taken from the bees. We hope he will be successful.

Some have asked me where the cans can be secured, and I will say that all are made by the American Can Co., but call for the cans made for their Texas honey-can trade. Now, in lieu of the regular cans you may use for the home trade, lard-pails, or Mason jars, which are all right, and perhaps better, as the cans are made primarily for the shipping trade.

I wish to refute the statement made that the production of bulk comb honey was the old-fogy way of honey-production. I assure you that it is not, and that it requires as

much skill and as fine a grade of honey as it does for section honey. I also assure you that the consumers are behind this move, and that it is only a question of time when the production of section honey will have almost disappeared.

Let me quote Editor Root as follows:

"Chunk comb honey is somewhat in disrepute, it is true, from the fact that it used to represent the product of the old box-hive, and was a mixture of everything—old combs, dead bees, pollen, propolis, wax-worms, light and dark honey—in fact, a little of everything that may come from an old-fashioned box-hive. Bulk comb honey, as Mr. Hyde would have us call it, represents an entirely different product—the very best table honey, being a mixture of the best extracted and the whitest comb honey. Some of my chance acquaintances have spoken in glowing terms of the 'real honey' of 'father's table,' as if that in sections were manufactured. To argue with them that the latter is just as pure is almost a hopeless task. Sometimes I think we might just as well satisfy their whims by giving them what they will accept, and I do not know of anything very much nicer than clean, sparkling extracted honey, of good quality, having chunks of delicious comb honey mixed in it of the same grade and quality. When such goods can be displayed to the consumer, and he knows it is all honey, he very likely would take it in preference to either comb or extracted separate.

"A correspondent near Oakland, Calif., once went out and peddled some of his very white comb honey in tall sections among the wealthy class. They would have none of it. Some of them were from 'Down East.' What did he do? He went home and cut that honey out of the sections, and mixed in it a nice grade of extracted, and sent another man around with the goods. The same people accepted that at once. Why, that was honey, just like that that used years ago on 'father's table.' Of course, they could easily sample it—something they could not do with the pearly-white comb honey in sections; and the mere taste of it was enough to assure them that it was all right."

Now, friends, I have told you about all that I can think of on the subject, and if there is anything further you would like to know, kindly ask me, and I will answer to the best of my ability.

H. H. HYDE.

Mr. Dadant could not be present at this session, and had no paper in response, but authorized Secretary York to state for him that Mr. Hyde's paper had been read by him, and that he agreed most wholly with what Mr. Hyde had said; that he had been very busy, had not had time to reply, and that he was almost fully in sympathy with Mr. Hyde's views.

W. R. Woods—In shipping with these cans, do you find any difficulty with the covers flying off? In case the goods should be shipped bottom side up, what holds the cover on?

Mr. Hyde—This is known as the "friction top" can. It goes on tight; the covers of the cases go squarely on top of these, and upside down, or any other way, the shipment goes through in perfect order. We have shipped something like 5000 pounds of honey in 3, 6, and 12 pound cans, and have not had a single complaint of honey not arriving in perfect order.

L. S. Emerson—I would like to ask if you use a queen-excluder, and where?

Mr. Hyde—We have not used a queen-excluder for the last five or six years, from the fact that we do not have on the comb-honey supers until we have the best honey-flow. When the main harvest comes, the flow is so rapid the queen has no opportunity to lay in the cells.

Mr. Carter—I have had 25 or 30 years' experience. I wish to say I am not a member of the Association, have not been an extensive bee-handler, yet I have had experience since I was about 16 years old. Some 25 or 30 years ago I took a notion I would like to get a few colonies of bees, and the next year I found myself with about 15 or 20, and one of the best yields of honey I ever witnessed. It came abundantly. I had no extractor, and hardly knew how to handle my honey. At that time foundation was introduced. I put in the foundation, for, as the gentleman indicated, they did not have time to build their comb, and they just filled the foundation in two or three days, the whole of the super. I used no section frames. Then the question was, What to do with my honey? I bought what are called butter-buckets in the East. We had nice, clean, wooden butter-buckets which I filled with the comb honey, and put extracted honey in to fill the spaces; then put the cover on tight, and there was a bail to handle it. I sold the honey at the highest price for comb honey. It went like hot-cakes. It was something new. Every one would say, "How beautiful!"

The comb honey was quite level with the top of the bucket. Since I came to California I have tried to start in the chunk honey business again, but found it was difficult to get comb, and yet I have gotten some, and have put that into little buckets. You can put your business card on the pail, and it is called "White Mountain Chunk Honey." It is beautiful white honey, filled even full. In regard to shipping, you can have (I am telling you from theory rather than practice) tight covers fit so well there is no leak to it, and on top of that another cover. I sell sometimes a little honey to my neighbors; I do not ship at all. But as soon as a lady looks into the bucket, she says, "I want one of these." It seems to take. She knows when she gets a section of comb honey that she gets 12 to 14 ounces. They do not weigh over 14 ounces at any time, and when she has taken off the wood and everything else, she gets 12 ounces. When short weight, as they frequently are, she gets only 10 ounces. But in this way she gets just as beautiful honey as in sections, and gets full weight. The bulk honey sells two to one with me.

A. I. Root—25 or 30 years ago there was a big trade on comb honey put up in glass jars—not in Mason jars, but more largely in tumblers. A good deal of it was glucose, and that threw it into disrepute. I trust people have forgotten about glass-tumbler honey with a little piece of comb and a good deal of glucose in it. There was a law against it passed in New York State, I think. They then put up comb honey—a small piece—and surrounding this was a liquid they called "corn syrup," and when they were taken to task about it they said the honey granulated. The whole matter got into disrepute. I remember distinctly, as much as 30 or 35 years ago, buying a stock of honey in barrels; I took it home and put it in Mason jars. I could not get enough of it. But when the cold weather came on, and it began to candy, that set us back. Last February, I think, while I was in Cuba, Mr. W. W. Somerford had quite a fever for bulk comb honey. He was buying 5-gallon cans. He told me he could get more for his honey in 5-gallon cans than for his finest section honey, and he was preparing to fill up his cans with this honey. I did not find out how it turned out, but, since then I find, for some reason or other, his market had "let up." He was doing a "land office" business there last February. There was no "corn syrup" about that.

Emerson T. Abbott—I wanted to ask Mr. Hyde in regard to honey graining in Texas. In our country it grains. It seems to me, in our climate, it would grain put up in that way.

Mr. Hyde—We do not do anything about that in the spring and summer. It does not grain until winter. However, honey that we put up during the fall, that we do not expect will be immediately consumed, we heat the extracted honey and seal a large amount with sealing wax, and it keeps all winter.

### "Getting Both Increase and Honey."

BY W. W. M'NEAL.

WRITING from Knox Co., Ills., August 8, on page 600, Mr. J. E. Johnson tells of his success at getting both increase and honey. He says that he began the season with 12 weak colonies in a starving condition, but by judicious feeding in early spring he increased them, by natural swarming, to 50 strong colonies, secured 1200 pounds of comb honey, 200 pounds of extracted, and—oh, my! there were nearly 1000 pounds more that would soon have to come off the hives! Verily, truth is sometimes stranger than fiction, and to write those figures, even in quotations, makes me feel as if my pen was taking a sheer on me.

Allowing that his bees finished only 800 pounds of the 1000 pound, this would give a total of 2200 pounds, or an average of 183 $\frac{1}{2}$  pounds to the colony, spring count, previous to the date of his letter. Judging from what he says in the 4th paragraph, we are led to infer that swarming did not begin earlier than June 15, and possibly not so soon as that. This being the case, then practically none of the

young queens were old enough to gather honey prior to the date of Aug. 8. Not being supplied with ready-drawn combs, the young queens were, of course, confined to a very limited amount of brood-comb for several days after they became fertile; hence we must base our figures on the count of 12 colonies for the number of pounds of surplus honey obtained.

But since this great amount of honey—2200 pounds—represented the joint efforts of the 12 colonies, the increase of 38 swarms was from only 11 colonies! One colony did not swarm because he took so much brood from it that it had no desire to swarm. This one filled 90 sections, so he thinks, and at the time he was writing they had 90 more nearly finished, which was 30 sections better than the best work of any of the swarms. A similar treatment of them all would have made the average only  $3\frac{1}{2}$  pounds less of honey, notwithstanding that the increase from that one colony was made much earlier in the season when it could ill afford to spare the brood and bees. The nuclei, we are told, built up to normal in strength.

Now, the question is: Why does Mr. Johnson lay special stress on his manipulation of the 11 colonies, with all the attendant vexations of such rampant natural swarming, when he could have avoided all that, and accomplished practically as much in increase of colonies and honey obtained by managing all of them as he did that one colony? We have it from his own statements that the method of artificial increase was really superior, for it gave in addition, virtually, freedom from the apiary.

Had Mr. Johnson practiced this method on the 12 colonies, using full sheets of foundation in the brood-chamber of the old colonies, in the place of the combs removed, and then given wired frames with starters to all nuclei, I think he would have found it to be the better way, at a very slight additional expense. Moreover, all his colonies would have been in far better condition at the close of the season as regards worker-comb. The probabilities are that much of the comb the swarms built in the brood-chamber of the new hives was drone-comb, which is, at best, a very undesirable state of affairs.

Another point in this connection was his manipulation of those extracting supers with two-inch strips of foundation in the frames. According to the rule of all good bees, and bad bees, I have had anything to do with, this would have resulted disastrously, for what comb was built beneath the foundation would have been drone-size of cell. The queen would hasten up there and consume valuable time laying drone-eggs, which become a burden to the colony as soon as hatched, and cast a shadow across the glittering rays of success.

For the purpose of enlarging the brood-chamber and promoting a rapid numerical growth of the colony, I would have advised the use of a case of combs; and, as second best, full sheets of foundation in the frames. The extracting case then materially enlarges the brood-chamber at a time of year when its occupancy by the queen results in a larger force of workers for the harvest. Instead of putting the first comb-honey super on top of the extracting super, it is better, in most cases, to place it between that and the brood-chamber proper. The bees will then quickly begin work in the sections, thus overcoming the tendency to flush the brood-chamber with honey. Large numbers of bees that otherwise would remain below to crowd upon the brood-combs are gotten out of the way in the best manner possible. The reverse of this would largely be the result when managed as Mr. Johnson did it. Besides, young bees will not enter an empty extracting super practically any sooner than they will a comb-honey super with fences; and when the combs are finished they are unfit for the purpose named. The honey they contain must be extracted and sold for less than if the same had been stored in sections. It would be, on the whole, a less profitable way of managing an apiary.

I will here state that a queen-excluding honey-board is really indispensable whenever desired to leave the extracting super on the hive until the brood hatches from it. The old queen must be kept in the lower story; but the honey-board should be placed between the extracting super and the section super, and not immediately above the brood-chamber, as in the usual way. It does not then interfere with entrance into the first super, but it does have a tendency to discourage the storing of honey in the upper one. When the extracting case is thus used, and left only long enough to start the bees to work in the sections, the honey-board is not absolutely necessary. But if the case remained on the hive, and the queen were to pass through the comb-honey super and again enter it, she would probably stay

there until queen-cells were capped below, and swarming resulted. In 10-frame hives there is very little danger of the queen going above; and the real advantage of the honey-board in either an 8-frame or 10-frame hive is to prevent such an unhappy occurrence as the killing of the mother queen by the virgin reared among the isolated combs of the extracting super. The presence of queen-cells in the super will not cause swarming under the same pressure, and a virgin queen will often be allowed to emerge from her cell and destroy the laying queen at a time of year when her loss would mean the ruination of the colony for surplus honey.

Mr. Johnson's manner of giving only one super to prime swarms that were large enough to fill the brood-chamber and super "chock-full," is simply unique in its being a dangerous plan to follow. The orthodox way of treating swarms, is to give an abundance of room at time of giving them, and then contracting "in two or three days" to the actual needs of the bees, or what the floral conditions seem to justify. The swarm issues, as a rule, because of an overcrowded and heated condition of the brood-chamber, and if the same conditions prevail in the new hive while the swarming fever is at its highest, the swarm is almost certain to decamp.

We must, however, concede to our friend the honor of securing a larger crop of honey, according to the figures, than that of our own this year. But we think that when he has given the two methods—natural and artificial increase—a more extended trial, he will welcome the latter with its many advantages, and also see that his success in the present case was largely in spite of his efforts at hive-manipulation.

Scioto Co., Ohio.

## The Movable-Frame Hive vs. the Box-Hive.

BY DR. C. C. MILLER.

WITH the permission of the Editor, I would like the opportunity of a little talk with "A Bee-Keeper in Virginia," whose communication appears on page 750.

I confess, my Virginia friend, that I am not often so much interested as in the reading of your letter, arising, perhaps, more than anything else from your ingenious way of putting things. If your bill of particulars were to be laid before a farmer, and you should say to him, "There's the bill; now you can take your choice, undergo an expenditure of \$338.18 for four years, or keep on with box-hives without any expense, and still get 50 pounds of surplus from each colony," I think he would hardly be blamed for shying at the expense. But is it put before him in that shape? Honest Indian, did you have it before you in that way when you decided to change from box-hives? Possibly if it had been put before you in just that light, even you might have hesitated. But did you think of it at all in just that way? Does any farmer? If he doesn't, then that's not what glues him to his box-hives.

But why did you stop at four years, or at 50 colonies? He might be so unfortunate as to be like some others, and run up to 500 or 1000 colonies. If only 500, then your annual estimate of \$85 would become \$850. If the \$338.18 didn't scare him out, perhaps the bigger figures might.

Are all the items given to be fairly charged to box-hives? A man could get along without a smoker—some do—even if his bees were in movable-frame hives. Indeed, most of the items you have given can be dispensed with by the man who has movable-frame hives, and I've known more than one farmer who kept his bees in such hives and yet made no outlay different from what he had formerly done with box-hives—although I agree that he might as well have stuck to the box-hives if he had no intention of making use of the advantages offered by the better hives. The fact is, that your items are not necessarily attendant upon the adoption of movable-comb hives. A man may change from box-hives with no other expense except that for hives, and his further expenses—which may be graduated all the way from very little to the fullest expense called for by the up-to-date sort of bee-keeping—must be charged, not to movable-comb hives, but to improved methods of bee-keeping.

You say, "You will understand that I expect it to pay me well (notwithstanding the expense), or I should not have entered on the necessary expense for the next 3 years. But most users of the box-hives couldn't, and wouldn't, stand the expense, even if they knew that they would double or treble their honey crop." That may be true in your locality; others may not be as bright as you in looking ahead,

but, take the country at large, and farmers, perhaps especially bee-keeping farmers, are an intelligent lot, and would not hesitate at an expense that would double or treble their income.

Your suggestion that they would so hesitate, reminds me of the story of the old farmer in Pennsylvania (I do not vouch for the truth of the story, for I am a Pennsylvaniaer by birth, and have no little respect for the shrewdness of some of those old Germans). Oil was discovered upon the old gentleman's land, and a speculator visited him promptly to buy the land, offering him \$25.00 an acre for it. The answer was, "Why, dot land—I pay \$50.00 acre for it, and it wort' more now." Then the speculator made a graphic picture of the possibilities in that oil-well. Other wells had yielded so and so, and the prospect was that this well would exceed any previous record—a hundred thousand barrels, costing a dollar each, would be wanted in a short time to contain the oil—was the farmer willing to stand the expense? "A hunnert thousand dollar! mine cracious! no; I not got so mooch money in de world; dot oil-well break me all up; you can have dot land for twenty-five dollars; dot was better as to pay hunnert thousand dollar ven I don't got hunnert thousand dollar."

Perhaps the best proof that the thought of expense does not keep farmers from adopting movable-comb hives is the fact that it has not kept them from it. Thousands of farmers are using the best hives, and in many, if not most, localities box-hives have entirely disappeared. Very likely the chief reason that some in this country are still using box-hives, arises from the fact that they are not yet informed as to the advantages of any other than box-hives.

I still must thank you for your interesting bit of reading, and hope we may have more from your pen.

Conducted by EMMA M. WILSON, Marengo, Ill.

### Putting Back Supers After Extracting.

Mr. Dadant's article, with the above caption, appeals to my interest because I have this year had the experience of J. S. Haag paralleled in my own apiary. The bees refused to clean out the extracted-combs, sealed over empty cells, and, as pointed out by Mr. Dadant, they occupied these supers sometimes, as it seemed, in full force.

Mr. Dadant advises the use of the enamel cloth between stories, or the perforated zinc. As it happened, I had some 10-frame hives covered with the enamel cloths, and the 8-frame hives either had, or had not, perforated zinc between the stories. The zinc seemed to make little difference about their occupying the upper story, and in at least one case I know that the queen was above the zinc after laying had ceased.

The 10-frame hives had their cloths because I did not at first think of giving them frames to clean, thinking they had less need than the 8-frame hives. However, I did, in two cases, give them combs, and in both they made a thorough clean, and *they were the only ones that did.*

In my case, the extracting and putting back was after the harvest was over, for that ceased suddenly this fall with a hard freeze about the middle of September.

Now, I did what Mr. Dadant would not under any consideration do—I gave the bees the combs to clean in the open air.

It is some years since I got a kink from R. C. Aikin, in the Bee Journal, in regard to open-air feeding. Up till that time I had considered it something to be deprecated entirely, but after he told *how to feed*, I find it the most practicable way of giving a general feed. The main thing is, when you are feeding, give plenty, and arrange so that all the bees can have easy access. I have never found it to lead to robbing.

Now, it is but a few days since I gave the bees a number of combs to clean up. On no consideration would I like to store them away just as they come from the extractor. Apart from the danger of souring the next crop, they are messy and disagreeable to handle. As a rule, my bees clean them up nicely in the upper stories, and that is the

way I prefer to have it done. They mend any that may have been broken, and they are so clean that it is a pleasure to store them away.

This year, as I have said, things were different. But we have some warm days here, even at this season of the year. On one of these I took a dozen or more of combs fresh from the extractor, and put them out-of-doors where the bees soon found them, and while they were pleasantly engaged with these I went to the hives for more—the ones they had refused to clean.

There is this to be said about an open-air feed—it puts the bees in a good humor, and any manipulations that have to be made with them are much more easily accomplished than when there is nothing of the kind going on.

Going to a hive, I had to take off the upper story with its combs full of bees, remove the excluder, put back the upper hive-body, shake the bees from the combs, and put these out with the others being cleaned up. Putting them out that way I did not need to be particular to shake off every bee as I otherwise would. Then, that hive is ready for its cloth, quilt and cushion, which I will admit it should have had earlier. Repeat the process until you think there is enough, and, take my word for it, the clean-up will surprise you.

There is much of human nature about a bee. Those combs, while in the hive, were regarded as a *possession*, but when out in the open they recognize the fact that it is a free-for-all scramble, and that those that work the hardest will get the most.

And a bee can not resist a display of honey, no matter how well its hive is stocked with that article—even as children with money in their pockets will scramble for pennies at a Fourth of July shower, or a Rockefeller pile up the millions, "for the good of the oil business." It's nature.

Custer Co., Nebr., Nov. 12.

MRS. A. L. AMOS.

Your experience tallies with ours. There is no way in which you can feel so perfectly sure that the work of cleaning combs will be thoroughly done as by letting the bees have access to them outside their hives, so they feel that they are getting an accession to their wealth.

Where they will do the work properly on the hives, of course that is much the better way.

Your 10-frame colonies made better work than the colonies in smaller hives, quite possibly for the reason that they had more vacant space in the brood-chamber.

You say that feeding in the open air puts bees in a good humor. That's true, while the feed lasts, but when the supply stops, look out!

The danger of starting robbing by feeding in the open air is one that should be considered, but, really, is it as serious as sometimes represented? Is it true that a bee once guilty of robbing never returns to an honest life afterwards? It is true that when bees are fed in the open air they will try to force an entrance into cracks of hives all over the apiary as soon as the supply ceases, but did you never see exactly the same state of affairs when there was a sudden stop of the flow of nectar in the fields? Repeated opportunities for observation on this point seem to show that there is no more danger of robbing after out-door feeding stops than there is after the stoppage of the natural flow.

Mr. Dadant wisely calls attention to the danger of having combs torn to pieces by the bees in their eagerness to get at the exposed sweets, especially if combs are new and tender, and you meet the case by giving enough for all and having it easy of access. That's the plan of the late B. Taylor, and is all right *when you can do so*. But sometimes you do not have enough for all, and then you must take a directly opposite course—in place of the Taylor plan using the Miller plan, and instead of making the honey to be emptied easy of access, making it so difficult of access that there will not be enough bees crowding upon one single spot to tear the combs. This is accomplished by piling the combs in supers or hive-bodies and laying an entrance comb in supers or hives for a single bee—perhaps more than one entrance if there are enough combs. With this plan there is less danger of robbing, but it requires more time, and the combs should be left until the bees cease giving them attention.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### EXTRACTING COMBS IN THE FALL.

I hardly think Mr. Dadant gets entirely to the bottom of the difficulties pertaining to daubed combs after extracting in the fall. Part of the trouble, I am convinced, lies in the fact that a portion of the bees have come to consider themselves as belonging upstairs to such an extent that they are not willing to stay below. As a natural result of this, they don't want all the honey carried away. Worth trying if they wouldn't bring up some to put in a set of perfectly dry combs. I first noticed this fall the following interesting fact: Where the super-combs are mostly drone, with a few of worker size among them, they take the honey out of the drone-comb and put it into the worker-comb. The latter can then be taken out and put through the extractor. Page 663.

### PROPER TEMPERATURE FOR QUEEN-LARVÆ.

A. C. F. Bartz clearly shows a possibility of getting a tender and minute queen-larvæ soused into a bath a good many degrees too cold. Surely don't do the little thing any particular good, whether or not the harm extends to turning out a poor queen. Right, that comb and all it contains is a little hard and slow to warm up when once it gets cold. Wouldn't a carrying-box carefully made to warm by a lamp be about the proper thing for such operations on cold days? Just give a rest to "Unfold thy *bosom*, faithful tomb"—or say faithful imbecile asylum. If I'm right, the surfaces of our bodies are not quite warm enough anyhow on such occasions; and anything tucked under our clothes to get heat on a cold, windy time is in the position of being inadequately warmed on one side and decidedly cooled on the other side. Page 663.

### DIFFERENCE IN SIZE OF BEES.

Taking the exact weight of two samples of bees in exactly similar conditions, is there ever so much difference from normal as 25 percent? I rather doubt it. We often feel inclined to say so at a casual glance—"These bees are a great deal smaller, or bigger, than mine." Usually a case of extreme contraction or distension, and not much else. Page 664.

### HOW USE A BINGHAM KNIFE—FOOL QUESTION.

The problem, which side of the Bingham knife to hold next the comb, rather stirred me up. Which end of a spoon would you stick in your mouth? You can put in either one—and you *can't* use the wrong side of a Bingham, except on small combs and around the edges. Handle is set off on the off side when the knife is made. Next we shall be discussing whether to drive the nail with the wood or the iron of the hammer—and whether to remove the lid of the honey-pail or punch a hole through the bottom. Isn't it sometimes justifiable to return a pleasant smile and say, "That comes pretty near being a 'fool question'?" Too great consideration for the great F. Q. gives the disagreeable impression that the Journal itself must be set to the key of F. Page 666.

### HOW TO USE A BEE-TENT.

On page 679 we read: "Bees always attack your tent from the side where the wind blows." Then follows the very proper hint to do our going out and in on the other side. My guess is, that the meaning intended there is the opposite from the one we would first take from that wording. Through a tent which stands in the wind considerable air is drifting, and carrying the smell of honey out on the lee side. I should expect bees to besiege where the good smell came out.

### PERHAPS THEY WERE SOLITARY BEES.

I wonder if "Virginia" was not mistaken about the insects he saw entering his hives being yellow-jackets. There are, I believe, solitary bees that enter hives mainly to lay eggs, and have their young reared in cuckoo fashion—developed, born and bred to the sly art of getting past the guards, there is less wonder that they succeed. I never heard of there being enough of them to accomplish any great harm. Page 682.

### HOW CAN THE BLIND LEAD THE BLIND?

A cry to me for help, eh? Another conspicuous case of seeking help in the wrong place, and ignoring the right one. If Mr. Beverlin will look on page 680, he will find a most gracious offer of help—quite adequate for the cure of single-blindness bread and the resulting wild mathematics. Page 685.

### THE TELEPHONE IN SWARMING TIME.

Yes, Yon Yonson, those new rural 'phones, to call us away in swarming-time, to hive other people's bees while our own go to the woods, we shall long for a 'phone so improved as to get out of order in swarming-time. Page 687.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Keeping Brood-Combs.

On page 585, you advise me to unite my bees in the spring. You will please inform me what to do with the hives (from which I take the bees) containing brood-combs partially filled with honey and larvæ? By the time I am ready for them for swarms they are ruined by the moth.

TENNESSEE.

ANSWER.—For fear some one may misunderstand, let me preface my answer by saying that in general spring is not so good a time to unite as fall, for in general bees are united because colonies are too weak, and it is better to unite them in the fall for the sake of better wintering. But when normal colonies are to be united merely because the owner desires to reduce the number, then spring is the best time; because if the uniting is done in the fall some colonies may die in wintering, and the number of colonies thus become less than desired.

The best thing to do with the combs depends somewhat on circumstances. Perhaps this will do: When you unite, let the united colony have the two stories and all the combs of the two colonies united, and leave them thus till about time to begin surplus work, when you will take away one story and half the combs, leaving those containing most brood. If swarming begins with you about the same time as the harvest, that will leave only a short time for the combs to be kept, and perhaps they would need no attention till needed for swarms. If, however, you thought it necessary, you could pile them up and treat them with bisulphide of carbon. If working for extracted honey, there would be no need to take the combs from the bees at all.

If anything in your conditions make my answer inapplicable, give me the conditions and I'll try again.

By way of postscript, it may be well to add that at the time of taking away the combs it may happen that there may be so much brood that you will be compelled to take away combs containing more or less brood. In that case, after giving brood to any colony which has not brood in all its combs, pile up the brood on one or more colonies five or six stories high, having a queen-excluder over the first story. Such a colony is not likely to swarm, and by the time you have used the extra stories for swarms you will have a powerful colony for field-work.

### Best Hive—Hybrid Bees—Foul Brood.

Last spring I commenced my first experience in bee-keeping with one colony of black bees. They were in an 8-frame hive, frames being 16½ inches by 11 inches, with ¾-inch top bar. They gave me 2 swarms this season, the first storing 12 pounds of surplus honey. The swarms are in hives of the same size. I wish to produce both comb and extracted honey, but mostly comb, as that is in greater demand here. I do not know whether to adopt a hive with a more shallow frame or not. It is better to have a deep frame for winter, I suppose.

1. What hive would you adopt, *i. e.*, a frame of what depth, and how many frames to a hive? I want to adopt a

good hive for wintering and surplus honey, and then "stick to it." Perhaps the one I have is all right.

2. What do you think of the long-tongued or red clover queens? I have seen them advertised so much.

3. Is there any danger of getting foul brood in one's apiary by sending away for queens?

4. May two kinds of bees be kept in the same apiary for 2 or 3 years without producing hybrids?

5. If so, how?

6. Are hybrid bees usually crosser than others?

7. When foul brood is found in an apiary where it has never before been known, what usually causes it? Is it carried by the bees from places where the disease is raging?

8. Some one who wrote for the American Bee Journal a few years ago, claimed that foul brood is caused by taking too much honey from the bees and then feeding sugar syrup. Is this true?

9. Is foul brood more prevalent among some races of bees than others?

10. If so, what race seems affected most?

NEW YORK.

ANSWERS.—1. Your hive is excellent for wintering, but for comb honey it is doubtful that you can get best results with so deep a frame. Some think that even 9½ is too deep. You ask what I would adopt. I'll tell you what I have adopted. I do not assume to know what is best in everything, but with the light I now have I am using the 8-frame hive with outside measure of frame the common size, 17½x9½, and find it works well for comb honey. It will also do well for extracted honey, although a larger hive would be better. Indeed, unless you intend to give close attention to your bees, a 10-frame hive would be better even for comb honey.

2. I think there is an advantage, and there may be a very great advantage in long tongues. In actual practice, however, I have come to doubt whether it is still worth while to pay any attention to the length of the tongues. Bred from the stock that gives best results. Very likely that may in most cases give long tongues, but whether tongues are long or short, we want the bees that will get the most honey.

3. Not much; I don't think many men would be dishonest enough to send out queens where there was any danger of sending foul brood as an accompaniment. As a matter of safety, however, it is not a bad thing to burn cage, bees and all, saving only the queen.

4 and 5. The thing is not practicable.

6. Yes, but not always.

7. Yes, it is carried in the honey stolen from diseased colonies.

8. Foul brood is due to the presence of the microbe bacillus alvei; neither spores nor bacilli of this kind are in sugar.

9 and 10. In Australia they say that the disease is more troublesome among black bees than Italians.

### Wired Combs from Starters—Unsealed Sections—Bees—Sheds—Other Questions.

1. In having a swarm with only starters in frames, can the frames be wired so that the completed combs will be as strong and straight as if full sheets wired were used at the start?

2. Is there any way of getting unsealed honey out of sections without using an extractor, and without injuring the combs? And can unsealed honey be left in the sections without spoiling till spring?

3. How soon after the first swarm has issued should the young queen in the parent hive have her wings clipped? or in other words, how soon after the first swarm issues is the young queen fertilized?

4. How soon after a first swarm has left should the parent hive be given a super with sections? (I take the super that was on the parent hive and put it on the swarm at once.)

5. Will it be disadvantageous having sheds over the hives? Sheds are 5 feet high in front and 6 feet high in the rear. The temperature goes as high as 100 degrees in the shade here. I have little or no shade in the apiary.

6. What is the length of the main honey-flow, ordinarily, in central Virginia?

7. Could any of the eucalyptus trees be planted satisfactorily in central Virginia? The temperature occasionally goes below zero here.

8. Would it pay, not only for honey but for gentleness, too, to insist on having all pure Italians in an apiary of 50

colonies, by killing all hybrid queens as soon as discovered, and replacing immediately with tested Italians? There are very few either wild or domesticated black bees in the vicinity. (I rather expect you will say, "Decidedly not," to this question, as you seem to think very highly of good hybrids.)

9. Has Virginia any bee-inspector?

10. Does it matter how soon in the spring supers with full sheets of foundation are put on strong colonies?

11. Is it not better to put them on a little too soon than a little late?

12. When absolutely no more increase is desired, would the following plan be likely to succeed? Queens are all clipped. Return first swarm after catching clipped queen. Put clipped queen in safe place for an hour or two. Open the hive and kill the young queen, and destroy all cells and queens about to hatch, then give them the clipped queen back again. Destroy all drones in the swarm to allow more room for the workers. Watch the colony and destroy all cells as fast as they appear.

VIRGINIA.

ANSWERS.—1. No; you can not be sure that the bees will build the septum directly on the wire.

2. No, unless it be to let the bees empty it. Generally, honey unsealed in sections will be granulated by spring, but if kept in a place sufficiently hot it will keep.

3. A queen may be clipped as soon as she lays, no matter when fertilized. The young queen may lay 16 days or more after issuing of prime swarm. In practice, it is well not to look till three weeks after swarming.

4. As soon as strong enough, which may be in a few days, and may not be at all. Generally, it is well to throw all the flying force into the swarm a week after swarming, in which case not much super-work can be expected from the mother colony for some time, if at all.

5. Sheds would probably be all right if not closed too much when hot.

6. I don't know. Perhaps the best way to get an answer from some one who knows is for me to guess, so I'll guess that the average length of the main flow is five weeks.

7. Doubtful, but it might be worth while to try.

8. "Decidedly not." Other things being equal, I'd rather have pure stock, but I would not secure it "by killing all hybrid queens as soon as discovered," unless there was already a great preponderance of pure blood. I'd favor the continuance of those which showed the best performance, and you are likely to find these among mixed as well as pure bloods.

9. I think not.

10. Yes; if put on too early there is a waste of heat at a time when heat is important.

11. Emphatically, yes. A little too early is just right.

12. No.

**Our Wood Binder** (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$3.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

## FROM MANY FIELDS

### Selling Honey in a Home Market.

Having had considerable experience selling honey to the consumer, I write for the benefit of beginners. I have been producing and selling honey, both comb and extracted, in Page County, since 1877, and have shipped very little to the wholesale houses. I find the home market better. Of course we cannot expect to sell the whole crop at once, but I frequently sell as much as a hundred pounds of extracted honey at a time to a consumer, but a dollar's worth of comb honey is as much as can usually be sold to the consumer at one time.

Considerable comb honey can be placed with the grocers and will lessen cash outlay for provisions, at least it is advisable to keep them supplied with what they can use. I think it is a good plan to keep honey on hand at all times, as I have more call and get better prices after others have sold out, and in off-years I produce about two pounds of extracted to one of comb, and find the production of extracted much more satisfactory than comb.

I have tried selling from house to house, on the sample plan, and have succeeded very well, but as I do not like canvassing I do not resort to this plan excepting when a large crop makes it necessary to prevent one crop lapsing over another; this has seldom been the case. I have some customers in other States who order from 50 to 100 pounds for home use, when I can sell at 9 or 10 cents per pound.

This has been the most favorable season we have had for several years; it gave me over 5000 pounds from a start of 50 colonies in the spring, and 20 bought during the season, and run largely for queen-rearing.

I have put 126 colonies into cellars, 35 of them queen-rearing colonies on small combs, with 21 colonies packed in double-wal hive on the summer stands. The colony on scales gave 265 pounds of extracted honey for the season. The best day was July 8, which gave 15 pounds net gain for 24 hours; to make this gain they must have carried over 20 pounds, as I find a shrinkage of 3 or 4 pounds during the night after a good day's work.

J. L. STRONG.

Page Co., Iowa, Nov. 26.

### Castor-Oil and Honey—Peddling.

I notice the editor desires the bee-keepers to tell the new kinks they have learned. I learned one just the other day, when I was peddling honey. A man said he tried to get one of his little boys to take castor-oil, and he could not get it down him. He then mixed it with honey, and had no more trouble. How easy! I wish we could fix up all our troubles and make them sweet as honey.

I suppose most bee-keepers have a cloth over the top of the hive, to keep the bees from sticking the cover fast, and they are always eating it full of holes. Mine don't. I use mostly pieces of gunny-sacks, but old ingrain carpet without any holes is dandy. Cut your pieces to fit, then give each piece a good coat of lard—old, rancid lard is as good as any. The bees will coat it over with glue and never gnaw a hole in it. Warranted; patent not applied for.

I had 1500 pounds of extracted honey and 200 pounds of comb honey from 22 colonies, spring count, and increased to 32 colonies.

I have been in business here only 2 years. I learned the trade in the West, where I had no trouble at all to keep the bees from warming. I think it must have been the cool nights; here it is altogether different, but I think I can keep the most of it down.

I peddle out all my honey. The best way I have found to peddle extracted honey is to have a heavy galvanized-iron can that will hold 12 or 15 gallons (that would be 144 or 180 pounds of honey), with a pair of drop handles riveted to the sides near the top, the cover to fit over the top and drop down about 2 inches with a handle to the top of it. Then getting

## Order Your Bee-Supplies Now

While we can serve you prompt, and get them at bottom prices.

a self-measuring molasses-gate—that is far ahead of the common honey-gate—and have it soldered very solid to the can; have the bottom slant about 1 1/2 inches from back to front. Make a solid box 10 inches high for the can to rest on, with cleats on top to keep the can from slipping. Bolt the box fast to a low spring wagon, just behind the seat, and tie the can solid from each side. Then you are ready.

I think I have the best wire-imbender that is sold, or that I have heard of, so far. I have used it 5 years, but I will tell you about that some other time. W. A. MOORE.  
Delaware Co., Ohio, Nov. 17.

**Best Hive for Women—"Baching."**

On page 728, the question is asked: Which is the best hive for women, the 8 or the 10 frames? I believe this is altogether a question of locality, and whether we wish to work for comb or extracted honey. In this locality the 10-frame hive becomes a nuisance when worked for comb honey, because the bees store so much honey below in the frames that the queen is almost crowded out. I use the 8-frame size entirely, and in the fall I extract 2 frames of honey from the sides of the brood-chamber, leaving the bees on 6 combs for winter. I have practiced this for several years, and I find that 6 combs are amply sufficient for their winter stores, and then I have 2 empty combs to give the queen in the spring, when otherwise they would be filled with candied honey and be comparatively worthless.

I believe in most localities, that with the above management, bees would starve before spring on 6 combs, but here the bees consume very little honey during the winter months, owing to the very even temperature—just a little too cold to start brood-rearing.

I have a plan of management which I have practiced for years, which is in my estimation far ahead of brushed or "shook" swarms for preventing increase and keeping all the force together at work in the sections, but I will have to defer this for another article.

I am surprised at C. H. Koentz for asking the Editor to help him out of his troubles. If he can't get a wife it's his own fault. He lives in a locality where the ladies outnumber the men, 3 to 1, and he can find plenty of them that are "willin'." If he were baching out here in the West, he would have just cause for complaint. What few girls we have here are so independent that there is no doing anything with them. Now, if the Editor is going to take a hand, please don't forget us Westerners. I have been "baching" for 9 years.

I have 300 colonies of bees.  
W. C. GATHERIGHT.  
Donna Ana Co., New Mexico, Nov. 16.

**Bee-Moth and a Bee-Hat.**

Two years ago I brought 3 colonies of bees; one of the colonies swarmed 4 times last season, but did not swarm at all this summer, and only stored honey enough to last them through the winter. From the colony that did not swarm I took 50 or 60 pounds of good honey, and they died before spring with plenty of stores in their hives. I fed the late swarms, as the season was not good in our locality. I got 3 colonies out of 7 through. I divided and made 2 colonies, and the same colony that I took the two from swarmed later on, and I caught on, so I still have 7 for winter again. I have made good bee-houses to put the hives in, and leave them there winter and summer.

Some time ago I noticed in the Bee Journal that one of the bee-keepers wanted to know what made the moth. It is the butterflies; they alight down on the bees when lying out before swarming and deposit their eggs on the bees, so when the bees go in the hive to eat, the eggs will fall off of them in the hive, and are hatched out by the swarms, and so the moth is there. I kept all the butterflies killed off this summer, and am not bothered any more.

I will tell you what kind of a bee-hat I have. Take green screen-wire, one yard in length; cut some off the side, so it will be only two

or three inches above the head; sew it together by lapping a little. Sew some double thin goods on the top for a crown, then sew a skirt to the hat, and put a good, strong string on the skirt near the middle of the back and tie around the waist, to keep the hat from tipping off. Also, have a draw-string in the bottom of the skirt and draw around the waist. Put armholes in it, with sleeves to draw on, and tie just above the elbow. Then with good gloves, and pants or overalls tied at the bottom, you are safe from beesstings.

NEBRASKA SUBSCRIBER.

### A Farmer's Hive—Report.

An all-around farmer's bee-hive, good for men but not for women, is 18 inches long by 18 inches wide, and 12 inches high, with a good super to hold 40 sections  $4\frac{1}{2}$  by  $4\frac{1}{2}$  by 1 $\frac{1}{2}$ .

My honey crop was 500 pounds of nice white comb honey, while my neighbor beekeepers got none. GEORGE KERR, Kent Co., Mich., Nov. 27.

### A Growing Bee-Keeper.

When I first subscribed for the Bee Journal I had only one colony of bees, and knew less about producing honey than they did. That was in the spring of 1900. This colony was the united forces from three trees in the farm, and fed on sugar syrup exclusively. I kept and fed on honey in 1902 I produced 1200 the queen 3 years. In 1903 I had a harvest of 1 $\frac{1}{2}$  tons of honey, in charge of 110 colonies of bees, and a local trade in bee-fixtures started. The American Bee Journal has been "the whole thing" to me. H. H. CHASE, McLeod Co., Minn., Nov. 24.

## Beedom Boiled Down

### Fighting Robber Bees with Fire.

F. L. Morrill had a bad case of robbing during a very hot spell. His account of it is given in Gleanings in Bee-Culture, and is in part as follows:

The bees were crazy, and began stinging before I came within a quarter of a mile of them. The air was full of mad, stinging bees. I soon found that it was the worst case of robbing I had ever heard of. The whole yard of 180 colonies was demoralized. Some of the combs had melted in the extracting-supers; and as it was at a time of year when there was no flow of honey it set the bees to robbing. I did not dare to close the hives up entirely, on account of the heat; but I immediately closed the entrances so that I tried everything that I had ever heard of to stop robbing, but with no success. The next morning I procured a brazing torch, such as painters use to burn off old paint, and taking a supply of gasoline, I went for the robbers. I went from hive to hive, throwing the flame on them as I went, wherever I found them trying to get in. They were gathered in great bunches on the now one-beeway entrances. I soon had to cover my hands, as this seemed to make them so mad that they would tackle even the torch. They objected to having their wings burned off, but I was in no mood for leniency. I worked nearly all day in this manner, and quiet in the afternoon had things somewhat along again.

The next morning I used a kerosene-torch with just as good results, but I did not find many robbers, and the next day things were in normal shape again.

### Roofs for Hives; Steel Roofs Short-Lived.

It is a very difficult matter now to get the old-fashioned iron in roofing-tin, the same as we used to get years ago. Iron made by the old process would last many years longer

# Langstroth on "The Honey-Bee"

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**GEORGE W. YORK & CO.**  
144 & 146 Erie Street, CHICAGO, ILL.

**THE DANDY BONE CUTTER** will double your egg yield. Thousands of poultry raisers say so. It costs less, turns easier, cuts faster and lasts longer than any other. Price \$1.00 up, sold on 10 Days' Free Trial. Send for book and special proposition.

for roofing than the present steel made by the new process. Indeed, builders and contractors have come to recognize the fact that the new steel roofings, unless galvanized, are very short-lived. The modern method of making steel seems to take out some elements that protect it from rust. One would naturally suppose that painting this steel, and keeping it painted, would protect it thoroughly, but such is not the case. Some of the modern steel roofs that we put on our buildings rust right under a good coat of paint. An old contractor said to me the other day that he would never again recommend to his patrons steel roofing, as the asbestos, magnesia, fabric, or gravel-and-tar roofing were more durable.

And this brings me to the question of tin roofs for hives. Unless the new modern steel is galvanized, it probably will not last as long as ordinary cheap paper; and an intending purchaser had better make his selection from covers made entirely of wood or wood covered with paper, cloth soaked in white lead, or galvanized steel. Do not use tin, if you do not wish to have your roof rust in a short time.

A very good substitute for tin is muslin soaked in white lead. I saw some excellent covers protected with this material. In Colorado, that had been in use several years, were good then. The cloth will take up the oil; and if it is painted occasionally it will outlast a good many times over; and what is of considerable importance, it is much cheaper. —Editorial in Gleanings in Bee-Culture.

### Control of Fertilization.

This that has been so earnestly sought after, and which seems so difficult of attainment, appears to be losing ground as to its desirability. The following Stray Straw from Gleanings in Bee-Culture shows the wind blowing in that direction:

Thinking it over carefully, I am inclined to lean toward the belief that entire control of fertilization might be a loss rather than a gain. If I can have control of the colonies that rear drones in my own and neighboring colonies, I believe that's all the control I want. In the mad chase after virgin queen in the upper blue, the "best man" will win. If the choice was left to me I'm afraid I'd make a bungle—I am not sure but you are right. Even if we could mate successfully in a big tent, there are some hand-picked drones, apparently good, lusty fellows, that would make poor progenitors. It is getting to be the practice nowadays to rear drones almost ex-

### A New Bee-Keeper's Song—

## "Buckwheat Cakes and Honey"

Words by EUGENE SECOR.  
Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

### "THE HUM OF THE BEES in the APPLE-TREE BLOOM"

Written by EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 strictly in advance payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

**GEORGE W. YORK & CO.**  
144 & 146 Erie St., CHICAGO, ILL.

clusively from one or two choice queens in a queen-rearing yard, then kill off the useless ones, or keep them from developing. By so doing, don't you nearly control the parentage on both sides? And if the drone with the greatest wing-power is the best man, possibly he is strongest in other ways. In one of our yards during the past summer, the major part of our drones were reared from one queen—a queen whose bees make a big record in honey a year ago. The wings of the same yard were reared from other queens whose bees did equally well. I had not thought of it before; but it strikes me the plan comes pretty near being equal to the "tent" plan of mating; for suppose we had a mammoth tent in successful operation, we would turn those same drones loose into that tent. Perhaps a really best man might weary himself to death to get out, leaving his less active inferior brother to perform the service. The question hinges down to this: Would hand-picked drones be better than Nature-picked drones? Nature works on the "survival of the fittest," and that plan has been working for thousands of years.—Ed.

CONVENTION NOTICES.

New York.—The Fulton and Montgomery Counties Bee-keepers Society will meet at the Central Hotel, Market Street, Amsterdam, N.Y., on Tuesday, Dec. 22, 1903, at 10 a.m. This will be the regular business meeting of the Society for electing officers, payment of annual dues, and any other business which may come before this meeting. Annual dues, \$1.00, which also includes a membership in the State and National Associations. T. I. DUGDALE, Sec. P. P. JANSEN, Pres.

Missouri.—The Missouri State Bee-keepers' Association will meet in Mexico, Mo., Dec. 15, 1903. J. W. ROUSE will act as host to direct the attendants to the hall, which is free to all who desire to attend. Board may be had at the leading hotels at \$1 to \$2 a day. Come, everybody! No interest in bees and honey means we have a big meeting. We now have 51 paid-up members. Let us make it 100. Procure certificates from your local railroad ticket agents when you purchase your tickets. It may be you can return for ½ fare. W. T. CARY, Sec. J. W. ROUSE, Pres.

**HONEY AND BEESWAX**

MARKET QUOTATIONS

CHICAGO, Nov. 7.—The supply of comb honey is large, and sales are being forced, so that it is a little difficult to give accurate figures. Sales are not easily made of fancy at anything over 13¢ per pound, but less grades selling lower. Extracted, white, brings @7½¢, according to kind, flavor and package; amber, 5½@6½¢. Beeswax, 25@30¢.

R. A. BURNETT & Co.

PHILADELPHIA, Nov. 9.—Honey arriving very freely the last week at prices little over 13¢. This month is best month in the year for demand of comb honey. We quote fancy white, 16@17¢; No. 1, 14@15¢; buckwheat, fancy, 15¢; No. 1, 14@14½¢; buckwheat and mixed, 13¢. Extracted, steady and quiet; buckwheat, 6@6½¢; clover, 7¢; mixed and amber, 6@6½¢. Beeswax, 28@30¢.

H. R. WRIGHT.

ALBANY, N. Y., Nov. 27.—Honey market some lower since the cold weather and Thanksgiving demand over. We quote: Fancy white, 15¢; No. 1, 14@14½¢; buckwheat and mixed, 13¢. Extracted, steady and quiet; buckwheat, 6@6½¢; clover, 7¢; mixed and amber, 6@6½¢. Beeswax, 28@30¢.

W. M. A. SELSER.

CINCINNATI, Nov. 27.—The demand for comb honey is slower now than it was six weeks ago, owing to the enormous quantities offered on all sides. Fancy comb is sold in single cases at 14¢. The supply of extracted honey is big, although the demand is good. We are selling amber extracted in barrels at 5½@6½¢. White clover, but not in cases, 7½@8½¢, according to quality. Beeswax, 30¢.

THE FRED W. MUTH CO.

BUFFALO, N. Y., Oct. 11.—The demand for white comb honey is better than it was. The trade is particular and wants only very white, clean stock. If the wax is yellow from taint it does not sell well, and price has to be cut. Fancy white comb, 14@15½¢; No. 1, 13½@14¢; No. 1, 13@13½¢; No. 1, 12½@13¢; No. 1, 12@12½¢; No. 1, 11½@12¢; No. 1, 11@11½¢. White extracted, 6½@7¢; amber, 6@6½¢; dark, 5½@6¢. Beeswax, 28@30¢.

W. C. TOWNSEND.

BOSTON, Nov. 25.—Western honey is arriving more freely in our State, causing a slight drop in prices. Fancy No. 1, in cartons, brings 11¢; No. 1, 10¢; No. 1, 15¢. Extracted, white, 8½¢; light amber, 7½@7¢; amber, 6@7¢, according to quality.

BLAKE, SCOTT & LEE.

KANSAS CITY, Oct. 23.—Receipts of comb honey good; demand good; market easier. Receipts of extracted light. We quote: Fancy white comb, 24¢ sections, per case, 13.00; No. 1, white and amber, \$27.50; No. 2, \$2.50. Extracted, white, 7¢; amber, 5@6¢. Beeswax, 25@30¢.

C. C. CLEMONS & Co.

CINCINNATI, Nov. 24.—The demand for honey is a little better. The prices rule about the same. Extracted is sold as follows: Amber, in barrels, from 5½@5½¢; in cans about ½ cent more; water-white alfalfa, @6¢ cents; white clover, 6½@7½¢. The comb honey market is quite lively, and it sells as follows: No. 1, single case, white, 14@15¢. Beeswax in good demand, at 30¢ delivered here.

C. H. W. WEBER.

NEW YORK, Dec. 4.—Comb honey is arriving in sufficient quantities to supply the demand, and, as to the quality, most of the white honey seems to be of color, and prices are good. Fancy white at 14¢; No. 1 at 13¢; amber, 11@12¢; and buckwheat, 10¢. Extracted, light amber, at 6¢; white, 6½¢; Southern, 5½@6¢ per gallon; buckwheat, 5½¢. Beeswax, 28@29¢.

HILDRETH & SEEGLEN.

San Francisco, Oct. 2.—White comb, 1-lb. frames, 13@14 cents; amber, 9@11¢. Extracted, white, 5½@6½¢; light amber, 50¢5¼¢; amber, 4½@5¢; dark amber, 4@4½¢. Beeswax, good to choice, light, 27½@28¢; dark, 25@26¢.

Market is more quiet than a few weeks preceding, but is fairly steady as to value. Spot stocks and offerings of both comb and extracted are mainly of lower grades, while most urgent inquiry anticipates a meeting for water-white the latter being the only kind meeting with much competitive bidding from buyer. Recent arrivals of honey included a lot of 121 cases from the Hawaiian Islands. The bees of the Islands feed mainly on sugar.

**WANTED! FANCY COMB HONEY**

In no-drip shipping-cases. Also Amber Extracted in barrels or cases. Will buy single case delivered Cincinnati. The Fred W. Muth Co. 3247 Front and Walnut, CINCINNATI, OHIO.

**A Solid Gold Fountain Pen Free!**

Finally, we have found a good Fountain Pen that is reasonable in price. The manufacturers of this pen say that if you pay more than \$1.25 for other fountain pens, it's for the name.

This pen is absolutely guaranteed to work perfectly, and give satisfaction. The Gold Nibs are 14 kt., pointed with selected Iridium. The Holders are pure Para Rubber, handsomely finished. The simple Feeder gives a uniform flow of ink. Each pen is packed in a neat box, with directions and Filler.

**How to Get this Fountain Pen Free!**

To a present paid-in-advance subscriber, we will mail this Fountain Pen free as a premium for sending us 3 NEW SUBSCRIBERS to the weekly American Bee Journal for one year (with \$3.00). Surely, this is an easy way to get a good Fountain Pen. Or, if unable to get the two new subscribers, and you want one of these Pens, forward us \$1.25 and we will send it to you by return mail. Or for \$2.00 we will send to any one the American Bee Journal for one year and a Fountain Pen.

This Fountain Pen would be a splendid gift to a friend or relative. Why not order both Pen and Journal for some bee-keeper as a present?

Address all orders to **George W. York & Co.,** 144 & 146 East Erie Street, CHICAGO, ILL.

### BEST

# Extracted Honey For Sale!

ALL IN 60-POUND TIN CANS.

## Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

## Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Our honey is put up in tin cans holding 60 pounds of honey each. These cans are shipped in wooden-boxes, and should arrive safely. We have nothing but **PURE BEES' HONEY** to offer, and so guarantee it. **Cash must accompany each order.** All prices are f.o.b. Chicago.

### Prices of Alfalfa Honey:

One 60-lb. Can @8c..... \$ 4.80  
Two 60-lb. Cans (in 1 box) @7½c 9.00  
(Larger quantities at the 7½c price.)

### Prices of Basswood Honey:

One 60-lb. Can @9c..... \$ 5.40  
Two 60-lb. Cans (in 1 box) @8c.... 9.60  
(Larger quantities at the 8c price.)

A sample of either Alfalfa or Basswood honey will be mailed on receipt of 10 cents; samples of both kinds for 16 cents. (Stamps accepted.)

**BEEWAX WANTED**—We are paying 28 cents cash or 30 cents in trade for pure average beewax delivered in Chicago (or Medina, Ohio).

**HONEY-JARS**—Don't forget to get our prices on all sorts of honey-packages.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shows herewith in reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

## Something FOR OUR Bee-Keeping Sisters in the Winter Time.

We think all ladies will agree with us in saying that every man should at least understand some business, with which, in case of necessity, he could support himself and family. The wealthiest people frequently come to want, and wretched, indeed, is the man who cannot earn a living after his wealth is gone. He sometimes fills the grave of a suicide. And why, in this enlightened age of progression, should not woman, as well as man, be able to depend on her own resources? In case her husband dies in poverty, must she starve or depend on charity? In case her husband falls to provide and grossly mistreats the woman he has sworn to cherish, must she humbly submit? A THOUSAND TIMES, NO! Let every woman, before she marries, have some knowledge that can be used to make her a living. Every mother, rich or poor, should make her daughters, in a certain degree, independent, by giving them some kind of a trade, and teaching them to be self-reliant. Mothers should have their daughters learn to sew, and not neglect this important part of their domestic education. The

daughter so taught will not only make a better wife and mother, but will also be more likely to secure a better husband, and will always command his respect. He will not look upon her as a helpless "know-nothing," but will know that if he fails in his duties she can live without him, and this can only strengthen the bond between them. A thorough knowledge of dress-making can always be turned into gold, and become the means of support for the mother and her little ones. She may never have to use this knowledge in this way, but she has a trade and can use it if necessary.

The outline cut shown herewith is a condensed copy of THE NEW LONDON LADIES' TAILOR SYSTEM for drafting and cutting ladies' and children's garments. For simplicity and accuracy it has no superior among the more expensive systems. Thousands of girls have learned more about drafting and cutting with this system than they knew about it after serving their apprenticeship in some of the dressmaking shops of the United States and Canada. Thousands of the best garment cutters have laid their complicated and expensive system aside, and are now using THE NEW LONDON TAILOR SYSTEM. Thousands have been sold at \$5.00 each, but we mail it Free to a paid-in-advance subscriber to the American Bee Journal for sending us two new subscribers at \$1.00 each; or we will send it to any one with a year's subscription to the American Bee Journal, both for \$1.75; or, we will mail the Tailor System alone for \$1.00. Address all orders to

## Editorial Comments

### Canadian Experimental Bee-Farm.

Quite interesting is the report which has been received at this office in the shape of "evidence" by Mr. John Fixter, the Apiarist before the Committee of the House of Commons. Some items from the report are here given:

"We found that for the farmer the 9 or 10 frame Langstroth hive is the best, while for the experienced bee-keeper I would say that the 8-frame Langstroth hive is much better, because the experienced bee-keeper will look after his bees better than the farmer usually does, and will see they have plenty of stores in the bottom section to carry the bees over the winter. I would say that the ordinary farmer should have a little larger hive than the experienced bee-keepers, so that his bees will be able to look after themselves."

The difficulty of getting bees to start in sections, Mr. Fixter thinks, is in many cases attributable to the fact that very small starters are used, and he advises full sheets of foundation in all cases, both in sections and in brood-frames, especially in the case of the inexperienced.

The split-top section, in use on this side to some extent many years ago, is mentioned as a new section only lately introduced, the split in the top-bar being an improvement, and making it much handier for the inexperienced bee-keeper.

Mr. Fixter says it has been very strongly recommended by the best bee-keepers in Ontario to wire brood-frames vertically rather than horizontally.

Experimenting with buckwheat, that sown June 16 came up in 7 days, and bloomed in 32 days from the time of sowing. That sown June 29 came up in 6 days, and bloomed 32 days from sowing. That sown July 6 came up in 7 days, and bloomed 37 days from sowing. That sown July 16 came up in 5 days, and bloomed 35 days from sowing. In each case the bees began work on it as soon as it was in bloom, the earliest interfering with the white-honey harvest, so it is advised to sow not earlier than July 1.

Regarding the wintering of bees, Mr. Fixter reports:

"We have tried very extensive experiments in wintering bees in the following situations: In the cellar of a private house; in the root-house where the roots are kept; in a pit, that is, a hole dug in the ground on the hill-side; out-of-doors, on the summer stands, and also in the house-aplary. We found that wintering in the cellar is the best method in this section of the country, and I am safe in saying it is better to winter in the cellar in any section of the country where the thermometer goes down to 10 degrees below zero. The amount of honey consumed by outside wintering will be about one-fourth or one-half more than it will be by wintering inside."

### A Problem About Watery Honey.

Quoting from this journal, a York County Bee-Keeper says in the Canadian Bee Journal:

"In 'Editorial Comments,' page 627, I find this: 'Good honey contains in the neighborhood of 1-6 of its weight in water; in a moisture-laden atmosphere it may attract to itself so much moisture as to be nearly half water.' Now, we will take, for instance, a barrel of 1000 pounds of good honey with the bung-hole left open, said barrel being stored in a moisture-laden atmosphere. It would draw into itself the difference between  $\frac{1}{6}$  and 1-6, which is  $\frac{5}{6}$ ;  $\frac{5}{6}$  of 1000 pounds

is 333 $\frac{1}{3}$  pounds; the total honey and water in the barrel would then be 1333 $\frac{1}{3}$  pounds, would it?"

Rather than to have the thin honey nonplused as to its course of action, why could not our good Canadian friend put it in a larger barrel?

Does it absolutely follow that, "water being lighter than honey, the barrel could not begin to hold that amount of honey and water?" Fill a pail with leaden bullets, and you may add several pounds of water without making the pail any fuller, although water is much lighter than lead. Is it not possible that there may be some kind of an understanding between honey and water that will allow both to occupy nearly the same space, just like the water and the bullets?

But what law is there to prevent the barrel overflowing whenever it became too full? That's exactly what happens in a sealed cell of honey when it stays long enough in a damp place.

### Preparing Alcoholic Drinks with Honey.

This seems to be an important part of bee-keeping in other countries, and one is wearied with seeing page after page of the foreign journals occupied with telling about such things. It is refreshing to find in the British Bee Journal the following protest against having such matters in a book intended for public instruction:

"However good the various recipes may be, we can not too strongly deprecate the giving of alcoholic beverages such prominence in a book intended for children, and we should be surprised if the Board of Education would approve of its use in schools."

American bee-papers have no space to waste than waste in that way. Alcohol is a poison, and its use should be restricted to mechanical and medicinal purposes, and in the arts. But some people are so "artful" that they think they must put it into their stomachs as a drink, and then the trouble begins. We never publish a recipe for making an alcoholic drink.

### Bee-Licenses for Out-Aplaries.

This is a live topic in the Australian Bee-Bulletin. A good deal of government land is occupied with trees that are great honey-producers, and squatters and others ring-bark these trees so as to kill them. This helps the grass-pasture for stock, but is rough on the bee-pasture. There seems a desire to have for other parts the advantage bee-keepers have in Victoria, viz.:

The Victorians have an arrangement with their Government whereby they can secure a license for the purpose of "a bee-farm not exceeding an acre in extent upon any crown lands, or upon any lands held under a pastoral lease, or a grazing area lease, or annual grazing lease." And ring-barking upon such land is expressly forbidden.

### Time for Development of a Queen.

Commenting on a recent publication, the British Bee Journal says:

On page 13, perfect queens are said to be "produced on the fourteenth day after the eggs are put into royal cells," instead of the sixteenth, which is the usual time.

Could not our esteemed cotemporary make a compromise between 14 and 16, making it 15, so as to agree with the teachings of "The British Bee-keepers' Guide Book?"

### Two Queens in a Hive Eight Months.

This is reported by the editor of the Australian Bee-Bulletin. They are mother and daughter, the mother having not a vestige of wing.

## Miscellaneous Items

The Arkansas Valley Bee-Keepers' Association was organized at Lyons, Kans., Dec. 5, with the following officers: President, Dr. G. Bohrer; Vice-President, J. D. Moser; Secretary, F. A. Wilber, Route 2, Lyons; and Treasurer, W. H. S. Benedict. We wish the new organization every success.

The Elgin County Bee-Keepers' Association, of Ont., Canada, was organized Nov. 21, with the following officers: President, Morley Pettit; Vice-President, J. A. McFarland; and Secretary-Treasurer, W. J. Robb. Organization seems to be the order of the day. It's a good thing for bee-keepers to get together.

A Stormy November.—The San Francisco Examiner for Dec. 1st, says that last month will go on record as the most stormy November California has had for 55 years. The normal rainfall for the month is 2.77 inches. Prof. McAdie, of the Weather Bureau, says that last month gave California 4.24 inches. This ought to cause the hearts of California bee-keepers to rejoice.

A Thermometer of good size has been received at this office from our excellent advertising friend, Walter S. Pouder. The wood part has printed on it Mr. Pouder's advertisement as a dealer in bee-keepers' supplies. It is a very useful article, and will serve to indicate the temperature in our office. Many thanks, "Walter."

The Chicago-Northwestern convention, whose very successful meeting we announced last week as having been held Dec. 2 and 3, re-elected its officers, as follows: President, George W. York; Vice-President, Mrs. N. L. Stow, and Secretary-Treasurer, Herman F. Moore, Park Ridge, Ills. In the notice given last week we overlooked giving the officers-elect. The writer being one of the number, perhaps the oversight is pardonable.

The Minnesota State Convention was held Dec. 2 and 3, at St. Paul, and it is reported to have been one of the best meetings that Association ever held. The officers elected are as follows: President, Dr. E. K. Jaques; 1st Vice-President, Scott LaMont; 2d Vice-President, W. R. Ansell; 3d Vice-President, P. J. Doll; Secretary, Mrs. W. S. Wingate, Richfield, Minn.; Treasurer, Dr. L. D. Leonard; and Executive Committee, H. G. Acklin, Wm. McEwen, and Wm. Russell.

A Big Honey-Tree Story.—The Lacon (Illinois) Journal published the following yarn about bees and a honey-tree lately. It fell into the hands of Mr. E. H. Beardsley, one of our subscribers, who sent it in. We think it compares favorably with some of the stories they tell of Texas bee-caves. We would have been willing to allow the Lone Star State to do all the "shining" in that line, but some Illinoisan evidently thought he must get up a whopper, too, and so he twinkles out with this one:

"This is a great year for honey. The white clover has been so plentiful that the only thing that has limited the production of the busy little bee has been the want of room. But this was not the case with a bee-tree that Bill Farr discovered one day last week along the banks of Mosquito Creek. Bill says that the tree is at least four feet in diameter, and is hollow from top to bottom. There appears to be only a thin shell inside the bark. His attention was attracted to the tree by the honey seeping through. He thought of cutting the tree down at first, but finally a better way suggested itself. He came to town and got one of those long copper faucets that they tap beer-kegs with. Then he bored a hole and drove the faucet in up to the hilt. Now, whenever he wants a few buckets of honey he goes to the beehive and turns on the faucet, and it runs out like molasses out of a sorghum barrel. He has already taken out 17 gallons, but it seems to run just as free as ever. The bees appear to make it as fast as he takes it out.

Rev. R. B. McCain, of Grundy Co., Ill., is perhaps one of the most successful new bee-keepers in the country. He was at the recent Chicago-Northwestern convention, and after arriving home and thinking it all over, he wrote us as follows:

DEAR MR. YORK:—Allow me to say that I thoroughly enjoyed the convention. I think the time well spent. I was glad to meet the bee-

keepers, and to make the acquaintance of so many clean, honorable, fine-spirited men. There must be something elevating in the bee-business, or else it is attractive to men of good habits and high moral purposes. And in this same connection let me say that it is a very great gratification to me to find that the American Bee Journal is not wanting in these same qualities. It goes a long way toward offsetting some of the evidences of sordidness and dishonesty which we find in the world, when we mingle with men whose lives are not circumscribed by the dollar-mark, and who undertake to conduct business enterprises on sound moral principles. I am sure that I can very heartily wish every one of them the best success. I am,  
Very sincerely yours,  
R. B. McCain.

In the right kind of life there is always more than dollars and cents, and things that only endure on earth. Lots of bee-keepers are also interested in possessing eternal characteristics, and all may do likewise if they choose.

## Some Expert Opinion

"In the multitude of counsellors there is safety."—BIBLE.

### Number of Brood-Frames for Comb Honey.

If for some reason you were to start in anew to keep bees, and were obliged to get an entirely new outfit—

Ques. 2.—How many frames for comb-honey production would you use? Why?

N. E. FRANCE (Wis.)—8.

WM. ROHRIG (Ariz.)—I do not produce comb honey.

O. O. POPPLETON (Fla.)—I do not produce comb honey.

Mrs. J. M. NULL (Mo.)—10. (Get better results in every way, in this locality.)

Prof. A. J. COOK (Calif.)—10, as this is the number in the hive preferred, as given in Question No. 1.

DR. J. P. H. BROWN (Ga.)—9 or 10. In my climate and location this number would take all the sections that the colony could use.

R. L. TAYLOR (Mich.)—Either 8 or 16 Heddin frames, according to circumstances. The less number when practicable to get the white honey into the sections.

E. E. HASTY (Ohio)—7—more if the field is a good one. Because I have been so doing for many years, and sufficient reasons for changing do not seem to appear.

EUGENE SECOR (Iowa)—8. Because, in my experience, I think it is about right. And, for indoor wintering, the hive is more easily handled than a larger one.

GEO. W. BRODBECK (Calif.)—8 frames. Give all the room necessary for the queen to breed in during the honey-flow, leaving no surplus room for storing honey.

Mrs. L. HARRISON (Ills.)—8. In this locality I tried the 10-frame hive, and it took so long to fill the hive that the bees completed a much smaller amount of white clover honey.

P. H. ELWOOD (N. Y.)—We use 7, usually, and sometimes 8. We like to have the frames pretty well filled with brood, and the number of frames used depends upon the queen and the season.

E. S. LOVESH (Utah)—9, still having the winter problem in view. It makes a hive about the same in width, length and depth. The hive being double wall, a super containing 21 or 28 sections could be used on it.

C. DAVENPORT (Minn.)—8. Because in my locality I can secure more surplus honey than I can with more. I have given this matter a thorough trial, in a large enough way, so I have no doubt about the matter.

JAS. A. STONE (Ills.)—10 frames for any purpose. For the reason that they are the mean between the two extremes, some preferring larger and some smaller, so we choose the 10, and see no reason for a change.

C. P. DADANT (Ills.)—10, with a dummy occupying the space of another frame. Because this would give sufficient space for brood and honey with a frame of the size mentioned previously, and because the super space would be quite ample.

G. M. DOOLITTLE (N. Y.)—10 Langstroth frames. Because some queens require that number of frames, and it is very easy making the same into an 8-frame hive, by slipping in a dummy on each side to take the place of the two frames taken out.

REV. M. MAHIN (Ind.)—I produce but little comb honey, and sell it all at home, and I am not authority. The number of frames I use are about equivalent to 8 Langstroth frames, and for my locality that is large enough, and not too large, for either extracted or comb honey.

C. H. DIBBERN (Ills.)—I would use 10 shallow closed-end frames to give as much room on top as possible. I prefer to use cases to hold 40 sections or more, rather than more cases with less sections. 2d, the bees are kept in a more compact bunch, and do not have to travel so far.

DR. C. C. MILLER (Ills.)—I don't know. If I had only one apiary, or didn't care for the weight of hives in moving, I would use 10 frames, because there is less danger of going into winter short of stores. On account of greater ease in lifting and moving the smaller hives, I now prefer 8 frames.

J. M. HAMBADON (Calif.)—I am not good comb honey authority, not being a specialist in that line. I am sure, however, I would not use a brood-chamber of less than 3000 cubic inches capacity. You can contract a large brood-chamber, but you can not expand a small one. I would want a 10-frame hive, but locally has something to do with this question.

ADRIAN GETAZ (Teun.)—Not more than 9. With more than that the supers are too heavy. Furthermore, when giving the first super to the colony, the weather is not very warm yet, and giving too much space then is injurious, as the bees can not keep up the proper temperature in a too-large space. The frames should be deep enough to make up what they lack in number, so as to have the brood-nest of the proper size.

E. WHITCOMB (Nebr.)—The colony will in no case begin to store comb honey until the brood-chamber is first well filled. I deem it better to tier up than to spread over the ground too much. The 8-frame hive is easier to put into winter quarters; it isn't so hot to work over in summer; it costs less money to make, and with the present price of lumber, all these questions must be taken into account lest we come out on the wrong side of the ledger.

J. A. GREEN (Colo.)—Either 8 or 16 of my shallow frames, according to circumstances. To explain fully the "why" of this would require a long article, or several of them. Briefly, because one section of the brood-chamber, or frames, is enough for the most profitable production of comb honey at certain times; while two sections, or 16 frames, are large enough at any time, and just right for profitable wintering and the building up of good colonies in the spring.

G. W. DEMAREE (Ky.)—No answer to this question can be made to apply to all conditions in so great a country as this. Each bee-keeper should study his own environment, and work in accordance with Nature's laws that are immutable. In the Middle States, where the spring brood may begin as early as March 20, giving the bees time to build up strong by the time the white clover harvest begins, the 10-frame Langstroth hive will give from 10 to 25 percent more comb honey than an 8-frame hive will, under the same management. Why? Well, the honey will show why!

L. STACHELHAUSEN (Tex.)—I would use 10 frames in one story. For comb-honey production this gives a larger top surface than 8 frames, consequently more room for sections. In winter and spring I would use two stories; this gives plenty room for the development of a strong colony. When the honey-flow commences, and the sections are given, 10 frames containing the most brood would be crowded into one story. The other combs without bees are used elsewhere in the apiary. This forces the bees at once to commence work in the sections. Larger hives (for instance, 12 frames) are not as handy to manipulate; smaller hives (8 frames) are out of shape, and cost more per frame.

S. T. PETTIT (Ont.)—The hive full until after swarming. For best results the hive must be practically full of brood from side to side when the sections are put on. I would not weaken the bees on any account by removing brood before swarming. At swarming, I would put them on one full frame near the center; then five or six dummies about one-half at each side of the hive; then fill up the center with starters. The full comb catches the pollen and carries a part of the weight of the bees, thus relieving the starters and the newly-built combs. If the bees are up to the mark in strength, and the top-bars thin, and if an all-metal queen-excluder, wedges and dividers, be used, I never could see but that the work over the dummies was just as good as over the brood, and I have taken many thousand sections in this way. These directions apply to a 12-frame hive; other hives may be treated similarly.

R. C. AIKIN (Colo.)—With my shallow 5x16 frames, I would use 8 to 16, usually 16, during the flow while storing surplus; but all the rest of the year, where out-door wintering is practiced, I would use 24, especially immediately before the surplus flow came on. Of these frames 8 are equal to 4 Langstroth frames, 16 to 8, and 24 to 12. The why is, that a large hive in the fall gives breeding-room, and store-room, too, so that at no time need the brood be unnecessarily reduced in quantity, thereby, in most cases, and particularly with young queens, insuring a good force of bees to start into winter. I would keep the brood-chamber large in spring because it gives more encouragement to breeding (note that the surplus room would be beneath the brood-chamber, such a hive), and tends to discourage swarming. When the flow arrives, contract to about 1/2 Langstroth-frame capacity—sometimes less. With a small chamber—6 to 8 Langstroth frame—during the flow, better finish and better results all around with small chamber, and more so with light flows or weak colonies.

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such efforts.

## Convention Proceedings

### THE LOS ANGELES CONVENTION.

Report of the Proceedings of the 34th Annual Meeting of the National Bee-Keepers' Association, Held at Los Angeles, Calif., Aug. 18, 19 and 20, 1903.

(Continued from page 791.)

#### OVERDONDNESS OF BEE-KEEPING.

"Is bee-keeping overdone? Is all territory occupied?" John F. Crowder—No, it has not begun yet. Up in the San Joaquin Valley the country is improving all the time; new alfalfa fields are growing all the time, and the bees don't quite keep pace with the increase. There are new fields in my territory.

T. O. Andrews—If they get into the fashion of cutting the alfalfa as they do here—they cut it eight and ten times—don't give it a chance to bloom. I doubt if there is 100 pounds, or 1000 pounds, of honey produced in three or four counties in this part of the State.

J. P. Ivy—I think the people that live in a locality have a great deal more to do with it than the locality. I have yet to know a community where a bee-man would be welcome with bees.

#### OVERSTOCKING A LOCALITY.

"What can be done to keep bee-keepers from imposing on each other by placing a large apiary close to another one?"

Dr. Miller—However difficult that question is, it is a question that will come up practically to many of your minds. A good many years ago I called down the anathemas of nearly the entire bee-keeping fraternity by saying that I believed that every man should, in some way, have some legal title to his locality. They asked me whether I meant it. I did mean it. I believe that a man should have, and if the thing proceeds far enough, it will some time come to that, and I stand here, with the risk of being called crazy again, to say to you that if bee-keeping is conducted on a safe basis, as other business, a man must have some kind of assurance that the territory he occupies will remain his.

George M. Wood—I wish to say to the bee-keepers here that this is one of the most vital questions that can be brought before this Association. We have been in this business, some of us, for years. I have been keeping bees in this county for 25 years. I first commenced in Sacramento, buying a lot of bees in Mr. Harbison's hives. I had peaceable possession of a range for 20 years. It is due to every man that his own earnings be protected. Are we going to let one man, or two men, come on either side of us with 100 or 200 colonies of bees, and put them on either side of my apiary, or your apiary, just as he sees fit, asking no questions whether it is right or wrong, whether it is benefiting you or injuring you? What are we going to do with this? Are we going to conduct this business on a peaceable principle? If we are, we want to know it. Will there be some resolution adopted in this Association to protect every man's interest in his bees? I do not care who he is. That is the law. All men need to protect themselves. If you are going to be infringed upon, protect yourself. You will be respected for protecting your house and your family, your property and your civil rights. Let this question be brought up, and let it be read in your households, by your firesides, by every bee-keeper in the land, and let the principle be lived up to. This is a question that is too little thought of in this Association, or in the United States. You can infringe on one man more than another. There is a little range over there. He has been there a number of years; he has a right to that range. If he owns a good location there, he has a right to a good range. Let us bring this question before the Association, and try to have some action taken on it in the future. What do you say about it, gentlemen? Such is going on all the time.

Delos Wood—I do not agree with Dr. Miller, nor with the man who has just spoken, who has the same name as I

have, but we are not related, that I know of. Suppose this man owns a farm, and possibly 200 colonies of bees on it. Suppose my friend, Dr. Miller, buys a farm and puts 200 colonies on it, and I buy a farm between them, and put on it 1000 colonies of bees. Who has a right to the range?

Mr. Crowder—I have had as much experience in moving apiaries, and having to move in different localities, as much, I think, as anybody in the State. If you don't own the land somebody may make you move off. I started in on one piece of land, and another bee-keeper came in and bought this land, and I had to go.

W. D. French—I think that any man who respects his neighbors—any bee-keeper, it seems to me—should know better than to infringe upon his neighbors. The moral part of it is good, but this Association never can do anything, and no laws could be passed that would be legal, that would prohibit one man from operating on his own territory. It is very good to talk it up, but it is not within the jurisdiction of the people themselves, because any law of this kind passed by any legislature would be unconstitutional, and there is nothing that would prevent any number of men keeping bees together. The moral part of it is very good, indeed, but it can not be helped by any legislation.

Mr. Abbott—What can we do to keep the other fellow from selling supplies where we sell?

Mr. Corey—Like Mr. Harbison, go far out in the mountains, where nobody wants to go, and nobody wants to go to church, school, or anything of the kind, and buy all the land that joins you, and if you can not do that, lease all that is around you!

#### BEST SEPARATOR—COMB HONEY IN CARTONS.

"What is the best all-around separator for comb honey?"

A. I. Root—Fence.

"Will it pay the comb-honey producer to put his best grade of comb honey in cartons?"

Dr. Miller—I think that depends entirely upon the market. There are markets which will pay for cartons, and give the advanced price. Other markets will not stand it at all.

Mr. York—As a dealer, I would prefer not to buy the honey in cartons with the producers' card on, as I wish to put it up in cartons with my own name on as seller.

#### STOPPING THE ADULTERATION OF HONEY.

"What is being done to stop the adulteration of honey, and what can we do to stop it?"

Mr. Benton—There has been a great deal of effort in the city of Washington to secure the passage of a Bill which should forbid the adulteration of honey, and putting it on the market under the name of honey—not to forbid the adulteration of honey, but to forbid its being put forth under the name of honey, when it is some other substance than honey. This Bill was introduced into Congress by a congressman from Pennsylvania, now deceased. At the same time one was introduced into the Senate, and year after year the Pure Food Congress met there and urged the passage of this Bill; not this Bill alone, but a Bill for pure food in general, and it included honey. It is now simply awaiting reintroduction. In that case a standard would be adopted for honey as well as other substances, and the substance would be collected and examined by the Chemist of the United States Department of Agriculture, who would then be empowered to decide as to the purity or non-purity of the substance; the parties could then be proceeded against under statute of the United States. This would regulate the sale of these articles in States and Territories under the government. It would still depend upon the States to take similar action. It depends a good deal upon people who are interested in the sale of these articles to push forward such a Bill as a model for all the States. It will come up at the next session of Congress.

Chairman—Is it not a fact that there was a Pure Food Bill slipped through, and the United States Government is now getting in shape to get it enforced?

Mr. Benton—There was a Bill regarding foods from foreign countries, but that covers only the importation of goods from foreign countries.

Prof. Cook—I think this is a very important matter. As I understand it, the Pure Food Law passed the lower house, but did not get through the Senate. I think we should do all we can to get it through. We ought to have it. It is one of the great necessities. We ought to reach out as strongly as we can in our State. That is something we ought never to lose sight of, and use every occasion we can to push legislation in that direction.

F. G. Teachout—Would it not be in order to appoint a committee to look after this matter, and urge it on, to do anything that can be done?

H. H. Hyde—I think the proper man to help it on is Mr. France. Let all of you work on your Senators, and let us request Mr. France to do all he can.

Chairman—Would it not be well to pass a resolution embodying these sentiments?

Mr. Hyde offered the following motion, which was seconded, put, and carried:

*Resolved*, That the National Bee-Keepers' Association urge upon their representatives in Congress, and in the Senate, to take up the matter of the Pure Food Bill in the interests of the people, and urge its passage.

#### QUEEN-BREEDER'S RIGHT TO A LOCALITY.

"The right of a bee-keeper to the undisturbed possession of the honey-field he occupies has received considerable attention and recognition of late. Should not the field occupied by a queen-breeder with a given race be similarly respected?"

J. K. Williamson—If you will all read Carlisle's "Title Deeds to Land," it will settle some of the difficulties of this question of property rights.

Frank Benton—It seems to me you are mistaking the scope of these questions, somewhat. Nobody claims that a man has a legal right to control honey produced on his neighbor's land or the public domain. Nobody has suggested a legal right. The whole question, it strikes me, is, as bee-keepers, should we not respect the rights of others in these matters from a moral standpoint? If a certain man, Dr. Miller for instance, has located his bees somewhere, would it not be, to a certain extent, immoral if I should go right across the road and start up the same business? I do not for one moment think I would not have a legal right to do that.

Speaking more to the question, a queen-breeder should have a moral right from the same standpoint. He is located in a certain region; let him have a fair chance, at least, of a pure mating of queens with the drones of a common race—the right of mating there for a large area. He may have a great many colonies of Italian bees; I may have a right to bring in a lot of those dastardly (!) Cyprians and spoil his Italians. Then I might bring in Carniolans; I might even put blacks in there. I might take an actual occurrence. I have been trying the Cyprian race of bees, and one reason I tried that race was I did not know they were supplied by any other apiary in the United States. I did not know to whom to recommend them. Another thing, the Department of Agriculture has sent out queens of this race. As they happen to own no bees, I put into the Department there an apiary of Cyprian queens, and furnished the stock to the Department free of cost, never receiving one penny for them. The A. I. Root Co. have an establishment three blocks below them, where they sell goods. You all know the stand taken by this firm on this point; that it was a moral wrong to encroach upon another man's territory. Yet they, or their agents, have put into that piece of property below there all sorts of bees, and that destroys utterly any experiments I might be making in that locality. Now, I doubt not they are not living up to the idea advocated as to the right of a person to the territory. I would not go down and set up an apiary beside one of pure Cyprians, and put Carniolans in it. I think the point as regards a queen-breeder is even more important than a honey-producer, because a queen-breeder goes into a locality he has selected, and it will be, perhaps, harder for him to select a locality free from contamination. Furthermore, his queens are going out all over the country, and the injury extends beyond him.

Emerson T. Abbott—I want to tell something the A. I. Root Co. did. They got a letter from a man in my town, asking if he could buy supplies from them, and they wrote back, saying: "Mr. Abbott sells supplies in St. Joseph, and we prefer not to sell to you." And I am not their agent, either!

#### BEES WORKING ON DIFFERENT FLOWERS.

"Bees are never seen working on two kinds of flowers at a time. Thus, Nature's plan is for bees to work on one kind of flower at a time, and carry its pollen from flower to flower, which helps the fruit."

Dr. Miller—The only question in that is a statement, and the statement is not strictly true. Bees do work on more than one kind of flower. I have seen them, but not very often.

Frank Benton—Pollen from distantly related flowers,

pollen not closely related, would not cross with any other, even a variety of the species.

#### REPORT OF COMMITTEE ON AMENDMENTS.

Mr. Marks—On behalf of the Committee on Amendments, I beg leave to report the following amendments to the Constitution, in accordance with Article IX of the Constitution: [These appeared on page 595, and as they are of special interest only to members of the Association, and as they will get them in the General Manager's Annual Report this month, we do not give them again here.—EDITOR.]

E. T. Abbott also handed to the Secretary copies of some amendments which he desired to have submitted to the membership of the Association at the next election. Owing to strenuous objection being made on account of their not having been presented to the Committee on Amendments, Mr. Abbott relieved the Secretary of them. During this part of the last session there was considerable wrangling, after which a special committee was appointed to determine what action should be taken in regard thereto. A recess was declared, at the close of which T. O. Andrews, secretary of the committee, being called on, said: "We beg leave to report that we recommend adjournment at once." On motion, the report was adopted, and the convention adjourned to meet in 1904, at the call of the Executive Committee.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### A Sister's Experience With Bees.

I have had a good deal of experience in keeping bees. I like the Bee Journal very much, and keep them all in a box. I have never read nor seen any bee-books. I do almost all the taking care of the bees and honey. I had 34 colonies last spring, and increased 16. I prevent my bees from swarming, and run them for comb honey. I have had good sale for all the honey my bees have gathered. I have had a bountiful crop this year. Two years ago a swarm came to my bee-yard from parts unknown, and they gathered 271 pounds of surplus comb honey this year.

I like the Sister's department very much. I think it should be made into a book, so that it will be a record left after we are gone to "the other shore."

This winter I will give you a correct answer of the humming of the bees in the cellar.

I have been keeping bees for 20 years. My husband made all the bee-hives and started me in the bee-business. Iowa. CATHERINE WAINRIGHT.

Are you not making a mistake in not having a bee-book? If you have done so well without a book, might you not do enough better with it to pay the price of a book several times? Remember that a bee-paper is not intended to take the place of a bee-book, but to supplement it.

### Queen Questions—Italian Bees.

The Bee Journal is a source of weekly pleasure to me, which I would not care to be without. I enjoy reading the Sisters' letters very much—they are interesting, having so many different experiences.

I now have 5 colonies, which are in a very flourishing condition. One is a pure Italian, and the other 4 a first cross, or half-bloods, I think.

I did not get very much honey the past summer, for I was anxious to build up and increase, but next year my bees ought to repay me, as I am in a good locality for them. Here in California the bees are wintered on the summer stands, and there are very few days, the year round, when they are not doing something. Nearly each month of winter there are some flowers blooming.

I should be glad to have these questions answered:

1. When a queen is superseded, can the bees rear as good a queen from her eggs as from eggs of a younger queen?

2. Are Italian drones always yellow, or are they sometimes black?

3. Would the journey from New York State to California shorten the life of a queen-bee?

4. Are Italian bees always yellow? and do the bands merge, or are they separated by a black band?

5. I bought two Italian queens (Doolittle's goldens); to one I gave young bees just hatching, and it built up into my most populous colony. The second one I introduced as per directions. Last month she died, leaving a young queen and a hive full of Italians behind her. Do you think the journey weakened her, or that she just simply failed, and the bees threw her out? I found her outside the hive, nearly dead, one day, but for about a fortnight both young and old queens were to be found upon one frame, living very peaceably together. Why did the bees nearly kill her and throw her out?

6. I have reared 3 queens from my choice Italian, and their bees have 3 bands, but are not as yellow as bees from the Italian queen. Would they be pure, or do you think them half-bloods? MARTHA WHITE.

Los Angeles Co., Calif., Nov. 23.

1. Just as good, if the queen superseded is as good stock as the younger queen.

2. They vary very much as to color, some being very dark.

3. Sometimes, and sometimes not.

4. The first three bands of the abdomen, beginning at the waist, are yellow.

5. It is very hard to say. For some reason she was superseded. Bees will sometimes supersede their queen when she is quite young, and evidently doing good work. Perhaps they are able to detect signs of failure before we can. It is not such a very unusual thing for the old queen to continue for some time laying in company with her successor.

6. The queens may be considered pure if their worker-bees have three yellow bands.

### To Soften and Whiten the Hands.

The Ladies' Home Journal gives the following:

Sleep in gloves with the finger tips cut off, and use the following formula: Myrrh, one ounce; honey, four ounces; yellow wax, two ounces; rose-water, six ounces. These ingredients are mixed into a paste, the wax, rose-water and honey being heated over boiling water.

### The Use of Drone and Queen Excluders.

BY C. P. DADANT.

We have of late been having much about queen and drone excluders between the brood-chamber and super; that the bees fill the brood-chamber and keep it full, and what they put above can be extracted without any danger of interfering with sufficient stores for winter, or at any other time. If this is the fact, I think it would be a good idea to get a supply of excluders for the coming year. Tulare Co., Calif. A. B. CARPENTER.

The use of non-use of drone and queen excluders depends altogether upon the management of the apiary. We have kept drone-excluders for sale for years, but I am quite willing to say that it was not because we think they are to be recommended, but only because some customers think that they can not do without them. Personally, I have no use for the queen-excluders between the stories, neither do I think well of the drone-excluders at the hive-entrance. The drone-traps are not a new thing, though evidently those made now are superior to those used of old, but old Butler, in 1609, recommended what he called a "drone-pot," to keep the drones out of the hive after they had once emerged from it. L'Abbe Collin, in modern times, was probably the first to use perforated zinc between the stories. This was about the middle of the nineteenth century. Yet, the use of queen-excluders has not gone forward as much as that of other more practical implements.

If the queen has plenty of room for her brood in the

lower story, previous to swarming, there will be no laying of eggs in the supers. The breeding in supers takes place mainly in very small hives—3-frame hives, or smaller—because a prolific queen finds herself cramped for room, and, of course, will seek all chances of depositing eggs. In large hives—those of 10 frames or more—the laying of eggs in the super takes place only in irregular seasons, when the flow is intermittent, so that combs are built, partly filled, and then partly emptied during bad weather, or a change in conditions. Those combs that have been fresh built, and emptied of the honey, are open to the queen, and she will find them readily if in search of additional room. It is, of course, unpleasant for the apiarist to see his nice sections spoiled in appearance by brood, for those combs in which brood has been reared, even but one time, are fit only for storage-combs, and not salable. But in a good season, when the flow is uninterrupted and strong, the bees fill the combs as fast as they are built, and the spaces left empty are scarce. The queen then remains over the brood and refills the brood-cells as fast as the young bees hatch.

In producing extracted honey by our method, with half-story combs above a large brood-chamber, the breeding in upper stories is very rare, and only, as I have said before, in irregular seasons, when quite a number of cells are left within reach of the queen. We found that even the placing of empty combs in the supers above the brood would not draw the queen above, if the thing was done in time, that is, before the combs below are too much crowded with honey. After one super is full of honey the other empty supers may be added above without much danger of the queen crossing over a half-story of full combs to hunt for cells. In all but exceptional instances the queen will not go far from the brood-center to lay. On the other hand, when the bees are run for extracted honey, it matters very little whether brood is hatched in the supers, provided the colony does not entirely desert the brood-combs to locate above. This happens sometimes, but the instances of this kind are so rare that I have never thought it worth while to bother with the excluders for the sake of avoiding it.

The greatest objection to the queen laying eggs in the supers when the colony is run for extracted honey is that often drone-combs are located in the super. If the queen finds these, and she is tired of laying worker-eggs, we take it that it is a rest to her to lay in drone-cells, either because of the different positions in which her body is placed for laying, or because the fecundation of the eggs that are to hatch as workers gives her more fatigue than the laying of eggs that pass through the oviduct without coming in contact with the sperm-sac. At any rate, it is positive that there are times when the queen will seek drone-cells, and it is usually when she has been laying eggs regularly, and in large numbers for some time.

If every comb in the super has been built on comb foundation, there will be no more drone-comb in the upper story than in the lower, but this is not always the case. We used to save our drone-combs, those cut out of the brood-chamber, to place them in the extracting supers, and we had a great many such combs in use when we recognized the fact that it would have been cheaper, in the long run, to have rendered up these combs for wax, and used worker-combs in the entire hive, supers and all, owing to the queen's occasional use of the drone-combs. The combs are not a temporary investment; they are to the bee-keeper almost the equivalent of real estate to the farmer, for they need never be destroyed, and they increase in value and strength with age, so that extracting-combs that have been in use 30 years are really better than new ones. So the primary cost of these combs is insignificant when compared to their usefulness.

I am convinced that the laying of eggs in the super by queens does not depend altogether upon the more or less fertility of the queens, but depends mainly upon the conditions of the season, and my reason for believing this is, that there are seasons when not a single queen lays eggs in the upper story, while there are other seasons, rare ones, when perhaps one-fourth of the queens in an apiary will occupy the upper story with brood, if there is any room there at all. If this brood is laid in worker-cells in extracting-combs, there is no harm done, but if it is in drone-cells, we have lost a portion of our crop, for it takes a large amount of food to rear and sustain those worthless gormands for the ephemeral duration of their life.

Hancock Co., Ill.

The Premiums we offer are all well worth working for. Look at them.

## Eucalyptus Honey—Dark vs. Light.

BY R. V. PAGAN.

WHEREVER the famous eucalyptus will grow we should think that bee-keepers would aid in planting it. Its honey is delicious, of excellent flavor, thick in body, though rather dark in color." So says the Editor on page 757.

I am not going to dispute that eucalyptus honey is "delicious" to you, Mr. Editor. I have tasted several different samples of it that came from Australia, its native place, and I surely would not class it as delicious. Some of it might pass as tolerably fair in flavor, but I think the majority of persons would vote none of it better than that, and some of it as unfit for table use. For years the effort has been made to find a market for it in London, but the effort has not been a great success. Australians say it is excellent honey, but the people of England do not agree with them.

A very little of some kinds of eucalyptus honey would greatly damage any kind of light honey for my taste, and I suspect it would for the general public of this country, so that I should much dislike to have eucalyptus grow in my locality if it should yield at the same time with plants yielding the best white honey. It might, in some localities, prove an English sparrow among honey-plants.

### COLOR OF HONEY.

On page 757, W. A. Pryal says: "I believe the time is not far off when color in honey will not cut much of a figure so long as the article is of good flavor. To my notion, some of the amber-colored honey I have tasted surpassed any of the so-called white honeys;" and the Editor adds: "Color in honey is now, and has been, a fad which we are certain will pass away like many another senseless fad."

Is not all of that said under a misconception? Does color, in and of itself, cut any great figure to-day? Suppose that all the white honeys were dark, and that all the dark honeys were light, and that they had always been so; do you think that water-white buckwheat honey, with its rank taste, would come any nearer to the price of alfalfa honey of a dark hue than does the present dark buckwheat to the white alfalfa? Buckwheat honey is lower in price now than alfalfa, not because it is darker, but because of the difference in flavor, and it so happens that most honey of light color happens to suit the taste of most people better than the generality of dark honey. In general, a lighter color is a sign of a better flavor, and, so long as that continues, the fad for light color will continue.

Since writing the foregoing, I asked a lady whether she preferred the dark or light color in honey. With some little hesitation she gave her preference to the dark color. It was the answer I expected, for I knew in advance that she preferred the taste of the dark. Very likely you will find that those who prefer buckwheat and the stronger-flavored honeys—and there are many of them—will all prefer the darker colors; and when the time comes that the majority of the people like the taste of dark better than light honey, then the fad will change—hardly till then.

[We are always glad to get sensible and honest criticism of what we may say in these columns. We hope, also, that we may never seem to convey the "know it all" impression in what we write. We don't know a great many things, and are learning all the time.]

Now, after having written that paragraph, we want to say further that after a number of years of experience in the honey-business, dealing with thousands of grocers, the great majority are faddish enough to think that they must have light-colored honey. They care little for the flavor, only so it is light-colored.

As to the flavor of eucalyptus honey, we were not speaking of imported eucalyptus honey. Our sample came direct from California, and it was most excellent honey, in flavor, body, and color. There may be varieties of eucalyptus honey just as there are of alfalfa and other honeys.

We shouldn't be surprised if Mr. Pagan would some day be glad to have even eucalyptus honey rather than none at all. What bee-keepers need is a sure, annual yielder, for no matter what the color or flavor (so long as wholesome) may be, there will be a demand for it somewhere in this wide land of ours.—EDITOR.]

## Doubling Up Colonies in the Fall.

BY T. F. BINGHAM.

**T**HE doubling of my bees for reduction in numbers, referred to in the American Bee Journal, depended entirely upon circumstances, and not any peculiar adroitness of the operator.

To understand the operation, it is essential to know that my hive is 12½ inches square and 6½ inches deep, composed of 7 closed-end frames, held together by a wire loop or link at each end. From one to ten such "hives" are a hive, according to conditions. Of course, the doubling did not take place until all the brood was hatched, and the loose honey all concentrated, usually in the top of the hive, or collection of hives, as above. This clearing of those parts or frames after the brood is matured is the main feature of reduction of parts, as well as colonies of bees. The small, short frames in the lower parts or hives the bees clear entirely of honey, if there is room enough in the parts above to hold it. It will be readily understood that one or more of these hives of empty combs could be quickly removed, and the remaining top hives of honey and bees set on the same bottom-board.

This year the honey was short in all hives, and a pile that was full of bees and 5 feet high in July could now be reduced to two, or perhaps one such corresponding hive. This, you will readily see, made it easy to unite to two, and still keep the hive down to a wintering basis.

As I wished to select queens, hives not having well-marked Italian bees were selected for reduction, and the queen removed. I tried several periods of time after removal of the queen, and found one or two days for queenlessness was desirable before uniting, which was done by setting one colony on top of another, one of which was queenless. Even though colonies deprived of their queen showed confusion and evidence of queenlessness. It was found that in some instances a few bees were killed if only queenless a few hours. No brushing, or shaking, or smoke, was used when setting them together, to induce them to be kind to one another.

The small hives were readily taken apart, or out of the pile, and, as appearances usually indicated which of them contained the queen, the finding was readily accomplished.

My combs or hives are now piled up safely, ready for another season's operations, while the bees are in hives containing no more combs than required for safe wintering, and quietly biding their time in the cellar. A few of them were rather light in honey, and I have been feeding them 2½ pounds of sugar syrup once a week. They seem to like it, and settle down just as well as if out-doors. They were put into the cellar Nov. 10. The cellar showed 30 degrees, and was closed. The cellar now shows 40 degrees with one ventilator open. It might be a pleasure for some bee-keepers to know that all the bees any queen can as a rule rear, in ever so large hives, when the season is over, will cluster in a hive of empty combs one foot square and 6½ inches deep.

Miss Wilson's lady friends, who don't exactly like to lift 50 to 100 pounds, might get a pointer from my hive as above. I have none to sell, however.

Clare Co., Mich., Nov. 30.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

**Our Wood Binder** (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

THAT TEXAS AVERAGE OF HONEY AND WAX.

As to that queer Texas yield of 12 pounds of honey and 41 pounds of wax per colony, I saw what the trouble was at the time, but thought best not to correct just then. Will not Prof. Sanderson, and all the rest, avoid a kind of statement so very liable to misunderstanding? Even if the printer doesn't go wrong and leave out the dot, half the readers will read wrongly. Very many of us are more or less rusty on mathematical kinks which we never use ourselves. If a single amount less than unity, or a few of them, are to be given, state them some other way. If figures must needs be used, don't be so stingy of them. Instead of .41 write 0.41, and mistakes by the reader will be cut down several hundred percent. Page 692.

HOW NOT TO LEARN ABOUT BEES.

The way *not* to learn about bees. (Apologies to A. I. Root.) Take every old farmer you can get at and pump him dry on the subject. My, what an amount of misinformation—and contradictory misinformation, at that—can be laid in by that method! Page 693.

LABORATORY FOUL BROOD AND PRACTICAL FOUL BROOD.

The bees are *unfriendly* to half-killed germs of foul brood, don't want to develop them, while the experimenter, of course, must be friendly. I think that circumstance accounts for most of the divergence between laboratory foul brood and practical foul-brood in the bee-yard. To get started in a vigorous colony of bees the germs must not only be alive, but lively. But don't you, on that account, do less than the best you can to keep *all* germs away! Page 696.

SHOOTING INSTEAD OF SHOOTING HIGH SWARMS.

In my domain, page 698, read "shooting" instead of "shooting," to get down the lofty swarm. This is the worse, because, in default of anything else that seems practicable, actual shooting is sometimes indulged in.

SOME INTERESTING CALIFORNIA HISTORY.

Mr. Harbison's remarkable talk should hardly be passed over without gleaming a little. Honey at a dollar a pound, and bees at 70 dollars a colony, and business brisk in both directions! Must be pleasant to remember these old California times, as it is pleasant in 12 apiaries is quite a lot. Apparently no one ever had time to figure up their biggest crop—only knowing it was a heap over 100,000 pounds of comb honey. (Biggest crop seems to have come when there were not nearly so many bees. 'Twould be only a matter of 30 pounds each for the maximum number.)

The point-blank contradictions of the human mind get a good illustration. "Nothing that bees could live on in California," was the verdict of many apparently intelligent men that had been there. Other men, who had been there, contradicted—and were right. Curious that the same thing had to be gone over again a few years later. "Nothing for bees to live on in southern California"—best bee-pasture in the State, if not in the world. Pages 709 to 711.

KEEPING A BINGHAM KNIFE CLEAN AND DRY.

Wonder if Bingham is right, that honey and water rusts the knife carelessly left in it much less than pure water. Quite imaginable. But don't you experiment in that line. The Bingham knife is a choice tool, and do you clean it up nicely every day—and dry it off lovingly with a nearly dry hand. Page 712.

CLEANING PROPOLIZED HANDS.

As to hot water versus cold water to clean propolized hands I'm going to spit up again. Use both. Don't expect to accomplish a job of such magnitude without quite a bit of work, and intelligent work, too. Clench the smooth limb of a tree, and, twisting slightly, make that take off the first installment of the propolis. Then get the coldest water you can and wash with very decided emphasis—without any soap at first—then put on the soap and do so some

more. Spots will still remain; scrape 'em well with the jack-knife—and then another round of soap and cold water—and then a second scrape with the knife. Last of all, warm water and soap. Cold water makes propolis so brittle that it will powder up; while under hot water it just masses together. But when there's not much left but *stain*, then warm water and soap get ahead best. Any good soap fit for heroically dirty hands. My experiment with Lava soap didn't please me. Altogether too much *lather*; and too long afterward the fingers smelled and *tasted*. Alcohol and kerosene and vinegar, and probably lots of other chemicals, are good—for those who incline to like them—but the above racket, using no kept-a-purpose article, seems to me to be the "orthodox" way. Page 712.

#### NON-SWARMING IN LARGE APIARY BY CELL-CUTTING.

Yes, Sister Wilson, King Abimelech didn't like to have a woman slay him, but you and I can manage it. Glad to be slain (ought to be, whether I am or not), and know that large apiaries are actually taken through the season, with more or less of non-swarming success, by the process of cell-cutting. I honestly thought that was "book farming" except where the colonies were few. Page 713.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Don't "Drown" Queens for Introducing.

"A York County Bee-Keeper," in the Canadian Bee Journal, quotes one of my replies in this department as saying that in introducing a queen the queen is to be held under water till "nearly or entirely drowned," and he seems to think that if entirely drowned a queen would not be of great value. After consulting the dictionary, and making a careful search among my assortment of excuses, the only excuse I can find that fits the case is ignorance—pure, unadulterated ignorance. I was not familiar enough with the English language to know that when a person or thing was drowned that person or thing was dead, dead. I thought that upon being submerged in water, when it ceased to move it was drowned. I should have said to hold the queen under water till she nearly or entirely ceased to struggle. If my York County friend will continue to help me in gaining a knowledge of the English language, I'll promise never again to advise the drowning of a good queen.

C. C. MILLER.

### Wintering and Swarming in Tenement Hives—Hard Pine for Hives—Sweet Clover.

1. Will bees winter well in a double-wall tenement hive (4 in one)?
2. How can I prevent bees in a tenement hive from swarming? Can I make brush swarms?
3. Will hard pine do for hives, or will the smell of pitch harm the bees?
4. Is sweet clover a good honey-plant in this locality? If so, how much seed is required to sow an acre? What time of the year should it be sown? Where can I get it, and what is the price?

ANSWERS.—1. Yes.

INDIANA.

2. Yes, you can make brush swarms in tenement hives, and the prevention of prime swarms is the same as prevention of prime swarms in other hives; but if one of the colonies can be moved only by moving the whole four, prevention of after-swarms will not be so easy as with colonies in separate hives.

3. I don't know, but I hardly think there would be a sufficiently strong odor of pitch to make trouble.

4. It is one of the best. About 10 pounds of seed will sow an acre. Now when farmers in your vicinity sow red clover. You can get it from most dealers in bee-supplies, or from seed stores, at about 12 cents a pound.

### Spraying Fruit-Trees—Rendering Wax—Domestic Goldenrod.

1. Is there a law against spraying fruit-trees when in blossom in New Jersey?
2. Late this fall I found eggs in a number of my hives, and thinking I would watch to see how late the bees would breed, I opened that hive a couple of weeks later, and found that every egg had disappeared. What became of the eggs, and is this a usual thing to happen?
3. Can you give a simple plan to render wax in small quantities,

for one who does not care to get the implements usually used for that purpose?

4. Sometimes late in the fall, or early in the spring, when there is snow on the ground, there come warm days when the bees fly out, and many of them drop, and, getting chilled in the snow, never rise again, but die there. (I winter bees outside.) Would there be any objection to confining the bees in the hives on such days? If so, do you know of any remedy to prevent the loss of bees from this cause?

5. Can you inform me where to get seed of domestic goldenrod? It is very much like the wild goldenrod, except that it is much more fragrant, and clumps of flowers are larger and deeper.

PENNSYLVANIA.

ANSWERS.—1. I don't know; I think not.

2. You are a closer observer than the average. I think it is not an unusual thing for queens to lay after the workers have decided that they will rear no more brood. Likely the workers ate the eggs.

3. From "Forty Years Among the Bees," page 307, I quote: "An old dripping-pan (of course, a new one would do) had one corner split open, and that made the extractor. The dripping-pan is put into the oven of a cook-stove with the split corner projecting out. The opposite corner, the one farthest in the oven, is slightly raised by having a pebble, or something of the kind, under it, so that the melted wax will run outward. A dish set under catches the dripping wax, making the outfit complete. Of course, the material to be melted is put in the pan the same as in the solar extractor."

4. Better not fasten the bees in, but shade the entrance thoroughly with a broad board or screen of some kind, so as to prevent the entrance of the light.

5. No, I never heard of it before.

### Splints for Foundation—Crossing Bees—Ventilating Hives.

1. Dr. Miller says he puts foundation on with splints 1-16 of an inch square. I would like to know where I can get the splints, as I have no tools to make them.

2. Is wire used when splints are used?

3. Do you keep them? If so, what is the price of them?

4. Most of the bee-keepers say that a cross between Italians and the common bees is better than either. What do you think of a cross between Italians and Carniolans, or a cross between Italians and Cyprians?

5. Do you ventilate hives at the top, when you unite on the summer stands?

VIRGINIA.

ANSWERS.—1. You can have them made at any manufactory where they have machinery for slicing, such as they use for slicing separators.

2. No wire is necessary.

3. No, I keep no supplies for sale. I do not remember the cost, but they are not expensive.

4. I have doubts about a cross of Italians and blacks being better than Italians. Some speak very highly of a cross between Italians and Carniolans; but I think the other cross is not so much in favor.

5. With some sort of packing—absorbents, as they are called—a very slight chance for upward ventilation is allowed.

### Cutting Out Drone-Comb—Honey Granulating.

1. When is the best time to cut drone-comb out of the brood-chamber, all things considered?

2. Is a thin board fitted tight in a super, with a hole cut in it, and wire-cloth or, and filled with cut straw or sawdust, safe winter protection?

3. Will pure clover honey, run out on a section, look like granulated sugar and sparkle by drying and by age? A neighbor gave me a section, with the name of the bee-keeper printed on it, that is partly covered with what appears to be sugar, from sugar syrup fed to bees. It looks like fine, granulated sugar, and sparkles, tasting like sugar. It is a question with me, and some other bee-keepers, whether or not honey will look like this with age.

NEW YORK.

ANSWERS.—1. That depends. Perhaps the best time in general is when a comb is empty and not in the care of the bees, so that you can put a patch of worker-comb in place of the drone-comb without interfering with the work of the bees. If the comb be in the care of the bees, then any time when the bees are actively at work.

2. I suppose you mean wire-cloth is over the hole. It will do with cut straw; sawdust might be a little solid. Planer shavings and dead leaves are good.

3. I don't know. It is just possible that honey might sometimes have that appearance.

### What Trees to Plant.

I have read Prof. Cook's "Roadside Tree-Planting and Reforesting," on page 760. I would like to hear more on the subject of tree-planting. What trees are suitable for rocky hillsides, and along streams, etc.? Also, trees that are suitable for a colder climate than California?

MISSOURI.

ANSWER.—Among honey-trees that might meet your desires are hard maple, soft or red maple, fruit-trees, tulip-tree (called also poplar and whitewood), locust and hickory, or basswood.

# 4 Percent Discount During December!

Send for our List, and order now. Take advantage of this discount. Have your goods on hand ready for use.

**JUST THINK OF IT!**

If all of the Sections we sold last season were placed unfolded, in a straight line, the line would reach over Three Thousand Five Hundred Miles.

## FROM MANY FIELDS

### Great Year for Bees.

What success I have had in bee-keeping I attribute to the "old reliable" American Bee Journal

Last spring I had 2 colonies of bees, and some empty hives. I bought 3 swarms in May, where they had settled, for \$1.00 each, and increased to 11.

It was a great year for honey here. After giving several preachers a lot, and all the neighbors some, and keeping enough for my own use, I sold 700 pounds at 12 1/2 cents a pound. It was all in pound sections. As soon as I take it off, I take it to the cellar and leave the door just a little open, so the bees will come out. Then it is not spoiled with too much smoke.

In the summer I put a box that is about 8 inches deep over each hive, for a shade, laying 2 pieces of board, one inch thick, across the hive, so there will be an air-space.

Bee-keeping is a side-issue with me, but I like it very much. C. W. BAKER, M. D. Harrison Co., Mo., Nov. 27.

### Queen Laying in Queen-Cells.

On page 766, just received to-day, I notice a little comment by Delos Wood on Mr. A. C. F. Bartz's article on queen-rearing, where he asks anyone who ever saw a queen lay eggs in a queen-cell to hold up his hands. Mine are up, and if I had 3 different queens yet alive, I have owned, I could very quickly make Mr. Delos Wood hold up his hands. One queen kept me supplied for over two months with eggs, and many are the times I have seen her back up into queen-cups, and when she crawled out I found an egg in the cell. I used to put in sticks of cell-cups for her every few days, and when filled with eggs and young larvae, removed to other hives for maturing. All such queens I used were old and were trying to supersede, but I saw a year-old queen backed in a natural cup just as I lifted the comb. They were making preparations to swarm.

I used to be of the same opinion as Mr. Wood, but I must believe my eyes. I also saw 7 worker-bees backed in a comb as far as their wings would let them at one time, and after killing these 7, I soon killed 23 more that were backed in the same comb. So, I came to the conclusion that laying workers are unlimited in number when they get started. I further believe that worker bees do not put eggs in a cell any other way than by laying

in there, but I do not know; but I also do not believe Mr. Wood ever saw a worker-bee take an egg from one cell deposited by a queen and carry it to another cell and place the same egg in it, and see it develop into a worker or a queen.

Mr. Bartz's plan would not work, of course, but if you have an old queen that wants to supersede, just get a lot of natural cups and stick with hot wax to the upper side of a horizontal slit in a comb in the center of the hive, and destroy all other queen-cell cups in the hive, and if she is at the right stage of supersedeure, in a couple of days you will have a nice lot of queens in them, which, after they hatch and are being fed, can be removed, and process repeated as long as the queen lives, or as you desire; and if you follow that up with several nice, gentle queens, week after week, and year after year, as I have done, you will surely see more than one queen backed in the cells; and if your queens are of properly selected stock, as they should be, you will soon have a lot of bees that will surprise you in what they can do. Let every queen be reared from the best mother, and so on for many years, and you will have no poor drones to mate your choice queens.

I have an apiary in San Bernardino Co., Calif., and I believe if Mr. Wood will come over to see me next summer, I can show him some proof of what I have said.

THOS. CHANTRY.

Daivison Co., S. Dak., Nov. 28.

### Poor Season for Bees.

The past season was rather poor for this locality. White clover was very plentiful, but the weather was so cold that several colonies at my out-yard died of starvation after the fields were white with clover. The bees did not commence storing surplus until near the 1st of June, and then the flow lasted only two weeks. I never saw so much swarming, and not a swarm stored any surplus, and all of those that were not hived on full combs had to be fed for winter. Our

## A "Dirt-Cheap" Bottom-Board

The Bee-Keepers' Review for November describes a Bottom-Board that costs absolutely nothing. This may seem strange, but it is strictly true.

This same issue also describes a Cover that will neither warp, wind, split, nor twist, yet it can be made for five cents.

Another interesting feature of this issue is the description of a cheap but novel method of supporting brood-frames, in which the point of contact

is so small that gluing of them fast is almost impossible—they can always be picked up with the fingers with no prying loose.

Send \$1.00 for the Review for 1904, and you will get, not only this November issue, free, but all of the other issues of this year. In other words, as long as the supply holds out, all of its numbers of this year (1903) will be sent free to the man who sends \$1.00 for 1904. This year and next for only \$1.00.

W. Z. HUTCHINSON, Flint, Mich.

Wholesale and Retail.

Several carloads continuously on hand. Send for our 40-page Illustrated Catalog.

LEWIS C. & A. G. WOODMAN, Grand Rapids, Mich.

main honey-flow is generally from fall flowers. I never saw so many flowers in my life as there was this year, but it was too cold and wet for the bees.

A great many young colonies have already started. I put my bees in the cellar last week; there were 155 colonies in rather poor condition.

H. H. PORTEK.

Sauk Co., Wis., Dec. 1.

### From An Old Reader.

I have taken the Bee Journal nearly 30 years. I have owned bees over 35 years, and have sold a great many tons of honey, all of my own producing, the most in any one year, being 3 tons. I have on hand from 1000 to 1200 pounds of honey, some light, some buckwheat, and all in one-pound sections. I have 130 colonies of bees to keep through the winter.

I shall be 71 years old Jan. 11. Well do I remember Mr. Newman, the former editor of the American Bee Journal, that so lately passed way. Not to underrate Mr. Newman, I will say that the Journal has taken quite an advance step since he left it.

C. ALEXANDER.

Onondaga Co., N. Y., Nov. 28.

### Good Year for Bees.

This has been a good year for the bees with me. I have 23 colonies, and got 1500 sections of comb honey, and 30 gallons of extracted honey.

EDGAR EASTMAN.

Buena Vista Co., Iowa, Nov. 30.

### Bees Did Well.

I have 10 colonies of bees, and they did well this season. On account of the dry, cool weather they did not swarm very much—4 swarms out of 10 colonies, and 2 of them out of one. I think the bees will do well here in a short time.

G. W. MOYCN.

Harvey Co., Kans., Nov. 27.

### Goldenrod and Asters in Illinois.

An editorial says, "Surely goldenrod and asters should have some bacterium in Illinois." Asters are of the composite family, and do not require any bacteria. Only plants of the legume family require bacteria. There are about 100,000 species of flowering plants, 6500 species of the legumes. All the lotwera, all the peas, beans, vetches, lupines, etc., belong to the legumes; also the sensitive plant and the locust trees belong to this family.

I think we do not get goldenrod honey in Illinois, because we do not have enough of the right kinds. Here we have only two kinds that I know of. In the East they have 30 or more kinds; some kinds probably produce honey better than others.

J. E. JOHNSON.

Knox Co., Ill., Nov. 25.

# A Solid Gold Fountain Pen Free!

Finally, we have found a good Fountain Pen that is reasonable in price. The manufacturers of this pen say that if you pay more than \$1.25 for other fountain pens, it's for the name.

This pen is absolutely guaranteed to work perfectly, and give satisfaction. The Gold Nibs are 14 kt., pointed with selected Iridium. The Holders are pure Para Rubber, handsomely finished. The simple Feeder gives a uniform flow of ink. Each pen is packed in a neat box, with directions and Filler.

**How to Get this****Fountain Pen Free!**

To a present paid-in-advance subscriber, we will mail this Fountain Pen free as a premium for sending us 3 NEW SUBSCRIBERS to the WEEKLY AMERICAN Bee Journal for one year (with \$3.00). Surely, this is an easy way to get a good Fountain Pen. Or, if unable to get the two new subscribers, and you want one of these Pens, forward to us \$1.25 and we will send it to you by return mail. Or for \$2.00 we will send to any one the American Bee Journal for one year and a Fountain Pen.

This Fountain Pen would be a splendid gift to a friend or relative. Why not order both Pen and Journal for some bee-keeper as a present?

THE AMERICAN BEE JOURNAL

**Beedom Boiled Down****Future of Sweet Clover.**

It has pained me to see the way in which many of the agricultural papers have talked about sweet clover, especially in answering inquiries. Here is something from the Country Gentleman, however, from John Chamberlain, that is a fair recognition of its true value:

"I never see a swampy growth of sweet clover that a man could fairly get lost in, as he would in a Southern canebrake, without wondering why some one has not taken it up and made it a leader in hay-producing plants. As we see it, only one crop is produced; but where it happens to be cut down before seeding, and before the main stem becomes woody, it springs up again at once and covers the ground with the most succulent growth imaginable, and is always quite indifferent to dry or wet weather. Some day we shall appreciate sweet clover."

The writer of the above item does not say outright that it will be eaten with the greatest avidity by almost all kinds of stock when they once create an appetite for it, but he seems to take it for granted it is of value. None of the clovers can be classed as noxious weeds. Of course, even rank red clover in a strawberry patch might be called a weed; and sweet clover has perhaps created the impression that it is a weed because it grows luxuriantly, even on the hardest ground by the roadside, where red clover would not grow at all. It is really one of the hardiest and most valuable of the clovers.—A. I. ROOT, in *Gleanings in Bee-Culture*.

**Tiering-Up Supers.**

Tiering up by adding the new super above the old one has been discussed of late, in a way that shows misconception of the idea. It is not always to put the new super on top, no matter how many supers are under, but always to have the new super just over the one that is approaching completion—not over the one that is just receiving the finishing touches. The latter should always be on top. If it would thus receive less attention than it should, there are too many supers on the hive. In other words, a super should be nearly completed when next to the brood-chamber, but when that point is reached, should change places with the new super, which has been added some time previously on top.

Many times this season I noticed that putting the new super next to the frames too soon results in neglect of the outside sections of the super approaching completion, to work the center sections of the new super. The flow was too slow for the bees to work willingly at the sides when they had plenty of room given directly overhead and next to the frames. Putting the new super above the old one for a time corrected this tendency. The center sections of the new one would be worked some, but at the expense of the old super, as happened by the plan of tiering underneath.—F. L. THOMPSON, in the *Progressive Bee-keeper*.

**Errors in the National Report.**

Referring to his talk given at the Los Angeles convention, Mr. A. I. Root makes these corrections in his paper, which we are glad to reprint:

On page 694, Mr. Samuel Wagner is credited with making the first machine with rollers for making comb foundation. Instead of giving Wagner the credit it should have been Washburn. Mr. Alva Washburn, of Medina, Ohio, made the first pair of rollers of wood ever saw, for rolling out comb foundation. He did this while working for me by the day; but, notwithstanding, the credit is due to him more than to anybody else, for having carried the operation through its ex-

**BEE=BOOKS**

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 &amp; 146 E. Erie St., CHICAGO, ILL.

**Forty Years Among the Bees, by Dr. C. C. Miller.**—This book contains 328 pages, is bound in handsome cloth, with gold lettering, and is printed on best book-paper, and illustrated with 112 beautiful, original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide, or Manual of the Apisary, by Prof. A. J. Cook, of Pomona College, California.** This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy, physiology of bees, 544 pages, 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee, revised by Dadant.**—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture, by A. I. & E. R. Root.**—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.**—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey, or Management of an Apisary for Pleasure and Profit, by Thomas G. Newman.**—It is nicely illustrated, contains 100 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.**—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur, by Thomas G. Newman.**—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apisary Register, by Thomas G. Newman.**—Devotes two pages to a colony. Leather binding. Price, for 60 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood.**—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping, by G. R. Pierce.**—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment, by Prof. F. R. Cheshire.**—Its Cause and Prevention. 10 cts.

**Foul Brood, by A. R. Kohnke.**—Origin, Development and Cure. Price, 10 cents.

# CHAS. A. CYPHERS'

NEW INCUBATOR CO.

Mr. Cyphers, formerly of the Cyphers Incubator Co., Buffalo, N. Y., has severed his connection with that concern and established a new organization under the title of CHAS. A. CYPHERS CO. for the manufacture of incubators and brooders of a much improved style. It will pay you to write for a copy of his new circular and ask to be registered for a copy of his 1904 catalogue, which will be ready about Jan. 10th. Address CHAS. A. CYPHERS CO., 32-17 Henry St., Buffalo, N. Y.

permental stage, and making it a practical success.

On the same page we are told that our good friend, F. Bingham, of smoker fame, has "hives of his own." It should read, "a hive of his own." It would seem very strange if an old bee-keeper like friend Bingham did not have some "hives," more or less, of his own.

On the same page, lower down, we are told the daily papers spoke about a "Quaker chap down in Ohio." The word *Quaker* should be *quaker*. We have always been more or less *quaker* to the outside world, but I have never been a Quaker.

On the next page we read, "The sorrow that covers a man's grave is oftentimes the poultice that draws out his virtues." The word *sorrow* should be *sol*. I used the old proverb in speaking of the death of Thomas G. Newman.

### Italians as Winterers.

In Gleanings in Bee-Culture G. M. Doollittle, in reply to the question whether Italians stand the cold winters in 43 degrees north latitude as well as the German or black bees, says:

"It is said by some that they do not; and I used to believe that the black or German bee was the hardier; but that was before I made any careful test in the matter. Some 25 years ago I began to look carefully into the matter of wintering; and during the experience of all these years since, I have become convinced that there is little if any difference in favor of either along this line. Some winters the blacks seem to do better; in others, the Italians come out ahead."

### CONVENTION NOTICES.

**Pennsylvania.**—All bee-keepers in the State of Pennsylvania interested in forming a thorough State organization, are requested to correspond with the undersigned.

Swartmore, Pa. E. L. PRATT.

**Kansas.**—The first regular meeting of the Kansas State Bee-Keepers' Association will be held at Topeka, Dec. 30. All persons interested in bees, whether members or not, are urged to be present.

Alliance, Ohio.

# Langstroth on "The Honey Bee"

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**GEORGE W. YORK & CO.**

144 & 146 Erie Street, CHICAGO, ILL.

## 20,000 Pounds

White Extracted Alfalfa HONEY FOR SALE.

DR. GEO. D. MITCHELL & Co., Ogden, Utah.  
4641st Please mention the Bee Journal.

### WANTED—Extracted Honey.

Mail sample and state lowest price delivered Cincinnati. Will buy FANCY WHITE COMB HONEY, any quantity, but must be put up in no-drip shipping-cases.

C. H. W. WEBER,

2146-48 Central Ave., CINCINNATI, OHIO.  
241st Please mention the Bee Journal.

**WANTED—Comb Honey** in quantity lots. We are perhaps the only dealers in this article owning as much as 150,000 pounds at one time. Please state quantity, quality and price asked for your offering. Thos. C. Stanley & Son, 241st MANZANOLA, COLO., or FAIRFIELD, ILL.

## FOR SALE!

White Clover Extracted Honey, which was taken from upper stories with a queen-excluder between, and the combs were nearly all sealed solid before extracting. It is very thick, and has that fine rich flavor that only honey thoroughly ripened in the lives can have. I would like to obtain a few more customers who would appreciate a fine article. Price, in new 60-lb. cans, on board cars here cash—first order—one can, 87½¢ a pound; 2 or more cans, 85¢; sample, 83¢. References: George W. York, of the A. I. Root Co., and the Charlotte National Bank, 493A3. C. MONETTE, Chatfield, Minn. Please mention Bee Journal when writing.

**WANTED! FANCY COMB HONEY** in no-drip shipping-cases. Also Amber Extracted in barrels or cans. Quote your best price delivered Cincinnati. The Fred W. Muth Co., 3241st Front and Walnut, CINCINNATI, OHIO.

## "What Happened to Ted?"

BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton, the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—40 pages, 5x8½ inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver.) Address,

ISABELLE HORTON,  
227 EAST OHIO STREET, CHICAGO, ILL.

## HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Dec. 7.—At this season of the year there is not much trade in honey, retailers having laid in their stocks for the holidays. Fancy comb honey for the Christmas trade has brought 13½¢; No. 1 grades, 12½¢@13¢; amber, 9½¢@10¢. Extracted, white, brings 60¢@7¢; amber, 50¢@6¢. All extracted honey is sold on its merits, quality, kind and style of package. Beeswax, 28¢@30¢. R. A. BURNETT & Co.

PHILADELPHIA, Dec. 10.—Large lots of comb honey being offered from States that were not supposed to have much stock. Beesmen, as usual, wake up now to the fact that they want to sell their comb honey and push it on the market, thus breaking the price. If they would only offer their honey in September, they would get more for it and it would be better for the producer and dealer. We quote fancy white, 14¢@16¢; No. 1, 12¢@14¢; buckwheat, 12¢. Fancy extracted, 8¢; amber, 6¢@7¢. We are producers of honey, and do not handle on commission. WM. A. SELSER.

ALBANY, N. Y., Nov. 27.—Honey market some lower since the cold weather and Thanksgiving demand over. We quote: Fancy white, 15¢; No. 1, 14¢@14½¢; buckwheat and mixed, 13¢. Extracted, steady and quiet; buckwheat, 6¢; clover, 7¢; mixed and amber, 6¢@6½¢. Beeswax, 28¢@30¢. H. R. WRIGHT.

CINCINNATI, Nov. 20.—The demand for comb honey is slower now than it was six weeks ago, owing to the enormous quantities offered on all sides. Fancy comb honey is selling at 14¢. The supply of extracted honey is big although the demand is good. We are selling amber extracted in barrels at 57¢@6¢. White clover, in barrels and cans, 76¢@7½¢, according to quality. Beeswax, 30¢.

THE FRED W. MUTH CO.

BUFFALO, N. Y., Oct. 11.—The demand for white comb honey is better than it was. The trade is particular and wants only very white, large, clean combs. Yellow wax is not so certain it does not sell well, and price has to be cut. Fancy white comb, 14¢@15¢; A No. 1, 13½¢@14¢; No. 1, 13¢@13½¢; No. 2, 12¢@12½¢; No. 3, 10¢@11¢. All the comb honey is sold on its merits. White extracted, 6¢@7¢; amber, 6¢@6¢; dark, 5¢@6¢. Beeswax, 28¢@30¢.

W. C. TOWNSEND.

BOSTON, Nov. 25.—Western honey is arriving more freely in our State, causing a slight drop in prices. Fancy No. 1, in cartons, brings a 17¢; A No. 1, 16¢; No. 1, 15¢. Extracted, white, 84¢; light amber, 70¢@75¢; amber, 60¢@7¢, according to quality. BLAKE, SCOTT & LEE.

KANSAS CITY, Dec. 5.—Receipts of comb honey larger; demand fair; prices easier. We quote fancy 24-oz. section cases, 57¢@62¢; No. 1, 47¢; No. 2, \$2.65. Extracted, white, 70¢@75¢ per lb.; amber, 60¢@65¢. Beeswax, 25¢@30¢.

C. C. CLEMONS & Co.

CINCINNATI, Dec. 7.—The market on comb honey has weakened, as the supply has been large and the demand for the holidays is not so white at 14¢; of grades, lower. Extracted I quote as follows: Amber, in barrels, 57¢@58¢; 60 lb. cans bring 54¢ more; alfalfa, water-white, 60¢@65¢; fancy white, 60¢@65¢. Beeswax, good demand; 30¢ per nice. C. H. W. WEBER.

NEW YORK, Dec. 4.—Comb honey is arriving in sufficient quantities to supply the demand, and, as to the quality, most of the white honey seems to be off color, more or less. We quote fancy white at 14¢; No. 1, at 13¢; amber, 11¢@12¢; 60¢@65¢; fancy white, 60¢@65¢. Extracted, light amber, at 6¢; white, 64¢; Southern, 55¢@60¢ per gallon; buckwheat, 54¢. Beeswax, 28¢@29¢.

HILDRETH & SEIGLER.

SAN FRANCISCO, Oct. 21.—White comb, 1-lb. frames, 13¢@14¢ cents; amber, 9¢@11¢. Extracted, white, 57¢@62¢; 60 lb. cans, 57¢@62¢; No. 1, 47¢; No. 2, 44¢; No. 3, 41¢. Beeswax, good to choice, light, 27½¢@29¢; dark, 25¢@26¢.

Market is more quiet than for several weeks preceding, but is fairly steady as to value. Spot stocks and offerings of both comb and extracted are mainly of amber grades, while most urgent inquiry is principally for water-white, and some of the better grades of comb. There is much competitive bidding from buyers. Recent arrivals of honey included a lot of 121 cases from the Malaita Islands. The bees of the Islands feed mainly on sagar.

# Extracted Honey For Sale!

ALL IN 60-POUND TIN CANS.

## Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Our honey is put up in tin cans holding 60 pounds of honey each. These cans are shipped in wooden-boxes, and should arrive safely. We have nothing but **PURE BEES' HONEY** to offer, and so guarantee it. **Cash must accompany each order.** All prices are f.o.b. Chicago.

## Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

### Prices of Alfalfa Honey:

One 60-lb. Can @8c.....\$ 4.80  
Two 60-lb. Cans (in 1 box) @7½c 9.00  
(Larger quantities at the 7½c price.)

### Prices of Basswood Honey:

One 60-lb. Can @9c.....\$ 5.40  
Two 60-lb. Cans (in 1 box) @8c.... 9.60  
(Larger quantities at the 8c price.)

A sample of either Alfalfa or Basswood honey will be mailed on receipt of 10 cents; samples of both kinds for 16 cents. (Stamps accepted.)

**BEEWAX WANTED**—We are paying 28 cents cash or 30 cents in trade for pure average beeswax delivered in Chicago (or Medina, Ohio).

**HONEY-JARS**—Don't forget to get our prices on all sorts of honey-packages.

If more convenient, Dues may be sent to the Secretary, at the office of the American Bee Journal.

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

# Some Good Clubbing Offers.

As this is the time of year when most subscribers renew their subscriptions, we wish to call special attention to the following, which we are sure will commend themselves to all:

- No. 1—The Bee Journal and Dr. Miller's "Forty Years Among the Bees" (book alone, \$1.00)..... **Both for \$1.75**
- No. 2—The Bee Journal a year and Prof. Cook's "Bee-Keeper's Guide," (book alone, \$1.20)..... " **2.00**
- No. 3—The Bee Journal a year and Dadant's "Langstroth on the Honey-Bee," (book alone, \$1.20)..... " **2.00**
- No. 4—The Bee Journal a year and Doolittle's "Scientific Queen-Rearing," (cloth bound) (book alone, \$1.00).... " **1.75**
- No. 5—The Bee Journal a year and Doolittle's "Scientific Queen-Rearing," (leatherette bound) (book alone, 75c) " **1.50**
- No. 6—Bee Journal a year and Standard Untested Italian Queen (mailed in May or June, 1904) (Queen alone 75c) " **1.50**
- No. 7—The Bee Journal a year and a "Novelty Pocket-Knife" with your name and address on it (knife alone, \$1.25) " **2.00**
- No. 8—The Bee Journal a year and a "Wood Binder," for holding a year's numbers (binder alone, 20c)..... " **1.00**
- No. 9—The Bee Journal a year and an "Emerson Binder," (stiff board) (binder alone, 60c)..... " **1.40**
- No. 10—The Bee Journal a year and a Monette "Queen-Clipping Device," (device alone, 25c)..... " **1.00**
- No. 11—The Bee Journal a year and Newman's "Bees and Honey," (cloth bound) (book alone, 75c)..... " **1.50**
- No. 12—The Bee Journal a year and Newman's "Bees and Honey," (paper bound)..... " **1.10**
- No. 13—The Bee Journal a year and Root's "A B C of Bee-Culture," (book alone, \$1.20)..... " **2.00**
- No. 14—The Bee Journal a year and a Foster Stylographic Pen (Pen alone, \$1.00)..... " **1.75**

Send all orders to **GEORGE W. YORK & CO.**  
144 & 146 E. Erie Street, CHICAGO, ILL.

## The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The holsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25 or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$2.00.

**GEORGE W. YORK & CO.**

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

## Editorial Comments

### The Merriest Christmas of All!

This is our wish to each one of the readers of the old American Bee Journal. May the gifts received and bestowed at this merry Christmas tide cause tender and loving thoughts in the hearts of both giver and recipient. It is the time of all the year when joy and happiness should prevail everywhere. That they may be in large measure in every home where goes the American Bee Journal, is also our earnest wish.

### Sections Filled With Foundation.

In a work under review, the British Bee Journal objects to the phrase, "sections filled with foundation," and thinks "filled" is a misprint for "fitted." On this side it is common to speak of sections filled with foundation, when, instead of a small starter of foundation, the section contains as much foundation as it is practicable to put in. Will our British cousin tell us how the same thing is expressed over there?

### Self-Hiving of Swarms.

A case of self-hiving is reported in Gleanings in Bee-Culture by G. W. Strangways. A colony with a clipped queen was placed on a stand about 18 inches high. An old hive made ready for the expected swarm was, by chance, left on the ground in front of the colony. One day it was discovered that this old hive was occupied, a swarm having issued and entered with its clipped queen without any one to witness the proceedings.

### Keep Your Colonies Strong.

This, called Oettl's Golden Rule, was considered so important by Father Langstroth, that in the closing words of his classic work, the following words are found:

"The essence of all profitable bee-keeping is contained in Oettl's Golden Rule: KEEP YOUR COLONIES STRONG."

Latterly, considerable emphasis has been put upon the importance of knowing thoroughly one's honey-resources so as to have colonies strong at just the right time, without having a lot of useless consumers when there is nothing for them to do. In other words, Oettl's rule would be modified to read: Keep your colonies as strong as possible when there is work in the fields, and keep down unnecessary numbers at other times.

There is good sense on the side of this modification—theoretically, at least—for what good can it do to have an immense number of bees in a hive at a time when they have nothing to do but diminish the amount of stores in the larder? But is it a thing to be put in practice universally? Can one always know in advance just when numbers will be needed? In localities where there are frequent and rapid changes in the amount of nectar to be had, is it possible to make the frequent and rapid changes so as to have the number of fielders always correspond with the amount of the nectar offered?

So far from this being the case with S. E. Miller, he thinks the rule with him should be: Keep your colonies *always* strong. No

doubt the reasons that make this rule applicable with him make it equally appropriate for a good many others; and he gives thus his reasons in the Progressive Bee-Keeper:

I want them strong early in the season, so that they may be able to build up strong during fruit-bloom, so that they will be ready for the white clover bloom. During the white clover bloom I want to keep them strong; so that if there is a surplus to be gathered during the latter part of July and early August, they will be early for it. I want them strong about Aug. 1st to Aug. 15th, so that they will be ready for the autumn flow, which commences about Aug. 20th, or later; and I want them stronger when they go into the winter, for it is a well known fact that strong colonies consume proportionately less quantities of stores than do weak colonies. Then, I want them strong early in the spring for the reason stated above, so that in my locality there is seldom a time that worker-bees will certainly become useless consumers, and should there be such a time I can not be sure that it is coming, in advance of its coming. Therefore, the rule with me must be, *Colonies always strong.*

Mr. Miller is broad-minded enough, however, to admit that what is true with him may not be equally true with others, and wisely adds:

From what I have said above, it is evident that no bee-keeper can be too well informed as to the resources of his own particular location.

### Staples for Fastening Hive-Bodies, Etc.

These seem to be coming into quite general use for fastening hive-bottoms and hive-bodies together, or for any other use where it is at times desirable to take away the fastening. The usual size of these staples is  $1\frac{1}{2}$  inches wide with points  $\frac{3}{4}$  inch long. It is a question of some importance whether this is the best size. Would there be an advantage in having staples of larger dimensions? Would there be any greater security in a staple 2 inches wide? There is little question that points more than  $\frac{3}{4}$  inch would hold more securely. Such a staple will hold quite well if it be driven in full depth; but if driven in full depth it is hard to draw the staple afterward. If driven in to such a depth that something can easily be slipped in to draw it, it may sometimes happen that the staple will be loosened by the shaking on the wagon in going to or from the out-apiary, especially if the staples be new and smooth. What is the experience of our constituency? What is the best size for staples?

### Organizing Local Bee-Keepers' Associations.

We are often asked about starting a bee-keepers' association—how to go about it. The same question was brought up at the recent meeting of the Chicago-Northwestern convention. Perhaps a few words outlining the manner in which this flourishing association was started might be of interest, and also be a help to others who contemplate a similar movement.

In the first place, we published a call in the bee-papers for a meeting of all interested in bees, to be held at a certain place, and at a stated time. If we were in a country town, we would put such a call or notice in the local newspapers.

Then, on the appointed day, the thing to do is to get together and organize by electing a chairman or president, a vice-president, a secretary, and a treasurer. Sometimes the last two offices are combined, making one person the secretary-treasurer.

In the absence of any special program, the best plan is to pass slips of blank paper around, and ask each one to write any question he may desire to have answered. Then the question slips are to be gathered up, and the president read each one, giving ample time, however, for a full reply by all who desire to take part in the discussion

After finishing the first lot of questions, pass around more slips of paper for questions, and so on until it is time to adjourn. This plan really makes the best convention. Very much depends, however, upon the president, whether the question program is a success or not.

For best results, we believe that no bee-keepers' convention should be held oftener than once a year. The bee-keepers in and around Chicago tried meeting twice a year, but it seemed to be a failure. The fall of the year is the best time, say the latter part of November and in December. Of course, there may be exceptional cases where two meetings a year are successful, but we believe in the majority of cases the annual meetings are best.

### Driving Bees.

This is an important feature of bee-shows in England, prizes being offered for driving in the shortest time. Yet some are beginning to raise the question whether driving bees should not now be considered a thing of the past. From one point of view it seems a pity to have it discontinued in public exhibitions, as there are in England some who are very expert at it.

Very likely some, if not many, of the readers of these pages will ask, "What do you mean by 'driving bees,' anyhow?" It means the driving of bees from box-hives into movable-frame hives, and would, perhaps, be better understood by the term "transferring." Yet among the younger members of the craft, in this country, are many who have never seen the process of driving or transferring, for the very good reason that there are no opportunities for the performance, all the bees in their localities being already in hives with movable combs. Localities, however, may still be found in this country where the box-hive is yet in fashion.

### The Life of Bees.

A fresh contribution to the subject is given by D. M. M., a prominent correspondent of the British Bee Journal. To a colony of black bees he gave an Italian queen June 6, liberating her June 7. Eggs were seen June 11. July 23, 50 percent of the bees were Italians; July 25, 75 percent; July 29, 90 percent. A few blacks were still seen Aug. 1, and all had disappeared Aug. 6. D. M. M. comments thus:

"It was marvellous to see how rapidly the blacks disappeared, especially during the last fortnight, when the decrease in numbers was something extraordinary. I calculated that, when the queen was inserted on June 6, the colony numbered 50,000 blacks; yet in 80 days they had all died out, showing an average mortality of about 500 bees per day. In the earlier weeks it was much less so; in the later ones it must have been very considerably greater."

If we assume that the black queen was removed June 6, that makes 61 days as the life of her latest descendant, supposing it died Aug. 6. That is much more than the six weeks generally accepted as the average life of a worker in the busy season. It is not fair, however, to take the latest survivor as a proper example of average longevity. Yet figure as we may, the data give no fair support to the belief that six weeks, or 42 days, is the average length of life. Six weeks from June 6 would give us July 18, when, according to the six-weeks rule, all the blacks should have disappeared, barring a few persistent hangers-on. But July 18 more than half the bees were still blacks. Even if we take July 29 as the time of the demise of the latest-born blacks, a time when a tenth of the blacks were still present, that will give us not less than 53 days as their lifetime.

Were these bees possessed of unusual longevity, or do our figures as to the lifetime of a worker, in the busy season, need overhauling? Perhaps this is a matter that should be taken up by the experiment stations.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample copy free; 10 for 20 cts.; 25 for 40 cts.; 50 for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; 1000 for \$7.50. Your business card printed free at the bottom of the front page, on all orders for 100 or more copies. Send all orders to the Bee Journal office.

The Premiums we offer are all well worth working for. Look at them.

## Miscellaneous Items

**Mr. J. H. Kallmeyer**, of Wilson Co., Tex., has been strolling around in Southern California lately.

**Mr. Geo. W. Iriker**, of Lucas Co., Iowa, reports his crop of extracted honey for 1903 as 40,000 pounds from 300 colonies. Nothing small about that, surely.

**Mr. John M. Hooker**, a former prominent English bee-keeper, has been visiting Southern California recently. He seemed to be very much interested in their method of bee-keeping, and while there visited the apiaries nearest the city of Los Angeles, taking some snap shots with his eyes and camera.

**Mr. W. T. Richardson**, one of Southern California's best and most prominent apiarists for years past, has disposed of his three apiaries of 900 colonies, located in the Simi valley, and has gone East to reside. It is hoped that the change will result in his complete restoration to health, and his return to California.

**The Honey Crop** in the region of Lake Windemere, England, is very small this year, so it is reported. "The wet weather of the past summer has not agreed especially well with the Italian stock that has been introduced into that country." Wet weather seems to work disastrously in at least two ways to the bee-keeper. It prevents the flowers from yielding nectar, and also keeps the bees in the hives.

**Prof. Cook a National Director.**—A leading California bee-keeper wrote us as follows last week:

"As there will be several vacancies on the Board of Directors of the National Bee-Keepers' Association the coming year, I desire to suggest the name of Prof. A. J. Cook as one who would represent all sections."

Prof. Cook would be a strong member of the Board. He is greatly in favor of co-operation among bee-keepers, too.

**Father Wm. R. Graham**, of Hunt Co., Tex., passed away Nov. 27, 1903. He was the pioneer bee-keeper of his State. Dr. Wm. R. Howard, when sending us a picture and sketch of Mr. Graham, said of him:

"I first became acquainted with Mr. Graham and family in 1876. We were like brothers from our first meeting. No man was held in higher esteem by all who knew him. He was devoted to his friends, and their success was to him a joy which he could not suppress."

A little later on we will publish Mr. Graham's excellent picture and biographical sketch.

**Southern California Still Dry.**—A prominent Southern California bee-keeper wrote us Dec. 9:

"I note that W. A. Pryal is in great glee over the honey prospects in his section of the State, as the result of a copious rainfall. His intimation that the southern portion of the State has also been favored is a mistake, as we have had only a sprinkle of rain thus far, with the consequent result of many long-drawn faces among the bee-keepers of Southern California. Early rains, though as a rule, are not of much benefit to the bee-keepers, and as our heavy fall usually takes place during the months of January, February and March, it is yet too early to predict a dry year for this section of the State."

**Bee-Tree the Property of the Land-Owner.**—Mr. Edwin Bevin, of Decatur Co., Iowa, sends us the following clipping:

OSKALOOSA, IOWA, Oct. 29.—The boys who cut down Henry Brandt's bee-tree and took down the honey have to pay for same. Judgment against two of the boys, Joe Holdsworth and Joe Griffith, was rendered in the sum of \$20 and costs, amounting to \$6.59, making a total of \$26.59 to be paid by the boys.

The case was brought by Henry Brandt, owner of the bee-tree. He sued for the sum of \$50. The boys located a bee-tree on the premises of the plaintiff. They cut it down and appropriated the honey. The plaintiff caused the arrest of the boys, and sought to recover the price of the property. He claimed that between 200 and 300 pounds of honey had been taken, and bees destroyed. In the adjudication of the case, the value of the tree cut down was estimated at \$5.00, the corn destroyed by tramping \$1.00, value of two swarms of bees, \$5.00, and the value of the honey taken \$11—making a total of \$30. The

question of the ownership of wild bees was argued carefully. The defense claimed that the bees were the same as wild animals, and were open property, but the court did not find judgment in accordance with this theory.

Boys who destroy property and steal must expect to pay for it when caught. Perhaps if they had gone to the owner and proposed to divide up the honey, in case any was found in the tree, he would have consented to cutting down the tree, and possibly might have helped in the work. Of course, in view of the way it ended, it would have been much cheaper and easier for the boys to have gone to some bee-keeper and paid him a good price for 200 pounds of honey. "Stolen sweets" sometimes "come high," as those Iowa boys can testify.

**The Annual Report of the General Manager of the National Bee-Keepers' Association for 1903 is on our desk.** It is a pamphlet of 60 pages, 6x9 inches in size. It is illustrated with half-tone engravings of all the officers and members of the board of directors. It contains a list of the membership, some 1600 in number, besides some other interesting matter. The receipts for the year, including the amounts received from former officials, is \$1741.68; the expenditures were \$626.60, leaving a balance on hand of \$1115.08. But the expense of printing over 2000 copies of the present Report will reduce the balance several hundred dollars, probably.

The Report is mailed only to members of the Association, who will also ballot this month for three directors, a general manager, and on some amendments to the Constitution.

**General Manager N. E. France** is to spend the month of January among the bee-keepers of New York State. They will find him a very pleasant man to meet, rather quiet, but one who knows his business, and is not afraid to say what he thinks. He is doing good work as General Manager of the National Association, and should have all the support and encouragement possible in his work, which is mainly a labor of love, for the financial returns he receives personally out of the general management is simply nothing when compared with the amount of work he is doing for the good of bee-keeping here in America.

**Mr. Wm. M. Whitney**, of Walworth Co., Wis., wrote us as follows, Dec. 10:

FRIEND YORK:—Home again, and am feeling first-rate. We had a very enjoyable time at our Chicago-Northwestern convention. Never attended a better one. I shall continue my effort to form an organization of the bee-keepers here.

Say, ask "Nebraska Subscriber" (see pages 797 and 798) to have his picture taken when he gets his "togery" all on. I just noticed his description of it in the Journal. W. M. WHITNEY.

Yes, we will be pleased to put his picture in the American Bee Journal if he will have it taken with his "togery" on and forward it to us.

## Sketches of Beedomites

### MR. GUS DITTMER.

Gus Dittmer was born in Prussia, Germany, in 1853. He came to the United States in 1862, and to Wisconsin in 1863. He received a common school education, and afterward was in the boot and shoe business until 1893. He took a colony of bees from a customer in payment of a debt, in the fall of 1882. He read "Quinby's Bee-Keeping" that winter, and the next spring began handling bees. He took a great fancy to bees from the start, and has been a bee-keeper and reader of the bee-papers and books on bees ever since. He now keeps from 75 to 100 colonies.

After starting in the bee-business he began to furnish his customers and other bee-keepers with supplies, and after a few years he was supplying the whole country around him, and was even doing some shipping. He began making comb foundation several years before leaving the shoe-business. In 1895 he started in the manufacture of foundation and supply trade exclusively, the plant then consisting of a building 9x16 feet, with a cellar the same size. In 1896 he built a

2-story house, 18x24, and in 1898 added a two-story upright to this, 22x28, and began buying sections by the car-load.

Up to 1899 Mr. Dittmer's foundation was all made by the old dipping process, but since then he has been developing the process by which all of his foundation is now made. In 1900 he perfected automatic machines, geared to his foundation mills, that will continuously pull foundation from the mills, paper it, print his card on it, cut into proper length, and pile it up, all at one operation, at the rate of from 25 to 75 pounds every hour, one person doing the work.

In 1901 Mr. Dittmer added a shop, 15x24 feet, for a 2½ horse-power gasoline engine and the sheeting machines, and since that time all of the machines are run by power.

This fall the capacity had to be further enlarged by building a warehouse, 24x50 feet, two stories high, and the old building will be used only for manufacturing comb foundation, for storing the same and beeswax, and for a shipping-room and office.

All of the work is done right in Mr. Dittmer's family. Fred works with his father continually, and Clarence and Bessie are always ready to run a machine. In fact, they, with the occasional help of Mrs. Dittmer, run out all of the foundation, making, during the rush, as high as 750 pounds in one day.

Mr. Dittmer has been supervisor on the Eau Claire County Board since 1892, and was chairman of the Board six years out of the past eight. He is a teetotaler, minds his own business, and doesn't loaf around town.

In 1878 Mr. Dittmer was married to Jennie Hatch, and they have four children, as follows: Fred, 23 years of age; Bessie, 21; Clarence, 18; and Margaret, 8.

Mr. Dittmer is the efficient secretary of the Wisconsin State Bee-Keepers' Association. He is also one of the regular, responsible advertisers in the American Bee Journal, and his business is growing just as one would naturally expect in view of the character of the man and the pushing business methods he uses.

### Making Vinegar Out of Honey and Water.

BY C. P. DADANT.

IF you simply mix the honey and water so that an egg will fairly float at the top, showing about the size of a dime out of water, it may be sufficient or it may not, according to the amount of ferment contained in the honey, and also according to the temperature after the mixture is made. To make vinegar there must be an alcoholic fermentation previous to the acetic, and the more thorough the first fermentation is, the better the acetic fermentation will be.

In order to hasten the fermentation, it is best to add some fresh fruit-juice to your honey-water. Then, if the liquid is cold, or if the temperature is low, it is best to heat the liquid till it reaches about 90 or 100 degrees. If it is kept warm, the fermentation will soon begin, and if it remains exposed to the air it will be but a short time till the sour taste begins to show.

We never allow any honey to go to waste. The washing of the cappings in a well-regulated apiary will furnish enough vinegar for two or three families, even if only a few hundred pounds of honey have been uncapped. In a large apiary the cappings are first drained through the uncapping-can in a warm room till they seem perfectly dry, and even then several barrels of sweet liquid can be secured from the washing of the cappings of 15 or 20 thousand pounds of honey. We figure that each thousand pounds of honey extracted gives us about 15 pounds of beeswax from the cappings, and, perhaps, five gallons of sweet water fit to make good vinegar. So the apiarist should never render his beeswax till it has been thoroughly washed.

Vinegar that will not sour may lack two or three things, which are all needed. Sufficient warmth, as stated above. If all other requirements are right, it will still be impossible for vinegar to sour if the weather is cold. A good place to keep a gallon of vinegar is right behind the kitchen stove. In a few days a jug full of mild vinegar will become very

chemist's contention that it was illegal. The reliability of his statement I leave to you, gentlemen, who are posted in such matters; we can only say our test proved the presence of quite a percent of cane-sugar, hence we could only pronounce the honey illegal.

We have prosecuted those cases, where intended violation was apparent, and we trust these examples may be prolific of good.

In conclusion, gentlemen, I must again congratulate the apiarists of the State on the fine quality produced, and also say that the Dairy and Food Department wish in every way to co-operate with you in advancing the interests of the honey-producers, as we believe we have a State of unsurpassed capability, and it only needs the energy and increased capacity of our apiarists to place Minnesota in the foremost rank in this another of her naturally favored industries.

extract honey, to place the combs in the hive, to remove or to introduce a queen, etc., gives them a lesson for the life which will certainly be more useful than if they should spend their time crocheting or embroidering in the heavy atmosphere of a stuffy parlor.

Madame Spencer, of St. Ives, takes care of her colonies absolutely alone, and she declares that, aside from the good health gained by exercise in the open air, she is indebted to her pets for quite a pretty income. It is true that she possesses a remarkable recipe, whose efficacy she has proven over and over again in the care of her bees: "Take," says she, "4 parts of enthusiasm, 1 part of sound common-sense, 1 part of perseverance, 1 part of courage, mix the whole and preserve in a bottle, and take as needed with a pinch of patience." Many lady bee-keepers in our land have followed this recipe, and have been present and taken part in our annual conventions.

Bee-keeping is, and will always remain, the poetry of agriculture, with which not only every man, but every woman, in city or country, should to some extent become acquainted.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### ...A Holiday Greeting...

Marengo, Ill., Dec. 21, 1903.

DEAR SISTER BEE-KEEPERS:—

*I congratulate you on the success of your department. It has been a success because so many of YOU have helped to make it so. Your hearty co-operation has been beyond my expectation. With heartfelt thanks for your contributions in the past, I bespeak a continuance of your favor in the future. I trust that we may hear from a still greater number in the coming year. Your letters are always eagerly welcomed, whether they record your successes or failures, or merely contain questions about our beloved pursuit.*

*To each one of you I wish*

"A MERRY CHRISTMAS" and  
"A HAPPY NEW YEAR."

*Yours sincerely,* EMMA M. WILSON.

### Gifts and Novelties Made of Beeswax.

"Even the bits of beeswax intended for use in the sewing basket to wax threads with, are now made attractive by being molded in the shape of fruit, strawberries, cherries, blackberries and plums, all being seen. On the top of each one is a small silver leaf from which comes a bit of silk cord."

So says the "Department for Women" in the Chicago Daily News. We may not all be able to make easily the articles here mentioned, but we can make very pretty and serviceable gifts for our friends' work-baskets with what conveniences we have at hand. An egg-shell, or a thimble, makes a very good mold in which to run your hot beeswax. While the wax is still hot enough to be liquid, take two pieces of pretty colored ribbon, dip one end of each in the melted wax, and let it remain there till cold; then remove from the mold and fashion your ribbon into a dainty bow, and you have a very pretty gift, which will be much appreciated by many of your friends on account of the good service it will do.

### Our Sisters Across the Sea.

R. Goldi is quoted as saying, in a Swiss bee-journal, some encouraging things for the sisters, which will bear repetition here without the use of quotation marks.

The bee-keeper who not only interests his sons in bee-keeping, but is able to inspire in his daughters a taste for it, so that in turn they may learn to uncap sealed combs, to

### Mother and Young Son Do the Bee-Work.

I can not keep bees and do without the American Bee Journal. I get so much information out of it. I had some bees for five years, and then I lost all I had—4 colonies. Then I bought one colony, paying \$10 for it; that was three years ago, and I now have 26 colonies, also 4 on shares, making 30 in all. We have something over 2000 pounds of honey, besides all a family of six children can eat. One son (13 years old) and myself have done the work.

I have tried to get subscribers for the valuable American Bee Journal, but those "old buckwheats" will not listen; they know it all.

Long live "Our Bee-Keeping Sisters" department!  
Union Co., Iowa, Nov. 23. BELLE MUTSCHLER.

## Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

CATNIP NEEDS EXTRA-RICH LAND.

So in medium and medium-to-poor soils catnip in field-culture doesn't grow worth a cent. Come to think of it, that agrees well with my observation, and I guess it's so. A plant for extra-rich land and half-mature fence-corners where it is too rich for grass and the generality of weeds. Page 716.

A FINE CALIFORNIA PICTURE.

We have had many fine pictures of apiaries of late, but W. J. McCarroll's, on page 726, seems specially noteworthy. We can see why black sage is called black—and the intensity of the California sun.

MANIPULATION TO LESSEN SWARMING.

Yes, Mr. Getaz, when only 10 percent actually contemplate the wickedness of swarming, and we manipulate 100 percent to head it off, there's a provoking amount of lost labor that comes in. That's where the languid, and the lazy, and the played-outs get a chance to crow feebly over the smart folks. I have several years with scarcely more swarms than I wanted. Thought, be-sure, I'd have another such last season. Gee! Page 727.

A POUND OF HONEY FOR A STING.

If we could all get a pound of honey as a consolation for each sting, a *la page* 728, it would total quite an income for some of us—providing our Lady Bountiful didn't go bankrupt.

10-FRAME VS. SMALLER HIVES.

Sister Wilson, of course you are right as to your own thoughts, but you leave out the biggest and loudest of the *claims* the 10-frame folks make. They claim larger swarms and larger colonies, decidedly larger colonies, pretty much all the time. They think that that means more surplus, even after the chamber below has done its worst in absorb-

ing it. I tell 'em that with my 7-frame arrangement I get some honey where they wouldn't get *any*. They have the cheek to deny this. Page 728.

#### SOIL BACTERIA FOR PLANT GROWTH.

In an editorial comment, page 739, bacteria are spoken of as if they were needed on the roots of asters and golden-rods. That is not the case, I believe. Most plants *do not try* to capture atmospheric nitrogen for nourishment, but rely wholly on the nitrogen contained in the soil. Only the clovers, and perhaps some other plants of the same natural order, have gotten onto the wonderful "scheme" of using atmospheric nitrogen captured for them by minute growths which they can harbor. The grape has nodules on its roots, but the inhabitants of the nodules are not supposed to furnish the vine with nitrogen. With a little lively imagination we could say that we must love the clovers because the clovers are bee-keepers. The root nodules are little hives, the inhabitants are little bees, and the nitrogen laid in is the honey—honey both for the use of the bee and the beekeeper—alike same as we'uns. And when both bee and beekeeper are dead, the fertility of the soil is found to have got ahead. All soils would be fertile if all plants worked this scheme—that is, so far as nitrogen could make them fertile they would be.

#### SMOKE AND NO SMOKE WITH BEES.

"We're all poor critters." If we take a notion—take a notion that it's a thing to be proud of to do without smoke—we can do much in that line, and make ourselves see it as the best way—especially when we are arguing with somebody out of reach of live bees. But contrariwise if we got in the habit of using smoke a little to excess, and somebody, unfortunately, pitched into us about it—and kept pitching in until we used twice as much as before, we can manage to see it best to use considerable smoke. An idle angel with mischief in his mind, could set the same man either way. As for me, I do not think ordinary smoke applied with a cold smoker harms bees to an extent worth mentioning. Thinking thus, naturally I think it foolish tactics to wait for signs of attack. Give them several puffs at the entrance the very first thing. Why not? Or are we in the bee-business for the simple purpose of showing off? Send in a few more puffs at the top immediately on opening. As for that several spells of puffing, and several waits of actual time by the watch, that's not for the bee-veteran but for the beginner. It's a very good plan for the beginner, indeed. Page 740.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### Feeding Comb Honey vs. Candy in Winter.

I notice that you are being asked quite frequently lately to tell how to feed light colonies in cold weather. I also notice you recommend candy made of sugar and water. I wish to ask if you ever tried such candy yourself. And, also, if you ever tried comb honey in place of the candy? I tried candy on 5 or 6 colonies a couple of years ago, and every colony so fed *starved to death*, while a couple of colonies that were given some comb honey in sections lived through all right.

Since then I have carried over a good many light colonies by feeding comb honey, and believe that, counting the extra risk and work of making the candy, honey is the cheaper of the two. Of course, the cheapest grade of honey will do, just so it is sound, ripe honey; or cull sections will do. For cellar feeding of box-hive colonies, turn hive bottom up, and lay on enough sections to make sure of plenty, and cover with a piece of carpet or quilt, or anything to hold the heat of the bees without being tight enough to smother them. For hives with frames, remove the cover and lay the honey on the frames, directly over the cluster, and cover the same way. Colonies in hives with frames may be fed the same way out-of-doors, excepting more covering is necessary over the honey. In either case the honey is laid down flat on the frames or combs, and, if it is

thought one layer of sections of honey is not enough, or it is desired to add more afterwards, the latter can be laid right on top of the first. The colonies so fed, with me, have *all* wintered perfectly, seemingly better than a great many colonies that had plenty of stores in their own combs, and wintered in the same cellar. The candy I fed was *not burned*, and was apparently just as it should be, according to the books, but the bees gnawed it up, and it dropped to the bottom-board about like hard candied honey would, and they died leaving part of the cake of candy on the frames.

Now, I am aware that "one swallow does not make a summer," but I am sure I always think of those 5 or 6 colonies I might have saved when I see some one advised to feed hard candy.

Let us know whether you know from personal experience that such candy can be made to do as *some say* it will.

IOWA.

ANSWER.—No, I never fed in winter, so there never was any need of my using candy. But others have used it, and I do not remember that any one has heretofore reported failure with it. Indeed, I think some say that they prefer it, although it is generally recommended for feeding in winter, because at that time it is not safe to feed syrup, and those who have to feed in winter are not likely to have sealed combs on hand. With your experience you are wise to prefer sections. I am wondering whether it may not be that some others have had a like experience without being so frank about telling of it as you are. It might be a profitable thing if those who have used candy would tell us of their success—or of their failure.

### Wants to Increase an Apiary.

I lost all of my bees in the winter of 1902-03. I have 8 more colonies of bees, and \$50 to begin with again, and wish to increase my apiary. Which is the more profitable, to buy bees in box-hives at \$3 a colony, transfer and divide, rearing the queens myself, or buy queens and increase from the 8 colonies I have? I reared my own queens the last two years.

Our main honey-flow is from alfalfa and sweet clover; we have a continuous flow from the last of June until the first of September.

UTAH.

ANSWER.—You say, "I have reared my own queens the last two years." That makes me think you have had considerable experience, and with a continuous flow for two months or more from alfalfa and sweet clover, you ought to get a nice return from your bees, so that it would be better to invest in the box-hive colonies and run the 8 colonies at least partly for honey. In any case, by buying you could have more colonies for next year, and so the sooner have the increased profit from a larger number. If, however, there is considerable danger that you may repeat last winter's experience in wintering, then you might better limit yourself to the 8, increasing from them so carefully that all would be strong for wintering.

### Width of Top-Bars.

An editorial in a recent bee-paper recommended top-bars of common hanging frames only  $\frac{1}{2}$  of an inch wide. Is that good advice? WISCONSIN.

ANSWER.—Paraphrasing the words of Lincoln, for those who need that sort of advice that is the very sort of advice they need. If you want me to answer the question with a curt yes or no, I must say I don't know. There might be more than one understanding of the question. It might be construed, "When common hanging frames are used, is it good advice to advise that they shall be only  $\frac{1}{2}$  of an inch wide?"

I rather incline to answer yes to that question. The one special advantage of loose-hanging frames is that there is no need of any dummy to get out the frames, but that by shoving the frames to one side you may lift out any one frame without lifting any other. To be sure, you may with fixed-distance frames lift out any one frame without lifting any other, but you must first lift out the dummy. If top-bars be  $1\frac{1}{2}$  wide, leaving only  $\frac{1}{4}$  inch between them, a larger number of frames must be moved to get one out than with  $\frac{1}{2}$  frames that make the space twice as large.

That, however, is a rather forced construction of the question, and we may broaden it by asking whether it is advisable to change from fixed-distance frames to the loose-

hanging frames mentioned. This advice has lately been given by at least two prominent foul-brood inspectors, the advice being given with emphasis. I believe the advice is good—at least to the extent that such a change would be a real improvement in some of the cases we have met. Fixed-distance frames, so thoroughly glued together that it is five times as hard to get out the first frame as it is with loose-hanging frames—when a foul-brood inspector meets such a case I don't blame him for saying emphatically that loose-hanging frames are better, and the narrower the top-bars the easier to get out the frames.

Suppose we put the question in its broadest sense, which, very likely, is the sense intended, and ask whether it is good advice to recommend loose-hanging frames with narrow top-bars. If you allow me to answer it for myself, under my conditions, I must give a very emphatic *no*. I have used loose-hanging frames with 1-inch top-bars—used them by the thousand for years—and for some years have

used fixed-distance frames, and it would take quite a little money to hire me to go back to loose-hanging frames. If the top-bars had been only  $\frac{1}{2}$  inch, it would have been easier to get out the frames; but if it were made so easy that any one frame could be taken out without moving any other frame, I still would not be willing to give up the advantages of the fixed distance. But I want so few and so small points of contact between the frames that it will always be a light thing to separate them.

Californians who work for extracted honey say fixed-distance frames are barred, because the spacers interfere with the knife when uncapping. If I were working for extracted instead of comb honey, I might agree with them. I have, however, a lingering notion that if some of them should work for a while with such frames as I use, they might endure the inconvenience of the spacers when uncapping, rather than to forego the advantages that I believe they would discover.

## A Solid Gold Fountain Pen Free!

Finally, we have found a good Fountain Pen that is reasonable in price. The manufacturers of this pen say that if you pay more than \$1.25 for other fountain pens, it's for the name.

This pen is absolutely guaranteed to work perfectly, and give satisfaction. The Gold Nibs are 14 kt., pointed with selected Iridium. The Holders are pure Para Rubber, handsomely finished. The simple Feeder gives a uniform flow of ink. Each pen is packed in a neat box, with directions and Filler.

### How to Get this Fountain Pen Free!

To a present paid-in-advance subscriber, we will mail this Fountain Pen free as a premium for sending us 3 NEW SUBSCRIBERS to the weekly American Bee Journal for one year (with \$3.00). Surely, this is an easy way to get a good Fountain Pen. Or, if unable to get the two new subscribers, and you want one of these Pens, forward to us \$1.25 and we will send it to you by return mail. Or for \$2.00 we will send to any one the American Bee Journal for one year and a Fountain Pen.

This Fountain Pen would be a splendid gift to a friend or relative. Why not order both Pen and Journal for some bee-keeper as a present?

Address all orders to

**George W. York & Co.,**  
144 & 146 East Erie Street,  
CHICAGO, ILL.

## "VICTORIOUS IOWA"

A good name for the Iowa Round Incubator that so often out-hatches its keenest competitors. Any questions? Our new catalogue answers them all. It is free—send for it.

Iowa Incubator Co.  
Box 198, Des Moines, Ia.

Please mention Bee Journal when writing.

## FROM MANY FIELDS

### Managing an Out-Apiary.

I will try to tell how I work my out-apiary. The greatest help I have is the drone-guard, made with cone-escape, with a tin slide, so I can close or open the escape. After the hives are leveled up I put a drone-guard on every colony but one; this is an extra-good colony that I keep for drones, and manage it so as not to have them swarm. I leave them for 8 or 10 days with no one to look after them.

When I go to the apiary I examine each colony carefully by removing the drone-guards to see if there are any dead queens. If I find any of these I give that colony a comb with eggs in it. I leave the guards off in the forenoon for the bees to get their hives well cleaned out; in the afternoon I put the guards on with the escape open. Until about 4 o'clock I look every little while for queens that may have come out to be fertilized. If I find one I let her in the hive and dispatch the drone.

I spend my time in doing anything that may need doing, and making sure that they have plenty of room at all times for both brood and honey. If there are any bees that seem to be loafing or lying out, I leave the queen below and place the brood in the upper story with a queen-excluding honey-board under it. About 4 o'clock I dispatch what drones are out, and close the escape, and leave them for another 10 days. This keeps my colonies strong, and I get more honey than my neighbors, and with no expense for labor. I have worked the out-apiary three years this way, but have made a success in getting honey, and without the expense of paying a man to watch the bees. C. J. BARBER.

Monona Co., Iowa, Dec. 12.

### Poor Honey-Years in Succession.

The honey crop was very poor here the past season, which makes five poor honey-years in succession, and each one of the years was poorer than the one before. A. W. SMITH.

Sullivan Co., N. Y., Dec. 1.

### Some Experience With Bees.

My experience with bees in the past, and outlook for the future, I would compare to the unregenerate son of Adam, and his condition after being converted to the Gospel of Christ. I feel, concerning apiculture, as if I had been "born again," and, "as a new born babe," desire "the sincere milk of the word" (American Bee Journal) "that I may grow thereby;" and yet, in this case, I don't know that I shall believe all things I read.

I am now 32 years of age, and my experience with bees has been as follows: About 17 years ago a swarm came to my father's home and settled on a cedar limb about 15 feet from the ground. My father rushed around and fixed up an old upright hive that he had pur-

## BOYS WE WANT WORKERS

Boys, Girls, old and young alike, make money working for us. We furnish capital to start you in business. Full instructions and a line of samples to work with. DEAPER PUBLISHING CO., Chicago, Ill.

Send us 10c stamps or silver for full instructions and a line of samples to work with.

chased bees in a number of years before (and lost them the same winter), and then rang the bell frantically for me. I being about a half mile away working in the onion-field, bare-footed, and in my shirt sleeves. Supposing the house was on fire, or somebody hurt, I ran the distance, and was told, "There is a swarm of bees in the cedar-tree, and I have everything ready, and am sweaty, and it won't do for me to get stung, you will have to drive them." So I climbed the ladder, rocket-knife in hand, clothed as I came from the field (It was a fine cluster, and would probably have filled a peck measure), and proceeded cutting off the limb, and, then, putting the blade of the knife between my teeth, started down. Presently I struck another limb, knocking off part of the bees, and a large number of them darted for my face and neck and stung me (I used to estimate it at 20 times). My appearance afterwards was that of one having a severe case of mumps.

Well, I deposited the swarm in front of the hive as quickly as possible, and then excused myself for the time being. Father, at this juncture, took a position at the rear of the hive, and with a long stick drummed them in.

The bees I have now are descendants from that colony, excepting from such as I sold up to the present time. Eleven years ago they had increased to 4 colonies, which I purchased from father, working the month of July for them. Three of them were in Langstroth hives, and one in a box. I have always wintered my bees outside, formerly putting them on the south side of a building, with no other protection than perhaps a few boards thrown on top of the covers. In more recent years I have packed them in straw, protecting all but the front of the hives.

This winter I have put on mouse-protectors, made by cutting a lath long enough to reach across the entrance of the hive, and nailing on it a strip of tin one inch wide, and pressing the same down at the entrance of the hive, leaving a bee-space beneath it. I kept the bees, purchased eleven years ago, until 1897, when I had 6 colonies that I sold, 5 to a neighbor, and one back to father. In 1899 I purchased 3 colonies from father (the increase from this one) by painting a 30x40 foot barn with two coats of white lead, furnishing the same.

In 1900 I tried doubling my number by dividing the colonies, but the next spring about the same number showed up living. In the spring of 1903 I started with 4 colonies, which have increased, by swarming, to 8, and

## The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

## Something FOR OUR Bee-Keeping Sisters in the Winter Time.

We think all ladies will agree with us in saying that every man should at least understand some business, with which, in case of necessity, he could support himself and family. The wealthiest people frequently come to want, and wretched, indeed, is the man who cannot earn a living after his wealth is gone. He sometimes fills the grave of a suicide. And why, in this enlightened age of progression, should not woman, as well as man, be able to depend on her own resources? In case her husband dies in poverty, must she starve or depend on charity? In case her husband falls to provide and grossly mistreats the woman he has sworn to cherish, must she humbly submit? **A THOUSAND TIMES, NO!** Let every woman, before she marries, have some knowledge that can be used to make her a living. Every mother, rich or poor, should make her daughters, in a certain degree, independent, by giving them some kind of a trade, and teaching them to be self-reliant. Mothers should have their daughters learn to sew, and not neglect this important part of their domestic education. The

I have again bought the increase from father's old colony, and have gone into winter quarters with 10 colonies, and the nucleus still remains.

It would make a small book if I were to go into the details of my experience with the honey part of this subject, so I will cut it off here.

I have been assisting a Mr. Myers in putting his bees into the cellar to-day. We weighed a great many hives (10-frame Langstroth, single-walled hives, without the top), and they ranged from 43 pounds to 81½. Of 61 which we put in to-day, the larger portion of them ranged from 55 to 75 pounds each.

CHARLES F. CLEMONS.

Scott Co., Iowa, Dec. 1.

### Bees Wintering Well.

Bees are wintering finely, and are well supplied in stores, with the exception of late swarms. Since the first of July the bees never did better or obtained more honey.

Cass Co., Nebr., Dec. 4. J. M. YOUNG.

### Best Crop in 15 Years.

We have had a better honey crop this season than for 15 years, and the most of the honey was gathered from white clover. I sold nearly all of my extracted honey for \$1.50 per gallon.

CHARLES DUCLOS.  
Saginaw Co., Mich., Dec. 4.

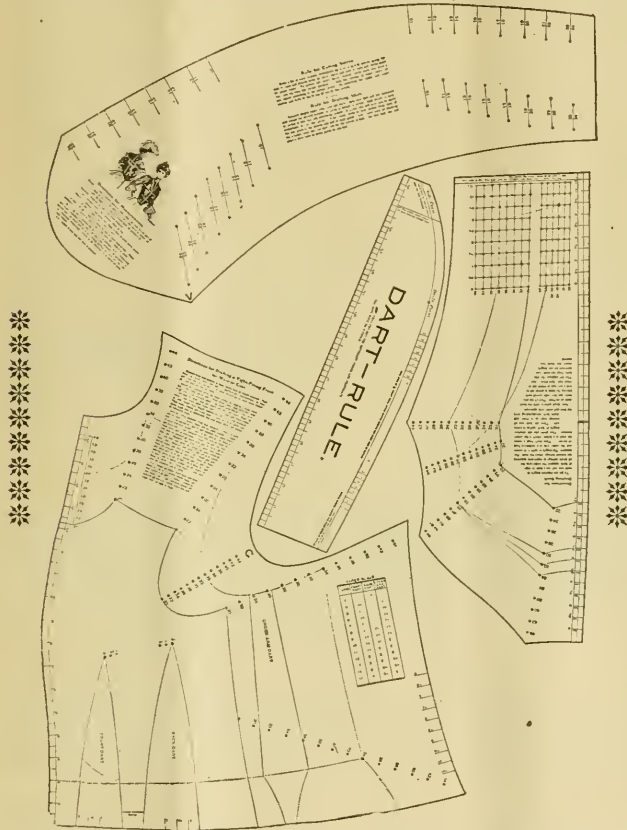

### Clipping and Introducing Queens—Other Kinks.

Our Editor York has called for an examination, and it is likely he will not rest easy until he has had us all "upon the carpet."

I have no college qualifications to parade before the eyes of the readers, but I have found a few gaps in bee-keeping which may be of interest to the beginners. I will not tell how many colonies of bees I have, or how much honey I got the past season, for the reason that it would not throw any light on the question asked; but I will say that our bees beat a 100-acre grove, and it will not take all the surplus to feed them while they are producing another crop, either.

First, I will tell which is the most suitable time for me to clip queens. Formerly I did this job in early spring, but the past season stores were low, nothing coming in, and as soon as a hive was opened the robbers started; a tent was a botheration, the wind would blow it over, and the limbs of trees in the grove aided in the trouble, and I abandoned clipping, thinking I must try one season without it; but the tall trees were an eye-sore to me, and just before swarming-time I determined to clip the queens, and be boss of the yard. The hives were here, but the queen was not coming in, and I could, by opening the hives early in the morning, as soon as I could see to tell a queen, find and clip from 8 to 12 while the "old lady" was getting breakfast. It took but a very little smoke, and often none at all. In the middle of the day I had lots more hunting to do to find them; the smoke would scare them off the combs, so I abandoned it, and waited for early mornings. By so doing I did the clipping the easiest and most agreeable way I have ever done it since I have been in the business.

The increase was managed in a different way from what I formerly used, and I like it. When a swarm came off, here to-day, I increased. First, this season I divided the old colony's combs and made two 4-frame nuclei, and gained an additional one over the old method. I wanted to increase to 30, so the first 15 swarms gave the desired increase, and what swarmed after that was returned to the old hive, by removing the queen when they issued. Then, this season I had one filled with drawn combs. I made sure to take an outside frame for each nucleus, as the outside frames usually carry more honey than brood. I took care that each hive had a queen-cell; if it was on the bottom of combs I cut it out and placed it, as the Bee Journal told us, in the center, and close to the top, so that it might not chill. I got fooled with one where I had placed division-boards instead of frames, and before I learned it they had

daughter so taught will not only make a better wife and mother, but will also be more likely to secure a better husband, and will always command his respect. He will not look upon her as a helpless "know-nothing," but will know that if he fails in his duties, she can live without him, and this can only strengthen the bond between them. A thorough knowledge of dress-making can always be turned into gold, and become the means of support for the mother and her little ones. She may never have to use this knowledge in this way, but she has a trade and can use it if necessary.

The outline cut shown herewith is a condensed copy of **THE NEW LONDON LADIES' TAILOR SYSTEM** for drafting and cutting ladies' and children's garments. For simplicity and accuracy it has no superior among the more expensive systems. Thousands of girls have learned more about drafting and cutting with this system than they knew about it after serving their apprenticeship in some of the dressmaking shops of the United States and Canada. Thousands of the best garment cutters have laid their complicated and expensive system aside, and are now using **THE NEW LONDON TAILOR SYSTEM**. Thousands have been sold at \$5.00 each, but we mail it free to a paid-in-advance subscriber to the American Bee Journal for sending us two new subscribers at \$1.00 each; or we will send it to any one with a year's subscription to the American Bee Journal, both for \$1.75; or, we will mail the Tailor System alone for \$1.00. # A HANDY TOOL-HOLDER!

Sent by Express, for \$1.50; or with the Bee Journal  
one year—both for \$2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or any one using a grindstone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

### How to Use the Holder.

**DIRECTIONS.**—The Tool is fastened securely in the Holder by a setscrew and can be ground to any desired bevel by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on an steady the Holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding Round-Edge Tools, the holes in the standard are used instead of the notches

started to build combs on the bottom of the hive-cover, just as the Bee Journal said it would. If we would always pay attention to instructions we could find the gaps, and often avoid difficulty. The 4-frame nuclei gave a super of honey each, and those that were returned to the old hives were in fine shape for business, and attended to it, too.

When Dr. Miller told us about drowning of queens to insure safe introduction, I tried it in less than an hour's time after reading it, and found it practical in each trial except one, and that one was a virgin queen, and she "came up missing." This is the way I did the thing.

Each was a laying queen, and was placed in a spiral cage and closed in, then the cage was placed in a vessel of water, deep enough to cover the cage. A comb with bees was out and ready for her. After a minute or so I released her among the bees, and sometimes, if not stupefied, she would start off on a trot with the bees after her; then she was given another immersion, and when released the would stagger and cling to the combs with all the "go" washed out of her, and would stand still and let the bees lick her off. The frames were then placed in the hive, and the next day she would be found busy laying. We had a lot of queenless colonies on which we tried the hurry-up plan, but had, instead, hurried it down, where I had run hatching queens in I would find them removing queen-cells. I wanted to save time, and used these queens to do so, but over 50 percent of these "run ins" "came up missing." This has bothered me for several years, and each time I laid it to the kingbirds taking the queen when on her

Please Mention the Bee Journal when writing Advertisers \*\*\*\*

wedding-flight, whereas she had never been allowed to live to take the flight, as the bees had killed her. Hereafter, if I can I prefer letting the queen hatch in the hive she is to occupy, and what cells hatch in my hands when removing them will never be used, unless it is an emergency; and before doing so she will get the water-cure. The kingbirds and I have buried the hatchet, and will be friends. I will kill no more of them. The queens will get the water-cure when clipping hereafter, as I usually have some balled from the sear she gets, which starts her running when released. The older bee-keepers may not be at the idea, but I believe the attack originates mostly from fear on the part of the queen. If it comes from the scent of being handled, the water will remove it. Try it, boys, as I did, and see what is in it.

Mr. Davenport, our neighbor on the North, was complaining about too much pollen being deposited in the brood-nest. Same thing here. The plague is a serious affair with me, as the combs often become so filled with it that there is but little room for brood. I can help it by breaking in the caps on honey, and have it carried up-stairs, which will enlarge the brood-space. My bees will not carry honey up-stairs from the brood-nest unless the caps are broken. I have read that the bees would clean the combs of pollen, but I waited a long time for them to do it, and waited in vain until I hit upon that plan:

I had a lot of combs which were a mass of pollen; these I was melting into wax; they had been in empty hives where the bees had carried all the honey that was in them, and had become dry. I found that by giving 4 of these with 4 of foundation to a new swarm they would clean them out as free from pollen as could be. I too, tried soaking them, but it was "no go"—the pollen appeared to swell tight, and stayed there; but if they had no honey in them they appeared to dry out, and bees did the rest, but with honey in them the pollen staid in the frames. I wonder what is

Mr. Hasty's opinion about it. All that I can see for us in this pollen district to do, is to remove the frames that are pollen-bound, and place them where the bees can clean out the honey, but not to allow robbing to originate from it, then leave the combs in the empty hive to dry, and not give over 3 or 4 at once. I would like a more simple remedy, but must use the above until some one tells me of a better plan.

I will say to Yon Yonson, that Tom Carter says we will try his method of catabing fish next summer, when the haycocks bloom. He is all right, and can come again.

I wonder if there is any danger of the bee-keeping sisters getting off and starting a paper of their own. Hope they will not, until we get some of those bachelors married off. Say, ladies, those fellows have no pluck, or they would have had a lady cook long ago.

A. F. Foote, of Mitchell Co., Iowa, appears to be worried over the problem of keeping queen increase. Some people like trouble well enough to take a spade and dig for it. If Mr. Foote will clip his queens' wings, and remove the queen when the swarm issues, the bees will return to the old hive, and he has then a double-header for business.

Mr. Patton, of Alabama, tries a dig at Mr. Davenport, of Minnesota, about his black bees. Say, Mr. Patton, come up here with some of your Italian bees and see if our bees don't "put it all over" your yellow

ones. They are nice to look at, but honey is what we are after, and our blacks get it.

A bulletin board is a nice thing in the yard. The "wants" can be placed where they are before our eyes in plain view. Often the wants are overlooked when placed in a notebook. Things needed to be done in a few days are sometimes forgotten, while a note of it on the blackboard tells you what is wanted. For instance, on examining a hive to remove the queen-cells, it is found to be pollen-bound. You probably have other urgent business and have no time then, and, if you do, it is hardly the right time to open the combs by cracking the caps, for there is no queen to occupy them, and the honey is not removed up-stairs until the room is needed. You make a note on the blackboard like this: "Open combs in 195," and date the note; you can't forget to do this, as it is there in plain view daily. When you have finished the job erase the note. We often run on "needs," but cannot apply the remedy, so the blackboard will finish up the odds and ends. J. P. BLUNK.

Webster Co., Iowa, Dec. 2.

### Introducing Queens.

I had some experience last spring in the introduction of queens, which differed very materially from any I ever had before. One colony out of 16 swarmed early, when there seemed but little for the bees to get, the swarms having to be fed, but later on they got to be prosperous. I caught the queen in the parent colony four weeks after casting the swarm, and killed her, introducing an Italian queen caged in her stead. The bees, in 50 hours, had released the Italian queen and received her apparently in good condition. Six days later, upon examination, the bees had killed the Italian queen and started new cells; these I cut out, and, on examination three weeks later, I found them, hopelessly queen-less, whereupon I grafted into the combs two nice Italian queen-cells, which they accepted and reared a nice queen. I then went to the prime swarm and introduced a queen which the bees killed in the cage before releasing her. I grafted cells into their combs, which they destroyed. I then left them alone two

## Langstroth on the \*\*\* Honey-Bee

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those

large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**GEORGE W. YORK & CO.**  
144 & 146 Erie Street, CHICAGO, ILL.

## Dr. Miller's New Book

Free as a Premium for Sending Two New Subscribers.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

### HOW TO GET A COPY OF DR. MILLER'S

### "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the **WEEKLY American Bee Journal** for one year, **BOTH** will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book *free as a premium* for sending us **Two New Subscribers** to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

## The American Bee Journal AND Gleanings in Bee-Culture

(If you are not now a subscriber to Gleanings)

**BOTH ONE YEAR FOR ONLY \$1.60.**

We have made arrangements with the publishers of Gleanings in Bee-Culture (issued twice a month), so that we can furnish that magazine with the Weekly American Bee Journal—both one year for but \$1.60; provided you are not now a subscriber to Gleanings.

This is a magnificent offer, and should be taken advantage of by all of our readers who are not now getting Gleanings regularly. These papers, although on the same subject, are conducted so differently, and contain such a variety of reading matter, that every bee-keeper should have them both. And they can be had for a whole year for \$1.60.

# BEE-BOOKS

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie St., CHICAGO, ILL.

**Forty Years Among the Bees,** by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide, or Manual of the Apisary,** by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 235 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee,** revised by Dadant.—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apian library is complete without this standard work by Rev. L. D. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture,** by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bee. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing,** as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey, or Management of an Apisary for Pleasure and Profit,** by Thomas G. Newman.—It is nicely illustrated, and contains 180 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture, Its Methods and Management,** by W. Z. Hutchinson.—The author of this work is a practical and enterprising writer. You should read it, being 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur,** by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apisary Register,** by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Poul Brood.**—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping,** by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment,** by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Foul Brood,** by A. R. Kohrke.—Origin, Development and Cure. Price, 10 cents.

weeks and grafted in more queen-cells, which they treated as the first ones. I knew they had no queen, as I had caught and killed her before introducing the queen, which they killed in the cage. This colony never would receive any aid, and continued in this hopeless condition until death resulted. Why were they so contrary? J. B. AUSMUS.  
Benton Co., Ark., Dec. 7.

## Moving Bees—Season's Report.

On March 7, 1903, I reached this place with 30 colonies of bees. I had to feed some before fruit- bloom, but we are located in the midst of 4000 bearing apple-trees, and a large area well set with white clover, catnip, smartweed and dandelion.

I have increased to 45 colonies, and sold \$150 worth of honey, the most of it comb honey. Our bees worked a good deal on red clover.

☐ In moving on the railroad we saved the work of sawing our hives full of air-holes to ventilate the bees, by simply tacking wire-cloth on the hive-entrances, and then placing each hive facing out from the center of a stock-car, and the motion of the train did the rest. When we reached St. Louis the switches never failed to see the few bees that had escaped from the hives, so they bumped us very easy. GEO. R. KELLY.  
Cooper Co., Mo., Dec. 8.

## CONVENTION NOTICES.

**Kansas.**—The first regular meeting of the Kansas State Bee-Keepers' Association will be held at Topeka, Dec. 30. All persons interested in bees, whether members or not, are urged to be present. O. A. KERNE, Sec.  
Topeka, Kan.

**New York.**—The annual meeting of the Oswego County Bee-Keepers' Association, will be held at Oswego, N.Y., Tuesday, Jan. 12, 1904. N. E. France, General Manager of the National Bee-Keepers' Association, will be present and address the meeting. All persons interested in bee, are cordially invited to be present. CHAS. B. ALLEN, Sec.  
Central Square, N. Y.

**Minnesota.**—The annual meeting of the South-eastern Minnesota and Western Wisconsin Bee-Keepers' Association will meet at Winona, Minn., at the Court House, in the County Commissioners' rooms, on Tuesday, Jan. 19 (and 20, 1904). A full attendance of the members, their wives and friends, is invited to this, our annual meet. All members everywhere are cordially invited to attend. W. K. BATES, Pres.  
Stockton, Minn.

**New York.**—Mr. N. E. France, of Plattville, Wis., General Manager of the National Bee-Keepers' Association, has been secured by the Bureau of Farmers' Institutes to speak at a series of the "Bee-Keepers' Institutes" in connection with the local bee-keepers' societies as follows: Cataudaga, Jan. 6 and 7; Romulus, Jan. 8; Cortland, Jan. 9; Auburn, Jan. 11; Oswego, Jan. 12; Hamilton, Jan. 13; Warren, Jan. 14 and 15. The meeting on the 15th will be that of the New York State Association of Bee-Keepers' Societies. C. B. HOWARD, Sec.  
Romulus, N. Y.

## HONEY AND BEESWAX

When consigning, buying or selling, consult  
**R. A. BURNETT & CO.,**  
199 SOUTH WATER ST. CHICAGO, ILL.

**WANTED—Comb Honey** in quantity lots. We are perhaps the only dealers in this article owning as much as 150,000 pounds at one time. Please state quantity, quality and price asked for your offerings. **Thos. G. Stanley & Son, 2441 MANZANOLA, COLO., or FAIRFIELD, ILL.**

**WANTED! FANCY HONEY COMB HONEY** In up-drip shipping-cases. Also Amber Extracted in barrels or cans. Quote your best price delivered Cincinnati. **The Fred W. Muth Co. 2241/2 Frost and Walnut, CINCINNATI, OHIO.**

**\$300,000,000.00 A Year** and you may have part of it if you work for us. Uncle Sam's poultry product pays that sum. Send the for samples and particulars. We furnish capital to start you in business. **Draper Publishing Co., Chicago, Ill.**

## HONEY AND BEESWAX

MARKET QUOTATIONS

**CHICAGO, Dec. 7.**—At this season of the year there is not much trade in honey, retailers having left their stock for the holidays. Fancy comb honey for the Christmas trade has brought 13½c; No. 1 grades, 12½c@13c; amber, 9½@10c. Extracted white, brings 6½@7c; amber, 5½@6c. All extracted honey is sold in one flavor, quality, kind and style of package. Beeswax, 28@30c. R. A. BURNETT & CO.

**PHILADELPHIA, Dec. 10.**—Large lots of comb honey being offered from States that were not supposed to have much stock. Beesmen, as usual, wake up now to the fact that they want to sell their comb honey and push it on the market, thus breaking the price. If they would only offer their honey in September, they would get more for it and it would be better for the producer and dealer. We quote fancy white, 14½@15c; No. 1, 12½@14c; buckwheat, 12c. Fancy extracted, 8c; amber, 6½@7c. Some producers of honey, and do not handle on commission. WM. A. SELSER.

**ALBANY, N. Y., Dec. 15.**—Market very dull, and lower since the cold weather. Quotations have to be shaded, and concessions made to effect any quantity sales. H. R. WRIGHT.

**CINCINNATI, Nov. 20.**—The demand for comb honey is slower now than it was six weeks ago, owing to the enormous quantities offered on all sides. Fancy comb is sold in single case lots and although the demand is good, we are selling amber extracted in barrels at 5½@6½c. White clover, in barrel and cans, 7½@8½c, according to quality. Beeswax, 30c. THE FRED W. MUTH CO.

**BUFFALO, N. Y., Oct. 11.**—The demand for white comb honey is better than it was. The trade is particular and wants only very white, clean stock. The wax is very low, and to maintain it does not sell well, and price is low. Fancy white comb, 14@15c; No. 1, 13½@14c; No. 1, 13@13½c; No. 2, 12½@13c; No. 3, 11½@12c; No. 4, 11@11½c; No. 5, 10½@11c. White extracted, 6½@7c; amber, 6@6½c; dark, 5½@6c. Beeswax, 28@30c. W. C. TOWNSEND.

**BOSTON, Nov. 25.**—Western honey is arriving more freely in our market, causing a slight drop in prices. Fancy No. 1, in cartons, brings 11c; No. 1, 10c; No. 1, 15c. Extracted, white, 8½c; light amber, 7½@7c; amber, 6@7c, according to quality. BLAKE, SCOTT & LEE.

**KANSAS CITY, Dec. 18.**—Since our last quotations there has been a dearth of western comb and honey on our market, and same is being sold (without any good reason), at prices not justified by market conditions. Fancy white comb, 25-section, 100-lb. cans, No. 1, \$2.50; No. 2, \$2.40. Extracted, white, per lb., 7½@7c; amber, 6½@6c. Beeswax, 28@30c. C. C. CLEMONS & CO.

**CINCINNATI, Dec. 18.**—The market on comb honey has been a dearth of supply has been larger than the demand. Fancy white comb, 14c; or grades, lower. Extracted, amber, in barrels, 5½@5c; in 60-lb. cans, 5c; more; alfalfa, white, 100-lb. cans, No. 1, \$2.50; No. 2, \$2.40. Extracted, white, per lb., 7½@7c; amber, 6½@6c. Beeswax, 28@29c. C. H. W. WEBER.

**NEW YORK, Dec. 4.**—Comb honey is arriving in sufficient quantities to supply the demand, and as to the quality, it is about the same. It seems to be of color, more or less. We quote fancy white at 14c; No. 1 at 13c; amber, 11@12c; and buckwheat, 10c. Extracted, light amber, 2c; white, 1c; amber, 1c. 50c per gallon; buckwheat, 5½c. Beeswax, 28@29c. HILDRETH & SEIGLEN.

**SAN FRANCISCO, Oct. 21.**—White comb, 1-lb. frames, 13½@14c; amber, 9@11c. Extracted, white, 5½@6c; light amber, 5@5½c; amber, 4½@5c; dark, 4@4½c. Soft, fancy white wax, good to choice, light, 7½@7c; dark, 25@26c.

Market is more quiet than for several weeks preceding, but is fairly steady as to value. Spot stocks and offerings of both comb and extracted are mainly of amber grades, while most urgent inquiry is principally for white-ware, the latter being the only kind meeting with much competitive bidding from the States. Recent arrivals of honey included a lot of 121 cases from the Hawaiian Islands. The bees of the Islands feed mainly on sugar.

# BEST Extracted Honey For Sale!

ALL IN 60-POUND TIN CANS.

## Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa Regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

## Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Our honey is put up in tin cans holding 60 pounds of honey each. These cans are shipped in wooden-boxes, and should arrive safely. We have nothing but PURE BEES' HONEY to offer, and so guarantee it. Cash must accompany each order. All prices are f.o.b. Chicago.

**Prices of Alfalfa Honey:**  
One 60-lb. Can @8c.....\$ 4.80  
Two 60-lb. Cans (in 1 box) @7½c 9.00  
(Larger quantities at the 7½c price.)

**Prices of Basswood Honey:**  
One 60-lb. Can @9c.....\$ 5.40  
Two 60-lb. Cans (in 1 box) @8c.... 9.60  
(Larger quantities at the 8c price.)

A sample of either Alfalfa or Basswood honey will be mailed on receipt of 10 cents; samples of both kinds for 16 cents. (Stamps accepted.)

**BEE SWAX WANTED**—We are paying 28 cents cash or 30 cents in trade for pure average beeswax delivered in Chicago (or Medina, Ohio).

**HONEY-JARS**—Don't forget to get our prices on all sorts of honey-packages.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it. Price, by mail, 6 cents; two for 10c; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

Some Good Clubbing Offers.

As this is the time of year when most subscribers renew their subscriptions, we wish to call special attention to the following, which we are sure will commend themselves to all:

- No. 1—The Bee Journal and Dr. Miller's "Forty Years Among the Bees" (book alone, \$1.00).....Both for \$1.75
No. 2—The Bee Journal a year and Prof. Cook's "Bee-Keeper's Guide," (book alone, \$1.20)..... " 2.00
No. 3—The Bee Journal a year and Dadant's "Langstroth on the Honey-Bee," (book alone, \$1.20)..... " 2.00
No. 4—The Bee Journal a year and Doolittle's "Scientific Queen-Rearing," (cloth bound) (book alone, \$1.00).... " 1.75
No. 5—The Bee Journal a year and Doolittle's "Scientific Queen-Rearing," (leatherette bound) (book alone, 75c) " 1.50
No. 6—Bee Journal a year and Standard Untested Italian Queen (mailed in May or June, 1904) (Queen alone 75c) " 1.50
No. 7—The Bee Journal a year and a "Novelty Pocket-Knife" with your name and address on it (knife alone, \$1.25) " 2.00
No. 8—The Bee Journal a year and a "Wood Binder," for holding a year's numbers (binder alone, 20c)..... " 1.00
No. 9—The Bee Journal a year and an "Emerson Binder," (stiff board) (binder alone, 60c)..... " 1.40
No. 10—The Bee Journal a year and a Monette "Queen-Clipping Device," (device alone, 25c)..... " 1.00
No. 11—The Bee Journal a year and Newman's "Bees and Honey," (cloth bound) (book alone, 75c)..... " 1.50
No. 12—The Bee Journal a year and Newman's "Bees and Honey," (paper bound)..... " 1.10
No. 13—The Bee Journal a year and Root's "A B C of Bee-Culture," (book alone, \$1.20)..... " 2.00
No. 14—The Bee Journal a year and a Foster Stylographic Pen (Pen alone, \$1.00)..... " 1.75

Send all orders to GEORGE W. YORK & CO., 144 & 146 E. Erie Street, CHICAGO, ILL.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and so fortunate as to have one of the "Novelty's" your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact reproduction of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$2.00.

GEORGE W. YORK & CO.

Chicago, Ill

Please allow about two weeks for your knife order to be filled.

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., DEC. 31, 1903.

No. 53.

## Editorial Comments

### A Happy New Year to All!

May 1904 be the best and sweetest year of all your bee-keeping lives. May many good new resolutions not only be formed, but sacredly kept throughout the year. Again, we say, A Happy New Year to all!

### The Index to Volume XLIII.

This, as usual, occupies several pages in this the last number of the old American Bee Journal for 1903. It seems to us it shows a much larger variety and number of apianian subjects than ever before. It is a record of a great year in the history of this journal. But we trust it is but an indication of what it will be during the year that is just beginning.

Few realize what it means to compile an index like the one appearing this week, unless having had the experience of getting up an index. We have had it to do almost every year for twenty years. It is a task that is not eagerly looked forward to. It is a tedious one. It is not at all interesting work, but when properly done it is of very great value to all who preserve the complete volume of the Bee Journal.

And what a volume a year's copies of the American Bee Journal makes! Over 800 good-size pages! And all for only one dollar!

### Clipping Queens Not a Preventive of Swarming.

For the sake of new members of the American Bee Journal family it seems necessary to say this once in so often. A writer in the British Bee Journal, speaking of clipping queens' wings, innocently says: "I tried this American plan.....but the swarm issued the week following." Now, be it known to all and sundry that clipping a queen does not in the slightest degree prevent the issuing of a swarm. Clip the wings of a queen, and a swarm will issue from that colony at precisely the same time it would have done if the queen had not been clipped, whether that time be a day or a year later.

The value of clipping consists not in the prevention of swarming, but in the fact that a clipped queen can not go with the swarm if it attempts to abscond, and the swarm will not abscond without a queen. But a little intelligent management is needed with clipped queens, for there is nothing to prevent the swarm leaving with a virgin queen a week or more after the issuing of a prime swarm.

### Curing Foul Brood with Formaldehyde.

Geo. E. Hinckley, foul brood inspector for Santa Barbara Co., Calif., claims to have cured foul brood in a very simple manner by means of formaldehyde, merely spraying the liquid three times upon the floor of the hive. He says in *Gleanings in Bee-Culture*:

At first I did not have the success that I desired; but I did a little differently each time, and finally have come to the conclusion that it will cure foul brood and black brood if rightly used. It has done the work all right, as I have used it of late. I have treated several apiaries, varying from two to over a hundred colonies in each, and have cured all that I have treated under my present system. Now, for my mode of treatment.

I use a Goodrich atomizer No. 4, and formaldehyde, equal part

with water. Go to the hive to be treated and raise the body of the hive in front enough to work so as to spray the liquid onto the bottom-board. The bottleful will be enough for about six hives for one application, which I make three as a course of treatment. I make the applications about two weeks apart, and apply it cold, and do no more than to spray it onto the bottom-board. If it is sprayed onto the combs it will kill all that it touches. The gas dries up the diseased matter in the cell, and the bees clean it out and make everything shine, and the colony soon becomes strong and prosperous; but the hive must have ventilation, or the gas will asphyxiate the bees, and that makes a bad matter worse. If the hive is tight the cover must be raised by placing something between it and the top of the hive, about  $\frac{1}{4}$  inch thick. After spraying the liquid on the bottom-board, set the hive back in place, and the work is done.

That a cure can be effected so easily seems almost past belief; yet it is possible. Coming from one in an official position, it is at least worthy of consideration, and if it should prove equally effective in other hands it will be a boon.

### Extracted Honey vs. Comb Honey.

The editor of *Gleanings in Bee-Culture* says: "When sections become more scarce and expensive, and when there are pure-food laws in State and Nation, extracted honey will to a great extent supplant comb honey, and its production will become more general."

That pure-food laws will increase the consumption of honey there can be little doubt; that they will have a tendency to make extracted honey supplant comb may be questioned. The fear of adulteration in extracted honey is at present against its sale; but is there not in the mind of the public just as much fear of adulteration in comb honey? Certainly more has been said in that direction in the public prints. Take away the fear of adulteration in each, and will there be any change whatever in the relative demand?

When the material for one-piece sections becomes scarce, four-piece sections can take their place, increasing the cost a fraction of a cent on a pound. Consumers are now willing to pay several cents a pound more for comb honey; would the addition of a fraction of a cent on a pound make any material difference in their preference?

### Bees Stinging a Returning Virgin Queen.

Dr. A. W. Smyth says, in the *Irish Bee Journal*, that "if a young queen returns to the hive, after leaving with a swarm, the workers will sting her at once." Is that so in all cases?

### Rules for Grading Honey.

In the *Bee-Keepers' Review*, R. L. Taylor pays his compliments to the rules for grading honey, after the following vigorous fashion:

Bee-keepers are further hampered by the set of artificial and impossible rules now in vogue for the grading of honey, which seem framed for the purpose of giving unfair purchasers of honey something about which they may complain with some show of reason in order to mulct the seller in a cent or two a pound, in that he claims to see stain on cappings of fancy honey, and more than the prescribed amount on grade No. 1. Strange to say, these rules entirely ignore quality; and thin honey, with an unpalatable tang, other things being equal, marches fully the higher grades, thick, well-ripened article. They strain at a gnat and swallow a camel. Every comb-honey producer knows that not one section in a thousand can be found that will not show some stain, and that a degree of stain that does not disfigure the honey is no detriment, but rather a guaranty of ripeness.

I shall not discuss these rules here, further than to say that any set of rules made to govern the grading of comb honey ought to insist on high quality for the higher grades. Such a rule would at least have a tendency to disseminate a knowledge of the conditions necessary to the thorough ripening of honey, as well as to put honey under

such conditions. I have no doubt that in the end it would increase the demand for honey, and thereby increase the ease with which honey may be sold.

It may reasonably be supposed that Mr. Taylor refers to the Washington rules, which appear as standing matter in each number of the journal in which his article appears. Some doubt is thrown upon this by his speaking of "the prescribed amount" of stain on grade No. 1, as if more stain were allowed on No. 1 than on fancy honey, whereas, in the rules, there is no distinction, both fancy and No. 1 having "both wood and comb unsoiled by travel-stain or otherwise."

That, however, is not material, for Mr. Taylor's main contention is for quality, and that is left unmentioned in other rules for grading, as well as in the Washington rules. It is undoubtedly true that the man who is best informed will put quality as the first consideration in purchasing honey. Now, let Mr. Taylor frame a set of rules involving quality that shall prove acceptable to the fraternity in general, and a debt of gratitude will be due him.

### Why Drones are Driven Out.

That interesting writer, Dr. A. W. Smyth, says in the Irish Bee Journal:

The workers, in the fall, keep marching and driving out the drones, so as to have them die on the outside of the hive and away from the colony. A dead drone in the hive in winter is very objectionable to the workers. A whole colony of workers frequently die in the hive, but I never detected any unpleasant odor from dead worker-bees, while a dozen or two of dead drones will give off a very disagreeable odor of putrefaction. The poison in the worker-bee becomes disseminated through the body after death, and arrests decomposition.

However it may be in Ireland, a pile of dead bees in this country is by no means always, if ever, devoid of odor. But the idea that the workers drive out the drones so that they may die outside the hive is a new and interesting suggestion. When you come to think of it, what other object could they have? If the drones die because the workers no longer feed them, they would die without any driving, but it is a good deal easier to drive out the living drones than to drag out their carcasses after death.

### Number Fifty-Three.

Did you notice that this copy of the American Bee Journal is "No. 53?" This year has 53 Thursdays in it, and so there are 53 issues of the Bee Journal. Really, only 52 are expected of us, but we put this one in for "good measure." We know it will be appreciated by many, as it contains the large and valuable index. So far as we know, no other bee-paper in this country ever issues an extra number. We know that some others print an extra number of pages, but we never knew any of them to issue 13 or 25 in any one year; it is either 13 or 24. But we reach 53 this year! And no extra charge. 548 pages of bee-literature for \$1.00! We ought to have 25,000 subscribers right now.

## Miscellaneous Items

Mr. Wm. McEvoy, the popular and efficient inspector of apiaries for the Province of Ontario, wrote us as follows Dec. 14:

"I am well pleased with the American Bee Journal, and hope to continue it to the end of my days."

Swiss Honey is being offered to Americans, it seems from the following which was recently mailed to R. A. Burnett & Co., by U. Tuchschnid, who does business in a large city of Switzerland. We print the circular as nearly like the original as possible, both as to language, punctuation, etc. Here it is:

I beg to offer you Swiss Honey nearest selection from flower harvest, yellow like gold, in cases of 50 glasses, 1 pound each, at 50 frs. a case, comprising packing, free Basle, payable at receipt with Cheque on Switzerland net.

Carriage Basle-New-York frs. 8.20 per 100 Kilogr. (1 case=37 Kilogr. gross). Insurance by land and sea from here to New-York against loss, average, breakage 6 percent which, on your demand, I shall effect here for your account.

This Honey is undoubtedly the finest article of Faucy Grocery; it is not only a highly exquisite delicacy, but also a remedy for many

an outward and inward infirmity, an antiseptic preservative remedy (cleaning wounds, blisters from burning); therefore it is warmly commended by physicians, especially for children. It is for the wealthy as well as for the poor, benefiting them all likewise.

Our quality is in no way to be put upon the same level with the common article of foreign countries; leaving even aside its being a produce of the Alpine flora, its strongly flavoured, incomparable nectar, it is not to be forgotten that with us teachers and parsons in the country are the chief apiarists, who do the business more from sheer pastime and with the utmost cleanliness. All our honey gets slung (worked out carefully), no such use as in foreign countries where often comb-honey, together with maggots, may even rotten brood is pounded, hulled and expressed. Such an article is not only nauseous, disgusting, but at the same time hurtful to health.

In order to serve my customers to the utmost nicety, I have chosen glasses, the nicely printed zinc lids of which close hermetically, so there will never be any leakage, however fluid the honey, in whatever position the glass may be; no clammy hands and—last but not least—Swiss Honey may be preserved for a whole generation without undergoing any change.

The patent cases to be shut and opened without any tool, contain compartments so that each glass stands separately. During ten years I have furnished honey to a house in New-York, never a glass has been broken, and yet honey is by 1½ heavier than water or wine. Cases as well as glasses by themselves are of good use.

Incomparable quality, sure packing and its lasting unchanged and palative for years and years, there are the titles to commend our article.

At first sight the price of the article may seem somewhat high, but he who has got acquainted with its superiority, does not mind that little more; Swiss Honey becomes indispensable for him. On the other hand, I could not possibly make any allowance, the produce of the article being limited and prices pretty high at home.

Inviting you to have a fair trial, I remain, Sir,  
yours truly

UL. TUCHSCHMID.

Of course, honey that "gets slung" may be better than honey that contains "maggots, may even rotten brood," "pounded, boiled and expressed." We don't know just to what "foreign country" he refers, where honey is taken in that way, but it must be in Europe somewhere, for surely we don't have that kind here.

At any rate, Mr. Tuchschnid is quite enterprising, and has a famous honey, if all his circular letter is to be believed.

## Contributed Articles

### Oil of Eucalyptus for Bee-Diseases—Cleaning Extracting-Combs.

BY C. P. DADANT.

MR. DADANT—I was very much interested in the article on foul brood, on page 696. I was afraid my bees have foul brood, but since reading everything I can find on that subject, I have concluded it is not foul brood. The bees die in the cells and nearly all of them are white, with black heads, and they are full of water. The cappings are not sunken, but are elevated, with a small hole in the center. I want to try your remedy—the oil of eucalyptus. If it isn't too much trouble please answer the following questions:

1. Would it be best to use the oil now, or wait until the queen begins to lay, which will be about the first of February?

2. How much oil will it take to treat 20 colonies five weeks?

BULLITT CO., KY.

I should not think of sending my answer to the above letter for publication, were it not that the same error has been made hundreds of times, to my knowledge. If the description given of the so-called diseased brood is exact there is no disease at all in this case. It often happens that the bees, from some cause or other which has not yet been made very plain, leave patches of larvae uncovered at the time of their transformation. That is, they narrow up the cell but fail to seal it, and leave a small opening through which the transforming of an insect may be seen. Sometimes a patch of brood several square inches in diameter will be treated in this way. It has been suggested that the lack of sufficient space between the combs for a full capping is responsible for their action, but I doubt this, as the cell is slightly raised in narrowing it, and, to my mind, this partial covering occupies as much space as the ordinary flat capping. Be this as it may, the fact remains that often the bees will thus leave patches of brood only partly sealed. When the insect goes through its last transforming stage, its eyes become dark first, they have a bluish-black appearance while the remainder of the body is yet white and im-

maculate. The effect is striking, the black head, with white body underneath and perfectly still condition of the chrysalis, give them the appearance of "silent corpses," to quote A. I. Root. The description given in the above letter answers this condition exactly. If our correspondent will examine the bees when in this condition, he will find that they are not at all decayed, but simply in a state of transformation. So he may rejoice in the fact that his bees have no disease, and that he is not the first one who has made this mistake, of taking a perfectly natural, but not often seen, condition for a disease. I have heard a number of such enquiries, and I am evidently not the only one who has met this question, for A. I. Root, already mentioned, speaks of often receiving enquiries concerning this particular condition of brood, from novice bee-keepers.

I am very glad to see so much discussion of the question of foul-brood. Sooner or later a very positive cure will be devised, so that we may not find it necessary to destroy any part of the hive. We owe thanks to men like Mr. France, who are so pertinacious in seeking remedies and making experiments.

The quantity of oil of eucalyptus to be used must depend upon the size of the hive. If this remedy should prove efficacious in foul brood (which is not yet entirely proven), it should be used in sufficient quantity to scent thoroughly every part of the hive for weeks together. A teaspoonful on cotton will give scent for quite a while, and doses must be repeated as often as necessary. From the experiments I have reported, I am sure it will do away with minor diseases, and whenever we do this we will find that we have much reduced the supposed scope of the true disease.

I cannot but take issue with those who say that the use of fire will ever remain the only thorough remedy for grave cases of foul brood. Some of the worst diseases of the human race have been entirely eradicated from civilized countries, and accidental cases are treated so as to bring about almost positive assurance of cure. It is only a few hundred years since the plague decimated cities in the most civilized portions of Europe. The plagues of Marseilles, of Florence, of Moscow, have become historic by their extent and horror. This plague, which was then called "The Black Plague," was probably none other than the "bubonic plague," which civilized countries fear no more, though it still exists in some uncivilized regions. But at the time when these terrible diseases were raging, there was no other method known of disposing of them than doing away with the sick people. I can still remember seeing, near my old birth-place (Langres), in old France, in the suburbs, a house which had retained the name of "La Maladiere," because in times of plague the sick persons were removed to that spot to fare as best they could. That was the only way they had then of fighting contagious diseases. But we have progressed, and are still progressing, thanks to the enquiring minds of our leaders in science and medicine, and the study of microscopy is one of the great factors in the present progress.

#### CLEANING EXTRACTING-COMBS-IN THE OPEN AIR.

I have just read the expression of opinion of "Our Bee-Keeping Sisters," on page 793, concerning giving extracting-combs to the bees for cleaning in the open air. I am still unconvinced of the advisability of this method. The combs are not all repaired, but rather further damaged by them. The bees have so free an access to these combs that even the neighbors' bees are welcome to the feast. The strongest colonies get the biggest share of the honey, and if there happens to be a weak colony in the neighborhood it seems as if hundreds of inquisitive bees take the opportunity of an uproar to pay them a visit to see whether their stores are well guarded.

I can see no objection to putting the combs back on the hives that we select, to have them cleaned during the night so that there is no uproar, and I still think it is the best way. It is probable, however, that with our deeper frames and very large hives, we have less trouble with bees moving upstairs than with shallow hives, especially as our supers are all shallow, and therefore less attractive to the colony as a residence.

Hamilton Co., Ill.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

## Different Races of Bees in the South— Smoker-Fuel.

BY JOHN KENNEDY.

ORIGINALLY there was but one kind of bees to be found in this part of the United States, and that was what is known as the black bees. They were considered great honey-gatherers, and feared by all who handled them on account of their cross, irritable disposition. Since the introduction of Italian bees, although to no great extent, there is now a variety of grades, and the genuine black bee is almost a thing of the past.

With the most of them the cross is so far off that nothing but a very close observer would detect it. I have been handling bees for five or six years, having an apiary of about 100 colonies, and in all my dark, or native bees, but few of them are without some yellow, and almost all of them are what I would call brown instead of black bees. While I have some late purchases of Italians and Carniolans, I find among my native bees some with almost as much yellow as the progeny from queens I have bought of reliable breeders.

I notice different writers in the American Bee Journal speak of their three-banded Italians. I think, if I am not mistaken, that all bees are three-banded that I have ever noticed. I have bees from two queens that are perfectly yellow. Then I have what the bee-men call the yellow, clover queens, with dark stripes, that look to me about what a half cross between our native and the Italians would be.

Now, to the point of my information wanted: These Italian bees are not nearly as large as our native bees, when I have always heard the Italian bees were larger. Can it be that I have been imposed upon by queen-breeders in selling me impure stock, or has the climate, or locality, or anything else, anything to do with it? I can not believe such men as I have bought queens of would sell me any "bogus" stock.

How is this? Are all Italians smaller than the native bees of this country? I have bees of eight different shades in the same hive; while some of them have a distinct yellow band, others of the same colony have no yellow at all; thus showing how bees vary in color. I noticed, among my yellow golden Italians, some bees with dark stripes. The Carniolan queens I have purchased recently have not hatched out any bees yet, and therefore I cannot report on their size. It is said they are much larger than the native bees; but if they don't prove to be of larger size than the Italians, they, too, will fall short of representation.

My object of writing this for publication is, that some reader may reply through the columns of the American Bee Journal by the way of comparing notes, for it may be that native bees of the Northern and Western States are smaller than those of this climate; and the Italians I have so far reared from Western queens may be the usual size, and all right. They are the first and only bees of the kind I ever saw; but they are greatly inferior in size to our natives. As to their honey-gathering qualities I can't say, but if we get through the winter, and I have enough to begin the next nectar season, I may be in position to answer, with them side by side, giving all an even chance.

It is strange to me that here in this temperate climate, where the summer constitutes the greater part of the year, the bees cannot give any surplus, and very often don't store sufficient to live through the winter. There must be something radically wrong. It may be in the management, or it may be all attributable to the lack of nectar. It is a fact, known to all the bee-men of this part of the country, that after the first of June, or thereabouts, our bees store nothing more; sometimes they may gather sufficient barely to live on, but to store any surplus is a rare thing.

I notice the different writers in the American Bee Journal speak of different honey-plants their bees gather from through the fall. Such a thing is unknown here, or at least to me. We have fall flowers, but I am not much of a botanist, and do not know the names of our fall flowers. We have them, of course, but it is seldom a bee is seen on them; and when they are it seems to be for pollen. Of course, we know they work on cotton, but that is about all I can see.

I have about come to the conclusion that the only way bees can be handled to any advantage here, unless it be in strictly isolated cases, is to plant forage for them, and the next question arises, What are the plants we could grow here that will furnish nectar? I read about goldenrod in the West as being such a good honey-plant. Why, here the bees hardly ever visit it. There are localities, however,

down here along the valley of the wooded part of the Mississippi river, where bees make a success; but out in the hills, where I live, 8 miles from the Mississippi river, there are only a few nectar-bearing plants. If I could get the information as to what to plant for my bees I would solve the problem very soon; but I don't know, and unless some good sympathizer will reply to this, I shall have to remain ignorant.

I love my bees, and have started out to understand their habits and nature as far as possible by close study, and I will be most grateful to any one who will reply to this article. I am going to plant the following this fall to try them: Alsike, crimson, sweet white, sweet yellow, and white Dutch clovers; and next spring, catnip, rape and buckwheat. How will these do, as planned above? I had some buckwheat on hand, but could not plant it until about the middle of September. It grew nicely and bloomed all right, as far as I can tell, but the bees did not seem to care much for it. I thought during such a scarcity here they would simply go wild over it; but I was the only one excited over the matter. The bees took it very calmly, although they worked it for the nectar. I don't think they gathered any pollen from it.

#### CEDAR-BARK FOR SMOKER-FUEL.

Before I conclude this article, I wish to add an item on smoker-fuel. I notice "Pennsylvania," on page 666, recommends corn-cobs. I believe I have tried a little of almost everything in the last 5 or 6 years of my experience, and have never found anything to equal the bark of the cedar-tree. The outside bark of a live tree can be gathered, and it is always dry, even on a rainy day. It is better than corn-cobs for one reason, especially—it does not create the heat that corn-cobs do; while cobs may last a little longer. You can skin the bark readily from a dead post and store it away in a dry place for future use. Nothing lights so quickly, in the way of wood, as cedar-bark, and it never goes out until it is all in ashes. You can lay the smoker down for half an hour or more without the least sign of fire in it, and give a puff or so and you have the smoke in large volumes. It may somewhat depend on the kind of smoker. I use the Corneil, improved. Cedar-bark is the fuel for that smoker.

Beginners, and especially lady bee-keepers, generally use too much smoke, and, if I will be excused for giving advice, I will recommend that no more smoke than is absolutely necessary should ever be used. It is a fact with me, and I can't see why it should not be so in all cases. You can handle bees so as to require little or no smoke. A friend visiting me offered to wager me I could not enter a hive and remove a frame without smoke. I took it up, but I selected a hive into which I had recently introduced an Italian queen, and had handled considerable. I not only removed one frame, but eight, and found, and pointed out, the yellow queen to him. You can make bees gentle by handling them properly. Smoke subdues them, of course, but it also irritates them. Adams Co., Miss., Oct. 19.

## The Movable-Frame Hive vs. the Box-Hive.

BY "A VIRGINIA BEE-KEEPER."

I WAS very much and agreeably surprised to find my letter on "Box-Hives vs. Modern Hives," (see page 750), noticed and commented on by so eminent a bee-keeper as Dr. Miller, on page 792. As he has asked a good many questions in his kindly comment, perhaps I will be allowed space enough to try to answer some of them, though I would like to preface my remarks by mentioning that I feel very much like a school-boy suddenly confronted by the head master, and asked to give him information on subjects which are his special forte.

First, let me quote a passage from my original contribution: "To illustrate the expense connected with the change from box-hives to modern hives, I give my own experience."

This may be another question of "locality," but the facts in my own case were substantially as set forth in my letter. That is to say, when I contemplated making the change to modern hives, and after I had laid off the ground for my apiary after having decided on the number of colonies I would keep and the kind of hives I would use, I made a rough estimate of the cost of the entire necessary supplies for an apiary of 50 colonies. This estimate I discussed with the owner of the hives that I had on shares, and proposed that the change should be made in the next four

years, and also proposed that he should pay one-half of the expenses and I would pay the other half, while the surplus honey should be divided between us evenly. He decidedly and emphatically refused, and I then offered to buy his bees in the box-hives, as I did, and which I considered a much better proposition for me. I stopped at for four years, because I do not, at present, intend to allow my apiary to grow larger than that, spring count, even if I have to destroy swarms, queen and all.

"Are all the items given, fairly to be charged to box-hives?" I suppose you mean charged to modern hives? I think I should be inclined to say "Yes" to this question, as it would be hardly worth while to make the change at all to movable-frame hives unless one expected to use rather more enlightened methods than those usually in practice by owners of box-hives. You say, "The items must be charged, not to movable-frame hives but to improved methods of bee-keeping." Well, for that matter the movable-frame hives themselves should also be charged to "improved methods of bee-keeping."

In this locality it is almost a misnomer to call the farmers bee-keepers, as they generally fail to keep them, losing most if not all swarms, and little or no attention is paid to bees, and little or no honey ever taken from them. I know of a few "patent" bee-hives in use, none of which I would accept as a gift, and several scattered box-hives. Thus, I should be inclined to say that, barring the expense, which I only stated as one reason against modern hives, the next main reason is that the farmers here do not give the time necessary to run an apiary successfully, and therefore would be very little better off with all the latest modern hives and appliances than they are with their old boxes.

I may add here, that for 8 or 9 years I had been desirous of starting an apiary, but had been deterred by the initial expense of modern hives and appliances; and the first 5 modern hives that I ever bought were purchased quite unexpectedly, and almost accidentally! Augusta Co., Va.

## Dr. Miller's Answers

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. Miller, Marengo, Ill.

### As to Answers by Mail.

Every now and then some correspondent asks a question which he desires to have answered by mail instead of having it answered in this department. Sometimes he seems to think his question is not of sufficient importance to be answered in print, and so he will be satisfied with a written answer. If the question is worth answering at all it is worth answering here, for any one who pretends to conduct a department of this kind ought to consider himself a fair target for any question on bee-culture not fully answered in the bee-books, and he should be ready to answer it here, if he can.

A larger number prefer a private answer because they think they might get it in less time. That might or might not be, for I am generally so crowded that a letter I am not obliged to answer may be delayed some time, whereas it is a matter of business to answer questions in this department as promptly as possible, no matter how crowded I am. Even if there is an abundance of leisure, it will easily be seen that if it would be right to answer one by mail it would be right to answer all in the same way, and that would take a good many days of every year without pay for the work.

Another reason for answering here, is so that a number can have the benefit of the answers, whereas an answer by mail would be limited to an individual.

A letter before me gives, however, a reason differing from all others. The writer says the answers in the Bee Journal are uncertain and unsatisfactory, and so he wishes a private answer. I see no reason why answers in this department should be less certain than those sent in a private letter. As to their being unsatisfactory, I am painfully conscious that such is the case sometimes, from the simple fact that I don't know enough to answer them any better. But what reason is there to suppose that any more satisfactory answer would be sent in a private letter? I am paid for answering questions in this department, and would get

nothing for a private answer. Do people generally work better when they work for nothing than when they get pay for their work? No, whatever may be their defects, the answers in this department are the very best I know how to get up, and I couldn't improve them for private circulation. But with study and practice I may improve; and hope that in the future this department will be a shade better than in the past.

Send on your questions and I'll give you the best answers I have in stock, but don't ask me to make an exception in your case as to the place for answering.

C. C. MILLER.

### Hives and Management for Comb Honey.

1. What consideration led you to change from the 10-frame hive? This would have been a valuable point in "Forty Years Among the Bees." Please give me this answer as exhaustively as possible. I am running 150 colonies for comb honey, and am ready to purchase that many hives, hence the question above.

2. Do you use "double deckers" with all your colonies up to the honey-flow?

3. If you have but 8 frames of brood at the commencement of the honey-flow, where is the advantage of "double deckers" if the same amount can be secured in a 10-frame hive? I had 8 frames of brood in all my colonies at the commencement of the flow. I fed 1200 pounds of sugar in Doolittle feeders, however.

4. You speak of much swarming the season just past; I thought you practiced forced swarming, examining colonies every 10 days for queen-cells. Well, how did you manage swarming this season? In your late work you speak of several methods not yet tested. What is the method you depend upon in the management of swarming?

5. Is there any method superior to hiving or brushing on 5 frames with starters? In practicing this method the past season, when white clover produced more pollen than honey, I had several hundred sections spoiled by pollen and brood, notwithstanding I used full sheets in sections. The pollen in the sections was not always accompanied with brood. Some of my finest cases of comb honey had pollen exclusively, no brood at all. Comb-building was very slow during a large period of the honey-flow.

6. In practicing forced swarming, I think the hatching brood should be transferred to the forced swarm so gradually as will keep the forced swarm in about the same condition as the colony from which it issued would have been in, had it had no inclination to swarm. The two drives, at intervals of 10 days, will not accomplish this result. How about shifting the parent colony every few days to the right, left, rear, and top, till most of the hatching brood is transferred from the parent colony to the forced swarm? How often should this shifting be done? I have practiced this to some extent this season, having scarcely a swarm issue from the forced swarm, though swarming was "furious," having had 16 in the air one Lord's Day by 10 o'clock.

7. On the 5-starter plan, I think the forced swarm, at the close of the honey-flow, should be transferred to the parent colony, which should have had just enough bees left (with a young queen) to protect the combs. After disposing of the old queen in a forced swarm, how should we proceed so as to get the forced swarm back to the parent colony, so as to have the brood and queen out of the five-starter combs into the parent hive?

8. As to the question of putting the second super above or under the first, I will say from a pollen-and-brood-in-sections standpoint, put the empty super above. I believe that had I practiced the reverse this season I would have had half of my supers with more or less pollen; but even as it was I had plenty of both in the sections, because the first super had but full sheets instead of combs half filled with honey.

9. In regard to wax-larva injuring sections, I will say that when the plain sections are packed in shipping-cases without fumigation, the wax-larva are about equal in some instances to an uncapping-knife. I have seen the entire face of a section uncapped almost completely. Would a teaspoonful of carbon-bisulphide poured into a shipping-case after it is filled minus one section, then the missing section replaced and the lid nailed on, be sufficient to destroy all eggs and larva? Does the bisulphide kill the eggs?

10. How does it come about that while I have much swarming, my neighbor, 50 yards away, has practically no swarming among his blacks year after year, although they are so crowded for room that they build comb on the outside

of the hive? I believe it would pay to rear queens from his stock for a non-swarming strain, or else ferret out the conditions peculiar to him that begets such results.

11. How many cubic feet per colony is required in cellar-wintering? I am thinking of putting the bees indoors.

12. And now for wintering in southern Ohio: A gentleman conceived the idea of banking his colonies to the top of the brood-chamber, and having packing on top of it. The result after several years has been a uniformly splendid wintering, so that colonies not protected would not compare with them the following season for strength and profit.

13. I am surprised at your using the Hubbard press and Daisey foundation-fastener, when the Rauchfuss is so superior. I can fold and foundation 3 sections per minute.

You will have to excuse me for the fusilade of questions, suggestions to questions, etc., for I have been 20 years among the bees, and have scarcely asked a question. No wonder I am no further along. My crop was only 2 tons from 100 colonies, with the prospect of feeding one ton of sugar. Increased 50, however.

OHIO.

ANSWERS.—1. I changed partly to be in fashion, partly because hives and supers were lighter to handle, and that bees might sooner finish up work in the smaller super. The 10-frame hives were not large enough at all times, and two stories of 10 frames each were too large.

2. No, only where they are actually needed. Some years few may be needed, some years many. So long as a colony has plenty of room in 8 frames there's no use in giving more, but it's a draw-back to restrict them to 8 when they need more.

3. By referring to my first answer you will see some advantages of 8 frames, even if 10 frames would hold all the brood, as lightness of handling hives and supers, etc. To some this matter of heavy or light handling is a small thing; to others it is very important. If you have but 8 frames of brood, never going beyond that, the case would be different, but by giving two stories you will often go beyond the capacity of the 10 frames, having 11 to 14 frames of brood.

4. As a matter of fact I don't depend upon anything, for lack of something entirely dependable. The past season watch was kept for queen-cells. If only eggs were found in cells, they were destroyed, and some colonies were satisfied to go through the whole season without getting any farther than to have eggs in cells. Such colonies are likely to give very satisfactory results. Some years a goodly number of colonies will not even go as far as to have eggs in cells, but last season was so badly exceptional that I'm not sure whether there were any of that kind. If upon the next visit cells were found well-advanced, perhaps sealed, it was pretty evident that the bees meant business, and would be likely to swarm before the next round. Then perhaps a swarm was snaken. Perhaps the queen was removed—killed if not entirely satisfactory in every way, otherwise put in a nucleus—and at the next round all cells were destroyed and a queen given. If a young queen was given that had just begun laying, no more attention was given to that colony for the season; if their own or any other old queen was given, they were further watched. Sometimes, when in a big hurry, cells were destroyed even when well advanced; and in that case the queen would likely turn up missing at the next visit. A young laying queen was given in her place and that colony counted settled for the season. I think that covers most of the cases, for some other things were tried on so small a scale as not to be worth relating. You see, I'm not very thoroughly settled in the matter, and perhaps never will be. It may be said in passing that as a matter of course there were cases in which cells were started for superseding instead of swarming, but one could not easily tell, and the safer way was to consider all cells as meant for swarming.

5. Shaking or brushing upon 5, or any other number of frames, is in my judgment not to be compared with the plan of having a colony go through the season without making any preparation whatever for swarming. Neither does it compare in results, I am afraid, with the plan of letting a colony go queenless 10 days and then giving a queen that has just begun to lay. If your large amount of pollen and brood in the sections was due to the fact that 5 frames with starters were given, then the plan of having a larger number of frames, or having them filled with foundation or drawn combs, would be superior.

6. My plan of working involves an objectionable amount of labor; I'm afraid shifting frequently the old hive would be still worse. I don't know just how it would work, and I don't know how often the shifting should be

done. I gained about the same end in what seems to me a more satisfactory way, with part of my shaken swarms. Instead of giving them empty frames, I gave them combs that had been shaken from other colonies ten days previously, and made no second drive. That gave them the increase of bees gradually and naturally, and I didn't see but it worked just as well as to give empty combs.

7. If you mean you kept the forced swarm on five combs throughout the season, I shouldn't expect good work in supers. Allowing, however, that you had done so, your question is simply one of uniting at the close of the season, and I would unite the two as in any other case.

8. It is quite possible that where bees carry much pollen into the sections there may be less carried into empty sections above than below, but that is a factor I have not had to take into account, not being troubled with pollen in sections.

9. I can see no reason why wax-larvæ should be any worse in plain sections than in others. A teaspoonful of carbon would be enough if confined, but would the case fit close enough? Both eggs and larvæ are killed.

10. I don't know why the difference. Does he get as much as you? Possibly his bees are too lazy either to store or swarm. Possibly there's something about your management that favors swarming, and it is possible that one right on the ground might discover the trouble—possibly not.

11. Something like 10.

12. I see no reason why banking colonies should not be a good thing, although it might be a little hard on the hives.

13. What one is accustomed to doing is likely to seem best; but if only 3 in a minute is your gait we would hardly want to follow in this locality, as we more than double that rate of speed.

So long as you ask questions in so intelligent a manner, your questions will always be welcomed; but don't you think it will be better to have your questions distributed along through the years rather than to wait again till the year 1923, and then send them all in a bunch?

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### The Lady Warwick College.

The British Bee Journal makes interesting mention of the work of the Countess of Warwick, as follows: "To train educated women in what belongs to the lighter side of agriculture—namely, dairy work, market gardening, poultry farming, bee-keeping and fruit-growing—was the idea of the Countess of Warwick, and was carried out by the founding by her of the Reading Hostel in 1898."

So great was the success of the enterprise that larger accommodations were needed, and for this purpose Studley Castle, Warwickshire, was secured, and last October the change was made, the name being changed from "Reading Hostel" to "Lady Warwick College."

The building finely accommodates 60 students, the grounds contain fruits and flowers, with 400 feet of glass, and the country around seems well suited to bee-keeping. Altogether it is a place where a young woman may be very happy in preparing herself for an independent as well as a useful life, that will allow her much of what is too often denied to the weaker sex—the blessings of the open air. Why could not some woman of wealth, on this side the water, erect for herself a monument of the same kind?

The British Bee Journal says: "There is no doubt that many women would be able to undertake the work taught at the college if they only knew how. Fruit-growing and bee-keeping must go together, and we know women can be successful in these branches, because we have seen some of the best results obtained by them."

### Hatching Eggs Over Bees.

DEAR MISS WILSON:—You will excuse my bad writing, as you see I have lost one eye, and don't seem to get a glass for the other one that I can see as I ought. You don't know

what an inconvenience it is, and I sincerely hope you never will lose your eyes.

Can any sister, or any one else, give the year and number that had the article in it about hatching eggs over the bees? I was not interested in chickens at that time; I read it, but I don't remember how it was headed, so I fail to find it. I have looked the indexes over of the past three years, but fail to find it, not knowing what the heading was. I remember it told how to prepare the nest and all. Perhaps the sister that was going to try it herself could tell. Of course, she read it, too, or she would not have tried it. There are a number of sisters that I am anxious to hear how they succeeded. I hope they will let us know soon their success.

I will tell, as soon as I get time, about my bees, but I have been so busy taking care of my crops and making a chicken yard and house, and fixing my pigeons' place, that I could not take the time to make a report. And losing my right eye I can not write at night, but I hope to have time before long.

MRS. SARAH J. GRIFFITH.

Cumberland Co., N. J., Oct. 26.

It may be well not to expect too much from using bees instead of biddies for hatching chickens. If any of the sisters—or, for that matter, any of the brothers—have tried it, will they kindly report whether it was a success or a failure.

### Mild Weather With Good Sleighting.

The American Bee Journal comes to us as a weekly visitor to relieve the monotony of the winter hibernating. I enjoyed that trip to Los Angeles, as told in the Journal. I have tried putting in practice some of the many pointers in the Journal. With what degree of success, next summer will tell better.

I have three new queens—Mrs. York, Mrs. Davis, and Mrs. Doolittle. "Children" all look alike. Shouldn't think the mothers could tell them apart. I can't.

We are having very steady mild winter weather, with beautiful sleighting.

MRS. D. W. BROWN.

Eric Co., Pa., Dec. 10.

You say the children all look alike, and seem to think that on that account the mothers can't tell them apart. Perhaps the mothers don't depend at all upon looks, but upon the odor. Do you suppose the mothers have names for all the children?

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get them subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

dark. I weighed them, and they averaged 50 pounds, none less than 44 pounds. The 8-frame hives weigh 20 pounds, leaving 24 pounds for the bees and honey. I weighed a good many of them Nov. 1, and then again Dec. 8, and found that they had consumed and lost from 4 to 5½ pounds per colony, the heaviest loss seeming to be in those that had weighed the heaviest, some as much as 63 pounds. I raised the covers and put a double thickness of muslin over the frames, and then put on the cover again.

GEORGE H. WELLS.

Johnson Co., Mo., Dec. 12.

**Did Better Than the Average.**

I have been a subscriber to the American Bee Journal only one year, but I have never wanted my money refunded, as I consider that I have learned more than a dollar's worth from its pages. But being "only a renter," my bees seem to have hardly a fair chance, as I have to move them around so much. I commenced three years ago with 5 colonies, and did not know the difference between a queen-bee and a house-fly, but I think with the aid of the "Old Reliable," etc., I will be able to produce enough honey for home use.

Last spring I had 10 colonies, increased to 16, and took off about 600 pounds of comb honey, mostly white clover. I had some customers who said that my honey was the best they ever ate. I have the long-tongue Italians, and I know that they stored a better average than any bees in my locality this year, and I compared with some "old hands at the business," too.

LYMAN NORTE.

Page Co., Iowa, Dec. 11.

**Report of the Minnesota State Convention.**

The Minnesota State Bee-Keepers' Association met Dec. 2 and 3 at Minneapolis.

The meeting was interesting and successful from a social point of view, and instructive scientifically. Papers were read by Pres. Wm. Russell, Mrs. H. G. Acklin, Prof. F. L. Washburn, State Entomologist; Walter Ansell, S. Lindersmith, N. P. Aspinwall, Mrs. W. S. Wingate, G. R. Frye, Dr. E. H. Jaques, Wm. Cairncross, and George A. Ferguson.

The work of the Association, through special committees for the year, has been in the direction of displacing adulterated honey from the market, and a constant pressure is made on the State Dairy and Food Commission to this end. Samples have been collected and sent to the Commission for examination, and they have sent warnings to grocers, and sales of adulterated goods stopped. The hardest thing in this line we have to contend with is the man without a name or a place of business, who goes from house to house and makes his sale.

Another direction in which the Association has made advance in is the facilities for exhibiting honey and the bee-keeping industry at our State Fair. We have made a gain from year to year in this exhibit until it is one of the finest at the fair.

There was much interest developed at the meeting in regard to co-operation in the bee-keeping industry. Two papers were read, and a committee appointed, of which Walter R. Ansell was made chairman, to further the interests of bee-keepers in this direction. Any one interested in this matter is invited to communicate with the chairman of this committee.

The officers elected for the coming year are: President, E. K. Jaques; 1st Vice-President, S. La Mont; 2d Vice-President, Walter R. Ansell; 3d Vice-President, John Doll; Secretary, Mrs. W. S. Wingate, of Richfield; Treasurer, L. D. Leonard; Executive Committee, Wm. Russell and Wm. MacCuen.

L. D. LEONARD, Sec.

Hennepin Co., Minn.

**BOYS WE WANT WORKERS**

Boys, girls, old and young alike, make money working for us. Send us 10c stamps or silver for full instructions and a line of work to work with. **DR. E. P. BISHOP & CO., Chicago, Ill.** Please mention Bee Journal when writing.

**Langstroth on the Honey-Bee**

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those

large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**GEORGE W. YORK & CO.**

**"What Happened to Ted"**

BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton, the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—60 pages, 5x6½ inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver.) Address,

**ISABELLE HORTON,**

227 EAST OHIO STREET, CHICAGO, ILL.

**BEE-BOOKS**

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 & 146 E. Erie St., - CHICAGO, ILL

**Forty Years Among the Bees,** by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide, or Manual of the Apisary,** by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.30.

**Langstroth on the Honey-Bee,** revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture,** by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.30.

**Scientific Queen-Rearing,** as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey, or Management of an Apisary for Pleasure and Profit,** by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture, Its Methods and Management,** by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur,** by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apisary Register,** by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood.**—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping,** by G. R. Pies.—Result of 25 years' experience. Price, 30 cents.

**Foul Brood Treatment,** by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Foul Brood,** by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

### HONEY AND BEESWAX

MARKET QUOTATIONS

**CHICAGO, Dec. 7.**—At this season of the year there is not much trade in honey at retailers. Heavy laid in their stock for the holidays. Fancy comb honey for the Christmas trade has brought 13 1/2c; No. 1 grades, 12 1/2c@13c; amber, 10@10c. Extracted white, brings 6 1/2c; amber, 5 1/2c. All extracted honey is sold on flavor, quality, kind and style of package. Beeswax, 24@30c. **R. A. BURNETT & Co.**

**PHILADELPHIA, Dec. 10.**—Large lots of comb honey being offered from States that were not supposed to have much stock. Beesmen, as usual, wake up now to the fact that they want to sell their comb honey and push it on the market, thus breaking the price. If they would only offer their honey in September, they would get more for it and it would be better for the producer and dealer. We quote fancy white, 14 1/2c; No. 1, 12 1/2c; amber, 12c. Fancy white extracted, 8c; amber, 6 1/2c. We are producers of honey, and do not handle on commission. **WM. A. SELSER.**

**ALBANY, N. Y., Dec. 15.**—Market very dull, and lower since the cold weather. Quotations have to be shaded, and concessioners made to effect any quantity sales. **H. R. WRIGHT.**

**CINCINNATI, Nov. 20.**—The demand for comb honey is slower now than it was six weeks ago, owing to the enormous quantities offered on all sides. Fancy comb is sold in single case lots at 14c. The supply of extracted honey is big, although the demand is good. We are selling amber extracted in barrels and cans, 7 1/2c@8c, according to quality. Beeswax, 30c. **THE FRED W. MUTH CO.**

**BUFFALO, N. Y., Oct. 11.**—The demand for white comb honey is better than it was. The trade is particular and wants only very white, clean stock. If the wax is yellow from travel, stain it does not sell well, and price has to be cut. Fancy white comb, 14@15c; A No. 1, 13 1/2c@14c; No. 1, 12 1/2c; No. 2, 11 1/2c; No. 3, 11@12c; No. 4, 10 1/2c; No. 5, 10@11c. White extracted, 6 1/2c@7c; amber, 6@6 1/2c; dark, 5 1/2c@6c. Beeswax, 25@30c. **W. C. TOWNSEND.**

**BOSTON, Dec. 21.**—The demand for honey continues good, with an ample supply of comb, and a light supply of extracted. We quote our market as follows: Fancy white comb, 16@17c; No. 1, 15@16c; and practically no No. 2 to offer. Extracted, 7 1/2c, as to quality. **BLAKE, SCOTT & LEE.**

**KANSAS CITY, Dec. 18.**—Since our last quotations there have been two cars of western comb honey put on our market, and same is being sold (without any good reason) at prices not justified by market conditions. Fancy white comb, 24-section cases, \$2.65; No. 1, \$2.50; No. 2, \$2.40. Extracted, white, per lb., 7 1/2c@7 3/4c; amber, 6 1/2c. Beeswax, 25@30c. **C. C. CLEMONS & Co.**

**CINCINNATI, Dec. 18.**—The market on comb honey has weakened, as the supply has been larger than the demand. Fancy water-white, 14c; of grades, lower. Extracted, amber, in barrels, 5 1/2c@5 3/4c; in 60-lb. cans, 5c more; alfalfa, water-white, 6@6 1/2c; fancy white clover, 7@7 1/2c. Beeswax, good demand, 30c for rice. **C. H. W. WEBER.**

**NEW YORK, Dec. 4.**—Comb honey is arriving in sufficient quantities to supply the demand, and, as to the quality, most of the white honey seems to be of color, more or less. We quote fancy white at 14c; No. 1 at 13c; amber, 11@12c; and buckwheat, 10c. Extracted, light amber, at 6c; white, 6 1/2c; Southern, 5 1/2c@6c per gallon; buckwheat, 5 1/2c. Beeswax, 26@27c. **HILDRETH & SIBLEY.**

**SAN FRANCISCO, Oct. 21.**—White comb, 1-lb. frames, 13@14 cents; amber, 9@11c. Extracted, white, 5 1/2c@6c; light amber, 5 1/2c@5 3/4c; amber, 4 1/2c@5c; dark amber, 4@4 1/2c. Beeswax, good to choice, light, 27 1/2c; dark, 25@26c.

Market is more quiet than for several weeks preceding, but is fairly steady as to value. Spot stocks and offerings of both comb and extracted are mainly of amber grades, while most urgent inquiry is principally for water-white, the latter being the only kind meeting with much competitive bidding from buyers. Recent arrivals of honey included in our list of 100 cases from the Hawaiian Islands. The bees of the Islands feed mainly on sugar.

Dr. Geo. D. Mitchell & Co., Ogden, Utah. 46Atf Please mention the Bee Journal.

## BEST

# Extracted Honey For Sale!

ALL IN 60-POUND TIN CANS.

## Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

## Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Our honey is put up in tin cans holding 60 pounds of honey each. These cans are shipped in wooden-boxes, and should arrive safely. We have nothing but PURE BEES' HONEY to offer, and so guarantee it. Cash must accompany each order. All prices are f.o.b. Chicago.

Prices of Alfalfa Honey:		Prices of Basswood Honey:	
One 60-lb. Can @8c.....	\$ 4.80	One 60-lb. Can @9c.....	\$ 5.40
Two 60-lb. Cans (in 1 box) @7½c	9.00	Two 60-lb. Cans (in 1 box) @8c....	9.60
(Larger quantities at the 7½c price.)		(Larger quantities at the 8c price.)	

A sample of either Alfalfa or Basswood honey will be mailed on receipt of 10 cents; samples of both kinds for 16 cents. (Stamps accepted.)

BEESWAX WANTED—We are paying 28 cents cash or 30 cents in trade for pure average beeswax delivered in Chicago (or Medina, Ohio).

HONEY-JARS—Don't forget to get our prices on all sorts of honey-packages.
