# AMERICAN BEE JOURNAL

43d Year.

CHICAGO, ILL., JAN. 1, 1903.

No. 1.

1. A scene on the Georgetown and Silver Plume Scenic Trip, near Denver.

2. "Umbrella Rock" in the Garden of the Gods, near Pike's Peak.

3. Little Luella Hall and a 12 1/2-pound swarm of bees.

4. Bee-yard of 98 colonies, belonging to F. W. Hall.

5. Home of F. W. Hall, of Sioux Co., Iowa.

6. Carnival Parade Wagon with Honey and Glass Hive of Bees

7. Bird's-eye view of Georgetown, Colo., from the South side.

8. A snap-shot from car window near foot-hills west of Denver.

9. A corner of Central City, Colo.

# THE AMERICAN BEE JOURNAL

PUBLISHED WEEKLY BY

**GEORGE W. YORK & COMPANY**

144 & 146 Erie St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

EDITOR—George W. York,  
DEPT. EDITORS—Dr. C. C. Miller, E. E. Hasty,  
Emma M. Wilson.

SPECIAL CORRESPONDENTS—G. M. Doolittle,  
Prof. A. J. Cook, C. P. Dadant,  
R. C. Aikin, F. Gruber, A. Getz, and others.

## IMPORTANT NOTICES.

**The Subscription Price of this Journal** is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

**The Wrapper-Label Date of this paper** indicates the end of the month to which your subscription is paid. For instance, "dec01" on your label shows that it is paid to the end of December, 1901.

**Subscription Receipts.**—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

**Advertising Rates** will be given upon application.

## The National Bee-Keepers' Association.

### OBJECTS:

- To promote and protect the interests of its members.
- To prevent the adulteration of honey.
- To prosecute dishonest honey-dealers.

### BOARD OF DIRECTORS.

E. WHITCOMB,	THOMAS G. NEWMAN
W. Z. HUTCHINSON,	G. L. DOOLITTLE,
A. I. ROOT,	W. F. MARKS,
R. C. AIKIN,	J. M. HAMSAUGH,
P. H. ELWOOD,	C. P. DADANT,
E. R. ROOT,	DR. C. C. MILLER.

### EXECUTIVE COMMITTEE.

W. Z. HUTCHINSON, President.  
JAMES U. HARRIS, Vice-President.  
GEORGE W. YORK, Secretary, Chicago, Ill.

EUGENE SECOR, General Manager and Treasurer, Forest City, Iowa.

MEMBERSHIP DUES, \$1.00 a year.

\*If more convenient, Dues may be sent to the office of the American Bee Journal, where they will be forwarded to Mr. Secor, who will mail individual receipts.

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (or two buttons) as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents, or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

## Forty Years Among the Bees

By DR. C. C. MILLER.

DR. C. C. MILLER.

The above is the title, and name of the author of a new bee-book which will be ready some time in January, 1903, as it is now in the hands of the printers. It is a book that every bee-keeper in the world that can read English will want to own and read. It will contain over 300 pages, be bound in handsome cloth, printed on good book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. The book will show in detail how Dr. Miller does things with bees.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, which finally tells how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called, "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters.

### How to Get a copy of Dr. Miller's "Forty Years Among the Bees."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book *free as a premium* for sending us **Two New Subscribers** to the Bee Journal for one year with \$2.00. This is a magnificent offer. Better send in the new subscriptions before Jan. 1, so they can begin with the new year. Or, if sent at once, we will throw in the rest of this year's numbers of the Bee Journal free to the new subscribers.

**GEORGE W. YORK & CO.,**

ESTABLISHED IN 1861

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., JAN. 1, 1903.

No. 1.

## Editorial Comments.

**A Happy New Year** to all the readers of the old American Bee Journal is our sincerest wish. May it also be, in every way, the very best year of all the years you have seen.

**Crediting New Queens Fairly.**—In a thoughtful article in the American Bee-Keeper, Arthur C. Miller calls attention to the impropriety of giving credit or blame to a queen for the success or failure of a colony during the first year of her introduction. Even if a queen were introduced as early as May 1, and 60 days be allowed as the average life of a worker, "it will readily be seen that from a third to a half of the crop is all that should be credited to the new blood." If Mr. Miller has made any error in his estimate, it is probably on the side of allowing the new queen more than her proper share of influence upon the crop.

**A Canadian Honey Exchange.**—Mr. Morley Pettit informs us that at Barrie, Ont., Dec. 18, 1902, a number of bee-men of the Province met to organize a honey exchange. W. A. Chrysler was appointed chairman, and Morley Pettit secretary, *pro tem*. The Association is to be called "The Canadian Honey Exchange," and the following officers were elected:

Directors—C. W. Post, W. A. Chrysler, Jno. Newton, and H. G. Sibbald.

Officers—President, H. G. Sibbald; Vice-President, W. A. Chrysler; and Secretary-Treasurer, Wm. Couse.

The membership fee is \$1.00.

We wish the new organization every success. And congratulate them on getting ahead of the United States bee-keepers. But the latter will catch up later on. Large bodies move in a less rapid manner.

**Bogie Man for Vicious Bees.**—In the British Bee Journal there was a case reported in which some vicious bees vented their spite upon a scarecrow or dummy dressed in a man's clothes. The cross bees appeared to leave their stings in the bogie man, and there was no trouble from them afterward. One of the leading contributors of the Journal, D. M. M., thinks the bogie man might do good by familiarizing the bees with the presence of something in the semblance of a man, but seems to feel almost positive that there was some mistake about the bees stinging the bogie man, arguing that bees are so discriminating that they do not sting inanimate objects, and that if it should sting anything like a felt hat there would be no loss of the sting, which would be safely withdrawn by the rotary motion of the bee. However, it may be in England, "in this locality" cross bees will attack a felt hat by the hundred, leaving the hat well spotted with stings that they have failed to withdraw.

**Liquefying Honey in Small Packages.**—One way that has been recommended is to set a case of small glass or tin packages in the oven of a cook-stove, or in some similar place, and allow gradual heat to bring the granulated honey to a liquid condition. Mr. Greiner says in the American Bee-Keeper that he has had very satisfactory results from using a solar extractor whenever there is sufficient sunshine.

**Box-Hives** are favored by a correspondent in the Farm, Bee, and Poultry Review, who says "it is the hive in most general use, and in the hands of an expert it is a good hive; for a brood-chamber I would ask for nothing better;" and Editor Colbourne adds, "I, too, am using a few box-hives for brood-chambers, and find that I get the best results from them."

Australia must be different from "this locality." The probability is that most bee-keepers in this country have not for years seen a box-hive with bees in it. What one would do "in the hands of an expert" of the present day can not be told, for the probability is that no expert would have one.

**Proportion of Honey to Wax.**—F. Greiner says in the American Bee-Keeper that he once melted 27 sections and obtained 12½ ounces of wax. If we assume that those 27 sections contained 25 pounds of honey, that would mean that it takes a pound of wax to contain 32 pounds of honey, or that it takes one-half ounce of wax to contain a pound of honey.

**Shall the National Do Marketing?**—There is in progress a healthy growth in the feeling that it is important for bee-keepers to unite and organize for various purposes, and gradually there will come crystallization of thought as to the best things to be done, and the best way of doing them. Not of the least importance is the matter of marketing honey. Shall the National Bee-Keepers' Association take hold of the matter directly without aid from any other quarter? Shall the National have nothing to do with it, and a separate organization be established? Shall a partially separate organization be formed, the two co-operating? These and other questions are open for consideration, and careful thought should be given them. The following, bearing directly upon the subject, is from an editorial in *Gleanings in Bee-Culture*:

Whether or not the National Bee-Keepers' Association should establish warehouses at various points is a question. The Association, as now organized, could not very well undertake a work of this kind; and it is doubtful in my mind whether it should do so; but it might work in harmony with another organization kindred to it. For example, the bee-keepers of Colorado have what is called the Colorado State Bee-Keepers' Association—an organization that has for its object the holding of conventions at certain seasons of the year. Then they have also another allied to the first one, known as the Colorado Honey-Producers' Association, which has for its object the receiving of the crop of the members and placing it on the market to be sold when the

market reaches its highest notch in the mind of an expert employed by the Association.

I remember it has happened several times that a buyer has gone through Colorado attempting to break down the market established by the Association. In vain did he try to get honey at less than the ruling prices; for so well were the Colorado bee-keepers organized that he went back home almost empty-handed, and finally had to pay the price simply because the bee-keepers of Colorado were so well organized that one central head controlled the price demanded, and, of course, obtained it—not only for one man's crop, but for all the members who put their honey into the hands of the central organization.

It is possible, then, that the National Bee-Keepers' Association might be affiliated with and indirectly connected with another organization which could take care of the commercial interests of bee-keepers, the same to receive their crops, properly grade them, and then dispose of the product after the market has been cornered, at a price that is not exorbitant, but which would give bee-keepers a fair living profit on the investment.

Editor Morehouse, of the Rocky Mountain Bee Journal, seems to hold much the same view, saying:

The National occupies a peculiar field, and serves a general purpose that does not come within the scope of an organization whose specific office is to market the products of its members. There is plenty of work for both a national bee-keepers' association and a national honey-producers' association, and while the membership in each may be nearly identical, we feel that bee-keeping interests, in general, will be better served by keeping them distinct as organizations.

We are quite in accord with the idea that the National Bee-Keepers' Association is not organized for the purpose of marketing the honey product of its members. A distinct and separate national company or organization should be formed for that purpose. This will be done, we think, if ever anything worth while is accomplished in the direction contemplated. The National can help greatly in getting the new organization started, we believe.

Next week we hope to have more to say on this subject, when we expect to publish a splendid article by Prof. A. J. Cook, that we have had for some time, waiting until after we had published that part of the Denver convention report which appears this week.

## \* The Weekly Budget. \*

SYMPATHY FOR DR. MASON'S FAMILY.—Mr. G. W. Vangundy, of Uinta Co., Utah, writes us as follows:

I am sorry to hear of the death of Father Mason. There are nine members of the National Bee-Keepers' Association here, and we all join with you in extending sincere sympathy to the bereaved family in their untimely loss. There are five or six of the Valley bee-keepers that are not members of the National Association, who unite with us in sending respects to the family of Father Mason.

G. W. VANGUNDY.

MR. F. W. HALL, of Sioux Co., Iowa, whose pictures appear on the first page of this number, wrote us as follows some time ago:

FRIEND YORK:—When we read your notes concerning the Denver convention and your several side-trips, it made us feel badly that we had to come home before ascending to the summit of Pike's Peak; however, the altitude at Silver Plume was about as much as my wife could stand. We felt sorry to have missed going to church and Sunday-school along with you at Colorado Springs; although my wife was very tired and felt quite poorly at the time, I was mainly to blame for not having gone.

I have quite a number of snap-shots of the scenery taken at various places through Colorado, which I will send

to you when I have had more time to print them. You will remember the "burro" at the beginning of the "Rockies," on the "Loop" trip; well, I have one of those finished, and one a little way from Central City, and one of Georgetown, on the same trip. I will send them to you now, and the others after I get them ready. F. W. HALL.

Mr. Hall finally finished up the pictures, and we have put some of them into the group as they are on the first page. Nearly all of the Colorado ones were taken while the cars were in motion. Some of them will doubtless be appreciated more by those who were privileged to take some of the side-trips after the convention.

In reference to the picture (No. 4) showing Mr. Hall's home apiary, he says:

As you will see, it was taken in two exposures, and the two prints fitted together as nearly as could be. The house on the left is a neighbor's across the alley. The top of our kitchen chimney shows slightly, the view being gotten from the roof of the dwelling. The feeder, as described to you in my former letter [see page 812], shows in the foreground at the right. Only one feeding-board was in operation at that time. It was necessary to add two more such, making three feeding-boards besides the lower trough, in order to give ample room for the bees to feed without too much crowding. F. W. H.

THE ONTARIO BEE-KEEPERS' ASSOCIATION.—Mr. Morley Pettit sent us the following on Dec. 23, in reference to the Ontario convention:

Representative bee-men from all parts of the Province met at Barrie, Ont., to attend the annual convention of the Ontario Bee-Keepers' Convention, Dec. 16, 17 and 18, 1902. Pres. J. D. Evans occupied the chair. Among those present were Prof. Creelman, B. S. A., superintendent of Farmers' Institutes; Prof. Frank T. Shutt, M. G. F. I. C. chemist; Mr. Jno. Fixter, apiarist, Dominion Experimental Farm, Ottawa; and Wm. McEvoy, Provincial Inspector of Apiaries for Ontario. The discussions were principally along the line of advancement in business methods, more systematic reporting of the honey crop for mutual benefit, and the formation of a honey exchange.

The officers for 1903 are: President, W. A. Chrysler; Vice-Presidents, J. W. Sparling and H. G. Sibbald; Secretary, Wm. Couse, of Streetsville; Treasurer, M. Emigh; Inspector of Apiaries, Wm. McEvoy, of Woodburn; Assistant Inspector, F. A. Gemmill, of Stratford.

Next place of meeting, Trenton, Ont.

Why Not Help a Little—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

## Convention Proceedings.

### Report of the Utah Bee-Keepers' Convention.

The little busy bee, and how to make it improve each slinking hour to the fullest extent, formed the theme of several interesting discussions at the recent annual meeting of the State Bee-Keepers' Association held in Salt Lake City. It was generally agreed that the production of honey, in Utah, is a pleasant and profitable occupation, when right methods are used.

Pres. E. S. Lovesy gave an interesting account of the recent National Bee-Keepers' Convention in Denver, which he and some others attended. They worked among the delegates to have the next convention held in Salt Lake City, and he thought their efforts may be successful. Favorable

comments were indulged in on the subject by many of the bee-keepers present, after which a resolution was offered, and unanimously adopted, instructing the President and Secretary to send a special and urgent invitation to the Executive Committee of the National organization to hold the next convention in Salt Lake City.

Judge J. L. Bunting gave an interesting account of the industry in the southwestern part of the State. He said the bee-keepers in that section had obtained over an average yield this season.

Frederick Dart and Vice-President R. S. Rhee, of Weber county, gave interesting sketches in regard to the progress in their localities. Mr. Rhee has over 100 colonies, and he disposed of his products at profitable figures.

In the general discussion it was shown that with the exception of those places where drouth, grasshoppers or smelter-smoke prevailed, the bee-keepers have obtained from a fair to a good crop of honey throughout the State. It is hoped that the smelter-smoke problem will soon be settled by the use of smoke-consumers.

Of interest to the housekeepers was the assertion of Mrs. Mary A. Sorenson, that she has used honey to good advantage as a substitute for sugar, in putting up fruit.

As illustrative of the possibilities in bee-keeping, Mr. F. W. Young cited a case of a man in his neighborhood who had 8 colonies of bees from which, in one season, he extracted an average of 300 pounds of honey from each, besides having several new swarms.

J. B. Fagg, the regular Secretary, being absent in Europe, J. N. Elliott was chosen to fill the position. A resolution was passed thanking Secretary Fagg for his long and faithful service in the interest of the Association, and also delegated him to represent the Utah Bee-keepers' Association in England during his sojourn there.

Among the bee-keepers present who took part in the discussions were the following: Judge J. L. Bunting, Frederick Dart, Vice-Pres. R. T. Rhee, Fred Schach, Mrs. Mary A. Sorenson, F. W. Young, N. D. Jensen, N. C. Jensen, T. N. Elliott, Mr. Woodbury, of southern Nevada, and others.

#### President Lovesy's Address.

I am pleased to meet our bee-keepers, under fairly favorable conditions at this time. While owing to the drouth and grasshoppers in some localities some of our bee-keepers have not obtained a full crop the past season, from reliable reports obtained from nearly all over the State we note that the average crop of bee-products in Utah has been equal to those of any other State, the average flow as reported ranging from 50 to 300 pounds. Some wrote that it was the most prosperous season they have had in from 3 to 5 years. In many localities the high-grade product itself is proof of the excellent flow. We took some samples of honey on our late visit to the National Bee-keepers' Convention in Denver. Some of it was equal, if not superior, to anything in the convention samples. It was presented to the Governor and other prominent Colorado citizens. Had we thought of coming out on top we would have taken more of it. We were treated so grandly by our Colorado and Eastern bee-keeping friends that we will ever look back to this trip as one of the most pleasant events of our lives. There were 6 Utah bee-keepers at the convention, and all enjoyed their trip.

We gave the Association a hearty invitation to hold their convention in Salt Lake City, in 1903, and if they accept we will try, as far as our feeble efforts will prevail, to make their visit as pleasant and agreeable as ours was while in Denver. We believe that if our bee-keepers take sufficient interest in this matter, the Association can be induced to come here; besides, everybody wants to make one or more visits to Salt Lake City, and as the great Irrigation Congress will be held here about the middle of September, 1903, the rates will be low, and we can conceive of no reason why our bee-keeping friends should not meet with us. As very few of the prominent bee-keepers of the Association have ever visited Salt Lake City, we hope they will not miss this opportunity.

As the question of a stronger organization is the order of the time, we hope our bee-keepers will make an effort to get into line. There is great need of improvement, especially in collecting information as to the amount of bee-products produced through the country each year, and how to obtain reasonable prices. To begin with, as many of our bee-keepers have obtained a fairly good crop, they must not rush it on an overstocked home market, at any price.

Our Secretary, Mr. J. B. Fagg, has left for Europe, where he will travel for two years, and will represent the

Utah Bee-keepers' Association while there. It will be necessary to elect another Secretary to fill the unexpired term. Our long association has been pleasant and agreeable, and while I regret his absence I wish him a pleasant journey and a safe return. E. S. LOVESY.

## THE DENVER CONVENTION.

Report of the Proceedings of the 33d Annual Convention of the National Bee-keepers' Association, held in Denver, Col., on Wednesday, Thursday and Friday, Sept. 3, 4 and 5, 1902.

(Continued from page 822.)

Vice-Pres. Harris—Can any member inform me where Mr. McIntyre's paper is, or whether there is one present? It was not read, and I see it was on the program for this morning. It is a little out of the regular order, but if there is no objection our good-looking Secretary will read the paper.

Dr. Mason—Do you mean me?

Vice-Pres. Harris—Yes, I mean you.

Dr. Mason—I thought the remarks of Mr. Harris would let me out when he said "good looking." You don't want to "put you foot in it" that way.

Dr. Mason then read the following paper prepared by J. F. McIntyre, of California, on

#### "SELLING EXTRACTED HONEY AT WHOLESALE; HOW TO GET THE BEST PRICES."

The statement that "to him that hath shall be given," etc., still holds good, only it should be made plainer. To him that hath *money* shall be given a high price for his produce, and from him that hath not money his produce shall be taken at a very low price, is the saying up-to-date. I believe that this law is as inexorable as Fate, when the words "at wholesale" govern what is said. A poor bee-keeper could peddle his honey, selling directly to consumers who do not know his weakness, at a good price, but the large producer can not do this; his honey must pass through several hands before reaching the consumer, and the price is governed by the market.

It is said, "All things come to him who can wait." Ah! there is the rub. How can a man wait who has hungry mouths to fill, and interest gnawing at his vitals?

I have before me San Francisco's Prices Current of July 4, 1902. Under Honey it says, "Buyers and sellers are too far apart in their ideas of values for much trading." Do you know what that means? It means that those having honey to sell now in California can wait. If there was one man who could not wait the buyers would get his honey at the present low price.

I don't know a single neighbor bee-keeper that has his last year's honey crop now on hand; they have all sold at a low price to speculators. Only a small portion of their honey has reached the consumer; the balance is in the hands of strong men who bought at a low price and are holding for a high price.

At our conventions this is often asked, "What are we going to do with the small producer who is too weak to hold his honey, and breaks the market?" I always look at the questioner to see if he wants to *kill* the small producer, let the speculators eat him up, or *organize* him. The question has never been answered to the satisfaction of every one present, but nearly all seem to feel as if the man had done wrong by selling so cheap.

The big-hearted man, with the love of humanity thrilling in his breast, gets up and says, "We really must organize these poor fellows so they will be able to hold their honey for a better price." The stoic gets up and asks "how much longer 100 of them would hold out than one, if they were all in the same fix and *must have money*?" The declaimers would laugh at such a weak corner on honey as that, and wait a very short time until it went to pieces. The "bulls" must have *real strength*; bellowing and pawing the dust does not scare the "bears" very much, so the organization fails to make its corner effective, the officers are blamed, and things are in worse shape than they were before.

Is there no hope, then, for the man who is too weak to hold his crop? Yes, there is still hope. The citrus fruit-

growers have done much to solve the problem. Their product was perishable, and could not be held, no matter how much money they had. Their business got into such bad shape that they were receiving expense bills instead of returns for car-loads of oranges shipped East. They had to do something or quit the business, and they did it. They organized to sell their fruit and get honest returns. They placed agents, under bonds, in every large city in the United States. These agents kept the head office in Los Angeles posted. Eleven million dollars worth is now consigned to these agents annually, and honest returns are made to the producer, and the acreage of citrus fruits has doubled instead of declining.

This organization, known as the Southern California Fruit Exchange, has become so successful that the members have all become co-operative cranks, and now propose to give other producers, who are too weak to maintain agencies of their own, the benefit of their agencies to sell their products.

The weak bee-keepers in this "neck of the woods" may now organize and market their honey at any time of the year through these agencies. The producers are finding out that the consumers are paying a good price for all the honey they use. The speculator, who is always a "bear" to the producer and a "bull" to the consumer, has overreached himself, and the bee-keepers now have an avenue through which they may market their honey without letting it pass through his hands. J. F. MCINTYRE.

Owing to the absence of Mr. T. Lytle, of Colorado, Mr. Harris called upon Mr. George W. York, who read Mr. Lytle's response as follows:

#### SELLING EXTRACTED HONEY AT WHOLESALE; HOW TO GET THE BEST PRICES.

The best prices for extracted honey—and the same might be said of comb honey also—will only be obtained when bee-keepers realize that modern, up-to-date business methods in production, transportation, distribution and selling, such as are successfully applied to other lines of industry, must be adopted and strictly followed.

Let us take as an example the citrus fruit industry so well brought to your attention by the paper just read. From very small beginnings, in the face of great obstacles, and without precedents, a great business has been established, placing these fruits in every city, town, and even village, of our broad land, tempting the buyer and profiting the grower. Many other business enterprises are following the same paths with equal success; the road, therefore, may be said to be well defined and traveled.

The obstacles, as I see them, are, first, a failure on the part of most bee-keepers to produce a thoroughly well-ripened honey, extracted or comb. Poo-hoo as much as you please, honey is not at its best for table use, if indeed for any other, when taken from the hive as soon as gathered. It lacks the aroma, the rich mellowness of well live-ripened honey, and fails to please the taste, to make the continual consumer that the well-taken article does. Cleanliness and good surroundings at the bee-yard will not force the taking of honey as soon as stored, and an experience of over 20 years without one failure to get above the ruling prices, confirms me in my opinions. I continue in the same markets, my honey is known, and sells in preference, and if true of comb honey it must be more true of extracted honey, so generally taken before ripe, and necessarily lacking in the points I have mentioned. I believe these things are as true, though perhaps in a slightly lessened degree, equally in the irrigated districts with the rain-belts, the irrigated areas having the advantage of a dryer atmosphere to keep it good after removal from the hive. I believe that those who maintain other views have never fairly tried to produce the best; and I have met quite a number who would not put on their own table that which they sent to market, preferring the better-ripened article.

Second, every distinct brand of honey should be properly and plainly labeled. Many a person will eat either a sage, alfalfa, basswood or buckwheat honey continuously, who would not care for the other brands, and it is poor business that fails to let one have that which he desires.

Of course, labeling presupposes a suitable package for the consumer, and all such packages, if handled by an agency such as the fruit-men have, should be of uniform and suitable size, and should bear the guarantee of such an agency. One can easily see an orange or apple—every one knows what they are. How many really do not know the taste, even, of good honey, and yet buy poor and dangerous sweets just because they are constantly before them in the

stores. Selling through one great agency, the demon of adulteration could be much better fought, and, cost what it may, this fight should be to a finish.

Let me heartily commend the matters brought to your attention by the paper to which I respond. Like a good, sturdy guide-post it points to SUCCESS. In my opinion, nothing else that the National can do could in any way compare with making plans for such handling of our product, either by this agency or some other equally well equipped. But it must be one agency, all others must be merged, or quit. Competition and failure we have. Let us try to get into real business methods. T. LYTLE.

F. E. Brown—I think that this is perhaps the important question, and I am very glad indeed that this thing has been sprung, and that we have these two papers dealing with the marketing of our honey in a wholesale way. We have listened to people from Colorado and other places wherein they produce their honey and sell it to consumers, but in California and other places we do not produce our honey, do it up and sell it; there is very little honey consumed in the State of California, and, perhaps, in other States where they produce large quantities. Our honey all seeks a market in a wholesale way, and the question is as to how we can derive the best results. We have before us such as the Citrus Fruit Growers' Association and the Raisin Growers' Association, which are examples indeed worthy for us to follow. A few years ago the raisin-growers of California associated together in order that they might maintain prices. Before that the growers were digging up their vines by the acre because it was not profitable to grow raisins; now the Raisin Growers' Association has placed it upon a paying basis; the same way with oranges—the orange growers in California maintain a price by which it is a profitable business. When I buy oranges in my own State I pay from 20 to 40 cents a dozen, the same price you pay here in Denver. When our honey seeks the same channels we will achieve the same results; and it seems to me this question should be agitated through our journals, in all assemblies, and in every way by which it is possible to get this before our people, in order that we may have our honey placed upon a profitable and substantial basis by which we may receive the actual value of the goods.

Dr. Mason—For the first five years that I was secretary, at every convention we had a paper on co-operation in some way or other, and some of us thought that was an important subject, and now we have a great question ahead of us, and it will be well now if we could do something definitely. It always does well to talk, but you can't accomplish anything by talking; you have to devise ways and means. Now, if Mr. Brown could tell us what we, as the National Association, ought to do, we would have something to work upon. Make it brief and to the point, and it will be just a great, big step in advance of where we have been. It seems as if it would be a proper thing for the National Association to take hold of this thing, and get it in shape. Of course, it will take time.

Mr. Brown—Of course, I could not tell you exactly how this thing should be; it is a deep question, it is a question that involves hundreds and thousands of dollars, but if the National Association would take hold of the selling of the honey, then I would have confidence to place my crop in the hands of the National Association where I would not in any local organization. To illustrate that, in central California I am the Business Manager of the Central California Beekeepers' Association; they voted me that position and placed their honey in my hands, that I might put it upon the market in a wholesale way for sale. They have confidence in me simply because they know me, but we can not expect to know individuals or certain salesmen, commission merchants, and so on, sufficiently to have confidence to place our goods there; but in the National Association we will have confidence, and I am willing to place my entire product in the hands of the National Association, and that can be done in this way: In each locality let them place their honey, not simply by shipping it to a certain point, but by reporting. I might report I have in my locality ten cars of honey, represented by samples submitted to the management of the National Association; and the management of the National Association, having in their hands their reports of the honey all over the United States and Canada, or other territory, are in a proper position to market this honey at the different markets that are open for the product, and not to force or overwork any particular point. That has all been discussed before. The small holders—the men who must sell, and must have the money in our local association—bring in their report to me, and I will go

with them to the bank and secure money for them, and they will pay interest upon the money they use. This very same arrangement can be worked out through the National Association. If I was in need of money and could not wait until the Association sold my goods, then I could afford to pay interest on the money that I had to have.

Dr. Mason—Instead of selling your honey at a sacrifice.  
Mr. Brown—Yes, that is the point. The Raisin Growers' Association do it in this way. They pool their product; it is all placed in the hands of the management of the Association as goods belonging to the Association, not in the hands of the individual at all; the goods were placed with them under written, signed contracts; the Raisin Growers' Association place the goods upon the market, and when one case is sold each person receives his pro rata, and so on until the whole store of goods is disposed of, declaring dividends at certain times as they proceed. The same thing can be arranged through the National Association in selling our honey.

H. Rauffuss—Couldn't it be done much cheaper by consolidation and co-operation? Couldn't it be carried one step further? We all admit it is done cheaper under the Raisin and Fruit Growers' Association than individually. Wouldn't it still tend to lessen the expense if the different organizations had one store-house and one management to market their production from?

Frank Rauffuss—In the first place, we found that if we wanted to do any business in this State we had to make it a stock company at the start. Now, if a person belonging to the Association brings in his honey to be sold by the manager, he is charged 10 percent commission for storing, selling the honey, and having it insured against fire, and collecting the money. Now, that might look rather big, 10 percent commission? I suppose it is, but we have to make it that large to be on the safe side, and two years ago we would also buy a little honey from the outside, and sell it to people that did not belong to the Association; then, we would make a little money out of the supply business, and in this way, after the season was over, and we closed up our business, it cost us one-tenth of one percent to have our honey stored, sold, money collected, and all. Just think of it, one-tenth of one percent! I would like to say, where is the association or business house that could do business for less than that? And we got an excellent price for our honey.

If there is a member of our Association that is short of money he will bring in a hundred cases of honey and say, "I would like to have some money on that." He can have his money at very low interest. If it is only a week until his crop is sold the interest is off.

I believe it will do a great many of our members good to look into the matter a little closer, and get some of our constitutions and by-laws and study the matter; but we ought to have something provided, we ought to be connected with this Association, or with some other association—we ought to have a central organization.

Of course, we of Colorado are trying to spread out and trying to have our local organizations—for instance, we have one at Longmont, and as we grow we will have some at other places, but really it ought to be done by some one else; it ought to be done by the organization, and they ought to go to work and do it. But how we could do it is very hard to determine. You can not figure these things out in five minutes. It took us a good many years before we could incorporate, before the people could be gotten interested in it and do anything for it. So far it has been successful, and I would like to make a motion to the effect that our chairman be empowered to appoint a committee of five to consider the matter, and find ways and means to organize and get closer in touch with such organizations; we shall call them business organizations, for that is really what they are. I don't think it is practical to have any State Association, or any other of those organizations do it; it has to be nothing but a business organization. It takes money to do it. Here in this State it has to be a stock company.

J. Merkley—I second the motion.

The chairman stated the motion, and, on the question being called for, put the motion, which, on a vote having been taken, was declared carried.

(Concluded next week.)

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

### Rearing Prolific and Long-Lived Queens.

BY C. P. PADANT.

THE discussion which has taken place in the American Bee Journal about this matter has drawn the attention of bee-keepers throughout the world. It may be of interest to the readers to hear some of the opinions expressed.

In the "Revue Internationale," of Switzerland, for October, 1902, Marius Barthelomy writes as follows:

"It was by crossing and selection that I obtained queens that are beautiful and robust, and producing bees which resist the diseases that prey upon the race, and which I attribute mostly to degeneration by weakness. One must be very careful in condemning a method, for all depends upon the manner in which it is used, the least oversight, the least fault, leads to failure.

"To obtain good queens, we need a temperature of not less than 65 degrees outside; eggs or young larvae from choice queens whose laying has been stimulated by feeding; plenty young bees from active colonies; a copious supply of food till the queens are sealed; and, lastly and sine-qua-non, the nucleus or colony must be gorged with bees. It is not necessary that the hive be large, if it is strongly supplied with bees.

"I find the Doolittle method excellent for extensive bee-keeping, but I like also the Alley method.... But my opinion is that the great effort must be in the direction of choice breeders to improve the race."

In L'Apicoltore, of Milan, Italy, the editor of that progressive magazine—the Signor DeRauschenfels, who is the author of a treatise on bees, and who has for years sustained the most progressive methods—writes the following in reply to statements and enquiries on the matter of queen-rearing:

"As to the opinion of Malan Brothers, that queens reared, as it is called, artificially, are less robust and suffer more from long travel than those reared at the swarming season or in replacing an old queen, we assert that though it is customary to prefer a swarm's queen-cell, to a 'supplied cell,' the queen which issues from the latter, provided it was reared in a normal colony, transported with sufficient care to a sufficiently populous, so that neither heat nor care could be wanting until the queen hatches, is neither less robust nor alert than the one which is reared in the normal family."

For many, many years, the tendency of our queen-breeders has been in the direction of color. All, or nearly all, their efforts were on this one point. The Italian bees were yellow, and the yellower the bees the purer they were thought to be. In-and-in breeding was a natural consequence of selecting always from the yellowest. Thus the breed was weakened, by a very unreasonable and yet very natural selection. Whatever popular sentiment demands is sure to come on the top. We are much less prone to look to color, because the Italian bee is very thoroughly established in this country, and hybrids few. So we are running much less risk of having our queens bred from only one pattern.

I believe that these discussions will lead to a great deal of good. Whether we decide that one man or another is right, we will certainly all come to the conclusion that we must use great care in the selection of our breeding-queens; and that we must, as much as possible, get our drones from choice stock also. All will also recognize that the queens must be bred in hives having a strong population, and lacking in nothing in the way of warmth, nourishment, and nurse-bees.

### A Central Honey-Producers' Exchange.

Written for the Wisconsin Convention held at Madison in February, 1902.

BY GEORGE W. YORK.

PROF. A. J. COOK, in his article published some time ago in the American Bee Journal, told of the wonderful success with which co-operation on the part of the producers of certain orchard products had met in California, notably the citrus fruit-growers. He urged a similar or-

ganization for the producers of honey. And Prof Cook is right.

But the question is, How shall an effective co-operative organization be formed among bee-keepers? I wish that I might prove myself a modern Moses who could lead out the children of Langstroth from the land of bondage of low prices and uneven distribution of honey to the Promised Land of fair prices and fair profits in bee-keeping. But though this may not be, still I may at least try to offer a few suggestions that will perhaps start some abler mind on the highway to wise planning and successful achievement.

I have long thought that in Chicago there should be organized and conducted a stupendous honey-producers' exchange. This central organization should ascertain the probable amount of honey in the country at the close of the honey harvest; should have large suitable space for the storage of honey; and be in a position to advance, if necessary, say a quarter of the actual value of the honey it undertakes to handle. It should also be in close touch with every large or small honey market in the United States, and be able to make shipments to foreign countries. Having the proper facilities and brains to manage all its affairs, it should soon be in a position practically to handle all the honey to be sold outside the home or local markets of bee-keepers in this broad land of ours.

Let it be generally known throughout the country that there is a great Honey-Producers' Exchange in Chicago, and from every town or city of any note in the United States there would come inquiries for honey. Many car-load shipments would be made not only direct from Chicago, but much in freight charges would be saved by telegraphing to the centers of honey-production (in California, Colorado or Arizona, for instance) for car-loads to be sent direct to St. Louis, New Orleans, Cincinnati, or to the Eastern markets. Of course, the surplus honey stocks should be used first to supply the needs nearest where produced, then afterward ship honey in from a distance. By so doing there would be secured a more even distribution, preventing an over-supply at any given point, and putting a fair amount of honey where now, perhaps, but little if any is used.

This central exchange should adopt and use (also authorize to be used under proper restrictions) its own brand on every case, can, jar, or comb of honey that is moved under its supervision. By so doing, in a very few years the honey put on the market by the Central Honey-Producers' Exchange would have a value that could not be estimated, for every pound of honey bearing its brand—and so its purity and quality backed up by the greatest honey-producers' exchange on earth—would command a higher price in every market on the globe.

Now, maybe I am visionary. Perhaps I have sawdust where bright brains should be. But to me this all looks feasible. Of course, it would take some capital to start it. A large storage warehouse should be leased; one efficient, pushing man, capable of managing large affairs, should be employed, and given the power to add such assistants as may be necessary. He should be the directing genius, responsible only to a board of say five directors, elected annually by the stockholders. Stock could be taken at so much per colony of bees owned, perhaps two or five dollars a colony. That is, if a man owned 100 colonies he would need to put in \$200 or \$500, as might be arranged. It should prove a handsome dividend-paying investment. But no honey should be excluded because its producer is not a stockholder, and all the honey of local bee-keepers should be brought up in instances where it is found that such honey is being offered at a price below what it should bring in view of its grade, and the carefully estimated amount of honey produced in the whole country that season.

Oh, I might go on, and on, and give detail after detail, but all that will unwind itself when once the thing is started.

I suggest further that this subject be taken up in the bee-papers and conventions from now until the next meeting of the National Bee-Keepers' Association, when definite action can be taken either by the Association itself or by individuals who may get together and organize for the purpose of planning and carrying out an exchange such as is here proposed, or one similar to it.

Bee-keepers need to do something, and that right speedily, in order to help themselves, by maintaining just and fair living prices for their honey. The National Bee-Keepers' Association could help greatly in getting this very important subject before the bee-keepers of the country, and in a way that will bring tangible results—results that will mean more to every honey-producer than anything

else that has happened since Father Langstroth unfolded the inside of a bee-hive to the view of wondering mortals. It would also mean much to the honey-consuming public. How few there are who really know the great value of honey as a daily food. Its medicinal qualities are scarcely dreamed of by the majority as yet. All this valuable information could be brought to the attention of the public through suitable advertising matter—by leaflets and through the newspaper press—all of which would tend to increase the demand for the delicious pure honey put on the market by the honey-producers' exchange.

I, personally, have had sufficient experience in the honey-selling business itself to warrant me in saying that here is a profitable field whose development only awaits—yes, pleads—the coming of a honey-producers' exchange such as I have outlined. And the bee-keepers themselves, could they once understand its objects, would hasten to embrace the opportunity to place themselves in line so that its beneficent results might extend to them.

If the bee-keepers of this land would be as wise and alert as are the bees they own, they would soon organize along the lines indicated, and thus place themselves and their precious product before the people in a way that would command not only high respect, but would also create an unlimited demand for all the concentrated sweetness in the shape of honey that could be produced annually by all the bees in all our grand country.

Cook Co., Ill. Jan. 17, 1902.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Good-Natured "Drones" are Welcome—Smoker-Fuel.

Referring to the article on page 760, I may say that however dangerous it may be in general for "any old drone" to attempt to enter this department, he may make the attempt without the least fear if his coming is accompanied by as good-natured and bright remarks as those of Mr. Whitney on the aforesaid page. Neither is our genial Afterthinker in the danger Mr. Whitney supposes. We shall always deem it an honor to have him consider the sisters of sufficient consequence to think about them, whether his thinking be before or "after."

As to apple-wood for smoker-fuel, it is again as Mr. Whitney says, a question of "locality." In the home apiary and in the Wilson apiary, aside from chips, apple is the favorite wood, while in the Hastings apiary it is never used, burr-oak having the preference. The first two apiaries are located in apple orchards, while the Hastings apiary is in a lovely little grove of burr-oaks.

### A Beginner's Experience with Bees.

MY DEAR MISS WILSON:—I take the American Bee Journal, and write to tell you how interested I have been in your articles on "Bee-Keeping for Women." I am a beginner, and am very much interested in bee-culture; in fact, I have what they call the "bee-fever."

In the summer of 1901 I got the "A B C of Bee-Culture" and studied it all summer and all winter. In the fall I bought two colonies of common bees in Simplicity hives. One colony died of starvation. The other, by feeding, managed to pull through. So, in the spring, I had one colony. I practiced stimulative feeding. I put a hive-body on top of the old one, to give them plenty of room, and to keep them from swarming, but they cast a large swarm the first of June, which I lost. In order not to lose a possible after-swarm, I took the top story off and set it on a stand by itself. I then bought a red clover queen and put her in. I clipped her wing first, but as I failed to cut out all the queen-cells I didn't for a moment believe she had been accepted. But I find the bees in that hive are different from the others. Many of them are very yellow; some of the drones are nearly all yellow.

1. Do you suppose she was accepted, after all?
2. If so, why are the bees not all yellow?
3. Do you suppose there could be two queens?

That colony gave me 60 sections filled with as beautiful white honey as I ever saw. I got only 10 from the other colony. I have sold it nearly all for 16 and 20 cents a section.

I now have the colonies packed on the top with chaff cushions, as the books direct, but I have put nothing on the sides. One is the Simplicity hive, the other is a Danzenbaker, which I bought in the flat, and nailed up and painted myself. The hives are very heavy with honey.

4. How do you think I have succeeded with this my first venture? I knew nothing whatever about bees; what I have learned has been through reading, and I read everything I can lay my hands on. I enjoy it thoroughly, all but the stings; they bother me quite a little. There is no pain of any account, but when the poison begins to go through my system I become unconscious, followed by nausea and vomiting. I am hoping in time I will get over that.

5. What do you think about it?

There is one thing I don't believe I will ever be able to do, that is, to find the queen in a full colony. It seems to me next to an impossibility to pick her from the mass of bees.

I don't care to bother with extracting, so I am going to work for comb honey entirely. I will use the Danzenbaker hives. I know nothing whatever about them, or any other, for that matter. I bought five in the flat last winter, and put them together without any assistance. It was like working out a puzzle, though, to get all the parts together. I had nothing to go by except the instructions in the little book that came with them.

I live in a town, and have my bees in the rear of the lot. No bees are kept for miles around. I can not give them much attention from the middle of June to the first of September, as I am away during that time.

I hope, Miss Wilson, I have not taken too much of your time with this preamble. But I did want to talk to somebody who knows about bees, and tell him or her what I have done. It seems to me I have done fairly well. The season was wet and cold, and not a good season for bees, the American Bee Journal says. I am sure no one could get along without a bee-keeper of some kind.

Monmouth Co., N. J., Nov. 25. LUELLA R. HALL.

ANSWERS.—1. Yes, I think she was accepted; she probably destroyed the queen-cells.

2. It is nothing uncommon to find that the bees are not all marked alike in the same hive, even if the queen be purely mated. If the hives are close together I think the bees mix more or less, as I have often noticed that where a colony of very yellow bees stood next to a colony of dark-colored ones, I would often find some very yellow bees in with the dark bees, and some black bees mixed with the yellow ones.

3. No, I do not think it very likely that there were two queens in the same hive. It is only rarely that two queens are allowed to remain in the same hive, and they are usually mother and daughter.

4. I think you have every reason to be proud of your first venture—60 sections from one colony was doing very well indeed. And you succeeded in getting a good price for it, too.

5. I am very sorry that bee-stings affect you so unpleasantly, but I will say for your comfort that when I first commenced to work with bees, a sting would make me sick for two or three days. A sting on the hand would probably swell my eyes shut. Now, when I am stung I do not suffer at all except the pain the sting inflicts, and in a very short time can not tell where I was stung. The system becomes accustomed to the poison in time.

Don't worry about not being able to find a queen. In time you will laugh over the idea that you even thought you could not find her, although at present it looks like a big undertaking.

Too bad that you have to be away from your bees just at the time they need attention most.

Don't worry about taking too much of my time. I shall hope to hear from you often. I shall be very much interested in hearing how you are succeeding.

**Our Wood Binder (or Holder)** is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

ABOUT THE SHAKEN OR FORCED SWARMS.

Anent the "shook" and how it should be shook. "Important that the bees should be gathering honey and secreting wax."—H. R. Boardman. Strong hint that bees, especially black bees, sometimes resent the performance and swarm out.—(Harry Howe.) M. A. Gill discovers for us that it is essentially the same as "driving;" which the bee-keeping Abraham, if not the bee-keeping Adam, used to practice. E. F. Atwater thinks it very important to give the shook more bees from time to time. Poulder (we are not surprised to learn) get's 'em up five stories high—the colonies made out of the residuary frames of brood. Ernest Root puts first the tremendous importance of rendering practical (if the thing fully works) a non-swarming out-apiary run for comb honey, and with small brood-chambers. Page 717.

BEES AND HONEY AT THE ST. LOUIS FAIR.

At St. Louis bees and honey won't be put upstairs, nor down cellar, because there is not to be any upstairs or down cellar in the agricultural building. Good. \$35,000,000 to be spent there, eh? The Yankee genius for wasting money is hugely developed, but it would be sad and queer if they wasted all that. Page 726.

HEALTH CERTIFICATE FOR MOVING BEES.

Hambaugh is right. No colonies to be sold or moved out of an infected apiary till written permission of the inspector can be given. Page 727.

SHADE FOR HIVES.

W. R. Ansell is right—to the extent that a good and sufficient shade-board is a little ahead of any practicable living shade. May play truant, and be absent when needed most, which the latter does not do. Page 728.

IS THERE A DIFFERENCE IN QUEEN-LARVÆ FOOD?

That bees may put a large lump of extra jelly in a queen-cell and yet the quality of the jelly be so poor that a very poor queen must necessarily result. This proposition drawn from Henry Alley, page 729, seems improbable to me, somehow. Mr. Alley calls for chemical analysis to show. I don't believe we have any chemists that are fully equal to a task of that sort. They may understand it, more's the pity. The difference between good and poor in similar foods (while often tangible enough) may be an exceedingly elusive distinction.

DR. MASON'S PICTURE.

The picture of Dr. Mason on page 739 is an excellent one. I have often wondered why the picture reproduced on the outside of No. 49 was so much in vogue. A base slander on the good Dr. Imputes a dull, corpse-like look to a man who both looked and was very much alive.

THE QUEEN AND SWARMING.

I would reply to Dr. Miller, on page 745, that although Alabama's first case is not technically an exception to the rule, that a queen of the current year is a remedy for swarming, it is a serious shortcoming in the rule—one of the things which prevent it from being of much use to us practically.

BEES CARRY DOWN COMB HONEY.

I think George Brown is liable to have cases, some time in the future, when bees that are light of stores below will provokingly neglect to carry down comb honey even when it is uncapped. Page 748.

COMB FOUNDATION IN SECTIONS.

Have a little more charity, Mr. Bartz. Use it in full sheets, and put in bottom starters of it, too. Not probable that such a lot of men, and such good men, hold their views insincerely to advise foundation. Neither is it probable that their ignorance averages a much greater density than—ours, for instance. I'm in the same boat with you as to practice—do not myself either use or advocate full sheets of

foundation in the sections—but still I am willing to assume that at least some of the folks in the other boat have adjusted themselves correctly to their own locality, bees and circumstances. Page 732.

#### BEES AND A RAINY CLIMATE.

And so in the most rainy county of the most rainy State (where the inhabitants are accused of having fins and scales), a good many farmers keep a few bees—sure sign that a rainy climate is not a total bar to honey-storing. Page 749.

#### MANY KINDS OF PHACELIA.

Thirteen species of phacelia in one section of California. Thanks to Editor Cowan for posting us about the phacelias. Evidently the tansy-leaved phacelia is a great producer of honey; but whether the amount and quality of the green forage it can be made to yield will tempt our farmers to raise it—aye, there's the rub. Page 750.

#### A LOT OF DONKEYS!

My, what a lot of donkeys gaze out upon us from the title page of No. 48!

## Questions and Answers.

CONDUCTED BY

DR. O. O. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

### Moving Bees by Railroad in Winter.

Could I move a few colonies of bees to Alcona, Mich., about the middle of January? It being cold at that time, would the combs break down in transportation?

Would the bees freeze before I could get them on their new stands and fixed for cold weather?

Please tell me all that is required for such handling, OHIO.

ANSWER.—The weather, the condition of the combs, and the manner of handling, all have a bearing on the case. The colder the weather, the more brittle the combs. If the combs are old and tough, there will be less danger of breaking. Wired combs are safer than those not wired. Unless the colonies were very weak, there would be no danger from freezing the bees. The distance is so great that you would probably move them by rail. Place them in the car so that the frames run parallel with the railroad tracks. Fasten them securely so that they cannot move about in the car. The entrance closed with wirecloth will give them all the ventilation needed for such cold weather.

### Spacing-Ancor for Brood-Frames.

I have noticed complaints as to spacing-staples used in the ends of the brood-frames. I herewith enclose a cut of a home-made "spacing-ancor" which I hope will satisfy complainants' taste, as it is very simple and made of the same size wire as the common staples comes in.

The spacing anchor is inserted through small holes pierced through the ends of the top-bar, and the sides of the frame. The holes are put in the middle of the bars, about  $\frac{1}{4}$  inch from the side-bars in the top-bar, and one inch from the top-bar in the side-bars. J. HILLER.

ANSWER.—The "spacing-ancor" as explained, passes through the top-bar  $\frac{1}{4}$  inch outside of the end-bar, and is then bent to pierce the end-bar an inch lower down. This makes the frame practically a wedge, which if let down evenly must automatically go to the right place. It certainly looks all right, and before I ever tried any end-staples I invented and used the same thing. In actual practice, however, it does not work so well as the staples. The very feature that commends it in theory is against it in practice. Until it is very nearly down in place, it allows one end to drop down inside, whereas the minute the staples strike at all, it prevents the possibility of the other end dropping down. This dropping down is the thing that has

been complained of, and the staples prevent it more than any other plan. It is possible that those who have had trouble about dropping down do not have the most accurate work, as others have no trouble of that sort.

If any one wishes to try the plan proposed he can easily try one or more frames by driving in a thin wire nail through the top-bar, and then bending it in to the end-bar.

### Bees Humming in the Cellar—Odd-Size Frames.

1. Do bees always keep on humming in the hives all winter when in the cellar, in which the temperature is 45 degrees? If not, please tell me the cause.

2. What will be the price, per hundred, for frames of these dimensions? Langstroth length bottom-bar, but 13 inches deep from top to bottom, outside measure.

IOWA.

ANSWERS.—1. I believe there are some who say their bees are found entirely quiet, but I think mine never are. A humming, more or less pronounced, may always be heard. They seem to go somewhat in waves, occasionally stirring up so as to make quite a little noise, but almost entirely quiet during the rest of the time. These periods of occasional waking up differ in the different hives, so that when one stands to listen at the door of the bee-room there is a constant, gentle murmur, which I confess I rather enjoy hearing.

2. I don't know. Such a frame, being an odd size, is probably not listed in any catalog, and would have to be made to order; but if you will apply to any manufacturer he will no doubt quote a price.

### Piling Up Hives with Bees for the Winter.

Would it be safe for me to stack up the hives with bees each upon the other in a warm room, without any fire near by, for the winter? Also, would it do to stop up the entrance with some small strips of wire-screen to keep the bees in? If so, would they need water before the winter is over? I am a beginner in the bee-business, just began last spring. NORTH CAROLINA.

ANSWER.—The probability is that it would not work well. Something depends on what you mean by a warm room. It is generally considered that 45 degrees is warm enough. If, however, you could have them in a room with steady heat, in perfect darkness, with pure air all the time, it might do to have them a good deal warmer. Don't think of fastening the bees in the hive. Some have tried it to their sorrow. When a bee tries to leave the hive in winter, if it finds itself penned in, it will raise a commotion and set others trying to get out, whereas if the entrance is free it will quietly go without disturbing any one else. The thing to do is to try to keep bees from wanting to leave the hive, not to fasten them in.

### Sowing for Bee-Pasturage—Moving and Wintering Bees—Shower-Grass.

1. Just adjoining my place is a railroad right-of-way, and on it a very high field, a quarter of a mile long. What can I sow on this right-of-way best for bee-pasturage? Of course the seed cannot be worked or cultivated, it can only be sown on top of the ground, and take the chances on growing.

Then, again, the weeds on this right-of-way are cut twice during the summer, by the section-hands. Now, as the seed cannot be worked in, and as the weeds and grass are cut twice a year, what would I better sow? There are several acres, and I would like to turn it into a bee-field.

2. Is it best to move bees when they have to be moved several miles now, or wait until spring? I prefer to move them now.

3. My home is built with an L, facing the south, and in that L I can put several colonies of bees. The house will protect them from both north and east winds. The sun can shine right into the face of the hive. Will that be a good place for bees in winter? I cannot keep them there in summer.

4. What do you think about "shower-grass" for Kentucky? KENTUCKY.

ANSWERS.—1. I don't know. I think I should take my chances on sweet clover. Seed sown either spring or fall,

especially if the stock could tramp it in, would be likely to make a catch, and if only a few plants should start, the seeds from them would make an increase. You should sow two years in succession, for the plants from the first seed would not bloom and mature seed till the second year. The cutting twice a year might do harm, and it might not—depends on when it takes place. If the first cutting should take place a little while before the time of blooming, it would be an advantage, probably. For if white clover

abounds you do not care for sweet clover till later, and cutting at the right time will make the sweet clover bloom later.

2. It would probably be a little better to move them in the spring, but in Kentucky the difference would probably not be much.

3. I guess it would be a good place. Try it.

4. I never heard of "shower" grass before. Perhaps some one else will tell us about it.

## How To Make Money With Poultry and Incubators.

That is the title of our new 1903 book—106 large pages. It is far superior in every way to its predecessors. It tells you all that is best in poultry keeping, duck growing, broiler raising, egg farming and the production of winter chickens or roasters, drawn from the experience of the best experts in the country. It fully describes and illustrates the unequalled

## CYPHERS INCUBATORS and Brooders,

which embody the greatest discovery of modern times in the field of successful incubating by artificial means. 250 illustrations show poultry plants that use Cyphers exclusively in the U. S., Canada, England, Germany, Holland, New Zealand and other foreign countries. Send 10c merely to pay postage, as the book is free for book No. 1. Circulars are supplied free.

## FROM MANY FIELDS

### Good Prospects for 1903.

We are having a very wet time here, snow, rain and ice, but no cold weather.

The bees are doing well on their summer stands. I expect a good honey crop next summer. I have 4 acres of grass clover and it is fine, and about 4 acres of alsike, and lots of white clover. We cannot help getting a good honey crop, and I will try and take good care of it.

L. A. HAMMOND,  
Washington Co., Md., Dec. 20.

### Bees at Work in California.

I have 4 colonies of black bees, and one of Italian. They are packing in pollen as hard as they can, and 3 weeks ago I had a colony of black bees that had only one comb built; it was a late swarm that was given me. I looked at them the other day and they had 6 combs heavy with brood and honey.

I am going to buy a lot of old boxes with bees right here and transfer them. One man has some bees and he never gets a swarm, and his sister got a patent hive and put one swarm in; it would not stay, so she caught another one, and said she would make this one stay in, so she poured hot water on them, and they died. She wondered why!

There are lots of eucalyptus flowers and Narcissus. The fruit-trees are budding out, and there are lots of roses and violets.

R. THOMPSON,  
Martin Co., Calif., Dec. 10.

### The Season of 1902.

It was a poor season for bees here; it was very cold in June, and the bees dwindled badly. I lost 14 colonies, and 3 more went breeding up very slowly, so I killed the queens and put swarms in with them, and they were all right. The first of July the weather was somewhat better, and the bees began storing in the extracting supers. I had 47 good colonies, increased to 71, and got 3200 pounds of first-class honey.

EDWARD KNOLL,  
Grey Co., Ont., Dec. 17.

### Results of the Past Season.

The bees did next to nothing the first part of the season, but did well the latter part. I got 1400 pounds from 32 colonies. The honey was darker than usual.

The bees have gone into winter quarters strong and heavy. The prospects for another year are grand.

C. A. FAIRBANKS,  
Jones Co., Iowa, Dec. 11.

### Bees Prepared for Winter.

I bought 5 colonies last spring, and increased to 10; they are yellow and blacks, and I have them in 9-frame chaff-hives. I prepared them for winter, as follows: Removed the oilcloth and placed a frame-work over the brood-frames, to allow one inch for the bees to pass over the frames, and then the straw mat, which is about 3 inches thick, to absorb the moisture; and packed outside, on 3 sides, with straw, and under the bottom-board, also

**BEST**

## Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

**Alfalfa Honey**

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

**Basswood Honey**

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

**Write for Quantity Prices by Freight, if Interested.**

A sample of either, by mail, 10 cents, to pay for package and postage.

**Order the Above Honey and then Sell It.**

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

**GEORGE W. YORK & CO., 144 & 146 E. Erie St., Chicago, Ill.**

the entrance, which is 5-16x13 $\frac{1}{2}$ . I left the opening about 2 inches wide.

The bees have not taken a flight since November 12. The other day it was fairly warm, and I noticed that half of the bees in one hive were dead, so I disturbed them, and found noldy combs. What caused the combs to become moldy, and the bees to die?

My bees have honey enough for the winter, but I did not get any surplus—too much rain and cool weather. My bees are well sheltered against the cold winds, on the north by hills, and on the west by timber.

I do not see how any bee-keeper can get along without the American Bee Journal.

CHAS. J. DOPPEL.

Ozaukee Co., Wis., Dec. 23.

### Bees Did Fairly Well.

My bees did fairly well the past season. I received about 35 pounds of honey per colony, and my best colony gave 50 pounds, 72 pounds during the month of September.

I run for extracted honey, and winter the bees on the summer stands.

I will have to call Dr. Miller's attention to the fact that I had a laying queen that crawled through the queen-excluder (a new one), and laid eggs in the extracting-super. She was a good-sized queen, at that; of this I am positive.

The American Bee Journal is all right.

CHAS. M. DARROW.

Vernon Co., Mo., Dec. 16.

### Bees Starved to Death.

I hear complaint of bee-keepers (in a small way) that their swarms of last summer are now dead from starvation. A few of our bees were carrying in water until the close of November.

We have calls for honey frequently, but have none to supply the demand. A car-load of comb honey arrived lately from California.

Mrs. L. HARRISON.

Peoria Co., Ill., Dec. 15.

### A Bad Year for Honey.

We have had a bad year for honey. The bees will have a hard time of it next spring, if they are not well fed.

G. D. HAWK.

Sullivan Co., Tenn., Dec. 5.

### Honey-Yield Disappointing.

The yield of honey has again been disappointing to the bee-keepers of northern Pennsylvania as a whole, although a few in some localities were more fortunate than the many.

Apple-bloom and other spring flowers yielded an abundance of honey, so that the colonies were very strong, and all hands were on deck in great expectation of harvesting a big crop of clover and basswood honey. But it was not to be. It has been many years since white clover blossomed as it did the past summer. The cold, wet weather caused the failure. Buckwheat yielded a very little honey. Had it not been for favorable fall weather the bees would have needed feeding; as it was, they gathered an abundance of stores for their own use, and some surplus. My yield of white honey was about 15 pounds per colony, and not so much fall honey.

We feel thankful that the prospect is very good for next year, as the wet season did wonders for white clover.

GEORGE SPITLER.

Crawford Co., Pa., Dec. 9.

### Bee-Keeping in Cuba.

I you were within hearing of my bees you would hear a mighty roar, and that means lots of work for the bee-man. They are now working on the purple bellflower (Aguinaldo narango), with white bellflower (Aguinaldo blanco) just coming into bloom.

I now have 300 colonies of bees. I shipped a ton of comb honey this morning; this comb honey venture is largely an experiment. I hope for success from it, however.

There are many things to contend with here, as well as in the United States. It seems to

me there are more vexations. For instance, we are having swarms every day, bees do not behave half so regular as in California. Just think of it, bees swarming in December!

Your humble servant is against another proposition. Bee-keeping is an all-the-year-round grind here, not much let-up. In California we had 4 months of labor and 8 months of rest.

J. H. MARTIN,  
Cuba, Dec. 5.

### A Report for 1902.

With 180 colonies of bees in the spring, I increased to 296 which I put into winter quarters Nov. 26. I harvested 5070 pounds of honey, which is all sold at 10 cents a pound.

A. L. BEAUDIN.

Chateaugay Co., Quebec.

### A Plucky Cuban Bee-Keeper.

Editor Hill, says of Col. Ganzalo Garcia Viera, in the American Bee-Keeper:

Without previous knowledge of the business, the Colonel purchased the apiary established on the south coast of Cuba by the editor of The Bee-keeper some sixteen years ago. During the late war the Spanish burned all his bees, which numbered about 2,000 colonies, and also his very complete apiarian equipment. Since then, however, Col. Viera has gone up again like a rocket, and now has about 1,800 colonies, in five or six apiaries, scattered through the mountains. Since his return to Cuba, we are advised that even before the bellflower had begun to bloom, about 15 tons of honey had been extracted. The prospect for 1903 of honey this winter is very favorable; and the colonel's enterprise is deserving of all the success which may come to him.

### Our Consumption of Sugar.

The people of the United States now consume eight times as much sugar per capita as they did in the first quarter of the last century, four times as much as the average per capita during the decade ending with 1850, and twice as much as they did in any year prior to 1870. In the years immediately prior to 1825 the average consumption of sugar was about 8 pounds per capita; in the decade 1840-50 about 16 pounds per capita; in the years immediately prior to 1870 the average was about 32 pounds per capita, (omitting

# SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

	5lb	10lb	25lb	50lb
Sweet Clover (white).....	\$.75	\$1.40	\$3.25	\$6.00
Sweet Clover (yellow).....	.90	1.70	4.00	7.50
Alsike Clover.....	1.00	1.80	4.25	8.00
White Clover.....	1.20	2.30	5.50	10.50
Alfalfa Clover.....	.80	1.40	3.25	6.00

Prices subject to market changes.  
Single pound 5 cents more than the 5-pound rate, and 10 cents extra for postage and sack.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

**GEORGE W. YORK & CO.**  
144 & 146 Erie Street, CHICAGO, ILL.

**\$12.80 For 200 Egg INCUBATOR**

Perfect in construction and action. Hatches every fertile egg. Write for catalog to-day.

**GEO. H. STAHL, Quincy, Ill.**

46A26t Please mention the Bee Journal.

## "Bees in Colorado"

I still have several hundred copies of the souvenir with the above title. The bee-papers and a good many people without visible axes to grind have said it is a valuable and attractive thing. If you should like to have a copy, send me a silver dime or 5 two-cent stamps, and I will mail you a copy.

"BEES IN COLORADO" is the title of a 48-page and cover pamphlet gotten up to boom the Denver convention. Its author is D. W. State, Bee-Keepers' Association. It is beautifully illustrated, and printed on enameled paper. It is a credit to Mr. Working, and will be a great help in acquainting those outside of Colorado with the bee and honey characteristics and opportunities of that State.—American Bee Journal.

**D. W. WORKING, Box 432, Denver, Colo.**  
Please mention Bee Journal when writing.

## Queen-Clipping Device Free....

The MONETTE Queen-Clipping Device is a fine thing for use in catching and clipping Queen wings. We mail it for 25 cents; or will send it FREE as a premium for sending us ONE NEW subscriber to the Bee Journal for a year at \$1.00; or for \$1.10 we will mail the Bee Journal one year and the Clipping Device. Address,

**GEORGE W. YORK & COMPANY, Chicago, Ill.**

**WANTED WHITE CLOVER EXTRACTED HONEY!**  
Send sample and best price delivered here; also Fancy Comb wanted in no-drip cases.

**THE FRED W. MUTH CO.**  
32At Front and Walnut, CINCINNATI, OHIO.

**DAIRYMEN ARE DELIGHTED**  
to meet us. We have for us. Cow keepers will have money. We start you in business. You make large profits. Easy work. We furnish capital. Send in cards for full line of samples and particulars.  
**DRAPER PUBLISHING CO., Chicago, Ill.**  
Please mention Bee Journal when writing.

## FOR SALE.

7000 lbs. Extracted Basswood Honey, stored in basswood barrels and kits. Large barrels each holding 330 lbs. net; ½ barrels, 130 lbs.; Kits, 33½ lbs. Prices—74c per pound in barrels, and 8c to kits, f.o.b. cars at Viola. Cash must accompany order. Sample by mail, 10c. Address, 41A13t N. L. HENTHORN, box 83, Viola, Wis.  
Please mention Bee Journal when writing.

the war years, in which the consumption was light.); from 1870 to 1880 it averaged about 40 pounds per capita; from 1880 to 1890 50 pounds per capita; in 1891 the figure was 66 pounds per capita, and has ranged from 62 to 68 pounds per capita since that time, the figure for 1901 being 68.4 pounds. These are the official figures of the Bureau of Statistics of the Treasury Department. They show an increased consumption from 8 pounds in 1825 to 66 pounds in 1901.

Considering the rapid growth of that "sweet tooth," this nation would probably be happier—certainly healthier—if it could be gratified largely with honey, instead of so much sugar.

## Sugar for Queen-Cage Candy.

Confectioners' sugar will not do for queen-cage candy. It should be of the right kind if queens are to be successfully sent through the mails, although it may not be easy to detect at a glance the difference between the right and wrong kind. As to distinguishing the two, Editor Root says in Gleanings in Bee-Culture:

In general, confectioners' sugar is brought to a finer state of pulverization than the ordinary pulverized sugar. If you examine the former with a glass you will see besides the cane-sugar crystals something else, and that something else is starch. Pulverized sugar should show nothing but minute crystal cubes when examined with a glass of high magnifying power. But there is another way whereby you can detect the starch, and that is by the taste. If you can some time get hold of some confectioners' sugar and a sample of pulverized, taste one and then the other. You will then perceive a difference. There is, still, another difference. Confectioners' sugar has more of a tendency to lump up. While the pulverized will do so to some extent, the other will cling together in chunks that have a sort of flaky, brittle feeling.

## Introducing Honey at Agricultural Fairs.

When the crowd began to increase toward the middle of the day, I produced a quantity of nice white biscuits from my lunch-basket, and with my honey-knife—clean and bright—I cut some of them into slices. I then opened a can of my finest honey and spread a little of it on each slice, using a small silver spoon for the purpose. Everybody was then invited to sample the honey. Hundreds of people undoubtedly had their first taste of extracted

# Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**GEORGE W. YORK & CO.**  
144 & 146 Erie Street, CHICAGO, ILL.

52At COLLEGE STATION, TEX.  
Please mention Bee Journal when writing.

honey on those two days I kept up my lunch counter, and many sales were made right there and then. When people become acquainted with a good article of extracted honey, they will often buy it in preference to comb, even at the same price, for it is more convenient to use.—F. GREINER, in the American Bee-Keeper.

**Prevention of Increase.**

When an early swarm issues, if I have a weak colony I put on it a queen-excluder and set the brood of the colony that swarmed with all adhering bees over this one (first cutting away all queen-cells), and leave it say a week or ten days, then I shake off the bees and run a new swarm onto these combs, first saving any of the combs that may not have much pollen in, for use in extracting supers, and supplying their place with foundation in the center of the brood-nest. This plan has worked very well with me.—A. BOOMER, in Canadian Bee Journal.

**A New Bee-Keeper's Song—**

**“Buckwheat Cakes and Honey”**

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

**“THE HUM OF THE BEES in the APPLE-TREE BLOOM”**

Written by EUGENE SECOR and DR. C. C. MILLER.

**PRICES**—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 *strictly in advance* payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

and you may have part of it if you work for us. Uncle Sam's poultry product 1903 that sum. Send 10c for samples and particulars. We furnish capital to start you in business. Draper Publishing Co., Chicago, Ill.

**“What Happened to Ted”**

BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton is the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—60 pages, 5x8 1/2 inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver). Address,

**ISABELLE HORTON,**

227 EAST OHIO STREET, CHICAGO, ILL.

**The Emerson Binder**

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this “Emerson” so further binding is necessary.

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

144 & 146 Erie St., - CHICAGO, ILL.

**Bee-Keeper's Guide,** or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 514 pages. 295 illustrations. Bound in cloth. 1902 edition—19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee,** revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

**A B C of Bee-Culture,** by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 500 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing,** as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey,** or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 100 pages, bound in cloth. Price, in cloth, 50 cents; in paper, 30 cents.

**Advanced Bee-Culture, Its Methods and Management,** by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

**Bee-Keeping for Beginners,** by Dr. J. P. H. Brown, of Georgia.—A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

**Bee-Keeping for Profit,** by Dr. G. L. Tinker.—Revised and enlarged. It details the author's “new system, or how to get the largest yields of comb or extracted honey.” 80 pages, illustrated. Price, 25 cents.

**Bienen-Kultur,** by Thomas G. Newman.—This is a German translation of the principal portion of the book called “Bees and Honey.” 100-page pamphlet. Price, 25 cents.

**Apiary Register,** by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foot-Brood.**—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping,** by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Poul Brood Treatment,** by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

**Poul Brood,** by A. R. Kohlke.—Origin, Development and Cure. Price, 10 cents.

**SHEEP MONEY IS GOOD MONEY** and easy to make for you to work for and to invest your business and furnish the capital. Work light and easy. Send 10 cents for full line of samples and particulars. DRAPER PUBLISHING CO., Chicago, Illa.

**Please Mention Bee Journal when writing advertisers.**

**HONEY AND BEESWAX MARKET QUOTATIONS.**

**CHICAGO, Dec. 8.**—There is no special change in the honey market, prices remain as last quoted and the volume of sales are not large. The weather is such as usually prevails at this time of the year, and the cold may induce people to buy more freely. Best lots of fancy white comb bring 14c per pound. No. 1 to choice, 15c; off grades, 2c to 5c less, and not much demand for them. Extracted, 79 1/2c for white; amber, 66 1/2c; Southern, 85 1/2c. Beeswax, 30c. R. A. BURNETT & Co.

**ALBANY, N. Y., Nov. 22.**—Honey market is still in strong position with ready demand for all receipts at good prices. Fancy white comb, 16c; A No. 1, 15c; No. 2 and mixed, 14 1/2c to 15c; buckwheat, 13 1/2c to 14c. Extracted, buckwheat scum, 65 1/2c to 70c; light grades, more plentiful at 64 1/2c. Beeswax, 29 1/2c to 30c. H. R. WRIGHT.

**BOSTON, Oct. 20.**—Our honey market remains firm, with good demand and fair stocks on hand. Honey is not coming forward as fast as usual, and the tendency of prices is steady. We quote our market as follows: Fancy white, 1 pound sections in cartons, 16c; No. 1, 15c; No. 2, very light supply, 14c; glass-front sections generally one cent less than this. Extracted, light amber, 3c; amber, 2 1/2c.

**BLAKE, SCOTT & LEE.**

**KANSAS CITY, Dec. 20.**—Market steady at quotations. We quote fancy white comb, per case, 24 sections, \$3.50; No. 1 at \$3.40; No. 2 white and amber, \$3.25. Extracted, white, per pound, 76 1/2c; amber, 66 1/2c. Beeswax, 29 1/2c. C. C. CLEMONS & Co.

**CINCINNATI, Dec. 8.**—The demand for honey, both extracted and comb, has eased off somewhat the past few weeks, however the prices rule steady, as follows: Extracted, amber, in barrels, 66 1/2c; white clover, 80 1/2c. Comb honey, fancy, 16 1/2c; amber, 11 1/2c. Beeswax, 29 1/2c to 30c. THE FRED W. MUTH Co.

**NEW YORK, Dec. 23.**—The market on comb honey is dull and inactive. While the supply is not large the demand has fallen off to a large extent and prices show a weakening tendency. We quote fancy white at 15c; No. 1, 14c; No. 2, 13c; and buckwheat at from 10c to 12c. Extracted is in fairly good demand; white, 74c; light amber, 64 1/2c; dark, 58 1/2c. Beeswax, in barrels, at from 28c to 29c. HILDRETH & SEIGLEKEN.

**CINCINNATI, Dec. 12.**—The comb honey market is a little quiet, almost everybody is filled up. As there is hardly any new supply coming in, there is no change in prices, namely: Fancy water-white, 16c; all grades less. The market for extracted white clover shows a slight advance. Fancy white clover brings 85 1/2c; alfalfa water-white, 64 1/2c; but amber, if anything, has weakened. I quote same, in barrels, 54 1/2c to 55c. Beeswax, 27 1/2c. C. H. W. WEBER.

**SAN FRANCISCO, Nov. 12.**—While comb honey, 10 1/2c to 11c; amber, 9 1/2c; dark, 56c-c. Extracted, white, 60 1/2c; light amber, 45 1/2c; amber, 34 1/2c. Beeswax, good packages, light, 26 1/2c; strictly fancy light, 29c-.

White is reported scarce; light amber honey is fairly supply. The bulk California produced honey is sold for Eastern shipment in cartons, lots from producing point at bottom price. Small lots of choice honey that can be used in local trade, bring more. Quotations are given at the present prices to producer, f.o.b. shipping point, on Eastern basis for extracted and California basis for comb.

**Wanted Comb and Extracted Honey!**

T. F. BINGHAM, Farwell, Mich.

**Tip-Top Glass Honey-Jars**

The picture shown herewith represents the best one-pound jar for honey that we know of. It is made of the clearest flint glass, and when filled with honey, and a neat label attached, it makes as handsome a package as can be imagined. Its glass top sets on a flat rubber ring, and is held in place by a flat steel spring across the top as shown in the picture. It is practically air-tight, thus permitting no leak,

which is an important thing with honey-sellers.

We can furnish these jars, f.o.b. Chicago, at these prices: One gross, \$5.00; two gross, \$4.77 a gross; five or more gross \$4.50 per gross.

If you try them once you will likely use no other kind of top or sealing arrangement for honey jars.

**GEORGE W. YORK & CO.,**

**DADANT & SON,**  
Hamilton, Hancock Co., Ill.

**The Holidays Are Almost Here.**

And you are doubtless undecided as to what to get your friends for Christmas.

Why not get.....

**The "Post" Fountain Pen**

The very best in the market; regular price, \$3.00, and not obtainable under this price anywhere. The Six Cardinal points Peculiar to the "Post":

**Self-Filling, Self-Cleaning, Simplicity, Durability, Reliability, No Leaking.**

**Given Absolutely Free**

For two new subscriptions to Gleanings and your own renewal with \$3.00; or for one new subscription and your own renewal with \$2.50; or your own subscription will be advanced 2 years, and the Pen furnished for \$2.50.

In each case all arrears, if any, must be paid in addition, the above offers being for subscriptions fully in advance only. We believe we can say truthfully, without fear of contradiction, that no fountain pen ever put upon the market ever received in so short a time so many unsolicited testimonials from such distinguished men as the POST. The above drawing shows its construction. To fill the POST, all you have to do is to dip the nib into the ink-bottle, draw out the plunger, and the pen is ready for use. Compare this with unscrewing the ordinary style, and refilling with a glass filler that you can not always find when wanted. The self-cleaning feature of the Post, as illustrated, will also commend itself. With most pens specially prepared ink must be used or they are soon of no use, because they become so gummed up and it is well nigh impossible to clean them. With the POST you simply dip the nib in water, draw the plunger back and forth like a syringe or siphon, and in less than five seconds it is clean and free for a perfect flow of any ink that may be handy. We will send, on request, a few of the many testimonials from noted men in various callings who have written merited words of praise for this most valuable invention. We can not offer the pen for sale for less than \$3.00; but by special arrangement we are enabled to offer it free as a premium with Gleanings in any of the following combinations: All arrears, if any, must first be paid at \$1.00 a year. Then for \$3.00 we will send Gleanings for one year, to two new names; for one year to yourself, and send you the pen free. For \$2.50 we will send you the pen and Gleanings for one year, and to one new subscriber a year; for \$2.50 we will send the pen and Gleanings for two years. If you have ever been disappointed with a fountain pen we assure you that you will not be with this one.

☞ If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents, or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

## Forty Years Among the Bees

By DR. C. C. MILLER.

DR. C. C. MILLER.

The above is the title, and name of the author, of a new bee-book which will be ready some time in January, 1903, as it is now in the hands of the printers. It is a book that every bee-keeper in the world that can read English will want to own and read. It will contain over 300 pages, be bound in handsome cloth, printed on good book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. The book will show in detail how Dr. Miller does things with bees.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, which finally tells how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called, "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters.

### How to Get a copy of Dr. Miller's

### "Forty Years Among the Bees."

The price of this new book is \$1.00, postpaid; or, if taken with the WEEKLY *American Bee Journal* for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the *American Bee Journal* whose subscription is paid in advance, can have a copy of Dr. Miller's new book *free as a premium* for sending us **Two New Subscribers** to the *Bee Journal* for one year with \$2.00. This is a magnificent offer. Better send in the new subscriptions before Jan. 1, so they can begin with the new year. Or, if sent at once, we will throw in the rest of this year's numbers of the *Bee Journal* free to the new subscribers.

✻ Editorial Comments. ✻

**A National Honey Exchange.**—This is a subject to which we have given some thought for several years. Sometimes we feel that we have almost perfected, theoretically, a plan or plans by which it could be made a great success. Then, after thinking some more, we don't feel quite so certain about it. But we think we have about settled, in our own mind, that if ever a successful honey exchange is formed, it will have to be done by those who have had large experience in handling honey. Perhaps a few extensive local bee-keepers can manage a local exchange, but when it comes to organizing and conducting an exchange commensurate with the honey business of the whole country, it will require the most experienced and most level-headed business men to be found in our ranks.

One of the first things, we think, is to get men of financial and moral standing to undertake to form and manage the organization. It will have to be men in whom bee-keepers have full confidence, else they will never consent to trust them with the handling of their crops of honey.

It will take time to make a success of the work. Permanent and profitable enterprises do not develop in a year. The first few years may prove discouraging. Things may not proceed as anticipated. Quite likely the less determined ones will want to drop out. But final success will depend upon sticking together. Are bee-keepers ready to do that?

It is true, as Prof. Cook says on another page, that the marketing of the crops in other lines have been profitably managed in the interest of the producers. But it must be remembered that in every case the products controlled were those to be found practically in a single State, or even in a single section of one State. Honey is produced everywhere. Citrus fruits in Southern California. When New York, and Michigan, and Ohio, and Pennsylvania, have large crops of honey, where will the larger Western crops be sent to?

It's a big subject. It needs wisdom and experience in order even to get started. But by discussing it, and getting our best minds to work on it, it is possible that by the time another crop of honey is ready to be marketed, plans may be sufficiently perfected to begin the new honey exchange. We hope it may be so.

The columns of the American Bee Journal are open for the best ideas you have on this or any other subject of interest to bee-keepers.

**Shipping Bees to Cuba.**—The A. I. Root Co. report the shipment of 500 colonies of bees to Cuba so successfully that "not a colony was lost nor a single comb broken." They were shipped in two fruit-cars to New York, thence by steamer to Havana, and then 100 miles inland by rail. Hot weather and poorly ventilated cars made the last 100 miles the hardest.

**Southern and Northern Bee-Keeping.**—In general it is known that in the South the winter problem does not trouble; that the season is perhaps three months earlier than at the North; but Editor H. E. Hill gives in the Bee-Keepers' Review some striking differences not so generally known. Comparing the location of J. B. Hall, in Canada, with southern Florida, he says in part:

Mr. Hall can store quantities of comb honey in the fall without fear of deterioration. In the humid atmosphere of South Florida it would most likely become worthless as a merchantable product within a week after being taken from the hive. Only continued artificial heat in a close room would save it from "weeping" or "sweating." This is a result of the well-known affinity of honey for moisture. During a great part of the year extracted honey exposed in an open tank, though sheltered, would become thinner instead of increasing its body. In this respect the contrast between the influence of the atmosphere in this country and the arid West is most striking.

Mr. Hall can store his extracting combs in an open shed from season to season. In South Florida they would be destroyed within a very few days by the moth-larva. Here the webs of this destroyer may always be seen during summer, in combs that have remained off of the hive over night; as they sometimes do during the extracting season.

Bees consume vastly more stores in Florida than in the North; hence, the increased item of "board" is considerable. This is a logical result of their continued activity. For the same reason the period of a queen's useful life is reduced about one-half.

"The Disappearing Trick" is a term coming into common use among Australian bee-keepers, and there's nothing funny about it, either. The older bees of a colony disappear in a sudden and mysterious manner, the strongest colonies appearing to be the ones most affected, causing very heavy loss of colonies. The bee-keepers are asking that government come to their aid by making investigations looking to cause and cure.

The Colorado Honey-Producers' Association is a great success, notwithstanding the fact that only about 20 percent of the Colorado bee-keepers have entered it. This offishness on the part of the majority is looked upon with some degree of discouragement, but the Rocky Mountain Bee Journal is inclined to be optimistic, and thinks there are two good reasons why there has not been a more general participation in the benefits of the Association. The first is that "new ideas, no matter how meritorious they may be, seldom attain popularity with the masses," so time must be allowed.

The second reason for apathy is one that may well be considered in reference to what may be done by organizations elsewhere, and, indeed, with reference to an organization taking in all. Editor Morehouse says:

The ware-room of the Colorado Honey-Producers' Association is a long way from some of the honey-producing sections of the State. Freight to Denver, in some instances, is nearly as much as freight to the great centers of consumption and distribution. So far as we remember, the Association members have never publicly announced a plan whereby members could ship through the Association and

avoid the payment of local rates to Denver, except by the organization of branch associations. This is not always practical, and it also entails a great expense. If it is announced that arrangements can be made at any point in the State to consign cars of honey through to final destination without having to stop and unload for inspection in Denver, we believe that the Association would immediately enjoy a phenomenal and substantial growth. Here is a local case for illustration:

Boulder is 29 miles from Denver. It is too far to haul a large crop of honey by wagon, and the car-rate is \$35. This makes the ware-rooms of the Association partially out of reach of the Boulder honey-producer. What, then, is the remedy? At the close of the honey season each member of the Association at Boulder can report his number of cases of honey to the Manager, and that he is ready to deliver at the car. When the Manager sees a market for his honey he can call for it to be delivered on a certain day, and if there is no one among the Boulder members proficient enough in the art of grading and loading, he can send some one who has had this training to inspect and receive the honey. The car can then be consigned directly from Boulder to the Eastern market, and the local charges to Denver avoided.

The plan is feasible for any railway station in this or any other contiguous State, and places the Association at the service of every bee-keeper in the State, no matter where he may be located.

**The Election of the National**, which was held in December, seems to be very unsatisfactory. Not as to its result (for at this writing no one knows who is elected), but as to the manner in which the ballot was prepared; also no amendments were submitted, though such were proposed at the Denver convention. In view of these irregularities, Mr. France writes us as follows for publication:

EDITOR AMERICAN BEE JOURNAL—

Dear Sir:—I feel that the lately issued ballot for officers of the National Bee-Keepers' Association is unfair. For the good of the Association I ask that a new ballot be ordered, said ballot to name all candidates for each office, so that each member can take his choice. Also, the said ballot to provide for voting on the proposed amendments to the Constitution. Yours truly,

Grant Co., Wis., Dec. 31. N. E. FRANCE.

We are glad that Mr. France, who was a candidate for the office of General Manager, has sent us the above letter, which he informs us he has also sent to all members of the Board of Directors, for if he is ever elected to any office he will want to get it in a fair manner.

Here is an exact reproduction of the ballot submitted to the membership so far as the wording is concerned:

BALLOT: to be used by members of National Bee-Keepers' Association in December, 1902.

For General Manager for 1903, to succeed Eugene Secor, who wishes to retire.

(N. E. France, of Wisconsin, has been regularly and properly nominated, and is believed to be worthy of your support.)

(Write name voted for)

For 3 Directors to succeed Thos. G. Newman, G. M. Doolittle and W. F. Marks.

(Write 3 names below)

Sign your name and mail AT ONCE.

We can not conceive who could possibly get up such a ballot. If any candidates are to be named, surely

all should be given. But it was unnecessary to name any on the ballot. None have ever been so named before. It has every appearance of being a scheme to defeat Mr. Abbott for the position of General Manager, who, with Mr. France, was also nominated for that office, in the American Bee Journal. Three or four candidates for directors were also nominated.

We have refrained from expressing publicly our personal opinion on the General Managership muddle heretofore, but we think it is now time for us to have our little say, which is this:

In our opinion, Mr. Abbott, when elected General Manager by the Board of Directors last summer, should have been allowed to serve to the end of the year 1902; then, if he showed, during that time, that he was unable to fill the office, another man could have been elected to succeed him. Had those in charge taken this view of the matter, a lot of trouble could have been avoided, as well as a half year of wasted time. Now let the membership settle it.

Of course, a new election must now be held, a fair and straight ballot sent out, including the amendments to the Constitution proposed at the Denver convention by Mr. Abbott. True, a lot of time and the Association's money have been wasted, but *now* is the time to straighten things up, and put an end to a lot of foolishness and mismanagement. The Association has done, and can still do, much good for bee-keeping; but unless all fussing and splitting of hairs among its officers are ended for good, it may as well suspend operations. But we believe it has a greater future than its past has been, and that very soon all difficulties will be satisfactorily adjusted. As its new Secretary we shall do all in our power to have the National Bee-Keepers' Association do the work for which it is organized, and we believe the bee-keepers will help when they are satisfied that all is well with it and its management.

## \* The Weekly Budget. \*

G. M. DOOLITTLE has had a break made in his life by the death of an invalid sister. Notwithstanding a very busy life, he has for the past two years found time almost daily to give her the ministrations of a loving brother.

EDITOR LEAHY, who was present at the Chicago convention, thus speaks of it in the Progressive Bee-Keeper:

"The Chicago-Northwestern Bee-Keepers' Association, which held its convention Dec. 3-4, was the best convention we have had the pleasure of attending for a long time. Besides the social features many interesting subjects were discussed with profit, we think, to all."

THE APIARY OF MR. E. H. BEARDSLEY is shown on the first page this week. Here is what he says of it:

The view is taken from the south side of the yard looking north. The building on the left is my shop (12x70 feet, and 12 feet high), where I do all my work, but the honey (when I have any) I carry into the house. The large building is the residence occupied by myself and wife, and a daughter and her family.

I brought my bees here April 6, 1900, about 45 colonies. I lost three or four colonies, but my crop for the season was 5500 salable sections, and some I cut out and sold as chunk honey; also quite a lot of bait-sections.

The next spring I found I had full brood in the yard, and nearly all the colonies were affected. I shook them from the combs and gave them full sheets of comb foundation, and doubled them two to three, and sometimes three to one. Some stuck, and some swarmed out and went into

other colonies, and when they got settled I had saved 8 colonies out of 48.

I bought more nuclei and built up, and in the fall I had 35 colonies and 2400 sections of salable honey, and lots of partly-filled sections.

Last spring (1902) the bees appeared to have come through the winter nicely. I lost only one colony before the middle of April, then they began to disappear, and by the middle of May I had lost 8 or 10 colonies more. Well, I bought more nuclei, ordered early, but did not get part of them until after the first of July. Oh, you know what weather it has been! Some of the nuclei built up (the ones I got June 1), and the late ones I doubled up and stole combs from old colonies to try to keep them over. I got very little honey, and it's poor stuff compared with that of other years. I have lost some with foul brood (destroyed two colonies in September), but I am hoping to do better next year.

I think now I have a sure cure for foul brood, and if you wish, here it is (I'm not selfish): Smother the bees in the night, dig a hole four feet deep, build a fire in the bottom of the hole, and when it gets hot put in the hive, bees, and all, and burn until it does not smoke. Then fill up the hole, and you have got that one, *sure*.

There is now a splendid show for white clover another year, but I am fearful for the sweet clover. So much rain drowned out all the young plants except on the higher land and on the sides of the streets where they are graded up.

E. H. BEARDSLEY.

**A FENCE-RAIL COLONY.**—Frank Rasmussen, of Montcalm Co., Mich., sent us the following picture and account of an open-air colony of bees:

This colony of bees, living and prospering the past season, as you see, without a hive or any protection whatever, was first discovered about Aug. 15, by a farmer known as

"BUFFALO BILL" AND HIS FENCE-RAIL COLONY.

"Buffalo Bill," on his lane fence about two miles from my apiary. The fence is of the patent rail kind, and the combs are built on the under edge of a large rail, the fence running north and south.

There are five combs, the outside ones bulging clear out beyond the rail, and are at all times exposed to sun and weather. The outer comb on the side not shown in the picture, had, at the time I made the picture, a patch of sealed brood about 5 inches square, some healthy and hatching, and some dead from exposure. The inner combs were well filled with brood in all stages. The combs contained but very little honey.

The bees are hybrids, and are still doing business at this date (Sept. 29) at the old stand. The man shown in the picture is the finder and owner—"Buffalo Bill."

FRANK RASMUSSEN.

**Queenie Jeanette** is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

## Convention Proceedings.

### THE DENVER CONVENTION.

Report of the Proceedings of the 33d Annual Convention of the National Bee-Keepers' Association, held in Denver, Col., on Wednesday, Thursday and Friday, Sept. 3, 4 and 5, 1902.

(Continued from page 7.)

Mr. Taylor—What business is there to come before the Association before the final adjournment?

Pres. Hutchinson—Committees to hear from.

Mr. Taylor—I would move that we take a recess and complete the business at the banquet hall this evening.

Dr. Mason—I second the motion.

The President put the motion to take up the reports of the committees at the banquet in the evening, which, on a vote having been taken, was declared carried.

The convention adjourned at 3:45 p.m., to assemble at the banquet hall in the evening.

REPORT OF COMMITTEE ON AGRICULTURE AND THE NATIONAL GOVERNMENT.

WHEREAS, The National Bee-Keepers' Association, composed of nearly 1000 members located in all parts of the Union, and represented at its 33d annual convention in Denver, Colo., in 1902, by many States and territories, expresses hereby its gratification at the recognition given apiculture in the United States Department of Agriculture at Washington, and the Association heartily indorses the work thus begun. At the same time it seems evident that a fuller, wider scope might, in the near future, be given to investigations in apiculture under the auspices of the Department, were more liberal and specific appropriations for this purpose to be made; and that the most advantageous application of such appropriations to the purpose intended, could be secured through the establishment (under the direction of the Honorable Secretary of Agriculture, in whose judgment and liberal-mindedness we have great confidence) of a separate division to be known as "The Division of Apiculture." Therefore, be it

*Resolved*, That we do hereby petition the Honorable Secretary of Agriculture, the Committees on Agriculture of both Senate and the House of Representatives, and the whole Congress of the United States, for such action on their part as will secure the establishment of the said Division of Apiculture in the United States Department of Agriculture, with an adequate appropriation for the purpose of conducting investigations in apiculture, both scientific and practical.

Further, your committee would recommend that the Board of Directors of the National Bee-Keepers' Association be requested, after due deliberation and consultation with those in charge of such work, make suggestions as to the most advisable lines of work to be undertaken by such Division of Apiculture, to the end that the latter and the National, and the various State and local apian societies, may work in harmony for the common welfare of our pursuit.

JAMES U. HARRIS,

R. L. TAYLOR,

GEORGE W. YORK,

F. E. BROWN,

OREL L. HERSHISER,

Com.

REPORT OF COMMITTEE ON EXHIBITS.

J. B. Adams, of Colorado, showed fancy glass jars of fruit made of wax.

J. U. Harris, of Colorado, 2 cases of honey.

J. C. Carnahan, of Colorado, 12 cases of fancy comb honey.

J. C. Belden, of Colorado, 10 cases of comb honey and bee-wax sections.

J. S. C. Sterrott, of Colorado, 4 cases fancy comb honey.

All of the above was from Mesa county.

W. L. Coggshall, of New York, sample of buckwheat honey.

O. L. Hershiser, of New York, sample of clover and buckwheat honey in jars with aluminum screw caps.

Rauchfuss Bros., of Colorado, 2 nuclei of imported Caucasian bees, and combined section-press and foundation fasteners.

The Colorado Honey-Producers' Association showed bee-hives, smokers and general supplies made by G. B. Lewis Co., and comb foundation made by Dadant & Son; also samples of extracted honey in glass jars and comb honey.

Frank Benton, of District of Columbia, showed samples of shipping-cages for queens.

J. Cornelius, of Colorado, sample of seeds of honey-producing plants.

Frank Rauchfuss, of Colorado, samples of fruit put up with honey.

W. Z. HUTCHINSON, }  
O. L. HERSHISER, } *Committee on Exhibits.*  
GEORGE W. YORK, }

#### REPORT OF COMMITTEE ON RESOLUTIONS.

Your committee would recommend the adoption of the following resolutions:

*Resolved*, That we are greatly indebted to the Colorado bee-keepers, and especially Messrs. Working and Rauchfuss, for the excellent preparations for the convention, and for the very cordial reception we have experienced; and we express our hearty thanks for the enjoyment of the trolley ride with its bracing air to sharpen our appetites, followed by a banquet to satisfy those sharpened appetites.

*Resolved*, That we thank the Denver and apicultural press for their effective help.

*Resolved*, That we express our appreciation of the courtesy of the authorities in allowing us the use of the beautiful Hall of Representatives.

*Resolved*, That we return our thanks for the instructive and entertaining lectures of Messrs. Gillette and Root, and for the music we have enjoyed.

*Resolved*, That we tender our thanks to Messrs. Wm. Bongardner, Robt. Orr, James Smith, and the Fruit Growers' Association of Grand Junction, Colo., for their generous donation of some of the choicest fruit of Mesa county; and to the Arkansas Valley Bee-Keepers' Association for the brotherly cordiality shown in their presence of some of the famous melons of Rocky Ford.

C. C. MILLER, }  
J. A. GREEN, } *Com.*

Two of the foregoing reports were given at the short meeting held just preceding the banquet tendered members of the convention on the last evening.

(The End.)

## Contributed Articles.

### The Need of a National Honey Exchange.

BY PROF. A. J. COOK.

I HAVE been asked to give my opinion at length on the matter that came up at the recent National Convention at Denver. I am glad to do so as I have thought a great deal about it.

As I read the signs of the times there are two tremendous movements now on foot; tremendous in themselves, even more tremendous in their promises and influences. I refer to Consolidation and Co-operation.

Consolidation is in the very atmosphere. Hardly a day passes that we do not hear of the formation of another gigantic trust. These bring with them so much of good policy, wisdom and economy that we can never hope to say them nay. All must admit that were all people generous, unselfish, and possessed of the Christ-spirit, trusts would be wholly a blessing. Trusts imply organization, and so we find all the great commercial interests thoroughly organized. Even where they have not yet consolidated into trusts, they are almost invariably organized beyond their mere corporate limits. They pool their interests; at least they work with an understanding that though not so potent to aid as when developed into the real trust is yet very full helpful influence. Thus co-operation is wider and more

generous than consolidation. Unwritten co-operation is wider in its reach than most of us even dream. In all our towns or cities three or more meat or milk carts traversing the same street show how consolidation would play a helpful oar. Co-operation is already at work for all sell at the same price, and each, if rational, regards the interests of the others. The fact that livery hire in a large city is precisely the same at each stable for like service shows how co-operation is reaching out everywhere. Uniform sleeping-car rates, and the nickel car ride, are further evidence. We cannot make all people generous and unselfish. We can hope for such in the future, but we see a long stretch between us and that.

#### WHAT CAN WE DO?

We can all organize and co-operate. That is what we must do. That is to be the grand consummation of the present century. The Magna Charta, Bill of Rights, Habeas Corpus, French Revolution, our own blessed government, none of them came easy. Each was born of great effort, struggle and hardship. Each came with blessing to the common people.

Co-operation among all classes implying very thorough organization will force men to do what unselfishness would do of its own volition. Our laboring classes will never secure their rights and a fair share of the world's fruits, or a right recompense for their labor, until they are all thoroughly organized and able to act as a unit. This time must, will come. If we are wise and right-minded we will all wish to help it on.

The recent serious coal-strike would be even more deplorable except as it will surely help to usher in this good time of universal organization of labor. One man, or even the craftsmen of one mine or factory, can never stand even, with capital massed and united as it is. All must combine. All will combine, as "ever the right comes uppermost, and ever is justice done." This so long as we have a greedy, selfish world is the laborers' only hope.

It will come slowly, and may take very long, but come it will.

God speed the day.

#### DOES THIS BODE DANGER?

Some will say, "Alack the day. Labor is ignorant, impulsive, uncontrolled, savage." With the reins in her hands there will be rough driving." I have no fear. I believe we are as safe, very likely safer, in the hands of the humble toiler as in the grip of the capitalist. The present strikers are recently from the poorest and most ignorant of Europe's lowest peasants. Yet for the most part how self-controlled has been their habit even under the most trying of circumstances.

#### FARMERS LAST TO ORGANIZE.

The farmers, including bee-keepers, are dependent, but not as dependent as are the general laborers, so they are not as certainly oppressed nor do they feel the hand of co-operation and consolidation as do the trades-union people. Yet with high freights and poor market they feel pressure that can only lighten when they, like the capitalists, and the trusts, have potent voice in the output and the value that shall be placed on it. How tremendously the farmer is interested in the development of markets, in wide and wisest distribution, in the curtailment of unfair competition. Yet at present how utterly unable he is to exercise control in any of these lines. His products are unique in being staple; they are very necessities, and so they and their producers should exercise a leading control. This grand consummation is coming. We can all help to hasten the glad day.

#### ORGANIZED CO-OPERATION, POSSIBLY CONSOLIDATION, THE SOLUTION.

In the very successful working of the Southern California Fruit Exchange we see the very successful forerunner. Half of our citrus groves have already combined and done a business of \$30,000,000 in less than nine years, and nine million in one year, and yet have sustained almost no loss, less than one-fortieth of one percent. Even its enemies admit its marvelous success, and that it has served the citrus industry very greatly even if it has not been its salvation.

Our orange-growers were far from markets, freights were exorbitantly high, competition with Sunny Italy with short distance and cheap transportation was terribly severe; except from the wise management of interested salesmen the industry would have been swamped. On the shoulders of the Exchange it has risen from the ashes of a red-ink decadence to perhaps the most prosperous rural industry of the country. There is no reason why apiculture and other

branches of farming may not reap similar benefit. Of course, if they are less concentrated in locality, and have not so intelligent a contingent, they must wait longer for this good fruit.

#### HINDRANCES TO SUCCESS.

There are serious inherent obstacles to rapid success in these directions. Our farmers, including apiarists, are isolated. They are generally unacquainted with the methods of trade, in these stirring times; they are suspicious, and fear to trust others; they often are very slow to give their products into the hands of others to handle; in short, reluctant to do what the successful railroad and factory must, and safely do in their operations. Our farmers must be educated to see the necessity, safety and great wisdom, of course. It will not be the work of an hour. Such experience, however, as that of Southern California Fruit Exchange is a valuable object lesson and a quick teacher. Are not our bee-keepers sufficiently educated to organize in like way? And thus become the second teacher in this great school of advanced and improved methods of business.

A second embarrassment comes from the need of first-class management. These combinations do a tremendous business. This requires great integrity, push, business sense, and breadth of mind and judgment. Such qualities are not lying around hunting for employment, and must be patiently sought for and generously recompensed. Railroads appreciate this fact and act accordingly. Farmers are not likely, from their very life habits, to appreciate such business character rightly, are slow to acknowledge its rarity, and are reluctant to recompense it as do other lines of business. This is certainly a grave obstacle but must be pushed aside, with more time and wisdom. Our people must recognize the value of business judgment, and must be willing to pay for it. A simple exercise of superior business instinct may win or save many times a high salary. How short-sighted, then, to refuse it when large interests are involved!

#### A MENACING COUNTERPART.

A threatening companion of this wise, competent manager is his cupidity. He may so fully appreciate his own value that he himself will put an enormous price upon his service. California has already suffered in this way. Mr. Kearney, of the Raisin Combine, won a very large success the first year of the organization. He was paid a very large salary. No doubt it might have been better to have retained him even at a much larger salary. It is not strange, however, that the farmers chafed under a proposition to increase the recompense largely. It has seemed strange to me that men cannot be broad enough to see that there is glory in such service far beyond the value of money. I should suppose that Mr. Dennis Kearney, and the fine business men that have helped to bring the Southern California Fruit Exchange to such tremendous proportions and to such gratifying success, would take such pride in their achievement that they would be more than content, and would be the last to jeopardize the further success by any proposition of higher remuneration. I can but believe that men will be raised up who will not only be able to push this work to its highest accomplishment, but will also be more than willing to accept salaries that will be tolerated, without irritation, at least, by our most wise and progressive farmers.

With this as an introduction I will leave the subject for a time, when I will outline what seems to me, in view of the experience already enjoyed in Southern California, may be adopted in the marketing of our honey product. I have a hope—not over sanguine, I must say—that with our excellent bee-papers and wide-awake, intelligent bee-keepers, we may commence a work of education that will soon bring us a honey exchange in California if not in the whole country, which will rival in interest and value that of the Southern California Fruit Exchange. There is every reason to believe that Arizona, Utah, Colorado, and very likely several other States, will quickly fall into line even if they do not lead California in this new enterprise.

Los Angeles Co., Calif.

## Pear-Blight and Sowing for Bee-Pasture.

BY J. E. JOHNSON.

I AM enough of a fanatic to be cranky on two things. The first is pear-blight, and second, sowing for bee-pasture. I have made pear-blight a study for years, have an orchard of 900 trees, and not the slightest trace of blight, although neighbors around me have blight, some

orchards being nearly ruined by it. Some might think me wild to run up against such a high fence as the authority of Professors Cook and Waite, but I ask for nothing better than a severe criticising from either, as I believe I have my thumb on the blight question, and can prove them both to be on the side-track. A Stray Straw in Gleanings says Kieffer pears were fine this year from trees which bore worthless fruit last year. They were not good last year because the trees did not contain enough blossoms to attract bees from other trees. Kieffers do not fertilize themselves sufficiently to make perfect its fruit, but will set fruit well unaided, but some fruit will always be ill-shaped, and not good, (hence the grading of Kieffer from 0 percent to 100 percent.) We have had ripe pears to eat from July 15 until winter; many trees were white with blossoms, and not one twig of blight.

Now I am going to criticise Dr. Miller, just a little. Catnip does not grow better in the shade, nor as well as it does in the full sunshine. It grows in hedges because of leaf-mold and protection from the tramping of stock, not because of shade. I had patches this year in places where old brush-piles had been rotted down in the form of a washpan inverted, from 3 to 7 feet high, thick and thrifty, and alive with bees every day, wet or dry, providing it was not raining or too cold for the bees to work. Now, from what I know of catnip (not so very much), I would say that ten acres, in addition to the other honey resources we have, would, in most seasons, give us a good crop, whether it was a wet or dry season. Without catnip, the same seasons we would sometimes get no surplus, because the flow from clover comes in jerks, (it is now you have it and now you don't have it). I have figured it thus: If you go over a white clover pasture and find one bee to every 10 feet square, on an average, all through its bloom, would not that be about right? Now I have seen 50 or more bees, as near as I could count, on 10 feet square of catnip, in these same old brush-piles, right in the sun. Now, according to this, 10 acres of catnip would equal 500 acres of white clover, besides catnip yields wet or dry, nearly all summer. Is it possible bees would work so eagerly on it if it did not yield well, and of good quality?

I have one acre sowed in catnip, slightly mulched to protect the young plants from the heat of the sun until well rooted, when it will be able to look after itself, so I shall be more able to know about this matter.

I began to sow seeds of different honey-plants nearly 20 years ago, but only in waste-places, and during this time I have lived in different parts of Illinois, as well as in Kansas, but I now have a nice little home of my own (80 acres of land). I will send you a picture of it this summer, if I live, as well as some of our fine Spoon River scenery, and I shall try to sift this matter of bee-pasture to the bottom. Our great bee-men have done much in solving questions in bee-keeping, but did any bee-keeper east of the Mississippi River ever try any honey-plant in sufficient quantity to know any thing about it? Or at least to judge of it, that is, for honey alone?

Now, with me, white clover always yields in dry weather, if we have the clover, but this is the way it works: When real dry we have not the clover; when real wet it does not "give down." I do not know which is the best, but sweet clover is a stand-by, unless extremely wet. Alfalfa is so closely related to it that I am positive it will act much the same, from what I can learn of it in the West. I was visiting in Kansas last fall; their soil is sandy, and the roots will soon creep down 8 or 10 feet in the ground; but here it may take several years to become adapted, but when it does you may be sure it will not disappoint us; it is not, however, a low-ground plant.

Bee-pasture east of the Mississippi River is the greatest unsolved question in bee-keeping, and notwithstanding all arguments to the contrary, I shall work at this one thing. It would mean much for many bee-keepers who have had failure after failure. Knox Co., Ill., Dec. 16.

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

## Can Good Queens Be Reared by a Cupful of Bees?

BY HENRY ALLEY.

**D**URING the hot political times that followed the Civil War, a Union general by name of Kilpatrick stumped the State of Massachusetts for the Republican party. General Kilpatrick was a fine speaker, and drew crowded houses wherever he spoke, and in every speech he made, he so framed his remarks that when a certain part was reached some one in the audience would ask a certain question, "Ah," General Kilpatrick would say, "I wanted you to ask me," and then the interrogator got a quick reply. Now I have no intention of making a political speech, as I am not a politician, and never was, yet I had an idea that all my statements would not pass unquestioned, as they are so at variance with the experience of many other bee-keepers.

Even the Editor could not permit some things to pass without a question. That's right, express your opinion; I'll find no fault. I am more than glad that some one has given me an opportunity, and an excuse, to say more on the subject of queen-rearing. On page 707, I am quoted thus:

"As fine queens as any one should desire can be reared with a cupful of bees, and as poor queens as ever lived may be produced by a bushel of bees;" and then the Editor says: "Unless he means that the cells are to be reared in a strong colony."

No, I don't mean to say the cells are first reared in a strong colony. I have seen good queens reared by a few bees, and the meaneest queens ever reared by the strongest colonies. But the queens in both cases were reared under quite different circumstances. When the few queens reared their queen, the honey-flow was at its height; when the bushel of bees reared the poor queens they completed their cells over an excluder—had a young queen in the brood-chamber—and the flow of honey had ceased, but the bees were liberally fed all the time cell-building was going on.

The cupful of bees were queenless, and wanted a queen; the bushel of bees had a good queen, and were in no need of another one. Does the reader see the point? Isn't this argument in keeping with what I have said in this Journal about rearing queens above an excluder while the bees had a queen, and a colony in a normal condition?

No, I did not mean any one to understand that the cupful of bees merely kept a few queen-cells warm that other bees had completed. The few bees did the whole business, from the egg to the fertile queen.

Excuse me if I partially repeat what I once said in this argument on queen-rearing. All the readers know that I use for nuclei a small-frame hive or box. The frames are about 5x5 inches square. Well, these little colonies can be brought up to a high state of prosperity, as they gather honey and pollen just the same as the large colonies of bees, and the queens fill the combs solid with brood. Now, when a cover is taken from one of these little hives, and the beautiful golden-bees are exposed to view, I tell you that they present a beautiful sight. Ask Arthur C. Miller if this is not so. He has seen them many times in my apiary. All my queens are fertilized in these miniature colonies.

Now, perhaps I have made this system of nuclei more of a success than some other people could. At any rate, the system is a success with me, and has been for nearly 30 years.

I allow the queens to remain in the nuclei from one to three weeks after they become fertile. By that time the combs are solid with brood, and in cases where a queen remain in a nucleus 3 weeks, young bees are hatching from her eggs, and thus a queen is tested for her purity, or impurity, as the case may be, and the little colony is in pretty good condition to rear a few queens.

Now, don't you think that if the queen is removed from one of these little colonies when in the above condition, the bees will rear as good a queen as can be reared by any process we know of? Well, I never reared queens in the above way, but when queens are so reared they are good ones.

Now, when I remove a queen from a nucleus in such a condition as above described, and a virgin queen is given the bees and destroyed, and the fact not known until about the time the fertile queen should be found laying, but instead of finding a laying queen there are more or less queen-cells, would you preserve or destroy such cells? Wouldn't you cut them out and make an effort to save the young queens? I certainly do in all cases. I now have in my apiary 20 as fine queens as can be found in America, and all of them were reared by the process just given—they are a sort of come-by-chance queens.

The first week in September, 1902, I had no virgin queens to give nuclei. One fine fertile queen was removed from one of these little boxes, and the bees given a chance to rear a queen. One cell was built, and from this cell I got a beautiful queen. In due time this queen was fertilized, and as she was so large, beautiful and well-developed, I have taken special pains to keep her through the winter.

Let me tell a little story here that in a way illustrates the difference there is between one best queen that ever was, and a still better one: Until within a very few years all the farmers here in New England used oxen on the farm, and every farmer was very proud of his animals. One old farmer was exhibiting his oxen one day to a neighbor, and of course had to speak of their good qualities. "Well," said the farmer, "that off ox is the best ox I ever see, and the high ox is a blamed sight better one than he."

That is just the way we feel about our favorite queens. The fact is, I cannot say sometimes which of the good queens are the best in the apiary. However, I will tell the readers of this Journal what I got from one of the little 4-frame nucleus colonies. A very large, fine queen was removed from a 4-frame box, and a virgin queen introduced at the proper time. Two weeks later I went to the above hive expecting, of course, to find a laying queen, and one all ready to mail, but instead of a queen I found 4 large queen-cells. They seemed to be so promising that they were removed and the young queens allowed to hatch out, and one of the queens seemed to be very much better developed in every way than the other three, and her great beauty and prolificness caused me to keep her until I could test her—a thing I did pretty thoroughly, too, before the season was over. One thing I did was to rear 400 queens from her eggs, and all her progeny proved as good as herself. This particular queen will spend her days in my apiary, and I would not think of selling her for \$100.

How this statement will make Editor Hill, of the American Bee-keeper, jump! Mr. Hill does not think any queen is worth \$100. I do; and I know the full value of a good breeding queen, and I think there are many queen-dealers who appreciate the value of a good queen.

One point more and I am done: One of the readers says I put the percent of inferior queens sold too high, when I set it at 90 percent. My remarks were based upon my own experience. Once in a while I purchase a queen of some one who advertises his stock on the sky-rocket plan. I will say that I have never been fortunate enough to get a good queen from any source. It is only justice for me to say that I never purchased a queen of Mr. Doolittle, A. I. Root Co., nor W. Z. Hutchinson. And, further, no strain of their bees was ever in my apiary. The only strain I now have is the Adel, except a queen a man down in Alabama sent me in August. He says the queen was reared from imported stock. I am inclined to think she was so reared, as nearly all her worker progeny are black.

By the way, why do people send to Italy for queens? Do those people expect to get better queens than American breeders can rear? Why, one man in California wrote me in August that he bought 8 queens from a dealer in Italy, and not one of them filled out two frames with brood. Dr. Gallup should hunt this man up and "go for" him. Such a queen-dealer needs a good deal of "doctoring." I am glad that Mr. Doolittle and myself can do much better than the Italian queen-dealer. We get that much credit from Dr. Gallup.

Essex Co., Mass.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Shaken Swarms in the South.

Mrs. Sarah A. Smith, in speaking of shaken swarms, says in the American Bee-keeper:

"I have used the method for ten years, and in some cases nothing answers better. But when you hear some one say, to brush all the bees off the combs and set them aside until enough young bees hatch out to take care of the brood, then you should use a little of your own commonsense, and do nothing so foolish. At least that is what it would be if done here.

"Every natural colony of bees I have ever examined

always has brood in all stages of development. Now, if you take all the bees away the brood must suffer before enough young bees will be hatched out to go on with house-keeping. And it is well to keep food from the unsealed brood for so long?

"Then, even in our warm climate I do not believe it would be warm enough for the brood. And last, but not least with us, just as soon as the combs were freed of the bees, the ants would start in and clean out all the brood and honey."

### Dropping the Bee-Paper in Winter.

EDITOR AMERICAN BEE JOURNAL.—

I received the notice last evening that my subscription to the American Bee Journal expires the last of this month. When my time is out will you kindly stop it until next spring? The winter is the only time I have to study, and I am very remiss in my bee-knowledge, and I want to study my "A B C of Bee-Culture" and also Prof. Cook's "Manual of the Apisary." I have had them both for over two years, and know but very little that is in either one.

The Bee Journal is all right, and I would not be without it when I am in my apiary, for every week there is something in it that I want to know about. But this winter I want to study my text-books.

I have 54 colonies; they went into winter quarters in good shape, very strong. I will divide them in the spring. We had a very good honey season this year.

I like the Bee Journal very much, and I will read my last year's book all over this winter. MRS. SUBSCRIBER.

I read "Subscriber's" letter over with a feeling of genuine regret. I fear you are making a big mistake. Your text-books you have with you, and you can study them whenever you have a little spare time, but if you stop your bee-paper that is so much that is lost entirely, and a single number may contain just the information that you especially need, and that single number may be worth at least ten dollars to you. I should certainly want my bee-paper every week, and put in whatever spare time I could find on my text-books. As I said, they will keep, and you are sure you are not going to miss what is in them, although it may take you a little longer to get through with them; but if you stop your bee-paper, that is so much gone for good. That is the way I should feel about it.

Surely, the long winter evenings, more than any other time of the whole year, ought to afford leisure to become familiar with the fundamental principles taught in the text-books, and at the same time to keep pace with the advance chronicled weekly in the "Old Reliable."

### Ants and Clipped Queens.

Here is a bright and breezy bit of an article written by Mrs. Sarah A. Smith, of Florida, in the American Bee-Keeper. She says:

"A funny thing happened to me last spring. I read, one evening, G. M. Doolittle's article on clipping queens, in *Gleanings in Bee-Culture*, and as each point in favor of clipping came up, I, like the three good school trustees, nodded my head and thought, 'Them's my sentiments, too,' and rather patted myself on the back and thought, 'Sally, aren't you glad yours are all clipped?'

"Well, next morning my daughter reported a swarm. I went out and looked to see where it had come from, and soon I found the hive with the queen in front dead, with about 100 meat-eating ants stinging her and trying to move her to their nest. I looked and thought of the evening before, and could only sit down on a hive and laugh. As you perhaps know, Mr. Editor, such subjects for merriment are the only ones we Florida bee-keepers have had for some years.

"I still believe in clipping all queens, but scald your ant-nests before swarming-time."

Of course, conditions are somewhat different with us in the North. We are not troubled with ants as they are in the South.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

NEW BELGIAN DOCTRINE OF FOUL BROOD.

I am not going to rage and pitch on the subject, nor to be "Hasty" in any extreme way, but as to the new Belgian doctrine about foul brood I just quietly don't believe it. We happen to have evidence that the very highest of scientific authorities sometimes disagree point-blank on bacterial matters. We shall hear in due time, from some institute just as high up, that *bacillus mesentericus vulgaris*, alone and of itself, is not capable of starting a case of foul brood. It occurs to me as possible that the real *bacillus alvei* may have escaped observation hitherto. Observers looking at b. m. v. while another and smaller microbe was doing the mischief. In a number of diseases pretty well known to be germ diseases it is freely confessed that the real germ cannot be shown as yet. If we may suppose the same foul brood it will help us out of our present trouble, and assist in some old ones, also. We have been told pretty authoritatively in the past that there was little or no danger of infection by means of honey—while practical experience is peremptory and positive that honey is the main means of infection—communicates the real microbe of the disease, but not the Belgian chap with long name, mayhap. Same (in the opposite direction) of the question whether beeswax communicates infection or not—the laboratory says yes, and experience says no.

The great majority of high authorities say human beings can take the tubercle bacillus (consumption) from the cow; but Prof. Koch, of Berlin, the highest single authority of the lot, denies this, and sticks to it like a Trojan. Don't be in a hurry to throw overboard all your previous scientific lessons at one little heave of an adverse sea. Page 787.

OLD BROOD-COMBS.

As to the dispute alluded to on page 755 there may be a solution yielding somewhat to both parties. There are old black combs and old black combs. If they have never been allowed to get filthy and moldy, and then dry as bones, mere blackness and a little extra weight doesn't harm them any for use in the brood-chamber. Manifestly they should be warmer and tougher. The cocoons and adhering nitrogenous matter do not accumulate forever, but are torn out from time to time. This serves as salad to go with the too exclusive honey-diet of winter. But a heavy old comb once permeated through and through with the fibers of mold, it may well be that such a one is never again quite as highly esteemed as a new comb would be. The mold fibers do not die, probably, but are always in there waiting for a chance to do more harm. Quite likely in some apiaries pretty much all the black combs have been at some time too badly damaged to recover fully.

PUTTING UP HONEY FOR RETAILING.

Five cents for honey and fifteen cents for other things, eh? What if thy brother, misled by the figures, should eat the other things and leave the honey? Or suppose that you yourself lived a double life in the style of A. I. Root; would you put up honey that way in your country home to be used by yourself in your city home? And where does the Golden Rule come in? All right to supply the small demand of those who really want that sort of thing. Then let's turn in and do what we can, in the best way we can, for the great mass of the people. Page 758.

GRANULATED HONEY FOR THE MARKET.

As for Mr. York (Perhaps you're heard of him), when he says he don't believe in feeding all creation with honey, one begins to feel that his denial of being an Irishman can hardly be accepted, he gives away his cause at such a rate. Further on, where he intimates that it is not pleasant to spend the hours explaining to everybody that our honey isn't sugar, nor lard, nor yet goose-grease, why, then he gets in a good weighty shot. But honey granulates in glass as well as elsewhere. And the rogue who adulterates will have his stuff looking well for the longer period—and so please the grocer. Some hard old facts we have to face in this hard old world. The man who'll invent a satisfactory

way to control swarming, and the woman who will invent a satisfactory way to control granulation, they shall be king and queen among w'e uns. Page 759.

#### GETTING FINE GRANULATION OF HONEY.

If I understand Mr. Coggsball rightly on page 760, it is a deft and valuable kink he is giving us. Honey well stirred just at the time it is beginning to granulate will have a finer grain and seem nicer to the palate of the eater. I think that's so. Presumably the stirring makes granulation proceed so rapidly that the granules do not have time to get big and coarse.

## Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

### Swarms Deserting Hives.

A neighbor of mine says that when he kept bees, and was ready to hive a swarm, he would first wash the hive thoroughly with salt water, and then hive the bees; and said he never had a swarm leave when he hived it in that way. What do you think of it? NEW YORK.

ANSWER.—Washing out the hive with salt and water is an excellent thing, if the hive is dirty. It might do just as well without the salt. If the hive is clean, it may do as well without any washing. The principal precaution against having a swarm desert a hive is to see that the hive is well shaded and ventilated. You can wash a hive in an ocean of salt water, and if you set it in the hot sun with a small entrance a swarm will desert it.

### Dr. Gallup's "Umbilical Cord," and Baron M. Lieawful.

Please tell us what you think of Dr. Gallup's umbilical cord, and of Baron M. Lieawful? INQUIRER.

ANSWER.—Having never seen Dr. Gallup's umbilical cord, I am hardly competent to give an opinion of it. Neither can I say with any degree of certainty whether the experiments of Baron M. Lieawful, as reported on page 829, would have precisely the same results in some other locality. Indeed, I have some little doubt as to the entire accuracy of some of the Baron's observations. A man who could be so careless in the use of scientific terms as to write "pupaskinna castoffica" instead of "pupaskinna castoffica" is not entirely free from suspicion as to errors in other respects. He is also unparadoxically careless in speaking of a queen as being "full of years" after having had 299 lives injected into her. She was full of *lives*—indeed, very full—but in scientific parlance it will hardly do to consider *lives* and *years* as synonymous. I dislike very much to say anything calculated to injure the Baron in any way, but I feel called to utter a word of warning against accepting all that he says with too implicit confidence without having the same things repeated by him or some other person in a different locality.

### Bees Gnawing Through Paraffine-Coated Material.

1. I have read somewhere that bees will not gnaw through any material coated with paraffine. I fancy it would be an easy matter to coat the under surface of cushions to be used for covering hives by giving the material a free sprinkling with paraffine shavings and then going over it with a hot smoothing iron.

2. By the way, if a bee can make a hole through duck and through building-paper, as it seems to me a bee can do, how is it that it cannot break through the skin of a grape? ONTARIO.

ANSWERS.—1. That bees will not gnaw through any material coated with paraffine, is a thing that in the lan-

guage of the newspapers "needs confirmation." At one time I tried covering sheets with melted propolis to prevent the bees gnawing them. Whether the bees would gnaw it I never learned, for I did not make a success of distributing the propolis. If I were still using sheets or cushions I should at least try the paraffine.

2. Conditions are different. If a sheet of tin were lying before you, you could easily take hold of it with one hand, and lift it. Suppose that sheet made into a hollow sphere twelve inches in diameter; you will find yourself powerless to lift it with one hand, because there is nothing you can grasp. The bee is just as powerless to take hold of a grape as you are to take hold of the polished sphere. It can, however, easily get hold of the threads of duck or the particles of the paper. But varnish the surfaces and the case is different. I formerly used enameled sheets in quantity. I doubt that a bee ever gnawed one unless the surface were first broken, or unless it could get at the edge of the cloth. The only question I should have about the paraffine would be whether it would not be so soft as to yield, as the skin of a grape will not.

### Candy for Winter Feeding of Bees—Space Over Brood-Frames—Width of Top-Bars.

1. Which is better for winter feeding of bees wintering outdoors, hard candy, or "Good" candy? and how should the "Good" candy be fed?

2. What do you consider the "exactly right" space over the brood-frames?

3. What width of top-bars do you prefer 1½ or 1-16? or is there any practical difference? I expect to make a number of hives this winter, and want to get them right. MICHIGAN.

ANSWERS.—1. Feed "Good" candy in cakes laid over the top-bars.

2. One-fourth inch is probably about right.

3. I am using 1½-inches with good results.

### Wintering Bees Outdoors—Dividing for Increase.

1. I have 15 colonies of bees, and have made a place for them on the south side of the building, and covered it with straw. Will it do to leave the south side open, or shall I close it? Which will be best?

2. How about dividing bees in the spring instead of letting them swarm? I read in Prof. Cook's "Bee-Keepers' Guide," to cut out a queen-cell and put it in the nucleus. Why can't I take a whole frame with a queen-cell and put it in the nucleus? IOWA.

ANSWERS.—1. Perhaps both. Close it partly, but leave plenty of chance for the bees to fly whenever a warm day comes. Better have it open entirely than to close it too much.

2. It may be all right to take a comb with a cell on it, providing the cell is in the right place. But quite commonly queen-cells are on the edges of the combs, and that would not do so well, for there is danger that the cell may be chilled. It should be centrally located, where it will be sure to be kept warm by the bees.

### Making and Using an Observation Hive—Mice in the Bee-Cellar.

1. How can I make an observation hive, that is, the exact size, the inside and outside measure?

2. When I have the observation hive ready, I will take a frame with wired comb foundation, put that in the hive, then I will hive a little swarm in it. Do you think this swarm will stay there and begin to work? You may say, "Take a comb with bees from another hive and put in the observation hive." But I do not want to do that.

3. Do you think an observation hive with one frame, full of bees, will winter all right? or do they need feeding? If so, when shall I do that?

4. I have about 20 colonies of bees in the cellar, with hive-entrances about ¾ of an inch wide, and the full length of hive; there are some mice in the cellar. Do you think they will hurt the bees? Would they destroy some colonies? or what do you think about? MINNESOTA.

ANSWERS.—1. There is no one size. You can make it any size you like, but the size should correspond with the size of the frames used. If a single frame is used, the inside

dimension should be enough longer and deeper to allow a bee-space of one-fourth inch or a little more all around the frame, and perhaps 2 1/4 inches in width. The outside dimension will follow itself. If your frame is the Langstroth, make your observation-hive of the same dimensions as your regular hive, only make the width about 2 1/4 inches.

2. Yes, if the temperature and ventilation are all right, I think they may succeed.

3. I think success will be doubtful; but there is no law against your trying it.

4. It is not likely that any colonies will be utterly destroyed, but the mice will do a good deal of mischief by gnawing the combs. The entrance of each hive can be closed with wire-cloth having three meshes to the inch. That will keep out the mice without obstructing the passage of the bees. It is not so well to lock the barn after the horse is stolen, and yet it may do some good to close the entrances now. If a mouse is imprisoned in a hive, it may do less damage than to have free run of all the hives.

**Don't Pay Double.**

**1-lb Keystone ... Honey-Jars**

These are clear flint glass jars holding just one pound, and the shape of a keystone. They are 7/8 inches high, and very pretty when filled with honey. The corks can be sunk a trifle below the top, and then fill in with beeswax, sealing wax or paraffin. We can furnish them in single gross lots, with corks, f.o.b. Chicago, at \$3.50; two gross, \$3.25 per gross; or five or more gross, at \$3.00 a gross. These are the cheapest glass one-pound jars we know anything about. We have only a few gross of them left. So speak quick if you want them. Address,  
**GEORGE W. YORK & CO.**  
 144 & 146 Erie St., - CHICAGO, ILL.

**FROM MANY FIELDS**

**Honey-Apiary for 80 Colonies.**  
 Please suggest any plan for building a house-apery to accommodate 80 colonies of honey. What are the advantages and disadvantages of such a plan over wintering on the summer stands? **JOHN P. TULL,** Philadelphia Co., Pa.

[Will some one who has had experience please answer Mr. Tull? We should be pleased to publish not only a full description, but also pictures showing inside and outside of the house.—EDITOR.]

**Not a Good Honey Season.**  
 The past season was not a very good one for the honey, too cold and wet. I had to feed the late swarms; the earlier ones gathered some surplus.  
 The prospects for a honey crop next year are good; there is an abundance of white clover and thistle. **G. C. ALLINGER,** Marion Co., Ohio, Dec. 9.

**Season Almost a Failure.**  
 The past season was a bad one for the bees in this locality, all on account of too much rain. I did not store any honey in the summer, but in the fall stored enough for winter, and I took off about 200 pounds of white honey in one-pound sections.  
 This is a good location for bees, as there are hundreds of acres of prairie-land, and ver-vain grows abundantly, and there is some white clover, but this year it was flooded nearly all summer. The prospects are good for next year. **C. J. SITTLER,** Henry Co., Ill., Dec. 9.

**A Young Queen-Breeder, Etc.**  
 We have the youngest queen-rearing boy in the United States. He will be 13 years old next February. He understands his business all right. His name is Thomas Judd Holgate, and his bees are in good shape for winter. He will become a member of the National Bee-keepers' Association Jan. 1, 1903. If there is another boy or girl of the same age that does as well I would like to know their whereabouts.

I notice that my name is mentioned for one of the Directors of the National Bee-keepers' Association. If I am elected I will do all I can for the interest of the Association and the bee-keepers. I think Utah is entitled to one director. January 1 we will have 12 members in a little less than six square miles. I have been working for the Association for the last two years, and I expect to make it win before I quit.  
 Bees are in good shape for wintering. I have mine put away nicely. **G. W. VANGUNDY,** Uinta Co., Utah, Nov. 22.

**Tincture of Arnica for Bee-Stings.**  
 As 1902 is about to expire, I take pleasure in renewing my subscription for the American Bee Journal. I consider I have had very good value for my money in the American Bee Journal—one thing alone—the use of

tincture of arnica, which some one advised for taking pain out of stings—has been of great benefit. I am one of those people that a sting gives considerable trouble, quite a lot of pain and considerable swelling. Tincture of arnica gives great relief to me, but I will say that an application of tincture of arnica to the sting, followed by another immediate application of tincture of myrrh, both applied as soon as possible after being stung, have given me so much relief that in three minutes after being stung I would never know from the feeling that I had been stung. Both liquids are very cheap.

About 18 years ago I was stung on the back of the neck on a vein. I reeled and fell to the ground in a very few minutes; they had to make quick work of getting a doctor, as I was commencing to get cold in the legs. The doctor advised a liberal application of whiskey on the inside, and I took two good, stiff glasses of straight whiskey, and an outward application of ammonia. I never felt the effects of the whiskey in the way of making me feel drunk in the least. I have had to use this treatment twice, both times by the advice of different doctors, but I am not an advocate of the use of intoxicating drinks in any shape or form, as I consider them a curse to humanity.

W. D. HARRIS.

Ontario, Canada, Dec. 23.

### Wild Cucumber—Bee-Escapes.

On page 755 I notice an article about wild cucumber as a honey-plant. There are two kinds growing here, but one kind the bees do not work on; it has two seeds in a pod, and only blooms two weeks. The other kind the bees work on freely, and it blooms all summer. The seeds grow in a cluster of six or seven, unprotected, only covered with fine stickers. Any person wishing to get acquainted with them can come here and take a walk through the corn-fields and the river-bottom. They introduce themselves. The honey from them is white and of good flavor.

I received a Porter bee-escape about six weeks ago, gave it a good trial, and have found it is impossible to get along without it, after one knows what it is and how easy it makes the work. I did not use the smoker when I took off the honey, and I did not find one bee in the super.

P. H. HARBECK.

La Salle Co., Ill., Nov. 31.

### Report for 1902, Etc.

My report for 1902 is not very good. From 36 colonies of bees, all in good condition, I got only 1000 pounds of extracted honey. The summer was too cold and rainy. In 1901 I got over 3600 pounds from 29 colonies.

I am not in favor of the Constitutional Amendment proposed at the Denver convention of the National Bee-Keepers' Association. It seems to me that the question of locality of an officer ought not to be raised. I regard all the bee-keepers of North America as one family, and it can not make any particular difference in what particular town or State an officer resides. What we are after is men well qualified to fill the offices. I understand that this organization is for the benefit of bee-keepers, and not for office-seekers. I would not like to see such wrangling for office as we have in politics.

FRED BECHLY.

Poveshek Co., Iowa, Dec. 7.

### Wintering Bees—Improve Winter-Time.

Since Dec. 1 the bees have been confined to the hives. To-day six inches of snow is on the ground, and it is beginning to thaw. We have had zero weather during the last ten days and several nights. To-day the bees could be seen nosing around the entrance inside, pushing out their dead comrades. This denotes that the hive is warm inside, giving the bees a chance to move their position in the hives in reaching their stores, if necessary.

This year I had my bees fixed up during the month of September. All surplus arrangements were removed from the hives and

To make cow's nap, use Charles Cream Separator Book Business, Dairying & Cattle 212 Free, W. Chester, Pa

put away long before October. Years ago I practiced the plan of letting the frost drive the bees down, by removing the cups or covers during very cool nights. In the morning all I had to do was to go around early and carry the surplus arrangements away to the honey-house. The plan is a very good one, if one is a little careless or negligent, but I find that an up-to-date bee-keeper will "get a move on" him long before Jack Frost comes around.

Years of experience have taught me that the winter is the proper time to make preparation for the following season, by fixing up hives and such things as are needed about the apiary during the summer. To prepare such work six or eight months ahead seems a little foolish to a beginner, but an experienced apiarist will recognize the importance of such preparations. By having all his supplies ready at a month's notice, for there will be so much work to attend to during the busy season that no time will be had for such work.

I do not like the saved-off or short-end top-bar frame. It is all right if the hives are all made just alike, and of the same length. Unless they are made thus they will be of different frames will go to "bucking," and one end of the frame will be up or down half of the time. I commenced to use them, but after a fair trial I "fired" them almost as soon as I took them up. Again, bees have a fashion of filling propolis in at the ends. The short-end frames are a good deal like the old metal-covered frame, sooner or later they will be all daubed up; at least that has been my experience.

In advising beginners, I would say that all copies of bee-papers should be taken care of, and then when the busy season is over, or during the winter months, they can be overhauled and looked over carefully. A vast amount of information will be obtained. A blank book should be kept, and whenever the reader comes across a good article that he thinks he would like to refer to afterwards, it should be written down where it can be found—the name of the paper, number of page, etc. Of course, the index at the end of each year would show all this, but I like the blank-book plan much the best, because it contains just what suits the reader's ideas.

— Cass Co., Neb., Dec. 15. J. M. YOUNG.

**Small Crop of Honey.**

The season for bees in this locality was very poor—too much rain, wind, and cold weather. Some have a small crop of surplus.

Bees, generally, are in fair shape for winter. There was plenty of white and sweet clover, but it was of little use, to the bees, on account of the weather. About three weeks of hot weather in July, and the bees swarmed at a great rate. I had 9 colonies in June, and 34 in September; I caught the most of them.

JAMES GODFREY,

**The Chicago Poultry Show is to be**

January 19 to 24 Inclusive.

Commercial Poultry for Sept. 5, 1902, said: During the Chicago poultry show we shall publish a daily edition of Commercial Poultry, and this we purpose making better than the editions we have published during the last two shows. During the week of the poultry show we shall also tender a banquet to the judges who place the awards on the birds in the show, and another banquet will be given to all winners of first prizes who exhibit three or more birds.

With improved press facilities we shall also add to our artistic force and make Commercial Poultry still more distinctively the leader of the poultry press of the world from the artistic point of view. We shall continue to make our style and not show after any other publications, and in all its departments make Commercial Poultry better and brighter than it ever has been, maintaining the place it has secured as the leader in circulation as well as literary excellence.

—BEST—

**Extracted Honey For Sale**

ALL IN 60-POUND TIN CANS.

**Alfalfa Honey**

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

**Basswood Honey**

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

**Write for Quantity Prices by Freight, if Interested.**

A sample of either, by mail, 10 cents, to pay for package and postage.

**Order the Above Honey and then Sell it.**

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

### Wholesale Marketing of Honey.

B. S. K. Bennett makes in Gleanings in Bee-Culture the following rather surprising statements:

The great bakery trust in the United States, with factories in each main city, is such an extensive user of honey that they pay their honey-buyer \$15,000 a year, or \$47 a day. This man does nothing but manipulate the market. How does he earn his salary? It matters little to him how many buyers there are. He sets the price, and sees to it, as has just been demonstrated in California, that no click can get a corner on the market nor on him (this is all private information), but it is what I went into the honey-business to learn. California producers have an offer, through one of the agents of this bakery trust, of 45¢ cts. per pound for all amber extracted honey for a three-year-delivery contract. In good years we rarely get above 35¢ cts. Is this a feeler as to our condition? or is it an expectation of an advance in price through the efforts of organization.

### Then and Now—Organization.

The editor of the Australian Bee-Bulletin gives a discouraging picture of the condition of bee-keepers in that far-off land, crediting it largely to the big stories that were told of the profits of bee-keeping. His closing words show that organization is in the air, even on the other side of the globe. He says in part:

"Take some ten years ago, when bee-keeping first became prominent in Australia. What were the stories told about it by persons who wished to avail themselves of a good opportunity to make money by selling supplies! The honey industry was going to excel the butter industry; there was to be more money in bee-keeping than in gold-mining; a square mile of forest and a hundred colonies was an assured income of £200 a year; a hive of bees in the bush would average 250 pounds of honey a year; in the town 150 pounds; it would add so much to the income of the public servants, and occupy but little of their time, and that would be all pleasure. Had there been less "blow" then, the industry would have been in better condition now. How have these beautiful pictures been realized? Not long since hundreds of empty

**HAVE RIPE TOMATOES** TWO TO FOUR WEEKS before your neighbors. Leaflet telling how, and 3 packets earliest tomato seed for 25c in stamps.

J. F. MICHAEL, R. 6, WINCHESTER, IND.

### "Bees in Colorado"

I still have several hundred copies of the souvenir with the above title. The bee-papers and a good many people without visible axes to grind have said it is a valuable and attractive thing. If you should like to have a copy, send me a silver dime or 5 two-cent stamps, and I will mail you a copy.

"BEES IN COLORADO" is the title of a 48-page and cover pamphlet gotten up to boom the Denver convention. Its author is D. W. Working, the alert secretary of the Colorado State Bee-keepers' Association. It is beautifully illustrated, and printed on enameled paper. It is a credit to Mr. Working, and will be a great help in acquainting those outside of Colorado with the bee and honey characteristics and opportunities of that State.—American Bee Journal.

D. W. WORKING, Box 432, Denver, Colo.  
Please mention Bee Journal when writing.

hives could have been purchased all over the colony of New South Wales for next to nothing—almost given away. Bad seasons, and decrease of forests, a limited market, lost hope in foreign markets. What is to be done? For those producers who have survived, no matter in a small or large way—to maintain and help the Bee-Farmers' Association—to work together honestly and sincerely for their own good. Producers should meet, and at least once a year do their best to meet, too; if nothing more, talk over the things concerning their welfare, and develop as much as possible a spirit of union and friendship.

### Basswood for Frames.

Basswood has been recommended by some as better than pine, while others say basswood is unfit for lumber in hives because it warps and twists so badly. According to G. C. Greiber, both are right, the difference being in timber itself. He says in Gleanings in Bee-Culture:

In my earlier days, some forty years ago, I was occasionally called on to assist in clearing up and fencing land, all suitable timber being split into rails. The timber was mostly beech and maple, with now and then large basswoods from three to four feet in diameter. These latter we cut into logs twelve or fourteen feet long, and with maul and wedge split them into rails. The logs of some trees split very easily. After starting the end with an ax, two or three wedges driven from the top into the opening would be sufficient to roll the halves apart. The split surface of these half-logs would sometimes be so straight and true that nothing short of a saw could have bettered it. The grain ran true in every way, something like pine; in fact, lumber cut from such trees, as I did in later years, would fill the bill of pine for many purposes.

Other trees only a few rods from the first, would act very differently—whether on account of different soil or a little difference in the lay of the land, I cannot say; but the fact remains the same, all our efforts to split the logs cut from them would fail. Even the application of gunpowder, blasting-rock fashion, would not separate the halves. The grain of these sections would wind about the tree—so much so that, in the length of our logs, it would make a quarter revolution; besides, the different layers were so completely braided or woven together that those logs which we did succeed in splitting had to be chopped the whole length before they would separate. I imagine that Mr. Niver's Grotton top-bars were made of lumber like the former, and venture the assertion that his confidence in basswood top-bars would vanish like dew before the rising sun if he should ever come in contact with some made of the latter kind.

## Catnip Seed Free!

We have a small supply of fresh, clean CATNIP SEED on hand, and will mail free, two ounces of it, to any present paid-in-advance subscriber of the American Bee Journal for sending us One New Subscriber for one year with \$1.00.

Two ounces of this seed will give you a good start of one of the best honey-producing plants known. We will also send to the new subscriber on this offer the rest of this year's Journals free. Address,

GEORGE W. YORK & CO.,  
144 & 146 E. Erie Street, CHICAGO, ILL.

**Short Seed Crop.**—It will soon be the seedmen's catalog time when every good farmer and grower will be expecting to receive the various seed catalogs issued by these enterprising merchants. Among the most interesting will be found the "Garden and Farm Manual" of Messrs. Johnson & Stokes, 217-219 Market St., Philadelphia, Pa. This catalog differs from those offered by any other seedmen in this country, as it is illustrated throughout with handsome photographs taken direct from the vegetables and flowers themselves. This gives it not only a distinction and quality of its own, but gives it an added value to the planter, as he can see exactly as though the vegetable itself were in front of him what the seed which he is ordering will produce. This old firm makes a specialty of introducing sterling novelties, and their success in this direction has scarcely been equaled by any other seed firm in this country. One of their latest introductions, and which has brought them a very considerable amount of favorable comment, is their "Sparks' Earliana Tomato." This has proven to be a novelty of very sterling merit, being the finest, large, round, smooth tomato and coming as early if not earlier than any other known sort. But it, together with nearly all other seed crops this year, is a very short crop indeed, and those wanting it will have to secure their supply early, as there will not be nearly enough seed to fill the large demand that is sure to come for it. This situation also applies to nearly all the early peas, cucumber seed, all muskmelon and watermelon seeds, and beans. A copy of this "Garden and Farm Manual" will be sent free if you mention that you saw this notice in the American Bee Journal.

## HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, Dec. 8.—There is no special change in the honey market, prices remain as last quoted and the volume of trade is not large. The weather is such as usually prevails at this season of the year, and the cold may induce people to buy more freely. Best lots of fancy white comb honey bring 16¢ per pound; No. 1 to choice, 15¢; off grades, 2¢ to 5¢ less, and not much demand for them. Extracted, 70¢ for white; amber, 60¢; Southern, 54¢@6¢. Beeswax, 30¢.  
R. A. BURNETT & Co.

ALBANY, N. Y., Nov. 22.—Honey market is still in strong position with ready demand for all receipts at good prices. Fancy white comb, 16¢; A No. 1, 15¢; No. 2 and mixed, 14¢@15¢; buckwheat, 14¢@14½¢. Extracted, buckwheat scarce at 64¢@75¢; light grades more plenty at 64¢@6¢. Beeswax, 24¢@30¢.  
H. R. WRIGHT.

BOSTON, Oct. 20.—Our honey market remains firm, with good demand and fair stocks on hand. Honey is not coming in at prices as usual, and the tendency of prices is steady. We quote our market as follows: Fancy white 1-pound sections in cartons, 16¢; No. 1, 15¢; No. 2, very light supply. All of our assortments generally one cent less than this. Extracted, light amber, 8¢; amber, 7½¢.

BLAKE, SCOTT & LEE.

KANSAS CITY, Dec. 20.—Market steady at quotations. There is no fancy white comb, per case, 24 sections, \$3.50; No. 1 in 12 sections, 14¢ and amber, \$3.25. Extracted, white, per pound, 74¢; and amber, 66¢@6½¢. Beeswax, 27¢@30¢.  
C. C. CLEMONS & Co.

CINCINNATI, Dec. 8.—The demand for honey, both extracted and comb, has eased off somewhat the past few weeks, however the prices rule steady, as follows: Extracted, amber, in barrels, 66¢; white clover, 80¢. Comb honey, fancy, 16¢@17¢; white clover, 11¢@12¢. Beeswax, 29¢@30¢.  
THE FRED W. MUTH CO.

NEW YORK, Dec. 23.—The market on comb honey is dull and inactive. While the supply is not large the demand has fallen off to a large extent and prices show a weakening tendency. We quote white clover, 11¢@12¢; No. 1, 14¢; No. 2, 13¢; and buckwheat at from 10¢@11¢. Extracted is in fairly good demand; white, 75¢; light amber, 64¢; dark, 54¢@6¢. Beeswax firm at from 28¢@30¢.  
HILDRETH & SPOELKEN.

CINCINNATI, Dec. 12.—The comb honey market is a little quiet, almost everybody is filled up. As there is hardly any new supply coming in, there is no change in prices, namely: Fancy water-white, 16¢; off grades less. The market for extracted white clover shows a slight advance. Fancy white clover brings 8½¢@9¢; alfalfa water-white, 6½¢@7½¢; but if anything, has weakened, I quote same in barrels, 5½¢@5¼¢. Beeswax, 27¢@28¢.

C. H. W. WEBER.

SAN FRANCISCO, Dec. 17.—White comb honey, 11½¢@12¢; light amber, 10¢@11¢; dark, 50¢@55¢. Extracted, white, 60¢@6½¢; light amber, 58½¢; amber, 44¢@45¢. Beeswax, good to choice, light, 24¢@26¢. Striped, 20¢@22¢.

The bulk of California produced honey is sold for Eastern shipment in carload lots from producing points at bottom price. Small lots of choice honey that can be used in local trade bring more. Quotations here given are current prices to producer, f.o.b. shipping point, on Eastern basis for extracted and California basis delivery point subject to agreement for comb.

**Tip-Top Glass Honey-Jars**

The picture shown herewith represents the best one-pound jar for honey that we know of.

It is made of the clearest flint glass, and when filled with honey, and a neat label attached, it makes as handsome a package as can be imagined. Its glass top sets on a flat rubber ring, and is held in place by a flat steel spring across the top as shown in the picture. It is practically air-tight, thus permitting no leak,

which is an important thing with honey-sellers.

We can furnish these jars, f.o.b. Chicago, at these prices: One gross, \$5.00; two gross, \$4.77 a gross; five or more gross \$4.50 per gross.

If you try them once you will likely use no other kind of top or sealing arrangement for honey jars.

Why not get

**The "Post"  
Fountain  
Pen**

The very best in the market; regular price, \$3.00, and not obtainable under this price anywhere. The Six Cardinal points Peculiar to the "Post":

**Self-Filling, Self-Cleaning, Simplicity, Durability, Reliability, No Leaking.****Given Absolutely Free**

For two new subscriptions to Gleanings and your own renewal with \$3.00; or for one new subscription and your own renewal with \$1.50; or your own subscription will be advanced 2 years, and the Pen furnished for \$2.50.

In each case all arrears, if any, must be paid in addition, the above offers being for subscriptions fully in advance only. We believe we can say truthfully, without fear of contradiction, that no fountain pen ever put upon the market ever received in so short a time so many unsolicited testimonials from such distinguished men as the POST. The above drawing shows its construction. To fill the POST, all you have to do is to dip the nib into the ink-bottle, draw out the plunger, and the pen is ready for use. Compare this with unscrewing the ordinary style, and refilling with a glass filler that you can not always find when wanted. The self-cleaning feature of the Post, as illustrated, will also commend itself. With most pens specially prepared ink must be used or they are soon of no use, because they become so gummed up and it is well nigh impossible to clean them. With the POST you simply dip the nib in water, draw the plunger back and forth like a syringe or squirt-gun, and in less than five seconds it is clean and free for a perfect flow of any ink that may be handy. We will send, on request, a few of the many testimonials from noted men in various callings who have written merited words of praise for this most valuable invention. We can not offer the pen for sale for less than \$3.00; but by special arrangement we are enabled to offer it free as a premium with Gleanings in any of the following combinations: All arrears, if any, must first be paid at \$1.00 a year. Then for \$3.00 we will send Gleanings for one year, to two new names; for one year to yourself, and send you the pen free. For \$2.50 we will send you the pen and Gleanings for one year, and to one new subscriber a year; for \$2.50 we will send the pen and Gleanings for two years. If you have ever been disappointed with a fountain pen we assure you that you will not be with this one.

### EXECUTIVE COMMITTEE.

W. Z. HUTCHINSON, President.  
JAMES U. HARRIS, Vice-President.  
GEORGE W. YORK, Secretary, Chicago, Ill.

EUGENE SECOR, General Manager and Treasurer, Forest City, Iowa.

MEMBERSHIP DUES, \$1.00 a year.

NOTE: If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons], as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

—BEST—

## Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

### Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

### Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

**Write for Quantity Prices by Freight, if interested.**

A sample of either, by mail, 10 cents, to pay for package and postage.

**Order the Above Honey and then Sell it.**

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

**GEORGE W. YORK & CO., 144 & 146 E. Erie St., Chicago, Ill.**

## The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the Knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.00.

GEORGE W. YORK & CO.

Chicago, Ill.

NOTE: Please allow about two weeks for your knife order to be filled.

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER  
IN AMERICA

43d YEAR.

CHICAGO, ILL., JAN. 15, 1903.

No. 3.

## \* Editorial Comments. \*

**The International Exposition of Bee-Culture**, to be held at Vienna, in Austria, April 4 to 26, bids fair to be an event of much importance. There will be on exhibition from the different nations colonies of living bees, hives, implements, products of bees, direct and indirect, etc. Interest is added by the fact that the Government Apicultural School, with its large apiary, is located at Vienna. It is the intention to have the groupings such that the status of bee-culture can be studied by countries. Living or preserved specimens of the enemies of bees will be displayed, from the bee-louse to the great bear. Honey-plants in great variety, so far as possible in bloom, will appear. Not the least matter of interest will be the opportunity to meet face to face bee-keepers of all lands.

Exhibitors and others may obtain desired information by addressing *Ausstellungen-Komitee*, Wien, 1, Schauflergasse 6.

**The Knotty Problems of Bee-Keeping**.—From an esteemed correspondent comes the following:

"I like the American Bee Journal, and enjoy reading the communications of the various contributors, yet I am somewhat disappointed. . . . Can't you get some of your many bee-men to round up each long-discussed subject, like *shaken swarms*, with a plain, practical digest of the whole matter? and give us little, young fellows some practical facts that we can understand and put in practice?"

Sometimes you may see hanging up in a store a sign with the legend, "If you don't see what you want, ask for it." Same here. The department of "Questions and Answers" is open "at all hours" for those who desire information. In the editorial department will be found from time to time epitomized views upon important subjects, and more or less in the same line from experienced correspondents. Yet with all this there will be times when conflicting views will be expressed, especially upon matters more or less new, and so long as the testimony is not all in it is not an easy thing to give anything like a summarized opinion.

Taking the matter of shaken swarms referred to: A summary would add nothing that has not been given, and no one would be competent to say that such and such testimony is reliable, and such and such is to be disregarded. Indeed, there may be conflict of the most emphatic character between two witnesses without any deviation from the strict line of truth on either side, the difference to be accounted for by difference in conditions or locality. So each one having the whole facts before him must judge for himself what will best fit his own case.

More than one writer has already given in these columns a summary of his procedure in the matter of shaken swarms. What our correspondent probably would like to

have would be something like an authoritative statement as to what will be the very best thing to *suit his own case*. It would, indeed, seem a most desirable thing to have implicit instructions given as to all the different things pertaining to bee-keeping. So far as that is possible, it is done by means of text-books and bee-papers; but when all is done that can be done, there will always be still left much for the judgment of the individual bee-keeper. Therein lies the charm, and at the same time the despair, of bee-keeping—the constant solving of problems that arise, only to be followed by others as fast as solutions are found for those already on hand.

It will be, in the future as it has been in the past, the pleasure as well as the duty of this journal to help so far as possible each one, especially the beginner, to solve the difficulties met with, and to this end questions as to those difficulties are always in order.

"If you don't see what you want, ask for it."

**Cleaning Smokers**.—F. L. Thompson says in the *Progressive Bee-Keeper* that he burns them out, and also cleans them "by soaking in water for 24 hours or more, when the creosote flakes off easily with the assistance of a knife." Of course, the metal part is separated from the leather and wood before being put to soak. A good kink.

**Advertisements of Sugar for Bees**, either in the form of sugar or candy, are quite common in English and continental bee-journals, which seems a little strange to American readers. One reason for the difference in this respect between this and other countries lies in the fact that in this country little is thought of the difference in sugars, the general belief being that granulated sugar made from beets is just as good as that made from sugar-cane. On the contrary, in other lands there is held to be an important difference. Especially in England is beet sugar strongly objected to as bee-food, being considered entirely unfit for winter food. So bee-keepers of that country look carefully to the source of their sugar. The latest number of the *British Bee Journal* to hand contains one advertisement of cane-sugar and five of bee-candy, the price of sugar being much the same as in this country, and the candy from 10 to 18 cents a pound.

**Defense of the Kingbird**.—The *Florida Times-Union* claims that the harm done by the kingbird or bee-martin to the bees is largely outweighed by the good it does in driving away hawks. It says:

When the hawk appears the king calls to his mate and the two rush to the attack with the directness of Schley's ships, and almost with the swiftness of a shell from the Brooklyn. They attack on opposite sides, and each tries to rise above the other—the female distracts the attention of the enemy while eluding blows from beak and talons by sudden turns and quick rushes to get in. But woe to the hawk that delays to strike at her—her mate has rushed above and then down—he clutches the feathers at the base of the skull and strikes straight for the eyes while beating

with his wings to confuse and distract. Then the hawk takes to headlong flight, and will drive through thick trees to free himself, or, blinded by the wings, will sometimes kill himself by striking against an object in the way.

Let the farmer recognize the kingbird as his friend, and give him the toll of a few bees gladly—he has earned them.

**Retailing Basswood Honey:**—On page 40 is an article by Mr. A. W. Smith, detailing his experience with basswood honey among his private family trade. But we think the explanation is principally located in his statement that about half of his trade prefer *buckwheat* honey. If any one prefers buckwheat honey, in all probability he will never like basswood honey.

But we think the basswood honey Mr. Smith's locality produces must be very different from the fine basswood honey found in Wisconsin and Minnesota. We have quite a quantity of as fine flavored basswood honey in stock now as any one ever need care for.

We have wondered whether Mr. Smith has not had basswood honey that was not well ripened. If so, it is about the worst stuff that can be put on the market. We think we should always prefer buckwheat honey to unripe basswood honey. But if the basswood honey is properly ripened it is indeed a fine honey to eat.

Of course, tastes differ so much. We personally prefer alfalfa honey, and can eat our share of it. But there are other people who prefer white clover honey, basswood honey, sage honey, tupelo honey, or *even buckwheat honey!*

**Replacing Queens.**—The Australian Bee-Bulletin advises the replacing of queens two years old, and gives the following sad picture of the condition of a colony left to its own devices:

It does not pay to keep queens two years old, as a rule. They gradually cease to lay, and the colony dwindles. If a daughter supersedes she may be lost in her wedding-flight. As the colony dwindles the nurse-bees decrease to become honey-gatherers. The brood is neglected. Honey may be gathered, but the last honey-gatherer at last dies. The queen may even survive all, or the old queen may die, and a young one come out and not sufficient bees to attend to her, she herself dying for want of food and attention.

Either conditions are different in Australia from what they are here, or else there is a marked difference in bees. Some of our ablest bee-keepers think it the wiser course to leave the matter of superseding entirely to the bees, and they would hardly expect one case in a hundred of entire loss if the bee-keeper never meddled. Before a queen becomes unfit for work—often before the bee-keeper can see the least sign of failing—she is superseded by the bees, the change of queens not affecting the strength of the colony in the least. Is there not some mistake about the nurses neglecting brood to become honey-gatherers? Will not a worker continue the occupation of nursing so long as needed for that purpose, without regard to age? Do workers not continue to be nurses in spring when six months old?

## \* The Weekly Budget. \*

A SERIES OF BEE-KEEPERS' INSTITUTES will be held in the State of New York as follows:

Canandaigua, March 2 and 3; Romulus, March 4; Auburn, March 5; Cortland, March 6; Fulton, March 7; Syracuse, March 9 and 10; and Amsterdam, March 11.  
Prof. Frank Benton, Apicultural Investigator, fur-

nished by the United States Department of Agriculture at the expense of the Bureau of Institutes of the State Department of Agriculture, will address the meetings.

The New York State Association of Bee-Keepers' Societies will hold its annual meeting at Syracuse, March 10, at 10 o'clock a. m., in the City Hall. Prof. Benton and other prominent bee-men have informed us of their intention to attend this meeting, and a profitable and interesting session is in store for those who attend. Special rates have been secured for entertainment at the Manhattan Hotel, Fayette St., at \$1.25 per day. C. B. HOWARD, Sec.

MR. WM. COUSE is also a director of the Canadian Honey Exchange. Through an oversight his name was omitted from the list given on page 3.

"A B C OF BEE-CULTURE," edition of 1903, is on our desk. It is a handsome volume in every way, and now contains about 500 large pages. It has just been thoroughly revised and brought down to date in everything that pertains to bee-keeping. More copies of this work on bees have been sold than of any other book devoted to the subject. The price is \$1.20, postpaid, or, if taken with a year's subscription to the American Bee Journal, the two will be sent for \$1.75. Send all orders to the office of the American Bee Journal.

YON YONSON'S quaint sayings are much enjoyed by some, while those who are little familiar with the Swedish dialect have difficulty in understanding them. Some of the words that trouble most frequently are as follows: *Ma* (pronounced may) means with; *ay* means I; *po* means on or in; *dom* means them, and sometimes they or those.

The question has been asked whether Yon's story about the telephone business has any foundation in fact. All that he has said about it is literally true, and Yon may well be proud of the part that he has had in the matter.

THE AMUSEMENTS OF CHILDREN.—An article on the amusements of children in *The Delineator* for February contains a wealth of practical suggestions. Most mothers are usually at their wits' ends to provide suitable entertainment for the children. The kindergarten is an aid in the solution of this problem; but it only occupies a portion of the child's time. The work of the kindergarten should be supplemented by play and instruction of a like character in the home. The seed sown in the heart and mind of the child bears abundant fruit in later years, and the good that they derive from song and story and healthful bodily exercise can not be overestimated. A love of Nature, habits of neatness and order, politeness of manner can be instilled in the little one by intelligent effort.

MR. J. ALPAUGH, of Ontario, Canada, writing us Jan. 3, from Florida, says:

EDITOR AMERICAN BEE JOURNAL—

I am on a winter tour through this State, but have just received word that all my bees and bee-appliances that I had up in Bruce County, Canada, were burned up, Dec. 27. I had the bees in the cellar, and all the fixtures in the house above. The loss was about \$800. No insurance.

Yours truly, J. ALPAUGH.

We regret very much to learn of the loss reported by Mr. Alpaugh. It is too bad that he had no insurance. We think it behooves every person who has insurable property to be careful to have it insured at all times. The \$800 would pay the insurance premium on a large amount for a number of years.

We hope Mr. Alpaugh will be able to stock up again with bees, that he may have a good season this year, and thus recover from his heavy loss.

The Premiums offered this week are well worth working for. Look at them.

## Convention Proceedings.

### Report of the Ontario Bee-Keepers' Convention, Held at Barre, Ont., Canada, Dec. 16, 17 and 18, 1902.

REPORTED BY MORLEY PETTIT.

The annual convention of the Ontario Bee-Keepers' Association was held in the Court House, in Barre, Ont., Dec. 16, 17 and 18, 1902.

Pres. J. D. Evans called the meeting to order at 2 p.m., and Mr. J. K. Darling offered prayer.

Sec. Wm. Couse read the minutes of the last annual meeting, which were approved.

Pres. J. D. Evans then read his address, as follows:

#### THE PRESIDENT'S ADDRESS.

I am glad to greet you again, to renew our friendship, and exchange our experiences. While the past year was not a record-breaker in the yield of honey, still the yield was fair, and quality and price good.

One of the lessons we have learned is, there is never a good crop in all parts of Ontario in one year, and any apiarist who has a large crop of honey should make inquiries as to the honey-yield in the whole Province before jumping to the conclusion that it is abundant and going to be cheap; the importance or correct information on this point, and the influence of the Association in keeping up fair prices, was well illustrated in the disaster that befell the attempt of certain commission men in Toronto to break the honey market last fall; and in this connection I wish to say that the thanks of the Association is due Mr. Byer for his prompt and energetic action in the case.

I am much disappointed in the slow increase in our membership. Early in the year the executive prepared a circular showing the usefulness of the Association to beekeepers, and had it mailed, at considerable expense, to about 7000 bee-keepers in Ontario. I regret to say that the increase in membership did not justify the expense. It seems amazing to me that any bee-keeper should be so blind to his own interests as to stand aloof from so useful a society. I was surprised at receiving only six applications for the services of the inspector of apiaries during the year, and wrote Mr. McEvoy asking him to let me know what applications he had received, and what apiaries he had visited. The inspector refused to give me this information, and quoted some old resolution passed in the time of the late Mr. Pringle, forbidding him to give any information of this kind except to the Minister of Agriculture.

If any such resolution is on the books of the Association it is of no force whatever, as by the statutes of Ontario the inspector has no authority to visit an apiary unless when sent by the president of the society. See Sec. 3, Ch. 283, S. A. 1897.

Section 6 of the same Act provides a fine of not less than \$20, or more than \$50, or imprisonment for two or three months, for any owner who conceals the fact that foul brood exists among his bees.

Section 10 of the same Act reads: "Every bee-keeper or other person who is aware of the existence of foul brood, either in his own apiary or elsewhere, shall immediately notify the president of the Ontario Bee-Keepers' Association of the existence of such disease, and in default of so doing shall, on summary consideration before a Justice of the Peace, be liable to a fine of \$5 and costs."

Section 12 of said Act orders the Association to report to the Minister of Agriculture each year, the number of colonies destroyed, and the locality where found, so that the secrecy sought to be observed is contrary to law, and absurd.

I think the Association should seek for the authority to appoint a spb-inspector in each of its districts, and thus save unnecessary travelling expenses; and that in the future our presidents should strictly enforce the law, that no inspector or sub-inspector inspect any apiary unless directed by the president for the time being. It would be well to have a by-law passed defining the duties of the inspectors, and the Act for the suppression of foul brood among bees, printed in the minutes of this session.

I greatly regret that through some misunderstanding Prof. Harrison was not in a position to carry out his experiments in curing foul brood with formalin. He wrote the secretary early this season asking for samples of foul and black brood, and asked that Mr. Gemmill supply them. Unfortunately, through the delay in the correspondence, and the fact that the sub-inspector (Gemmill) was busy, samples were not sent until it was too late, and we will have no report this session from the Professor. I hope he will be supplied with all necessary materials for his experiments next season, for they are of the utmost importance.

I hope that we may have a pleasant and profitable meeting.  
J. D. EVANS.

Wm. McEvoy thought people whose bees have foul brood should do as they do in Wisconsin—report directly to the inspector. The president changes every year, and has not the opportunity of understanding the situation as the inspector can.

R. F. Holtermann—We must act in a legal way. If the Act is wrong, have it amended; but in the meantime the inspector should comply with the Act; then he has the Act to back him.

Mr. Gemmill—The Foul Brood Act of Ontario was the first law of its kind in America. We can not expect it to be perfect; but if we do not like it let us appoint a committee to have it amended.

On motion, a committee composed of the following was appointed to amend the Foul Brood Act: Messrs. Darling, Sibbald, Gemmill, Byer, and Newton.

#### FEEDING FERMENTED HONEY,

"Can slightly fermented honey be safely used for spring feeding?"

W. A. Chrysler—Yes. I prefer to heat it and evaporate to the consistency of ripe honey, then add water to make it thin enough for feeding.

J. K. Darling indorsed this.

#### KNOWING FOUL BROOD AND CURING IT.

"How do you know foul brood, and how is it cured?"

Mr. McEvoy explained the symptoms and gave his valuable cure. To dispose of the brood leave about a quart of bees, and pile up two stories high for 10 or 12 days till most of the brood hatches. Treat this colony for foul brood in the usual way, and give them a queen. All operations should be done in the evening, and during a good honey-flow. If the flow should stop suddenly you must feed. You can't cure foul brood in fruit-bloom—the flow is too risky. If it should stop you might have starved brood. Wait till June. Mr. McEvoy has not much faith in forced swarms curing this disease, as one shaking does not rid the bees of the diseased honey in their sacks.

#### WEED-PROCESS COMB FOUNDATION.

"What is your experience with Weed-process foundation?"

Mr. Chrysler—I have not used it.

W. J. Brown—It is no advantage.

Jas. Armstrong—For the brood-chamber I would not use anything else. There are more sheets of the foundation per pound, and it is stronger.

Mr. Holtermann—The objection raised to section foundation is that the bees do not work on it so readily. Pressure in milling it makes it harder.

C. W. Post—It is good when properly manipulated.

W. J. Craig—The hardness depends on the wax used. Wax from cappings is much harder than that from old combs.

Several members said they found the bees prefer old-process foundation. Some maintain the contrary.

#### FULL SHEETS OF FOUNDATION AND FORCED SWARMS.

"Is it advisable to use full sheets of foundation in making forced swarms?"

Mr. Chrysler—If you do, put an empty hive-body under for a few days.

Mr. Post—For extracted honey use foundation. For comb honey use starters. Five or six starters give worker-comb; more than that give drone-comb.

#### FORCED SWARMS.

"Is forced swarming a success?"

Mr. Chrysler—Yes, if you do not shake prematurely. Wait for some sign of swarming.

F. A. Gemmill—This matter has been well discussed in recent bee-papers. Forced swarms should be made when there is honey coming in. The bees should be allowed to

fill themselves before shaking. These swarms should be as much like the natural as possible.

Mr. Evans—I prefer shaking on full sheets rather than on starters.

Mr. Holtermann—I have been practicing this more or less for ten years. A colony should not be "swarmed" until cells are started. When one is found in this condition smoke and jar to cause the bees to fill themselves, then go on to the next hive. Continue until No. 1 has had plenty of time, then shake. Do not shake off all the bees.

#### GETTING RID OF ANNOYING ROBBER-BEES.

"How would you get rid of robber-bees following around the yard and bothering while you are working?"

Mr. Chrysler—Find out which colony is doing it, and shake them off on starters. This gets them roused up and filled with honey. Give them sections, and they go to work.

Mr. Holtermann—I do not see how robber-bees can be gotten rid of in the way mentioned. On every hive we have a portico with grooves in the front into which we can slip a screen and confine the bees to that portico. When any work has to be done at a time when no honey is coming in, and robbers are about, put on these screens early in the morning. Every colony in the yard is thus confined to the hive in a way that does not worry them, for they can fly about in the portico. No robber-bees can leave home to disturb at any other hive, and you can clip queens, extract buckwheat honey, or do any other necessary work, without the annoyance or danger of robber-bees.

Mr. Post advocated setting out a few smeared combs for the bees to clean up. After that they will be quiet for the rest of the day.

#### THE NATIONAL BEE-KEEPERS' ASSOCIATION.

"Is it advisable for this Association to adopt similar work to that of the National Bee-Keepers' Association?"

Mr. Gemmill—As members of the National Bee-Keepers' Association we have its full protection, and nothing further is needed.

Mr. McEvoy read an invitation from N. E. France, asking the Ontario Bee-Keepers' Association to join the National in a body.

Mr. Craig—The National has refused assistance in the case of Brock vs. Patterson, although Mr. Patterson is a member.

Mr. Holmes—They refused on the ground that Mr. Patterson's lawyer was not in their employ.

#### WINTER TEMPERATURE FOR BEES.

"Would you expect bees to winter well where the temperature remains constantly at 41 degrees, Fahr.?"

Morley Pettit—I would consider it a perfect cellar if the temperature never varied from 41 degrees, Fahr., provided a chaff cushion or some such top packing is on each hive.

Mr. Byer—My cellar has that temperature, but I feared it was too low.

Mr. Holmes recommends 40 to 42 degrees as the right temperature.

Mr. J. L. Byer then read his paper on

#### MARKET REPORTS.

For different reasons it was with much reluctance I consented to write a short paper on this phase of our business. My chief objection was my lack of experience as compared with a number of my hearers to day, coupled with the fact of certain peculiar and somewhat unpleasant conditions existing the past season; the same, no doubt, that prompted our executive committee to bring this subject before you at this our annual meeting.

From the first it has seemed to me that the term "market reports" was hardly comprehensive enough. "Crop reports," to my mind, is a little more expressive. With this thought in view, I have taken the liberty to use the two phrases, not exactly as synonymous terms, yet in conjunction the one with the other. For the sake of convenience I have divided the subject-matter under two headings—"Market or Crop Reports," as published in the regular market columns of our bee-papers and other papers, and "Market or Crop Reports" appearing from time to time in the news columns of our dailies and other periodicals.

With the first-named part of the subject I believe there are few of our bee-keepers who have much to complain of. As far as I have been able to ascertain, the bee-papers giving us reports of crops and prices of honey, are reasonably correct, and are endeavoring, to the best of their ability, to give the bee-keepers all the information they are able to do

under conditions as they exist to-day. As to our daily and weekly papers, I have never noticed that the general public, or merchants either, for that matter, take much notice of honey quotations in the regular market columns. Sometimes I have received more for my honey than the market quoted, and at other times less. From the "Honey Column" in *Gleanings* for Sept. 15, I copy the following extract of report forwarded to said paper, under date of Sept. '02, by a Toronto firm that handles considerable honey each year: "Extracted honey, white clover, good body, 8c per lb." Some was bought at 9c, even at 10c, but the crop turned out better than was expected, and bee-keepers are willing to take less. It seems a mistake that bee-keepers are all crowding their product on the market at the same time, and what they can not sell they consign to commission houses that always break the price. The facts, as outlined in this report, are so simple as to need no comment from me.

While not aware that any considerable quantity of honey was placed in the hands of commission men so early as Sept. 10, I am, however, quite alive to the fact that it is quite natural for the bee-keepers (especially men of slim pocket-books) to exchange their honey for money just as soon as they can get what they consider a fair remuneration for their product. Let me add that as long as the marketing of the honey crop is conducted in the haphazard manner of to-day, any amount of preaching to the contrary will not prevent the bee-keeper of limited circumstances from converting his honey into hard cash at his earliest opportunity. These remarks might perhaps be applied to the small producers as well, a class, by the way, that has been censured so much in the past that we can well afford to leave them alone in the discussion to-day.

The second division of our subject is, no doubt, by far the most important one for us to take into consideration—perhaps the only part of the question that we are much interested in. For some inexplicable reason anything appearing in the news columns of our papers is at once swallowed as gospel truth by the majority of their readers. This fact has often been the means of prompting people to circulate false items and reports for the sake of the "sensational," for notoriety, individual gain, and other selfish reasons. It may be that some who took the baits held out in our papers the past season, and who are yet smarting from the effects of the baits, will be hoping that a tirade of abuse will be showered on the heads of those "awful fellows"—the wholesale men. While not in sympathy with methods of business as practiced by certain firms, yet I realize, as every fair-minded man must, that this question, like all others, has two sides to it. So, instead of denouncing the "other fellow," my purpose to-day will be rather more to see if we as bee-keepers are not sometimes, to a certain extent, indirectly responsible for reports being circulated adverse to our interests. "Charity begins at home," likewise some other virtues, so I will give an instance in my own experience the past season, which taught me a little lesson.

During the busiest part of the season the editor of one of our local papers paid us a visit in the aptary one afternoon. Being very busy, I forgot to "put a flea in his ear" before he left us, as to any report of his visit he might write up in his paper. The following week I was surprised to find in a quite racy account of his visit with us the statement that we would have *so many tons* of honey this year. While the item was not so much of an exaggeration, yet I felt sure that it would have a bad effect, for, to the average reader, a ton of honey seems like something prodigious. Although I at once interviewed the editor of our other local paper, and asked him not to copy the item in question, this did not prevent local editors in adjoining towns from copying the same. Now, as to results: In a short time letters came to me asking for quotations on honey, coupled with statements like these, "Honey must be a great crop this year," "As you have so much it must be very cheap," etc.

A much more forcible illustration in this line was the notorious statement, published in one of the Toronto dailies, purporting that honey was a great crop in all sections of Ontario, consequently it would be cheaper than for some years; also stating that a certain wholesale firm had had the refusal of a large quantity of extracted honey. To make matters worse, the Associated Press copied the article, which was scattered broadcast over the land, and somehow the authority of the Department of Agriculture became attached to the same. It is only fair to say that the firm in question, after some time, repudiated the statements credited to them. However, that did not prevent a number of bee-keepers from stampeding in the meantime, and selling their honey at a very low figure.

Now, as to the bee-keepers part in causing reports like

this to be sent out, while, as before intimated, not endorsing methods employed by certain firms to find out what the crop of honey, yet the fact remains, that if they are going to do business in a business manner, they must in some way at least have an idea as to the amount of honey in sight. As long as we as bee-keepers do not provide them with better plans for gaining information of the honey crop, we should not be too emphatic in saying just what they should do, or just what they shall not do. I venture to say that if we could have the privilege of perusing some of the letters sent to the wholesale firms by bee-keepers, in answer to the query as to their crop of honey, we would be greatly surprised at the glowing accounts of big yields, etc. We would not wonder that wholesale men sometimes jump at conclusions.

Some time in September of this year, speaking with different wholesale men in Toronto, I was surprised to hear them speak of bee-keepers coming to them and telling of their big crops of honey. One man in particular, who had a fair crop of honey this year, seemed to have visited nearly every firm for the purpose of expanding himself. I did not wonder that when I tried to assure them that there was not a large crop of honey in Ontario this year, they shook their heads in a knowing way, intimating that I had "an ax to grind;" or I would not talk like that.

In conclusion, while having treated this subject only in a superficial way, yet I frankly admit that as conditions are to-day I have no suggestions to offer, other than the very simple ones that will readily occur to the mind of every one without me taking the time to mention them. The only logical solution of the problem of reporting and marketing the honey crop is, that we want to change existing conditions. While prices for honey, as for nearly all other products, must always be largely controlled by the laws of supply and demand, yet this is the case to a greater extent with some things more than others. For instance, many varieties of fruit are of a very perishable nature, and in the event of a large crop there is not time for proper distribution. On the contrary, good honey will keep indefinitely, and even if we have a fair crop no glutting of the markets need take place if it be properly distributed. As it is to-day, a fair crop in one locality will often overload the nearest market, even should there be a comparative failure of the crop in other sections. This will at once bring to our minds the paramount issue before the bee-keepers of to-day—commercial organization. In this age, when the combination spirit is so rampant in the land, that some one has suggested that "ten mills make one trust, ten trusts make one combine," should be added to our tables of weights and measures, I feel that we should be very careful how we move in this direction. I have nothing to offer along this line, indeed, it would be presumption on my part to do so, as we are shortly to listen to a report from a committee appointed to look into this matter. Nevertheless, I feel sure that anything that will better the conditions of the bee-keepers, and at the same time not violate the principles of the Golden Rule, will receive the hearty support of the majority of the members of the Association.

J. L. BYER.

Mr. Craig—This subject was under discussion in the Canadian Bee Journal last season, but no definite conclusion was reached. Mr. Byer's paper has left the matter as we all see it. So far as the journals go, they receive their information from the very best sources. The directors have faithfully given reports, and every member of this Association, and every reader of the Canadian Bee Journal, from the Atlantic to the Pacific, have been kept posted with reference to the condition of the honey crop. The trouble lies with bee-keepers who think to save money by staying out of the Association and not taking the Journal. We have suffered from press reports; we can't control these. The report sent out by the Associated Press last season came from the hands of manipulators. Postal cards were received by the leading bee-men of Ontario, asking the amount of honey they had. Some were foolish enough to reply to these. They had no business to reply. If the house which sent them out wanted honey, and asked for quotations, well and good; but by telling them our business we leave ourselves at the mercy of these men. I can't offer any remedy except a honey exchange.

Mr. Sibbald said that he was a bee-keeper in summer, and wholesaler in winter, so he had a chance to see both sides. He pointed out that a dealer would not buy unless he had an idea of the Province. It is important that some one be ready to buy our honey, and to sell it we must give the dealer some idea of the crop, so he can buy in a way to

make a profit. But bee-keepers do give some funny reports. For instance, one man writes in that he has 255 pounds per colony, and you afterwards find out he has two colonies. Another reports 15,000 pounds of honey, but it turns out that he has 300 colonies. If we had a honey exchange we could get a fair price all around, and dealers would rather deal with a corporation. The market situation here is about like this: For two years the crop was practically a failure. Some who had crops, sold at a fair figure, and the dealers made well on it. This made the dealers keen, and when better years came the bee-men made well, but dealers loaded up too heavily. Next year they are going to be wary; if there are more bees in the Province than ever before, and if a good crop comes, look out for a big drop in the price.

Mr. Couse—Buyers have a right to learn the supply. Sellers want to learn the price. Our honey has to compete with South American honey, Cuban honey, etc., which are shipped to Toronto for manufacturing purposes, and buyers need to be cautious.

Mr. Dickenson—In the British market our honey does not compete with these southern honeys. They are for manufacturing purposes. Ours is solely a table honey. In Liverpool our honey commands twice the price that Jamaica honey does.

Messrs. Couse, Holtermann, Heise, Byer, Sibbald, and others, pointed out that in Toronto our honey is in direct competition with southern honeys. Large quantities are used in manufacturing, and although superior as a table honey it is no better for manufacturing than the others. It is manifest then that so long as Canadian honey is crowded into Toronto its price can not rise above that of the inferior southern kinds.

Mr. Dickenson insisted that we should ship to England, where it is appreciated for table use.

Mr. Evans—Manitoba and the Northwest is a good place to ship. Send it canded in 10-pound pails. These pails are very useful out there. But to save freight it is almost necessary to ship in car-lots.

Mr. Chrysler—Our extracted honey is not all good table honey. It should be graded, and let No. 2 honey compete with outsiders; No. 1 will bring a good price.

Mr. Holmes—What is the opinion of the convention with reference to telling wholesalers how many pounds of honey you have? How would their question compare with my asking how much money they have?

Mr. Evans—Don't report a big crop enthusiastically, nor conceal the fact of a failure.

Mr. Holtermann—The report of the best bee-men is not a fair representation. Let the report be fair, and not inflated.

Mr. Chrysler—Give the yield per colony, and compare with last year's yield.

(Continued next week.)

### Getting Ready for the Next Season.

BY G. M. DOOLITTLE.

BY the time this reaches the readers of the American Bee Journal, their bees will all be in winter quarters, and they doubtless, as many another has done, well be asking themselves what next they can do to be best preparing for another season. All who are truly bee-keepers will not think of idling winter away, waiting for spring to come to see what will turn up with the bees and their business, but will be looking around immediately to see if it is possible to be in better readiness than they were the year before, and especially how they may be gaining more knowledge regarding their pursuit.

I do not think there will be a dissenting voice when I say that the all-important point is a thorough knowledge of apiculture. And if this is so, there is no better time to gain that knowledge than the long winter evenings which are now before us. Get around the back volumes of the American Bee Journal, and other bee papers and books, if you have them, and read them carefully and thoroughly, so as to put what you learn in practice the next season, and thus you will have just what you wish at your "fingers' end" in

the busy part of the season, when you would not have time to ask questions or visit some bee-keeper to find out just what you might wish to know. In this way anyone can always be advancing, instead of retrograding.

Don't be found around the country store or saloon on winter evenings, sitting on dry-goods boxes and barrels, filling the minds of others, or allowing your mind to be filled with idle gossip, and often worse than idle gossip; or spend your time over an old, dingy checker-board, or musty pack of cards, or the billiard table. These things are not in place for an energetic, wide-awake bee-keeper, with plenty of unread bee-literature at hand. "Read, study, think," should be our motto always, and especially at this season of the year. And we will find only fun in these things, if we are interested enough in our business to make a success of it.

Then, during the daytime, we can be getting everything ready that we wish to use during the next season, so it can be put right where we want it at a moment's notice. The first to get ready should be our supers or surplus arrangements, so that we can set the whole on in one day, if necessary, just when the honey-flow begins. Get these around, and scrape off all the propolis adhering to them and the separators, and all bits of comb, should there be any fastened to any part of them. All bits of comb should be saved, and to save them best the wax-extractor should be close at hand, and all waste pieces of comb put into it during the whole season. As often as it is full, get out the wax and have it ready to fill again.

All sections that are partly filled with honey should have the honey extracted from them, unless you will need it to feed in the spring, as this honey will not be likely to correspond in color or quality with that which the bees will put in to finish out the sections the next season. To extract this nicely, fix a shelf close to the ceiling of your room, put the honey thereon and keep the room so warm that the mercury will stand at from 90 degrees to 100 degrees for four or five hours before you commence to take the honey out. By placing the honey near the ceiling we do not need nearly so much fire to heat it as would be required if placed on floor or bench. These partly filled sections, if we tried to extract them without warming, would be all ruined, so far as the combs are concerned, and the apiarist's prospect of a good yield of honey the coming season would be quite badly damaged also; for, according to my value, these are better than money in the bank, and will give a greater interest.

After the honey is extracted, these sections are to be put in the center of each super, as "bait-sections," thus securing an early commencement of work by the bees in the supers, and also so the full sections shall come off at once, which, as a rule, makes the bees loth to enter a second lot. I usually put in from two to eight of these baits, according to the number I have in proportion to the colonies I expect to run for comb honey the next season, when the rest of each super is filled out with empty sections, each having a starter of *thin* foundation in it, or fill the sections with full sheets of foundation, as you prefer. Having the sections all nice and each super filled and all complete, pack all nicely away where they will be kept clean and free from dust till wanted for use.

The next work is to secure the material for further sections, by buying or otherwise, and make it up. To arrive at the number I wish, I allow 150 one-pound sections for each old colony I expect to work for comb honey during the next season, and after 30 years of experience I find this estimate is not far out of the way. Of course, there are many seasons in which I do not use them all, but when we have a season like that of 1901 in this locality, with an average of 180 one-pound sections all complete, we are pleased to have 150 of them all prepared at the beginning of the season. It is well always to be sure to have nearly enough, for it is far better to have some left over unused, than to find ourselves with not half enough when the honey season is in full blast.

Many put off this getting-ready part till spring, so that they may know how their bees winter, but the one who expects to make a successful bee-keeper will not do this; for if the getting-ready part is put off till just before the honey harvest, the result always shows a greater or less loss.

Having the section part all in readiness, we next come to our hives, frames, covers, bottom-boards, etc., all of which should be looked over, repaired or built new, just in accord with the number of colonies we expect to increase to the next season. Then having these all in readiness, we next wire the frames we expect to use brood foundation in, and put the foundation in also, so that this part will be in readiness. Many put off this part, thinking that the bees will not work this "old foundation" after it has been in the

frames for some months, but, rest assured, that the bees will work this foundation just as well when wanted, as they would had it been put in the frames an hour before placing them in the hive. After having the frames thus prepared, place the number you wish to use in each hive, and pack all nicely away.

We are now done, all but the material for any experiments which we may have planned to make, and we can get this out to suit our fancy, and have all in readiness, by which time probably spring will be upon us, and the bees call us to the active duties of the season of 1903.

Now, after any have done as above, who have not been in the habit of doing so before, they will find that they have enjoyed the winter better than ever before, while at the same time they have advanced more in the pursuit of bee-keeping than they ever did in any two years before. If they do not so find, then their experience will be entirely contrary to that of many of our most practical apiarists.

## Selling Basswood Honey to Consumers.

BY A. W. SMITH.

**M**Y object in writing this article is to give my experience, and try to find out if it is the same as the experience of bee-keepers in other parts of the country.

The bee books and papers say, "Develop the home market," and I have followed that advice so that from a market of a few hundred pounds, 20 years ago, I now have a market for from 6,000 to 8,000 pounds per year, and nearly all of it is sold direct to consumers, or to retailers who sell it to consumers, and it will probably average about  $\frac{1}{3}$  comb and  $\frac{2}{3}$  extracted each year.

I can sell raspberry, clover, buckwheat or goldenrod honey, or a mixture of either two or all of them, and my customers will be well satisfied; but when it comes to the basswood honey they will not take it at all, if they can get any other; and a mixture of even ten percent basswood honey with any other kind I get will spoil the flavor of the whole lot. If they have to take basswood honey because I have no other kind for them, they are sure to tell me, when they buy honey of me the next year, that they do not want any more basswood, and they frequently tell me that they gave away what they had, or else say they have most of it on hand, because they did not like it.

Basswood honey is the whitest honey I get, and looks very nice, and would sell well if it even had a fair flavor, but its nice looks are a damage to the honey market, for persons who are not in the habit of buying much honey will buy some of that once, because it looks so nice, and, by the time they have eaten that, they have concluded that their folks "don't like honey, anyhow;" and the chances are ten to one that they will not buy honey again even when they can get the choicest clover or buckwheat.

A large number (perhaps 40 percent) of my customers prefer the buckwheat honey, but if they cannot get that they will take any other kind I happen to have—except the basswood—and be ready to buy again next year.

If a bee-keeper desires to develop a good home market with basswood honey he must have a different quality of basswood honey from that which the bees get in this part of New York State, or else have a different lot of customers than those who buy honey of me year after year.

Perhaps some may think I am too much prejudiced against basswood honey, but I have simply given the facts as I have found them while developing my home market.

## More on the Queen-Rearing Question.

BY DR. E. GALLUP.

**I**T seems that Mr. Alley is getting hot under the collar. He saw his first queen in 1859, while I saw mine in 1835—24 years before.

I received two queens from him which he says were perfect in every way, yet in another place he says that they were reared by a method he now condemns. First, they were small and inferior in size, but the two Mr. Doolittle sent were at least one-third larger than Mr. Alley's, and the shape of the Doolittle queens was much more nearly perfect than Alley's. The shape of the queens has a great deal to

do with my judgment in deciding their good or bad qualities. See my article in a previous number on "The Shape of Queens."

Mr. Alley says, "I do believe that fully 90 percent of all the queens reared are as worthless as so many house-flies."

Now, I am so foolish as to think that is a more sweeping condemnation of all queen-breeders, himself included, than I ever thought of making. No one can place a finger on any article written by me where I have condemned queen-breeders promiscuously. I have only been telling how many of the queens received have turned out, and explaining so that the evil can be remedied.

See page 506 (1902), an article by W. H. Laws, a queen-breeder of experience; and page 596, under the head of "Strong Colonies for Queen-Rearing." See also page 652, a proposition to Mr. Alley by Edward Scroggin. Why not take up with that proposition, Mr. Alley? Are you afraid that but 10 percent of your queens would be good? See page 603 on "Rearing Queens," by R. J. Cary; and also page 493, under the head of "Hand-Shake for Dr. Gallup."

When I said that Messrs. Alley and Doolittle complied with the requirements, etc., I have to acknowledge that I was mistaken. I supposed that Mr. Alley, having had large experience, must know that a pint of bees could not keep up the necessary warmth and amount of food for a perfect queen.

As to his statement that good queens could not be reared in a colony with a laying queen, how was it queens reared before Mr. Alley was born managed to survive? Do, or did, all bees have their queens taken away before starting queen-cells? So far as my experience goes, with one exception where queens were reared by natural swarming, the first cells are sealed before the queen leaves the hive. In natural superseding the egg is laid in the cell, and the queen, when hatched, lives in the same hive with the old one until she dies. We get the best of queens in that way. I have had two instances where both have lived through the winter together.

There is an item in the Pacific Bee Journal, credited to a German journal—Deutsche Bienenzucht—which says that queens reared in natural-swarming time are *always* larger and of greater longevity than queens reared from worker-larvæ. Now, whose theory does that correspond with, Mr. Alley's, or mine? German writers are quoted as being well-informed.

Mr. Alley says the talk about the umbilical cord—"missing link"—is nonsensical, out of place, etc. Well, it must be, if his statements are true, that queens reared in small nuclei containing a pint of bees are equal to any queens ever reared. He affirms; I deny that statement, *positively*. Now, Mr. Alley, it is just as far from my house to yours as it is from your house to mine. Why was, or is, that "missing link" attached to some embryos and not to all? If I examine any number of queen-embryos during swarming or superseding time, and all have that attachment, it must have been placed there for some purpose. Then, if we examine hundreds of cells built in nuclei, or in any ordinary colony that we compel to rear a queen by taking away the old one, and *cannot* find a single embryo with that, something is lacking; Nature makes no mistakes.

I have said heretofore that the embryo, after being sealed up, draws sustenance or nourishment through that tubular cord. This nourishment adds both size and longevity to the queen. Now, the reader will, I hope, understand that in no case in all my observations on bees have I made my conclusions from one sample or specimen, as Mr. Alley accuses me of doing.

In the days of 1859 to 1860, Mr. Alley says there was no "missing link." I venture the assertion that it was always there, with properly-reared queens. I discovered my first one just 43 years ago, and have been looking in vain for one on all nuclei-reared queens every since. But in order to bolster a false theory, he thinks it necessary to deny facts. Falsehood and misrepresentation cannot disprove facts. I wonder how, in the name of common-sense, he could, after dissecting a cell to see whether there was an umbilical cord, have the queen hatched, and assert that she was either perfect or worthless? He is either compelled to ignore the umbilical cord, or abandon the statement that queens are as good reared in nuclei as those reared naturally in strong, populous colonies.

It would be a peculiar coincidence if in rearing queens—10 percent only being good, as he asserts—he did not have two good colonies in his apiary. I said, years ago in the American Bee Journal that all the colonies of an apiary could be bred up to the same approximate standard of excellence. Why does not Mr. Alley do so? Is it to be wondered

at that his patrons do some tall kicking, as he says in his article? It would look to a man up a tree like a sort of lottery business if only 10 percent of the 50,000 queens that he boasts of were good. Mr. S. Q. Conkle, a neighboring bee-keeper, says he received two queens from Mr. Alley of the 90-percent or "fly" class. I have heard of other parties complaining of the same trouble. If he did not have complaints it certainly is to be wondered at, so long as he advocates rearing queens in small hives but with a pint of bees.

I suppose that it is a great comfort to Mr. Alley to build a man of straw and call him "Gallup," so as to show the reader how easily he can knock him down; or to dress Gallup up in bear-skins and try to set the dogs on him. Now, if Mr. Alley does not know that falsehood and misrepresentation is not argument, I do.

I am sorry that I brought Mr. Doolittle into this controversy, but I hope he will survive. Mr. Sutton, a near neighbor, says he had a splendid queen from Mr. Doolittle, and different parties say that they have received splendid queens from him. See my article in a late number on exchanging queens with Dr. Hamlin, and the results, reason why, etc.

Did you know, Mr. Alley, that the one that kicks hardest demonstrates that he is the most guilty? Only think, 90 percent of 50,000 worth as much as so many flies! No wonder you kick. If I were as guilty as that perhaps I might squirm a little myself, who knows?

Conducted by EMMA M. WILSON, Marengo, Ill.

### Honey for a Bad Cough.

The following is from the "Health and Beauty" department of the Chicago Daily News:

"Equal parts of honey, olive-oil and pure home-made wine made from grape-juice or currants, is both soothing and strengthening for a bad cough."

### Cleaning Out Unfinished Sections.

On page 781 (1902) Mr. Bevins gives his plan for cleaning out unfinished sections, and says I may find all the fault I please with it. Now, I am not going to find one word of fault with your plan, Mr. Bevins. It is an ideal plan if you can get your bees to empty out the honey and carry it down. The trouble with the plan with us was that we could not get the bees to do it with any degree of certainty. Occasionally they would do all right, but only occasionally, even with an empty hive-body put on and the sections placed above that, they seemed to think it was all right to let it remain where it was.

I am sure we tried your plan most thoroughly before we gave it up. We wanted a plan we could feel sure that every drop of honey would be emptied out. With the robbing plan you can feel perfectly sure that all will be emptied. With us the other plan was too uncertain.

I wonder why your bees will carry the honey down, and ours are so stubborn about it, for, as you say, it is an advantage to feed where it is needed. I would go farther with your criticism than you did, for I believe the colonies that have plenty of stores get the most of the honey, as they are usually the strongest. As far as feeding colonies is concerned, it is not a very satisfactory way to do, but for getting the sections emptied it is a success.

We would much prefer to use your plan if we could only succeed in getting it to work. So far as I can see, we did exactly as you did, and we even put on the empty hive-body between, but they refused to take it down, and they needed the stores, too. Is there some kink about it, or is this to be laid to locality, too?

I am very glad to know, however, that some one else has had trouble along the same line. Does that sound selfish? Well, you know "misery loves company," and I confess I felt better when I read, on page 811, this from the pen of such a able authority as Mr. Hasty:

"A beginner will say to me: 'Why not leave the sections on the needy colony when you have got them there

once?" To make bees clean up combs placed over them and carry down the honey, is one of the provoking things of apiculture—more frequently failure than success."

### A Temporary Bee-Shed.

Perhaps our bee-keeping sisters would like to know how one of their number built a shelter for her bees. Well, here is the story of that structure, which, by the way, was more useful than beautiful:

Imitating the example of Gail Hamilton, I went out one morning to build—not a barn—but a bee-shed. Like her, I did not know exactly how to build my proposed edifice, but, in her words, I could "keep up a mighty clatter till some one should come that did know," which amounts to the same thing.

In my case the carpenter had disappointed me about coming to make the shed, and while waiting for him the weather had suddenly turned cold. November winds were howling, and, in this extremity, I went out to erect a temporary covering for my bees wherewith to bridge over the time till the carpenter should appear. Briefly, my architecture was as follows:

I put a barrel at each corner of the hive, and as the hive rests upon a bench, I was obliged, in order to make the roof high enough, to lay thick boards from barrel to barrel across the tops. Over all of this was placed a disused door as a roof, while against the open spaces at the sides and back, were leaned pieces of boards. And now, behold with your mind's eye, the completed structure!

To use the words of Ovid, I did not know whether "the workmanship surpassed the material," or, reversing the sentence, whether the material surpassed the workmanship. Doubtless the building would have disgusted a bee on account of not being hexagon in shape, but so far as my own opinion was concerned, the barrels—or columns—even if not of the Doric order, seemed to possess a proudly swelling air, as if to assure me that I would be justified in hanging out my shingle as a carpenter.

However, the shed served its purpose, although its mission was short, for in a few days the weather moderated, and with the first warm rays of the sun came a man laden with nails, hammer, and saw. Soon a bee-shed was made, and soon the hive itself was prepared for winter.

Now I can gaze upon the whole affair with satisfaction, hoping that my bees will go safely through the winter, and that when spring comes again the queen will be able to open parliament under the most happy auspices. Vive la mere abeille!

KATE V. AUSTIN.

Wayne Co., Ind., Dec. 10.

Talk about women not being able to drive a nail! Well, here is a woman that can build a whole building without driving a single nail. How's that?

## The Afterthought.

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### OLD BLACK COMBS AND QUEEN-REARING.

I guess A. C. F. Bartz is right, that old black combs when cut are not built out again with nearly the readiness which the new comb would be. But they build queen-cells on the cut edge just as readily, or at least readily enough for use. Page 761.

### LATE STRAWBERRIES—BEANS, ETC.

Two quarts of fall strawberries for northern Illinois is not only doing pretty well, but it is also one more of the numerous evidences that the earth's weather has been unhinged somewhat for a year or more. I'm foud of lima beans, and take much pains to have plenty. Last year, although the plants grew luxuriantly, there was not a single pod on a great part of them. And some that had pods had no beans in the pods. This year limas bore the most beans I ever knew them to. Sweet potatoes were just the opposite—best I ever had last year, best in yield, and biggest potatoes. This year there was not one that could be fairly called big enough to eat on a patch that looked finely as to

outward appearance—myriads of long, slender roots that never fattened up. When the *fruit* of plants is so variable we need not be surprised that the nectar-flow varies. Page 763.

### SHOCKED SWARMS.

And now, on account of the shock of the shake when the shaking is shocking, Shaker wants 'em called "shocked swarms." A suggestion altogether shocking. I suppose if you then put a shock of corn-fodder around them for winter protection they'll be double-shockers. Page 765.

### LIGHT IN THE BEE-CELLAR.

Yes, why not take a little pains to have the bee-cellar so it can enjoy health-giving light so long as light does no harm? But the fellow with the big "forgettery" might fonder to darken his cellar until after much harm has been done. Page 771.

### AN INDEX TO AN INDEX.

I fear Mr. F. L. Thompson's index would itself have to have an index. Page 772.

### SCISSORS VS. KNIFE IN QUEEN-CLIPPING.

If I am right on the scissors versus knife question, it is not the cutting off of the queen's leg, nor even half of a leg, that is the main thing to be feared; it's a cutting off of a foot, or a part of a foot. Some love their queens so well that they don't want their feet to be in the condition in which men's hands are apt to be in the buzz-saw and shingle-machine regions. This is an old idea, and I was not the starter of it when it did start. I think Mr. Doolittle has spoken of it pretty freely—can't be sure. May have been somebody else whose writing produced the strongest impression on my mind. Somebody (whose suggestion I will warmly second) says, hold a queen's wing in the blades without clipping for a spell, and minutely watch results. Quick as a flash she will put a foot between the blades in the effort to push the scissors away. Finding they cannot be moved she takes it out; but she will probably repeat the effort a great many times. Her movements are so much quicker than yours that seeing the coast to be clear is of no avail. You order your hand to operate at the instant when things are all right; but the fraction of a second that has to pass between the mental order and the hand's execution is just the time when she pushes at the scissors once more and gets a maimed foot. And her master never (that is to say, hardly ever) takes pains to know what he has done—never maimed a queen in his life. The proposition is that *mathematically it can't very well be otherwise* than that a considerable percentage of queens clipped with scissors in the most common styles have a maimed foot—and that Dr. Miller has a lot of them this minute. Hope the brethren will "peel their eyes," and put on big specs, and just honestly see once. As for me, I confess I don't *know*. I only cogitate. Page 771.

## Questions and Answers.

CONDUCTED BY

DR. O. O. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

### Wants to Increase Fast.

I am desirous of increasing my apiary as fast as possible the coming season.

1. Would it be advisable to allow a colony to cast a prime swarm, having it on the old stand, then divide the frames of the old hive into 2-frame nuclei, allowing but one queen-cell to each set of 2 frames?

2. If advisable, how much time should elapse from the casting of the swarm until dividing? I wish to secure as much honey as I can together with increase, and these question are based on the supposition that swarming will occur during May and June.

ILLINOIS.

ANSWERS.—1. There is a sort of discrepancy in your questions. In the first place you say you want to increase as fast as possible, and afterwards that you wish to secure

as much honey as you can together with increase. There is an old saying: "You can't have your cake and eat it, too." If you want to increase as fast as possible you must give up the idea of surplus; and if you want to secure as much honey as you can, you must do little or nothing in the way of increase. Answering your questions specifically, it may be said:

1. The plan you propose will favor a good crop of honey, for it will leave *all* the foragers on the old stand, but it will leave the nuclei rather weak. A little change of program will not interfere seriously with the honey-crop, and will leave your nuclei in better working order. When the colony swarms, leave the old hive on its stand and set the hive with the swarm as close beside the old hive as possible. A week later take away the old hive and use its brood for nuclei, setting the swarm in place of the old hive. The field-bees of the mother colony will to a large extent join the swarm, but so many young bees will have hatched in the old hive that the nuclei will be strong in bees.

2. As already said, the division will be made about a week after the issuing of the swarm. Are you not setting the swarming period rather early for northern Illinois? You are just about as I am, and bees in this locality are more likely to swarm in July than in May.

### Langstroth-Simplicity Hives.

How many Langstroth-Simplicity 8-frame hives are made the same size? The reason I ask this question is, I sent to one firm for hives, and to another for extra supers of the same size and make, but they didn't fit.

WISCONSIN.

ANSWER.—It is an unfortunate circumstance that it sometimes happens that two different concerns use different measurements for things that go by the same name. Generally, however, there is a standard size for things that have a recognized name, and a super professing to fit a Langstroth-Simplicity hive ought to do so, and in case it is by some mistake of the wrong measurement you will probably find that the manufacturer will be ready to rectify the error.

### Queens Getting Through an Excluder.

On page 12, Charles M. Darrow says:

"I will have to call Dr. Miller's attention to the fact that I had a laying queen that crawled through the queen-excluder (a new one) and laid eggs in the extracting-super. She was a good-sized queen at that; of this I am positive."

From that, one would suppose that I had said something understood by Mr. Darrow to teach that such a thing would not happen, and I wish I knew what it was. I should expect a queen to pass up into an extracting-super in any case where the perforations were sufficiently large. The case is different with a section-super. It is a rare thing for a queen to go up and lay in sections that are filled with foundation, even if no excluder is used.

### Cellar-Wintering—Shaken Swarms—Extracting—Amount of Stores for Winter—Large Yields—Catnip or Sweet Clover.

1. I have 40 colonies of bees in the cellar, and the most of them have plenty of honey now. The cellar is under a part of the house where there is no fire. It is rather damp, water standing in it every time it rains much, in the fall or summer, but dry when it is frozen up. Now the point is, how cold will I have to keep it? It has been about 35 or 36 degrees since I put the bees in. My idea is that it would be better to have it 38 or 39 degrees, as it is a damp cellar and liable to mold the combs. What do you think about it?

2. I don't want my bees to swarm naturally next summer. Suppose I take two brood-combs, about May 25 or the first of June, from each colony, with what bees that will stay on them, and put them in an empty hive, then take 6 more brood-combs from each colony, shake all the bees off of them and put them in with the new queen. Don't you think that would be all right for a shaken swarm? By that time the old colony would have 4 combs left in a 10-frame hive.

3. How many stories do you think a colony of bees ought to have to extract from? I extracted from the brood-combs last summer, just having the lower story, and got 80

pounds of white honey. Could I have gotten more if I had on one or two more sets of combs?

4. I have a colony of bees with a super of sections on, partly filled with honey, and the bees are all up in there. Will the bees go down in the lower story when they eat the honey, or will they stay up there and die?

5. A bee-keeper here told me that a colony of bees ate 15 pounds of honey in October, 10 pounds in November, but 5 or 6 pounds would last them until the middle of March. How much does a good colony of bees require each month, from the first of November until the first of May?

6. Do you think it possible to get from 250 to 300 pounds of honey from one colony of bees, in one season? It looks rather big to me.

7. Which do you think is the better to sow around by places for bees, catnip or sweet clover? WISCONSIN.

ANSWERS.—1. I think there would be less mold, and the bees would do better, if you have it warmer, say about 45 degrees.

2. The great trouble with the plan is that you could not have queens of the best character by letting such nuclei do all the work of queen-rearing. Until the young queens are nearly ready to emerge from their cells, it is better to have the cells surrounded by a strong force of bees.

3. With 10-frame hives, one upper story might do if you extract often enough. If you do not extract till the honey harvest is over, then enough stories should from time to time be added so that there would never be any lack of room for storing. From this you will see that the number of stories depends much upon the strength of the colony and the goodness of the season. One story might be enough, and five might be needed. It is quite possible you might have had more honey with more room. If there were no objection against extracting from the brood-combs, a sufficient one would be that there is danger of throwing larvae, and of spoiling the honey by throwing out the pupae of the young bees.

4. That depends. If it should be warm enough, they will move down, providing, of course, that there is honey below. If too cold they will die on the empty sections. You could help matters by moving the hive into a warm room (better at night) and giving them time to make the change, of course fastening the bees in the hive with wire-cloth.

5. There is such a variation as to make it impossible to give an exact answer. The practical point is to know what will be safe. While one colony might use only 10 pounds of honey from the first of November till the first of May, another may use three times as much. It will do no hurt to let the first have 30 pounds, but it would do a lot of hurt to give the second only 10 pounds; so the wise plan is to give too much rather than too little.

6. Oh, yes, there have been greater yields than that.

7. Sweet clover, if the ground is to be trodden down much; I don't know which, if the ground is protected.

### Will the Bees Winter Well?

The year just closing has been the poorest for bees and honey of any year in the past 30, to my knowledge. My bees built up strong and were put in their winter "overcoats" in good shape, and left on the summer stands. I say in *good shape*, but others may differ from me in regard to ventilation, which is only at the entrance, narrowed down to 7 inches long by  $\frac{3}{8}$  inch wide, and 2 inches of sawdust on all sides and top. Have I done right to have the bees winter well? Or should I have gone around and cracked the tops all loose and put something under them to give upward ventilation? I know this has been advised by many old heads, but is this correct? I have my doubts, and think the bees know best, else they would not be so *sticky* in warm weather when they will persist in sticking up every crack and crevice, no difference how warm the weather. And the closer the top of the hive is *stuck up*, the warmer it will be, and the more honey you will get. So? ILLINOIS.

ANSWER.—So far as possible the covers of my hives are all left glued tight. But, then, my bees are wintered in the cellar. If they were wintered outside, I should want something else than a single board over them—either under or over the board—something to keep them warm. The bees are warmer with all glued tight, so long as all keeps dry. But if a lot of moisture from the bees should settle and freeze on the cover, and should then thaw again and come dripping down on the bees, they might be worse off than if the moisture had been allowed to escape.

### BEE-KEEPERS' SUPPLIES

1903 CATALOG READY.—If you have not received a copy annually, send us your name and address, and one will be mailed you FREE.

**SPECIAL OFFERS.**—On all cash orders received before April 1, 1903, we allow a discount of 2 percent.

To parties sending us an order for Supplies amounting to \$10.00 or more, at regular prices, we will make the following low rates on Journals: Cleanings in Bee Culture (semi-monthly) 50c; American Bee Journal (weekly) 70c. List of Agencies mailed on application.

Please mention Bee Journal when writing.

## Dittmer's Foundation!

Retail and Wholesale.

This foundation is made by a process that produces the superior of any. It is the cleanest and purest. It has the brightest color and sweetest odor. It is the most transparent, because it has the thinnest base. It is tough, and clear as crystal, and gives more sheets to the pound than any other make.

**Working wax into Foundation for Cash a Specialty. Beeswax always wanted at highest price.**

Catalog giving FULL LINE OF SUPPLIES with prices and samples, FREE on application.

## The Cyphers Incubator

Self Supplied Moisture

is the one incubator which differs from all others. It is the only machine of this kind which is made on the renowned Cyphers Plan, which embodies the greatest discovery of modern times in the field of successful incubation by artificial means. To know just how much better they are than any others you should get a copy of our new Big Book, "How to Make Money With Poultry and Incubators." It devotes much space to this subject and has chapters on the different profitable branches of poultry keeping, duck growing, broiler raising, egg farming, winter production of winter chickens and roasters, etc., all by the best expert in this country. Photographic views of latest poultry plants from all over the United States, England, Germany, Holland, New Zealand and other foreign countries. Send 10c for book No. 50 to pay postage. 48 page book, 8 1/2 inches, 15 free. Circulars free.

low, upon its receipt, or 30 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

## FROM MANY FIELDS

### The "Charge" of Dr. Gallup.

Just see the Dr. Gallup  
On a wild and ruthless charge,  
To wreck the reputation  
Of the queen-breeders at large.

All methods give us worthless queens,  
Excepting his alone,  
And this the Doctor hurls at us  
In no uncertain tone.

But in a sortie up H. Alley—  
Which proved to be not blind—  
He found it hot on either side,  
And hotter still behind;

And ere he reached the end of it  
He ran against a Root  
Which "Shook" him up in Ernest,  
And barred his way, to boot.

And after all the Doctor's said,  
And all the Doctor's done,  
I doubt if from his favorite plan  
One queen-breeder he has won.

From their years of wide experience  
His charges seem so brittle,  
That to change the course of queen-breeding  
He surely will Doolittle.

And be must think he's bullet-proof,  
Or else he is a "Shriner,"  
To face the great guns of the craft,  
Including Brother Greiner.

Volusia Co., Fla., Dec. 15, 1902.

### Ginseng Growing and Bee-Keeping.

In reply to F. Durant's question on page #12, I would say, as a rule, it takes ginseng seed 18 months to germinate and grow, and when the plant is 5 years old it is at its best stage to dig for market.

I generally stratify the seed for 12 months, and then plant. I get best results in this way. I have been cultivating ginseng for some years. It is easy to cultivate, and goes well with bee-keeping. It takes some time to get started in business, but after once started, by planting the seed every year you can have a nice bed of roots to harvest every year, and at present prices it is quite profitable.

W. G. M. SHAFER,  
Berkeley Co., W. Va., Dec. 18.

### Little Queens—Robber-Bees.

I hatched out seven queens from a mother direct from the Island of Cyprus. One queen was so small but for her form she could scarcely be distinguished from the workers. I removed a black queen from a hive and introduced her. In two weeks she was as large and fine a queen as you would wish to see, and a splendid layer.

For prevention of trouble from robber-bees I always use cheese-cloth (cheapest grade). I cut the pieces so as to fit tight over the front of the hive, and draw it back and tuck on the sides. It gives plenty of ventilation. I use it on top-beds and cold frames. It is cheap, and with care will last many seasons.

O. M. BLANTON,  
Washington Co., Miss.

### A Poor Year for Honey.

I am well pleased with the "Old Reliable" for the year that I have taken it, and think it a very good investment. While the past year has been a poor one for honey, I have learned some new things.

I have 39 colonies on the summer stands, some in good shape and some in poor shape. The bees gathered honey here only the first and second weeks in July to amount to any-

thing, but the prospects are good for a good crop of honey next season, if the winter is not bad on white clover. The fields are well covered with it. S. A. PALMER.  
 Henry Co., Ohio, Dec. 24.

**A Poor Honey-Year.**

We had a poor year here, although the fall was beautiful. No cold weather until to-day. The few bee-men I know say the nights were too cool and dews too heavy for bees to gather much honey. Those who had combs already built, and extracted what was brought in, got a moderate amount. I tried for comb honey, and had no combs built, so got very little.

P. LEMASTER.  
 Spartanburg Co., S. C., Dec. 26.

**Osmosis and Atavism.**

I wish you would get some of your contributors to write an article on Osmosis, and so shut off reference to the "unbiblical cord" in bees. It is a very interesting study, and I should enjoy seeing it followed.

I note Cheshire declines to consider the legs which appear for so short a time on the larva as referable to atavism. Can you tell me what theory is accepted? (See Cheshire, Vol. 1, page 240.)

By the way, I have a very simple plan for amateur introduction of queens which I have found useful. Shall I send you a sketch? GEORGE W. ADAMS.  
 Essex Co., Mass., Dec. 29.

[Perhaps Prof. Cook will help out on the subjects suggested.]

Yes, we will be glad to publish your method of introducing queens.—EDITOR.]

**A Surprising Season—Feeding Bees.**

Last season was one of surprises all through. It began with a fair promise of another drouth equal to the previous year, or even worse; but May 3 we were surprised with the heaviest rain that had visited us for about two years, and the rains kept right along until we once or twice a week all through the season. September 13, Jack Frost surprised about 60 percent of the corn before it was ready for it, and killed what honey-producing flowers remained, cutting off as nice a flow of honey as I ever knew at any time of the year.

I started the season with 21 colonies, very light in stores; I fed them right along until well into June, when they were able to care for themselves. The first two weeks of July they stored about 200 pounds of white clover, partly basswood, in the sections, and did considerable swarming. Then the honey-flow stopped—I supposed for good, on account of the wet weather, but from August 21 to September 10 the bees surprised me by storing a good 1000 pounds of honey in the sections, besides all of them laid in plenty of stores in the brood-chamber for winter. My "round up" for the season is 1200 pounds of honey, and an increase to 32 colonies, all strong in bees, and heavy with winter stores.

I put strength of the colonies to the feeding in the first part of the season, which I did in this way:

I secured a lot of empty fruit-cans, from half a pint to a quart capacity each; filled them with granulated-sugar syrup, placed a thick cloth over the top, and a small piece of board over that, then turned the whole bottom up on boards laid over the rails on the opposite side of my shop from the apiary, so the bees could fly over or around the shop to get at the feed. There being no other bees kept nearer than two miles as the bee flies, I had no trouble with neighbors' bees, and, I will add, not a single case of robbing, as I have had when trying to feed inside the hive; and not a colony injured by wax-worms this season.

While this method of feeding is not "according to the books," it has proven very successful, and perfectly satisfactory with me. I made the syrup quite thin, so the bees could suck it out through a cloth. Of course, I removed the cans on days when the weather was not suitable for the bees to fly. Besides looking after my bees, I have made

it my business to chase up the hens, about 125 of them, and have gathered and sold eggs to the amount of \$83.76, besides what were used in the family, and raised chickens.

I was greatly shocked and pained to learn of the tragic death of Dr. A. B. Mason. Of course, I knew him only in bee-literature, and as a lover of bees, and respected him as such, as I am inclined to feel toward all men—and women, too—engaged in that business.

A. F. FOOTER.

Mitchell Co., Iowa, Dec. 15.

**Growing Ginseng.**

In reply to F. Durant, on page 812, I will say: It takes ginseng seed 18 months to germinate. For instance, seeds gathered and planted in the autumn of 1902 will not come up until the spring of 1904. The roots will reach their best size in six years from seed, when they should be taken up and dried. Young plants begin to bear seed when two years old. C. W. BRADISH.

Lewis Co., N. Y., Dec. 23.

**Lost in Winter and Spring.**

There was a general loss of bees last winter and spring, with nearly every one that had bees. I lost all my colonies but one, and it was very weak; I got no surplus honey from it until in the fall. Nearly all others were in the same way. Cold winter and late spring were the cause of loss and failure; the bees are in better shape for winter now than they were a year ago. We hope they will do better next year than they have for two years past.

H. M. SHERPEY.

Washington Co., Tenn., Dec. 29.

**A Report from Washington.**

I started last spring with 7 colonies, which were on the place I bought. I paid \$2.00 a colony. I took hold of them June 1, and to my surprise I found them in very poor condition—they had apparently had very poor attention, combs built in every which way, and too late in the season to straighten them, so I concluded to let them alone until next spring, when I shall try to put them in proper shape.

I have the black bee, or nearly so, but will improve the stock just as soon as I can. I increased to 14 colonies, and, as near as I can tell, they are all in good condition, with plenty of stores to winter. Bees are wintered on the summer stands here, without any protection, with only a little chaff on top to keep them dry. My bees have been flying almost every day up to this time.

Judging from what my bees did the past summer, and from what I can learn of those that have kept bees here in the past, I would call this a fairly good bee-country.

Two of my colonies proved to be of no account, or at least did not store any surplus. So from 5 colonies, spring count, I received over 500 well-filled sections of nice, white honey, as nice as I had when keeping bees in Chicago. I can sell it right here in town at 12½ cents a piece or section.

Our principal honey-plants are alfalfa and sweet clover. Our honey season here is a trifle longer than in Chicago. We get our surplus from June 10 to the middle of August.

I shall try to increase from year to year, and if I find the business profitable I may devote all my time to bees in a few years.

I certainly love to be around bees. It makes my heart glad to hear their hum. I do wish you could be with me about the middle of April, when my 10-acre apple-orchard is in full bloom—everything white with blossoms; it is a sight to behold, and to hear the "Hum of the bees in the apple-tree bloom," a regular bee-paradise.

I enjoy the old American Bee Journal as much as ever, and would not like to be without it; if anything, I read it with greater interest since I am out here than I ever did before.

WM. MILLER.

Yakima Co., Wash., Dec. 9.

[Mr. Miller lived in Chicago until last spring, when he removed to Washington. He was one of our intimate neighbors, and was

very successful with bees. In fact, we do not recall any one else who was such a successful beginner as was Mr. Miller. We wish him and his delightful family all kinds of good luck in their new and far-away home.—E.H.]

**1-lb Keystone ... Honey-Jars**

These are clear flint glass jars holding just one pound, and the shape of a keystone. They are 7½ inches high, and very pretty when filled with honey. The corks can be sunk a trifle below the top, and then fill in with beeswax, sealing-wax or paraffin. We can furnish them in single gross lots, with corks, f.o.b. Chicago, at \$3.50; two gross, \$3.25 per gross; or five or more gross, at \$3.00 a gross. These are the cheapest glass one-pound jars we know anything about. We have only a few gross of them left. So speak quick if you want them. Address,

**GEORGE W. YORK & CO.**

144 & 146 Erie St., - CHICAGO, ILL.

The Iowa Round Incubator.—When the Iowa Round Incubator was first introduced there was considerable discussion concerning the radical departure it made in incubator construction. Incubators had been made square so long that people were inclined to think that was the proper way to build them. Then the proprietors invented the catch-line, "No cold corners," and at once thinking people began to understand the advantage of an incubator in which the temperature could be kept exactly at the same degree in all parts of the egg-chamber.

While the principle was always right, and the Iowa has been a success from the very first, a constant effort has been made to improve the construction of them. The heating apparatus, the regulator, the ventilation were all perfected, but it was felt that the liability of wood to shrink, swell, warp, crack and split left something to be desired in the way of material from which to construct the case

or body of the machine. Metal would not do, for it expands and contracts under varying temperatures, and corrodes under all circumstances. Finally "trunk board," a fiber board used for making trunks that cannot be smashed, was hit upon. This trunk board is capable of being bent so as to make the case of the Iowa Round Incubator one solid piece except where the ends are joined together. Trunk board does not shrink, swell, warp or crack, and it cannot be split even with an ax. It is water and air proof and yet light and strong. No material ever invented is so perfectly adapted to the use to which it is put as this trunk board for the Iowa Round Incubator.

They have just published a little book telling all about their incubators and brooders, which contains much valuable and interesting information. This book together with other printed matter, will be gladly sent to any of our readers who will ask them for it and mention this paper. All requests should be addressed to Iowa Incubator Co., Box 198, Des Moines, Iowa.

**HONEY AND BEESWAX MARKET QUOTATIONS.**

CHICAGO, Jan 9.—The demand is not more than usual; hence stocks are sufficient, especially as Cuba has now comb honey on this market. This is a new source of supply, and is a factor that must be reckoned with, as it obviates the necessity of laying in a stock during the summer and autumn to draw from in the winter and spring months. The best grades of white, 14c; buckwheat, 13½c. Extracted, white, 76½c; dark and buckwheat, 76½c; darker grades, 10c. Extracted, 76c for white, and 67c for ambers. Beeswax steady at 30c.  
R. A. BURNETT & Co.

ALBANY, N. Y., Jan. 7.—Honey demand and receipts light. We quote white comb, 15 cents; mixed, 14c; buckwheat, 13½c. Extracted, white, 76½c; dark and buckwheat, 76½c. More demand for buckwheat than any other here.  
H. R. WRIGHT.

BOSTON, Oct. 20.—Our honey market remains firm, with good demand and fair stocks on hand. Honey is not coming forward as fast as usual, and the tendency of prices is steady. We quote our market as follows: Fancy white, 1-pound sections in cartons, 16c; No. 1, 15c; No. 2, very light supply, 14c; glass-front sections generally one cent less than this. Extracted, light amber, 8c; amber, 7½c.  
BLAKE, SCOTT & LEE.

KANSAS CITY, Dec. 20.—Market steady at quotations. We quote fancy white comb, per case, 24 sections, \$3.50; No. 1 at \$3.40; No. 2 white and amber, \$3.25. Extracted, white, per pound, 76½c; amber, 66½c. Beeswax, 27½c. C. C. CLEMONS & Co.

CINCINNATI, Jan 7.—The demand for all kinds of honey has fallen off considerably in the last few weeks, owing to the many other sweets offered at this season of the year. Lower prices are no inducement to increase the consumption, as the demand is not there, and we will not be anxious at the end of the month; consequently it is fully to offer at lower prices. We quote amber extracted in barrels at 5½¢/6¢; white clover and basswood, 8¢/9¢. Fancy white comb honey, 16¢/17¢; lower grades half to sell at any price. Beeswax firm at 29¢/30c.  
THE FRED W. MUTH Co.

NEW YORK, Dec. 23.—The market on comb honey is dull and inactive. While the supply is not large the demand has fallen off to a large extent and prices show a weakening tendency. We quote fancy white at 15c; No. 1 at 14c; No. 2, 13c; and buckwheat at from 10¢/12c. Extracted is in fairly good demand; white, 74c; light amber, 64¢/7c; dark, 56¢/6c. Beeswax firm at from 28¢/29c. HILDRETH & SROEKEN.

CINCINNATI, Jan. 3.—The comb honey market is a little quiet, almost every-body being filled up. As there is hardly any new supply in, there is no change in prices, viz.: Fancy water-white, 16c; of grades less. The market for extracted white clover shows a slight advance. Fancy water-white, 16c; strictly fair, 15c; fair, 14c; and buckwheat, 14c/15c; amber, in barrels, 5½¢/5c. Beeswax, 27½c.  
C. H. W. WEBER.

SAN FRANCISCO, Dec. 17.—White comb honey, 1½¢/1½¢; light amber, 10¢/11c; dark, 5¢/6c. Extracted, white, 6¢/6½c; light amber, 5¢/5½c; amber, 4¢/4½c. Beeswax, 26c. Strictly fancy light, 26¢/27c.

The bulk of California produced honey is sold for Eastern shipment in carload lots from producing points at bottom price. Small lots of choice honey that can be used in local trade bring more. Quotations here given are current prices for product, l.o.b. shipping point, on Eastern Shipment for extracted and California basis delivery point subject to agreement for comb.

**Tip-Top Glass Honey-Jars**

The picture shown herewith represents the best one-pound jar for honey that we know of. It is made of the clearest flint glass, and when filled with honey, and a neat label attached, it makes as handsome a package as can be imagined. Its glass top sets on a flat rubber ring, and is held in place by a flat steel spring across the top as shown in the picture. It is practically air-tight, thus permitting no leak,

which is an important thing with honey-sellers. We can furnish these jars, f.o.b. Chicago, at these prices: One gross, \$5.00; two gross, \$4.7 a gross; five or more gross \$4.50 per gross. If you try them once you will likely use no other kind of top or sealing arrangement for honey jars.

Langstroth on the Honey-Bee—Revised, The classic in Bee-Culture—Price, \$1.20, by mail.

BEESWAX WANTED DADANT & SON, Hamilton, Hancock Co., Ill at all times.

We Beg to Announce the

1903 Edition of the "A B C of Bee-Culture."

85th Thousand.

This is a book of over 500 pages, like some of the previous editions, has been brought clear up to the times. Even brushed and "shooked" swarms are mentioned and described under the head of "Swarming." The latest methods of bottling honey are given under the head of "Extracted Honey." A new list of honey-plants, especially those found in the South and far West, particularly those that are big vendors of honey, have been incorporated, and many new engravings have been inserted here and there.

If there is any particular feature in which this edition is different from all others, it is in the fact that it is written to conform to nearly every locality in the United States. When the book was put out in 1878, the instructions were intended more particularly for those who lived in the North Central States. But the several trips of the reviewer over various portions of the United States from time to time have led to some modifications here and there—particularly details of management. The subject of Swarming, for instance, has been modified to fit the conditions as they exist in Texas, California, and the far West, as well as the Eastern and Central States of the North. Several new articles have been inserted. Among them is one on Locality. This chapter goes into detail showing how one State or Province differs from another; and how methods of management must be varied to fit special conditions.

The subject of Wax-Presses has been thoroughly overhauled, showing rendering and pressing in open air, in hot water, and in steam.

In the matter of Wintering, again special instructions are given for the Southern and Western bee-keeper where wintering protection is not necessary, but where there is danger of starvation.

The biographical department has been largely revised, and new subjects have been added to take in some of those bee-keepers who have lately risen to prominence in the bee-keeping world.

The picture gallery, while it has some of the old well-known views, has a number of new ones, particularly some in the West and South.

As usual the book has been enlarged, and, altogether, we are putting out for 1903 an edition that is new from cover to cover, or is as nearly such as it could be if it were written during the latter part of 1902, word for word, paragraph for paragraph throughout the entire book. The fact that it has been kept standing in type during all these years has made it possible to make changes anywhere at any time when necessary.

Price, in cloth, by mail \$1.20; or clubbed with Gleanings in Bee-Culture one year, both post-paid, \$1.75.

43d Year.

CHICAGO, ILL., JAN. 22, 1903.

No. 4.

WEEKLY

HIVING A SWARM.

APIARY OF J. A. WATKINS, OF LATAH CO., IDAHO.

PUBLISHED WEEKLY BY

**GEORGE W. YORK & COMPANY**

144 & 146 E. Erie St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

EDITOR,

**GEORGE W. YORK.**

DEPT. EDITORS,

DR. C. C. MILLER, E. E. HASTY, EMMA M. WILSON

**IMPORTANT NOTICES.**

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec31" on your label shows that it is paid to the end of December, 1903.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

Advertising Rates will be given upon application.

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelities," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

**GEORGE W. YORK & CO.**

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

## An Italian Queen Free

— IN MAY, 1903 —

To Regular Paid-in-Advance Subscribers Only.

We wish to make a liberal offer to those of our regular readers whose subscriptions are paid in advance. It is this: We will send you FREE by mail, in May, 1903, an Untested Italian Queen for sending us \$1.00 and the name and address of a NEW subscriber to the American Bee Journal for a year. This is indeed a big premium, as the queen alone would cost you 75c.

We are booking orders for Queens now for next May delivery. Will you have one or more? This offer ought to bring in many orders. Our queens are reared by the best queen-breeders, and give satisfaction.

Address,

**George W. York & Co., 144 East Erie St., Chicago, Ill.**

# AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., JAN. 22, 1903.

No. 4.

## \* Editorial. \*

The Pure-Food Bill has passed the National House of Representatives by a vote of 72 to 21. It prohibits the introduction into any State or Territory of any article of food or drug which is adulterated or misbranded. Having gone through the House with so little opposition, it ought to go through the Senate with a whoop; but just by way of making a sure thing doubly sure, it would be a good thing for each bee-keeper to sit him down as soon as he reads this, and compose a short epistle to his Senator, urging the passage of the bill.

**Bees Working in a Tent.**—In the American Agriculturist we are told that Mr. Bunce tried growing cucumbers in a tent, and not a cucumber set until the doors of the tent were opened to allow the entrance of bees, and then some grew large enough for small pickles. It says further:

"The presence of bees in a tent is considered by Mr. Bunce indispensable to success. He thinks if the doors of the tent were left open in the middle of the day, bees would come in. When asked if other and unwelcome insects would not also enter, he replied that the moth producing the tobacco-worm flies only at night. He says *strawberries have been grown under cloth on Long Island with brilliant success, the fruit maturing two weeks earlier than in the open.* But bees must be allowed free entrance."

**Southern Honey.**—Some of the bee-keepers in the South object in vigorous terms to having their product called "southern" honey. And why not call it so? Is not all honey produced in the South "southern honey?" And yet it sometimes happens that a thing that looks all right on the face of it may be all wrong. If the term "southern" honey has come to mean honey of a decidedly inferior character, one can hardly wonder that a man who produces what he knows to be honey of a superior character, even though it be produced in the South, should object to having applied to it a term that labels it of inferior quality.

Editor Hill, in sending himself a Southerner, voices the sentiment of up-to-date Southern bee-keepers, by saying among other things:

"It is doubtless a fact that the South puts upon the market a larger percentage of low-grade honey than any other section of the country. The unprogressiveness of many sections of the South is well known. The product of the 'bee-keeping' element in such localities, as well as that of other branches, is

necessarily inferior; but this is no reason why the up-to-date producers of the South should have to suffer the stigma, which belongs, obviously, to a product which he has not been guilty of placing upon the market."

And this time he is right.

**Butter and Honey.**—"Honey," says the American Bee-keeper, "is frequently recommended as a substitute for butter, to spread on bread; but no one appears to have observed the fact that butter and honey constitute a combination that's not at all disagreeable to take."

Yes, that's a combination not to be despised, one that was held in high esteem centuries ago. Said an ancient writer (Isaiah), "Butter and honey shall he eat, when he knoweth to refuse the evil, and choose the good."

**General Manager's Explanation.**—On page 20 is an editorial on "The Election of the National," in which we called attention to several errors and irregularities, besides giving a letter from Mr. N. E. France, who also asked that a new ballot be taken. The reasons why a new ballot was called for were stated.

We have now received the following letter from Mr. Secor to President Hutchinson, the latter saying, "I think, in justice to him [Secor], it ought to be published:"

FOREST CITY, IOWA, Jan. 5, 1903.  
W. Z. HUTCHINSON, Pres. Nat'l B.-K. Ass'n.  
My Dear Sir:—I have your recent letter in which you state that there is some dissatisfaction among some of the members of the Association in regard to the form of the ballot recently sent out, and because there were no constitutional amendments submitted.

I am sure that any fair-minded member, when he learns the facts in the case, will exonerate the General Manager from blame in both cases.

The reason why Mr. France's name was mentioned on the voting blank was that he was the *only person* nominated in a proper manner. His name had been regularly presented to the Chairman of the Board, and seconded by at least half a dozen members. It, therefore, came to me officially, and I was obliged to notice it.

It may be said that other names were mentioned through the bee-journals. Granted. I now think I remember one person who nominated *five or four members for the same office* in this manner. By what constitutional provision is the Board of Directors, or the General Manager, required to take cognizance of every suggestion that every person may write to periodicals published in the United States? Why were not these nominations made to the proper officials of the Association? If these matters are brought to me officially I can not take the responsibility of indorsing them.

Now, as to the constitutional amendments offered at the Denver convention. How could I submit so important a matter as that to a vote without a word from the Secretary?

In fact, I never saw a copy of them until after the voting blanks had been sent out, and then only a stenographer's report of them.

Dr. Mason wrote me, just before his death, that he had no copy of the proposed amendments; that they had never been turned over to him. If the Secretary of the Association could not certify what the proposed amendments were, how could I be expected to take the responsibility of interpreting them? I said before, and now repeat, that I did not see even a purported copy of the amendments till after the voting blanks had been printed and mailed.

If we do not wish to be governed by constitutional authority why have a constitution? If we do not practice business methods, and follow parliamentary usages, our Association is but a rope of sand, and not worth saving.

I hope soon to turn over to my successor the records and funds of the largest and most prosperous bee-keepers' association in the world; and if we will stop our quibbling about unimportant matters, and put our shoulders to the wheel in the spirit of fraternal helpfulness, the future of the Association will be brighter than ever; but if factionalism and love of office prevail, it will be rent in twain and die a premature death.

Sincerely yours,  
EUGENE SECOR, Gen. Man.

There are several points in Mr. Secor's letter of explanation which we would like to touch on in full, but we must be brief.

In the first place, we contend that Mr. France's name should have been omitted from the ballot, for it was not necessary that any one be nominated at all, nor necessary to print names of nominees on the ballot. Why, a person not previously nominated might have been elected, so the nomination cuts no figure whatever. We can not account for the naming of Mr. France in any other manner, than that some one thought it would be an excellent way to defeat Mr. Abbott, whom the majority of the Board of Directors did elect General Manager last summer.

As to the omission of the amendments from the ballot, Mr. Secor's excuse is rather weak, for he says Dr. Mason wrote him, before he died, about the amendments. It seems to us that a General Manager knowing there were amendments to be presented on the ballot would make at least a little effort to get them. Dr. Mason died the forepart of November, and we did not get our ballot until Dec. 20—surely ample time to find a copy of the amendments if they were really wanted for voting purposes.

We have reason to believe that the intention was not to present the amendments at all, as they were not favored by some in authority. It was the Secretary's duty to get a copy of the amendments before the Denver convention closed, and see that they were forwarded to the General Manager in time for balloting. The General Manager, knowing there were amendments to be voted on, should

have insisted on having a copy of them to mail with the ballot to the members, as provided by the constitution.

We may say further, that we think it will hardly pay any officer to be so red-tape as Mr. Secor's letter indicates he was; surely, it will not tend to inspire confidence in the Association to follow such a precedent. Also, we think it shows poor taste for Mr. Secor to intimate that the "love of office" is inspiring the opposers to unfair methods, who insist that common-sense and ordinary business practice shall be used in the management of the National Association, when Mr. Secor himself has been in the office of General Manager as many years as he has.

**No-Drip Cases Without Paper.**—Dr. W. O. Eastwood, finding it troublesome to use paper in shipping-cases, poured in melted paraffine, running it clear around the bottom and then pouring it out. That required only a small quantity, and left the shipping-case with no more chance for leaking than if it contained the paper.

Although this plan must have its limitations (for it can hardly be used with 24-section cases having the bottoms in two parts), it is well worth trying by those who are not expert at using the paper in 12-section cases. It will probably be necessary to nail the bottom at the middle to the back and to the front strip, otherwise the weight of the sections might spring down the bottom and break apart the paraffined joint. If the plan is a success, it will no doubt be found easier for the inexperienced than to use the paper.

Of course, the no-drip strips must not be omitted.

## Weekly Budget.

MR. C. H. PIERCE, of Columbia Co., Wis., called on us last week. He expects a good season with the bees this year. His are wintering well.

MR. N. E. FRANCE has been talking on fruit and bees at the farmers' institutes in Wisconsin this winter. He knows how on both subjects.

**CALIFORNIA BEE-KEEPERS TO ORGANIZE.**—We have received the following which will be of interest to California bee-keepers particularly:

**TO THE BEE-KEEPERS OF CALIFORNIA.**—At the recent session of the State Bee-keepers' Association, held in this city, the subject of co-operation for the disposal of our product was again presented, and forcibly emphasized by F. E. Brown, the successful manager of the Central California Association.

The necessity of such a movement seems evident to all, but the question of method has been the one great difficulty to overcome. George L. Emerson, the enterprising Orange County producer, presented a plan that met the hearty approval of those present, resulting in the appointment of the following committee to consider and devise a plan of organization: F. E. Brown, George W. Brodbeck, L. S. Emerson, M. H. Mendleson, L. E. Mercer, and J. F. McIntyre. The committee, not being able to complete its task before the adjournment of the State Association, take

this method of presenting it to the bee-keepers at large.

The approaching season, the necessity of prompt and decisive action, have resulted in the committee taking steps to incorporate the California National Honey-Producers' Association. The principal place of business will be Los Angeles; capital stock \$25,000, divided into 500,000 shares, value 5 cents—each share to represent one colony of bees, thus confining this organization entirely to bee-keepers. Sufficient stock has been subscribed to inaugurate this movement, and insure its undoubted success. With the object of enlisting the interest of all bee-keepers, and for them to learn the details of this project, a meeting has been called to be held at the Chamber of Commerce, in Los Angeles, Jan. 20, at 9:30 a.m.

We further desire to call attention to a few reasons why bee-keepers should combine:—

First of all, "In union there is strength." By joining together, freight-rates, supplies, and other expenses, are reduced to a minimum.

By marking and sealing our honey we guarantee its purity, thus preventing the possibility of adulteration. The guarantee of purity will increase the demand.

The establishment of uniform prices and grades will prevent individual competition and the consequent depression in prices.

The combination of the small producer with the large one gives strength to the former and removes him from the clutches of the speculator.

The entire management will be in the hands of bee-keepers, with no other interests involved, assuring equal benefits to all. Facilities for storage will be provided. All honey will be graded and sealed by an official grader.

Members will be permitted to retail in less than car-load lots. Advances will also be made on consignments, if desired.

The above are a few of the details which we present for your consideration, and urge your attendance at the meeting called.

GEO. W. BRODBECK, *Cor. Sec.*

We hope this new organization will prove to be what California honey-producers need in order to control the marketing of their product, so that it may be disposed of in a way that will bring good returns to its members. They have a large contract on their hands, but it is well worth pushing to completion, as we believe it will prove a success when once gotten in working order.

**YOUR NAME AND ADDRESS.**—We take the following from *Gleanings in Bee-Culture*, and only wish that it might be read by every person in the world, or at least by all who expect to do any business with others. The experience of The A. I. Root Co., as described in these paragraphs, does not differ from the experience of every other firm:

Every man and woman, and, that matter, every child, should be urged very early to adopt some particular way of signing his name and address. Yes, as soon as a child can write his name he should be urged to adopt some particular form. If he decides to use only initials, let him always stamp in the same way. If his name is Smith, in view of the great number of Smiths, he would better spell out in full his first or second name; but, having once decided (perhaps by the aid of his friends) just how he is going to make his signature, let him stick to it. And he should also encourage him to have a rubber stamp put on his stationery, so that all can know in plain and unmistakable letters just what he is called, and how he is addressed. Married women especially should heed the above. It is a woman's privilege to write her name Mrs. John Smith or Mrs. Susan Smith; but she should be urged to do always one or the other. A few days ago "Mrs. John Smith" complained that she sent us some money, and we did not give her credit. After much fuss and bother our book-keeper found she signed her name Mrs. Susan Smith, and wrote from

a different postoffice from what she had ever written before, and, therefore, the book-keepers were obliged to open an account with Mrs. Susan Smith at another postoffice, and hadn't one of the employees happened to remember some honey being placed on the book where no account could be found, I do not know what would have been done.

The better way, by all means, is to have your correct name and address printed on envelopes or writing-paper, one or the other of the above methods being used. But if this is too much trouble, then get a rubber stamp, and stamp everything you send out, not only to save this great, busy world time and money, but to save yourself annoyance and disappointment. Lots of people make haste to call great business firms dishonest, just because these people themselves have not got enough life and push to avoid the trouble of blundering addresses, as I have indicated in the above. If you can not scrape up enough energy to let folks know who you are, and where you live, in black and white, you ought to have been born a century or two ago, when it did not matter so very much whether the outside world knew whether you were alive and kicking or not.

REV. L. L. LANGSTROTH A PRESBYTERIAN.  
—It seems from the following that through an oversight, or lapse in memory, we made an error in reference to Father Langstroth:

MR. EDITOR:—In that delightfully gotten-up periodical, *Class Advertising*, an article appeared which was written by the Editor of the *American Bee Journal*, all of which I can indorse except the statement that the movable-frame hive was invented by Rev. L. L. Langstroth, "a Congregational clergyman." Father Langstroth would be neither a better nor a worse man for being a Presbyterian rather than a Congregationalist, but it is just as well to be accurate in regard to religious principles to one who played so prominent a part.

When 26 years old Father Langstroth was, for two years, pastor of the Second Congregational Church in Andover, Mass., but many years ago he became a Presbyterian. When preparing for Root's "A B C of Bee-Culture" a biographical sketch of Father Langstroth, I desired to be entirely correct. I wrote to him, and in reply he said, under date of March 26, 1888:

"I am now a minister in the Presbyterian church. Although not a settled pastor, I preach occasionally, and delight in nothing so much as the Christian work. My parents were members of the First Baptist church, the mother Presbyterian church in the United States."

I have good reason to believe that he continued in the same connection during the remainder of his life. Last summer, when giving a talk before the Winona Assembly, I spoke of Father Langstroth as a Presbyterian clergyman. Inward, one of my auditors made the correction that Mr. Langstroth was a Congregationalist. The pastor of the Presbyterian church at Dayton, Ohio, who happened to be present, replied, "Mr. Langstroth was a member of our presbytery, and it was while preaching in my pulpit that he fell dead."

C. C. MILLER.

Of course, it is always best to be exactly correct in all statements, but, really, isn't there just about as much difference between a good Congregationalist and a good Presbyterian as there is between tweddledum and tweddledee? We would think just as much of Dr. Miller if he were a Methodist instead of being a Presbyterian! But, after all, it is not the particular denomination that a man belongs to, but his Christian living that counts, not only in the present time, but in the Eternity beyond, if the Good Book be true.

However, we want to thank Dr. Miller for calling our attention to Father Langstroth's Presbyterianism. We will try to be more careful the next time we have occasion to refer to it.

## Convention Proceedings.

### Report of the Ontario Bee-Keepers' Convention, Held at Barre, Ont., Canada, Dec. 16, 17 and 18, 1902.

REPORTED BY MORLEY PETTIT.

(Continued from page 39.)

#### UNITING LATE SWARMS.

"How and when would you unite late swarms?"

In August and September. Set one on top of the other. Mr. McEvoy—Unite them in the evening. Get the bees to fill themselves, then shake the bees of one hive down on the entrance of the other, and let them run in. Smoke them well.

Mr. Heise—Remove from each hive all the frames not occupied by bees. Lift the remainder with the bees on them out of one hive into the other, and the deed is done.

#### BEST WAY TO FEED LIGHT COLONIES.

"What is the best way to feed colonies put away too light, no combs of honey being available?"

Feed them cakes of candy put over the frames. This does not disturb them much, and by absorbing the moisture the candy gradually liquefies and also adds to the dryness of the bees.

Mr. Evans told of a man who bored a hole in the top of a box-hive which he had in the cellar, poured in a little feed every few days, and the bees wintered well. He did not recommend this method as one to be generally adopted, however. Mr. Holtermann would feed two or three pounds at one feed, then run the chances on saving them by feeding the first thing after they come out of the cellar. A shallow pan shoved in under the combs on the bottom-board is used in Germany for this purpose.

Mr. Armstrong—I have fed bees syrup every month in the year except February and March. I use a feeder in a super on top of the hive.

Mr. McEvoy—This would be all right for strong colonies, but no good for weak ones.

#### EVENING SESSION.

The following paper was written and read by W. J. Brown:

##### WHY I AM A BEE-KEEPER.

This may be considered a very simple subject indeed. I often thought that something outside of the ordinary worn-out subjects of spring management, summer management, the best method to produce comb honey, extracted honey, etc., at our annual reunions was necessary in order to make them a little more interesting. But I hesitated for a time, then after seeing a synopsis of the program for this meeting in the October number of the Canadian Bee Journal, and seeing your humble servant was down for a paper, and that, about the first paper on the list, and without any subject assigned me, I scratched my head for a time, not knowing whether your executive committee was only having a little fun with me on account of my Hibernian strain or not; and I finally concluded that in all probability that was the case, particularly so when they selected that clever young Dutchman over there to knock me down faster than any two of you could pick me up.

My first impulse was to present you with something a little more out of the ordinary than even the one which I have adopted; but remembering that some one, a few years ago, brought in some subjects that received pretty hard knocks because those subjects did not treat directly on bee-lore, I concluded that such ground would not be safe for me to tread upon, and so I decided to tell you why I am a bee-keeper.

First, because of a natural fondness for honey—a fondness that never relinquished its hold, and I never expect that it will. Well do I remember when I was a "kid," how I used to rummage the wild bumble-bees' nests; even to get one drop of sweet nectar made my heart glad.

As manhood advanced, so also my ideas; so then to my joy a box-hive of bees I bought.

My second reason for being a bee-keeper was that my

instinct of nature led me on to search, and, if possible, find out the mystery of the mysteries connected with the honey-bee in those primitive days—at least primitive they were to me, as I had not the opportunity of studying standard works on the honey-bee, and bee-papers galore, as you, fellow bee-keepers, have to-day. Yet every moment and every hour of my time that I could possibly spare from other pursuits was taken advantage of in the study of my little workers, and thus add to my joy and knowledge.

My third reason for being a bee-keeper was the great pleasure of having honey (Nature's sweet) on my table three times a day the whole year round, and at being able to treat my friends and neighbors to a feed of honey when they come in; and at hearing the hum of the honey-bee in the apple-tree, the clover field, and elsewhere.

My fourth reason for being a bee-keeper was the financial side of the question, as I had an idea for a long time that there was more money in bee-keeping than in any other line of business on the face of this broad earth. But while my taste for honey is as keen to-day as ever, and my appetite for research in the mysteries of the honey-bee is as ravenous as it was a quarter of a century ago—and there is little even yet that affords me more pleasure than to be able to treat my friends and neighbors to a little honey, and to hear the merry hum of those dear little honey-bees, when they are in the clover and buckwheat fields—I must say I am slightly disappointed in my fourth reason for being a bee-keeper, viz.: the financial side of the question. True, with proper care and management on the part of the manipulator there is money in bee-keeping, but for the one who has made a pile out of it a dozen have made a failure. For my individual part, I have nothing to complain about, in having taken it up as a pursuit, as I like the honey, I like the bee, I like to work among them, and I like to see the dollars come in as the result of my being a bee-keeper.

And now look out and see how Mr. Heise will come along like a hewer in a lumber camp, with his broad-ax, and make the chips fly. But I am here on the ridge-pole, and can fight bees, wasps, or even Dutchmen, as well as any one. So, roll up your sleeves, and get ready to pitch right in and make things lively for a little while, anyway, even if you can not lick me, by showing Mr. President and the cream of bee-keepers of this banner Province of Ontario assembled here this evening, some better reason why you are a bee-keeper than I have shown you why I am a bee-keeper.

W. J. BROWN.

Mr. Heise—These reasons would fit most of us, and perhaps the financial reason is the greatest.

#### SPRING MANAGEMENT.

R. F. Whitesides read a paper on "Spring Management."

Mr. Post—For outside wintering we want things tight and dry, and good packing on top of the hives. Great care must be exercised in spreading brood, not to do it too early in the season. Cellar-wintered bees should be kept in until they can be set out to stay.

Mr. Fixter—Bees should be set out early. We set some out this year on March 22, with a foot of snow on the ground, and they did all right.

Mr. Miller—Queen-clipping should be done in fruit-bloom.

Mr. Dickenson—If snow is on the ground when bees are to be set out, sprinkle some straw around the stands.

Mr. Pettit—Clipping with us in southern Ontario should be done before fruit-bloom, else the hives are so full of bees it is difficult to find the queen.

Mr. Darling sees no advantage in waiting for a suitable day to put the bees out. When the time of year comes put them out in the evening, and they will be quiet until a suitable day comes for them to fly.

Mr. Heise—Early clipping refers to cellar-wintered bees. For those packed outdoors, we do not like to unpack them until it is time to put supers on. I have also noticed that in a prosperous colony it is often easier to find the queen than in one that is very weak.

#### SPRING PACKING OF CELLAR-WINTERED BEES.

"Would you advise packing in spring for cellar-wintered bees?"

Mr. Miller—I used to do it, but don't any more.

Mr. Holmes—Put newspapers under the cover.

#### CARING FOR EXTRACTED HONEY.

"How take care of extracted honey?"

Mr. Miller—Put it into cans or barrels as soon as pos-

sible, and store in a dry, warm place. Do not leave it exposed to the air.

#### FREING COMBS OF POLLEN.

"What is your method of freeing combs from an overabundance of pollen?"

Mr. Gemmill—Spray them with a fine spray, then throw out the pollen with the extractor.

#### DEAD BROOD—WIRING FOUNDATION.

"Dead brood in the hive a few days after casting a swarm. What is the cause? The result?"

Mr. Dickenson—This may be caused by turning the parent hive around too often, and so depleting it of bees for the sake of the swarm.

"Is it advisable to wire foundation?"

Mr. Miller—Yes, it enables me to use section foundation in shallow frames.

Mr. McEvoy uses seven vertical wires in the frame, laced back and forth from staples in the top-bar and bottom-bar.

There was a division of opinion on the advantage or disadvantage of wiring, some of Canada's most successful bee-men being on either side of the question.

#### HIVE-ENTRANCE FOR OUTDOOR WINTERING.

"What size entrance do you prefer for outdoor wintering?"

Mr. Miller— $\frac{1}{2} \times 1\frac{1}{2}$  inches.

Mr. Holtermann—Whatever style of entrance we have, the top packing must be porous enough to allow of upward ventilation. If the change of air has to be accomplished by the entrance alone, the bees must exert themselves to create a draft, and this is not good.

Mr. Sparling—The nature of the packing above has much to do with good wintering.

Mr. Armstrong could not see that it made any difference whether the top packing was tight or not. The entrance should be  $\frac{3}{8} \times 5$  inches.

Mr. John Fixter then read the following description of experiments on the question,

#### DO BEES INJURE SOUND FRUIT?

During the summer of 1901 an experiment was started when there was no surplus honey to be gathered from plants outside, with ripe fruit of four different kinds—peaches, pears, plums and grapes. These were exposed in different places near the Experimental Farm Apiary, where it was easily accessible to the bees. This experiment was continued during the season of 1902, with the addition of strawberries and raspberries. All fruit was placed in the same position as in the experiment of 1901.

On July 2, 1902, ripe fruit of four sorts of strawberries was tried in each place—the Williams, Clyde, Buback and Warfield—exposed in different places where it was easily accessible to the bees; a, Inside the bee-hive; b, On branches of trees in the apiary enclosure; c, On shelves in a workshop, to which bees had access through an open window. Every care was taken that all the fruit used in this experiment should be perfectly sound.

Fruit exposed inside the bee-hives. The fruit was exposed in three different conditions: 1, Whole fruit without any treatment; 2, Whole fruit that had been dipped in honey; 3, Fruit that had been punctured in different places with the blade of a pen-knife.

Four colonies were selected for the experiment, all of about equal strength. Each of these colonies was in a hive upon which was placed a super divided in the middle by a partition. In each one of the four hives the whole specimens, of fruit not dipped in honey, were placed within three empty frames, tied together as a rack; in the brood-chamber, the whole specimens of fruit dipped in honey were placed in one compartment of the super, and the punctured specimens were placed in the other. The bees began to work at once, both upon the dipped and the punctured fruit, and kept continually on it as long as any liquid could be obtained. They also clustered thickly on the whole sound fruit, but did not appear to be getting, or even trying to secure, any substance from the berries.

Fruit exposed on the shelves in a workshop the bees did not visit at all, nor on branches of the trees in the apiary; in the two latter places the fruit appeared to dry up and mold. In the hives all fruit decayed more quickly from the extra heat from the bees; this experiment was tried but one week.

July 29, experiment with four varieties of raspberries—the red, purple, very light-colored, and the black-caps.

Each box contained some of each sort. They were placed in hives in exactly the same position as the strawberries. At this date there was considerable honey coming in. The bees did not touch any of the fruit in the hive, super, trees, nor in the house-apiary. On July 31, half of each sort of berries that were sound were cut in halves to see if they would attack the fruit, but they did not touch any of them. All the sorts in the hives decayed much sooner than the fruit exposed. That exposed to the air dried up considerably and molded.

A second test has been made with peaches, pears, plums, and grapes, with practically the same results. The bees actually starved where separated from fruit-juice only by the skin of the fruit.

JOHN FIXTER.

#### COMB FOUNDATION EXPERIMENTS.

Mr. Fixter also reported some experiments with foundation from the results of which he recommended hiving swarms on combs or full sheets of foundation. He also recommended alternating combs with foundation to get the latter drawn out.

Mr. Evans thought it not desirable to put foundation between combs in the super. The combs will be bulged, and the foundation will only be slightly drawn out. When you come to extracting you will have thin, tender combs which you can scarcely extract.

Morley Pettit—This will not happen if the foundation is alternated with frames of brood; but the best place to have combs built in is the super. The bees will there build the combs fast to the bottom-bar much better than in the brood-chamber. In order to avoid the bulging mentioned we have what we call a "foundation separator" to place between the comb and the foundation. This helps sustain the weight of the bees and relieves the foundation of that sagging influence, and causes them to build full, even combs.

Mr. Sibbald—I consider hiving swarms on combs a waste of combs—a bad thing; hiving on foundation is half bad; on starters is just right. We want all the combs we can get for the extracting-supers. Give a swarm a hive full of combs, and the queen will soon fill them with brood. Now, if you have a short honey-flow you have a lot of useless bees hatching out just at the close of the honey-flow. We don't mind drones—the workers will kill them off.

Other members were skeptical about the economy of the last statement.

Mr. Chrysler—If we hived swarms on combs for comb honey they would store honey below instead of in the sections, and then swarm.

Mr. Sibbald—The parent colony has good combs and a young queen. If you do not wish increase, the swarm can be returned at the close of the honey season, and the poor combs melted up.

Mr. Pettit—If the swarm is hived on about six starters, and the rest of the hive filled up with dummies, a large percentage of these starters will be built into good worker-combs. The rest make good extracting-combs, and are all the better for having been bred in once—they are stronger, and less liable to break in the extractor or in cold weather.

Mr. Sibbald—If I hived my swarms on six starters they would not stay.

Mr. Pettit—Very well, then; hive on a full set of starters, and in a couple of days remove what starters they have not begun work upon, and put dummies in their place.

Mr. Newton and others indorsed Mr. Pettit's view, but Mr. Sibbald did not consider this a "short cut."

Mr. Sparling—In a few weeks you can replace the dummies with combs.

Mr. Sibbald is not particularly anxious for worker-combs. These combs are tougher for having been bred in once.

Mr. Miller—They should be washed before using.

Mr. Dickenson—After the first extracting I can see no difference in them.

(Continued next week.)

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards, for such effort.

## Contributed Articles.

### No. 6—Improving the Race of Bees.

BY ADRIAN GETAZ.

(Concluded from page 534—1902.)

I WANT to begin with an apology. In a previous article I said that the West cages cost too much. Somehow or other, I had in my head an idea that the price is 25 cents apiece. I discovered since then that they are much cheaper.

Near the top of page 518 (1902), the compositor seems to have skipped a line. What I meant to say was: "Perhaps plenty of food and big cells go together, and we know that good queens and plenty of food do go together."

#### SOME CRITICISMS ANSWERED.

I wish to answer briefly some criticisms which have been made.

I am accused of being too dogmatic. That fault is more apparent than real. I used to write differently, but I was very often misunderstood, or something essential had escaped the attention of the readers and spoiled the contribution. This has led me to adopt a clear-cut, positive style of writing.

The "theories" concerning heredity, etc., that I have tried to condense in these contributions, are the conclusions reached by hundreds of scientists, eminent thinkers, stock-breeders, etc., during the past two or three centuries. As such, they are entitled to some consideration. To what extent I have succeeded in "condensing" is, of course, another question.

A critic not finding some things that he thought ought to be there, charitably (?) suggested that perhaps I did not know. The fact is I had to leave out a great many things in order to keep within the limits of space at my disposal.

I am also accused of ignoring the recent discoveries in bee-dom. I suppose reference is made here to the Gerstung and Dickel theories. In my opinion these theories (at least for the present) decidedly "lack confirmation."

To avoid misunderstanding, I should have stated that the drones reared in worker-cells cannot pass through the ordinary perforated-zinc.

#### INFLUENCE OF NURSE-BEES.

I said that the characteristics of nurse-bees, such as color, aptness to gather honey, etc., are not transmitted to the larvae they feed. That statement has been challenged. The critic says that if corn is planted in a soil containing hypophosphite of magnesia, the young plant will bear blossoms quite different from that of corn.

The point is quite important as it has a bearing on queen-rearing. Suppose we have a Jersey calf. Does any one think that by feeding it with milk from a Shorthorn cow that the calf would acquire the color, disposition of taking fat, etc., of the Shorthorn stock? Not at all. And we may safely conclude that it is the same with bees, at least until positive proof of the contrary is given. There cannot be anything like hypophosphite of magnesia in the food given to the larval bees. That food is a mixture of honey, pollen, and secretions of the stomach-glands of the bees, the whole partially digested before being given to the larvae. The composition of that food is practically invariable, so it matters not which race of bees we employ as nurses. But it matters very much whether enough of that food is given to our young queens or not, or whether they are well cared for or not. The three following conditions are therefore imperious:

1. Plenty of food—or rather raw material for same—nectar or feed.
  2. A large number of nurse-bees to prepare the food and take care of the young queens.
  3. A colony strong enough to keep up the temperature.
- I want to insist on that last condition, as it is seldom noticed. It is necessary that the proper temperature should be kept up, not only during the larval stage of the young queens, but also until they are ready to emerge from the cells.

When the cells are capped the young queens are, after all, not much more than mere worms. The real development takes place while they are in the sealed cells. Unless

the temperature is at the proper point, this development will not take place as it should. Cases are on record of queen-cells exposed to the cold hatching out queens with defective wings and legs, and very probably with defective interior organs, also.

#### QUEENLESS COLONIES VS. UPPER STORIES.

Both can be used, evidently. But in using an upper story, it must be remembered that the bees have then a full quota of brood to take care of in the lower story, and if the apiarist is not careful the upper story may be neglected.

I prefer a queenless colony, adding (by exchange) a comb or two of hatching brood from some other colony every few days. This process will keep up the strength of the colony especially in young bees, and, as there is but little brood to take care of, the young queens, even if they are numerous, will be well cared for.

#### NUCLEI VS. FULL COLONIES.

Somebody said as good queens as any have been reared in even small nuclei. I guess so. I also guess that worse queens than any have been reared that way, too.

I don't see why good queens could not be reared in nuclei, if the nuclei are not too weak, if the weather is warm enough, and if the honey-flow is good. But let the weather be cool, and a nucleus will not be able to keep the temperature up to the proper point. Let the honey-flow slack, and robber-bees set up business; then the whole force of the nucleus will be needed for the defense of the home, and the care of the young will be neglected.

(THIS IS NO JOKE.)

About a year ago now, I met a brother bee-keeper, Mr. X.

Mr. X. had just read something about artificial queen-rearing, and was quite enthusiastic about it. He gave me a glowing description of it.

Unfortunately, his memory was at fault on some points. He spoke all the time of transferring eggs instead of larvae. As soon as I saw my chance, I asked him: "Brother X, you say they put the stick of cells and eggs in the gum. Now the cells are turned down. 'Pears to me that those eggs ought to fall off?'"

Brother X looked very much embarrassed, scratched his head once or twice, and all at once brightened up and said: "Oh! They just put a little bit of thick honey in the cells, and the eggs stick to it!" Knox Co., Tenn.

### Experience with Forced Swarming.

BY J. T. HAIRSTON.

I HAVE had considerable experience with forced swarms. I wish to say there is no difference between them and natural swarms, if rightly made. What applies to one applies to the other, and practically there is nothing new in them. Transferring by drumming is identically the same.

As to forcing before or after cells are started, it doesn't make any difference; only if the apiarist has as many colonies as he wishes, he should force only those that have cells started, as they would swarm anyway.

I have found by experience that giving a frame of brood does no good, but harm. I tried giving brood until I found the bees would stay far better without brood; and as to giving honey, after the swarm has become established it is all right, provided the bees are not gathering any honey; otherwise it is useless.

If the colony is run for extracted honey it doesn't matter whether the bees are hived on drawn combs; if run for comb honey, hive on 1/2-inch starters, or full sheets of foundation, but never on wide starters.

If hived on starters, after the queen begins to lay, three frames should be removed, and space filled with dummies; and after the five frames are filled with full sheets or drawn combs. The super should be put on the hive when the swarm is hived, partly filled with "baits," with a honey-board on.

If the swarm has plenty of room, ventilation, and shade, until it has become established in its new home, it is not likely to abscond. But I have found that if a frame of brood is given it begins, usually, to construct cells preparatory to swarming.

If, as I previously stated, a forced swarm is rightly made it is not likely to desert its hive. The bees should be made to fill themselves with honey, and be treated like a natural swarm.

Forced swarming is a boon to the specialist with out-yards, as he can handle his bees with less help, as one day in the week is all the time needed for each yard. He can examine each strong colony, and all that are preparing to swarm can be shaken, and there's no watching for swarms. Cherokee Nation, Ind. Ter., Dec. 29.

## The "Missing Link" in Rearing Queen-Bees.

BY DR. E. GALLUP.

SOME forty years ago, when I first moved to Iowa, I saw the largest and strongest colony of bees that I had ever seen, up to that date. They were in a hollow basswood log, and the queen was the largest, by nearly one-third, that I had ever seen. The log contained as much comb as four 10-frame Langstroth hives, and all was worker-comb. Here was where I first saw the "missing link," and the largest queen-cells that I had ever seen.

That fall I saw, at Decorah, another large colony in a dry-goods box, and another extra-large queen. It seems the owner had four large swarms to cluster together, and, not knowing how to divide them, had hived them all together, and they had built all worker-comb.

The following spring I found another extra-large colony in a hollow butternut-tree, and when I transferred them they had another of those extra-large queens and all the comb was worker-comb. Previous to this, in Wisconsin, I took an extra-large colony out of a small house four feet square, by six feet tall, built on purpose, and stocked by setting a common box-hive on sticks at the top of the house without a bottom-board, consequently the bees had extended their comb down and outside the hive, and all was built worker-comb. I studied long and seriously on the question of why those extra-large colonies and extra-large queens. I reasoned that the queen must be extra-prolific, and the bees must be longer-lived, or they could not keep so populous winter and summer, year in and year out.

Therefore I built my large hives to test the question, and other questions that puzzled my mind. I filled those hives with all worker-comb, and after superseding the first queens I had extra-large queens, and long-lived ones, and long-lived workers as well, and I demonstrated to my own satisfaction that bees reared queens to suit the capacity of the hive, to a certain extent. Remember that I was not ridiculed into this idea, and I don't think it very likely that I shall be ridiculed out of it in a hurry.

On page 696, E. F. Atwater says: "Now the larger part of our bees are run for extracted honey, with little or no swarming." A little farther on he says: "How shall we explain the fact that the Dadants have so little swarming with their large hives?" Simply because they run for extracted honey, and manage purposely to prevent swarming, as they have informed you in back numbers of the American Bee Journal. Further on, he says: "Astonishing to say, when given the opportunity, they respond nobly, with 10, 12 or 15 frames of brood." Well, who said they would not? But will they keep it up for 5 or 6 years? That is the "question before the house."

I wrote an article for publication, a number of years ago, and asked this question: If one or more colonies in an apiary produce twice as much honey, and twice the number of bees, of the balance of the hives, in the same apiary, why can not we rear queens and bring the balance, approximately, up to that standard? We certainly can. "If not, why not?" If one or more queens will lay eggs right up to the full capacity, for 5 or 6 years—and even then examine them as closely as we may, we cannot see any diminution of the number of bees in the colony, when the bees supersede her—can we not rear other queens equally as good? "If not, why not?"

If we can rear 10 percent of our queens good, and 90 percent poor, why not rear 90 percent good, and only 10 percent poor? If the bees in one colony live to be 90 days old in working season, and another colony lives to be only 50 or 40 days old at the same time, and in the same apiary, what is the cause of the difference? If we rear our queens in small nuclei, and they cease their prolificness at the age of from one month to one or two years, and they are small and inferior in size when compared with those reared in extra-large and populous colonies, and those reared in the nuclei lack the missing link, while those reared in the populous colonies have that appendage, what is the cause? Of course, I mean under the swarming impulse.

Now, Mr. Atwater, you have the same privilege of

learning that I did; I studied and answered all those questions, and more, long and seriously, and I may say intensely, and I answered them satisfactorily, at least to myself. Do not theorize as many do, but confine yourself to actual facts. Theory is not practice. As I have never reared queens for sale, and never expect to do so, no one can accuse me of seeking a free advertisement of my queens.

Remember, at my age it is quite a task to sit down and write an article for publication, and go into all the minute details, all the whys and wherefores, so that the merest novice in bee-keeping can comprehend what is meant, perfectly and understandingly.

Soon after I learned to drum out, and make artificial swarms, by Mr. Wellhausen, in Wisconsin, bee-keepers sent for me far and near to divide their colonies. We knew nothing of movable-comb hives them. Well, I worked at it more or less for two seasons, and in the meantime I divided my own bees, instead of waiting for them to swarm naturally, and I began to notice that the old colony that was compelled to rear a queen did not appear to do as well as they ought. Many of them became queenless, etc. This puzzled me. I studied long and seriously over it, but did not find any solution to the question. When I divided nearly 100 colonies and found dead queens in front of the hives, and some queens crawl out of the hives, and crawl off when only four weeks old, I was puzzled still more. I had begun to use movable-comb hives; then I had no such trouble when my bees swarmed naturally.

When I found the first missing link I cut out all extra cells, to prevent swarming; I examined every cell, but found no missing link in a single cell. Then I began to think I was mistaken, and never had seen a missing link. But I finally stumbled onto one in a naturally-built cell; then I soon discovered that I could find them every time when dissecting natural cells, built at swarming-time, or when superseding. It was a very easy matter then to come to the conclusion that they were placed there by Nature for a purpose, Mr. Alley to the contrary notwithstanding. The reader will please notice that Mr. Alley tries to ignore or deny that it is of any benefit whatever. But Nature makes no useless mistakes of that or a similar kind. His argument will not even hold water. Orange Co., Calif.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### "I Don't Know"—Probably Counted All.

MR. EDITOR:—Do you think Mr. Hasty meant anything wicked by what he said about the donkeys on that title page? How many do you think he counted?

### Honey for Putting Up Fruit.

Honey used in caramels is delicious, and in some kinds of cookies and cakes I think it better than sugar. Now, the question is, Can fruit be put up with honey successfully? and is it as good as sugar? Have any of the sisters tried putting up fruit with honey? If so, what kinds of fruit have you put up? How much honey did you use? What kind of honey did you use? What was the result? Please tell us all about it.

### Shade-Boards vs. Living Shade.

On page 9, Mr. Hasty says: "Mr. W. R. Ansell is right to the extent that a good and sufficient shade-board is a little ahead of any practicable living shade. May play truant, and be absent when needed most, which the latter does not do. Page 728."

Now, my bee-keeping sisters, let the men-folks work in the broiling sun if they want to, but don't you be misled by any such sophistry. Those shade-boards may do as well for the bees as living shade, but how about you? If I had to work with bees on an open plain without any shade, I don't think I would work with them long. For one thing, the men don't care for their complexions; we do. If you have out-apiries, and those shade-boards have to be placed

on the ground when a storm approaches, or there is danger of their blowing away, then I think they will do exactly what Mr. Hasty says they won't do—"play truant."

A serious objection to shade-boards, aside from their not shading the bee-keeper, is the fact that they have to be taken down and put up again every time a colony is overhauled. That would take both time and strength.

My ideal would be to have, if possible, living shade for the bee-keeper, and where that can not be had the next best thing is to have a movable shade. This I have greatly enjoyed.

So far as the bees are concerned, if they can not have living shade, the right thing is a double cover of thin material. Even if there is living shade, such a cover is a desirable thing for the dead-air space makes it cool for summer and warm for winter.

### Remedy for Hoarseness.

The juice of a lemon, half an ounce of glycerine, half an ounce of honey, is an excellent remedy for hoarseness, and is easily prepared. Take a teaspoonful every few hours.

### Wetting Brittle Sections for Folding.

If you have sections that you have kept over from last year without making up, and they have become dry and brittle, breaking badly when bent, try pouring a little boiling water in the V-grooves, but be careful not to get the water on the dovetailed ends of the sections, else you may have trouble in putting them together. The sections usually come 500 in a crate, and you can wet the whole 500 at one time. You would better take out a few of each layer, then wedge them up tight before wetting. If you don't take any out, they will swell after they are wet, and will be wedged in so tightly that you will have trouble in getting them out.

To take them out easily before wetting, turn the crate on its side, then the ones that are left will not tumble when some are taken out.

If you take a funnel and put in a plug whittled down to a sharp point at the lower edge, leaving room for only a small stream of water to pass through, and hold the funnel directly over the grooves, pour the hot water into the funnel and move quickly along the line of grooves, you will find it works well. A small tea-kettle about half full of boiling water makes it easier to manipulate without spilling the water where you don't want it to go. Be sure the water passes clear through to the other side of the crate, so that all the sections will be wet.

Some advise putting sections in a damp cellar before using, but I believe the hot water is better.

You may think it a little early to talk about making up sections, and perhaps it is, but it is better to be too early than too late, and really they can be made up any time during the winter whenever you find time for it.

### Husking-Bees.

Miss Rural—And were you never in the country during the season for husking-bees, Mr. Sappy?

Mr. Sappy—No. The idea! How do you husk a bee, anyway?—Philadelphia Press.

The Buffalo Convention Report is issued in pamphlet form, size 6x8½ inches, 80 pages and cover. Besides a full report of the proceedings of the 32d convention of the National Bee-Keepers' Association, held in Buffalo, N. Y., Sept. 10, 11 and 12, 1901, it contains fine half-tone portraits of all the officers and directors of the Association; also the Constitution, a list of the membership up to the end of 1901, and the two latest bee-songs—"The Hum of the Bees in the Apple-Tree Bloom" and "Buckwheat Cakes and Honey." We believe it is the finest ever gotten out for the Association. Of course, all members of the Association receive a copy free, but there are thousands of our readers who are not yet members, but who should have this valuable Report. Better send for a copy, if you have not yet received one. Price, postpaid, 25 cents, or with the American Bee Journal one year—both for \$1.10. Send all orders to the office of the American Bee Journal. Better order soon, before all are gone.

The Premiums offered this week are well worth working for. Look at them.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### JOINING "THE GREAT MAJORITY."

I am so got up, somehow or other, that I cannot see a statement which involves a false idea without a certain measure of distress. Am I unusual in that, or are there lots of other folks affected that way? And is it a good way to be got up, or is it a misfortune? On page 773 it is said that the rest of us will soon be called to join "the great majority." This figure of speech is accepted by nearly everybody. If we think of the whole world, and all time, the expression is in accord with facts; but we don't carry the whole world in our thoughts. We are thinking about the present races in our own country, that *our* dead are much more numerous than our living. Believing this implicitly, I once (for what reason I cannot imagine) started in at a little study and figuring to answer the question, *When did our dead become a permanent majority?* The result astonished me; perhaps it will astonish those who read this—they can easily verify the figures. Our living are 76,000,000; our dead have not nearly attained that figure yet. The next discovery was also surprising in its way. The *dead never will be a majority* till the present rate of increase stops. Take our total population at successive periods, not too far apart, and (Be careful there, not to kill the same person twice!) divide the great flocks into dead and living—the earlier ones of course all dead. Or apply a reasonable death-rate per thousand to the figures of each successive census.

### PUTTING IN FOUNDATION WITH A SCREW-DRIVER.

And so Mr. Abbott still puts in foundation with a screw-driver. I don't know what we are going to do about it. As long as the foundation goes in—goes in as well and as rapidly as he cares to have it, 'spects we'll have to submit. Even if he picks cherries with his mouth instead of his hands, he must be the boss. Page 773.

### THE BEST MANAGEMENT.

"He who can so manage as to exchange all surplus bees grown during the season, for honey, and come out with the same number of colonies he started out with, has solved the problem best."—F. Greiner, page 776.

Just so. In religion folks oft think they *have* the graces because they can tell about them in words; but in bee-culture I don't think many will make a similar mistake about the above. Good to have the things in words, and to repeat the words *o'er* and *o'er*; but though we watch, though we fight, possibly though we also pray, most of us are going to fall short. Those words occur in a meaty article. The *experiences* that shaken swarms sometimes abscond even when brood is given them, and that once a shaken swarm managed to come to nothing with an entrance-guard on—these experiences are valuable, lest we run too much to theory on current fads.

### BEAUTY AND GOODNESS A SPAN.

I don't know but it's time to say once again the little word that there is to be said on the other side—have heard so *very often* the manifest truth that beauty in bees is not what we want. Sure, and it is 'nt—but just listen: The scrub cow has no beauty, and her milk is blue. The Jersey is delicately beautiful, and her milk is surprisingly rich. Beauty is not what is wanted in this case; but somehow the beauty and rich milk are pretty sure to be found in span. Same of the nice-looking Holstein. Her looks are an outward and visible sign that she can lick the scrub out of her boots in the number of gallons. 'Spect it's rather the rule than the exception that a valuable quality has some look—*usually a nice look*—that sticks closely to it. But this is no excuse for the scandal of selling mere prettiness when nobody knows or cares what the honey-qualities are. Page 776.

### THE "LAYING HABIT" OF QUEENS.

And isn't W. J. Stahmann *away off* in thinking that limited laying for the first week or two is going to do anything to make a young queen prolific? Reasonable that laying habits running the whole first season might persist

through life, *providing it's so*. And, in good sooth, the other, in case it's so, is much more important for us than if it looked reasonable. Reasonableness can probably be found later on, if the fact is assuredly just as claimed. Is a queen like a rocket? A rocket held down for a very short time is going to fly lower on account of it. Page 776.

#### EMPTYING HALF-FILLED SECTIONS.

The experience of Edwin Bevins is that with a super bottomed with burlap in such a way that the bees can only get through a hole at one end, they empty half-filled sections pretty promptly. Wonder how often this will fail. Suspect that *sometimes* a weak colony will vote that the chamber is a little cool, and they can just as well bring down the honey some other day. Page 781.

## Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

### Sweet Clover.

1. How many pounds of sweet clover seed does it take to sow an acre?
2. Will it grow on new land very roughly plowed?
3. Which is the better honey-producer, the white or the yellow?

MICHIGAN.

ANSWER.—1. Sow the same amount of seed that is generally sown of red clover in your neighborhood. Half as much will do if seed is scarce and land plenty. But if you want sweet clover to bloom every year on the same land, you must sow two years in succession, for it is a biennial.

2. Yes, and it will grow on land not plowed at all, if the seed be tramped in by stock.

3. I don't know. Some claim that yellow is better than the white, but the white is better known. It would be a good plan to try both.

### Shaken Swarms and Other Old Ideas.

How new that shaken swarm idea is! C. J. H. Gravenhorst gave it more than 30 years ago. Then read J. H. Nellis' catalogs, and the half-Langstroth frames and half-cases way back in the seventies; also in The Exchange. The Gravenhorst swept swarms is an old and well-tried satisfactory practice. I have known of its use 26 or 28 years. Mr. Heddon got lots of his work from the Nellis half-cases.

The old-timers are not all dead yet. Some remember the past use. CONNECTICUT.

ANSWER.—Yes, forced or shaken swarms are much older than many suppose. The plan is so much in accord with natural swarming, being merely a way of anticipating it, that it is quite the natural thing that one should think of operating by it, and so it comes to pass that probably a good many in different quarters conceived of it independently of each other.

### Some Cross Italian Bees.

My bees needed shaking this year, they did not swarm or work, either. I bought 6 colonies in box-hives last winter, and transferred them to Heddon hives. They were blacks, and tarts at that, and I had a job, too. I thought from all I had read that if I put in Italian queens their brood would be gentle, but I was mistaken. They are as pretty as can be, but are just as cross as the blacks were. I dare not take a friend in the garden where they are, as they dispute possession, every time. Why is this?

SOUTH CAROLINA.

ANSWER.—Italians as a whole are gentler than blacks, yet they are not all alike, and sometimes a colony of Italians is anything but remarkable for good-nature. It may be

that you have been unfortunate in getting a colony exceptionally cross. It is also possible that another season you may find them more gentle. The past season was in your locality one to give cause for ill-nature in almost any colony—cool nights with heavy dews and little storing.

### Oregon and Washington for Bee-keeping.

Please give what information you can about Oregon and Washington in regard to apiculture. What is the main source for honey? How does that country compare with Minnesota for bees? What about climate and soil?

MINNESOTA.

ANSWER.—These questions are too much for me, and I am not sure just where is the best place to apply for information—possibly by addressing Hon: James Wilson, Secretary of Agriculture, Washington, D. C.

### When to Transfer Bees.

I began the bee-business about four months ago. I bought 33 colonies of bees, and find the ones in large hives in better shape than those in the small hives. I have taken as high as 40 pounds of white honey from one hive, and only cut off the hive 6 or 8 inches to put on a super in the spring. I have about 12 colonies to transfer. When would be the best time to transfer them?

TENNESSEE.

ANSWER.—The usual time for transferring is in fruit-bloom, although there is an increasing disposition to defer it till three weeks after the casting of a prime swarm.

### Were They Prime Swarms.

I had a swarm of bees issue from the parent hive July 13, and hived them on 10 drawn combs, on the old stand, moving the hive from which they swarmed some distance. On July 14 they swarmed out of the hive; I put them in again, and then took a comb of unsealed larvae and put in the hive, and put them back again. This time they stayed and went to building queen-cells. I tore the queen-cells down, and they built them up again, and on August 4 they swarmed again with the old queen clipped. Were they both prime swarms?

NEBRASKA.

ANSWER.—I don't know. A swarm issuing with a laying queen is usually entitled to the name of "prime swarm," and when such a swarm sends out a swarm the same season, the latter is called a virgin swarm. It looks as if there was something abnormal in the case you mention, the second issue being by dissatisfaction of the bees with their queen, and I don't know enough to say positively as to the proper nomenclature.

### Extracting Honey—Comb vs. Extracted.

I see in a catalog that the Cowan Extractor, No. 15, is made for the Langstroth frame, of which the top-bar is 17½ inches long, 9½ inches deep.

1. Can I extract a frame that is not so long?
2. Or from frames not so deep as the Langstroth?
3. Is there more profit in producing extracted than comb honey?

OREGON.

ANSWERS.—1 and 2. Yes, a shorter or shallower frame can be extracted in such an extractor all right.

3. I don't know. In some places one kind, in other places the other kind is the more profitable. The kind of honey may have something to do with it. The man may have a good deal to do with it. There are many bee-keepers who work for extracted honey exclusively, and they probably think that under all the circumstances there is more profit in that kind of honey for them. The same may be said of comb honey. It is possible that no man living can tell which would be better for you without actually trying the two side by side.

### Average Income per Colony—Book for Amateurs—Worms in Colonies.

Upon your reply to the following question will depend whether I follow bee-culture as a business, or for pleasure:

1. What is the enclosed sage? Is it a honey-producer?

2. I am situated about 900 feet above valley level, out of the frost-line; within 2 miles, in either direction, are about 1000 acres of enclosed sage, 100 acres orchard (prune and apricot), 3 acres eucalyptus, and large quantities of flowers. How many colonies of bees will they support, there being no bees in any quantity in the neighborhood?

3. What should be the average income per colony?

4. I have "Bee-Keeping for Beginners," by Dr. Brown, and the "Cook's Manual." Would you suggest any other book for an amateur?

5. I have purchased 5 colonies of black bees containing about as many worms as bees. What will I do with them? CALIFORNIA.

ANSWERS.—1. [The enclosed plant is a Fleabane, but too dry and withered to determine the species. It belongs to the Composite family.—C. L. WALTON.]

2 and 3. I don't know. Questions like these are exceedingly difficult to answer. Indeed they have no exact answer. If you should ask me the average yield per colony in my

location for the past five years, I might tell you exactly; but if you ask about the next year or the next five years, I must say I don't know. It may be very much more or very much less. If you can get some one situated as you are to tell you what his results in the past have been, it will give you some data on which to base a guess. Sorry I cannot give you any more satisfactory answer.

4. "Dadant's Langstroth" and Root's "A B C of Bee-Culture" are both worthy of the highest commendation.

5. Go through all the colonies and dig out at least the worst cases. Wherever you see a web of the wax-worm, dig it out. Take a wire-nail, dig open one end of the gallery, then start at the other end and tear it open till you have opened the whole length. That will generally dislodge the worm, which you will dispatch. Do all you can to keep the colonies strong, and as little as possible to weaken them. Weak colonies are the ones that succumb to worms. As soon as you can, Italianize. With strong colonies of Italians you will not need to pay any attention to worms.

**FROM MANY FIELDS**

**Smoker-Fuel—Wintering Well.**

The smoker-fuel question I have watched with a vigilant eye, but I have not seen the kind mentioned that I use. I do not know its real name, but I call it "stump smoke." It grows on the side of old, decayed stumps in the woods. Find it when it is dry; if you gather it then, you will find it the very best fuel for smokers there is. One smoker-full will last and burn from 4 to 9 hours. Try it and report.

Bees are wintering well at this date.

R. J. CARY.

Fairfield Co., Conn., Dec. 29.

**Trying Year in Texas.**

This year has been a trying time on farmers and bee-keepers. I have 186 colonies of bees, and they went into winter quarters in fine shape. I still live in hopes, if I die in despair. We have had an abundance of rain which brought up the mint crop, and if we have the right season in 1903 we will surely be in the fight on honey.

F. J. R. DAVENPORT.

Ellis Co., Texas, Dec. 26.

**Catnip as a Honey-Plant.**

I think catnip is one of the best honey-producing plants we have, as it produced some forage for our bees about six months the past season. Where I found it growing the thistle, was in an old abandoned quarry, where the sun beats in very warm. There was about two acres of it.

ARTHUR STANLEY.

Lee Co., Ill.

[We can supply catnip seed at 20 cents an ounce, postpaid.—EDITOR.]

**Paraffin in Bottom of Shipping-Cases.**

I have found the use of waxed-paper in the preparation of no-drip cases a little troublesome. I have to send away for it, moreover. Hence the necessity for inventing some other contrivance. It occurred to me that the joinings between the bottom-board and the side and end, and those at the angles for an inch up, might readily be made water-tight by the use of paraffin. I tried the experiment just now. With a small iron plane I made some paraffin shavings. These I put in an empty tin box that had been used for holding belladonna plaster, and melted. I then poured a small quantity of this liquefied paraffin into one corner of a case, and by tilting it as required (the case, I mean), I caused the paraffin to flow all around in the angles at the four corners. This scheme worked very

## "What Happened to Ted"

BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton, the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—60 pages, 5x8 $\frac{1}{2}$  inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver). Address,

ISABELLE HORTON,

227 EAST OHIO STREET, CHICAGO, ILL.

Please Mention Bee Journal when writing advertisers.

nice, indeed. All that now seems necessary to perfect the arrangement will be to put some excelsior in the bottom of the crate on which rests the cases. I leave the plan with you to speak for itself, free from any restriction as to whatever use you see to make of it.

At preserving time, I find the plane a convenient instrument for making the paraffin shavings, which my wife uses by putting them in the jelly tumblers and before she pours in the hot jelly or fruit.

DR. W. O. EASTWOOD.

Ontario, Canada, Dec. 19.

## Prefers 10-Frame Hives.

I started last spring with 19 colonies, and increased to 37, which I have in the cellar, having put them there Nov. 26, in good shape. My honey crop was light; I had only 180 pounds of section honey, which I run for altogether. I look for a good honey crop next season. I never saw as much white clover as there is now.

As to the hives that suit me, I prefer the "Wisconsin" to all others. I bought 11 Danzenbaker and 5 Wisconsin last spring and find I like the Wisconsin the better; the Danzenbaker is too shallow. I found that my bees swarmed twice as much in 8-frame hives as they did in 10-frame. I will not use any but 10-frame hives in the future.

As to wintering bees in the cellar, I had such good luck last winter that I am trying it again. I put a ventilator 9 by 13 inches in it, so I can ventilate it to suit me.

E. B. PRITCHETT.

Warren Co., Iowa, Jan. 5.

## An Old Subscriber.

I commenced in the days of Wagner, and have taken the American Bee Journal about all the time since, and am now over 80 years old. It is much better today than it has ever been before. Long may it live.

J. W. ROBINSON.

Columbia Co., Wis., Dec. 2.

## Queen-Rearing.

They say that in a multitude of counsellors there is safety, but I tell you that as far as queen-rearing is concerned, Gallup, Alley, Doellittle, etc., have got me where I hardly know where I am at. I rear queens only for my own use, and will want the best that can be reared. I have tried nearly all the methods given, with varying results, during the last few years, and have thought that I had settled down to the best way to rear queens, but now comes a host of old veterans (as witness the last volume of the American Bee Journal) and almost quarrel over the way queens should be reared. So you see where it places us ordinary mortals, who just begin to think we know something. But let them come, and while you are about it, let W. H. Laws finish what he promised us on page 568 of the American Bee Journal for 1902.

Yours for further enlightenment,

L. L. TRAVIS.

Wyoming Co., Pa., Dec. 30.

[All right, there are no laws, as far as we know, against Mr. Laws finishing the queen-rearing story he began. He can send on more of it any time he finds time to write it out.—EDITOR.]

## Didn't Get Any Honey.

This is the first year since I commenced to keep bees that I did not get any honey—not one pound from 45 colonies; but everything looks favorable for next year. 1901 was too dry, and 1902 too wet, but I got 800 pounds in 1901.

JOHN A. BLOCHER.

McLean Co., Ill., Dec. 27.

## Swarming—Light Honey-Yield.

Although 85 years old next month, I still keep a few colonies of bees, not for the profit but for pleasure and pastime. I live in the city and have not room for more than 30 or 40 colonies. I run them for comb honey. I con-

troil swarming by destroying the queen-cells; if they should swarm, I always save them. I have not had a swarm abscond for 15 years. I watch them closely, and as soon as they are all out I open the old hive and take out a frame of brood, place it in a new hive with frames and starters, and put it near where they are about to alight. Quite often they go in without alighting; if not, shake a few of them in front of the hive. As soon as they are in the hive move it slowly to the place where it is to remain for the season. The scouts come back and find the swarm gone, fly around until discouraged, and go back to the old home. In about 3 days I put on a super with sections and foundation.

The past season was very light in the honey-yield. I had 22 colonies, spring count, got an average of 40 pounds per colony, and sold it at home at 15 cents for full pound sections. I cannot do without the "old reliable" American Bee Journal. JOHN CLINE. Lafayette Co., Wis., Dec. 31.

**Forced Swarm from Two Colonies.**

The following plan, given by J. E. Crane, in Gleanings in Bee-Culture, will suit those who want to increase:

Some place their bees out in the spring in pairs, two colonies close together; and when the swarming season arrives one of these colonies is shaken into a new hive, while the other is removed to a new location, and given the brood-combs from the one from which the bees have been shaken. Thus, one new colony receives all the bees from one old one, and all the mature bees of the other with surplus boxes, etc.

A little later, however, the colony having the double allowance of brood will need another shaking to prevent swarming. Here is the plan given by L. Stachelhausen, in the same paper:

These artificial swarms can be used in different combinations. For instance, to prevent swarming in out-apiaries I use the following management, which Doolittle recommended some years ago: The strongest colonies are brushed or shaken on starters on the old stand. The brood-combs and a queen from a nucleus in a Miller cage, closed with candy, are set on the place of another strong colony, and this is set on a new stand. In this way swarming is prevented in too strong colonies.

For comb honey we need very strong colonies, so we can shake all the bees from two strong colonies into one hive, and set this swarm on the stand from which it received the queen. The brood-combs of both colonies are set on the stand of the other colony without the queen. With the queen, if she is a good one, and one or two brood-combs, we can form a nucleus. Ten days later this colony is brushed off, and the old or a young queen introduced. So we have two strong colonies which can be used for comb-honey production, and a number of combs containing capped brood, which can be used for quickly strengthening nuclei or other weak colonies.

**Bacillus Alvei and Mesentericus.**

Are they the same? Dr. Lambotte thinks he has proven that they are; our "After-thinker" is skeptical; Adrian Getaz also demurs. In the American Bee-Keeper, besides giving reasons for some doubt, he gives so succinctly the reasons for Dr. Lambotte's belief that it is worth while to quote at length, as follows:

The bacillus mesentericus is not always, and, in fact, not often met in decomposed and

**Tip-Top Glass Honey-Jars**

The picture shown herewith represents the best one-pound jar for honey that we know of.

It is made of the clearest flint glass, and when filled with honey, and a neat label attached, it makes as handsome a package as can be imagined. Its glass top sets on a flat rubber ring, and is held in place by a flat steel spring across the top as shown in the picture. It is practically air-tight, thus permitting no leak,

which is an important thing with honey-sellers.

We can furnish these jars, f.o.b. Chicago, at these prices: One gross, \$5.00; two gross, \$4.75 a gross; five or more gross \$4.50 per gross.

If you try them once you will likely use no other kind of top or sealing arrangement for honey jars.

putrefying substances. Wet bread and cold cream are the substances on which it is usually seen. The numerous germs which are always present in the air, and so rapidly decompose dead substances, belong nearly all to another order of beings.

Briefly, the arguments presented by Dr. Lambotte are these:

1. The bacillus mesentericus and bacillus alvei have the same shape, the same size, and present the same arrangement when cultivated.

2. Both bacilli produce (out of the matter in which they live) a rosy, glue-like substance.

3. Both have the same effect on the serum of the blood, when injected in the veins of an animal. This last consideration is presented by Prof. Lambotte as conclusive.

4. A "culture" of bacillus mesentericus was spread over some brood to give them the disease. The larvae were killed, but after three days the bees had cleaned them out, and no further damage was observed. This experience was repeated a number of times with invariably the same result.

Prof. Lambotte then tried another plan. He took a number of larvae, ground them, and made a "culture" with it. In this culture he introduced some bacilli mesentericus—repeated the operation on the same set several times, so as to get them used to that kind of food. These are not the terms that he used, but it is the meaning. Then he applied the culture to a comb of brood. The result was, that about one-fifth of the larvae were diseased, and the remainder had been cleaned out by the bees, when examined.

Well, as Dr. Miller says sometimes, "I don't know," but, judging by Dr. Lambotte's own report, I should rather think he is wrong.

As to this first item, I may say that the two bacilli, though apparently identical, may yet be different. Bacilli are very small things, and only their general size and shape can be ascertained under the microscope. It is very much like looking at two men at a distance of a quarter of a mile with our natural eyes. Their general size and shape can be seen, but all the details of the face, hands, etc., escape our sight entirely.

As to the second point, while the products obtained are in both cases rosy, glue-like, and of about the same consistency and color, they may yet not be identical. And if they were it would not be impossible that two dif-

DR. C. C. MILLER.

# Forty Years Among the Bees

By DR. C. C. MILLER.

The above is the title, and name of the author, of a new bee-book which will be ready early in February, 1903, as it is now in the hands of the printers. It is a book that every bee-keeper in the world that can read English will want to own and read. It will contain over 300 pages, be bound in handsome cloth, printed on good book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. The book will show in detail how Dr. Miller does things with bees.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, which finally tells how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called, "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters.

## How to Get a copy of Dr. Miller's "Forty Years Among the Bees."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book *free as a premium* for sending us **Two New Subscribers** to the Bee Journal for one year with \$2.00. This is a magnificent offer. Better send in the new subscriptions before Jan. 1, so they can begin with the new year. Or, if sent at once, we will throw in the rest of this year's numbers of the Bee Journal free to the new subscribers.

GEORGE W. YORK & CO.,

144 & 146 East Erie Street, CHICAGO, ILL.

**BOYS WE WANT WORKERS**  
Boys, of all ages and young alike, make money working for us. We furnish capital to start you in business. Single letters, \$1 for full instructions and a line of samples to work with. DRAPER PUBLISHING CO., Chicago, Ill.

## The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

MARVIN SMITH CO.,

65-57-59 N. Jefferson St., CHICAGO, ILL.

ferent bacilli could produce the same substance.

The fourth item seems to me a clincher against the Professor. A culture of bacillus alvei from a diseased colony applied to sound brood, as the Professor did, would have, in each and every instance, developed a raging case of foul brood, while the application of a culture of bacillus mesentericus failed to produce any disease. However, I do not want to be too dogmatic. The Professor says that some of his diseases at introducing the bacillus also failed.

The fifth item is not very conclusive. One-fifth of the larvae got sick, and very sick at that, and their sickness was almost, if not altogether, like foul brood. Still, it might not have been foul brood. We might prepare a concoction of putrid meat, "embalmed beef" or such things like that, which, when eaten, might produce a sickness very much like cholera morbus, and yet it would not be a case of cholera morbus.

If that fifth of the larvae which got sick were really a case of foul brood, the whole colony would become diseased entirely in the course of a few months. Unfortunately nothing is said on that point.

In view of this failure to develop foul brood by inoculating cultures of bacillus mesentericus, it may seem strange that Prof. Lambotte still insists that it is the same bacillus which produces foul brood. He claims, however, that the spores are probably always present, and only develop when the conditions are favorable, that is, lack of proper food, too much dampness, etc.

Those who know how rapidly foul brood spreads throughout a whole apiary even when the colonies are in the very best condition, are not likely to accept such an explanation.

**Rules for Making Forced Swarms.**

1. Don't brush unless it is very strong.
2. Don't brush unless there is a good flow, or to control the swarming fever, as perhaps you will have to do at times.
3. Be sure that the bees gorge themselves with honey.
4. If you don't leave a few old bees in the old hive you must not shake out the thin unsealed honey, for the young bees use it as a substitute for water, and, of course, the force left will all be needed to nurse the brood.
5. If you use any drawn comb in the supers, and none in the brood-chambers, you will catch some pollen. Unless an excluder is used, the queen will go above and lay in the sections that contain drawn comb.
6. Don't use an excluder if you can avoid it, as it tends to discourage the bees from promptly entering the supers.
7. If you use any drawn and shaded.
8. Be sure to reinforce the swarm with another drive from the old hive within seven days.—J. E. CHAMBERS, in Gleamings in Bee-Culture.

**CONVENTION NOTICES.**

**Wisconsin.**—The Wisconsin State Bee-Keepers' Association will meet Feb. 4 and 5, in Madison, Wis. Special program prepared. Excursion railroad rates and special hotel rates secured. N. E. FRANCEL, Pres.

**New York.**—The annual meeting of the Oswego County Bee-Keepers' Association will be held at Fulton, N. Y., Saturday, March 7, 1903. Prof. Frank Benton will be present and address the meeting. An interesting program is being prepared, and all persons interested in bees are cordially invited to be present. MORTIMER STEVENS, Pres.

CHAS. B. ALLEN, Sec.

**Michigan.**—The Michigan State Bee-Keepers' Association will hold its annual convention Feb. 3 and 4, 1903, in the Council Rooms of the City Hall, at Lansing. The rooms are in the third story, back away from the noise of the street, yet they can be reached by the elevator.

Arrangements have been made at a nice, clean hotel, the Wentworth House, only two blocks from the place of meeting, where bee-keepers will be accommodated at \$1.50 a day.

The Michigan State Dairymen will hold their convention at the Agricultural College, at Lansing, on the same dates, as also will the State Veterinaries, thus enabling the members of all three societies to come at reduced rates. When buying your ticket you will pay full fare, and ask for a certificate "on account of Michigan Dairymen's Convention," as the secretary of this convention is to sign the certificates for all the members of the Dairymen's Association, which will enable you to go back at one-third fare.

The first session will be on the evening of the 3rd, when E. R. Root will show us "Bee-Keeping from the Atlantic to the Pacific, as seen through the Camera and Stereoscopic." This will consist of portraits of distinguished bee-keepers, of apiaries, hives, implements, methods, etc., all fully explained. A more enjoyable entertainment for a bee-keeper can not be imagined.

Mr. C. A. Huff, who has been experimenting the past season with formalin for curing foul brood, has promised to be present. Messrs. Soper and Aspinwall are not far away, and will probably be present. Mr. Aspinwall has kept about 70 colonies for the past 10 years, without losing a colony in winter. He can tell us how he has prevented this loss; also how he prevents swarming. Mr. T. F. Bingham, who has been so successful wintering bees in a cellar built like a cistern, is also expected. Messrs. A. D. Wood and J. H. Larrabee will help to make the meeting a success.

This is the first time that the convention has been held in the Southern part of the State in several years; let us try to out and show our appreciation of the event.

W. V. HUTCHINSON, Pres.

**HONEY AND BEESWAX MARKET QUOTATIONS.**

**CHICAGO, Jan. 9.**—The demand is not more than usual; hence stocks are sufficient, especially as Cuba has now come honey on this market. This is a very healthy supply, and is a factor that must be reckoned with, as it obviates the necessity of laying in a stock during the summer and autumn to draw from in the winter and spring months. The best grades of white comb sell at 156¢ per pound, with travel-stained and light amber, 13¢@14¢; darker grades, 10¢@12¢. Extracted, 76¢@1c for white, and 67¢@7c for ambers. Beeswax, 27¢@30¢.

R. A. BURNETT & Co.

**ALBANY, N. Y., Jan. 7.**—Honey demand and receipts light. We quote white comb, 15 cents; mixed, 14¢; buckwheat, 13¢@14¢. Extracted, white, 76¢@77¢; dark and buckwheat, 74¢@75¢. More demand for buckwheat than any other here. H. R. WRIGHT.

**KANSAS CITY, Dec. 20.**—Market steady at quotations. We quote fancy white comb, per case, 24 sections, \$3.50; No. 1 at \$3.40; No. 2 white and amber, \$3.25. Extracted, white, per pound, 76¢@77¢; amber, 66¢@67¢. C. C. CLEMONS & Co.

**CINCINNATI, Jan. 7.**—The demand for all kinds of honey has fallen off considerably in the last few weeks, owing to the many other sweets offered at this season of the year. Lower prices are no inducement to increase the consumption, as the demand is not there, and will not be until about the end of the month; consequently it is folly to offer at lower prices. We quote amber extracted in barrels at 86¢; fancy water-white and basswood, 96¢@97¢. Fancy white comb honey, 16¢@17¢; lower grades hard to sell at any price. Beeswax firm at 29¢@30¢.

THE FRED W. MUTH CO.

**NEW YORK, Dec. 23.**—The market on comb honey is still and inactive. While the supply is not large the demand has fallen off to a large extent and prices show a weakening tendency. We quote fancy white at 15¢; No. 1, 14¢; No. 2, 13¢; and dark, 12¢@13¢. Extracted is in fairly good demand; white, 77¢; light amber, 67¢@7c; dark, 54¢@65¢. Beeswax firm at from 28¢@29¢. HILDRETH & SOBLEN.

**CINCINNATI, Jan. 3.**—The comb honey market is a little quiet, almost everybody being filled up. As there is hardly any new supply in, there is no change in prices, 17¢. Fancy water-white, 10¢; off grades less. The market for extracted white clover shows a slight advance. Fancy water-white brings 34¢@35¢; alfalfa water-white, 31¢@32¢; amber, in barrels, 54¢@55¢. Beeswax, 27¢@28¢.

C. H. W. WEBER.

**SAN FRANCISCO, Dec. 17.**—White comb honey, 11¢@12¢; light amber, 10¢@11¢; dark, 5¢@6¢. Extracted, white, 66¢@67¢; light amber, 5¢@5½¢; amber, 46¢@47¢. Beeswax, 24¢@25¢. Light, 26¢@27¢; strictly fancy light, 29¢@30¢.

The bulk of California produced honey is sold for Eastern shipment in carload lots from production points at bottom prices. Smaller lots of choice honey that can be used in local trade bring more. Quotations here given are current prices to producer, f.o.b. shipping point, on Eastern basis for export. Quotations for cash delivery point subject to agreement for comb.

**NEW IDEAS**CONTAINED  
—IN—**ROOT'S CATALOG for 1903**

—THE—  
**A. I. ROOT CO.,**  
Medina, Ohio.

**The New Danzenbaker Nailless Cover.** This is one which we believe will become very popular. It is a reversible flat cover. The **FLAT** cover is preferred by many large bee-keepers. It is metal-bound and already put together before leaving the factory. See catalog for illustration. This can be ordered for our regular Dovetailed hive either 8-frame or 10-frame. Investigate the merits of this cover before placing your order.

**The "A" Bottom-Board.** This is something entirely new this season. It consists of a 2½-inch rim with a tilting floor-board, allowing an adjustment of depth of entrance to suit season or individual preference of user. This bottom will also be found very valuable for cellar-wintering, and for moving bees there is nothing equals it for convenience and safety. Mr. E. A. Salisbury, of Syracuse, N. Y., a bee-keeper and supply-dealer of over 25 years' experience, says: "The new style 'A' bottom can NOT BE BEAT. We put up one, and it is THE THING."

**German Wax-Press.** This we've improved since a year ago, placing a heavy oak cross-arm above in place of cover-plates. We believe it is perfect in construction.

**Cornell Smoker for 1903** has a new nozzle which is not inclined to topple over at the most inopportune time; this nozzle is supplied with wire-coil handle. The bellows is bound with projected metal bindings which protect the leather, strengthen the bellows-boards, prevent warping of same, and form a very convenient hold in operating the smoker. The general plan is the same as heretofore, but these added improvements make it much superior to anything we have formerly supplied. Made in three sizes. Prices: Jumbo, \$1.25; Standard, 55c; Junior, 65c. Postage, 25c extra.

**Vesuvius Smoker.** This is the name of the new smoker we are preparing to furnish this year, which is entirely different from anything we have heretofore offered. It is a breech-loading hot-blast, with removable grate attached to cover. The nozzle of this smoker is fastened permanently to barrel. This has same metal binding as the new Cornell. Price, \$1.00; postage, 25c extra. See illustration in the catalog.

**Brass Smokers.** We can supply the Cornell, Vesuvius, and large-size Bingham smokers with brass stoves at 25c each additional.

**Super Springs.** The supers sent out this season will contain removable springs instead of the stationary springs as formerly supplied.

**Other Goods.** We are always on the lookout for improvements in bee-keepers' supplies, etc., and will introduce such as soon as we are satisfied of their superiority over the ones now in use.

Agencies carrying a stock of our hives, etc., will be supplied with these improvements in good time for this season's trade. If you are not posted as to where you can buy our supplies advantageously, write us.

**GEORGE W. YORK & CO.** 144 & 146 Erie Street, CHICAGO, ILL.

# The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your Pocket-Knife will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it prepaid for \$1.25, or give it as a Premium to the one sending us; or, NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

**GEORGE W. YORK & CO.**

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

# An Italian Queen Free

—IN MAY, 1903—

To Regular Paid-in-Advance Subscribers Only.

We wish to make a liberal offer to those of our regular readers whose subscriptions are paid in advance. It is this: We will send you **FREE** by mail, in May, 1903, an Untested Italian Queen for sending us \$1.00 and the name and address of a NEW subscriber to the American Bee Journal for a year. This is indeed a big premium, as the queen alone would cost you 75c.

We are booking orders for Queens now for next May delivery. Will you have one or more? This offer ought to bring in many orders. Our queens are reared by the best queen-breeders, and give satisfaction.

Address,

**George W. York & Co., 144 East Erie St., Chicago, Ill.**

## \* Editorial. \*

**Honey for Tired Eyes.**—It is said that when the eyes are tired from long study and reading, a little honey rubbed on the lids at night will relieve them. Easy enough for bee-keepers to try, if they ever have the tired eyes.

**Shipping and Grading Comb Honey.**—This is a subject that we have written on several times during the past few years, and, judging from our annual experience we ought to write on it every time the season comes around for handling comb honey.

Recently we purchased a lot of honey from an Iowa bee-keeper. He did not ask us how we wanted it packed for shipping, nor did we volunteer the information, thinking that of course he knew how to do it all right.

There were over 40 twenty-four-section cases in the lot, and, would you believe it? They were shipped *singly*, instead of being packed six or eight cases in a crate, with straw under them, and the crate with two handles at each end.

And what of the result? There wasn't just seven cases of it entirely broken out of the sections, and some more combs cracked more or less. What a pity, to produce comb honey, and then through inexcusable carelessness or ignorance ship it in a way that must inevitably result in a loss, besides a miserable, sticky mess to clean up, as it all had to be handled over section by section, wiped off, the cases washed out, and the honey put back into them, after sorting the broken from the whole combs.

Now, as to the grading: There wasn't any attempt at this. There was No. 1 white, amber, buckwheat, and granulated, all mixed in a case! Out of some 40 cases there were eighteen of amber and buckwheat, one of granulated, two of culls, and the balance No. 1 white. Had this lot of honey been shipped to some commission men, they would likely have paid about 8 cents a pound for the lot, calling it all amber and broken. They would not, in all probability, have gone to the extra work of sorting out the various grades, separated the broken combs, and cleaned up the dauby mess.

We hope this experience will not only teach a lesson to the particular snipper who sent this lot of honey to us, but our description of it should serve as a warning to all our readers who produce and ship honey, to prepare it

properly for safe transportation on the railroad.

About the same time we received a shipment of nice, white comb honey from Wisconsin, which was prepared properly, with shavings in the bottom of the crate, and not a comb was broken down. It was also properly graded. There was a great contrast between the last shipment and the first one referred to. It was a pleasure to handle the Wisconsin lot, while the Iowa shipment was discouraging all the way around—undoubtedly to the shipper as well as to us.

**Simmins' Forced Swarms.**—All the time there is coming to light fresh evidence that forced swarms have been made by many who have said nothing about it, and there are not wanting cases in which publicity has been given to the practice, but for some reason less attention was formerly given than lately to the matter, and so a repetition of things said years ago will now be timely. A letter from the well-known English authority, Samuel Simmins, calls attention not only to the method of forced swarms, published by him many years ago, but to a material difference in details which is worthy of serious consideration. Mr. Simmins says:

### FORCED SWARMS.

Did you ever read my "Non-Swarming Pamphlet," published in 1886? If so, you will see how forced—then called artificial—swarms were to be hived on starters in preference to full sheets of foundation, with this very important difference:

"All the bees were taken from one colony, half the bees from another. The latter had all the spare combs—hence, still two powerful colonies and no increase."

Now, why do you make two weak colonies out of one strong one, as you are all doing? Is that progress? Will that give you the highest results? Certainly it will not.

In my own case I was obliged to add one or two combs of brood, principally because the bees having nowhere to place the incoming brood, would take it into the sections. After that there was no trouble in that direction.

Here is an extract from my "Non-Swarming Pamphlet," 1886, page 29, chapter on "How to Control Swarming;":

"When . . . the honey-flow has commenced, select any two strong colonies. . . . no matter how far apart; remove from one all the brood-combs but two left in the center. . . . and fill up with three frames having guides only on either side. Now return all the bees by shaking and brushing from the combs; and also one-half of those bees from the second colony. . . . Then put on supers of a capacity of not less than 40 pounds at one time, with all sections filled with [drawn] combs."

The brood-combs removed were given to the other hive deprived of part of its population and this afterwards served for either extracting or comb, and, with so many combs, this colony gives up all thought of swarming, though presently having an immense population.

SAMUEL SIMMINS.

**The Future of Alfalfa**, so far as it relates to bee-keeping, is a matter of interest to Western bee-keepers. While some feel no anxiety in the matter, others feel that the doom of alfalfa as a honey-plant is not many years in the future. The whole matter hinges chiefly on the time of cutting alfalfa for hay. It is maintained by some that for best results alfalfa should always be left standing till at least well advanced in bloom, while others maintain that it must be cut much earlier. The conclusions of the experiment stations as to this are not reassuring. Those of Colorado, Kansas, and Utah, are agreed that alfalfa must be cut when first coming into bloom—say when one-tenth is in bloom—in order to get the largest amount of protein—that part which is absolutely necessary in order to form blood and muscle. When the cutting is delayed till the plants are half in bloom, there is a falling off in protein, and a still greater falling off when in full bloom.

Even if all should agree that for best results alfalfa should be cut when not more than one-tenth in bloom, the plant will, no doubt, continue to be an important factor in bee-keeping. That tenth will mean a good many tons of honey. Then there will always be a liability to delay. Where a very large surface is to be cut it will not be possible to cut all in one day, if indeed in a goodly number of days, and every day's delay will mean just so much addition to the larder of the bees. A considerable acreage will be used as pasture, giving a continuous yield, and always there will be a considerable amount allowed to go through its full season of bloom for the purpose of maturing seed.

So at the worst there will still be no little for the bees, and with the usual hopefulness of bee-keepers the producers of alfalfa honey will keep right on gathering in their precious harvest until the time of failure comes—if it ever comes.

**The Value of Foods.**—The following clipping from that important English periodical, Chambers' Journal, has been sent by a Canadian physician, Dr. W. O. Eastwood:

We once heard an intelligent child complain that "all the nicest things to eat seem to be unwholesome." If that child, now of larger growth, should happen to alight upon the report of a lecture delivered lately before the South-West London Medical Society, by Dr. Robert Hutchison, he will rejoice greatly, for the lecturer demonstrated that many nice things have a very great dietetic value. He condemned many of the much-belauded patent foods, and showed that, upon analysis, they compared very unfavorably with meat, eggs, milk, and sugar. "A pound of honey at ninepence," he said, "is a better source of sugar than a pound of malt extract at three shillings." And, speaking of cod-liver oil as a means of administering fat, he

remarked: "In cream you get a more valuable substance, because ordinary cream contains more than 50 percent of fat, and butter fat is as easily digested and absorbed as the fat of cod-liver oil, besides being much more palatable and considerably cheaper.

The lecturer also spoke highly of the value of chocolate and Everton coffee, because in both you get a combination of fat and sugar without water. Unfortunately it is difficult to make people believe in the great value of a diet within their reach. They will turn away from such commonplace things as milk and eggs, and go to any amount of trouble to procure costly preparations having only a tittle of their value as food. The lecturer's good opinion of cream, honey, chocolate, and coffee will be received with enthusiasm by the rising generation, if not by their elders.

It is gratifying to see that the medical profession are assigning to honey the important place it once occupied as an article of food and medicine. It certainly does not seem that the inclination to gag on the part of the patient aids in the assimilation of cod-liver oil, and if something at less cost can be substituted for it, at the same time substituting a pleasurable sensation for the gagging, common-sense would approve the substitution.

And the same common-sense would approve the substitution of honey for malt extract, however highly the latter may be esteemed, if the honey "is a better source of sugar" at one-fourth the cost.

May the tribe of Dr. Hutchinson increase!

## Weekly Budget.

MR. MORLEY PETTIT, who was present at the Chicago-Northwestern convention, has begun a report of that convention in the Canadian Bee Journal, which shows that Mr. Pettit has his observer and his condenser both in good working order.

THE DEATH OF RAMBLER—John H. Martin. —The following we take from Gleanings in Bee-Culture for Jan. 15:

### THE RAMBLER SICK IN CUBA.

Mr. J. H. Martin, better known as "The Rambler," has been very sick with fever; but from the last account he was on the mend. He is getting to be pretty well advanced in life, reaching 63 last December; and the last time I saw him (in California) I could see that age was beginning to tell on him. He has been working hard in Cuba, securing a crop of honey, and we trust he will now save his strength sufficiently so we shall have the opportunity to enjoy again his good-natured chats.

LATER, JAN. 13.—The sad news has just been cabled us by our Manager, Mr. de Beche, that Mr. Martin is dead. Of course, there were no particulars; but the run of the fever was evidently too much for him, and the end came all too unexpectedly.

Rambler's hosts of friends will sincerely regret to learn of his death. We hope to be

able soon to give a picture of him and some biographical notes in these columns.

THE APIARY OF V. H. FISHER appears on the first page. When sending the engraving, Jan. 17, he wrote as follows:

I started in the bee-business in 1894, with one colony, and now have nearly 30, besides having sold a number.

The picture does not show all the hives. The building is a honey-house, for storage of hives, hives, supers, extractor, tools, etc.

A folding bee-tent is also shown, piles of supers, and a solar wax-extractor near me, when I was holding a large frame of honey.

The hives are all improved 10-frame Langstroth, made by myself, as I am a carpenter by trade, and a manufacturer of hives in a small way, putting in all my spare time in winter and rainy days in the shop making them.

I have a 3-horse-power gasoline engine sawing machine, and other wood-working machinery in the shop. I make an improved gable cover for hives, which is first-class. If kept thoroughly painted on both sides it does not warp, check, or leak.

The latter part of the past season was first-class for honey (too wet early); I had supers fairly well filled that were put on Sept. 13 and 14. This was eight or ten days later than I have ever put on supers, and the sections were filled. I obtained about a ton and a half of comb and extracted honey from 30 colonies, spring comb.

The prospects seem good for the coming season, as the bees went into winter quarters in good shape, with plenty of stores. Everything points to early swarms.

V. H. FISHER.

## Convention Proceedings.

Report of the Ontario Bee-Keepers' Convention,  
Held at Barre, Ont., Canada, Dec. 16, 17  
and 18, 1902.

REPORTED BY MORLEY PETTIT.

(Continued from page 54.)

WEDNESDAY—MORNING SESSION.

### PRODUCTION AND MARKETING OF EXTRACTED HONEY.

The subject assigned me by the committee is not one which I would have chosen, but as so much has been said in the past, and that by men of wider experience and a more thorough knowledge of the business, it might not be amiss for me to touch on some points which might raise a discussion, and in that way be of more service than would a lengthy essay, no matter how well put together.

First, in the production of honey, it is conceded we must have the bees to start with. Then we must have the man, and as neither one can produce extracted honey without the other, I would say the man is of far more importance than the bees. A first-class man will do far more with an apiary of inferior bees than could a useless man with the same number of colonies of the best strain of bees; and both together can not produce honey if there is no need to be gathered, as many of us have found to our disappointment. Granted all these conditions are favorable, what then?

First, we should aim to produce an article which will sell itself, if possible to do so.

Second, produce as much of it as possible. Quality first, quantity second, every time. What is "quality?" Flavor first, always; then body and color, or color and body, as

circumstances require. This for the home market. For shipping purposes I would put color first in quality, flavor second, and body third. Why the difference? For shipping purposes honey must be attractive and catch the eye, and there is a pretty general idea abroad that lightness in color is a sure indication of superior quality, and we must please the eye. Now, if we can combine the richest flavor and firmest body with the lightest color—almost or quite water-white, if you wish—we will have the ideal honey. In actual practice, how many get that? You who have been selling honey of different shades direct to consumers may answer that question. Why should not a fine-flavored honey, which is a rich straw-color, or an amber color, stand ahead of a water-white which is lacking in flavor?

Question: How can we secure the highest flavor with the lightest-colored honey every time? Localities differ. Seasons differ in the same locality, and so does the flora in the same locality. Pure clover honey differs in shade in the same locality in different years, and so does it differ in different localities in the same year. Why is this? How should such honey be graded? I would say flavor should stand first. Allowing honey to be well ripened in the hive gives a finer, firmer body. Does it give a richer flavor? I think it does.

Second, the marketing. This is a matter needing our most careful attention. If it is the home market, just show the would-be purchaser some of that first-class honey, and it is sold—at least as much of it as they need for the present. A word of caution here: Don't sell too much honey in one house at one time. Let them clean up their dishes every few weeks. A jar of granulated honey on the top shelf of the pantry is not likely to help sell a very fine liquid article which comes to the door. Better let them want honey a few days. Supply a good article at a fair price, and you are tolerably sure of your customers, unless you keep them waiting too long.

Is the honey to be shipped and sold to strangers? Well, I give it up. There are commission men—good men and true, at least some of them—perhaps they don't know much about handling honey. Then there are men who are wanting to buy all the honey in sight, but are not prepared to pay much—there has been such an enormous crop. Ar they any help in marketing our honey? Then there are

some who might purchase a quantity at wholesale and pay a fair price, but who will bring the producer and dealer together? What about that honey exchange?

J. K. DARLING.

The discussion was at first on the amount of honey which should be sold to one private customer. The conclusion was that to new customers we should not sell large quantities, but an old customer knows what he wants.

With reference to candied honey, if we sell the honey liquid we should explain to the customer that it will granulate, and tell him to put it in sealers from which he can dig it out and use without melting it up.

Mr. Holtermann described a novel way of selling granulated honey. A barrel of honey is set up in a grocer's window, and the barrel taken off, leaving the barrel-shaped cake of honey. One grocer, last winter, sold three 600-pound barrels in this way after Christmas, and this fall gave an order for five barrels "as a starter." The honey is cut off the barrel with a wire, as cheese is cut, and wrapped in paper by the pound, or in any quantity the customer desires. This makes a splendid advertisement. It becomes the talk of the town.

This idea met with much opposition. The paper would taint the honey, the honey would collect dust and flies, it would absorb moisture and melt down, etc.; but Mr. Holtermann said that the proof is that it has been tried and has worked.

Mr. Dickenson—I like honey best candied, and my family does, too.

Mr. Brown—Bottled honey sells best liquid.

Mr. Sibbald—We frequently have bottled honey sent back because it has granulated.

Referring to Mr. Darling's paper, quality is most important. Many bee-keepers send out poor honey, even honey that will ferment. This hurts our business more than anything else.

Mr. Newton—We are not making much impression on people trying to teach them to use candied honey. They prefer the looks of it liquid.

Mr. Pettit—The trouble is, when we sell people liquid honey, and it candies on their hands, they say it has all gone to sugar." Better sell it in its natural state, and put on a label with directions for liquefying.

Mr. Holmes—The barrel is a good thing if practical. Yet it is at variance with the modern tendency toward small packages.

Mr. Byer—We must use our judgment as to the trade. If put up in glass it must be liquid, yet we should further the sale of granulated honey as much as possible. For the home trade I use 5-pound and 10-pound pails, labeled with directions for liquefying.

Mr. Miller—Honey granulated in 5-pound slip-cover pails is clean to handle; if a customer tips a pail it does not drip, and it is always ready for sale.

Mr. Couse—If a man orders a quantity of honey I do not let him have it all at once. I can care for it better than he can, and take it to him liquefied just as he needs it. If the honey always goes out in good shape a great deal more can be sold.

Mr. Whitesides—We should get the honey into the hands of the buyer as cheaply as possible. Selling in paper, or in lard or butter trays, tends in this direction. If honey is sold liquid it requires to be liquefied so often, and where it is in bottles this is difficult. It may be done by setting the bottles in a room kept at a temperature of 140 degrees, Fahr.

Mr. Morrison prefers a small tin package.

Prof. Shutt—We have learned that honey is very absorbent. In a dry atmosphere Mr. Holtermann's barrel might be all right, but in a damp climate it would accumulate moisture.

Mr. Holtermann—In a small city a barrel will be sold in ten days, so it has not much time to accumulate moisture.

Mr. Evans—Small barrels might be used for a smaller trade.

#### CLIPPING QUEENS' WINGS.

"How do you clip queens' wings?"

Mr. Miller—Set the comb on end, then follow her with the thumb and finger until you can grasp her shoulders. Then clip with a small pair of scissors, either on the comb or in the hand.

#### NOST PROFITABLE MANAGEMENT OF BEES.

"How would you manage bees to get the most money with the least labor?"

Mr. Miller—This is a big question. Roughly speaking,

it is by out-apiaries, short cuts, and learning to get along with little skilled labor outside of your own.

#### SPRING PROTECTION OF BEES.

"What do you advise for spring protection of cellar-wintered bees?"

Mr. Miller—Reduce the entrance, and have good top packing.

Mr. Fixter—Set the bees in a place sheltered from cold winds.

#### THE BEST CLOVER.

"What is the best clover for both bees and farmers?"

Mr. Miller—Alsike clover.

Mr. Fixter—Alsike and sainfoin give more honey. Sainfoin is not so woody, and is cut later. It is also a better fertilizer. It gives a second crop, as alsike does not.

The general opinion was that alfalfa does not yield honey here, the climate being too dry.

#### MANAGING OUT-APIARIES.

"In managing out-apiaries, would you have a full outfit at each yard?"

Mr. Miller—Yes, and haul the honey home as soon as possible after the extracting is done.

#### SIZE OF BROOD-CHAMBER.

"Is 2000 cubic inches sufficient capacity for a brood-chamber to suppress swarming?"

Mr. Miller—We need a large brood-chamber.

Mr. McEvoy—Yes, the brood-chamber should not be too large.

Mr. Holtermann—The Dadants have used large hives successfully for 15 or 20 years. If you are a good bee-keeper you can get a 12-frame Langstroth filled with brood. The shorter the flow the more bees you want, and the less you want them to divide up by swarming.

C. W. Post—If you have a large hive you can reduce it when necessary.

Mr. Dickenson prefers a smaller hive for a short flow.

Mr. Heise—With a hive holding 10 frames 11 inches deep, and an exclusive clover flow, averaged 133 pounds per colony.

Mr. Chrysler—A good queen can fill a large hive with brood in fruit-bloom.

#### QUEEN-EXCLUDERS.

"Would you advise an all-metal or slatted queen-excluder?"

Mr. Armstrong—The Heddon excluder made with strips of wood and perforated metal is the best, but it is difficult to make. The all-metal excluder does not clog up so quickly with propolis.

Mr. Sparling has some excluders with 2-inch strips across the middle, which seem to work just as well as the all-metal.

#### DEPTH OF FRAME—PROSPECTS FOR 1903.

"Would you use a deeper frame than the Langstroth?"

Mr. Heise—I use a frame 11 inches deep.

Mr. Holtermann—it is best to keep to the standard.

"What are the prospects for next year's honey crop?"

Mr. Armstrong—They never were better. There is the most clover we ever had. If the alsike does not leave, and we have a good fall set, we may be sure of a good crop next year. I speak particularly for heavy clay land.

#### RETURNING SWARMS TO PARENT COLONY.

"Is it a good plan to return swarms to the parent hive after two days?"

Mr. Armstrong—No, they would be out that day or the next.

Mr. Darling—If it is a second swarm cut out the queen-cells and return them at once. In cutting the cells liberate on the combs all the queens which are ready to hatch, and run the swarm in at the entrance. If you happen to miss any cells they will swarm again; but these free virgin queens are different, and they insure the colony against accident to the queen which is out with the swarm.

#### CELLAR-WINTERING OF BEES.

Mr. Dickenson blocks each hive up from the bottom-board on four blocks, and tiers them up three high. Wintering is a matter of temperature, dampness cuts no figure. He runs his bees in on a truck; can put in 150 colonies in four hours. The bees are all right if they are quiet.

Mr. Brown lives near Ottawa. He wants to get his bees in Nov. 10 to 15, a day or so after a good flight. He re-

moves the wooden cover and leaves only the propolis quilt on all except the top hive in the pile, on which he leaves the cover. He is not particular, but blocks up the hives where convenient. He has less than 3 percent dead in the spring when carrying them out. Temperature 40 to 45 degrees, Fahr. A ventilating stove-pipe runs from the floor up to the pipe of a stove in the drawing-room overhead. He finds the 10-frame Gallup winters better than Langstroth hives.

Mr. Holmes—Change the propolis cloth for a cotton and sawdust cushion.

Mr. Miller—I would do away with the blocking by leaving off the bottom-board and piling one hive across two.

Mr. Fixter—Mr. Pettit's plan works perfectly. Pile the hives on a bench which is higher at the back than at the front. Block up the back of the hive from the bottom-board with 3/8-inch blocks. Put on a chaff cushion to keep the top of the hive warm, so the moisture will not condense and run down on the cluster.

#### HOW TO EAT HONEY.

"How would you eat bread with honey on it if you have a large mustache?"

Mr. Armstrong—Perhaps Mr. Newton can tell.

The opinion of the meeting was that you should have Canadian honey of good flavor and body, then either turn the bread upside down or else stand on your head!

#### AN ADDRESS ON "PROGRESS."

Prof. Creelman, B. S. A., Superintendent of Farmers' Institutes for Ontario, gave a stirring address on the subject of Progress, at the second afternoon session. The object of these associations is to give information, and people are anxious for it. Twenty thousand persons attended the Winter Show at Guelph last week. A lecture room seating 600 was not able to accommodate one quarter the people who sought admittance. Here lectures were delivered at all hours of the day by men competent to speak on all branches of farming. Farmers were asking questions about bacon, poultry, beef, cheese. There is coming to be as great a demand for information about honey. All these other industries were but a short time ago in their infancy. When they began to boom, people feared over-production, but the demand has increased with the supply. A few years ago Canadian pork could not compete with Irish or Danish pork, but Canadians combined and forced in a good article. Jno. Bull is conservative, yet when he got a taste of Canadian "pea-fed" bacon his appetite for it increased at the rate of one million dollars' worth per year. We supply 70 percent of the cheese on the English market. Twenty-five million dollars is spent by England for Canadian cheese, and it comes mostly from Ontario.

Now give them a taste of Canadian honey; always send a good article, and there is no chance of over-doing the honey-business. In going from Liverpool to London you pass through large cities whose names you have never heard. All manufacturing cities produce not one pound of food, but all require to be fed from outside the country. Let the bee-men of Ontario get into line with the fruit-men and poultry-men, and create a more lively interest in the industry and the Association.

Prof. Creelman advocated a closer relation with the Department of Agriculture. He suggested an affiliation with the Fruit-Growers' Association. As we also have some common interests we could meet at the same time and place, and so get reduced railroad rates; advertise together; have joint evening sessions, etc. At the Fruit-Growers' convention each director was asked to bring in a written report of what they had done to advance the interests of the association during the year. The directors take pride in this sort of thing. If not, they are not elected next year. The Department of Agriculture is ready to do what they can to help every association as soon as they see good use is being made of the money.

With regard to selling honey, we must create a demand. Keep the papers full of it. Keep store windows full of it. Get people to eating honey instead of the adulterated jams, marmalades, etc.

The following is the

#### REPORT OF THE INSPECTOR OF APIARIES.

During the season of 1902 I visited bee-yards in the counties of Huron, Middlesex, Perth, Brant, Wentworth, Lincoln, Welland, Halton, York, Cardwell, Grey, and Simcoe. I inspected 91 apiaries, and found foul brood in 30 of them, and dead brood of other kinds in many others which had been mistaken for foul brood. I also found several fine

apiaries completely cured of foul brood that had been reported to be diseased.

The frequent showers that we had in the early and middle part of the past honey season kept the bees in their hives for hours at a time, and this taking place when the bees had a very large quantity of larvæ to feed, caused a rapid using up of the stores, and as fast as the cells were emptied the queens layed in them, and soon after that all brood-chambers became full of brood, and as they were left in that condition, with the bees being driven in from time to time by the rains, which were followed by sudden warm spells, brought on the greatest rage of swarming ever known in the Province of Ontario, and created a great demand for comb foundation, and some bee-keepers not having any on hand, and not expecting to get any very soon, used some old combs (that were saved from colonies that had died from disease), and spread the genuine article—a thing the same parties will never do again.

All old, diseased combs should be melted and put through a wax-press, as that is the only kind of an extractor that will take all the wax out of old combs.

It would greatly improve the apiaries in many localities if their owners would use more foundation, and melt a part of their old combs each year until they were all renewed.

While on my rounds through the Province I was much pleased with the very generous treatment that I received from every bee-keeper.

Wm. McEvoy.

(Concluded next week.)

## Contributed Articles.

### Heredity in Bees—Further Explanations.

BY L. STACHELHAUSEN.

ON page 422 (1902) I wrote a short article in which I tried to explain the way the worker-bees can transmit to their offspring their own qualities. Prof. A. J. Cook honored me by considering this article, and wrote an answer to it on page 567. Probably I did not express my ideas plain enough, because Prof. Cook speaks of the evolution in bees, and says:

"In all organisms parents.... are ever producing offspring varying from each other.... Thus while all parents tend surely to transmit their own peculiarities to their progeny, there is always as surely a like tendency to variation."

In all this I fully agree with Prof. Cook, but in my article I did not intend to write about evolution of the bees, or the possibility of variation, but to consider the transmission of all regular characteristics, form and power of organs, and other peculiarities of the *worker-bees*, through the queen to the offspring of the *worker-bees*, while the queen and all her ancestors never possessed these peculiarities. This surely can't be called a variation, and so Prof. Cook's article does not cover the case.

We know that from an impregnated egg a queen can be reared, and this is quite in accord with other organisms, as the young queen is very like her mother (variations are possible). This needs no explanation, at least not for our purpose. Now comes the dividing point: For a certain nourishment of the young larva we get no queen, but a worker-bee from the same egg. (And under certain circumstances even animals, which are part queens and part worker-bees). These worker-bees are not variations of the queen, but the regular progeny of the queen, and quite unlike herself. The problem is to explain this, and this is entirely impossible, if we consider queen and worker-bees as independent animals.

Our theory is, that the queen is no perfect animal; her sexual organs and functions are fully developed, but all organs for nourishment are undeveloped, or entirely missing, not only the inner organs but the exterior organs of nourishment, as for honey, pollen, etc., too. The queen is not able to preserve her life without the worker-bees, not even for some hours. On the other side, in the worker-bees the sexual organs are rudimentary, but all organs for nourishment are fully developed. We say the true female animal is *queen and worker-bees combined*. With bees we have the peculiarity that the sexual organs are in a separated body, and the organs necessary for nourishment in another

separated body. The way in which they are nevertheless closely connected, I tried to explain in different articles.

Another theory is possible: We can say some ancestors of the queen had all the organs and instincts which we at present observe with the worker-bees, and the power to transmit these peculiarities remain latent in the queens, and appear regularly by a certain nourishment of the larva. This theory is very probable, and, if true, would make impossible any further evolution of the bees.

If we accept our theory we have no more difficulty. In the same way, as it is possible, that the egg of a mammalia inherits the disposition to develop into an animal with the same form of the head or the legs, etc., as the parents have; it is impossible, too, that the eggs produced by this *combined female bee* can develop into a queen or into a worker-bee (or into a drone, if not impregnated); and while one of these forms will develop depends entirely on the food given to the larva. The food is deciding, but the disposition for these different developments must be inherited. The fact that in the female bee the sexual organs are in a body separated from the body which contains the nourishing and blood-forming organs, is a peculiarity of the bees, and does not alter the functions of the organs at all. The discovery of how these different bodies work together is one of the most important discoveries in the physiology of bees, and solves problems which were unsolvable before, and it was the purpose of my article to explain this. It is astonishing that all this is entirely ignored by the bee-keepers in the United States.

On page 563 (1902) Prof. Cook says: "This mother-queen had the power to transmit them [the good qualities of the worker-bee] else they [the young generation of worker-bees] would not possess them." Just so. But the question which I raised is: How can she transmit these qualities which she or her next ancestors never possessed?

If an Italian queen is mated to a black drone, the drones from this queen, according to parthenogenesis, will be pure Italian drones; but if our theory is correct, and the worker-bees are hybrids, these drones should show at least a small sign of black blood. Different prominent bee-keepers (among them Mr. Doolittle) are said to have observed this small amount of black blood. Some concluded, from this fact, that parthenogenesis was an error. As we had other proofs for parthenogenesis, we considered these observations as impossible, and mistakes; but if we accept our theory we have no more difficulty in explaining the fact. That the influence of black and hybrid nurse-bees is not more visible in the color of the offspring is no proof against the theory, as the power to transmit certain peculiarities may be different, so that queen and drone have more power to transmit the color.

What Prof. Cook says about the evolution of animals, especially bees, is very interesting. That a change of environment causes some variations in animals is surely true, and we see this in all our domestic animals which at present are so much different from the wild animals from which they are descendants, that we, in some cases, have to consider them as different species. Bees, too, to a certain degree change their habits. If we use very large hives, for instance, the bees will by and by lose all desire to swarm. Even here these peculiarities must be transmitted to the progeny from the worker-bees, if they should become fixed.

Another way of evolution is by acquired peculiarities. If the worker-bees of a colony should, by much stretching and using of the tongue, acquire a longer tongue, this would not help anything toward improving our bees if the worker-bees could not transmit their own peculiarities to the coming generation.

Bexar Co., Texas.

## Sweet Clover—Is It a Noxious Weed?

BY C. P. DADANT.

NOTICE on page 803 (1902) that a reference is made to us in regard to what we have said about the sweet clover being easily destroyed by cattle. I wish to give the sum of my experience on the subject.

Sweet clover was introduced in this part of the country by an old friend of ours, in the fifties. This person at the same time brought the seed of dandelion. There may have been others who brought these seeds as well, but we know of these instances because our friend told us that the two plants mentioned were not in existence around here until he sent for the seed. He had sowed the sweet clover in a very steep hillside near the Mississippi river, on the com-

mons, but the place was so steep that the cattle could not get all of it, and it kept reproducing itself till my father went and gathered some of the seed for a trial of it in cultivation.

We had then a narrow strip of land fenced in by the original owner on the outside of our farm limits. This strip was three-cornered, and unpleasant to plow, and for that reason we put it to sweet clover. It remained in sweet clover probably for ten years or more. At the end of that time, a survey showed us that it was outside of our farm limits, which we did not know till then. We concluded to remove the fence to the line. This left the sweet clover exposed to all the cattle of the vicinity, as all open land was at that time.

Within two years, that sweet clover which had grown to the height of six feet or more, and had been so thick that a man could make his way through it with difficulty—that clover, I say, had all disappeared, and had given place to the blue-grass and white clover that usually cover our commons when regularly pastured. When I say it had *all* disappeared, I mean it in its broadest sense, for there was not a single plant left. It had been entirely destroyed by two years' pasturing that only causes the blue-grass and white clover to thrive that much better in the same spot. Of course, it was close grazing that did it. Our farmers will all remember that pasturage became very short upon the commons of Illinois just before the law was passed which forbade cattle running at large. Had this been a fat pasture, I suppose that enough of the sweet clover would have been left to keep it alive in a small way.

Now the fact I have just narrated evidences the ease with which the clover can be eradicated, and this is of some use to the bee-keeper. Many persons have accused bee-keepers of introducing a noxious weed when they sowed sweet clover in their neighborhood. But this is *not* a noxious weed. Although it will grow wherever other weeds will grow, it does not invade cultivated fields. It cannot invade them since it is a biennial, and therefore offers two seasons in succession for its eradication. Granting that it may come up in a field during the year, it cannot bloom the first season, and therefore the plowing of the following spring will destroy it before it has seeded itself.

Sweet clover is rank in growth, and masters the soil only in out-of-the-way places where neither stock nor cultivation interferes with it, and in those places it takes the places of much more noxious weeds than itself. It emits a sweet perfume, which is certainly preferable to the smell of the jimson-weed (*datura stramonium*), and it does not cause diseases like the ragweed which we all know is responsible, through its pollen, for the existence of hay-fever—a disease which is only known where the ragweed exists. The sweet clover not only occupies the place of the latter weed but chokes it out of existence by its most vigorous growth wherever these two weeds are left free to fight the battle of the "survival of the fittest." In addition, sweet clover is one of the greatest soil-enriching plants in existence, for its roots are long and large, and it takes most of its nourishment from the atmosphere.

Those who complain of the existence of sweet clover do not take into consideration the fact that such weeds must grow where sweet clover grows. So is it not much better, and more profitable to the community, to have a useful honey-producing, sweet-smelling, healthy and a soil-enriching plant, than the rank, ugly and unhealthy, useless ragweed?

Do not understand me as saying that sweet clover is a good pasture plant. If it is allowed to grow, it is too rank for a good pasture plant. If pastured close, it does not stand the strain. So it is only an inferior pasturage plant. But it makes good feed for stock if taken at the right time. We have a friend in the Province of Quebec—a Mr. Pelouquin—who has repeatedly told us that sweet clover proved quite a boon to them in their cold climate. When spring opens in Quebec, it takes a long time for pastures to become good. But it appears that sweet clover of the second year's growth gets to be about a foot high before any grass can be had. They then mow it and feed it to the stock. This mowing does it no harm, and they can still count upon a honey crop and quite a little feed from it even after having secured from it an early stock food-crop which nothing else would furnish.

I think the reader will agree with me that the sweet clover deserves no blame, but that, on the contrary, it should be introduced on all soils where weeds are expected to grow, even if it were not a first-class honey-producing plant.

Hancock Co., Ill.

## The Nucleus Method of Rearing Queens.

BY DR. E. GALLUP.

MR. ALLEY says, "How this must surprise my friend Dr. Gallup," after saying that he worked on the plan that if a colony was deprived of its queen the bees would rear another. Yes, I was surprised that a man after having as much experience as he claims he has had, should still advocate the rearing of queens on the nucleus plan and recommend others to use it.

Farther on he says that he knows by actual experiment that just as good queens can be so reared, as can be reared by any other method ever given to the public; and I know by actual experience that they cannot be, and are not as good. I have come to the conclusion that Mr. Alley does not even know what a good queen is. I quote from Prof. Cook's Manual, pages 91 and 92:

"We should infer that the best queens would be reared in strong colonies, or at least kept in such colonies until the cells were capped. Experience also confirms this view. As quantity and quality of the food and the general activity of the bees are directly connected with the full nourishment of the queen-larvae, and as these are only at the maximum in times of active gathering—the time when queen-rearing is naturally started by the bees—we should also conclude that queens reared at such seasons are superior."

My experience—and I have carefully observed in this connection—most emphatically sustains this view. Now, Professor, how dare you so emphatically contradict Mr. Alley, a man who according to his own statement, reared queens in nuclei before you or I knew anything about bees? Isn't that funny?

Mr. Alley says at the conclusion of his article that he will risk his reputation as a queen-breeder on the result. I cannot see for the life of me, how his reputation can be very great when by his own showing 90 percent of his 50,000 queens reared have turned out to be worth as much as so many flies. Only think, 45,000 worthless queens he must have been rearing just for fun! Isn't it astonishing, how large minds often run in similar channels? I started in and reared my first queens by tying a piece of comb with a string to the top-bar of a frame, and using a small quantity of bees, for I then supposed that a queen was a queen, no matter how she was reared; but, it did not take me 50 years to find out that queens reared in this way were worthless, and inferior in every respect, and that the plan is unnatural, unreasonable and unscientific. It is unnatural to deprive a colony of bees of their queen and compel them to rear a queen at any time, whether conditions are right or not.

Now, what are the natural conditions? The colony is strong in numbers, they are gathering abundance of stores, thus keeping up an abundance of warmth and vitality, they also have lots of nursing-bees to prepare the royal jelly, etc., all of which is lacking in the nuclei. The cells are started and the queen deposits the egg in the cell. If even after the cells are started, and all is proceeding right so far, if from any cause the supply of forage is cut off suddenly swarming is abandoned, the cells are cut down, drones are expelled, and there is no more swarming that season, even if the weather is ever so propitious, until a new crop of drones is reared. This accounts for the bees clustering outside and not swarming so many seasons in old box-hive times. How many seasons we have watched in vain for swarms, and no swarms came out. Any person, we care not who, that practices the nucleus plan of rearing all his queens, for a series of years, will find his colonies running to the lowest ebb. Any person, we care not who, that practices rearing his queens in extra-strong and populous colonies, and under the swarming impulse, will find the reverse, and he will find the first-named queens and workers short-lived and unproductive, while the last-named will be long-lived and productive, even in comparatively poor seasons. Don't expect to bring your queens up to the standard in one season.

I wish to say to A. C. F. Bartz, on page 760 (1902), please don't class me with the professional queen-breeder, as I have never reared queens for market, never have sold a single queen to my recollection, but there is probably no man living that has expended so much time and labor in experimenting with bees, on nearly all lines, purposely for my own satisfaction, and as I have been a noted and prominent writer I wished positively to know by my own experience what I was writing about, regardless of what other people said. I am keeping a few bees now on purpose for my own amusement, and for experimentation.

At the time I had such a great loss of queens, you can see all were reared on the Alley plan, that is, no queen in the hive. In losing the queens I also lost the colonies, as none of them were superseded. Why? Because the queens failed so soon and so suddenly that there was no unsealed brood or eggs for the bees to rear a queen from. When I saw the first queen crawl out of the hive, I picked her up and placed her back into the top of the hive, and she immediately crawled out at the entrance again. I then opened the hive and examined for queen-cells, and found none, and the brood all too far advanced to rear queens from. In watching closely I saw 4 other queens crawl out in the same manner, and no queen-cells and no brood to rear queens from.

Now, Mr. Alley cannot say that the loss was owing to my ignorance in introducing in those cases. I will give Mr. Alley the credit of trying to crawl out of a smaller hole than I ever attempted to crawl through. The reader will see that those queens were not introduced at all, but reared right in the hive. Don't understand me as saying that I saw all those queens crawl out in one day, or at one time, but on different times and days. The most of those that died in the winter I found either on the bottom-board or dropped by the bees in front of the hive.

I had noticed the loss of queens and colonies previous to this, but did not pay much attention to the matter. All were reared on the Alley plan of depriving a colony of their queen. But the above wholesale loss set me to studying into the matter. I have tried the plan of filling a colony full to overflowing with young bees, brood, etc., and then taking their queen away and compelling them to rear queens. They usually rear a lot of queens and do fairly well for two seasons, but they do not begin to come up to good queens reared under the swarming impulse. In fact, as far as I have discovered, they lack the missing link. Please see Mr. Riker's article, on pages 766 and 767 (1902).

Please do not borrow any trouble about Gallup not being able to keep up his end of the row. Alley's tirade of abuse and misrepresentation harms no more than water harms a duck's back. I am just enjoying the fun, and in the meantime trying to interest the general reader. I am not, and never have written for the benefit of those that know more than I do, but for those that know less. I never claimed to know it all.

Now, let any person that wishes to improve the race of bees try the Alley plan and see for himself, if he chooses. This is a free country; but I can tell that he will make a move in the wrong direction. Then let him try the plan of rearing queens in large hives, with strong and populous colonies—the stronger the better—and see how he comes out. Let him start with the very best queen he can get in every respect, not one that has been reared on the Alley plan, for it may take three or four generations to bring them anywhere near the natural standard; then see which he will choose for profit. That is somewhat different from Alley's advice. Any one has the same privilege to go over the same ground that I went over years ago, instead of believing either Mr. Alley's or my bare statement. You can readily see Mr. Alley is seeking a free advertisement, while I have nothing to sell. The contrast between the two kinds of queens will be so great that a blind man with his eyes shut can note the difference. Orange Co., Calif.

## Our Bee-Keeping Sisters

Conducted by EMMERSON M. WILSON, Marengo, Ill.

### Amount of Foundation to Use in Sections.

It is very necessary that foundation be used in sections, at least enough for a guide, so the bees will build straight. There may be a diversity of opinion as to how much is best to be used, but all, I think, will agree that at least a starter is a necessity.

Some think it cheaper to furnish just a starter, and let the bees build their own comb; while others think it best to give the bees all the advantage they can in the way of foundation by putting in full sheets.

So far as concerns getting the comb started in the middle of the section, a starter half an inch deep will answer.

Of course, this means a saving in the purchase of foundation.

There are, however, good reasons why some think it better to put in a large amount of foundation, even to filling the section full.

Where a small starter is used, there will be more or less drone-comb built, and a section containing part drone-comb does not present so good an appearance; and you know that a comb honey the matter of looks is important.

Another thing: There is generally very little drone-comb in the brood-chamber, not as much as the bees would like to have used for drone-brood, and when drone-comb is built in the sections there is much likelihood that the queen will lay in the sections unless queen-excluders are used.

Even if excluders are used, the bees will hold some of the drone-comb open for the queen to lay in, thus leaving parts of sections unfinished.

Another advantage, and at times the greatest advantage of all, is the fact that when a flood of honey comes, the bees have a greater surface to work on with full sheets, and there seems plausibility in the claim of some that more honey can be secured than by using small starters. It surely must be a saving of time for the bees.

The question for each one to decide for herself is whether the saving of cost of foundation by using small starters will be worth more or less than the advantages of full sheets.

We have decided the question, that for this "locality" we can not afford to have anything less than full sheets.

### Look Out for Mice in the Bee-Cellars.

You are not forgetting those mice in the cellar, are you? If you are, you will be ready to vent your vengeance on them next spring when you see the big holes they have made in your nice combs. You would better vent it now with a little strychnine and cheese. It will be more to the point.

I think I hear some one say, "She told us that before." So I did, but if you are any like me you will need some one to tell it to you often, else you forget.

### A Thermometer for the Bee-Cellar.

Have you a thermometer in your cellar? If not, you would better get one and keep it there. You can get one for 15 or 20 cents.

About 45 degrees is generally considered the best temperature for bees, but all thermometers are not alike. If you have a lot together you may find that they vary ten degrees. How are you to know which is right? Put your thermometer in your cellar, then keep close watch of your bees, and see at what temperature your bees keep the most quiet, then try to keep them at that temperature.

That is the right temperature for you. At least that is what your bees say.

### Honey-Muffins.

Two eggs, 2 cupfuls flour,  $\frac{3}{4}$  cupful extracted honey,  $\frac{1}{2}$  cupful milk,  $1\frac{1}{4}$  tablespoonfuls butter,  $1\frac{1}{2}$  teaspoonfuls baking powder,  $\frac{1}{2}$  teaspoonful salt.

Separate the eggs. Beat the yolks until thick, melt the butter, add it and stir in the honey, milk and salt. Sift in the flour, beating until smooth. Then fold in the whites of eggs, which have been beaten stiff. Add the baking powder at the same time. Bake in muffin-rings set on a griddle. When done, drop a bit of butter on top of each, sprinkle with pulverized sugar, and serve; or, omitting the sugar, pass extracted honey with them.

For special occasions a delicious sauce is made from honey and almonds, two tablespoonfuls of finely shredded blanched almonds being mixed in each cupful of honey.—The Delineator.

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards, for such effort.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### EASY FALL INTRODUCTION OF QUEENS.

Glad it was the careful Mr. Doolittle that said the usual precautions of introducing queens can be dispensed with late in the fall when brood-rearing has entirely ceased. Reasonable—but we want some good testimony in addition to sweet reasonableness when a queen's life is at stake. Just remove old one—wait two days—drop in new one. That the bees shall be quiet, and not cross at the time, is to be assumed, I suppose. Page 787.

### UNTESTED AND TESTED QUEENS.

It would be nice to say, "Untested queen," "Color-tested queen," "Tested queen"—making three grades; but the breeders, or some of them, are going to hang on like a bulldog to the old established use of the term, "Tested queen." You see. Page 787.

### INFORMATION ABOUT THE HONEY CROP.

So 48 out of 400 Colorado bee-keepers return a postal card sent to them with request for information about the crop. And Californians are not "spry" to give away their information to Coloradoans, and *vice versa*. Shall we scold? Or shall we smile—and say, Let's quit trying to travel on the good-nature of other people? Page 789.

### OLD LOCALITIES VS. THE NEW.

Yes, many old localities must see their crops gradually decline (on the average); while on the plains, as dandelions and white clover and sweet clover, etc., come in, the change is the other way. Interesting to see that in Hall Co., Nebr., from 1860 on, bees lived six or seven years—no surplus, no swarms—but now swarms and surplus all the same as in the white man's country. Wm Stolley, page 791.

### WISE BEE-KEEPERS STORE NOW.

Bees are not storing now, but wise bee-keepers are. Just so, Sister E. M. W. Page 792.

### ADVANTAGE OF OBSERVATION HIVES.

Ralph D. Cleveland is right. There ought to be lots of more simple, cheap observation hives. The reasons he gives are correct—and in addition it would advertise our business and sell our honey much more than enough to pay cost. Pages 801, 805.

### BALLED QUEENS.

Against Mr. Doolittle this time. Can't back him, except that possibly he may be right as to his own locality. When the bees of a newly-hived swarm ball their queen, give up to them at once—that the incident is a failure, and that the bees may as well go back to the old hive first as last—do that anyhow. This is about what my experience indicates. He says it is *exceptional* for them to ball her the second time after she has been properly released. Page 804.

### WHY THE BEES ATTACKED THE HATPIN.

On the issue between Mrs. Snyder and Miss Wilson, as to why the bees attacked a black hat-pin and not the black veil where drawn over the edge of the hat, I'll venture this guess: It takes black color *plus something else* to stir the dander of bees very much. Probably the hat-pin sparked which the veil did not. Possibly also it had a little chatu, or dingle of some sort, that kept bobbing around. I have seen bees attacking the end of a stove-pipe out of which smoke was crinkle-crankling. Sparkles and quick motions much worse than any possible color. Page 609.

### APIARY GARMENTS—SMOKING BEES.

Mrs. Snyder's best new idea is that a garment worn in the apiary and nowhere else will contract an odor conciliatory to the bees. Looks quite reasonable.

To smoke a colony—wait ten minutes—smoke again—wait ten minutes more—smoke again—rather expensive of precious time. But I once had a colony I so dreaded to encounter that I wouldn't have minded the time. For timid persons, just for the first time getting up spunk to handle bees, I should call it an excellent device—one of the best possible. Page 609.

## Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

### Sowing Sweet Clover on Waste Land.

I want to know something about planting sweet clover. I am thinking of going into the bee-business, and if I do I will go to Butler Co., Pa. I would have two or three hundred acres of worn-out ground for pasture; briars and curly grass grow on it now. If I sow sweet clover around over the ground, would it take hold? Or what could I plant on it for pasture? OHIO.

ANSWER.—The likelihood is there is nothing better for your purpose than sweet clover. If you scatter the seed where it will be tramped in by horses or cattle it will be pretty sure to catch, no matter how hard the ground. Indeed, it seems to grow better on a hard roadside than on soft plowed ground. There is one danger, however, and that is, if stock that has learned to eat sweet clover is allowed to run on it when it is young, they may eat it down so closely as to kill it.

### Pollen in Combs.

I send a piece of comb that I cut out of a brood-frame, and would like to know what is in the cells. It was gathered about the middle of June. Will the bees clean it out? If not, what can I do with it? About half of the brood-chamber cells are filled with it. MICHIGAN.

ANSWER.—I find nothing in the cells except a good supply of pollen, and that is in fine condition. If there is an unusual amount of it in the hive, you can give some of it to other colonies in the spring. In most places a pound of pollen is worth as much as a pound of honey; when scarce it may be worth a good deal more.

### Sowing Sweet Clover.

1. When is the right time to plant sweet clover?  
2. Does it bloom the first year?  
3. What kind of land should it be sown on? I want to order a 5-pound package, and before sowing I want to know all about it.

I have 2 colonies of bees to commence with next spring. They are in box-hives, but after swarming I intend to transfer them into good hives. They are Italians.

MISSOURI.

ANSWERS.—1. The seed may be sown in your vicinity, and it is well to have the ground made quite solid with a roller or otherwise. One of the most successful ways of getting a stand of sweet clover is to sow it on hard ground either fall or spring, and they have it well tramped in by live-stock.

2. It does not bloom till the second year, and dies root and branch the following winter.

3. It will not grow on solid rock nor in clear water; almost anything between these two will answer. It makes a fine growth on tough clay where nothing else cares to grow.

### Average Per Colony from Linden, Etc.

1. How much can 6 good colonies store in an average year, from say 25 average-size linden trees?

2. I work in the Cleveland parks. Would the honey from park shrubbery, where there is some *Kalmia latifolia*, rhododendrons and azaleas, be injurious? OHIO.

ANSWERS.—1. I don't know. In a very good year I should think the bees would have all they could do while the yield lasted, there being four trees to each colony; and if so the amount they stored would depend on the length of the harvest and the amount of yield each day. The daily yield might be 10 pounds for as many days, making 100 pounds

per colony. But then my guess that four trees would keep a colony busy may be all wrong, and a good many years there would be nothing at all from the lindens, some years a light yield, and some years a very short yield. Possibly the average yield might be 25 or 30 pounds to the colony, but I'm ready to let some one that knows more about it prove that my estimate should be doubled—or cut in two.

2. I should not be very anxious about it.

### Will August Bees be of Value in Spring?

Will worker-bees reared in August and September live through the winter? and long enough in the spring to be of any value in brood-rearing?

They had out-of-door exercise until Dec. 1, 1902; since then they have had no flight at all. It is now Dec. 28.

ARKANSAS.

ANSWER.—The lease of life of a worker-bee is a very variable quantity, chiefly depending on the amount of work done. With a good fall flow, a bee born in August is likely to die before November. If there is nothing for it to do from the time of its birth till cold weather, it may live to do fair work the following spring.

McEvoy's Plan of Increase is given in the Canadian Bee Journal. His plan of putting frames of brood into extracting-suppers, barred from the queen, so as to be sure of brood well fed and all sealed, is worthy of attention. He says:

Early in the honey season I lift two combs full of brood (about ready for capping) above the queen-excluders in many of my strongest colonies, and leave them there for nine days (the time it takes from the egg to the capped brood), so as to get all the brood extra-well fed and capped over. After these combs of brood have been nine days above the excluders, I collect two combs of brood from one super, two from another, and two from a third, with plenty of bees to cover them, and place these six combs of brood in an empty hive, and then give them a protected queen-cell, or a comb with eggs in from one of my best colonies, so that they can rear a queen, or cage a queen on the comb for about 24 hours, if I have one. The brood in these six combs being far advanced when it is placed in a new hive, will all be hatched out in a few days after.

I add brood to these young colonies from time to time until they are very strong in bees, and place supers on the early-made ones, and from these in fair honey seasons I get a super full of nicely capped honey.

The Premiums offered this week are well worth working for. Look at them.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get them subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

Honey as a Health-Food is the name of a 16-page leaflet (3½ x 6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 10 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order.

# Save Trouble

Are you one of those people who go around bothering your friends and acquaintances with some Ten or Soap or Jewelry or something else they don't want, so that you can get your own end and get a dinner set for a present! If you are you can just quit right now. Send us one-quarter of the price of any of the ten or soap, or jewelry dinner set, and keep the good will of your friends.

Elysian Pattern, Semi-Formal Ware.

This elegant ware is made by J. & G. Meakin of Hanley, England. Each piece bears the stamp of the Royal crown and their name as a guarantee that it is not made in the ware in China and Italy, like French china. The shape is elegant, as shown in the cut. The decoration is a double border of scrolls and flowers work all under the glass, so it is perfectly smooth to the touch and can never wear off. The color is a bluish green, something entirely new and in excellent taste. It is all of the first selection. No seconds or imperfect pieces. And is such a set as you would be lucky to get for \$15.00 in any retail store. The set contains 12 each: Tea, Breakfast, sauce and Butter Dishes, 2 scallop Vegetable Dishes, 4 covered Butter Dish, 2 Meat Platters, 1 Sauce Boat, 1 Sugar, 1 Creamer, 1 Bowl, 1 Pickle Dish, 10 pieces in all over \$8.27 and if you send us \$1.38 extra we will send 12 Footed Bowls for soup, milk and many other uses. This would make 12 pieces for \$9.75. If you live in Michigan don't answer this ad, because we live in Michigan too. The trade in Michigan, and outside of Michigan you now have the opportunity to buy anything you want in Furniture, Carpets, Lace Curtains, Wall Paper, China, Silverware, Art Hardware, and House Furnishing Goods at actual Wholesale Prices. You can save to 5% on all your purchases in this line. All Furniture dealers buy in Grand Rapids. We don't want to manufacture or import direct almost everything we sell. Free samples of carpets and wall paper sent on receipt of 10c to pay postage. Send for our 300-page illustrated catalog. We pay postage.

# FROM MANY FIELDS

## Encouraging Signs in California.

I have the pleasure of telling that we had about 2 1/2 inches of rain, as a God's blessing on our dry earth. Since the middle of last April we have had no rain, but we are having fine weather in Southern California. The new life of green shows everywhere, as the new hope of a good crop of everything.

At Christmas it is a beautiful sight to see the valley flowering and green, and the heads of mountains covered with snow.

This last year our honey crop was almost a failure; some got only 300 pounds from 75 colonies. My bees gave me 4 tons of honey from 200 colonies.

F. S. BUCHHEIM.  
Orange Co., Calif., Dec. 27.

## Good Convention—the Exchange.

I am going to take the American Bee Journal as long as I live. It is worth more than the dollar.

We had a good convention at Barrie, and started a Honey Exchange, the Directors being as follows: H. G. Sibbald, C. W. Post, Wm. Coose, W. A. Chrysler, and John Newton. I have unlimited confidence in every one of these five men, and in the new union. I expect to see them handle over 100 tons yearly, of the best quality of honey in the world.

The bee-industry of Ontario is booming, and after our Honey Exchange gets into good working order it would not surprise me very much if it would handle as much as 300 tons or more of choice honey every fall.

I canvassed every man at the convention, and got nearly every one to join the National Bee-Keepers' Association. While on my rounds through the Province I will canvass every bee-keeper to join the "Ontario Bee-Keepers' Exchange" and National Bee-Keepers' Association.

Wm. McEvoy.  
Ontario, Canada, Dec. 26.

## Indigo for Stings.

Mr. W. S. Harris recommends tincture of arnica and tincture of myrrh for the sting of a bee. I have used indigo, and recommended it for others, and have not known it to fail to stop the pain almost instantly. It is good for any insect poisoning.

F. M. KERR.  
Crawford Co., Ohio.

## Clipping Queens with Scissors.

I am wondering very much whether our Afterthinker here queens differently from the way we hold them when he clips with scissors. He talks (page 42) as if the queen makes it her business to keep trying all the time to push the scissors away while the clipping is going on, and the clipping is done by a quick move on the part of the bee-keeper before she gets out of the way. There is nothing of that kind in this locality. The work is deliberately done on the part of the bee-keeper, and the clipping is done when the bee-keeper sees and knows that no foot is in possible danger. He cogitates that mathematically it can't be otherwise than that I have a lot of maimed queens this minute.

Now, look here—Mr. Hasty, you keep inside your own domain. You're not to make wild speculations and guesses—you're to after-think. And when you come to give a sober afterthought to the matter, you will hardly want to say that without my knowing it I have a lot of maimed queens just because you don't know how to clip with scissors.

Say, Mr. Hasty, come around with me at the time of spring overhauling, and if you can find a single queen that I have maimed by clipping, I'll—I'll—I don't know what I will do, but I believe I'd be willing to have you

## BEE-KEEPERS' SUPPLIES

1903 CATALOG READY.—If you have not received a copy annually, send us your name and address, and one will be mailed you FREE.

**SPECIAL OFFERS.**—On all cash orders received before April 1, 1903, we allow a discount of 2 per cent.

To parties sending us an order for Supplies amounting to \$10.00 or more, at regular prices, we will make the following low rates on Journals: Cleanings in Bee Culture (semi-monthly) 50c; American Bee Journal (weekly) 70c. List of Agencies mailed on application.

Please mention Bee Journal when writing.

**A Celluloid Queen-Button** is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

**NOTE.**—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto to queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

## If you want the Bee-Book

That covers the whole Apicultural Field more completely than any other published, send \$1.20 to

C. C. MILLER.  
McHenry Co., Ill.

## Report for Season of 1902.

We had a poor honey crop here last season. I had 46 colonies last spring, in good condition. I got 600 pounds of extracted honey, 1050 pounds of comb honey, and increased to 76 colonies, by natural swarming. They are all in good condition at present.

There was an abundance of white clover here last summer, but the weather was too wet and cold. I winter my bees in a cellar, under a workshop. It is 14 by 20 feet high, with good ventilation. It has a cement floor.

THEODORE REHORST.

Fond du Lac Co., Wis., Jan. 5.

## Growing Ginseng.

It takes about 5 or 6 years for ginseng to mature for good, cultivated seed; then it is not full-grown, but it will do to market.

Wright Co., Minn.

F. GENT.

## A Farmer Bee-Keeper.

I started in bee-keeping with a box-hive colony which a neighbor gave me 7 years ago; since that time I have been working with bees, and with the help of the "Old Reliable" I have been able to make them pay me 3 times as much, for the amount invested in them, as any other property I have.

I am a farmer, and there are lots of bees in old Franklin county, but not much interest taken. Some are in box-hives, some in logs.

I love my bees. I winter them on summer stands. I had 36 colonies, all in Langstroth hives, the spring of 1902; I increased to 49, and got 1,000 pounds of honey, which I sold for 10 cents per pound.

I now go all over the country transferring in Langstroth hives; I also rear some queens from the best queens that I got from the queen-breeders.

M. H. SOSSAMANN.

Franklin Co., Ark., Dec. 28.

## What is a Swarm?

There has been some controversy in the American Bee Journal in regard to "swook" or brushed swarms. Some claim they should be called brushed swarms, others "shook" swarms. I think it all depends upon whether they are shaken off the combs or brushed off.

But why call them swarms? When is a colony of bees a swarm of bees? My idea heretofore has been that a colony of bees can only be called a swarm of bees when they are out of their hives and flying in the air—when they are swarming. As soon as the swarm clusters, or at least when they are hived, then they are no more a swarm, but a colony. Perhaps I am wrong, but if I am right then it is wrong to say a brushed or shaken or swook swarm. The one is a shook colony, and the other a brushed colony, and not a swarm at all.

Fulton Co., Ind.

S. MORRETT.

## Cotton-Waste for Smoker-Fuel—Shade-Boards.

Seeing so much lately in the Bee Journal about shade-boards and smoker-fuel, I thought I would tell what I consider the best smoker-fuel, and my plan of making shade-boards.

I have kept bees for several years, and am now nearly 78 years old. During my life I have used all kinds of rotten wood, planer shavings, and all kinds of old rags. In the first place, I would say that rotten corn-cobs, well dried and pulverized, are better than any rotten wood; still, I have something that beats everything else I ever tried. It is what is called "waste." It is what the engineers and firemen use to clean their engines with. When it becomes saturated with oil they throw it away. When they stop for any length of time they generally clean up. My first experience with it was about eight years ago. I took a bunch of it and put it in the smoker, and since then I don't want any rotten wood. All you have to do is to take a

Jan. 29, 1903.

bunch just large enough to fill the smoker, and just touch a match to it, and you are ready for business. You may set your smoker down, and when you pick it up it is all ready for business; it will not go out when once filled, and lasts nearly half a day.

As to shade-boards, I make them with shingles and strips, say  $1\frac{1}{2}$  inch, shingles only one thickness. As to size, any man can choose what suits him best. If it did not take so much time and space I would give my plan of putting them together.

Our honey crop in this part of Minnesota was not good. I commenced last spring with 60 colonies, and took about 350 pounds of comb honey. I put 91 colonies over winter quarters. E. B. HUFFMAN.

Winona Co., Minn., Jan. 2.

**Bee-Keeping in Cuba.**

The Gleanings in Bee-Culture's man "Rambler," and other Americans with bees in their bonnets, have invaded the western end of our beautiful island, but I want to tell you the La Gloria Colony is rapidly branching out in the bee industry.

We have had the preliminary meetings of bee-keepers, representing several hundred colonies of bees, looking to the formation of "The Eastern Cuba Bee-Keepers' Association." Our aim is to represent several thousand colonies of bees, and co-operate in knowledge. Then, too, we aim to join the National Bee-Keepers' Association, if permissible, and get in with the National commercial organization, if one is formed.

Our field for honey-production is good—royal and other palms, black mangroves, and many varieties of flowers through the woods. Cuba, Dec. 6. DR. E. M. DAVIDSON.

**Poorest Crop in 30 years.**

Our last years' honey crop was one of the poorest in my 30 years' experience in bee-keeping. Some of my colonies began to starve by Sept. 1, consequently I fed all the bees in the month of September, and hope to get them through the winter all right. Prospects for next season are very good.

Johnson Co., Kans. M. ZAHNER.

**Introducing Queens.**

The past season was a very poor one here, very little comb honey.

As I have never seen it in print, I will tell the way I introduce a queen, and have never lost one by this way:

The next morning after the queen arrives I remove her from the colony I wish to introduce her, and wait until they get to the height of their excitement, as bees always are when their queen is lost. I then place two little sticks,  $\frac{3}{4}$  inch thick, just far enough apart so the cage of the queen comes in will a little more than reach, and set them on top of the frames, so the queen will not be over the space between two frames; and put an empty super on the hive, put on the cover, and leave the colony entirely alone for four days, so as to give the bees plenty of time to eat the candy out and release the queen.

If the bees should happen to start queen-cells you can wait two days and cut them out, unless you want your bees to swarm.

Sometimes a queen will arrive in a feeble condition, or dabbled all over, and then instead of waiting for the bees to eat out the candy I release her myself as soon as the bees are very uneasy from the loss of a queen, with the result that I have always found them safe and sound. FRANK S. DEGROFF.

St. Lawrence Co., N. Y., Dec. 29.

**The Blight Question—Sowing for Bees.**

In Prof. Cook's article, page 22, he strikes the nail on the head (as he usually does), when he says: "All must combine, and all will combine, as ever the right comes uppermost, and ever is justice done." I am strictly a lay member, but would be pleased to be kept in the straight and narrow path.

While not agreeing with the California fellows on the blight question, and while not ad-

## "Bees in Colorado"

I still have several hundred copies of the souvenir with the above title. The bee-papers and a good many people without visible axes to grind have said it is a valuable and attractive thing. If you should like to have a copy, send me a silver dime or 5 two-cent stamps, and I will mail you a copy.

"BEES IN COLORADO" is the title of a 48-page and cover pamphlet gotten up to boom the Denver convention. Its author is D. W. Working, the alert secretary of the Colorado State Bee-Keepers' Association. It is beautifully illustrated, and printed on enameled paper. It is a credit to Mr. Working, and will be a great help in acquainting those outside of Colorado with the bee and honey characteristics and opportunities of that State.—American Bee Journal.

**D. W. WORKING, Box 432, Denver, Colo.**  
Please mention Bee Journal when writing.

vancing any cure for blight. I once happened to live one summer where there were no bees, but in a district where nearly everything in fruit line thrived, especially in the varieties of pear and apple, and it was all kinds, too—tree, limb and twig, also fruit-blight—and it was impossible for it to have been done by inoculation by bees or insects, especially the twig and fruit, as one day they were all green, thrived and growing, the next day blighted, shriveled and blown by wind. The variety called it "electric blight," claiming there was no blight there until the telegraph and telephone lines were stretched through their district.

As I feel a little critical, I noticed another article by J. E. Johnson, of Knox Co., Ill., who claims he has an orchard of 900 trees and no blight. Now, whether that is not a smooth way of securing an "ad," I am not sure, as after the assertion he leaves the subject. I would prefer that he would get the affidavits of some disinterested neighbors to that effect, and then give us the formula or peculiar method of cultivation, i.e., if he wishes to be a great public benefactor. The seed-sowing part of his article is a rich, productive soil is waste or uncultivated lands to scatter seeds on, but when we use good, tillable land for raising bee-pasture only, I am afraid it will hardly pay, while all kinds of blooming crops give two dividends. I find that turnip is a fine honey-plant, blooms at a season just after fruit-bloom, and the bees literally cover it from morning till dewy eve. If florists in their "ads" and circulars would always say whether or not certain flowers were honey-secreting, they would secure many sales from apiarists that at present they do not.

There are the "Sisters" that call a fellow an "Old Drone." Not being a bachelor, this probably is admissible, but suppose a fellow is not "old," and more, if there is another insect that really deserves sympathy more than the drone-bee, I am not acquainted with it. In the first place, Mr. Drone-Bee is fed on the fat of the land, groomed and kept sleek, not allowed to wait on himself, hovers the brood in cool nights and after a time of elegant leisure is pounced upon and ruthlessly driven from his own home to starve. Just think of it!

W. S. MITCHELL,  
Cherokee Nation, Ind. Ter.

## Feeding Bees—Dividing or Shaking.

I thought I might write how I fed the bees 200 pounds of sugar. I fixed up some feeders with floaters in them that gave me far better results than the Miller feeder.

I kept the mice out of my cellar by the use of poison and traps.

I have practiced dividing my bees for 15 years; I suppose every large bee-keeper does this. I always run out-aparties by the shaken or dividing plan.

I took all the honey from my bees last fall and fed sugar syrup. I have sold nearly all my comb honey, for the last two years, as chunk honey, cut it up and put it in Mason jars, and then filled up with extracted honey. I find ready sale for this kind of a package. I found a way to keep the honey from granulating in the jar. Put in just a little tartaric acid. I do not see that it hurts the honey. What do you think?  
C. J. BARBER,  
Mouona Co., Iowa.

## New and Old Things in Beedom.

When will there cease to be something new in the bee-keeping line? I've been puzzling my brain over that fellow, who came over from Canada, "by letter" to have a talk with Mr. Doolittle. How that could be done, "by letter," and have the questions and answers in such consecutive order, and have them so interwoven together—first one asking a question and then the other; and each answering the other's question—is more than I can get through my stupid noodle. If a "phone were used, it is easy to understand it; or, if wireless telegraphy were brought into requisition, we might comprehend it; but the other thing beats me. It is worse than the 13-14-15 puzzle. I give it up.

Not only something new, but old things—matters we might suppose were buried out of sight—bob up, like Banquo's ghost, to annoy

144 & 146 E. Erie St., - CHICAGO, ILL.

Please mention Bee Journal when writing advertisers.

us, and get us "all by the ears" again. Now, it's the color of what we wear in the bee-yard, I'll be careful to "sing low," for I don't want any hair-pulling—have but a few stray locks left, and prize them highly. Have always worn black—or nearly always—but not of the rough, woolly texture. Usually have a pair of flack-silk stockings drawn on outside my trousers, to keep them from being soiled as I work in the hive. Never have experienced any inconvenience on account of annoyance of the bees by so doing. Perhaps my bees were better-natured than some others. Often roll up my sleeves to my elbows, go down to the very bottom of the hive, or a strong colony without a sting-never wear gloves.

Have seen bees alight all over a person wearing light-colored fuzzy garments, but when exchanged for something smooth, it seemed to take all the fight out of them. You know, a cross bee will make a *bee-line* for one's eyes if she can get there, but if the eyes are protected, will get as near as she can. How she will buzz around, peeping through your fingers from side, going through a place to dart through!

There is a reflection of light from the eyes, as we always see in the photograph. The bees are attracted by it; or they seem to know that there is the vulnerable point for attack. The head of the "hat-pin," which has been recently referred to, has just such a point of reflection, seen from any point of view, and becomes an attractive object for investigation. I think it would make no difference whether the head of the pin was white or black, red, green or blue. Wearing this hat-pin is a new idea. Think I'll stick a couple or so in the top of my old bee-hat for the bees to play with.

There is another thing that has attracted my attention not a little since commencing the study of the honey-bee, and that is a kind of mild differing material from the miller which we often see infesting the hive of bees. Hear of them occasionally as being among colonies of bees and comb honey, but in all my experience, have never found so many as this year. Have found more than I ever saw in any old box-hive of black bees. They seem to do no particular harm. Who can give us any light on the subject? Write to Walworth Co., Wis. W. M. WHITNEY.

## CONVENTION NOTICES.

**Wisconsin.**—The Wisconsin State Bee-keepers' Association will meet Feb. 4 and 5, in Madison, Wis. Special program prepared. Excursion railroad rates and special hotel rates secured. N. E. FRANCE, Pres.

**New York.**—The annual meeting of the Oswego County Beekeepers' Association will be held at Fulton, N. Y., Saturday, March 7, 1903. Prof. Frank Beuten will be present and address the meeting. An interesting program is being prepared, and all persons interested in bees are cordially invited to be present. M. T. STEVENSON, Sec.

**Michigan.**—The Michigan State Bee-keepers' Association will hold its annual convention Feb. 2 and 4, 1903, in the Council Rooms of the City Hall, at Lansing. The rooms are in the third story, back away from the noise of the street, yet can be reached by the elevator.

Arrangements have been made at a nice, clean hotel, the Wentworth House, only two blocks from the place of meeting, where bee-keepers will be accommodated at \$1.50 a day. The Michigan Dairymen will hold their convention at the Agricultural College, Lansing, on the same dates, as also will the State Veterinarians, thus enabling the members of all these societies to attend the same. When buying your ticket you will pay for fare, and ask for a certificate "on account of Michigan Dairymen's Convention," as the secretary of this convention is to sign the certificates for all three of the conventions. This certificate will enable you to go back at one-third fare.

The first session will be on the evening of the 3rd, when E. R. Root will show us "Bee-Keeping from the Atlantic to the Pacific, as seen through the Camera and Stereoscopic," which will consist of portraits of distinguished bee-keepers, of apiaries, hives, implements, methods, etc., all fully explained. A more enjoya-

ble entertainment for a bee-keeper can not be imagined.

Mr. C. A. Huff, who has been experimenting the past season with formalin for curing foul brood, has promised to be present. Messrs. Soper and Aspinwall are not far away, and will probably be present. Mr. Aspinwall has kept about 70 colonies for the past 10 years, without losing a colony in winter. He can tell us how he has prevented this loss; also how he prevents swarming. Mr. T. F. Bingham, who has been so successful wintering bees in a cellar built like a cisterna, is also expected. Messrs. A. D. Wood and J. H. Larrabee will help to make the meeting a success.

This is the first time that the convention has been held in the Southern part of the State in several years; let us turn out and show our appreciation of the event.

W. Z. HUTCHINSON, Pres.

## 1-lb Keystone ... Honey-Jars

These are clear flint glass jars holding just one pound, and the shape of a keystone. They are 7½ inches high, and very pretty when filled with honey. The corks can be sunk a trifle below the top, and then fill in with beeswax, sealingwax or paraffin. We can furnish them in single gross lots, with corks, **\$3.25** Chicago, at **\$3.50**; two gross, **\$3.25** per gross; or five or more gross, at **\$3.00** a gross. These are the cheapest glass one-pound jars we know anything about. We have only a few gross of them left. So speak quickly if you want them. Address,

## HONEY AND BEESWAX MARKET QUOTATIONS.

**CHICAGO, Jan. 9.**—The demand is not more than usual; hence stocks are sufficient, especially as Cuba has now comb honey on this market. This is a new source of supply, and is a fact that must be considered with a view to the necessity of laying in a stock during the summer and autumn to draw from in the winter and spring months. The best grades of white comb, 15¢; fancy white comb, 16¢; light travel-stained and light amber, 13¢@14¢; darker grades, 10¢@12¢. Extracted, 7¢@8¢ for white, and 6¢@7¢ for ambers. Beeswax steady at 30¢.

R. A. BURNETT & Co.

**ALBANY, N. Y., Jan. 7.**—Honey demand and receipts light. We quote white comb, 15 cents mixed, 14¢; buckwheat, 13¢@14¢. Extracted, white, 7¢@7½¢; dark and buckwheat, 7¢@7½¢. More demand for buckwheat than any other here. H. R. WRIGHT.

**KANSAS CITY, Dec. 20.**—Market steady at quotations. We quote fancy white comb, per case, 24 sections, \$3.50; No. 1 at \$3.40; No. 2 white and amber, \$3.25. Extracted, white, per pound, 7¢@7½¢; amber, 6¢@6½¢. Beeswax, 27¢@30¢. C. CLEMENS & Co.

**CINCINNATI, Jan. 7.**—The demand for all kinds of honey has fallen off considerably in the last few weeks, owing to the many other sweets offered at this season of the year. Lower prices are no inducement to increase the consumption, as the demand will not be so good until about the end of the month; consequently it is folly to offer at lower prices. We quote amber extracted in barrels at 5¢@6¢; white clover and basswood, 4¢@5¢. Fancy white comb honey, 16¢@17¢; lower grades hard to sell at any price. Beeswax firm at 29¢@30¢.

THE FRED W. MUTH CO.

**NEW YORK, Dec. 23.**—The market on comb honey is dull and inactive. While the supply is not large the demand has fallen off to a large extent and prices show a weakening tendency. We quote fancy white at 15¢; No. 1, 14¢; No. 2, 13¢; and buckwheat at from 10¢@12¢. Extracted is in fairly good demand; white, 7¢@7½¢; light amber, 6¢@7¢; dark, 5¢@6¢. Beeswax firm at from 28¢@29¢. HILDRETH & SOBLEN.

**CINCINNATI, Jan. 20.**—The demand for comb honey has fallen off, which in general happens right after the holidays, although prices rule as before: White clover, 15¢; extra fancy water-white, 16¢; no demand for lower grades. Extracted honey is in fair demand, and sells as follows: Amber, in barrels, 5¢@5½¢; in cans, ctf alfalfa, 7½¢; white clover, 7½¢@8¢. Beeswax, 28¢@30¢. C. H. W. WEBER.

**SAN FRANCISCO, Jan. 14.**—White comb honey, 11¢@12½¢; light amber, 10¢@11¢; dark, 6¢@6½¢. Extracted, white, 6¢@6½¢; light amber, 5¢@5½¢; amber, 4¢@4½¢. Beeswax, good to choice, light, 26¢@27½¢; strictly fancy light, 28¢@30¢.

The country merchant, representative of honey of 1902 in the State at 15 cents, worth 5¢@6¢ per pound at primary points, subject to a \$1.10 freight-rate to the East.

CELL-CUPS AND FINISHED CELLS.

CAGES OF QUEEN EXCLUDING METAL.

# Stanley Queen Incubator and Brooder

An Arrangement that Allows the Bees Access to the Cells and Queens at all Times.

(Patent Applied for.)

One of the greatest objections urged against a lamp-nursery, or any kind of a nursery where bees are hatched away from the bees, is that the cells and their inmates are robbed of the actual care of the bees. When the bees have access to a cell, and the time approaches for the queen to emerge, the wax over the point is pared, and, as the queen cuts an opening through the cell, and thrusts out her tongue, she is fed and cheered in her efforts to leave the cell. A queen hatched away from the bees loses all of this food, cheer, and comradeship; and, until introduced to a nucleus, or full colony, has not the natural food that she would secure were she among the bees.

All of these objections are overcome by an invention of Mr. Arthur Stanley, of Lee Co., Ills. Mr. Stanley makes the cell-cups according to the directions given in Mr. Doolittle's "Scientific Queen-Rearing," sticking the base of each cell to a No. 12 gun-wad. By the use of melted wax these wads, with the cell attached, are stuck, at proper intervals, to a strip of wood exactly the length of the inside width of a Langstroth brood-frame. Two

wire staples driven into the inside of each end-bar, slide into slots cut in the ends of the cell-bars, and hold them in position.

The process of transferring larvae to the cells, getting the cells built, etc., have all been described in the books and journals, and need not be repeated here. When the cells are sealed they may be picked off the bar (still attached to the gun-wads); and right here is where the special features of the Stanley process steps in. Each cell, as it is removed, is slipped into a little cylindrical cage, made of queen-excluding zinc, the cage being about two inches long, and of such a diameter that the gun-wad fits snugly, thus holding the cell in place and stopping up the end of the cage. The other end of the cage is plugged up with a gun-wad. Long rows of these cages, filled with sealed cells, are placed between two wooden strips that fit in between the end-bars of a Langstroth frame are held in position by wire staples that fit into slots cut in the ends of the strips. To hold the cages in their places, holes, a trifle larger than the diameter of the cage, are bored, at proper intervals, through the upper strip, thus allowing the

cages to be slipped down through the upper bar, until their lower ends rest in corresponding holes bored part way through the lower bar.

A frame full of these cages, stocked with cells, may be hung in a queenless colony, and will require no attention whatever except to remove the queens as they are needed. The workers can freely pass into and through the cages, cluster upon the cells, care for them, and feed the queens after they hatch, exactly as well as though the queens were unaged.

These cages are unsurpassed as introducing cages, either for fertile or for virgin queens. The bees are not inclined to attack a queen in a cage to which they can enter, yet they can surround, caress, and feed her. They can become acquainted with her, and give her the same scent as themselves. When desirable to release her, one end of the cage can be stopped with candy, and the bees allowed to liberate her by eating it out.

By putting food in one end of the cage, a queen may be kept caged, away from the bees, the same as in any other cage.

# AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., FEB. 5, 1903.

No. 6.

## \* Editorial. \*

**Bee-Keeping in Illinois.**—The following concerning the value and importance of the bee, honey and beeswax industry of the State of Illinois, is taken from the United States census report for 1900:

Number of bee-farms or apiaries.....	34,932
colonies of bees.....	179,553
pounds of honey.....	2,961,080
“ beeswax.....	75,200
Value of honey and beeswax.....	\$343,200

In the order of largest amount of honey produced by States, Illinois is 5th. Texas takes the lead, except in average number of pounds per colony, and in this Arizona is first.

Surely, with such a showing as Illinois is able to make, her bee-industry deserves recognition at the hands of the Legislature, by way of an anti-foul brood law, which should be passed this winter. It will not do for Illinois to be the last in the list of progressive States in this regard. Already Wisconsin, Colorado, California and Michigan are ahead.

**Bee-Keeping in the South** is, in its leading features, the same as in the North. The natural history of the honey-bee and its habits are the same everywhere. Yet there are differences due to locality that can not be ignored except at a loss. Wintering in the South scarcely needs a thought; in the North it is a perplexing study; and if the attention be closely given to this and some other differing points, one is likely to imagine a greater difference than really exists between the two regions. This leads a correspondent from the South, while greatly appreciating the value of the American Bee Journal, to say:

“I am somewhat disappointed in not seeing anything from this section, or anywhere near us at all. Our climate and conditions are very different from those described by most of your writers. I am only a beginner, and therefore not able to write for old veterans, or I would try now and then. Can't you stir up some of the Southerners?”

This journal, as its name implies, is not sectional. It is intended for the whole country. If our correspondent will go through the different numbers of the American Bee Journal for the past year, and cross out all matter not applicable to his section of country, he will probably be surprised to find how little will be crossed out, and what a large mass of useful reading he will have left.

Moreover, it is largely what its subscribers make it. If one part of the country sends in

more contributions than another, it is mainly because the contributors so will it. Neither is our correspondent alone in finding no contributions from any one within easy mailing distance. This is a country of a good many square miles, and correspondents are well scattered. Many a reader at the North can also say, “I find no writer from anywhere near us at all.”

Our correspondent, and others like him, may help the matter by putting aside their modesty and sending in contributions themselves, telling of their experiences and their wants, and they will probably find that nothing will more quickly draw out others situated in like conditions, so that they will not have long to complain of hearing from no one “anywhere near us at all.”

**Insects and Plant Diseases.**—At the Universal Exposition to be held in St. Louis in 1904, under the classification of Useful Insects and Their Products, Injurious Insects and Plant Diseases, there will be installed in the Agriculture Palace displays as follows:

Systematic collections of useful and injurious insects.

Bees, Silkworms and other hombycids. Cochineal insects.

Systematic collections of vegetable parasites of plants and animals.

Appliances for rearing and keeping bees and silkworms. Their products—honey, wax, cocoons.

Appliances and processes for destroying plant-diseases and injurious insects.

There will be no charge for space occupied by such exhibits, and a limited amount of power for the operation of mechanical devices to illustrate processes of special interest will be furnished to exhibitors without charge.

**Producer's Name on Honey.**—We have received the following from Mr. P. D. Jones, of Livingston Co., N. Y.:

**EDITOR YORK:**—Will you allow me a small space in the American Bee Journal to say a few words on your comments on marking honey-cases, on page 627 (1902)?

You say that you received a nice lot of honey with the producer's name on each section and case, and that you scraped off all the marks, and put on your own name. Now I ask, Was that act an honest one? I say no. You robbed that producer of the honor and credit of producing and shipping a fine crop of honey, and took all the credit yourself. His address on his cases was to let dealers know where to find honey that was all right, and well put up for the market, so that next season there might be others that would want to deal with him, and it would make competition for his honey, and a better price, which means more money for his honey.

You say that it is not a safe rule to put your name on comb honey. Why not? I have kept bees and sold honey for 55 years, and I have never been hurt yet. I have no trouble

in getting rid of my honey, and my name is on every case that I ship.

You say that you have worked up a demand for “York's Honey,” and not Smith's, or Miller's, or Nelson's. But how did you do it? You bought some very nice honey that some one had taken a great deal of pains to produce, and put up in very fine style, and scraped off his name and put on your own, and palmed it off as your own production. Now, is that right? I say no. Had I ever sold you honey and learned that you scraped off my name and substituted yours in its place, I am certain that our dealings would have ended right then and there.

If the commission merchant wishes his address on the honey he buys, let him send his stencil-plate to the seller and ask him to use it on the cases, and not object to the producer's name being on at the same time; his wishes will be granted without fail.

You say that you have a right to put your name on if you are willing to stand responsible for its purity. What an idea! Did you ever buy any comb honey that was adulterated? If you have, and get any more, please send me some at my expense.

Some persons are ever ready to criticize others, but do not like to take the medicine themselves.

P. D. JONES.

We do not expect to buy any honey of Mr. Jones—wouldn't take it as a gift, if we were compelled to keep his name on it. We are not quite so foolish as to keep the producer's name on any honey we offer for sale, for Jones, nor Smith, nor several other producers would each produce all we sell during a season. And we don't care to have grocers ask us for more of Smith's honey, and be compelled to tell them we are out of it, when we have a lot more on hand from several other bee-keepers that we know is just as good, if not better than Smith's.

It is all right for Jones to put his name on his honey if he is retailing it himself, or selling directly to grocers, but we wouldn't care to have his nor anybody else's honey with name of producer on it.

We never say on our labels that we are the producers of the honey we sell, not even if it is really from our own apiary. That isn't necessary at all.

We hope that on the next wheat, or corn, or potatoes, or hogs, Mr. Jones produces and sells he will be sure to put his name—he should brand the hogs, see that his name is on every grain of the wheat, on every ear of corn, and on every potato! Any one can see the ridiculousness of all this.

We have spent hundreds of dollars in working up a demand for “York's Honey,” and not that of Jones, Smith, or even Yon Yonson. And our conscience is as clear as a bell on this subject, too.

**Bees Carrying Pollen.**—Do bees use judgment in carrying pollen? In some cases, perhaps in some places, bees carry in more pollen than in others. Some complain that

more is stored than is needed. Possibly this may not be true in every case where it is suspected. In spring a large amount of pollen is used to carry on brood-rearing, and if a stock of it had not been stored up in the previous summer the amount of brood reared might be curtailed. It is an interesting question to know whether the bees use enough judgment to let up on gathering pollen when they have a large stock on hand, or whether, like honey, it is gathered at all times when it can be had, whether the stock on hand be large or small.

One way to help decide the matter would be to take from a colony that had been queenless a long time all its combs of pollen and give them to a colony with a laying queen. Then, if the bees use any judgment in the matter, the bees with the laying queen might lessen their pollen-gathering and the queenless colony increase it, unless there is something in the nature of the case that makes old bees cease to gather pollen.

## Weekly Budget.

**THE NATIONAL ASSOCIATION.**—We have received the following announcement from Pres. Hutchinson, giving the result of the election held by the National Bee-Keepers' Association in December, 1902:

Having received from Ellis E. Mason, Secretary of the National Bee-Keepers' Association, the results of the December election for General Manager and three Directors, I make the following announcements:

Whole number of votes cast for General Manager 610, of which N. E. France received 489; E. T. Abbott, 117; scattering, 4. Mr. N. E. France is hereby declared elected as General Manager.

Whole number of votes cast for Directors 567, of which G. M. Doolittle received 364; W. F. Marks, 262; Thomas G. Newman, 249; Udo Toeppferwein, 149; Wm. A. Selsler, 105; Wm. McEvoy, 86; G. W. Vangundy, 74. The rest of the votes are scattered among 120 members, no one of them receiving more than 31 votes. Mr. G. M. Doolittle having received a majority vote, is hereby declared elected as Director. No other candidate for Director having received a majority vote, as is required by the Constitution, no other is elected. The Constitution says that the Directors' term of office "shall be four years, or until their successors shall be elected and qualified," thus Mr. F. M. and Mr. Doolittle, G. Newman retain their offices, at least for the present.

W. Z. HUTCHINSON,  
President National Bee-Keepers' Association.

On the subject of the election muddle in which the National Association now finds itself, Mr. Herman F. Moore, an attorney, and Secretary of the Chicago-Northwestern Bee-Keepers' Association, has this to say:

COOK CO., ILL., Jan. 27, 1903.

EDITOR AMERICAN BEE JOURNAL.—

I have read everything that has been printed on the General Managership muddle. There is no doubt but that the words, "has been regularly and properly nominated, and is believed to be worthy of your support," should never have been printed on the ballot. I can not excuse Mr. Eugene Secor for their presence there. He, a practical politician, must have known the propriety at the time. Perhaps he thought this was only a family matter, and the ordinary rules of ethics did not apply. I hope I am not unjust or uncharitable when I say that I believe the *trava* reason for his action was a desire to "get back" at Mr. Abbott. The presence in his

Annual Report, of words indicating that Mr. Abbott had never turned over the money, goes to prove this view.

Mr. Abbott never was my personal preference for General Manager, nor was Mr. France. But I felt that, as Mr. Abbott had agreed to submit his status to the election in December, there should have been no attempt to prevent such a submission. I believe the said words printed on the ballot were the result of an effort on the part of some of our officers or members to "do up" Mr. Abbott, at all events. If so, such action is on a par with the most disreputable party politics, and must be openly condemned.

However, I think the old National is in no danger of immediate dissolution, any more than the family is in danger when the boy comes home and announces to father and mother that he is "not going to school any more." The young man gets a certain needed chastisement, and the great institution goes along very much as before.

Let me say while I am writing, that our "order" by the greatest bee-keepers' society in the world) must be governed by strict parliamentary rules. All bodies of men, associated for a common interest, have from time immemorial submitted themselves to certain rules that make for harmony and the dispatch of business. There are "Roberts' Rules of Order," "Reed's Rules," etc. Some of the errors into which our officers have fallen would have been easily avoided by following closely the rules of order applicable to such cases. This great body of 1000 American citizens can be controlled in no other way.

I am satisfied that no new election is possible under our Constitution, which says, "The election shall be held in December each year." No new ballot can be cast until December, 1903, and none of us desires 12 months to elapse and nothing doing. The matter has gone to the voters in the regular way, and they have decided for Mr. France. This should end the dispute. I think even Mr. Abbott would not desire to go to the voters again for another beating.

I think I am within the facts in saying that Mr. N. E. France, the General Manager-elect, has not only met all the conditions of a good officer, satisfactory to all. Let him serve his term, and let our National Bee-Keepers' Association move on to victory. HERMAN F. MOORE.

**CONVENTION NOTICES.**—We would like to suggest to secretaries of bee-keepers' associations that they send in notices of their meetings at least 30 days in advance of holding the same. Recently we received two notices too late to get them published before the meetings were to be held. We are always glad to publish such notices if received in time, but, of course, it is of no use to have a notice appear after the meeting has been held.

We trust all secretaries who read this will kindly remember it. Also remember to write the convention notice on a separate sheet of paper.

**MR. J. S. BARB AND APIARY.**—When Mr. Barb sent the photograph for the engraving on the first page, he wrote thus:

I send a picture showing our home and a part of my apiary. My grandfather, Gabriel Barb, settled on this place in September, 1821. He had built a log-house where our present home now stands, which was built in 1833. When my grandfather moved here he brought a colony of bees along in the old log-gum that my left hand is resting upon.

My father, Isaac Barb, was born in the log-house Dec. 18, 1822, and lived all his life on this place until he died, Nov. 21, 1886. I was born in the old log-house March 5, 1850, and have lived all my life so far on the old farm, and will stay here as long as my life. Bees have been kept continually since 1830, and there will be bees kept here as long as I stay. Is it any wonder that I *love* to work with the bees?

In the foreground of the picture are two other pioneer hives, also a straw-hive that

was made 34 years ago. I have an old box-hive that father used to keep his bees in, and in the season of 1869 he took a box of honey from that hive that held a little over 30 pounds, and it sold for 30 cents per pound; it came to \$10, and the next year he took a box from the same hive which weighed 36 pounds. This box was sold at 25 cents per pound, and brought \$9, or \$19 worth of honey from the same colony in two seasons.

In 1870 we started with 514 old colonies; the first swarm issued June 5 or 6, and from that time until July 3 we had 76 swarms. Our bees were nearly all in box-hives, and we did not know then about cutting out queen-cells and returning after-swarms.

In the fall of 1874 we had 30 colonies when winter began, and in the spring of 1875 there were 8 colonies left. In the fall of 1878 father had 36 colonies and I had 9. In the spring of 1879 he had 3 colonies left and I had none. I had some fun that spring taking out honey from the hives and getting out beeswax. We took nearly 200 pounds of honey from 14 hives, in the fall, and 60 pounds of beeswax. Those were some of my earlier experiences in keeping bees. I have had some about as discouraging since, still I stick to the bees (and they stick pretty close to me, sometimes, too).

You will notice a hive to the left of the extractor; that colony belongs to a stock of bees that were on the farm, at my uncle, William Sanger, near North Bristol, Ohio, for over 90 years before I brought it over to its present location, as I am keeping it on shares now. There were 4 colonies when I brought them over four years ago last spring, but only one is left. I got a rousing swarm from it last season. I took nearly 50 pounds of extracted honey from the 2-story hive back of me at my right.

There are two hives, one on each side of my wife, and also one back of the 2-story hive which has two cases of sections on. I traded a 5-weeks old pig for those 3 colonies, and 15 cents extra, a year ago the first part of last June. I got about 40 pounds of honey from them last season. I wintered all three of them, and another colony I got on another trade two years ago last June is shown right back of the hive between my wife and me. From those 4 colonies and their increase (3 swarms) I took nearly 150 pounds of comb honey last season. My best yield from one colony is 55 pounds of comb honey; total yield about 250 pounds of comb, and nearly 50 pounds of extracted honey.

I commenced the season with 14 colonies, bought 4 swarms at \$1.00 each, I furnishing the hives, and I now have 29 colonies. I gave the boy at my right in the picture two after-swarms put together—one July 2 and one July 4. August 13 they cast a good-sized swarm with a young queen, as I heard two young queens piping in the hive the evening before.

Those chaff hives shown between the two trees in the upper row are empty. The tree back of me is a hard-maple tree which was planted in the spring of 1876—Centennial tree, 26 years old, and a circumference a little above the ground. I carried it nearly a quarter of a mile when I planted it.

The other persons in the picture are my wife, Eliza Barb, her nephew, Harry Royer (who is living with us), and my aunt, Mrs. Elizabeth Duhl, my father's only sister, who was also born in the old log-house Jan. 29, 1820.

I call this the Hillside Pioneer Apiary. I commenced taking the American Bee Journal in January, 1883, and have taken it ever since. It grows better and better. J. S. BARB.

### Keep Them Going.

"One step won't take you very far—  
You've got to keep on walking;  
One word won't tell folks who you are—  
You've got to keep on talking.  
"One inch won't make you very tall—  
You've got to keep on growing;  
One little ad. won't do it all—  
Your've got to keep them going."

### WAX-PRESSES.

#### Their Advantages Over the Sun-Extractors—Directions for Making and Using a Cheap But Effective Hot-Water Extractor.

BY H. H. ROOT.

WERE we to go to Cuba we should find some men who keep bees only for the wax they produce. Much of the honey is fed back or wasted, because the natives think it pays them better to ship the wax than to bother with the honey. If they were to come here to the United States they would find some men who run apiaries solely for the purpose of getting the honey, paying no attention to the wax, but wasting it by throwing away old combs, etc. These men represent extremes, and probably there are not many bee-keeper who would advocate either method; but it is a recognized fact that a great amount of wax is wasted by being thrown away as dirt, old comb, etc. It is pretty generally known now that the sun-extractors are not the most economical in the long run. They have their uses, and are very convenient to leave in some handy place in the apiary, to act as a receptacle for small pieces of burr-comb which collect all the time. I do not know that any estimate can be given of the percent of wax that is wasted in rendering old combs in a sun-extractor, as it depends on the age of the combs, and how much dirt there is in them.

Lately the most up-to-date bee-keepers are beginning to use extractors in which the wax is pressed out of the old comb by means of a screw or a heavy lever, while the contents are heated above the melting point. There are three methods of rendering from old combs: 1. Pressure on the combs, when heated by steam; 2. Pressure under hot water; 3. Pressure on the comb which has been heated somewhere else.

In my experiments with wax-presses I consider steam-presses by far the most efficient. They are quicker, easier to operate, and do better work. Some have said that the old comb should be under hot water when the pressure is applied, because, as the mass of wax oozes out from the dirt, it instantly floats to the surface, giving place to that which may come afterwards; or, in other words, the hot-water method "takes in the slack." However, I believe this to be simply theory. I do not see why melted wax can not drop down from the old comb, which is surrounded by steam, just as well as it can float up from it when surrounded by hot water. Lest some one should say this is also theory, I would state that by actual test I have proven its correctness.

All other things being equal in my experiments, I have found that there can be just as much wax obtained by the steam method, and in much less time, than by the hot-water method. Aside from this, there are many objections to the hot-water. The juices from the dead bees or larvae give the water a very dark, reddish-brown color, darkening the wax to a very great extent. After the pressure has been applied, and about all the wax comes out of the old comb that will come, it is then very hard to get the melted wax off the surface of the water. The only way is to let the whole mass cool so it may be taken from the top in the form of a cake.

In the third, the comb is heated in a wash-boiler or some other receptacle on the stove, and then poured into the press. I have not had as good results with this as with the other two. I admit that it is a quicker method; but when a bee-keeper renders out wax it is usually done in the winter, when his time is not the most important item. I am convinced that a great deal of wax is left in the comb unless the said comb is kept at a high temperature during the process of pressing. Again, lest some one should say that this is theory, or that my experiments have not been made correctly, I would say that one writer, after reading an article in *Gleanings in Bee-Culture* for Sept. 15, on the subject of wax-presses, stated that he could get more wax by his method of pressing the comb after it had been heated elsewhere than by pressing it in hot water or steam. To prove his statements he sent a sample of the pressed-out comb, saying that we could test it for ourselves, to show that it

contained no wax. As he suggested, we did test his sample in hot water, and found that it contained 25 percent pure wax. I do not mean that this method of pressing out old combs, which has been heated in another receptacle, leaves 25 percent of wax, but I do assert that it leaves a great deal more wax than the two other methods—that is, of pressing under hot water or with steam.

In describing a home-made press, since steam would require a more expensive apparatus, I will tell about a home-made wax-press using hot water as the method of heating, and giving very good results, though not as quickly as with a steam press:

The first thing to get is a water-tight barrel. Saw it off, making a tub about one foot in depth. Bore a hole in one side near the bottom, and insert a short piece of pipe, to be used to drain off the hot water and wax after pressing. A wooden plug should be fitted into the end of this pipe, to act as a valve.

We must next consider how we are going to apply the pressure—with a screw or with a lever. In my experiments either works about the same, only a lever take two to operate it, making it more expensive, and not quite so quick. I prefer a screw, and used such a one as can be found in an ordinary carpenter's bench-vice—something that can be obtained very cheaply at any hardware store. A cross-piece of hardwood, 4 inches wide by 3 inches thick, should be placed across the top of the tub, and one of corresponding dimensions underneath. These should be connected by two side-pieces, also of hard wood, about an inch from each side of the tub, and the whole firmly clamped together by long half-inch bolts with heavy washers. The nut belonging to the screw should be placed in a hole bored through the middle of the hardwood piece extending across the top of the tub, and the tub itself is to rest on the under piece. A plunger must be made having a smooth, hard top on which the screw is to rest.

When ready to begin operations, wrap up (in cheese-cloth) about 5 pounds of old comb or refuse from the solar wax-extractor, and place this package of comb in the tub. Next, pour on top of this one good-sized pailful of boiling water. It will be enough since the tub is only one foot high. Place the plunger on top, and slowly turn the screw down. The wax will immediately float to the top until the screw is clear down. Next, turn the screw up; and after tipping up the plunger with a stick, haul over the contents of the cheese-cloth package, and again apply the pressure. By this time all the wax, or as much as can be obtained, will be at the surface of the hot water, and the whole may be poured off or drawn off through the spout, and allowed to cool. By keeping four or five pailfuls of water going it is not difficult to have hot water as fast as necessary. In this way I succeeded in getting 18 ounces as the average amount of wax from 5 pounds of very old combs, and in less than 20 minutes. This amount would, of course, vary greatly according to the age of the comb and the amount of dirt or old cocoons in it.

Save up your old combs; and some winter day, when your time is not worth much, render them out and you will be surprised at the amount of wax that you receive. You can easily make 50 cents an hour—a very low figure—and in time which would otherwise be worth very little.

Medina Co., Ohio.

### Easy Bee-Keeping—Prolific Queens—Introducing.

BY E. A. MORGAN.

ON page 776 (1902), in an article by F. Greiner, reference is made to the bee-keepers' convention last winter where a friend gave his management of bees. It consisted in giving plenty of room—two extra 10-frame brood-chambers full of comb were added below. It prevented swarming.

It might have prevented it in one instance, but it is not the want of room which causes bees to swarm, especially Carniolans; location controls everything. It is prosperity that makes bees swarm. I well remember several years ago paying an enormous price for a few non-swarming queens warranted never to swarm. But in my location every one swarmed, though given as much room as our friend gave. I learned later that they were reared in a district of great scarcity, and had not enough prosperity to swarm.

The advice given—invest \$60 in catnip, keep 15 colonies of bees, then give plenty of room and go a-fishing 5 days of

the week, would hardly work up here. The fishing on Yellow river is good, but the mosquitoes here in the woods are No. 12 size, and the way they attack a man, piercing right through a thick coat and gloves, makes it impossible to fish; to me every bite is worse than a bee-sting.

Four hundred pounds surplus per colony, at 15 cents—6000 pounds \$900, *a la* Dr. Gandy. Investigation proved only a small garden patch of catnip was growing in his vicinity, and no honey in sight. I think catnip and sweet clover good honey-plants, and the planting should be encouraged, but none of us expects to get 400 pounds surplus per colony, with \$60 worth of seed sown, and few will make a living at bee-keeping and go a-fishing 5 days in the week.

#### PROLIFICNESS OF QUEENS.

Mr. W. J. Stahmann, page 776, speaking of prolificness of queens says we cannot have prolific queens without a large hive, and in his experience a queen reared and allowed to lay eggs for a space of a week or more in a small hive, or having a small amount of bees, will seldom make a prolific queen, regardless of the stock she comes from. I have been a queen-breeder quite extensively for 20 years, and have all my queens mated in 2-frame nuclei, keeping them there until I have orders for them or want to use them myself, and I often keep them one or two months in such nuclei with a small force of bees, without in any way affecting their prolificness. When introduced to a mammoth colony they are just as prolific and long-lived as though mated in a big hive. In fact, I think all queen-breeders confine young queens to small quarters for a longer period than one week, without injuring them.

#### TROUBLE IN INTRODUCING A QUEEN.

On page 779 (1902) if Washington had placed his queen in a Miller cage at once instead of waiting 48 hours, then in 48 hours removed the plug, filling the entrance with a little comb and honey, then close the hive, in two days she would have been laying. Waiting 48 hours after removing the old queen gives the bees time to start queen-cells, then they will continue to rear them and become hostile to a new queen. My plan is to run their own queen into the introducing cage, let her run around a few minutes, then destroy her and run the new queen in the same cage, thereby getting the scent of their own queen, then no trouble will occur.

The question was once asked Josh Billings which was best, a large or a small hive, and arguments of advocates of each presented. He said both were right. The man with a small hive was right, for he never had bees and honey enough to fill his hive; and the one with a large hive was also right, for he couldn't get a hive large enough to hold his bees and honey. Hence it is a matter of location. This is the reason we all differ. Disposition of bees are changed by location.

Chippewa Co., Wis.

## Chunk Honey—Various Apiarian Kinks.

BY J. M. YOUNG.

EVERY fall, after all the supers are taken from the hives, I overhaul all the unfinished sections, cut out what honey there is in them, trim the unfilled cells all off, and sell this as chunk honey. By putting it in a vessel of some kind, it can be sold to the grocers very readily, and can be put in common wooden dishes the same as butter is sold to customers. By this means the bee-keeper can get rid of everything in the comb-honey line that will not do to sell otherwise.

#### PAINTING HIVES AND SUPERS.

I don't see how an up-to-date bee-keeper can get along without having his hives painted. It certainly pays. The advantage of having them look clean and nice is one big item. I would paint the supers one color, and the hives another; the edge of the queen-excluders would be of a different shade, as well as the edges of the honey-boards. I now have hives in my apiary that have been painted 20 years that look very well yet, although they have been painted a time or two within this time. The advantages of having them painted are many, and a hive should not be set out even one season without being painted.

#### EXTRACTING-COMBS PREFERRED TO SUPERS.

In the early part of the season I select all such colonies as seem a little weak, or that are not likely to work in the supers, and fit them up with extracting-combs for extract-

ing purposes; by this means every colony in the yard can be made to bring the bee-keeper in some revenue, that otherwise would lie around idle. Of course, plenty of combs should be given these weak colonies, and they should have good queens to start with. Colonies that won't work in the supers will store honey in the combs if given them. It will be a surprise to see the amount these weak colonies will store.

#### ROTTEN WOOD FOR SMOKER-FUEL.

I notice that some of the bee-keepers are talking up smoker material. I have always used rotten wood for smoke, and it is best and cheapest. Every spring I take the team and go to the woods and select old rotten logs—basswood if I can get it, and I usually do—and haul home a wagon-box of it, put it some place where it will dry quickly, and when dry it will light instantly with a match after being put in the smoker. It makes a good smoke, and is cheap, and it can be obtained wherever there is timber. I sometimes put it up in barrels, and put it away in some out-building.

#### BEEES UNDER SNOW.

Whenever the snow begins to melt then it is time to shovel it away from the entrance or the front part of the hives, but not until it does begin to melt. Disturb the bees as little as possible, unless they begin to fly. The more bees are disturbed when it is cold, the worse it is for them. If there is snow on the hives, or in the corners, I would get it away from them, for when it begins to melt it will run into the hives more or less and wet the bees over the packing. Bees in the winter season must be kept dry if they are wintered successfully. It will not hurt them to be in a snow-drift—I don't advise their being covered clean up, but it will not hurt them for a short time. Since we have been in business, my bees have been covered up several times by snow-drifts, so that if I didn't know where they were I could not find them. My experience has been that they won't smother if they are covered clear up with snow, if the hive is kept so that it will not leak.

Cass Co., Nebr.

## Convention Proceedings.

Report of the Ontario Bee-Keepers' Convention,  
Held at Barre, Ont., Canada, Dec. 16, 17  
and 18, 1902.

REPORTED BY MORLEY PETTY.

(Continued from page 70.)

#### PERCENTAGE OF WATER IN HONEY.

Frank T. Shutt, M. G. F. I. C. Chemist, Dominion Experimental Farm at Ottawa, outlined some important experiments which he has been conducting relative to the percentage of water in honey under various conditions. His first work was to lay the foundation for his experiments by demonstrating that the method of determining the percentage of water in honey followed by other chemists who have published reports, is unreliable, because to expose honey for a length of time to a very high temperature causes it to lose weight by decomposition of levulose, as well as by evaporation. This he explained to the bee-keepers' convention at Woodstock last year.

The method which he adopted and found satisfactory is to expose the honey on sand or pumice for a length of time at a comparatively low temperature, 60 degrees C., and in a partial vacuum. He then experimented with honey from uncapped, partly capped, and capped comb, kept in glass-stoppered and cheese-cloth-covered bottles, in a dry and in a moist atmosphere. The results show that while honey in an ordinary atmosphere loses slightly, that preserved in a saturated atmosphere gained considerably in weight, due to absorption of moisture. Where honey was exposed to a saturated atmosphere the normal percentage of moisture—about 15 percent—increased in one case to 31 percent, and in another instance where the honey was exposed in a flat dish, to 43 percent. Throughout the experiments honey was found to have a great affinity for moisture. That from partly capped combs contains less water than that from un-

capped, but more than that from capped combs. The percentage also varies with the season. Honey containing more than the normal percentage of water, not only is thin and unattractive, but readily ferments. These results and the experience of our best bee-keepers show that honey should not be extracted until all or at least partly capped. It should then be exposed as little as possible to the air, and unless sealed perfectly should be kept in a dry place. If these simple rules be followed it will keep indefinitely.

Prof. Shutt showed the result of his experiments in three charts.

EXPERIMENTS ON STORAGE OF HONEY—1902.

		Percentage of Water.	
Honey as extracted from capped comb		15.88	
A	Honey exposed to dry atmosphere one month	14.24	
	Honey exposed to moist atmosphere one month	31.46	
B	Honey exposed to dry atmosphere 20 days	13.84	
	Honey exposed to moist atmosphere 20 days	48.23	
A—Honey in glass cylinder.			
B—Honey in open flat dish.

G.S.—Glass Stopper.  
C.C.—Cheese Cloth.

Mr. Holtermann—These results are very important. They should be placed in the hands of buyers to teach them the proper care of honey.

Mr. Heise—When the weight of honey increases by the absorption of moisture, does the bulk also increase?

Mr. Darling—We know that it does by the way honey in comb swells out against the capping when in a damp place.

By motion of Messrs. Gemmill and Holmes, a vote of thanks was tendered Prof. Shutt and Prof. Creelman, for the instructive and inspiring manner in which they had addressed this convention.

SUPPLYING MOISTURE IN A DRY CELLAR.

"Is it advisable to supply moisture in cellar-wintering in the case of a very dry cellar?"

Mr. Holtermann—There is more danger from a dry cellar than from a moist one. A bee-cellar should have a wet and dry bulb thermometer to test the matter.

Mr. Holtermann thought the air should be almost saturated. He would like to see the matter thoroughly tested. In the cellar where he is wintering his bees the fresh air passes first through a small room where there is a stove to warm it slightly if necessary. When he considers the cellar too dry he sets two buckets of water in the room, with a blanket extending from one to the other in such a manner that it is kept soaked with water. This exposes a large surface of moisture to the dry air, which takes up the water and itself becomes moist.

Mr. Dickenson thought a damp cellar all right.

Mr. Sibbal prefers a dry cellar, but can make any cellar dry if it is large enough to partition off a room for the

bees. This seems to make the bees' compartment dryer. Where possible, he has a hole in the ceiling for ventilation, then piles straw and chaff, or sawdust, over it to keep the air from escaping too rapidly.

Mr. Post experimented with the hygrometer in his cellar last winter, and decided that 2 degrees between the wet and dry bulb thermometer was about the right thing.

EXTRACTING-COMBS FROM A FOUL-BROODY COLONY.

"Is it safe to use again extracting-combs that have been used over a colony slightly affected with foul brood, said combs having been over a queen-excluder and have never had brood in them?"

Mr. McEvoy said it was perfectly safe for a skilled man who understood all the conditions; but he thought it better always to err on the safe side.

RELIEQUIFYING HONEY IN GLASS JARS.

"How liquify honey which has granulated in glass jars?"

Have a large pan to reach clear across the stove with a slatted frame to hold the bottles. Loosen the corks. As soon as the honey is liquefied seal it up again while yet hot.

MOVING BEES ON SLEIGHS.

"Is there much risk in moving bees on sleighs in winter?"

Mr. Holtermann told of buying bees in New York State in the fall of 1901. They were hauled to the train on sleighs, shipped to Brantford, and hauled on wagons to the apiary. They stood ten days in the yard, but as the weather remained cool they were put into the cellar without a cleansing flight. Any one can imagine the condition they were in; in the abdomen of each bee was a globule of watery feces—the first stages of dysentery. Mr. Holtermann raised the cellar temperature to 72 degrees, Fahr., for two weeks, until the bees, upon examination, were found to have these globules literally dried out of them. He then lowered the temperature to about 40 degrees, Fahr., and kept it as near there as possible the rest of the winter. No dysentery appeared, and the bees came out in good shape in spring.

In the evening W. Z. Hutchinson's paper, on "Commercial Organization," was read by the Secretary, after which the members banqueted in the dining hall of the Queen's Hotel.

THURSDAY MORNING.

The report of the committee on honey exchange was read by W. A. Chrysler, as follows:

ONTARIO HONEY EXCHANGE.

This Association shall be called "The Ontario Honey Exchange," and a commercial part of the Ontario Bee-Keepers' Association, and shall include in its jurisdiction the Province of Ontario, with such additional territory as from time to time may be found feasible to organize.

Its object is to establish a reliable and fair market price for the product of its members, the more proper distribution of honey, and to establish, when advisable, foreign and distant Canadian markets.

The main officers of the Exchange shall consist of five Directors elected by the members of the Ontario Bee-Keepers' Association at each annual meeting, and to hold office for one year, and shall direct all business of the Exchange.

As soon as elected they shall elect from their number a President, Vice-President, Secretary, Treasurer, and Business Manager, who shall be known as officers of the Ontario Honey Exchange.

They will choose a location and obtain by rental or otherwise, a suitable office and warerooms in some central city, that shall be known as headquarters.

They shall, where feasible, appoint one or more persons to organize each district that is not already organized into a District Bee-Keepers' Association, and should be affiliated with the Ontario Bee-Keepers' Association.

To all such affiliated societies instructions shall be given from the main office for the collecting and forwarding of honey, beeswax, etc.

The local affiliated societies may elect from their number, called a local manager, who shall be made responsible to the local association, and that to the main office for all moneys and goods he may be entrusted with.

It shall be the duty of the local association to appoint their secretary or local manager, to obtain statistics of honey, bees, etc., in his district, when called upon by the General Manager to do so, and shall include other informa-

tion, such as estimates of the amount of honey produced, the amount that members will require to sell to consumers and the retail trade on their own account, and the amount likely to be placed in the Exchange. Also, if a shortage in the district, the amount that could profitably be shipped in.

Members in unorganized districts in any part of Canada shall also be requested from the head office to report on the honey crop, and estimates similar to local associations. In case some may not wish to join either the local association or Honey Exchange, the local manager, or a member, may offer them within a business margin of the selling price of honey, and place it in the Exchange on his own account, or as his own honey. (He will have the privilege of receiving an advance in money on his producing a warehouse receipt.) They will not then sell to others for a less price.

Funds may be advanced to members by the Exchange to the amount of three-fifths of the value of honey consigned, and charge the current bank interest.

The directors of headquarters of the Exchange, on obtaining crop reports from the local associations and others, shall set the prices of the different grades of honey for a certain period; at the end of such time specified they may lower, raise, or maintain same prices as the market will warrant.

All honey sold by the Exchange shall be graded according to rules adopted by the Ontario Bee-Keepers' Association.

Honey sold from the local managers' warerooms, and also that of headquarters, must be graded by the member supplying it, and re-examined and graded, if necessary, by the Manager in each warehouse.

All honey received by the Exchange for sale must be branded and sealed by the stamp of the Ontario Honey Exchange, and backed by a good, strong guarantee.

The duties of the President, Vice-President, Secretary, Treasurer, and Business Manager, shall be arranged by the Provisional Directors, as circumstances will admit, until the constitution and by-laws are thoroughly revised and amended, ready for incorporation.

The remuneration of the five (commercial) directors shall be determined by the directors of the Ontario Bee-Keepers' Association, and shall be taken from the dues and profits of goods handled.

It should be the object of the Exchange to place the honey as near as possible to the consumer, saving extra transportation and commission for its members.

The funds for carrying on the Exchange will be obtained by plans and in a manner advised by the directorate.

W. A. CHRYSLER.

Mr. Sibbald—This matter is most important. The number of bees kept in this country is increasing rapidly.

Mr. McEvoy—The business is going into the hands of specialists.

Mr. Sibbald—If we organized only for the sake of crop reports, it would be worth while. In the case of failure in one part, and over-production in another, the honey could be equalized, and a uniform price and uniform consumption could be maintained in the Province. We would also prevent the over-crowding of central markets which is now prevalent. We could soon learn how much honey is produced in the Province, how much consumed, and consequently what would need to be exported.

If there were a registered trade mark we could know just where our honey goes, and get at the source of adulteration. Then, in the matter of advertising, individually we have not sufficient capital, but by systematic advertising by an Exchange the consumption of honey could be doubled, and more.

An Exchange could afford to export the surplus honey at a sacrifice in order to keep the home market brisk. It would come alike to all. We do not wish to enhance the price so as to make it prohibitive, we want only a fair and uniform price. Organized reporting and systematic grading would make the indifferent bee-man spruce up and produce a better article.

It was resolved that the bee-men present meet at the close of the convention to organize a honey exchange.

Moved by J. D. Evans, seconded by R. F. Holtermann, this Association will co-operate with the directors of the Industrial Exhibition, Toronto, in making the Dominion Exhibition, to be held by them, a success, and that the President and Secretary forward a petition to the Dominion Government, asking financial aid to said exhibition. Carried.

Mr. Fixter brought up the matter of exhibiting at St. Louis, urging that preparations be begun at once in order

that we might put up a creditable exhibit there. It was decided that the matter be left in the hands of the executive.

On motion, it was decided that the executive committee meet Mr. Creelman, Provincial Superintendent of Farmers' Institutes, and make arrangements with him to help this Association in advertising its meetings and getting out programs.

A vote of thanks was tendered to Mr. Fixter for bringing up and urging the matter of a honey exhibit at St. Louis.

On motion, the Board of Directors were allowed to grant money for organizing a honey exchange.

(The End.)

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Mrs. West and Bee-Keeping in the South.

At the Denver convention one of the many bee-keeping sisters that I enjoyed meeting very much was Mrs. West, of Texas. She is a brisk business woman, has very decided views, and a unique manner of expressing them. It was a pleasure to me to hear her talk. Those that met her at Denver will, I feel sure, be glad to see the communication from her in this number. If she would, I feel sure she might give us a good many interesting and instructive items about bee-keeping in the South.

### Bottom Foundation Starters in Sections.

One of the things it may be worth while for us to talk about a little is whether it is best to have a bottom starter in the sections or not. Some one may say, "What do you want a bottom starter for, anyway? A top starter is all that is needed to make the bees build straight, isn't it?" Yes, they will get along very well with only a top starter so far as building straight is concerned, but is that all that is needed? Don't you have any trouble with having your honey break out of the section, especially if you ship it? Now, doesn't most of the trouble from breakage come from the fact that the honey is not securely fastened to the bottom of the sections, as it was at the top?

If it is securely fastened to the section all around, build solid full, isn't it pretty safe from breakage, with good handling? Then doesn't it look a good deal better?

If it is securely fastened at the top and part way down the sides, there is great danger from breakage, but if it is securely fastened at the top and bottom, even if not fastened at the sides at all, it is pretty safe. But if it is securely fastened at the top and bottom, you need not worry about the sides—they will be fastened all right.

Another thing: During a slow flow—and especially is this true with a weak colony—the bees will sometimes draw out only one side of the foundation, and fill it with honey, and the weight will cause it to sag over to one side, and it will be fastened to the separator. This will not happen with the two pieces, for the first thing the bees will do will be to fasten together the two pieces, even if they do not put any honey in.

A good size for the top piece is  $3\frac{1}{4}$  inches deep, and for the bottom starter  $\frac{3}{8}$ -inch deep. If the bottom starters are made deeper they will fall over and make trouble, and the bees will sometimes gnaw them down if they are much shallower. That would leave a  $\frac{1}{8}$  inch space between the pieces, providing there was no waste in the foundation by fastening it in; but that waste increases the space to something more than  $\frac{1}{8}$  of an inch.

This space between the pieces does away with any sag there might be by the stretching of the foundation, and the result is a straight, well-filled, securely-fastened section of comb honey.

### Reading in Winter—Other Comments.

I notice on page 25 one of the subscribers asks to have discontinued her copy of the American Bee Journal until

spring. Well, I don't want anything like that. We have the "A B C of Bee-Culture," "Cook's Manual," Doolittle's "Scientific Queen-Rearing," and other bee-books. Then I take two other bee-papers besides the Bee Journal, and they are all full of good instructions. I am afraid I'd miss something by letting the Bee Journal go by. I do not consider myself so smart in intellect, but have sense enough to read more than one book in the winter.

Well, don't you think the Baron quite a smart fellow to inject long life into his queens? And he signs his name right. His story reminds me of other long-winded stories about catnip and large yields of honey.

You will remember a bee-keeper was telling us at the Denver convention about a Texas honey-producer selling adulterated honey, or trying to do so. Well, I wrote to the one who reported it at Denver, and asked him to send me a letter so I could send it to the Bee Journal, but no, he will not do it. He went all around with excuses, and so on, but will not come out on the adulterated-honey question. I want to be honest in all my dealings, and will be; so should be the bee-keepers all over the land.

My bees went into winter quarters in good shape in November.

I sowed horsemanit, and it is up well; in the spring I will plant quite a lot of sunflowers, and they are something the bees like so much.

Well, Miss Snyder struck the keynote when she said bees did not like a dirty smell. Bless the little bees, how I love them! First, because they are so industrious; and then they are so clean. I have no use for a dirty, lazy person, and never blame the bees for "doing business" with such people.

Ellis Co., Tex., Jan. 14.

MRS. C. R. WEST.

## The Afterthought.

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### FEEDING BY WHOLESALE.

It's pretty lively business—187 pounds per hour—for bees to carry away feed in the open air. Divided among the 97 colonies it is about 2 pounds per colony per hour. Presumably some would get more, and some slow coaches quite a bit less than that. Mr. Hall's simple arrangements are worth remembering, in that they worked tolerably well. Page 812.

### SPREADING PEAR-BLIGHT.

Half inclined to say that Prof. Cook "gave us away" badly, and reprehensibly, in admitting that bees spread pear-blight on trees never in bloom, while their *alibi* was entirely unbroken. We know very well they wouldn't touch blight-juice in time of nectar-flow. Will they touch it at all? We demand that somebody should see them. Surely, on rows of little nursery trees they would not be hard to see. Page 813.

### A RAPID STYLE OF INCREASE.

Keeping the old colony mainly together, and taking out one comb from time to time, thought to be the most rapid style of increase. Looks reasonable. But in that style of procedure watch out lest you chill or starve lots of unsealed brood. Page 814.

### COMBS COLORING HONEY.

Dr. Mason rather got the drop on the convention about honey from black combs being normally white. Still, perhaps we should discount his evidence a little. In actual use I think bees polish the interior of a cell every time they use it. Put honey into a comb yourself and there is a lack of this polish. It's pretty plain that the rough, unpolished surface would give out more coloring matter than the polished surface would. With all discounts made, however, it's lawful to give the combs which are not black the preference. But it's not a pleasant question—the question, Must I sacrifice some of my extracting-combs and get new ones built? Page 822.

### GROWING ALFALFA IN THE EAST.

So the plains folk caught the alfalfa woodchuck because they had to catch him or starve. We see. Not being

driven to it our luck has been less. J. E. Johnson says "no doubt" the right bug can be developed here in time without using inhabited soil. Hardly so strong as that. Common clover has animalcula which serve a similar purpose to itself. If these differ only very slightly from the ones under consideration, probably he is right. If otherwise, such accommodation to live on a new plant might take too long. Especially, we must remember, the accommodation can not begin till they begin to live on the alfalfa to some extent. Might be driven to begin in a very dry soil in which nothing else was growing—and perhaps this is one reason for the better success in dry regions. Page 823.

### CHAFF-HIVES IN COLORADO.

Old and worn but not settled. What a lot of other things in apiculture are just so, too, Mr. Aikin! And your experience is chaff-hives in Colorado winter bees hardly as well as singles do. Pin for that! Page 823.

### FILLING CASES WITH SECTIONS OF HONEY.

All around first, and last in the center—is Mr. Holdener's way to fill section-cases that have paper trays in them. Perchance Mr. Doolittle was thinking about cases that have only two tiers, and in which every section touches the tray somewhere. A tin guide is manifestly needed for these. Page 828.

### KEEPING BEES ON SHARES.

L. E. Kerr seems to hold the belt as the champion bees-on-shares man. Has 200 colonies out thus, scattered 300 miles. Also keeping some on shares himself. Never any trouble. We are surprised to see past report and repute so traversed. Having an itemized bargain fully written down seems to be the secret. Must be a quite reasonable man in addition. Page 828.

## Questions and Answers.

CONDUCTED BY

DR. C. O. MILLER, Marango, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

### Tartaric Acid to Prevent Honey-Granulation.

Will you please inform me by return mail, what kind of acid is used in syrup to keep it from granulating? And how much of the acid is used to a gallon of syrup?

TENNESSEE.

ANSWER.—An even teaspoonful of tartaric acid for every 30 pounds of sugar is stirred into the syrup about the time the sugar is dissolved. The acid is first dissolved in a little water.

Now it seems a tough thing that I am not allowed to answer that by mail; but then you can easily see that if I answer your question by mail I must answer others, and that would take a lot of time that I can't afford. You wouldn't like it if I'd answer some one else by mail and wouldn't answer your questions by mail, would you? Neither would they like it for me to answer yours and not theirs. So long as I can not answer all by mail don't you think it the best plan for me to treat all alike, and answer all in this department?

### Rapidity of a Honey-Extractor.

About how many revolutions in a minute should comb-baskets in a honey-extractor go?  
MINNESOTA.

ANSWER.—I don't know, and I don't think any one knows, for there is no fixed number of revolutions so long as there is a difference in extractors and combs to be extracted. An extractor in which the comb is a great distance from the center of the shaft will not need to revolve so rapidly as one with the comb nearer the shaft. A new and tender comb will not stand so rapid turning as an old, tough one. But you will soon learn by experience, for so long as the comb stands it without injury you may feel safe that you are not turning too fast.

### Getting Propolis Off Fence Separators—Keeping Pollen Out of Sections.

1. Is there any other way of getting the propolis off of fence separators besides the tiresome way of scraping? Will boiling injure the glued joints?

2. Is there any sure way of keeping pollen out of the sections, where the swarm is hived on starters, in brood-frames, on the old stand, with supers partly filled placed on a new hive?

ANSWERS.—1. I don't know of any better way than to scrape. Boiling in water would dissolve the glue, and would not be a success in removing the propolis.

2. I don't believe there is, if you give the sections at the time of hiving. Better wait two or three days after hiving before you give the sections; then the bees will have such a start in the brood-chamber that they will not want to carry pollen above.

### Moving Bees in Winter-Cases.

Would you advise moving 30 colonies of bees, in winter-cases, 6 miles on sleighs? or would you wait until spring? If done now, what precautions are necessary? CANADA.

ANSWER.—If convenient, it would be as well to wait till spring. If moved now, take pains to avoid having the combs tip over sidewise, or swing from side to side, especially when the cold is very severe. When quite cold the combs are brittle and easily broken.

### Feeding Bees in Winter.

I have a few colonies that have not quite enough honey to run them through the winter, so I would like to feed them, but as I have never done any of it before, I would like to know how to do it, at this time of year. What is the best and cheapest feed for them?

ANSWER.—That's one of the things that you will find fully answered in your bee-book, and it will be the best investment you can make to get a bee-book if you have none. You will find from the book that if you have no combs of honey the best thing will be to make cakes of candy an inch or so thick. Just boil the sugar in a little water, being very sure not to let it burn, pour it into greased pans, and when cold lay a cake over the top-bars and cover up close.

### Comb Honey for Home Use—Propolisin.

1. I am running for comb honey. How would it work to put super foundation in brood-frames and set the hive over a strong colony, with a queen-excluder between the hives, and use the honey thus stored for my own table? Would they store more honey by so doing?

2. In the January number of Gleanings there is mention made of a "propolisin" for sores. Can you tell me how it is prepared?

ANSWERS.—1. It will work well, and I think you will get more honey. A good many Texas bee-keepers are quite enthusiastic about bulk honey, producing comb honey in the way you speak of, cutting it up and packing it in cans, and then filling up with extracted honey.

2. I don't know how "propolisin" is prepared, as I think the process has never been made public. It is quite possible, however, that you could get the same benefit with very little preparation. If the propolis is soft, it might be spread on a cloth and applied where desired, and if hard it might be powdered and mixed with lard or melted tallow.

### Keeping Queens—Transferring Bees.

1. When is a queen-cell ripe?

2. Where should the queen-cells be kept until we can use the queens?

3. We have some queens which we wish to keep until spring, when we will transfer some blacks out of old box-hives. Where should we keep them?

4. We have some queens that we have put in strong colonies, that have not mated. There will be some warm weather through the winter, that the bees will stir out, but they have no drones. Will the queens lay through the win-

ter, or will they wait until next spring, when drones will be reared?

5. When would be a good time to commence transferring from box-hives, in this locality? ALABAMA.

ANSWERS.—1. The term "ripe" is applied to a queen-cell when it is near the time for the young queen to emerge, perhaps any time within two days, possibly within three, of emergence. When a cell is sealed, you may know that at the farthest it will be only about eight days till the young queen emerges. Usually the sharp point of the cell will be gnawed away something like two days before hatching, leaving the cell quite rounding at the end. When a number of cells are shut in with an excluder in a strong colony, as mentioned on page 761 (1902), the time being all right for swarming, the bees will allow only one of them to emerge, and you can open the hive and take out any cells that are very ripe, these cells having the cap partly gnawed open by the young queen within. Of course the free queen can also be taken out, if you should happen to see her. The bees will keep the young queens (all but one) imprisoned in the cells a day or more after they are ripe enough so you can see the slit where the cap is partly gnawed open.

2. You can keep the cells in a nucleus until one of them hatches, when all the rest of the cells will be destroyed unless you remove or cage them. In other words, you can keep only one queen in a nucleus.

3. You may succeed in keeping them in nuclei.

4. You should not expect your unmated queens to lay through the winter, and their chances for mating next spring are not good.

5. Transfer in time of fruit-bloom, or perhaps better still, wait till the colony swarms, and then transfer three weeks after swarming.

### What Caused the Foul Brood?

Ten or 12 years ago I lost a large part of my bees during the winter, by bad honey; they got the dysentery, and the combs were in bad shape for swarms and nuclei. I could not get them cleaned by the bees so I bought 8 pounds of foundation, and in the summer I tried to increase as fast as I could. The first few nuclei I made had combs, and then I made a few that had foundation, and after awhile I found they had foul brood, but those on the full combs were healthy. I burned all the nuclei that were sick, made new ones, and gave them foundation; only a few were on full combs, but as soon as they had brood then they had foul-brood again, but not in those that had full frames, but every one that had a little foundation in. They were burned and also the rest of the foundation, and a little later on one hive more; all the other colonies kept free from the sickness. Was it possible that the germs of the disease were in the foundation? Or were the nuclei affected in some other way?

ANSWER.—According to what you tell about the matter, it looks very much as if the foundation was to blame, and yet it has been generally understood as a fully settled thing that even if foundation were made from diseased combs there would be no danger. In spite of appearances, I am of the opinion that the foundation was not to blame.

### Removing Honey from Bait-Sections.

I sent a sample of some comb honey which my bees gathered in September. Please examine it and tell me what it is gathered from?

From the first it never seemed to be a liquid, but more like molasses sugar; later it became quite hard and white. Do you think the bees will carry it out in the spring?

I have quite a number of bait-sections with it in. I set the sections out for the bees to clean out last fall, but they left that in.

ANSWER.—I don't know from what the honey was gathered, but it is certainly very solid, and withal quite tough. I am very much afraid you can not get it emptied out of the sections so as to make them proper for bait-sections. By spraying them with water as often as the bees lick them dry, you may get them emptied out, but some of the granules might remain, and that is generally considered objectionable. Perhaps the best thing will be to melt them up, heating them carefully and slowly so as not to injure the flavor of the honey, then taking off the cake of wax when cooled.

# Rumely Engines

both as to traction and generating and supplying power, are typical of all that is best for threshermen. They are rear wheel drive, gears are of cast, cross heads and slides are protected from dust, they are free from all trappy devices. Single or double cylinders, burn wood or coal, or direct fire for burning straw. Fit compasses in the threshing field for the famous **New Rumely Separators**. Free catalogue describes all. Write for it.

**M. RUMELY CO., La Porte, Indiana.**

Please mention Bee Journal when writing.

## The Rural Californian

Tells all about Bees in California. The yields and Price of Honey; the Pasturage and Nectar-Producing Plants; the Bee-Ranches and how they are conducted. In fact the entire field is fully covered by an expert bee-man. Besides this the paper also tells you all about California Agriculture and Horticulture. \$1.00 per year; 6 months, 50 cents. Sample copies, 10 cents.

# What You Yonson Thinks

Vel, my goodness, ay don't kin understand yor for dom hav such plenty awful big rumpus bout da general manager muddle. Ay tank if dom don't stop derts quarvning, an play fair, dom goan to all fall in da puddle. Ven ay tank to how no goat no holes in lines an Keop das N. B. K. A. ban' vagon in da middle of da road.

My goodness, Peter Peterson, he yust bean purdner to yoin himself into das N. B. K. A., but now he say if dom goan to hav big fiteing den he tank dom hav to excuse Peter. For long time ago ay read sermon in Gleanings on Mr. A. L. Gleanings he say dat Satan yust lurned a new trick. My goodness, ay tank he bean springing som new trick on da officers of da N. B. K. A. ven dom big bee-mans vot love each odder plenty much for long time, an for menny years dom bean pat each odder on da back an say, "He (Mr. Abbott) iss a awful snak a feller, an he iss plenty honest an good temperance man, an he iss yin da feller for general manager?" an den all dom big bee-mans, vat dom call directors, dom vote for him and he vas elected, and every thing seems to be going so nice som a little red vagon, but dom forgot to greas dat vagon vid da oil of human kindness, and it seems dom all want to ride da frunt seat. But dat vagon begins to run awful heavy, an mak awful big nois an racket, an ay tank if dom all goan to ride in da frunt seat dom better greas da frunt veels any vay, and it is nutting better dan da oil of human kindness.

My goodness, ay like all dom big bee-mans, an' ay believe dom all iss good an honest, but Satan is trying to slip into derts hearts so dom can't love each odder an overlook each odder's faults. My goodness, ve all have faults, an if ve don't overlook each other's faults, den da Lord don't goan to forgive our faults, an he say ve haiff to go to da left hand' side vid all da goats; an den da bad man goan to ride us on da goat, and it goan to go awful hard vid us, an ve be awful sorry.

My goodness, yor for can't we love each odder, and tak each odder by da hand, an all york together? Dom directors acknowledge dom mak da mistake vot cause das rumpus. Now, yor for shall other people suffer for da mistake of da directors? Did not our Savior suffer for us all? An' don't he say if ve hate ours brother ve shall never enter da kingdom of heaven? If ve love ours brother let us show it in ours akshuns, an' da N. B. K. A. shal goun an flourish as da green bay-tree.

Now let us all stop fiteing each odder, an fite Satan, an da slop hunny mans, and da foul brood, an so on. Dere is plenty to do, so let us not stay home an quarv lak children, but let us go out in da field an york, an not monkey york' till it bean purdner sundown. An' if anybody vot feel lak dom vot to fite, let dom fite sin an Satan. Ay tank ve all can find him yurly close to home.

Ay tank now ve come to big hill, an it is time for Yon Yonson to push, and if dom officers vil yust tak off da break an dom beemans vil all help, ve vill soon be goan hally booping agin. Tak new start, hav lection over an have it fair, an all dom fellers vat mak bee-papers, don't tell us forty-seven times

# SWEET CLOVER

And Several Other Clover Seeds.

## FROM MANY FIELDS

### Results of the Season of 1902.

I had 18 colonies come out in good shape last spring, and increased to 22. I had to feed all through June, when they ought to have been pushing in white clover. I got no honey until August 15, then there was a good flow from buckwheat, goldenrod, white asters, and numerous other fall flowers, from which we secured 950 pounds of honey in the 4x5x1 $\frac{1}{2}$  plain sections, which sells at 12 and 14 cents per pound in the market. J. R. KAMERER.  
Van Buren Co., Mich., Jan. 12.

### Rearing Long-Lived Queens.

It was with great pleasure I read Mr. C. P. Dadants' article on "Rearing Long-Lived Queens," on page 807 (1902).

Mr. Dadant always hits the shoulder, and yet so tempered with courtesy is the blow that it leaves no bruise. I read his articles with the deepest interest, feeling assured that whatever he advances has been fully tried and tested. This I also feel of the writings of Mr. Doolittle and Dr. Miller, and now with this trio opposed to Dr. Gallup's charge of universally poor queens, I think that gentleman would display wisdom and discretion by retiring from the field.

I am not sure that Mr. Doolittle admits this attachment of the nymph to the cell is an "umbilical cord," certainly it has never so appeared to me. I have always looked upon it as a support to young royalty, made necessary by the inclination of the cell, and, if I am right, it will not be found in case of the worker, as the position of the cell does not require it. I have seen this attachment in the chrysalis of other insects, and while it may answer as a means of conveying nourishment corresponding to the umbilical cord in animals, I am yet to be convinced of it.

Mr. Dadant's article can be profitably read by all interested in queen-rearing, and particularly by those who, in search for something new, are inclined to turn aside and "Gallup" up an "Alley" that presents itself.

C. S. HARRIS.

Volusia Co., Fla., Dec. 25.

### Results of the Past Season.

On the last day of May, 1902, I bought 26 colonies of bees. They were in pretty fair shape, except one very weak colony which I built up by giving combs of brood from other colonies.

As it was so cold during June and July they did not make a big record, but increased only to 42, and stored 1200 pounds of comb and extracted honey.

I dispose of my honey in the home market. The extracted I put in 1-quart Mason jars, and sold at 35 cents per jar. The comb honey I sold at 12 $\frac{1}{2}$  to 15 cents per section, for the fair to good grades.

Most of the bees in this part of the country are wintered in cellars, although I think they can be wintered as successfully outdoors, and I think I shall try that way next winter.

To make cows pay, use Sharples Cream Separators. Book Business, Dairy and Cnt. 212 free. W. Chester, Pa.

The wintering problem is one thing the beekeepers in the Salt River Valley, Arizona, where I used to live, do not have to contend with.

White clover here this year was still blooming on Oct. 25, and the bees were working on it.

In answer to the question of F. Durant, page 812, concerning ginseng, if the ground is properly prepared, and other things favorable, it will be marketable in from 7 to 10 years after planting for the seed to germinate.

I think the American Bee Journal is a good paper, and wish it every success.  
Benzie Co., Mich., Jan. 5. B. L. BYER.

**Depend on White Clover.**

The "Old Reliable" is all right, and I do not want to keep bees without it. The winter of 1901-02 was bad on the bees, about 2/3 of them dying in this neighborhood. We had 24 colonies and they all died but 7. These 7 colonies increased to 12 and stored 350 pounds of comb honey.

We have to depend on clover mostly; we have plenty of fruit-bloom, but we have nothing to count on except white clover. We have a very large paper mill here and they take all linden, poplar, maple, and all kinds of white wood, so there is not much encouragement for bee-keeping here. But we will have to do as the old lady said, "Grin and bear it."  
S. H. STAUFFER.  
Blair Co., Penna., Jan. 9.

**California and the Government Report.**

California should be heard from, at least since Texas got so far ahead in that report, and Nebraska has all but taken California's laurels.

That report of 1899 was made in a very short year for California. Southern California produced about 74 cars of honey. Where

# 1-lb Keystone ... Honey-Jars

These are clear flint glass jars holding just one pound, and the shape of a keystone. They are 7 1/4 inches high, and very pretty when filled with honey. The corks can be sunk a trifle below the top, and then fill in with beeswax, sealing-wax or paraffin. We can furnish them in single gross lots, with corks, f.o.b. Chicago, at \$3.50; two gross, \$3.25 per gross; or five or more gross, at \$3.00 a gross. These are the cheapest glass one-pound jars we know anything about. We have only a few gross of them left. So speak quick if you want them. Address,

## 28 cents Cash paid for Beeswax.

This is a good time to send in your Beeswax. We are paying 28 cents a pound—CASH—for best yellow, upon its receipt, or 30 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,  
**GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.**

would Texas be in a year like 1897, with Southern California's crop of 500 cars, valued at \$800,000?

Notice also that the proportion of the Texas product is only 50 percent on the investment, while California, even in a short year (1896), yields nearly 100 percent, and Colorado 90 percent on investment.

That California report was from 6,000 farms, while Texas reported 60,000. I append the Government figures:

Value of bees in 1899	Value of pro- dued in 1899	100
California.....\$396,885	\$391,939	100
Colorado..... 149,406	171,740	90
Texas..... 845,483	488,527	50

B. S. K. BENNETT.  
Los Angeles Co., Calif.

[The above was sent to Mr. Working, for the Denver convention, but was mislaid and not found in time, so is given now.—EDITOR.]

### Growing Alfalfa—Honey-Boards.

I would say to the readers of the American Bee Journal that they are wasting their time trying to raise alfalfa on ground that lifts with the freezing in the winter. Alfalfa will not grow where freezing pulls the fence-posts out of the ground. Where alfalfa does best the ground cracks open with the winter freezing, showing that it contracts. Alfalfa has very long roots, and although it will come up and grow well almost anywhere the first winter, if the ground is moist enough to raise the plant with the freezing; and this will be the case whether there are any tubercles on the roots or not.

Don't bother about the tubercles; if you have the land to grow it on, the tubercles will come.

I see no reports of better results than I had with a few bees last year. From 2 colonies, spring count, I increased to 7, and took off 545 finished sections of comb honey. From one 12th-of-June swarm, I took 201 finished sections.

If you use a honey-board it saves a lot of dashed sections to turn the side with the stripes on up, and hold it a bee-space above the sections by driving four small nails through it, and let nails stick out a bee-space from the smooth side.

Heat escapes from the top; if bees have a good blanket of some absorbent, nonconductive substance on top, it seems to me it is useless to try to cool them in the shade. A tank of water well protected on top will not freeze.

GRIFFEN CULBERTSON.  
Phillips Co., Kans.

### A Queen-Introducing Experience.

I think it will be hard on bees around here this year. It is so long since they had a flight, some time about Nov. 20.

I had quite an experience with a queen I got last summer. I had a colony that lost their queen and were so for two or more weeks. It was away at the time and I judged the time to be about that long. Well, I gave them 4 frames of brood fit to rear a queen, but they did not, so I sent for a queen, and received her all right. I changed cages, that is, I put the queen in a new cage, and introduced her in the evening, between the combs. Now, all the brood in the hive was about 10 days old, and no queen cells in the hive. I looked at her the next morning, and found that she was out of the cage, and running about the combs as unconcerned as you please. I in-

**MARVIN SMITH CO., 55-57-59 N. Jefferson St., CHICAGO, ILL.**

Please mention Bee Journal when writing.

tended to leave her locked up until the bees would eat the candy and let her out by themselves, but in fixing the cage between the combs I guess they became pried open and she got out. Well, they didn't seem to mind her any, and I thought she was all right, and left them alone. About 10 days after, I looked at them and to my great surprise found 3 queen-cells and no queen. The cells were worker-cells, and so small that you would not think a worker could be reared in it. Sixteen days after introducing the queen, I looked again and found one queen out, and the others just coming out. I killed those 2 and left the one that was out first. I gave them some more brood, and some time afterward she started to lay, and kept right at it until cold weather started.

So you see, they were simple enough to kill one, they were wise enough to rear three.  
Dubuque Co., Iowa. JAMES KANE.

**CONVENTION NOTICE.**

New York.—The annual meeting of the Oswego County Bee-Keepers' Association will be held at Fulton, N. Y., Saturday, March 7, 1903. Prof. Frank Benton will be present and address the meeting. **Tip-Top Glass Honey-Jars**

The picture shown herewith represents the best one-pound jar for honey that we know of. It is made of the clearest flint glass and when filled with honey, and a net label attached, it makes as handsome a package as can be imagined. Its glass top sets on a flat rubber ring, and is held in place by a flat steel spring across the top as shown in the picture. It is practically air-tight, thus permitting no leak,

which is an important thing with honey-sellers. We can furnish these jars, f.o.b. Chicago, at these prices: One gross, \$5.00; two gross, \$4.75 a gross; five or more gross \$4.50 per gross.

If you try them once you will likely use no other kind of top or sealing arrangement for honey jars.

**HONEY AND BEESWAX MARKET QUOTATIONS.**

CHICAGO, Jan. 9.—The demand is not more than usual; hence stocks are sufficient, especially as Cuba has now comb honey on this market. This is a new stock of supply, and is a factor that must be reckoned with, as it obviates the necessity of laying in a stock during the summer and autumn to draw from in the winter and spring months. The best grades of white comb sell at 15¢/16¢ per pound, with travel-stained and light amber, 13¢/14¢; darker grades, 10¢/12¢. Extracted, 70¢/8¢ for white, and 66¢/7¢ for ambers. Beeswax steady at 39¢.  
R. A. BURNETT & CO.

ALBANY, N. Y., Jan. 7.—Honey demand and receipts light. We quote white comb, 15 cents; mixed, 14¢; buckwheat, 13¢/14¢. Extracted, white, 70¢/75¢; dark and buckwheat, 70¢/75¢. More demand for buckwheat than any other here.  
H. R. WRIGHT.

KANSAS CITY, Dec. 20.—Market steady at quotations. We quote fancy white comb, per case, 24 sections, \$3.50; No. 1 at \$3.40; No. 2 white and amber, \$3.25. Extracted, white, per pound, 67¢/71¢; amber, 66¢/70¢.  
C. C. CLEMONS & CO.

CINCINNATI, Jan. 7.—The demand for all kinds of honey has fallen off considerably in the last few weeks, owing to the many other sweets offered at this season of the year. Lower prices will be no inducement to increase the consumption, as the demand is not there, and will not be until about the end of the month; consequently it is folly to offer at lower prices. We quote amber extracted in barrels at \$3.00; white clover and basswood, \$2.80/3.00. Fancy white comb honey, 16¢/17¢; lower grades hard to sell at any price. Beeswax firm at 29¢/30¢.  
THE FRED W. MUTH CO.

NEW YORK, Jan. 23.—Demand for comb honey quiet on all grades, and prices show a downward tendency. Supply quite sufficient to meet demand, if not more so. We quote fancy white at 15¢; No. 1, at 14¢; No. 2, at 12¢/13¢; dark and buckwheat, at 10¢/12¢. Extracted also quiet with abundant supplies with the exception of white clover. We quote white at 7¢; amber at 6¢, and dark at 6¢. Common in barrels from 40¢/65¢ per gallon. Beeswax firm at from 29¢/30¢.  
HILDRETH & SORLEKEN.

CINCINNATI, Jan. 20.—The demand for comb honey has fallen off, which in general happens right after the holidays, although prices are as before: White clover, 15¢/16¢; extra fancy water-white, 16¢; no demand, or low grade. Extracted honey is in fair demand, and sells as follows: Amber, in barrels, 5¢/5½¢; in cans, 6¢; alfalfa, 7¢; white clover, 7½¢/8½¢. Beeswax, 29¢/30¢.  
C. W. WEBER.

SAN FRANCISCO, Jan. 14.—White comb honey, 11¢/12¢; light amber, 10¢/11¢; dark, 9¢/10¢. Extracted, white, 66¢/70¢; light amber, 5¢/5½¢; amber, 4¢/4½¢. Beeswax, good to choice, light, 26¢/27¢; strictly fancy light, 29¢/30¢. The country merchant, representative of trade interests, estimates "entire stock of honey of 1902 in the State at 15 cars," worth 5½¢/6¢ per pound at primary points, subject to a \$1.10 freight rate to the East.

**WANTED WHITE CLOVER EXTRACTED HONEY!**

FROM THE BEEHIVE TO THE BEEKEEPER'S HAND

**If you will take**

the pains to observe carefully the conditions of the honey market from time to time, you will not fail to appreciate the fact that there is a good demand for the fancy grades of honey at all times and at good prices, while the supply of the medium and poorer grades may be about equal to the demand.

**In Poor Seasons**

then, you should produce the very best grade possible, because it brings a better price compared with the cost of production, and consequently a greater percent of profit, and

**In Good Seasons**

when there is a large crop, and a correspondingly lower price, it finds a ready sale, while other grades are slow in moving and are perhaps not sold until the best grade is all disposed of.

**Why not then buy**

hives and other supplies which are sure to increase the amount produced, raise the grade of honey obtained, and multiply the chances of securing the highest price because of the use of the very best goods obtainable?

**“The Best is the Cheapest”**

not only holds good in other lines, where the best grade is first sought after at the highest ruling price, but is also true in the selling of honey.

**Root's Goods**

secured the highest Award at the Pan-American Exposition, and Gold Medal at Paris Exposition.

## IMPORTANT NOTICES.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec03" on your label shows that it is paid to the end of December, 1903.

**Subscription Receipts.**—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

**Advertising Rates** will be given upon application.

CELL-CUPS AND FINISHED CELLS.

CAGES OF QUEEN EXCLUDING METAL.

# Stanley Queen Incubator and Brooder

An Arrangement that Allows the Bees Access to the Cells and Queens at all Times.

(Patent Applied for.)

One of the greatest objections urged against a lump-nursery or any kind of a nursery where bees are hatched away from the bees, is that the cells and their inmates are robbed of the actual care of the bees. When the bees have access to a cell, and the time approaches for the queen to emerge, the wax over the point is pared, and, as the queen cuts an opening through the cell, and thrusts out her tongue, she is fed and cheered in her efforts to leave the cell. A queen hatched away from the bees loses all of this food, cheer, and comradeship; and, until introduced to a nucleus, or full colony, has not the natural food that she would secure were she among the bees.

All of these objections are overcome by an invention of Mr. Arthur Stanley, of Lee Co., Ill. Mr. Stanley makes the cell-cups according to the directions given in Mr. Doolittle's "Scientific Queen-Rearing," sticking the base of each cell to a No. 12 gun-wad. By the use of melted wax these wads, with the cell attached, are stuck, at proper intervals, to a strip of wood exactly the length of the inside width of a Langstroth brood-frame. Two

wire staples driven into the inside of each end-bar, slide into slots cut in the ends of the cell-bars, and hold them in position.

The process of transferring larvae to the cells, getting the cells built, etc., have all been described in the books and journals, and need not be repeated here. When the cells are sealed they may be plucked off the bar (still attached to the gun-wad); and right here is where the special features of the Stanley process steps in. Each cell, as it is removed, is slipped into a little cylindrical cage, made of queen-excluding zinc, the cage being about two inches long, and of such a diameter that the gun-wad fits snugly, thus holding the cell in place and stopping up the end of the cage. The other end of the cage is plugged up with a gun-wad. Long rows of these cages, filled with sealed cells, are placed between two wooden strips that fit in between the end-bars of a Langstroth frame are held in position by wire staples that fit into slots cut in the ends of the strips. To hold the cages in their places, holes, a trifle larger than the diameter of the cage, are bored, at proper intervals, through the upper strip, thus allowing the

cages to be slipped down through the upper bar, until their lower ends rest in corresponding holes bored part way through the lower bar.

A frame full of these cages, stocked with cells, may be hung in a queenless colony, and will require no attention whatever except to remove the queens as they are needed. The workers can freely pass into and through the cages, cluster upon the cells, care for them, and feed the queens after they hatch, exactly as well as though the queens were uncaged.

These cages are unsurpassed as introducing cages, either for fertile or for virgin queens. The bees are not inclined to attack a queen in a cage to which they can enter, yet they can surround, caress, and feed her. They can become acquainted with her, and give her the same scent as themselves. When desirable to release her, one end of the cage can be stopped with candy, and the bees allowed to liberate her by eating it out.

By putting food in one end of the cage, a queen may be kept caged, away from the bees, the same as in any other cage.

**Editorial.**

**The Crucial Time of Wintering** is yet to come. The novice often congratulates himself along in January or February that his bees are wintering so well, only to find later on that before settled warm weather comes many of his colonies are dead, and those that remain are badly depleted. A week toward the close of winter will show more dead bees than a month at its beginning, sometimes twice as many. It is not well to crow before you are out of the woods.

**Shaken Swarms in England.**—The British Bee Journal does not boil over with enthusiasm with regard to shaken or brushed swarms. It says:

"We fail to see any improvement in, or much, if any, practical difference between the 'new dodge' and the well-tried methods of making artificial swarms practiced in this country for many years past."

Indeed, it seems to think they have something even better there. That "one better" plan will probably be given in the said journal, when it will be a pleasure to produce it in these columns.

**Taking Out and Returning Bees to Cellar.**—Is it desirable, when a favorable day comes, to take bees out of the cellar in winter and then return them after a flight? Naturally one would suppose that giving the bees a chance to fly and relieve themselves would leave them in better condition to endure further confinement. But actual trial seemed to show that bees thus treated were rather worse than better for it. It was generally agreed that after having been out for a flight the bees did not afterward settle down in the same quietude as before their flight.

But the matter has again become unsettled because of the report of the A. I. Root Co., that in the winter of 1901-2 they took out colonies for a winter flight and then returned them with apparently good results.

It is just possible that the former view is incorrect, and as the matter has a very practical bearing it would be well if many who winter their bees in cellars would put it to the test. In the vicinity of Chicago there has been no day warm enough for bees to fly since some time in the middle or latter part of November, and it is possible that such a day may now come any time. The same is probably true throughout most of the large territory where cellar-wintering prevails. When

a good flight-day comes let a certain number of average colonies be taken out and then returned in the evening, or, at most, not more than a day or two later. Then note whether the colonies so treated appear better or worse than the others after the season has fairly opened.

If the bees can be relieved by a flight before settled weather comes, it will be well to know it and to act accordingly. Those who believe in the practice may well ask why it should be that a winter flight, or several of them, should be conceded on all hands to be a good thing for bees wintered in the open, if the same thing is bad for cellared bees. But if further experiment should only result in re-establishing more firmly the belief that it is better to leave bees in the cellar until they can come out for good, it is well for us to know the fact.

This journal will be glad to receive reports from any who may experiment along the lines indicated.

**Moving Hives with Open Entrances** has been practiced by some and mentioned approvingly, but H. H. Hyde says, in the Progressive Bee-Keeper, that after testing it to a certain extent he does not approve of it. A good deal of emphasis can be read into the last part of his sentence when he says, "It might work very successfully for a time or two, but oh, the time that it does not do so!"

**Right Bees for Queen-Rearing.**—Swarthmore, in Gleanings in Bee-Culture, says that the bees of the best age are those which are engaged in the daily play-spell. He captures these at the time of their playing. An ordinary section-super has wire-cloth nailed over it, and this is placed in front of the hive to catch the playing bees. Then a thin board large enough to cover the super is slipped down between the super and the hive, and the imprisoned bees can then be used at the will of the operator.

There may be just a little question as to the correctness of his position that there is any serious objection to having been too young for queen-rearing. A bee that has not been out of the cell an hour may not do much in the way of nursing, but it will be getting older all the time, and it is possible that it may do its share when not many hours old.

**Discharging Feeces in the Hive.**—Do healthy bees discharge their feces in the hive? The general opinion has probably been that during winter confinement bees never discharge their feces in the hive until the intestines become so distended that their contents can no longer be retained, when the

bees might be considered in a more or less diseased condition.

Along with this view it has generally been held that the discharges were always more or less liquid in character. The late S. Cornell, of Ontario, stoutly held, and gave ocular demonstration to substantiate his belief, that at least sometimes the discharges were dry. Some authorities in Europe have held the same opinion, maintaining that under favorable conditions bees discharge their feces from time to time in a dry state in the hive, and that careful examination of the debris on the floor of the hive would demonstrate the truth of this belief.

The practical bearing of this matter is that if it be true that bees in a perfectly healthy state do void the contents of their intestines from time to time in a more or less solid form, then if the right conditions can be maintained there need be little anxiety as to long confinement, and little need for a flight till warm weather comes. In any case no harm can result from trying to maintain the conditions favorable to the frequent voidance in a dry form of the contents of the intestines. Chief among these conditions are pure air and the proper temperature.

**National Organization** is not looked upon with rose-colored glasses by H. H. Hyde, judging from an article written by him in the Bee-Keeper's Review. As objections to success are named: Unwillingness of beekeepers to unite with the organization; dishonesty of members; expense of operation; and the fact that to succeed the combine must "do away entirely with wholesale dealers in honey, and must sell to the retail merchants entirely."

The writer naively says that he has personal experience as a large buyer and shipper, thus appearing to be in the class of wholesale dealers, and his statement that doing away with wholesale dealers is one of the difficulties in the way of success of a national organization gives rise to the question whether the wish may not be father to the thought. The organization, however, will suffer most, in the judgment of Mr. Hyde, from "professional grabblers who take delight in picking a flaw, and in causing trouble in general."

**Gathering Statistics** is one of the things more or less talked about just now. Some think the National Association should do the work. Others think it might be done by the proper department of the National Government. Is it not possible that there might be some sort of co-operation. Gathering statistics involves expense. If we can have Uncle Sam foot the bills, in whole or in

part, and thereby have good service, it would be a desirable thing.

One consideration is that the Government is already in the business of gathering statistics. It has experience in that line, and it has the proper machinery for the work. That being the case, it looks pretty clear that the Government could do this *adroit* work at less expense than could another organization which would gather just one line of statistics.

The question then arises whether it is possible for the National Bee-Keepers' Association to do the work in a more satisfactory manner itself, and, if so, whether that increased efficiency would be worth all it would cost. The subject is open for consideration, and these columns are open for its discussion.

## Weekly Budget.

THE SIXTH ANNUAL REPORT of the General Manager of the National Bee-Keepers' Association, for 1902, reads as follows:

FOREST CITY, IOWA, December, 1902.  
To the Members of the National Bee-Keepers' Association:—

The past year has been a busy one for the General Manager. Bee-keepers seem to have more trouble with their neighbors than formerly. When the country was sparsely settled, and life was not so strenuous as at present, it was a rare case when neighbors sought to restrict the acknowledged right of the beekeeper and honey-producer. But the severe competition in the line of business, and the crowding of people into towns and cities, have developed a selfish spirit which crops out on many occasions.

But with one exception, no serious legal conflicts have occurred. The past decisions of courts establishing and confirming the rights of bee-keepers are of great importance whenever threats are made or actions begun to determine the legal rights of our members. Many of these decisions have been briefed and printed in pamphlet form for use in just such emergencies. Whenever a member gets into trouble because of his bees, and is threatened with damages, or ordered to remove them, the printed matter we have is sent to him or his attorney, and in a majority of cases the matter is dropped without further proceedings. It has been my practice not to encourage litigation. If I have reason to believe from the statement of a case that the bee-keeper is at fault, that he has so managed his bees that they have annoyed his neighbors needlessly, I do not encourage resistance to reasonable authority, but endeavor to have him reform his methods and avoid trouble. Bee-keeping is respectable, and I would have it respected through a proper system of management and the high character of its followers.

The most import case, which has been referred to the General Manager during the past year was one from Minnesota. Mr. V. Shebat, of Wabasha County, wrote me in July that he was likely to get into trouble on account of his bees, stating the case in a very clear, business-like manner. I sent him such advice and help as I thought necessary. In a hotly contested case which followed he was triumphantly vindicated. He was so grateful for the assistance rendered that he wrote the following to the American Bee Journal, which I hereby copy, as it states the matter fully, and is of great importance, perhaps, to warrant the use of the space it occupies.

STATEMENT OF MR. SHEBAT.

"I desire to say a few words through the American Bee Journal to the bee-keepers of America.

"I have been a member of the National Bee-Keepers' Association for 12 years, and for

more than 13 years have kept about 60 colonies of bees on a lot that I own here, and have never had any complaint made to me about my bees doing any damage or being a nuisance until this summer.

"A large church is situated on the corner opposite the lot on which my bees are located, but no complaint was ever made that they annoyed or injured any one. This summer a large church-school for girls was commenced on the lot adjacent to mine, and a city ordinance was manipulated through our city council declaring it a misdemeanor for any one to keep bees in our city, 'within 600 feet of any church, school-house, or other public place, or within 100 feet of any dwelling in said city.' This ordinance was passed in the latter part of July, and within a few days thereafter two actions were begun against me under said ordinance, and one under our State law, which declares, 'any act or commission which injures, annoys, or endangers the comfort, repose, health or safety of any other persons, is a public nuisance.' These were all criminal actions, and I was arrested in each case.

"The case under the State law was virtually abandoned for lack of evidence, and I was declared not guilty, but the case under the new city ordinance was prosecuted with bitterness and animosity. The trial was in our recorder's court, before a jury, and lasted the whole of one day.

"My attorney, Col. J. T. Bowditch, defended me on the following grounds, viz.:

"1st. That the ordinance was not authorized by our city charter.

"2d. That the city council had no power to make a nuisance of an act not possessing an ordinance against it, unless the act itself was in fact a nuisance.

"3d. That the ordinance in question resulted in taking and damaging property for public use without just compensation to the owner, contrary to the Constitution of the United States and of this State; that it abridged the natural rights of private citizens; that it was unreasonable and unjust.

"4th. That if the keeping of bees contrary to the terms of this ordinance was a nuisance at all, it was a private nuisance, for which all persons injured thereby had their redress in the courts, and was such a nuisance as could not be regulated by any general ordinance or law.

"These were the main points of my defense, but, of course, each was greatly elaborated by my attorney.

"I am happy to say the jury returned a verdict 'Not guilty,' and I have since received the congratulations of many bee-keepers on the happy ending of the vicious fight that was made against me.

"My chief object in writing this communication is to thank the National Bee-Keepers' Association publicly for the valuable aid it rendered me in this fight, and to impress upon all bee-keepers the benefits to be derived from belonging to such an organization.

"In the beginning I informed the officers of the Association (the General Manager) of the passage of the ordinance, and the danger threatened. They at once forwarded to me suitable briefs for the use of my attorneys, and suggestions how to proceed if I should be arrested. My attorney says the briefs were of the greatest assistance in preparing my defense. That, in fact, they lightened his labors fully one-half.

"After the case was decided I sent to the General Manager, Eugene Secor, a statement of the costs against me, and also a statement of the costs I had incurred in defending myself. I at once received a check for \$40, to pay a part of the expenses I had been put to. Surely, this is an Association worth belonging to, and it seems to me we ought to do all in our power to support and aid any institution that does as much for us as the National Bee-Keepers' Association.—V. SHEBAT.

Quite a number of other appeals for help and advice have been received, but none of them required any financial aid. The printed matter and letters were all that they required.

The correspondence and the routine work of the office are considerable. Indeed, the duties have been more burdensome than I felt like carrying, considering the unjust criticism of a few ambitious members. In my

last annual report I asked to be relieved, and, later, tendered my resignation, but was prevailed upon to serve out the present year. I now repeat that I wish the voting membership to elect my successor.

In severing my official relationship with the Association, perhaps the friends will allow me special all attention to some things that have been undertaken or accomplished during my incumbency.

When the Association was reorganized in 1896, it commenced business without funds and without prestige. I was its first and only General Manager. Through the hearty support and indefatigable labors of many loyal and influential bee-keepers, it grew from zero to nearly a thousand members; and, although a good deal of money has been spent in defense of bee-keepers, and to advance their interests, the financial statement submitted herewith shows its healthy condition. It is no boast to say it is the *largest and most prosperous* of all similar organizations, and is doing work that no other Association attempts since the voluntary withdrawal of the old 'Bee-Keepers' Union,' under the leadership of that successful manager, Thomas G. Newman.

Here is a statement of some of the more important things accomplished or attempted by this Association during the last five years:

In 1898 a good deal of time, energy and money was spent in promoting the *Pure Food Legislation*, and in trying to prevent the rescinding of a classification rule by railroad authorities in regard to shipping bees.

The same year an attempt was made by the city authorities in an Illinois town to remove all bees from the corporation. This was prevented by help of the Association.

In 1899 the Association attempted to stop the sale of adulterated honey in Chicago, and spent \$300 therefor. While the suits were not successful, the publicity which the suits brought about educated the people to such a degree that an Illinois Pure Food law was passed the next year.

A number of bee-keepers were also successfully aided by advice and help from the Association.

In the year 1900 the celebrated Uter vs. Uter case was successfully fought out, and the court rulings and decision will be valuable as a precedent whenever quoted in like cases.

The same year a case testing the Pure Food Law of Michigan was brought against a retailer of adulterated honey, and the party found *guilty and fined*.

During the year 1901 another important suit was determined in Rochester, N. Y., fully testing the right to keep bees in cities. (The City of Rochester vs. Taunton.)

These cases, in addition to the many settled out of court through the efforts of the Association, and, therefore, never heard of will inform the new members what the organization has been trying to accomplish.

It has also published for reference and distribution wherever needed, the following pamphlets and folders:

1st. BEES AND HORTICULTURE.—A 14-page pamphlet (2d Ed.) in which is brought together the latest and best thoughts on the value of bees to the fruit-grower, dandy, etc., endorsed by leading editors and agricultural writers.

2d. THE CITY OF ROCHESTER VS. TAUNTON:—A brief of the law case above referred to.

3d. A NEW YORK SUPREME COURT CASE defining property in swarms.

4th. A NEW YORK CASE as to the liabilities of bee-keepers for injuries done by bees.

5th. THE WIDELY QUOTED ARKADDELPHIA CASE successfully fought by Mr. Newman as to the rights of bee-keepers.

Newspaper articles, the tendency of which was to prejudice the public against the use of honey, written in ignorance by sensational reporters, have been replied to, and in many cases satisfactory retractions secured.

Members of Congress and chairmen of important committees have been asked to favor and promote pure food legislation with a view to stopping the sale of glucose syrup under the guise of honey.

In this, my final official report, I wish to acknowledge my obligation to many

friends and loyal supporters, and to express my thanks for kind and encouraging words. But I am firm in the conviction that it is time for me to slacken the speed of over-driven machinery, and turn the affairs of the Association over to a younger or more vigorous man.

I have had no conflict with the present Board of Directors, nor with any of the Association officials. The utmost harmony has prevailed in our deliberations. I feel grateful for the confidence reposed in me, and the unceasing loyalty shown by them.

### Financial Report.

#### RECEIPTS.

Amount on hand at last report.....	\$ 718 67
Received for membership fees during year .....	546 50

Total .....	\$1,265 17

Paid printing this report, ballots, names.....	22 00
Salary, 15 percent of amount received for memberships.....	81 97
Balance on hand.....	803 72
Total .....	\$1,265 17

#### NOTE.

If it is observed that the above item for membership fees is out of proportion to the number of names, it is stated in explanation:

1st. That a large number joined through local or State associations at 50 cents each.

2d. That I have not received a cent of the money paid to Mr. Abbott by the members, although their names are on the list.

3d. The untimely death of the secretary, Dr. Mason, probably accounts for his not remitting money in his hands for dues collected at Denver and at other times. He sent list of names in September, but no money.

Respectfully submitted,

EUGENE SECOR, *Gen. Mgr. and Treas.*

There are only two comments that we wish to make on the foregoing, viz:

Instead of \$300 having been paid in the Chicago adulterated-honey cases in 1899, it was \$200. And, even then, some not familiar with the details thought it was a large sum to pay. We know that the same work, if done by some other attorney, would have cost more. But it was money well spent, we think.

Second, one might naturally infer from Mr. Secor's Note 3, near the close of his Report, that Mr. Abbott was still holding the money he received for annual dues last summer, after being elected General Manager by a majority of the Board of Directors. But such inference would not be true, as Mr. Abbott sent by check the net amount in his hands to Secretary Mason. So Mr. Abbott can not be blamed if the General Manager did not receive that money. According to the Constitution of the Association, the Secretary, as well as the General Manager, is authorized to receive annual membership dues.

Mr. GEORGE W. FORBIS, a well-known farmer living in Howard Co., Mo., has just discovered that he has been living in a house that contains honey. Six years ago a swarm

of bees settled between the weather-boards and plastering of his residence. Lately he decided to investigate, and on taking away the weather-boarding, found that the bees had made a solid wall of honey. More than a hundred pounds of the finest quality of sweetness was taken out. Some bees seem to like large hives. These must have been something like the colonies Dr. Gallup has been writing about, and perhaps even the workers of this particular colony had the "missing link!"

THE APIARY OF MR. C. LINDBLOM appears in three views on the first page. He wrote as follows concerning it:

I take pleasure in sending you three pictures. No. 1 shows my bees on the summer stands. No. 2 presents the apiary in winter quarters, and No. 3 is my dwelling-house with two small colonies packed like the rest, but on the south side of the house.

In packing my bees, I first put two sticks across the frames, next two thicknesses of burlap, then the super on the hive filled with dry leaves. The cover is then put on, when the first part is done. Next I put on a lot of slough-grass all over and between the hives about 2 feet deep, and in this way I have wintered my bees nine years, and lost only 6 colonies. I winter an average of 12 colonies, always giving them plenty of feed, and have the hives face the south. C. LINDBLOM.

HE UNDERSTOOD HIM.—Fritz, a German lad, and little Tom were fond of each other, although neither could understand what the other said.

"Why, Tommy," said his father, "your playmate does not speak English, does he?"

"No," said Tommy; "but when a honey-bee stung him yesterday he cried in English, and I understood him."

## Convention Proceedings.

### Chicago-Northwestern Convention.

#### Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

The meeting was called to order by Pres. York, at 11 a.m., Dec. 3, and Secretary Moore offered prayer, who afterward read the minutes of the previous meeting, which were approved.

Pres. York then introduced the following bee-keepers from a distance: W. Z. Hutchinson, from Michigan; Mr. and Mrs. Pickard, Mr. Wilcox, Dr. Nussle, Mr. Whitney, Mr. Morrison, and Mr. Clute, all from Wisconsin; Mr. Niver, from New York; Morley Pettit, from Canada; Huber H. Root and Mr. Simon, from Ohio; Mr. Watts, from Indiana; and Mr. Armstrong, from Iowa.

Pres. York—Also Mr. Baldrige, one of the oldest bee-keepers in Illinois. We are always glad to have him here. How far back does your experience take you, Mr. Baldrige? Don't be afraid to tell because you will give your age away.

Mr. Baldrige—I can't tell exactly; before the war.

Pres. York—Spanish War?

Mr. Baldrige—Civil War.

Pres. York—Before two wars. I am sure we are going to have a good meeting, and as others come in we will have the room crowded. I received a letter from Canada; the writer of it wanted a copy of our program, and I told him

we had no program for this convention. We don't need it here. They seem to need a program over in Canada. They have it, anyway. It was Mr. Pettit, and he is with us. We simply ask questions and discuss them; we all take part in making up the "program," as well as discussing the questions.

On motion, a committee was appointed, composed of Mr. Horstmann and Mr. Clute, to meet Mr. France at the station when he should arrive at 1:15 p.m., and escort him to the convention.

F. Wilcox—May I be permitted to say a few words before Mr. France is introduced, because I may not have another opportunity? In the letter from Mr. France he speaks of bringing free copies of his foul brood volume for distribution. I know something about the preparation and publication of those bulletins, properly called. He prepared it for publication, and upon inquiry found he could get it published for about half the price by local papers, and elsewhere, and then attempted to draw pay from the State under the general appropriation for doing it, and failed. He is not a politician, and did not understand the process for securing pay for these bulletins, so he had to bear the expense out of his own pocket. I thought I might remind those who receive one of them, that it comes entirely from Mr. France, and not from the State of Wisconsin.

Pres. York—We are glad to know this. We will appreciate it all the more as a personal gift from Mr. France.

Mr. Moore read the Treasurer's report, which was approved, and showed a good balance on hand.

Pres. York—I suppose we are one of the "best healed" bee-keepers' associations. I think most of them have to take up a collection. We used to do that, but we have gotten beyond that, and now have some money in the treasury.

Sec. Moore—I suppose all of you know by this time that Dr. Masou did under very distressing circumstances. He was one of the best known bee-keepers in the world, and beloved by every one who knew him. I move that the chair appoint a committee of three to draw up resolutions of condolence to his family, and such other matters as should properly come under the work of such committee, and pre-

sent it to the Association when they get it complete, either this afternoon or to-morrow, for adoption.

Messrs. Hutchinson, Root, and Wilcox were named as the committee.

Pres. York—We now come to the program. I believe I said we didn't have any, but we have an order of business. Mr. Horstmann—I move that we have a few minutes recess, so as to give the members a chance to pay their dues. Carried.

Pres. York—Before we have this intermission I would like to say that the dues are one dollar, and this dollar pays for your membership not only in this Association, but also in the National. The dues of the National are also one dollar, but if you join this one you become a member in both Associations for the one dollar, where otherwise you would have to pay a dollar to join the National and another dollar to join this Association. I hope every bee-keeper who comes here will become a member of this Association.

After a short recess the convention proceeded.

Pres. York—I would like to appoint a committee to distribute slips of paper for questions. This is the way we make up our "program." Mr. Niver and Mr. Green will act on that committee. Now, if you have any questions you would like to ask and have discussed, write them on the slips of paper, and they will be collected a little later, so we will have some questions to go on with.

Mr. York—I have four questions we will begin on while you are writing others, and we would like to have each one who wishes, and will, take part in these discussions. I do not like to call on any one, but unless we get started promptly we will have to start by calling on some one. These questions were sent in by mail. The first question is this:

#### CARRYING DRAWN-OUT SECTION BY RAIL.

"Is it possible to carry by rail quite a distance, sections containing foundation which has been drawn out by the bees and emptied of honey, without damaging the same? If so, how should they be packed?"

Pres. York—Who has had experience in shipping sections containing foundation which has been drawn out by the bees and emptied of honey? How can you ship without this comb breaking out of the sections? Has any one done anything of that kind?

Mr. Wilcox—There will be no trouble whatever if the weather is sufficiently warm. All you want is to ship them in hot weather.

Dr. Nussle—I would like to have them shipped packed in the super as they are when they are drawn in the summer. Heat them up and put in the super, and you can ship any distance, winter or summer.

Mr. Hutchinson—I don't see why there should be any difficulty in shipping these any more than honey. The bees can not draw out that foundation with honey without connecting it at the top and partially at the sides, and we have shipped such honey, and the thing would be the same. I don't see the point the questioner wishes to make—why foundation can not be shipped as well as honey.

Pres. York—I suppose the questioner has what Dr. Miller would call "bait-sections." Has any one else anything to say on that question? Is there anything further that can be said?

Mr. Pettit—If the sections have been kept over winter in a cold place, and were cracked, I should not think they could be shipped at all; but otherwise they would ship more easily and safely than if they had honey in.

Pres. York—Mr. Wilcox suggests that a gas stove be sent along with them!

Mr. Simon—What Mr. Pettit has said is very true, that the comb is not more susceptible, or not as much susceptible, to breakage without the foundation, or without the filling of the honey, as it would be with it; therefore, I should consider it perfectly safe to ship them in almost any kind of weather without the honey in it as well as with it. Do you understand what I am driving at?

#### WHAT COLONIES TO COUNT AS PRODUCERS.

"When finding the average amount of honey produced by a certain number of colonies, should the colonies which produce just a few pounds—say two or three—be counted as honey-producers?"

Mr. Hutchinson—Count every colony that produces any honey.

Mr. Wilcox—If I am counting up the average per colony, I take no notice of the honey produced from a young swarm, but I count all colonies even if they don't give me a single pound, in fixing the average per colony.

Pres. York—How does Mr. Whitney do? Did you ever get an average? How do you make it?

Mr. Whitney—I don't know any other rule than that suggested by Mr. Wilcox. I usually count mine spring count—average spring count. Last season my average spring count was a little over 163 pounds from 33 colonies.

Pres. York—Comb or extracted?

Mr. Whitney—Comb. They gave me nearly 3500 pounds from 33 colonies.

Pres. York—Is there any other view on this, or do we all agree that the proper way is to count all the colonies? If so, we will go to the next question.

#### COUNTING THE AVERAGE PER COLONY.

"In estimating the number of sections produced by a colony, are salable ones alone counted?"

Pres. York—Are they all counted, or only the salable ones? How do you count them?

Mr. Whitney—I would explain my method of counting in answer to that question. I count only such as you can crate and ship away. The unfinished sections I ordinarily put back and let the bees finish them up, or extract them and keep them for bait-sections.

Pres. York—Judging from most of the honey shipped to market, I would say not every one does that way. I have had it come in hardly half sealed, and half filled. Think of sending sections of honey away to market in that condition! Is there any one else who produces comb honey who cares to answer this question? How do they do over in Canada, Mr. Pettit?

Mr. Pettit—We don't count the sections that are not salable, of course. We extract those and count them in with the extracted honey, or use the sections for bait-sections.

Mr. Niver—I have found some who don't have any No. 2 honey at all, in my travels the last two months. Beekeepers should simply take and sort when they take up a super, and take off as No. 2 all that won't grade No. 1, and put it in the super and set it in front of the hives at night, and let the bees carry it in to fill up their No. 2's so they have only No. 1 to sell. That is quite a nice way, I think. That is, it gives good results.

(Continued next week.)

## Contributed Articles.

### A National Honey Exchange Outlined.

BY PROF. A. J. COOK.

IN a late number of the American Bee Journal I gave what seems to me a fair description of the signs of the times in regard to combination, whether of capital or work and the great importance of co-operation in all lines of work. I there stated that I would in a succeeding article outline what seemed to me a feasible course for the beekeepers to pursue. This is not visionary or a mere theory. It is indeed what has already proved a success with the citrus growers of Southern California. I need not, however, say Southern California now, because our Citrus Fruit Exchange has already entered and captured central California, and is even gaining a foothold in the northern part of the State. What I give, then, is no theory, it is a sort of evolution. Although the Citrus Fruit Exchange started nine years ago it is to-day an acknowledged success, and all agree that it has been the salvation of a most important industry of our State.

California is peculiarly handicapped in the circumstances attending her fruit industry. We are over 2000 miles from market, and the freight charges on fruit to the Eastern cities are about one dollar a box. We had to compete with Italy and other sub-tropical and foreign nations where citrus fruits were produced. There transportation was by water, and, so, very cheap. Our superior intelligence, energy and enterprise made it possible for us to eclipse them to a marked degree in the quality of the fruit, but with railroads against us, and their determination to "charge all the traffic would bear," it was impossible for us to win success except through co-operation. As a result we have to-day the Southern California Fruit Exchange. By

the aid of this the citrus-fruit growers of our section have won a substantial success, and I doubt if any rural industry in the country can make a better showing, despite the great disadvantage of distant market and railroad transportation.

#### A HONEY EXCHANGE POSSIBLE.

For an exchange in any line to succeed demands a very intelligent constituency. Our citrus growers of Southern California are largely educated men. They read, think, and many had wide business experience before they commenced the work of fruit-culture. Such co-operation as the Exchange implies must be founded upon faith in each other, absence of distrust and suspicion, and a willingness to pay for first-class business talent, what other lines of business are willing to pay, and do pay. Our bee-keepers, to be successful, must read and think. As a general thing the apiarists are a reading, thinking people. If I am right in this conjecture then they will be more free from suspicion and more ready to act upon recognized business principles; freer from distrust and suspicion, and must agree to procure the best business talent and ability, even though they do have to pay what seems an exorbitant price for it.

#### THE PLAN OUTLINED.

I feel certain that in time we shall have a national honey exchange. Yet, as in our government relations, the different States will act separately, and each will have its own exchange which in many respects will be quite independent of the others, though all will be organically united and one man of signal ability who is manager of the great national exchange will have general direction over all the subordinate exchanges; that is, the exchanges of the separate States. This general manager would have his headquarters in some great central market, I should suppose probably Chicago would be headquarters for the national exchange.

Of course, this general manager would have his advisers. This might be a sort of executive committee appointed from the various States, and would be composed of men of marked business ability. It would very likely be better to have this executive committee of these advisers of the great business manager made up of the business managers of the different States, in which case, of course, meetings could not be held oftener than annually, and so the business would have to be largely by correspondence. In these days of typewriters and telephones this would be no serious handicap.

The work of this general manager would be chiefly distribution and marketing. He would have his ear constantly to the ground, and would know exactly the status of all the markets of the country, and thus he would direct from the different States the sending of honey to market in a way that the best distribution would be accomplished. This would make glutting of the market an impossibility. He would have charge of appointing salaried salesmen in all the great cities, who would, under his charge, distribute the honey as the needs of the various sections require. They would also look out for the distribution among smaller places in the near vicinity of the city or town. They would also be constantly developing markets.

These various salesmen would be in constant communication with the head manager, and thus he would know through them the condition of the market in all sections of the various States. Thus his office and duties would be much the same as that of the general manager of the Southern California Fruit Exchange. The latter, however, meets his advisers once a week during the busy season, while, as stated above, the general manager of the honey exchange could hardly meet his advisers oftener than once a year.

This general manager ought to be a man of very superior business ability. Such services could not be secured except at a large salary. I should say that \$10,000 would be none too much for the right man to fill this place. He should have business instinct and capacity that would more than pay his salary many times over during a single year.

#### THE STATE HONEY EXCHANGE.

Each State exchange likewise must needs have a business manager, also of unusual business capacity. He would take charge of the exchange for the State, and would, I believe, be the one from the State to advise with the general national manager. He would have advisers also. These should be honey-producers, and should be men of business tact and shrewd business management. The duty of the State business manager would be to keep in close immediate touch with all the county or local exchanges through the State. He would also be in constant communication with

the national manager. He would direct the various local exchanges when, how, and where to ship honey, and would arrange all the details. It is possible that it would be wise to give into his hands a portion of the marketing in his own State, which of course would be done only after the closest conference with the national manager. He and his advisers would arrange all the details of packing, grading and shipping, and in case it was found desirable to advance the money to bee-keepers who were unable to wait until the sales were made, he would be the one who would look after the details of this arrangement.

The third wheel in this great system would be the local exchange. Each would have its general manager or superintendent, who might be, and I think should be, the adviser of the State manager. He would be the go-between connecting the State manager with the individual honey-producers. He would also look after the details of the local exchange, such as storing of honey, packing, shipping, labeling, etc.

#### ADVANTAGES OF THE SYSTEM.

The great advantage from such a system of distribution and marketing would be that of all such combinations—the producers would have something to say as to the price which should be received for their product, and thus would not be called upon, or at least would not be compelled, to take less for their product than the actual cost of producing it. At present the bee-keepers, like all other agriculturists, have nothing to say regarding what their wares shall bring in the market, no more than they have regarding the price of such articles as they may wish to purchase. This seems a great wrong, and by such combination as this exchange would secure, the agriculturist can win a right which in all the world's history thus far he has been deprived of.

Again, this system of marketing would enable the producer to arrange an intelligent and wise distribution, so that while no section was crowded by a surplus of his product, all sections would at all times be supplied with a sufficient amount for the needs of all the people. Heretofore there has been no system at all in this matter of distribution of products. Who can doubt but that a wise reform in this matter would be fraught with the greatest results to any industry that should secure it?

A third advantage would be the fact that the honey would be all put up and graded in a uniform and excellent style, so that buyers would be attracted as they cannot be where much of the product is sold in a form that is neither attractive nor economical. The packing could also be done very much cheaper. The grading also would be perfect, and thus every man's product would be sold on its own merits. This improvement in style of packing and this thorough grading would of necessity increase the demand for the product everywhere, and would result in greatly increased sales. The reduction in cost of packing has been about one-third in the fruit exchange. That it would be less in the honey exchange I see no reason to believe.

Still another advantage from this system of doing business would be a combination in the purchase of supplies, and thus all supplies would be bought at uniform rates, would be uniform in style, and all would be of the very best style, pattern and finish. Here again the citrus fruit exchange has made a great advance over the experience of the orange and lemon growers before the association was founded.

In the case of the Citrus Fruit Exchange the cost of marketing, including telegrams, all clerk hire, everything, is a little less than three percent, and is done much better than it ever could have been through commission men. I see no reason why the same large gains may not accrue to the bee-keepers if they can only consent to form such an organization as is outlined above.

Again, the losses during the nine years of the history of the California Citrus Fruit Exchange where about thirty million dollars worth of fruit has been sold, has been less than one-fortieth of one percent. We sometimes hear it said that farmers can not do their own business. I would like to know of a business firm or any organization or association, the country over, that has done business of such magnitude with such an infinitesimal loss as the Citrus Exchange.

If our bee-keepers will only consent to act together, and will secure men of that large business capacity which will enable them to run successfully the large undertaking, I see no reason why an abundant success may not be secured. The scheme is a grand one, and must develop slowly. California, Colorado, and Arizona, ought soon to be ready to carry it out, and with them as examples we may hope that the other States will soon wheel into line.

## Forced Swarms—Questions About Them Answered.

BY J. E. CHAMBERS.

ON page 819 (1902) are some questions about forced swarms, in answer to which I will say that it does not matter in the least whether or not they are made before queen-cells are started, for the reason that no swarm should ever be made for the sole purpose of controlling the swarming impulse, when there is no honey-flow, for in the great majority of cases no good results can reasonably be expected, unless there is a good, strong flow right at the time the colony is swarmed, in which case it will not do to wait for cells to be started, for we want to get the bees to work in the supers at once, not even to lose a day's time. And in order to do this, we must work our bees in a way that will bring them up to the flow in the best possible shape for the honey-gathering; and, he who cannot accomplish this will not succeed with the brushed-swarm method. But if you have them in condition, and honey is coming, don't wait a minute. Brush them, cells or no cells. Remember, the main thing is lots of bees and a good, strong flow of nectar. Reinforce them with a second drive in eight days, and again in eight days more, if the flow continues.

I find large starters are best in my locality, and full sheets in sections. No frame of brood is ever needed with me in order to control absconding, however, a comb of brood will do no harm, and in many cases it will have a strong tendency to prevent swarming-out. There is nothing in the idea that a comb of brood must be removed on the second day after it is given in order to prevent swarming-out. I speak of this in my own locality; with others it may be different.

There is always more or less uneasiness among bees that have been brushed, and unless the work is done rightly, they will be apt to swarm-out. However, I don't think there is any more danger of absconding than with natural swarming, provided reasonable care is exercised.

I do not consider that any advantage is to be gained by the use of drawn comb. On the contrary I think it is a big mistake to use it, for the reason that the bees will begin work in the brood-chamber first, if drawn comb is used, and may continue to waste time storing in the brood-nest when they should be at work in the supers; and that very loitering in the brood-chambers may induce swarming. And, again, they always seem less inclined to enter the supers promptly. For this very reason drawn combs are more convenient to cluster on than starters, and the queens will start laying at once, thus occupying a large part of the force in the brood-chamber.

In conclusion I will say, that to get the best results a shallow hive is necessary. It is almost impossible to get the full benefit of the brushed-swarm method with a deep hive, with most of us. Contraction is the word.

Concho Co., Texas.

## Apiculture in Germany vs. United States.

BY J. A. HEBERLY.

IT is interesting to note the difference of present-time bee-keeping in Germany and the United States, but it is surprising to see the great variety of hives, different sizes of frames, to hear the loud praising of a particular form of hive by one group, and the equally loud condemnation of the same hive by another group of apiarists, and still all pursue the same object—to induce the bees to store the most honey.

In Germany the hives are not set out singly in the garden or field, but are put into bee-houses. Sometimes it is only a wooden shanty to protect the hives from the weather, with poor light, and bees having access to the interior; more commonly they are bee-tight, single or double walled, mostly of wood, but sometimes of masonry; some are quite ornamental.

In most of them the bees fly to the south only. Usually there are but two tiers of hives, rarely three tiers, for hives are operated on from the rear, styled Dothe or Berlepsch hive, vulgarly called "breech-loader." For this form of hive the bee-house usually has ample light from the opposite side from where the bees have their entrance. For hives operated on from above, the light generally enters from the same side the hives stand, and just above the body of the hives. Generally there is but one tier of such hives, but

some, to save expense, sacrifice convenience and put two tiers, one above the other.

Then there are bee-houses called "pavilions," where the bees have their entrance from three or all four sides, with only one tier, providing ample room and light for hives operated on from above. This last is a late type, but quite expensive compared with the pavilion or old, designed for breech-loading hives. These consist of multi-hives for 4 or more colonies side by side with only a division-board between them. The front and two sides are double-walled, on a solid foundation of masonry. Two, and sometimes three, of these multi-hives are put on top of one another, thus forming one side of the pavilion; two more walls of multi-hives at right angle to the first, and the sides of the pavilion are finished. The fourth side of a small pavilion will be taken up by the entrance. In a large one there is room for a few hives on one or both sides of the door, if it is not preferred to put to the side of the door, a tier of drawers for implements, frames not in use, etc. Sometimes a row of drawers is put on the foundation, and multi-hives on top of these, because it is very inconvenient to work when the hives are near the floor. The four sides do not touch each other, there is a space of 6 to 10 inches left in each corner for the windows which are as high as the sides of the pavilion; they are pivoted in the center, the middle on the base and ceiling, so they readily turn on their long axis to the right or left, that the bees may be let out which flew off the combs while being operated on.

A neat flat roof, provision for ample ventilation, and the pavilion is finished. These are quite economical where breech-loaders are in use, costing little more than the single hive would cost, and are quite a nice addition in a garden or park. It is claimed that bee-tight bee-houses and pavilions are nice to work in, when nectar is scarce, without danger of robbing, and that often work can be done that would be impracticable on account of the weather where the hives are in the open air.

Germany.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### The Bee-Cellar in Winter.

Only two months or so now before those who winter bees in the cellar will be thinking about taking them out.

Are you keeping pretty close watch of your cellar? Does it smell sweet and clean? Bees, the same as human beings, need fresh, pure air, all the time. I am afraid that a good many of the human family do not have it always, and no doubt the bees are often in the same condition.

What do you do when your rooms need ventilation? You open up the doors and windows and let in the fresh air. If the weather is very cold you do not leave them open very long, still you feel you must have fresh air even if it does bring the temperature down for a while. Pretty good plan to give the bees the same treatment.

### Queen Laying in January—A Little Beginner.

Did you ever have a queen that started to lay eggs Jan. 10? She has brood in all stages, and she is a young queen of 1892, and was hived June 23. Her swarm was a weak one, so I had her hived in a hive with the entrance all open. Then next the hive got moth-worms. I cleaned her combs and took out the brood, so that the bees could get all eggs of the wax-worms. When that was done, in the beginning of August, she started to lay again, and laid a lot of eggs. When the honey-flow was almost over I started to feed them until they had enough. So I was rid of the moth-worms, and she had built up nicely by fall, with plenty of young bees. Now she has not been fed for two months. January 16 I opened the hive, as I wanted to see whether they had stores enough, and I found they had eggs and brood in all stages. What is the reason she started to lay so early? Our temperature was from 4 to 6 degrees above zero.

I am a beginner in bee-keeping. I get the American Bee Journal and have some bee-books besides. I have

never found anything about a queen starting to lay at this time of the year.

I commenced with 2 colonies, then I found one of them was queenless, so I united them, and increased to 7 colonies during the summer, and they are in pretty good shape.

I am a little girl, 8 years old, and I enjoy reading Yon Yonson's letters in the Bee Journal. What has become of him? Was Dr. Miller after him with a sharp stick, or what is the reason he has no more letters in the Bee Journal? E. W. ABEL.

Northampton Co., Pa., Jan. 18.

You don't say whether your bees are outdoors or in the cellar. I judge from what you say that they are out-of-doors.

In cold weather we keep up the heat of our houses by burning fuel, coal, wood, etc. The bees do the same, only honey is their fuel, and it is burned inside their little bodies. The colder the weather the more fuel is needed.

The heat of the cluster must be kept at about 50 degrees. In very cold weather to keep the outside of the cluster at 50 degrees, the inside of the cluster must be very much warmer, and contradictory as it may seem, the colder the weather the warmer it will be in the center of the cluster. After all, that isn't any different from what it is in our homes, for the colder the weather the hotter must our fires be to keep up the proper temperature. So the heat being so great in the center of the cluster it is no uncommon thing for the queens to begin to lay in February, or even in January, when wintered out-of-doors.

They will not begin to lay so early when wintered in the cellar, because there is not so much heat in the center of the cluster.

I didn't know what had become of Yon Yonson, but hoped he was not sick. Many of us, with you, missed his quaint sayings; but he is with us again, I see.

"The Sisters" will be glad to make the acquaintance of a bright little up-to-date bee-keeper only 8 years old, who enjoys reading the Bee Journal. I hope this is not the last time we are to hear from you. I, for one, will be anxious to know how you succeed.

tion is soulless and cruel—about the choice between a thief and a robber—and often financially foolish to boot. Wick- edness develops so that in time it blinds even a soulless cor- poration's eyes so it cannot see its own interests. O that impossibilities might melt into possibilities! O that some- body might invent a corporation with a Christian soul in- side of it! We'd vote him up to be the brother of the arch- angel Michael.

SMELTER-SMOKE CONSUMER AND BEES.

Looks like the Utah brethren are hugging a false hope, if they hope anything in the line of smoke-consumers will save their bees much. Smoke-consumers are to save fuel, and to abate the nuisance of falling soot. I fear they do not make the final products of combustion any more whole- some—if indeed they do not make them worse. Chlorine and arsenic still. Carbon becomes carbonic acid, no longer dirty but much worse for animal life. Sulphur and phos- phorus become sulphuric and phosphoric acids, more vio- lently harmful than before, but liable to seize on moisture near by and not go so far. If arrangements are made to toss the vapors in a heated condition high into the air, that may help some. Page 5.

SUGAR PER CAPITA.

If our people eat sugar 68 pounds per capita per year, then (considering the number of babies and extreme poor) a good many individuals must eat twice the ration, or 136 pounds. How many ounces would that be per day? About six. I'm aware that I eat even more than that, but it's al- most hard to believe it of the other folks. Page 13.

OPEN-AIR COLONY.

An open-air colony of bees in Central Michigan is quite an interesting freak. Of course they couldn't go through the winter alive there. Possible to take the rail into the cellar—but then there would be the difficulty of their lack of honey. I wish very much we could have had that colony carried over somehow, and set back there next spring. Even a few boards laid on the fence till spring rains and winds were over would not deprive them of their claim to be called an open-air colony. Page 21.

POOR MAN AND CAPITALIST—GREEDY MANAGER.

Yes, Prof. Cook, we are no less safe in the hands of the humbler than in the grip of the capitalist—or no? Solomon takes the other side—holds that a poor man when he gets a position to oppress a poor man is like a cloud-burst, that sweeps everything away—has practically no mercy, where the rich oppressor would have some. (Prov. 28:3.) It's possible, yes probable, that the masses have risen quite a bit since Solomon's time. But humble little bear, and big, proud grizzly bear—some of us are like way-faring Johnny- cake in the nursery tale. We look at both ruefully; and we won't climb up unto either of their soft, easy-bed tongues until we are absolutely obliged to do it.

And so the one-of-a-thousand manager wants a thou- sand-and-to-one salary. Strange. Not in the business for his health, I fear. With both the name and the game of being a greedy grabber for other folks, it's asking too much to ex- pect him to be modest in grabbing for himself. Page 22.

**\* The Afterthought. \***

The "Old Reliable" seen through New and Unreliable Glasses. By E. E. HASTY, Sta. B Rural, Toledo, O.

A NEW HUMORIST.

Our new humorist who has three-year-old workers and ten-year-old queens, look out he doesn't get your scalp hanging at his belt. Page 829.

RELIEFING HONEY IN GLASS JARS.

How to relieve honey in little glass bottles without spoiling the labels is quite a problem. Can be done in the kitchen oven. Don't! First you know you'll forget and explode a lot of them—and there are too many divorces now. Solar extractor no doubt splendid; but that is just the time of year when few want to relieve. Where there is much such work to be done no doubt a huge heating-box, with thermometer inside, would be the thing. Heating arrange- ments such as would not be liable to run very much too high anyhow. Page 3.

COMBINATIONS, CO OPERATIONS, EXCHANGES, AND "SICH."

I'm like a big dog chained under the hind axle of a big wagon. (Perhaps a small dog would be a more suitable figure.) I hang back awfully and persistently; occasionally I bark; but the wagon goes right on, oft in the precise direction I don't want it to go. What is said on page 6 (1903), for the moment e'enymost made me slack my chain and walk right up under the vehicle. Perhaps the orange and lemon growers endured the business conditions of our fathers as long as they ought to. Not sure it was their duty to keep on sending oranges East and getting expense bills in- stead of cash. Nice—to be able to double their acreage and get satisfactory returns on \$11,000,000 worth of fruit. (Let's see, sin has a reputation of looking nice, has it not?) But what shall we do with the claim that they were sin- ning, sinning against wife and babies, in the old competi- tive way? Competition is sneaking and cruel; combina-

**Questions and Answers.**

CONDUCTED BY

DR. C. O. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

"Missing Link" in Queens—Iowa as a Honey-State, Etc.

1. On page 56, and other pages in back numbers, Dr. Gallup speaks of the "missing link" in queens. What do you understand such missing link? Is it a deficiency in the female organs that make them non-prolific and short-lived? I have bought quite a number of queens in the last 5 years, and fully 2/3 of them did not live over a year from the time they were introduced, and none of them lived over 2 years; while home-reared queens, reared by natural swarming or

supersedure, will live 5 years. This is no guess-work, I know it to do so.

2. Last September I bought a nice, select queen. She went to laying in a short time, and laid on until cold weather knocked her out, and a few days ago I found her lying in front of the hive, dead, while there were but a few other dead bees thrown out with her. Do you think she could have died from starvation on account of the bees being unable to feed her during the cold snap we had a few weeks ago?

3. How does Iowa rank as a honey-State?

4. What part of the State is considered best?

5. Would it be too cold for a West Virginia man?

6. Which is considered the better State for bees, Ohio or West Virginia?

WEST VIRGINIA.

ANSWERS.—1. I am not certain that I know enough about it to give you a satisfactory answer. The "missing link" spoken of by Dr. Gallup seems to be considered something like an umbilical cord. This last is the cord through which circulation of blood is kept up between the parent and the fetus in the womb, and how anything of that kind can take place in a queen-cell is beyond my comprehension. Mr. Doolittle seems to give the matter his endorsement, which is no little in its favor, for Mr. Doolittle is usually very careful in his statements. Scientific men remain intensely silent with regard to it. I don't pretend to know anything about it, and I may be mistaken in my guess, but that guess is that nothing new has been observed at all, and that the whole thing is nonsense.

2. No, it would hardly be of starvation unless the whole colony starved, for the queen is always one of the last in the colony to starve to death.

3. About average.

4. No particular choice.

5. Probably not.

6. About the same.

I have answered those last four questions, without being at all sure, and will be glad to have any one correct me if I am wrong.

### Best Location for Bees—Drone-Comb.

1. Which of two localities would you consider the better for an out-apiary, one beside a very large cedar swamp, and the other where wild berries grow fairly abundantly, and where clover would be in reach in moderate quantity?

2. Can one "overdo" it in removing drone-comb during the summer? Would it be a mistake to take away all, or nearly all?

ONTARIO.

ANSWERS.—1. I think I'd take the berries and clover, although I don't know much about cedar swamps.

2. Don't worry about overdoing it. The best you can do, there will probably be all the drones reared that you will need. But it would be a good plan to leave some drone-comb in a few of your best colonies, trying to keep drone-comb out of all others. It is just as important to have drones of best stock as it is to have best queens.

### Getting Increase and Not Honey.

1. I have 3 colonies of bees, and they have their brood-combs built so unevenly that it is almost impossible to divide them. I wish to increase in colonies, and do not care to produce honey at present. Would you advise me to put new brood-frames with foundation starters in the lower story, and place the brood-combs in the upper story?

2. Will the queen and the worker-bees start to rear in the brood-chamber?

3. Will the nurse-bees take care of the brood in the upper story?

4. Can I do all this, and still increase the number of colonies the same season?

5. When is the best time to make this change?

I have quite a number of basswood trees. IOWA.

ANSWERS.—1. Yes, that plan will work, although it might be better to fill the frames below entirely with foundation.

2. Yes, after the brood-frames are entirely filled in the upper story the bees will build down below.

3. There will be no trouble on that score.

4. The plan proposed will hinder or prevent natural swarming. But when the bees have fairly started in the lower story, then you can set the upper story on a new

stand, being sure not to take the queen with it, allowing the bees to rear a queen of their own, although it will be very much better to give them a queen, or at least a sealed queen-cell.

5. About the time bees are working well on white clover will be a good time in your locality. It might be a better plan at this time to give the second story, and to put an excluder between the two stories, being sure that the queen is in the lower story; then removing the upper story to a new stand ten days or so later.

### A Galvanized-Iron Honey-Tank.

Will a tank made of galvanized iron do to put extracted honey in to settle, skim, and then draw off into shipping packages? I want to let it remain in the tank only a short time.

WISCONSIN.

ANSWER.—I think it would work all right.

### Thickness of Top-Bars.

Do you believe that a half-inch thick brood-frame top-bar will tend to prevent the bees building burr-comb on such frames, as well as the  $\frac{3}{4}$ -inch top-bar? Which kind do you use?

NEBRASKA.

ANSWER.—I do not believe that the  $\frac{1}{2}$ -inch will prevent burr-combs quite as well as the  $\frac{3}{4}$ . Mine are  $\frac{3}{8}$ .

### Making Hives—Spacing Frames—Sweet Clover—Filberts.

1. I have some hives to make. How will it do to make them about 13x14 inches, and 14 inches high, with the upper story about 11 inches deep?

2. How far apart should the frames be placed, and what kind of lumber should they be made of?

3. Will sweet clover bloom the same year it is planted?

4. How old do filberts have to be before they bloom?

MISSOURI.

ANSWERS.—1. Bees will work in almost any kind of a hive; but it is not wise to make one of an odd size.

2. Generally, frames are  $1\frac{3}{8}$  inches apart from center to center, but some prefer  $1\frac{1}{2}$ . There is no better lumber for them than pine.

3. It does not bloom till the second summer, then dies the next winter, root and branch.

4. I don't know anything about filbert trees; if it is a honey-plant perhaps some one can tell us about its blooming.

### Building a Bee-House in Texas.

I am an amateur bee-keeper, and would like to put my out-apiaries in houses for protection against thieves. We do not need any protection against the cold here, and such a house, single-walled, for protection against thieves, can be built at a cost of about \$1.00 per colony.

Bees begin to get some honey here in April, but we get no surplus until July, all from cotton. May is warm and the bees barely make a living. June is about the hottest month we have, and the bees get a good living and sometimes a little surplus. I know of no one that has kept bees in a house in this State, so I ask for information.

1. Would the bees store as much honey in such a house as in the open?

2. Would they swarm less?

3. Would so much shade keep them from building up sufficiently strong for the honey-flow in July? (Note the weather conditions here.)

4. What are the disadvantages of such a house?

ANSWERS.—1. I think they would.

2. I don't know. That would depend a good deal on the ventilation. If close, so the bees would be warmer than in the open, they might swarm more. If thoroughly ventilated, so the bees would be cooler than in the open, they might swarm less.

3. No, I don't believe the shade would prevent their building up.

4. I don't know anything about it from personal experience, but aside from the matter of expense I think you might find the greatest objection to be that it would be a hot place for you to work in.

**What you Yonson Think**

For long time ago it was a man som was name Adam. He was a good man, an he never had nut anyting rong, but he was deceived by da evil spirit, an he ete of da frute vat he was told not to ete. He make plenty big mistake, an because of das mistake ve iss born sinners, an da world is full of sin an misery, and ve half to lord work four ours dally bread.

But in you vat Adam vos vak lak mistak, ven da Lord ask him yv for he ete of da frute vot he was commanded not to ete, he say it was da voman's falt. Now, if you vil read da bible careful you vil fine dat Adam was given das commandment before Eve was created, and it vos Adam's not an Eve's falt. An' da Lord cused the ground for Adam's sake, an so it iss even now, it iss easy to vak mistak, but it iss plenty hard yob to fix it up lak it vos before. An' if ve don't votch out, a little mistake grow plenty fast, an' by and ve goan to hav big harvest, an' vot vesov ve goan to reap.

Ven bad peoples mak mistak it iss bad, but ven good peoples mak mistak it iss lots vorse, cause deir influence go so much further an' du more harm.

Now, somebody mak plenty awful big mistake about da lection of da general manager, an' dom is all good mans, so it dun lots of harm. Now, everybuddy vat mak dat mistak let dom not rest till dom mak it rite. Now, ven y got card to vote for general manager, ay got paper vot dom call report an' it sad dom never got da money from Abbott vot he collect; but Abbot he pay das money for long time ago, an got receet vot he carried till it soon be vord out. An' on nodder von paper it say, ven dom try to explain 'bout you dom call 'da late unpleasantness'—dat is very nice name for plenty bad thing—but it say da directors don't can lect general manager, ven it don't vas any vacancy. But, my goodness, dom knowed dom dun it. Vy for dom goan to do something dom can't do? An' den because dom can't do it, dom blame Abbot for da bolting. Dat iss lak little yob vot bought gun, an' after he svaered it be von't to trade bak. Ay don't can understand vy for dom go to so much trouble to beste a yob.

If Mr. Abbott dun sumting awful rong let him stan up an everybuddy vat never dun any thing rong let him trow big stone at Abbott. Ay tank it don't goan to tak very big pile ma stones to supply da demand before dom vas all good friends, an dom sed nice things bout each odder. But ven good friends work together to do good den Satan he sneak up behine an' to mak dom to disagree, an if he can just mak dom to quarrel den ay tank he make big lak, an rejoice. But ven Satan rejoice den da angels veep.

Mr. A. I. Gleanings, he bean rite sermons for long time, an he du lots of good, an if you tak notes all dom big benefit, ve iss good mans, an' dom iss nearly all Christian an' ten prence mans. Dom don't even chew tobacco, cause dom follow Mr. A. I. Gleanings teachings, an dom don't smoke corneob pipe, cause Gleanings he giv da Clark's cold-blast smoker so dom can keep cool. Derr is no odder bissen vat got so many Christian leaders som keeping, an if dom vil vout poln hands and de Satan den Satan vil hav to run lak sixty. An' ve don't goan to hav any more trouble; an' ve can turn ours attention to honey-plants an shoobked svarrus, an pupa-kinnes castoffice (little cord vot dom try der quenees up ven dom git too hi lifed and vant to svarru).

Now, ay tank all dom little bee-mans lak to Yonson vot belong to N. B. K. A. should vote vot dom tank is best, but all dom directors vot vote for an' lect Abbott before, dom ought to vote for Abbott das time, cause dom is honest an' acknowledge it vas all deir falt, an' dom shud undn da rong dom allreddy dun to Abbott. In place of trying to pull a good brooder down, dn lak da good Samaritan, cause ve should prefer ours neighbor before ourselv.

Now, if it bean anybody vot don't lak You Yonson cause he express his opinion about

YON YONSON.

## FROM MANY FIELDS

### Good Season in 1902.

We had a very good season in 1902, considering our locality, northern Kentucky. I started in the spring with 600 colonies of bees, increased to 83, and took 2500 pounds of nice white honey in one-pound sections. We got no honey last fall. My bees are in good condition at this date.

There seems to be good prospect for a honey crop this year. The ground is full of white clover.

I admire the old *American Bee Journal* as much as ever.  
P. McDOWELL.

Mason Co., Ky., Jan. 24.

### Fine Weather for Bees.

We are having fine weather here for bees. Nine degrees below zero is the coldest we have had so far. The bees have had a good flight every 20 days, and a good clean-out.

I have my bees under a good shed, out of all the storms.

I have not had the best health this winter.

G. W. VANGUNDY.

Uinta Co., Utah, Jan. 24.

### Fastening Foundation in Sections.

We used the Daisy Foundation Fastener, but I did not like the way it worked, so I made a little change, and thought it might help others to tell how I fixed it. The way it was, it got too hot for the wax and would melt it down if it did not hurry. I nailed a tin on the block that holds the sections, and let it just miss the iron plate (under the plate); the tin cuts off all the heat from the lamp so the plate will not get so hot, and the heat from the lamp cannot get to the starters.

I think I have made it plain.

JOHN ERDMAN.

Berrien Co., Mich., Jan. 23.

### Bees Demoralized—Bee-Honey.

My bees were demoralized last year, as were those of the rest of the fraternity, but I fed them, and humored them as well as I could. I built them a nice cellar and on top of that a nice bee-house, so they will be in shelter and shade, as it may be desirable.

My place on University Heights is high and exposed to public gaze. Now the bees is a puzzle to the passers-by, that is, if they don't come too near.

REV. H. A. WINTER.

Dane Co., Wis., Jan. 27.

### Wintering Bees—Season of 1903.

My bees did fairly well the past season—I sold 35 pounds of fancy-white comb honey at 15 cents per pound, from 2 colonies, and I took out several pounds for home use. I am wintering 4 colonies, which seem to be in pretty fair condition. I winter my bees under ground, just leaving an air-hole. I pile ground first, then put sod over the top, which I lay like shingles, and on the very top I put an extra-big sod, and it keeps the snow or rain-water out, and keeps the bees dry and warm.

1902 was a pretty fair season for bees in this locality, only it was a little too cold up to June, but the latter part was warm enough for bees or human beings. There were plenty of rains all summer, floods tearing bridges, and the railroads and cornfields were all

To make cows pay, use Sharples Cream Separators

# Marshfield Manufacturing Company.

Our specialty is making SECTIONS, and they are the best in the market. Wisconsin BASSWOOD is the right kind for them. We have a full line of BEE-SUPPLIES. Write for free illustrated catalog and price-list.

**Marshfield Manufacturing Company, Marshfield, Wis.**

Please mention *Bee Journal* when writing.

washed out. The corn crop in this part of the country did not amount to very much, as the corn all froze.

We are having a very comfortable winter so far; it has not been 20 below zero yet, and not more than six inches of snow. Last week the snow was nearly all gone, but yesterday it snowed some and to-day a little more, which will almost make sleighing.

I do not see how any bee-keeper manages to get along without the American Bee Journal. Clayton Co., Iowa. B. F. SCHMIDT.

**Has Kept Bees Long.**

I put my bees in for the winter packed well with chaff and ground cork. I have 52 colonies. They stored only 200 pounds of surplus last season, it being too wet or cold.

I had to feed several colonies in the fall; I had 58 colonies then, but when I commenced to pack for winter I found 6 colonies had started out.

I have kept bees for 38 years, and sometimes have more than at other times. I use all movable-frame hives. I used to use the D. P. Kidder hives, but have now discarded them and am using the Falconer chaff hive, also some Simplicity and Chautauqua, and the dovetail. They are all very satisfactory to me. The fence separators I do not like, nor do I like the plain sections; I would rather have the 4 1/2 by 4 1/4 with wood separators or even tin. I have used both kinds. The trouble with the fence separators is, the bees build comb to them so that when I take out the sections a good many of the cappings are broken, and it makes them leak.

ELISHA BAILEY.

Erie Co., N. Y., Jan. 27.

**Swarming-Out in Winter.**

My bees are wintering finely. They had a flight 2 weeks ago, which did them lots of good. I had one swarm out then just like in summer. I did not know what to make of it at the time; they went in with their next door neighbor, which was a weak one, but had plenty of stores, but when I examined their hive I found the queen dead, and about 30 pounds of honey, so I concluded they could not exist long without a queen.

P. H. HARBECK.

LaSalle Co., Ill., Jan. 24.

**A Fair Crop Last Year.**

I had a fair crop of honey last year, but would have gotten more if it had not been so wet. I got 1300 pounds from 21 colonies, spring count, and increased to 41.

MORTIMER DAVIS.

Livingston Co., N. Y., Jan. 19.

**Italian Bees—Smoke for Foul Brood.**

I have read so much about the long-tongue queens that it makes me laugh. The Italians are the best workers in every respect. The advantages of the Italian bees are:

1. They are more industrious.
2. The queens are more prolific.
3. They can obtain honey from flowers where blacks cannot.
4. They will not hang on the outside of the hives for weeks and months before they swarm, like the blacks do.
5. They seldom sting, unless they are roughly handled or abused, then they will defend themselves vigorously.
6. They are a hardier bee, and can stand more cold than the blacks. I have kept bees for the last 45 years, and tried all kind of bees, but the Italian takes the lead.
7. The Italian bees swarm earlier.

I have read so much about clipping queens' wings, and I tried it several times, but I soon let it alone. It is what I call a nuisance. It may do for an old quack doctor who has nothing else to do, but it would not agree with most bee-keepers. A clipped queen when it leaves its hive is sure to fall to the ground, and the ants, spiders or toads will soon take care of her. I would rather lose a colony than clip all the queens. I have handled bees from childhood, and I can handle them like flies. I can take a whole colony of bees, and

**A Celluloid Queen-Button is a very**

pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

Note.—One reader writes: "I have every reason to believe that it would be a good idea for every bee-keeper to wear one of the buttons as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; and at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees.

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

**BOYS WE WANT WORKERS**

Boys, Girls, old and young alike, make money working for us. We furnish capital to start you in business. Send us 10c stamps or silver for full instructions and a list of "applies to live with." **DRAPER PUBLISHING CO., Chicago, Ill.**

**The Deming Catalog.**

The 1903 catalog of the Deming Company of Salem, Ohio, is just off the press. As usual, our readers will look to it to exemplify in practical form the latest ideas in spraying orchards, vines, potatoes, shrubbery, etc. The Deming people have been so long engaged in the business of making Sprayers, and their whole line has been brought up to such high efficiency in the estimation of spraying people, that it has become second-nature to look to their catalog to show what is best adapted to any particular purpose. It includes Hand, Bucket, Knapsack, Barrel, Mounted and Power Sprayers. In certain sprayers of their line, notably the Century, Simplex, Peerless and Success Knapsack Sprayers, the mechanical agitation of the liquid, insuring perfect mixing of poison with the water, is worked out to a nicety. The wide adaptability and general usefulness of the line cannot be without perusing the catalog. As usual, it will be madness to any one writing for it. Kindly mention the American Bee Journal when writing them.

empty them over my naked body without receiving a sting. I stated the same thing some 24 years ago when Mr. Newman was editor of the American Bee Journal.

For foul brood I use hickory-wood smoke three times a week. Fill the hives plump full, until it pours out of the entrance. Keep it up from spring until fall.

**GUSTAV LETPOLD.**  
Will Co., Ill., Jan. 9.

**About Half a Crop.**

In 1902, from 18 colonies, spring count, I got 362 pounds of comb honey, and 346 pounds of extracted—about half a crop for this section of country.

The floral matter was unusually prolific, more particularly the basswood; and just at the beginning of the flow of the latter those tremendous rains utterly destroyed the nectar on which the honey crop principally depended.

We did not have that continued cold weather in June like many complained of. I wintered my bees over the summer stands, with winter-cases, slipped over the hives, snugly packed with leaves.

The outlook for white-clover the coming season is great.

**M. N. SIMON.**  
Wood Co., Ohio, Jan. 26.

**No Nectar in White Clover.**

I have seen a great deal of complaint about white clover not having nectar in it the past season. I have been in the bee-business since 1880, and have made a close study of honey-plants. Clover will not yield much the year it comes from seed. The young clover comes up in the spring, and in June and July it is growing runners, the same as strawberry plants; these runners take root like the berry-runners do, until the ground is all watered over the second year when the plants have their growth and the whole extent of the plant goes to bloom, honey and seed. The blossoms come all along on the runners that grew the year before.

In 1901 the drouth in this country killed all the clover, and blue-grass, too. The clover came up in full glory when it commenced to rain last spring. Next season promises to be a great one for honey in this part of the country. The prospects are the best I have seen for 15 years. Get ready for it, and see if your non-swarming plans fail.

**FRANK VOORHEES.**  
Henderson Co., Ill., Jan. 21.

**The Climate of Washington.**

In the "Question and Answer" department (page 779, 1902), I notice a statement which is somewhat misleading, as to the climatic conditions of our State. The statement reads thus: "It rains almost constantly from the first of November to the first of March." It is signed "Washington." Now, as for the western part of the State, this statement is no doubt about correct, but it does not apply to eastern Washington, as we don't have more than about 2 days in which it rains or snows in a week, on an average, from Nov. 1 to March 1 of any season of the year. We don't have any more rain here than is needed for the good of the country.

It might be of interest to some readers to know upon what days bees were able to fly last winter, in this country; I will give the dates and temperature, as this will give an idea of the weather that we have here. The dates, as per diary kept by me in connection with bee-keeping, are as follows:

Nov. 13, packed bees for winter; temperature 48 degrees; Nov. 14, 50; Nov. 24, 45; Jan. 4, 46; Jan. 7, 53; Feb. 15, 50; Feb. 21, 48.

After this date they usually take frequent flights. In winter my bees in a long, low shed, all boxed up in cases, and the entrance to the entrance so kept by me when the weather is suitable. The hives set on their stands, and are about 4 inches apart. I use a Hill's device on top of the frames, and a gunny-sack quilt on this; then put on an empty sprayer, then take a large gunny-sack quilt and spread over all, and press the quilt down to the other quilt, and then fill its super with chaff, fold the quilt over it, put on the cover,

**Tip-Top Glass Honey-Jars**

The picture shown herewith represents the best one-pound jar for honey that we know of. It is made of the clearest flint glass, and when filled with honey, and a neat label attached, it makes as handsome a package as can be imagined. Its glass top sets on a flat rubber ring, and is held in place by a flat steel spring across the top as shown in the picture. It is practically air-tight, thus permitting no leak,

which is an important thing with honey-sellers.

We can furnish these jars, f.o.b. Chicago, at these prices: One gross, \$5.00; two gross, \$4.77 a gross; five or more gross \$4.50 per gross.

If you try them once you will likely use no other kind of top or sealing arrangement for honey jars.

**"What Happened to Ted"**

BY ISABELLE HORTON.

This is a true story of the poor and unfortunate in city life. Miss Horton, the author, is a deaconess whose experiences among the city poverty stricken are both interesting and sad. This particular short story—60 pages, 5x8 1/2 inches, bound in paper cover—gives somewhat of an insight into a little of the hard lot of the poor. Price, postpaid, only 10 cents (stamps or silver). Address,  
**ISABELLE HORTON,**  
227 EAST OHIO STREET, CHICAGO, ILL.

pack straw all around and between the hives and they are ready for winter. I use the S. Frome Langstroth hive. I have an electric circular cross-cut saw, with mandrel, and complete outfit of this kind, also a set of carpenter tools, so I make all my hives, supers, frames, hive-stands, bottom-boards, covers, and everything in that line except sections and separators.

I have the "A B C of Bee-Culture," as textbook, and the American Bee Journal as my helper, so I am very well equipped for the business.

By the way, I want to say that the coldest weather we have had this fall and winter, is 14 degrees above zero one morning, and 10 degrees for 3 or 4 different mornings. It is now Christmas day, ranging from 36 degrees in the morning, to 42 degrees at noon.

Whitman Co., Wash. L. V. RICKETTS.

**Management for Best Results.**

Partly to disagree with the statement on page 823 (1922), and partly to give my own views on wintering bees and suitable hives, I wish to say a few words that may benefit some beekeepers in my vicinity. Of course, I am running mostly for extracted honey.

I have all 8-frame hives, and will tell how I work them to get an extra-good yield of honey when others in this locality complain of short crops.

I use 2 hive-bodies, one on top of the other, and 16 frames of brood-combs. Of course, the second hive should not be put on until the lower hive is full of brood, which is generally about June 1. After the second hive is on, put a honey-board over it, and if the weather is all right put a third story on with extracting-combs. In my case the bees go up into the third story with most of their surplus, and the combs are always nice, white and clean. Of course, I have plenty of hives which would not be advisable for those with a large number of colonies; but this is intended more for people with 25 or 50 colonies of bees.

Now, 10-frame hives would not be so good in my case, because they are too heavy and bulky to handle, and 20 frames are too many for the keeper to occupy, while 10 are not enough; 16 seem about right. The bees may fill the two outside combs with honey—so much the better for winter stores.

In regard to the article on page 823, 6 brood-combs would not be enough for most of my queens, and I don't see how you can have a strong colony of bees with so few combs, unless you build up with more combs, and then take away when they are strong; that will generally force the bees up into the surplus apartments. But in regard to putting 6 or 8 frames of honey over a hive of bees for wintering, that will not always work, for the bees may starve and not find the honey in cellar-wintering. I have four similar cases this winter, where I had to take out the outside frames and spread the others and put honey from the top story down with the bees. It's all right, generally, if the bees have been occupying the combs all summer, but to put honey in a top story just before putting bees into the cellar doesn't always work, unless they are crowded for room. P. H. DAVIS.

Hennepin Co., Minn.

**CONVENTION NOTICE.**

New York.—The annual meeting of the Oswego County Bee-Keepers' Association will be held at the Hotel C. on Saturday, March 17, 1923. Prof. Frank Benton will be present and address the meeting. An interesting program is being prepared, and all persons interested in bees are cordially invited to be present.

**Pencilaria—A New Feed.**—A. A. Besener, of Cook Co., Ill., says: "The new fodder-plant, Pencilaria, made a phenomenal growth as compared with corn and other plants of that species, some of the plants reaching a height of ten feet in spite of the floods covering my ground a foot deep during the summer."

This new fodder-plant seems to be attracting universal attention among our readers, and the crop is truly wonderful, as it yields from three to seven cuttings per year from one sowing and has produced 55 tons of green fodder per acre from three cuttings in a carefully weighed test.

The seeds are so very small that one pound will plant an acre and still one plant usually has 25 to 75 stalks growing 7 to 14 feet in height. When it is figured that one-fourth acre will produce sufficient fodder to support a cow six months either for summer or winter food, and that the dry hay as well as the fresh fodder is highly nourishing, the value of the new plant will be better appreciated.

Knowing that many of our readers will want to try it, we have arranged with the introducers, the Iowa Seed Co., of Des Moines, Iowa, to send a small sample (sufficient to plant a row 100 feet long) free to any one who wishes it. Be sure to mention the American Bee Journal when writing them.

**HONEY AND BEESWAX MARKET QUOTATIONS.**

CHICAGO, Jan. 9.—The demand is not more than usual; hence stocks are sufficient, especially as C&H has now comb honey on this market. This is a new source of supply, and is a factor that must be reckoned with, as it obviates the necessity of laying in stocks during the summer and autumn to draw from in the winter and spring months. The best grades of white comb sell at 156¢/16c per pound, with travel stated and tint amber, 136¢/14c; darker grades, 106¢/12. Extracted, 76¢/8c for white, and 66¢/7c for ambers. Beeswax steady at 30c.  
R. A. BURNETT & Co.

ALBANY, N. Y., Jan. 7.—Honey demand and receipts light. We quote white comb, 15 cents; mixed, 14c; buckwheat, 13¢/14c. Extracted, white, 7¢/7½c; dark and buckwheat, 7¢/7½c. More demand for buckwheat than any other here.  
H. R. WRIGHT.

KANSAS CITY, Jan. 31.—The demand for honey has been very light; receipts fair. We quote as follows: Extra fancy, per case, 24 sections \$3.40; strictly No. 1, \$3.30; No. 1 amber, \$3.00; \$3.25. Extracted, white, per pound, 7c; amber, 6¢/6½c. Beeswax, 30c. C. C. CLEMONS & Co.

CINCINNATI, Jan. 7.—The demand for all kinds of honey has fallen off considerably in the last few weeks, owing to the many other sweats offered at this season of the year. Lower prices are no inducement to increase the consumption, as the demand is not there, and will not be until about the end of the month; consequently it is folly to offer at lower prices. We quote amber extracted in barrels at 53¢/66¢; white clover and basswood, 60¢/94c. Fancy white comb honey, 16¢/17c; lower grades, hard to sell at any price. Beeswax firm at 29¢/30c.  
THE FRED W. MUTH CO.

NEW YORK, Jan. 23.—Demand for comb honey quiet on all grades, and prices show a downward tendency. Supply quite sufficient to meet demand. It is not more scarce. We quote fancy white at 15c; No. 1, at 14c; No. 2, at from 12¢/13c; dark and buckwheat, at from 11¢/12c. Extracted also quiet with abundant supplies with the exception of white clover. We quote white at 7c; amber at 6½c, and dark at 6c. Common in barrels from 60¢/65c per gallon. Beeswax firm at from 29¢/30c.  
HILDRETH & SORLEKEN.

CINCINNATI, Jan. 20.—The demand for comb honey has fallen off, which in general happens right after the holidays, although prices rule as before: White clover, 15¢/16c; extra fancy water-white, 16c; no demand for lower grades. Extracted honey is in fair demand, and sells as follows: Amber, 5¢/5½c; extra fancy, 6c; alfalfa, 7½c; white clover, 7½¢/8½c. Beeswax, 28¢/30c.  
C. H. W. WEBER.

SAN FRANCISCO, Jan. 14.—White comb honey, 11½¢/12½c; light amber, 10¢/11c; dark, 5¢/6½c. Extracted, white, 6¢/6½c; light amber, 5¢/5½c; amber, 4¢/4½c. Beeswax, good to choice, 11¢/12¢/27½c; strictly fancy light, 29¢/30c. The country merchant, representative of trade interests, estimates "entire stock of honey of 1922 in the State at 15 cars," worth 57¢/60¢ per pound at primary points, subject to a \$1.10 freight-rate to the East.

BECAUSE its editors are practical men who have had wide experience, exercise great care as to the matter that goes into its columns, and seek to be of real service to the readers in every way possible.

BECAUSE of the writings of Dr. C. C. Miller who is probably one of the oldest and best informed writers on the subject of bees.

BECAUSE its articles are written by many of the most successful apiarists who have spent their lives in this pursuit.

BECAUSE it contains extracts from other bee-publications, not only American, but foreign journals as well, which are interesting, instructive and also valuable to every bee-keeper.

BECAUSE the articles by Mr. A. I. Root under the heading of "Our Homes" is of interest to every member of the household.

BECAUSE of "Notes of Travel" containing write-ups of visits to different sections of the country are very instructive. Current numbers contain articles on Cuba, and bee-keeping there.

BECAUSE it gives in each issue a revised report of the honey and beeswax market in the principal cities of the United States. These reports are from reliable honey merchants of high standing. You will be advised of any advance in the market, and will therefore not dispose of your honey below the ruling price.

BECAUSE Volume XXX, just completed, contained 160 half-tone engravings, many of which were half or full page. These illustrated some very interesting features in bee-keeping. We shall be as fully as liberal with these engravings the coming year.

BECAUSE it comes twice a month. The price is \$1.00 per year, \$1.50 for two years, \$2.00 for three years, \$3.00 for five years, in advance. Trial subscription, 6 mos. 25 cents. We will begin your subscription with January 1st number if you request it.

BECAUSE for \$1.00 you may have Gleanings one year and one untested Italian queen after April 1st; \$2.00 will entitle you to Gleanings and one untested Red Clover queen; for \$1.75 you may have Gleanings and a copy of "A B C of Bee-Culture," postpaid; \$1.00 will secure you Gleanings and one Standard Cornell smoker, postpaid.

Dr. Miller's  
NEW  
BOOK  
Now  
Ready.

Sent by Return Mail

EVERY  
BEE-KEEPER  
WILL  
WANT  
A COPY.

DESIGN IN GOLD ON COVER.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## How to Get a Copy of Dr. Miller's "Forty Years Among the Bees."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book *free as a premium* for sending us **Two New Subscribers** to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

## Editorial.

**Shaken Swarms.**—Much has been written and said about shaken swarms, but it may not be amiss to give somewhat succinctly the manner of proceeding in general, so that any new-comer may have the desired information, and that any others may have it for ready reference.

Shake off part or all of the bees from the combs, leaving on the old stand the old queen with the bees and frames filled with full sheets or starters of foundation. That's the thing in a nutshell, and it is very simple, there being left on the old stand much the same as a natural swarm.

Yet, as to the minutiae of proceeding, especially as to the disposal of the frames of brood, there is much diversity of opinion and practice. What is best for one place, or for one set of conditions, may not be best for another, and there is left room for each one to use his own judgment.

Some wait until the presence of queen-cells show preparation for swarming before operating. Some operate as soon as the colonies are sufficiently strong, or the season sufficiently advanced, without waiting for queen-cells. As already intimated, some shake off only part of the bees, others shake and brush off all. As to what is left in the hive with the shaken swarm on the old stand, the same variation prevails as with natural swarms. Some hive the swarm on starters, some on frames filled with foundation. Some give to the swarm a frame of brood in order to prevent absconding, but this frame of brood is by many removed and replaced with foundation after two or three days.

So much for the swarm itself; now as to the disposal of the brood. Half the bees, or such a matter, may be shaken into the swarm, and the brood with the remaining bees put on a new stand, there to rear a queen, or else to have a queen or queen-cell given them. In any case all the field-bees may be expected to return to the old stand.

All the bees may be brushed from the combs, and the combs distributed where they will do the most good—perhaps for helping to build up weak colonies. A favorite way in some parts of Europe is to put the combs of bees brood in a second story over another strong colony, and it is said that a colony thus strengthened will not be expected to swarm. But this is when working for extracted rather than for comb honey.

It will be well for beginners to become

somewhat familiar with this matter, and take those peculiar plans which may seem best adapted to their circumstances, modifying them afterward as experience may dictate. Questions concerning the matter will no doubt be cheerfully answered in the proper department, but when making out your questions, first study carefully whether some of them are not fully answered in what is said here.

**Gasoline as a Motor** for extractors—Editor Root has "in his head" a gasoline-engine by which a honey-extractor may be operated with the expenditure of not more than a quart of gasoline per day.

**Fertilization in Confinement.**—Copying after the Davitte plan, R. F. Holtermann reports in *Gleanings in Bee-Culture* an experiment with a tent 25 feet high and 30 feet in diameter. The tent was close beside a large apiary, and on the side of the tent next the apiary were placed nuclei containing virgin queens, and at the opposite side colonies containing the drones. In each case free entrance at the will of the bee-keeper was allowed for the drones and queens into the tent, the regular outside entrance for the workers being supplied with perforated zinc. The drones flew freely, and seemingly at home, in the tent, but the queens spent their time trying to get out through the perforated zinc, and were fertilized only when the zinc was removed, so as to allow their flight into the open air. If the drones could be persuaded to "make themselves at home" in the tent, it seems that it ought not to be impossible to persuade the young queens to do the same.

**Moving Bees.**—It is generally understood that while bees moved only a short distance return in large numbers to the old stand, those moved a long distance mark anew the location and stay where they are put. Geo. W. Williams thinks this is a mistake, and says in the *Progressive Bee Keeper*:

While the bees are shut up in the hive, as they must be to move them, how do they know whether they are being moved five miles or five rods? They do not know, nor have no way of ascertaining until they get out of their hive and look around, and the old bee that has been moved five miles comes out of the hive, if there is no obstruction in the way, and flies direct, as she thinks, for the old field, but finds, when too late, that she is in a new territory, and lost, lost "for keeps," while those moved only a short distance return and hover around their old stand, and we can see them and note the number lost; while those moved a long distance do not know where to go, scatter about and perish, and we have no way of knowing how many are lost only by the depletion in the hive.

There are just as many bees lost out of a

colony moved five miles or five rods, if everything else is equal. The point in favor of the long-distance move is brought about from the fact that in a long-distance move we shake and disturb the bees more than in a short move, and the more they are disturbed the more they will fly around the entrance at the first coming out to see what the trouble is.

While this may be worth thinking about, the probability is that those who have moved bees to a distance will say that they have never noticed any depletion in numbers, and if it be true that "there are just as many bees lost out of a colony moved five miles or five rods," there ought to be no difficulty in recognizing a great diminution in numbers.

**Swarms With Clipped Queens.**—Do swarming bees usually cluster on the ground with a clipped queen? Delos Wood and Dr. Miller say in *Gleanings in Bee-Culture* that when a swarm issues with a clipped queen they rarely find the queen on the ground with a cluster of bees about her; that when she comes out she will be climbing about in the grass looking out for herself, and in the great majority of cases will return to the hive without any cluster being formed about her. Editor Root favors what is perhaps the commonly accepted view, replying to Mr. Wood:

You and Dr. Miller may be right; but certain it is that many clipped queens I have found near the entrance of the hives, from colonies that had just cast a swarm, and had a cluster of bees around them. It may be that I happened on to the "exceptions that prove the rule."

**Queenless Bees Carrying Pollen.**—It is probably accepted as a rule quite generally that a queenless colony carries in little or no pollen, and it is also agreed that an unusual amount of pollen will be found stored in such a colony. These two things do not go together. Close observation will probably show that a queenless colony carries in as much pollen as a colony having a queen if the observation be made during the first part of its queenlessness. But the pollen not being needed to feed young bees, there is an accumulation, and either because the bees realize that it is not needed, or for some other reason, they carry in very little pollen. So the rule is of no value when applied to a colony that has been queenless only a short time; but when a colony is found carrying in little or no pollen when others are carrying in much, it may be suspected that such a colony has been without a queen for some time.

**Bulk Comb Honey.**—Mr. H. H. Hyde serves notice in the *Bee-Keepers' Review* that Texas will produce bulk comb honey in spite of any effort of a National organization to the contrary. He says, "I fancy that the

first thing the combine would undertake to do would be to make a demand that the South-western producers quit putting up bulk comb, and go back to section and extracted honey;" although he does not say upon what he bases this fancy. He certainly gives a good argument against any such attempt, in the statement that Texas alone produces 200 to 300 cars each year, with a demand beyond the supply.

It would hardly come within the province of a National organization to "quash the demand for bulk comb," and oblige the production of extracted or section honey in place of bulk comb, any more than it would come within its province to say that section or extracted honey alone should be produced. Perhaps, however, it may not be necessary to object seriously to anything of the kind until there is some intimation from the promoters of the scheme that any such improper discrimination is intended.

## Weekly Budget.

THE HEDDON PATENT EXPIRED.—James Heddon announces in the American Bee-keeper that the patent on his hive "expired last September, and so all are free to make and use it."

THE WISCONSIN CONVENTION was held the first week of this month at Madison. The officers elected for the ensuing year are these:

President, N. E. France; Vice-President, J. Hoffman; Secretary, Gus Dittmer; Treasurer, H. Lathrop. Recommended as next State inspector of apiaries, N. E. France; as State Fair judge of apiarian exhibit, F. Wilcox; committee on legislation, N. E. France; committee on St. Louis Fair, the executive officers of the Association including F. Wilcox.

The legislative committee has a bill in the State Legislature to amend the law of 1898, allowing \$700 instead of \$500 for the suppression of foul brood. The bill has had a hearing before committees, and is so far favorable. We trust it may pass, as it is only just and fair to the bee-keepers of that State.

THE APIARY OF N. STAININGER, of Cedar Co., Iowa, appears on the first page. The following refers both to the apiary and to its owner:

Mr. N. Staininger, although not yet an old man, has had many years of experience as a bee-keeper, having worked with bees ever since he was 10 years old. In those pioneer days, if the bees all died during the winter he would go out into the woods and find a colony of wild bees, which he would capture in order to get a start for the next year.

Even by the use of the crude materials then at hand to aid one in caring for bees, Mr. S. was very successful in this line of work. He was energetic and progressive, and a visit to his apiary will convince one that he was not willing to rest on his first laurels of success, but has kept up with the times, and has been quick to see the value, and to adopt many of the new methods and contrivances for bee-culture.

Mr. Staininger does not run to large numbers of colonies, keeping them down to 225 to 250.

He is also engaged in another line of business; and it is surprising that with all his

to do, he is able to keep everything in such perfect order, and not allow the number of colonies to increase nor decrease more than he wishes. His bees show the finest marks of the Italians. He has introduced queens to a number of apiaries in his neighborhood, and they have always proven a great success.

Mr. Staininger's honey market is almost entirely in his own town, for he is known as a man who always has the best, and who does a square business. He is still in the prime of manhood, and we hope that many more years of successful bee-culture may lie ahead of him.

E. W. Coe.

## Sing a Song.

If you'll sing a song as you go along,  
In the face of the real or the fancied wrong;  
In spite of the doubt, if you'll fight it out;  
And show a heart that is brave and stout;  
If you'll laugh at the jeers and refuse the  
tears  
You'll force the ever-reluctant cheers  
That the world denies when a coward cries,  
To give to the man who bravely tries;  
And you'll win success with a little song—  
If you'll sing the song as you go along!

If you'll sing a song as you plod along,  
You'll find that the busy, rushing throng  
Will catch the strain of the glad refrain;  
That the sun will follow the blinding rain;  
That the clouds will fly from the blackened  
sky;  
That the stars will come out by and by;  
And you'll make new friends, till hope de-  
scends  
From where the placid rainbow bends;  
And all because of a little song—  
If you'll sing the song as you plod along!  
Selected.

## Amount of Honey Annually Produced in the United States and Cuba.

At the Philadelphia convention of the National Bee-keepers' Association a few years ago, I gave a set of figures going to show the approximate amount of honey annually produced in the United States. This estimate was based on the number of section-boxes made and sold by all the manufacturers in the United States, for during that year we learned the entire output. The amount of goods sold in various parts of the country would also give something of an idea of the amount of extracted honey produced. Well, this estimate, without going into details as to how the results were arrived at, show that there was 50,000,000 pounds of comb honey and 100,000,000 pounds of extracted, or a total of 150,000,000 pounds, all told. The actual valuation of this, conservatively figured, would be about \$10,000,000.

In answer to a correspondent, I repeated these figures, and the editor of the Pacific Bee-Journal compared them with the United States census report of the annual honey crop. He has prepared a new set of figures by putting them in such a shape that they will be more easily understood. According to his way of figuring, my estimate of 150,000,000 pounds of honey would make 7000 carloads. The United States census report on the same basis would make 6977 carloads, or only 335 less than my estimate. These figures are significant when we come to consider the fact that they were arrived at through totally different and independent sources—significant because they are so close together. But my estimate, as made three years ago, was figured on a very conservative basis; and the United States census report of 1899 probably did not take account of all the honey produced. In fact, as our readers know, I have questioned the accuracy of the report. But either way we figure it, both

estimates are under the actual output of honey in the United States at the present time.

I think we should be safe in concluding that we may estimate that the actual product of this country is not far from 10,000 carloads. This seems like an enormous amount of honey; but if one will go through some of the large supply-manufacturers of this country, and look over the order books, he will have no occasion to doubt these figures.—Editorial in Gleanings in Bee-Culture.

## Brood Clear to the Top-Bars.

E. F. Atwater holds the view that if there is a slight stretching of the foundation in the upper part of the frame, there is less likelihood that it will be occupied with brood. He says in the American Bee-Keeper:

Editor Root and Dr. Miller have been having a lively "echo" about brood coming to the top-bars of the Langstroth frame. Dr. Miller's frames are filled with combs built from full sheets of foundation staid with splints; no sagging there; so brood is much more likely to extend to the top-bars. Root's combs are built from foundation staid with horizontal wires, consequently sagging all along the top-bars, and the bees build their brood in cells ever so slightly elongated, consequently an inch or so of honey along the top-bars.

Mr. Yoder, of Idaho, an apiarist of many years experience, suggested this to me, and I am satisfied of its truth, though there are exceptions to this rule.

## Stingless Bees.

A. I. Root has found them in Cuba, and has obtained a colony from Ciriaço Guiterrez. He found the bees under the eaves in boxes 8 inches square and 20 long. He says in Gleanings in Bee-Culture:

The honey and pollen are stored in cells, or rather, bottles the wax set upright with the top open. These cells are large enough, some of them, to hold, say, one or two tablespoonfuls of beautiful honey. They are about the shape and size of a pullet's egg, small end up. When filled they are sealed over. The brood-comb is a separate affair; and as the bees are smaller than common ones, the cells are smaller, and the comb is *horizontal*. Mr. G. was kind enough to make us a present of a hive; and while I write (out-of-doors) they are carrying in the honey and pollen at a big rate, close by my head. We have just opened their hive and sampled their honey; but they made no objection of any sort. They keep the entrance to the box contracted by propolis so only one bee or two can get in at a time; and we betwixt the insect of any sort that presumes to come near the sentinel that always guards this doorway day and night. Should a robber Italian presume to come near, a dozen dart for her with lightning rapidity and fury. Although they can not sting, they have very powerful jaws to bite. Now, when you would like to keep bees and produce your own honey, but fear the stings, here is your chance. Of course, you will have to come to Cuba, for I do not think they will stand even Florida's cold weather. How much honey can they gather? Mrs. G. said they would give, perhaps, two quarts of honey per colony per season.

## Grass for Confining Moved Bees.

In grouping my hives ready for the temporary sheds (the way we winter our bees in western Idaho), all known plans were tried to make the bees adhere to their new location, but results were unsatisfactory until we hit on the plan of stulting the entrance full of grass. Next morning when the bees find themselves shut in, there is great excitement until they work their way out, and few bees return to the old stand. We believe that this principle is of great value where bees are to be moved a short distance.—E. F. ATWATER, in the American Bee-Keeper.

## Convention Proceedings.

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 102.)

#### UNFINISHED SECTIONS OF HONEY.

"If one is unable to have all the honey removed from sections until too late in the season, will those sections be fit for use the summer following?"

Dr. Nussle—They will be good next summer, if you have them emptied, of course.

Pres. York—The question is, if one is unable to have all the honey removed from the sections until too late in the season, will those sections be fit for use the summer following? The question implies that the honey is still in the sections.

Mr. Gerbracht—My experience in this has been that the honey is apt to candy over winter, but the natural heat of the bees will reliequify this; but such sections can be built at the same time.

Mr. Wilcox—I rather expect some of the others here will entertain different views from me on that subject, but it has been my practice to use them if I fail to get them emptied in the fall. In the spring I uncapp them, place them in the super and turn them over to the bees, and let them empty out the honey; immediately before the honey harvest commences clean them out, and when I can get them on they will refill them, and they will be all right. I can't see the difference. It may be possible that such honey would be more liable to granulate in the comb, but they go on the market so early that I never know that any of them are granulating. I am inclined to the opinion that they are just as good, but I understand some eminent writers say not.

Pres. York—Yes, Dr. Miller says so, I believe.

Mr. Cady—I use them right along without taking the honey, and I see no difference in the sections; no trouble from granulation or anything of the kind.

Mr. Watts—I agree with that. I have done the same thing. I have had lots of combs that were not filled. All that it is possible to keep over I keep over, and put on my bees in the spring, and I see no difference; they go right on and fill up the combs.

Mr. Whitney—It would seem to me that if one had an extractor it would be better to draw the honey out in the fall and save the sections for refilling, than to allow the honey to remain in over winter.

Mr. Wilcox—Perhaps I misunderstood the question. If they have remained over winter, of course that settles the point.

Mr. Baldrige—In my section of the country if they left honey in the comb over winter it would be granulated solid. Do these gentlemen claim that they put the granulated honey on the hive, and that the natural heat of the bees will reliequify it?

Mr. Gerbracht—I put on the sections that were granulated solid. I put them on as bait-sections, the best I had. My intention at the time was to have them fill out the same, but when it came to take these off there was no difference whatever between these and those unfinished at the time. There was no difference, all the granulation was gone, and everybody knows that the longer honey is left with the bees the better it gets. It was reliequified by the bees.

Mr. Wilcox—I thought I made it as plain as I could. I never put honey back on the hives in the spring that was taken off in the fall, and I don't want to be understood as saying that. I said I uncapped them and placed them outside two or three weeks before the honey harvest to be cleaned by the bees, and at the opening of the harvest place the empty combs in the hives. If you put the fall honey back on the hives in the spring accidentally or any other way, they will fill around it. It would be unsalable. Of

course, I would not put honey back in the hives that remained over winter. Have it cleaned in the spring before putting back in the hives.

Mr. Niver—I would like to discuss this subject a little further. What kind of honey was it?

Mr. Gerbracht—This honey was, of course, late in the season granulated honey. As it happened, what we had this year was the same. We had very little white honey this year. It was mixed.

Mr. Niver—I know honey will not do it in our country. It might stay there from July to Eternity without reliequifying. I don't know what kind of honey he has.

Mr. Pickard—Basswood honey won't liquefy.

Mr. Niver—Are you sure that is the same honey in there after the season is over? Isn't it possible that the bees took that honey out and then filled it up with other honey?

Mr. Gerbracht—I don't question that at all. This honey was sealed, and never was unsealed.

Mr. Niver—How?

Mr. Gerbracht—Because they cleaned out all the unsealed, and almost immediately afterward honey begins to come in and they begin to fill it.

Mr. Niver—You feel positive that they don't take it out and seal it up again?

Dr. Nussle—They will carry the granulated honey right out of the sections and fill again, you know, with clear honey.

Mr. Cady—I have had the same experience with the gentleman who has the floor.

Mr. Pettit—Am I mistaken in saying that Mr. Doolittle says that candied honey put into the hive early in the summer will be reliequified before the close of the season?

Mr. Baldrige—That's the experience I have.

Mr. Pettit—I have no experience. Those sections of honey would be travel-stained; they would be second-grade. I wouldn't like them for myself, but still I think that's what Mr. Doolittle says.

Mr. Baldrige—Those sections are put on to fill up supers the best way possible. I wouldn't advise it as a general practice. I had the sections partly filled, and the best I could do was to set them back. This honey was entirely reliequified, and there was no way of telling that they had been refinished.

Pres. York—Anything else on this question? If we only had Dr. Miller here now we would have some fun.

Mr. Simon—We put on sections partly filled that had been sealed in the fall—we put them on in the spring. They brought them out sealed, and what was granulated will remain granulated, and what balance is filled out full will form a given part, but it has been our experience that what we put on in the spring will be fresh honey, and the other will be old honey, and I would not put it on the market.

Mr. Baldrige—Supposing that the honey is granulated and you don't want to take any risk. One way is to uncapp that honey, dip the sections in water, set them in a box and put that under the hive and let the bees take it all out, and not run any risk. That's the way I do. No trouble to get rid of good, rich granulated honey in the comb.

Pres. York—How does the water affect the wood of the sections?

Mr. Baldrige—Not at all.

Mr. Green—On the question of whether granulated honey will reliequify, Mr. Doolittle expresses himself very strongly in the papers, saying that it would be reliequified on the hive, and that was within three months, I think.

Mr. Pickard—Our experience is it will not in Wisconsin. They will clean it out, but it won't reliequify.

Mr. Moore—For me, there is only one practice: Any section to be emptied with the extractor, put the empty section on the hive, and clean up dry, then in the spring you have it where you want it.

Mr. Pettit—I don't wish to be understood that I would recommend this practice of putting back old honey, because I am sure you would have second and third grade honey where you might easily have fancy honey in those sections. I notice this season that from drawn sections we have sections not so well filled as sections filled with foundation at the beginning of the season.

#### AFTERNOON SESSION.

The meeting was called to order at 1:30 p.m.

Pres. York—Dr. Miller is here. [Applause.] Mrs. Miller is here, too, but I won't point her out to you.

Dr. Miller—She is right there—the one with the green waist on.

Pres. York—That is the only thing that is green about Mrs. Miller. I can assure you all.

Dr. Miller—I am about her sometimes.

Pres. York—Yes, we know you are about her sometimes. May be that is one of her trials!

Others who had come in were: Mr. Clyde Cady, of Michigan; Miss Candler and Mr. Jones, of Wisconsin; and Mr. Kluck, the president of the Northern Illinois Bee-Keepers' Association.

The first on the program was Pres. York's annual address:

#### THE PRESENT NEEDS OF BEE-KEEPERS.

It would be interesting, and perhaps profitable, did time permit, to trace the growth of bee-keeping from its infancy as a pastime and as a business until this present hour. But it is not my purpose just now to read to you a history of bee-keeping, however much I might desire so to do, and however much I am incapable of such a task. But we who are here to-day are mainly interested in things that affect *our* own welfare as bee-keepers, and care not so much as to what affected or interested our predecessors.

#### LAWS ON BEE-DISEASES.

One of the pressing necessities at this time are laws on foul brood and other contagious diseases among bees. The bee-keepers of every State that has not already such a law on its statute books must work to that end. Illinois, especially, needs to move at once in this direction. There are localities in our State where, if something is not done soon, bee-keeping will be a thing of the past. At the coming session of our State Legislature a bill should be introduced and passed, so that when another spring-time comes we may be ready with an efficient inspector to look after the apiaries that are affected with foul brood or other dread diseases.

This Association, in connection with the State Association, should act in this matter, and see that the necessary steps are taken to secure the passage of such a law. We must protect the lives and health of our bees else there will be no bees to keep, and, like Othello, our occupation will be gone.

#### ORGANIZATION AMONG BEE-KEEPERS.

There is a tremendous lack of interest among bee-keepers in the line of organization for their own advancement. Nearly every other industry is organized, and reaping the benefits of such get-together plans. Bee-keepers do not seem to realize the advantages that are to be gained from such organization. We need some Moses to lead us out along these newer and better lines, and to show us wherein we are standing in our own light.

Perhaps the first and main reason for organization and pooling our interests is to secure a better marketing of our honey product from year to year. Too many bee-keepers regard their honey crop as just so much extra gain—or like finding money. They do not regard it as they do their other farm crops, hence they rush it off to the grocery store and accept whatever may be offered them in cash or trade. This is exceedingly unfortunate, for too often such foolish procedure, if at the beginning of the honey-selling season, may be the cause of the loss of many dollars to other bee-keepers, as it has a tendency to set the price for the entire season.

Now, if bee-keepers were thoroughly organized such a thing would rarely occur, and thus all would be protected, and all reap a richer reward from their toil and honey product.

Bee-keepers should take a livelier interest in their National Bee-Keepers' Association. Where it now has less than a thousand members it should have several thousand. Were such the case, bee-keepers could secure almost anything they go after. But there is a whole lot of selfishness that must be thrown overboard before the most successful organization can be obtained. There is seemingly too much of the feeling that each individual member will not get in return 200 cents for every 100 he invests in membership dues. We must take a broader view of things. We must learn to have satisfaction in the general advancement of the good of *all* rather than the little success of the individual. Thus, and thus only, can we hope to raise the standard of bee-keeping and bee-keepers.

#### THE MARKETING OF HONEY.

There is much we need to-day in the line of marketing honey. There is perhaps little to be desired in packages, either for comb or extracted honey in a wholesale way. However, there might be an improvement, or more uni-

formity in the grading of comb honey. But so long as every bee-keeper thinks his own honey, like the young fellow imagines his girl—the "only onliest"—just so long is there going to be disagreement and trouble in grading. It seems strange that it is so utterly impossible to get two or more bee-keepers to grade their comb honey alike, but such seems to be the fact, nevertheless. Perhaps this convention can help in this matter, as well as in others that I suggest.

#### A NATIONAL HONEY EXCHANGE.

For years the American Bee Journal has discussed this subject, which is one of such magnitude that no one seems to know where best to take hold in a practical way. And yet, in certain quarters, judging from what has been written recently, some might be led to think it an entirely new thing under the sun. But don't you believe it. A number of our brightest minds has been meditating as well as writing concerning a honey exchange, and some day I have no doubt something tangible and helpful will result. Surely, something of the kind must come. Bee-keepers will have to get together on this subject of marketing their honey, else there will continue the present haphazard way of disposing of the crop which so often demoralizes prices and spoils what would otherwise be good markets.

But before much headway will be made in the direction of a honey exchange, bee-keepers must have more confidence in each other. They must also be willing to pay well for expert management; and they can afford to do this, and will do it, when they see that it will be to their financial interest to do so.

Perhaps in no other business are there more and better brains than in bee-keeping. Then why may we not expect that this great question, like many another, will be solved to the satisfaction of all concerned?

But I must not run on, else there will be no time for more important matters in which you are interested. I merely desired to call attention to a few of the real needs of bee-keepers to-day, as I see them, trusting to your ability and wisdom to devise plans as to how all the needs are to be met.

#### OUR ASSOCIATION.

A closing word as to our Association—the Chicago-Northwestern. There is no good reason why it should not exceed in membership and good works every other association of bee-keepers on the continent, except, perhaps, it be the National. We have the field. We have the bee-keepers in that field. What is needed is that every bee-keeper in the field covered by this Association shall become a member. Don't forget that only \$1.00 pays your annual dues, not alone in *this* Association, but also in the National as well. This is a big advantage, and ought to be embraced by every bee-keeper at least within a radius of 300 miles of Chicago.

And now I trust that our present sessions may be both interesting and profitable, and that you may all feel well repaid for having come to this meeting.

GEORGE W. YORK.

(Continued next week.)

## Contributed Articles.

### No. 2.—The Hive-Problem—Size and Shape.

BY R. C. AIKIN.

IN the previous article I said that a hive 12x12 inches, and 20 to 30 inches high, was approximately an ideal size and shape for wintering and breeding. The reason is that the colony cluster can, when there is a good strength or large number of bees, easily keep warm all that is above them, for they can cluster clear across the hive, filling it with bees from wall to wall in all directions, and when so touching all sides all above the cluster is bound to be warm.

As indicated before, in summer the colony has filled from the top down with honey. If the flow stopped when half way down, there is yet much breeding-room below, which is usually used to advantage in rearing many bees for winter, so the colony can go in with a cluster sufficiently large to withstand much cold, yet have plenty of stores above them. Again, they may fill the hive to the exclusion

of much brood, then go into winter with large stores and few bees, and when a few zero snaps have pinched off the edges of the little cluster there are not enough bees left to make a start in spring, or, at best, a very late start, too late to be ready for a honey-flow. A very short honey-flow may give the other extreme—little honey and a great hive full of bees.

Now observe that these varying conditions must always be to contend with. It is true that an 8-frame hive one year may prove about right because the flow or other conditions were such that about the proper combinations of bees and honey existed. But right in the same yard and season will be other colonies that, owing to having been either weaker or stronger when the flow came, will be found in very different condition, going to both extremes. In some cases the hive has been too big, in others too small, and all in the yard of the same stock of bees and the same season. Then what are we to do?

Well, there is no one thing that will meet all the difficulties, and it is hard at best to avoid the troubles by combining all the remedies at our command. The hive, as improved from the old box or gum as described, that is, one of about 12x12x20 or 30 inches, has had for its object the elimination of some phase of the difficulties, putting under man's control more and more all the factors. It happens, however, that we often sacrifice one thing to obtain another, done sometimes consciously, and sometimes unconsciously. Let me illustrate:

With the old-fashioned box or gum the apiarist could not so easily control the colony to supplant inferior queens, nor take out stores when honey-bound, or put in more when short of stores. Neither could undesirable combs be removed. Often it was difficult to get the colony to store in supers, the brood-chamber being stuffed with honey to the death of the colony the next winter. In order to get combs that could be manipulated, and overcome some of these troubles, the movable frame was invented. Then the deep, narrow hive did not give good results in getting super-work done, so the hive was made shallow to get the surplus stores above, and, as compared with the old way, the results were marvelous, and in the craze to get more and more the good of the colony was sacrificed so far as future usefulness was concerned. The introduction of the improved hive was followed with almost unprecedented winter losses, and even to this day it is a fact that the average apiarist does not comprehend the use of hives, and the shallower the hive the greater the losses, and because by the shallow hive once the colony is gotten into condition to do good work, it is worked for all there is in honey and immediate profits, to the detriment or extinction of the colony. Then comes the cry that the hive is a failure and nine times out of ten the real reason the failure comes is because the manipulator either does not know how, or will not supply the necessary manipulation and management.

All this would imply that a hive must be elastic—be such that it can be accommodated to conditions so as to preserve the equilibrium of conditions, and put the whole thing at the command of the apiarist. I know that there are apiarists that can and do succeed with the 8-frame hive, but it is not proved that that size is the best even with those same apiarists. I am confident that the apiarist who succeeds with the 8-frame can do just as well with a larger hive, and even better. I have used hives as small as 4-frame capacity, and up to 12-frame and larger.

I am, and have been for more than ten years, using a hive 13 inches square, and with frames 6 inches deep. It is in fact a sectional shallow-frame hive, and each section is about equal to five Langstroth frames. In actual practice two sections of this hive are about equal in working results to 8 or 9 Langstroth frames. But the fact that the hive is in sections makes it elastic, and I can use it any size I may wish, and circumstances require.

□ Suppose there is a fine honey-flow on, and I wish to get all the honey possible into surplus regardless of preserving the colonies of bees, I can do it by contraction. Suppose, again, that I have a quick and full flow that is followed by a slow one, or intermittent, I can contract for the good flow and get the surplus when the conditions are favorable for super-work; then when the slow flow comes, when one can not possibly get good results in comb-honey work, the colony can have the brood-nest enlarged to any size that will allow the storage of all that comes, and at the same time allows of all the breeding the colony wishes to do, and such colonies are the ones that go into winter in prime condition.

Just as I have explained before, the colony run in an 8-frame hive all the year through (I speak of the brood-

chamber) will at times have too much honey and too little brood, and vary through every grade to the other extreme. Bees left to their sweet will in big boxes or hives of 15 to 30 frame capacity, will winter more successfully and make larger and better colonies—ones that will send out immense swarms, and put up piles of honey—than can possibly be obtained from the small hives with the same effort.

It is a fact that in most localities where bees are kept, the flow season when the surplus is obtained is of short duration. My present field, but a few years ago, gave almost the whole crop in about three to four weeks in June and July. Then it was important that I have large hives and plenty of stores in the winter and spring before the gathering of surplus, or, if the hive was small, I must resort to feeding and constant watchfulness to keep the colony in the small hive from getting out of stores. I observe from reading the writings of those in localities where there is a supply of nectar previous to the harvest season—a supply ordinarily to keep breeding at its best—that if there be a cold spell or any kind of weather that shuts off the supply, feeding has to be resorted to, else starvation or other damage. I also gather that after the main flow these same localities often have slow flows, or dark honey, conditions that cause the overloading of the brood-combs and consequent reducing of the strength of the colony. I have had such experiences myself, and on no little scale, either; I know that this is a common difficulty, and usually is not provided against by the apiarist.

It is right along these lines that come the benefits of an elastic hive. I venture there is not one location out of ten where much benefit could not be had by such a hive. Of course, the apiarist must manipulate at the proper time, and if he will not do so he would better have a large hive *all* the time. The only use a hive can be is to give advantage in manipulation, and the only time a small hive is actually needed is when there is a honey-flow on that we want in surplus; hence, I desire my colony to have a large hive at all seasons outside of the honey-flow that is my harvest flow, then the colony can spread itself and go right along with little care if for any reason I can not give it the attention.

Returning again to a consideration of the hive I proposed as an illustration in my previous article—a two-story hive of 6 frames each story, a 12-frame hive—such a hive will accommodate almost any colony so far as numbers are concerned, and at the same time will accommodate any queen with breeding-room, and have store-room to hold feed for all the brood she can produce. There would be nothing to prevent such a colony in such a hive from being comfortable and roomy; then when the flow came on they could be shut to one chamber of 6 frames for the short time of the harvest, and, as soon as the main flow was over, doubled again on 12 frames, and would take care of themselves through the fall and fix up a brood-nest better than the master.

(To be continued.)

## Rearing Extra-Large, Long-Lived Queens.

BY DR. E. GALLUP.

SOME 20 years ago I was stopping at a friend's house on the mesa, where I found 7 colonies of wild bees in squirrel-holes, badger-holes, and one hanging on a willow tree; by the appearance of the comb it must have been there three or more years. Six of those colonies were in close quarters. The willow-tree colony had only a small quantity of comb, as they could not build outside of the cluster. But one colony was in a large cavity, and had a very large colony, and an extra-large queen. I transferred one hive full of comb, set two extra supers on top, and the bees filled all three, equal to three standard 10-frame hives. All the other six colonies had medium and some quite small queens, and a small quantity of bees. This large colony had, no doubt, been there several years, judging by the appearance of the combs, and had superseded and reared queens to suit the capacity of the hive. The cavity was small at the top, and all the comb was worker-comb, and dug out in the sides of a baranca in black adobe soil. Now, Eastern people will perhaps wish to know the meaning of mesa and baranca. They are Spanish or Mexican words. Mesa means an elevated flat piece of land; baranca means what you would call a gully, washed out by heavy rainfall. I have seen them 50 feet deep, and the wall perfectly perpendicular.

Our California squirrels live in the ground, and are

about the size and shape of your grey and black timber squirrels. They destroy tons of growing grain and other stuff. A 20,000-acre ranch paid a man 25 cents per acre for destroying them with poisoned wheat.

A man came for me to take some bees out of his house. My son did the work, and I superintended. They were in a cavity under an upper veranda about 8 feet long and 4 feet wide. They had first built at one side of a division-board placed there as a brace. They had been in there four or five years. They extended their combs back, and finally built on the other side of this board. We took out about 100 pounds of good honey—60 pounds of good, white orange blossom honey gathered last spring. Every cell was built worker size. Here had evidently been one of those large queens and large colonies, but for some unaccountable reason the bees had dwindled to but few in numbers, and no queen or brood of any description. You can readily see that Mr. Alley had nothing to do with rearing those queens, neither had Gallup anything to do with his ignorant and bungling introducing. "How did it happen?" Read carefully Mr. W. J. Stahmann's article on page 776 (1902). He says: "In several generations the egg-laying capacity of queens can be increased, and, on the other hand, if kept in small hives the tendency is to degenerate and lessen the capacity of a prolific strain of queens." Positive fact. That article hits the nail right on the head.

Now, Mr. Alley says he always selects his best cells and very best queens to send to his customers. Now, my friends, if you will use extra-large and prolific queens, and extra-large and strong colonies, as I have described, every cell built at swarming-time, every queen hatched out will be first-class, long-lived, etc. There need be no selection as there is in cells and queens reared in small nuclei. If you wish to deteriorate your stock of bees to the lowest possible degree, rear your queens in the above manner for a series of years. On the other hand, if you wish to rear them up to the highest possible standard of perfection as to prolificness, longevity, etc., use extra-large hives and colonies. In that manner, and in no other way that I know of, can we improve our stock. As Mr. Stahmann says, we can make a wonderful improvement in a series of years. There is no mistake in the fact, for it is a fact, and a positive fact.

This theory will apply to the improvement of stock, vegetables, trees, etc. Who would think of making the improvement that has been made in stock by the deteriorating plan that Mr. Alley recommends—insufficient nourishment, warmth, and all the necessary requirements for success?

Here is an illustration in the vegetable kingdom: On the next block to me two ladies each set out a banana plant last spring. The one spaded up the ground for quite a distance, spaded in a liberal supply of well-rotted manure, has stirred the ground repeatedly, and given a good supply of water. The other plant was set in a small hole, the ground all around the plant hard and dry; it has been watered only occasionally. The first-named plant is in an extraordinarily flourishing condition, while the last-named is only about one-fourth as large. I measured one leaf on the large plant Dec. 1, and it measured 8 feet long and 5 feet 7 inches broad in the middle. Now, which plant think you will give the largest cluster of fruit when it comes to bearing?

Let us contrast the extra-large hives, large queens long-lived, and long-lived workers, with the small 8-frame hives, small queens short-lived, and short-lived workers, and see how we come out. For queens and workers reared on the nucleus plan are short lived when compared with those of the first-named class. The extra-large colonies are always in a condition to take advantage of a honey-yield whether late or early, unless the apiarist has deprived them of all their stores at a season when he ought not.

Our orange-blossom yield comes very early here. See the case of the large colony gathering 60 pounds of orange-blossom honey mentioned above. You see they were in a state of Nature—neither Gallup nor Alley had ever tinkered with them.

Now, we will take the small hive with the nucleus-reared queen. Early in the spring the colony is weak in numbers because they are so short-lived. The first move they have to make is to rear brood to replenish their numbers, and by the time their numbers are built up the season is passed and nothing stored, and if there is another yield the bees are in a starving condition and must be fed. Now, I hold that a large natural colony is self-sustaining at all times, even in our driest seasons. For I never have seen the season that there was not a short flow from some source, and your large colony with long-lived bees is in a condition

to fill up in a very few days. I never could see the propriety of having an extra-large number of colonies on hand, if one-half or more were productive. Why not reduce the number and have all productive, and produce more honey? If all can not be brought (approximately) up to the standard of perfection, please give the reason.

Orange Co., Calif.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### That Much-Talked-of Hat-Pin.

In regard to that oft-referred-to hat-pin, it was only a plain, black-headed hat-pin. Nothing unusual about it that I know of. I am going to try a white-headed one next summer, to see if it affects the bees the same way.

Mr. Whitney, if your locks were only long enough to do up on top of your head, you would find a deal of comfort in that same hat-pin, aside from giving the bees something to play with.

### Cotton-Waste for Smoker-Fuel.

We have used cotton-waste for smoker-fuel a good deal—such as has been used for journal-packing on car-wheels. It is easily lighted and burns well; it also lasts well. I never liked to handle the stuff very well, and it has a very disagreeable, oily odor. When smoking bees out of sections we were afraid to use it, for fear it would spoil the flavor of our nice, white sections of honey, but at other times it is excellent. It is, however, not always easily obtained.

### Dead Bees on the Cellar-Floor.

Are you keeping the dead bees swept up in your cellar? Better do it. It will help to keep things sweet and clean.

We would not like a lot of dead people lying around on the floors of our homes. I don't believe the bees do, either. How promptly everything objectionable is carried out of their hives when they are out-of-doors, able to fly, and do their own house-cleaning.

If it happens to be anything too big for them to get out, they will cover it over with propolis. They keep everything dainty and sweet about their premises. Too bad to make them suffer bad odors when they can't help themselves.

Another thing to be taken into consideration is the health of the people living over the cellar. To live over a cellar with foul odors is not the healthiest thing in the world; and our own health ought to be reason enough for keeping it clean, even if we cared nothing for our bees.

### Cleaning Out Unfinished Sections and Frames.

I agree with Mr. Bevins in his plan of cleaning out unfinished sections. That is the way I have done for two years, only on a smaller scale. The only difference is, I have not used the burlap over them, which is a good plan where there are a good many, but as I did not have so many I would not have thought of doing so. I put in the supers four or six of the section-holders, and then set the super on the hive, then uncapped where the honey was, and set six or more about on the holders, then put on the cover, and the bees did nice work for me. I did not put them close together so they could get at them all over. I would take them out when clean and put in more, so they have done good work for two years. In that way, as Mr. Bevins says, the colonies that need it get it, and no chance for robbing, as the other bees do not know it is there.

I told in a previous article of uniting my bees and putting the frames that had honey in on top of the ones I united. I got them all cleaned out as nicely as the sections, and some of the frames I gave to others that might need more. So I have a nice lot ready for use when the time comes to need them.

I write this for the sisters who, like myself, are doing

a small business with bees; it is not for those who have a large bee-business; they know all about it.

The gentleman who thinks a woman can't drive a nail is very much mistaken. I have made all my hives ever since I have had bees. I made them out of dry goods boxes, at that, for they were much cheaper than other lumber, and my means are limited.

Now as to the one who is stopping the paper in the winter. I think she will miss it, for that is the time when bee-keepers will have more time to give their experiences. I could not think of doing without it, especially since the sisters have a department. I look for that the first thing, and must see all the headings. Some time I will tell the sisters how I dressed at first, and how I dress now, and how I water the bees early in the spring to keep them from getting chilled.

I suppose I am about as old as any of the sisters, as I am in my 79th year. MRS. SARAH J. GRIFFITH.

Cumberland Co., N. J., Jan. 30.

Seventy-nine years old, and makes all her own hives out of dry goods boxes! Mrs. Griffith must be able to use a saw as well as a hammer. Who can beat that record? We shall look with interest for her further communications. It is pleasant to know that a practical bee-keeper of her age enjoys the new department.

### For Chapped Hands.

To make a salve for chapped hands take an ounce of yellow beeswax and olive oil and melt them together slowly on the stove or in the oven. Pour into a couple of egg-cups which have previously been wet with cold water. When the salve is cold turn it out and it will be ready for use.—“Health and Beauty” Department, Daily News.

## \* The Afterthought. \*

The “Old Reliable” seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

#### EXPERIMENTING WITH CATNIP.

Thanks to Mr. J. E. Johnson for putting an acre in catnip. Of course he must tell us how it pans out. Hardly do to assume, as he does, that catnip is *proven* to be an abundant yielder at all times by the mere fact that bees nearly always seem to be on it. In time of dearth bees will work for a small fraction of a yield. Mr. J. will be of decided interest and value to us, if he lives up to his program, even in a normal location. What is wanted is a ten-acre island five miles out from a pleasant coast—apiary on the main—and a single good hive taken out just when something experimental promises a yield. Page 23.

#### FEW OR MANY BEES REARING A QUEEN.

We grant it, Mr. Alley, that bees that earnestly want a queen will do the best they can, whether they be few or many; and that bees half undecided in mind whether to finish rearing the brat or to pull her out, and eat what the cell contains, they may not do the best they can. The result in the latter case is not likely to be an article to go in the first class. I think, however, that the question of outside temperature nights and odd times jumps to very great importance whenever the bees are very few. (See also Adrian Getz, page 55, on this point.) Mr. Alley may be pretty nearly right in the rare case of ten days of unbroken high temperature, and plenty of all kinds of food at hand in the hive. Page 24.

#### THE SLUGGARD'S BEE-ESCAPE.

Lazy man's bee-escape (not knocking J. M. Young, page 29): wait till cold weather and pull the top all off at night.

#### CHARM AND DESPAIR OF BEE-KEEPING.

You can't solve it like a mathematical problem and have it forever done with. If you assume that you have done so, you'll get left some time, sure. This was inspired by the following good sentence of yours, dear Boss: “Therein lies the charm, and at the same time the despair, of bee-keeping.” Page 35.

#### SPARING THE PESTS (?)

Yes, spare the kingbirds because they chase hawks—and spare the hawks because they eat mice—and spare the mice because they eat the worms in our combs—and spare the worms 'cause if the bees didn't have 'em to contend with they would get shiftless, and lose their vim and go. At last accounts mosquitoes may yet be killed. Page 35.

#### HIVES WITH PORTICO AND SLIDING SCREEN.

Nice—the way Mr. Holtermann has things, page 38—every hive with a portico and every portico with a sliding screen. When nothing honest is doing, and you want to open hives, every colony not under manipulation can be shut in. This can sometimes be done without their knowing it, and with the minimum of worry on their part when they do know it. Some would decide that the extra cost and work of making such hives and the care of keeping them ready to spring at any time would be too much. That is, too much for the few cases they would actually use the device, in their style of doing things. Law unto himself, each bee man must be, in such decisions.

#### WHAT AND HOW TO READ.

Mr. Doolittle, on page 39, was just right in telling us not to waste our time and addle our minds (and souls, too), as some incline to do when business is slack. He was right also to urge the reading of bee books and papers in a more deliberate and systematic way than possible in busy times—the re-reading and comparison of them. Still, let me lead on a little further. Can't you chop off a magazine or two, which are merely pretty, and sadly near to being nothing else, and give some earnest hours to reading real and up-to-date information? Take one of those magazines which scan the whole field of human research and human life and give a succinct of it weekly. So far as I know there are but two (both New York), The Literary Digest, and Public Opinion. If you get a sample of each you will see which one it is you want. “Knowledge for its own sake” is a drum I incline to beat on pretty loudly. If you have considerable acquisitions outside of bee-lore you'll be wiser in bee-lore too. Each kind of truth helps each other kind—helps it to expand the mind and make a broad, mellow, ripe man. Ah, me! but off it treads things up fearfully in the process.

#### “A HUNDRED YEARS AMONG THE BEES.”

So Dr. Gallup knew queens, and presumably beans, as long ago as 1835. If he holds on a bit he'll be able to write “A Hundred Years Among the Bees.” Page 40.

## Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Editor.)

### Queen Died on the Alighting-Board.

This (February 2) has been the best day for fight that our bees have had since before Thanksgiving, and they have taken full advantage of the opportunity. I have one colony of beautiful Italians, and to my grief I found the handsome queen lying struggling in death on the alighting-board. She lived possibly fifteen minutes after I discovered her. What was the probable cause of this? The colony has always been healthy and has done fine work for two seasons. The queen is two years old. It is possible that a younger queen is still in the hive? How early should I give them brood, or introduce a new queen? “WREXAM.”

ANSWER.—It is hard to tell why the queen was killed. It is, of course, possible that there is a young queen in the hive, but I'm afraid not. Let them alone till bees begin to fly nearly every day, and then give a frame of brood, unless you find brood already present. If they start queen-cells, you may be pretty sure there is no queen present, and then the sooner they have a queen the better; and the best way being to unite them with a weak colony having a laying queen.

### Wants Honey, Not Increase—Locality and Size of Hive.

I have fifteen colonies of hybrid bees in 8-frame hives from which I would like to take as much comb honey as possible next season.

1. Which do you think would be the better plan, to let each colony swarm once, thus doubling the number, or prevent swarming altogether?

2. What do you consider the best method of keeping bees from swarming? The plan I have followed was to keep cutting out the queen-cells every six days.

3. Do you think locality determines the size of hive to be used? Some say the 8-frame hive is the best for this locality.

MICHIGAN.

ANSWERS.—1. That depends on circumstances. In any place you will probably get more honey if you do no increasing, *providing* you start the season with all the colonies the locality will support. If the locality will support more bees than you have, you will still do better without increasing if your harvest closes early. But if you have a good flow late enough so that when a colony swarms both the swarm and the mother colony will have time to build up strong for the late flow, then it will be better to have one swarm from each colony.

2. Perhaps the plan of making a shaken swarm is more in favor just now than any other, especially when working for comb honey.

3. Not only locality, but the honey-flow, and the management, make a difference as to whether an 8 or 10-frame hive is better.

### Honey-Extractors—Frames—Supers—Foundation, Etc.

1. I notice in a catalogue that the Cowan honey-extractor, No. 15, is made for the Langstroth frame, of which the top-bar is 18½ inches long and 9½ inches deep. My frame top-bar is 18½ inches long and 6 inches deep. Can I extract from this frame in that size extractor?

2. I am going to buy an extractor. Would you advise me to buy a No. 15 Cowan?

3. Do you think a frame of that size is a good extracting frame?

4. Last year (1902) I was producing comb honey, and my bees stored about 60 salable sections. Now, I want to know how many supers, 8-frame, I ought to have ready?

5. Does a frame of this size require wiring?

6. How many pounds of foundation will it take to fill 200 frames of that size?

7. How far from the bottom-bar ought it to be?

8. How far from the end-bar?

OREGON.

ANSWERS.—1. Yes.

2. Unless you expect to use frames larger than the Langstroth I think you will find it will suit your purpose all right.

3. Yes, 6 inches is a good depth for an extracting-frame.

4. You do not give sufficient data upon which to base an answer. If I understand you correctly, you had last year an average of 60 salable one-pound sections per colony. But you do not say whether that was an unusually small, unusually large, or an average yield. If that is an average yield, the probability is that you ought to have for each colony not less than three extracting-supers containing frames such as you describe. You should figure to have enough to meet the needs of the best year.

5. You can use a frame 6 inches deep without wiring, but it will be better with it.

6. That depends on the kind of foundation you use. If you use light brood, it will take something like 17 pounds.

7. About ¾ inch.

8. It may touch the end-bars, and at most should not be more than ¼ inch from them.

### Doolittle's Comb-Honey Management—Ripening Honey.

I am studying Mr. Doolittle's book on "Scientific Queen-Rearing." In the back part of it he tells how he does the work to produce comb honey. I cannot understand all of it, and it seems to me that he uses a different hive than we do, perhaps. We use 8-frame Langstroth hives.

1. Does he put only one super on a hive during the whole honey-flow?

2. On page 126, what does he mean by shutting the bees out of the side boxes? We could do nothing of the kind, as I understand our hives.

3. What does he do with his sections, to ripen the honey,

and not have the moths get into it? As I understand him, he takes away all the capped honey once a week, or oftener, if needed.

4. He says, raise the cases, sections and all. Does he mean raise a section-holder full of sections? We use the 4½ by 1½ section. Any explanation that would make it plain would be appreciated by me.

5. Will honey ripen as well kept in a store-room as if kept over a colony of bees?

IOWA.

ANSWERS.—1. If I am not mistaken, Mr. Doolittle, in his excellent work, is speaking of the Gallup hive, which he formerly used chiefly if not entirely. I think he is speaking of one super on a hive, using something like wide-frames in these, but he also uses part of the lower story to receive these wide-frames at each side.

2. I suppose that when he speaks of shutting the bees out of the side-boxes he means the spaces in the lower story at each side of the brood-frames. Of course you could do nothing of the kind with 8-frame Langstroth hives.

3. He puts the sections in a honey-house with black walls and roof, where they will be kept very hot by the heat of the sun. As to wax-worms, with the kind of bees he has (an excellent strain of Italians) the likelihood is that he need pay no attention to the moth or its larva. Formerly, when he had more black brood among his bees, I think he fumigated his sections about every two weeks.

4. Yes, he means raise a frame or case full of sections from the lower to the second story.

If I have in any way misinterpreted our friend, Mr. Doolittle, I hope he will set us straight.

### When to Order Queens—8 vs. 10-Frame Hives.

1. I desire to send for three Italian queens for spring or summer. At what date ought I to order them sent to me?

2. Please give the advantages and disadvantages of 8 and 10-frame hives, respectively, for use in Northern Illinois? I find but little in text-books, to which I have access, on the merits of 8 and 10-frame hives.

3. Do you confine a queen to eight combs, or do you sometimes, in the spring, place one hive-body and combs on another, and allow a queen to use 16 frames for brood-rearing, or a larger number than 8 frames?

4. Is it practical to allow a queen to occupy more than 10 frames for brood-rearing? If so, how is it managed?

ILLINOIS.

ANSWERS.—1. That question may be understood in two ways. You may be asking as to the date when you shall order, or the date when you want them sent. In any case you will do well to order some time before you want the queens sent. If you have "money to burn," and care nothing about price, then put in your order right away for tested queens to be sent you about the middle of May, or as early as you can have a good place to put them. If you think it advisable to send for untested queens, then order them to be sent about the middle of June. It will be difficult for you to get them before that, and if they are reared much before that time there will be some doubt about their being quite as good as later-reared queens. If you don't mind sending a distance, you may be able to get them from the South a month earlier.

All this is on the supposition that you want to get all the benefit from them this year that you can. But it would have been still better, in order to get the best results from them this year, if you had had them sent last July, August or September. I would a little rather have a queen reared during a good honey-flow, and it is easier to get them then at a fair price.

2. It takes less watching and manipulation to get and keep a colony strong in a 10-frame hive, and to keep them from starving. The smaller hives are lighter to handle, take up less room, and sometimes a colony can be got to work sooner in a super if in the smaller hive.

3. If I were not allowed in any case to give a second story to give a queen room, I certainly should not think of using 8-frame hives. If possible, I should like always to have every colony so strong before the harvest that it would need a second story.

4. It is managed by simply adding a second story *below* just as soon as the first story is filled, or a little before that time. Many a time 10 frames will not be enough, and 15 may be needed. But when supers are given, each colony is reduced to one story.

**FROM MANY FIELDS**

**Prospects for a Good Crop.**

I had a short crop last season, 3,000 pounds from 90 colonies—2,500 pounds of extracted and 500 pounds of comb honey. I put 110 colonies into winter quarters. We are having a fine season, and things look now as though we may have a good honey crop in 1903 if the Mexican boll weevil does not cut off our cotton flow. If it does, it will be hard on us in this part of Texas.

Later I will write something on foul brood in Texas, and how I manage it. I have not had a case of it in three years in my apiary. LON ROSSON, Ellis Co., Tex., Jan. 17.

**Bees Wintering All Right.**

I have 70 colonies of bees in the cellar and they seem to be doing all right. The prospects for honey the coming season are good. GEORGE A. OHMERT, Dubuque Co., Iowa, Jan. 30.

**"Shoestring" as a Honey-Plant.**

I take much pleasure in looking at the illustrations and readings of the different honey plants. As I see nothing mentioned of the "shoestring" as a honey plant, I will send a specimen. It commences to bloom about July 1, stays in bloom for about three weeks, and yields abundantly for about ten days. I had one colony that gathered 60 pounds of honey while the shoestring was in bloom the past season. The plant grows from 12 to 20 inches high, and has from 6 to 10 heads on the stalk. It grows on the prairies abundantly in this part of Nebraska.

I had a colony of bees that I divided and had 160 pounds of honey from the parent colony, and each had ten frames well filled in the brood chamber for winter stores. My bees are a cross between Holy Lands and Italians.

I like the AMERICAN BEE JOURNAL very much. JAMES SANFORD, Wheeler Co., Neb., Jan. 28.

**Poor Year for Bees—Shade-Board.**

Last year was a very poor one for bees. I got only 145 pounds of honey from my colonies and increased to 15. But like the rest of us, I have hopes for a better year.

Three 12-inch boards, each 36 inches long, cleared at each end, make a very good shade-board, as I have found.

G. B. WILLIAMSON, Jones Co., Iowa, Feb. 5.

**Forced Swarming.**

My! how it is snowing at this writing—1:40 p. m.—and I can find nothing to do but to interview the heaps of bee papers (AMERICAN BEE JOURNAL, a weekly visitor) which are stacked up in my book-case.

Yes, and the way those two jolly bee veterans cross swords is fine. Sail in, for I love a battle of royalty when there is a queen at stake.

I wonder if you had not better be careful in making brushed swarms before they start cells to supply the wants of the parent colony, or there may be a forerunner of profriggity in the parent colony, unless supplied with royal cells, or a queen from no less than royal cells. Did our veterans ever discuss this question?

J. T. Hairston says, on page 55: "As to forcing before or after cells are started,

**PERSONAL TO SUBSCRIBERS**

WE WILL SEND to every subscriber or reader of the American Bee Journal a full-sized ONE DOLLAR package of VIT-E-OILE, by mail, POSTPAID, sufficient for one month's treatment, to be paid for within one month's time after receipt. If the receiver can truthfully say that its use has done him or her more good than all the drugs and doses of quacks or good doctors or patent medicines he or she has ever used. Read this over again carefully, and understand that we ask our pay only when it has done you good, and not before. We take all the risks; you lose nothing to lose. If it does not benefit you, you pay us nothing. VIT-E-OILE is a natural, hard, amanting rock-like substance—mineral—ore—mined from the ground like gold and silver, and requires about twenty years for oxidation. It contains free iron, free sulphur and magnesium, and one package will equal in medicinal strength and curative value, not only all our most powerful, efficacious mineral water, drunk fresh at the springs. It is a geological discovery, to which there is nothing added or taken from. It is the marvel of the century for curing such diseases as Rheumatism, Bright's Disease, Blood Poisoning, Heart Trouble, Diphtheria, Catarrh and Throat Affections, Liver, Kidney and Bladder Affections, Stomach and Female Disorders, La Grippe, Malarial Fever, Nervous Prostration and General Debility, as thousands testify, and as no one, answering this, writing for a package, will deny after using. Give age, sex, and weight.

This offer will challenge the attention and consideration, and afterward the gratitude of every living person who desires to be healthy or who suffers pains, ills and diseases which have defied the medical world and grown worse with age. We care not for your skepticism, but ask only your investigation, and at our expense, regardless of what ills you have, by sending us to you for a package. You must not write on a postal card. In answer to this, address:

it doesn't make any difference; only if the apiarist has as many colonies as he wishes, he should force only those that have cells started, as they would swarm anyway." Now, Mr. Hairston, I challenge that statement (mind, in a friendly way), that is, if you do not comply with the aforesaid reasons. If you left the parent colony with either queen or cell they would be forced queens that had hatched, and not hatched as Nature intended. For Nature forces nothing, but everything exists simply because it is needed.

Now, to illustrate this theory: You are expecting to go away in two days and you must fit up 3,000 sections with full sheets of foundation, as you will not return until after it is time to put them on. You get the foundation, and you find you have only enough for about 500, that is, if you use full sheets, but you cannot, as you will not have time to get any more, and you must fit up full of the sections with some foundation. Now what? Why, you are forced to use starters. Had you known in time, you would have been prepared and had plenty of foundation for the 3,000 sections, and could have used full sheets, and by doing that you see you could have done as you intended, instead of being forced to do something that you did not intend to do.

ROBERT J. CARY.  
Fairfield, Conn., Jan. 26.

### Poorest Season in 20 Years.

The last season was the poorest one for honey we have had in this locality for over twenty years. No honey in this locality, and bees that have not been fed will all starve before spring, I think. I fed mine too late, and I am afraid they will not winter very well.

C. JOS.  
Putnam Co., Ind., Jan. 17.

### Prevention of Increase.

As soon as I see a colony preparing to swarm, as indicated by starting queen-cells, I smoke or drum on the hive to cause the bees to gorge themselves with honey. I then lift the hive from the old stand and put a new hive on the old stand, prepared as follows: Put two frames of honey, one in each end of the hive (I use the Gallup frame), then fill the hive with drawn comb or full sheets of foundation; now put a sheet of wire cloth on the new hive, and the old hive on top. Put the queen and shake most of the bees into the new hive, cut out all queen cells, allow a small entrance to the upper hive, close the hive up snug and warm, and the job is done, until the brood nest below is well established, which will be in about ten days. I then take a look for queen cells that I fancy are present. I cut them out, then the wire cloth is removed and a queen-excluding honey board put in its place. I have tried putting the brood above the queen excluders, but it gave very poor results, the bees seeming to rush up to the brood, and I think they killed the queen because she would or could not go there also.

J. M. CRUCKSHANK.  
Ontario, Canada, Jan. 26.

### Bees Probably Lost from Spraying.

Five years ago I had 50 colonies of bees, fall count. The following summer I lost 17 colonies. They came through the winter all right, were very populous and did extra well until apple bloom came, when I began to notice a decrease in the bees. One colony, in particular, which was in an improved Simplicity hive and about ready to swarm, had a good start in the super, a fair size swarm hanging on the outside of the hive, when, all at once, during apple bloom, there were no bees on the outside of the hive and none in the super. The colony did not die, but did nothing since then, until

## MAN AND HORSE

have easier work when a low-down handy wagon is used. Low-down, it is easy to load; wide tired and low draft it is easy to move. Short turn makes it easy to go around short turns or into narrow places. A man saver and a horse saver. Wood or metal wheels, and all at prices so low that no farmer can afford to be without a Farmers' Handy Wagon. Our new catalogue, just off the press, is the best we have ever published and will be mailed you free if you ask for it.

FARMERS' HANDY WAGON COMPANY  
SAGINAW, MICH.

when in full bloom. I am told bee-keepers are having the same experience around Glasford, because of the fruit trees being sprayed while in bloom. How can bee keepers get out of such trouble? Move out, or is there some other way out? Peoria Co., Ill. GEO. B. SLACK.

(The only way we know is to get a law enacted against spraying fruit trees while in bloom, and then enforce the law.—EDITOR.)

## Brushing Bees Off Combs.

On page 803 (1902), on "Brushing Bees From Combs," Editor Hill gives Mr. Poppleton's plan of getting ahead of the dodgers when clearing extracting combs of bees, with strong feathers. I think the Pickard homemade bee brush way ahead of the stout feathers. The general procedure is about the same. Instead of resting the comb on the frames, I take the combs by the upper corner and hold it in front of the hive and with a downward stroke of the brush throw the bees down in the grass. I then treat the other side the same, then brush both sides with a quick motion something like whetting a scythe. In the meantime my assistant gets another comb loose and gives it a shake or two, dislodging most of the bees, then passes it to me, and I dispatch the dodgers in short order.

The Pickard bee brush was illustrated about two years ago. I have used it two seasons, and would not be without it. It

## The Test of Time

not only proves the increasing popularity of plain sections and fence separators, but the superiority of these supers for the production of comb honey over other styles.

The use of Root's Hives with plain sections and fence separator equipment mean—

**Larger Crop,**

**More "Fancy" Grade,**

**Less No. 1 and 2 Grades,**

**Better Price,**

**Satisfied Merchant,**

**Enthusiastic Customers,**

**Increased Sales,**

**Greater Profit.**

And a ready market the coming season, which is one of the important factors in the building up of a home market for honey. It is one thing to dispose of a fair grade of honey at a moderate price, but quite another to retain the good-will of the merchant handling your honey. To secure his co-operation and stimulate the trade, great care should be exercised as to the attractiveness of the honey offered. It should not only be "Fancy" but the honey should be well capped and put up in neat shape. To obtain these results you should use Dovetailed hives and supers equipped with plain sections and fence separators. Insist on Root's make and you will not be disappointed.

## The A. I. Root Company,

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "4e093" on your label shows that it is paid to the end of December, 1903.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

Advertising Rates will be given upon application.

## FROM MANY FIELDS

### Shaken or Forced Swarms.

I will try and answer the following questions through the AMERICAN BEE JOURNAL:

"1. I read your article on page 55. Why not shake on wide starters?"

"2. They did not punctuate as you intended. I think you wanted to say that 'after the five frames were filled then insert drawn combs or frames filled with foundation.' Did you not?"

"3. I see Mr. Miller, at the Ontario convention, said: 'Do not leave extracted honey open.' Do you agree to this?"

"4. Why need we turn hives upside down in transferring?"

"5. Our alfalfa blooms about every five or six weeks during summer. Now, why wouldn't you shake at the beginning of every flow, as I want to double my colonies and get the alfalfa honey in supers and let them fill up brood-chamber from heartsease for winter?—F. KINGSLEY, of Nebraska."

ANSWERS.—1. Because if the bees get ahead of the queen in building comb they will build drone-comb. By using half-inch starters the queen, if a prolific one, will keep up with the bees with egg-laying, and consequently there will be less drone-comb built.

2. Yes; I intended to say "and after the five frames are filled the dummies should be removed and space filled with full sheets of foundation or drawn combs."

3. Yes, I agree with you. I never extract until all honey is sealed and well ripened; then I put in a tank holding 3,600 pounds to settle, and seal, as I think it retains its flavor better.

4. In transferring from box-hive I turn

the hive upside down, as the honey is at the top, and as the lower end is generally open it is less trouble to turn the hive over; and, besides, if there is any honey in the hive, in tearing off the cover the honey would begin to run, and bees can't be driven over sticky combs. Another reason is, if bees are inclined to rob you are liable to start them.

I don't think your bees would build up sufficiently to shake every five or six weeks. If you did shake that often you would more than double your colonies. If your bees are strong enough to shake at the beginning of the first flow from alfalfa you can do so; but if I wanted to increase my colonies I would not make the second drive, but would leave enough bees to take care of the brood and remove the old colony to its permanent place and give a queen or ripe cell, and it will be ready for the fall flow, and depend on the swarm for your surplus from alfalfa. *Never shake until your bees are strong and there is honey coming in.*

J. T. HAIRSTON.  
Cherokee Nation, Ind. Ter.

### Press for Forming Sections.

I enclose a sketch of section-press that I invented and used for the last two seasons. It does the work fast and easy. A lever raised by a spring folds the section, place in press; pull down the lever and the section is pressed nicely together and is square.

The small pieces in the corners (xx) are pieces of a section-box; they are three so the section will be pressed a little more than square (they will spring back square).

On the side of the press have a board that covers the opening so the section will be placed in opening square and even.

I don't think any more explanation is necessary; if so, will be glad to answer any question you may ask.

Modoc Co., Cal.

I. C. BACHTEL.

[This section-press will no doubt make good work, as it is practically the same as one in use for a long time, although later presses have largely taken its place. Section-presses are furnished ready-made at such moderate prices that one could hardly afford to make one of these for his own use, especially as this can hardly be called an improvement.—Ed.]

### Cleaning Partly-Filled Sections.

Allow me to say a word or two about cleaning partly filled sections, as I notice Miss Wilson has some trouble in having them cleaned out by the bees (page 41). I have no trouble and have now on hand some four or five hundred, which I use in the spring on such hives as I find in need. The Bevins method, in theory, may be all right but is not practical for several reasons.

1. If the colony is a little weak (and those are the ones that need feeding) it allows too much cold air to circulate through the body of the colony and chills them.

2. It does not separate them sufficiently but what they can get at it at any time. But you will take a thin board, mortise a hole at one end  $\frac{1}{2}$  by 3 or 4 inches, and place it on the hive, then a super on that, set the sections in promiscuously, and uncap and deface the honey enough to set it running, I am inclined to think you will have no further trouble in having your desires accomplished. The board should be thin,  $\frac{1}{4}$  or  $\frac{3}{8}$ , placing the mortise in the front to avoid draught.

I had the same trouble mentioned with cloth, but since using the above method I succeeded every time. Should there be a failure where the honey is capped, deface

it with a chisel or other implement you have in use. I use a one-inch firmer chisel, which I find to be the handiest tool for all-round purposes that I can find. A smoker, chisel, goose-wing and an old-style case-knife and you can have all the balance of the whole paraphernalia in the bee-kindom. Try the goose-wing for a brush and see if it does not surpass any brush mentioned in the supply catalog.

A. Y. BALDWIN.  
DeKalb Co., Ill.

### Worcester Co., Mass., Convention.

The annual meeting of the Worcester (Mass.) County Bee-Keepers' Association was held Saturday, Jan. 24, 1903. The following officers were elected: President, Charles E. Prouty; first vice-president, Horace P. Jacobs; second vice-president, Norman B. Parsons; secretary and treasury, Charles R. Russell.

Plans were made for some very interesting meetings during the spring. Speakers from outside, papers from our own members (including ladies), banquet outings to surrounding parts during the summer; in fact a whole season of enjoyment is before us.

At the meeting of Jan. 24 Mr. S. A. Burgess related a very pleasing incident. He has lived in one house all or nearly all of his life. More than fifty years ago a hive of bees was placed in a small attic room; as soon as the hive was full the bees made comb on the outside and gradually spread out until the walls and ceiling are nearly covered, and for more than fifty years the bees have been allowed to use that room. The writer has never been there, but he hopes to go before long and will be able to give a complete description.

Another one of the older members, Mr. S. B. Parsons, is very enthusiastic on the subject of bee-stings as a cure for rheumatism. He has no relish for the story told by Dr. Mackie of a man who was so firm in the clutches of that disease he could not walk; he was taken to an apiary and wheeled in a barrow to the side of an unusually cross colony. The hive was kicked over and the sick man jumped up and ran, cured of his trouble!

Later I will tell more of our association, number of members and other matters pertaining to bee-keeping in this vicinity.

C. R. RUSSELL.  
Worcester Co., Mass.

### Observations on Queen-Rearing.

I see by Mr. Alley's last article he disdains to refer to my \$25 proposition, and well he may, as he would surely lose if he were to send me five queens reared from worker-eggs in nuclei.

I am also able (after reading Mr. Alley's article) to pick out conclusive evidence enough in that article to condemn his entire method of rearing queens. In that article he speaks of a very populous nucleus that after having their queen taken away refused to accept a virgin queen, and that this same small nucleus reared a batch of queens from their own brood among which was one that was worth \$100, and that the others were not good enough for breeders.

Now, I want to ask Mr. Alley: Did you ever think that that small colony was so crowded that the queen you took away had deposited an egg in a cell-cup, and that the colony would have swarmed in a few days anyway, and that \$100 queen was a natural queen, and all the rest were only queens from worker-cells?

Another thing I want to state for the benefit of the uninitiated, and that is, look out for any queen reared who has \$100 queen as his system of rearing queens must be seriously wrong, or he would have more good queens, and as a

(Continued on page 139.)

# AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., FEB. 26, 1903.

No. 9.

## \* Editorial. \*

**Honey North and South.**—There is always a possibility that two persons looking from different standpoints will see the same thing in different lights. The following letter illustrates this:

EDITOR AMERICAN BEE JOURNAL.—

Commenting upon Editor Hill's paragraph as quoted on page 51, I wish to say that, in the minds of some, there is some doubt that the South puts upon the market a larger percent of *low-grade* honey than any other section of the country.

Again, "The unprogressiveness of many sections of the South is well known." (Is this unprogressiveness confined to the South?) "The product of the bee-keeping element in such localities is necessarily inferior." Why so? Does man's laziness or ignorance have any effect upon the bee? Is it necessary that the bee-keeper be of the general type? Escambia Co., Fla. C. C. PARSONS.

Editor Hill, himself a Southerner, and, indeed, a fellow-Floridian with Mr. Parsons, is pleading for justice to the South, and, no doubt, both men are of the progressive type, and if all men of the South had been just like them, it is likely that there never would have been any occasion for Mr. Hill to make his plea.

There is unprogressiveness in the North as well as the South, but whatever may be said as to the proportion of each, the fact remains that when honey has been put on the market as Southern honey, it has been quoted at a lower rate *because* it was Southern honey. No doubt, the nectar collected by the bee of the most up-to-date bee-keeper is not a whit better than that collected by a bee belonging to the ignorant and shiftless, but when that product is ready for the market there may be a distinct difference in appearance, and also in real value. One sample may be thoroughly ripened and luscious, while the other is thin, watery, and unpleasant to the taste. There may also be a marked difference in two samples of comb honey, both gathered from the same honey-plant.

Nothing has given ground for the belief that Southern honey, in general, is more or less inferior. It is unfair to Mr. Parsons to say that his honey should bring any less in the market than another sample exactly like it produced farther north. This injustice should not continue. If he can make it appear that it was all a mistake to suppose that any considerable quantity of honey produced in the South was inferior, he may in time change the significance of the term "Southern honey." But that would take a good deal of

time, and possibly no amount of time would make the effort successful. Possibly he will find it a shorter task to take the ground that justice requires that his honey should stand on its own merits for what it is, without having any classification that shall arouse prejudice against it.

**Duty on Honey to Canada.**—In the report of the Ontario convention, on page 83, reference is made to the fact that Cuban honey is shipped to Toronto. It would, perhaps, more clearly represent the market if it had been said that there is a specific duty of 3 cents per pound on all honey going into Canada. Mr. Holtermann has called attention to the fact that he mentioned this duty particularly to the convention in this connection. So writes Mr. Morley Pettit, who reported the Ontario convention for the American Bee Journal.

**The Texas Experiment Station Report** has been received. It is a neatly printed pamphlet of 53 pages, six of which are occupied by the report proper, and 39 by an elementary treatise on bee-keeping for farmers and others desiring to keep a few bees. Prof. Fred W. Mally is professor of Entomology at the Agricultural and Mechanical College, assisted by Wilmon Newell, the latter having immediate charge of the apiary, and apparently the laboring oar in the preparation of the Report.

The Experimental Apiary was established in 1902, with seven colonies of bees, which were increased during the season to 21. The sum of \$300 was voted by the Legislature for use in the year, and was invested in bees, queens, hives, books, honey-house, etc.

The effort has been to breed to the highest standard of excellence, keeping careful record of all colonies, and selecting the best as mothers of queens and drones.

It is proposed during the coming year to make a comparative study of the different strains or races of bees, and especially to determine approximately the comparative length of life of the different races. This is believed to have an important bearing upon the harvest in seasons of special drought.

The study of honey-plants will also be continued. It seems a little curious to note that while American varieties of buckwheat are set down as partial or total failures, Japanese buckwheat gave the best results of all plants tested. The report says:

With medium or even poor soil, and a very small amount of moisture, this plant can be depended upon to begin blooming 30 days after planting, and will continue to bloom for 30 days, at the end of which time the seed is ready to gather. It will be seen that it is a

very easy matter to regulate the time of sowing, so that a honey-flow will be had from this plant at the beginning of a dearth of natural forage for the bees.

Japanese buckwheat thrives best when drilled in rows about three feet apart, and cultivated during growth. The seed brings from \$1.00 to 1.50 per bushel. In case seed is not desired the buckwheat can be cut and cured as in other hay, and is found to make valuable feed for farm animals. If grown more extensively there is no doubt that such hay would bring a good price in the open markets.

The cowpea, especially the speckled variety, is commended.

In the treatise on bee-keeping, in a list of eight reliable text-books adapted to the beginner, Maeterlinck's "Life of the Bee" stands next to the highest, and Doolittle's "Queen-Rearing" last. Otherwise the information is reliable, and calculated to be of good service to the class for whom it is intended.

**Age of Brood-Combs.**—In this country it has long been held that so long as worker-comb is in good condition there is no need to renew it in the brood-nest, and in Europe this view has also gained ground. In England, however, a different view is held. A late number of the British Bee Journal advises that brood-combs be gradually renewed, two or three each year, but not more than three in a single season. That means that in somewhere from three to six years, age alone incapacitates a comb for further service. The question is whether it is the climate of England, or what it is, that throws a comb out of service in so few years when there have been so many proofs that elsewhere a comb 20 years old is as good as new—in some respects better.

**Honey in Bait-Sections,** in the practice of most bee-keepers, is never allowed, the honey being scrupulously cleaned out of the combs by the bees in the fall before it has time to granulate. Some, however, have no fear as to ill results from having a little honey left over in the sections to be used as baits. Bearing upon the subject is the following in the British Bee Journal, from H. S. Shorthouse:

The occasional crystallization of one jar of honey which granulates, while the others remain bright and liquid, is accounted for by the fact that the bottle either contains a small portion of grit, or is slightly rough or irregular in some particular part of the inside, which lends a starting point of crystallization to the sugars which are contained in the honey in what we will term a state of supersaturation.

An experiment (on crystallization), using sulphate of soda for the purpose, most beautifully illustrates this theory. If we take a quantity of sulphate of soda, dissolve it in a minimum quantity of hot water, and whilst warm tie over the neck of the vessel in

which it is contained a parchment paper and allow it too cool, we can at any moment cause the solution to crystallize by the puncturing of the paper with a needle, or by keeping the bottle air-tight we can retain it in solution form.

Again, we can make solutions of chemicals, and can manipulate them without any signs of separation, but the introduction of a further small crystal of the same, or some other substance, will spontaneously cause the crystallization of the whole, and I feel assured that the granulation of honey can be accelerated by the addition of a very small crystal of the ordinary cane-sugar.

## Weekly Budget.

PROF. A. J. COOK, of Los Angeles Co., Calif., writing us Feb. 16, reported "prospects for a honey crop in California good. Splendid rains."

MR. THOMAS G. NEWMAN, of San Francisco, Calif., has been very ill. So it is reported in his *Philosophical Journal* of Feb. 14. It says he was stricken Feb. 5, which was the 49th anniversary of his wedding day, and adds:

He has been fighting a battle-royal for more than three weeks with a larynx, in one of its worst forms. For eleven nights unable to rest or sleep, and yet each day taking up the work in all its trying, taxing details which is necessary to the editing and publishing of the paper and general work of the book concern connected with it.

Their friends, who have observed the vast amount of work which was being done by both Mr. and Mrs. Newman, and have seen how weary they were growing, are not so much surprised that at last one of them has fallen at his task, and with the barness on.

On Thursday, in going to the post-office, Mr. Newman suddenly lost consciousness and fell to the pavement, receiving what proved to be but a slight scalp wound. He was carried to a drug-store near by, and fortunately regained consciousness sufficient to give information regarding himself. He is now in a critical condition, and complete rest is the strictest and almost the only means of assuring his restoration even to where he may take up the work he has been compelled to drop.

Mr. Newman's host of bee-keeping friends will read the foregoing with much regret; and all will unite in the hope that he may be spared, and that his recovery may be entire as well as speedy.

THE CALIFORNIA ASSOCIATION.—We have received the following from Pres. Geo. W. Brodbeck, of the California National Honey-Producers' Association:

MR. EDITOR:—I herewith send you a copy of our by-laws defining the purposes of our organization. You will notice that it is a corporation, nevertheless it is a co-operative proposition, controlled entirely by bee-keepers. The requirements are such that it need exclude no one.

Yes, it is evident we have a big contract on hand, but judging by the display of interest up to date by the receipt of communications asking for information from all sections of the State, the subscriptions for stock that are coming in daily from both large and small producers, the requests that are coming in from all localities for some one to come and organize local associations, all go to prove that never before in the history of California bee-keeping has this fraternity displayed such interest in helping along a project as they are doing with this one. We purpose in getting

a live, wide-awake manager, that will keep in touch with every stockholder, be he large or small, making no distinction, working only for the good of the whole.

Geo. W. Brodbeck.

The By-Laws referred to by Pres. Brodbeck, are these:

### BY-LAWS OF THE CALIFORNIA NATIONAL HONEY-PRODUCERS' ASSOCIATION.

"The name of the corporation shall be the California National Honey-Producers' Association.

#### ARTICLE I.

*Corporate Powers.*—The corporate powers of this corporation shall be vested in a board of five directors, who shall be stockholders, holding three hundred or more shares of stock in their own names on the books of the company, and three shall constitute a quorum for the transaction of business.

#### ARTICLE II.

*Election of Directors.*—The directors shall be elected by ballot, at the annual meeting of the stockholders, to serve one year and until their successors are elected. Their term of office shall begin immediately after election.

#### ARTICLE III.

*Vacancies.*—Vacancies in the board of directors shall be filled by the other directors in office; and such person shall hold office until the first meeting of the stockholders thereafter.

#### ARTICLE IV.

*Power of Directors.*—The directors shall have power:

1st. To call special meetings of the stockholders when they deem it necessary. And they shall call a meeting at any time upon the written request of the stockholders holding one-third of all the subscribed stock.

2d. To appoint and remove at pleasure all officers, agents and employees of the corporation, fix the compensation, and require of them security for faithful service, when it shall be deemed advisable.

3d. To conduct, manage and control the affairs and business of the corporation, and to make rules and regulations, not inconsistent with the laws of the State of California, or the by-laws of the corporation.

4th. To incur indebtedness. The terms and amount shall be entered on the minutes of the board, and the note or obligation given for the same, signed officially by the president and secretary, shall be binding on the corporation.

#### ARTICLE V.

*Duties of Directors.*—To cause to be kept a complete record of all their minutes and acts, and of the proceedings of the stockholders, and present a statement at the regular annual meetings of the stockholders, showing in detail the assets and liabilities of the corporation, and generally the condition of its affairs.

2d. To declare dividends out of the surplus profits, when such profits shall, in the opinion of the directors, warrant the same.

3d. To supervise all officers and agents and see that their duties are properly performed. To cause to be issued to the stockholders, in proportion to their several interests, certificates of stock.

#### ARTICLE VI.

*Officers.*—The officers shall be president, vice-president, secretary and treasurer, which officers shall be elected by the board of directors.

#### ARTICLE VII.

*President.*—The directors at their first meeting shall elect one of their number as president.

1st. The president, or in his absence the vice-president, shall preside over all meetings of stockholders and directors and shall have the casting vote.

2d. He shall sign all certificates of stock

and all other official documents and shall draw checks on the treasurer, and shall perform such other duties as may be necessary for the good of the corporation a consistent with his office.

#### ARTICLE VIII.

*Secretary.*—The board of directors shall elect a secretary.

1st. It shall be the duty of the secretary to keep a record of the proceedings of the board of directors and of the stockholders.

2d. He shall countersign all checks drawn upon the treasurer, and discharge such other duties as pertain to his office and are prescribed by the board of directors.

3d. The secretary shall serve all notices required either by law or the by-laws of the association.

#### ARTICLE IX.

*Treasurer.*—The treasurer shall receive and keep all the funds of the association in a bank and pay them out only on the check of the president, countersigned by the secretary.

2d. At each annual meeting of the stockholders he shall submit, for their information, a complete statement of his accounts for the past year. He shall discharge such other duties pertaining to his office as shall be prescribed by the directors.

#### ARTICLE X.

*Superintendent.*—A general superintendent shall be appointed by the directors and removable at their pleasure. It shall be his duty:

1st. To take charge of all property belonging to the company and to control and direct all business and labor, such as grading, sealing, storing and shipping honey, and any other duties required of him as the directors.

#### ARTICLE XI.

*Compensation of Officers.*—The officers shall receive such compensations as the directors may from time to time determine upon.

#### ARTICLE XII.

*Certificates of Stock.*—Certificates of stock shall be of such form and device as the directors may direct; and each certificate shall be signed by the president and secretary, and express on its face its number, date of issuance, the number of shares for which, and the person to whom it is issued.

The certificate book shall contain a margin, on which shall be entered the number, date, number of shares, and name of the person expressed in the corresponding certificate.

#### ARTICLE XIII.

*Transfer of Stock.*—Shares of the association may be transferred at any time upon the sale of the bees which they represent, by the holders thereof, by endorsement on the certificate of stock. But no transfer shall be valid until the surrender of the certificate and the acknowledgment of such transfer on the books of the association.

2d. The receiver of the new certificate shall be required to sign the by-laws of the association. No transfer shall be valid if the holders are indebted to the association on any account whatever.

3d. No surrendered certificate shall be canceled by the secretary before a new one is issued in lieu thereof; and the secretary shall preserve the certificate so canceled as a voucher. If, however, a certificate shall be lost or destroyed, the directors may order a new certificate issued upon such guarantees by the parties claiming the same as they may deem satisfactory.

#### ARTICLE XIV.

*Meetings.*—The regular annual meeting of the stockholders shall be held on the first Wednesday in January of each year at 10 o'clock, in Los Angeles, at such place as the directors may provide, and each stockholder shall be notified by letter by the secretary at least two weeks before the time of meeting; provided that when such day shall fall on a legal holiday, then

such meeting shall be held on the next business day at the same hour.

At each annual meeting directors shall be elected by ballot to serve for the ensuing year, and until their successors are elected. No meeting of the stockholders shall be competent to transact business unless a majority of stock is represented, except to adjourn until such time as may be deemed proper.

Special meetings of the stockholders may be called by the president whenever he may deem it expedient, and he shall call such special meeting when requested to do so by the holders of at least one-third of the subscribed stock of the association. Notice of special meetings shall be given in the same manner as provided for at regular meetings, or when the stockholders are all present and sign a written assent thereto on the record of such meeting.

The president and secretary of the association shall act as president and secretary of stockholders' meetings, unless the meeting shall decide otherwise.

**Directors' Meetings.**—Regular meetings of the directors shall be held immediately after the annual meeting of the stockholders, and also upon the first Monday in each month at 10 o'clock a. m., and notice of such monthly meeting is hereby dispensed with. A majority of the directors shall constitute a quorum for the transaction of business. In case of an equality of votes the president may have a second or deciding vote.

Special meetings may be called by the president by his sending a notice in writing to each director four days before the time of the meeting called. Said meeting may be dispensed with at the discretion of the board.

#### ARTICLE XV.

**Elections.**—At all corporate meetings each stockholder, either in person or by proxy, shall be entitled to as many votes as he owns shares of stock. Such proxy shall be in writing and filed with the secretary.

#### ARTICLE XVI.

**Seal.**—The association shall have a common seal consisting of a circle having on its circumference the words "California Honey-Producers' Association."

#### ARTICLE XVII.

**Governing the Sale of Honey.**—No stockholder shall sell his honey crop or any portion thereof for less than the prices set by the directors.

A commission shall be paid to the association to defray the expense of grading, sealing and other costs of marketing.

2d. Money shall be advanced on honor to the association warehouse by a stockholder upon his written request, and such honey shall be held as security. It is sold or the loan, with interest, paid in full. The association shall furnish money on such loan at the lowest rate of interest that it is able to secure. All honey upon which loans are made shall be insured, and all other honeys shall be insured upon arrival at the warehouse unless the superintendent shall be notified to the contrary by the owner.

3d. The directors shall not change the selling price oftener than once a month. Stockholders placing honey in the hands of the association may choose their own time for selling, and when a member places his honey for sale at the rate set for a certain month he shall receive his proportionate amount of all money received by the association on sales of honey belonging to individual members during said month, provided it shall be received and the superintendent notified that it is for sale not later than the tenth of the month. Honey put on at a later than the tenth of said month shall be placed in the next month's division.

If a member wishes to place his honey in the warehouse and hold it for a raise in price he shall be permitted to do so,

and only the actual expense of grading, storage, etc., charged.

A member who has honey in the warehouse on sale may withdraw said honey upon fifteen days' written notice to the superintendent. Honey not on sale is always at the owner's disposal.

Honey belonging to the association must be placed on sale in the same manner as that belonging to an individual.

#### ARTICLE XVIII.

**Withdrawal of Members.**—A member may withdraw from the association at the annual stockholders' meeting by turning over his certificate of stock to the association, and he shall receive one-half of the price paid the association for said stock, and his proportion of all surplus money in the treasury, but honey produced during the year of membership must remain until sold.

#### ARTICLE XIX.

**Amount of Stock.**—No person shall buy less than one share of stock for each stand of bees owned by him, and he shall be required to give a written statement declaring how many stands of bees he owns at the time of his subscription for stock, and at each annual meeting of the stockholders. In case of an increase in bees of more than fifteen per cent that is not represented by a share of stock to the stand of bees the owner shall buy more stock in proportion to the increase.

Where there is a decrease of fifteen or more per cent and the owner has bought his limit of one share to the stand he shall return stock to the association in proportion to his loss in bees, for which the association shall pay him at the same rate as provided in Article XVIII.

The board of directors may offer stock for sale to the membership, aside from the initiatory stock, as the necessity of the association demands, but not to exceed ten shares to one colony of bees.

#### ARTICLE XX.

**Amendments.**—The by-laws may be altered or amended at any meeting of the stockholders by a majority of stock represented at such meeting.

#### ARTICLE XXI.

**Fines.**—Any member who at any time violates these by-laws or the conditions stated by them shall, after being duly notified and heard in his own defense, pay such fine as may be imposed upon him by the directors, not to exceed \$200 for each offense.

#### Know All Men by These Presents:

That we, the undersigned, being the holders and owners of more than two-thirds of the subscribed stock of the California National Honey-Producers' Association, hereby assent to the foregoing by-laws and adopt the same as the by-laws of the said corporation. In witness whereof we have hereto subscribed our names this 19th day of January, A. D. Nineteen Hundred and Three.

L. E. MERCER,  
GEO. W. BRODBECK,  
M. H. MENDELSON,  
L. S. EMERSON,  
GEO. L. EMERSON.

#### Know All Men by These Presents:

That we, the undersigned, directors and secretary of the corporation known as and called the California National Honey-Producers' Association, do hereby certify that the above and foregoing by-laws of said corporation were duly adopted as the by-laws of said corporation on the 19th day of January, A. D. Nineteen Hundred and Three, and that the same do now constitute the by-laws of said corporation.

L. E. MERCER,  
GEO. W. BRODBECK,  
M. H. MENDELSON,

L. S. EMERSON,  
GEO. L. EMERSON,  
Directors.

GEO. L. EMERSON,  
Secretary of the Association.

All beedom will watch with deep interest the progress and work of the California beekeepers. While they are not exactly leaders in the work of co-operative effort in the sale of honey, yet on account of the importance of their crop, and at this time the feeling after a better way on the part of honey-producers generally, whatever of success or failure may develop in the California organization will be specially noted. Surely, they have the heartiest wishes of all for the accomplishment of every worthy desire and object.

THE STEADY SUBSCRIBER is thus honored by the grocers' Criterion:

"How dear to my heart is the steady subscriber, who pays in advance at the birth of the year; who lays down his money and does it quite gladly, and casts round the office a halo of cheer. He never says 'Stop it, I can not afford it,' nor 'I'm getting more papers than now I can read,' but always says, 'Send it, the family likes it,' in fact, we all think it a real household need." How welcome he is when he steps in the sanctum, how he makes our hearts throb, how he makes our hearts dance. We outwardly thank him, we inwardly bless him, the steady subscriber who pays in advance."

Just the same in the Bee Journal office.

MR. J. P. IVY is one of Arizona's successful bee-keeping sons. A friend of his sent us the following in connection with the pictures found on the first page:

For some years I have been quite deeply interested in bees as a pastime and recreation, but never was pleasure greater, and never was there a more delightful surprise, than the hospitality shown me by Mr. J. P. Ivy. I met him, introduced myself, and he invited me to spend a night at his home—a home of comfort and happiness. Had keeping it itself been no pleasure to me, this meeting and course of beedom, so to speak, would amply have repaid me.

In my wanderings over the country (I live in Delaware), I have never seen so complete, simple, and practical a system of apiculture as that of Mr. Ivy. Its economy and neatness strike the observer. Among the foremost of the great bee-keepers of the West, Mr. Ivy has six large out-apiaries, and ships several car-loads of honey every season. In a business of this magnitude some mutual understanding and adjustment of freight-rates, etc., are all-important. He, side by side with other progressive men, has striven to make the honey-business a straight and settled business, with just profits and fair dealing, and to advance the science of bee-keeping as well as to make an honest, honorable living.

E. G. BRADFORD, JR.

DR. GALLUP, THE BARON, BANANA HONEY.—That is rubbing it into Dr. Gallup. If I were in his place I certainly should gallow off after getting a roast like that.

However, I should suggest to Baron M. Licawful to change his name to "Baron von Munchausen." I have no doubt that it will be necessary for Baron M. Licawful to provide himself with collar and chain for his queen, as she certainly would be a dangerous insect if she ever ran amuck.

Tell us something of banana honey: that's all we get here. PORTO RICO.

If you get banana honey you likely know more about it than almost any one else who reads this journal. Suppose you tell us something about it.

## Convention Proceedings.

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 118.)

Mr. Moore—I move that we proceed to discuss the questions appearing in the President's address seriatim. The motion was seconded and carried.

#### LAWSON BEE-DISEASES.

Pres. York—If Mr. France were here he could start us off on that.

Mr. Wilcox—At the first convention I ever attended that subject was up as the most prominent subject for discussion. Dr. Miller was present, and he was the only champion there was on the affirmative side of the question. It had been referred to a committee and laid over a year. One of the committee was Prof. Cook, and the other was Prof. McLain, and they reported that legislation for bee-keepers was inexpedient, and not advisable. And that seemed to be the sense of that meeting or convention. Dr. Miller alone standing out in favor of his theory that legislation for bee-keepers is desirable, and I believe he has something to say yet. How many times I have thought of it, since foul brood laws and pure food laws became enacted, and since our Association was formed to protect each other as far as possible from dishonesty. It seems to me a good thing. I don't know about legislation, or how we can bring it about, but I would like to see and hear much on that subject.

Pres. York—We would like to hear from Dr. Miller if he hasn't forgotten what he said 25 years ago.

Dr. Miller—I confess I did forget. When Mr. Wilcox spoke first I thought he had gotten the men mixed, but I do recollect now. There is this about it: There are States all about us that have felt the need of this very thing; they have secured the legislation, and they are better for it. I very much doubt if you can find a man in the State of Wisconsin—a bee-keeper—who thinks it was a bad thing to have the law. Perhaps there are some. How is that, Mr. Wilcox?

Mr. Wilcox—I have never found one who is against it. We are in favor of pure food laws, foul brood laws, and any other good laws that can be enacted.

Dr. Miller—Regarding foul brood, I never saw a case of it. I was once where it was, and I was foolish not to look at it. I don't know, but I hope I may never see it in my place. One of the investigators across the Ocean has told us that the bacilli alvei, the germ of the foul brood, is nothing more nor less than one of the common microbes—bacillus mesentericus vulgaris—that is pretty nearly everywhere. Once at our house we had trouble with bread that would get soft and stringy.

Mr. Moore—Mold?

Dr. Miller—Not dry, though; and that's made by the same thing that makes the foul brood.

Pres. York—Then your wife didn't make that bread? [Laughter.]

Dr. Miller—(I wish the president would keep his audience in order, and not interrupt me.) The only point I wish to make in that is, that there is more danger than we think of in foul brood. I have always felt, so long as there was none of it near me, I was entirely safe. I don't feel as safe as I did. Now, I would feel much less safe if I knew of foul brood within two miles, within ten miles of me. I don't know what day there may be a case of foul brood ten miles around me. For that one case I want to be provided in advance. I have no foul brood in my apiary, but I want the law so that if something of that kind does come I will feel safer than I am to-day, and you are all in the same boat that I am. You may not feel anxious about it, but you are not safe as long as there is no law to keep somebody from bringing foul brood next to you, on the next farm. No inspector to come around and look at it. You are paying

for fire insurance, and some of you for life insurance, and you would think it was very bad if you let your policy lapse and have no fire insurance. Now, you need all the insurance you can get against foul brood. You need the laws, and right along with that comes closely connected this matter of Wisconsin. Any one of you can't do much about getting foul brood laws, but as an organization here together you can do something.

Pres. York—This is certainly very important, and if we are going to attempt to get a foul-brood law during the coming winter we must start soon. The State Legislature meets in January. I have suggested that this Association co-operate with the State Association. Mr. J. O. Smith is the president, and Mr. Jas. A. Stone is the secretary. Mr. Stone lives near Springfield, and could have the matter in charge.

Mr. Moore—One thing that occurs to me. We don't exactly think that Illinois is a back number in laws. For the protection of women it stands, I think, in the front rank of all the States. If you will read some of the law books you will find that women are classed as idiots and insane persons, and in Illinois they are classed as the superior of man, and their property rights are accorded to the very highest degree, and there are many laws in Illinois that are up to the times. There is not a law on the statute books of Illinois about bee-keepers' interests. Not a single law. That alone shows you the great need of something being done. All around us, one State has a law on foul brood, another has a law against spraying of fruit-trees in blossom, but Illinois has no laws whatever except the general food law which has just been passed, the old food law which has been a dead letter. With this exception there is no law for the benefit of bee-keepers especially.

Pres. York—We would like to hear from Mr. Clarke on this. I know several times at my office he has spoken about doing something.

Mr. Clarke—I think it is a most important thing. Now there is absolutely no protection to a man who understands the business, because some party that may have bees with foul brood, if he is 10 or 20 miles away from him, still as a kindness to one of their friends he may ship in a foul-broody colony to a man whose bees haven't got it. If shipped within a mile or two, it is only a question of a short time until he will have it in his own apiary. Of course, where a man thoroughly understands it, and it is within a mile or two of him, he can practically get clear of it. If he lets it get developed thoroughly in one or two colonies, and does not know it is amongst them, directly a frost comes and cuts off the flowers, the bees are going to look around and do some robbing, and they are going to take the foul-broody colony. The odor is offensive. They have no more than a bottle of honey in the hives because bees won't lay in the cells filled up with foul brood, so when they go into winter quarters they will have very few bees to protect their honey, and the others will rob them out, and when you get robbing in 80 or 100 colonies it is going to spread in every colony. Though one colony taken into your apiary in the fall would not develop at once, but directly the queen begins to lay in the spring they are going to take them, as well as two or three, and distribute them in the three or five hundred hives, and that goes to develop foul brood so that the man who has 200 colonies, with foul brood within two miles, isn't safe. This man can at the present time ship them to some friend half a mile from you, and you have no recourse at all. You can't say, "Here, destroy that colony," for if he doesn't want to he can keep them and throw them open to your bees if he wants to. There is absolutely no protection to a man. Besides that, I think it is needed as a protection to the public. Now we know that the instinct of the bee is that when there is a super put on, or a box to remove the honey from the brood-chamber up, if opened down below where the honey can be started over the foul brood scale, they will move that honey up into the super and drop down. That honey is sold. Under these circumstances I think that the law is not only a protection for the bee-keepers, but the public as well.

Dr. Miller—How many are there here whose bees are now troubled with foul brood, have it either in their own apiaries or near by?

Pres. York—How many have it at the present time?

Six held up their hands.

Mr. Clarke—I may say this, that although you can get an idea of the number here, practically up-to-date bee-keepers that will be at a convention, still how many bee-keepers are there that don't take any interest in these conventions? These are the men we want to get after. The men who come here want to keep up with the times. We have dis-

cases amongst every live creature under the sun. These are the men that this law is aimed against. Not at the bee-keeper who is here. They come to the convention, they get all the information and are informed.

Dr. Miller—These five or six men that raised their hands are not the ones who need the foul-brood law. The rest of us are the ones that need that law and want to have it. If I had foul brood in my apiary to-day I wouldn't give much whether you had a law or not. I haven't got it, and don't want it, and want things in shape so that I can fight it off.

Mr. Wilcox—I don't want to say anything in favor of a foul-brood law particularly, but I do want to say something. We, in Wisconsin, have one. Our State Association made the start. It is satisfactory to us. We hardly see how we can improve it except that we want two or three hundred dollars a year more to pay our foul-brood inspector. With that exception we think we are satisfied. I think I can speak the sentiment of every bee-keeper in Wisconsin when I say that we almost demand of you that you proceed to get the foul-brood law enacted in Illinois, and attempt to suppress the disease in this State so that it may not be transported continually into ours. We are continually in danger in buying queens or honey from your State, and if you go before your Legislature with a committee and Bill drafted to suit you, you will have no difficulty in getting it enacted. We had no difficulty when they saw that we were in earnest, and knew what we wanted, and how we wanted it, and you can do the same. I believe you can, and I know that you will be fortunate if you get as good an inspector as we did; but you need two of them, for your State is large enough to need it, and you will be completely successful in getting the disease so under subjection that it will not be spread. You will cure every case almost as quickly as it shows in any locality, and you will be proud to think that you have done it.

Mr. Kluck—If the bee-keepers of Illinois can only get a foul-brood law by coming together here and at other places this winter, it will be the end of their troubles. It is the men that keep bees that expect to get a crop next year who think it is a whole lot like finding money. They are the ones that do the most harm. If they have foul brood they say, "Well, bee-keeping doesn't pay very well; I will let that go. If the bees live they will live, and if they don't they will die." If we had a foul-brood law we could send the inspector there; he would condemn the apiary, and the man would either have to clean it up or destroy it. The most danger that we have from foul brood is from this man who keeps bees in anything from a nail-keg up to a dry-goods box, and they are in such shape that you can't do anything with them but destroy them. They are like a man that has horses that have distemper. After his horses have it he doesn't care whose get it. If we can only get a foul-brood law, and go before the Legislature and see our representatives in our different districts and tell them, "Now, you be sure and vote for this foul-brood law," why, we would have accomplished a great deal for Illinois.

Mr. Thompson—I don't think, like Dr. Miller, that the five or six gentlemen here who have foul brood don't need the law. I haven't foul brood in my own apiary, but I discovered it about half a mile from me, and I think I am in need of a law as much as any man in Illinois. I have to watch very closely now so that it doesn't get in mine. I was fortunate in finding a man who was willing to destroy it, as far as I know. All foul brood that was discovered is now in ashes.

Mr. Wilcox—How can you prevent it getting in yours, if it is within half a mile of you?

Mr. Thompson—The State law will help.

Dr. Miller—I believe that this organization can do more than any other agency in the State towards securing a foul-brood law. I very much doubt whether any of you would dispute that. I believe that if the whole time of this convention from now until the final adjournment should be taken up in discussing this, and then action should be taken resulting in getting a foul-brood law, it would be time well spent. I am not advising that, but only to show the importance I think attaches to this subject.

(Continued next week.)

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get them subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

### Bees and Pear-Blight—Some Information.

BY J. E. JOHNSON.

ON page 77, Mr. Mitchell seems to doubt the truthfulness concerning my having 900 pear-trees free from blight, and prefers affidavits from disinterested neighbors. Now, my neighbors are all pretty much interested, but if he will write to the bank of Williamsfield, Ill., or C. C. Davis & Co., grain merchants, or the postmaster at the same place (enclosing a stamp for return postage), they will enlighten him.

I have also 900 other trees—peaches, apricots, Japan plums—and will plant more pears this year. I am, however, a very small orchardist compared with many others. W. S. Mounts, of this State, has 11,000 pear-trees, and is a successful grower, and bees spreading blight does not worry him much.

It is not my intention to misrepresent, or boast of my ability, but I have very carefully studied the success as well as failure of other growers, have also studied somewhat about chemical physiology and pathology, and have a microscope strong enough to reveal the blight bacteria and some other agents of the plant-life called bacteria or microbes, but it does not make them as large and plain as I should wish. For the benefit of some let me say that the bacteria family are vegetable organisms, and do not belong to the animal kingdom; their mode of propagation is by a process of budding, and they increase very rapidly only in the elements favorable to their propagation, and no blight could exist except as the result of a microbe; and if we care for our trees as Nature has intended, they will not become favorable to the propagation of said organism, hence they would be blight-proof.

I do not wonder that my article on page 77 was criticised, as I did not write it for publication. I'll tell you how it was. At the Chicago convention Dr. Miller asked me to write to him and explain certain things in which we were both interested. The article was extracts from that letter. The Doctor has been patiently answering so many of our questions, and helping us out of our many troubles that I think he has begun to rejoice in our tribulations, and as I did not have any particular trouble he thought he would hunt me up a little, so he sent it to the American Bee Journal for publication.

Well, criticism taken in moderate doses is very healthful, and I am thankful for it.

Now, from what investigations I've made, and from what experience I've had, and I might say from many other fool notions, I'll try and tell you my opinion of pear-blight.

The natural home of the pear is in temperate Europe and Asia. Pear-blight is a thing unknown except in America; bees are known nearly the world over. In central France a pear-tree that was over 600 years old was destroyed a few years ago by storm. It was known as the Queen Anne pear-tree. In the suburbs of Boston are French seedling pear-trees nearly 200 years old, free from blight. In Illinois are pear-trees from 60 to 80 years old bearing regular crops, and have never had blight; these are French seedlings, and have been neither fertilized nor cultivated.

Almost any pear-tree will grow rapidly in soil poor enough to starve an apple-tree to death. Their roots penetrate the earth deeper than any other fruit-tree, which shows plainly it reaches some element not abundant near the surface. And I claim that when a tree is heavily fertilized with nitrogenous manure the growth is forced unnaturally, and will cause too abundant a flow of sap to the buds or blossoms, or any part of its new growth, and that the super-abundant supply of sap becomes favorable to the propagation of the blight bacteria, which is one of the agents of fermentation, plainly distinguished by the odor. I think the blight bacteria can and does live in the air, especially when moist and warm. Natural warm air is always moist, and contains more water than cold air, and moist, warm weather is very well known to be very favorable to the spreading of blight, in my opinion, from two causes, viz.: First, by causing abundant sap in the tree; second, by being favorable to the blight-germ.

There are hosts of different kinds of disease-germs in

the air we breathe, and in the water we drink, but they do not produce sickness unless some parts of our bodies are favorable for their lodgment, when they will propagate and cause sickness. Now, the air always contains water, and what we call pure water also contains air. A pear-tree, body and branch, contains both water and air. The air in the sap, or water of the tree, contains nearly 35 percent of oxygen which passes from the earth through the body, branch and leaves; also the air, not in the water of the sap, which contains only 20 percent of oxygen, which is inhaled by the leaves. Now, if the blight-bacteria live in the moist, warm air, and the tree itself contains air, the air contains water, and so does every live tree, what is to hinder it from entering any part of its new growth and propagating if the sap is favorable to its propagation? I believe there is a limit to the amount of sap any tree can carry, and when there is a super-abundance of sap, or an element of that sap, it becomes subject to the agents of fermentation, of which the blight-bacteria are members. Some varieties are either able to utilize more sap, and form into wood or fruit-growth, or are more careful in the selection from the elements of the earth, therefore more proof against the germ. Rapid growers are not always the most subject to blight, but any variety will blight if abundantly stimulated.

From what experience I have had, and from what investigations I have made, I am led to believe that although the blight-bacteria will live in the nectar of the blossoms, they will not bud and propagate there unless in rainy or moist weather, which would tend to prevent the bees from utilizing the nectar, or rains or heavy dews which would dilute the nectar, thereby rendering it subject to fermentation, and therefore the bees would be, to a certain extent, a means of prevention of blight by keeping the nectar from becoming soured or stale. It is a well-known fact that seasons that are dry, and the bees working on blossoms every day, are just the seasons when blight spreads very little; and seasons of rainy weather, when bees are hindered from working on blossoms, are the seasons when blight often does the most damage.

That bees are agents in destroying the means of their own existence is contrary to the laws of Nature, which are God's laws, and always correct.

In conclusion let me say, do not understand me to mean that a pear-tree must be starved to be healthy, but that it must not be stimulated. Analysis of the pear-fruit shows that generally it contains about one-third less nitrogen than the apple, and more than twice the amount of potash, three times the amount of lime, and nearly twice the amount of phosphoric acid and sulphuric acid. Therefore, feed the tree the elements it uses when it bears heavily. All these elements are present in the soil, but the element used is what should be replaced. Abundance of nitrogen causes rank wood-growth. Phosphorous is a mineral, very essential to pear-trees. Potash is the backbone of all fruit-manures. The last two are abundant in wood ashes. Potash gives color and flavor to fruit, and makes trees productive. Nitrogen retards production.

Knox Co., Ill.

## Suggestions to Writers—Queen-Rearing.

BY ARTHUR C. MILLER.

ON page 55 is the conclusion of an article by Mr. Adrian Getaz, which has appealed to me in several ways. It is quite evident that some of the criticisms to which he has been subjected have hurt, and lest it should cause him more or less to cease his writing, I want to begin this article with a word of cheer to him, and to all others who are sincerely and *unselfishly* trying to advance the science of bee-culture to the end that it may become both a more pleasant pastime and a more profitable business.

He complains of being accused of dogmatism. Well, that is a trifle. There are two classes of persons prone to use that accusation against an author—those who are envious, and those who are prejudiced, and neither are worth considering. But the assertive, dogmatic style, while not conducive to popularity, serves a very useful purpose—it arouses *opposition*. This, when aroused in the mind of another enthusiast, is conducive to new investigations, deeper research, and live discussion. Ofttimes the dogmatic form is the only one that will arouse some persons, but, once aroused, their work and their writings are well worth all the censure, criticism and pain it took to get them.

Again, he complains of being taken to task for not

embracing in a single article everything relating to a topic. Some people want a free text-book with every issue of the paper.

Yet, again, he writes of being tasked with not being up-to-date on biological matters. A recent remark of a biologist may console him and some of the rest of us: "The only way to be up-to-date in biology is to live in the 'to-morrow.'" Theories are like a clothes-horse—while the latter are to hang clothes on, the former are to hang experiments on. If they will support the experiments they are good, and we call them "laws;" if not, we cast them aside and make new ones.

Further along, Mr. Getaz remarks on some details of queen-rearing, and names "three imperious conditions." I think that if he will consider the following, and will carefully experiment thereon, he will revise those conditions:

The first and greatest essential—the one without which all else is useless—is a nurse-force of *young bees*. Furthermore the presence of old bees is a detriment. Size of nurse-force is a relative quantity.

The second essential is, eggs, or larvæ under three days from the egg.

And, third, the presence of *pollen*, and honey or syrup readily accessible to the nurses.

To explain: Young bees do all the nursing. Old bees, when present with them, sometimes help themselves to "pap" which should go to the development of larvæ. This is particularly so in inclement weather.

Size of nurse-force should be governed by three things—season of year, number of cells to be "grown," and hive-chamber, its shape and size. A nurse-force of a given size can care for more cells if they are grouped in the center of a chamber which the nurses nearly fill, than if strung out in a long row in a chamber which the nurses can only partly fill.

The second condition is well understood and acknowledged.

The third is all too often forgotten, at least the pollen part. To obviate any chance of scrimping of larval food, it is essential that pollen should be present in the queen-rearing colony; and whether honey is present or not, or whether or not nectar is being gathered, more uniform results are secured and danger is removed by keeping a supply of *syrup* in a feeder always accessible to the bees.

To prove the correctness of the foregoing, take a pint of young bees—those just preceding the age of field-work and younger; give them eggs or larvæ for two to four queens and the other conditions as stated, and fine queens will result. Also take a peck, more or less, of old bees—field-bees; give them any number of eggs or larvæ you choose, and all the other conditions, and not once in a thousand will the resulting queens be worth the bother of killing.

Providence Co., R. I.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Fastening Foundation in Sections.

Mr. Erdman, on page 108, tells how he controls the heat from the lamp while fastening foundation in sections with the Daisy fastener. I use the Daisy fastener, but have never had any trouble in controlling the heat, by turning the flame of the lamp up when I wanted it warmer, or down when I wanted it cooler.

Have any of the sisters had any of the trouble mentioned?

### Bees Short of Stores—Feeding,

On account of sickness and lack of help I failed to prepare my bees for winter. Before I could attend to them some colonies died for want of food. I fed them the best granulated sugar, two parts sugar to one of water. I fed them in a glass fruit-jar with cloth tied over the top and inverted. They will carry down two quarts during the night; some I have fed six quarts. I am sick with la grippe, and unable to attend to them. I forgot to say that the last

two times I fed them my daughter was sick, and the sugar was made into a good syrup, but not near the boiling point. Some that was left was all crystallized, and I am afraid it is that way in the hives. If so, is there danger of the bees starving? I know there is plenty in there if they can use it. Please let me know whether they are safe, or if there is anything I can have done, as I think of them all the night long. Cass Co., Mo., Feb. 3. LUCY M. WAGNER.

You say that your syrup crystallized, and you evidently fear that the trouble came from not boiling the syrup.

It is not at all likely that boiling syrup makes any difference. It would crystallize just as quick after boiling as before. The sugar is already cooked as thoroughly as it can be, all it needs is to be dissolved. All the boiling does to the sugar is to dissolve it. Cold water will do that, too.

The right thing to do is to feed early, and feed thin. That will give the bees a chance to evaporate and make the chemical changes necessary to prevent granulation.

If you use a Miller feeder you can put in the syrup, or you can put in the dry sugar, anywhere from one to 15 pounds. Then make a depression in the center and add a very little water at first. After that has soaked slowly through the sugar, so that the first that goes into the feeder will be sweet, you can add as much water as you want to—you need not bother to measure it. Of course, the amount of water used must be governed somewhat by the amount of sugar used. If you use only one pound of sugar, you would hardly fill the feeder full of water, but if 15 pounds is used you can put in as much water as will go in. When the bees have taken it up, put in more water, and so on until all the sugar is used up. This is an easy and nice way to feed.

A crock-and-plate feeder can be used also with sugar and water. But remember you can not feed thin feed late in the season, because too-thin feed is unwholesome for winter stores.

When late feeding must be done, use five parts sugar to two of water, and add one even teaspoonful of tartaric acid to 20 of sugar to prevent granulation. It is better to use the feed hot, for the reason that the bees will take it down faster.

If you have extracted honey you can make Scholz candy and feed them candy in place of syrup. In winter this will be very much better.

What you want to know is, What to do about it now. It is not likely that your syrup crystallized so badly but that your bees can at least use part of it. The first warm day it may be well to examine and see how the matter stands. Then supply what is lacking by giving them Scholz candy, or, as you are so far South, and it is getting so late in the season that it is likely your bees will have a flight every two or three days, you can give them thin syrup.

### A New Stove-Blackening.

Instead of blackening the kitchen stove, to smut utensils, hands, and flat-irons, dissolve beeswax and gasoline and rub it over the stove when cold. The result is a very good imitation of blackening, and there is neither dust nor smut.—National Stockman and Farmer.

### POROUS COVERING FOR HIVES.

Mr. Holtermann's style of putting the argument in favor of porous covering in outdoor wintering will sound unusual to some. May be all right just the same.

"If the change of air has to be accomplished by the entrance alone, the bees must exert themselves to create a draft, and this is not good."

Is it common, even when air inside gets pretty bad, for bees to fan in winter? I'm not positive, but incline to say it is not. Of course, they do not fan except when the cluster is broken up, at least to some extent—but perchance few of us know exactly how often that takes place. Page 54.

### A COMB FOUNDATION SEPARATOR.

A foundation separator—to hold up part of the weight of the bees, and to make it impossible for them to elongate the adjacent cells. This is not for sections but for full depth combs. Defends their full space, and keeps them from being built with protuberances and hollows. This appears to be a good thing. Morley Pettit, page 54.

### DIFFERENT BREEDS AND QUALITIES.

Mr. Getaz will probably admit that different breeds of cows give milk of different qualities and decidedly different richness; but I see he rigidly bars off anything of the kind in different breeds of nurse bees.

May be  
If Mr. G. he  
Was a ba-bee  
He would more light see—

and cry for some of that Jersey Food instead of that old thin stuff. Page 55.

### FRAME OF BROOD AND SHAKEN BEES.

J. T. Hairston reads his experience that a frame of brood does harm in a shaken swarm, and that they stay better without it. Rather strange—but genuine experience among bees will now and then be strange. As to their starting queen cells on it the first thing, I rather guess that's something more than merely local and exceptional. Frame can be taken out again after being in a week and serving its purpose to prevent absconding. Page 55.

### NON-LEAKING SHIPPING CASES.

Queer that so obvious a device to prevent cases from leaking was not more talked of and used long ago. (Paraffin or wax melted and run around the corners.) With either plan in universal use the wholesale man would find some cases leaking. Which plan on the whole would conduce to the least leaking? On the one hand there's the didn't-see-'em cracks and holes, and the springing loose due to being mercilessly banged on the road, or due to poor nailing. On the other hand, there's the blunderer who spoils the tray in the first instance, and the examination blunderer, who takes out a section to look at and tears down the paper wall as he rams it recklessly back. But on the whole, I guess the paper trays have it. Among other merits they keep the wood from soaking until it looks badly, so the cases are nicer to use a second time. Pages 59 and 52.

### DR. LAMBOTTE'S IDEAS ABOUT FOUL BROOD.

"Powerful weak"—is Dr. Lambotte's attempt to upset the established ideas about foul brood. Providing, that is, that Adrian Getaz, on page 62, gives us a fair idea of the argument. If the field was entirely clear, and nobody knew a thing about the cause of foul brood, he ought to make a more conclusive case for his explanation and bug before inviting the whole world to adopt his views.

### HONEY ON Tired EYELIDS.

How does that honey on the eyelids operate to rest the tired eye inside? Want to know, you know. If the parts surrounding the ball are fevered (quite likely they are in such a case) I can imagine that closing the pores of the skin might check the local fever, and that when the local fever was checked the eye would get well faster. When I was a boy and hands got desperately sore and cracked up in the autumn winds, plenty of honey rubbed on and stockings drawn over to keep from daubing the sheets would take the fever all out between bedtime and morning, and give the cracks a nice start toward healing. Page 67.

The Premiums offered this week are well worth working for. Look at them.

## The Afterthought.

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### OSMOSIS, UMBILICAL CORD, ETC.

And Osmosis wishes to exterminate the Umbilical Cord. First we know the Umbilical Cord will sail in to exterminate Osmosis; and, dreadful to see, they may Kilkenny-cat each other. Well, if Atavism sitting on the fence is left to us we'll manage to get along. Page 45.

### FEEDING IN THE OPEN AIR.

The inverted can, resting on a square of thick cloth—and lots and lots of them—for feeding the whole apiary in the open air. Very simple; and yet it has not often been suggested before—if at all. A. F. Foote, page 45, finds it to work well. Chances to fail with it though, I surmise.

## Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

### Tartaric Acid in Syrup—A Correction.

On page 89, the statement is made that to prevent granulation of syrup an even teaspoonful of tartaric acid should be used for each 30 pounds of sugar. I don't know whether the fault was mine or the printer's, but that 30 should be 20. It is possible that the smaller quantity would do in some if not most cases, but the teaspoonful for every 20 pounds is surer. The better plan, however, is to feed so early and so thin that no acid is needed. C. C. MILLER.

### Recipe for Making "Good" Gandy.

Please give the recipe in full for making the "Good" candy for bees to winter on. I have extracted honey and sugar.

Answer as soon as possible. I have no text-book and cannot find any recipe. ONTARIO.

ANSWER.—Heat the extracted honey, being *very* sure not to burn it, and stir it into the sugar till it seems quick thick, and take it from the fire. Then pretend you're kneading bread dough, with sugar instead of flour. Have the dry sugar on your bake-board, put the sugar-dough on it, and knead all the sugar into it you can. Let it stand a day or two, and then knead some more sugar into it until it is quite stiff, unless it is already quite stiff. That's all there is of making the Scholz or Good candy.

You probably have little idea how much a text-book on bees would be worth to you.

### Taking Bees Out—Best Extracting-Frames—Chunk Honey—Best Bees.

1. I have 14 colonies of bees in a cellar that I made in a bank. It is 6 feet square by 5 feet high, and an A-shape roof with an air-pipe in the center of the roof. I put the bees about a foot from the ground. The cellar is very dry. The bees seem quiet so far. What time do you think will be the best, in this climate, to take the bees out in the spring?

2. Will pure honey sour before candying, or afterward?

3. Which is the better frame for extracting, the shallow, or regular Langstroth frame?

4. Which is the most profitable to produce, chunk honey or extracted?

5. What strain of Italian bees do you consider the best? And to what kind of bees do you give the preference?

IDAHO.

ANSWER.—1. I don't know enough about the climate in Idaho to say. A good time is about the time red or soft maple is in bloom; but you may not have any trees of that kind in your neighborhood. When they can fly out frequently, say every three or four days, you will be safe to take them out.

2. Yes, it may if it is thin enough, or is in a place where it becomes thin enough.

3. A shallow frame is considered preferable, but many use the regular Langstroth frame so as to have only one kind of frame.

4. That depends largely upon your market. If there is a good market for chunk honey at a fair price, that is best; otherwise not.

5. Those that give the best results in storing, no matter what kind or color. The leather-colored Italians are perhaps as hopeful as any; but leather-colored Italians are by no means all alike.

### Full Drawn Combs vs. Starters—Dummies.

1. I have been reading that full drawn combs are not the right thing to use, but to use starters. What would be the

best thing to do with old combs that are in hives where the bees had died? Could not the cells be shaved off and just the base or foundation be left, and then let the bees have them just as you would foundation?

2. What are dummies made of, and how are they made?

I will give my experience with a swarm inside of a house. Last July (5) I went over to Perry to visit a friend of mine, and he had a swarm in the side of his house which had been in there for eight years. They had gone in at the corner of an upstairs window, and they had built combs up and down, and between one of the studdings of the outside of the house, and had then gone in between the upstairs floor and ceiling of one of the lower rooms. There were combs that were 10 feet long. I secured 100 pounds of white honey that was free from pollen and young larvae. The queen was the largest I ever saw, she was a third larger than any in my apiary at home, cells that were like large peanuts. They were crossbred bees I ever worked with, being a gray color. I took them out and put them in a new hive, and they stored enough to keep them this winter. I will report more about this swarm of bees the coming summer. IOWA.

ANSWERS.—1. Most bee-keepers would count old combs out of which bees had died as valuable stock, and would give them to bees to use over again. Better find out whether starters are better for *you* than are full combs before you decide to prefer the starters.

2. A dummy is made of wood, pine being the best wood for it. Make a board with a top-bar to it so that the whole thing shall be much the same as a frame filled out solid with wood. It may be an inch thick, but  $\frac{3}{4}$  inch in thickness will answer as well or better, depending upon where you mean to use it.

### Bee-Sting Remedies.

Some bee-keepers may congratulate themselves for receiving slight pain when stung by a honey-bee, while others have to bear intense pain, as was my case last summer. In having a swarm I had the misfortune to receive a sting on the left ear. After a short time, about five minutes, I began to itch intensely, then my entire body broke out as though I were stung all over by the bees. What is a good preventive for a sting? I used spirits of ammonia, but to no effect.

ILLINOIS.

ANSWER.—In the case mentioned, the best preventive would have been a bee-veil. If you mean the best remedy, there is none. Perhaps it might be better to say there are hundreds of them, for nearly every one will tell you of this or that remedy that has proved best. Possibly nothing is better than a local application of common mud or wet clay, of course, getting out the sting the first thing. When the whole body is affected in the way you mention some have found relief by a pack in a wet sheet. If you have not had many stings it is quite possible that after receiving a few more the system will become so habituated to it that there will not be any very bad results from a sting. In some cases, however, the results continue to be so bad that it is advisable to give up trying to work with bees.

### Questions on Management.

1. Can I make a weak colony strong in the spring by taking a frame of hatching brood and adhering bees from a strong colony and adding it to the weak one?

2. Can old comb be wired? If not, can I use it in the extractor?

3. If bees are shaken on starters only, as suggested by many bee-men, would they not build too much drone-comb in the brood-nest?

4. If I can increase by taking a frame of brood, having a ripe queen-cell, from a strong colony in the spring, and put this in nucleus, should an empty comb take its place in the old hive?

5. A sheet of foundation is put in a hive between two combs; now, the bees will, in most cases, bulge the combs on either side of this sheet of foundation, instead of drawing it out. What is the remedy? KENTUCKY.

ANSWERS.—1. It will make it stronger—probably about 5,000 bees stronger, if it is a pretty full frame—but it depends upon how weak the colony is whether that will make it a strong one. As a general rule one frame of brood would not make a weak colony strong. But look out that you do not do more harm than good by taking brood from a strong

colony to give to a weak one. The frame of brood will do more good in a strong colony than in a weak one, unless the strong one be very strong.

2. You cannot wire them, but you can use them in the extractor without wiring. Thousands of combs were used in extractors before wiring was known.

2. There is much danger of it. Some practice giving four or five frames with starters, and when these are about filled giving the balance of the frames filled full of foundation.

4. One frame of brood will do if you have bees enough with it. If you mean to take only the bees adhering to the one frame of brood, that would be a rather weak nucleus. Two frames of brood with adhering bees would be a good deal better.

5. If you put a sheet of foundation right in the middle of the brood-nest, with brood each side of it, there will be no bulging where the brood is, and perhaps none at the upper part if the honey is sealed there. If there is unsealed honey in the upper part, there is likely to be bulging there, and you can remedy the matter by slicing off the bulged part. You can also keep the frames of foundation at one side of the hive.

**Italianizing—Shaken Swarms—Stimulative Feeding—Transferring.**

1. What time next season would it be best to Italianize my bees, to secure the most honey and pay me all around? They are blacks, and rather poor workers (in 8-frame hives).

2. In practicing shaken swarms, should the super be put on at once, or wait until the brood-chamber is nearly filled? In shaking bees off combs would the queen be injured? And would the remaining bees (say one-sixth) in the old hive, with brood, rear a good queen? Would you use starters or full sheets of foundation in this plan?

3. Would it pay to practice stimulating feeding next spring? When should I commence in this locality (Southern Iowa), and how much a day should I feed? This locality is poor for spring bloom, and bees are rather light.

4. I have some bees in a box-hive to transfer. Would you transfer in fruit-bloom or wait until about swarming-time, and use the forced-swarm method? IOWA.

ANSWERS.—1. A little difficult to say. So far as concerns getting in better stock, the sooner the change is made the better; but then the change is in danger of interfering somewhat with the progress of the colony. Besides it is easier to get good queens later, so it may be well not to make the change till the harvest is well under way.

2. Supers may be put on at once if an excluder is used; otherwise wait two or three days till the queen has a fair start at laying below. The queen is not likely to be injured by being shaken off the combs. I would not expect the very best queens reared in the hive with only a few bees, and a good deal of time would be lost if the start was made with a young larva. Full sheets of foundations may be given, or else four or five frames given with starters, and when these are filled give the balance with full sheets.

3. Unless you have a good deal of experience, you may do more harm than good with stimulative feeding, but if you want to try it better try it with part of your colonies and see how they compare with the others. Do not begin till bees fly every day, and then feed a pound or so every other evening.

4. Very likely it will be better to wait till swarming.

**Moving an Apiary a Short Distance.**

I have two small apiaries located about forty rods apart. One apiary contains eight colonies. I moved them in a row, placing them about four inches apart, and packed them with

chaff on all sides, excepting the front, which is south, and placed a board before the entrance of each hive. They seem to be doing well at this date.

The other apiary contains twenty-one colonies, and is packed in the same manner. In the spring I wish to move them to a new location, together, about midway between their present locations. What precautions should be taken in moving them, and when should it be done? OHIO.

ANSWER.—If it were not for the packing you could move them any time now. But it is better not to disturb the packing until later, so you might postpone the moving until time for spring flight. If you could move them just before their first flight it would be well. When a day comes with the temperature at 45 degrees or higher in the morning, and rising all the time, with a bright sun and not windy, you may be pretty sure of a good flight-day, and then will be a good time to move them. Shut the bees in the hives, handle the hives roughly in moving them, and when it gets warm enough for them to fly freely—say 50 degrees or more—pound on the hives well, and then open them. First, however, it will be a good plan to make everything on the old locations look as different as possible, so that they shall not look like home to the bees. It would be no harm also to put boards in front of the hive entrances.

**Forced Swarming.**

I wrote to you about one year ago asking advice concerning a colony of bees that I had which I feared had foul brood. I want to report now that I found later that the disease was foul brood, and I found four other colonies with the disease, all of which I treated on the McEvoy plan in June, with entire success, at least I have not seen any symptoms of it since. I examined them carefully several times, and made a special examination when I fixed them for winter in October, and I believe they are cured.

Now, Doctor, I want to adopt the forced-swarm plan the coming summer; I do not want to increase. I have read what has been written lately in the bee-papers on this subject, and yet, when I think of doing the work on the plans suggested, there are a few questions that arise in my mind.

1. To have no increase I must make three drives, the second one in 21 days. Will the second and third drive be accepted by the new colony without quarreling? And if not, how shall I proceed to make them behave peaceably?

2. May there not be a new queen in the old hive, and laying some time before the third drive, or should I cut out the cells? OHIO.

ANSWERS.—1. The business is expected to be done at a time when bees are gathering and not at all inclined to be quarrelsome, so no precautions need be taken.

2. When you make a shaken swarm you are expected to shake the combs, and to shake them hard. That will destroy all advanced cells, at least all sealed cells, at the first drive. The same thing will occur at the second drive, leaving no chance for a laying queen at the third drive. If a virgin queen should be present, she can be left to the tender mercies of the bees.

Allow me to add that there is no law compelling you to make a third drive, and, between you and me, I don't believe I'd make any drive after the first. You can shake and brush off all the bees at the first drive, and then you're done with it so far as that colony is concerned. Then you can pile up the beeless brood on some weak colony, piling it up till you have four, five, or six stories of brood, an excluder preventing the queen from laying in the upper stories. Then when the brood has hatched out, you can take away the combs, or leave them to be filled with honey. If you are so unfortunate (?) as to have no weak colony, you could use a strong one.

it that you can't rear a queen from an egg taken from a worker cell that will have a colony that large at this time of the year.

In reply to "The Charge of Dr. Gallup," a bit of poetry on page 44—I wish to say that I do not condemn queen-saving or queen-selling, but I do say, and say it from experience, that I honestly believe that the only queens that are really of any value are those reared from eggs that the queen deposited in cell-cups, and that any queen reared from worker-eggs is worthless. Furthermore, if any queen-breeder wants to rear good, long-lived queens, just bring about the condition in a hive where the bees will start plenty of cells, and the queen will lay in them and save all the cells, and send out those queens to your customers and let me hear about it and I will probably want some myself, but I won't have them shipped with a few bees by mail, but with at least two Hoffman frames and bees by express.

In the last verse of said poetry above referred to, "big guns" are mentioned. Don't you know big guns are out of date, especially those black powder, smoky kind? We use only high-pressure smokeless powder and quick-firing guns on this coast.

you understand). To-day, Jan. 27, has been the warmest recorded, being 78 degrees in the shade. For the past week the bees have been out sunning themselves and incidentally getting into all kinds of mischief. There is little for them to gather at this time of the year, and nothing but a small boy can get into more mischief than an apiary of idle bees.

To-day I made a formal call on all of them. By the Carniolans I was received peaceably; by the Holy Lands with indifference, and by the Cyprians with many objections. However, all had sufficient stores, and were soon left to their own sweet will. A colony of pure blacks, which I captured in the woods last fall, and which are not yet thoroughly tamed, boiled out of the hive in confusion when the latter was opened, and the whole colony tried to get away, but ultimately returned, as good bees should. Have you ever noticed that you can domesticate a colony of "wild" bees by careful handling for a few weeks or months, so that they will not boil over and persist in getting where you don't want them?

And with all our blessings, we now have a honey flow! Not a large one, 'tis true, but nevertheless the bees are daily gathering pollen and a little nectar from both the Japan quince and from mignonette, both of which are cultivated upon the college campus. And, by the way, that Japanese quince acts very much as if it would be valuable if cultivated for honey—not for a surplus crop, but for spring building—as it is perhaps the earliest bloomer of all native plants in central or eastern Texas.

We expect our honey flow to commence about March 1. Abundant rains have blessed all parts of Texas, and is an almost infallible indication of a good honey crop the spring following. Unless

# ORCHARD STARTING

would be the race this spring if people could see our nurseries. Of apple trees  $\frac{3}{4}$  to six feet high, the showing is seldom approached, certainly nowhere this year. Every one guaranteed on white roots, full of vigor and strength. No sign of disease.

very unfavorable weather prevails during the honey season—as so many showers as to wash the nectar from the blooms—Texas will probably produce the coming spring one of the largest honey crops on record.

So, while you pass the "long winter evenings" (which to us are unknown), reflect that there is one place in the United States where the bees need no cellar, and the bee-keeper cares not one whit about the price of coal.

WILSON NEWELL.  
 Brazos Co., Tex., Jan. 37.

**An Old Subscriber.**

MR. EDITOR: Some weeks since I saw a communication in the AMERICAN BEE JOURNAL from one of your subscribers stating how long since he commenced taking the "Old Reliable." Well, I imagine that I rank among the oldest of your patrons, having been a regular subscriber to the first eight volumes (which I had bound in calf and still possess); also at irregular intervals ever since when I was at home and not engaged in business which prevented me from giving proper attention to my bees. I have never since 1872 kept more than ten colonies (generally less); just enough to supply my children and grandchildren with a little "sweet-tooth-filler" semi-occasionally. It is with unalloyed pleasure that frequently I take down those old volumes and re-read the articles by the fathers in (American) apiculture—Alley, Doolittle, Gallup, Grimes (deceased), A. I. Root, and a host of others whom my failing memory cannot recall.

I remember one subject of discussion which I have not seen mentioned for years, and which I fancy most of the modern bee-keepers take but little interest in, "parthenogenesis." However, I am intimately with some "tots" (embody bee-keepers, possibly) who exhibit considerable familiarity with the Greek polysyllable, because, whenever they visit their grandire, he organizes a spelling-class of eight members, to each of whom that succeeds in spelling "parthenogenesis" correctly he gives the choice of a bright new dime (a supply of which he keeps on hand for the purpose) or a section of honey.

Now lest some one of the younger generation should say "Will that raggular old fellow ever cease his chatter?" I will simply say I am, Your most obedient,  
 KOMPOPHAKELLEREMON.

**Carniolan-Italian Bees.**

Some time ago I saw a request in the AMERICAN BEE JOURNAL for information about the Carniolan-Italian bees. In reply to that request and for the benefit of those who may desire to know something more of them I will say that I am now using those bees largely. That is to say, I have over 150 colonies and have had two years' experience with them. For me they are greatly superior to the

**IT IS A FACT**

That our line of Bee-Keepers' Supplies are some of the best goods in the world and that our system of dealing with our trade is not excelled by anybody. Plenty of testimony from satisfied customers proves these things. Write and get our suggestions, our catalog and our discounts for winter-time orders—ALL FREE.

**IOWA ROUND INCUBATOR**

R. C. Haereminsten, Norwood, Minn., got 425 chicks from 380 eggs. He followed directions, the machine did the work, because it was built on right principles and by good workmen. The IOWA has fiber-board case, does not absorb heat, warm or crack. Regulation and ventilation perfect. Our free book gives more details and full particulars. Everything about incubation free.

**IOWA INCUBATOR COMPANY, BOX 158, DES MOINES, IOWA**

**GREAT CROPS OF STRAWBERRIES**

And How to Grow Them.

The best book on strawberry growing ever written. It tells how to grow the biggest crops of big berries ever produced. The book is a treatise on Plant Physiology, and explains how to make plants bear Big Berries and Lots of Them. The only thoroughly scientifically-grown Strawberry Plants to be had for spring planting. One of them is worth a dozen common scrub plants. They grow BIG RED BERRIES. The book is sent free to all readers of the American Bee Journal. Send your address to

**That Harrison Apple-Tree Sale.**—An opportunity for starting an orchard or planting even a few select trees is now afforded fruit-growers which does not recur every spring. Our great nurseries of Harrison & Sons, of Berlin, Md., have been for several seasons making a specialty of root-grafting, and growing of apples with intent to make wide sales in the spring of 1903, and by supplying a superior article in trees secure a vast spread of their trade in a single season. The object sought was to be obtained by grafting the best varieties of apples in advance in price. From information we have through other sources than the proprietors, a view of the Harrison nurseries right now is a sight to gladden the eye. There are multiplied thousands of trees which, as was the design of the Company, are in the pink of condition for spring planting. Trees coming from this source are always in good health and the grafts are especially clean, smooth and vigorous. Everyone is upon a whole root-graft and the rooting is strong. It was a part of the plan to have every variety worthy of attention come in at the same time. Accordingly, over 100 varieties, Summer, Fall and Winter apples are ready to meet the requirements of growers. The trees are classed for sale and shipping purposes as 3 1/2 to 5 ft., 4 to 6 ft., and 5 to 6 ft. As special care has been taken in the production of stock, so it is to be exercised as well in the packing to insure that every order shall reach the purchaser in the pink of condition. The Harrison people are guaranteeing absolutely safe delivery of this stock anywhere in the United States. If you plant even a few trees arrives in poor condition is to be replaced. A special apple-tree list showing varieties, sizes, etc., has been prepared to send to inquirers about this stock even if you plant even a few this spring, don't fail to write for it. Please mention the American Bee Journal when writing.

Please mention Bee Journal when writing advertisers.

Italian and they far excel the Italian in every good trait save one—they do not stick to their combs as well. They are better comb-builders, and that means superior honey-gatherers. They are more healthy and winter to perfection under varying circumstances. They breed up quickly, and always stand ready for a honey-flow, short or long. As is characteristic of both races, they are heavy and readily go over three miles from choice. I have had many opportunities to observe this fact, as there are none of these bees kept in this country except my own. I have found them at that distance by the thousands, and at a time when there was no scarcity of nectar, either.

They are superior for section honey, for the reason that they build the comb to the wood better and cap it smooth and white. They also build much faster, and are always stronger in bees than the Italians. The swarming propensity alone prevents them from becoming popular, though with me they have never given any trouble in that way. I am confident that the expert will find a way to work them; I have my own peculiar system and always produce great results with little or no swarming.

They mostly have the markings of Italians, though finer, and alternating with the white, silvery bands of the pure Carniolans. They are large and very gentle. The queens are dark, rather coarse, larger as a rule than Italians. Candidly, I believe them the best of bees for honey in existence. After having used them for two years I am more than pleased and have decided to work with my Italians. The latter have not the strong nursing power needed in this locality and linger along all spring before getting sufficient strength to do any gathering. The Carniolan-Italians, on the contrary, are storing when the Italians are only beginning to breed fairly. In the northern climate it may be different, I know that a much smaller force is needed there than with us. J. E. CHAMBERS.

**CONVENTION NOTICES.**

New York.—The annual meeting of the Oswego County Bee-keepers' Association will be held at Fulton, N. Y., Saturday, March 7, 1903. Prof. Frank Benton will be present and address the meeting. An interesting program is being prepared, and all persons interested in bees are cordially invited to be present.

NORTIMER STEVENS, Pres.  
CHAS. B. ALLEN, Sec.

Ontario.—There will be a meeting of the beekeepers of several counties, and any others, in the Court House at Brantford, Ont., Canada, March 2 and 4, beginning at 7 p.m., March 3. The question of the present food-brood and practical discussion as to the management of bees will take place. The Dominion and Provincial Governments, it is expected, will be represented and from present interest a large turnout, even some from distant counties, likely. All welcome. R. F. HOLTERRMANN.

New York.—A series of Bee-keepers' Institutes will be held in the State of New York as follows: Canadaga, March 2; Cortland, March 4; Auburn, March 5; Cortland, March 6; Fulton, March 7; Syracuse, March 9 and 10; and Amsterdam March 11.

Prof. Frank Benton, Apicultural Investigator, furnished by the United States Department of Agriculture at the expense of the Bureau of Institutes of the State Department of Agriculture, will address the meetings.

The New York State Association of Beekeepers' Society will hold its annual meeting at Syracuse, March 10, at 10 o'clock a.m., in the City Hall. Prof. Benton and other prominent bee men have informed us of their intention to attend this meeting, and a profitably interesting session is in store for those who attend. Special rates have been secured for entertainment at the Manhattan Hotel, Fayette St., at \$1.25 per day. C. B. HOWARD, Sec.

Growing Strawberries. — "Great Crops of Strawberries and How to Grow Them," is a booklet, the advertisement of which has been running in the Bee Journal for some time. It is not a mere catalog but a concise treatise on Plant Physiology, and explains the best methods of developing the fruit-producing organism in the plants so that under the cultural methods prescribed, they double up on the crop of berries both in quality and quantity. It surely does explain how the fruit-producing parts of the plant exist, and how they can be developed, and gives the best modern methods of tillage. Fruit-growers greatly appreciate this work. It gives them a new light and enthusiasm in the work, and is surely working a revolution in strawberry-growing. — You can get a copy of this booklet by addressing R. M. Kellogg, Three Rivers, Mich., and at the same time mentioning the American Bee Journal. You will be delighted with it. Better write for it now.

**HONEY AND BEESWAX**  
MARKET QUOTATIONS.

CHICAGO, Feb. 7.—The market is in rather an unsettled state. The offerings of late have been numerous, and there is a tendency toward lower prices, owing to the supply being much larger than expected at this season of the year. The fancy grades of white will sell at 15¢/lb per pound, but anything below this grade is difficult to place at anything above 10¢/lb. Extracted honey is also easy, and the best grades of white obtainable at 8¢/lb, and amateurs at 6¢/lb. Beeswax steady at 30¢ upon arrival.

R. A. BURNETT & Co.

ALBANY, N. Y., Feb. 14.—Honey market is bare of stock here and white selling at 15¢; mixed, 14¢/lb; dark, 13¢/lb. Extracted wanted at 14¢/lb; or white, 1 1/2¢ for bulk water; dark; buckwheat most in demand. Beeswax, 30¢.

H. R. WRIGHT.

KANSAS CITY, Jan. 31.—The demand for honey has been very light; receipts fair. We quote as follows: Extra fancy, per case, 24 sections 28¢; fancy, 26¢; white, 27¢; bulk water, \$3.00/\$3.25. Extracted, white, per pound, 7¢; amber, 6¢/lb. Beeswax, 30¢. C. C. CLEMONS & Co.

CINCINNATI, Feb. 7.—The demand for all kinds of honey has fallen off considerably in the last few weeks, owing to the many other sweets of this season, and this reaction, we think, is no inducement to increase the consumption, as the demand is not there, and will not be until about the end of the month; consequently it is folly to extract at lower prices. We quote: amber extracted in barrels at 5¢/lb; white clover and basswood, 8¢/lb. Fancy white comb honey, 16¢/lb; lower grades hard to sell at any price. Beeswax firm at 28¢.

THE FRED W. MUTH CO.

NEW YORK, Jan. 23.—Demand for comb honey quiet on all grades, and prices show a downward tendency. Supply quite sufficient to meet demand, if not more so. We quote fancy white at 15¢; No. 1, at 14¢; No. 2, at 13¢; dark and buckwheat, at from 11¢/lb.

Extracted also quiet with abundant supplies with the exception of white clover. We quote white, at 7¢; amber at 6¢, and dark at 6¢. Common in barrels from 60¢/5¢ per gallon. Beeswax firm at from 27¢/30¢.

HILDRETH & SORLEKEN.

CINCINNATI, Feb. 7.—The comb honey market continues to be draggy and hardly any demand and therefore prices are weak. Fancy white clover comb sells for 15¢/lb; for amber there is no demand. The market for extracted is fair and prices rule as follows: Amber, 5¢/lb; white, 6¢/lb; dark, 6¢/lb; white clover, a little more; alfalfa, 7¢; white clover, 8¢/lb. Beeswax, 29¢/30¢. C. H. W. WEBER.

SAN FRANCISCO, Jan. 14.—White comb honey, 1 1/2¢/lb; light amber, 10¢/lb; dark, 5¢/lb. Extracted, white, 6¢/lb; light amber, 5¢/lb; amber, 4¢/lb. Beeswax, good to choice, light, 28¢/27¢; strictly fancy light, 29¢/30¢.

The country merchant, representative of trade interests, estimates "entire stock of honey of 1902 in the State at 15 cars," worth 5¢/c per pound at primary points, subject to a 1 1/10 freight-rate to the East.

## The Test of Time

not only proves the increasing popularity of plain sections and fence separators, but the superiority of these supers for the production of comb honey over other styles.

The use of Root's Hives with plain sections and fence separator equipment mean—

**Larger Crop,  
More "Fancy" Grade,  
Less No. 1 and 2 Grades,  
Better Price,  
Satisfied Merchant,  
Enthusiastic Customers,  
Increased Sales,  
Greater Profit.**

And a ready market the coming season, which is one of the important factors in the building up of a home market for honey. It is one thing to dispose of a fair grade of honey at a moderate price, but quite another to retain the good-will of the merchant handling your honey. To secure his co-operation and stimulate the trade, great care should be exercised as to the attractiveness of the honey offered. It should not only be "Fancy" but the honey should be well capped and put up in neat shape. To obtain these results you should use Doveetailed hives and supers equipped with plain sections and fence separators. Insist on Root's make and you will not be disappointed.

## The A. I. Root Company, MEDINA, OHIO.

N. B.—If you are not posted as to where you can buy Root's goods advantageously write us. Ask also for catalog of Bee-Keepers' Supplies and specimen copy of Gleauings.

**Weekly Budget.**

EDITOR E. R. ROOT is the son of his father as a hobbyist, although he does not ride a hobby with the reckless abandon of the elder Root. On account of his health he has gone back to the beef diet, confining his eating entirely to lean meat with the accompaniment of a small piece of dry toast. Along with this he is somewhat enthusiastic over a set form of muscular exercise under the name of "Physical Culture." Whether as a beef-eater or a gymnastic contortionist, or both, the hearty hero is indulged in this quarter that our good friend of the sprightly and able Gleanings may speedily be as strong as ever—and more, too.

JOHN H. MARTIN, the well-known apicultural writer, died at the age of 63 years, of pneumonia, in the hospital at Havana, Cuba, Jan. 13, 1903. Mr. Martin was perhaps first known as a writer in the American Bee Journal over the nom de plume of "Scientific;" and for the past 15 years, as "Rambler," he has contributed regularly to Gleanings a series of illustrated articles of special merit. A kindly, humorous spirit seemed always bubbling to the surface in his writings, and in his many rambles he seemed to make friends

wherever he went. Indeed, in the most colorful plights, he always seemed to find a funny side.

Mr. Martin was a deacon of the Congregational Church, an earnest Christian, at one time president of the Christian Endeavor Society, and for many years superintendent of the Sunday-school. He left no family, his wife having died many years ago, leaving a shadow on his life that seemed never entirely lifted.

In closing a beautiful tribute to Mr. Martin's life, Editor Root had this to say:

Perhaps no single writer who ever wrote for Gleanings ever called forth more praise from our subscribers than the Rambler. His seriocomic writings, filled as they were with valuable hints, and the exact portrayal of every locality through which he traveled, made him not merely a funny man, but a dignified correspondent, who could and did give us much of value through his writings. While Gleanings mourns his loss it mourns it no more than every subscriber who has followed him through these years; and when the news was flashed back from Cuba that the Rambler was dead, I felt as if a near and dear friend had passed away; and I never met any one who had come in contact with the Rambler who did not hold him in exactly the same high esteem.

The leaders in bee-keeping are fast passing away. During the past few months a number of them have gone, among them being Chas. Dadant and Dr. Mason; and now the Rambler has been called. They will all be missed here by the thousands who enjoyed their personal acquaintance and writings.

**Dr. Miller's New Book**

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

**How to Get a Copy of Dr. Miller's "Forty Years Among the Bees."**

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

### Aid from the National Government.

—It is only the right thing that the general government should aid bee-keepers in the way of apicultural investigations to a much greater extent. There is at present some prospect of this. If you desire it, write at once to Hon. Redfield Proctor, United States Senate, Washington, D. C., and urge that in addition to the amount appropriated for the department of Entomology, an extra amount be appropriated for apicultural investigations. Mr. Proctor is Chairman of the Committee on Agriculture and Forestry.

**Snow and Sunshine** is often a bad combination in spring for bees wintering outdoors. Especially is this the case when the snow is very soft. The bright sun entices the bees out, and the dazzling snow seems in some way to affect them so that they drop into it, sinking deeper with each struggle, and soon become so chilled that they never rise again. The beginner is warned to combat the effects of one or both. If the bees are not in much need of a cleansing flight, the easiest thing to do is to place before the entrance of each hive a board to prevent the sun from shining into the hive, unless it is very early or late in the day. If it is thought best that the bees should fly, then the snow should be swept up for a considerable distance about the hives, or else something like hay should be used to cover the snow.

### Swarming Prevention Better than Control.

—Notwithstanding the great advantages of forced swarming over natural swarming, there can be no disputing the point raised by some that it is merely a matter of controlling swarming so as to have it come at the time when it suits the bee-keeper, leaving the entire prevention of swarming a desideratum. Among the many plans tried for prevention of swarming, that of Samuel Simmins attracted considerable attention at one time in this country, but for some reason not many made a success of it. The heart of the plan depended upon the fact, supposed or real, that so long as bees had room below the brood-nest, and were occupied building there, there could be no thought of swarming. Mr. Simmins believes that the reason for the failures in this country was that the plans recommended by him were not correctly carried out.

Room for building was to be given below

the brood-nest, and as often as a fair start was made there the combs were to be cut out and moved above. In order to reduce to a minimum the labor of management, the Simmins' Conqueror hive was devised. This consists of an outer case in which the supers, as also the brood-chamber, are received like so many drawers in a bureau, there being room for a super beneath the brood-chamber, so that this lower super can be taken out and moved above without at all disturbing the brood-chamber. While this may be the most convenient hive for the purpose, there is nothing, as Mr. Simmins has pointed out, to prevent trying the plan with other hives.

Regarding the plan, and its comparison with forced swarming, Mr. Simmins writes in a private letter:

"But, after all, why swarm at all when under "Prevention" as opposed to "Control" without increase? My "Conqueror" hive allows of starters *below* the colony when required; or, better still, when arranged for comb honey, the super of sections is started (with full sheets in sections) *under* the colony; this super is placed *above* the colony when the bees are crowding into it, and all being placed between the colony and the other super of sections already above. The one moved up is followed by another under, and so on in rotation.

"Thus, you are constantly getting the bees to continue comb-building below, and all the while deceiving them by carrying it above"—thus, by starting building below and finishing above, you take all the swarming fever out of them—you keep more powerful colonies, and secure higher results.

I may say that only the "Conqueror" hive-construction will allow this easy shifting of supers. The principle has been adopted in more or less perfect form (mostly imperfect) by all British hive-makers since my system has been developed.

I should indeed be glad to know that you also have made a success of it. The only thing is, will you get the hang of the *correct* construction and management? Many have not, hence failures. SAMUEL SIMMINS.

### Treatment of Foul Brood.

—Much has been said about foul brood and its treatment, and there are probably some who have read little or nothing of the kind, thinking that it is a subject that does not concern them, their bees being entirely healthy. It would be very much better to read all that is written on the subject, even if one never expects to see a case of foul brood. Then one would be free from needless anxiety upon the appearance of some trouble in no way connected with foul brood, and in case of an attack would be ready for prompt action.

At the Ontario convention, as reported in the Canadian Bee Journal, that eminently practical man, Inspector McEvoy, gave the following, all of which will be useful reading for beginners, and part of it may be new to some of the veterans:

For the treatment of it, the bees must be thoroughly cleansed of the old honey that they took from the old hive. There are times when you should shake them on to full sheets of foundation and make a cure, but it is too risky, for while you might cure nine-tenths of the bee-ward, if it worked out in the other one-tenth it would only go on and destroy all you had done.

If it is in the honey season, shake the bees down on little starters, taking all the comb out. Shake them into the empty hive and give them half an inch of comb foundation starters, and do the work in the evening. If the flow should stop or slacken through rains or unsuitable weather, apply the feeders at once and start a flow in that way, and they will draw out these little pieces of foundation. If you allow the little they brought from the old comb to be stored in the new, that will cause trouble; take away, therefore, the built-out starters and give them sheets of foundation, and when this foundation is worked out it is forever gone in every case; this will cure every colony it is found in.

It is one thing to cure the bees, but you may cure with a great loss, that is, you may destroy all the healthy brood, also. Leave about a quarter of the bees (after you shake them down) on one set of combs; take the combs from this, that and the other, enough to make five stories and leave it about 10 or 12 days, and most of the brood will hatch out; after about 10 days in the honey season shake them down and put them through this treatment again, and give them a queen or queen-cell. In going through the bee-yard put a cross upon those hives; if one is very bad put three crosses; if middling, two, and soon.

Don't do this work in the morning or middle of the day, because if you shake the bees out, and do it in the middle of the day, they will become restless, and some will swarm out and mix in with what you have already treated.

After the honey season is passed, and you find a few have it, even if it is only a few cells, don't think that it will ever cure itself, because as long as a comb lasts it will remain. Those few that are there let alone, but take the others that are sound and feed them with sugar syrup until you get a lot of nice sealed combs, feed them down till they will swarm out. In an evening in October go to the diseased colonies, lift the combs out, shake the bees back and give them five or six combs of these sealed stores. The honey they took out of the infected combs they have to keep, as they have no place to put it; the queen has stopped laying; the cold weather is coming on, and it will be digested and taken out of the way. Just as good a cure as in June or July.

Never attempt to cure any in fruit-bloom—it is too risky—because the weather might change suddenly, and the flow stop coming in, and you will meet with quite a lot of starving larvae; the cold weather is the unsalted stores, and they won't uncap the stores they have quick enough to feed the amount of brood. It is not proper to do it then; wait until June.

In these weak colonies you have two or three crosses on, take two or three—or whatever it may require to make a good swarm—cleanse that and cure it. These others that have plenty of fine brood, tier the brood up from the others, and you will make up what you lost; you will gain it in the new.

# Convention Proceedings.

## Chicago-Northwestern Convention.

### Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 135)

#### ILLINOIS LAW OF FOUL BROOD.

Pres. York—Do you wish to say anything further, or do you wish to take any action by motion? I think we have probably said enough about the necessity of this law, now what steps do you wish to take towards securing it? Do you wish to have a committee appointed?

Mr. Wilcox—I suppose it is not my business to interfere with the Legislature of Illinois.

Dr. Miller—You have the same right on that as any one. You can make a motion that a committee be appointed to co-operate with a committee that may be appointed by the State Association, to draft and prepare what is wanted.

It was moved and seconded that a committee of three be appointed to have in charge the securing, if possible, a foul-brood law for the State of Illinois, to co-operate with a similar committee from the State Association.

Mr. Swift—Wouldn't it be well to have that committee fortified by a preamble and resolution adopted by this convention in favor of such action? They would then have the fortification of the united action.

Pres. York—We might suggest that this committee prepare such a resolution.

Mr. Moore—I want to amend the motion by adding, "and also with the National Association to this end."

Pres. York—I think the mover of that motion will accept that.

Mr. Moore—I say the National specifically. I have been secretary for four years now of this Association, and there have been a multitude of motions made and carried, ordering the secretary and committees to do a great many things, but they have all fallen to the ground. I want this Association to understand that this thing will always follow unless they are carried out in the proper way. Go back when they got their foul-brood law in Wisconsin. If we want a foul-brood law here we have to do as they did and say, "Here, France, we want a foul-brood law in Illinois; here is \$500 to pay your car-fare and hotel bills, and call on all the \$500 of your for what is necessary." Any mere motion passed, advising and ordering this committee to co-operate with any other Association without funds to carry it out, is as empty as a tin bucket, and I thought I would like to tell you that before you pass this resolution. There is only one way to do it. The National has now about 1000 members; one of the functions of the National is to aid States to get proper laws on their statute books. Why can't the States do that? Why can't the local associations do that? Simply because they can't raise the money. The National has 1000 members, and if this was done by the National, and properly drafted, having the 700,000 bee-keepers in the United States, and get them to put their money up, then there would be no reason why we couldn't get ten or twenty thousand dollars. You will never get a foul-brood law without some money, with one, two, or five hundred dollars, and the services of some man like Mr. France, that has all his time to devote to the Legislature, and a politician, to push it through.

The motion was seconded and carried.

Pres. York—Whom will you have on this committee? If you will name them we will elect them.

Mr. Wilcox—It would seem to me much better for the president to take time to inquire concerning them, and then make the appointment, and I will move that he be authorized to make the appointment of a committee of three, and not to be in haste to do it. Select those men most suitable.

The motion was seconded and carried.

Mr. Wilcox—I don't want to do all the talking, but I am thinking all the while with respect to the suggestion of

Mr. Moore. I think it would be wise to offer a motion here that the surplus fund in the treasury of this Association be applied to defray the expenses of this committee, so far as they may be available.

Pres. York—Do you make that as a motion?

Mr. Wilcox—Yes. We found that difficulty in Wisconsin. Mr. France had to advance all the money, and then we had to make it up the best way we could.

Mr. Moore—I would like to ask for information. Under the present law of the National can money be taken out of their treasury to have laws made in the local States—different States?

Mr. Hutchinson—As I understand it, the funds of the National Association can be used for any purpose that the directors may decide. When we tried it in Michigan we had no doubt but that they would assist us in that way. It was necessary to go at it immediately, and Mr. Root, myself, and George E. Hilton, were in the effort two years, and Mr. Root and myself paid Mr. Hilton's fare, and he gave his time, and we paid his hotel bills and railroad fare, to get the law through at Lansing. The matter was laid before the National Association, hoping that they would help us out, but when it came to a vote they turned us down; but I have always thought, and still think, that that is a legitimate use for their money. Afterwards, the bee-keepers of Michigan partly made up the money to Mr. Root and myself; the rest of it we paid out of our own pockets. It is entirely useless to pass a resolution and send a committee unless you have money back of it. I am in favor of the National Association assisting the different States in getting proper legislation on that subject. Some of those who voted against it, said the reason why they did that was that they thought it was going to open the door for every other State to come in. Suppose it did? Why not? I can't see that as a valid objection.

Mr. France had just come into the room, and was then introduced.

Pres. York—Perhaps Mr. France can give us some advice as to how to proceed.

Mr. France—I haven't been here long enough to know the drift of the conversation that has been going on, or what your plans are, but I certainly know this much, and that is, that the State of Illinois needs laws on foul brood, and you want it from the next Legislature. I am getting samples of foul brood from Illinois frequently, asking for help, which I have gladly given. I think it wise for your legislative committee—don't make that committee too large. We lost our effort two years by making the committee of several. Usually when it gets down to business the committee consists of but very few.

Mr. Hutchinson—Mr. Moore and myself were making the point that there has to be some money spent.

Mr. Moore—The question arose of using the National Association's funds for this purpose.

Mr. France—How much has this convention's treasury to work on?

Pres. York—About \$25.

Mr. France—How much has the State Association of Illinois?

Pres. York—Nothing.

Mr. France—Well, you are nearly in the condition that Wisconsin was in to start.

Mr. Moore—What does it cost? Suppose the Illinois Association would say to you, Mr. France, "You get a foul-brood law, and call on all of the members," how much cash would it take?

Pres. York—How much would you do it for? That's it. [Laughter.]

Mr. France—I don't believe it is as much the cash as every one's shoulder to the wheel. We first attempted it by raising a fund. We raised a fund, and then they said, "France, go ahead and get legislation." It was a drop in the bucket started in the right direction. One man in the Legislature has no influence. I was laughed at all over the Legislature, appealing for the interests of bee-keepers. It was too small a question. Some one even suggested that the next thing some one would want legislation to look after the flies, and, really, one man said they might even want some one to look after the bedbugs! Then I found that it was necessary that each individual bee-keeper see personally, or write, his representative in the Legislature, and have him vote for it, and the vote stood 93 to 2 in our favor. It wasn't money alone. I took \$25 out of my own pocket, and I found one legislative committee before whom I appeared suggested the idea that it took money to run things through the Legislature. He slightly hinted that it might take money to buy our way through. I told him I

was sorry, but I had no money, and I hadn't heard of a bee-keeper disgracing himself by putting his hand down into his pocket for any lobby money. We were there, and we got it.

Mr. Moore—How many bee-keepers have we in this State?

Pres. York—Several thousand.

Mr. Moore—Suppose we have 3000 bee-keepers, what would you do? What must we do to get in a large number of the 3000 bee-keepers to-day? That's the thing that's needful.

Mr. France—By the aid of the editors of the bee-papers I had to lay a plan, and I learned that I must have the names of the bee-keepers. They furnished me the names of the bee-keepers, then I corresponded with them. I sent out 600 letters, and received 180 replies. That was the first response.

Dr. Miller—Now you are talking business.

Mr. France—Then I sent out more, and by-and-by those became interested, and by-and-by I had letters by the basketful when the time came for the Legislature in our State. I think that will be the way you will accomplish it in this State.

Pres. York—We ought to get Mr. France to move over to Illinois for a while. We can employ him!

Mr. Niver—I was just asking Dr. Miller to give me a name here for one of those endless-chain affairs; each one who gets one of these letters is to write ten more. For instance, we could get from the list of the bee-papers a certain number of Illinois bee-keepers, and send out a letter to that effect, that the one who receives it write ten personal letters to ten of his friends, and have each one write the Legislature. In that way couldn't we get a big lot of letters?

Pres. York—Do you wish the letters sent to the committee, or to the committee in the Legislature?

Mr. Niver—For one, I must know who is the representative of my district. I never did know yet.

Mr. Hutchinson—We went so far as to publish them in the bee-papers.

Mr. Niver—As a rule, I think, very few bee-keepers know who represents them in the State Legislature. I don't think I ever knew that fact yet. That is as much of a politician as I am.

Mr. Moore—Ask the policeman on your beat; he will tell you.

Mr. Niver—There is none.

Mr. Moore—Or the postmaster.

Mr. Niver—I know the postmaster. By getting a lot of letters in that way to our committee at the Legislature—whatever plan would be thought best—I think we would get a large number of letters in a very short time on that plan.

Pres. York—That letter can be considered when the committee is appointed.

Mr. France—I will say that I took the pains to correspond in Washington with our representative, and got a copy of the statistics on bee-keeping in the United States Census.

Mr. Moore—Can we get that by writing to our member in Congress?

Mr. France—Yes, sir.

Mr. Moore—What is the title?

Mr. France—United States Census Report of 1900, on Agriculture. I could, by opening my grip, give you the statistics for Illinois, if you want them.

[Messrs. Herman F. Moore, Chas. Clarke, and C. F. Kannenburg, have been appointed as the committee to cooperate with the State Committee on Legislation, who are, Messrs. J. O. Smith, Jas. A. Stone, and Chas. Becker.—GEORGE W. YORK.]

(Continued next week.)

**Honey as a Health-Food** is the name of a 16-page leaflet (3½x6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 10 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order.

### Big Honey Harvest Expected—Spring Care of Bees.

BY C. P. DADANT.

I believe that, since I have been in the bee-business, the prospect for a good honey crop has never been better than it is at present—in this part of the world at least. For ten years or more, the white clover has been an entire failure. From different causes—drouth, hard winters, etc.—it has failed to show up as it had done in former years. In 1889, for instance, our crop, from white clover alone, was upwards of 80 barrels. But at that time our pastures, our meadows, were like a white carpet at the time of clover bloom.

During the past wet season, young white clover has come up in abundance. I can hardly pass a spot of pasture-land without seeing the white clover leaf peeping out from under the snow. The shelter made by snow has been good so far; the green grass and clover have suffered none from the cold. There is a good harvest in prospect, unless something unexpected happens.

The apiarist who is anxious to succeed ought to be well prepared, if this crop comes, to take full advantage of it. If the winter is mild, the bees may prepare themselves fully and in good time, but there is quite a point to be gained by helping them artificially. What they need is early breeding, and plenty of warmth. Our hives must, therefore, be well protected from the cold, especially from the keen northern winds of February and March. If the hives are populous the bees will begin to breed early and will consume plenty of honey. One must make sure that none of them are compelled to stint themselves for want of a sufficient amount. The weak colonies should be reduced to the space they can well cover and should be stimulated, whenever there is mild weather, by a little feed given judiciously where the bees can reach it easily, and where the robbers will not be likely to get to it. The amount fed to colonies for stimulating the breeding must not be large. In most cases one or two teaspoonfuls of warm food will show beneficial results for several days. Feeding small quantities, and feeding often, is much better in spring than feeding large amount of honey all at one time. It is also better to feed diluted sugar than strong-smelling honey. The former will give no smell, while the later, especially when warm, will have a decided influence on robbing, inducing many of the bees to lurk about the hives in which the colonies are fed.

A very warm situation for hives is not objectionable, in spring, but on the contrary is conducive to good results. I once established an out-apiary at the house of an old Frenchman who had been a gardener, and owned a small hot-house. This little building was established at the head of a ravine which had washed away the soil to a depth of about 6 feet, with a width of some 20 feet, close to the old gardener's home. This ravine was a very ugly-looking chasm and an eye-sore till he devised this hot-house walled in on three sides at the head of it.

Not only the establishing of this building had effectually stopped the enlarging of this ditch, but it had given him a good place for raising early vegetables. The front was all glass, being faced to the southward. When I brought my bees to his place he had quit gardening, his hot-house was useless, and he had hit upon a plan of putting his six hives of bees side by side in this building for winter. When the weather was very cold a wooden front was hung over the glass front of the house so as to keep the bees quiet. But it is astonishing how quiet they would keep even if the front was open, whenever the weather was too cold. No matter how warm it might be inside, they would not sally out, but would remain quietly at home. But it did not take much to stir them up, and the least intrusion was resented by them.

Those hives were rich in stores. They began breeding early in the season, and when I moved some 25 hives to the same apiary, in the month of April, it was plain that either of these six hives could have furnished four times as many bees as my own which had been moved to this place from

an ordinary summer-stand in our home-apary. When the apple-blossoms opened, those bees were ready for work and took in some surplus—a thing which I had never seen before. When the clover came, the six colonies began to swarm, and I dare say we harvested more swarms and took more honey from those six colonies than from the other 25 put together. Some of the earliest swarms cast some swarms themselves which made good colonies before fall. From 31 or 32 colonies, all told, we increased to some 60, and took four or five thousand pounds of surplus honey.

In my mind this evidences the necessity of keeping our bees well sheltered from the cold in the spring. But to keep them sheltered means nothing if they do not have a plentiful supply from which they can draw to breed, and it is in this that large hives are of use. With large brood-chambers, there is always a plenty of honey, if the colony has been treated right the previous season. So the bees are more likely to be able to breed, when they should. But in any case, it is not a bad policy to give stimulating feed. As I said before, it must be given in small doses. We are not aiming at the storing of honey. All we want is to keep the bees active by giving them to understand that help is at hand. If my reader has never tried it, he does not know how quickly bees get accustomed to being fed. Give a colony nourishment for three days at the same hour and at the same place, and they will expect it the fourth day, exactly as if they were spoiled kittens or well-fed chickens. But the feeding must be done in a judicious manner.

If you want to feed your hens to make them lay, you would not throw your grain to them in a 4-inch snow, or at improper hours. Your aim would be to place it where they could get at it without getting too cold or without having to stay off their perch at an unseemly hour. You must treat your bees as you would your hens—keep their habits in mind, and feed them only when and where they will not be compelled to become chilled to reach the food. Remember that their honey-supply is expected to last them till the warm days come, and if you give them extra feed, give it only when you know that it will do good and can do no harm.

If the bees are fed early in the morning in cold weather, or when they ought to stay in the hive, a great many of them will become excited and will rush out and get chilled. If food is given for stimulating breeding, it should be given in the evening when there is but little chance of the bees venturing out, and when the robber-bees are not likely to disturb them.

Hancock Co., Ill.

## Methods of Rearing Good Queen-Bees.

BY L. STACHELHAUSEN.

MR. HENRY ALLEY expresses the opinion that no good queens can be reared by a colony having a fertile queen. This is an astonishing assertion if taken into consideration that in the natural state all queen-larvæ during the swarming-time are nursed by bees when a fertile queen is in the hive; the same is true when an old queen is superseded by the bees. The queens reared in queenless colonies are rare exceptions. But I think Mr. Alley is opposed to the upper stories over a queen-excluder for rearing queens in them.

I am of the opinion that in these upper stories as good queens can be reared as in queenless colonies, and by both ways worthless queens, too, if we do not observe some other important points.

Mr. Alley correctly says, on page 725, "The entire thing lies with the nurse-bees." If our bee-keepers had given more attention to the nourishment of bees such questions would have been settled long ago. Such analyses as Mr. Alley asks for were made years ago, and they show that the food given to queen-larvæ, or that given to worker-larvæ less than four days old, and that for young drone-larvæ, have a different chemical composition, nevertheless they all are fully digested pollen and honey (chyle), and are prepared by the young nurse-bees in the true stomach. The chyle is identical with the blood of the bee, showing even the blood-globules. All this is sufficiently proven, but in some of our text-books we do not find it mentioned, or an incorrect explanation is given.

How the same food can have these different compositions is explained in different ways, but as this is more theory I will not say more about it. We know that the bees need a good supply of pollen and honey to prepare royal jelly, or still better if pollen and nectar is gathered from the field. Further, we know that a colony has more and

richer larval food (and this is royal-jelly) if the number of young bees is large compared with the number of young larvae. These young bees prepare the chyle and feed the larvæ instinctively; if not enough young larvae are present the young bees find no consumers of the chyle; it remains longer in the stomach and is getting richer in albumen. This surplus of young bees, and consequently of chyle, causes in swarming-time the building of queen-cells, and at last swarming; at other seasons, if a queen is not prolific in egg-laying any more, we have again a surplus of young bees, and the old queen will be superseded. A large surplus of young bees compared with the open brood is the most important thing for rearing queens. In a colony with old bees only, or in a weak colony, we will get worthless queens. We have to consider this, we may rear queens in upper stories or in queenless colonies.

I rear some queens for my own use and none for sale. I rear them in upper stories over an excluder, and at a season when the bees are gathering honey, and I think no better queens can be reared. If I had to feed the colony I would probably prefer a queenless colony.

The advantage of these upper stories is not to get better queens, as by a queenless colony if properly managed, but it is that this colony is not spoiled for honey-production, and is developing in the lower story just as well as any other colony; this is a great advantage. Besides this, the preparing of the colony takes less time and labor. For rearing queens in upper stories we must have a strong colony, or the cells are not accepted; but queenless colonies will rear some kind of a queen even in the poorest condition. For this reason in upper stories there is less danger of getting worthless queens. I know this, because this way of queen-rearing is the main cause that Italian bees and artificial queens have lost all reputation in Germany.

I will describe the way I use for rearing queen-cells:

1. I take 5 or 6 brood-combs without bees, from some other colonies, and hang them in an upper story over a queen-excluder and over a strong colony.

2. Eight or ten days afterwards nearly all of this brood is capped, many young bees are hatching daily, and as no young larvæ are present a surplus of chyle is prepared, and the colony is in proper condition for queen-rearing. Now I remove the hive to a new place, but the upper story with bees and all is set on the old stand. Soon this colony will show all signs of queenlessness, and now (in 2 or 3 hours) I give the brood-strips (Alley's method) between two brood-combs.

3. Twenty-four hours afterwards this hive is arranged, that is, the hive with the queen is set again on the old stand, and on top of it, over the excluder, the story with the now started queen-cells.

Sometimes I manipulate differently. I may give this queenless colony another set of queen cells and remove the first lot to another upper story prepared 7 or 8 days before. Or the first lot of queen-cells may remain in this queenless colony until they are ripe and can be used in nuclei, as this is the easiest way to prepare a queenless colony for cell-building, if such a one should be preferred. Probably it would be better to set this queenless colony with the entrance closed in a cellar and keep it without open brood for a long time, that is, to give the brood-strips later.

Some scientists believe that the youngest bees prepare the richest chyle, what we would call royal-jelly. If this is so, hatching brood should be present in the colony which rears queen-cells, and this is secured by the above plan. Mr. Alley takes away from a strong colony the queen and all the brood, and gives the brood-strips after some hours. Hereby we have the necessary surplus of young bees, and they are in proper condition, but this method could probably be improved by giving some capped brood at the same time with the brood-strips.

It is considered as very important to select larvæ for queen-rearing at the correct age. If the larval food for queen and worker larvæ (less than 4 days old) would be the same in the same colony, as some believe, any larvæ under this age would be good enough; but if the food for the young worker-larvæ and the royal jelly is different, as the analyses as yet seem to indicate, we should select larvæ as young as possible. To decide this question it would be necessary to analyze larval food taken from queen-cells and worker-cells from the same hive and at the same time. This was not observed in the analyses mentioned above. Besides this, we see another difference—the queen-larvæ are always floating in an abundance of food, the young worker-larvæ, too, as long as they are small, receive more food than they consume, but later not so much food is given any more. For this reason very young larvæ are preferable

under all circumstances. If we use Alley's brood-strips we can select quite young larvae, not larger than the eggs, or we can select even eggs lying flat on the bottom of the cells, which are very near to hatching.

Artificial cell-cups will not produce better queens than natural ones: their advantages are that we do not need to cut any brood-combs or to destroy any larvae as with the Alley method; they bear rougher handling, but I can't see any necessity for rough handling. The disadvantages are: We can't transfer quite young larvae, just hatched from the egg; as some royal jelly is necessary for this method we must destroy some queen-cells already started, the whole process taking more time and labor than the Alley-strip method. The Alley cells must be started in a queenless colony; with the Doolittle artificial cups this is not necessary, but the most queen-breeders do it, so one of the advantages of artificial cells is lost. Grafting the cells takes more experience, and is more difficult for the beginner than to prepare the brood-strips. What method a bee-keeper will prefer depends entirely upon how great or little he estimates the different advantages and disadvantages. After trying all the different methods I went back to the Alley strips, and can't help believing that if the artificial cell-cups are preferred it is merely a case of fashion.

If the cells are nearly ripe, they are generally introduced to nuclei, or we let them hatch in a nursery and introduce the young virgin queens. If the latter plan is used, the queen should remain in the nursery as short a time as possible—the younger the queen the easier it is to introduce her safely, and a young queen kept in the nursery for some days is always spoiled more or less, and sometimes she will be a dead queen. For these reasons I use the nursery as little as possible—I would rather form new nuclei, if I happen to have more good cells than I need.

The size and strength of the nuclei are of importance, too. For more than 40 years, once in a while somebody recommended using quite small frames, and to use 2 or 3 of them and a few bees to form a nucleus. The greatest disadvantage of these small nuclei is, that too large a percentage of young queens are lost. I tried the plan a few times in different years, and never was satisfied. The nucleus should have at least 2 or 3 of the regular frames and enough bees to cover these frames. On the other hand, the nucleus should not be too strong. In a 2 or 3 frame nucleus the queen is found at once; if 6, 7 or more frames are covered with bees it takes, sometimes, considerably more time and labor. If my nuclei are getting too strong I divide some of them, and if I should get more than I need for queen-rearing I unite with some other one, or strengthen them in another way, and work them for extracted-honey production.

To get the queens fertilized in an upper story over an excluder does not work satisfactorily even if a double excluder is used. When I expected the young queen was laying eggs I found she was missing. As far as I know the plan is abandoned. If we use a wire-cloth in place of the excluder, we have in fact a separate nucleus which could just as well be placed on another stand. The only advantage is, that this nucleus is warmed somewhat by the strong colony in the lower story, and both can be united at once, if the nucleus is not needed any more. For this reason the plan seems good in a Northern climate, if queens should be reared early in the spring.

I rear my queens in February, March, and some in April. In May our main honey-flow commences, and at that time I make forced swarms for comb-honey production. By this manipulation I can get a large number of combs containing capped brood only. If I use these brood-combs for strengthening the nuclei I can give them a hive full of them at once, and in a short time I will have a strong colony, and can get a crop of extracted honey from it the same year.

Bexar Co., Texas.

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

**The Premiums** offered this week are well worth working for. Look at them.

## The National Association

N. E. France the New General Manager.

EDITOR AMERICAN BEE JOURNAL, Chicago, Ill.—

Dear Sir:—N. E. France, Platteville, Wis., General Manager and Treasurer-elect of the National Bee-Keepers' Association, has qualified by furnishing a bond as required by the Constitution of said Association. He is, therefore, duly qualified to perform the duties of such office.

Very respectfully,  
Feb. 17, 1903.

W. F. MARKS,  
Chairman Board of Directors.

The above notice ends the General Managership of N. E. France, one of the most unfortunate and inexcusable pieces of mismanagement we have known for a long time. Of course, Mr. France was in no wise responsible for the mismanagement nor the questionable methods resulting in his election, and he condemns them as strongly as any one possibly could. It certainly will not be pleasant for him to serve under the circumstances, as he knows that unfair means were employed to put him in his new position. We believe, however, that he will serve the Association to the best of his ability during the rest of this year.

### Producer's Name on Honey-Packages.

As several articles have appeared in the papers on this topic, I wish to say a word.

I go to any grocery store and buy, if you please, any kind of goods, such as canned fruits, vegetables, fish, breakfast foods, or any other article on the shelf. Each package has an attractive wrapper with flashy colors, also the name and address of the producer or firm said goods are prepared for. Go where I will, the same brand sells for the same price. Suppose I decide that some particular firm puts up the goods that suits me best. I find I can depend upon that brand, it makes no difference whether I buy it of Smith or Jones of my city, or X Y Z of any other city. Remember the producer's name is on each package. Suppose I want to buy that brand from the producer, and save the profit of the middle man. I write the firm for goods or prices, and what do I get? My letter is returned to their local dealer to supply the order, and a reply to me from the producer that their business is done only through their local agents, that they sell direct to wholesale jobbers or the local agents.

All kinds of producers and manufacturing industries, after careful testing every means of marketing and the protection to their business, have found this the only safe way to do business. By this method the producer, as soon as his produce is in marketable shape, can dispose of the entire crop, get his cash, and at once devote his entire time and money to producing the next crop. Marketing is a business that demands more skill and business tact, and the wholesale jobbers have worked every possible means of marketing. It may seem to me as if, when I buy a can of goods, the price I pay is enough to pay profit to each dealer and the producer also. This is partly true, but, the facts are, by these careful business methods and sharp competition the goods are now sold much cheaper than would be possible with any other method.

You say, What has all this got to do with the name on the bee-keeper's honey-packages? I ask, Are we bee-keepers, or our honey, better than others? and is there any better marketing method? Is it not time that we learn to market our goods with attractive labels and our name thereon, and also the National Honey Exchange stamp as the jobber? Then our honey, except for home market, as soon as ready for market, will go to the nearest warehouse to be graded by an expert, and stamped what the contents are. It may be produced by A. B. of N. Y., or X Y Z of California. The National stamp is a guarantee of the purity and kind of honey. Then, under one grand, united system we can produce the honey, and be a partner in the profits of the middle-man, also getting better prices, and avoiding overstocking one market and the next town going without.

The wisdom of this will be proven by the local organizations now incorporated, and in the near future all combining into the one National. Not only the selling of honey, but the buying of supplies, getting better transportation rates on bees by freight, and needed legislation in the various States to protect the bee-keepers. There are over 700,000 bee-keepers in the United States, and quite a large number in Canada, and I am sorry to say only a few over 1000 now belong to the National Bee-Keepers' Association. It is rapidly growing, and the prospects are that many large gatherings of bee-keepers during the year will become a part of the National, as by so joining the annual dues are only 50 cents each to the National. Let every member bring at least one new member into the fold, and add to the strength of the Association. In union there is strength.

N. E. FRANCE,

General Manager National Bee-Keepers' Association.

P. S.—I am now working to amend a Bill in the New Mexico Legislature, compelling the spraying of fruit-trees, so as to protect the interests of bee-keepers and fruit-growers. There is also an attempt being made to have the Iowa Legislature enact spraying laws.

N. E. F.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### A Cool Morning.

Sixteen degrees below zero this morning, Feb. 17. That is the coldest it has been this winter. Glad our bees are in the cellar.

### Brilliantine for the Hair.

A good brilliantine for dry, harsh hair is made by mixing well together one ounce each of glycerin and bay rum, adding two ounces of clarified honey and four ounces spirits of wine. Rub a little well into the scalp once a week.—"Health and Beauty" Department, Chicago Daily News.

### Bee-Keepers Always Hopeful.

Bee-keepers, as a general rule, are looking forward to the next season, and usually expecting a good crop. It is pleasant to keep up our courage by talking of the favorable signs. The prospects here seem good. The clover covered the ground abundantly last fall, and until late in the season the growth was vigorous. Since then it has been covered most of the time with a light fall of snow. So the promise for 1903 is good.

### Honey in Putting Up Fruit.

Having seen a request in the "Sisters' Department" for persons to give their experience in putting up fruit with honey, I thought I would give mine.

Some years ago I saw in the American Bee Journal an article on preserving grapes in honey, by laying the grapes (picked from the stems) in a jar and pouring extracted honey over them until covered; and that they would keep any length of time. We gave it a trial, but in a short time the acid in the grape caused it to ferment.

Then we experimented still further, by cooking the grapes and honey, and were surprised, on eating them, to find them so delicious. This led me to use it again at different times, in sweetening cherries, raspberries, blackberries, apples and grapes; and we liked it in everything except apples. Our friends, when visiting us, all spoke highly of our fruit, and, with very few exceptions, said they could tell no difference in flavor.

I have never used honey in preserving fruits to any extent, for long cooking destroys the honey-flavor, and makes it strong. I have used it in making grape marmalade, using half sugar, and it was fine.

As to the amount of honey used, I sweeten to suit my

taste, and have used both liquid and granulated. I know it can be used successfully in some kinds of fruit, and will keep any length of time, and the only reason I do not use it every year is the scarcity of honey so much of the time, that sugar is cheaper for me.

I have used honey in making cakes and cookies, and for making popcorn balls nothing could be better; cooking the honey until it will spin from a spoon, and then pour over the corn and make into balls.

MRS. J. L. STRONG.

Page Co., Iowa.

Thank you very much, Mrs. Strong, for giving us so fully your experience with putting up so many different kinds of fruit with honey. I am sure you have given it quite a trial, and proved to your own satisfaction at least, that it can be made a success. I have no doubt that you are right, that it may be cheaper to use sugar, and the lack of honey may prevent a good many from using it. Still, if honey is so much more wholesome it may be cheaper to use it even if it costs more in dollars and cents.

The only kind of fruit that we have tried with honey is strawberries, and they were good. I confess that I should not have known whether they were put up with honey or sugar if they had not been labeled. We used a very fine grade of alfalfa honey which had no very pronounced flavor. It comes the nearest to just a pure sweet of any honey I ever tasted, and for that reason is fine for cooking purposes.

I have made honey popcorn balls, only I used part sugar. They were fine. Next time I am going to try all honey and see what success I have.

The person who uses the most honey in our family is my mother, and she uses a small quantity at almost every meal, and has done so for some years. Last Sunday (Feb. 15) she celebrated her 84th birthday. She is a remarkably preserved woman for her age, both physically and mentally. One thing that is a little out of the ordinary is, that she never uses tea or coffee. For breakfast she has a drink of hot water, honey and cream, and seems to enjoy it as much as most people advanced in years do their tea and coffee. How much of her good health may be attributed to the use of honey I don't know, but I believe it is good for her.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### THE "SNIPPER" AMONG BEE-KEEPERS.

"Many a true word is spoken in jest"—and many an apt saying, without father or mother, is born of a typographical error. When Carlyle wrote the hackneyed old expression, "Dead Sea apples," the types made it "Dead Sea apes;" and in that form it went round the world with a rush. We rather need a name for the man who produces honey—white, amber, and dark, fancy and culls—and mixes all in the same case. According to page 67, he's a "snipper." Instead of cutting an honest garment "according to his cloth," he snips it full of holes. Snips his consignees' good-nature into shreds. Snips badly the consumer's right to have what he orders. Snips his own pocket-book nicely, too—we are almost glad of it. Possibly he thought he could snip off the time and expense required to case correctly. Seems to be a case of snip and be snipped on his part, as evidently his common-sense has been snipped badly. And the moral is, Don't be a Snipper.

Hope the types will soon furnish a name for another fellow worse than the Snipper, who is abroad in the world. A Toledo grocer recently showed me some of the fellow's honey, and wanted my opinion of it. Not graded correctly, eh? That time you missed it. Graded straight as a string; but such a grade—it was a long way below culls—unsealed nectar with the combs not built out to proper thickness yet.

### SIMMINS' SHAKEN SWARM.

The Simmins modification of the shaken swarm deserves a trial. We want to see what "locality" it is going to work in. To have no increase and no weak colony would be just splendid. Practically, what's to hinder the bees of No. 2 from going back home? And those that don't go will be nurses—not needed in their new home, and decidedly

needed in their old one. And might the queen of No. 1 get balled? And might the over-abundant nurses with nothing else to do insist on rearing young queens? Mr. S. says No. 2 gives up the idea of swarming. That is reasonable. Would it be worth while for us to find out whether any possible case of swarm-fever might not be halted by ruthlessly getting away all the young nurses too callow to fly home? Page 67.

MALT EXTRACT AS A SOURCE OF SUGAR.

Ah, but, but! Malt extract is not taken simply as a source of sugar. It is hoped that that curious presence-action, which is one of the wonders of chemistry, resides in it. Chemicals sometimes do their duty when certain "boss" substances are present, and neglect their duty when the boss is away. If Dr. Hutchinson will go to work and prove that honey is a better digestion-boss than malt extract, that would be something like. At present I believe the dominant word is that honey itself is easy of digestion, but that it interferes with the digestion of other things. Page 67.

FELT LIKE GETTING RAMBLER BACK.

And Rambler gone, too! When I heard it I felt a little bit as Orpheus did when he heard Eurydice was dead—felt like getting him back again. Page 68.

SWARMING AND AFTER-SWARMING.

I rather guess that Mr. Darling is right, on page 69. It's concerning the period after the prime swarm has gone, the period when after-swarming, with its vexations and its unreasoning persistence, is on the carpet. Queens in the cells mean another swarm; but the idea advanced is that a lot of liberated queens running around on the combs rather constitute an influence in the opposite direction. Imaginably, I should say, you might get a swarm inside of an hour by liberating a lot of queens; but if they stay an hour they will swarm no more unless you have missed a cell.

MUSTACHED CANUCK NEEDN'T STAND ON HIS HEAD.

And that chap who has no other beard than a mustache which a bumble-bee might select for nesting purposes—the Canadians seem to think that he had best stand on his head when he eats bread and butter and honey. Exception in case the honey is best Canada, when merely inverting the slice would do. Page 70.

## Questions and Answers.

CONDUCTED BY

**DR. O. C. MILLER, Marengo, Ill.**

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

### Cleaning Moldy Combs.

What can I do with moldy comb? Is there any special way to clean comb in which brood and bees have died? COLORADO.

ANSWERS.—Nothing is needed to be done with either moldy combs or those in which bees have died except to give them in care of the bees. They will clean them up in short order. A good way is to put a hive full of such combs under the hive of a strong colony. Then let the bees take their time to clean them.

### What Was the Trouble?

1. One of my colonies of bees came out to-day at 12 o'clock, and settled on the ground near the front of the hive. I looked in the bunch of bees for the queen, but did not see her. I then looked in the hive to see what could be the trouble. Everything seemed to be all right. I found 2 roaches, and saw a little sign of worms, but only a small web at one side at the bottom of the frame. They had 6 or 8 pounds of honey in the hive. The temperature was about 70 degrees to-day. What could be the matter with them, and what made them come out? I put them back and they seem to be satisfied this evening.

2. Is 6 or 8 pounds of honey enough to keep them until March 15, with ordinary weather? NORTH CAROLINA.

ANSWERS.—1. I don't know what the trouble was, nor why the bees came out, unless it was that they had been confined for some time, and became very much excited when the weather warmed up enough for them to fly. Bees that have been wintered in a cellar

swarm out in that way sometimes when taken out in the spring. But I suppose your bees were wintered outdoors, and it is not likely that they had been confined very long, so the best answer I can give is to say I don't know. I'll be glad if some one can give the right answer.

2. That depends upon how early the bees in your part of North Carolina can gather anything in the spring. From the time your letter was written till March 15 is 46 days, and during that time much honey will be used in rearing brood, so that it is somewhat doubtful whether they will have enough to last unless they have some good source from which they can gather before the 46 days are up.

### Bees Sticking Frames Together.

I am a beginner in the bee-business, and have the Danzenbaker hive. The bees stick the frames together so that it is impossible to lift them out without jarring and making the bees ugly. Is there any way to remedy the trouble? NEW YORK.

ANSWER.—I know of no way of preventing bees from depositing propolis where two surfaces come together as with closed-end frames. Where propolis is troublesome I would rather forego the advantage of closed ends, and use some kind of self-spacers with the smallest possible points of contact practicable.

### Bees in a Damp Cellar—Best Bees.

What difficulties may be expected from keeping bees in a damp cellar? and how can these difficulties be overcome while the bees are in such a cellar? IOWA.

2. What is the best breed of bees known? IOWA.

ANSWERS.—1. Diarrhea is likely to result if the temperature is not sufficiently high. Bees have been reported as wintering in the best condition in a very wet cellar when the cellar was kept warm enough and well supplied with fresh air. Obviously the thing to do is to raise the temperature sufficiently, and to see that there is a sufficient change of air.

2. Opinions differ. Italians are quite general favorites.

### Dividing to Prevent Swarming.

Being a new subscriber to the American Bee Journal I am not informed on methods discussed regarding the dividing of bees to prevent swarming. I am located in the "Alfalfa Belt," and would like to know the most successful way to prevent swarming; and to know if a novice is justified in attempting to do it. NEBRASKA.

ANSWER.—There is nothing difficult or complicated about the matter of shaken swarms, and you may as well start in on it first as last. So much has been said about the modus operandi that it is not necessary, probably, to give any further instruction about it; but if there is any point on which you would like to have light, don't be afraid to ask questions, and I'll answer them to the best of my ability.

### Feeding Bees in Winter—Best Hives.

A friend gave me 2 colonies last fall, and informed me the hives were filled with honey and would last until spring. Jan. 15 I opened one of the hives, on a fine day, and found the queen and 5000 bees dead, and no honey in the comb. I then went to work (never did such a thing before), took 2 pounds of granulated sugar and made candy and shoved it down between the frames of the other hive. Yesterday (Feb. 10) being a fine day, I opened the hive again and found all the candy gone, and repeated the operation as before.

1. I want to know whether there is a better plan.

2. What is the best hive to have? A friend of mine has a hive with a glass door in the back, and holes in the top for small boxes of comb honey. NEW JERSEY.

ANSWERS.—1. Hardly, unless it would be to lay a cake of candy on top of the frames and then cover up warm.

2. Glass in a hive adds to it, but in a way of expense rather than of value. There are differences of opinions as to what is the best hive. For my own use I prefer the Dovetailed with Miller frames, but have no quarrel with those who prefer something else.

### Management for Increase.

I have several colonies of bees with the supers on the hive now. Can I take them at swarming-time, as they are the same size of the brood-chamber, move the old hive away with the old queen, and leave the young colony in the place of the old one, and be all right? Is that a good way to increase my bees? TEXAS.

ANSWER.—If I understand you correctly, your idea is to take away the lower story and put it in a new place, taking the queen with it, leaving on the old stand the upper story, trusting to the bees to rear a new queen in the story that is left on the old stand. The plan may be successful to a certain extent, providing there is brood left on the old stand, among it being eggs or very young brood. But it will be very much better to leave the old queen on the old stand, with the story that has least brood in, for the whole field-force will be left at the old stand. It will also be a good plan to give a queen or a sealed

queen-cell to the part removed. If you have to let the bees do the whole work of rearing their own queen, you will be more sure of a good queen by this plan: Remove the queen to the new stand, leaving most of the brood on the old stand; about a week later make the bives exchange places. You will see that by this means you will have your queen-cells reared in a colony with a strong force of workers, and then when you make the change the old queen on the old stand will have the field-force and a chance to lay all she wants.

### Location for Bees—Transferring.

I am a beginner with bees, but have read a good deal on the management of them.

1. I will give the location that I am in, and would like you to tell me what you think I can obtain from each colony. I am about one mile from a creek bottom, having almost all kinds of growth, such as pine, sweet-gum, red-oak, maple, linden, elm, etc. We have lots of wild flowers,  $1\frac{1}{2}$  acres in peach orchard, a farming country, and no bees except mine. I have 6 colonies, and want to increase to 25. Do you think that will be too many for my location? I am going to run for comb-honey, and I can get 12 $\frac{1}{2}$  cents per pound.

2. I notice that a writer advises transferring in time of fruit-bloom or about 15 days after swarming. Why should I wait 15 days? I have 3 colonies to transfer. My bees are in very good shape, I guess, for they have some honey, and are watering to-day (Feb. 8). I don't put them in a cellar, but leave them out in the yard. TEXAS.

ANSWERS.—1. I don't know enough to guess within a long ways of what you will get per colony. After you have harvested the honey crops of five years you may be able to tell a little about it, but the succeeding five years may not be at all the same. But I would have no great fear about 25 colonies being too many for your location. Very likely it will support three times as many.

2. Don't you mean 21 days instead of 15? The reason for waiting 21 days is that at the end of 21 days all the worker-brood will be hatched out, leaving no brood to bother about.

### Hives Where Bees Died with Foul-Brood.

I have 25 N-frame Langstroth hives in which the bees died with foul-brood. I have burned the frames and combs. Can I prepare and safely use the hives next spring? UTAH.

ANSWER.—Good authorities say it is safe to use the hives without doing anything to them. As an extra precaution you can wet the inside with kerosene, and burn it out.

### Feeding Bees in the Cellar.

I have 85 colonies of bees, piled 5 high in a small cellar, with the bottom-board of 25 and the cover on. They are short of feed, some having starved to death already. I do not see how I can feed them all candy on top of the frames, so I can get the cover back on, and so I can pile them again, as they eat it so slowly.

How would it do to feed them honey through the pepper-box feeder over the top of the frames (say 3 or 4 pounds), then replace the covers and repile them as fast as they can be fed, a few at a time? MINNESOTA.

Your plan will answer. At the same time you are using the pepper-box feeders, and in order to expedite matters, are not the hives so placed that you can feed some of the colonies from below? Of course that will be only colonies so strong that the bees are down to the bottom-bars, in which case either honey or candy could be fed. You could also put candy over them, so far as room in the cellar would admit. By making a shallow frame to cover each hive, you could give the candy to each colony, put the frame over the hive, and then put on the cover. That would perhaps be the quickest way, if you do not care for the expense of the frames. A frame an inch or two deep would answer.

### Perhaps Bulged or Crooked Combs.

I am in the bee-business on a small scale, having about 30 colonies, and am buying all I can get a hold of, that are in old boxes, kegs, etc. I hope to increase 100 by fall. What bothers me is this: When I attempt to examine a colony, I find that when I raise the brood-frames out of the hive I break them, that is, as one is raised out it rubs against the sides of the adjoining ones and tears great, ugly patches in the comb. I used the Heddon-Langstroth hive, and the Langstroth frames, 8 to the hive, for comb-honey only. Where is the trouble? I can't have the heart to cause my bees so much work, and I must look after them. I am particular in leveling up my hives each spring. Would it be better for me to use 7 frames instead of 8? CALIFORNIA.

ANSWER.—I'm not entirely sure whether your frames are built crooked in the frames or not. Of course, if they are built crooked, the crooked part should be cut where necessary and straightened in the frames. I think, however, that you mean the combs are straight in the frames, only they are so crowded together that when you try to lift one out it is bulged, as you say, against the next comb. I wish I could see your combs; then I could tell better. If they are loose-hanging frames, and there is no dummy in the hive, then you must crowd together a number of the frames so as to make room to lift one out. If there is a dummy, lift that out first, so as to make room

to lift out the first frame. More likely, however, you have fixed-distance frames. Perhaps there is a dummy, but so much propolis is crowded in between the frames that it is harder to lift out the dummy than it is to lift out one of the frames. In that case clean out the propolis from the parts that come in contact, thus making room enough to get the dummy out.

It may be that there is no dummy, but self-spacing frames that crowd the hive full. If so I am sorry for you. But don't be discouraged. Goto work and scrape the bee-gum of the parts that come in contact with each other, and if then you haven't room to get the dummy in beside the frames, use one frame less and put in a dummy at one side. But if the dimensions are all right there ought to be plenty of room for eight frames spaced  $1\frac{3}{8}$  inches from center to center and a dummy 5-16 or  $\frac{3}{4}$  beside. The inside width of the hive should be 12 $\frac{1}{2}$  inches. It may be you are in a place where propolis is had, and that is a bad one. If so, change to frames spaced with staples, or with nails like the Miller frames would be a great relief to you.

If, now, I haven't hit your case, be sure to come again and give me more particulars.

### Sowing Sweet Clover.

As a further contribution to the subject I heartily endorse the following from Herman Betke, of St. Louis Co., Mo.:

"I have seen in the American Bee Journal that there are some inquiries as to the best way to sow sweet clover, and you advise to sow on hard ground, and let live-stock tramp it in. Now this is very good, but one may not have the live-stock, or it may not be convenient to have stock tramp in the seed, so I thought I would give you my way of sowing sweet clover.

"I sow on hard ground, and after sowing give the land a good scratching with a harrow. This will cover some of the seed, and a good rain will wash the loose soil over most of the rest. When the ground is very hard it may be advisable to run the harrow over the ground before sowing, and, of course, after sowing."

### Granulated Honey in Extracting-Combs.

A great many of my extracting-combs were about half filled with honey, last fall, and I delayed extracting until the latter part of November, when I found it had granulated badly, and the extracting was very unsatisfactory, leaving the combs heavy with white granulated honey. What should I do with them before putting them on for the spring flow? SOUTH CAROLINA.

ANSWER.—You can melt up the whole business, and then when it gets cold pour out the honey, or take off the cask of wax. But that would ruin the combs, and is hardly advisable if the combs are good. Perhaps the best thing is to let the bees clean them out as soon as the weather allows frequent flights. Spray the combs with warm or hot water as often as the bees lick them dry. The combs may be put in the hives with the bees, but the work will be easier and more rapid if the combs be put out some distance from the apiary. If there is a time after bees can fly freely when there is nothing for them to work on, you will find that feeding these combs will be just the thing to boom brood-rearing.

### Feeding Candy in the Cellar.

I don't know whether it is mere bad luck or through ignorance on my part, as a beginner, but my 34 colonies of bees, in the cellar, seem nearly destitute of stores. I have started to feed some of them Vitalo candy. They stored honey in the sections until a short time before putting them into the cellar, Nov. 1; and just before putting them in the cellar I fed them until it got too cold. The temperature in the cellar ranges from 38 to 50 degrees, with no sudden changes.

1. How much candy would it take to feed 34 colonies of bees from now until the middle of April?
2. Would it do to set 2 hives on top of each other, with the cover off of the one, and the bottom off of the other, and feed them that way? That would be the same as 17 colonies. Would that be any cheaper? Would they fight and kill each other?
3. When I put the candy in upon the frames, that leaves the cover open about an inch all around. Is that all right? or what should I do? WISCONSIN.

ANSWERS.—1. The amount of candy consumed by a colony of bees in the cellar from the first of March to the middle of April is very variable. Better give each one not less than 5 or 6 pounds. Some of them may not need a third of it, and some of them may need all. It will not be a waste if you give them more than they need, for they can use it later.

Don't think of doing anything of the kind unless you wish to unite and have only 17 colonies remaining. The bees may not fight, but one of the queens will most likely be killed.

3. It may do, but it is leaving the hive pretty open, and it will be better to cover over with old carpet, gunny-sack, or something of the kind.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

**FROM MANY FIELDS**

**Nice Weather for Bees.**

At the present time we are having nice, warm, spring-like weather. The spring birds are singing around, and the blue-bird has come, and it seems as if the backbone of winter is broken. The bees are taking advantage of such nice weather. They are doing finely this winter, and the prospects are good for a good honey crop. L. A. HAMMOND.  
Washington Co., Md., Feb. 13.

**Having Fine Rains.**

We are having fine rains. Everything is looking all right at this time for a good honey season. S. Q. CONKLE.  
Orange Co., Calif., Feb. 10.

**Carrying out Cellared Bees for a Flight.**

Referring to the editorial on page 99, as to the benefit of carrying bees out of the cellar to have a flight in winter, I would say that last winter (February, 1902) I took out one colony that seemed to be very uneasy; the day was fine, the bees flew nicely, and after returning them to the cellar they seemed very quiet the balance of the winter. February 1, 1903, was a fine day, bees out in winter quarters flew nicely.

The bees in this locality did quite well the last half of last year, beginning with July 3.

# PERSONAL TO SUBSCRIBERS

WE WILL SEND to every subscriber or reader of the American Bee Journal a full-sized ONE DOLLAR package of VIT-EORE, by mail, POSTPAID, sufficient for one month's treatment, to be paid for within one month's time after receipt. If the receiver can truthfully say that its use has done him or her more good than all the drugs and doses of quacks or good doctors or patent medicines he or she has ever used. Read this over again carefully, and understand that we ask our pay only when it has done you good, and not before. We take all the risk; you have nothing to lose. It does not benefit you, you pay us nothing. VIT-EORE is a natural, hard, adamantine rock-like substance—mineral—ore—mined from the ground like gold and silver, and requires about twenty years for oxidation. It contains free iron, free sulphur and magnesium, and one package will equal in medicinal strength and curative value 500 gallons of the most powerful, efficient mineral water, drunk fresh at the springs. It is a geological discovery, to which there is nothing added or taken from. It is the marvel of the century for curing such diseases as Rheumatism, Bright's Disease, Blood Poisoning, Heart Trouble, Diphtheria, Catarrh and Throat Affections, Liver, Kidney and Bladder Affections, Stomach and Female Disorders, La Grippe, Malaria, Fever, Nervous Prostration and General Debility, as thousands testify, and as no one, answering this writing for a package, will deny after using. Give age, life and sex.

This offer will challenge the attention and consideration, and afterward the gratitude of every living person who desires better health, or who suffers pains, ills and diseases which have defied the medical world and grown worse with age. We care not for your skepticism, but ask only your constipation, and at our expense, regardless of what ills you have, by sending to us for a package. You must not write on a postal card. In answer to this, address,

## LABOR SAVING WAGONS

### THE FARMERS' HANDY WAGONS

are useful and time and labor saving every day in the year. Low down, they load easily; low draft, they are easy on the horses; wide tired, they do not cut ruts across the fields. The wide platform will carry a big load without building it high. For hauling tools to and from the field, hauling manure, hauling hay, grain, logs, lumber, or anything else where a big, wide load is to be moved the Farmers' Handy Wagon is better than any other vehicle. Stronger and more durable than any other wagon. Wooden wheels guaranteed to hold tires five years. Iron wheels have spokes hot-forged in, not cast in. Dealers sell them. Send today for latest catalogue containing full details of the many ways in which our wagons are superior to others.

If your dealer cannot or will not get this wagon, do not buy any other without first informing yourself concerning the Farmers' Handy Wagon. Remember no other is "just as good."

Please Mention the Bee Journal when writing Advertisers\*\*\*\*\*

We look forward for a good year the coming season, but can not just tell yet which way the wind will blow.

If the bees confined in the cellar are uneasy, and a day comes in midwinter that will give them a chance to fly freely, I believe it will pay to give them a chance. If snow is on the ground scatter straw freely over it for a few rods around—a little will go a long way. This last advice is for beginners; the veterans know how.

I have been a constant reader of the American Bee Journal for eight years. "The proof of the pudding is in chewing the string," was an old saying, but I prefer to eat the pudding; this I get in what I learn from the "Old Reliable."  
L. G. BLAIR.

Grant Co., Wis., Feb. 13.

### A Disagreeable Winter.

It is a bad winter here—cold, windy, and very disagreeable all the time. I saw bees flying a few days ago. They were in fine condition. My 53 colonies are all doing nicely.

HENRY ALLEY.

Essex Co., Mass., Feb. 23.

### Robber-Bees Stinging—Forced Swarming—Smoker—Fuel.

I notice on page 543, about "Robber-Bees Stinging," and I agree with W. W. McNeal, of Cook Co., Ill. I had a colony of black bees (weak), placed away from the rest of my apiary, the rest of my bees being Italians. The Italians started to rob my blacks, and as

I went to the robbed colony I very soon found out that robbers do sting. I contracted the entrance so that no bee at a time would pass, and saved my black bees.

I am hard against any way of increase except by natural swarming. When there is no nectar in the fields to gather, why, you do not have to feed the nuclei of brushed swarms; nor any weak ones made by unnatural swarming. You may leave the swarm and return after swarms, or cut queen-cells out and prevent after-swarms.

For smoker-fuel I find nothing better than hard maple, cut as long as the smoker, and split and put in with a lot of coals in the bottom to start it. One smoker full will last a half day, or longer, if you don't use it much. Jones Co., Iowa. G. B. WILLIAMSON.

The South Dakota Convention.

The South Dakota Bee-Keepers' Association held its annual convention Jan. 28, in Yankton. There was a good attendance, and there were many subjects of interest discussed. There is a growing interest in apiculture in the State. We expect to double our membership this year, and also to produce double the honey of former years, if the season is favorable. Last season was a poor one for honey in this locality, our average being about 50 pounds per colony of comb honey, and 100 pounds of extracted.

The bees seem to be wintering well, those on the summer stands especially. Mine had a good flight Jan. 15, and they were all alive

**Incubator Triumph of the Age**—It was Chas. A. Cypfers, president of the well-known Cypfers Incubator Co., who, after 8 years of study and experimenting, discovered "the diffusive principle" in successful artificial incubation. By means of Mr. Cypfers' great discovery, embodied in the incubator bearing his name, the natural moisture within the egg is conserved, answering all purposes, the chicks coming larger and stronger because hatched "in nature's way," and under all ordinary conditions no thought or attention whatever need be given to the heretofore troublesome and often disastrous "moisture question" or to the proper ventilation of the hatching chamber.

(Cypfers incubators, as manufactured to-day, are practically automatic, being self-ventilating, self-regulating, and requiring no supplied moisture. All the attention they need is 5 minutes in the morning and 5 minutes in the evening to fill the lamp, trim the wick and turn the eggs. The incubator does the rest and does it perfectly.)

Mr. Cypfers built his first incubators with his own hands, wood work, metal work and all. To-day—only 6 days later—the Cypfers Company occupies a mammoth plant at Buffalo, N. Y., employing over 300 persons, and operates its own stores in New York, Boston and Chicago. The company also has agencies and distributing depots in the principal cities of every State in the Union and in Canada, Europe, Australia, New Zealand, British South Africa, South America, Mexico, the Hawaiian Islands and the Orient.

The 7th annual catalog of the Cypfers Company, entitled, "How to Make Money with Poultry and Incubators," is unquestionably the most valuable book of its kind ever published. It contains 12 special chapters from the pens of experts, covering every branch of profitable poultry-keeping. Heretofore, this annual Catalog and Guide has been sold at 15 cents per copy, although worth many times the amount, but this latest and most valuable edition will be mailed free, prepaid, during the next 30 days, to all interested persons who will write for it and name the American Bee Journal. Address, Cypfers Incubator Company, Executive Offices, Buffalo, N. Y.

up to that time, and seemed to be strong, and very few bees are dying so far. I winter the bees on the summer stands, and work for comb honey altogether, and natural swarming. Last season I had 17 new swarms, and did not lose a swarm or a queen from spring until packing time for winter. I think that a record-breaker, don't you?

The following is a list of the officers of the South Dakota Bee-Keepers' Association for this year: President, G. L. Dibble; Vice-President, L. A. Syverud; Secretary, J. M. Hobbs, of Yankton; and General Manager, J. J. Duffack, District Vice-Presidents: H. Schell, P. N. Cross, G. L. Chamberlain, L. A. Syverud, and G. L. Dibble.

Yankton Co., S. Dak. J. M. HOBBS, Sec.

## Report for the Season of 1902.

I started last season with 3 colonies in chaff hives, and although it rained nearly every day in June I increased to 6 colonies, and took 200 pounds of honey, which I sold for 15 cents, besides the sections that were not well filled, which we used ourselves.

The main crop was buckwheat, and a lot of fall aster honey, which was as clear as water.

DEAN LAUDENSLAYER.

Clearfield Co., Pa., Feb. 4.

## Cellar-Wintering of Bees.

Is it desirable, when a favorable day comes, to take the bees out of the cellar in winter and then return them after a flight? Years ago I wintered my bees in a very dry cellar, where the temperature ran from 50 up to 60 degrees, Fahr., and I wintered bees in there pretty well. I gave them a flight as soon as possible. One year (I don't remember which year it was) I thought I would try to answer this question, and left two colonies in the cellar; the rest I gave a flight, and after I got them on the summer stands they were very weak, and did not come out of the cellar. I took them into a warm room and they crawled out on the floor, but could not fly. They looked like a queen full of eggs. About a week after that every one was dead. I believe if I had taken them out with the others they would have kept all right.

Here is my guess: With the uneven temperature and very dry cellar they felt uneasy for a long time, and ate more than they should, got too full, and could not get rid of it.

In 1896 I put the bees into the cellar Nov. 22, where I could keep the temperature between 42 and 46 degrees, and tried this question again. I took a strong colony whose weight was 50 pounds March 2, we had a nice wind; that day I got the colony out of

the cellar, and the weight was 53½ pounds. They had a good flight, and the colony was strong. I left them until night, and the weight was 52 pounds. On April 4 I put the bees on the summer stands, and their weight was 44 pounds; so it lost 14 pounds, or 8 pounds in one month after its flight; and the rest consumed about 7 pounds during the whole winter, and came out in good shape, too. Their cellar is under the house, with a warm room on top; the cellar is very damp so the water runs on the walls, still the bees winter in there all right. For example, last winter I put in 64 colonies, kept them in 4½ months, and 62 came out in very good shape; 2 were weak, and those 2 were Italians; they quit breeding so early in the fall that the most of them died from old age.

Now, somebody might say that under the house is not a good place, the bees get disturbed too much; but that is not so with me, because I am very particular with my bees. Sometimes I go down with a light and look over them, and the bees hang there as if they were sleeping. I winter them without hives-bottoms.

If we want to winter our bees well, let them have good healthy stores of food and strong colonies, a wet cellar, and an even temperature, then we do not need to be afraid to winter our bees for five months without giving them any flight or fresh air.

I would like to shake hands with Mr. Leupold (page 109). I, too, have been working among bees since childhood, nearly 53 years ago. I had more than 20 colonies in straw hives when I was 5 years old. I can do the same trick that he can; but I take a dead colony. H. B. STUMPE.

CONVENTION NOTICES.

New York.—The annual meeting of the Oswego County Bee-Keepers' Association will be held at Fulton, N. Y., on Saturday, March 7. Prof. Frank Benton will be present and address the meeting. An interesting program is being prepared, and all persons interested in bees are cordially invited to be present. MORTIMER STEVENS, Pres. CHAS. B. ALLEN, Sec.

New York.—A series of Bee Keepers' Institutes will be held in the State of New York as follows: Canandaigua, March 2; Syracuse, March 4; Auburn, March 5; Cortland, March 6; Fulton, March 7; Syracuse, March 9 and 10; and Amsterdam March 11.

Prof. Frank Benton, Apicultural Investigator, has finished the 1902 United States Department of Agriculture at the expense of the Bureau of Institutes of the State Department of Agriculture, will address the meetings.

The New York State Association of Bee-Keepers' Societies will hold its annual meeting at Syracuse, March 10, at 10 o'clock a. m., in the City Hall. Prof. Benton and other prominent bee-men have informed us of their intention to attend. It is hoped that a very interesting session is in store for those who attend. Special rates have been secured for entertainment at the Manhattan Hotel, Fayette St., at \$1.25 per day. C. B. HOWARD, Sec.

A Feeler.—Attention, bee-keepers of Missouri! Let us organize a Missouri State Bee-Keepers' Association. What do you say? I move we elect Mr. John Nebel, of High Hill, Mo., president pro tem. Who will second the motion?

Other motions in order will be to elect a secretary and treasurer, and other officers that may be needed, and then adopt a constitution and by-laws, and proceed to business generally.

This "feeler" goes to about 200 or more bee-keepers who are readers of bee papers. If you appreciate it, please send me a dime to help bear expenses, and your name will be recorded as a charter member. If I get more than enough replies containing money or stamps, I will turn the hands of the treasurer, whoever you may select. If I do not get enough to pay expenses I will tell the Association all about it, and they can adopt any course they please.

Wakenda, Mo., ours truly, W. T. CARV. The above "feeler" was scattered over the State of Missouri about two or three weeks ago, as an open circular letter. I have received 32 replies containing money or stamps, and encouraging words. Fourteen of them seconded my motion for John Nebel for president pro

tem, and two nominations were made for secretary and treasurer. Other replies will be gladly received, and your names entered as charter members for 10 cents, until further notice is given. In your replies please vote for president pro tem, and nominate candidates for secretary and treasurer. W. T. CARV.

New York.—The annual meeting of the New York State Association of Bee Keepers' Societies will be held in the City Hall, Syracuse, N. Y., commencing Monday, March 9, 1903, at 7 p. m., following the Onondaga Co. Bee-Keepers' meeting and institute which is to be held at the same place during the day. Program: Monday, 7 p. m., "In Search of New Bees—Limitation," Prof. Frank Benton; Tuesday, March 10, 9 a. m., Secretary and Treasurer's report, C. B. Howard; President's annual message, W. P. Meek; Discussion, offered by Dr. C. L. Parker; "Objects to be sought and methods to be employed toward increasing the usefulness and efficiency of our organization," O. L. Herbersier, F. Greiner, Chas. Stewart; Question-Box; Appointment of Committees; Adjournment for dinner.

120 p. m., presentation of credentials and payment of dues by delegates; Election of officers; Reports of committees; Miscellaneous business; "Breeding bees for the harvest," Prof. Frank Benton; Discussion, opened by N. L. Steyer, 5 p. m., "In Search of New Bees—Limitation," Question-Box; 5 p. m., Adjournment.

Prof. Frank Benton is the Apicultural Investigator, and is furnished by the U. S. Dept. of Agriculture with his expenses are paid by the State Bureau of Institutes.

Special rates have been secured for entertainment at the Manhattan Hotel, Fayette Street, \$1.25 per day. C. B. HOWARD, Sec.

**HONEY AND BEESWAX**  
MARKET QUOTATIONS.

CHICAGO, Feb. 7.—The market is in rather an unsettled state. The offerings of late have been numerous, and there is a tendency towards lower prices, owing to the fact that the supply is larger than expected at this season of the year. The fancy grades of white will sell at 15¢ per lb. as the demand is not so great for this grade much difficult to place at anything above 10¢/lb. Extracted honey is also easy, with the best grades of white obtainable at 70¢/lb, and ambers at 66¢/lb. Beeswax steady at 30¢ per lb. R. A. BURNETT & Co.

ALBANY, N. Y., Feb. 20.—Honey demand quiet; receipts and stock light. Comb selling, light, 15¢; mixed, 14¢/15¢; dark, 13¢/14¢. Extracted, dark, at 7½¢/lb. Beeswax firm, 30¢/32¢. H. R. WRIGHT.

KANSAS CITY, Feb. 21.—The demand for both comb and extracted honey is but moderate, receipts light. We quote as follows: Extra fancy white comb, per case, \$3.40; strictly No. 1, \$3.30; No. 1 amber, \$3.63; 25; No. 2, white and amber, \$2.50. Extracted, white, per pound, 70¢; amber, 66¢/65¢. Beeswax, 30¢. C. C. CLEMONS & Co.

CINCINNATI, Feb. 7.—The demand for all kinds of honey has fallen off considerably in the last few weeks, owing to the many other waxes offered at this season of the year. Lower prices are no inducement to increase the consumption, as the demand is not so great, and we do not fill about the end of the month; consequently it is folly to offer at lower prices. We quote amber extracted in barrels at 5½¢/6¢; white clover and alfalfa, 5¢; white comb, 16¢/17¢; lower grades hard to sell at any price. Beeswax firm at 30¢. THE FRED W. MUTH CO.

NEW YORK, Jan. 23.—Demand for comb honey quiet on all grades, and prices show a downward trend. Supply plentiful, but not in great demand, if not more so. We quote fancy white at 15¢; No. 1, at 14¢; No. 2, at from 12¢/13¢; dark and buckwheat, at from 11¢/12¢.

Extracted honey is in abundant supplies with the exception of white clover. We quote white at 7¢; amber at 6¢, and dark at 6¢. Common in barrels from 60¢/65¢ per gallon. Beeswax firm at from 30¢/36¢. HILDRETH & SROEKEN.

CINCINNATI, Feb. 7.—The comb honey market continues to be draggy and hardly demanded and therefore prices have weakened. Fancy white clover comb sells for 15¢/15½¢; for amber, there is no demand. The market for extracted is fair and prices run as follows: Amber, 5½¢/5½¢; by the barrel; in cans it brings a little more; alfalfa, 7½¢; white clover, 8½¢/8¢. Beeswax, 28¢/30¢. C. H. W. WEBER.

SAN FRANCISCO, Jan. 14.—White comb honey, 11½¢/12¢; light amber, 10¢/11¢; dark, 5¢/6¢. Extracted, white, 66¢/65¢; light amber, 58¢/57¢; amber, 46¢/45¢. Beeswax, 30¢ to choice, light, 26¢/27¢; strictly fancy light, 29¢/30¢.

The country merchant, representative of trade interests, estimates "entire stock of honey of 1902" to be draggy and hardly demanded, and therefore prices, subject to a \$1.10 freight-rate to the East.

**WANTED** WHITE CLOVER EXTRACTED HONEY! Send sample and best price delivered here; also Factory Comb wanted in no-drip cans. THE FRED W. MUTH CO., 324½ Front and Walnut, CINCINNATI, OHIO. Please mention Bee Journal when writing.

## Weekly Budget.

REV. JAMES M. SMITH, of Santa Barbara Co., Calif., writing us Feb. 28, said:

"My home was burned lately—total loss. The family were all away camping. My file of American Bee Journals and every book were burned."

We regret exceedingly to learn of Mr. Smith's heavy loss. Of course, many things undoubtedly held sacred as well as of pecuniary value are lost. Only those who have passed through such a "clean sweep" know anything about it. We hope but few will be called on to experience it.

### Apiary of Wm. W. Green.

The picture shows my hobby at the height of its prosperity last summer—not high enough to be alarming—with "Yours truly" standing beside his crack colony.

My two little assistants, aged 8 and 9, show rather indistinctly near the edges of the picture.

I started keeping bees three seasons ago, purely for pleasure and recreation, and I must say, that I have attained what I sought. Madam says she would like some honey, if you please, but I get all my pay before the crop comes off. Rather think my pay was the larger last year.

I have 26 colonies in a rather narrow city back-yard—whose limit will be about 36—and run for extracted honey, using Jubo 10-frame hives (Draper bars)—and could not be induced to change for smaller. My field is very poor, one-half being Lake Michigan, and the other half so sandy that its product is small. The poor field brings me one blessing,

however—no foul brood within reach of my bees.

Entered in the game for pleasure, I have experienced a good deal, mostly with the different races of bees. Last year I had pure Italians, blacks, and Cyprian queens Carniolan mated. So far the latter have come out the best, with Italians second. My data is as yet, however, too limited to be conclusive. One could not ask for a better race than the Cyprio-Carniolan, first cross. The queens are very prolific, the bees tremendous workers, large, gentle, and uniformly marked, being distinguishable from three-banded leather-colored Italians. In the next generation the Italian disappears, pure black bees appearing regardless of the mating of the young queen.

My only original feature is that I number the queens and not the hives. Each hive has a brass card-holder tacked on it with a numbered water-proof card therein, and when the queen changes her abode the card goes with her.

I clip all my queens, principally for the purpose of "branding" them. I am not troubled with much swarming, using such large hives, although some of my best queens—Cyprio-Carniolans—have needed more than one hive-body for a brood-chamber.

It is perhaps needless to add that the American Bee Journal has added greatly to the pleasure I have obtained from bee-keeping.

WM. W. GREEN.

### Apiary of C. W. Virgin.

Although my apiary is not very large, there is a whole lot of room for it to grow.

It was started from a swarm of bees found in the woods (Oct. 26, 1901—the old empty hive which is on the right). They were taken home, kept in the cellar all winter, swarmed out twice, and the remaining swarm was then put into a hive.

From the first colony on the left I got 20 pounds of surplus; from the next enough stores to winter on; the third, and last colony, I have had to feed.

I have several more colonies that I found in the woods last fall, all in the cellar and doing nicely.

I got some of them home too late in the fall to feed; I don't know whether they have enough to winter on or not. I can see a few of the bees, and a little of the comb through a hole, but can't get in to them without splitting the stumps, and I don't want to do that until in the spring.

C. W. VIRGIN.

Stearns Co., Minn.

### Apiary of Peter Gallee.

One afternoon, in 1896, when Peter Gallee, with a friend, returned from a stroll to his home his wife met him and said she was glad he had come, for she had caught a swarm of bees, and she wished him to put them in a box or something right away, else they might go off. Peter said, "That is best; let them go off," for he would not have anything to do with them. His friend said he could hive them, so they were put into a box—a colony of nice yellow bees. They swarmed, and the swarm was boxed. Now, Mr. Gallee got interested in the bees, and thought if he were going to keep bees and do any good with them they should be kept in something more convenient to handle, so he got some Langstroth hives and commenced to handle bees in a practical way, and produced section honey. The bees kept increasing so that other hives were needed, and he now uses lock-cornered hives with Hoffman frames. Last year he had 35 colonies, spring count, and produced 2200 pounds of comb honey besides the increase. He has now about 65 colonies.

He winters on the summer stands by grouping the hives in twos, leaving the fronts open, but the sides, ends and tops are covered with straw, hay or grass, as is most handy at time of packing, the whole kept in place with four lath frames fastened with stakes and ties, with shades drawn on top to carry off the water. He sees that each colony has enough stores until spring, when he looks to their condition, and helps with a little feed, if needed. By this method very few colonies are lost in win-

tering, and what is very interesting is this: The colonies seem to get through with a small amount of stores, and we generally hear the first honey of the season is sold from this apiary in his district.

Mr. Gallee does not send off for queens, his apiary being from the original stock, excepting a stray swarm or two which may have come into his yard, so his queens are raised on the supersede or else the swarming impulse.

His apiary is on the Missouri River, and he thinks if he had forage all around his bees would do still better.

Has any one an apiary started with one swarm of black bees, and not helped with queens from other sources in a square box, or better, than Mr. Peter Gallee's apiary?

RAY CO., MO. JOHN S. SEMMENS.

### The Apiary of G. H. Wells.

My son took the picture of the "Diamond Apiary" and me. Only 19 colonies appear, while we have 21, and on the most of them the diamonds show, being put on with vermilion paint, and each hive is numbered with black paint inside of the diamond.

We began to study the bee-business two years ago, starting with one good colony badly hived, and one other on in a square box, so that both had to be transferred into good hives, which I did with the help of an old man that had handled bees for some years, but had not studied the business, so, of course, I have made some big mistakes; but I have tried to learn what I could by reading the bee-papers and books. One of the big mistakes I made was to take a very fine queen out of her hive (the colony had been hived June 2, and had given me 57 pounds of nice comb honey), and put in a young queen that I got from Texas, and she died, or was not to be found the next May. So I learned that when I have a good queen, and she is doing well, to let her alone, whether she has one hand or three, although I have nine nice 3-handed queens.

Last year the bees in this vicinity did no good except in increase. I bought several young colonies, and at the close of the swarming-time we had 26, but we had to double them up because they did not build comb enough to hold syrup to winter on, so by putting two colonies together they will be able to pull through. I fed them about 200 pounds of sugar, and then put them in the back chamber and darkened the window, but left it so I can give them plenty of air, and they seem to be doing nicely so far.

I think I would better raise them up from the bottom-board by putting a 3/4 strip under the hive on three sides, and then put queen-guards in front to make sure the mice will not get in. Better be safe.

G. H. WELLS.

Cass Co., Iowa.

## Queen-Clipping Device Free!

The MONETTE Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings. It is used by many beekeepers. Full printed directions sent with each one. We mail it for 25cents; or will send it FREE as a premium for sending us One Year's subscription to the Bee Journal for a year at \$1.00, or for \$1.10 we will mail the Bee Journal one year and the Clipping Device. Address,

**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie St., CHICAGO, ILL.

## The Emerson Binder

This Emerson stiff-board Bladder with cloth back for The American Bee Journal we mail for but 60 cents; or we will send it with The Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

No. 11.

## Editorial.

An Illinois Foul Brood Law is what the bee-keepers of this State are endeavoring to have passed during the present session of the Legislature. Referring to the matter, Secretary Moore, of the Chicago-Northwestern Bee-Keepers' Association, has this to say:

PARK RIDGE, ILL., Feb. 16, 1903.

DEAR BEE-KEEPER:—

The time has arrived when we can reach our representatives at Springfield and get a *Foul Brood Law* enacted. The Secretary of the Chicago-Northwestern Bee-Keepers' Association is in personal touch with more than half a dozen of the members of the Legislature now in session. About 70 of the members are from the city of Chicago and Cook County, and can be personally reached. It will be necessary to raise some money to pay postage and other necessary expenses. Every bee-keeper in Illinois (several thousand) must be reached by mail. The matter must be argued before committees of Senate and House. About \$300 may be needed to cover necessary expenses. Subscriptions so far are:

(George W. York, \$25; Herman F. Moore, \$10; H. M. Arm, \$5; Peter N. Duff, \$10; Mr. and Mrs. Frank Brown, \$5; Dr. C. C. Miller, \$5; J. A. Ilgnet, \$1; Mrs. N. L. Stow, \$5; C. F. Kannenberg, \$5; G. E. Purple, \$5. The subscriptions will be used only to pay necessary expenses. The money will be expended by the executive committee of the Chicago-Northwestern Bee-Keepers' Association. The Association shall be custodian of the funds, and any surplus over what is needed to get the passage of the law will be placed in the treasury of the Association.

Now, send in your names and money, for we must have a *foul brood law* in Illinois, and now is our opportunity. The writer has had the honor of the friendship of the Hon. Henry W. Austin, of Oak Park—a member of the present Illinois House—for some years, and he is personally interested in the passage of this law.

Any one knowing of a member of either Senate or House who is interested in bees, will confer a favor by notifying the undersigned.

It will be well to have a number of the prominent bee-keepers all over this great State present when our Bill comes before the committees of the Senate and House. If only one or two were present they might think we did not amount to much. Watch the American Bee Journal, and we will keep you informed.

The Bill will go before the Legislature as a petition from the Illinois State and the Chicago-Northwestern Associations jointly. We ask an annual appropriation of \$1000 in our Bill.

Let all the bee-keepers in Illinois rally, and we shall have the law we so much need. *Nothing can prevent it* but the *indifference of those most interested*. Remember, you must act promptly, as the Legislature is now in session, and committees have been appointed.

Since the writing of the above the chairman

has been to Springfield and addressed both the Senate and House Appropriations Committees, to which our Bills were referred. Both committees gave us a very respectful hearing, and the House committee carried a motion to report it favorably to the House, and recommend that it do pass. The Senate committee had yet to act at the time the writer left Springfield, but it seems certain that they are favorably disposed to our Bill.

Now, any of the Illinois readers of the American Bee Journal, who can reach a member of either House or Senate before our Bill comes to a vote, please do so, as we need all the help we can get.

Pres. Smith, Sec. Stone, and Treas. Becker, of the Illinois State Bee-Keepers' Association, did some hard work before the committees. Mr. Stone had a hive, and Mr. Smith a frame of foul brood comb.

HERMAN F. MOORE,  
Chairman of Foul Brood Committee,  
Chicago-Northwestern Bee-Keepers' Association.

March 6, 1903.

**Carpet-Grass** (*Lippia nodiflora*) is lauded in gleanings in Bee-Culture as a honey-plant of great value. Its name is suggestive of its appearance, and it flourishes where without it the ground would be bare. Stock eat it. It flourishes in nearly all parts of the West Indies. It has been lately introduced in the Bahamas, and is now the leading honey-plant there. W. K. Morrison thinks that sufficient perseverance would succeed in establishing it on the vast sandy wastes known as the piney woods of Florida, and Editor Root waxes eloquent after the following fashion:

If the sandy wastes in Florida could be covered with such a mass of green verdure, with its tiny little flowers so redolent of precious sweetness, what a transformation would be made! Verily, the desert would become a garden of Eden; and the happy hum of bees would gladden the hearts of many thousands of bee-keepers.

**Giving Bees a Cleansing Flight** is advocated by G. A. Deadman in the Canadian Bee Journal. He favors taking them out of the cellar and giving them a flight, say for this locality about the first fine day between the 5th and 10th of April, or possibly before if any prospects of early spring, and then putting them back again for perhaps two weeks or so. One object of this is to start brood-rearing, for bees do little at brood-rearing so long as they remain in the cellar. To be sure, they will start brood-rearing just as early if taken out at the time he suggests and left out; but he argues that during that two weeks' time many bees will be lost by flying when too cold for the bees to get back safely to the hives.

An item that Mr. Deadman does not mention, although we doubt well aware of it, is that the evils of confinement increase toward spring in something like a geometrical ratio,

and bees will suffer more during the last two weeks than perhaps during the first two months. If they can be relieved by a cleansing flight, and then do as well in the cellar afterward without any evil effects from that flight, there will be a gain.

But it has been pretty generally believed that bees thus returned to the cellar would be so uneasy that the evil effect of this would overbalance all the good results. If a large number of bee-keepers who cellar their bees will this spring try the experiment of taking out and returning a certain number of colonies, and then comparing their after welfare with that of the colonies remaining in the cellar till later, it will go a long way toward settling the question.

**Testing Honey-Barrels.**—To test honey-barrels before waxing, a bicycle-pump is recommended in Gleanings in Bee-Culture instead of blowing into the barrel with the breath.

**Remedy for Laying Workers.**—C. M. Arons, in Gleanings in Bee-Culture, recommends that the larva be removed from one of the queen-cells started, and a worker-larva from a fertile queen put in its place. From this a queen will be reared. It is claimed by some that a virgin queen, when first hatched, is kindly received in any colony, even where a laying queen is present, and only when the virgin becomes a day or so old does jealousy arise between her and the reigning queen. If that be true, a good deal of time would be saved by giving the laying-worker colony a just-hatched virgin—if you have one.

**Bee-Keepers Need the Scientist,** says Arthur C. Miller in the Bee-Keepers' Review. It is too often the case that a bee-keeper of very limited experience puts that limited experience against the conclusions of the ablest scientist, rating the investigations of the scientist as something misty and unreal. To such a person the following wise words of Mr. Miller may be commended:

The scientist differs from the ordinary observer and student in degree rather than in method. The former proceeds with caution; testing, trying and weighing each step of his experiments; makes his observations as abundant as possible; compares the results of his work with those of others, when possible; and thus deduces from these what he believes to be "laws." The ordinary observer, on the contrary, proceeds less methodically; is content with less exhaustive experiments, and decides off-hand. But between the two extremes there are so many shades that he is a reckless individual who will say, "Here is the dividing line." So, let the scoffer beware, for he, himself, may be a truer scientist than the man at whom he scoffs.

## Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 149.)

### JOINING THE NATIONAL IN A BODY.

Pres. York—While the tellers are counting the ballots we may as well proceed. What about joining the National in a body?

Dr. Miller—I move that this Association as a body unite with the National.

The motion was seconded, put, and carried.

Pres. York—The secretary tells me that this is Dr. Miller's time for an address. I don't know whether he brought it with him or not. I know he brought his wife!

Dr. Miller—I made my address several times this afternoon, and probably will repeat it before night.

Pres. York—We will take up the next question.

### SQUARE OR TALL SECTIONS—WHICH?

"Which is preferable, square or tall sections?"

Pres. York—I think Mr. Huber Root could answer that pretty well, judging from what he knows about them.

Mr. Root—I don't know; it is a hard question to decide at all. I should prefer to let each one decide that for himself. I don't think that one man or one company of men could decide that for anybody. I think half would want square and half would want tall. It doesn't seem to me that we can decide that without an actual test.

Pres. York—How about Missouri, Mr. Leahy? Do they care anything about it down there?

Mr. Leahy—Unfortunately for Missouri we haven't had any honey this year. We sell more of the square sections than any other kind, but I attribute that largely to the hives. In the different States surrounding us they are fitted already for the square sections. I favor the taller sections myself, providing that they hold about the same as the  $4\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{1}{2}$  sections. The Baldwins, in Missouri, have been large producers of comb honey. They use a section  $4\frac{1}{2} \times 5$ . They get a little more for it, because people who buy it think they are getting a little more for their money. It is a larger section. I believe that we are drifting toward the tall section. My ideal section is the  $4 \times 5$ . I would recommend that size.  $4 \times 5 \times 1\frac{1}{2}$  is my idea of the ideal section. Then there are many that won't like to change their supers for the benefit that will come from a tall section. I do not like a real narrow, tall section. I never heard of any one that liked the  $3\frac{1}{2} \times 5$ , although some buy them.

Mr. Clarke—I would like to get an idea from some of those who have been using  $4 \times 5$  sections in this locality, as to how their sections have been filled this season. This was a season that they can be tested. How many unfinished sections have they had this year? I mean in a locality where there has been a poor honey crop. It has been a wet season, and a good testing season for that.

Mr. Root—I just wish to say that I agree with everything that Mr. Leahy has said, and I think the  $4 \times 5$  sections are coming up, although we sell more  $4\frac{1}{2}$  square sections. Every man to whom we sent  $4 \times 5$  sections sends in more orders, and I don't know of any one who ever used the  $4 \times 5$  section who ever went back to the square, and that's taking the voice of the whole people, and not only a few.

Mr. Whitney—I have used both kinds. Two years ago I had an equal number of each,  $4 \times 5$  and  $4\frac{1}{2}$  square. The grocermen liked the  $4 \times 5$ , but when I got out a section of honey and put it on a plate, and submit it to the ladies, they say, "Give us the square section." They thought it looked better on the table than the  $4 \times 5$ . They weighed substantially alike. Of course, the  $4 \times 5$  looks more like a windowpane. From all we see, it looks as if there was more honey in it, and the grocermen like it better because they think the tall sections sell easier, perhaps, and they can make a

fraction of a cent per pound more. I think they fill just about as the  $4\frac{1}{2}$  square, no better I think.

Mr. Niver—I have been having quite an experience in that line in the last two months, buying honey up in Wisconsin. There is a transition state up there as to what was the preferred section, how they are going to change their supers. I talked it over with a good many bee-keepers, and tried to figure out some kind of a way. How are you going to do it?  $4 \times 5$  sections will not fit their supers;  $3\frac{1}{2} \times 5$  will, five rows of them; four rows of  $3\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{1}{2}$  is what we use in New York. They only fill a fancy section, weigh just about  $\frac{3}{4}$  of a pound. That's what our idea is to get. The reason for that was, that it made an even 15 cents at the price it was then at retail. We were trying to work for the grocerman. We believed that he was our best friend, and we should work to get him suited in the best way to retail. We sold these sections for 12 cents, and he retailed them at 15 cents each. We never sold by the pound. I don't believe in that kind of work. That made our old supers so that we could use them. If you use any other size than  $4 \times 5$  you have to put in blocks or wedges at the end, because it won't fit your supers, and it is a little difficult to figure and get them just right to suit everybody; but I think that  $4\frac{1}{2} \times 4\frac{1}{2}$  are away back, especially if bee-keepers want to get to the tall sections, because it seems the fashion is running that way.

Mr. Wilcox—There is just one thing in Mr. Niver's remarks that I would notice. I have not had enough experience with the two in comparison to know which is the better, but the suggestion that he produces a  $\frac{3}{4}$ -pound section, one well filled for the general market, is something worth knowing. If any great number do that it is quite possible the grocerman will seek it, and in time there will be a greater demand for that than there will be for an honest pound section, because they can sell that for a pound section. I am afraid if they do that they will either force those who produce honest pounds to come to the  $\frac{3}{4}$  section, and the public will understand the facts, and the advantage gained will be lost. The price will be adjusted accordingly. At the present time we have the  $4\frac{1}{2}$ , and it has been the standard. When it was first brought forward by A. L. Root it was an honest pound, and, properly filled, it was. It has stood better than any other could, and I really believe that it is entirely satisfactory to the honest trade to-day, and if I should attempt to sell a 14-ounce section, or a 12-ounce section, and have it called a pound, I am afraid I would lose customers. I know there is somewhat of a demand among grocermen for something that is a fraction short, and they want to buy by the pound and sell by the piece. It is rarely that they find fault with 15 ounces to the pound—15 ounces to the piece, if you please.

Mr. Niver—We once had a two-pound section, and everybody used it, and there was quite a kick when we got it down to one pound. I don't know but an honest  $\frac{3}{4}$  is just as honest as an honest pound. It is all the same. There is no pretension made in any section. When you come to the retailer he says, "Take your choice." He don't say, "Take a pound." It is just as honest to sell the man's  $\frac{3}{4}$ -pound section, and the grocers think they can make more money out of their pieces. This question of dishonesty doesn't "cut any ice" when selling by the piece. If a man says they are all one pound, and they are  $\frac{3}{4}$  of a pound, that is deception. Anybody can find it out. That old cry for an honest pound is like the political cry for an honest dollar.

Dr. Miller—Why is it that the general trade, the grocers, etc., prefer to have honey average just a little less than a pound?

Mr. Leahy—A  $4 \times 5$  section, to my notion, fits on the super better than any other to put them crosswise. There isn't so much sagging to the holder of the section, and one thing that I like about a  $4 \times 5$  section is, that where the super is not deep enough it is very easy to add a piece of wood around it. Dr. Miller has asked the question why it is that retailers, grocermen, wish to have a section weigh a little light. Any one who has handled comb honey in large quantities knows that a case of 24 sections that weigh 20 pounds net will sell quicker, and that the merchants will in some way or another get pay for 24 pounds, or he will charge just as much for a section that weighs 15 ounces as he would get for one that would weigh 16, only in the smaller way of selling a pound there is not much thought of an ounce. We make a great many cabbage crates, and if we can't make them up to weigh 23 pounds they don't want them, and I have asked them why they wanted them that way. "Well," they said, "we just make three pounds on the crate, and the cabbage is worth more than the

crate." In other words, when they sell a crate of cabbage they want to substitute three pounds of wood in place of cabbage, and the market recognizes that 20 pounds is the weight of the crate, and they force the manufacturer to make them that way or he can go out of business, and we haven't been able to make them heavy enough, so they bought heavy Southern gum, and heavy yellow pine, and when the small merchant buys his crates of cabbage they put in the crate at 20 pounds; it is customary. I don't know which would be the best way to get a plan whereby the wholesaler and the retailer can steal a little honey from their customers. I don't know whether we ought to allow them to do it. I know some consciences say, "We don't put it up that way;" and some do, and sell it quick, and get just as much per pound for it, if not a little more.

Mr. Kluck—I remember well when we had the two-pound sections, and when the 4½ x 4½ x 2 section wasn't wanted. Now we have what we call the Ideal. That is 3½ x 5, and they hold 12 ounces of honey. I have found that I can sell all my Ideal sections before I can sell any pound sections. Ask them so much a piece, well filled, and all practically alike, and I sell them all first. So much a section is a little lower than a pound, and they will take them all first, and they will all be sold first, and I think the time has arrived that we can sell the Ideal a long ways before selling the others. It is almost impossible to sell a two-pound section on the market. They all want the Ideal section, and, to my notion, it is going to be the leading section of the day. It will exactly fit an 8-frame hive. There is no fixing around to these.

Mr. Root—I would like to ask if we sold none but the Ideal if they would sell quicker than a given number of the 4½ square? Isn't it because he has two sizes, and one is a little cheaper than the other that he sells the other first?

Mr. Kluck—The other is cheaper in regard to section, but dearer in amount of honey, and they would sooner pay more for less honey than for the other.

Pres. York—For the Chicago market there is no preference in sections. You can not get any more for a tall section than for a square one. I would also say that the grocery trade in Chicago almost unanimously demands light weight. We can scarcely sell sections that weigh a full pound. The grocers want sections that weigh 21 to 22 pounds to the 24 sections. I am speaking from experience, not hearsay. I know nearly all the grocers refuse to buy heavy weights. They want them light weights.

Dr. Miller—Do they buy by section or weight?

Pres. York—They buy weight and sell by the piece. They seem to have gotten onto that trick.

Mr. Kluck—How does the Ideal section sell?

Pres. York—They are all "ideal" in one way, but we have practically no 3½ x 5 sections here. I don't believe I ever saw more than one small shipment of that kind.

Mr. Baldrige—Is it not a fact that the dealers who have light-weight sections are trying to sell their cases by the case, instead of by weight?

Pres. York—Yes, I think that is true to a certain extent. They are trying to force them to buy by the case instead of by the pound. I received a market quotation from Kansas City, where the firm had changed the quotation from the pound to the case. It was the first notice I ever received from that commission firm. I could make a confession here about buying honey by the case wherein I was badly beaten, so I think I won't say anything further about it. I know I never want to buy any more that way.

Mr. Baldrige—I was in a wholesale house to-day, and they won't sell only by the case. They want us to pay for 21 pounds as much as we would pay for 23 or more.

Dr. Miller—There is one thing that was touched on in relation to this, and that is how to change from the supers we now use with a 4½ to something that would take a tall section, and in what way would that change be made with the least expense. I think that all of the 4½ supers can be changed to 4x5, but I don't think you meant that as a case.

Mr. Leahy—If you will take them, any one of you who have the 4½ x 4½ supers, and add a little rim at very slight expense, then you are ready for the 4x5 section. I don't believe there is any other way that you can change from the square to the tall section.

Mr. Niver—I would like to ask Mr. Leahy what width he would make his section?

Mr. Leahy—In speaking on that subject, I said my ideal section was 4x5x1¾.

Mr. Baldrige—With or without separators?

Mr. Leahy—If I were going to use them myself I would use separators, but I know very prominent bee-keepers who use them without separators, and produce very nice honey

by using starters. I would use them with separators, but not a 12-ounce section, but one about 15 ounces.

Dr. Miller—I think 4½ x 5½ would bring you about the same as 4½ x 4½.

Mr. Wilcox—I would like to ask Dr. Miller, or any other man, would there be a gain or a loss in using a thin section as against a thicker one, that is, in the storage, in the cost of it?

Dr. Miller—I don't know; that's easier asked than answered. I try to carry, too, to a considerable extent. I think there is a loss. I think it will cost you more to store the same weight of honey in the tall sections than it will in the square. I am pretty sure I can say that far. It will cost more in the first place, you will have to use more foundation; and when you make a thinner section it costs you more unless you go beyond a reasonable thickness.

Mr. Niver—On that point I have had a good deal of experience. In our locality we find that the thin section not to exceed 1½, they will cap and finish far better than they will a thick section. Our 1½ we threw out because they must draw it out and carry the honey. They will carry it much quicker and cap it quicker, that's the reason we changed to a tall section. The bulk of our honey comes in August, and in order to get them finished and fit to sell, and capped over, we found it was to our advantage to have a thinner section, because the bees would cap them so much quicker in a little cool weather; but it might not be so in other localities.

RESULT OF THE ELECTION.

The election of officers resulted as follows: President, George W. York; Vice-President, Mrs. N. L. Stow; and Secretary-Treasurer, Herman F. Moore.

Contributed Articles.

Natural Swarming—Formation of Nuclei.

BY G. M. DOOLITTLE.

A GAIN, as my custom is during the long winter evenings, I have been going over the summer numbers of the bee-papers, to see if there was anything of importance missed in the hurried reading necessary during the summer months, when there is so much to do. In this reading I came across something from the pen of one of our most practical men, which seems more like the mistake of a novice than otherwise; but as it appeared in the American Bee Journal, and so far as I have seen, has not been noticed, I think I will call attention to it, as it may help some beginner to form correct opinions, and know more of how natural swarming is conducted. What I allude to reads as follows:

"Thus [when a prime swarm issues], the able-bodied members of the hive, accompanied by the queen, leave for a new abode, allowing the young bees to remain and rear a queen. Usually the preparations for emigration are begun several days ahead by the rearing of queen-cells, and, when the bees leave, the young queen is about to hatch."

In nothing pertaining to bee-keeping have I spent more time and study than I have on natural swarming, and if the above is right all of my study has been in vain. I find it this way:

When the colony becomes inclined to swarm, the bees form embryo queen-cells in which the old or mother queen deposits an egg, one in each, that are to produce queens. In due time these eggs hatch into larvae, which are fed royal jelly till the cells are sealed over. With the sealing of the first queen-cell (or cells) the swarm issues. This is the rule, and the exceptions are that the swarm sometimes issues on the day the eggs are laid in the queen-cells, or at about the time the first of the queen-larvæ hatch.

Only under conditions of unfavorable weather have I known this rule and the exceptions to be violated. With the sealing of the queen-cells we have seven days intervening before the young queen emerges, so that it could not possibly be said that "the young queen is about to hatch." The only time when it could be said, would be when the swarm was kept back by foul or unfavorable weather. Where any of the first queen-cells are sealed between one

o'clock p.m. and six o'clock the next morning, a swarm may be expected during the next nine hours, if the day is favorable. Should there be high winds, cold or rain, the swarm will stay quietly in the old hive, and if such weather continues unabated for one, two, three, four, five, six or seven days, the colony may keep these queen-cells, and swarm on the first favorable day that comes; in which case should they be kept back from four to seven days, it might be truthfully said that the young queens were about to hatch or emerge from their cells. But not one swarm out of 500 ever issues under these circumstances, for by the time three or four foul days have occurred, the bees begin to feel poor from the lack of honey coming into the hive, give up swarming, tear down the queen-cells, and carry the embryo queens from the hive. But I have known, in one or two cases, the bees to preserve these young queens under unfavorable weather till the eighth day, when one or more of the young queens would emerge from their cells soon after the swarm had left; and one of these cases was this last summer, during which it rained 28 out of the 30 days in June, and 24 out of the 31 days in July. Then the writer says that the "young bees" are allowed to remain and rear a queen.

We often hear that the old bees go with the swarm, and the young bees remain in the old hive. This is as I find the matter: Bees of all ages, except those so young that they can not fly, accompany the swarm, and those of all ages stay with the old colony. Hundreds of times have I seen the ground in front of the hive covered with bees from six to ten hours old, all white and fuzzy, and too young to fly, that had tried to go with the swarm, and I never yet hived a swarm but what I could find hundreds of these young bees just a little older, enough so that they could barely fly, hanging in the cluster with the other bees, some of which were so old that their wings were nearly worn off. Nature makes no mistakes. If only old bees accompanied the swarm, these old bees would die of old age before any young bees would emerge from the cells in the newly-formed home, for where bees build their own combs, as they always do when combs are not supplied by man, it must be 23 to 24 days before many, if any, young bees appear, and this is more than half of the lifetime allotted to worker-bees at this season of the year.

#### DIFFERENCE BETWEEN PRIME AND FIRST SWARMS.

On page 539 (1902), I see I am asked to tell "what is the difference between a prime swarm and a first swarm." As I understand it, a prime swarm is a swarm that is perfect, or at its best at the time of issuing, or such a swarm as we have been talking about in this article, where the mother queen accompanies the swarm, which is composed of bees of all ages. A first swarm may be a prime swarm, and it may not be. In cases where the old or mother-queen dies in or about the swarming season, the bees will proceed to rear a queen from the brood left after her death, when, in due time, the first young queen will emerge from her cell and lead out the first swarm, which would be to all intents and purposes an *after-swarm*, except that it might have a larger number of bees with it than most after-swarms have.

If I wrote that a "prime swarm is often erroneously called a first swarm," such was done without fully considering the form of expression I was using. It should be expressed that a first swarm is often erroneously called a prime swarm.

#### FORMING NUCLEI.

On page 583 (1902), is an article from the pen of Dr. Miller, in which he conclusively proves that in his locality, and with his bees, it is possible to form nuclei from bees and combs taken from a colony having a laying queen, without taking any precaution as to keeping them from returning to their old home. In my former articles on this subject, I told just what had happened with me when I had tried such a plan, and I had supposed that bees would act the same with other people as they did with me, so, perhaps, I was too sweeping in my assertion, that were two bushels of bees taken from a colony having a laying queen, and placed in a new hive on combs of brood, without any precautions being taken, they would all stampede for home without leaving enough to form a decent nucleus. And that was just as I have found it, in conducting scores of experiments along this line, only the two bushels of bees were not generally used.

But last season gave me a surprise. As it rained nearly all the while during the month of June, when I must form my nuclei for queen-rearing, and not having enough queenless bees to form what I wanted, I, one day in my

desperation, formed some nuclei in just the way Dr. Miller says he did, and plenty of bees staid for them to "hold the fort." This seemed so strange to me, in view of my former experience, that I set to thinking, and I remembered that it had been over a week since the bees had flown, and for this reason quite a share of the bees taken did not know of any other home than the place they were put in. Besides this, it kept cold and stormy so they could not fly under three days after I formed these nuclei, so that this added much to their disposition to stay "where put."

But later on, when the bees were flying every day, I tried again in the same way, and had the same difficulty that I always had, of going to the nucleus hives the next morning only to find the combs deserted, except a few very young, fuzzy bees, the most of which had emerged from the brood in the combs given them.

I am not positive, but the reading of Dr. Miller's article above referred to, looks as if he might have formed his colonies (if not nuclei) by taking bees from several colonies having queens, and putting them together to form new colonies. If he did this, I should expect them to stay much better, for where I wish bees taken from a colony having a laying queen to stay where I put them, I take the bees from several colonies, mix them all up, and then form a colony of these mixed bees (small or large), and the larger part of them will adhere to the combs of brood in the new location. This mixing process seems to disconcert them, causing them to be so confused that they forget their anxiety to get back home, until they become accustomed to the surrounding circumstances. ## No. 3—The Hive Problem—More About Size and Shape.

BY R. C. AIKIN.

THERE is no doubt in my mind as to the failure of the present form of hive to fill the bill in results. As I have shown in the two preceding articles, the regular Langstroth hive is not as fully suited to our needs as might be, for wintering it is too wide—or rather long—for its depth, and is not easy to contract or expand. However, I believe if bee-keepers would use either 6 or 7 frames to the chamber, filling out the remaining space with dummies or followers, then at all times outside of the harvest flow carry them two deep, that better results would be accomplished.

I have for several years advocated the 10-frame hive for this territory, doing so because the 8-frame hive was too small. I have not changed my mind in the least as to size except to favor even larger than the 10-frame; I now think that very often a 12 frame is not any too much. I consider the shape of the Langstroth hive as not satisfactory, because it must be too large in its top surface to get proper depth without getting the hive too big during the harvest, so as a compromise, and to continue the use of that hive, I doubled up, thereby getting depth without enlarging the super surface. It is more natural for the bees to have the depth about twice the width, in any event have the depth considerably more than width and length. The Langstroth frame is too long, but used as I have indicated, two sets deep, it is not so bad.

One reason why I am adopting the 8 frame width, is because its width approximates the proper proportion as to height when the hive is two stories high, or one story with 2 or 3 supers on. A two-story Langstroth hive, whether the same depth is in brood-chambers or equivalent in supers or combination, is about 20 inches. If a little was cut off the end of the hive and put on its height, it would be almost ideal. With the hives of these proportions I am confident we can get better average filling of the supers, and there being but 24 sections instead of 28 they will be filled and ready to come off sooner. If one wants to keep supers on longer they can be raised and others put below, yet the travel over the finished sections raised to the top is reduced to a minimum. Still another advantage is that when a super is raised and a fresh one put under, work will be pushed more rapidly in the new one, and work going on freely in the super always lessens the crowding of the brood-chamber. If a colony can once be gotten to work in the super, we have in a very large degree gotten the control of that colony to keep down swarming, and to get steady and good super work.

To accomplish more nearly what I have just been outlining as to shape of hive, I am adopting a new divisible-

chamber hive, each chamber to have the capacity of about 4 Langstroth frames. In width it is the same as the 8-frame dovetailed, and its length 16 inches. The net measurements are 5 $\frac{1}{2}$  deep, 12 wide and 16-16 long. The frame is 5x16, usual spacing and closed-end standing-style. The reason for adopting this size is that it will conform to the 4x5 section. I believe I can get better finish in the 4x5 section than in the 4 $\frac{1}{2}$ x4 $\frac{1}{2}$ —it conforms better by being higher than its width. If the sections would fit as well, and lumber would work as well, and covers were as easily made for a wider hive as for the narrower, I would prefer to have the brood-chamber the same in width each way, but 24 sections gives me so close to the ideal that I have settled on that shape—12x16 for length and width, and a 5-inch deep frame. Six-inch lumber will cut either super or brood-chamber, and the same body is to be used more or less interchangeable and for either purpose.

In using such a hive I have found some things that would not be expected. Suppose I have a swarm onto sections of this hive—its capacity 8 Langstroth frames—work well, as usual, be begun in the top section, and almost immediately I can put on a super and have it occupied. There is a tendency to work upward from the starting point, or rather to work above it. As I understand it, it is this way: The colony having started in the top or second section of the brood-chamber, if a super be then added above and honey is being stored, they feel that they ought to store the honey above the brood that is being reared, so that in practice I have had, when swarms were hived, the colonies to fill one section of the brood-chamber and one or more supers, and that when there was an empty brood-chamber below of 4 Langstroth frames capacity. I think it is unusual to get much super work over a set of frames in the Langstroth hives until there is no more room below in which to store.

The main points are in having a hive that conforms to the natural conditions as much as possible—one that when there is no super on will be to the best advantage and liking of the bees. As supers are on but a small portion of the year, why not have the hive so it will be normal the whole time, if possible, and not one or two months out of the twelve, and these one or two the very ones in which there is the less need of economy of heat, and of conformity to instinct and inclination of the bees. The greatest need, and the time that taxes the apiarist the most to succeed, is in the wintering and springing—if only we can get the bees for the harvest we can manage the harvesting problem. Give me the hive and system that will put more bees in the field for action in time for the flow, and I will very largely increase my profits. The great problem is to get ready for the harvest, and I want the hive that will help in that direction; that done, I will get the honey.

If Mr. Doolittle reads this he will no doubt try to ridicule my ideas, and say he doesn't want his bees brooding sticks and spaces as they would have to do when there are so many frames, and bottom and top bars all through the hive. I do not want them there, either, I would gladly do away with them if I could, but how can I? The same width and depth of hive serves the bees just as well if there be no sticks at all from cover to floor, but we cannot contract nor ever make a success of comb honey with the constantly deep brood-chamber, at least with present knowledge. I have used frames as deep as 15 inches, and as shallow as 4 $\frac{1}{2}$  inches, outside measure, and I am making, and have made, a success of so very shallow frames. I have for several years had bees on a 4 $\frac{1}{2}$  deep frames, and they make colonies equal to anything on Langstroth or Gallup frames. The sticks are an aggravation, and the people who so strenuously object to them do just as Mr. Doolittle does—have two sets of sticks between every two supers.

Mr. Doolittle kicks about a few sticks in the brood-chamber, and not so long ago stormed about the thick top-bars to brood-frames, but now he uses a great quantity of lumber in his top-bars and adds still more to it by having a space above these bars and above that another set of sticks before the bees come to the sections; and if he wants to put on a second super two more sets of sticks are between the first and second sets of sections. Objectors to the sticks and spaces, all overlook the fact that usually the colony is confined to the space between two sets of sticks at the season of the year when the economy of heat is most needed, for the greater part, and when the colony becomes strong enough to cross the sticks and cluster on both sides of them, then they can rear brood in a ten-bushel box about as well as anywhere.

I am not advocating a wholesale change of hives. I am not yet throwing away other hives to adopt the new-fangled divisible brood-chamber hive. I am using both 8 and 10

frame dovetailed, and other styles of Langstroth hives, American frames, and several others. It is after having used a great variety in style and size of hive and frame that I come to the conclusions that I have, but having seen the demonstration of the principles, I point out to the fraternity the findings that all who can may benefit thereby. There is a future for the shallow sectional style of hive which becomes in fact a large hive, but it is not going to put all other hives in the fence-corner at once. I am confident that those using 8-frame hives can make good use of that style and get the practical application of the large-hive principle just as I have out-lined by using two stories and then contracting, and I firmly believe that in nine cases out of ten it will be found quite profitable if properly applied.

The wintering troubles in the ordinary hive are in many cases largely overcome by the use of cellars, but the large hive and colony will go far toward solving the cellar-problem. I note that I am by no means alone in the elastic-hive question, and in the large-hive matter there is a host of believers. Mr. Doolittle has for years been advocating the same principles, but reaches the goal by another route. Larimer Co., Colo.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Starting in Bee-Keeping.

I am suddenly thrown on my own resources for support, and as my home is in a rich alfalfa district I believe I could do well keeping bees, but I do not understand the business, and there is no one here from whom I can obtain instruction. I write you to know where I can go for thorough instruction in all departments of the business.

Would it be best to try for a situation with a skilled apiarist? I want to devote my time to the work, and get a practical knowledge of the business as thoroughly as I can, and as soon as possible. MRS. E. K. HOFFMAN.

Phillips Co., Kan., Feb. 20.

You are fortunate indeed to be in a rich alfalfa district, if you are going into the bee-business, as large crops of beautiful honey come to bless those that live in the alfalfa districts. But there is another thing to be considered: Is the ground fully occupied by other bee-keepers? If so, it would be trespassing for you to start another apiary. It may be that the coast is entirely clear, in which case you are fortunate.

In some of the State agricultural schools they give instruction in bee-keeping, but I do not know whether they do or not in Kansas.

I think it would be the very best thing you could do to try for a situation with a skilled apiarist. Of course, the nearer home you could obtain such a position the better it would be for you.

You might try putting an advertisement in the American Bee Journal. I should think that would be the quickest way to obtain such a situation.

There are many things about the business that you must learn from the bees themselves, and if you are fortunate enough thus to get the benefit of the knowledge of a skilled apiarist, it will no doubt save you many dollars and cents. In the meantime, I should advise you to put in your time until spring studying a text-book, getting as thoroughly posted as possible in bee-lore. It will be a great help to you.

### Water for Bees.

It seems a little out of season to talk about watering your bees, if, as in a good many localities, they are snugly housed in the cellar at the present moment. However, it is well to anticipate their wants. Indeed, there may not be any anticipation in the case where the bees are wintered out-of-doors. Just as soon as there comes a day warm enough for them to fly, one of the first things they will do is to start in search of water.

Bees are hard drinkers, and it is a matter of some importance that they have easy access to plenty of pure water

without being obliged to fly some distance to secure it. Especially is this true in the early spring when cold winds, sudden changes in temperature, etc., work such havoc with our bees. Water they must have, and if they do not have it supplied near home they must seek it elsewhere.

More bees are lost in the early spring by flying some distance, becoming chilled, and never getting back to their hive, than some bee-keepers are aware of. We don't want anything that will induce them to take long flights, much less anything that will oblige them to.

Bees are largely creatures of habit, and when once they have established a drinking place it is not so easy to change them from it. And one of their favorite selections is the watering-tank, causing much annoyance to stock, and to the people taking care of the stock as well. It is also a great nuisance to have them around the well or cistern pump. Especially is this the case if there are small children in the family.

All this bother may be avoided if we select their drinking place for them, and get them started in the right place before they have learned to go anywhere else. This is not difficult to do. A large jar filled with water, with a number of pieces of wood put into it for the bees to alight upon (if they are somewhat rotten all the better), is all that is needed to make a good watering place. If this jar is kept supplied with water after the bees once get started there will be no more trouble about their bothering you anywhere else. It is a good plan to put a little salt into it once in a while. Then it will not be a breeding place for mosquitoes, and the bees seem to like it better when it is a little salty.

## Questions and Answers.

CONDUCTED BY

DR. C. O. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

### Feeding Honey from a Dead, Mothy Colony.

I am a beginner in bee-keeping. I bought 2 colonies last October, but I had to kill one colony on account of having so many moth in it when I bought them. I have 6 store-combs half full of honey, from the hive of the colony I killed. Would it be wise to keep the combs for a swarm to start with, or would I better give it to the other bees to empty the comb?

PENNSYLVANIA.

ANSWER.—The probability is that it will be better to let the colony have the honey for spring use.

### Absconding Colony—Observation Hive—Weak Colony—Keeping Queens.

1. June 26, 1902, I caught a swarm in the pasture on a fence-post, and I lived them in an old box, about 12 inches wide and 2 feet long, and 8 inches high. I carried it home, and when I got there I turned the box upside down and the bees began to work there the same day, and 8 days after the first day the box was full of combs and some brood. Then I moved them about 2 feet from its old stand, and put a new dovetailed hive in its place with 8 Hoffman frames and division-board; then I took the box and dumped all the bees in front of the new hive. They began to work there the same day, but the other day they went to the woods. It was a big swarm of black bees. Why didn't the bees stay in the new hive as they did in the old box?

2. I have an observation hive that holds 1 Hoffman frame. I will put a frame with wired comb foundation in that hive, and have a little swarm in there, about June 26. Do you think they will rear brood and send out a swarm the same year they are hived?

3. Whom is Finland under? and what is the name of their King? Who is the King of Norway? Who is the King of England?

4. I had a weak colony of bees this fall, and put 12 pounds of uncapped honey on top of them, and on top of that a super of maple leaves. I put the colony in the cellar where the temperature is from 40 to 45 degrees. Do you think the bees will winter all right?

5. How long can I keep a queen before introducing her to a colony, after I receive her by mail? Where should I keep her?

MINNESOTA.

ANSWER.—1. If I understand you, the bees were put in the hive 8 days after June 26, and they staid there till "the other day," or about the first of February, as your letter is dated Feb. 9. The only reason I can suggest why a colony should desert its hive in the middle of the winter is that it was a case of starvation, or "a hunger-swarm." But I have some doubts about your having had weather warm enough for that, for their has been no day in this region warm enough for bees to

fly since early in the winter, and it is not generally warmer in Minnesota than here. So it is quite possible that I do not understand correctly, and, if so, please explain more fully and I'll try again.

2. They will rear brood, and they may send out a swarm, but the chances are against the latter.

3. These questions are outside the scope of this department. Not kings, but queens, are to be discussed here, and only those queens as are found inside of such palaces as measure less than two feet in each direction.

4. Maybe, and maybe not. Getting down to 40 degrees is not so well as to have it warmer. Make sure the bees are in the honey; for a cluster of bees half an inch below the honey, at 40 degrees, would starve.

5. I suppose you mean keep her in a cage. She may be kept a month or less or more, the time varying greatly. She should be kept somewhere where there will be summer temperature.

### Cutting Out Queen-Cells and Swarming.

How would it be to cut out all of the queen-cells but one before they swarm? Would they swarm more than once then?

SUBSCRIBER.

ANSWER.—It might make some difference, and it might make none. A better way is to cut out all cells but one after they swarm. If only one is left there will be little danger of any more swarming.

### Managing Virgin Queens.

Please tell me how to manage the virgin queens while taking their wedding-flight. Where a person wants to rear a few for his own use, say five or six will hatch from a choice queen and they take their flight in three to five days, one could be mated, but how about the others, and holding and getting them ready to be introduced to dark colonies, where the entrance-guards are on?

IOWA.

ANSWER.—The only way is to have each virgin queen in a separate colony or nucleus. If you have several in the same hive, there will at once be a fight to a finish, at least until all but one are finished.

### Testing Honey for Adulterants.

Is there any simple way of finding the presence of glucose or other adulteration in extracted honey? "A B C of Bee-Culture" has a simple test for wax. There is a lot of honey on the market, in this vicinity, sold for pure honey, but some of us are unbelievers, and would like to test it.

MASSACHUSETTS.

ANSWER.—I know of no simple way of being sure whether a sample of honey is pure. One of the German bee-journals has for some time had a standing offer of I think not less than \$200 for a simple test that could be relied upon, but no one has secured the prize.

### Transferring Bees Ground-Cork for Winter-Packing—Observation Hive—Bee-Literature.

I am very much of an amateur at bee-keeping, 16 years old, having purchased my first colony only last fall, but I intend to go into the business more extensively as soon as possible.

1. My colony is in an odd-sized frame hive, and I wish to transfer to a 10-frame hive in the spring. Would it work if I were to get the queen and most of the bees into the new hive on full sheets of foundation, put a queen-excluding zinc between, and put the old hive above the new one? Would the bees take the honey below, or would the queen fill the cells as fast as made?

2. How does ground-cork rank as a winter-packing material?

3. Do the sides of an observation hive have to be covered with some opaque substance, or will the bees allow the light to penetrate their domicile at all times?

4. I have my hive facing the east. Would the bees do better in the summer if facing the south?

5. I have as reference bee-book "The Honey-Bee," put out by the Department of Agriculture, which seems to cover thoroughly all the essential points. Farmers Bulletin No. 59 on "Bee-Keeping" may be had for the asking, and is worth having. The larger book costs only 15 cents.

6. In Chamber's Encyclopedia I see this statement: "The best and newest honey is a clear fluid contained in a white comb, while older honey is of a yellowish and even reddish tint." Does honey in white comb change color with time?

MINNESOTA.

ANSWERS.—1. Yes, it will work all right, only you must wait till the old hive is pretty well filled, perhaps about the time white clover is first in bloom. It matters little whether you get any bees below, if you get the queen there the bees will take care of themselves. Still, it may be a little better to have a fair force with the queen from the start. It is not likely that any honey will be carried down. It will rather be carried up, and as fast as cells are emptied in the upper hive by the hatching bees they will be filled with honey.

2. One of the very best, if not the best.

3. It is usual to keep the hive darkened when not under observation, but not absolutely necessary. Perhaps the bees will daub more propolis on the glass if the light be continuous.

4. When you get a second colony you can try it and see. I doubt if you will find any difference.

5. As I look out of my window just now, I see the ground covered with snow. If I were to say that all points in Illinois were covered with snow, you would be likely to tell me that I must not conclude that, just because there is snow as far as I can see. Just so as to all the essential points of bee-keeping. The works you mention are excellent as far as they go, but as you journey farther in the realm of bee-keeping you will find many points not covered by them, some of these points being essential to the best success in bee-keeping. I think I will be doing you a favor to advise you before your apinary attains very large proportions to secure one or more of the excellent text-books that cover the ground more fully.

6. Between you and me, "George," that doesn't sound as if that cyclopedia knew much about honey. Comb changes its color with time, if left in the hive, but when the honey is kept in good condition, either in or out of the hive, it remains of the same color. There is honey that is "of a yellowish and even reddish tint," but it has that tint when first gathered by the bees.

One who at 16 writes so neat a letter is likely to make a successful bee-keeper, for neatness is one of the most important things in bee-keeping.

### Caging a Virgin Queen—Bees Died in Hive.

1. How can a virgin queen be caged and held before being mated?  
2. I have 18 colonies, packed and well protected out-of-doors, but I just left the supers on the same as in summer. Now I notice 5 colonies are dead; they had enough honey to have lasted them until spring. They are in clusters between the frames and combs, just the same as though they had frozen to death. I began to rake the dead ones out with a stick, but the odor was so bad I could hardly work with them. Is it possible it is dysentery? I am sure I do not understand it, although it have worked with bees for 15 years.

ILLINOIS.

ANSWERS.—1. Perhaps from one to three weeks. But it is better to have the time just as short as possible. Caging doesn't do a virgin queen any good.

2. Yes, it is very possible dysentery or diarrhea is present, although it is hardly possible that the honey is up in the super where the bees couldn't reach it, and so they starved to death. But in that case it hardly seems the odor should be so bad.

### Taking a Colony Out of a Tree—Foul Brood.

1. I have found a colony of bees in a tree, about 15 feet high. What is the best way to get them out of the tree without hurting the bees?  
2. Can I take the bees out of the tree in February? If not, when is the best time?  
3. How can I tell when a colony of bees has foul brood?

MINNESOTA.

ANSWERS.—1. When it is warm enough for bees to fly you can fly the tree and then split it open, providing the fall does not split it. Better still, if you are willing to take the trouble, and conditions are favorable, cut off the tree just below where the bees are and let it down with a rope. Perhaps you can first cut off the tree above where you think the bees are, making it easier to let down.

2. If you fell the tree, better wait till it is warm enough for the bees to fly. If you cut or saw it off, letting it down carefully, you can do that in February; and if cut above and below the bees you may be able to haul the section of the tree with the bees to your home, setting it up as a hive to await warmer weather before getting the bees out.

3. You can tell by examining the brood to see whether you find present the symptoms described in your text-book.

### Getting Bees From a Roof—Hoffman Frames—Increasing Fast—10-Frame Hive.

1. I have a colony of bees in the roof of a house. How can I have them in a frame hive without taking up the roof?  
2. What time would be the best to transfer them?  
3. How would you winter bees on the summer stands?  
4. Are the self-spacing Hoffman brood-frames the best?  
5. What is the best way to increase bees fast?  
6. How would the 10-frame dovetail hive be for comb honey?

ILLINOIS.

ANSWERS.—1. That depends altogether upon the circumstances. It is possible that there is no feasible way without taking up the roof. It is possible that you can get at them from inside without the least difficulty. If so, give them enough smoke so you can cut out the combs, then fasten these in frames, get the bees on them, making sure that you have the queen, then, when you've got all the bees, close the hole or holes through which they have been entering, so that not a single bee can enter.

2. Probably it would be well to do so as soon as the weather is warm enough for them to fly nearly every day.

3. Study up carefully all that is said on the subject in your text-book, and then adopt the measures that seem best suited to your conditions. If anything in the text-book is not entirely clear, ask all the questions you like in this department. As you are only a little north of latitude 41 degrees in Illinois, it is possible that bees would winter with very little protection of any kind, only so that there be something to prevent the wind from blowing directly into the entrance.

4. If bee-glue is not troublesome where you are you will find them excellent. If glue is plenty, they are bad.

2. There are a great many different ways of artificial increase, and what is best for one is not always best for another. If you are experienced sufficiently you will find the nucleus plan good. It would be out of place to give a full treatise on artificial increase in this department, and you will do well to study up the principles in your text-book. You will find the subject quite fully treated in the book "Forty Years Among the Bees."

6. For many it is excellent. Some like a still larger hive, but in that case they use for part of the year two stories of 8-frame hives.

### Question on Queen-Rearing.

On page 760 (1902), Mr. Bartz has an article on queen-rearing. What is his object in using an excluder under the whole hive instead of an entrance-guard or queen-trap? MISSOURI.

ANSWER.—I don't know what his object is, but the plan is good. It may be that he does it because the bees will have greater freedom than merely to have the entrance closed with excluder-zinc. Of course, the mere closing of the entrance with the zinc would prevent the issuing of the queen just as well, but it would give a better chance for air to have the excluder the full size of the hive and the entrance under it, especially if there is a deep bottom-board; and it would allow still better ventilation to have both hive and excluder raised an inch or so by a block under each of the four corners.

While you ought to secure excellent queens by the plan proposed, you must not be disappointed if in some cases the bees become dissatisfied with the queen for the continued failure to swarm, thus causing the loss of the queen. Neither should you expect to have queens as prolific as those mentioned by Mr. Bartz. Indeed, I think there would be some mistake if he means that each of his queens keeps 40 or 50 Langstroth frames filled with brood.

### Pollen in Sections of Comb Honey.

1. What is the very best plan for a comb-honey producer to practice in order to keep pollen out of the sections?

2. Is it caused by hiving swarms on starters only? If so, what can we do to prevent it? I had quite a lot of very nice sections ruined with it the past season. WISCONSIN.

ANSWERS.—1. I don't have very shallow brood-frames. Anything that tends to have the queen lay in the sections encourages pollen there, so queen-excluders are good to keep pollen out. But you don't need queen-excluders. I don't use them, and perhaps not one section in a thousand has pollen in it. Have thick top-bars, and fill the sections full of foundation. The thick top-bars make the queen less likely to go up. If you have only small starters in sections, the bees will build the drone-comb in them, and then the queen will go up to lay in the drone-comb, and pollen will follow.

2. Yes, if you have a swarm on small starters and give it the supers with sections well under way, the queen will be quite likely to go up in the supers. And she is likely to do the same thing if your brood-frames are filled with foundation. Either use a queen-excluder, or else don't give the supers till the bees have made a start in the brood-chamber and the queen has begun to lay there.

### Weight of a Colony—Honey Canding in Unfinished Sections—Taking Bees from Cellar.

1. How much is the doretailed hive—honey, comb, bees, etc.—supposed to weigh just before putting them into the cellar?

2. Is there any danger of the honey canding in unfinished sections before time for use next spring?

3. Is there any danger of the moth-millers getting in them? I have them in the supers all ready for use, stacked up in the honey-house. If so, what shall I do to prevent it?

4. When is the proper time to take bees out of the cellar here in Wisconsin?

5. How far apart is it best to have bees on the summer stands? and how far up from the ground?

6. What do you think of this locality (Polk Co.) for keeping bees? WISCONSIN.

ANSWERS.—1. I want my 8-frame hives to weigh at least 50 pounds. Ten-frame hives ought to weigh 100 pounds more.

2. Yes, you may safely count that every one will candy.

3. There is no danger of their making a start at this time of year, and if they are where they will freeze, that will kill not only the moths and the larvae, but the eggs as well.

4. About the time of the maple leaves are in bloom is a favorite time, providing the weather seems warm enough at that time.

5. Raise them 3 inches or more above the ground, and set them 6 feet apart from center to center each way, providing you have abundance of room. If room is scarce set them in pairs, the two hives of each pair almost touching each other, and leave a space of about 2 feet between the pairs, having the rows 6 feet apart or more. If you want to economize room still more, set the hives in pairs in a row as already mentioned, and then set another row close beside it, letting the hives of the two rows stand back to back.

6. I don't know anything about your particular locality, but Wisconsin, in general, is a good State for bee-keeping.

# \$1,500.00 FREE TWO \$350.00

IN GRAND PRIZES

IF YOU CAN COUNT AND PLAN YOU CAN WIN!

Each dot is a distinct dot; any little blur on the paper or in the printing is not counted. There are no double dots.

If this Chart of Dots gets destroyed in any way we will send you another if you will please return the original stamp for postage.

## SUCCESSFUL FARMING

One of the best 32-page illustrated farm papers published, will give to those who count the dots in the above diagram correctly or nearest correctly, or in case of the suggest best plan, **TWO \$350.00 PIANOS AND \$800.00 IN CASH.** Read offer carefully. **Greatest offer ever made!** You may lose \$500 by not entering contest.

**Two \$350.00 Schiller Pianos as first prizes**—one to a lady and one to a gentleman; **second prize, \$200.00 in cash; third prize, \$100.00; fourth, \$50.00; fifth, \$25.00; next, \$10.00; next, \$5.00; the next twenty-five, \$3.00 each; next thirty-five, \$1.00 each; two special prizes of \$150 each (see below). Surely out of this immense list you can win. If you can count and plan you can.**

**AWARDS WILL BE MADE AS FOLLOWS:** The person giving correct or coming nearest the correct number, gets first prize, next nearest second prize, and so on down the list. **The Pianos** will be awarded to those who count correct or nearest correct—one to a lady, the other to a gentleman. If there should be a tie in the count for any prize it will be awarded to the one of those tying who suggests best plan of counting the dots. It is likely the person giving nearest the correct count will win as it is no easy matter to count these dots.

**GRAND SPECIAL PRIZES**—To the gentleman and lady winning the Pianos will be given an **Extra Cash Prize of \$150.00 Each** if they have three advance subscription counts entered. That is, have paid two years in advance to Successful Farming \$1.00 for the two years. If you win the piano and have paid one year at 50 cents the judges will give you the piano only. If you win the piano and have **two years paid you get \$150.00 extra.** It will pay all to have the three advance counts.

**CONDITIONS**—The contest is open to all. Fifty cents pays for one full year's subscriptions to **Successful Farming**, and entitles you to one count; \$1.00 pays for two years and entitles you to three counts and makes you eligible for the grand **\$150 Special Prizes.**

**TWO ELEGANT \$350.00 SCHILLER PIANOS FREE.** These are fine prizes and in order to give ladies and gentlemen each an equal opportunity, one will go to a lady and one to a gentleman. Mark your subscription blank below stating whether you wish to enter "ladies' contest" or "gentleman's contest." Two different members of a family may compete, one in the ladies' and the other in the gentleman's contest, if they wish. Fifty cents pays for one year's subscription to **Successful Farming** and entitles you to one count, or \$1.00 pays for two years and entitles you to three counts, and by taking one on each side of what you think is the correct number you are more likely to win and besides if you win you get the grand special prizes of \$150 each which you do not get if you only have one year paid in advance. See above regard to special prizes.

**Please Note**—There is no element of chance, of guess work or lottery about this. It is a test of skill pure and simple. If you can count the dots correctly you can win. The number of prizes is so large you are bound to hit it somewhere.

**State Treasurer, Gilbertson, Mayor Brenton and a Banker, They Will Select, to Award Premiums**

To Whom It May Concern: We know the publishers of **SUCCESSFUL FARMING** and can assure anybody interested that they will pay every premium they promise and treat every contestant fairly, showing no partiality. They have asked us to act as judges toward the prizes, and we will gladly act in that capacity.—G. Gilbertson, Treas. State of Iowa, and J. M. Brenton, Mayor of Des Moines.

Nobody connected with our paper is allowed to compete. Surely with such judges all may be assured fair treatment. You are as likely to win as anyone.

**Key to Dots**—To all who wish it and will write on separate sheet of paper "Send me key to dots," and sign your name and P. O., and enclose 5 cents to cover expenses, we will at close of contest send you a key to the dots showing just how many there are. Every contestant should order one, but it is not necessary unless you wish one. No key will be sent out until close of contest.

Contest closes April 30, 1903, but set your counts in at once, the earlier the better. Contestants having three advance subscription counts entered may enter additional counts at 25 cents each. Address,

**SUCCESSFUL FARMING,**  
Manhattan Bldg, DES MOINES, IOWA

**She Won a Piano For \$1.00.**  
"You may say to all the world, I received my piano, an elegant Schiller. I never heard of you until I answered your ad, so you have no favorites. I will answer any body sending stamp.—Daisy Keller, Belle Plain, Iowa."

**A Check For \$150.**  
"Oh I am so glad. Just received your check for \$150. It proves to me that you deal fairly with all. I paid the \$150 on our place.—Wills Steinhorn, Merrill, Ia."

**First Prize—She Ever Won.**  
"I won \$100, all my own. It pays to enter your contests. They are surely conducted fairly.—E. M. Hall, Montrose, Mo."

We will send names and addresses of dozens and dozens who have won bicycles, watches, sewing machines, besides many larger premiums, to any body writing for them.

Publisher **SUCCESSFUL FARMING**, Manhattan Bldg., Des Moines, Ia.

I enclose \$..... for subscription to **SUCCESSFUL FARMING** and I wish to enter the..... (write ladies' or gent's) **Dot Contest.** (If \$1.00 is paid send three counts; if more than \$1.00, send one additional count for each \$1.00; if only 50c is paid send **ONLY ONE** count. The \$150.00 special prizes go only to those having **THREE** or more counts entered.)

My Count is: (1)..... (2)..... (3).....

Name.....  
(Have paper addressed to head of the family)

P. O. .... State.....

Remarks: My plan of counting is.....

### What Yon Yonson Thinks

Vel, ay vent to Chicago to da grate Chicago an nortvstern bee-keepers' meeting, an ay had plenty good time. All you bee-mans vot didnt gon you mist it plenty bad. An if you dont' nox next time you vil hit it da same vay ver you mist it dis time.

My goodness, ay fine out lots 'bout bees, an how to make dom lay plenty honey. An ay see lots of big bee-mans, but dom don't look so very big, an' dom don't seem to feel so very big, but dom iss plenty smart. An little bee-keepers lak Yon Yonson can yust sit still an' lern more as nobody elst. Da Nortvstern bee-keepers associating iss some plenty good thing, an if you give Mr. Moore, da man vat du da ritng, von dollar, he join you in to deiers lodge, an da N. B. K. A., hote on da same time, so po das vay ve can kill 2 burds vid a von dollar bill.

It was awful nice gurl at da convention; som rite lak sixty, an she rite down all vat dom sopt, so Mr. New York print it in Merican bee-paper.

Yon Yonson never bin to Chicago before, so after da convenshul was over, ay tank mebbly it iss better ay look around. So ay vent to stock show an' seen da hogs, cows, horses, an so on, an dom was plenty nice. So ay go to da bord of trade, ver you know dom hav so many bulls an bears. Ay dont can understand' how dom can keep so many cattels an bears together, but mebbly its 'cause it is dis different locality; but, mine goodness, ay was too late, for dom yust sed amen. Ay look roun, but ay dont' did see any cattels or bears, but ay herd feller vat sed some ting 'bout vattered stock, so ay tank mebbly dom drove dom cattles to da lake to drink, or mebbly dom bears eate dom cattles all up.

So, befor ay go home ay tank mebbly its better ay buy som leetel present for Mrs. Yon Yonson, so ay go into plenty big store an ay git some present, kine a cheep, of cours. Da klurk he akt awful nice an friendly, an vont Yon Yonson to buy hole pile ma plumy fixens, but dom dont' kin fofl Svede ma po das vay.

Vel, ay dont' got nuff change, so ay give him ten dollar bill, an he rite on a pece of paper, an he put my ten dollars in a little basket vat hang on a vire. An my for da good laud, dat basket took crasy streak an yust run away ma hole ting. "My goodness," ay say, "You dont' goan to play no Yank trick on Yon Yonson," ay say. So ay lit out' holly heoping after da basket. "Hold on da," klurk say.

"Yes, you bet ay hold on to my ten dollars, if ay ketch da basket," ay say.

Da store was ful ma vimens, but dom cleared da track ven dom see me after da basket. But dom dont' got more sens dan to laff. But purty soon ay run rite over tree vimens, an ay fell down an butup my nose in da floor. My goodness, da yust hurt lak forty blases; an ven ay git up an put my nose bak in shape ay dont' kin see da basket. But von grate, big man feller he tak bolt of me, an he say: "My goodness, hay-seed seems to be goan

down," he says. "Ay don't vont any hayseed," ay say, "but ay won't das crasy basket rot vun off vid my ten dollars," ay say.

"You cum along ma me," he say. An he talk me bak, an der was da basket an my change. My goodness, ay don't kin see vy fore da basket tak such crasy spells an run all over da store, po das vay, so ay say good by, caus I don't care to stay long vy even da furniture git crasy spells. Da klurk he mak big smile, an he say, "Cum bak agin, Unkel George." "All rite," ay say, "but if you don't vouch out da basket, mehly run avay da store an hole, buting match." ay say, "I'll keep an eye on da basket, Unkel George," he say. "My name bean Yon Yonson, an ay don't bean yours Unkel George," ay say. "But you iss a plenty nice feller, but here I nor no smart sun you, ay vont bean bif I nor no place elst," ay say.

But, my goodness, da bean lots ma peoples in Chicago, an every body da da street seems to be in plenty avay big hurry. An' dom yust go on da trot lak da was fraid some von vas after dom ma sharp stick, an' dom don't say "how de du" to nobody. An' by da depo dom mans stan aroun ma nice buggies an vont Yon Yonson to ride. An in da depo it vas plenty sine vat ay vas bime vy ay say. "My goodness, go ahead, ay vas bime vy ay say." "Don't I can see da town." Ay don't vy cumm off from white clover paster, an da grass don't grow fast nuv after my feet go to seed," ay say.

So he yust laff, an he mak goo-goo eyes at nodder vun feller, an' go on an ten to his bissen. But ay had good luck and got hom all rite.

Yon Yonson

**FROM MANY FIELDS**

---

**Good Season for Honey.**

We had a very good honey season in 1902. I had 9 colonies in the spring, increased 6, and caught one extra. I got 750 pounds of surplus honey, and sold the most of it for 12½ cents per pound, only keeping what I wanted for my own use.

Mrs. BEN FERGUSON.

Ford Co., Kans., Jan. 19.

**Cleaning Out Unfinished Sections.**

What Miss Wilson says, on page 41, about cleaning unfinished sections, affords me an opportunity to say a few more words on that subject.

1. To begin the work early in the fall.
2. To be sure to have a piece of burlap or other loose-woven cloth between super and brood-chamber, so that there shall be left only a small space above the brood-frames uncovered.
3. That the uncapping of the sealed honey be not delayed until the weather becomes so cool that the bees are compelled to stay in the brood-chamber a large part of the time.
4. I can see no advantage, but rather some disadvantage, in placing an empty hive-body between brood-chamber and super.

Although I was very successful in getting sections cleaned out in the way I have related, yet, in some instances, when a super full of sections seemed to be more than the colony needed, I would take out a part of the unsold ones and place them, about sunset, at the entrance of the hive of some other colony that needed feeding. Doing this on

warm evenings the bees would clean them out during the night, or so early in the morning that no attempts were made at robbing.

If Miss Wilson has had such poor success after trying everything that I suggested, I own that I do not understand the reason why, and ask her to review her procedure and see if something was not omitted.

Piling up supers of unfinished sections to be robbed out by the bees of the whole yard is too wasteful a method to be practiced. Rather than give a large share of the honey to the colonies not needing it, I would put the honey on all the needy ones, and then if any sections remained uncleaned near the close of the season, I would pile these up and let the bees have access to them.

Mr. Hasty's answer to "Beginner" is rather discouraging. I wonder whether Mr. Hasty leaves the sections on the needy colonies and then does nothing else. I did so once, but not any more. If the sections are not isolated from the brood-chamber, and the sealed honey not uncappped, and this work not done while the weather is yet warm, it is likely you will not get many sections cleaned out. EDWIN BEVINS.

Decorat. Co., Iowa.

### Wintered Well So Far.

Bees have wintered well so far, and have commenced to rear brood.

I can not get along without the American Bee Journal. A. W. ATKERSON, Jasper Co., Mo., Feb. 13.

### Propolisin for Piles.

I will attempt to tell "Minnesota" (page 90) how to make propolisin:

Take propolis and olive oil enough to make it soft when mixed. Put into a vessel and heat slowly until the propolis is melted, then strain through a cloth and let cool. I suppose about 3 measures of oil to 1 of propolis would be about right; if too hard, add more oil. I got the recipe in Gleanings; I do not remember the page or date. Mrs. Rousseau has made some and uses castor-oil. This is the best remedy for piles I ever knew anything about. Made with castor-oil it seems to be especially adapted for the cure of this disease. The way to use it is to cleanse the parts thoroughly with water warmed, then insert a lump at bedtime, and again in the morning. L. C. ROUSSEAU.

Ellis Co., Tex., Feb. 11.

### Fears Short Stores.

Last spring I bought 19 colonies of bees. They increased to 42 in spite of me, and gave me 500 pounds of comb honey. Two colonies starved, and another was eaten up by millers. I am afraid some of my bees went into winter quarters short of stores. Polk Co., Wis., Feb. 2. V. A. HANSON.

### Appear to Winter All Right.

I have been in the bee-business for the last 50 years, and now have more than 40 colonies. They did fairly well last winter. I winter them on the summer stands. To all appearances they are wintering all right. I am 74 years old. RILEY SANFORD.

Wayne Co., N. Y., Feb. 16.

### Dr. Gallup's Queen-Rearing Comb-Reporter.

I have been a bee-keeper for seven years, and read with delight Dr. Gallup's articles on rearing long-lived queens; also the counter articles of the breeders whom he has touched on the raw. The Docteur has set the ball in motion, and it will not stop rolling until his "unbiblical cord" theory is proved or disproved. My sponsor is a bee-keeper of 37 years' experience, and he claims, of the hundreds of queens purchased, he has never received a queen, reared by any method or breeder, that has lived more than one year. Is this unusual mortality caused by rearing from worker-larvae, or is it the sudden stoppage from laying, and consequent injury

from transmission through the mails? Let the breeders and laymen ventilate this question thoroughly. In the meantime, go on Dr. Gallup; if you are wrong you have performed a genuine service in opening this question; if you are right in your theory, you have been an incalculable benefit to bee-keeping posterity. NORTON WAGNER.  
Lackawanna Co., Pa., Jan. 31.

**Best Flight in Two Months.**

The bees are having a flight to-day, the first good flight for two months. They seem to be all right so far. J. F. MICHAEL.  
Randolph Co., Ind., Feb. 2.

**Oregon and Washington for Bee-Keeping.**

I notice on page 58 the above heading. I do not think there is any one man that can answer that question. Washington alone differs a great deal. It is a big State. While the western part of Washington, and the western part, or coast, is extremely damp; they have lots of rain, but little or no snow. The bees can generally fly all winter. Blossoms are in abundance, but weather in which to gather honey is scarce. The bees generally begin to gather pollen the last days of February and the first days of March; but usually after that there comes a setback of rain which lasts sometimes until July, with but little good dry weather. Of course, there is some good weather, but the last four or five years have been remarkably wet.

Of blossoms here that give honey we have the salmonberry, thimbleberry, huckleberry, blueberry, blackberry or blue caps, white, red, and yellow clover, dandelion and fireweed. And the trees that give honey are the vine-maple, crab-apple, barberry, soft maple, and a whole lot of others too numerous to recollect; besides fruit-trees and small fruit such as raspberry, strawberry, and blackberry. Cultivated berries do well here. It is rainiest near the coast, and diminish as you go further inland. The honey gathered, with or without water, is a good deal better than California honey; and I have sold my honey, put up in one-half gallon jars, for 60 cents per jar. This is all the information I can give about Washington, and it is also true of Oregon.

We live close to Columbia, and when we go to town we cross the river at Astoria, Ore. A map will show this is Wahkiakum Co., Wash., while Astoria is in Clatsop Co., Ore.

We have the first snow we have had in two years; it is 4 inches deep. O. K. RICE.  
Wahkiakum Co., Wash., Jan. 28.

**Fears Heavy Loss of Bees.**

My bees stopped breeding early last fall, and I fear a heavy loss this winter and spring on account of the age of the bees and the hard winter. They are on the summer stands, and have had but one good, cleansing flight during the winter. H. W. CONGDON.  
Monona Co., Iowa, Feb. 9.

**Report for Two Years.**

The year 1901 was a little better than the year before. Spring was a little backward, the bees built up fine after all, but the honey crop was very short; they gave some surplus and went into winter quarters in good condition. My bees came out in the spring of 1902 stronger in bees than they have since I have had bees, so this leads to great hopes; but, dear me, to think we should see the reverse! It was the worst spring for cold and wet weather, which seemed to blast all of our hopes. Our honey-flow comes here about the middle of June, but no honey was coming. The stores of the bees were on the decline. Weak colonies were starving and absconding their hives, leaving the brood. But all at once a change came the first week in July, when the honey came, and those colonies that had built up at that time did fair work, as it was a good flow all through July, and so this part of the country got a good crop of honey

**Tennessee Queens.**

Daughters of Select Imported Italian, Select long-tongued Monarchs, and Select Straight 5-band Queens. Bred 3/4 miles apart, and mated to select drones. after all, and the bees were in good condition for winter. So 1902 turned out all right, and I was satisfied.

I can not account for Mr. Doolittle's statement, that bees need no ventilation in the cellar more than they get through the walls. This is a puzzle to me. I have a tube in mine 8 1/2 inches, and it has not been closed one day all winter to this date. The inner door has been open nearly two weeks. The temperature is 44 degrees; a few mild days it run up to 45 degrees, and they were roaring. It was all right to open the other door at night, as it cooled them down to 38 degrees, and they were as quiet as could be; they could hardly be heard, so I do not see what I should do without ventilation. I believe that without ventilation my bees would come out and get lost on the cellar-bottom.

This winter I will make an experiment in two directions—first, in taking them in on Dec. 8 and 9, with the mercury 4 and 8 degrees below zero; second, with ventilator and inner door open; at this time they seem to winter all right, and so I hope for a wintering, and a good honey season for 1903, so that we may secure a good crop.

C. H. VOIGT.  
Keewaunee Co., Wis., Feb. 5.

**Tartaric Acid and Granulation.**

On page 78, Mr. C. J. Barber, of Monona Co., Iowa, wrote: To prevent extracted honey from granulating, I put in a Mason jar a little tartaric acid. Will he please let us know how much that is in two quarts of honey (by weight or measure)?

ARTHUR SCHULTZ.  
Dodge Co., Wis., Jan. 3.

**One of the Old Bee-Keepers.**

MR. EDITOR:—You have improved the American Bee Journal almost beyond measure. When I first took it—must be over 40 years ago—the Waggoner published in Philadelphia—it was hardly a comparison to what you have made it to-day.

I venture to say I am the oldest bee-keeper on your list; I kept bees in Pennsylvania 25 years; came here after the war (1866), bringing bees with me, making it 37 years that I have been here.

It amuses me sometimes to note how singularly some persons write about their conclusions, as if they knew it all, and no doubt, think they do, and may be correct from their standpoint, or their location; but, as a whole, or a combination of circumstances and locations, they are simply "off," and they would not believe it if the strict truth were told them. But "variety is the spice of life." Fairfax Co., Va., Feb. 9. Wm. Ulrich.

**Northeastern Wis. Convention.**

The bee-keepers of the Northeastern Wisconsin Association held their second convention at the residence of John H. Terens, in Manitowish County, Nov. 8, 1902. The meeting was called to order by Pres. Terens at 10 a. m., and was opened by the reading of the address. Fred Jacobsthal was appointed secretary *pro tem*. Fred Trapp then read a paper on "Wintering and Ventilation of Bees," which brought out a good discussion, as all present were quite interested in the subject. After the discussion a vote was taken on which is the best way to winter bees, inside or on the summer stands. Six were cast for inside wintering, and 8 for outside wintering.

A paper was read by C. H. Voigt, on "Prevention of Absconding Swarms." After it had been fully discussed, John Cohens followed with "What Hive is Best Adapted to this Climate?" He wanted the 8-frame Langstroth. After discussing that topic it showed that the majority were in favor of the 10-frame Langstroth. John H. Terens then gave a talk on, "Black or Italian Bees, Which are Better?" He did not think the Italians gathered any better honey than blacks; in his opinion the blacks would gather just as nice honey as the Italians, but he was in favor of the Italians, if for nothing else than their fine dress. A committee of three was appointed by the

president to draft a program for the next meeting. A cordial invitation is given to those who may read this, and that live near, and are interested in bees, to meet with us on the date given in the program. The State foul brood inspector, N. E. France, has promised to be with us. We hope it will be an interesting meeting.

A vote of thanks was tendered Pres. Terens for his kindness in fixing up a room in which to hold our meeting, and offering the same again, if it was good enough, which offer was thankfully accepted.

The convention then adjourned to meet again on the date given in the program.  
**FRED JACHIMSTAL, Sec. Pro Tem.**

The following is the program for the semi-annual convention of the Northeastern Wisconsin Bee-Keepers' Association, which will be held at the residence of J. H. Terens, of Mishicot, May 12, 1903, opening at 10 a.m. sharp:

1. Foul Brood—N. E. France.
2. Queen-Rearing, How Can the Most Profitable Queens be Reared?—L. C. Koehler.
3. Spring Drivelling—C. H. Voigt.
4. Which is the Most Profitable Hive for Wintering?—J. H. Terens.
5. Best Way of Marketing Honey—Fred Trapp.
6. Absconding Swarms—John Cochems.
7. Which is the More Profitable, Comb or Extracted Honey?—Fred Jachimstal.
8. Bee-Pasturage—Y. Cloupek.

**COMMITTEE.**

**CONVENTION NOTICE.**

Michigan.—The Northern Michigan bee-keepers will hold a convention March 20 and 26, in Bellaire, Antrim Co., in the Town Hall. Special rates have been secured for entertainment at the Ellis Hotel, and also the Bellaire House, at \$1.00 per day.  
**GEO. H. KIRKPATRICK.**

The Ormas Incubator.—Probably no reasonable priced incubator has a larger sale or a greater number of friends than the Ormas, advertised in this number. This machine is made of the best material, but being made in a small town where the cost of construction is reduced to the lowest point, it can be sold at a low price and yet be made of good material.  
 The sales double up every year, and now the Ormas is known all over the country as a

strictly first-class low-priced machine. It may truly be said of this machine that it is cheap in nothing but the price.  
 Mr. Banta has made a study of incubation and understands what is needed in building such a machine for the average operator. It is simple in construction, easy of operation, and sold on a guarantee as strong as such a document can be made. The catalog is a really interesting little book, and poultrymen should have it for reference. Send for it. Address: L. A. Banta, Ligonier, Ind., and kindly mention the American Bee Journal when writing.

The Titus Nursery, Nemaha, Nebr., issues a very neat catalog entitled "How to Grow Fruit" that is bristling full of information gained by years of experience in growing fruit for the market. Every one of our readers who is interested in growing fruit should have this catalog, which can be obtained by addressing the firm, free of charge. "The Queen of Apples" is well worth sending for. Special attention is paid to the "Queen of all Apples"—Virginia Beauty—a large red winter apple of the finest quality. Virginia Beauty carried off the award for the best new apple not previously shown at the late St. Louis Fair against 20 competitors. The Judge remarked, "It is the best flavored apple ever sampled."  
 Mention the American Bee Journal when writing.

**HONEY AND BEESWAX**  
 MARKET QUOTATIONS.

CHICAGO, March 7.—The demand for comb honey has been and is of small volume, prices are weak, concessions being made where necessary to effect sales. Fancy white comb held at 156/10c; all other grades of white are irregular at 139/4c; light amber, 106/12c; dark and amber, 96/4c. Extracted white comb, 66/2c; 78c; other white grades, 66/2c; amber, 54/6c. Beeswax steady at 30c.  
**R. A. BURNETT & Co.**

ALBANY, N. Y., Feb. 20.—Honey demand quiet; receipts and stock light. Comb selling, light, 15c; mixed, 146/15c; dark, 139/4c. Extracted, dark, at 74/5c. Beeswax firm, 30 1/2c.  
**H. R. WRIGHT.**

KANSAS CITY, Feb. 21.—The demand for both comb and extracted honey is better, receipts light. We quote as follows: Extra fancy white comb, per case, \$3.40; strictly No. 1, \$3.30; No. 1 amber, \$3.05; No. 2, white and amber, \$2.50. Extracted, white, per pound, 66c; amber, 66c; Beeswax, 30c.  
**C. C. CLEMONS & Co.**

CINCINNATI, Feb. 7.—The demand for all kinds of honey has fallen off considerably in the last few weeks, owing to many other sweets offered at this season of the year. Lower prices are no inducement to increase the consumption, as the demand is not there, and will not be until about the end of the month. We quote amber, it is folly to offer at lower prices. We quote amber extracted in barrels at 54/6c; white clover and basswood, 68/9c. Fancy white comb honey, 16c/lb; lower grades hard to sell at any price. Beeswax firm.  
**THE FRED W. MUTH Co.**

NEW YORK, March 5.—There is a fair demand for white comb at 15c per pound for fancy, 13c/14c for No. 1, and 12c for amber, with sufficient supply to meet the demand. Dark honey will be held up with very little sale; it is selling at about 11c per pound. Extracted rather weak and in quantity lots, prices generally shaded. We quote: White, 76/75c; amber, 66/67c; dark, 6c. Beeswax scarce at 30 1/2c for good average.  
**HILDRETH & SOBELKEN.**

CINCINNATI, Mar. 7.—The comb honey market has weakened a little more; is freely offered at following prices: Fancy white, 146/15c; no demand for ambers whatever. The market for extracted has not been changed and prices are as follows: Amber in barrels, 54/6c; in cans, 66/6c; white clover, 86/88c. Beeswax, 28/30c.  
**C. H. W. WEBER.**

SAN FRANCISCO, Jan. 14.—White comb honey, 11 1/2c/12 1/4c; light amber, 10/11c; dark, 8/9c. Extracted, white, 66c/67c; light amber, 52 1/2c; amber, 46/47c. Beeswax, good to choice, light, 26 1/2c/27c; strictly fancy light, 29/30c.

The country merchant, representative of trade interests, estimates "entire stock of honey of 1902 in the State is 15 cars," worth 5 1/2c/6c per pound at primary points, subject to a \$1.10 freight-rate to the East.

## If You are a Bee-Keeper you are Interested in Smokers.

Don't you want one that will hold fire indefinitely, and that will respond instantly with a good volume of smoke even if you haven't been using it for half an hour or more? Then get a CORNEIL or a VESUVIUS.

Have you ever been bothered by a nozzle flying open and spilling the fire just when you needed it most? Then get a CORNEIL, the nozzle of which will not fly open, or get a VESUVIUS, which has no removable nozzle.

Have you ever burnt your fingers on a hot nozzle? Then get a CORNEIL.

Did you ever have the grate fill up? Then get a CORNEIL or a VESUVIUS, which have removable grates.

Do you have trouble in lighting your smoker? Then get a breech-loading VESUVIUS.

Do you like a small, light, smoker? Try the Junior CORNEIL.

Do you like a large smoker that will not need reloading for hours? Then try a Jumbo CORNEIL.

Do you like brass smokers that will not rust? Then take your choice of a VESUVIUS or three sizes of the CORNEIL.

Do you often wish that something could be put on the bellows to give your fingers a better hold? Then try one of our smokers which are bound with folded tin in such a way as to give much better hold than any slot cut in the wood.

### PRICES.

Jumbo Cornell 4. inch	.....	\$1.25 each;	3....	\$3.45;	postage.....	\$.25
Standard " 3 1/2-inch	.....	.85 each;	3....	2.25;	postage.....	.25
Junior " 2 1/2-inch	.....	.65 each;	3....	1.80;	postage.....	.25
Vesuvius 3 1/2-inch	.....	1.00 each;	3....	2.70;	postage.....	.25

All brass smokers, 25 cents each.

## Artificial Queen-Cell Cups,

EVERY bee-keeper who rears queens by the Doolittle method, knows how tiresome it is to dip the cells; it takes time, and they are not uniform. Have you ever thought how convenient it would be to have ready-made cell cups for queen-rearing?

We have lately begun to make these by a different method altogether, whereby all are uniform and perfect. The base is thick enough to withstand any reasonable amount of hard usage, and the top has a veritable feather-edge.

We are prepared to furnish a hundred of these cell-cups to every new subscriber who sends us a dollar for a year's subscription to *Clearings*. Old subscribers may also take advantage of this offer by paying up all arrears and ordering *Clearings* one year in advance.

The bee-keepers' Bill is known as HOUSE BILL No. 356 in the House of Representatives, and as SENATE BILL No. 207 in the Senate. When writing to Senators mention the latter Bill, and when writing House members mention the former Bill. All the members of the Legislature can be addressed *State House, Springfield, Ill.*, instead of to their residence post-offices.

Now, let every Illinois reader of the American Bee Journal write at once to his Senator and Representatives, requesting them to support and vote for the Bill "making an appropriation for the Illinois Bee-keepers' Association." Write to as many other members of the Legislature as you can, in addition to your own Senator and Representatives. The bee-keepers from all over the State should simply "snow them under" with letters.

We may say that we think there is a good prospect of the Bill being passed. But the more letters from bee-keepers to the lawmakers the better.

Do it now!

GENERAL MANAGER FRANCIS OF PLATEVILLE, Wis., wrote us March 2 as follows:

I go one week to Farmers' Institutes, talking bee-culture and small fruit; and then have to stay at home a week to catch up in General Manager correspondence.

To-day I have received for dues from 28 members in 13 States—Maine to California. I have a basket full of letters to answer. Several State Legislatures I am laboring with to enact better laws of interest to bee-keepers; and a case to investigate where a city declared bees a nuisance.

No danger of the General Manager being out of a job very soon.

N. E. FRANCE, Gen. Mgr.

THE REARING OF CHILDREN is the subject of a discussion in the Progressive Bee-keeper by F. L. Thompson and Sommambull. As Mr. Thompson is a bachelor more or less confirmed, and as it is generally understood that Sonny has never waked up sufficiently to select a wife—well, we shall see what we shall see.

JOHN V. NEBEL, one of the veteran bee-keepers of Missouri, has been elected a member of the State Legislature, in spite of the fact that his opponent belonged to the party which, for years, has held the ascendancy. There's good timber for law-makers among bee-keepers.

TEXAS and UTAH are both doing good lively pulling for the next National convention. So is California.

# AMERICAN BEE JOURNAL

ESTABLISHED IN 1861  
THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., MARCH 19, 1903.

No. 12.

## \* Editorial. \*

### DEATH OF THOMAS G. NEWMAN.

About 5 p.m., March 10, we received the following telegram announcing the death of Thomas G. Newman:

AMERICAN BEE JOURNAL, Chicago.—

Father just died. Month's illness. Gastritis. 70 next September.

A. H. NEWMAN.

The following biographical paragraphs are taken from a sketch written by Dr. C. C. Miller for *Gleanings in Bee-Culture*, in 1888:

Thomas Gabriel Newman was born near Bridgewater, in southwestern England, Sept. 26, 1833. He was left fatherless at ten years of age, with three older brothers and a sister, the mother being left a penniless widow by reason of the father's endorsing for a large sum. The boys were all put out to work to help support the family. Thomas G. chose the trade of printer and book-binder, serving an apprenticeship of seven years, and learning thoroughly every inch of the business from top to bottom, in both branches.

Early in 1854 he came to Rochester, N. Y., where he had relatives; and before noon of the day of his arrival he secured a permanent situation in the job-room of *The American*. Within two months he took the position of assistant foreman on the Rochester Democrat, then the leading Republican paper of Western New York. Later on he spent seven years editing and publishing a religious paper, called the "Bible Expositor and Millennial Harbinger," in New York, and published a score or more of theological works, some written by himself. In 1864 he moved to Illinois, sold out the business, and, for a "rest," took his family to England. Returning in 1869 he located at Cedar Rapids, Iowa, where he published and edited its first daily paper. In 1872 he sold this and removed to Chicago, where he embarked in the business of publishing *The Illustrated Journal*, a literary serial printed in the highest style of the art, and magnificently embellished. The panic of 1873 ruined this luxury, bringing upon him a loss of over \$20,000.

In 1873 a friend introduced him to the Rev. W. F. Clarke, who wanted to dispose of his interest in the *American Bee Journal*, which interest was one-half, subject to an unpaid contract. This he bought, and afterward the interests of F. Grabbe and Geo. Wagner, thus becoming the sole proprietor. For a man not afflicted with the bee-fever, he cold blooded to pay more than \$29,000 for the simple "good-will" of a paper with no printing-office or supplies of any kind, shows an unbounded confidence in the future of bee-journalism. Few men, under the same circumstances, would have achieved his success. For three years he employed successfully as editors Rev. W. F. Clarke, Mrs. E. S. Tupper, and Dr. C. C. Miller, meanwhile applying himself to the study and practice of bee-culture, increasing his apiary from three colonies, purchased for experimental manipulation, to more than 100

colonies in 1879, when he disposed of them because troublesome to surrounding stores.

With a positive dislike for financial transactions, he is fortunate in his son, Alfred T., who has ability in that direction. Besides his son he has two daughters, all married, and five grandchildren.

In 1870 he went to Europe, at his own expense, as representative to the various bee-keepers' societies, and attended conventions in England, France, Italy, Austria, Germany, etc., and was awarded several gold medals for exhibitions of American apianian implements.

In no one thing has Mr. Newman shown the persistence with which he follows up any matter he undertakes, more than in his fight against adulteration, and in connection with it what he so constantly calls the "Wiley lie." Prof. Wiley, with all the weight of his official position under government, perpetrated the "scientific pleasantry" that comb honey was manufactured without the aid of bees. Far and near it was copied by the papers, the Professor looking on complacently at the mischief he had wrought, without offering a word to stop its course. Mr. Newman demanded a retraction, with no success, for a long time, but he kept up the warfare, denouncing the falsehood with ever-increasing vigor, using such strong language, and such bitter denunciations that one could hardly withhold sympathy for the poor Professor, who miserably belabored. But it is probable that nothing short of such vigorous language would have wrung from Prof. W. a tardy denial of the truth of his statement and a mingled attempt at apology and self-justification.

Notwithstanding the use of vigorous language on the printed page, in his attacks upon that which he deems unjust or false, in personal intercourse Mr. Newman is always the courteous gentleman. Hardly up to medium height, he is of strong build, and of active temperament. In convention he is a good presiding officer, and an easy speaker, sometimes rising to flights of eloquence on themes which, treated by others, would be but commonplace. C. C. MILLER.

Probably the majority of our readers will best remember Thomas G. Newman as editor of the *American Bee Journal*. He was our honored predecessor, relinquishing all connection with this journal June 1, 1892. With the exception of about one year of the eight preceding that date, Mr. Newman was our employer, and he was a good one, too. As we look back now upon those years, when we were getting hold of the ins and outs of both the bee supply and publishing business, we wonder that he could have been so uniformly patient and courteous, when we must have been exceedingly trying many times. But he was ever the same, though often suffering with physical ailments and burdened with business perplexities and cares.

Mr. Newman published the *American Bee Journal* for about 20 years, taking it at a time when the bee-business was practically "in the beginning." We believe the paper then had less than 800 subscribers. When he left it had 5000. He was a tireless toiler, and took great pride and interest in his work. He

was fearless for the right, and did all he knew to do in order to make the *American Bee Journal* of the most value to its subscribers. It was no easy task for us to follow in his footsteps, as we were then wholly unknown to the bee-keeping world. But under his direction and training for years, we were daring enough to make the attempt, even though it was a risky thing for us to do.

Mr. Newman was for two years President of the National Bee-Keepers' Association, and for about 15 years General Manager of the National Bee-Keepers' Union, which did so much to secure for bee-keeping valuable decisions and precedents in law for the protection of the industry. For years he filled the office of General Manager without remuneration, except the feeling of satisfaction that comes from knowing that one's work is done to the best of one's ability. But he also had the satisfaction of knowing that his efforts were not only successful, but appreciated by bee-keepers.

For the past seven years Mr. Newman has resided in California, where he went partly on account of his wife's health. We believe Mrs. Newman was greatly benefited, but not so Mr. Newman. For several years preceding their departure for the "Sunset State," he suffered much from la grippe, from which it seems he never fully recovered.

Thomas G. Newman is gone. The old-time leaders in the bee-keeping world are fast passing away. Chas. Dadant, Dr. A. B. Mason, John H. Martin—how rapidly they are going from the field of action. Naturally, in Mr. Newman's case more than in any of the others who have preceded him, do we feel a deep personal loss. He was our intimate friend for years, and even after they were separated thousands of miles, we still kept in touch by correspondence.

Mr. Newman's host of bee-keeping friends will look upon his picture and read these few memorial lines with sadness. They knew him well. He helped them fight their battles and win their victories. He may have made a few enemies—but who that stands for anything worth standing for has not? But Mr. Newman never held a grudge against a mortal man. He was ever kind and forgiving, and ever strove to live by the Golden Rule. In business he was an honest man; true to all; and leaves a rich moral heritage to all who knew him.

Our readers, we know, will unite with us in extending to Mrs. Newman and family sincerest sympathy in this their time of bereavement.

**Taking Bees Out of the Cellar.**—Are you making any experiments in the matter of the time of taking bees out of the cellar for a

flight and then returning them? Some advocate taking out in March and leaving out just long enough for a flight before returning. Others say take them out in April about two weeks before time to take them out for good. If you experiment at all in the matter, don't go into it to no wholesale manner, but treat at least a part of your colonies, if not the greater part, in the manner you have heretofore been in the habit of treating them. Only by comparison will you be able to judge as to the best way. Then keep watch as to which colonies seem to be in best condition at different times, especially at the opening of the harvest, and please report.

#### Those Who Have No Foul Brood.—

Probably not one out of ten, possibly not one out of a hundred, of those bee-keepers who have not personally suffered from foul brood, have sufficient interest in the matter to have read enough on the subject to give them anything more than the most vague idea about it. Then when the disease actually appears in a colony belonging to such bee-keeper, he allows the disease to progress steadily, in serene unconsciousness of any danger until it has spread to many or all of his colonies, and has become of such virulent type in some of them that he can no longer be blind to it. Then he is in a panic, not knowing what to do, and wasting still further time in trying to find out.

The wise bee-keeper, even the veriest novice with a single colony, should know enough about the disease to spot it on its first appearance. He should also know enough to act at once when he does spot it. He should know enough not to be unduly excited when he finds something unusual in a colony that is not foul brood. So the advice can hardly be too strongly emphasized, to read up on foul brood, even if there is no expectation of ever seeing a case. Have ready for immediate reference whatever literature you may have upon the subject, so that no time may be wasted in looking it up in case it should suddenly be needed.

#### Formalin to Kill Foul Brood.—

It will be remembered that experiments over in Canada seemed to show that the bacilli of foul brood, and even the spores, were destroyed by exposure to the fumes of formalin, whether they were in the larvae, the dried cells, or in the honey. This is a matter of thousands of dollars, for if the effect of the fumes are such that a comb from a foul-broody hive can be entirely cleansed from all traces of the disease, then all the brood-combs that otherwise would be burned can be saved. As a practical contribution to the subject, the following from C. H. W. Weber appears in *Gleanings in Bee-Culture*:

You may recollect that, when in Denver, I was talking to you about killing the foul-brood germ by fumigating it with formalin gas, by Prof. Harrison's method. I mentioned to you that I would experiment with this fumigating cure, just as soon as I arrived home. With the assistance of a bee-keeper I began operations immediately. This gentleman had a hive infected with foul brood. We took the infested frames from the hive and placed the bees in another hive. We then fumigated it with the formalin gas, and, when disinfecting, replaced the infested frames in the old hive. We then shook the bees back on to the original frames. The result

was, that the colony cleaned up the combs nicely, and a few days later the combs were filled with eggs, and, later, larvae, the latter being perfectly white, and no signs of foul brood since in the colony.

Later in the season I tried this method for friends who had colonies afflicted in the same manner. As the season became too late for brood-rearing, I could not ascertain any results. About three weeks ago I sent two frames, which had been badly infected (but which I had previously fumigated, to all the spores of foul brood), to Prof. Dr. Guyer, of the University of Cincinnati. I requested him to endeavor to restore life to the foul brood, which he promised to try to do. A few days later I sent him another frame infected with foul brood (this frame I did not fumigate). To-day, two weeks after, I visited the professor again, and he reported that he had made about 20 trials, all told. The frame not fumigated, he says, flourishes with foul brood. To the other frames, which were fumigated by this process, he said it was impossible to restore any signs of life. He still has part of the fumigated frames, which he will experiment further, and will then report results. I will acquaint you further with any future results we may secure.

#### Shaken Swarms in Australia.—

The editor of the Australasian Bee-Keeper advises against the practice of equalizing colonies and then shaking a swarm from each, regardless of preparations for swarming, but favors shaking each as soon as preparations for swarming are found.

#### Filling Syrup in Combs.—

S. E. Miller says in the *Progressive Bee-Keeper*:

I am surprised at Editor Doollittle (page 1014, *Gleanings for Dec. 15*). In advising how to fill combs with syrup, he says:

"To get it into the cells, pour in a fine stream from a dipper or some utensil having a spout which should be held a foot or more from the comb," etc.

Now, Friend Doollittle, you have likely filled many more combs than I, but I can tell you a better way. Take a tin cup, about a 3-pound can—one that has been used and cast aside is good enough—punch the bottom full of small holes, about such as a three-penny nail will make. If the holes are punched from the inside the syrup will flow more freely than if punched from the outside. An old file, with the point intended for inserting in the handle, shaped to the proper form and size, makes a puncher for the purpose.

Having your perforated-bottom can prepared, lay the comb on its side in the bottom of a tub. Hold the can about a foot above the comb with the left hand, and with the right hand take a dipper and fill the comb with syrup. Pass the can over all parts of the comb until one side of the comb is filled, when the other side can be turned up and the operation repeated. If there is about half an inch of syrup in the bottom of the tub, it is all the better, as it will prevent the syrup from running out of the side first filled. You see, by this means, we have 100 or more streams of small size instead of only one.

Very likely Mr. Miller will be thankful for suggestion as to still further improvement, even though the improvement refers to minor matters. Instead of the can being held a foot above the comb, let it be at least three feet above it. If the syrup be allowed to fall from a height of an inch, in spite of its being in a fine stream, very little of it will find its way to the bottom of the cells, and in a little while there will be a layer of syrup all over the comb, leaving the cells still filled with air, and any syrup poured on top after that will simply run off. When held a foot above the comb, the result will be better, but still it will not work so well as when the syrup falls from a greater distance. The momentum

gained by falling from a greater height is the same in effect as making each drop heavier, making it go with a rush to the bottom of the cell. For, although the syrup may leave the can in a fine stream, it goes a very short distance before separating into drops.

It is important that the syrup be hot—just as hot as it is possible to have it without melting the comb. The hotter the syrup the smaller the drops.

Holding the can three feet above the comb is tiresome. Easier and better work can be done in this way:

Punch three holes at equal distances in the upper edge of the can; tie the end of a string in each hole, and tie the other end of each string to a nail in the ceiling, letting the three nails be perhaps three feet apart. Then no weight comes on the band, and all you have to do is to steady the can and move it about where you want it.

#### The Dealer's Rights.—

Do they include that of Erasing the Producer's Name and Putting on His Own? is the heading of an article in the *Bee-Keepers' Review*, in which the writer, J. E. Hand, says:

"How is a honey-producer going to advertise his business, and work up a trade for his product if he is not allowed to place his name on his honey? It has taken me years to learn how to produce a real fancy article of comb honey, and I would be very foolish to give to Mr. York, or any one else, the benefit of my experience, simply because he happens to buy my honey. He has a right to place his name on the package as the seller of it, but not as the producer, as this would simply be lying, and an injustice to the producer. I would not sell a pound of honey to any man who would object to my name and address somewhere either outside or inside of every case, and always outside of every crate. Any one who is smart enough to produce a fancy article of comb honey should be smart enough to sell it himself without giving his dearly bought experience to some one who could not produce a pound of honey to save his life."

In a footnote Editor Hutchinson says there are two sides to the question. It is entirely proper for a producer to desire to establish a reputation for his honey, and to have his name on the package, and such a producer should sell to some one who is making no effort to build up a special trade; but with regard to those who are making such effort, he says:

"If I were at work building up a trade here for honey, I should wish to have my name on every package, and not that of the producer. That would be a natural feeling. If I spent time, and money, and thought, and energy, in building up a market for honey, I should wish to reap the reward. I should not advertise that I was the producer of the honey that I sold. I should impress upon my customers the idea that I was an expert judge of honey, and took great pains to secure that which was of excellent quality and absolutely pure. I should take great pains to live up to my professions, and always furnish an excellent article, and thus lead my customers to believe that when they bought a bottle of honey, or a section of honey with my name on it, they could rest assured that it had my guarantee, and that it was all right. If I should send out honey having upon the packages only the names of the different producers of whom I bought honey, I would never succeed in building up a demand for the honey that I sold. One day I might be selling Smith's honey, the next day Brown's, and so on.

#### A Mild Winter

is the term that must be applied to the one just closing, unless March does some savage work in the way of cold weather in the next few days.

## Convention Proceedings.

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 165.)

Pres. York—I would like to introduce Mr. Frank B. White, of Chicago, a friend of poultry-keepers and bee-keepers. He is a very white man, as you will see.

ADDRESS BY MR. FRANK B. WHITE.

I am grateful to your president for giving me this opportunity to speak to you. I hope I am a friend of the bee-keepers, the producers of that sweet which we like to eat. Mr. York can testify that I eat some. I do not know what I can say that would be of interest to you. I am not familiar with the bee-keeping business to any great extent. I might offer a suggestion or two as to how you could increase the demand for your product, and if I might have about five minutes of your time I would like to do that.

I had the pleasure, yesterday, of addressing the State Horticultural Society, at Minneapolis, and I was pleased to see the interest they took in what I had to say about the handling of fruit.

I want to suggest to you that I believe, without doubt, that there is an opportunity of enlarging the demand for your product. If you expect to get a larger price for your honey you must increase the demand in some way. I want to call your attention to the fact that but few of the hotel menus contain the name of the product you produce. Other edibles are mentioned there, health foods by the score, and any one can go into the health-food business if he has a flour-mill and sawdust at hand! You can sell your product with a little advertising. Now, if that can be done with something we have no faith in, why can't it be done with a good, substantial sweet article like honey? I believe it can. I believe the list of things we eat should contain honey as well as meat, vegetables, and fruit. California found herself without a market for her oranges. They were producing more than they could dispose of. At the present time the only thing lacking is transportation, and the distribution of the product doesn't worry them at all. It is simply because they unitedly, as a State, used a judicious system of advertising. I maintain they might have gone on and created a further demand. I have no doubt in the world but what the people could sell many times what they do if they would get in line. Now, you producers of honey ought to pay attention to the distribution of your product along that line.

I do not know just what the object of this organization is, other than to teach each other, as you have been trying to do in the discussion that I listened to for the few minutes that I was here; but it seems to me that you left off your discussion at the very vital point of marketing your product in a way that seems to me should be handled by your organization.

Now, I have no doubt but what many of you are shipping your honey to Mr. York. He is making an effort to create a demand for honey in this city, but there is a great deal of waste energy and waste effort simply because we do not avail ourselves of the opportunity afforded by judicious advertising along the lines of shipping and packing, etc. Now, without running into opposition with Mr. York, if I were a honey-producer near a city or village of two or five thousand people, I believe that I would sell every pound of honey that I produce right in that community, and if I could not do it with the present demand, I would try mighty hard to make a demand. There is many a neighbor of yours who would eat honey if he knew how good it was. It simply means he hasn't had a taste. He will buy patent medicines and patronize mail-order houses, but he wouldn't send away for much honey. I don't know whether any of you have ever tried to acquaint your neighbors with the fact that you have honey for sale. That is the thing you

ought to do, and sell your honey at home, then any that you have to send away will bring you a better price, thus making a demand for your product at home, as well as away from home.

Out a little ways from Chicago there was a man who grew one year 40 bushels of gooseberries. Gooseberries were selling at the store for six cents a quart, and the good wife said she was not going to prick her fingers, nor have her children prick theirs, for six cents a quart, so he went to the newspaper office, inserted a small notice which cost him 75 cents, and then went away for two days. When he returned his good wife met him and said: "Well, I am glad you came. I haven't done anything since you went away but answer the telephone. I have sold all the berries, and could have sold twice as many." She got 12 cents a quart instead of six for them. He advertised fresh berries right from the bushes, and he commanded 12 cents for them.

Now, I believe you can create a demand for honey at a better price if you will do a little advertising. If I were a producer of honey I wouldn't let a pound of honey go away from my place without my stamp was on it, so that they would have to read that every time they took a piece of honey; but I don't know any patent that you can get to have the bees to stamp it on. Mr. York doesn't offer any honey that he doesn't stamp very plain. The little pound box—I would have my name on all four sides, all around. I don't know but what I will go in the honey-business. If I do, and you see "White's Honey," you will know that I am doing what I say. I would expect that my bees were going to produce just as good honey as anybody's. Mind you, I claim that the thing that is not good is not fit to advertise. My honey is just as good as anybody else can produce, and better. The article itself is the best advertiser in the world. If it is good put your own stamp on it, and let that stamp be big and plain.

Dr. Miller—if you send to a commission man, or some one else to sell, he will scratch your stamp off.

Mr. White—I would have it burned in so deep that he couldn't scratch it off. Don't let him come that on you, Dr. Miller.

But this is all foreign to my work. I can't go out and advertise your product at all, but I do delight to see, when I go to a fruit-store, something that indicates where it comes from. The fact of the matter is, those of us who have to buy things shipped in here, if we get hold of a good thing we want to be able to get it again, and if it was marked we would know what to call for. We buy our butter by name. We call for that creamy butter because we know that that butter is all right. The fact is, before that thing was heard of all butter was alike to us who had to buy it here in Chicago.

Yes, this means something, and it certainly will mean something to you, men, if you will follow that suggestion. I wouldn't recommend that the members of this Association produce anything but honey that is first-class, and then every one of you affix your name and the fact that you are a member of this organization—it is a stamp of genuineness, and it will overcome a lot of this stuff talked about as molasses honey.

Something of that kind is the best thing that I know of to create a demand, and those of us who want a good thing will look for that article.

Why do you let the other fellow dictate terms to you? Why not make the demand for your article at the price you think you ought to have. If you ship half your honey to Chicago, Mr. York will be making more money. The honey you sell at home you can sell for a good, round price, if you create a demand.

I don't know whether there is anything else I have to say. That is all I think of, anyway, Mr. President. Thank you.

Pres. York—Evidently I didn't tell Mr. White what to say. I will explain it all to him some day, and hope he will come again. We will now go to the next question.

#### FEEDING BOILED GRANULATED SOUR HONEY.

"If I boil granulated sour honey will I be able to feed it to the bees?"

Mr. Niver—Is there any such thing?

Pres. York—Yes, sir.

Mr. Wilcox—I would like to have whoever answers that question say whether after the bees have stored it it will be sweet honey or not. I don't know whether it will be any better after the bees have taken it and re-worked it.

Mr. Moore—There is a distinction to be drawn there. I have a notion that the candied part is not sour, and that the act of melting it, or, perhaps carry it a little farther

wouldn't say boil it, but when you melt honey somewhat old and sour you will find a good deal of froth that comes out from the honey. This sourness, I am of the opinion it could be brought to a heat enough without boiling the honey so it wouldn't be sour.

Mr. Whitney—Did you try it?

Mr. Moore—I have melted a great deal of candied honey. I have melted some lots that would pretty near fill this bill of candied and sour honey, and I feel sure, in some cases, the heating without boiling would pretty nearly sweeten it. I am quite sure the boiling would sweeten it, and then you can have it for summer food.

Mr. Wilcox—I wish you were sure you are right about that. I had a barrel returned to me once, and I had it about to a boiling heat.

Mr. Moore—What proportion of it?

Mr. Wilcox—Very thin honey to candy, consequently it doesn't become very solid, and I put in saleratus and boiled it, skimmed it thoroughly, and then tried it on my own table, and it was still sour. That experiment satisfied me.

Mr. Moore—How thick was it after it was all done?

Mr. Wilcox—About as thick as ordinary honey.

Mr. Moore—Did you try it on the bees?

Mr. Wilcox—I didn't go so far. I couldn't get them out, and if any one can I would like to know how.

Dr. Miller—Answering perhaps what is desired by the questioner, that is, as to whether that honey can be profitably and profitably fed to the bees, I should say that in the early part of the season it could be fed and turned into brood very profitably. I believe the bees will take it and use it nearly as well as straight honey. There is something, though heating honey that is a little bit sour will improve it. Possibly it might be so sour that it could not be improved.

Mr. Purple—I am sorry to say that I haven't had quite experience enough in this to go as far as I would like, but I fed several pounds to some of my bees, black bees, this fall. They had given me all they had stored, and I couldn't do anything else except extract it and feed it back. I fed back sour honey boiled, and boiled hard. It will froth over, but if you boil it well it will stop, and just let it settle down, and it wasn't sour. It looked like, say the consistency of malt or boiled cider, but it was sweet, and wasn't sour. I was looking at a colony last Sunday, that had nothing but that to live on, and there were only half a dozen dead bees in the hive.

Dr. Miller—Wait until spring.

Mr. Purple—That's what I want. I am sorry I can't report more fully. These colonies didn't have a pound in the hive.

Mr. France—Are those bees in-doors or out-doors?

Mr. Purple—In-doors.

Mr. Moore—I suppose you know the process of turning sweets into vinegar. Every lady, when she makes bread, raises it, knows that there is alcohol formed in there, and that is largely gaseous—the generating of the sugar into alcohol. Now, when it starts to ferment the sugar has been turned into alcohol, then the alcohol turns into acid vinegar. Now boil this and a froth is caused by the gaseous alcohol. That's why boiling improves it, and whether it is cured entirely or not depends on how far this turning of the sugar into alcohol has progressed, and on certain chemical changes. When a chemical change has gone on, nothing will bring it back to the original state. I should think it would be perfectly safe for summer feeding, but for winter feeding I think you would be taking the lives of the bees into your own hands.

Dr. Miller—The one general remark about feeding this sort of honey, in no case would I ever allow it to be used for winter stores. I should be very much surprised if Mr. Purple wouldn't settle down to the opinion that he never wants to feed in the fall anything but good, sweet honey. In the summer bees might work on boiled vinegar, and make some use of it when they are flying every day, but in the fall I wouldn't work over any honey.

Mr. Wilcox—Is that equivalent to admitting that the bees do not make the change, and make sweet honey of it?

Mr. France—Right along this line I agree with Dr. Miller. I find, especially in our State, that bees that have been wintered in-doors, and have been fed this sour honey, although boiled, it is dangerous; but where they are out-doors you have more chance of their sweetening it up; but a good, wholesome honey is by far the best.

Pres. York—I want to introduce Emerson T. Abbott, of Missouri. They had a wreck on the road he came on, and he was delayed in getting here.

Mr. Abbott—I wasn't in the wreck, but the other fellow

was, and we had the pleasure of sitting for 6½ hours waiting to know whether we would ever get out of it or not. If you have ever sat that way you can imagine how we felt. We were thinking about you. I am glad to see you all, glad to be with you, and hope to have something to say later.

(Continued next week.)

## Contributed Articles.

### A "National Honey Exchange" Outlined.

BY G. E. DUDLEY.

1. THERE should be a great central organization which we will name "The National Honey-Producers' Exchange," with a General Manager to keep in touch with the State and local associations in order to send their honey to the various markets of the country, thus avoiding glutting the central markets as is now the case.

2. The National Exchange should employ as their agents the Citrus Fruit Exchange, at the lowest possible rate obtainable, to gather in the honey from all sections of the country not easily reached by the National Exchange, and sell the same in the best markets nearest to where it is produced; also, to handle such other honey as the Manager of the National Exchange might turn in to it if it should become necessary for him to do so.

3. State and local associations should be formed to grade the honey and ship it according to the rules and instructions of the National Exchange, or those of the Citrus Fruit Exchange, where it is more easy to deal with the latter. These State and local associations should, of course, choose local managers who should look out for home interests, and keep in touch with the General Manager of the National Exchange.

NOTES AND COMMENTS.

Each association shall have its stamp or seal to be used where the National association has no proper representative. Also each case of honey shall bear the number of its producer, so that poor honey can be traced back to the packer. When local associations can sell their honey at prices equal to or higher than they could get by selling through the National association, they should be expected to do so.

The Citrus Fruit Exchange having agents and buildings in nearly every city of the country, the National, by employing them as their agents, would be able to cover the whole country from the start, thus giving sections too remote from the National organization a chance to sell their honey through a proper channel.

When the National Association grows to cover the whole country themselves, they could drop the Citrus Fruit Exchange.

The National would establish agencies wherever desirable.

It seems reasonable that the new California National Honey-Producers' Association could make a proper bargain with the Citrus Fruit Exchange, and get in a working basis for this season. Let them harness the successful Citrus Fruit Exchange into their work, as their agents, and they will be a success from the start.

Will not the California National carry out this program? Arapahoe Co., Colo.

### Extra-Large Hives and Long-Lived Queens.

BY DR. E. GALLUP.

NOW, Yon Yonson, let me have a whack at you. You say, why not rear a queen in a barn, and then you could have one big enough for a pony to ride on. Well, you see that would not work. On the same day we took the honey out of the house, spoken of in another article, my son had the offer of a colony on the roof of a tank-house, providing we gave the man the honey. So my son bought the colony home on the wheelbarrow. They were in quite a large box. We transferred comb and brood enough to partly fill 3 frames.

Now, Yon, you can readily see they were in a barn, to

all intents and purposes, for they could not concentrate the animal heat sufficiently to keep the wax soft enough to work it into comb, providing they gather enough nectar to manufacture the wax. Wax is secreted whenever bees gather more than they have place to store it, etc. They were in a semi-starving condition, for a part of the brood had perished.

Well, I put them into an 8-frame hive, adjusted a division-board close up to the 3 frames, fed them a pint of melted sugar, and they went to work. This was the middle of August, it is now Dec. 13, and they are a good colony. I have fed them in all about 15 cents worth of sugar, as they could gather enough to live on, but not sufficient to build comb. Whenever I inserted an empty frame in the center of the cluster, for them to fill, I fed them a pint of melted sugar, and the queen occupied with eggs every cell that was empty; the bees were compelled to secrete wax, as they could not get rid of it in any other way.

The queen was large and prolific. I used repeatedly to raise the comb from the hive she was on, and watch her hunt for a place to deposit her eggs, and see her extending at the rate of 5 or 6 eggs per minute from her abdomen. Mind you, that was the only colony I had in the yard, and no ready-made comb to give her. Now, I wish to ask you chaps that are afraid of a queen laying herself to death, How much more would it have shortened her life to have laid those eggs in cells, than it did to drop them on the bottom-board? At some future time I may have something to say on the subject of a queen shortening her life by laying too much.

A friend living at Tustin, paid boys 25 cents each for picking up some 50 swarms; he put them in common-sized hives, but used no division-board, and the consequence is, many of them are weak, and some 15 of the number "came up missing" entirely. Now, if he had used a division-board judiciously, all would have built up to profitable colonies. Now, you can see they were in a barn, to all intent and purposes, as they cannot build outside of the cluster of bees. Neither will the queen deposit eggs where there is not sufficient warmth for them to hatch. In building up small swarms to profitable colonies, if you have a good queen—and a poor one is not worth keeping, anyway—always use a division-board. Then insert your extra frames, ready-made comb, or foundation, in the center of the cluster; but do not move too fast or you may spoil the whole; keep the increase more than the decrease, and you will win in the end.

I once made 16 colonies from one, in Iowa, in one season. They built all their own comb, filled their hive with honey, and all came through the winter in splendid condition. Remember at that time I knew nothing of comb foundation, and I reared all my 15 queens by natural swarming, and all from that one queen, so all were good ones.

I am often asked how many colonies one ought to purchase to begin bee-keeping with. My reply is usually one or two good colonies, and make the balance; in the meantime you will be gaining valuable experience.

I began bee-keeping in Canada 65 miles north of Vermont; have kept bees in Wisconsin, in Northern Iowa, and now in California. So I know all does not depend on locality, the kind of hive, etc. But the management has a great deal to do with success or failure in any locality, as well as the season. Bees are managed in these localities so as to be self-sustaining even in poor seasons, when you know how. I confess that bee-keeping in some respects is quite different here from what it is in the East. There, when you have hot weather you often have it hot and sultry night and day, while here in this beautiful valley it is not so. The sun may shine quite hot, but there is a splendid cool and refreshing breeze directly from the Ocean, so it is always cool in the shade, and always cool nights. In Canada, Wisconsin, and Iowa, I have sweltered in the daytime, and could get no real rest at night. I would get up in the morning all fagged out and completely exhausted; while here in the hottest weather we sleep a sound, restful sleep, and get up rested and refreshed and strengthened for our days labor. It is an old man's Paradise. You may go to bed at night thinking it may not be hot, and go to sleep under a very light cover, but I always have an extra cover at the back of the bed, so as to draw it over me before morning, if I need it.

Now, what I am getting at is this: You want an extra-strong colony of bees to store honey in the supers to good advantage. They may begin storing, but before morning they are compelled to withdraw and cluster closely around the brood, to keep up the necessary warmth, and that makes it late before they get back to work in the super. That is

why I lost a fine batch of queen-cells in the wire queen-cell protector, although I placed them well in the center of the cluster.

A writer in the Pacific Bee Journal, who lived north of the Tehachapi Mountains, during a 3 days' cold north wind, stated that he lost fully one-half of his bees in the 3 days' blow. You see, they had to withdraw from the super and pack closely around the brood-nest in order to protect the brood. You see, Mr. Greiner, he jumped at that conclusion. No mistake about it. He had been extracting, and the supers were full of bees, but when he looked in the supers after the wind, and found them all empty of bees, he hastened to write about his bad luck. We cannot pile up supers here, to good advantage, 3 or 4 stories high, because if we open a place for ventilation at the top, it causes a cold draft of air like the draft up a chimney, and that compels the bees to stay below to protect the brood. Orange Co., Calif.

## Shaken Swarms—Cause of Poor Queens.

BY GEO. W. STINEBRING.

I WISH to write a little in regard to artificial swarming, by shaking. I will just say that it is not new to me, as I have practiced it more or less for 30 years and have never failed to get as good a "swarm" as by the natural process, in fact it is very nearly the same as natural swarming.

My plan is to wait until the bees commence to swarm naturally, and then I go to the ones that I want to have swarm and open the hive, and look the frames over until I find the one that the queen is on, and set that frame in the new hive, place it on the old stand, and carry the old hive away a rod or so. And as I do this about the middle of a nice day, the most of the working bees are out gathering, and will return to the new hive. I also generally shake a part of the bees off 3 or 4 more of the other frames in addition to the one that the queen is on. A swarm made in this way is always sure to stay and be contented, and give no further trouble. The only trouble that I meet with now is that the seasons have changed so that is hard to tell what part of the year the harvest, if there is any, or the swarming season, will come in.

So far as the queen question is concerned that has been agitated so much of late, I am inclined to think the main cause of poor queens is either because they have been reared in poorly supplied nuclei, or by in-and-in breeding—quite likely both. As for my part, I have bought quite a number of queens, and never received very good ones, the best one that I ever had being away back in 1868. She was a pure Italian, issued with 2 swarms, mated with a black drone. That one gathered honey and sent off swarms when other bees were starving.

I also find that bees do not go as far to gather honey as most people think they do. About a mile, or nearly so, will cover most of the distance. I keep the most of my bees about two miles from home, and see quite a difference.

Wayne Co., O.

## The Growing of Basswood Trees.

BY J. D. GEHRING.

IN his answer to "Wisconsin" (page 810—1902) concerning the propagation of basswood trees, Dr. Miller says, among other things, that seedling trees never live to the second year. He also says:

"This year I saw hundreds of them when they were 2 or 3 inches high, and I've just been out looking over the ground and I cannot find a single plant. What becomes of them is a mystery to me. Judging from the freedom with which these have sprung up, I should say it is best to plant in the fall [of the year], covering the seed from  $\frac{1}{4}$  to  $\frac{1}{2}$  an inch."

"Wisconsin" should have been informed that success in raising of basswood trees depends somewhat upon the locality—even in the same State—because basswood trees do not grow naturally anywhere and everywhere, though they can be propagated, if properly treated, almost anywhere.

Now, if I had "Wisconsin" to deal with I would talk to him about like this:

1. Plant your basswood seeds about the time when Nature plants them, and in the kind of soil in which they most readily and numerously "come up" and flourish into blooming trees. If there are basswood trees in the "woods" in your locality, you can easily find out what kind of soil they

flourish best in. Well, I advise you to plant the seeds in the same kind of soil, and no other—no, not even should you have to go a day's journey to get it, or get along without basswood honey.

3. I think this question would be properly answered by saying: A basswood tree is not limited to a specified number of years before it begins to bloom; that depends more upon soil, climate, local conditions, and—care, if "raised by hand."

The proper care-taking—the "nursing"—of the sproutings, until they begin to be large enough to take care of themselves when transplanted to their permanent location, is of so much importance that success depends largely upon it. One part of the process of nursing consists in transplanting the baby trees when 3 or 4 inches high, to a place suitable for them—a place where they will be sheltered from icy blast and scorching sun. And, wherever the nurslings may be put, be sure to screen them from rabbits and bovines.

Mulching must not be forgotten, but—look out for mice! Mice are also fond of basswood seeds, and are to a great extent responsible for the remarkable scarcity of volunteer basswood sproutings where flourishing mother-trees cast showers of seeds. Douglas Co., Kans.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### RAGE OF SWARMING IN CANADA.

Interesting to learn from the exceedingly well-informed Mr. McEvoy, that Ontario had its greatest rage of swarming last summer. T'other way in most places—yet similar cause. Very unpropitious conditions stop all swarming. A little better and there will be a few swarms. Somewhat better, but still rather poor so far as honey is concerned, and they may rear brood and young queens—and swarm and swarm and swarm—just because they can do that and can't do much else. When the very propitious conditions come they oft get interested in piling up the surplus and forget about swarming. Page 70.

### VARIATIONS AND IMPROVEMENTS IN WORKER-BEES.

The theory which Stachelhausen explains on page 70 should have sober consideration, and not be poh-pohed down—too near being the only thing in the field on a very difficult and important problem. When there are variations and improvements in the worker-bee *how* can these improvements be transmitted, since the worker has neither son nor daughter to transmit them to? I imagine that some readers do not even yet get the idea advanced by Mr. S. Let's start with the fact that certain worms can be cut in two in the middle and by healing of the wounds we have two worms instead of one. Next let us conjure up a worm of fine and remarkable qualities. One end lays eggs and the other end secretes honey. Both end eats, but sometimes the egg-laying end is also fed a-la-canary-bird by the other end—fluid circulation throughout the whole. How can our worm transmit its qualities—variations included? Same way as any other organism does, however that may be. Next our worm gets cut in two. Getting well all right, the two sections, for mutual help and advantage, continue to live in the same vicinity. No more commingling of fluids by way of a central waist; but the two parts mutually give each other abundant portions of the circulating fluid—*here alleged to amount to precisely the same thing*. Does it? Looks so. Mere fastening together doesn't seem to promise anything.

Now we do not know precisely and absolutely all that the worker-bees feed to the queen ("More things in heaven and earth, Horatio, than are dreamed of in your philosophy"), but the theory demands that we consider the interchange practically the same thing as if worker and queen were by a common waist nicely joined together as one being. In the latter case transmission of improvements would not worry us—why should it then in the real case, if the case is precisely the same thing practically? In other words, the queen and the workers, in the breeding season, constitute what is really one organism although not so visible. The result is that anything organic which affects any

part of the organism affects the reproductive part also. Do I believe all this? No. What then? Well, as a certain fellow worker has been known to remark, I don't know.

### MR. WHITNEY AND THE SISTERS' HAT-PIN.

And so Mr. Whitney is going to ornament his masculine head-gear with hat-pins, to furnish the bees with objects to attack, so they will not steer for his eyes. Ingenious Whitney! But if the sisters should take it as an affront, and get after him with the hat-pin a-la-bayonet, he'd prefer the bees. Page 78.

### OLD COLONY OF BEES.

A log hive that dates back to 1821 is something we don't see in every apiary picture—and 90-year-old colonies are not at all plenty. But I note the language to be "only one is left" instead of only the original one is left. If Mr. Barb only means that the family of colonies has been kept track of and kept separate for 90 years, that does not amount to so much. Let up on the lines a little more and behold we all have bees thousands of years old. Pages 81 and 84.

### UNCLE SAM'S APIARIAN STATISTICS.

And so Uncle Sam, in his last census, has actually got some State statistics about bees that look as if of some value, and not worse than worthless, as some of us would incline to expect. Here and there bees taken and here and there bees not taken, makes a queer result when you come to add it up. Having got begun, Uncle Sam may improve. Page 83.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Information About Bee-Culture.

Please send information regarding bee-culture.  
Lake Co., Ill. LETITIA JONES.

Your letter is so vague it leaves one in the dark as to the kind of information you want. I don't know whether you are at present keeping bees or are thinking of going into the bee-business. If you will put your question or questions a little more definitely, stating just what you want to know, I will be glad to help you if I can.

If you wish general instruction in bee-keeping it could hardly be given in this way. Your best plan would be to get a good text-book and study it thoroughly. I will ask the publishers to send you a catalog of text-books, any one of which will be helpful.

### Early Spring Care of Bees.

Almost spring, almost time for the hum of the bees again. I always look forward with a great deal of interest to the time when the bees can be taken out of the cellar.

One of the first things to do after they are out is to see that they have plenty in their larder—this will also hold true for those wintered out-of-doors. Probably more bees are starved in the month of April than during the whole of the preceding winter.

It does seem too bad to get them through the winter all right, let them start a big lot of brood, and then let the whole business die of starvation.

You can lift the cover, look over the tops of the frames without lifting any out, and if you see sealed honey there is no immediate danger. If you don't see any sealed honey it looks suspicious, and you would better examine further by lifting out the frames. Then supply their wants if in need, or likely to be in need soon.

Spring is the time for watchfulness. Keep watch. Don't imagine that you have done your whole duty if you have seen to it that your bees have just enough stores for immediate use. If bees have a full larder they seem to have more heart, and go at brood-rearing with a will, and a big lot of brood means good, strong colonies ready for the harvest.

If you keep watch you will be surprised to see what a big lot of honey is used up by the bees in rearing brood.

It is nice to be able to take out empty combs and replace them with combs filled solid full of honey—the nicest and most satisfactory way of feeding that I know of. But you have to look ahead and have your combs of honey in order to do this. We have about 250 combs filled full of honey ready to give our bees this spring if they need them. I gave myself a little pat on the back as I wrote that, and thought, "Doesn't that sound well? 250 nice combs of honey." But let me whisper to you, I don't think we ever had so many before!

It takes a good bit of foresight and determination to have these combs of sealed honey ready for use in the spring. Make up your mind good and strong now that you will be ready next spring, if you have to set aside part of your colonies next summer to do nothing else but to fill up brood-combs full of sealed honey.

### Preventing Bees from Flying!

One day last week I was called to the telephone, and a woman wanted to know what she could do to prevent her bees from flying out of the hives. She wanted to know if there was not some way by which she could fasten them in. She said many of them were dropping on the ground, and she was afraid that they were lost.

Poor little bees! Think of fastening them in the hives and preventing them from flying when it was the very first time since last fall that they had had a chance to fly! It was a beautiful day, too. The bees were, no doubt, having a grand time, and she little realized the good it was doing them. It is a little strange that while we have had an unusually mild winter, there was no day after November warm enough for a flight until Feb. 26. After such long confinement no doubt some bees would fly out never to return again, but where one was lost dozens would be benefited. I wonder how often we fail to recognize our blessings just as that woman did.

### A Good Furniture Polish.

For a good furniture polish take one pint of turpentine, add two ounces of beeswax cut in small pieces. Use a tin basin and set it in the oven when not very warm, so as to melt the wax without burning the turpentine. Stir constantly. Apply to the furniture with a woolen rag, and rub vigorously with another.—Chicago Daily News.

## Questions and Answers.

CONDUCTED BY

DR. C. O. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

### Transferring Bees—8-Frame Hives.

1. I have a large box full of bees. I see in the book how to transfer, but this box has 2 holes in front, and a hole in the top, over which to put a box to get honey. Now if I stop up the holes in front and put a patent hive on top, and drum, would they go into the hive? The hive would hang over the box a good deal.

2. Why do the prime swarms always swarm again in a month after hiving?

3. I use the 8-frame hives. Are they too small for comb honey? I think I will put supers on, the end of this week, for the bees are very busy on almond, acacia, and gum-trees. You would think they were swarming to hear them to-day. I had to open all their entrances wide a week ago.

The worst time is in August and September; the wasps go for them so I have to close them up. If I don't look out they will turn the bees out of the hive. I am getting Holy Land queens to try, but will keep my brown ones for they do not get mad, and are fine workers. A man has some Italian bees a distance from here, but will beat them, and store better honey and do better capping. I will send you a box this spring, to see how you like it. The people that I work for let me keep bees on their place, and give me two hours in the afternoon and most of Sunday, so I do well. I love bees, and watch them all day on Sunday, and fix them up. I got stung once on the chin, but it was my fault. I took a lot of bees out of a roof, as no one would tackle them, and I got 15 percent. I took them out in 10 min-

utes, they were under the shingles. I have another lot to take out when I have time.

ANSWERS.—1. I'm afraid they would be rather slow about going up through so small a hole. Of course it would be no harm to try it, and if it didn't work then you could turn the hive upside down. It doesn't matter much if the two hives are not close-fitting. Smoke them a little at first, so they will not come out and sting you, and after they get fairly started they won't mind if the fit is imperfect. Oh, they don't, in most places. It is a very rare thing for a prime swarm to send out a swarm till the next year. It is something unusual if yours always do so.

3. No, there are probably more 8-frame hives used for comb honey than any other size. But for best success you will need two stories for a strong colony up to the time of putting on supers.

### Using Unfinished Sections—Working with Tents.

1. I have about 300 unfinished sections left from last year, and do not know whether I ought to use them this season or not. I tried some last year but was not satisfied. Some time ago I read an argument between Doolittle and someone else, the former stating that it worked all right, while the latter said it was not. What is your opinion?

2. I see some advocate using tents while working with bees. Do not bees in trying to fly get entangled in the netting? ILLINOIS.

ANSWERS.—1. Of those who have made any observation in the matter, probably the majority have had the same experience as you, that unless the least and last bit of honey has been cleaned out by the bees before it has granulated, the sections will not be satisfactory to use again. There are some (but I think very few) who say they have had good results. Whatever unfinished sections you have at the close of the coming season, plan to have emptied out by the bees, and such sections will be of great value as baits at the beginning of the honey harvest.

2. I never had the slightest trouble of that kind, and I never heard of such trouble.

### Lazy Bees on Old Combs.

1. I have several colonies of bees on very old and almost jet-black combs, that are very lazy. Could I get them to work by giving them fresh, clean foundation to draw out, or give them drawn-out combs?

2. When is the best time to do so, and how? WISCONSIN.

ANSWER.—1. No, indeed, don't get into your head the notion that old black combs make bees lazy. If they did, most of my bees would be very lazy.

2. The best time to get new combs drawn out is in the height of brood-rearing and harvest; but so long as combs are straight and in good condition I would never think of replacing them because they are old.

### Making Increase by Dividing.

I have kept bees for 12 years, and had foul brood among them all the time. I lost all of them once—43 colonies. I lost the most of them a second time, about 30 colonies, before I learned that it was foul brood, and how to manage it. I have since made bee-keeping a success.

My neighbors would not do as I told them, and their bees died. I commenced the winter with 60 colonies, killing 12 that were infected. The bees went through the shingle roof of my honey-house, and robbed some of the infected honey.

1. I think the safest way would be to transfer the whole lot into clean empty hives. (I thoroughly boil everything that the bees have used). I would like to make 100 colonies from the 60, and would like to make as many as I can from a beautiful golden queen I have. My bees are mostly blacks and hybrids. Can I start a colony with each frame and supers, then carry away a strong colony when the bees are flying strong, and place the hive with the frame of brood in its place?

2. Will the frame of brood and flying bees make a good colony?

3. Should I wait for queen-cells to be started before doing this?

4. Can I successfully smoke or drum the bees out of the hive with crooked combs, without breaking the combs?

5. How can I tell when I have the queen out of said hive if I do not see her?

6. Would it be safe to leave the young hatching bees in such a hive to take care of the young brood, in swarming-time with a good honey-flow?

7. If so, can I shake these young bees after they hatch out, and start a good colony from them?

8. How long should I wait for the bees to fill up with honey before I shake them in another hive?

9. What is the best method of making them fill up?

10. Also tell me the best way to drum them into another hive, when the combs are too crooked to lift out. OREGON.

ANSWERS.—1. Yes, but it is hardly the best way.

2. It may, if the colony removed is strong enough, and if the work is done early enough in the season.

3. You may have to wait pretty late for queen-cells to be started. Let me suggest this: Begin in fruit-bloom to build up the colony that has your best queen by giving it brood from other colonies, the brood as well sealed as possible, adding more brood every few days. No

harm if you build it up three or four stories high. After you have built it up strong, let it stand a week or more, so there shall be no very young brood in the hive except from the choice queen. Then take three or more frames of brood with the queen and adhering bees and put them in a hive on a new stand. A week later you will find in the queenless colony a lot of sealed queen-cells. You can now take from this hive a frame of brood and bees and proceed with the plan you proposed, although it may be better to use two frames of brood for each nucleus. Let each one have two or more sealed cells, so that they may select the best, and see that the cells are centrally located so there is no danger of their being chilled.

4. Yes.

5. I don't know of any quick and easy way. If you give to the bees a comb or combs in which you are sure there are no eggs, the comb being in good condition for the queen to occupy, you will find eggs present within 10 minutes or so, if the queen is there. If you are not sure you can also tell by the actions of the bees whether the queen is present or not. If no queen is with them they will become very uneasy in the course of 10 or 15 minutes.

6. No, if no bees are left, a cool night would result in chilled brood, and much of the brood would starve before the hatching bees would feed them. Besides, the hive would be a good mark for robbers.

7. You may do so if you leave in the hive (or return to it) enough bees to take good care of the brood. That is, you can drum them, but not shake them.

8. and 9. You can't shake bees out of a hive unless you can lift out the frames separately. But you can drum them out, and they will fill up while being drummed, or you can wait two or three minutes for them to fill up after you have drummed perhaps five minutes, and then you can go on drumming.

10. Pound on the hive with your fists or with two sticks.

### Basswood Trees.

Where can I get basswood trees or seed to start trees? How is a good way to start a few trees? and what kind of soil is the best for them? ILLINOIS.

ANSWER.—Any nurseryman can get them for you, and sometimes they are advertised in bee-papers. Any soil in your State that will grow other trees will probably do. It is a difficult thing, I believe, to grow them from seed, and a common way to get a start is to dig up the young plants where they have started in the woods.

### Catnip and Sweet Clover—Moving Bees.

1. What is the best time of year to sow catnip and sweet clover seed in Kentucky, where it has to be sown on waste land and public highways, and depend on it being trampled in by stock.

2. Should they be sown in firm or loose soil.

3. When can catnip sown now, or in the spring, afford bee-pasture next season? Of course, I know the clover will not.

4. What is best, or will any bee-plant grow in the mountains? Near me are thousands of acres of what we call "knob-land," most of the timber has been cut off, leaving the ground pretty thickly covered with small growth of briars and brushies. Now what I want to know is, whether I can afford to spend a few dollars throwing seed on this waste knob-land. Of course, it will have to be sown down among the leaves to sprout in. Please advise me.

5. As per advice in the Bee Journal a few issues ago, I moved from their summer stands 2 weak colonies of Italians (the rest of my

bees being black) to a place some 50 feet distant, and protected from the north and east winds. The weather has been bad, and bees have not flown since I moved them 4 weeks ago, until day before yesterday, and I found that many of my pretty Italians had gone back to the old stand, and finding it gone, had entered the nearest bivies and were being killed. It's a lesson learned, however. But is there any way to prevent this? I shall have to move them from where they are now, back on the summer stand after winter is over, and I dislike losing any of them, for I want to Italianize my entire stock from these two colonies. Can you suggest how to move them, or what to do to cause them to return to the hive to which they belong? KENTUCKY.

ANSWERS.—1. Any time from the time seed is ripe in the fall till vegetation starts in the spring. Of course it will not be well to be too late in the spring, and at least for sweet clover it will be all the better to have the seed tramped in quite early in the fall. But you will hardly find the catnip seed succeed as well as the sweet clover when subjected to constant tramping. Catnip does better with some kind of protection, as in fence-corners and hedgerows.

2. Sweet clover seems to do best in very firm soil. I hardly think it is the same with catnip.

3. Catnip is a perennial, continuing permanently when once started. I think you can not count on bloom the first season, and I think it will be all the more in size and strength after the second year.

4. I should be very hopeful as to sweet clover, trying catnip on a less extensive scale.

5. Shut the bees in the hive before moving them, keeping them imprisoned a longer or shorter time according to the weather. If you leave them till the weather is quite warm, then a shorter time of confinement will do, for if confined too long they may smother. Even when it is quite warm, if you close the hive after they stop flying in the evening or before they fly out in the morning, there will be little danger of any harm from confining them till the middle of the day. You can move them any time while confined in the hive, perhaps all the better toward the close of their confinement, handling them rather roughly in moving, and pounding on the hive before opening. As an additional precaution you might set up a board before the entrance of each hive, so that the minute a bee leaves the entrance it will bump its head against the board and have its attention called to the change in surroundings.

### Simmins' Forced Swarms.

Please inform me what Simmins means by giving the brood-combs removed to the "other hive deprived of part of its population." Does he mean in a second story, for there would be no room in the first if only one-half of the bees were taken away? Or does he mean to take half the bees, with the combs, from the second colony?

And does he mean in the first colony to fill up with as many comb-guides as there are brood-combs removed?

A neighbor loaned me a copy of the American Bee Journal, and the account of "Simmins' Forced Swarms" interested me.

NEW JERSEY.

ANSWER.—The first colony has all but one or two combs of brood taken from it, retaining all its own bees, and receiving half the bees of the second colony. Frames with starters take the place of the removed brood-combs. The second colony has half of its bees taken, but none of its brood, and it gets all the brood taken from the first colony. Of course, it must have a second story to receive the brood, and it will need one or two extra frames to fill up. This refers to what is said on page 67.

### 25 Colonies Bees For Sale.

All in dovetail Langstroth hives, wired frames with full sheets foundation, 2 supers on each live, with modern super furniture; 28 empty hives, brood-chamber with full straight combs on wired frames, combs in good condition; 2 furnished supers on each hive, lot of other beekeepers' supplies, wax-extractor, etc. 12A2t FRANKLIN MOORE, Baileyville, Ill. Please mention Bee Journal when writing.

### Paw Paws.

Delicious as bananas or muskmelons. Trees beautiful on lawn or garden. Fruit in bearers. Seed, per package, 10 cents, postpaid.

Address and benefit, ROCKY BEACH ORPHANAGE LANSING, MICH.

### A Grand Apple-Tree Opportunity.

We trust our readers are availing themselves in large numbers of the Special Apple-Tree Sale of the Harrison Nurseries. It will pay to buy from the Harrison people. A special rare opportunity is offered in their state of this spring. They are closing out an immense stock of clean, healthy, strong-rooted trees of all good varieties, specially grown to furnish the superiority of what their nurseries produce. Every shipment goes forth packed in a superior manner and is guaranteed to arrive safely any time in the country. Write for their list of trees, free list, and send in your order if you have not already done so. Address them, Harrison Nurseries, Box 30, Berlin, Md. Please mention the American Bee Journal when writing.

### FROM MANY FIELDS

#### Methods of Rearing Queens.

Our first instructions given by M. Quinby were very economical. He said just as good queens could be reared in full colonies. Having full confidence in this veteran in bee-keeping, I followed his directions, but from lack of experience I was not as successful as I might have been. So I concluded to try a larger comb, 5/8 inch. These were more successful and having had more experience, I succeeded in rearing some fairly good queens which were used to Italianize some colonies of common bees. But when the honey-flow ceased, these small colonies soon became destitute of honey, and if not watched and fed would swarm out about the time queens were old enough to lay, or before. These small hives do not hold bees enough to keep the temperature at the proper degree, and the queens may suffer from cold if a few rainy days come.

At the present time queens-cells are started in full, strong colonies, and no combs are

used in the yard smaller than 6x12 inches, and 3 or 4 are used in the hive for the queen to hatch and become fertile.

I have no trouble to rear queens that are prolific; in fact, we get the best results from a moderately prolific queen, one that will just keep a 10-frame hive well stocked with brood and bees, and not get the swarming fever.

I cannot understand why Dr. Gallup has had so much worse luck in buying queens than anyone else. I have purchased quite a number of queens, and have had but one that was not satisfactory.

I am feeding some light colonies syrup made from sugar and honey. They are in the cellar. I will report results in the spring.  
Page Co., Iowa. J. L. STROONG.

**A Correction—Dr. Gallup Sick.**

Tell "Porto Rico" that I measured the banana leaf with a square and pole, and by some mistake the American Bee Journal had it 3 feet and 7 inches, instead of 2 feet and 7 inches, I believe, or perhaps it was 3 feet and 7 inches. I made a memorandum of it at the time but lost it, and the frost has killed the plant.

I am very sick, and don't expect to get well. Dictated by DR. E. GALLUP.  
Orange Co., Calif., March 9.

[We hope Dr. Gallup won't get discouraged. We know he is not as young as he once was, but in that land of "The Fountain of Youth" where he dwells, we hope he may live and be happy for many years yet. Still, when one is around the 80's as is Dr. Gallup, he naturally would not expect to be spared much longer in this world.—EDITOR.]

**Bee-Keeping in Oregon and Washington.**

On page 58 is an inquiry which I wish to answer to the best of my ability. In the first place, Oregon and Washington are divided by the Cascade Mountains into two distinct climates. That on the east side of the mountains is dry and cold, more like Kansas and Nebraska, and is called "Bunch Grass," while to the west is a warm, wet climate, and is called "Web Foot," and as space nor time will permit me any more than to take up one section at this writing I will proceed to tell something of "Web Foot."

During January, February and March it is rain and snow at least three-quarters of the days. April is generally over one-half rain. May, showers; June, principally good weather; July, August, and most of September dry without rain; the latter part of September and October, fine fall weather. November and December are rain, and some snow about Christmas.

Now, as to the bees: In the Willamette Valley they start off well in the spring, but are not able to keep it up, as there is too much acreage in small grain, so the bees fill their hives with food, and, and other very poor honey during the latter part of the year. And I wish to say that I have an out-

**800 lbs. of Honey One Season**

From one col.; 5 tons comb honey with 33 colonies one season. First to advertise bees that would store honey from red clover 30 years ago. Fine Queen on the market. Original of "Gold Dust" strain of Rose Comb Buff Lehighes—largest and best layers of all Lehighes. My circular tells you all. F. BOOMHOWER, 1242. GALLUPVILLE, N.Y.

**BOYS WE WANT WORKERS**

Boys, Girls, old and young alike, make money working for us. Write for circular to start you in business. Send us 10c stamps or silver for full instructions and a list of samples to work with. DRAPER PUBLISHING CO., Chicago, Ill.

**HIGGINSVILLE BEE SUPPLIES.**

We have received a car-load of these unique supplies. These goods are equal to if not better than any other on the market. Write for circular. We are also agents for the PROGRESSIVE BEE-KEEPER, price, 50 cents per year. Send your orders and subscriptions to us. We sell at factory prices. FRANK A. TAYLOR, Catalog Free. Routed Rock, Tex.

**PERSONAL TO SUBSCRIBERS**

WE WILL SEND to every subscriber or reader of the American Bee Journal a full-sized ONE DOLLAR package of VITE-O-RHE, by mail, POSTPAID, sufficient for one month's treatment, to be paid for within one month's time after receipt, if the recipient can truthfully say that its use has done him or her more good than all the drugs and dopes of quacks or good doctors or patent medicines he or she has ever used. Read this over again carefully, and understand that we ask our pay only when it has done you good, and not before. We take all the risks you have nothing to lose. If it does not benefit you, you pay us nothing. VITE-O-RHE is a natural, hard, adamantite rock-like substance—mineral—ore—mined from the ground like gold and silver, and requires about twenty years for oxidation. It contains free iron, free sulphur and magnesium, and one package will equal in medicinal strength and curative value one gallon of the most powerful, efficacious mineral water, drunk fresh at the springs. It is a geological discovery, to which there is nothing added or taken from. It is the marvel of the century for curing such diseases as Rheumatism, Bright's Disease, Blood Poisoning, Heart Trouble, Diptheria, Catarrh and Throat Affections, Liver, Kidney and Bladder Ailments, Stomach and Female Disorders, La Grippe, Malarial Fever, Nervous Prostration and General Debility. Ask thousands to testify, and as no one, answering this, writing for a package, will deny after using. Give age, ill's and sex.

This offer will challenge the attention and consideration, and afterward the gratitude of every living person who desires better health, and medicinal diseases which have defied the medical world and grown worse with age. We care not for your skepticism, but ask only your investigation, and at our expense, regardless of what ill's you have, by sending us for a package. You must not write on a postal card. In answer to this, address:

Front & Walnut Sts., CINCINNATI, OHIO.

yard in the Willamette Valley that I propose to move to the mountains in the spring; for this very reason.

The mountains are fine for bee-pasturage in a great many localities, but the weather is somewhat worse, and I wish to say that in this locality the black bee is by far superior to the Italian, as she will sleep quietly while it rains, and is ready with a hive full of bees when a good day comes; while the Italians will push out and spring a wild until there is nothing left of them. Then, again, the Italians are more subject to dysentery, as they gather so much poor stuff in the fall that the blacks won't touch.

In the mountain the first is pollen from hazel, then come soft maple, vine-maple, Dog-wood, blackberry, raspberry, and the most important is Chittin or Casara (which equals the basswood in yield of honey for Oregon), then comes a wonderful yielder known locally as "fireweed."

The market is good for anybody who will sell and deliver his own honey, as it sells readily at from 10 to 15 cents per pound, or in other words, extracted honey sells at 10 cents per pound, chunk honey in buckets at 12 1/2 cents, and nice white sections at 15 cents.

I speak from experience, being a bee-keeper and surveyor, having traveled over a large portion of this country, and I wish to put in a word of caution right here, that is, be careful in locating, as a few miles makes a great difference in climate and pasture. Then, again, if you wish to keep many bees in any locality, be sure you sow plenty of white clover besides. **GEORGE B. WHITCOMB.**  
Linn Co., Oregon.

### Results of the Season of 1902.

I started in the spring of 1902 with 93 colonies, and the bees did very well for a few weeks, but it got very dry, and I had to feed my bees up to June 5 in order to keep them from starving, but on June 5 they got their first honey, and kept up until Nov. 10. I got 20,100 pounds of honey, and increased to 187 colonies; 6000 pounds of it was in Danz. sections, and 14,100 was extracted, all very good. The bees are doing nicely. I finished extracting Jan. 29, 1903, and the bees brought in the first pollen Feb. 1. I examined the colonies, and was surprised to find from one to six frames of brood in nearly all.

The elm trees are blooming, and the maples are nearly open. If we do not get a very cold and backward month now we will have early swarming, and the way things look now we will have a good honey season.

The best colony gave me 10 32(4x3)-section supers of very nicely filled honey. The best colony I run for extracted honey stored about 400 pounds. Now, had I not better figure

how much 20,100 pounds will make to the colony, or there will be another round-up like two years ago, and then not know for sure how much I had per colony? As near as I can figure out, they averaged a little better than 213 pounds per colony, which I think is very well. I got about 225 pounds of bees-wax during the season.

The Danz. hives and 4x5x1 1/4 sections have come to me to stay; they are the hives for comb and extracted honey. F. J. GUNZEL, Poinsett Co., Ark., Feb. 2.

Dividing to Prevent Swarming.

I notice in the Bee Journal quite a lot about dividing colonies of bees in many different ways, but all arriving at the same result—preventing swarms. Now, if all used the Heddon hive for increase, they would find it easy work. I don't need to move a frame or shake a bee to make a new colony. Just snipe a strong, exchange places, and there will be no fighting, and in a few days it is hard to tell which colony is working the stronger.

I also noticed that some doubt what I mentioned last summer in regard to bees disliking black. I wish those having cross bees would try the different colors in dresses and then report later on, whether the bees make a distinction.

Last summer a beginner transferred a few black bees; they went to robbing, and nearly all went into one colony, but no fighting. If I had been there I would have exchanged hives often enough to have had them all even. The advice given was a little different, but mine would have been too late.

SAMUEL HEATH, Armstrong Co., Pa., Feb. 2.

Bee-Keeping in Northern Ontario.

You see the columns of the Bee Journal are open for the best ideas of interest to beekeepers. I find it interesting, and also notice that the correspondents tell plain facts about bees and honey.

I am surprised at the statement that you are troubled (in the States) with so many insects, also foul brood, in connection with beekeeping. In this part of Canada we have no foul brood or insects, and do not dwindle. When our bees are put away in the fall we never see them until next spring, when they come out in millions, strong and healthy, and every bee on the offensive. There is a light and a strong breeze to see and handle bees, and, if not properly handled, foul brood and insects will attack the colonies.

It is said that the honey crop has been very poor with our American cousins. It has not been so with me where I live. I never had such a large quantity as the bees gathered last fall, hundreds of pounds from a few colonies. But every colony that I have is as

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and address of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelities," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.50.

GEORGE W. YORK & CO.

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

Rumely Company New Catalog.

From the city of LaPorte, Ind.,—"the Maple City"—comes fresh from the press the catalog of our regular advertising patron, The J. Rumely Company. In acknowledgement of the pride all its people have in this enterprising city, it bears on its front cover-page a beautiful wreath of Autumn-tinted maple-leaves; on the back page a cut in colors of the great Rumely manufactory with the best embellishment, and the book throughout is attractive in form and substance. It has a fit subject; its purpose is to illustrate and describe the well-known and popular Rumely Traction Engines and Separators. The objects of a catalog are well conceived and maintained to the end. No one can take up the book without being impressed with the fact that the Rumely Company intends that the purchaser shall know all about the Rumely goods. About one-half the book is taken up with full-page illustrations. Every point is made plain, so far as illustrations can do it and the descriptions are so minute and exact as to leave no questions or doubts in the minds of the reader when he has finished. The Company evidently proceeds upon the theory that if threshing machinery buyers appreciate just what their line consists of, it will be amply able to stand its ground against all competition. This must be conceded a wise policy where goods have the sterling character possessed by those of this concern. The book will be welcomed by all who are interested in high-grade threshing machinery. It will be mailed free to anyone writing for it. Please mention the American Bee Journal when asking for a copy.

Please mention Bee Journal when writing advertisers.

 TOPEKA, KAN.

good as three or four colonies that others have. You might ask, How is that? Here is the reason: My queens are known as "The Prolifics." The honey-bees are of a large size, and they are great comb-builders and fast honey-gatherers. On my 200 acres of farm land we have any amount of basswood blossoms, goldenrod, and thousands of wild flowers and other nectar-giving flowers for the bees. We have also all kinds of trees, the leaves of many having honey on the upper side of the leaf. We have also rivers, creeks, and lakes of the purest and best running water, and no swamps or stagnant water, so you can see that we have here a veritable land flowing with milk and honey. It is foolish for one to expect honey from bees when there is no proper forage for them when the water is not good and the climate dirty. We have myriads of birds from the States in summer. The bees and birds seem to know a healthy climate.

Again, I have never met a man yet who knows how to feed his bees. Like man, and all else, the honey-gatherers, and all the delicacies, of different kinds of honey in the fall, and there is nothing in the medicinal pharmacopia that can come up to it. I never have this honey. I have a beautiful orchard, with a southern aspect, and in the spring it is a perfect picture to see the bees covering the apple-blossoms, and the hum is like a locomotive wading through a snow-drift. Our water courses come to spend the summer at our lakes here in Muskoga, and they have said they never saw such splendid honey as they have eaten in our towns and villages. As to the keeping qualities of my honey, it is always as good the following June as when gathered the previous September; both in the comb and out of it. Who can beat this? Ontario, Canada. **JAMES BROWN.**

## Various Methods of Rearing Queens.

I have 40 colonies of bees, ranging from blacks to bright golden Italians. I have queens imported direct from Italy, queens reared by the Doolittle and by the forced method, also queens reared by the bees as nature called them at swarming-time, and by the superseder plan, but I have had no experience like Dr. Gallup, with any of the methods.

By the way, Dr. Gallup, will you please tell us why that colony in the basswood log did not do as those colonies you had in your 36 and 48 frame hives—rear a queen to suit the capacity of the hive, and swarm the next season. I have had colonies in yours, with the proof of their being there for number of years, whose queens were reared by Nature's plans, and I have to see the first one that was in any way superior to the queens reared by the Alley or Doolittle methods, under proper conditions.

Now, Dr. Gallup, I'll tell you what I'll do: I will use 5 colonies containing queens by the Alley or Doolittle method; you take 5 colonies containing queens by Nature, and set them beside mine, and if I don't get more honey from my 5 colonies than you will from yours, in this locality, I'll board you one year for nothing, while you prove to me how you did it.

The bees are all on the summer stands, and are in fair condition at this time.

There is much white clover, which has been well protected by the many stows, and prospects are good for a white clover honey-flow, if the weather is favorable at that time.

**A. ZIEGLER,**  
 Huntington Co., Ind., Feb. 9.

## Fruit-Tree Spraying.

This was the subject of the monthly meeting of the Worcester County Bee-Keepers' Association, Feb. 14. The opening paper was read by H. P. Jacobs, who in brief said:

"There is no cause of friction between the bee-keeper and fruit-growers. It is fast coming to where trees must be sprayed, if the grower is to have salable fruit for the market. But fruit-growers and bee-keepers must realize this: As bee-keeper we are interested more in the time when not to spray, on account of the danger of killing bees. The Creator designed the bee for a special purpose,

 Single pound 5 cents more than the 5-pound rate, and 10 cents extra for postage and sack.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

**GEORGE W. YORK & CO.**  
 144 & 146 Erie Street, CHICAGO, ILL.

which is to aid nature in pollinizing flowers of different kinds. There are varieties of the same kind of fruit, and the honey-bee was made to carry the pollen from one tree to the other. Thus it was evident that the time to spray is not when flowers are in bloom. It is stated that soon as a flower is fertilized it ceases to secrete nectar and its petals fall. I should say that after the bud opened enough to admit any spray it is wiser not to spray, not only for the bee-keeper, but for the fruit-grower, since we must rely upon the bees to pollinize the fruit-blossoms, if we are to get a good crop of fruit. In summing up the matter I would say that trees are liable to be poisoned by spraying while in bloom, the liability increasing in proportion as the weather is favorable to bee-activity. Spraying should be done one week before blooming, two weeks after blooming, and again two weeks later."

It was shown by one speaker that New York State has a law which makes it a criminal offense to spray fruit-trees while in bloom.

Secretary A. A. Hixon, of the Horticultural Society, announces that Worcester fruit-trees are over-run with San Jose scale, and these must be wiped out or many fine orchards will be ruined. He showed twigs cut from pear, crab, peach and plum trees, infested with this pest.

It was further shown that very few in this vicinity do any spraying at all. Before the meeting adjourned the president appointed Mr. Hixon and the secretary a committee to draw up resolutions to send to our senator at Washington, urging the adoption of the Pure Food bill at this session. C. R. RUSSELL.

Worcester Co., Mass.

**CONVENTION NOTICE.**

**For Good Road-Making.**

At the Auditorium, in the city of Chicago, on the evening February 20 the National Good Roads Convention assembled for its opening session. The National Highway Commission appointed by President Roosevelt and consisting among others of such distinguished members as Gen. Nelson A. Miles, Colonel Jacob Astor and Col. Albert A. Pope, were liberally represented. The Governors of most of the States in response to the invitation, and delegates, and representatives are also present from every local good roads association of any consequence in the United States.

An assembly constituted as this one was should have been able to shape some policy to bring order out of a very chaotic but all important subject. A most healthy sign was the presence of the strong band of the General Government, heartily seconded by the different States. We cannot conceive of any field in which State or Nation can direct or encourage the spending of money which will result in the great body of rural people such direct and permanent good as the improvement of highways. Necessary and unavoidable subjects of such general topics. No definite plan was formulated for the detailed work of road improvement. Yet something like this one would have been a step in the right direction and of all things the most practical. We instance the elementary principles of road-making, namely drainage, raising center, well roads, and rolling. Even outside of paving, these are prime essentials in municipalities. They are also essential in the country. The first two are correlative, the one being the necessary result of the other. As to the rolling and the road-bed, if the purchase of heavy engines for the purpose, such as are used in cities and towns, be too radical a step, the use of the roller, which has been adopted at least one good, practical measure if it had passed a resolution advocating the general

use of broad-tired vehicles on the road. The same benefits are to be derived from it that flow from the use of the steam roller. And in its use the same would be nothing to the county or township authorities, the mere use of such wheels instead of wearing and the rollers, do constantly. Where the narrow wheels rut and furrow and lead to washing, the broad tires roll and make compact and permanent. It is only necessary to behold the road districts in regions where the broad-tired wheel is in general use to become at once an advocate of their general employment.

Many towns with unimproved streets set a limit by ordinance to the width of tires which may be used, the tires being in all cases to have at least such a tread as will give the needed packing and rolling and prevent the wheels from slipping. This ordinance creates far heavier draft and frequently makes the street absolutely impassable. The illustration herewith well illustrates our meaning. We reproduce it by courtesy of the Electric Wheel Company of Quincy, Ill., who by the manufacture of it which adopted the same purpose we are mentioning is doing much to further the cause of good roads all over this country. It will be apparent that the draft made much lighter by the broad-tired wheel than the narrow one even for the first tracking over a rutted surface. It is unnecessary for me to pick and improve the bed and still further lessen the draft, while exactly the reverse is true of the narrow tire. In the practice of experience of every farmer did not unequivocally settle this fact, the experiments made by the Experiment station at the University of Missouri would place the matter beyond cavil.

There are other essentials which will enter into road-building of the future. This is one—a very important one. All the more important because so vital of good roads, and so much of the interest of the authorities, and attended with no extra expense to the user of the broad-tired wagon, but on the other hand, it is a far greater benefit to the user of the draft and far greater convenience than in any other way.

Please mention Bee Journal when writing advertisers.

**HONEY AND BEESWAX MARKET QUOTATIONS.**

CHICAGO, March 7.—The demand for comb honey has been and is of small volume, prices are weak, concessions being made where necessary to effect sales. Fancy white comb held at 150¢ loc; all other grades of white are irregular at 130-140¢; light amber, 7¢; amber, 6-6 1/2¢; ambers, 9-10¢. Extracted, clover and basswood, 7-8¢; other white grades, 6-7¢; amber, 5 1/2-6 1/2¢. Beeswax steady at 30¢.

R. A. BURNETT & CO.

ALBANY, N. Y., Mar. 14.—Honey demand quiet; receipts and stock light. Comb selling, light, 15¢; mixed, 14-15¢; dark, 13-14¢. Extracted, dark, at 7-7 1/2¢. Beeswax, 30-32¢.

H. R. WRIGHT.

KANSAS CITY, Mar. 14.—The demand for both comb and extracted honey is better, receipts light. We quote as follows: Extra fancy white comb, per case, \$3.40; strictly No. 1, \$3.30. No. 1 amber, \$3.25; No. 2, white and amber, \$3.20. Extracted, white, per pound, 7¢; amber, 6-6 1/2¢. Beeswax, 30¢.

C. C. CLEMONS & CO.

CINCINNATI, March 11.—The demand for extracted honey is good at the following prices: Amber, barrels, 5 1/2-6 1/2¢, according to quality; white clover, 8-9¢. Fancy comb honey, 15 1/2-16 1/2¢. Beeswax strong at 30¢.

THE FRED W. MUTH CO.

NEW YORK, March 5.—There is a fair demand for white comb at 15¢ per pound for fancy, 13-14¢ for No. 1, and 12¢ for amber, with sufficient supply to meet the demand. Dark honey will be cleaned up with very little left; it is selling at about 11¢ per pound. Extracted rather weak and in quantity lots, prices generally shaded. We quote: White, 7-7 1/2¢; amber, 6 1/2-7 1/2¢; dark, 6¢. Beeswax scarce at 30-32¢ per pound average.

HILDRETH & SOBELSKA.

CINCINNATI, Mar. 7.—The comb honey market has weakened a little more; is freely offered at following prices: Fancy white comb, 15¢; demand for ambers whatever. The market for extracted has not been changed and prices are as follows: Amber in barrels, 5 1/2-6 1/2¢; in cans 6-6 1/2¢; white clover, 8-9¢.

C. H. W. WEBER.

SAN FRANCISCO, Mar. 14.—White comb honey, 1 1/2-1 3/4¢; light amber, 1-1 1/4¢; dark, 5-6¢. Extracted, white, 6-6 1/2¢; light amber, 5-5 1/2¢; amber, 4-4 1/2¢. Beeswax, good to choice, light, 26-27¢; strictly fancy light, 29-30¢.

## Gleanings IN Bee-Culture

### Do You Need Gleanings?

Certainly. If you do not read GLEANINGS IN BEE CULTURE and know the condition of the honey market as reported in the Honey Column, you are likely to sell a good crop of honey at from 10 to 25 percent below the market price, as we know of some who did last season, simply because they did not know that the market was better than it had been in former years. For these reports alone you ought to have GLEANINGS. The honey market is correctly and definitely quoted from the principal cities of the United States and corrected every issue.

N. E.—In our ad. in the American Bee Journal, Mar. 12, with reference to brass smokers, please read, "All brass smokers, 25 cents each EXTRA."

THE  
**A. I. Root Co.,**  
Medina, Ohio, U.S.A.

## DEPARTMENTS.

### STRAY STRAWS.

By Dr. C. C. Miller, of Marengo, Ill. Dr. Miller is one of the best known writers in the U. S. In each issue of GLEANINGS he gives us a page or two of short notes commenting on articles found in the various American and foreign bee-journals. These are not only interesting but valuable. Very few bee-keepers have the time to read all the bee-journals, even if they could afford it, and you will get in Stray Straw notes relating to bee-culture from all over the world.

### PICKINGS FROM OUR NEIGHBORS' FIELDS.

By Stenog. In each issue will be found immediately following the last-mentioned articles, another series of short notes picked up from the various bee-papers, with comments by Stenog. This department has been here now for nearly three years, and is full of interesting and witty matter. You have to read Stenog's writings to appreciate them. We can not do them justice in a brief description.

### OUR HOMES AND HIGH-PRESSURE GARDENING.

By A. I. Root. Will be continued as heretofore, and in the editorial column Mr. E. R. Root will continue to give the latest developments in bee culture.

### BEE-KEEPING IN CUBA.

Mr. A. I. Root has just returned from Cuba, and will give a series of articles on his sojourn there in his usual interesting manner.

## SPECIAL OFFERS.

### Offer No. 11

For 25 cents we will send GLEANINGS 6 months' trial subscription to new subscribers.

### Offer No. 22

For \$1.00 we will send GLEANINGS for one year and an untested Italian Queen valued at 75 cents, but at this low price we reserve the right to send queen some time in June when we have a choice supply.

### Offer No. 24

If you order \$10.00 worth or more of goods from our catalog at regular prices, paying cash for them, for 50 cents more you can have GLEANINGS for one year.

### Offer No. 25

For \$1.00 we will send GLEANINGS one year and a Clark Smoker, postage 20 cents extra. Or, for \$1.25 we will send the Cornell Smoker, postage 25 cents extra.

### Offer No. 26

For \$1.75 we will send GLEANINGS one year and our Cyclopedion on Bees, the A B C of Bee-Culture, of 500 pages.

## Weekly Budget.

DR. C. C. MILLER, of McHenry Co., Ill. wrote us March 17:

"To-day the few colonies that are out of the cellar are having a fine flight—65°."

Evidently celebrating St. Patrick's Day!

THOMAS G. NEWMAN was announced last week in these columns as having passed away March 10, in San Francisco, Calif. The Philosophical Journal (of which he was editor at the time of his death) contained the following in the issue of March 14:

PASSING OF THOMAS G. NEWMAN.

Mr. Thomas G. Newman passed to spirit life Tuesday, March 10, at 12:45 p.m.

For several years Mr. Newman had been an invalid, and about three years ago he was stricken with nearly total blindness.

From the latter affliction he was slowly recovering, and, in the last few months, was thanking the good angels for their mistaking care in restoring to him his sight.

About six weeks ago he was taken with the grippe, but persisted in attending to his work until Feb. 5, when, overcome by weakness, he fell on the pavement in front of the St. Nicholas Hotel.

He was carried to his home, and all that the most skillful care could do was done to insure his recovery.

For a few days it was thought that restoration to health and usefulness was possible—even probable—and especially was this true after arrangements had been perfected which insured the permanency of the Journal, which had been his life work in recent years, and the perpetuity of which was his absorbing ambition.

Early last week there came signs of a reaction, and day by day his friends saw the life-force slipping from him. Hope was compelled to give way to resignation to the decree of fate.

His son, Mr. A. H. Newman, was telegraphed for from Iowa, and arrived in time to see his father before he passed to the unconscious state, which, for several hours, preceded his final transition.

Mr. Newman was born in Bridgewater, Somersetshire, England, and was married to Eliza Fowell (who has remained his staunch help-mate these nearly 50 years) Feb. 5, 1854. The same year Mr. and Mrs. Newman came to America on their wedding tour, and have remained in this country continually since, except during the years 1866 to 1869, when Mr. Newman was engaged in business as printer and publisher at Teignmouth, England.

Mr. Newman has been engaged in many newspaper ventures, the most important having been the American Bee Journal, which he conducted from 1873 to 1892, and the Philosophical Journal, which he has conducted since, first in Chicago, then in San Diego for a brief time, and since 1897 in San Francisco.

Mr. Newman was one of those true-hearted men whom all men know to love, and who thought vastly more of the welfare of others than of himself.

Besides his wife, there survive him his only son, Mr. A. H. Newman, Mrs. F. H. Chenoweth, and Mrs. H. P. Cook, the first two of whom were at their father's bedside at his passing out. The other daughter was in the East, and could not get here in time to see him in this life.

Mr. A. H. Newman, in a letter dated at San Francisco, March 16, said concerning his father's picture used on the first page of last week's issue, that it is "the latest and best in existence." To which he added this in reference to what we have reprinted above from the Philosophical Journal:

In relation to further information I will say that the latest number of the Philosophical Journal, which has undoubtedly reached you before this time, contains a little synopsis of my father's life, and I don't know of anything that I could add excepting that the funeral took place on Sunday, March 15, at 2 p.m., from the Lodge Room of the Pacific Lodge of F. & A. M., and at the request of Golden Rule Lodge No. 726, of Chicago, of which he was a life member; and it was his request that he be buried with Masonic honors.

Yours truly,

A. H. NEWMAN.

THE KING-BEE OF NORTHERN COLORADO, says the Rocky Mountain Bee Journal, is M. A. Gill. He will enter the honey harvest of 1903 with 1250 colonies, says the same journal. That's banking a good deal on successful wintering on the part of Mr. Gill, seeing the statement was made in the January number. But the success of the past may fully warrant such banking.

READ ALL THE BEE-PAPERS.—In the March Bee-Keepers' Review is a characteristic editorial by Mr. Hutchinson, with this heading: "A Man Can't Know Too Much About His Business." From it we take these paragraphs:

If a man is making a specialty of bee-keeping, I believe it is a mistake not to take all of the journals and read all of the books on the subject. He can't afford not to read them. Ever since I began bee-keeping I have read all of the journals, and have found it profitable to do so. Many a time one little item has contained information that was worth dollars and dollars to me. In my travels about the country I find that the most successful bee-keepers read all, or nearly all, of the journals. Men who have been in the business the longest, who have kept the most bees, those who have had the most experience, and who, it would seem, stood in the

least need of advice or help from journals, are the ones who are the most anxious to read them. They have learned their value.

Let no one imagine, however, that the reading of all of the journals will make of him a successful bee-keeper. Neither will the keeping of a large number of colonies alone lead to the same result. Successful bee-keeping does not depend upon any one thing; it is a well-rounded whole of many parts. But don't forget that any lack in one or more of the component parts makes a bad showing in the final summing up.

We believe we have seen all the bee-papers that have been published in this country during the past 20 years, and, with perhaps one or two exceptions, every one of them has been worth many times its subscription price to those interested in bee-keeping.

We can not understand how any one who expects to make a success with bees can hope to do so without taking several of the best bee-papers published to-day. For about \$5.00 we suppose that all of them could be taken—less than 10 cents a week! It's a poor business indeed that could not stand that. At any rate, every bee-keeper should have at least one good bee-paper. If this journal doesn't "fill the bill," then try another. That is the way we should do, if we couldn't afford to take all of them.

**FREE** as a....  
**Premium**

**A Foster Stylographic PEN....**

This pen consists of a **hard rubber** holder, tapering to a **round point**, and writes as smoothly as a ball pen. **The point and needle** of the pen are made of **platinum**, alloyed with **iridium**—substances of great durability which are not affected by the action of any kind of ink.

They hold sufficient ink to write 10,000 words, and **do not leak or blot**.

As they make a line of **uniform width** at all times they are **unequaled for ruling purposes**.

Pens are furnished in neat paper boxes. Each pen is accompanied with full directions, filler and cleaner.

**BEST MANIFOLDING PEN ON THE MARKET.**

**19,000** Postmasters use this kind of a pen. The Editor of the American Bee Journal uses the "Foster." You should have one also.

**How to Get a "Foster" FREE.**

Send two NEW SUBSCRIBERS to the American Bee Journal for one year, with \$2.00; or send \$1.50 for the Pen and your own subscription to the American Bee Journal for one year; or, for \$1.00 we will mail the pen alone. Address,

(Exact Size of the Pen.)

## Editorial.

**Clipping Queens** is greatly favored by some and as severely condemned by others, but, as a rule, those who favor clipping have tried queens clipped and unclipped, while those who condemn it have never thoroughly tried clipping. If you have never tried clipping, it might be a good plan for you to clip a small proportion of your queens, and then you could judge better as to which plan is best for you.

**Laying Workers.**—One continues to see mention in bee-papers of a colony having "a laying worker," with perhaps a remark as to what became of "the laying worker." It should be remembered that careful analyses have shown that in a laying-worker colony a large proportion of the bees are found to contain eggs. The shaking off the bees at some distance from the hive, so that "the laying worker" may not find her way back home, will thus be seen to have some imagination connected with it. A laying worker will probably find its way back to its home as readily as any other worker.

**Placing Hives in Pairs** is strongly advocated by those who have practiced the plan. It is claimed that the bees will never make the mistake of entering the wrong hive of a pair; if a mistake is made it will be by entering the corresponding hive of another pair. This gives the advantage of economy of space. A further economy is gained by putting two rows together close, back to back, thus making the hives in clusters of four. If you level your hives with a spirit-level—and by all means you should—you will find it much easier to level a stand for two hives than a shorter one for one hive, taking less than one-fourth the time.

**Introducing Virgin Queens.**—The Australian Bee-Bulletin, page 200, says: "Bees are said always to accept a virgin queen." That is one of those half-truths that are often the most dangerous errors. The truth is that, in general, virgin queens are not nearly so easy to introduce as laying queens. The bees seem to want some one to engage immediately in the work of laying eggs, and a virgin queen does not fill the bill. There is, however, a short time in the life of every virgin queen when she seems to be readily accepted by any colony, even one

which has a normal queen with which the bees are entirely satisfied. That time is during the babyhood of the queen, and does not last many hours after she emerges from the cell. At that time she does not seem to be recognized as a queen—she is merely a baby, and will do neither good nor harm.

As soon, however, as she becomes old enough to put on the airs of a queen she must take her chances as such. If the colony is in need of a queen, her chances of acceptance are much better than if she had been left out of the hive till more mature. She is already there, in peaceable possession, and possession is nine points of the law. If there is present a laying queen that the bees are thinking of superseding, the young Miss has the same chance as if she had emerged from a cell matured in the hive. But if there is present a laying queen with which the bees are entirely satisfied, then as soon as she is old enough to be recognized as having royal blood in her veins, she is promptly seized as a usurper.

Just remember that until a virgin queen is a few hours old she will be kindly received in any colony. Whether she continues to receive kind treatment after she begins to assert her royalty depends upon circumstances.

**Have You a Spirit Level?**—If not, get one and use it in leveling your hive-stands before they get any heavier. If your bees are in the cellar, level the stands before the bees are brought out. Don't think you can level well enough by the eye, especially if the ground is not level. Just level two or three stands by the eye, and then test them by a level, and you will very likely be done with the eye-business. No matter about leveling from front to rear—perhaps it will be all the better if the hive tips a little forward—but from side to side they should be level.

**Absorbent Covering for Hives.**—Straw mats, coverings of chaff, etc., have been used to put over brood-frames in winter, and are much in favor. The name "absorbent," however, conflicts with the popular theory as to such coverings, which is that the atmosphere of the hive slowly passes up through the pores of the mat or other covering. If the air passes through it can hardly be said to be absorbed. The real value of such coverings probably consists in their being non-conductors, retaining the heat. The following *Straw Straw* from *Gleanings In Bee Culture* is in point:

R. Rhombert, in an able article in *Bienen-Vater*, reports investigations as to ventilation. He put a straw mat over a hive, filled the hive with smoke, then watched the smoke

escaping upward. It came through the needle-holes, the wrinkles in the binding, and especially along the crack where the cushion lay on the hive, but never a bit came through the straw. That the straw is impermeable is further shown by the fact that it becomes damp. If air passed through it, then the moisture would pass through and settle on the outer surface, leaving the mat dry. If he is right, and I suspect he is, then we are a bit off in thinking that cushions are good because the air passes through them. They are good because they are non-conductors, keeping warm. The air must be allowed to escape through little holes or cracks, and the under surface may be water-tight, only so it is warm.—[There is something in this, I believe. Absorbents will take up water; but if they would allow air to pass through them, that water would be evaporated, but it is not. The common practice now is to put a sealed cover over the brood-frames in winter, and then the so-called absorbents on top, not to "absorb," but to provide a non-conductor of heat.—EDITOR.]

**Use of Drones.**—Among the old writers will be found those who credited the drones with laying all the eggs. Later they were counted water-carriers. Modern authorities generally consider their sole function that of fecundating the young queens, yet of late there seems a tendency to attribute to them other functions.

Some maintain, in a general way, that a colony will do better if allowed to rear a reasonable amount of drones, the fact that the bees are eager to rear drones being sufficient proof that it is the right thing to do. But it is not always a safe thing to appeal to Nature. That would lead the poultry-raiser to have as many cocks as hens in his flock.

There seems, however, more force in the argument that drones aid in keeping up the heat of the colony, and this argument obtains more especially among some of the German and French bee-keepers. One German writer gives what he considers a striking instance. A very strong colony, from which might have been expected a heavy harvest, had all its drones destroyed, and the harvest was almost nothing, because a large proportion of the field-bees had to stay at home and keep up the heat, which heat would have been provided by the drones.

Admit that the destruction of the drones resulted in a cold hive, does it follow that a good thing to have in each colony a force of drones, independently of their use as mates for the young queens? Suppose that the drone-comb in which the drones were reared had been worker-comb instead. Would not the workers reared therein have served equally well as heat-producers? Will not a pound of workers produce just as much heat as a pound of drones? Will they not produce more? It is not the bee that is sitting perfectly still, but the bee that is moving about in lively action that produces heat. The nurse-bees are in lively action, the drones are not. The drone takes its exercise out in the open air, warming its heat in warming the weather rather than in warming the hive. The truth would seem to be that the workers produce more heat than the drones, and produce it at no cost, while they are at work as nurses, awaiting the time when they will add to the stores of the hive as fielders.

## Convention Proceedings.

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 182)

#### IS SPRAYING IN BLOOM A CRIME?

"Is spraying fruit-trees in full bloom a crime against bee-keepers?"

Mr. France—I think in four States of the United States there are laws on that subject, making it a criminal offense to spray fruit-trees with poisons.

Pres. York—It is not a crime in Illinois, but it is not a good thing to follow to spray fruit-trees while in blossom.

Mr. Moore—I would ask the president to ask some one here who knows about that to explain it in detail. This is very interesting, and I am sure some of them have not got it in their minds why fruit-trees, or, rather, why blossoms should not be sprayed with poisonous mixtures.

Pres. York—Mr. Abbott, why should fruit-trees not be sprayed while in blossom?

Mr. Abbott—Because it is dangerous to the life of the fruit itself. Any kind of mixture is detrimental to the development of the germ, and if we could make the most farmers understand that—if they could see that they are killing the best fruit they have when they try to kill something that doesn't exist. There will nothing hinder it except the canker-worm, and a man who is wide-awake and looks after them can have them all exterminated before fruit is in blossom, and then wait a few days and go after them again as soon as the time is past and the bloom has fallen, and get rid of them in that way. That is the only thing that I know of that we have in Missouri that can be reached. They are simply wasting their time trying to reach the codling-moth. The reason you can't kill them is, they have a way of hanging at the end of the blossom of the apple; they do not immediately enter the apple but eat around, and while the apple is yet upright if a little poison lodges in there and the blossom closes up the larva goes in there and eats it and kills him. If you get some poison in there, and they will stay, you can do something; but over 10 percent go some place else.

Mr. Fluegge—I would like to say that the farmers around our way got into the habit of not using a spray or mixture, but they throw the poison with a powder-gun, blow it up into the blossom. That would poison just as the spray.

Pres. York—Would the powder injure the blossom as much as the moist spray?

Mr. Kluck—The powder will only hang to the tree or to the blossom if it is a little moist. If it is dry it will scarcely make any effect, and it will not do any harm; and if it is damp, why the bees will get the poison just the same as if sprayed.

Mr. Fluegge—The farmers out our way get up quite early while the dew is on the fruit-trees.

Dr. Miller—The important part to have made public in that matter is, that the poison coming upon the delicate end of the pistil injures them. We are not so anxious that the people shall know that it hurts the bees, but we are anxious that they shall know that it hurts the fruit, and to throw the poison there, either dry or moist, or take it at a time when it is moist from the dew, there is moisture enough in that pistil so that when the dry powder is thrown upon it it will hurt the fruit.

Mr. Abbott—Another important thing is to have the farmer understand that he is not only running the risk of the possibility of injuring the fruit, but he is wasting his powder. He is shooting at the squirrel, not the squirrel that has run in the hole, but the squirrel, that hasn't even gone into the hole, or hasn't even been there. The farmers are shooting at an animal before it is born.

Mr. Johansen—Whether it is powder spray or a liquid it is on the same principle, the powder is sprayed when the dew is on, and would form a liquid, and the poison to the bees would be just the same as if the liquid were sprayed on it. It has been decided by different experiments that it is injurious to the fruit, that it will kill a large percent of the blossoms. I always read every spraying article, and I have never found one who advised spraying while in blossom except Wm. Stahl. All the information we can get from an experiment station is that it is detrimental to the fruit, and greatly so.

Mr. Armstrong—We have said that the spraying is criminal. Is it criminal because we are destroying the bees? We are speaking in behalf of the bees now.

Dr. Miller—It is not criminal in this State. I think Mr. France mentioned that there were four States in which it is criminal. It is criminal there simply because it is against the law. The law is, that they shall not spray while the fruit is in blossom.

#### BEEES USING MOIST POLLEN IN SPRING.

"Will combs of moist pollen left out in empty hives be used by bees in the spring?"

Dr. Miller—Yes, to a certain extent, if the bees are scarce of pollen, and there is no pollen yielding in the flowers. When there is plenty of pollen in the flowers they prefer to take that.

Mr. Fluegge—Will not the weather bake it hard so that the bees can not use it?

Dr. Miller—As a rule, if you leave it there long enough it will become dry and hard. I was answering on the supposition that it was in good condition.

Mr. Fluegge—To save such combs what should be done to keep them in good condition to use the next spring?

Dr. Miller—They keep during the winter, and in the spring put them in the care of the bees.

Mr. Whitney—Suppose that those cells of pollen become molded by being out in hives during such weather as we had the past season? What would you do with them?

Dr. Miller—Then I think it would spoil.

Mr. Whitney—You would count that the whole of the pollen in the cells was injured?

Dr. Miller—I don't know, the under part might be good, but I wouldn't count on it any. I wouldn't use it.

Mr. Whitney—I had something of that kind for the first time this fall; I left it out a few days longer than I should. It was outside in damp weather and the pollen molded.

Dr. Miller—I wouldn't like to use it.

Mr. Wilcox—I have many times had combs stored in an outside cellar in which they frequently become molded, and I placed them in the hives in the spring and the bees carried it out.

Dr. Miller—I was thinking of putting it in the hives for the winter. In the spring I wouldn't hesitate giving the bees anything.

Mr. Whitney—Those frames of molded pollen are outside, and will be kept out.

#### REMOVING POLLEN FROM COMBS.

"How can pollen be removed from combs when not needed?"

Dr. Miller—I should say it isn't needed when it is all dried and spoiled, and then I should try to get out by soaking it.

Mr. Pettit—I asked that question myself. In my locality we have more pollen than we know what to do with. I have been in the habit of melting up good combs because I did not know how profitably to get the pollen out of them.

Mr. Gerbracht—If one cares to go to the trouble of taking the pollen it can be soaked for half a day or so, and then can readily be washed out with an ordinary spray.

Mr. France—I had a sample sent by an Illinois beekeeper in this vicinity lately. He had what he called a surplus of pollen in the combs, and wishing to keep these combs for extracting-combs he soaked them and then hung them out for that mixture to penetrate—then tried to throw the pollen out with the extractor, if possible. In part he succeeded. In a little while, upon examining these, he found there were millions of little life in these combs. He feared that something had gotten in them, and it wasn't foul brood, and he wanted me to examine them; and under the microscope I found they were little live maggots, and it was then in the maggot eggs. I asked him if it was in the comb where there were bees? They don't destroy comb very much, but are working largely to destroy comb.

WILD HONEY-BEES.

"Are there any wild honey-bees in the United States?"  
Dr. Miller—Lots of them.

Mr. Wilcox—I am curious to know what the gentleman means by wild honey-bees. I came to Wisconsin as much as 50 years ago, and went off into the woods many miles from any settlement, and found the woods full of bees. Were they wild, or were they tame?

Dr. Miller—If you find a colony of bees in a tree that somebody doesn't own, those are wild bees. Take them and put them in a house, and they are tame bees; then they swarm the next year and go back in the same tree, and they are wild bees.

Mr. Moore—If the one who asked this question wants a straight up-and-down, flat-footed answer without shirking, I will say all the bees are wild bees, so recognized in the law. If not, how does it come they swarm to the woods? They don't know you as the cow or horse. It is perfectly plain that all bees, anywhere and everywhere, are wild bees. They don't even have a love for home.

Dr. Miller—That's all right; Mr. Moore is a lawyer. I am a bee-keeper. I am right, too.

Mr. France—On the point of law, why is it then that they tax bees in the State of Iowa?

Dr. Miller—Don't they in Wisconsin? They do in Illinois.

### Age of Bees—Longevity and Energy.

BY J. A. GREEN.

THAT bees under ordinary circumstances live but a short time is well known to all who have taken the trouble to experiment during working season. The changing of the queen, as in giving an Italian queen to a colony of black bees, gives an opportunity for the careful observer to demonstrate this fact beyond doubt. As this test is made only during the working season, and as we know that bees live a much longer time during the winter months, we assume, and no doubt with correctness, that nearly all bees work themselves to death, their days being greatly shortened by the fatigues and accidents of their busy lives. It has been noted that queenless bees usually do but little work and consequently live longer. I once had a striking illustration of this fact.

One spring I found a small colony of bees queenless early in the spring. A queen for them was not to be had except at a high price, and it was too early for them to rear a queen with any likelihood of developing into a good colony. I had learned long before this that it was unprofitable to unite such a colony with another at that season. So I simply let them alone. For some reason they did not waste their energies in developing laying workers, their combs, whenever I looked at them, being entirely free from brood or eggs. I opened the hive several times during the season and often noticed the bees guarding the entrance and occasionally flying in or out. The last time these were noticed was on Sept. 5. Several days after, not seeing any bees at the entrance, I opened the hive and found them all gone. But they had lived through nearly the whole of the working season in addition to the winter. I think those bees were hatched not later than October 15, or perhaps Nov. 1, though there is a chance that they came from brood started much later than usual. The probability, though, is that brood-rearing stopped at the usual time in the fall, which would make them at least ten months old.

I wish that I might have had some queens from the mother of those bees, in order that I might have determined whether their exceptional longevity was accidental, or a family trait that might have been transmitted. It is doubtful if a more valuable trait could be secured, unless it be that of a greatly increased working energy, than the vigor and strength of constitution that would enable bees to withstand for even a few days longer the hardships of the working season. As the part of the bee's life that is spent in honey-gathering is so very short, it is evident that every day added to the average life of the working force would

mean a very substantial increase in the amount of the honey gathered by the colony. It is a matter of common observation that there will be a great difference in the amount of honey stored by two colonies that to all appearances are exactly alike at the beginning of the honey-flow. We generally ascribe this difference to the greater working energy possessed by one. Very likely in many cases at least, this is the true solution, but I think that many times the superiority of the winning colony lies only in the ability of each of its bees to put in a few more days' work than their competitors.

Again, most of us have noticed that there is a remarkable difference in the way colonies breed up in the spring. Of two colonies apparently alike on April 1, one may be twice the size of the other three months later. We usually lay this to the greater prolificness of the queen in the larger colony. This may often be true, but I think that in most cases the bees of the larger colony have lived to a greater age. This would keep a larger force of bees in the hive all the while, when if no more eggs were laid, but, further than this, it is the presence of this greater number of bees that permits more eggs to be laid and reared into brood.

There is nothing unreasonable in the supposition that the bees of one queen live longer than those of another. We are all familiar with the fact that some families in the human race are much longer-lived than others, and that this quality is transmitted from generation to generation. There is a field here for the scientific queen-breeder that it seems to me has been all but untouched. Of course, those who have selected their breeding stock according to the amount of honey gathered, and the way they have bred up in the spring, have included this factor, perhaps without knowing it, but, if so, it has been largely a groping in the dark that could not yield the results that a more definite knowledge of the ends to be aimed at might have secured. If any breeder has paid special attention to this point, I have never heard of it.

Whether or not there be anything in Dr. Gallup's theory in regard to the "missing link," and however much of exaggeration there may be in his wholesale condemnation of modern methods (or perhaps I might say *all* methods) of queen-rearing, he deserves credit for calling attention to the value of long life in workers as well as in queens. It is a subject for the deepest thought and the most careful experimentation.

Mesa Co., Colo.

### Foul Brood in the Province of Ontario.

BY INSPECTOR WM. M'EVROY.

FOUL BROOD will soon be a thing of the past in Ontario. The Province of Ontario had at one time more foul-broody apiaries than any other Province or State in the world, and now has less diseased ones than any country, barring none. Ontario has to-day more sound and very choice apiaries for the number kept than any other country in the world, and what has brought about such great results as these is a thing that I will here explain.

In 1890 Mr. Gemmill (one of the best all-round bee-keepers that any country ever produced) saw very plainly that the whole bee-industry of our Province was going to be wiped out by the very rapid way that foul brood was then being spread all over the country, with no law to check it or prohibit the sales of the many diseased colonies that were being shipped into very many localities. Mr. Gemmill knowing all this to be a fact, took hold and spared neither time nor expense until he got the foul brood Act passed, which has proved to be the best thing ever done for the bee-industry of Ontario.

Just as soon as the Act was passed I was appointed inspector for the Province by the directors of the Ontario Bee-Keepers' Association, on account of it being widely known that I had been curing diseased apiaries for years before that, and had been a success at the business, and for this reason was considered a suitable man for the position.

I knew that I had a big job before me at that time, and wanted a few thousand pamphlets published with my method of treatment in to be sent to every bee-keeper in the Province. This was complied with, and 10,000 of these little books were ordered to be printed at once. A little later I wrote asking to have 500 printed in German. This was also granted, and in a short time after that the 10,000 foul brood pamphlets were sent direct from the Minister of Agriculture to the bee-keepers. These were a great help to me in getting the many diseased apiaries cured.

The directors of the Ontario Bee-Keepers' Association

took hold at that time and helped me all they could, and sent me lists of the apiaries that they wanted inspected, and urged the bee-keepers everywhere to go strictly by my treatment, which helped me immensely to get the disease wiped out.

The first season that I went out on my rounds through the Province, I found the disease in every village, town and city that I went into, and also in every country place where bees were kept, and now I am very much pleased to say that I have succeeded in getting the disease almost driven out of our Province, and now have it under perfect control, and can very easily attend to the few apiaries that are suspected to have a little of the disease in them. I have a few apiaries in the county of Norfolk that are suspected to have the disease, and a few in the county of Simcoe, and a little work to do in western Ontario, and some down east; this is all that I know of, and I know more about the true condition of the apiaries of Ontario than any man in it.

N. E. France is, and has been, the only inspector for Wisconsin. W. Z. Hutchinson is the only inspector appointed for Michigan. But here in Ontario we have two inspectors to do the work (myself and Mr. Gemmill), and I have sent him out but twice in the last ten years.

Mr. Gemmill and I are not enough to satisfy some three or four men, and these men want local inspectors appointed all over the Province. We have 43 counties in Ontario, and counting that we have eight townships in each county, that would make 344 townships. Now, suppose that we appoint an inspector for each township, and that each of these 344 men was to send in his bill at the end of the season for \$30, that would only amount to \$10,320. Where would this little sum come from? Would these men make no mistakes? They certainly would, and very many of them, and when they would find foul brood, black brood, starved brood, chilled brood, and brood that had been poisoned through some foolish man spraying fruit-trees while in full bloom, they would report many cases to be foul brood when it was not. I have received more or less reports of this kind every year since I have been inspector, and some from bee-keepers that I did think would know it, and when I got to their place was very much surprised to find that they were mistaken, and that it was a dead brood of another kind, and not foul brood at all.

Any bee-keeper that has foul brood should apply to me to help him, and he can depend upon it that I will never report to any person but the Minister of Agriculture what I found in his apiary. No bee-keeper should be foolish enough to allow any person to examine his colonies that would report that his apiary had foul brood, if he found it there, because it hurts the sales in all such cases long after the diseased apiaries have been cured. Cure your diseased colonies if you can, and, if you can not, apply to me, and if you have good reason to believe that the disease is in other apiaries in your locality, send me a list of the apiaries you want inspected, and I will see that they are cured; but do not ask me to tell if I find the disease in any of them, because it would cause trouble and do others no good. I have to see that the diseased apiaries are cured, and that is sufficient.

Woodburn, Ontario, Canada.

## Queen-Rearing—Replies to Critics.

BY HENRY ALLEY.

I HAVE seen much in this journal during the past winter that was of more or less interest to the general reader. I have also seen much that could only interest the persons who wrote the articles.

Now I admire having anything I send the papers for publication criticised in a fair, manly way. In fact, I court criticisms at all times. But when criticisms run to mere personalities, I surely shall call a halt, so far as paying any attention to them. Competent critics can do any opponent honor; but he who has had no experience in the matter under discussion, and his argument is very personal, or says "I think so," "I don't believe it," etc., these are the people who should not appear in public print as critics. Such people think they count, and have done a smart thing, but the readers who possess a fair amount of horse-sense take no stock in their cheap talk. For instance, a man away out in Oregon made some remarks, on page 130. This man said: "I can pick out conclusive evidence enough to condemn his entire method of rearing queens." I want to say to that man that the methods I use in queen-rearing were tested, found good, and pronounced so by the foremost bee-keepers

of the world long before that man's head was as large as a cranberry. The idea of any man criticising another when what he says plainly shows that he has had no experience at all in the matter he so violently condemns!

"Beware of the \$100 queen-man!" Why, I am unfortunate enough just now to have a queen-bee I would not sell for \$100. Isn't that really a misfortune? Just my luck! What! a queen-bee not worth \$100? Let me tell a little experience in this connection. Now, I am not certain about the year, but I think it was the season of 1878. All the bees in eastern New England perished during the winter, not on account of a hard winter, but from some unknown cause. The next spring I was not the owner of a colony of bees, not one, not even a 50-cent queen. Well, I had to go among my friends hunting up bees, and if possible a *breeding* queen. Had I not found one I surely would have gone out of the bee-business that year. I found one man in a town 6 miles away who had lost all his bees but one colony in which I had put a fine Italian queen the summer before. There was about a handful of bees and as fine a queen as I ever owned. She was a \$100 queen, dead sure. See if she was not worth that, when you have finished reading this story. That queen and the few bees were my entire stock in trade until I went for miles around the country and found 25 colonies of bees. I bought all the bees I needed after a while, though only a colony here and there, and many of the colonies were very weak. A good honey season and favorable queen-rearing weather prevailed through the season. Now, here's how I came out in the fall: I reared and sold more queens that year, and at a greater profit, than in any other year I have been in the queen-rearing business. My whole success was in the one queen and handful of bees. Now, Mr. Whitcomb, you set a price on that queen.

Mr. Whitcomb starts his article, on page 130, by saying: "I see Mr. Alley disdains to refer to my \$25 proposition, etc." I am in total ignorance as to what Mr. Whitcomb refers. I have seen no proposition from anyone, directed to me in any publication. There, Mr. Whitcomb, I am done with you. You may shoot away as much as you please. I can spend my time to much better advantage than reply to such articles as you or any other unheard-of bee-keeper can call my attention to.

I also see in the same copy of the American Bee Journal that my old friend, Dr. Gallup, has not forgotten me. I only want to say to the Doctor that he need not accuse me of doing free advertising for myself. It is all unnecessary for me to do that. I have been in the queen-rearing business 40 years, and never in any year could I rear enough queens to fill all the orders that came to me. Last fall I returned \$100 sent me for queens that I could not supply. All this business came through the American Bee Journal, as I did not advertise in any other paper last year. Doesn't this speak well for York and Alley?

Some people are always happy in lauding their own virtues and belittling those of other people.

Now I'll come down to something that will please the readers of the "Old Reliable."

It has been said in this paper that no queen-breeder sends out good queens. Of course, that is very sweeping, as it takes in all but the person who makes the charge. He's all right. I remarked in one of my previous articles that the rearing of black queens and yellow-banded queens were quite different things to do. 'Tis the easiest thing in the world to rear black queen-bees. It requires no experience nor science. Anybody can do it whoever saw bees. Doesn't the reader remember when the only fowls in existence were the old dung-hills? Everybody had good success in raising chicks and in setting eggs by the millions. An old hen would "steal" her nest and bring a chick out of every egg that happened to be under her when she commenced to sit on them. Just so with rearing old-fashioned bees and queens. How much success do the people have nowadays with the new-fangled breeds as compared with the dung-hill variety?

I'll ask all the queen-breeders in the land if they do not have a good deal more trouble to rear what are called "pure" Italians than they do in rearing hybrid queens? It is so. No one will deny it. Yet we are condemned because all our queens do not prove to be as good as those hybrid queens reared by some people. We all can rear just as good hybrids, and by much less fussy methods. Bee-keepers do not want to buy hybrid queens; they won't have them. Nor do people care any more to buy the old dung-hill breed of fowls.

Some of the queens we send out do not prove to be as good as they are expected to be. But these same queens

were promising when they were shipped. The fault is not in the breeding. By this I mean that the breeder used all his endeavors to produce good queens, and the queens appeared to be all right when they were sent out. Don't say the breeder was careless, or that he don't know how it is done—credit the trouble to the great difficulty in breeding queens of the yellow-banded strain.

For the benefit of the readers I present a cut (Fig. 1) showing a batch of queen-cells built by a method with which

umbilical appendage—through this attachment the young are nourished. Why is an umbilical cord necessary in any animal that is supplied with food sufficient to bring it into existence while it is maturing? When born it is able to feed itself almost the moment it breathes?

The umbilical-cord advocates may be correct in their theory, but to me the whole thing seems very improbable and unreasonable.

To-day, March 2, 1903, I received a letter from a bee-

Fig. 3.

Fig. 1.

Fig. 2.

few bee-keepers are acquainted. Now the four rows of cells, as illustrated, show all the correct indications of first-class work done by bees. You will see that every cell is large, long and heavily waxed. This latter feature is the strongest indication that the occupant of each cell is as good as can be reared.

This batch of queen-cells was the last built in my apiary in the season of 1902. Had they been started earlier in the season twice as many cell-cups would have been started.

Two powerful colonies of bees were used to complete the cells, as the bees that start the cell-cups are not allowed by the system to do so. The bees that start the cups work only 24 hours on them. Then about a dozen of the cups are given to the most powerful colonies in the yard to finish up. Who on earth knows of a better system of rearing queens? Speak right up and let us all know. I have experimented in this line nearly half a century, but I know of nothing so good, nor do I know of any method that will come up to it. *I can rear better queens this way than 'tis possible to rear under natural swarming.*

One writer says, "No good queens are reared except in cases where the queen drops an egg in a cell-cup." I know better, for years of experience, that but very few queens are reared from cell-cups. Surely they are not in the natural way. Now and then a cell-cup can be found at about swarming-time that has an egg in it. But there is no evidence in any case that the cell-cup was first formed and the egg put in it by the queen. I have seen an egg in some very shallow worker-cells. At swarming time, when the bees come across such eggs they start up a cell-cup at that point. I have seen queen-cells built out on the face of solid brood, in the center of a comb. When there happened to be a cell with only an egg in it when the bees were seized with the swarming fever, and that egg was used from which to rear a queen, there was not the slightest chance for a cell-cup in that spot.

Why don't people give actual facts, and not say, "I think?" *I think* does not go in a court of law. Why should it count elsewhere any more?

In Fig. 2 I also show a single queen-cell. It will be seen that this cell is also very heavily waxed, large at the base, etc.

The third cell (Fig. 3) illustrates a very poor cell, that is, a cell from which a very poor queen will emerge. It is mean, short, and in no way indicates that the unborn queen is of any value. Now when the queen emerges from the cell she most likely will give positive evidence of the "missing link."

I have noticed that "missing link" in some cases, but only on some queens that are half-nurtured, and most likely were reared from a larva three or more days old. I never saw anything about good, healthy young queens that would indicate the existence of an umbilical cord. Only the unborn offspring of warm-blooded animals are connected by an

keeper away down in Argentine Republic, in which he says:

"I am a great admirer of your system of rearing queens, which I learned through the American Bee Journal."

The above shows how a man who keeps 300 colonies of bees appreciates a good thing. Essex Co., Mass.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Emptying Unfinished Sections.

On page 130, Mr. Baldwin tells how he succeeds in getting the bees to empty sections. We tried practically the same thing without entire success. There was one difference, however: We tried it in the fall, he in the spring. We want our sections all emptied in the fall, as we use them for bait-sections, and would consider them spoiled for that purpose if the honey was allowed to candy in them, as it will be sure to do if left till spring.

### Women Carpenters to the Front.

Ever since reading the experience of Kate V. Austin (page 42), I have been contemplating with a good deal of satisfaction how easily I could "take the wind out of their sails" by relating my own experience in carpentry work. When, lo! presto, change. There remained only a gentle zephyr in my own sails when I read the invitation to "beat the record" of Mrs. Griffith (page 121). But while I am not 79 years of age, I am a sort of semi-invalid, relegated to rural life to regain nerve force expended during a long stenographic experience. And while I do not make my own hives, I did make two bee-sheds last fall out of green oak inch lumber. The sheds are 16 feet long, 3 feet wide, and 3 feet high, with lean-to roofs covered with tar building-paper, and taut wires drawn over the upper and lower edges of the roofs and attached to the sides, to keep the wind from "raising the roofs."

I greatly fear our brother bee-keepers will have to look well to their laurels, or they will be taken away by their Twentieth Century sisters who can send a nail *straight* to its intended destination, manipulate a dull, broken-handed saw, and dextrously substitute a carving knife for a plane.

I may be tempted in the dim, distant future to confide

to the dear sisters something about a beginner's first year (1902!) with 40 colonies of bees. But I shall have to enlarge my vocabulary before I could do it justice. Suffice it to say for the present, that the aforesaid beginner survived the ordeal, with a gain of a whole encyclopedia of experience, and a loss of a number of pounds of adipose tissue.

I enjoy the American Bee Journal much more now than "we girls" have exclusive right to a corner. L. S. R., Ashtabula Co., Ohio.

Shouldn't wonder if L. S. R.'s gentle zephyr would create quite a breeze. It ought to, I am sure. Two such bee-sheds out of green oak lumber was no small undertaking—but let me whisper in your ear that when a woman makes up her mind to do a thing she usually does it, tools or no tools; but the description of the same is good, and will appeal to most of us, as we probably have had a similar experience. I had a good, hearty laugh over it.

Just ask the average man to use the same tools, and he would say—but, there, I am not going to tell you what he would say, you can imagine; but let me tell you, the average woman will make a creditable job with just about such an outfit.

Now, really, L. S. R., do you think it just right to tantalize us in this way? You know very well that we are just sighing to hear "about a beginner's first year, 1902." Do you think it sisterly to keep that whole encyclopedia of experience to yourself—now, do you?

I am very glad you enjoy our corner.

### For Lovers of Honey-Comb.

The following was given in a daily paper:

"Cut the honey-comb from the box and put it in the dish in which you wish to serve it. Then stand it in a warm (not hot) oven. The wax will come to the top and can be easily taken off, leaving a nice, clear honey. In this way one may enjoy a pure, delicious honey without the disagreeable wax."

It seems rather contradictory to be talking about disagreeable wax to "lovers of *honey-comb*." Think of paying the extra price for comb honey only to melt it and reduce it to the form of the lower-priced extracted honey! Better tell that woman to buy a jar of "York's Honey!"

### Life's "Little Things."

A German bee-journal gives the following:

"Our life is made up of little things. The things that count most in life are little things."

That's right; the business-end of the bee isn't a quarter of an inch long.

### A Honey Cough Medicine.

An excellent cough medicine that may be made at home consists of olive oil, 2 ounces; paregoric, 2 ounces; honey, 2 ounces. Dose: One teaspoonful every two hours, if the cough is severe.—The Delinquent.

## The Afterthought.

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

BEES CAN MANAGE THE POLLEN SUPPLY.

On the matter at the end of page 83, I find my mind protesting that our bees are not fools. They know when they need pollen—and it's exceedingly probable that they have some sense of it when they are getting an over-large supply on hand. Should hardly think so obvious a matter worth experimenting on. Pollen sometimes spoils on their hands; and then the work of clearing it out is sometimes a serious one—and as such put off in favor of the more pressing work of the hive. When bees have been accused of too much

pollen I guess it's usually a reasonable stock of fresh pollen and a lot of damaged pollen, both on hand at once.

### WAX-EXTRACTORS AND WAX-RENDERING.

Mr. H. H. Root, in an excellent article on wax-rendering, speaks of the sun-extractor as wasting wax. So it does if you throw the remainders away. Don't throw 'em away. In my experience they keep for an indefinite period. Looks to me like a good plan to keep the cake till a large amount is on hand and then work it over. Possibly in somebody else's method the worms would eat up the cake, but they don't with me. Notwithstanding the shortcomings of the solar wax-extractor, don't think of running an apiary without one.

Took him down a bit—that chap who sent a sample of the perfect work his press did. His cake was not all dough—three-quarters dough and one-quarter pure wax. Eighteen ounces of wax from five pounds of old comb was a very high order of success. Comb that has had much brood reared in it is not to be put in the solar at all. It is a serious matter to keep comb from being all eaten up while the happy leisure time to render it arrives. Box in a dark, cool cellar, and put there before any larvae get hatched, is perhaps as promising a resource as any. Page 85.

### KEEPING QUEENS FOR MAILING.

No doubt, Mr. Morgan, most queen-breeders keep young queens where for weeks they can lay but little—waiting orders—and scout the idea of it's doing them a particle of harm. Sometimes, however, the provoking chap who challenges the universal opinion and practice is the very one we ought to listen to a little. And so to have Mr. Stahmann wiped out with one prompt wipe, and never thought of more, is not just what I prefer to see. Page 86.

### BEES IN A SNOWDRIFT.

I would say to J. M. Young, page 86, that the trouble with bees in a vast snowdrift is not that it smothers them, but that they are too comfortable, and start a ruinous amount of brood at the wrong time in the year.

### HONEY TAKING UP WATER.

We knew very well that honey exposed to damp air gains water and gets thin—but we did not know exactly to what extent by weight. Would hardly have guessed that it adds 15 percent in quite ordinary circumstances, and in very favorable circumstances twice that. So thanks to the Canadian Chemist Shutt. Page 86.

### RELIQUEFYING HONEY IN BOTTLES.

On page 87 it is said concerning reliquefying honey in glass bottles: "Loosen the corks." This is absolutely necessary? I'm rather afraid it is; but still I cherish the idea that a sufficiently gentle application of heat in a warming-box will do the job nicely, and save corks, labels, and everything. But I'm thinking of high-class honey perfectly kept. Of course, if the honey was poor to begin with, or if it has grown poor with the lapse of time (as it sometimes does), it may froth on being heated and demand vent. Perchance the whole contents will have to be turned out and the bottle refilled.

### BOTTOM STARTERS OF COMB FOUNDATION.

Interested to learn that bees build the bottom starter and the upper one together before enough honey is put in the top one to swing it out of perpendicular. Should have guessed there was a danger there, but have no experience with bottom starters myself. Page 88.

### MELTING HONEY OUT OF WAX.

The last phrase on page 90—"taking off the cake of wax when cooled"—intimates that, of course, the heat will be high enough to melt the wax. As melting out honey without damaging it is one of the most difficult things we undertake, why not try more—much more—time, and a temperature below the melting-point of wax. The unmelted wax can be squeezed out. Am just now trying this on a pan of cappings that got solid before it drained. This one trial seems to be a success; but I should expect honey candied in the comb to be a little more stubborn.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

# Questions and Answers.

CONDUCTED BY

DR. C. O. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

## Carniolan Bees—Getting Increase.

1. Will Carniolan bees protect the hive, or colony, from wax-moths as well as the Italians?
2. Could I put a hive-body on each colony of bees, and when there is a large amount of bees, take off the top hive and move the old one, setting the top hive on the old stand, and introduce a queen safely, providing I have a honey-board between the two hives? I wish to increase the size of my apiary, and expect to buy several queens this spring, but do not know which breed would meet my requirements. The wax-moths are the worst thing we have to contend with.

ARKANSAS.

ANSWERS.—1. I don't know. Will some one please tell us? The Italians have good reputation in this regard.  
2. Yes, but it might not prove the most satisfactory plan.

## Putting Bees Out of the Cellar Early.

1. What will be the probable result if I put my bees out of the cellar, on the summer stands, a little too early? Will they not, when coming from the cellar, stand a little severe weather or freezing as well as bees that are out at the same time and have not been housed?
  2. Did you mean to say that bees may be safely put out-of-doors when the buds on soft-maple begin to swell, or the sap run? The days are warm, and my bees are getting restless. IOWA.
- ANSWERS.—1. They will be likely to fly out when too cold, many bees being thus lost. I don't know that I can give you a satisfactory reason for it, but I don't believe a colony brought out of the cellar will stand severe March weather as well as one that has been out all winter.
2. No, if the soft-maple is to be taken as a guide, wait till it is out in full bloom.

## Introducing Queens.

I bought an Italian queen last August, introduced her on the day of arrival. She was accepted all right, and assumed her duties at once. About two weeks afterward I was surprised to see young Italian workers about the entrance of the hive.

Why should a colony be left queenless 24 hours after removing the "old" queen, before introducing the "new" one? I have not handled many, but what few I have, have all been introduced just one hour after removing the old queen, and every one accepted. All that I introduced was in August or the first of September. Perhaps it would not work earlier in the season.

Yesterday (Feb. 26) was a warm, spring-like day. When near my house at noon, on the way to dinner, I could hear the humming of the bees, and on going out to the bee-yard it seemed as if there were a couple of swarms in the air. They were having a great flight.

I have 9 colonies in the cellar; they never did so well and kept so quiet as this year, to date. ILLINOIS.

ANSWER.—A colony of bees with a satisfactory queen will never accept another kindly within an hour of the removal of their own queen, and they are left queenless 24 hours or more, so that becoming conscious of their queenlessness they may be ready to accept any queen given them. You say you introduced them successfully within an hour of the removal of the old queen, but I feel pretty sure that they were caged, and the real introduction came hours afterward when the candy was eaten out and bees and queen had an opportunity to shake hands. Whether it is best to put the caged queen in the hive at the time of removing the old queen or some time later is a mooted question.

## Feeding in the Cellar—Foul Brood—Extracting-Frames, Etc.

1. When bees are fed in the cellar at a temperature of about 40 or 45 degrees, will the queen go to laying and hatching brood?
2. Which is the best food for bees when they run short of stores in the winter, candy or syrup?
3. What are the chief causes of foul brood? I have never heard of a case in this section.
4. My hives are all 8-frame Langstroth hives. Would 10-frames be better, where the bees are confined to the cellar for five months?
5. I notice some give their bees flights during the winter. I see no way of doing it here, where the ground is covered with snow 5 months.
6. Will it be necessary to wire foundation in shallow extracting-frames to be used in a Cowan extractor?

7. Can 2 shallow frames be put in one basket of a Cowan extractor?
8. How much more honey should a good colony store by placing shallow extracting-frames with foundation, and extracting the same whenever filled, where the colony would store 50 pounds of comb honey?
9. Would it be wise to have Italians, red clover bees and Carniolans all in the same yard, and let them mix with each other?

NEW YORK.

ANSWERS.—1. Hardly, unless the feeding be kept up regularly for some time.  
2. Candy.  
3. The chief and the only cause is the presence of a microbe, *Bacillus alvei*, and the disease is generally conveyed to a healthy colony by means of honey from a diseased colony. A drop of infected honey no larger than a pin-head is enough to start the destruction of an entire apiary.  
4. That depends. It would take less care on your part to prevent starving if you should change to the larger hives.  
5. I think if you watch closely you will find that there is no place in the State of New York, probably, where there will not be at least one day warm enough for bees to fly before time to take them out for good.  
6. They will at least be better for it.  
7. Yes, if the frames are small enough, although it may not be the most convenient.  
8. I don't know. The answer has been given all the way from nothing to two or three times as much, there being a great variation under different circumstances.  
9. Yes, if you do not care about keeping either kind pure.

## The Nucleus Method of Increase.

I am desirous of increasing my bees as much as possible. We have honey coming in during fruit-bloom, and a little during dandelion bloom, but after that not much until alfalfa and sweet clover, which commences the latter part of June and continues until the last of August or first part of September, then the honey comes in slowly.

We cut alfalfa three times. The first and second crops have plenty of time to bloom, and there is often quite a lot of bloom on the third crop.

1. Will it pay me to make nuclei and feed them between fruit-bloom and alfalfa (last week in June), to build them up, when honey is worth 5½ cents per pound? or will it pay the best to sell the honey at that price?
2. Can I increase fast by taking strong colonies and brush or shake the bees on foundation or starters in a new hive on the old stand, leaving the brood in the old hive in a new location, and give them a capped queen-cell, when enough bees have hatched from the combs, and feeding both with honey until the honey-flow is good in the field? Will this plan work, and pay?
- I rear queens according to Doolittle's cell-cup plan. UTAH.

ANSWERS.—1. So long as you want the increase, better feed the nuclei.  
2. The plan is not good for rapid increase. You can beat it with the nucleus plan.

## Shaken Swarms.

In using the shaken-swarms process, how will it do to shake all the bees and queen of one colony, and nearly all the bees of another colony into an empty hive, putting the two old hives together, one on top of the other, with one of the queens and just enough bees to care for the brood, in a new location? Will the colony having the brood be likely to cast a swarm? How would you work them, when the brood hatches confine them to one brood-nest, and put on a super? I want comb honey, and no increase. Would this plan work well? OHIO.

ANSWER.—Somewhat the same plan as you propose is in use across the water. S. Simmins, of England, practices the plan given on page 67 of this Journal. In Germany it is the practice of some to take all the brood from a shaken swarm and put it over another strong colony. Either of these plans leaves you with the same number of colonies. The Germans (and it is from Germany that the shaken-swarm plan came) say that when you put this force of brood over a strong colony, the colony thus strengthened by so much brood will not swarm. Evidently, however, the colony would not be in the best condition right away for comb honey.

But why do you want to put one of the hives in a new location? and would you leave nothing on the old location? That wouldn't work, for you of course know that the field-bees would go back to their old location. Very likely, however, the two colonies you mean to operate upon are standing close together on the same stand, and then you would be all right. A little care must be taken not to leave too few bees on the same stand, for in a day or two all of its field-bees will have deserted it for the old stand, and it will be still weaker than you left it.

The colony with the brood will not be likely to swarm unless you take away some of its brood-combs.

Yes, the colony with the brood could be set to work on sections by reducing to one story. Neither would it be necessary to wait till the brood hatches (about three weeks), but perhaps in about ten days you could take away one story, leaving the combs with most sealed brood. There would probably be some danger of this colony swarming.

You express surprise that you find in "Forty Years Among the

Bees? That I don't like the Manum swarm catcher. That hardly gives the correct situation. If I should follow natural swarming, especially with uncapped queens, I should want to use it. But I don't like natural swarming, nor anything connected with it, and would probably succeed in making a failure of any sort of a swarm catcher.

### Rendering Combs into Wax—Spring Feeding.

1. Give a good plan for melting up some wax when I have no solar wax-extractor. I do not have wax enough to pay to buy a solar machine.

2. Will a brass or copper vessel injure the quality of the wax?
3. Would you mix syrup with honey fed this spring?

ILLINOIS.

ANSWERS.—1. Take an old dripping-pan (a new one will do as well), split open one corner, and put in the pan your old combs or whatever is to be rendered. Put the pan in the oven of a cook-stove with the split corner projecting outside, of course leaving the door of the oven open. Put something under the inside corner of the pan, making it an inch or so higher than the split corner, so that when the wax melts it will run out. Set under the split corner a dish to catch the dripping wax, and there you are.

2. I don't know; I think not. Iron will darken it.
3. For spring feeding it will be a little better to have pure honey, but syrup will do very well.

### Why Didn't the Queens Hatch?

Why did my queen-cells not hatch last summer? I practiced the Doollittle plan of making queen-cells. I used a common wooden rake-tooth to shape the cells. All the queens would live until about three days before hatching, and then die. I am a beginner, and ask for information.

MAINE.

ANSWER.—I don't know. Just now I think of only two things as most likely. One is, that the young queens may have been put where they chilled. The other is, that they may have been shaken.

### Transferring Crisscross Combs.

I have some hives with comb all crosswise of the brood-frames, and would like to ask how to transfer the bees to another hive, without hurting the bees.

COLORADO.

ANSWER.—You can transfer them just as your text-book instructs you to transfer from a box-hive, or you may take the easier plan of turning the hive upside down, and with a handsaw cut loose any attachments of combs to the sides of the hive, and then lift the body of the hive off the combs. Then you can easily get at the combs to deal with them as you please. If you wait till three weeks after the colony has cast a swarm, there will be no worker-brood in the way.

If the case is not very bad, and some of the combs are straight in the frames, lift out the straight combs, then cut enough to get out the others, and then straighten them in their frames.

### Early Pollen-gathering—Wiring Frames—Making Hives—Foot-Power Saw.

1. About 3 o'clock, p.m., Feb. 15, I went out to look at my bees. The sun was shining brightly, but the wind was blowing cold (in the morning it was 16 degrees below freezing), and I found them working quite freely, and some carrying in pollen. What is the reason they carried in pollen so early? Other years I saw the first pollen about the middle of March.

2. If I wire the shallow 6-inch frames, can I use extra-thin surplus foundation in them? How many wires ought I to put in, and where should they be?

3. Which is the best way to do, to have enough extracting-supers to last the whole season through and extract all at once, or put on one super and let the bees fill it almost full, then raise it up and put another under it, and then extract when it is full, and so on?

4. How many feet of lumber will it take to make 100 bee-hives, 10 frames, with four 6½-inch extracting-super frames and all complete?

5. What do you know or think about the Barnes combined machines? I would buy one as soon as possible if I knew it would not run too hard. Can it be run with the foot to satisfaction?

6. Have you one, or do you make your bee-hives?

7. If it is too hard to run it with the foot, could I get a little pulley, and put it on the axle (as it might be called) of the big wheel, and put on some water-power? Would the pulley or belt be in the way?

8. If it can not be run with the foot, what are they made for?

9. There is a little ditch in front of my shop and bees, and there is running water there about a foot wide. How many horse-power is this equal to, running through a trough about 20 feet long, 4 feet lower at the bottom than at the top? Would it be better to have it incline about a foot, and let it fall about 3 feet on the water-wheel?

OREGON.

ANSWERS.—1. There was no unusual reason for their carrying in pollen on that date. Bees will always carry in pollen when it is warm enough for them to fly, if there is pollen to be had. But there must

be something wrong with your thermometer if it marked 16 degrees below the freezing point when the bees were flying.

2. I don't know, but I fear you could not use extra-thin without four or five wires. You could probably use thin surplus foundation with two horizontal wires, one 2 inches below the top-bar and the other 1½ to 2 inches lower.

3. Dadant & Son are away up in producing extracted honey, and they have enough frames so they do not extract till the close of the season.

4. I don't know; I have never cut any bee-hives from the lumber since I gave up using box-hives. Any one, however, who can cut them out can figure up the amount of lumber. It will vary somewhat according to the boards used, some lengths making more waste than others. The work can be done to so much greater advantage at the factories where they are made by the thousand that I can not afford to do any of the work except to nail them together.

5 and 6. As already said, I do not make my own hives, and have never had any of the Barnes machines, but their reputation I know to be excellent.

7. I have had no experience in the matter, but there is little doubt that they could be rigged to run by any kind of power.

8. Those that are made for that purpose can be run by foot-power, and for some may be all right, as where no great amount of work is to be done, and extra help can easily be had; but unless a man has extra strength he will hardly want to run one alone all day long. I am rightly informed.

9. I don't know. Any one who is entirely at home in such matters can have the floor.

### Feeding Granulated Corn-Sugar.

What about granulated sugar made from corn? Would it do to make into syrup to feed bees in the spring, when they can fly every few days?

ILLINOIS.

ANSWER.—I never saw granulated sugar that was made from corn, but I have seen it in solid cakes, and there is probably not much difference. I think you need not fear any harm from feeding it to the bees in the spring when they fly every few days. But I wouldn't like to warrant that it will do any good, for it is somewhat doubtful whether the bees will take it.

### Bees Rushing out of Hives When Uncellared.

We have had trouble about our bees rushing out lively when taken from the caves and cellars, all getting mixed apparently, and when returning fill some of the hives full of bees and leave others badly weakened, so as to make it detrimental to the depopulated hives. Would a wet rag stuffed in the entrance be good, leaving only room for a few bees to pass in and out at once? or would simply closing the entrance almost entirely answer?

IOWA.

ANSWER.—I confess to you that there are things connected with your question that I don't understand. Every year, for many years, I have taken out my bees with a rush, taking them out so that all could have a flight that first day. Others say that when they do that the bees swarm out and make lots of trouble, but I have never had any serious trouble. Some say to take out a few each day. That would work badly here, for when it comes time to take bees out of the cellar there may not be two days in succession fit to take them out. Indeed, the two good days may be several days apart. Possibly one reason for the difference lies in the condition of the bees. The night before mine are taken out, doors and windows are open to the widest, and all night long they have fresh air. So, when they are taken out they do not feel the change of air, and often they do not fly out of the hive at all for some minutes after being put on the stands. If taken out of the close air of a cellar when they are very uneasy, they may get so excited that they will swarm out.

A big rag made very wet is one of the best things to lay against the entrance when you want to keep bees in temporarily, but I doubt that it would help any in your under consideration. I would rather have the bees so quiet that there is no need to fasten them in. By giving them a tremendous airing the night before taking out, and please report results.

### Keeping Bees in a City.

1. If I kept a few colonies of bees on the roof of a barn in the city, would they be apt to sting or bother people passing by on the street? The barn is about 50 feet from the street.

2. Is a bee-keeper liable for damages if some one is stung in his vicinity?

3. As a rule, do bee-keepers in cities have much trouble with their neighbors about their bees?

4. Would the bees attack a horse in passing in and out of the barn?

WISCONSIN.

ANSWERS.—1. No, there would be scarcely a possibility of any trouble.

2. That's a question for lawyers to answer, each one for his own State, but under ordinary circumstances he would probably not be held accountable.

3. Very little, so far as I know; but, of course, they are generally careful.

4. Not likely, the flight of the bees being above where the horse passes.

**FROM MANY FIELDS**

**Good Prospects for Clover.**

Prospects are exceedingly good for the coming clover honey crop, with the bees wintering well, with plenty of good flights for those outside, and plenty of mild weather for all. There is not much frost in the ground—a thing which, in the past, has counted well for clover honey. **FRANK COVERDALE,** Jackson Co., Iowa, Feb. 14.

**Coldest Weather of the Winter.**

This has been the coldest weather we have had this winter; it registered down to zero, and will damage the bees of this section a great deal. The bees have not had the proper care to stand so bad a spell of weather—they are left to take care of themselves. They swarmed so much last summer that 30 percent have already died. Those that have taken some interest in their bees say they were all right until this cold snap, and we don't know how they will get through this spell. It looks like snow, and the ground is covered with snow now. **M. H. SOSSAMAN,** Franklin Co., Ark., Feb. 20.

**Clipping Queens' Wings.**

I would beg leave to differ from Gustave Leopold in regard to clipping the wings of queens. In an experience of 33 years in handling bees, probably one-third of the time with most of the queens clipped, while others were unclipped, I would rather take care of 100 colonies with clipped queens than 10 unclipped.

Hives with clipped queens must be set close to the ground, so the queen can return if the swarm is not discovered when they come out. Of course, if the hive is set 3 or 4 feet from the ground she will soon become food for ants or rats, if she is not able to return to the hive. The weeds and grass must also be kept down around the hives, and the hives put 6 feet or more apart. **S. L. SHERMAN,** Mahaska Co., Iowa, March 4.

**Last Season Nearly a Failure.**

The past season was nearly a failure in this locality. From 52 colonies, spring count, I got about 900 pound-sections of honey, but swarms galore. The bees got honey enough to keep them in the swarming-fever, which they did in great shape. I doubled down to 77 colonies, which I put into winter quarters in very good condition. They are doing well up to this date, but I am some alarmed about the condition that they will be in in the spring, as the fall flow did not amount to anything, from which, of course, they did not breed late; it is the late brood that tells in the spring.

We are having an old-fashioned winter, 12 inches of snow on the level, and very cold weather; it has been as low as 42 degrees below zero. I have a bee-cellar that never freezes, so the cold weather does not worry me as far as the bees are concerned. I will report how the bees come out in the spring. **FRANK E. KNAPP,** Wadena Co., Minn., Feb. 20.

**Missouri to Organize—Good Prospects.**

I have just read the call for the organization of a Missouri Bee-Keepers' Association, which I heartily second, and have sent in my fee as a charter member. I have often wondered why such an organization was not formed long ago. Missouri has lots of bee-keepers, as the last census will show, and I hope before long to see a strong union of Missouri bee-keepers. I am as great a bee-enthusiast as ever lived. My grandfather was a

great bee-keeper, settling in Missouri in 1840, when the woods were full of wild bees. He was an expert hunter, and had a barrel of wild honey every fall. My father followed him, and I am following both. I would rather hunt bees than do anything else I know of. There are still some wild ones, and I am known all over the country as the bachelor bee-hunter and bee-keeper, although I am only a young man yet.

I have some of the best bee-books which I read and study with pleasure. I have taken the "old reliable" American Bee Journal for four years, and I have every copy nice and clean.

We have the best prospect I ever saw for a good crop of honey next year. I hope it will prove so.

H. S. CARROLL.  
Shelby Co., Mo., March 6.

### Season of 1902.

We had a poor honey season in 1902, but my bees averaged 100 pounds per colony, and still some increase.

I like the American Bee Journal and the gritty old Dr. Gallup. J. G. RYSTRUM.

Chicago Co., Minn., Feb. 23.

### Prospect Better than Last Year.

We are just now having a much-needed rain, making the prospect much brighter, but even with this we are not yet fully assured of a honey crop as the rainfall up to date is only a fraction over 9 inches; but the prospect is much better than at this time last year.

GEO. W. BRODBECK.  
Los Angeles Co., Calif., March 5.

### No Cuban Bee-Keeping for Him.

I have just returned from a four months' sojourn in the island of Cuba, and now hasten to attend to my neglected business. I shall never own a single colony of bees on that island. If there is any place on this earth where eternal vigilance is the price of success it is in the island of Cuba. The bees are forever and always doing just the opposite of what the bee-keeper wants them to do. Deliver me from Cuban bee-keeping forever.

THOS. BRODERICK.  
Cayuga Co., N. Y., March 5.

### He's Getting There.

I became interested in bees one year ago, knowing nothing about them at the time. I bought a colony of Italians and the Langstroth book, and subscribed for the American Bee Journal. I am getting there slowly.

I increased my one colony to three, got 10 pounds of honey, and found out I have a whole lot to learn.

HARRY GREVES.  
Hudson Co., N. J., March 9.

### A Queen-Rearing Experience.

I have been very much interested in the discussion on queen-rearing in the Bee Journal lately. While I do not know much about it myself I have studied it a good deal, and have come to the conclusion that Mr. Alley's queens can not be as good as queens reared in the natural way, although Mr. Doolittle's plan may be all right, provided his colonies are good and strong.

Now, I will tell of a little experience I had with a colony. It cast a very large swarm; of course I looked for the queen, as she was clipped, and I failed to find her, and the swarm returned and clustered on the front of the hive and remained there eight days, after which a second swarm issued with a young queen; they clustered, and I lived them, and they did well that year (six years ago). The first swarm was still clustered on the outside of the old hive two days after they swarmed with the young queen, the old clipped queen came out, and the swarm that was clustered on the hive followed her. I caught and caged her, and moved the old to the new stand, and put another in its place, putting the caged queen on the alighting-board. When the swarm returned I let the queen run in with them, and they did well. The colony

Alfalfa Clover.....	1.00	1.80	4.25	8.00
Alfalfa Clover.....	1.50	2.80	6.50	12.50
Alfalfa Clover.....	1.00	1.80	4.25	8.00

Prices subject to market changes. Single pound 5 cents more than the 5-pound rate, and 10 cents extra for postage and sack.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

**GEORGE W. YORK & CO.,** 144 & 146 Erle Street, CHICAGO, ILL

with the young queen wintered well and started swarming early; they swarmed six times, and I took over 100 pounds of extracted honey from the hives, not counting the swarms, which have as much as 150 pounds more, as I extracted from two of them, and wintered four of them without feeding. That was a queen reared under the swarming impulse. **EDWARD KNOLL,** Gray Co., Out., March 2.

## Shaken Swarms—Catnip.

Shaken swarms—how about the extra frames (sometimes)? Melt the old combs into wax, is it? Old combs are best, sometimes. Ah, law! Mr. Aikin (page 119); the brood might be half and half above and below. Then, my!

Don't be too hard on Dr. Gallup. Experience sometimes is a good teacher. I have seen the big queens with the big colonies myself, and the longest-lived ones, too.

I will try to tell something about catnip some time. My bees are wintering on it partly this winter. **HAWKEYE.**

## Hard Winter on Bees.

This winter has been a pretty hard one on bees, compared with former winters.

December was unusually cold, and the ground was kept covered with snow. Only on the first and last days of that month had the bees a flight, and on Dec. 4, 25 and 26 the mercury went down 2 degrees below zero.

January proved to be somewhat better; the snow gradually melted away, and my bees had a flight on Jan. 1, 3, 6, 15, 16, 25 and 31. We had but two zero days—Jan. 11 and 12.

February was the meanest month so far. Bees flew on Feb. 1, and celebrated Washington's birthday in fine order, as all dutiful and

# SPLIT HICKORY BARGAINS!

The following vehicles are all of the celebrated Split Hickory make and are sold direct to user from factory at factory prices. We send them anywhere on

## 30 Days' Free Trial

and absolutely guarantee them for two years from the time they leave our factory. Our 1903 catalogue is now ready and contains hundreds of exclusive styles of vehicles and harness of every description. It is free and you should send for it before buying a vehicle or harness. We manufacture every vehicle we offer for sale. If you can't get a Split Hickory you are sure of getting something that will please you and a bargain. Remember you can only buy a Split Hickory of us direct as we do not sell jobbers or dealers.

This is our **SPLIT HICKORY HUMMER \$35**

Has 30 oz. full rubber top, split hickory wheels, best quality axles & springs, finely finished, heavy and substantial, the best value ever offered at the price. Sold on 30 days' free trial and if it don't prove itself a bargain and if you don't consider you have saved \$35.00 send it back.

Our **SPLIT HICKORY WINNER \$40**

It not only wins trade for us, but praise from every user. Has genuine leather quarter top, spring cushion and back, heavy braced shafts, in fact everything complete and up to date. Is roomy, comfortable, easy riding and light running. Everyone shipped on trial, no questions asked if not satisfactory, just send it back if it isn't \$30.00 cheaper than equal quality at retail.

And here is our **SPLIT HICKORY SPECIAL \$47.50**

the buggy that won't sell favor in every state in the union last year. Impossible to give description here. Has 100 pounds merit. Nothing like it every offered vehicle buyers before. We only ask a comparison with a \$65.00 buggy at retail and if in your judgment, it isn't 'better don't keep it. Costs you nothing for the trial.

This is our **Split Hickory "FASHION" SURREY \$72.50**

Roomy, comfortable, strong and substantial. Equal to surreys that retail for from \$100 to \$125. Free trial and guaranteed two years.

Write at once for our free catalogue of vehicles and harness; a penny spent for a postal may save you \$25.00. Remember there is only one place to get Split Hickory Vehicles and that is at our factory. We have no agents. **OHIO CARRIAGE MFG. CO.,** Station 6 Cincinnati, Ohio. Please mention Bee Journal when writing.

## POULTRY PAYS

when the hens lay. Keep them laying. For hatching and brooding use the best reasoning and proved Incubators and Brooders—built upon honor, sold upon guarantee. **THE ORMAS** L. A. Bonita, Ligonier, Indiana

46A20t Please mention the Bee Journal.

**PENCILARIA** the money maker for farmers.  
 Produces four times as much hay as clover, twice as much as cane, millet or any other plant, and of better quality. One lb. will plant an acre. Per lb, 75c. 1/2 lb. disc. sample free if you mention this paper. Large illustrated catalogue, Garden and Farm Seeds, Sweet Corn, etc., FREE. IOWA SEED CO., Des Moines, Iowa.

**HIGGINSVILLE BEE-SUPPLIES.**

We have received a car-load of these unique supplies this year and are nearly all sold. We expect to order another car soon. These goods are equal to if not the best on the market. Give us a trial order. We are also agents for the PROGRESSIVE BEE KEEPER, price 50 cents per year. Send your orders and subscriptions to us. We sell at factory prices.

**Helper Wanted**

Young man with some experience to assist in large apiary in Chicago, close to church and city; everything modern. To help man with years of experience in bee-keeping, mechanical. Give age, experience, wages wanted, reference, etc. Address, G. PURPLE, Care American Bee Journal,  
 144 E. Erie Street, CHICAGO, ILL.

patriotic bees should. We had five zero days in February, and it was 14 degrees below zero on Feb. 16. So far, we have had 41 inches of snow, of which about 6 inches on the level remains.

There has been a larger percentage of dead bees this winter than usual; but take it all in all I can say that my bees have wintered well. But we still have about eight weeks before we can say that we are out of the woods. I expect that losses in wintering about here will be heavy before we have reached the month of May.  
 W. M. STOLLEY.

Hall Co., Nebr., March 5.

**Bees Wintering Well.**

We had the finest weather from Feb. 24, and every day got warmer. Feb. 26 we put the bees out, and they had the finest flight.

November 18 we put 53 colonies in the cellar, and not one of the colonies died; they are all strong and heavy. And, oh! what joy to see the bees come, gathering water and to hear their joyful hum. During that time my daughter cleaned the cellar and opened the windows to let fresh air in, and so all was finished to take them in again. The evening was warm, and the sky clear, so I thought we will let the bees out, as the next day would be a nice one, too, so we covered them with carpets, blankets and bags. In the morning, when I awakened, I heard it raining, so I got up and wakened the children—it was 3:30 a.m.—and in one hour we had the bees all safe and dry in the cellar. They are in such good condition that I only wish for a good, big nectar-flow in all flowers and blossoms.

THEODORE STEGER.

Washington Co., Wis., March 3.

**Black Bees vs. Italians.**

Last year I obtained 12 colonies of black bees. I won first prize on their honey, at the Clark County Fair, over honey stored by Italian Bees.

On page 109, the article about "Italian Bees—Smoke or Foul Brood," I differ from. The writer says they are the best workers in every respect. Answer: Cracker-barrat catalog.

1. Size prevents rapid action. The black bees are more active and nervous.
2. Queens vary in that respect; I don't think color has anything to do with it, or breed.
3. They have to be crowded to it.
4. That will occur with both, and can be prevented.
5. They all believe in protection.
6. My blacks are in dove-tailed hives, and it has been 30 below zero where they stand; they are in good shape yet.
7. Swarming depends on the season.
8. Clipped queens are all right. You must be with the bees in swarming season. Don't depend on the dinner-bell. In case a queen is lost, remove the old hive from the stand.

**That New Work**

ON QUEEN-REARING now ready to mail. Contains hundreds of new ideas on queen-rearing. Book and Tested Breeding Queen, \$2.00.

**BOYS WE WANT WORKERS**

Send us 10c stamps or silver for full directions and a line of supplies to work with. WRAPER PUBLISHING CO., Chicago, Ill

take out a frame of bees, shaking them gently around the entrance where the old hive stood, and they will cluster about the queen, if she has not been killed or gone off with the swarm.

9. Wisconsin bees sting.  
10. For food brood, if the case is so bad that it needs treatment from spring until fall, burn all diseased parts of the hive with the bees.  
HOMER C. STONE.  
Clark Co., Wis., Feb. 24.

**Forced or Shaken Swarms.**

I note what Mr. Crayken, on pages 123 and 124, where he challenges my statement on page 55, wherein I say: "As to forcing before or after cells are started, it doesn't make any difference; only if the apiarist has as many colonies as he wishes, he should force only those that have cells started, as they would swarm anyway."

I thought my meaning was clear, that as far as the swarms were concerned it made no difference; but as to the disposition of the parent hive it makes quite a difference. If the swarm is forced before the cells are sealed the parent hive should be given a ripe cell or a queen. I am a firm believer in strong colonies at every stage, and do not believe in rearing queens with a pint of bees. Still, I am not ready to swallow all that is advanced on the side of strong colonies, especially the "umbilical" part.

I was trying to impress that as to the method of swarming there was no difference between the natural, and the artificial, so far as the swarm is concerned. I tried to have the bees made to fill themselves with honey. As to the old stand, the combs can be used to build up weak colonies, or a second drive or shaking can be made in seven or eight days later, or any other disposition can be made as the apiarist chooses. There is nothing new or complicated in the method of swarming, and the only thing that surprises me is that the method is given to it. The method is all right, and nearly indispensable to the specialist, and I am inclined to think they all practice it more or less.

Cherokee Nation, Ind. Ter., Feb. 23.

**CONVENTION NOTICE.**

Utah.—The spring meeting of the Utah State Bee Keepers' Association will be held in the City and County Building, Salt Lake City, April 5, at 10 o'clock a.m. All bee keepers of Utah and adjoining States are cordially invited to be present.

Lowest, Pres.

**Standard Italian Queens**

OF THE HIGHEST GRADE,  
Bred in Separate yards from superior stock of best and large colored Strains. Selected from among the best queens in England, the Clover and Honey Queens in America. Bred by us with the greatest care for business. No disease among our bees. Our elevated country, with its pure mountain air and pure sparkling spring water furnishes the ideal place of health for bees and man. See our circular for the rest. Queens sent out last season by us arrived in the very best shape except a few that succumbed late in the season in the North. Our Queens have gone to California, Oregon, Canada, Colorado, Cuba, New Mexico, and many of the States. We rear all queens sent out by us from the egg or just-hatched larva; in full colonies. Our method is up-to-date. If you want to know what we have, and what we can do, in the way of Bee and Protoc Queen raising, write us quick we can send them; just give us a trial order.  
Prices: Untested Queens, \$1.00; 6 for \$5.00; 12 for \$9.00.  
Tested, \$2.00; Selected, \$3.00; Best, \$5.00.  
Full Colonies, with Tested Queen, \$6.00.  
3 frames Nuclei, wired Hoffman frames, no Queen, \$1.00; 3 frames, no Queen, \$1.00. Add price of Queen wanted to price of Nuclei.  
Special rates on Queens by the 100. Safe arrival and satisfaction guaranteed. Shipping season begins in April. Write for circular. It is FREE.

**GEORGE W. YORK & CO.,**  
144 & 146 Erie Street, CHICAGO, ILL

**HONEY AND BEESWAX MARKET QUOTATIONS.**

**CHICAGO, March 7.**—The demand for comb honey has been and is of small volume, prices are weak, concessions being made where necessary to effect sales. Choice comb sold at \$5.10; all other grades, white are irregular at 13¢ to 14¢; light amber, 10¢ to 12¢ dark and amber, 9¢ to 10¢. Extracted, clover and basswood, 10¢; other white grades, 6¢ to 7¢; amber, 5¢ to 6¢. Beeswax steady at 30¢.  
**R. A. BURNETT & CO.**

**ALBANY, N. Y., Mar. 14.**—Honey demand quiet; receipts and stock light. Comb selling, light, 15¢; mixed, 14¢ to 15¢; dark, 13¢ to 14¢. Extracted, dark, at 7¢ to 7½¢. Beeswax firm, 30¢ to 32¢.  
**H. R. WRIGHT.**

**KANSAS CITY, Mar. 14.**—The demand for both comb and extracted honey is better, receipts light. We quote as follows: Extra fancy white comb, per can No. 1, \$3.30; No. 2, amber, \$3.00; No. 2, white and amber, \$2.50. Extracted, white, per pound, 7¢; amber, 6¢ to 6½¢. Beeswax, 30¢.  
**C. C. CLEMONS & CO.**

**CINCINNATI, March 11.**—The demand for extracted honey is good at the following prices: Amber, barrels, 5¢ to 6¢, according to quality; white clover, 8¢. Fancy comb honey, 15¢ to 16¢. Beeswax strong at 30¢.  
**THE FRED W. MUTH CO.**

**NEW YORK, March 5.**—There is a fair demand for white comb at 15¢ per pound for fancy, 13¢ for No. 1, and 12¢ for amber, with sufficient supply to meet the demand. Dark honey will be cleaned up with very little left; it is selling at about 11¢ per pound. Extracted rather weak and in quantity lots, prices generally slacked. We quote: White, 7¢ to 7½¢; amber, 6½¢ to 7¢; dark, 6¢. Beeswax scarce at 30¢ to 31¢ for good average.  
**HILDRETH & SÖGLERN.**

**CINCINNATI, Mar. 7.**—The comb honey market has weakened a little more; is freely offered at following prices: Fancy white, 14¢ to 15¢; no demand for ambers whatever. The market for extracted honey has not been cleared and prices are as follows: Amber in barrels, 5¢ to 5½¢; in cans 6¢ to 6½¢; white clover, 8¢ to 8½¢. Beeswax, 2¢ to 3¢.  
**C. H. W. WEBER.**

**SAN FRANCISCO, Mar. 11.**—White comb honey, 12¢ to 13¢; amber, 9¢ to 11¢; dark, 7¢ to 7½¢. Extracted, white, 6½¢ to 7½¢; light amber, 5¢ to 6¢; amber, 5¢ to 5½¢; dark, 4¢ to 4½¢. Beeswax, good to choice, light, 27¢ to 28¢; dark, 25¢ to 26¢.  
Demand is fair on local account for water-white, uncancelled, but there is not much of this sort obtainable. Market for ambers is at ruling rates. Canned stock and common qualities are going at somewhat irregular and rather easy figures, holders as a rule being desirous of effecting an early clean-up.

**WANTED WHITE CLOVER EXTRACTED HONEY!**

## Good Reading.

We mention here a few hooklets, pamphlets, etc., which we will mail free upon application to parties interested. If you wish the whole number, enclose five cents for postage.

**BOOKS FOR BEE-KEEPERS** is a booklet of 16 pages which gives a complete list of bee-books, including German and French bee-books and translations; books on fish-culture, strawberry-growing, green-house construction, gardening, etc.

**BEEES AND QUEENS** is an 8-page booklet containing much valuable matter on the subject of queens; reasons why they don't lay; test of purity, etc. It also names price on imported and domestic, Italian and Carniolan queens, as well as nuclei and full colonies.

**FACTS ABOUT BEEES** is a 72-page booklet by F. Danzenbaker. It is of especial interest to producers of fancy comb honey. It deals chiefly with the Danzenbaker hive; drawings are used to show the construction of the hive and the manipulations to secure the best results. A number of pages are devoted to reports of bee-keepers who have used this hive. Ninth edition now ready. Mailed for 2 cent stamp.

**OUTFITS FOR BEGINNERS** is a little pamphlet giving the initial steps necessary for one to make a successful start in bee-keeping. It also includes a number of outfits, and names prices of same.

**FOOD VALUE OF HONEY** is a 14-page leaflet by Dr. C. C. Miller. Tells why honey should be eaten in preference to other sweets, and includes many cooking recipes in which honey is used. This is intended for free distribution by producers to stimulate a greater demand for the sale of their honey. It can be printed with the producer's card on the front cover and advertisement on the back, if desired, very cheaply.

**SEED CATALOG** will soon be ready. This lists seeds for the garden, seed potatoes, basswood seed and trees, alsike, white Dutch, medium and mammoth red clover seed, alfalfa, sweet and crimson clover seed, buckwheat, rape, cow peas, turnip, sunflower, soja beans and coffee berry, borage, catnip, dandelion, motherwort, figwort, mustard, spider plant, portulaca, Rocky Mountain bee-plant, sweet peas and other seeds; thermometers, barometers, powder guns, insecticides, tobacco-dust, sprayers, hot-bed sash, starting boxes, potato-planters, transplanting machines, etc.

**RUBBER STAMP CATALOG** illustrates and describes self-inking stamps, molding and block stamps to be used with ink pads; model and U. S. bad dates; ink pads and ink for renewing same; interchangeable stencils; metal bodied rubber type and holders, and printing wheels.

**LABEL CATALOG** includes samples of one, two and three color work; also labels printed on three colors glazed paper; price-lists for the printing of circulars, catalogs, letter, note, statement and bill heads; shipping tags, envelopes, business cards, etc.; display cards, caution cards for shippers of comb honey, etc.

**SPANISH CATALOG** is an abridged edition of our regular catalog of Bee-Keepers' Supplies, and is of interest to Spanish readers only. Give us the names of any of your Spanish friends interested in bee-keeping.

# Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

# An Italian Queen Free

— IN MAY, 1903 —

To Regular Paid-in-Advance Subscribers Only.

We wish to make a liberal offer to those of our regular readers whose subscriptions are paid in advance. It is this: We will send you FREE by mail, in May, 1903, an Untested Italian Queen for sending us \$1.00 and the name and address of a NEW subscriber to the American Bee Journal for a year. This is indeed a big premium, as the queen alone would cost you 75c.

We are booking orders for Queens now for next May delivery. Will you have one or more? This offer ought to bring in many orders. Our queens are reared by the best queen-breeders, and give satisfaction.

Address,

George W. York & Co., 144 East Erie St., Chicago, Ill.

# ESTABLISHED IN 1861

THE OLDEST BEE-PAPER IN AMERICA

43d YEAR.

CHICAGO, ILL., APRIL 2, 1903.

No. 14.

## \* Editorial. \*

**Improvement of Stock.**—It may seem like harping a good deal on one string, but the matter is one of so much importance that it warrants a good deal of repetition, and besides there are some new members of the American Bee Journal family that perhaps need telling for the first time. Those who have been working faithfully, perhaps for years, in the direction of the best stock obtainable, can skip this.

No observing bee-keeper has failed to notice the disparity of results often obtaining between two colonies sitting side by side. To all appearance one colony is as strong as the other, conditions are the same for each, yet one stores twice as much as the other. The only way to account for the difference is by attributing it to the difference in stock, and that is equivalent to saying that the difference in results is caused by the difference in queens, for the character of the stock depends upon the character of the queen.

If you have in any one of your colonies a queen that is satisfactory, well and good. If not, make up your mind here and now that you will try to get from some source a queen that will be likely to improve your stock. The matter is the more hopeful because the introduction of fresh blood will at least score one point of gain.

Having one good queen you will have one good colony, and having one good colony the road leading to improvement of other colonies is neither long nor difficult. Of this, more hereafter.

**Breeding from Freaks** has been condemned by F. B. Simpson, those queens being considered freaks whose workers make very exceptional work in storing. Others, however, insist upon the rule, "Breed from the best," whether those "best" be considered freaks or not. The Rocky Mountain Bee Journal, usually very reliable in giving advice, seems to take ground in the matter that is a little difficult to understand. A correspondent writes:

I had one new swarm that commenced work in the brood-chamber and super at the same time, and stored 95 pounds of first-class section honey. I contemplate rearing queens from this colony.

To this the Rocky Mountain Bee Journal replies:

It would be better, perhaps, to purchase a tested queen of some reliable breeder to use as a basis, rather than the freak colony you

mention. As a rule, it is the experience of breeders that freaks rarely reproduce themselves, but usually revert to the opposite extreme. G. M. Doolittle, by carefully selecting mother-queens that have made the best averages, during a period of over 30 years, has very greatly increased the average yield per colony in his apiary.

But were those not precisely freaks that Mr. Doolittle used? Unless he has been misunderstood, he simply bred from those whose workers gave largest yields.

**Cleaning Propolis Off the Hands.**—One of the most convenient things to use is butter; not better than lard or other grease, perhaps, but generally more conveniently at hand. Take just a little butter, rub it on the glue till the glue scrapes off readily, then wash with soap and water—preferably hot water.

**Aikin's Bologna-Sausage Package** for honey takes up no less than seven pages of space in *Gleanings in Bee-Culture*, and a strong plea is made in favor of putting up honey in this form; that is, in the granulated condition in paper. Small cost is of course one chief argument, the paper bags costing about one-tenth as much as tin lard-pails. The other principal argument is the matter of convenience. A penknife runs two or three slits in the paper, and then the paper is easily peeled off, leaving the lump of granulated honey on the plate like a brick of butter. Then a slice can be taken and used just as a slice of butter, and from this can be taken individual portions just as with butter, the individual being able easily to take what he wants and to put it just where he wants it, without the trouble of having the honey stringing and daubing where it is not wanted.

With a certain class there is likely a future for honey put up in this style, and if there is, the credit for it should be given to Mr. Aikin.

**Time to Cut Alfalfa.**—Some anxiety on the part of bee-keepers has been felt because there was a fear that it would become the general practice to cut alfalfa in first bloom, giving little opportunity for bees to work upon it. This anxiety was by no means allayed by the fact that experiments at the Kansas experiment station seemed to favor early cutting. Not, however, the experiment station of Colorado, a State *par excellence* an alfalfa State, makes a very different decision. Bringing the question down to the very practical form, "At what stage should alfalfa be cut to get the greatest feeding value per acre?" the reply is, that when cut in full bloom an acre will produce 11 percent more beef than when cut in first bloom, and 58 per-

cent more than when cut in half bloom. The following is from the report:

If we cut enough alfalfa in bud to make 100 pounds of hay, the same alfalfa would make 126 pounds if allowed to stand till in half bloom, and 145 pounds if allowed to stand till in full bloom. If allowed to stand longer it would decrease. If the question were, "When shall we cut alfalfa in order to make the most hay?" the answer would be, "When it is in full bloom." The question as presented to us is, "When is the best time to cut alfalfa?" This time is evidently that at which we shall have, not the largest yield of hay, nor of the best quality, but the largest yield of digestible food ingredients. This answer considers two factors—composition and digestibility. Every feeder will mentally add, "But there are other things to be considered," which is true, but it is assumed that the animals will eat the hay of which we are writing, and will relish it.

We have given the amounts of hay which the same quantity of alfalfa would give when in bud, in half bloom, and in full bloom, using the figures obtained for our Colorado alfalfa. The 100 pounds of early-cut hay will contain 15 pounds of albuminoids and 1.5 pounds of amids; the 126 pounds of hay, alfalfa cut in half bloom, will contain 15.8 pounds of albuminoids and 2.9 pounds of amids; the 145 pounds of hay cut in full bloom will contain 19 pounds of albuminoids and 2 pounds of amids. Leaving the value of the amids out of the question, for they are assumed to have only a small value as compared with albuminoids, and reducing these figures to the basis of a pound, we find the relative values to be 1.18 for the early cutting, 1.00 for that cut in half bloom, and 1.08 for that cut in full bloom. Or, stated otherwise, 86.2 pounds of alfalfa hay cut in bud, or 92.6 pounds cut in full bloom are equal in value, using the albuminoids as the criterion, to 100 pounds of alfalfa hay cut in half bloom, so that alfalfa hay cut in half bloom is inferior to that cut in bud. In this statement we assume that the albuminoids are equally digestible at the three different stages of development here specified. If this be true, the largest amount of digestible proteids would be obtained by cutting in full bloom; for while the relative values of the hay cut in bud to that cut in full bloom is 100 to 107, the yield is about 100 to 145, leaving an advantage of 38 pounds of hay on each 145 pounds of hay cut in full bloom. These figures refer to the first cutting,.....

The feeding experiments are decidedly in favor of the early cutting, calculating the value on pound for pound of hay produced. But if we calculate its value in terms of beef produced per acre, we come to the same conclusion, which we arrived from the consideration of its chemical composition and the relative crops produced at the respective periods. Mr. Mills summarized the results of his three seasons' feeding as follows: That to produce one pound of gain, beef, it requires 18.21 pounds of hay of the early cut; 23.44 pounds of the medium cut; and 26.11 (Bulletin 44). But we have seen that the relative quantities of the early, medium, and late cut are 100, 126, and 145. Accordingly we would obtain for the values of the respective cuts in terms of beef, 5.3 pounds for the early, 3.8 pounds for the medium, and 6.0 for the late cut. We conclude, therefore, answer the question in so far as it pertains to the first cutting, that the best time to cut

alfalfa is at the period of full bloom, for at this period we not only get the largest amount of hay, but also the largest return in pounds of beef per acre.

□ The results of feeding experiments with the second cutting leads to the conclusion that the best time to cut this crop is what Mr. Mills designated his medium cut.

□ I conclude that, after allowing for a little latitude in the use of the terms "half bloom," "full bloom," "late bloom," etc., the time to cut alfalfa in order to get the greatest value per acre is at the period of full bloom, and that there is a period of about a week during which its value is essentially constant.

## Weekly Budget.

E. E. HASTY, of Lucas Co., Ohio—our "Afterthoughter"—wrote as follows, March 25th:

"The cold snap of three weeks ago didn't seem to do much harm. Perhaps yesterday's gale with thermometer near freezing will do more—more brood started now."

MR. T. F. BINGHAM, of Clare Co., Mich.—the popular Bingham smoker man—wrote us March 26:

"The weather is bright and frosty this morning. All colonies came out alive from the cellar, in time to be caught in a cold snap. It will be a good test on early exit from ventilated cellar, should enough live through in my thin hives."

SOMNAMBULIST AND F. L. THOMPSON.—Somnambulist seems to view with some little trepidation the seating of F. L. Thompson upon the editorial tripod in the office of the Progressive Bee-Keeper, saying:

F. L. Thompson takes a position on the editorial staff, and, oh! my! won't we all have to toe the mark, and at the same time keep up a succession of dodgings to escape getting our ears boxed? I've my head to one side now in anticipation of a slap, because I feel like favorably commenting on his January contribution.

YOUR SUBSCRIPTION to the American Bee Journal—how about it? Is it paid in advance? If not, why not attend to it at once? We doubt if there is a single reader that begrudges the small sum of one dollar for a year's subscription to this journal. Naturally, we believe it is the biggest and best dollar's worth of bee-literature that is produced to-day. Certainly, one dollar is a small sum for 52 copies, or over 800 pages, of the Bee Journal.

When sending your own renewal subscription, why not send in some new ones and get some of the premiums we offer for so doing? See page 210.

THE NEW GENERAL MANAGER of the National Bee-Keepers' Association, Mr. N. E. France, is the best-known bee-keeper in Wisconsin. He is also Inspector of Apiaries for that great State. His predecessor in the General Manager's office, Eugene Secor, turned over to him the snug sum of \$921.60, and reported about 1000 members. But the membership should be doubled this year. We wish that every reader of the American Bee

Courtesy Illinois Experiment Station.

Alfalfa Plants, Showing an Uninoculated Plant on the Left, and an Inoculated Plant, with Root Tubercles and Increased Growth, on the Right.—(See page 215.)

Journal were a member. This alone would put an additional sum of money in the treasury that could be spent in the interest of bee-keeping in a way that would tell for years to come. There is much important work that could be done, provided the financial means were provided therefor.

Reader, if you are not already a member of the National Association, why not join at once? If you prefer, or if it is more convenient, you can send your dollar to this office, as we are the Secretary of the Association for this year. We will forward your dues to the General Manager, who will send you a receipt.

We have received quite a number of membership dollars recently, and would be glad to take care of a lot more.

DADANT & SON, of Hancock Co., Ill., as most of our readers know, are successors to the old and honored firm of Chas. Dadant & Son. They are makers of comb foundation,

and their reputation for making a good article has increased with the years. A large lot of comb foundation, shipped by them to their French correspondent at Paris, was unexpectedly stopped at the French custom-house at Havre, and ordered examined for traces of adulteration by the French Revenue officers. The Government Chemists at Rouen, to whom samples were sent for analysis, promptly reported the foundation to be made of *absolutely pure beeswax*.

But this verdict will be no surprise to their American friends, for they all know, and have known for over a quarter of a century, that the name "Dadant," in connection with comb foundation, is a synonym for honest as well as superior goods.

PASTE FOR LABELS.—In making paste for labels on tin, I use equal parts of hot water and honey, and dissolve enough corn-starch to make a thick paste. This works perfectly. —H. C. AHLERS, in Gleanings in Bee-Culture.

## Convention Proceedings.

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 197.)

#### THE USE OF CHAFF-HIVES.

Pres. York—You can ask any question you would like to hear discussed, and we will have the slips gathered up pretty soon, so we will have questions on hand all the time. There is one slip here with simply "chaff-hive" on it. I don't know what the questioner wants to ask. How many are now using chaff-hives?

Eight held up their hands.

Pres. York—I suppose all the rest do not use them. What advantage is there over the non-chaff single-walled hives?

Mr. Whitney—This question of hive is like many others a question of locality. I always used chaff-hives until I sold out my bees last spring, and now I have an old-style hive I wish I was rid of. I like the chaff-hive. A double-wall hive, the second story a single shell with an outside case that is sufficiently high to contain two or three sections. I find that the best hive that I have ever seen. I think I can produce more honey with such a hive as that than any other. The bees in the double-wall hive, such as I described, however strong they may be, will gather around the section-cases. I scarcely ever have any hanging out when I use that kind of a hive. I know it isn't popular with most people, but give me the chaff-hive of the kind I describe over any other kind I ever had.

Pres. York—Let me ask Mr. Root or Mr. Leahy about the demand for chaff-hives. I could answer for this point, but perhaps it would be better for the manufacturers to answer that.

Mr. Root—I wouldn't be able to answer.

Pres. York—Mr. Leahy, how is it about the chaff-hive down in Missouri?

Mr. Leahy—I used to be a believer in the chaff-hives. I used to think that I got brood earlier in the spring, and I believe I did, but later on, when the warm seasons came, the bees didn't develop as fast then as they did in the single-walled hives. Cellar-wintering I believe in. I have disposed of all my chaff-hives—gave them away.

Mr. Whitney—I am aware, as I said before, that the chaff-hive is not a popular one. One great reason I think is, it is an expensive hive, costs twice as much as any other hive that I have ever seen; but, as Mr. Leahy says, I think they do develop brood more rapidly in the spring, and by the time fruit-bloom is on, especially in this locality, you will have a very strong colony of bees. I have always had. I disposed of my bees last spring down at Kankakee, looked them over in April, and my friends said, "What strong colonies of bees you have." I said, "I always have; I wouldn't have any other; and they are always ready as soon as there is any honey to get." During the hot season the double-wall hive, I think, protects the bees from the extreme heat of the sun. I can set them right out without any shade, and during the early spring, when a single-wall hive, it seems to me, would be affected by the extreme heat and cold, the double-wall hive maintains a medium temperature like a refrigerator, for instance; there isn't the variation that there is in a single-wall hive. I think the bees are carefully protected in such a hive. I know that I produce so much more honey than my neighbors that they wonder why. I told them that I thought it was partly the kind of hive I used, and perhaps because I gave them more attention than some others, and get twice the amount of honey that other people get.

Mr. Wilcox—Did you try any without chaff in the same apiary?

Mr. Whitney—Not here, but in Ohio I did. I have always had better success with the chaff-hive, that's why

my experience in that matter has determined me in favor of that hive. I never think of protecting my bees in this locality except by putting cushions on top of the hive. I have never lost a colony from freezing.

Mr. Niver—In central New York everybody uses chaff-hives. In Wisconsin they can't use them at all. I think it is altogether a matter of locality. In Wisconsin they must winter them in a cellar. A chaff-hive in a cellar is a nuisance. We, in New York, can't winter outside without the chaff-hive, and we can't successfully get our bees in the spring ready for business without the chaff-hive. We can winter outside, everybody in our locality (in Tompkins Co., N. Y., which is the greatest county for bees), they all winter in chaff-hives, and using them that way and in that locality it is correct. There are a great many things besides wintering. In our apiaries we have no robbing. There is four inches of space for them to get in. No loose cracks, and then the sun can't warm them up so they will fly out when they don't want to. We never want the sun to warm them up. If it is warm enough they will swarm there. It will be mostly a matter of locality. Each one must study his locality.

Mr. Abbott—I had a big experience with hives when I first went to Missouri. I bought and sold the best. I ran an apiary of about 200 colonies. The result was I had a chaff-hive—a Jerseyville hive. It had a place for packing around over the brood-chamber 6 or 8 inches. I had these in my apiary, quite a number of them, because that was the only hive that was sold and pushed when I went there; and among them I had a number of hives that were  $\frac{3}{8}$  of an inch thick, and one inch, and I was a great believer in the chaff-hive; although I had kept bees in Tioga Co., N. Y., I never had thought of a chaff-hive, and I don't know it yet that bees will freeze. I never thought anything about it until that winter. The first colony that swarmed, and the colony that stored the most honey, was in a  $\frac{3}{8}$  hive, no protection at all, right out-doors in Missouri where it gets 23 degrees below. That made me look the matter up, and I watched it for several years, and I discovered that the first bees that swarmed were always in these thin-walled hives, and the bees in Jerseyville hives didn't swarm as quickly as the others, and they didn't give me any more honey. I haven't any use for chaff-hives in Missouri. Possibly in Wisconsin I might have to use them. I wondered why it was. I don't know, only the bees warmed up quicker and began to breed sooner, and a number of those hives were protected by putting store-boxes over them, and then they were taken off early in the spring. I think the thin-wall hives, protected that way, were the best, and responded quicker than any I know, and I was buying and selling the best for eight or ten years that way. I thought these hives were of no account, but that was the result. Of course, I wouldn't advise anybody to use that kind of a hive.

Mr. Kluck—I have always been using 8 or 10 frame hives, also a large chaff-hive, and I find the chaff-hive produces from one-half to two-thirds more honey than the 8 or 10 frame hive does; and at the same time it is more safe in wintering bees in the chaff-hive than in the 8 or 10 frame single-wall.

Dr. Miller—How many frames?

Mr. Kluck—Ten frames in the lower story.

Dr. Miller—That is the same size frames as your others.

Mr. Kluck—Yes, sir; and another thing in support of them, in the spring you can breed the bees handier, and also it keeps them from swarming.

Mr. Flugge—Take a single-wall hive, winter in a good cellar, and protected by wall-paper on the outside and an air-space between, would you not favor greatly the chaff-hive for spring protection and rearing brood?

Mr. Niver—Is that something in the same line as a house-apiary? Do you mean to have them above ground?

Mr. Flugge—I mean in a good cellar without the protection in winter, and in the spring when you put them out protect them; not leave outside in the winter, partly beneath ground, in a house-cellar, and there is very changeable weather in the spring when you put them out.

Mr. Niver—If it is a house-apiary he is wintering in, in our locality we wouldn't recommend it. I lost 90 percent in that kind of an arrangement for two years.

Mr. Chapman—If you will try common, ordinary tarfelt, make a wrapping of it and tack a lath on where you join it, you will find that as good a spring protection as anything you can get, after taking them out of the cellar.

Mr. Wilcox—As for protection I think it may be a little hot excepting the few cold days that will come on during the first month, and I find a better method, and that is to place them where they will have the sun in the forenoon and no

wind, if I can find such a place conveniently near. They will breed out nicely protected from the wind and exposed to the sun, and I don't think if you can give them that, that it is advisable to go to the extent of further protection.

Mr. Fluegge—I think having only six colonies of bees as I have, it would be pretty hard to get wind-protection from four sides. I think it would be easier to protect the hives partly.

Mr. Wilcox—I never knew an east or south wind to do any harm.

Mr. Fluegge—I think a southeast wind, or a directly east wind, coming over Lake Michigan, does harm to our bees in the spring.

Mr. Wilcox—If you were 200 miles from the lake it wouldn't do them much harm.

Pres. York—I have a slip of paper which reads: "Speaking of wild bees, if the person who asked if there are any such bees, will call at 68th and Morgan streets, Chicago, next summer, he will never doubt that there are wild bees there!"

(Continued next week.)

## Contributed Articles.

### Mouse-Proof Honey-Hou — Poor Honey Crops—Co-operation.

BY F. GREINER.

THE following is a sort of confidential letter intended for publication:

"On page 729 I read: 'After sections are cleaned out pile up in honey-room and cover up mouse-tight.'"

This practically admits that the honey-house of the writer, Miss Emma Wilson, harbors mice. I wonder how many readers of the American Bee Journal put up with such conditions, are pestered with mice in their honey-rooms. If there is any thing objectionable in a honey-house or workshop of a bee-keeper it is mice. They will soil our sections, destroy combs, frames, separators, quilts, cushions, etc. Why tolerate the nuisance? A honey-house must be bee-proof, anyhow, at least bee-keepers (except the Coggsalls) think so. If it is bee-proof, is it not mouse-proof? If it is not, it can and should be made so. I have never had any damage done by mice in my honey-house and workshop combined. They simply cannot get in, that's all!

Still, I believe in keeping all supers, empty or full, covered to keep out dust, spiders, flies, etc. All filled or honey-containing supers or hive-bodies are kept covered with bees-escape boards, not only to prevent the above-named things from making our honey unsightly, but to make a sure thing still surer—to make it impossible for bees ever to find it. I have had some sad experiences in this line. Once I left a window open when going to dinner. On my return the bees were in possession of the building, and bushels of them were collected and clustered at the windows. By nailing blankets over the windows from the outside, except over one, and by other tactics, I finally became master of the situation.

At another occasion the bees had entered a lot of stacked-up supers through a crack in the floor of an upstairs room, said room having been fitted up in a loosely built carriage-house temporarily for my use. A great deal of damage had been done in this second instance, the bees having had a long time to put in their work. On being sent for, and arriving late in the afternoon, I had hard work to clean out the bees and restore order. I learned a lesson that I will never forget: To stack my supers upon regular hive-bottomers, close the entrance with blocks and cover up bee-tight.

#### REPORTS OF THE HONEY CROP.

Mrs. E. Burdick, from New Mexico, says on page 730: "Bees have not done anything—only one full super per colony." A full super does not count anything with Mrs. Burdick. It would with me, as I will show further on.

I recollect another bee-keeper from the South reporting about a year ago: "Had a poor season; averaged but 16 gallons per colony. A year ago my average was 22 gallons."

Mr. Doolittle, if I mistake not, has told of harvesting

120 or 130 pounds of comb honey per colony in a poor honey season. Many others have made similar reports during the year, or years, past. When reading them I am at a loss to know what a poor or a good season is. It seems to me that as long as bees can gather enough for their winter supply, the season must be called a normal one. Dr. Miller, when he had to feed a ton or more of sugar had reason and might talk about a poor honey season. When the season is such as to enable one to take any surplus, it must be called favorable; and when the average runs up as high as 50 or more pounds it has been an exceptionally good one. A surplus yield of 400 or 600 pounds goes beyond my comprehension, and I find no term to express it.

All bee-keepers may not look upon this matter as I do. For the sake of clearing this thing up let us take the first case of Mrs. Burdick and see what it means. Her bees had done nothing, only filled one super. If the super contained 24 sections, and the honey was either clover or basswood, it would have bought, judiciously sold, not less than \$3.50. With no other work on hand one might attend to 300 colonies in 3 yards without other help. The income from the honey sold would present the neat sum of over \$1,000. The number of colonies have probably been increased also, and some may be turned into money. We will not count that, nor what may be obtained by selling wax. An income of a \$1,000 in a poor season is not very bad. Let them come. I have lived well with smaller yields.

The second case—the 16-gallons average—means more than 150 pounds of surplus per colony. For good table honey, in glass, I obtained this year 10 cents net. I might not have been able to sell many tons at that price. Let us put it down to 7 cents. At this low price each colony would have turned out the owner \$10.50, or 200 colonies would have given an income of \$2,100. This does not look to me like a bad thing in a poor season. I can't help wondering how much some people engaged in bee culture expect to make, or what would satisfy them.

In a paper read at the Bee-Keepers' Convention in Buffalo, Mr. P. H. Elwood said, "The bee-keepers are poor." It cannot be possible that they are, with such honey-yields. The bee-business would be like a veritable gold-mine, as compared with farming, if in poor seasons such yields were being secured. If it is true that they are poor, then bee-keepers do not get the large yields they report.

The point I wish to make is, that things are often not called by the right name. The bee-keeper need not flatter himself, and tell about it, how much better he can manage than his neighbor. Other up-to-date men would do equally as well as he, in a poor season, with the same chance.

#### CO-OPERATION AMONG BEE-KEEPERS.

For the purpose of disposing of their honey, this seems to be uppermost in the minds of many, as gleaned from numerous articles in different bee-periodicals. Perhaps a move of this kind is all right, and may result in good, as regards the producer, if successful. From my own standpoint, with conditions as they surround me, I see no need of it whatever. I try to produce what is wanted, and sell it for what I can get for it. Producers of other articles of food are situated precisely as I am, and do as I do. If by co-operation we aim to distribute our product evenly, the general public would be benefited; but if our aim is to control prices, keeping them up or raising them, the move will be decidedly wrong. Many writers are of the opinion that honey is low, or too low, in price. They dwell upon the subject. It is my opinion that honey is sold at a higher price, comparatively, than other things—too high to encourage and increase consumption. Twenty-five years ago honey sold for not materially more, although a very fancy lace-trimmed lot brought me, f. o. b. here, 15 and 16 cents. At this price the bulk honey sold in New York (on commission) in 1876. In 1886 it sold in Philadelphia at 14 cents. Since then prices ranged between 12 and 15 cents, according to the supply and demand.

The farmers' wheat, 25 years ago, brought here \$1.50 per bushel. He did no better at that time than he does now with 75 cents per bushel. The farmers' income has been reduced to one-half, while the bee-keepers' income has almost held its own, during the same period. He ought to do well.

The greatest obstacles to co-operation are to get the bee-keepers to co-operate; and lack of available capital.

Ontario Co., N. Y.

The Premiums offered this week are well worth working for. Look at them.

## Importance of Bacteria to Alfalfa.

BY J. E. JOHNSON.

**F**IRST, what are alfalfa bacteria? They are not bugs of the masculine gender, as Mr. Hasty seems to infer, on page 824, but are little flowerless plants which feed upon the roots of alfalfa, and gather nitrogen from the air, and fix it in the plant alfalfa. They are so small, says Prof. C. G. Hopkins, of the Illinois Agricultural College and Experiment Station, that one little tubercle the size of a pin-head may contain a million of these bacteria. As to their originating without inoculation, I believe it is considered impossible, or at least not probable, but all alfalfa seed probably contain bacteria in the dust along with the seed, and may contain some tubercles; but as alfalfa seed is generally pretty clean, the inoculation would be slight. Probably several years would elapse before the field would be thoroughly inoculated, and much of the alfalfa would suffer for want of available nitrogen, and be considered a failure and plowed up. In the west where land is cheaper in price, and the people more inclined to give it a chance, owing to non-success with other forage-plants, the same fields were re-seeded or let stand until the little plants called bacteria multiplied and filled the soil with countless numbers, and the alfalfa would then flourish and "the woodchuck would be there."

The different clovers must also have bacteria in order to be grown successfully, but Prof. Hopkins says they are of a different species, and that clover bacteria will not aid alfalfa. Neither will the cow-pea bacteria aid soja-beans. All have their own kind.

Now let me say that 14 years ago I was in the West (southern Kansas), and the farmers all claimed that clover would not grow there, but by persistent efforts they have finally succeeded, and now grow fine clover, and no doubt the clover bacteria along with the seed continued to multiply until the soil is now thoroughly inoculated. Even now many in Oklahoma say clover will not do there; but if they will get say 100 pounds of soil from an Eastern clover-field, in my now considered unfavorable localities clover may do well.

Prof. Hopkins says that the alfalfa bacteria have been found in a few places in Illinois, and wherever a field of alfalfa was found to have these tubercles the alfalfa did well, but where they were not present it was a failure. He advises farmers to sow alfalfa on hilly land or bottom land, or on almost any soil except wet, low ground where water will stand. Alfalfa grown on infected soil will do well almost anywhere in the United States; where so grown, it will yield 3 or 4 cuttings in Southern Illinois. Now as one little tubercle will contain as high as 1,000,000 of these bacteria, and one alfalfa plant will have 100 or more tubercles on its roots, or 100,000,000 of these bacteria or microscopic plants to aid it to be a flourishing alfalfa plant, can we justly expect it to yield honey when grown without these bacteria? They are a part of the plant, and the alfalfa is not complete without them.

Prof. Hopkins writes to me that he is told alfalfa does yield honey in Illinois, but as in his experiments the alfalfa is cut before it has a chance to bloom but very little (he advises early cutting), he has not been able to tell much about the honey part of it. Possibly he did not even think about that part of it, but I shall ask him, in behalf of the bee-keepers of Illinois, to test the matter this season.

In Dupage Co., Ill., 21 tons of alfalfa hay was cut in one season on two acres, or 10½ tons per acre, and that in 1901. You all know that was a dry season in Illinois. Now with such crops of hay as that, you may be sure the farmers will soon embrace alfalfa culture, and when it is grown properly, and not until then, can we expect it to yield honey.

It was through the enthusiastic efforts of Prof. Hopkins that this matter has been fully tested, and we feel justly proud of such men. The Illinois Experiment Station has done much valuable work. Their bulletins are free. Get them, and read them, especially Nos. 76 and 80; they are all good.

I think I am justified in saying that alfalfa properly grown in Illinois will yield honey just as well as it does in the West, where it yields with or without irrigation.

In conclusion, if we succeed in getting alfalfa successfully raised for both hay and pasture in the East, will the farmers cut their hay too early to let it yield honey? No. There are many cattle-feeders in this vicinity, and they will not cut even their clover until the heads turn brown, nor their timothy until it begins to ripen, as they all agree that when so fed in connection with corn it gives much better

results than when cut green; and so it is for horses that work on the farm, or used as drivers on the roads, or in fact anything except dairy cows. Here we raise corn and oats, and with the over-pressing work of plowing corn and harvesting and threshing, alfalfa would have to wait.

I think alfalfa will play a very important part in the future, both as to forage and honey in Illinois.

Prof. Hopkins, of the Experiment Station at Urbana, Ill., has agreed to furnish me with as much infected soil as I want, at 50 cents per 100 pound, which he says is for the expense of handling, drying and racking. He says that in a thoroughly inoculated alfalfa field nearly every particle of dust would contain these germs, so you may see that 100 pounds would soon inoculate an acre; then that acre could be the means of inoculating the soil of a whole neighborhood. I think he is making efforts to supply all who wish with infected soil, at least all who live in Illinois, and maybe others, I don't know.

In three separate tests at the Experiment Station with inoculated and uninoculated soil, the average of nitrogen gathered by the bacteria, and fixed in the plants, alfalfa was grown at the rate of \$5.25 per acre. The weight of free nitrogen in the atmosphere is equal to about 12 pounds each square inch of the earth's surface, so the supply is inexhaustible, and so may enrich our land from the air instead of hauling manure. However, the ground should be pretty rich to begin with, and the application of lime to the soil is beneficial, especially to upland. Knox Co., Ill.

## Joining the National—Other Matters.

BY J. M. YOUNG.

**D**O you belong to the National Bee-Keepers' Association? and have you paid your dues? If you don't belong you can't be an up-to-date bee-keeper. The Association needs your dollar, anyhow, and you might need some help from it. If nothing more, I would belong to get all the proceedings and reports that come up from time to time. By all means you should be a member to ask your neighbor to join with you. It is a dollar well spent, and you will not miss it.

### USE OF BEE-VEILS AND BEE-SMOKERS.

Bee-veils are a good thing in their place, and are all right to have around when visitors are looking at the bees, but to see a bee-keeper wear one makes me feel as if he was not a good, genuine bee-keeper, and is afraid of bees. I seldom have one on, only in extreme cases, but I always have a lighted smoker and use smoke plentifully. I have had as cross bees as they generally get, and have had as many as 100 colonies in one apiary. I seldom open a hive unless I have a smoker, all in good trim (although it is not needed at all times) sitting close by in case of an attack.

### GETTING KNOWN IN THE BEE-KEEPING WORLD.

Does everybody know you are around home? and are you generally known among the editors of the different bee-papers as a bee-keeper, and that you have been in the business? If not, you would better get your name out among the bee-keeping fraternity in some way or other. It is a good idea, if you have anything to sell, and to make bee-keeping a success financially, a person must be generally known throughout the country. This can be done by judicious advertising through the leading bee-papers, telling them what you know, and what you don't know, through the press.

### GET A RUBBER STAMP WITH NAME AND ADDRESS.

Every bee-keeper should have a small stamp, then stamp all his stationery and everything he sends out by mail. On every bit of matter sent through the mail put your name and address, for it will save your customers, and people who do business with you, a world of trouble. Again, it prevents mistakes in many instances. I put my name and address on every section I use on the hives, or that the honey is built in, and I also use it on every box I send out by express or freight; the latter stamp, of course, must be a larger one, for shipping by freight or express.

### SLOPING BOTTOM-BOARDS.

I like sloping bottom-boards. Years ago, when I first began bee-keeping I used the American hive, made by H. A. King & Co. They were made, (as the old bee-keepers will remember) with the sloping bottoms. I liked the idea then, and always found them to be a big advantage over

the flat bottoms, especially in early spring; in cleaning-out time, all the dead bees were a great deal easier taken out, and the water that was caused by the bees had a good chance to run off.

During the present winter I am working on this same idea, that of sloping bottoms and a hive-cover combined by simply reversing, and having the top and bottom one and the same thing. In fact, the model that I am working on is a part of the up-to-date bottom-boards, with the same old idea of sloping of 30 years ago brought back into use again. I will test it in my own apiary one season before I say anything about it, and see how I like them. I don't suppose it will keep out the moths, or keep the bees from swarming; but just wait and see.

Cass Co., Nebr.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Mrs. Griffith's Bee-Dress.

I promised the sisters I would tell them how I dressed when I commenced to keep bees, and the way I dress now.

I made bloomers with a rubber at the ankles, and a loose sacque with a belt to button around the waist, and rubber at the wrists; kid gloves, and a hat with mosquito-netting around it. I soon found that all that rig was too much trouble to put on, and too warm, so I dropped a piece at a time until I left off all but the hat.

Now I use only the hat, and not always that. When a swarm comes out, if they settle low, I put the hive under them and shake them in, and let them be for a little while. I pin my sleeves at the wrist, to keep the bees from getting up my sleeves, and put on my hat; that is all the preparation I make when I am going to do anything with the bees. I do not have anything on my hands, as I like to have them bare. Let me be working with the bees, or pulling weeds, or anything else, I like them bare, as I do not mind the looks of my hands, and I can work the best with them bare. I seldom get stung, and if I do, I don't mind their sting as the bite of the Jersey mosquito; they hurt me more than the bee-sting.

SARAH J. GRIFFITH.

Cumberland Co., N. J.

### A Whole Bee-Keeping Family.

MISS WILSON:—I always enjoy the writings of "Our Bee-Keeping Sisters," and since this department has been started, the American Bee Journal has become doubly interesting. I have often wondered how much interest was really taken by bee-keepers' wives in their husbands' business.

I regret to note that those sisters who write seem to be "padding their own canoe," and there is no husband connected with the business. Now, please record that here is one sister who is trying to be a "helpmeet" to her husband, especially in the busy season of the year. For eight months our four children are in school, therefore at that season we do not have much time for bee-work, neither is there a necessity for a great rush in the bee-yards. Yet, on Saturdays we make and wire frames, paint hives, put together nucleus shipping-boxes, etc., and always manage to find something we can do profitably that might have to go undone later.

I must say it is a pleasure to spread the paint on nice, clean, new hives, and I have painted a hundred in one day, and manage, by the help of the girls, to keep up our household, too. With 500 colonies of bees in seven yards, from 4 to 20 miles out, there is hustling when the honey-flow begins until ready to be taken from the hives.

In this delightful climate camp life among the hills is delightful, with a wagon loaded with extracting and camping outfit, plenty of "grub," tents, bedding, etc., the wagon going ahead, we follow in the carriage. Best of all we have a negro cook who tends the team, helps about the heavy lifting, and does the odd jobs, and is much appreciated.

We usually reach the yard next to be worked in the afternoon. Tents erected, supper prepared and over, we

spread our beds for the night, and early next morning we are ready for business. Husband and our oldest son, Huber, age 16, will remove the honey from the hives and bring it to the extracting tent, while myself, and Alice, 14, and Kate, 12, will extract the honey and cut out the nice, white combs and pack in screw-cap cans ready for the market. Some of you Northern section-honey-producing sisters may laugh at this bulk-comb-honey product, but believe me, we can not nearly supply the demand, and it nets us nearly as much per pound as section honey; then we have the advantage of filling in around the comb with extracted honey.

Are we afraid of stings? Yes, some—and stray bees brought into the extracting tent sometimes annoy, by crawling around too familiarly.

Our girls insist that it is more cleanly and comfortable to wear boys' overalls while working in the extracting house, hence they have their papa to buy them large, roomy overalls, which are drawn on over their clothing. Of course, visitors are not expected.

We have never kept a record of a whole day's work, but I think myself and two girls can extract, cut out, and pack, a ton of this bulk-comb honey in one day, with sufficient help to do the lifting.

I, for one, would like to hear from the wives of bee-keepers.

MRS. W. H. LAWS.

Bee Co., Tex.

Mrs. Laws' letter will be read with interest by all the sisters, wives included. She is right, we ought to hear more from the wives. I am sure we would be glad to.

How pleasant it must be to have all the family interested, and have some part in the work. I know something about how nice it is, for at one time our whole family worked with the bees.

Your visits, Mrs. Laws, to the out-apiaries must be delightful—reads like a pleasant summer excursion. You enjoy all the pleasures of camp life (negro cook included), with the profits thrown in.

Tell those girls for me that I think they are very sensible in their choice of dress.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### CALIFORNIA AS A HONEY-STATE.

Glad to see B. S. K. Bennett, of California, stand up for his State. Guess he's right, too. California lost the lead to Texas by being caught in a bad year. Probably a good many of us will continue to think of California as the leading State in honey. Page 94.

### MOVING BEES WITH OPEN HIVE-ENTRANCES.

Yes, Mr. Hyde, to try to move a lot of bees with entrances open and fall at it—that's a thing we can shudder at even without having experienced it. Page 99.

### HOW THEY "DO" FRANCE.

The old and worn proverb, "They do things better in France," seems to have got juggled a little, and behold it is, *They do* France, to teach him better things, in Wisconsin.

Pretty much everywhere exact red-tape is mighty; and saving half the expense oft counts little or nothing, a crime. Political millennium not here yet. Page 101.

### THE AVERAGE PER COLONY.

The Northwestern didn't seem to get up much of a fight over the question how to count averages. Here is a man who has 100 colonies. Half of them die in winter. Forty of the remaining 50 come through "powerful weak," and don't get on their feet till harvest is past. Harvest is good, and the 10 good ones store lots of honey. The 40 he calls "nuclei," and so is enabled to say, "My average was about 100 pounds." Shall we tolerate this? or shall we smite him, and tell him his average was only 20 pounds? Page 102.

### THE HONEY EXCHANGE AND ITS WORKINGS.

Oranges and lemons are luxuries, but somehow the people will have them. Honey is a luxury—and most people

consent to go without very easily, if the article is not handy. This queer and ugly fact should be figured on in deciding as to the possibility of a Honey Exchange. Also, this related fact that higher prices are not nearly so much needed as the cultivation of the market clear from the bottom. Doubts whether the proposed Exchange will cultivate or do the opposite thing. A stream is not expected to rise higher than its fountain; and an organization formed of those who extract their honey before it is really ripe will hardly refuse to handle unripe honey. Page 103.

**BEE-KEEPING IN GERMANY.**

It is news that T. A. Heberly tells us about German beekeeping—that bees are not set abroad there, but kept in bee-houses. Of course, he is correct, in part at least. We have in time past heard much of migratory beekeeping in Germany. We can hardly infer that they pick up and migrate house and all. Possibly Germany may be a big place—so big that they have "locality" there. Page 104.

**WINTERING BEES UNDER EARTH.**

B. F. Schmidt says he winters bees under ground; but when we read more fully it appears that he puts the ground over the bees instead of the bees under the ground—piles tough, nicely cut sod around to make each hive a sort of Esquimaux hut. This seems to be a novelty. Where winters are not inclined to be wet, and tough sod is handy, I guess it's a promising way—that is, for those who are devoted to their bees and have but few. He makes plain dirt do for part way up at the bottom of the hut. Page 108.

**FOUL BROOD AND HICKORY SMOKE.**

Some of us incline to think that the foul brood which is cured by hickory smoke can not be a very foul kind. "Save your bacon" some other way—or rather, save your bacon that way, and your bees some other way. Page 109.

**STATE OF WASHINGTON A BIG STATE.**

And so Washington (State) is a big place also; and the east end of it can file a claim to the effect that usually it gets no more rain than is needed. We hear. How exceedingly easy it is for the most of us to use language which reaches much farther than our observations reach. Page 110.

**Questions and Answers.**

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Editor.)

**Taking Good Care of the Brood.**

It is an easy thing to be careless in giving advice, and not the easiest thing, even when one desires to be careful, always to advise in such a careful way that no inexperienced person shall thereby be led into error. Some words of mine, on page 139, calls forth the following from Delos Wood:

"You say to pile brood over a weak colony 4, 5, or 6 stories high. Now, Doctor, you certainly, with 40 years' experience, ought to know it would take a rousing big colony to care for 6 stories of brood above their own, and even with a strong force many eggs and young larvae would perish. Tell 'Ohio,' if he shakes all the bees off, to put the combs over a strong colony and make it a *boom*. Or shake off the bees and let the old and new hive be side by side, or the old one just behind the new one for a few days, till the bees get well started in the new hive; then destroy queen-cells and put the old hive on top of the new with excluder between. This does away with the swarming-fever, prevents increase, and keeps the colonies strong.

"In this locality it won't do to put brood over the shaken swarm until they have begun to build comb and the queen commences to lay. If you do, the bees go to the brood and build cells, and leave the queen to die.

"Don't strengthen a weak colony from a strong one in the spring. Make the weak one to help the strong one by giving brood from it to the strong one. Then after the main honey-flow the weak one may be allowed to build up strong for winter, or helped if need be from the strong ones."

If my advice should lead any one to pile six stories filled with brood above a weak colony all "at one fell swoop," it would surely be a rather serious thing, so I am much obliged to Mr. Wood for calling attention to the matter. I have been in the habit for years of piling

up brood over weak colonies, giving first a single story, then adding other stories a day or more later, and when giving the advice I failed to think of that point. I'm afraid I'll never learn to be as careful as I ought to be in such things.

Mr. Wood understands my advice one story worse than it really is, for I spoke of piling up till the whole pile was 5 or 6 stories high, including the story the weak colony already occupied.

In general, I should prefer piling the brood on weak rather than strong colonies, especially in working for comb honey, for the strong colonies do not need help, and such a mass of brood will make the weak ones strong in a short time.

I do not know what should make the difference, but I have in many cases put the queen on foundation in a lower story with all the brood in the upper story and an excluder between, when the queen would go to laying within two or three days. I should not, however, call that a shaken swarm at all.

The advice to make the weak help the strong in spring rather than to make the strong help the weak is in accord, I think, with what I have always advised.

C. C. MILLER.

**Basswood Seedlings in Their Second Year.**

On page 183, J. D. Gehring quotes me as saying concerning basswood, "that seedling trees never live to the second year." Unless Mr. Gehring can refer me to page and paragraph, I can hardly believe I ever said anything so foolish as that. There are thousands upon thousands of seedling basswoods that have lived many years beyond their second year; in fact, I do not know that I ever saw a basswood tree that was not a seedling, except a few that were dug as sprouts coming up about a tree or a stump.

What probably was thus misconstrued by Mr. Gehring, was my saying that among the many seedlings coming up under the row of trees in front of my house, none has ever lived to the second year. If Mr. Gehring can tell us why this is so, I should be thankful. It can hardly be the character of the soil, for the trees under which these seedlings spring up each year are of luxuriant growth, and in the woods, in the back part of the place where seedlings continue in growth, the soil is much the same. There is, however, in the woods a natural mulching of forest leaves, and it is possible that may make the difference.

C. C. MILLER.

**Starters or Full Sheets—Clipping—Other Questions.**

1. Which do you consider the most economical, starters or full sheets of foundation? I see there is a difference of opinion.
2. Do you think it best to clip the queen's wing?
3. Which is the best for this climate, to put bees in a dry cellar or put on their "overcoat"?
4. How would a dead air-space all around the hive of 2 inches do without any packing to make nests for mice?
5. Will it injure a young queen to keep her laying in a small nucleus for several days, then put her in a large colony? Some say that it will.
6. What do you think of the Swarthmore plan of rearing queens and fertilizing them? Is that not too much inbreeding?
7. I want to Italianize a lot of hybrid colonies, and I want the best kind of Italian strains.

IDAHO.

- ANSWERS.—1. I think that for most people there is sufficient advantage to pay the extra cost of full sheets.
2. It is most decidedly best for me, and the probability is that it would be for you.
  3. I don't know, but I think the climate is mild enough in Idaho to favor outdoor wintering.
  4. I will answer you very good purpose. Arthur C. Miller has reported favorably on wrapping tarred paper about the hives and tying with strings.
  5. I should not be afraid of it.
  6. So far as I understand it, drones not related to the queen can be used by that plan.
  7. You can buy a queen for each colony, but it will be less expensive to get one or two queens and then breed from these.

**Uniting and Feeding Bees.**

My 24 colonies of bees are in the cellar under the dining-room. They are nice and dry, but I have not examined them nor molested them at all, and as the weather is getting warm I am anxious to find out how they are off for stores, as I had a few light colonies. I wish you would advise how to proceed. If I find them too light to pull through would I better unite two or more later on and feed them, or try to feed them in the cellar separately?

As I do not care for a very big increase in colonies, would it not be as well to unite early in the spring? If I do that, how will I manage the queens?

NEBRASKA.

ANSWER.—The weather seems unusually warm for the time of year, and there is little doubt that by the time this reaches you there will be a day warm enough for bees to fly, when you can take them out of the cellar, and then it will be easier for you to tell which colonies are dangerously light in stores, and supply their needs. Then if you are afraid of cold weather afterward, you can return them to the cellar. Feed those that need it, according to instructions in your text-book and advice in this department. Do not unite colonies because light in stores, but if weak in bees it may be advisable. Whatever colonies are to be united may as well be united now as later. You

need pay no attention to the queens when uniting, as the bees will look out for that, but if you have any preference for queens kill the poorer of the two to be united. Indeed, there is some advantage in any case in killing one of the queens a day or two before uniting.

### Painting Hives—Section Starters—Clovers—Size of Hive.

1. Would you prefer hives painted or not?
2. What size starters in the sections?
3. What kind of clover would you have for quality and quantity, alsike or the white for honey?
4. What size hive, 8 or 10 frame dovetailed, for comb honey?

MINNESOTA.

ANSWERS.—1. I prefer unpainted hives, but don't like their looks. 2. I use for 4 $\frac{1}{4}$  x 4 $\frac{1}{4}$ , sections a top starter 3 $\frac{1}{8}$  wide and 3 $\frac{1}{4}$  deep, and a bottom starter 3 $\frac{1}{8}$  wide and  $\frac{3}{8}$  deep. 3. I hardly know; perhaps 8-frame if very close attention can be given to the business; certainly 10-frame if the bees can have much attention.

### Transferring—Extracting to Give Room—Artificial Pollen.

I am a beginner with bees, but have read a good deal about their management. I have 25 colonies, the most of them in Langstroth hives, but some in box-hives, and I want to transfer them as early as possible.

1. When is the best time to transfer?
2. The most of my bees are long-tongue Italians, and they have a good deal of brood at present, but I don't think they have room enough, as they started in the winter with 10 Langstroth frames full of honey. Would you advise extracting part of the frames?
3. The bees have been carrying in sawdust from the mill, and gathering pollen from the cedar-trees. I gave them about two quarts of wheat flour, and they carried it into the hives in about three hours. Is that good for them? or should they have rye flour?

KENTUCKY.

ANSWERS.—1. At the time of fruit-bloom is a good time to transfer, but the tendency nowadays is toward waiting till the colony swarms and then transferring 21 days after swarming.

2. Go a little slow about extracting to give room. Bees are using up honey very rapidly in rearing brood, and very likely they will empty out the honey fast enough. However, you can inspect the combs, and if you find no empty cells, but all filled with either brood or honey, and a large proportion of it honey, then it may be advisable to make room. There is more likelihood that the queen will be crowded with honey much later in the season.

3. I don't suppose there is any material difference between wheat and rye flour. It may be not so well to give fine flour as to give bran and all.

### Taking Bees from the Cellar.

I have been keeping bees for five years, and have been a close reader of bee-literature, but I do not remember ever seeing anything in the papers as to the different methods used by bee-keepers in taking their bees from the cellar in the spring.

Perhaps none of them have the trouble I do, that of the bees flying before I can get them from the cellar-door to the stand in the yard—about 4 rods. I have put an old piece of carpet over the front of the hive, but they will crawl on it, and when I shake them off they do not know where they belong.

WISCONSIN.

ANSWER.—If you are going to take out all the bees on the same day, smoke each colony a little before taking them out. That'll fix 'em. But don't smoke in the cellar unless you're going to take all out. You can, however, smoke them just as soon as you get them outside the cellar-door. Or take a *big* rag, dip it in cold water and don't wring it out, but lay it dripping against the entrance so that no bee can get out. They'll not take the trouble to crawl on the rag when it is wet.

### Using Combs on Which Bees Died.

1. I bought 3 colonies of bees, and lost one. What is the best thing to do with the old comb? Would I better take out the comb and seal the frames, or would it be all right to put another colony in the old hive and let the bees clean it out to suit themselves?
2. How is the best way to hive a swarm?
3. Would it be all right to make a building 4x4x7 feet, and put a swarm into it? Would the bees swarm in the spring, or would it keep increasing and not swarm at all? And would they be more likely to rob small colonies?
4. Why do you shake the supers during the flow of honey? Why not shake the bees down?
5. How can you tell when a colony is going to swarm?

PENNSYLVANIA.

ANSWERS.—1. Give it to the swarm just as it is. If badly daubed with diarrhea scrape off the worst.

2. The very best way I know of is to have your queen clipped, and when the swarm issues take away the old hive and set the empty one in its place. Then the returning bees will hive themselves, and you can let the clipped queen run in with them. If you see the

queen when the swarm issues, catch her and drop her among the bees when they have started into the hive.

3. Don't try it. They would not be likely to swarm, but it would not be entirely reliable as a preventive. A colony in an ordinarily large hive would be just as sure not to swarm, and it would grow just as large. But there would be no special danger of the bees robbing other colonies.

4. Probably more bee-keepers smoke than shake. But if you can succeed in shaking out all the bees it's a good thing, for it's a very difficult thing to smoke them all down.

5. Look for queen-cells, and expect a swarm when the first queen-cell is sealed. If there is a second swarm it will be somewhere about eight days after the first. When you're uncertain about a second swarm, put your ear to the hive in the evening, and if you hear the young queen piping look for a swarm the next day.

### Is Carrying Pollen Indication of Queen's Presence?

Is it a sure indication that a colony has a queen when the workers are carrying in pollen and working nicely? I think it is. Am I right?

WISCONSIN.

ANSWER.—I would hardly call it a *sure* indication. A colony may continue to carry in pollen for some time after the loss of the queen, as evidenced by the unusual amount of pollen in a queenless colony, but, as a general rule, you need have little anxiety about a colony hard at work and carrying in large loads of pollen.

### Wiring Shallow Frames.

How many wires should there be in those 6-inch shallow frames? and where should they be?

OREGON.

ANSWER.—Put in two wires at equal distances from top and bottom bars and from each other.

### Spring Feeding—Blacks vs. Italians.

I have a few colonies of black bees and some Italians in dovetailed hives. I use self-spacing Hoffman frames.

1. If I remove the division-board and divide the space up among the frames, would the bees build between the frames? The combs are good and straight.

2. In am feeding my strong colonies once a day. Will I profit by it? I work my apiary for comb honey, and I think the black bees finish a section closer, smoother, and the wax looks whiter than that of the Italians. Is it imagination or a fact?

WISCONSIN.

ANSWERS.—1. I'm not sure whether I understand you. There ought to be no division-board in the hive, but very likely you mean the dummy which should be in one side of the hive. If you take that out and then equalize the spacing, the bees will build out the cells sufficiently to fill up all the extra space given to them. What do you want to take the dummy out for?

2. Maybe, and maybe not. If you feed them on days that will not permit them to fly, when they are not lacking in stores, you're likely to do mischief.

3. It is very likely a fact, so far as whiteness is concerned. There are Italians which fill out the honey so close to the cappings that it doesn't look as white as where there is a good air-space left. Then there are other Italians that make very white wax.

### Pounds of Honey to One of Wax.

How many pounds of honey will a colony of bees consume in making one pound of wax?

UTAH.

ANSWER.—For a long time it was generally accepted that it takes 20 pounds of honey to make one of wax. Of late there has been much discussion regarding it, some estimates being as low as two or three pounds of honey for one of wax, with perhaps a more general gravitating toward five to seven.

### Buying Italian Bees—Formalin Gas for Foul Brood—Feeding in Spring.

1. Where can I purchase a Langstroth 4-frame nucleus, with a laying Italian queen?

2. Where can I get formalin gas? and how must I use it for foul brood?

3. Can I feed sugar syrup to bees as soon as they can fly out in the spring? If so, in what quantity?

4. I have just melted up some brood-combs with honey and pollen all together. I took off the wax when it was melted—can I feed that honey to the bees this spring?

WISCONSIN.

ANSWERS.—1. I think the publishers of this Journal can serve you, unless you find something nearer home in the advertising columns.

2. Get it through your druggist. I know nothing about its use from actual experience, but I believe the drug is placed in a box having an opening through which the fumes escape into a hive-body placed over the combs to be operated on being in this hive.

3. Yes, when bees fly freely you can feed any quantity you like.

4. Yes.

## NEW RUMELY SEPARATOR

exemplifies all that is best in the threshing machine maker's art. Nothing approaches it for him who makes threshing a business. It threshes, cleans, saves for the farmer, makes money for its owner and has the speed and durability. Threshermen should investigate the Wind Stacker, Self Feeder and other attachments and features which mark the Rumely as the prince of threshers. Write for the Rumely catalogue before buying. Mailed free.

### Standard Italian Queens

OF THE HIGHEST GRADE.

Bred in Separate yards from superior stock of Golden and Leather-colored Strains. Selected from among the best stock of Long Tongue Clover and Honey Queens in America. Bred by us in the greatest care for business. No disease among our bees. Our elevated country, with its pure mountain air and pure sparkling spring water furnishes the ideal place of health for bees and man. See our circular for the result. Queens sent out last season by us arrived in the very best shape, except a few got chilled late in the season in the North. Our Queens have gone to Oregon, Canada, Colorado, Cuba, New Mexico, and many of the States. We rear all queens sent out by us from the egg or just hatched larvae: in fall colonies. Our method is up-to-date. If you want to know what we have, and what we can do, in the way of fine, large, prolific **QUEENS**, and how quick we can send them, just give us a trial order.

Prices: Untested Queens, \$1.00; 6 for \$5.00; 12 for \$9.00.

Tested, \$2.00; Select, \$3.00; Best, \$5.00.

Full Colonies, with Tested Queen, \$10.00.

3-frame Nuclei, wired Hoffman frames, no Queen, \$2.00; 2-frame, no Queen, \$1.50. (Add price of Queen wanted to price of Nuclei.)

Special rates on Queens by the 100. Safe arrival and satisfaction guaranteed. Shipping season begins in April. Write for circular. It is FREE.

## FROM MANY FIELDS

### An Abnormal Season.

Last season was very abnormal, and the bees did not do extra well. There was too much wet and cool weather during fruit-bloom, and the bees got nothing of it. There was plenty of white clover, but whatever honey they got was used for brood-rearing. There was excessive swarming, but the swarms were very hard to catch; some went right off and never clustered. The bees were always very cross.

D. E. EVERS.  
Otoe Co., Nebr., March 10.

### Wintering Bees in Cellars Containing Running Water.

Over 20 years ago my father had five apiaries, and wintered mostly in cellars. My oldest brother did the managing. In one cellar there was a running spring of water. Last summer my brother told me that the bees in that cellar wintered better than in any of the others. Perhaps the warmth of the spring water had something to do with it.

On page 159, Mr. H. B. Stump gives a good record for cellar-wintered bees, and makes the remark that "the cellar is very damp, so that water stands on the walls."

Mr. G. M. Doolittle has contended for years that moisture did no harm, if the temperature was kept uniform at 45 degrees. Mr. Stump seems to go beyond that and claims that moisture in the cellar not only does no harm to the bees, but is a positive benefit.

If I am not mistaken, that phase of cellar-wintering has not been discussed in the bee-journals. If there are people who winter bees in cellars containing springs they might be in a position to give facts of considerable value to be known in general.

I would like to know if Mr. Doolittle would recommend building a bee-cellar over a spring, in preference to choosing a dry bank, both locations being on a side hill.

**JOHN S. CALLBREATH,**  
Delaware Co., N. Y., March 9.

### Some Tennessee Honey-Plants.

We have not had very cold weather this winter. Our bees have wintered very well so far. They are gathering pollen and some honey. The maple and elm trees are now in bloom. We have a tree here commonly called bee-willow—I have forgotten the botanical name of it. It is now in bloom. On fair days the bees have a jubilee. Garden flowers will soon be in bloom, then the peach-trees. In April, apple-trees and other fruit-trees. In May, locust, and tulip or poplar timber will be in bloom. Various other trees will be blooming during spring and summer. A few farmers sow buckwheat, which comes in July and August. Red clover is not cultivated as it should be, but we have some white clover in the pastures, which gives some nectar in the season its before frost. Another source of honey is honey-dew; it comes the last of May and first of June. We then get fine honey if the weather is favorable for the bees to work. Sometimes the rain makes it unfavorable for bees to gather fall honey. We have a weed that grows spontaneously in the fields. Some call it stickweed, some frosted, it is in bloom in the forenoon, hence the name. It granulates so the bees cannot do much with it.

H. M. SHERREY.  
Washington Co., Tenn., March 11.

### Foul Brood in Illinois.

The Foul Brood Bill now before our State Legislature is a very important one, and one of a broader nature than at first may be supposed by many.

The bee-keepers are not the only ones interested, by any means. The farmer that grows the small red or the mammoth red clover, alsike and white clover is also affected by the number of bees kept in the vicinity, the fact

GUS. DITTMER, Augusta, Wis.

being that the honey-bees are largely instrumental in the fertilization of the blossoms, thus giving the farmer a good crop of seed for future use and sale, for its use in reseeded his meadows and pastures is so essential to the growing of farm stock of almost all kinds. The buckwheat crop is also much improved by the work of our bees. The fruit-grower is largely helped in securing of better crops of fruit by the aid of the bees.

The bee-keeper needs such a law as a just protection to his property and to its very perpetuity. Thus it will be seen that, from a narrow view, three classes of our people are in need of a foul brood law—the farmer, the fruit-grower, and the bee-keeper. If this dread disease is allowed to go unchecked very few bees may be left to do the much-needed work for those above-named.

Our State needs such a law, and that badly. As bee-keepers we should now be fully awake and shower our law-makers with letters asking the most earnest support.

I have at hand a letter from our representative, Hon. W. W. Gillespie, stating, as one of the House Committee, that the bill had been read and recommended by the Committee, that it do pass. This is encouraging so far. He also said he would do all he could to secure its passage. F. A. SNELL, Carroll Co., Ill.

### The Hamilton Co., Ohio, Association.

It has been frequently urged in the bee-journals that one of the pressing necessities of the times is the enactment of a law in every State of the Union to protect the apiary from the ravages of foul brood.

It is to be regretted that so large and important a State as Ohio has no such law on its statute books, yet from Government statistics it produces more honey than the State of Colorado; its bee-keepers are more equally distributed over the State, and the consumption of honey in its manufacturing industries is so extensive that other States have to be drawn on for supplies to meet the demand.

A number of bee-keepers in Cincinnati, and adjoining suburbs in the county of Hamilton, held a meeting last August and formed an organization called the "Hamilton County Bee-keepers' Association," the first of its kind, exclusively in the State, with a membership of 50, and at each monthly meeting of the executive committee new members are being enrolled, and from all indications, where the constitution and objects of the association are fully understood by bee-keepers, still greater accessions to its ranks are expected, as in this county there are upwards of 500 bee-keepers.

The executive committee feel gratified and enthusiastic at the result of their preliminary efforts. They would strongly urge through the medium of the American Bee Journal, that similar initiative steps be taken in each of the 38 counties in the State, as early as possible in this spring, so that this association may have a united support in demanding of the Legislature, through their delegates, the enactment of laws for the suppression of foul brood, as it is enjoyed by California, Colorado, Wisconsin, New York, Michigan, Florida, etc. Hamilton Co., Ohio. WM. J. GILLLAND.

### Producer's Name on Honey.

In reading the article by P. D. Jones, and your reply, on page 83, I was very much impressed with the seriousness of this vital question, and I think we need an intelligent adjustment of this matter. I wish to register my protest along with that of Mr. Jones. I, like him, with considerable skill and painstaking, produce considerable comb honey, and, according to grade, I am willing to stand back of every pound with my own name. I sell my honey in a wholesale way, very often the whole crop to a single concern, with each section stamped, and so far they seem to prefer it that way; in fact, this year I was asked to stamp my honey, and I know they do not erase the name, because I was given many letters from dealers who say they saw my honey, and asking quotations on honey. Of

To make cows pay, use Sharples Cream Separator Book Business Dairy and Cat. 212 free. W. Chester, Pa.

course, I am compelled to tell them so-and-so of their place bought my entire crop, and, no doubt, can supply them, but will be pleased to correspond for my crop next year. This makes competition and higher prices, and that is my reward.

Now, if the dealer was to erase my name and substitute his own he would be robbing me of my just dues, and if that is not illegal it ought to be punishable. But there is an unwritten law governing these things. I am not in the mood, neither do I have the inclination, to make a reputation for Mr. A's or Mr. B's honey; neither do I care to build up the reputation of all the honey produced in Idaho by painstaking care. And, there is a natural law of compensation which rewards each individual for their greater efforts. Now, Mr. York, you would not think of erasing the name from a package of D. M. Ferry's seeds and substituting your own, and selling it as such? If you erase the name from the honey you certainly do a very unjust thing. Come, Mr. York, own up that you are beaten; there's two to one, and numbers count.

ALMA OLSON.

Fremont Co., Idaho, Feb. 21.

[Were we to say more on this subject it would only be to repeat what we have said many times. We never say on our labels that we are the producer's of the honey we sell. We have spent hundreds of dollars in creating a demand for "York's Honey," and not for Olson's or that produced by Jones. Their whole crops would be but as a "drop in the bucket" compared to what we sell during a season. We stand back of all the honey that goes out as "York's Honey," and know nothing of Olson's, or Nelson's, or Miller's honey, and care nothing about their honey. We are not working to sell their honey, unless we buy it, when it becomes "York's Honey," like any other good honey we buy. After it passes out of their hands they have nothing further to do with it, having received their pay for it.

When you sell your wheat or oats to a dealer do you insist on having your name on the bags holding the wheat or oats? Well, hardly!—EDITOR.]

**That Missing Link in Queen-Rearing.**

With the editor's permission, I will give my notion on the so-called umbilical, "missing link" or "line," as you please.

Where does it begin and end? What is its object? Dr. Gallup says, page 454, "attached to the vulva." He, being a doctor, is in a good position to know what he writes about. When I read this I sent me to thinking. What a place for the beginning of an umbilical cord, anyhow! Do all queens have them? How about the workers and poor drones! Would "umbilical queens" be on the market, and what would be the price of the "extra-select-tested" from the "prize long-umbilical queen"? These and many more questions came to my mind as I lay awake nights.

After reading the text-books of an amateur I resolved to let my bee settle the matter, and set some nuclei going for close observation. Let me say here that my library has 34 volumes (colonies) of 20 pages each, and for many years they have been my best books. Meanwhile, Mr. Doolittle, page 503, took up the "line" and tightened the kinks by corroborating Dr. Gallup's article. He says: According to my old teacher, the missing "link," that which will produce the best queens—is supplied in nearly every instance when using the plan of queen-rearing as given in "Scientific Queen-Rearing." But Mr. Doolittle has given us the ending of the "line" as being "all under and through the royal jelly in every conceivable direction," while his old teacher says: "Those roots and tendrils do not go wandering around through the mass of royal jelly." Which is right, teacher or pupil? According to the former, the object of the cord is "to suck up substance from the jelly and convey it to the

queen," and the pupil leaves the same impression.

Now we have it all in a nutshell. Isn't it grand? With the subject set forth and championed by such high authorities as quoted above, I have been a little slow to expose myself. But with my true nature to back me up, I now wade into the brack fearlessly.

My nuclei were kept going until late in November—carried them in and wrapped them up nights. The cells were examined frequently, and in the pupae stage carefully dissected, mounted in water and viewed with the aid of lenses. The so-called "link" was exposed and magnified separately, and in no instance did it prove to be anything more than a part of the delicate lining that the pupa queen gives to her couch when she "lies down to pleasant dreams," as it were.

Unbilious nonsense! There is no such thing. Sting-trowel theories dwindle to nothing in comparison. Nay, my bees have a stronger proof that it is a fallacy. Here is a truth they have taught me, and for their sake I will speak for them. I challenge the entire bee-keeping fraternity to disprove it. Here it is: *Honey-bees, including queens, drones and workers, are inactive and take no food while in the pupal stage.* This is also true in other of the higher orders on insects, as the Lepidoptera and Diptera. If these assertions are correct no further proof is necessary.

The lump of royal jelly in the cell has nothing to do whatever with the kind of queen it contained. Why, it never became a part of her. It is what she ate, and not the left-over dried waste that developed her. Nature is what she is, and she will not yield one jot to our pet theories, even though we spin them ever so fine. We can produce the highest grade of "puddin'" only by living in close touch with our bees and hearkening to all they teach. **EVAN E. EDWARDS, Madison Co., Ind.**

## Stinging a Hatpin—Other Peculiarities of Bees.

I think I have an explanation for the action of bees in stinging a hatpin head. It involves the trait I learned when a boy, back in Illinois, by which we boys used to jug bumble-bees, hornets and yellow jackets, and doubtless would catch bees or any stinging insect.

We would take a jug (white preferred) partly filled with water, and set it near a nest, in plain sight, and then disturb the inmates, when they would come out and fight the jug, which was at the mouth until they went in with the peculiar thud made by an insect going into a jug or the bung-hole of a barrel. Disturbing them a few times would exterminate the entire colony. Bees generally sting at some mark, as mouth, nose, eye or ear. I have had them sting at a white shirt-button on my wrist-band.

If there are only one or two bees that are anxious to fight, I try to get them to attack the nose of my smoker, and give them a whiff of smoke, which soon quiets their nerves.

My bees were very cross when I got them three years ago, but they are quite gentle now. Bees are irritated by jars, as a person's breath, the smell of poison from the stinger. I avoid these things as much as possible. I don't think they know me from any one else, or pay any attention to any smells, except the above. I wear the clothes which I wear at my other farm work, and they are often tainted with various smells. The sweat from my face often drops into the hive without disturbing the bees. I think my bees know when I have the smoke in my nose, and I am almost sure—so little that it does not seem to be sufficient to have any effect—keeps them quiet, when if there was no smoke used they would come out for a general fight. **Prowers Co., Colo. C. STIMSON.**

## The Season of 1923.

The last season, around here, was a bad one for gathering honey, from nearly spring to late fall. There was plenty of bloom in its season, but having so much rain and cold spells, the rains washed all nectar out of the bloom, which made it hard for bees to gather honey, except from the basswood flow, and for two

or three weeks during this flow the bees did fairly well.

I put out 6 colonies, spring come; 2 of them dwindled out, which left me 4. I bought 3 prime swarms, and caught 2 wild ones, and increased to 15 colonies, but did not get much honey. I had to feed syrup to 3 late swarms, and I am at present feeding 5 colonies sugar candy; I may have to feed more after putting them out on the summer stands.

I am in a good location, on the Des Moines river, with a good range for bees, season considered. Last season was a bad one for robber-bees getting in their work; I had to keep the hive-entrances closed pretty nearly all season. I had one weak colony that was attacked by robbers, and they locked horn with the robbers, and went out, bag and baggage.

I winter my bees in a storm cave with sand floor; it is as dry as can be; the door faces the south, and in fine weather, when the sun is shining, I open the door and the bees come out and have a flight. I am letting them have their second flight to-day, there being no snow on the ground, and they are well sheltered from wind.

I bought 3 colonies 2 years ago; they were in old racked up boxes; the wax-worms got away with one of them.

I could not get along without the American Bee Journal; it is a weekly visitor to me. Say, couldn't you strain those smart Alects breed up a strain of bees without a sting, as well as a strain of bees with a longer tongue? It is a fine fly, and the bees are out having a playing spell. W. IRVINE.

Webster Co., Iowa, March 7.

**CONVENTION NOTICE.**

Utah.—The spring meeting of the Utah State Bee-keepers' Association will be held in the City and County Building, Salt Lake City, April 5, at 10 o'clock a.m. All bee-keepers of Utah and adjoining States are cordially invited to be present. J. N. ELLIOTT, Sec. E. S. LOVESY, Pres.

Missouri.—Bee-keepers of Missouri will meet in convention at Moberly, in the Commercial Club Rooms, at 2 o'clock p.m., on April 22, 1903, to organize a Missouri State Bee-keepers' Association. We expect to complete our organization on that day and have some bee-talks the day following. Everybody is invited who is interested in bees, and honey. Let us have a good turnout and a good time. Good hotel accommodations can be had at \$1.00 and \$2.00 a day. The Monitor Printing Company will tell you where the Commercial Club rooms are located. W. T. CARY, Acting Secretary. Wakeanda, Mo.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapels. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the queen-buttons as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with a sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to lighten many a person in regard to his honey and bees."

The picture shown herewith is a reproduction of motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

**California!** If you care to know of its Fruits, Flowers, Climate or Resources, send for a sample copy of California's Favorite Paper—

**The Pacific Rural Press,**

**Tip-Top Glass Honey-Jars**

1-pound.

7-ounce.

The pictures shown herewith represent the best jars for honey that we know of. They are made of the clearest flint glass, and when filled with honey, and neat labels attached, they make as handsome packages as can be

1/2-pound.

imagined. The glass top rests on a flat rubber ring, and is held in place by a flat steel spring across the top as shown. They are practically air-tight, thus permitting no leak, which is an important thing with honey-sellers.

We can furnish these Jars, f.o.b. Chicago, at these prices:

	1 gross.	2 gr.	4 gr.
1-lb. Jars	\$5.00	\$9.50	\$18.00
7-oz. "	4.50	8.50	16.50
1/2-oz. "	4.00	7.50	14.50

If you try them once you will likely use no other kind of top or sealing arrangement for honey-jars.

**GEORGE W. YORK & CO.**  
144 & 146 E. Erie Street, CHICAGO, ILL.

A Perfect Ear.—The Seed-Corn question is a subject of much interest to the farmers just now, and there is perhaps more space devoted to it in agricultural papers than at any other subject. The corn-judging schools which have been held in Iowa and Illinois for 2 or 3 years past have been well attended, and farmers who have always thought that they knew what a good ear of corn was, are finding that there are more points to be considered than they had heretofore imagined could exist. The Golden Seed Corn is a new variety introduced to the world by the Iowa Seed Co., of Des Moines, Iowa. This corn is perhaps the greatest step in advance over old varieties which has been made during a number of years, but it still must be recognized that as yet perfect corn does not exist. The best judges of seed-corn do not claim ever to have seen an ear which would score 100 percent when carefully judged. There are many points to be taken into consideration; the length and circumference of the ear, and depth, color and shape of grain; solidity, size and color of cob, filling out at tips and butts, proportion of corn to cob, etc., and it is difficult to get all the good characteristics combined in any one ear.

The above-named Seed Company have this year published a Corn Manual which is one of the most valuable little books that we have seen. It gives a great amount of practical information which has never before been published, and also full instructions for raising seed-corn. Every one who expects to grow even a single acre of corn should have a copy of this book to help select their seed-corn in a more intelligent way, and the Iowa Seed Co. offer to send a copy to any reader of this paper for 10 cents in stamps, or they will send it free to any one purchasing seed-corn from them this year. Please mention the American Bee Journal when writing.

**For Sale** 30 COLONIES of Italian Bees, in Lanerstroth and Simplicity hives. Price from \$5.00 to \$7.00 per colony. Satisfaction guaranteed. JOHN HERBERT, 1342 HAMPSHIRE, KANE CO., ILL.

**HONEY AND BEESWAX MARKET QUOTATIONS.**

CHICAGO, March 24.—The trade is of small volume with little change in prices of any of the grades. Choice white comb sells at 15¢/16¢ with amber and other off grades sold at 2¢/5c less. Extracted, 7¢/8c for white, according to kind and flavor; dark grades, 5¢/6¢/7c. Beeswax, 30c. R. A. BURNETT & Co.

ALBANY, N. Y., Mar. 14.—Honey demand quiet; receipts and stock light. Comb selling, light, 15c; mixed, 14¢/15c; dark, 13¢/14c. Extracted, dark, at 7¢/7½c. Beeswax firm, 30¢/32c. H. R. WRIGHT.

KANSAS CITY, Mo., Mar. 14.—The demand for both comb and extracted honey is better, receipts light. We quote as follows: Fancy white comb, per case, \$3.40; strictly No. 1, \$3.30; No. 1 amber, \$3.03/\$3.25; No. 2, white and amber, \$2.50. Extracted, white, per pound, 7c; amber, 6¢/6½c. Beeswax, 30c. C. C. CLEMONS & Co.

CINCINNATI, March 11.—The demand for extracted honey is good at the following prices: Amber, barrels, 5¢/6¢/6½c, according to quality; white clover, 80¢/85¢; fancy comb honey, 15¢/16½c. Beeswax strong at 30c. THE FRED W. MUTH CO.

New York, March 5.—There is a fair demand for white comb, 15c; fancy white, 13 1/4c for No. 1, and 12c for amber, with sufficient supply to meet the demand. Dark honey will be cleaned up with very little left; it is selling about 10¢ per pound. Extracted honey is good and in quantity lots, prices generally shaded. We quote: White, 7¢/7½c; amber, 6¢/6½c; dark, 6c. Beeswax scarce at 30¢/31c for good average. HILDRETH & SAGLEEN.

CINCINNATI, Mar. 7.—The comb-honey market has weakened a little more; is freely offered at following prices: Fancy white, 14¢/15c; no demand for amber. Extracted honey, the market for extracted has not been changed and prices are as follows: Amber in barrels, 5¢/5½c; in cans 6¢/6½c; white clover, 80¢/85c. Beeswax, 28¢/30c. C. H. W. WEBER.

SAN FRANCISCO, Mar. 11.—White comb honey, 12¢/13¼c; amber, 9¢/11c; dark, 7¢/7¾c. Extracted, white, 6¢/6½c; light amber, 5¢/6c; amber, 5¢/5½c; dark, 4¢/4½c. Beeswax, good to choice, 18 1/2¢/20¢; cork, 25¢/26c.

Demand is fair on local account for water-white, ungraded, but there is not much of this sort obtainable. Market for same is firm at ruling rates. Canned stock and common qualities are going at somewhat irregular and rather easy figures, holders are quite being desirous of effecting an early cleanup.

**GEORGE W. YORK.**

DEPT. EDITORS,  
DR. C. C. MILLER, E. E. HASTY, EMMA M. WILSON

**IMPORTANT NOTICES.**

**The Subscription Price** of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

**The Wrapper-Label Date** of this paper indicates the end of the month to which your subscription is paid. For instance, "dec03" on your label shows that it is paid to the end of December, 1903.

**Subscription Receipts.**—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

**Advertising Rates** will be given upon application.

# Dr. Miller's New Book

**SENT BY RETURN MAIL.**

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

## HOW TO GET A COPY OF DR. MILLER'S "FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the **WEEKLY American Bee Journal** for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book *free as a premium* for sending us **Two New Subscribers** to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

Address all orders to

**GEORGE W. YORK & CO.,**  
144 & 146 E. Erie Street, CHICAGO, ILL.

A STANDARD-BRED

# QUEEN=BEE FREE

To Our Regular Paid-in-Advance Subscribers.

We have arranged with several of the best queen-breeders to supply us during 1903 with **The Very Best Untested Italian Queens** that they can possibly rear—well worth \$1.00 each. We want every one of our present regular subscribers to have at least one of these Queens. And we propose to make it easy for you to get one or more of them.

In the first place, you must be a regular subscriber to the American Bee Journal, and your own subscription **must be paid in advance.** If it is not already paid up, you can send in the necessary amount to make it so when you order one of these fine Queens.

## A QUEEN FREE FOR SENDING ONE NEW SUBSCRIBER.

Send us \$1.00 and the name and address of **One NEW** subscriber for the American Bee Journal, and we will mail you one of the Queens free as a premium.

Now, go out among your bee-keeping neighbors and friends and invite them to subscribe for the old American Bee Journal. If you want some to show as samples, we will mail you, for the asking, as many copies of the American Bee Journal as you can use.

Should there be no other bee-keepers near you, and you desire one of these fine Queens any way, send us \$1.50 and we will credit your subscription for one year and also mail you a Queen. Of course, it is understood that the amount sent will pay your subscription at least one year in advance of the present time. So, if your subscription is in arrears, be sure to send enough more than the \$1.50 to pay all that is past due.

We prefer to use all of these Queens as premiums for getting new subscribers. But if any one wishes to purchase them aside from the Bee Journal subscription, the prices are as follows: One Queen, 75c.; 3 Queens, \$2.10; 6 Queens for \$4.00.

We expect to mail the orders that are received after this date early in June, and thereafter almost by return mail.

Now for the new subscribers that you will send us—and then the Queens that we will send you! Address,

**GEORGE W. YORK & CO., 144-146 E. ERIE ST., CHICAGO, ILL.**

formaldehyde. *Bacillus alvei* (germ of foul brood) was found in the comb *not* subjected to formaldehyde; none was found in the combs which had been treated with formaldehyde."

This establishes beyond a doubt that formalin gas is a sure cure for foul brood; and I hope that bee-keepers who are unfortunate enough to have colonies afflicted with this disease will give the new cure a trial.

To this Editor Root replies as follows:

I do not feel so certain myself that formalin gas is an absolute sure cure; but the experiments thus far conducted by Mr. Weber give us great reason for hoping that we have something here of more than ordinary value. If we can treat diseased combs by so simple a plan as this, we can wipe foul brood out of a yard with very little expense or trouble.

For years it has been claimed in European bee-journals that this or that drug could be successfully used in treating foul brood, and a very few in this country have been of the same belief. For some reason cases of successful treatment in this country have not been reported with the same frequency as in Europe. Some have claimed that a reason for this lies in the fact that in Europe the disease has to some extent run its course, while in the fresher fields of this country it appears with emphasized virulence.

Editor Root has uniformly insisted heretofore that no drugging could be relied on. Is our esteemed cotemporary not going a little too far to the other extreme when he says, "If we can treat diseased combs by so simple a plan as this, we can wipe foul brood out of a yard with very little expense or trouble?" The use of formalin, if it is as successful as claimed, will enable us to save our combs and honey; will it do anything more? It will not save the brood. Will it do anything more than to put the trouble of disinfecting the combs in the place of the trouble of burning them? Even that, however, will be an important gain.

**Winter Losses in the West** seem to have been severe. The Rocky Mountain Bee Journal says:

Our reports from the Western slope indicate that the loss will be large, due to the severe cold weather and depleted vitality of the bees. Denver bee-keepers estimate that the average loss in their locality will amount to 50 percent. In northern Colorado the loss is above normal, but not so severe. We have no reports from the Arkansas valley.

It is too early yet to make a reliable estimate of winter losses. There are colonies that now give promise of survival that will not reach the first of May, unless the spring is extremely favorable.

## Convention Proceedings.

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 214.)

#### PICKLED BROOD.

"Is pickled brood ever rosy?"

Dr. Miller—No.

Mr. France—I agree with Dr. Miller on that. I never knew pickled brood to be rosy, neither do I believe that pickled brood will ever develop into anything else.

Dr. Miller—It will string a little bit, won't it?

Mr. France—No, it never gets rosy.

Dr. Miller—Won't it draw out a little bit?

Mr. France—There may be a stage at which it may be drawn out a little—elastic; but it is only a matter of a couple of days.

Pres. York—Is it contagious?

Mr. France—No, sir.

#### EXTRACTING-SUPERS.

Mr. Clute—How many prefer the large extracting super? How many prefer 16 and 20 frame extracting supers instead of 8 and 10?

Mr. France—I think that hinges largely on the locality.

Dr. Miller—Wouldn't it also depend largely on his apiary? If he had only two colonies he wouldn't want a 16-frame extractor—I beg pardon—super.

Mr. Niver—How do you use 16 frames in an extractor?

Mr. Clute—My 16-frames are expanded by a piece on top that allows the 16 frames to go crosswise of the whole.

Mr. France—I see that Mr. Niver is not understanding Mr. Clute in regard to that. As he came back from Cuba he explained this hive to me. The hive-body has a little projection so that the other set of frames, the extracting frames, go crosswise, and the length is sufficient. When you put the full length in there you have about 18—some of mine I have 20. The idea came from Mr. Coggsball, who uses them very largely. You are getting extracting combs, two sets in a one-story hive. They are in the next tier to the brood. Now, during extracting I like that style of hive. We can take off honey faster in that than in any other hive I have ever seen.

Mr. Clute—The plan didn't come from Coggsball. It is the same as the 8 and 10 frame hives. I have a cut of the hive here, which I will be glad to explain.

#### LONG-TONGUED BEES.

"Has this season's test proved any superiority in the long-tongued bees?"

Pres. York—I think the man who has the long-tongued bees is not here, as I hear no answer to the question.

#### LAYER OF AIR OVER SECTIONS.

"Is a layer of air over sections usually filled with bees? and will more honey be stored on that account?"

Pres. York—It seems to me that Dr. Miller was the man who talked about "a layer of air."

Dr. Miller—I think it is usually filled with bees. I don't know whether more honey will be stored. I know if there isn't air there, there will be bee-glue there. In other words, with "a layer of air," as he calls it, when that layer of air is there the bees will come in there, but they will not put bee-glue on a surface as they will in a crack or an angle. Wherever a bee can pass through itself, it thinks—at least I understand it thinks so—that there should not be a crack there big enough for anything else to go through, and they will plug that full of bee-glue; but having the space there for them to get through, they may furnish a little bee-gule, but it won't be anything like the quantity they will put there; so I will say the advantage of the bee-space is not that you will get more honey, but you will get less bee-glue there with that space than without it.

Mr. Baldridge—How much space would you use?

Dr. Miller—About a quarter of an inch.

Mr. Baldridge—Do you ever use an inch, or an inch and a half?

Dr. Miller—Yes, I have had in some cases, though perhaps not intentionally.

Mr. Baldridge—A few years ago Mr. Root made a good many hives with a cover and 1½ or 1¾; and a man shipped me a car-load of hives once, and he had mats with them. I didn't use them, though; I threw them away, and that left a space of 2½ to 3 inches above the frames, and I found it very desirable, and I wouldn't object to-day to having a cover made leaving an inch or 1½-inch space. Some say they will fill that space with comb and honey. I have had that done, but that I consider a great advantage; I am ahead so much, and, besides, it is an indication that they need more room.

Mr. Craven—I will ask Mr. Baldridge if any burr-combs were built?

Mr. Baldridge—Where the space is shallow, but I have found it very desirable. The bees belonged to Mr. Flanagan. I had a car-load of them. Frequently I used to find them full of young bees when I would take the cover off, especially after they were on the hive for a while. I took the cover to any colony to strengthen them. All young bees, nearly.

Dr. Miller—I would like to ask whether Mr. Baldridge considers that irregular comb—for, of course, that would be irregular comb built in that space—whether he considers it more desirable to have that there than in the sections?

Mr. Baldridge—Well, of course, the comb would be built irregularly in that top cover, but they wouldn't attach it to the frames.

Dr. Miller—No, that is not the question. Do you consider it more desirable to have that irregular honey up there than to have it built in sections? Do you think that that irregular honey built there is so much more than they would have stored if they hadn't had that?

Mr. Baldridge—Yes, sir; and I am just so much ahead

Dr. Miller—Well, I just think you are mistaken. [Laughter.] Now, I want to say to you that I have very great respect for Mr. Baldrige. He was keeping bees and mastering the art when I was trying to find out what diseases they had when I heard the noise of the quacking down in the bottom, and Mr. Baldrige has been in the business long enough to teach us.

Mr. Baldrige—I will say this: I seldom find bees working in that cover unless they were lacking room below, and that's why I say I am just so much ahead, that if it hadn't been there they would have put it in the brood-nest. I was producing extracted honey.

Mr. Horstmann—It is not safe to try that plan. After a meeting of this kind we almost always work on the plans spoken of during the convention. I am sure the bees will put that full of comb before going into the super. If you raise the hive up they will build below the frames. It may work all right in Mr. Baldrige's location, but not here.

Dr. Miller—Please let us have clearly before us that Mr. Baldrige is talking of extracting-combs. I haven't any doubt, although you would have two inches of space over extracting-combs, and the bees would have to be crowded a good deal for room before they would put an ounce in there. It takes quite a little bit of crowding to get them to work in a space of  $1\frac{1}{4}$  inches, and you have to take two inches of space over there and give them plenty of comb to fill in for extracting, and you won't be troubled much with irregular combs.

Mr. Horstmann—I am satisfied that they won't work up there if they have extracting-combs to work on. We are producing comb honey. If any one is working for extracted honey, and he likes that space, I believe it would be all right.

Mr. Whitney—Mr. Baldrige, do you apply that principle even to the slightest space above sections?

Mr. Baldrige—I would. In the sections I would add bait-combs, and in this cover there is nothing to entice the bees to commence until they are full. They won't commence to work there until they are crowded.

Mr. Whitney—I should think they would soil the sections.

Mr. Niver—Mr. Chairman, I am responsible for this quarrel, though they get a great deal more honey by leaving a bee-space above the sections. I quarreled with him because the sections were all stained on top, and they always will be. He said he got so much more honey when he filled that bee-space with bees when they get to work. I always believe in the enamel cloth, so the bees can get on top there. All this machinery they get up for sand-papery on top is bosh. With the enamel cloth the bees can't touch the sections at all.

Mr. Purple—How does it tier up?

Mr. Niver—We have all our supplies made with that idea. We have a skeleton honey-board so the bees can not possibly touch it, whether we tier up or not. That point of putting up more honey because you have an air-space filled with bees, I want to find out.

An adjournment was then taken to 6:45 p.m.

(Continued next week.)

### Present Status of the Pollination Question.

BY PROF. A. J. COOK.

THE urgent request of a subscriber, enforced by our Editor, leads me to present this important question in the light of the most recent research.

The experiments of Mr. Waite, made nearly 10 years ago, with mine made soon after, and the more recent work of Prof. Fletcher, settled beyond question the following facts:

Many if not all varieties of our fruits that bear seeds must always be pollinated to grow at all, and all to produce seeds. Most, if not all, require—some possibly always, most, if not all, at times—cross-pollination to set a full crop of fruit. As some one has stated, Nature seems to abhor close-pollination. Some plants, like the cereals, and grasses, are fertile with their own pollen. Nearly all our fruit-trees

need the invigorating effect of cross-pollination to produce a maximum yield of fruit.

The way these experiments were conducted was to cover the blossoms with netting just before the blossoms opened. This netting was so close in its meshes as to preclude the entrance of even the tiniest insect. The blossoms were kept covered until they wilted and fell. This, of course, kept away all insects—the great agents of cross-pollination. It was found that in many cases, of pears, plums, prunes, etc., there was no fruit at all when the blossoms were covered. Often, while there was some fruit, there was a very limited crop. In some cases, as with Royal apricots, in my case the covering seemed not to diminish the crop at all; in fact, I secured more fruit from the blossoms that were covered.

It might be objected that the covering, and not need of insect visits to insure cross-pollination, was the cause of the fruit failing to set. In my case this could not be. In more than one instance, where the bees were thronging the blossom-crowded trees, I unwrapped the netting and permitted the bees to visit flowers, after which I at once restored the screen. I marked the blossoms visited, and these, and no other, fruited. In one case, of Kelsey plum, it is very interesting; every fruit that the string-mark showed had been visited by bees developed, and no other.

These experiments show clearly that the screens are no bar to setting and development of fruit; and sustain the view, with emphasis, that cross-pollination is essential in many cases to a full setting of fruit, or even to the development of any fruit at all.

The cases of fruit failure, where there are no bees, or a scarcity of bees in the orchard, and when fruiting was markedly increased where an apiary was secured within or close beside the orchard, are becoming so common in California that there is in many sections an anonymous acknowledgement of the need of bees in the orchard by the orchardists themselves. Indeed, in many cases of trees blooming profusely, each season, and yet setting little or no fruit, there is probably one of two explanations that will always, or nearly always, meet the case: Either there are too few insects (bees are the main agents), to do this necessary work of cross-pollination, or else there is only one variety of fruit-trees that blossom at the time in the orchard. Many orchardists in California have become clearly convinced of the wisdom—yea, the positive necessity—of mixed planting of varieties that blossom at the same time, if one would secure the largest returns.

It will be remembered that a Mr. Smith, now deceased, of one of the Lake Erie islands, was a bee-keeper and also a fruit-grower. He frequently wrote for the American Bee Journal and Gleanings to the effect that bees were not necessary. The islands had no bees, and yet the orchards were immensely productive. Others have orchards of only one variety—Bartlett pears, for example—and yet secure large crops. They, of course, question the importance of cross-pollination. The facts of such persons are undeniable; their conclusions are not at all warranted. There is conclusive evidence that crossing among both animals and plants give added vigor. In fact, the origin of sex in both plants and animals is to be accounted for on this principle of added vigor consequent upon inter-crossing. The Bartlett pear will often produce full crops with no other variety near. It is probable that in all such cases the environment and all the circumstances are propitious, that the trees are in great vigor, and are as a result fertile to their own pollen. It is equally well established that any unfavorable change of season, any lessened care, or untoward circumstance, may enfeeble the trees, and they will become entirely sterile to their own pollen. We can easily believe that trees on the fertile limestone soil of the Erie islands, bathed by the moist lake winds, and abundantly watered by the copious rains incident to the region, would be at a maximum of vigor, and would very probably be self-fertile. I have no hesitancy, however, in asserting that such trees may at any time become barren, unless other varieties are hard by, and unless bees are in the near precincts to act as the needed "marriage priest" to effect the needed cross-pollination.

We must not forget, then, that while it is always wise to mix varieties, and secure the near proximity of bees, yet in rare cases trees—probably those in fullest thrift and vigor—will bear well, even by themselves, and with no insects to bring to the stigmas the pollen from the flowers of other varieties.

One other fact should be borne constantly in mind: In nature, trees and bushes are more scattered—an acre will usually have hardly a score of a kind, and contiguous acres will often vary greatly in their species. Thus the limited

number of nectar-loving insects in Nature are sufficient to do the pollinating work. In our orchards it is different. A hundred trees, and even thousands of bushes and vines, often are crowded on a single acre. Many of these bloom in the early spring-time, when insects are few and far between. Here, then, we must supplement the agencies of pollen dispersion. Bees, fortunately, are just to our hands. Each hive pours forth its thousands of these little flower-lovers. And even in spring-time they crowd the blossoms of shrub and trees. Thus, without artificial crowding of trees and shrubs, we must likewise arrange for supernumerous agents of pollen dispersion. We find these abettors in our bees, each apiary sending out not infrequently millions of bees to engage in the transfer of pollen from flower to flower. These facts then are settled:

1. Cross-pollination is usually needed to secure full fruiting.
2. Occasionally very vigorous trees or plants are fertile to their own pollen.
3. Seeds can never be produced without pollination.
4. Rarely trees will bear fruit (seedless fruit) without pollen. The navel orange is an example.
5. Insects are necessary to cross-pollinate the bloom.
6. In the crowding of varieties as we do in orchard culture, we need more than the native insects, and in such case the honey-bee is the only available agent.
7. The wise orchardist will always mix varieties in his orchard, and will look to it that abundant bees are always near by at time of bloom. Los Angeles Co., Calif.

## Queen-Rearing—Gallup vs. Alley Methods.

BY ARTHUR C. MILLER.

“AND the pot called the kettle black.” Dr. Gallup and Mr. Alley are on the point of coming to blows, and all because each is sure he is right, and that the other is wrong. But they are both right and both wrong. The man who speaks between two combatants generally gets his own head broken, but even at the risk of that I will step in here and see if I can throw a little light on the subjects discussed—if one can call assertions and counter-assertions discussions—and stop the “scrap.”

I have forgotten who began it, but I think it was Dr. Gallup's article on “umbilical cords.” Granting that, I will try first to show the Doctor wherein he is wrong, and where he is being taken effect for cause.

I suppose the Doctor is familiar with the metamorphosis of insects, but for the benefit of those who may not be I will state that no such thing as an umbilical cord is known to exist in the insect world. The larval bee during its growth casts its skin several times, and not only its skin but the lining of the alimentary canal. It will be seen from this that any umbilical cord connecting the larva with the food or cell would be cast off on the first moult. Besides this, there is no need for any such “cord” for assisting the nourishment of the larva, for not only does it take food with its mouth but it likewise absorbs it through that portion of the skin lying in the food. After the cell is sealed the larva spins its cocoon, the silk coming from an opening in the lower lip. When the spinning is complete the larva casts its skin for the last time, and it is this last cast with its *silk attachments* which the venerable Doctor has mistaken for an umbilical cord. It has nothing, and can have nothing, to do with the nourishment of the larva.

I am sorry to take this step from the Doctor, and I fear it will embarrass some gentlemen who have been claiming it as a great virtue of their queens.

The Doctor quotes from Prof. Cook in support of his contention, that the best queens are reared in strong colonies, but neither the Doctor nor the Professor tells us *why*. To be sure, the Professor does say: “As the *quantity and quality of the food and the general activity of the bees are directly connected with the full nourishment of the queen-larva, and these only at the maximum in times of active gathering*—the time when queen-rearing is naturally started—we should also conclude that queens reared at such seasons are superior.” (My italics). Dr. Gallup says that only in big colonies can good queens be reared, and that such colonies are cells containing the “umbilical cord” produced. Dr. Gallup's description of a big colony frames the idea of a *minimum* of 20 Langstroth frames (or the equivalent) covered with bees. Now Mr. Doolittle, whose queen-rearing colonies at a *maximum* are equal to but a half of what the Doctor considers safe, says all his queen-cells show the “cord.” Surely there is a “missing link”

hereabouts. But never mind, for it is not the size of the colony that tells the story, nor the “general activity of the bees,” to which we must look for an answer to the riddle, but the *constitution of the colony*, and it is just here where the Doctor's naturally big colonies win.

The feeding of all larvæ is, under normal conditions, attended to by the young bees, and a big (naturally big) colony has an abundance of these. Now if we are to talk of rearing a lot of queen-cells under the supersedure or swarming impulse, simultaneously with care of the worker and drone brood, such a colony will and can do it perfectly. But to assume that such a colony without any brood to care for, is necessary to the production of 10, 20 or 100 cells, is an absurdity. The Doctor has so mixed his subjects that I am unable to decide whether he is talking of rearing queens commercially by his plan, or simply of the ordinary succession of queens in swarming.

Mr. Alley was writing of commercial queen-rearing, and as I have several times visited his apiary in the height of his queen-rearing season, use his system myself, have tried all known plans, and know the *laws* governing successful queen-production, and that Mr. Alley's system conforms to those laws, and that I neither rear queens for sale nor am under any obligation to Mr. Alley (though I believe he has given me two queens), I believe I am in a position to make an impartial statement of his side of the case. The “laws” governing the production of queens I have given in a previous article, so in this place I will only try to show why a few bees of proper age are sufficient for “growing” a *proportional* number of cells.

From experiments, which as yet are by no means conclusive or exhaustive enough to warrant positive statements, I believe that one bee (nurse-bee) can and does supply food for several worker-larvæ. Now is it “awful” to believe that a pint of nurse-bees (1600, Root's figures) can properly and successfully rear *one queen* and at the same time feed two or three hundred worker-larvæ? These are the conditions under which Mr. Alley's nuclei rear queens when he fails to give them queens. Queens thus reared I have seen at the head of just such colonies as Dr. Gallup describes. But Mr. Alley does not depend on his little nuclei for rearing his queens; it is only by chance that now and then one has the opportunity to rear a queen. He starts his cells in “full colonies,” so far as bees, honey and pollen are concerned, but destitute of brood except for the prepared strips for queen-cells. For cell-building colonies he selects those particularly strong in young bees, and he goes even farther. After the cells are well under way he takes them from the starting colony and gives them to a colony having lots of hatching brood as well as unsealed larvæ—one from which the queen was removed twelve hours previously. By this method he gets his cells superabundantly stocked with food, and the resulting queens attest the value of the system.

I revert to the quotation from Prof. Cook. He lays stress on the conditions of honey-flow, weather, populousness of colony, etc., saying that the best queens can be reared then. Certainly, *because* nurse-bees are then very numerous. Many bee-keepers grasping the conditions only so far as stated by Prof. Cook, have assumed that feeding the cell-building colony will accomplish the desired end. They have entirely missed the point. The feeding must be done in time to cause the rearing of a lot of young bees, and *these* are to do the work.

A word in regard to nuclei and I will close: First their size must be governed by temperature; that is, locality and season of the year. Mr. Pratt succeeds with very small ones; Mr. Alley who is close to the coast has them twice the size of Mr. Pratt; and a friend nearer the Canadian line uses them a half larger than Mr. Alley's.

These diminutive colonies must be regularly fed if their success is to be ensured. For this Mr. Alley uses sugar syrup. Honey must never be used. If a nucleus becomes too populous he exchanges a frame of brood and bees for an empty frame, the removed frame going into one of the stock colonies he uses for making nuclei. Sometimes he accomplishes the same thing by moving the nucleus to another spot, being careful not to do this when it is likely to cause the loss of a virgin queen.

If the bee-keeper will take the trouble to learn exactly what Mr. Alley's nucleus system is—its simplicity, its cheapness and its mobility—they will adopt it, only varying the number of combs in the nuclei to fit their climatic conditions.

If all hands will stop mud-throwing and turn to and look for the *why* of things, the apicultural press will be more interesting than ever before, and bee-keeping will fairly jump forward. Providence Co., R. I.

## Why Feed Bees Sparingly and Often?

BY C. P. DADANT.

**A** FEW letters of enquiry received by me since the publication of the article about spring care of bees, on page 149, have shown me that some of the beginners do not understand the reason why the bees should be fed sparingly and often, to stimulate spring breeding. This is an important matter, and I believe it should be elucidated as fully as necessary.

When the bees are not harvesting anything in the fields, they are comparatively quiet. The breeding takes place, as the warm days come, but is not pushed with much vigor until the blossoms begin to appear and a little nectar is found. Whenever they begin to find nectar, there is more stir in the hive. The bees that come home from the field, instead of depositing it in the cells, often hand their load to the young bees, so as to be able to get off to the field again. Thus a number of bees are carrying about. Whenever one of them meets the queen, she respectfully and deferentially holds her proboscis towards her and offers her a taste. Being offender solicited to eat, the queen consumes more honey, and her eggs are matured more rapidly. So, during a honey-flow, no matter how light it be, the queen's breeding increases until the fatigue of a protracted laying puts an end to her prolificness.

The doings that I have just mentioned may be witnessed daily in an observation hive, made of one single comb, with glass on both sides. Such a hive is very useful to learn the habits of bees. You may read of such things in books or in the journals, but they do not impress themselves upon your mind when you read of them as they will if you are an eyewitness to the details of the hive-life. With such a hive, you have a source of endless information and amusement. You can see the actions of the bees when returning from the fields, the nursing of the young, the laying of the queen, the respectful care which the bees take of her, their sorrow when she is taken away, their labor to replace her, the rearing and hatching of both bees and queens, etc. An observation hive ought to be kept at least for a portion of the year, by every one who is desirous of becoming fully informed as to the habits of the bees.

If the bees are fed sparingly and often, there is a constant carrying about of nectar, the queen is offered food often, the bees are stirred up and create more heat than if quiet, and the result is a greater amount of brood produced. If the feed is given in large quantities, all at one time, for the entire season and to enable them to reach the honey crop in safety, it will, of course, have a good effect, but will not be so advantageous as the same amount given at different times. The bees will store it away to use as is needed, but, a few days after feeding, they will be back again to a quiet condition, unless the flowers are appearing. To be sure, if there were flowers yielding honey, I should not think of advising any one to do any feeding. We are only speaking of the days, unluckily too numerous, in early spring, when the bees can find nothing, or next to nothing, in the field. With repeated light feeding, the colony is kept in a stimulated condition, the amount of food consumed will be greater than if the nourishment is given all at one time, but the number of eggs laid will be much greater, and the colony will be strong earlier.

It is not all to have plenty of bees in your hives, you must have them at the right time. If a colony remains weak till the opening of the crop has begun, unless this crop is to be protracted six weeks or more, for it takes 21 days on the average for the worker-bee to hatch, and after that about 10 days more before she becomes an active field-worker; so it is in March and April that we must induce our bees to breed. The March bees strengthen the colony and enable it to rear the April brood on a larger scale, and the latter is in the field just about the time of the opening of the harvest.

The colonies which were fed sufficiently and properly, sparingly and often, during the spring months, are sure to make the good colonies for the harvest, unless their queen lacks in prolificness. Let me cite you an instance of involuntary feeding which will show the help that light and constant feeding gives to a colony.

At the end of the winter in 1902, we had a few hives in which the bees had died, though their supply of honey had been ample. Each of these hives contained several combs heavy with honey. They were cleaned up and closed up, awaiting the proper time to re-stock them with bees. They were very old hives, had been manufactured by us in 1870, and had been in constant use since that time. One of the

hives had a very small hole on the underside, in its bottom-board, a hole so small that only one bee could get through it at one time, and this even with some difficulty. This small hole was discovered by the bees of one of the colonies in the yard and they immediately went to work to appropriate the spoils. We had noticed the bees flying about, a few at a time, but a cursory examination had failed to reveal any trouble, so nothing was done to interfere with them. The robbing of that honey extended over the space of at least two weeks, by the bees of just one hive. It changed the condition of that colony so much that it seemed to have doubled its strength within a month or so, and its crop was about double that of the next best hive in the yard. It had bred its bees at the right time. The robbing of the combs had extended over this long period of time, just because it was impossible for the bees to get through the hole any faster, even their own eagerness being an impediment to their progress, as two or three bees would often try to get in at the same time and interfere with one another's speed.

This is a good instance of the good done by feeding sparingly and often. I would, however, not recommend a voluntary following of a similar course. The bees that become accustomed to this robbing in the open air soon become a nuisance, while the bees that are fed at home in the evening are never led into bad practices unless pilfering chances are opened to them.

It is hardly necessary to repeat what I said before, that feeding should be done with judgment. A colony heavy with honey should not be fed, as it may accumulate too much. A good way to stimulate such a colony is to uncap a few cells of its sealed honey from time to time. The doing of this forces them to handle their honey, and acts in a similar way to feeding. On the other hand, a very weak colony that has but a few handfuls of bees requires but a very scanty feed. Too much will cause its ruin, for it will be unable to take care of it, and the robber-bees from stronger colonies will attack and may overpower this one. The apiarist must examine his colonies often, judge of their strength and their needs, and use care and discernment as to the amount and frequency of feeding to be done.

Hancock Co., Ill.

## Association Notes.

### Good Advice to Bee-Keepers.

There are many keeping bees in the suburbs of cities, and whose bees are an annoyance to neighbors.

#### SPOTTING CLOTHES.

This is generally worse the day bees are set out on the summer stands. Bees go only short distances at that date. It is best not to set the bees out on wash-days, but the day following; by the next week the trouble will be over. If they must be set out, and it is wash-day, go to the neighbor who is washing, explain the situation, and offer a present of some honey if she will delay washing one day.

#### AT WATERING-PLACES.

Always provide abundance of water in several places for bees. Shallow wooden dishes with sloping sides, with a slatted-board float, is a good form of watering dish. Somewhere have some salt, also air-slacked lime where bees can go to. There is something about it bees like, and it will save trouble to supply the bees' demands. If your bees bother a neighbor's pump, go and put a piece of cheesecloth over the spout and fence the bees out as well as furnishing a strainer for the water. Stock tanks are places of annoyance. Just above the water line on the inside of the tank fasten a 3-inch strip, it will not bother the stock, and will keep the bees from going there. Also see to it that the overflow is so arranged as not to make a mud-hole near the tank.

#### IN THE NEIGHBOR'S GARDEN OR FIELD.

If your neighbor or his horse are stung by your bees in his garden or field, I find it a good plan to donate some honey, at the same time ask him to do such work on cool days or early mornings. If he is unable to keep the garden clean, then some early morning surprise him by taking

your own horse and cultivate for him up to breakfast. Generally one such act will establish such good feelings no farther trouble will arise. I have proven it so.

#### AT GROCERY STORES AND RESIDENCES IN THE FALL.

After the honey season often bees are a great annoyance at the above places, especially in empty sugar and syrup barrels, and candy shops. Go to those places and ask to place the packages where bees can not get to them. Go to sugar-cane mills and keep the premises cleaned up, and to neighbors' kitchens where bees come in and bother while canning fruit, and ask them to keep the door and windows screened while at such work. Bees do not go where no sweets abound.

#### IN THE HIGHWAY AND PUBLIC PLACES.

If people or teams are stung in such public places by your bees, it is your duty so to locate the bees, or change the surroundings, that they do not disturb the public. If damage to person, stock or property is done by the bees, the owner is liable for damages; and if it continues may become a nuisance. High board fences, or high hedges are a great help. Even with all possible precaution if bees are near the street the bees at times will bother. Keep out of trouble if possible. Don't get the idea that the National Association can win every case. You must keep within the law if you want protection. Avoid conflicts, compromise, and live up to the Golden Rule.

N. E. FRANCE,

General Manager National Bee-Keepers' Association.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Spring Stimulative Feeding—Gnawed Cappings.

1. What is the best time to begin feeding bees in the spring to start them to brood-rearing? Is the middle of March too early?
2. What is the dark brown substance, similar to sawdust, found on the bottom of the hives? Is it the excrements of the bees?

ILLINOIS.

ANSWERS.—1. If the weather was such that the bees could fly every day, and there was nothing for them to gather, then it might be a good thing to feed to stimulate brood-rearing, no matter how early it might be. But such a condition does not occur very often, and it may be well, unless one has had a good deal of experience with bees, to let stimulative feeding alone, for it is a two-edged sword that may do more harm than good.

2. Mainly the cappings of combs that the bees have gnawed away during the winter in getting at the honey in sealed combs. Some say that there are also some excrements of the bees mixed with it.

### Using Partly-Filled Sections—Hiving Swarms—Shaken Swarms.

1. I desire to use sections again which were placed on the hives last year and not filled out. They are some mused. Should they be all scraped off nicely, or just set out again as they are?
2. What do you consider the best way to hive a swarm of bees, in a 10-frame hive with all old combs?
3. Can old combs be satisfactorily used with shaken swarms? If so, what is the *modus operandi*?
4. If starters are always used with shaken swarms, will not the old combs accumulate for the moths to regale themselves in?

L. S. R.

Ashtabula Co., Ohio.

ANSWERS.—1. If the bees have never put any honey in them, or if they were all nicely emptied out by the bees last fall, put them on just as they are. If they were not emptied by the bees last fall, and contain honey, don't use them at all, for almost surely some of the honey left over winter will have granulated, and the smallest amount of granulated honey left in the cells will affect the honey put into them.

2. I don't know of anything different from hiving a swarm on full sheets of foundation or frames with starters. Perhaps you had something else in mind; if so, ask again, and I will try to answer.

3. Yes, some prefer old combs to anything else. Remove from its stand the hive to be operated upon, and put in its place the hive with empty combs. Then taking one by one the combs from the removed hive, shake and brush the bees into the new hive, just as you would if foundation were used.

4. If starters are always used there certainly would be an accumulation of drawn combs, but it would not be necessary to turn them over to the tender mercies of the moths, for they would be melted up—but I should use them.

### Hiving a Swarm from a Tree.

Would some of the bee-keeping ladies tell us what they do in case a swarm of bees clusters in a tree out of reach with a pole?

WISCONSIN.

ANSWER.—I would keep the wings of the queens clipped so that when my bees clustered in a tree out of reach of a pole, I would pick up my queen and cage her, put her at the entrance of the hive, and go on with my work serenely oblivious to the fact that those bees were in the top of the tallest tree they could find. They might come back at their leisure.

That is, I should generally do that way. Occasionally it will happen that a swarm will come out with a virgin queen, in which case I should take a saw, climb that tree, saw off the limb, and bring them down, if I could reach them. If they were away out of reach on an overhanging branch, out of all possible reach by climbing, and out of reach of a pole—well, it is a big nuisance, but I will tell you what we did do once with just such a swarm. We nailed two long, light poles together, drove a spike in the end of one, and over this spike we placed a long rope, with a stone securely tied in the end; with a good deal of trouble we succeeded in pushing the stone over the limb and down came the stone bringing the rope with it, and we were masters of the situation. We put the hive on the ground under the limb, taking hold of both ends of the rope gave it a lively jerk, and down came the swarm squarely in front of the hive. Part of them made a bee-line for the hive, and part persisted in going back to that limb, and we had to keep up a lively jerking on that rope to prevent quite a cluster from returning to the tree, but we finally got the swarm.

I often think such a swarm costs more than it is worth to get it. I am sure I should hate to be obliged to climb after them all.

Any good stone-thrower might tie a stone to the end of a ball of wrapping-twine and throw it over the limb, then tie the rope to the wrapping-twine and pull it over.

Perhaps some of the other sisters will tell us how they do.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

#### BEER-FLIGHTS IN WINTER.

It's a better showing than we can often make—but not such a great deal better—that Washington puts up on page 110—two flights in November, none in December, two in January, two in February. We don't usually have it quite as damp as they do (which counts for something), and my bees last winter flew, once in November (three successive days), not at all in December, once in January, twice in February. But then, my worst winter would show no flights at all, and probably their worst would still have some.

#### MOVING BEES A SHORT DISTANCE.

I think E. F. Atwater, page 116, has a good idea. When you move a hive a short distance it is better than the regulation board set up in front to make every bee that comes out dig out through a mess of grass. Can't help knowing that there has been a change then.

## EXTRA COMBS FOR WINTER.

It would be handy when one has extra combs of honey, and bees to go in the cellar that have not honey enough, to put on an upper story containing a heavy comb or two and some empty ones. We have one good witness to the important matter that they fail to find the honey and go up. P. H. Davis, page 111.

## BEES CARRYING DOWN HONEY IN THE FALL.

"Nothing succeeds like success." Mrs. Griffith, not minding her 79 years, has succeeded so far in making her bees carry down honey in the fall—has succeeded both with sections and with light combs. Page 120.

## LONGEVITY OF DIFFERENT RACES OF BEES.

Some experiment-station work on the longevity of different races of bees is much to be desired. Glad the Texas station has an eye on so important a problem. Hope they will not forget to compare inside the same race, the meanest bees they can get with the best ones they can get. We need proof that poor bees are shorter-lived than others. Page 131.

## CARNIOLAN-ITALIAN HYBRID BEES.

As to the Carniolan-Italian hybrid, J. E. Chambers seems to make an enthusiastic report—begin storing surplus when the pure Italians have only got to breeding fairly. This is Texas, we must remember. And as to whether giving our bees a dash of Carniolan blood may not make still worse our present worst evil—uncontrolled swarming—as to that, he is not able to re-assure us much—except he himself has got through two seasons without any serious trouble.

Finding bees over three miles from home by thousands, and that, too, when no dearth prevailed, is a valuable observation. Only in the unusual case when one has bees unlike all surrounding bees is it easy to tell exactly how far bees go. Page 142.

## WISCONSIN BEE-KEEPERS THAT HELPED.

So 180 bee-keepers out of 600 would help Mr. France in his move on the legislature—to the small extent of answering his letter. Glad to hear that with some poking up they afterward did much better than that. Page 149.

## BEES UNDER GLASS IN APRIL.

Yes, Mr. Dadant, bees with royal abundance of pollen and honey already in the hive, and put under glass in April, ought to boom, and do extra-big things, as yours did. And it is a wise suggestion of yours that glass over the bees won't make the forage outside any more abundant. If they are to depend on that alone, while having very scant store within, 't would hardly be worth while to "greenhouse" 'em at all. Page 149.

## CAUSE OF SWARMING—REARING QUEENS.

Stachelhausen is one whose opinion we respect; and he thinks swarming is caused by a multitude of young nurses having prepared food in their stomachs and no young brood to feed it to. That's the dominant idea, I guess. Perhaps we shall have to expand it so as to take in as helpers in lesser degree all the other discontents of prosperity. We can note as a curiosity that the nurses don't get what they are after, if that's what they swarm for. A number of days must pass before there will be any young brood to feed in the new homes.

Sagacious remark. A queenless colony will rear some sort of a queen even if the conditions are very bad; but bees over an excluder, where a good queen is below, unless the conditions are somewhere near right they *will not rear*; and this fact is some protection against worthless queens by that method. Page 150.

**Honey as a Health-Food** is the name of a 16-page leaflet (3½ x 6 inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 10 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order.

# Questions and Answers.

CONDUCTED BY

DR. O. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

## Entrance-Guards and Swarming.

I have been thinking about bee entrance-guards to keep my bees from swarming. If I have a guard on a hive and the bees are swarming, and the queen can not get out, how many times will they swarm and go back into the hive before they go to the woods? or won't they go to the woods at all? What will become of the queen?

MISSOURI.

ANSWER.—Bees don't always act alike, but the general rule would be something like this: When the first queen-cell is sealed the bees will swarm out, and no queen being with them they will return, for a swarm will not go to the woods unless a queen is with them. A day or two later they will swarm again, and the swarming may be repeated several times in the next week or ten days. At the end of that time the first virgin queen will leave her cell, and the old queen will turn up missing, being put out of business either by the workers or the young queen. If the entrance-guard keeps the young queen from taking her wedding-flight, she may, after a time, begin laying, but her eggs will produce nothing but drones.

## Shallow Extracting-Frames.

1. Do shallow extracting-frames need wiring?  
2. Is it best to use foundation in shallow extracting brood-frames, if so, how wide a strip?

OHIO.

ANSWER.—1. Yes, if filled with foundation, unless the foundation is heavy.

2. If used for brood-rearing it is better to have them filled with foundation. If only for extracting a starter half an inch deep may do, the chief purpose being to get the combs started straight in the middle of the frame.

## Break-Joint Honey-Board—Paint for Hives.

1. What is meant by break-joint honey-board?  
2. I would like to know whether any one has ever painted hives with Avenarius Carbolinone instead of white paint? If so, did the bees accept it? They say mice will not gnaw, or the ants bother, hives painted with it.  
3. How does the new Danzenhaker bottom-board and cover strike you? And how do those that have used them like them? Iowa.

ANSWERS.—1. A break-joint honey-board is one made with slats like a wood-zinc excluder with the zinc left out. Instead of having the spaces between the slats correspond with the spaces between the brood-frames, the spaces between the slats are directly over the centers of the top-bars, and that makes it called "break-joint." It has been claimed that with this break-joint feature there were special advantages of importance, but in my own experience I found no such advantage. With thick top-bars and proper spacing I now dispense with honey-boards altogether.

2. I can say nothing about this from personal experience; perhaps others can.

3. The Danz. bottom-board, patterned after the Miller bottom-board, is good. The new Danz. cover is ingenious, and the reversing feature is of value. If, upon trial, it proves never to warp or separate at the joints, it ought to be a material improvement over former plain board covers.

## Transferring Bees—Combs a Solid Mass—Good Bee-Country.

1. I am just starting in the bee-business out here in western Washington. I have 8 colonies, transferred them from box-hives or took them from trees, all except one colony, but did not get any increase from the 8 colonies. What was the reason?

2. In putting them into Langstroth-Simplicity hives, I tied them with strings, as recommended in "A B C of Bee Culture." That is where I made the mistake, as the bees cut the strings, and now the 8 frames are one solid mass of combs. What shall I do with them? I would like to have them in such a shape that I can manipulate them. I have been thinking some of letting them alone until next fall, then put them on straight combs in new hives. How would that do?

3. This seems to be a good country for wild bees. That is an indication of its being a good bee-country? Last year I went out into an old logging work, and found three bee-trees in less than three hours. I found nine trees in four days. I consider that good work for a novice at bee-hunting. We had a lovely month of February, and my bees gathered pollen for two weeks, off of what some people ca-

pussey-willow. It seems to furnish a large amount of pollen for early spring brood. But, March, oh! she is unruly, for snow is 10 inches deep in the woods, so I took snow by the forelock and killed three deer on it.

I like the "old reliable" American Bee Journal, but some of the veterans seem to be in conflict in their ideas, perhaps on account of locality.

WASHINGTON.

ANSWERS.—1. The lack of increase might come from more than one cause. It might be too poor a season for swarming, it might be that the transferring was too late, or it might be just possible that your bees are little given to swarming.

2. You will do as well not to wait till fall. Perhaps as good a plan as any is to wait till three weeks after the colony swarms. After that time the worker-brood will be all hatched out, and you can either transfer combs or melt them up.

3. Yes, wild bees are the same as tame bees, and if one does well the other will.

You don't need to send a stamp when you send a question.

### Rape as a Honey-Plant.

Is rape much of a honey-plant? Would it be of any use if sown in grain? It is sown in grain to be used for pasture during the fall, and I have understood that the bees work on it. I will send down some this spring to alsike clover. How would it do to sow rape with it? and how much to the acre?

One of my neighbor bee-keepers, Martin Anderson, had the misfortune to have his bees nearly all drowned while in the cellar.

MINNESOTA.

ANSWER.—I have never heard much about it in this country, but in Germany rape is highly prized as a honey-plant, and sometimes bees are hauled some distance to be in reach of rape-fields. I doubt the advisability of sowing with grain, but have no positive knowledge about it, and perhaps some one else may say if I am wrong.

### Moving and Purchasing Bees—Transferring—Danzenbaker Hives—Sweet Clover.

1. I have bought a few colonies of bees in box-hives. When is the best time to take them home?

2. In purchasing bees, if you had your choice of 30 colonies in box-hives at \$3.00 per colony, how would you proceed to select them? I propose to transfer them to movable-frame hives. When is the best time to do this?

4. Would you advise using full sheets of foundation?

5. Our climate is rather changeable. How do you think the Danzenbaker hive would work by using 2 brood-nests one above the other, and keep the colonies strong? How would it work to slip a super between them when about to swarm?

6. Would you advise the use of Danzenbaker, or some other hive?

7. How is the foundation fastened to the Danzenbaker frames? Is it fastened the same as the Hoffman frames?

8. How do you think sweet clover will do here in central Wisconsin?

WISCONSIN.

ANSWERS.—1. You can take them home at any time now. Better now than later when the frames are full of brood and honey.

2. Select those that seem to be the strongest in bees, and not too light in honey, judging of the former by tipping the hives, and of the latter by hefting them. In addition to this, if you can have those that cast swarms last year you will be sure of young queens.

3. In fruit-bloom is a good time, although it is perhaps still better to transfer three weeks after swarming.

4. Yes.

5. The two brood-chambers would be all right if intelligently used, but it is doubtful about the super between.

6. I should prefer the dovetailed; others might prefer the Danzenbaker.

7. Yes.

8. Finely.

### Mating of Queens and Drones—Rearing Queens.

I have several books on bee-culture, but none of them strikes the principal point—they do not point out the way to mate Italian queens to Italian drones in an apiary of blacks or other bees. I am sending to Italy for two queens, one to breed drones, the other queens; although they should be from different sources. I may say I have been looking for a discussion of this question in the American Bee Journal, but it has not turned up. I have 17 colonies and the larva will be transferred to artificial cups and cells placed in a Doolittle nursery.

1. Please say how queen-breeders mate queens purely white bees of other "nationalities" are present?

2. Can this be done without entrance-guards, as I have none?

3. Queens are to be hatched in Doolittle nursery-cages, introduced to nucleus 3-frame hives.

4. Please give me the exact diameter across top of wax-cup pegs, on which the cups are to be cast. I can make them, and they look beautiful, but I fear mine is a little too large.

5. Please tell me whether burlap is what we call "American oil-cloth"?

ENGLAND.

ANSWERS.—1. They don't; at least not always. For if it is desired to keep a certain kind pure, they do not have any other kind in the

apiary. But something may be done toward getting what you want in this way.

Put the cellar the hives containing the drones and the young queens. After it is too late in the day for other drones to fly, take out the cellared hives, and incite them to fly by feeding. You may be a little more sure of this if the cellaring has continued two or three days. You may also succeed by taking them out in the morning, so as to get them to fly before other drones are out.

2. For the foregoing no entrance-guards are needed.

3. The nucleus hives will be all the more convenient to carry in and out of the cellar, and perhaps you could have in these your drones as well as queens.

4. The numbers 3, 4, 5 will help you to remember the diameters of the different kinds of cells: 3 queen-cells to the inch, 4 drone-cells, and 5 worker-cells. But I doubt it is so important to have the queen-cells of exact size as it is drone or worker.

5. No, they are utterly different. American oil-cloth or enameled cloth being impervious to water or air, and burlap being very open. Perhaps you call burlap "gunny sacking." It is a coarse stuff made of jute, flax, or manilla, and is used for very coarse bags, for wrapping around furniture to be shipped, etc.

Success to you in your far-away English home.

### Alsike Clover—Shade-Trees.

1. Does alsike clover produce honey the first season after seeding? and does it continue alike each year?

2. Would you advise shade-trees for bees as far north as this?

3. Which is the best honey-producer, alsike clover or alfalfa?

WISCONSIN.

ANSWERS.—1. I think it yields little or no honey the same year it starts from the seed, and does not live beyond the second year. If wrong, I shall be glad to be corrected.

2. As far north as Wisconsin bees will probably not be injured by the shade of trees, and possibly they are the better for it. However it may be for the bees, I should like it for the benefit of the bee-keeper.

3. That depends upon what place you are talking about. In some parts of the West alfalfa leads, but in Wisconsin an acre of alsike will probably yield more honey than a hundred of alfalfa.

### Honey in Unfinished Sections Not Granulated.

I have seen quite a lot lately in the Bee Journal about the honey in unfinished sections candying, and as I have on hand about 150 of them, that I intended feeding to my bees this spring, I took a look at them to-day, expecting to find them all candied, but such was not the case. The honey is just as clear as when I put them away, so I guess the bees will have no trouble to clean them out this spring, as soon as the weather is warm enough so I can give it to them.

Now this seems strange, in the light of the experience of others, and I cannot account for it unless the place where the sections are kept has something to do with it. I keep them as I do my comb honey, in a hall in the second story of my dwelling-house, where the heat from the lower rooms goes up the stairway and keeps them warm. Is there anything unusual in this?

NEBRASKA.

ANSWER.—Very unusual, and not unusual at all. It is unusual for honey to be kept in so good a place, but not unusual for it to stay clear when kept in a hot enough place.

### Cleome and Other Honey-Plants.

What about artificial pasturage for bees? Is Cleome pungens worth cultivating for the honey alone? Is the honey of good quality? Is it light or dark, and how does it compare with white clover honey? Please give the names of other plants that are good for artificial pasturage in this locality and vicinity.

I would be pleased to know if there are works on the above subjects. I have a couple of acres to devote to artificial pasture just for the honey if it is probable that success might come of it in any way.

I am a beginner and will say that last spring I purchased eight colonies of pure, or nearly pure, Italians; the first thing I did was to lose four of my old queens, but with the four other queens and the other four queenless colonies I succeeded in rearing 31, and all are in good shape now—all that I have opened except one have lots of brood in all stages. One hive has about six Langstroth frames, and the others have two to three frames, of eggs and larvae. We have considerable white clover and sweet clover in this neighborhood. We have quite a bit of marsh-pasture, and some of the yellow flowers (coreopsis), making a good early spring and late fall pasture, especially the yellow for fall. We also raise buckwheat here.

WISCONSIN.

ANSWER.—Cleome pungens is not worth cultivating for honey alone. I do not remember to have seen any statement as to the character of its honey, and I don't know whether any one ever secured enough of it to test just what it was like.

There is probably no work published that treats particularly on honey-plants, although the text-books on bee-culture give some information regarding them. It is not likely that you will find any plant that will yield sufficient honey to make it profitable for you to occupy land with it unless it yields a profit in some other way. Sweet clover will probably come as near it as anything you can find. If stock in your locality have learned to eat sweet clover either green or dry, it will pay to occupy good land with it.

**What Yon Yonson Thinks**

It seems kinse of funny how da shook swarming fever spread so fast. It was yust few cases till las' summer it broke out plenty bad, an before da lears fall purdner every bee-keeper had tuch of it; an sum got it plenty bad. Ay tank mebbey nex' summer dom goan to shake der bees so dom kant rest. Now, for da big bee-keepers ay tank it was all rite, but for little bee-keepers lak Yon Yonson ay tank it is better to sow som catnip an sweet clover and plant more rossbers. An den pat dom begin da back an tell dom to elder fish or cut bait. But not shake dom ay more dan necessary. Ay don't vont to shake dom, or brush dom, or kick dom aroun ven dom iss good.

Som say it is better to drive dom two times, so purty soon ven dom big bee-keepers vont help, dom vil advertise fur feller to help drive da bees. Now, Yon Yonson don't need help to drive da bees to swarm, but mebbey nex' summer be goan to need feller to drive da red clover bees to da clover field, an burd dom do dom don't git to da catnip. Ay tank dat goan to be plenty hard yob, coz dom is yust so crasy fur catnip som anything vat never vas. My goodness, vy for dom bees swarm for any way!

If ve know fur shure den ay tank its better ve don't let dom swarm a tall, but let dom yust roll in der hunny.

Now, ay goan to tell you vy for dom bees swarm. In da spring ven dom little bees begin to mak hunny, an dom little grasshoppers begin to mak grass, an dom butterflies begin to mak butter, den da nites is kinse of cool, and dom bees don't lak to sleep upstairs, an dom begin to pack away hunny in da top of da brood-frames, an ven dom git it capped over dom don't lak to go upstairs an yorb, so dom keep on crowding der queveens furder down, an purty soon der queveens he git mad, an he call der house to order an dom hole big meetings. Da young bees vat is use to have play spells, dom lak to have plenty big time, an dom mak moshoun to swarm, den da drones vot hang aroun 'an don't yorb but always lak to ete at da first table, dom secon' da moshoun, an ven dom vote da drones holler "Eye" so lody dat da moshoun is carried. An dom git redy to swarm. But if dom hole meeting in evening den da old bees is home, an dom vote "No," an den dom send da drones upstairs to bed, outen any supper. An den purty soon dom vote to yorb an pack away hunny in da upstairs.

Now, if you don't give dom nuff room den dom crowd der queveens, an da queveens he git mad an dom swarm; but if you give dom upstairs too big, den it is apt to be too cold, an dom don't vas like it, an yust crowd der queveens an swarm yust der same; but if you vil yust put on shallow extracting combs, and den ven dom begin to yorb in den, den give dom room yust so faster as dom need it, but if dom begin to crowd der queveens, den yust uncap der hunny in da downstairs an smoko der bees so dom tak on plenty hunny, an den

**Standard Italian Queens OF THE HIGHEST GRADE.**

Bred in separate yards from superior stock of Golden and Leather-colored Strains. Selected from among the best stock of Long Tongue Clover and Honey Queens in America. Bred by us with the greatest care for business. No disease among our bees. Our elevated country, with its pure mountain air and pure sparkling spring water furnishes the ideal place of health for bees and man. See our circular for the rest.

Queens sent out last season by us arrived in the very best shape, except a few got chilled late in the season in the North. Our Queens have gone to California, Oregon, Canada, Colorado, Cuba, New Mexico, and many of the States. We rear all queens sent out by us from the egg or just-hatched larva; in full colonies. Our method is up-to-date. If you want to know what we have, and what we can do, in the way of fine, large, prolific **QUEENS**, and how quick we can send them, just give us a trial order.

Prices: Untested Queens, \$1.00; 6 for \$5.00; 12 for \$9.00.

Tested, \$2.00; Select, \$3.00; Best, \$5.00.  
Full Colonies, with Tested Queen, \$6.00.  
3-frame Nuclei, wired Hoffman frames, no Queen, \$2.00; 2-frame, no Queen, \$1.50. (Add price of Queen wanted to price of Nuclei.)  
Special rates on Queens by the 100. Safe arrival and satisfaction guaranteed. Shipping season begins in April. Write for circular. It is FREE.

shut da hive and smoke da entrance so dom go upstairs an unload, den dom soon mak room for der quevens, an' der queens he yust go on packen away eggs for winter an der bees carry der honey upstairs an everything yust work lak forty-seven, an dom don't ean tank 'bout swarming.

An' if Dr. Miller vill yust try das plan to mak dom tak da honey from da downstairs and put it in der shallow combs above, an so on, he soon don't haf to run after da vilodap of da non-swarming bees.

Mr. Baron Lie-penty-had, he got noder plan. He pump der quevens full of high life, an den he litte string vat dom call Pupa-skinnae Castoffice roun der quevens neck, so he don't vas git away, an den der quevens he lay more as a million eggs per nuit. But ay hind since dat it ain't so. Mr. Lie-penty-had must be awfil smart feller, but der quevens got litte too much hif life, so he scratch roun an vord his feet out, an be hav to git cork legs for him. Ay lak to git von of dom quevens.  
YON YONSON.

**FROM MANY FIELDS**

**Feeding a Little Daily.**

I am just a beginner in bee-keeping. I had 15 colonies last fall, and have lost 2 colonies this winter. I am feeding the bees a little every day, so as to get the hives full of bees by the time the fruit-trees are in bloom.

JOHN M. BAKER.

Wood Co., Ohio, March 23.

**Prospects Not Encouraging.**

The prospect for this season is only average, as we have had, up to this date, only half enough rain to insure a crop.

JOHN G. COREY.

Ventura Co., Calif., March 5.

**Cleaning Out Partly Filled Sections.**

On page 130, Mr. Baldwin says that the Bevins method of getting partly filled sections cleaned out may be all right in theory, but is not practical for two reasons:

1. If the colony is a little weak it is liable to get chilled because too much cold air circulates through the body of the colony.

This may be true of bees in Dupage Co., Ill., but it is not true of colonies of bees here, unless colonies are so weak that it would not be advisable to try to winter them. As a matter of fact, I do not feed weak colonies until I have suited so as to have colonies of good strength for wintering.

2. He says that my method does not separate the bees and sections so but that the bees can get at the sections at all times.

Well, I want the bees to have access to the honey in the sections at all times. A thin board mortised as he describes, may be of some advantage where the autumns are colder than they are here, but the burlap is all right for this locality. I do not see that setting the sections promiscuously on that board has any advantage over my method of arranging them. When sorting my honey in the fall I place the unfinished sections back in the super on the section-holders with wedged felloes, and all separators removed. The sections with no sealed honey are speedily cleaned out, and then these are removed, leaving the others far enough apart for easy manipulation. Whether a firmer chisel is better than the uncapping knife, each one must decide for himself. I prefer a clean smooth cut to any mangling performance. I smiled, not quite audibly, when Mr. Baldwin cited as evidence of the superiority of his method, the fact that he has 400 or 500 sections ready for use next spring. I have more than 1000 sections ready for use next season; in fact, about 50 or 60 twenty-four section supers full.

I have no quarrel with Mr. Baldwin about his method of getting his half-filled sections

**Muth's Special the Best**

A complete line of LEWIS' MATCHLESS SUPPLIES at their factory prices.

Regulation dovetail with 7/8 Warp-Proof Cover and Bottom. Costs more, but sold at same price as regular.

See special inducements in our 1903 Catalog.

cleaned out, and write simply to show that my method is practical.

Summing up the matter under discussion, this is about the size of the difference between Mr. Baldwin's method and my own: He would use a thin board, with a small hole in one end of it, between the brood-chamber and super, in order to prevent a too free circulation of air through the brood-chamber. This, I believe, to be unnecessary with colonies of reasonable strength. If not of reasonable strength, I would make them so.

I use a piece of burlap because it allows the heat of the cluster to ascend into the super, and work can go on there at all times, except when the temperature is so low, from circulation of the bees to cluster on the brood-combs. With a tight-fitting cover on the super, there is no circulation of air that will do a fair-sized colony any harm.

My aim is to have the work done as early in the fall as possible. EDWIN BEVINS.  
Decatur Co., Iowa, Feb. 27.

**Season of 1902—Big Queens, Etc.**

Last season was the most honeyless I have known in 55 years of bee-keeping. Rain, rain was the order of the day the whole season. The result was no surplus to speak of, and colonies light in winter stores.

I am not going to say we expect a big crop in 1903, for I have learned by experience that a few big thunder-storms can knock the poetry out of the brightest prospects of a honey crop in double quick.

While writing for the "Old Reliable" I was to propose three cheers for Dr. Gallup and Baron Lieawful. Oh, now, Mr. Editor, I feel so kind of good and happy over the discovery of great minds. Just think of it, the Doctor has discovered a law in the bee-world that like the laws of the Medes and Persians chaeght not, and that law is, the larger the hive the larger the queen reared therein; the larger the queen the larger the colony; the larger the colony the larger the crop of honey! Now, let us all strike in on that line and see how soon we can get a queen as large as a yearling heifer! What boots it though we have to build hives like our barn, 30x40 feet.

And then think of the Baron's wonderful discovery, wrought out with such scientific research and mathematical exactness as to seconds of time, and the astonishing results achieved. "O! brethren, the world do move." Let the Doctor give us the big queen, and the Baron the great longevity and fertility, and some other man start a blacksmith shop to keep the queens shod and to splice their antennae occasionally, and we can set up for bee-keeping!

Some of the older bee-keepers may remember I spoke a few years ago, through the American Bee Journal, of starting in haste for London, England, to secure one of those wonderful queens that were called "Punic bees." I am glad I didn't go. We've got something better.

In conclusion, allow me to say to any queen breeder who wishes to try the "Biblical cord," I will mail 20 or 30 free of charge by enclosing stamp to pay postage.  
W. J. DAVIS, 1st.  
Warren Co., Pa., March 5.

**Cloth Over Frames—Giving Bees a Flight.**

Last season was a very poor one for bees in this locality. It was so wet and cold up to July 15, and then we had some fair honey weather. We got 25 or 30 pounds of surplus honey per colony, and the bees gathered plenty to winter on in the cellar. My bees are wintering finely so far; the thermometer has been down to zero for the past week, 4 degrees was the coldest here.

The coming season ought to be good for bees here, as the white clover made good growth the past season.

I notice some of the bee-keepers advocate the use of cloth over the top of frames; they are probably all right in a dry season. In such a wet season as we had here I do not think they amount to much. I had them on my colonies until the wet weather came, when I pulled them off and put on a 1/2-inch board

**Tennessee Queens.**

Send for circular.

Daughters of Select Imported Italian, Select long-tongued (Moore's), and Select Straight 5-band Queens. Bred 3/4 miles apart, and mated to select drones. No bees owned within 2 1/2 miles; none impure within 3, and but few within 5 miles. No disease. 30 years' experience. WARRANTED QUEENS, \$15 cents each; TESTED, \$1.50 each. Discount on large orders. Contracts with dealers a specialty. Discount after July 1st

2,418, 2,419, 2,420, 2,421, 2,422, 2,423, 2,424, 2,425, 2,426, 2,427, 2,428, 2,429, 2,430, 2,431, 2,432, 2,433, 2,434, 2,435, 2,436, 2,437, 2,438, 2,439, 2,440, 2,441, 2,442, 2,443, 2,444, 2,445, 2,446, 2,447, 2,448, 2,449, 2,450, 2,451, 2,452, 2,453, 2,454, 2,455, 2,456, 2,457, 2,458, 2,459, 2,460, 2,461, 2,462,

in; slip the cover just far enough from our corner to pour a teaspoonful of bisulphide of carbon. Close the cover, and that colony is "cured" to a certainty. But you must take the contents of the hive and move it away, and you must do this when no bees are flying. If you have spilled no honey about, the hive is safe to use again.

It is not so much trouble to cure a colony of foul brood, but to keep from spreading the disease is what you must look out for. If you have a lot of weakened colonies with this disease, never undertake to move the hives close together to strengthen so you can cure them. Just as surely you will spread the disease. It is better to treat all diseased colonies at nearly the same time as possible.

Now, Mr. Garrett, I have given you a plan by which you can cure your bees of foul brood, but you must do your work carefully, and during a flow of honey, and my advice to you is to let the other fellow treat said disease with medicine. I have found that bees do not need much medicine in Texas.

Now if you get what you want out of this, I will try again, if you ask. LON ROSSON.  
Ellics Co., Texas, March 7.

CONVENTION NOTICE.

Missouri.—Bee-keepers of Missouri will meet in convention at Moberly, in the Commercial Club Rooms, at 2 o'clock p.m., on April 22, 1903, to organize a Missouri State Bee-Keepers' Association. We expect to complete our organization on that day and have some bee-talks the day following. Every body is invited who is interested in bees and honey. Let us have a good turn-out and a good time. Good hotel accommodations can be had at \$1.00 and \$3.00 a day. The Moberly Printing Company will tell you where the Commercial Club rooms are located. W. T. CARY, Acting Secretary.  
Wakenda, Mo.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

GEORGE W. YORK & CO.  
144 & 146 Erie Street, CHICAGO, ILL

Originators of 30-Day Plan.—In another part of this issue we are printing the advertisement of the Kalamazoo Carriage and Harness Mfg. Co. of Kalamazoo, Mich. These are the originators of the Free Trial Plan of sending vehicles any where with the privilege of 30 days' examination and trial, the purchaser being perfectly satisfied once he accepts the vehicle. This plan was unique in its conception, and a good many dealers thought it was impractical, but the quality of the goods that the Kalamazoo Carriage & Harness Mfg. Co. turn out, justifies them in making this very liberal offer, as they manufacture a fine grade of vehicles. Their business has increased very much in the past few years, and they are interested in getting really a first-class job at the lowest prices possible write to them for their Free Catalog, which is now ready for distribution. Their address: The Kalamazoo Carriage and Harness Mfg. Co., No 161 Ransome St., Kalamazoo, Mich. Please mention the American Bee Journal when writing them.

\$5 TO START YOU IN BUSINESS. We will start you with the first \$5 you take in to start you in a good paying business. Send 10 cents for full line of samples and directions how to begin.

BEE-BOOKS

SENT POSTPAID BY

GEORGE W. YORK & CO.,

144 & 146 E. Erie St., CHICAGO, ILL

Forty Years Among the Bees, by Dr. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

Bee-Keeper's Guide, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only one of the most helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 54 pages. 25 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

ABC of Bee-Culture, by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 190 pages. Price, in cloth, 75 cents; in paper, 50 cents.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and enterprising writer. You should read his book; 190 pages; bound in paper, and illustrated. Price, 50 cents.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, March 24.—The trade is of small volume with little change in prices of any of the grades. Choice white comb sells at 150¢/160¢ with ambers and other off grades slow at 20¢/25¢ less. Extracted, 70¢/80¢ for white, according to kind and flavor; dark grades, 55¢/65¢. Beeswax, 30¢. R. A. BURNETT & Co.

ALBANY, N. Y., Mar. 14.—Honey demand quiet; receipts and stock light. Comb selling, light, 15¢; mixed, 14¢/15¢; dark, 13¢/14¢. Extracted, dark, at 70¢/75¢. H. R. WRIGHT.

KANSAS CITY, Apr. 2.—Our market is almost bare of comb honey; the demand is good. We quote you as follows: Fancy white comb, 24 sections, \$3.50; No. 1, white, \$3.40; No. 2, white and amber, \$3.25; No. 3, extracted, white, 60¢; amber, 55¢/60¢. Beeswax, No. 1, per pound, 25¢; No. 2, 20¢; No. 3, 15¢. C. C. CLEMONS & Co.

CINCINNATI, March 11.—The demand for extracted honey is good at the following prices: Amber, barrels, 55¢/65¢, according to quality; white clover, 80¢/90¢. Fancy comb honey, 15¢/16¢. Beeswax strong at 30¢. THE FRED W. MUTH CO.

NEW YORK, March 5.—There is a fair demand for white comb at 15¢ per pound for fancy, 13¢/14¢ for No. 1, and 12¢ for amber, with sufficient supply to meet the demand. Dark honey will be cleaned up with very little left; it is selling at about 11¢ per pound. Extracted rather weak and in quantity lots, prices generally shabby. We quote: Amber in 1/2 cwt. cases, 60¢/70¢; dark, 60¢. Beeswax scarce at 30¢/31¢ for good average. HILDBRETT & SORLEKEN.

CINCINNATI, Mar. 7.—The comb honey market has weakened a little more; is freely offered at following prices: Fancy white, 14¢/15¢; no demand for ambers whatever. The market for white clover has not been changed, and prices are as follows: Amber in barrels, 55¢/65¢; in cases, 60¢/65¢; white clover, 80¢/85¢. Beeswax, 28¢/30¢. C. H. W. WEBBER.

SAN FRANCISCO, Mar. 11.—White-comb honey, 12 1/2¢/13¢/14¢; amber, 9¢/11¢; dark, 7¢/8¢. Extracted, white, 60¢/70¢; light amber, 55¢/60¢; amber, 50¢/55¢. Beeswax, good to choice, light 27¢/28¢; dark, 25¢/26¢.

Demand is fair on local account for water-white, uncandied, but there is not much of this sort obtainable. Market for same is firm at ruling rates. Candied stock and common qualities are going at somewhat irregular and rather easy figures, holders as a rule being desirous of effecting an early clean-up.

WANTED WHITE CLOVER EXTRACTED HONEY!

Send sample and best price delivered here; also Fancy Comb, wanted in moderate cases. Address: THE FRED W. MUTH CO. 324 1/2 Front and Walnut, CINCINNATI, OHIO. Please mention Bee Journal when writing.

Please mention Bee Journal when writing.

# Special Notices.

## Beeswax Market.

We are paying, till further notice, 30 cents cash, or 32 in trade, for average; one cent extra for choice yellow wax.

## Three Carloads of Honey-Jars.

We have orders with two factories for 3 carloads of honey-jars to be delivered soon. One car of No. 25 jars and Mason jars goes to our branch in Mechanic Falls, Maine, while another car is coming here. The third car is of square jars also—Tip-top jars. We are getting in position to take care of orders for honey-jars promptly, and at the best available price.

## Shipping at this Date.

The orders continue to roll in in good volume, so that we are still 15 cars behind on orders for car-loads. Smaller orders are shipped with reasonable promptness within 2 or 3 days after being received. The railroads continue to annoy by delay to shipments in transit. The consequence of such delays in bee-keepers' supplies are not quite so serious now as they will be later on; and it is of the highest importance that you anticipate your wants as far in advance as possible, so as not to be without the goods when the time comes that you are ready to use them. Two percent off for cash with order this month.

## Second-hand Foundation-Mills.

We still have on hand a good assortment of second-hand foundation-mills, which we list as follows. Any one desiring samples from these mills, or further particulars, we shall be pleased to supply on application.

- No. 014, 2x6, hex. cell, extra-thin super. Price, \$8
- No. 037, 2x6, hex. cell, extra-thin super, good. Price, 10.
- No. 2132, 2x6, hex. cell, thin super. Price, \$10.
- No. 2227, 2x6, hex. cell, thin super. Price, \$10.
- No. 059, 2x12, round cell, medium. Price, \$12.
- No. 044, 2x10, Pelham, nearly new. Price, \$6.
- No. 034, 2 1/2 x 12 1/2, round cell, very old style, in fair condition. Price, \$10.
- No. 051, 2x10, round cell, medium brood. Price, \$10

## The New Super Springs for 1903.

We have up until lately been using wire springs to produce the necessary compression in comb-honey supers. These were secured to

the inside of the super side. There came to be a general demand for a REMOVABLE spring, and we accordingly made some samples made of wire; but owing to the difficulties of manufacture, and the further fact that the tension of the wire varied considerably, we finally decided on flat steel springs. This spring is very similar to if not identical with the super-spring first used by Capt. J. E. Hetherington, of Cherry Valley, N. Y., some 30 years ago, and which, we understand, he has been using ever since. While this form of spring is a little more expensive for the material used, it is easier to make. The Root Co. is now turning out these springs by the thousand. All the 1903 supers put out by us from this date on will have these springs; and we anticipate they will be well received by the general bee-keeping public. Capt. Hetherington, who for many years enjoyed the reputation of being the most extensive bee-keeper in the world, is not apt to adopt an impracticable device; and the fact that he pronounced the principle good is pretty good evidence that the fraternity at large can safely adopt it. There are those who prefer a spring fast to the super instead of loose. By putting the spring in position, and giving a staple over one end, these may be securely fastened. A staple similar to the No. 11 double-pointed tack but a little wider is needed. We will have them soon at 20 cents per pound.

## A Nail-Puller for a Quarter.

On receiving a shipment of hives or other goods, how often have you felt the need of a good nail-puller with which to open the boxes without breaking or splitting them? Such nail-pullers as were effective have been beyond the reach of most people who have a box to open only occasionally. Here is something that works on the same principle as the best nail-puller, and yet is within the reach of every one. It will be worth all it costs in opening up one shipment of hives. It is nickel-plated, weighs only 3 ounces, and may be carried in the pocket, yet it is strong enough to draw nails up to 2 inches. The jaws are bedded over the head of the nail; then with the hammer attached, the nail is easily drawn. The bees may be got off from some cement-coated nails, and then, of course, you can not get a hold on them. Usually the grip is such as to hold the nail under the head, so it is not likely to be carried off. Price, only 25 cents each; by mail, 30 cents. A heavier size is made that will take 2 1/2-inch nails. Price, 35 cents; by mail, 40.

## IMPORTANT NOTICES.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec30" on your label shows that it is paid to the end of December, 1903.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

Advertising Rates will be given upon application.

## Weekly Budget.

GEO. W. BRODBECK, of Los Angeles Co., Calif., President of the California National Honey-Producers' Association, wrote us on March 27:

"The season here in California, until of late, has again been in doubt, but recent rains make it more promising, so that we now feel confident of a crop. A large yield, though, will require more and better rains; but of this we feel more hopeful, and I am extremely anxious that this shall prove a bounteous year."

DR. MILLER'S NEW BEE-BOOK is receiving very flattering comments from the editors of the other bee-papers. Mr. Ernest R. Root, of Gleanings in Bee-Culture, gives this ray write-up about it:

### "FORTY YEARS AMONG THE BEES."

In our last issue I promised to tell you more about this new and interesting book by Dr. C. C. Miller. I have read page after page of it [Dr. Miller's new book], and the more I read the more I am convinced that it is one of the most practical books that was ever written. There are 101—yes, 100!—little tricks, little tricks of the trade, little ideas, and big ones, too, which, while they may be old to some of the veterans, I am of the opinion will prove to be new and useful to the majority of them. The Doctor has crowded into these 328 pages his ripest experience; and not only that, he has drawn from the ideas of others so that we have the very latest and best in the way of practical information from one who has actually spent "forty years among the bees."

In our previous issue I spoke of the fact that the writers of text-books, and editors of

papers, often assume too much knowledge on the part of the one they are supposed to instruct. Our author, while he is not writing for beginners, does not assume anything of the sort. He describes just what he does in the bee-yard, and how he does it. Even in the simple matter of catching a queen, he goes into full details, illustrating by photograph each step in the operation. And that reminds me that, some four or five years ago, I told the Doctor he ought to get one of those little pocket kodaks; that one who wrote as much as he did ought to be able once in a while to give a picture of the *modus operandi*. The next thing I knew he had bought him a little camera, and was snapping it on every thing right and left. Why, you just ought to see how he illustrates in his book his various manipulations, with that handy little instrument. Take, for example, his method of getting bees off the combs, as shown in Fig. 26, page 83. Without the book itself I can not describe to you exactly the vigorous shake or "shook" he gives a comb; but with his left hand he holds and bars combs, and with his right hand, or fist, rather, he comes down on the back of his left hand, holding the frame, with a quick, sharp blow. Why, you can actually see Dr. Miller's chubby fist knocking every bee clean off. Did you ever try to shake a comb with two hands, giving it the most vigorous kind of "shook," but it would not "shook" at all the bees off, unless they were black ones? Well, take Dr. Miller's plan, and, presto! every bee will drop *instanter*. In Fig. 28 he shows the art of sweeping bees off the comb; in Fig. 31 how he stays up his foundation with wooden splints, and a good plan it is, too.

Again, we get a glimpse of the Doctor holding his Miller feeder, just as if he were describing its merits before a convention. Another view that is most interesting is the drive leading up to the Miller mansion. On one side of the road is a row of beautiful lindens, making the view from a purely artistic point very attractive. Fig. 29 shows the sealed brood of laying workers; and it is the best representation in printers' ink of such brood I have ever seen. Fig. 60 is a remarkable view of a section filled with foundation—one large top starter and one narrow bottom starter.

In Fig. 61 we see the Doctor in his light summer clothing, trimming foundation up for sections. Yes, we can almost see the sweat rolling down his good-natured face. In Fig. 83 we are forcibly reminded of the fact that the Doctor believes in cool dress for summer work among the bees. One thickness of clothing, bee-veil, and hat, shoes and stockings, complete his regalia, and he looks very neat and comfortable standing up among his favorite rose-bushes. In Fig. 84, again, we see Miss Wilson, his sister-in-law, in her very neat bee-suit. Well, I might go on and describe each of the 112 pictures that are so interesting and also instructive.

Yes, the book is full of good things—packed full of them, and I question very much whether any progressive bee-keeper, beginner or veteran, can afford not to read this book clear through. You may say you have read the Doctor's writings for years. Granted. But you will find that there are many things that he describes in his book that he has never put on the pages of a bee-journal—not because he was not willing to impart what he knew; but because, when he sat down to write a book, one thing after another suggested itself until he unfolded a new story that is as good as a story, and far more profitable.

Editor W. Z. Hutchinson, of the Bee-Keepers' Review, had this to offer after having "dipped into it here and there."

### "FORTY YEARS AMONG THE BEES."

A few years ago Dr. C. C. Miller wrote a readable and instructive book called "A Year Among the Bees." In the preface he gave advice for conducting the affairs of the apiary from the beginning to the end of the year, hence the name. The demand was such that the book was soon out of print, and I have often wondered why the good Doctor did not get out a new edition. I have always attributed this to a lack of time on the Doctor's

part, as he once told me that, years ago, he had looked forward to the time when he might have a little leisure, but, later, he had given up all such hopes. It seems, however, that he has been using his time of late in writing an entirely new book, with a title that sounds very much like the old one, but it means forty times as much, as this "Forty Years Among the Bees." In it the author goes briefly but so wisely, over his forty years of bee-keeping, for he has really kept bees for forty years. Not only this, but he gives us a delightfully written biographical sketch of his boyhood in Pennsylvania, his heroic struggles in securing an education, in which he boarded himself, cutting his weekly expense for board only, to only 35 cents a week, which so affected his health that he has never fully recovered from it. I found this account of his early life so interesting that I read it aloud to the whole family. Most vividly did it recall my own boyhood's days, in which I roamed the forest as free as the wild things in whose lives I became so interested.

Another very interesting feature of the book is the large number of kodak pictures with which its pages are embellished. The Doctor has surely learned how to "push the button," or have some one do it for him, with considerable proficiency.

I have not yet said one word about what is probably the most important part of the work, that is, the main body that gives the solid instructions regarding actual work in the apiary. There are two reasons for this: One is the lack of room in this issue to do the subject justice, and the other is that I have not read it. I have done this, however; I have dipped into it here and there, just enough so that I feel warranted in saying that it is the master-piece of the author's forty years among the bees. I shall read it, however, every word, and future issues will contain frequent comments upon what I have read in "Forty Years Among the Bees."

The postpaid price of Dr. Miller's book is \$1.00; or with the American Bee Journal free year—both for only \$1.75; or we give it free as a premium to any one who is now a regular paid-in-advance subscriber to the Bee Journal, and who sends two new subscribers to the Bee Journal for a year with \$2.00 to pay for same.

MR. L. C. MEDKIFF'S APIARY is shown on the preceding page. He wrote thus, when sending the picture:

I send a picture of my apiary taken in the fall just before taking off the upper hive-stories. I had a fair crop of clover honey, but one of the poorest fall crops I ever knew or heard of for this locality. We had lots of flowers, but it rained so much and was so cool that the bees gathered very little. I had to feed about half of my colonies, of which I have 51.

The hive that I am standing by, with a smoker resting on it, contains one of my favorite colonies, and is one of superior stock.

L. C. MEDKIFF.

STENO—the man on the fence who is noted for his "Pickings from Our Neighbors' Fields" in Gleanings—had the following appreciated paragraph about this journal in his department recently:

"Although I have not had much to say about the 'Old Reliable' lately, it is not because it does not deserve it. Mr. York is not relaxing any of his efforts to make his journal indispensable to every bee-keeper. The high moral tone of the journal is very commendable. Mr. Hasty is always at his best here."

MR. THOS. WM. COWAN expected to start from California about Easter for Boston, thence to Europe, and possibly Africa, to be gone a year. Mr. Cowan is a great traveler when once he gets started.

not get the swarming-fever; and, as I put two upper stories on each of the strong colonies at this visit, there is no swarming except in cases of supersedure of queens during the honey season. This does away with all watching for swarms.

As I want my clover honey separate from the basswood, I make a third trip the first of July, and extract what clover there is, putting back the upper stories to catch the last end of the clover and basswood flow.

What clover and basswood there is I extract about Aug. 1; and, as there is no fall flow at this yard, this ends the season.

If it were not for keeping the clover separate, it would not be necessary to make more than three visits a year.

I have an assistant living about one-half mile from this yard, and he looks over the colonies, and adds upper stories where needed, visiting the yard twice during the honey-flow—once about June 24 and again July 12. He also helps me extract and pack the bees for winter—in all, about eight or ten days' work. This yard is one-third mile from any house, and there is no one there to watch and hive swarms when I am away.

Now, for results: The crop of 1901 was 10,500 pounds, and, last year, it was 4,500 pounds, making 15,000 total for two years. This was sold at wholesale at 7½ to 9 cents per pound, at an average of about 8 cents, making \$1,200, or \$150 each for the eight trips.

## Convention Proceedings.

### Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 229.)

Mr. N. E. France, Inspector of Apiaries for the State of Wisconsin, talked on foul brood during practically the whole of the evening session, as follows:

#### FOUL BROOD—ITS CAUSE AND CURE.

There are many parts of this subject, and so many and varied are the interests that I hardly know on what part of it to touch. I had outlined quite a paper, thinking that it might go to the press, and through the published report of this meeting do considerable good. The headings had been finished, and I had started to typewrite out a full report, when some one—some of my comrad bee-keepers who had been in the northern counties hunting—sent down some deer heads without so much as asking me if I were at home, or would do the work for them, with instructions to "Mount this head for my house and send it back;" other heads kept coming in until I had dozens on my hands, so my prepared paper had to wait—the deer heads (fresh meat) could not wait, but needed immediate preparation.

I have been unable anywhere to procure an artist capable of making a drawing looking down into the depth of the brood-comb as the naked eye sees it. I went to three of our State Normal Schools in our State; gave the artists samples of comb, explained to them what I wanted, and they said, "Yes, we can see it." "Now," I said, "I am not asking the price, but can you make a drawing of this?" They said, "I will try it;" and after a time they would send me back the comb, saying, "I can not get the depth as the naked eye can see it." Consequently, if I can explain it so that you can understand it, it is the best I can do.

First, What is foul brood, and what does it look like? It is a germ disease. Now, in going over our State at Farmers' Institutes for the last six years, I have been surprised to find old bee-keepers who were well versed upon bee-keeping, and by so-called bad luck nearly run out of the bee-business, not knowing that foul brood was underlying all their trouble, and they didn't know what the disease was, and as I heard a remark made since I have been here, that one of the strong indications to detect it would be by the odor or smell. I will confess that so far as my study has gone, and from samples obtained from various States, as well as from all over my own, I find many, many yards where, in the same apiary, one colony is affected and the next is not; another is affected and the next one to it is not; one has a strong odor of foul brood, and the other little

or none, according to the condition of that hive. Now, why that is I can not say. We may have foul brood in our yard and not detect it by any odor. If we had a room where we could have the sunlight from the morning sun shining in I would ask nothing better than that each one would individually take a piece of comb containing foul brood and see the different stages of it for yourself. There is nothing like seeing to impress it upon one's mind. If those who have not seen it—and I will confess that the samples I have can not be seen well in this light—I question if you can get any satisfaction out of it, but I will try to explain some of the stages of the disease.

This disease, as I find it largely in the Northern States, especially Illinois, Minnesota, Wisconsin and Iowa, and on to the west, seems to affect the bee when it is along from four to nine days of age; sometimes it will be later. As we go farther south into the Southern States, it seems to affect it at an earlier day, along from two to three up to six days of age, making its first appearance.

Those first symptoms to the naked eye perhaps would not be noticed. I had to shade it here to show that it lies down curled up; right there is where it gets its first fatal blow; it is in the food. Foul brood becomes contagious to that larval bee just when it is fed the disease, and not before, and never until then. For instance, this cell [referring to drawing] is diseased and that is not, simply because this has been fed the disease and that not.

The first indications are that this larval bee becomes restless, and instead of lying down in a flat, curled-up condition, it becomes standing on the point end, with the larger portion of the larva uppermost, and a little brownish streak begins to show. The naked eye, perhaps, would not notice it at that stage; but instead of that growing (these are not true drawings)—all of us have seen the natural healthy brood—this bee, lacking the vigor of a healthy bee, the germs of disease preying upon it, it becomes weakened and falls flat upon the lower side-wall of that cell instead of standing apparently out from the walls of the cell.

Right at that stage the gases begin to accumulate internally in that larva, and it becomes somewhat of a gelatine or glibby nature, and the moment that larval bee strikes the lower side-wall of the cell (represented as if the comb were turned, looking straight down from this—this would be the lower side-wall of the cell in its natural condition), wherever that strikes it will never let go; wherever pickled brood, chilled brood, starved brood, may strike against the lower side of the wall, or upper, it is sure to stay, and it is lost.

You can take a pair of tweezers and go down in here and take that out, but if it is foul brood, and it once strikes the side-wall, it is there for all time, and I know of no medical treatment that will ever cure that germ of disease once there. Instead of maturing and hatching, the cells become sunken instead of being capped over; they begin to be irregular, the gasses accumulating, drawing down apparently until it will break the capping sometimes in the center, but more frequently to one side of the center, the weaker part giving away, and have ragged holes in the cappings. Quite often that is the first stage that the naked eye would see.

Now, at that stage it has become dead matter; when it is in the ropy stage it is brown and stringy and ropy in its nature. The head of the bee will become dried faster than the rest. As I have tried to illustrate, here on the lower side-wall the head end of the bee turns up; back of that, as this spreads out in the cell, just as it is getting ropy, there apparently is a little back-bone with ribbing showing, then the odor is worse; it is then at the ropy stage; it may stay in that condition from three or four days to three weeks, according to the condition of the weather; such weather as we are having lately it would remain in one unchanged condition the entire time. It will continue to dry down on the lower side-wall of the cell until we have just a little thin scale; sometimes it is as thick as the side-wall of the cell; quite often it is not even so thick, but invariably this one thing prevails—the head of that bee will become dried before the rest and curl up, and frequently that little bunch right at the top, and no one need ever mistake that for anything else. In the comb here in the window, that was the first indication that I looked for—this dried-down scale with that curled-up appearance.

If there are any questions on that part of it, perhaps we had better hear them before going further.

Mr. Meredith—I would like to ask a question in regard to ropiness. If it would be extended out by a toothpick, would it represent half or three-quarters of an inch?

Mr. France—That would depend upon the season. Just

at this stage, when there apparently is back-bone and ribbing showing, and it is nearly flat across the cell, it is most rosy, and that is about the stage when the cappings are sunken in; then a toothpick would draw it out probably nearly the length of the cell before letting go; but now, at this time of the year it has become thickened by the coolness of the atmosphere, and would not draw it so far; it would be thicker.

Dr. Miller—Did I understand that that curled-up head is always present? Will you always recognize that?

Mr. France—I have never known it to fail as yet; both from samples from our own State and from nearly all of the States where I know of the disease. I have tried to compare it from different localities, and never knew it to fail. I find that in comparing that of the different localities with that of my own State, it varies little.

Dr. Miller—Will you tell us whose writing you ever saw that mentioned that feature of a turned-up head?

Mr. France—I think Dr. Miller, for one.

Dr. Miller—No, I think not; I think I never saw nor heard of it before.

Mr. France—That is the one thing. And one thing further: I have so often taken the comb out of the hive like this one I find in the window, and invariably when I go to a bee-keeper and examine the yard, if one colony seems to be stronger than another I pass that and go to the weaker one. In the weaker colonies I will find any disease if it is in the yard anywhere. I carefully open them, and if it is very bad undoubtedly I get an odor. If we look into a comb in that direction, straight in [indicating], that comb looks fairly clean, but if you want to see it, turn the top towards you, so that your eyes strike the lower side-wall; then a little from the front end you will see that dried, hard, curled-up larva in there; and in this one, while they are hardly as thick in depth as the side-walls are, they are considerably aged.

How many of you can be here to-morrow before half past nine? I want you to know every stage of this foul brood while we are here, because I have the samples, and I would hate to commit myself on examination of the comb by lamplight, although I did go to a yard the first of July after nine o'clock at night to inspect it, because it was demanded of me. I had gone through two apiaries, finding several colonies diseased. I had an appointment at a considerable distance, over 100 miles from there the next day. It would not do to skip neighbor Smith's place, so I called at his house about nine o'clock; we had only a lamp. I asked for the weakest colonies in the yard. I opened the weakest one, and said: "Mr. Smith, shut up the hive instantly; this comb must go to the house." They had one of these glass reflectors on the lamp; it hung on the side of the wall. We looked the comb over; it was similar to this one; the first thing I noticed was the sunken cappings; run a match or toothpick in there and draw it out, and you could see that brown, rosy stage; then where the ribs were we had a knife and cut away the upper portion of the rib on the lower side-wall, and we could see those black, dried-down scales. "Well," he says, "What will I do?" "Treat your bees, and do it to-morrow." I told him what to do, and he said he would do it. I was back there just 23 days from that time, reviewing that section of country; the basswood was in bloom; each of the hives had eight full sheets of foundation drawn out, brood well on towards maturity, and 48 full sections ready on each of his hives. It shows what can be done if it is done at the right season; if done during the basswood season it doesn't seem to set them back much.

Dr. Miller—To help us to understand that same point, will you refer to the picture and tell us about that lower part; is that meant to be an outside or bottom cell?

Mr. France—This is supposed to represent, as if I had cut away the upper side, showing just the lower, here being the lower, and this the extreme bottom of the wall [indicating].

Dr. Miller—The upper part, as it stands there, is the mouth of the cell?

Mr. France—Yes, sir.

Dr. Miller—So that the mouth of the cell is lower down?

Mr. France—I tried to illustrate it in this form, but can not make a good drawing.

Dr. Miller—The point in it is, is that turned-up head the bottom of the cell or mouth?

Mr. France—Yes, the lower side-wall near the front end, as if this were the cell [indicating]. I can touch it almost the moment I touch the cell.

Question—The septum in that case is away back?

Answer—Yes. (Continued next week.)

## Contributed Articles.

### A Plan for Prevention of Swarming.

BY L. STACHRLHAUSEN.

DR. C. C. MILLER:—I just received from Chicago your pretty book, "Forty Years Among the Bees," and commenced at once to read it and I am delighted with the many practical hints it contains.

It seems to me you are still misunderstanding my plan of preventing swarms—and perhaps a "certain editor" is to blame, who talked of forced and "shook" swarms in combination with my plan. What you say (on pages 173 and 174 of your book) is certainly true for these forced swarms, but not for my plan. You say: "There are thousands of prospective bees in the brood taken away." That is the reason I unite these bees, hatching from the brood taken away, as soon as they are of any value to the main colony. Certainly the young bees do housework, but in the main colony (forced swarm) is at first none or very few brood; as soon as the young bees are employed in the other hive with nursing the brood; as soon as young bees are needed in the main colony they can be given by brushing off some of the combs. That will not cause swarming, as long as there is no surplus of young bees compared with the open brood (Gerstung theory).

Another explanation: I see, page 113, you have observed the advantages of large hives for development in the spring. An 8-frame hive is entirely too small for this purpose, consequently you give two stories as soon as needed; but these two stories are not practical for comb-honey production, so you crowd the bees and 8 brood-combs again into one story, when the honey-flow commences (page 130). You take away 1, 2 or more brood-combs and at some circumstances some bees, too. I think that is weakening the colony considerable, and your colony is now in just such a condition that the swarming-fever is induced, because the queen has not enough empty cells to lay eggs in them.

I, too, use very large hives in the spring. When the honey-flow commences I crowd the bees into a small brood-chamber without brood, and give the supers. Now comes my invention:

By using the Heddon plan to prevent after-swarms, the bees, which hatched from the brood taken away, are united with this colony as soon as they really do field-work, that is, as they fly. Every single bee of the colony, in whatever stage she may be, is used in this colony, as soon as she can be useful, and the egg-laying of the queen is interrupted very little.

You say that with you a colony, which shows no desire to swarm, will give more surplus than one in which swarming is prevented in some way. This is not so in my locality I have no trouble at all with colonies swarming during the honey-flow, but I never could get satisfactory crops of comb honey from an old colony with a brood-chamber as large or larger than a 10-frame hive. Swarms hived just at the beginning of the honey-flow have given me the most surplus honey. But they have the disadvantage, that they are getting weaker every day; but that is easy to overcome. Let the brood hatch in another hive outside of the swarm, and unite with the swarm as soon as they can be useful.

A main advantage of my plan is, that no queen must be hunted up. The whole manipulation does not take much time, and can be done when convenient. I do not think a simpler and better plan could be invented.

I used this plan the first time about five years ago; for two years I have not produced any section-honey, because here bulk-comb honey pays better. Othsrwise I would probably have tried a few variations. For instance, the automatic plan of uniting, as recommended by F. L. Thompson, in the Progressive Bee-keeper, seems worth trying. Another plan proposed by M. R. Kuehne, California, in a letter to me, I will try this year. A colony is shaken on starters and the sections given; on top of them is laid a board with an opening closed by a double wire screen (as the Root's use for getting queens fertilized over full colonies); the brood-combs, with enough bees to protect them, are set in a story over this wire screen. Now these bees in the upper story can rear a queen. I would give them a ripe queen-cell, and as soon as this queen is fertilized and lay-

ing, the wire screen is removed and the two queens can fight it out. It is probable that the young queen will kill the old one. If the colony in the upper story should get too strong, some of the bees can be brushed from the combs in front of the lower hive at any time.

If you prefer not to manipulate the colonies except they have queen-cells, you can wait till the first cell is capped, but then it is time to manipulate the colony. I thought it too much work to examine so many colonies every 10 days.

I hope that you will think better now about this plan.

Bexar Co., Texas.

[Accompanying the foregoing was this from Dr. Miller, to whom Mr. Stachelhausen wrote the above:—EDITOR.]

MR. EDITOR:—One always runs some risk of misrepresenting when trying to describe something with which one is not entirely familiar, and so, when trying to tell what my good friend, L. Stachelhausen, is in the habit of doing, it is not so very strange that I did not speak entirely "by the book." His letter of correction, although not intended for publication, is so full of interest to bee-keepers in general, that I take pleasure in sending it to you that it may have a larger reading.

C. C. MILLER.

## An Overdose of Feeding—Use of Drones.

BY C. P. DADANT.

**A**FTER writing the article about feeding bees in the spring, which appeared on page 149, I showed it to a friend, who read it with interest, and said to me: "Good. I'll follow these instructions myself. It is an excellent system."

A few days later my friend came to me with a complaint. The feeding had not turned out satisfactorily, and his bees were in an uproar. So we went to his apiary and I soon discovered that one of the colonies which had been fed was being robbed. We carried it away, and as the weather cooled off suddenly, we were soon able to open it and discover its condition. It was a very weak colony, covering only two comb-spaces, and the can-feeder which he had used had been placed over a comb two rows away from the cluster. A little honey had dripped to the floor, and as the hive was slanting considerably forward, the honey had run out of the entrance. The robber-bees had found this and had begun pillaging this hive. There was but little to do, the colony being so weak.

This is in line with some remarks that I have made previously. The beginner cannot be too careful how he feeds. Good, average or strong colonies, when fed, take possession of the food at once. They store it in their cells, and although it creates an excitement among them, this soon subsides, especially if the feed is given at night right over or close to the cluster. Whether a can feeder is used, or a frame feeder, or a trough over the bees, or a simple dish in the cap, the warning must be the same.

Feed your bees where they can get at it immediately even if the weather is cool. Do not feed a queenless colony, or a colony that is too weak to rear brood. If a colony is weak but sufficiently strong to rear brood, it may be fed very successfully and helped along, if the feed is given it properly in the right amount and in the right place. The smaller the cluster, the less the amount of feed to be given at one time. Do not use an entrance feeder, as you will have to close that colony to make sure that the bees of a stronger will not help themselves at the same time and overpower them. If you keep it closed you are apt to forget it, or to open it too early or too late.

Let your feeding be done so the bees may get the nourishment in the warm part of the cluster. To feed the weak colony near the entrance or in too large a quantity is equivalent to feeding your newly hatched chicks in the same yard with the grown-up fowls. They will get next to nothing. It is even a worse practice with the bees than with the fowls, because the little chickens are fed from day to day, and you do not expect them to store away any of the feed except in their crops. But your bees are fed for future use, and you must not place them in a position in which the bigger colony may take away from them that which you know they will need for themselves.

All colonies that are worth retaining may be fed safely if the correct amount is given them in the proper place and at the proper time. Evening is always the best time to feed, because the night will give them time to store away out of reach of the neighbors and close to the cluster the supply furnished. They also get over the natural excite-

ment caused by the finding of food. But when all colonies are fed, the strong ones at once begin to send out scouts that lurk about all the unguarded spots and soon find and carry away that which is not sufficiently defended against their depredations.

The Lord & Thomas Advertising Agency have spread over the commercial world a motto which we may well parody. They say, "Advertise judiciously." It is not all to spend money for advertising—that money must be spent "judiciously," or the result will be negative, and you will have cause to blame yourself for your bad luck. So it is with feeding bees, and we may well repeat, when the bees are in need of help, feed your bees *judiciously*.

### USE OR USELESSNESS OF DRONES.

The point made on the use, or rather the uselessness, of drones is well taken (page 195). Those French or German writers, who support the idea of their usefulness because of the warmth they produce are all disciples of the old school. If drones produce heat, it has taken heat to rear them, and the heat and food used in rearing them would have produced worker-bees that are just as able to keep up the warmth of the hive as the drones are. The workers are small, it is true, but they take less room to rear, and consume less honey, and, when they are reared, if they happen to be needed in the field, they can turn out, and do turn out, and put in their time harvesting honey; while a drone is a drone till he is exterminated by the active laborers, after having consumed a goodly portion of the surplus of the colony.

In a state of domesticity we need drones only in a few of the best colonies, and it is a mistake to allow them to be reared in every colony as plentifully as the bees would naturally do it.

Hancock Co., Ill.

## Does Much Egg-Laying Shorten a Queen's Life?

BY DR. E. GALLUP.

**N**OW let us look into the theory that many writers advance, that if a queen lays too much she shortens her life, and will lay herself to death before her time comes, or she will empty her spermatheca and become a drone-layer early in her life.

We will take for an illustration one of the best milking breeds of cows. In order to produce the largest flow of milk, and the richest, all depends upon the amount and quality of her food, good care, etc. Now, do you believe that by extra care, feed, etc., to keep up the greatest possible flow of milk, her life is shortened? If you do, I do not. Neither do I believe the milk extracts from her vitality, but it is manufactured from the food she is fed.

Now, we will come back to the queen. In a normal or naturally large colony, and a good flow of forage, the nurse-bees prepare her food, it is predigested by the nurse-bees, and of the richest kind. They are constantly offering it to her, and during the height of her laying she is constantly accepting it. It is estimated that she lays more than her actual weight in eggs every 24 hours. And are those eggs manufactured by extracting the material from her body, or are they manufactured from the amount of the material or quality that she is fed on? And suppose the flow of forage continues constantly for six months, more or less, according to atmospheric or climatic condition, and we give her abundant room to deposit eggs, and an abundance of bees to keep up the necessary warmth, she can and will keep on egg-laying. What are you going to do about it? That is the question.

Why, if you are afraid she is going to lay herself to death, you can easily stop her laying by withholding her food.

In close observation of my long-lived and prolific queens, none of them diminished their egg-laying perceptibly until they were superseded, and not one of them, so far as I observed, became a drone-layer, as I did not allow drone-comb in their hives, and they were extra-prolific. My experience has been that all such extra-large colonies supersede their queens before I can see any sign of failure. In two cases the queens were superseded in the fall; and both mother and daughter wintered together, and both kept on laying until the following June. I have often wondered if after one impregnation the spermatozoa did not keep on increasing and multiplying in the spermatheca so as to keep up the supply. But, when we consider that the sac may

contain millions of germs in an extra-large queen, as the sac is certainly larger than in one of those small, degenerated queens, it can be accounted for, as we certainly know that there are lots of them that become drone-layers the first or second season, and I never have seen spring dwindling with long-lived queens and long-lived workers.

The first colony of bees I ever purchased was when I was 15 years old. It was in an old-fashioned straw skep, as they were called then. I had bees before, given me by my aunt. I paid \$7.50 for the straw-hive colony—an extra price because it was the old lady's lucky colony. You see I purchased her luck. I was bound to start right.

The hive contained about the same number of cubic feet or inches as a double 10-frame Langstroth hive. That was in Canada, 65 miles north of Vermont. They were kept in an open shed, built on purpose, facing the southwest. Our winters were long and cold, yet that colony wintered perfectly every winter—no dead bees on the bottom-boards. They came out as strong in the spring as they went in in the fall—no dysentery and no spring dwindling; all the comb was worker, except a very small piece of drone-comb in one side of the hive, about the size of my hand.

I always had one or more swarms from that colony, and usually a 20-pound box of honey in a season, and all the queens from that colony were of the large, long-lived variety, and very prolific. Of course, neither Gallup nor Alley ever monkeyed with them in the rearing or introducing of them, so there was nothing unnatural about them.

I saw my first queen from that colony—they were called "kings" in those days. I was taught by my aunt to ring bells, rattle old tin pans, etc., to make them cluster, then spread a white sheet in front of the hive, shake the bees on the sheet and watch them run in, and so I saw my first queen. She looked extra-large to my eyes at that time. How long they had been kept in that hive and reared in that comb I had no means of knowing, but this I do know, the combs became so full of cocoons that the bees became mere dwarfs and ceased to swarm or produce any profit whatever, and finally "went up the spout." Ever since that experience I do not keep old black combs for breeding. Of course, some writers claim that the age of the comb makes no difference in the size of the workers, but they are grandly mistaken. I know better.

Several writers are afraid there will be no limit to the size of the hives or queens, but there is, all the same. I have found that the 2-story Langstroth 10-frame hive is about the safe limit, as to size of hive, or one-story 20-frame hive for experimenting with. Now, the reason I have recommended queens reared in such a hive, and by natural swarming is, that I know that queens thus reared have the umbilical cord attachment, and I am not certain that queens reared by any other method do have that attachment, although we comply with all other requirements, such as abundance of nourishment, warmth, etc. That queens are reared with that attachment is a positive fact. You chaps that deny this, bring to my mind an old story in my life that I must tell now.

I was attending the County Fair at Ripon, Wis., and, of course, as usual, had quite a crowd around me listening to me talking bees, and among the crowd were two old gray-headed gentlemen, who showed by their actions and looks that they did not believe all my "yarns." Finally one of them spoke up and said:

"Look here, young man; I am an old man, have kept bees for years, my father kept bees for years, and my grandfather before us kept bees for years, and none of us ever saw such a bee as you describe; therefore I know there is no such a bee in a hive."

So you can see how easily a person can be mistaken. Because you have not seen the umbilical cord, and no scientist has ever made the discovery, you think your argument is on a solid foundation. Any person can demonstrate this, but not by looking for it on queens improperly reared.

Why is it that so many queens sent out do extra well the first season, but fail entirely the second season?

Orange Co., Calif., Dec. 23, 1902.

**Our Wood Binder** (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Dimensions of a 10-Frame Hive.

What are the inside dimensions of the Langstroth 10-frame hive? We have started with one colony, and would like to make our own hives until we can get enough colonies so that we can get five at a time.

Union Co., S. Dak.

MRS. GEORGE S. EDDY.

ANSWER.—18¼ inches long, 14¼ wide, and 9½ deep.

### Lotion to Whiten the Skin.

A lotion to whiten the skin is made by combining four ounces of extracted honey, one ounce glycerine, one ounce rosewater, three drams citric acid, and six drops of the essence of ambergris. Apply a little to the face and hands two or three times a week, using a linen pad for the purpose.—Chicago Daily News.

### Clarified Honey for Brilliantine.

On page 152, I saw a recipe for brilliantine for the hair, and as I am not sure what is meant by clarified honey, will you please tell me? I shall be grateful, as I have been looking for something of the kind for some time.

Montezuma Co., Colo.

MRS. OLIVE GEORGE.

ANSWER.—The recipe that you mention is not mine, but one copied from the "Health and Beauty" department of the Chicago Daily News. What is meant, I think, is a good quality of extracted honey.

### Overstocking a Locality with Bees.

I notice on page 167, the answer to Mrs. E. K. Hoffman's inquiry as to how to get into bee-keeping, and the statement that if the ground was fully occupied by other bee-keepers it would be trespassing to start another apiary.

I am inclined to the opinion that that is putting it a trifle strong. I would say it would be discourteous, and unkind, and unprofitable in the end. But no worse than to start a grocery store on a street that was fully occupied, which happens quite often.

I kept bees in an alfalfa district last season, and it is my opinion that there is very little danger of overstocking an alfalfa district.

The American Bee Journal is very much appreciated and carefully read by me.

B. F. L.

If there is no danger of overstocking an alfalfa district, then there is no need of any further talk on the subject, but the actual fact is that some of the bee-keepers in the alfalfa districts of Colorado are complaining that already their districts are overstocked.

It does not seem to me that the case of the grocer is a parallel one, although, perhaps, most people who have not given the subject much thought would agree with you.

In the first place, there is this radical difference: If several men occupy the same field with bees, each man will get his share of the pasturage in proportion to the number of colonies he has, while the grocery trade is by no means in proportion to the capital—the hustler may outsell his competitor with double the capital.

Suppose there are five grocers in one place, fully occupying the ground and doing all the business; and a sixth one starts a store. Now, there are three things possible:

1st. Those five grocers already in the field may be able to hold their trade in spite of the interloper, and he may get nothing to do, and be obliged to quit the field.

2d. The new man may be such a hustler that he will entice some of the others, and so get his share, thus reducing the trade of the others.

3d. There may be extra exertion on the part of all, and they may reach out to more distant points in raising the

total business so that although the new man gets a share the old ones will do as much business as ever.

Neither of these three cases will be entirely the same in bee-keeping. The first case is entirely impossible, for the new comer will get his pro rata portion of the nectar in spite of any effort on the part of the others.

Something like the second case may happen, but there is this great difference: The encroaching grocer is at a disadvantage, for the others have the advantage of an established trade, and it is not the placing of his capital there that gets him his trade, while the old established bee-keepers have no advantage, and the new man is sure of his share of the trade (nectar) merely by placing his capital (colonies). The third case is utterly impossible in bee-keeping, for the bees can only forage within a fixed limit.

The case of the stock-raiser would be a more parallel one. If a stock-raiser had a field fully occupied, and another man should come and dump into that field a bunch of cattle to be fed, he would be much like an interloping bee-keeper. But the stock-raiser may have a legal claim to the ground, while the bee-keeper has only the moral claim of priority.

Truth compels me to say that these views are not original, but obtained from one who has given the matter much thought.

### A Beginner's Troubles and Questions.

This is a nice country for bees, and we bought 7 colonies last spring. We had good luck in getting nearly all the swarms, but as we did not know anything about bees we did not take care of them as we should, although we tried our best, and now we are losing our bees, which is quite a loss to us in our circumstances, just commencing in a new country.

The bees did quite well in the summer, considering the cool weather we had. We put 20 colonies away last fall—new colonies—but not knowing about feeding bees, as now we have found out in reading the American Bee Journal, our bees did not have proper attention. As there is no one near that we can find out anything about bees from, I thought perhaps you would be kind enough to answer some questions, and maybe we could save enough of our bees to start with in the spring.

We had intended buying our hives and supplies soon, but it begins to look as though we will not need them. If we lose all our bees we will not be able to start again this year, and it discourages us very much. We intend to build this summer, and would have a good cellar another year for them. I suppose the place we have for them is not proper, but we heard of a bee-keeper in southern Minnesota that had this kind of a place. It is a house double-boarded, tar paper between. It is dark in there; we have the bees tiered one hive upon the other.

We tried to get some Porto Rico sugar, as given in "A B C of Bee-Culture," but we could not get it, so we are using light brown, and 2 colonies have died since we commenced feeding them. They are all short of stores, and others are getting smaller. We also lost 2 colonies that had plenty of honey, so we do not know the reason. We have lost 5 colonies already, and I am afraid, from the way they look now, that we will lose them all. Do you think it would be better to build a shed and leave the south side open so the sun can shine on them?

Would granulated sugar be best to feed them? We followed the directions given in the "A B C of Bee-Culture" for early spring feeding. The bees seem to like it; it forms a syrup, but perhaps that is not best to use.

We think we are through with the coldest weather now, and if we could only save enough bees to start again I should be glad, and would try to learn more about them.

I thought perhaps you would tell us something about what would help us. I don't know where else to get information. We made our hives last summer. Also let me know something about feeding. Would old cloths be all right to put over the brood-nest to keep the bees warm? You know our hives are different from yours. We haven't the quilts in ours.

Could we put some colonies together, as some have died, and there is only a small colony left?

How about the queens if we try to unite?

We have had some warm days this winter, and I thought perhaps we could unite some and feed. We have no honey to feed them.

You will see by my letter we are very ignorant as to how to take care of bees, but I hope we may improve.

Mrs. C. G. CRUICKSHANK.

Crow Wing Co., Minn., Jan. 20.

A repository above ground, closed as yours, is not a good place generally, neither is a shed facing south as you propose, unless the bees are packed on all sides excepting the south. But it will not be best to make any change until there comes a day warm enough for the bees to fly. On a still day with the sun shining they will fly when the thermometer is no higher than 50 degrees. It is now getting along toward spring so close that it is possible that all that will be necessary will be to set them out the first day they can fly and leave them out, but it will be much better to give them some protection, if it be nothing more than to pile corn-stalks about the hives.

I am glad you have a text-book to consult, but I think if you will look again you will find that it advises granulated sugar for feeding. Neither is *spring feeding*, but winter feeding the thing for you. Spring feeding is not to be considered until bees can at least fly every few days. I think your text-book will tell you that you should not feed syrup of any kind in winter, but candy made of granulated sugar. If this is made in frames, or in cakes and laid on top of the frames covered up warmly, you will have done the best thing you can for your bees, so far as can be judged from what you have written.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### METHOD OF STARTING QUEENS IN AN UPPER STORY.

So far as words and names go, Stachelhausen's method of starting queens in an upper story is a sort of a swindle. His upper story is on the bottom-board, and the queen and main colony elsewhere at the time. Practically, however, I guess he has a splendid idea—take the bottom story entirely away for one day, and then bring it back. All protracted monkeying on the part of the keeper, and waste of time on the part of the bees, are thus shut off, and you *know* your cells are being started. Yet the advantages of rearing queens above an excluder are kept, most of them. I did not know the plan of getting the queen fertilized from the upper story was abandoned, and was a little surprised to hear Mr. S. say so.

Interesting to see that Stachelhausen thinks the larvae usually taken for the Doolittle method are not young enough for the very best results—would sooner take them an hour or two before they hatch than to wait many hours after. And so, perhaps, it is a good plan to repeat this sentence of his:

"After trying all the different methods I went back to the Alley strips—and can't help believing that if the artificial cell-cups are preferred it is merely a case of fashion." Page 151.

### HONEY FOR SWEETENING FRUITS.

Mrs. J. L. Strong finds the sweet of honey harmonizes well with most fruits, but that *apples* are an exception. Kind o' seems to me I have had occasion some time to notice that honey and apple-sauce made a bad combination. Unless somebody comes forward to report success in sweetening apples, let that stand for the present as disapproved. Page 152.

### CONSUMPTION OF STORES IN WINTER.

On page 158, H. B. Stumpe's experiment is instructive. A good colony taken out to fly in winter used up eight pounds of food in the one month next succeeding, while the others used only seven pounds in all winter. Presumably this extra eating was caused by extra brood-rearing—and that is undesirable in the cellar. The widely different results of winter flight seem to be explainable on this line. *Sometimes* it has no effect but the good ones of airing and drying both bees and hive, stopping the worrying, and giving the bees a chance to empty their bowels. *Sometimes*, in addition to these good things, a great lot of brood gets started, and soon the bees are in a worse condition than before.

USING THE SMOKER—FEEDING A NATURAL SWARM.

And so with G. B. Williamson's style of fuel and smoker, one smoker full will last half a day if you don't use it much. Some of us use our smokers.

Natural swarming is indeed good practice; but if you set it down that natural swarms never have to be fed you'll get badly left some time. "Left" is the exact word. A hungry swarm hangs together almost winter-cluster style for a good, long spell, and then seizes the first bright, warm hour to leave the ranch. Page 156.

A MODERN ENTHUSIAST—NUMBERING QUEENS.

So many have grown staid and half-way cold that it is delightful to read once a genuine, intelligent enthusiast. This is anent William W. Green and his apiary, pages 161 and 162. His report of the Cyprio-Carniolan cross is worth its place, certainly. How nice it would be if the qualities of a first cross would only stay so, instead of getting "every which way" with succeeding generations!

Having the hive-number belong to the queen and travel around with her is nice—in some respects—not nice to have numbers die, as queens eventually must. And for big apiary and cold heart it wouldn't do at all. The maxim that "figures can not lie" would get all battered up.

A RECORD ON INCREASE.

Sixty-five colonies against his will, and no bees or queen to make them of but one wandering swarm, is quite a record—a record which Mr. Peter Galleo may hold until somebody calls "Sixty-six!" on him. Page 162.

THE DIAMONDS DIDN'T SPARKLE.

But Mr. G. H. Wells couldn't get his bright, red diamonds, with black figures inclosed, to impress their prettiness on us in the picture. Never mind, Mr. W., we know they are pretty—and also impress you with a sort of my-own-ness, which is a good thing to have. Page 161.

THE "VIRGIN" APIARY.

The three modern hives and one old memento of C. W. Virgin constitute the most restful and rural view of the four. The grove looks almost like a natural forest. Nothing says, "Hustle!" nothing says, "Crowding here!" Page 161.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Colony Left the Hive.

I had a swarm of bees come out to-day, or left the hive. I had been feeding more or less for the last two months. There were no young bees in the brood-chamber, or sealed brood. What was the trouble with them? I am a beginner, having kept two or three colonies for the last two years. Iowa.

ANSWER.—Possibly it was a hunger swarm, the bees leaving the hive because they had nothing to eat. Sometimes, however, they leave the hive when there seems no way of accounting for it except pure cussedness.

Using Hives Where Bees Died—Spraying Fruit-Trees.

1. I have lost 9 colonies of bees this winter. Will it do for me to put new swarms in the combs of the hives again, when they swarm this summer?

2. A man living a mile from where I do is going to spray his apple-trees with Paris green this spring. Will my bees bring it home to their hives? NEW HAMPSHIRE.

ANSWERS.—1. Yes, it will be all right.

2. If fruit-trees are abundant, your bees may not go so far. If scarce they will be likely to visit those trees when in bloom, and if he should spray during bloom it would mean death to the bees. But if he is an up-to-date fruit-grower he will spray only before and after bloom. The experiment stations have clearly settled that spraying during bloom is a damage to the fruit crop, and in several States it is against the law to spray during bloom.

Burr and Brace Combs—Telescopic Hive-Covers.

1. I am only a beginner, having 3 colonies in Danzenbaker hives. One has built burr and brace combs until I dread opening the hive. Would there be any danger of chilling the brood if I were to drum them into another story, after settled warm weather is here, putting a queen-excluder in, to keep the queen above?

2. Would full sheets, starters, or old comb be better for their new place? I would prefer to have them build new comb, because the old comb is crooked (taken from a box-hive), and naturally leads them into bad habits of comb-building.

3. I have some telescopic covers. Is it necessary to have more than the thin super-covers if they are used, or is a heavy cover, Koot's E or F, required also? MARYLAND.

ANSWERS.—1. There would be no danger of chilling the brood, and it might work all right and it might not. I knew one case in which the queen staid over the excluder two or three weeks and never laid an egg. Put the queen and the new story under the excluder.

2. Full sheets.

3. With a telescopic cover the thin super-cover is all that is needed.

Transferring—Getting Bees Out of an Old House.

1. Can bees be transferred at this season of the year (March 30)?

2. How can it be done to the best advantage?

3. How does Mississippi rank as a honey-producing State?

4. How can bees be gotten out of the loft of an old house? Can they be driven out with smoke? MISSISSIPPI.

ANSWERS.—1. Yes, any time when it is warm enough. Much transferring is done in time of fruit-bloom, which is much earlier, of course, in Mississippi than in the colder North.

2. I don't know of anything different from the instructions laid down in the books. But it might be better to wait till 21 days after the issuing of a prime swarm.

3. I have no definite knowledge about it.

4. It depends upon position, etc. If where you can readily reach them, smoke enough to quiet them, and then cut out the combs.

Keeping Bees in a House Room.

I have a room in the second story about 10 by 12 feet, with one window. By opening the window about 6 inches, and tacking sheeting over the remainder of the window, could I keep colonies of bees in the room? and would they go to and from the room and be able to locate their own hive on returning? I am living in the city, and want to accommodate 10 colonies that way, if possible. ILLINOIS.

ANSWER.—I'm afraid your plan wouldn't work satisfactorily. Bees cannot see as well as you, and with so little light they would hardly find their hives, especially when cloudy. It might do if you should leave the whole window entirely open, with an awning to keep out rain. Or you could have holes through the wall to each hive.

Cutting Out Drone-Comb—Moldy Drawn Comb.

1. If I go over each colony and cut out the drone-comb, will the bees build worker-comb in the space, if it is done when I put them out?

2. I have several frames of drawn comb that are moldy, and have quite a lot of dead bees in. Will the bees clean them out? and when and how is the best time to have it done? MINNESOTA.

ANSWERS.—1. They will be nearly sure to fill in drone-comb. Fill in the holes with patches of worker-comb.

2. They'll clean 'em up all right. Give them wherever needed, and if you have no immediate use for them do this way: Put them in a hive-body and set under a good colony, so the bees must pass through them in going in and out, and the bees will clean them. Do it any time.

Bees that Allow Robbing.

What can be done with bees that allow themselves to be robbed without making any resistance to the robbers? I have several colonies every spring destroyed in this way. They just work away and pay no attention to the robbers, even right through the fruit-bloom. They do not seem to distinguish the robbers from their own bees, or else do not care. I have tried everything I know, and without avail. The bees are not queenless. PENNSYLVANIA.

ANSWER.—I have never had any experience in this line, and don't know what can be done. But others have reported the same difficulty, and some one may be able to give the remedy; so the question is referred to the constituency.

Transferring Bees—Using Sun Wax-Extractors.

I began the bee-business in August, 1902. I bought over 30 colonies in boxes. I have lost 7 by starving, or at least 5 by starving and 2 by moths. My bees that were able to be robbed last year are all right now; they are gathering in pollen by the wholesale. I tried transferring one colony yesterday morning. I fed them with some others which I am feeding, and then in the evening I drummed them

in a frame hive. They seem to be all right to-day. I thought I would feed them for awhile and let them go. The fruit is just beginning to bloom here, and so I thought I would try that one to see how it worked, and it worked like a charm. I have 7 others to transfer.

1. Do you think it advisable to transfer the balance of them at present (March 22), or wait until April?

2. Do you think the bees will starve after they begin to bring in pollen?

3. Do you think it is a good idea to fill a sun wax-extractor full, or just put in a little comb at a time? It is 12 inches high, glass top, you know.

TENNESSEE.

ANSWERS.—1. Now is a good time to transfer, while fruit is in bloom; but it may be still better to transfer each colony 21 days after it swarms.

2. Generally not, but sometimes there comes a dearth, when they must be fed or starve.

3. If there are no combs that have been bred in, you can fill up, but if you put anything over an old comb the cocoons will hold the wax like little cups.

Bees Standing on Heads—Frames Bee-Glued.

1. What is the matter with my bees? They seem to stand on their heads, and roar around the entrance.

2. What shall I do when frames are glued together? My frames are Hoffman frames, and are glued tight to the excluder, so that it breaks and tears up the frames to get them loose.

TEXAS.

ANSWERS.—1. They are probably ventilating, making their wings move lively, so as to change the air in the hive.

2. Fry up the excluder carefully, starting it at different places, and then scrape off the burr-combs. Then don't let them go so long without cleaning again. You see it takes time to get in such bad condition, and likely you have not cleaned them off for several years.

No Italian Blood in Them.

I enclose six honey-bees, the kind I keep. Is there any Italian in them? If not, what are they?

NEW JERSEY.

ANSWER.—The bees received are of the kind called smashed bees. Before they were smashed I think they were black bees, with no Italian blood in them. It would be easier to tell if they had been sent in a tin or wooden box, or in a block with a hole bored in it.

Shipping Nuclei—Bees Building Comb.

1. I have a customer who wants a queen and nucleus. How shall I send them? Are there cages for that purpose?

2. What is most profitable, full sheets of foundation or starters? Some say the bees produce so much wax when they are building comb, even if we furnish them old comb or foundation. How is this?

INDIA.

ANSWERS.—1. The usual way is to make a cheap affair in the form of a hive large enough to take three or four frames, well provided with wire-cloth, the frames when received to be put in full-sized hives. I do not keep anything for the purpose.

2. For most persons I believe full sheets are best. I always use

A Few Cheap Smokers!

We find we have on hand a few slightly damaged Clark and Bingham Bee-Smokers, which got a little damp and soiled at the time of the fire in the building where we were about 2 years ago. They are all almost as good as new.

We have some of the Clark Cold Blast, which when new sell now at 55 cents each; some of the Large Bingham—new at 65 cents each; and some of the Little Wonder Bingham—new at 50 cents. But to close out those we have left that are slightly damaged, we will fill orders as long as they last at these prices:

Clark at 25 cents each; Little Wonder Bingham at 30 cents each; and Large Bingham at 40 cents each.

We do not mail any of these slightly damaged Smokers, but will put them in with other goods when ordered, or sell them here at our office when called for—at the above prices.

GEORGE W. YORK & CO., 144 & 146 E. Erie Street. CHICAGO, ILL.

65 Best Queen of Sixty-five 65

MR. ALLEY: BELLE PLAINE, MINN. I have a queen received from you in 1900. Her bees are the best honey-gatherers of an apiary of 65 colonies in which are queens from different breeders—natural queens, as Dr. Gallup calls them. The Adel queen is the best of the lot. C. J. OLDENBERG. Price List now ready. H. ALLEY, 1644t Wenham, Mass.

FROM MANY FIELDS

Wintered Well.

Out of 159 colonies of bees put into the cellar last fall I have found 4 dead. The others seem to be in fine condition. I have 12 colonies packed outside which have not been inspected.

H. W. CORNELISON.

Washburn Co., Wis., March 21.

Bee-Keeping in Florida.

Bees in this locality are usually kept in a very primitive way. March 20 I visited an apiary of 30 colonies, located in a persimmon grove, on fine Bermuda sod, and surrounded with a picket fence. But the hives—not worthy of the name—hollow logs with a board on top. I told the owner that if I were the bee I would not work in such things. The bees were very diminutive blacks.

I went with a party, in a sail-boat, who went there to purchase honey. The apiarist had no comb honey, but thick strained honey which he sold for 75 cents per gallon, or 20 cents per quart. He took no bee-paper, but had often thought of getting patent hives. A species of wild sage was blooming very

them. Some wax may be secreted when not needed, but not a great deal. If the demand had nothing to do with the supply, we ought to find scales of wax to the amount of several ounces under a swarm hived on full combs, whereas you will find little difference in the amount of these scales whether full combs or empty frames are used.

3. You will find Miller queen-cages on the price-lists of supply dealers, but these are not the improved Miller cages described on page 246 of "Forty Years Among the Bees." I consider the improved decidedly better; but others may not think so.

Keeping Down Increase—Rearing Queens.

1. I have 5 colonies of bees, and do not wish to increase. What would be the effect if I should leave on the entrance-guard all the season? Would the bees kill the queen after repeated efforts to swarm?

2. How long would it be safe to keep the young queen confined? 3. Would she be apt to lead off a swarm when she took her flight to meet the drone?

4. Would the plan prevent the bees from absconding?

5. Can I rear a good queen in a small nucleus by giving plenty of bees and cells that are started in a strong colony, say cells 12 days old? WISCONSIN.

ANSWERS.—1. Yes, they'd kill her.

2. Till you hear no more piping.

3. No more than in usual cages.

4. Yes, if you have only one colony; but with numbers there will be doubling up, going into wrong hives, and other troubles. I tried the plan thoroughly and it's bad.

5. Yes.

Queen-Cells in February—Foul and Chilled Brood—Unfinished Sections.

1. February 24 I opened a hive in which I thought the bees were starting, and upon examination I found it had 3 capped queen-cells. This colony had a queen in the fall. What is the cause of these queen-cells appearing at this time?

2. What is the cause of bees crawling in the cells of the brood-frames and dying? They seem to be all right in every other way.

3. Would it be safe to let them keep these combs, or give them clean ones?

4. Last year I was bothered with black spiders and moth. Do they come back every year? What is the best way to get rid of them? 5. How can a person tell the difference between brood and chilled brood? I can find nothing regarding chilled brood in the text-books.

6. I have some unfinished comb in sections that are partly filled. Would it be safe to let the bees finish these? ILLINOIS.

ANSWERS.—1. Some accident might have happened to the queen after you saw her in the fall, or the queen may be played out.

2. Likely they were caught by the cold away from the cluster.

3. The bees will clean them.

4. Yes, you will find them faithful in their visits. Try to have no lurking places for the spiders, and have your colonies so strong that the bees will clear out the moths. Italians are much better than blacks to keep out moths.

5. Chilled brood doesn't string out like full brood.

6. The honey will not be so good in them.

Rumely Engines

both as to traction and generating and supplying power, are typical of all that is best for threshermen. They are rear geared, gears are offset, cross heads and slides are protected from dust, they are free from all trappy devices. Single or double cylinders, burn wood or coal, or direct flue for burning straw. Fit companions in the threshing field for the famous New Rumely Separators. Free catalogue describes all. Write for it. M. RUMELY CO., La Porte, Indiana.

abundantly all around in the vicinity of this apiary, and the owner said that it was fine for bees. There are many resources for honey; during March, yellow jessamine, ti-ti, sage, fruit-bloom of many kinds.

The most of the people living on home-steads in the piney woods keep a few colonies in log-gums. On my asking them if they had much honey last year, they invariably answered, "I have not robbed them yet; we don't care for honey; prefer syrup."

From my observations I think bees consume more honey in this climate than in a cold one. They work all winter, carrying pollen and a little honey, and are usually cross. What they store during the spring flow is consumed during droughts in summer. I am often told, "My bees all starved during the drouth last summer," or, "The moth ate them up." So the winter of their discontent is not by freezing, but the opposite—heat and lack of moisture.

An intelligent bee-keeper, who lives on the St. Johns river, told me that the best localities in the South for profitable bee-culture were very malarious, and had many annoying insects.

Mrs. L. HARRISON.  
Washington Co., Fla., March 23.

**Shaken Swarms—Sweet Clover, Etc.**

Lately I have noticed a number of articles on "Shook Swarms" and "Sweet Clover," and thought I might add a little of my experience.

I bought my first swarm when I was 16 years old (about 10 years ago).

For the first 3 or 4 years my bees did not do much swarming, owing either to mismanagement or the season.

As increase was what I wanted, I tried some experiments along that line. I tried dividing the bees, brood and honey, leaving one or two nuclei to rear a queen on the entrance of an empty hive and letting them run in; but results were not satisfactory.

The first artificial swarm that pleased me was hived in July, on 10 frames with starters in the brood-nest and 9 frames with full sheets in the extracting super. They built full a set of brood-combs and stored enough honey in time to winter on, besides 80 pounds for me in the upper story; this was about 5 years ago. Since then I have practiced the same system with many others, which would be like this:

Take 3 or 4 boxes (cracker-boxes for instance), lay one down on the side with the edge on the hive-cover or sheet by each colony you wish to shake from.

Then smoke and drum on the first two colonies you intend to shake from. When this is done start at No. 1, pick out combs, one or two at a time, and shake in front of the clustering-box; work fast and use the smoker some to hurry them into the clustering-box.

When the combs have all been shaken, and you know the queen is in the box, put on the upper stories, if any, and cover.

Proceed to No. 2, and so on until each box has a "shook swarm" clustered in it. Now, if enough time has elapsed to make them feel homeless, commence with No. 1, shake the bees on their combs, which should be in readiness. Shake them down at the entrance the same as a natural swarm, and they will live themselves.

I have made as many as 20 or 25 in one afternoon.

I notice that some writers are afraid sweet clover will not stand close pasturing. That has not been my experience. We have about 15 acres of sweet clover on clay point in a pasture of 80 acres grazed by cattle and hogs. It comes up every spring and keeps spreading. In 1891 the blue-grass and timothy all dried up, but this clover furnished feed for the stock and some honey for the bees. It was cropped and the stubble was laid on the ground, and the bees could walk from one bloom to the other without wearing their wings out.

We had about an acre on rich low land that got the start of the stock in the spring, and grew higher than the backs of the cattle and horses. The neighbors thought this was good stuff to sow for pasture, but when the dry weather came, in July and August, feed got

so scarce, and the stock commenced on this and trimmed up everything they could eat, leaving it looking like a mess of hazel-brush; it seemed to thrive as well as ever, new shoots kept coming out, and they were as fast eaten off, until freezing killed it.

I should like to ask Mr. Barber (page 78): Why put anything in his honey to keep it from granulating? If it is pure, put into a tank and heat from 160 to 170 degrees, and use a thermometer to be sure about temperature. Out of 600 pounds which I canned while it was hot, 5 months ago, only 54 pounds has shown any signs of grain in it, and this had been heated, for experiment, to 150 degrees and had caudled again.

Why cut your comb honey in chunks, and put into cans for "extracted" or "comb"? It is neither one nor the other. It seems to me that the wholesale grocers put enough of this stuff on the market without imitating them. It seems to me that if a customer wants comb honey let him have it straight, and extracted the same. If a bee-keeper is why mix them?

No offense meant, Mr. Barber. I suppose others are doing the same. This is the way I look at it. B. A. ALDRICR.

Woodbury Co., Iowa, March 9.

**One of the Olives.**

What is the enclosed domestic shrub? It is our earliest bloomer, and is attractive to bees. EAST TENNESSEE.

[This is the first flower of the season. It belongs to the Olive family along with the ash and lilac, but as a native of Japan and China no common English name has been given to it. Botanists call it "Forsythia viridissima." It is an ornamental shrub, the abundant bright yellow flowers appearing before the leaves.—C. L. WALTON.]

**Prospects of an Early Spring.**

We are having very nice weather, and it has the appearance of an early spring, with the temperature between 65 and 70 degrees, which has brought the maple to bloom, and the busy bee is once more bringing in pollen from the first flower of the season. The robins and the bluebirds have also made their appearance, and fill the air with their sweet music, to remind us of the beautiful spring-time.

My bees have wintered well, having lost only 2 weak colonies, and the remaining 52 colonies are doing nicely on ample bloom. The prospects are bright for 1903.

WM. H. HEIM.  
Lycoming Co., Pa., March 20.

**That Old Colony—Wintered Well.**

Mr. Hasty must not be hasty about that "old colony of bees" mentioned on page 184. If he will put on his "specs" and look at the article again, he will see plainly that said "old colony" belongs "to a stock of bees that were on the farm of my uncle, Wm. Sager, near North Bristol, Ohio, for over 90 years before I brought them over here," instead of saying that said "old colony" was over 90 years old.

The name of my aunt should have read Mrs. Elizabeth Diehl, instead of Duhl. She has since gone to her rest; having died Nov. 28 1902.

I was very sorry to hear of the death of Thomas G. Newman. I met him at 2 conventions of the National Bee-Keepers' Association, at Columbus, Ohio, in 1888, and in Chicago, in 1893. So they go, one by one—Charles Dadant, Dr. A. E. Mason, "Rambler," and next Thomas G. Newman, all in less than a year. I never met Father Dadant or "Rambler," but I had met Dr. Mason several times, and I regarded him as a very dear personal friend, and I was very much grieved to hear of his death.

Bees have wintered very well, and have been carrying in pollen lively for several days. March 14 was the first day I noticed them carrying it in. There is lots of white clover,

# QUEENS!

Golden and Leather-Colored Italian, warranted to give satisfaction—those are the kind reared by QUINN-LE-QUEEN-BREEDER. Our business was established in 1888. Our stock originated from the best and highest-priced long-tongued red clover breeders in the U. S. We rear as many, and perhaps more, queens than any other breeder in the North. Price of queens before July 1st: Large select, \$1; six for \$5; Tested Stock, \$1.50; six for \$8; Selected Tested, \$2 each; Breeders, \$4. Two-frame Nuclei (no queen) \$1.50 each.

Special low price on queens in lots of 25 to 100. All queens are mailed promptly, as we keep 300 to 500 on hand ready to mail.

We guarantee safe delivery to any State, Continental Island, or European Country. Our Circular will interest you; it's free. Address all orders to

In order to introduce this SUPERIOR stock I am going to offer a limited number of frame Nuclei with a fine Tested Queen for \$2.00 each; Queen alone, \$1.00; Selected Tested, \$1.50 each; Breeders, \$3.00 each; Untested, from same stock, 75 cts. each, or \$4.50 per doz. Discounts on 25 and 100 at a time. My Queens are bred by the best known methods, and I challenge the world to produce finer Queens or stock. Safe arrival and reasonable satisfaction. Address, **W. J. FOREHAND, Ft. Deposit, Ala.** 16A2T Please mention the Bee Journal.

and if we have the right kind of weather we may look for a good honey season the coming summer. I hope this will be a prosperous year for bee men and women all over the land. **J. S. BAIR.**

Trumbull Co., Ohio, March 26.

### Wintered Well—Good Year Expected.

As far as I know the bees have wintered quite well in this community. We put them on the summer stands March 12, the earliest time (queenless) out of 101 put in the cellar last December. March 13 the bees flew like they do in the summer, and March 18 the mercury went up to 78 degrees. Soft maple is in bloom, and it was like summer all around, even in the bee-yard, bees carrying in both pollen and water, cleaning house and trying the strength of the weak colonies by troying to rob.

Indications point to a good year for both the bee-man and the farmer. **L. G. BLAIR.** Grant Co., Wis., March 19.

### Looks Like a Good Year.

The American Bee Journal has been a great help to me, as I am just a beginner in apiculture, starting in last spring with 6 colonies, 5 of which I bought in box-hives, and transferred them to Langstroth hives, which I made myself. I now have 11 colonies, having lost 2 that starved on account of my being sick at the time they should have been looked after.

March has been warm and rainy so far, and to-day the bees are busy around the soft maple, which is just beginning to bloom, and with plenty of sweet clover it looks as though we were going to have a good year for honey. **HARRY S. CRAIG.**

Madison Co., Ind., March 12.

### Nice Weather—Prospects Good.

We are having nice warm weather, and the bees are carrying pollen, and a little honey. I examined my bees carefully and find 2 colonies queenless. They are strong, and have lots of honey. We never had better prospects.

We have about 20 or 25 acres of crimson clover, and a few acres of Alsike, and the prospect is good for lots of white clover. **L. A. HAMMOND.**

Washington Co., Md., March 3.

### Organization in California.

Thus far the prospects are good for a honey crop in this part of the State.

Bee-keepers are watching with considerable interest the progress of the California National Honey-Producers' Association. I think if they have an honest set of officers at the helm, and the Constitution and By-Laws are gotten up with an honest purpose, and the promoters will take a proper interest, with a competent manager at the head, something can be accomplished for the good of the fraternity. I know I for one am in favor of organization, as I have had some loss by a commission merchant in San Francisco this season, and it would naturally set one to thinking what is the next best thing to do. But that little word "if" stands in the way quite often in our lives. **CHAS. D. BROWN.** Placer Co., Calif., March 3.

### Season of 1902—Taking Bees Out.

Last year, from 96 colonies, we got about 13,000 pounds of extracted and comb honey.

Last season, when we had a swarm, father said I could have it if I would give it, so I went to work and hived it, gave it one frame of comb drawn out, and the remaining 7 of foundation not drawn out. In a few days I looked in and saw the queen was laying, and in about another week I looked in again and saw they had almost all their frames of foundation drawn out; in a few days we put on 24 sections. When we took them off in the fall they had 20 out of the 24 filled with honey of fine quality. From 96 colonies we increased to 105, and

## Tennessee Queens.

put 45 into the cellar, and left the remaining 57 outside. The ones outside had several flights; if the weather is the same tomorrow we will take those out of the cellar.

In a recent number of the American Bee Journal there were some hints on taking bees out of the cellar. Last spring we took ours out—they were out five or six days, and had some fine flights—when the weather changed, and we had to put them back into the cellar for a few days, when we brought them out for the summer. The flights of those few days saved almost all of the colonies.

FRED BANKER (aged 14).  
Brown Co., Minn., March 21.

**Wintered Well and Appear Strong.**

I am pleased to say that all my colonies wintered well, and appear strong. I have found quite a little capped brood, and queens are laying all right.

F. H. DRAKE,  
Worcester Co., Mass., March 10.

**Honey Crop Outlook Good.**

The outlook for a honey crop is good. White clover is in fine shape, and the bees have wintered in the condition so far. I have lost but one colony, and still have 110.

THEO. S. HURLEY.  
Tama Co., Iowa, March 14.

**Some Results of Bee-Keeping.**

I like the American Bee Journal very much. I have been keeping bees about five years. I commenced with 2 colonies in box-hives, one of which I have yet. I did not know much about them at first, except what I could pick up from bee-keepers. I put away 12 colonies last fall, and sold about \$140 worth of comb honey last year, all white honey. We did not have any fall flow here.

I think beginners should have a text-book and bee-papers.

V. VAIL.  
Winona Co., Minn., March 23.

**Worcester County Convention.**

In a former letter I mentioned an immense swarm of bees that had taken possession of an attic-room 50 years ago. At the regular meeting of the Worcester County Bee-keepers' Association, held March 14, the owner of the building announced that the bees disappeared some time early in the fall, but could not give any reason for it. The room, as it was partitioned off for the bees, was about 8 feet square. It is like a great hive, with comb upon the walls, and all over the original hive, which was placed in the middle of the room. The floor is nearly covered with honey from broken comb, which has fallen from the walls. From this latter fact Pres. Frouthy thought that nice or cold weather were to blame for the dismantled condition of the room.

The secretary read a very interesting paper on "Spring Management," by C. S. Blake.

The story of an Illinois bee-keeper's loss of many colonies, resulting from spraying trees during bloom, was related, and the warning given not to buy spraying outfits from dealers advancing such ideas.

Extracts from a letter from George W. York, relating to black honey, brought to a close one of our best meetings.

C. R. RUSSELL.

**Longs for Enchanting Forests.**

In spring and early summer I long for the lone and enchanting forests of my boyhood days. Their fascinations cling to me, and sometimes almost make me wish to live them over again. At my feet were the dry leaves, the spring flowers and the bees, while in the trees overhead, and all about me, were the beautiful birds of song, happy in the life and liberty given them of God. Then the rooster would bark at us by day and by night, and the wild deer would shy about in the distance, cropping the heritage here and there. O how the hoot and the screech of the owl, and the howl of the great fierce timber-wolves would make the small boy's hair rise when driving the cows home rather late in the even-

**Italian Queens, Bees and Nuclei.**

We have a strain of bees bred specially for honey-gathering and longevity, at the following prices:

- One Untested Queen ..... \$1.00
- One Tested Queen ..... 1.35
- One Select Tested Queen. 1.50
- One Breeder Queen ..... 2.50
- One - Comb Nucleus (no Queen) ..... 1.40

ing from their wanderings in the woods for their daily living.

I wish I had the power to describe to you the charms of visiting some of our great pine forests of those days. I wish some of our old pioneers would in prose or poetry write them up. The young people of to-day have but a slight conception of them in their beauty, imposing height, of their hush in stillness, their sigh and their murmur in a gentle breeze, or of their terrific roar in storm.

S. T. PETTIT.

Ontario, Canada, March 11.

**Looked for Cold Weather.**

I have 51 colonies of bees, and they have been carrying in pollen for the last 10 days. We are having very nice, warm weather, but I am afraid it is too early for the bees to breed and carry pollen. I am looking for some rough, cold weather yet which I think will be very hard on the bees.

WM. REIBER.

Center Co., Pa., March 21.

**White Clover Prospects Good.**

The white clover has come through the winter in fine condition around here, and the prospects are good for a honey-flow next season.

I put 108 colonies in the cellar the last of November. They are wintering nicely so far.

WM. R. CREASER.

Dunn Co., Wis., March 20.

**Moving Bees—Good Prospects.**

I have moved 17 colonies of bees with me, and all that were fairly strong came through all right; the weaker ones did not seem to stand it quite so well. Two of them seem very poorly. I just removed the covers and put wire-cloth over them and over the entrance, and they did not seem to suffer when I could keep the car open, which I could not do on account of the smoke from the engine some of the time.

The prospects here are good for a crop of honey this year, judging from the amount of white clover.

GEORGE H. WELLS.

Johnson Co., Mo., March 22.

**Expects a Favorable Season.**

Two years ago I started with 2 colonies of bees, and the following winter lost one from smothering. I kept them in a cellar and did not give them enough ventilation. I now have 5 colonies wintering in the cellar and doing well.

I put up a shelf nearly 3 feet high, and set the 5 hives on this shelf, with blocks under the corners of each hive, raising them about 2 inches. This gives room under the hives to remove all dead bees and litter, and I have had no trouble with them up to the present time.

The temperature of the cellar has not been lower than 45 degrees during the winter. I fed one colony occasionally during the winter because I thought it was a little short of food, and shall continue to feed until time to put them out-of-doors.

I look forward for a favorable season for bees to work, as we had rather a poor season last year, owing to cold and wet weather the forepart of the season and dry the latter part. This is my first epistle on this subject, and for fear of intruding upon Von Yonson's time and patience, I will close by saying the American Bee Journal is all right. A. M. DEITZ, Charlevoix Co., Mich., March 16.

**Safe Spring Feeding.**

For several years I have used a 1/2-inch cover for my hives during the winter, instead of covering the top entirely with burlap. In this board cover I have a circular opening 6 inches in diameter. I lightly tack a piece of wire-cloth over the opening in the fall, put on the winter-case, pour in planer-shavings until it reaches 6 inches deep in the center, and I am done with bee-work for five months.

About the second week of March, usually, I remove the shavings from the top of the

# How to Paint a House Cheap

## And Have it Guaranteed to Look Better, Wear Longer and Cost Less Than the Best White Lead Paints.

Never Fades, Cracks, Chalks, Peels or Blisters and is Not Affected by Gases. Fifty Sample Colors and Illustrated Booklet Prepaid to Any Address Absolutely Free.

The cost of painting the house and barn, out-buildings, beehives, and fences is a heavy burden. Cheap paints soon fade, peel or scrape off, and white lead and oil costs so much, and has to be replaced so often that it is a constant expense to keep the bright, clean appearance so desirable in the cozy cottage home or the elegant mansion. The following are a few of the large users of Carrara Paint:

Pennsylvania R. R. Co.; Pullman Palace Car Co.; Chicago Telephone Co.; Central Union Telephone Co.; Field Museum, Chicago; Kenwood Club, Chicago; Cincinnati Southern; C. & E. R. R. Co.; Denver & Rio Grande R. R.; Wellington Hotel, Chicago.

Carrara is used because it lasts longer, never fades, never cracks, never blisters, never peels, covers more surface than the highest priced paints, and costs less than the cheap mixed paints that in-

The Waldorf-Astoria, New York. One of the Most Magnificent Hotels in the World, Has Used Tons and Tons of the World-Famous Carrara Paint.

jure instead of protect. Carrara Paint is the best possible covering for beehives, as it does not chalk or peel, and perfectly protects the surface over which it is used, and one painting of Carrara will outlast two of the best white lead. A gallon will cover twenty-five 1½-story houses—two coats. There is but one Carrara. It is made by the Carrara Paint Agency, General Offices, 751 Carrara Bldg., Cincinnati, Ohio, and any one having a house to paint should send for 50 free sample colors and our beautiful booklet, showing many buildings reproduced in all the colors just as they are painted from this great Carrara. We also furnish the most rigid tests for 25 years; and bear in mind that it is the only paint ever manufactured that is backed by a positive guarantee in every case. Distributing depots in all principal cities. Write to-day and save half your paint bills in the future.

Please mention Bee Journal when writing.

hives, take off the wire-cloth, and place a saucer about 4½ inches in diameter down in the circular opening and resting upon the frames. I put a piece of cloth in the saucer, allowing it to extend over the sides and touch the frames. Over the saucer I invert a cover about 6 inches square (inside measure) and 2 inches deep. Through this cover I have previously bored a hole large enough to admit a tin tube—an ordinary dipper-handle will make two—then I put back the planer-shavings and my preparations are done. Each evening I pour about five tablespoonfuls of this syrup down through the tin tube and into the saucer. Nothing is left of the syrup by morning. To read the description it may seem like a good deal of work, but it is all very easy work, and, once made, the articles last forever. I have never yet tried a plan that is so free from fussiness and danger of robbing. It is absolutely safe, and I have found it successful in every instance.

"WREXHAM."

### CONVENTION NOTICE.

Missouri.—Bee-keepers of Missouri will meet in convention at Moberly, in the Commercial Club Rooms, at 2 o'clock p.m., on April 22, 1903, to organize a Missouri State Bee-keepers' Association. We expect to complete our organization on that day and have some bee-talks the day following. Everybody is invited who is interested in bees and honey. Let us have a good turn-out and a good time, and hotel accommodations can be had at \$1.00 and \$2.00 a day. The Monitor Printing Company will tell you where the Commercial Club rooms are located. W. T. CARNEY, Acting Secretary, Wakenda, Mo.

Please mention Bee Journal when writing advertisers.

### Standard Italian Queens

#### OF THE HIGHEST GRADE.

Bred in Separate yards from superior stock of Golden and Leather-colored Strains. Selected from among the best stock of Long Tongue Clover and Honey Queens in America. Bred by us with the greatest care for business. No disease among our bees. Our elevated country, with its pure mountain air and pure sparkling spring water furnishes the ideal place of health for bees and man. See our circular for the rest. Queens sent out last season by us arrived in the very best shape, except a few got chilled late in the season in the North. Our Queens have gone to California, Oregon, Canada, Colorado, Cuba, New Mexico, and many of the States. We rear all queens sent out by us from the egg or just hatched larvae in W.C. colonies. Our method is up-to-date. If you want to know what we have, and what we can do, in the way of fine, large, prolific QUEENS, and how quick we can send them, just give us a trial order.

Prices: Untested Queens, \$1.00; 6 for \$5.00; 12 for \$7.00.  
 Rested, \$2.00; Select, \$3.00; Best, \$5.00.  
 Full Colonies, with Tested Queen, \$6.00.  
 3 frame Nuclei, wired Hoffman frames, no Queen, \$2.00; 2 frame, no Queen, \$1.50. (Add price of Queen wanted to price.)  
 Special rates on Queens by the 100. Safe arrival and satisfaction guaranteed. Shipping season begins in April. Write our circular. It is FREE.  
**T. S. HALL,**  
 13A½ JASPER, PICKENS CO., GA.

### The Emerson Binder.

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "EMERSON" no further binding is necessary.  
**GEORGE W. YORK & CO.,**  
 144 & 146 Erie Street, CHICAGO, ILL.

### HONEY AND BEESWAX

#### MARKET QUOTATIONS.

CHICAGO, April 7.—Choice to fancy white comb honey sells in a limited way at 15¢ to 16¢ per pound. There is no certain price for other grades, but they sell slowly at 30¢ to 5¢ less per pound. Extracted, 66¢ for white grades; ambers, 54¢ to 64¢. Beeswax, 32¢ per pound.

R. A. BURNETT & Co.

ALBANY, N. Y., Mar. 14.—Honey demand quiet; receipts and stock light. Comb selling, light, 15¢; mixed, 14¢ to 15¢; dark, 13¢ to 14¢. Extracted, dark, at 67¢ to 68¢. Beeswax firm, 30¢ to 31¢.  
 H. R. WRIGHT.

KANSAS CITY, Apr. 2.—Our market is almost bare of comb honey; the demand is good. We quote you as follows: Fancy white comb, 24 sections, \$3.50; No. 1, white, \$3.40; No. 2, white and amber, \$3.25 to \$3.25. Extracted, white, 64¢; amber, 54¢ to 64¢. Beeswax, 32¢ per pound.  
 C. C. CLEMONS & Co.

CINCINNATI, March 11.—The demand for extracted honey is good at the following prices: Amber, barrels, 54¢ to 64¢, according to quality; white clover, 84¢ to 94¢. Fancy comb honey, 13¢ to 14¢. Beeswax strong at 30¢.  
 THE FRED W. MUTH Co.

NEW YORK, April 8.—Comb honey is moving rather slowly of late and prices are somewhat declining. We quote fancy white at 14¢ to 15¢; No. 1, white, 13¢ to 14¢; No. 2, extracted quiet and easy, with plenty of supply. We quote white at 64¢ to 67¢; light amber, 54¢ to 64¢; dark at 5¢. Beeswax steady at 30¢ to 31¢.  
 HILDEBR & SGOELKER.

CINCINNATI, April 7.—The comb honey market has weakened a little more; is freely offered at the following prices: Fancy amber, 14¢ to 15¢; no demand for ambers whatever. The market for extracted has not changed and prices are as follows: Amber in barrels, 54¢ to 64¢; in cans, 66¢ to 67¢; white clover, 84¢ to 94¢.  
 W. H. W. WEBER.

SAN FRANCISCO, Mar. 11.—White comb honey, 12¢ to 13¢; amber, 9¢ to 11¢; dark, 7¢ to 8¢. Extracted, white, 63¢ to 71¢; light amber, 53¢ to 61¢; amber, 50¢ to 57¢; dark, 46¢ to 49¢. Beeswax, good to choice, light 27¢ to 28¢; dark, 25¢ to 26¢.

Demand is fair on local account for water-white, uncandied, but there is not much of this sort obtainable. Market for same is firm at ruling rates. Candied stock and common qualities are going at somewhat irregular and rather easy figures, holders as a rule being desirous of effecting an early clean-up.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec03" on your label shows that it is paid to the end of December, 1903.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and credited.

Advertising Rates will be given upon application.

## Weekly Budget.

Mr. W. A. PRYAL, of Alameda Co., Calif., wrote us as follows, April 6:

"This is a grand year for this end of California, and from reports it will be so over the State. We have had abundant rains at the right time. The days are now perfect, and there is a profusion of flowers, wild and cultivated."

A CORRECTION.—In Mr. F. Greiner's article, on page 214, near the end, read as follows instead of the way it was printed:

"Twenty-five years ago honey sold for not materially more, although a very fancy lacer-trimmed lot brought me \$2 and 25 cents in New York for some years my honey brought, I believe, 15 and 16 cents. At this latter price the bulk of my honey sold in New York (on commission) in 1876."

Mr. H. C. MOREHOUSE, editor of the Rocky Mountain Bee Journal, has lately been adding to his "force." He tells of it in the following paragraph:

The rapid expansion of our business has made necessary the employment of additional help. We have been looking for some one whom we hoped would prove a capable assistant for some months past, and on Sunday, March 15, he made his appearance. He arrived hatless, coatless, pantsless, shirtless, baldheaded, and—nameless. He is nameless still, but is otherwise pretty well provided for so far as his immediate necessities are concerned. We have engaged him to tarry under our roof for at least 21 years, and we shall hope to admit him to an equal partnership at the expiration of that time. As this is the first assistant to the firm of Ourself & Wife,

we feel considerably "stuck up" over the matter, and any discrepancies in this issue of the journal must be attributed to that cause. While our feet are still stumbling over the clouds of Mother Earth, our head is (it feels like it is) floating somewhere away up in the ethereal blue.

Our congratulations to "The House of Morehouse."

Of course, Mr. M. is excusable for typographical errors this time. "Ethereal blue" is "ethereal blue" in this "locality."

MR. TOFIELD LEHMAN and Miss Emma Butikofer, of Fayette Co., Iowa, were married Feb. 17, 1903. A local newspaper, when announcing the happy event, said:

Mrs. Lehman is a young lady of amiable traits of character, and will make a splendid helpmate. Mr. Lehman is a well-to-do farmer, and a gentleman in every respect.

Mr. Lehman is also a wide-awake bee-keeper, and doubtless that new home will have plenty of the sweet things of life.

A. B. CARPENTER, of Tulare Co., Calif., sent us the picture of his apiary and the following concerning it, dated Feb. 14, 1903:

I send an amateur photograph of my apiary taken by my son, and finished to put on our Christmas tree last December. I stand on the right, son-in-law next on the left. My wife stands behind a prop, being near-sighted she did not see it. My daughter on the left with a black cat in her arms. In the background is the extracting house.

I have 90 colonies of bees, and shall lose a few, possibly. There have been but a few days this winter that the bees have not flown more or less. This morning was the coldest

APIARY OF A. B. CARPENTER.

of the winter, the mercury 21 degrees above zero; at noon the bees were flying more or less. The apiary is under two silkworm mulberry trees. The shade will measure 26 by 18 yards. They grow yearly long enough to place a row of stands around the outside. The trees have to be propped strongly to hold them up. When in full foliage they make a dense shade, and, of course, it is pleasant working under them in the hottest weather.

With me, last year was not a remarkably prosperous one. I do not know that I can be called more than an amateur, having had only four years experience with the extractor, and two years previously with comb honey. I love to work with the bees, but it begins to be heavy work for me at 75 years of age.

A. B. CARPENTER.

Through an error made by our engraver, the picture of Mr. Carpenter's apiary was made only about half the size we had intended. It must be a cool, shady spot in which to work with the bees when the trees are in full foliage.

## Dr. Miller's New Book

SENT BY RETURN MAIL.

The book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with over 100 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard.

The first few pages of the new book are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees.

HOW TO GET A COPY OF DR. MILLER'S  
"FORTY YEARS AMONG THE BEES."

The price of this new book is \$1.00, post-paid; or, if taken with the WEEKLY American Bee Journal for one year, BOTH will be sent for \$1.75.

Or, any present regular subscriber to the American Bee Journal whose subscription is paid in advance, can have a copy of Dr. Miller's new book free as a premium for sending us Two New Subscribers to the Bee Journal for one year with \$2.00. This is a magnificent offer, and should be taken advantage of at once. For many of our readers it is not only an easy way to earn a copy of the book, but at the same time they will be helping to extend the subscription list of the old American Bee Journal, and thus aiding also in spreading the best kind of apicultural information among those who would be successful bee-keepers.

## \* Editorial Comments. \*

**Ignorance About Bees.**—Arthur C. Miller seems to be stirring up trouble by hinting in the strongest kind of a way that we don't yet know all about bees, and that what we don't know isn't always so. He seems to be wanting in respect for accepted traditions. For example, we all "know" that bees pack pollen in the cells by butting their heads against it after the fashion of a belligerent ram. To be sure, none of us ever saw a bee in the very act, and we never took the trouble to discuss whether it was a reasonable belief or not, but we've read it, and then it was easier to go right along believing it than to take the trouble to think about it.

Now, see the irreverent manner in which that fellow, Miller, goes for that venerable tradition, in the American Bee-Keeper:

As the pellets of pollen are dropped on the floor of the cell by the gathering bee, a mere ramming in by the head of any bee would pack it very unevenly, much at the lower side and little or none at the upper, a consideration which heretofore seems never to have attracted attention. Also, as every organ is adapted to its particular function, we should expect to find the front of the bee's head hard and smooth, if it was intended and used for this purpose; whereas it bears a pair of delicately articulated antennae, and simple and compound eyes protected by a multitude of fine hairs, surely anything but a battering-ram.

As a matter of fact, the pollen is packed by the bee with its mandibles, and is a process of pushing, kneading, and spreading. The work can often be found in an incomplete stage, and the pollen will then be found thickest at the lower part of the cell, but it does not remain so, for that, or the next lot, will be worked into the upper part, making all even.

**Bulk Comb Honey** (comb honey cut out of the frames and packed in cans or other vessels and filled out with extracted honey) is strongly advocated by H. H. Hyde in an article in the Bee-Keepers' Review, in which he says:

It has been demonstrated time and again that bees will store all the way from 50 percent to 100 percent more honey when worked for bulk comb than they will when worked for section honey, and many believe (the writer included) that where the bees are worked as outlined above, nearly, if not quite, as much bulk-comb honey can be produced as could be produced of extracted honey alone; and especially does this hold good where the localities have fast flows of honey, in which a great amount of wax is always secreted whether there are any combs to build or not.

If it is true that an average of 75 percent more bulk than section honey can be produced, and if the bulk can be sold for 57 percent as much as the section honey—to make it a little more concrete, if the bulk brings 8-4-7 when the section brings 15 cents—then the scales will promptly turn in favor of the bulk, for the amount of money received will be the same in either case, while the outlay of money and labor will be less for the bulk.

There may, however, be some question whether in other localities than that of Mr. Hyde would the proportion of bulk to section honey be so great. Many would probably find that they could secure very nearly as much honey in sections as in full frames, and in this same article Mr. Hyde assures us that it requires as much skill and as fine a grade of honey for bulk as for section honey. Of course, however, there must be figured in favor of the bulk the amount of extracted packed with it.

Each one must decide for himself as to the proportionate amount of honey he can secure, and the relative price in his market.

## DEATH OF DR. E. GALLUP.

On Monday morning, April 13, we received the following letter announcing the death of Dr. Gallup:

ORANGE CO., CALIF., April 7, 1903.

EDITOR YORK:—My father, Dr. E. Gallup, died Sunday, April 5, at 3 o'clock. He had been sick in bed about six weeks, but had been failing in health for about two years. He would have been 83 years of age on the 23d of next August.

I have 14 colonies of bees now, 3 of this year's swarms, one having come out to-day at 1 o'clock. Bees have just begun to store.

Yours sincerely,

HERBERT S. GALLUP (aged 16).

So Death, the ruthless reaper, has cut off another of the old-time bee-keepers—this time one of the very earliest writers on bees in this country, as well as one of the very latest writers, for only last week we published an article from his pen, and still have one more, which will appear soon.

Dr. Gallup was always a good friend of the American Bee Journal. He rendered it noble service at times when such service was of untold value—before either Mr. Newman or its present editor took hold of it. At one time, in its early years, his timely aid seems to have saved it from what might have been a total collapse.

For a number of years Dr. Gallup's name disappeared from the printed pages of the bee-papers. Just why, we do not know, unless it was that he was almost entirely out of bee-keeping during those years. But about 10 years ago we saw his name somewhere, and decided to resurrect him as a writer if we could, and so wrote to him. The result is well known to all who have been regular readers of the American Bee Journal for the past few years.

Dr. Gallup was Mr. Doolittle's teacher in bee-keeping, over 30 years ago, and his book, "Scientific Queen-Rearing," was dedicated to him.

A few biographical notes would doubtless be interesting to all, which were published in these columns in 1893, having also appeared in a bee-paper (now extinct) in 1870:

Elisha Gallup was born on Aug. 22, 1820, in the town of Melbourne, county of Sherbrook, Canada East. His parents were born in Connecticut, on Long Island Sound. By occupation he is a farmer, with the exception of eleven years a miller. He removed to Wisconsin in 1859, and settled in the town of Metomen, Fond du Lac county. In June, 1865, he removed to Mitchell county, Iowa. And now, in the fear that we may not do justice, we will here introduce friend Gallup, and let him speak for himself:

"From my earliest youth I have been an enthusiastic admirer of the busy bee; in fact, my earliest recollections are of the bees and bee-hives. Often have I heard my mother say, if she lost me when a little fellow, she was sure to find me by the bee-hives. My intense desire to learn and investigate the bees in every particular has been such that I have dreamed of them at night, and thought of them in my waking hours to an almost absorbing extent, and to-day I am still a student; and I find those persons who proclaim themselves finished in every branch, are the ones who in reality know the least.

"My early advantages were of a limited nature in the way of education—scarcely common-school advantages did I have. My first reading upon the subject of bees was a small pamphlet written by a Mr. Weeks, of Vermont, which abounded in errors. My next was a work by Mr. T. B. Miner. I picked up my first real insight into the true system of bee-keeping from an old German by the name of Well-husen. He made 125 colonies from one in two seasons. And here I will remark that I have been suspected of getting my knowledge upon the subject of bee-culture from Mr. Langstroth's work; but to settle that matter quickly and satisfactorily, I have never been known to quote from Mr. L.; neither could I have done so, from the fact I had it not to quote from. Once I remember to have had the privilege of skimming through it one evening, at the house of a friend, and that was merely to see if there were any new ideas put forth.

"Eight years ago last season (in 1861) I obtained my first movable-comb hive. My progress from that time I felt was rapid, from using a glass observatory hive of a single comb, for several seasons in Canada, of my own getting up. In my own opinion, the movable-comb hive is very far superior.

"Mr. Quinby's first edition of his book struck me as being excel-

lent; and when I saw an advertisement of his second edition, knowing that he had the advantages of the movable combs, I looked forward with confidence, and expected to see some questions fully discussed by him which I considered of vital importance; and when I obtained the book and found that it had almost stood still, and those questions not even mentioned, I was disappointed in the work, and this determined my course to some extent.

"For the purpose of fitting myself to appear before the reading world, I attended writing school, so as to accomplish myself in at least writing a legible hand. This was in the winter of 1855-56. As you say, you are somewhat familiar with my writings, I leave you to judge of my success. My disadvantages at my time of life I fully appreciated; but being a man who has the fortune not to look back when the hill has once begun to be climbed, my ambition and energy kept me ever on the onward path. I commenced first to write for the American Bee Journal, and to-day my private correspondence would fill a goodly-sized volume, of which I am proud—with innumerable testimonials from different parts of the United States and Canada, and from those who were entire strangers, which enhances their value, being assured it is not flattery."

In a letter written to us, dated July 20, 1893, which we published Aug. 10, 1903, Dr. Gallup said this:

"I have but very little time at command now to reply to your request, but I send you a photo which I had taken about three months ago. All my friends say it looks older than I really do. Every one says that I hold my age remarkably. I know that many a young man does not show the activity that I do.

"Of course, I am not in the bee-business now, but I still take a great interest in the business, and when I see a couple of boys managing an apiary and taking out 20 tons of honey this season, and others in proportion, it makes me sort of hanker after the bees as of old.

"My second wife died last March, and left me with three little ones—the oldest six years, and the youngest two years—and I am caring for them without the assistance of a woman. I will be 73 years old the 23d of next month, and I am still strong and hearty, and, to all appearance, good for some time yet.

"I left Iowa completely broken down, both mentally and physically, and I have regained both in this grand and glorious climate. I was fully determined to go into the bee-business here, and did make a start, but the demand for my services as a hygienic and common-sense doctor has been such that I could not get out of the business, and to carry on the two was impossible.

"I feel now that I must live to care for my little boys and girl. They are the comfort of my old age. DR. E. GALLUP."

The children left by Dr. Gallup will have the sympathy of all beekeepers in their lonesomeness and bereavement. They can have the encouraging feeling that their father was an important factor in the development of progressive and practical bee-culture in the infancy, when Langstroth, and Quinby, and Grimm, were also laboring to place the industry of bee-keeping on a sure foundation.

**Curing Foul Brood in Early Spring.**—M. A. Gill has a profitable cure for each foul-broody colony just so long as hives hold out in which healthy colonies have died the preceding winter. Here is the bill of particulars as given in the Bee-Keepers' Review:

Early in the spring, before the colony has expended much energy in rearing brood to die, I drive the bees from the foul-broody colonies into an empty hive or super, and set them away in some convenient place 25 to 30 hours. Then, by one of my hives of combs and honey I sprinkle the bees, which, by this time, may be a little sluggish, and after they have fed each other and become lively, I run them into the hive above mentioned.

Of course, there is nothing new or remarkable about this cure, only that you have cured your diseased colony; and have done it at a time when they can build up rapidly, as all their brood will hatch instead of perhaps only 40 percent. You have also used your empty combs to the best advantage, and shut off the chances of a diseased colony being robbed out during the death of spring, by perhaps two or more of your healthy ones.

**Uniting Weak Colonies in Spring.**—A beginner, who has a number of weak colonies in the spring, is likely to think he will help matters by uniting them. Those of more experience know that a number of very weak colonies united in the spring will disappear in just the same time as if left separate, but that there is some gain by uniting one or more such weaklings or dwindlers with a fairly strong colony. They have learned this from experience, but perhaps no one has heretofore given the reason why. The following from Arthur C. Miller in *Gleanings in Bee-Culture* is refreshing:

A colony weak in the spring is composed, very largely or entirely of old bees. They must keep warm, gather food, and rear brood. Each day their numbers decrease rapidly, and but few young bees are hatched to take their place. The old bees are enfeebled; they easily succumb to the adverse weather conditions, and wear out quickly, the effort to keep warm and rear brood being too much for them to do successfully. Unite several such colonies, and you have not materially changed the conditions. It is just as hard for them to feed brood;

nearly as much energy is required to keep the necessary heat, and their death-rate is the sum of that of the individual colonies. But put one or more such weaklings with a good colony, the old bees are at once relieved of all nurse duty, and of playing furnace. They start out from a warm hive, and can put every bit of their waning strength into gathering nectar, the usual work of such bees under normal conditions. While they last they are a real aid to the strong colony; and when they are gone, young bees nourished by the nectar they have gathered, are ready to take their places.

Uniting in the fall is generally done under reversed conditions. The bees are almost always young, or a large part of them are; brood-rearing is decreasing, and field-labor is about over, consequently a combination then of several small colonies into one good-sized one is successful if done early enough.

**A Hive-Entrance Reducer**, gotten up by Mr. L. M. Gilbert, of Dupage Co., Ill., is described as follows:

The engraving herewith represents a piece of wood  $\frac{3}{8}$  of an inch square and  $1\frac{1}{4}$  inches long, with a space cut out on one side  $\frac{3}{8}$  of an inch by 11 inches (B in the illustration), and on one adjoining side  $\frac{3}{8}$  of an inch by 2 inches (A in the illustration), and is designed as a reducer for the deep entrance of the Danzenbaker bottom-board, the

combined bottom-board and hive-stand, or any entrance of  $\frac{3}{8}$  inch or less in depth.

This is to be placed on the bottom-board with cut-out down, and pushed under the front of the hive-body even with the front.

A small staple or nail driven on the inside of each side-piece of the bottom-board, and on a line with the inside of the front of the hive, will prevent it going under too far.

If using the  $\frac{3}{8}$ -inch side of a reversible bottom-board, and wishing to reduce the entrance, it can be placed flat side against the front of the hive with the small opening down. With the deep entrance and one of the spacing sticks you can have any one of three size openings. The spaces may be varied to suit the individual.

Without the use of a bee-veil, or disturbing the bees in any way, you can walk up to the side of the hive and remove or place in position one of the reducers at ten or more hives in the same time that you could lift a hive from the bottom-board, reverse it, and set the hive back in place.

If the stick is not in use it can be left on the cover, and will be always at hand when needed. The length, as given above, is for a 10-frame hive, but if one inch is cut off of each end it will fit an 8-frame hive.

One hundred of these sticks make a package only 9 inches square and  $1\frac{1}{4}$  inches long. L. M. GILBERT.

**Why Demand for Honey Sometimes Falls Off.**—Here are some words of M. Moyer, in *Gleanings in Bee-Culture*, that some bee-keepers ought to paste in their hats and read over semi-frequently:

At present it seems to be the aim of bee-keepers to get their honey off their hands at the highest prices, and care very little what becomes of it after that. They have not studied sufficiently the importance of creating a greater demand for their goods. A pail of good honey, sold in good condition, will create a demand for another one; but if it does not give satisfaction it spoils the sale of perhaps a dozen. I know from personal experience that families average 10 pounds a month as long as they get a good article, and that one pail of inferior cut off that demand for a whole year. They imagined they got tired of honey, when the fact was the honey was not up to the mark.

**Honey as a Health-Food** is the name of a 16-page leaflet ( $3\frac{1}{2} \times 6$  inches) which is designed to help increase the demand and sale of honey. The first part is devoted to a consideration of "Honey as Food," written by Dr. C. C. Miller. The last part contains "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by every one who has honey for sale. It is almost certain to make good customers for honey. We know, for we are using it ourselves.

PRICES, prepaid—Sample for 2 cts.; 10 for 10 cts.; 25 for 20 cts.; 50 for 35 cts.; 100 for 65 cts.; 250 for \$1.50; 500 for \$2.75; 1000 for \$5.00. If you wish your business card printed at the bottom of the front page, add 25 cts. to your order.

**Maple Sugar and the Sugar Bush**, by Prof. A. J. Cook; 44 pages; price, postpaid, 30 cts. This is by the same author as "The Bee-Keepers' Guide," and is most valuable to all who are interested in the product of our sugar-maples. No one who makes maple sugar or syrup should be without it. Order from the office of the American Bee Journal.

# Convention Proceedings.

## Chicago-Northwestern Convention.

Report of the Chicago-Northwestern Bee-Keepers' Convention, held in Chicago, Dec. 3 and 4, 1902.

BY OUR OWN SHORTHAND REPORTER.

(Continued from page 245.)

### FOUL BROOD—ITS CAUSE AND CURE.

A Member—That larva that lies down against the side of the cell, is that after the cell is capped?

Mr. France—It has probably been capped; it is beginning to have this sunken appearance, and about to begin that perforation in there?

A Member—Then you can not detect foul brood in cells that have never been capped?

Mr. France—I should usually say no, unless you have been schooling yourself on this, and looking for it before hand.

A Member—Would the introduction of the queen from a foul-broody colony received through the mails introduce foul brood?

Mr. France—Well, I am not a queen-breeder, nor don't want to affect any one's market. I will say yes and no; no, providing you take that queen-bee and introduce her in a clean cage and destroy the cage that she came in. Right on that point: In the largest county of our State we had a peculiar case. There were some 40 odd hives, new that season from a supply house, that had never had bees in them; he had put his new swarms in them; the old queens were not desirable ones; he sent to one of our distant cities for some queens—five of them—and introduced them in the cages they came in. After a time he wrote me that there was something wrong in those hives, and so remarkable an instance was it, that it was every other all in one row, it excited my curiosity. How could it be so, and what was the cause? No other bees in the vicinity were diseased. Why should these be, and in that peculiar way? Finally I learned that these five queens had been introduced in those same hives; then I said, "You put it there. Where did you get your queens?" He told me, and I said, "That apiary is diseased; I know it has been for some time."

I have answered a good many questions in our State, and I have written out the answers and questions, making them very short, and will read them; they may be of help to some one here:

### QUESTIONS AND ANSWERS ON FOUL BROOD.

1. How does foul brood become contagious? By robber-bees getting diseased honey.

2. Do the germs float in the air and thus spread? No. Often bees hatch from diseased combs.

3. Are any combs from a diseased colony safe to use? If so, what and where? Combs above a queen-excluder, or those never having had brood in are generally safe if they have been cleaned out by the bees and exposed to the air for some time. They need careful inspection before using; also after.

4. Is honey from diseased hives safe for people to use? Yes, but not desirable.

5. Can honey from diseased combs be safely fed to bees? Yes, if *boiled* first. By that word boiled, I mean the honey boiled—all to boil, and stir it while boiling.

6. Is foundation from diseased combs safe to use? Yes. I proved this in 82 trials.

7. Does foul brood affect adult bees? I think not much. They gather honey and swarm.

8. How long will it take foul brood to destroy an apiary? That depends upon conditions, seasons, etc. I know of 108 colonies, strong in April, and all dead inside of one year. Others were diseased more or less for 12 years, but they had fair management that saved them. Usually one to three years.

9. Will a queen from a diseased colony produce diseased brood? No; but I know of several cases where the intro-

duction of foreign queens in the cages they came in caused disease. It is not safe to use foreign cages to introduce queens in. Put the queen in a clean cage on arrival, and burn the other and bees in it.

10. Is honey stored above the brood in boxes or super-combs safe to use? Yes, for people, and possibly for bees. I know it is if boiled before using.

11. Are super-combs partly drawn out over diseased brood, that have not had honey stored in them, safe to use? Yes, as a rule.

12. Is there any danger of using tools that have been used in handling diseased bees? Yes, if they have become soiled or stained with honey from the diseased hive.

13. How do you disinfect such? Plenty of hot water kills the germs.

14. Can you cure this disease late in the fall. If so, how? If you have plenty of sealed honey in healthy combs, after brood-rearing is over, place the combs in a clean hive and drive the bees in with smoke, or, better, brush them from the combs into the new hive, and the colony is cured. The diseased combs to be treated later. But if you have not the above, and the bees have a good supply of honey and bees, they will winter, and then treat them next spring.

15. What harm is it if you make public the names of places diseased, or owners of such bees? Allow me to illustrate: Your bees are diseased; you sell queens; I make public foul brood among your bees. How many queens would you sell? The same is true in the sale of honey. On the other hand, we at once cure the bees, and everything is perfectly safe—then your business is as before. The National Association can do a good deal in this line some day.

16. Is it necessary to burn anything to cure foul brood? No. But often it is good economy. It all depends upon surrounding conditions.

17. How do you cleanse a diseased hive to make it safe to use again? Generally all that is needed is to scrape the inside of the hive. But if honey has been soaked into the lumber I would use some boiling water. The danger, as a rule, is not in the hive. Wm. McEvoy has cured thousands of cases and not scalded the hives.

18. Is there any danger of buying combs to use? Yes. I know of many cases where that was the means of contracting disease. Also using implements from strangers.

19. Is solar or sun extracted wax, honey, or the refuse from such, safe to use? No, not if any diseased combs were in the extractor. It is not hot enough.

20. Is there any danger in buying second-hand honey-cans or barrels? No. And I want to say second-hand goods of any kind are poor property to store honey in. Especially the 60-pound tin can, if emptied by manufacturers.

21. Will pickled brood, or black brood, produce foul brood? No. They are separate and a different germ. They are not liable to be in the same hive. Small-pox will not produce diphtheria, scarlet fever, or typhoid fever.

22. Can foul brood be cured by abundant feeding? No, so long as there is an abundance of feed coming in, either from natural sources or from feeders. When the supply stops, and brood is fed from stored honey from a diseased cell, said larvae will become diseased and die.

23. Will a foul-broody colony swarm? Yes, it is often the case. Diseased lightly.

24. Will a diseased colony carry disease while swarming? Yes, it is liable to do so.

25. Is such a colony goes to the woods, will that bee-tree be diseased? No. I have proven this in four cases at least. Said bees are without any combs or even foundation in the tree until they have produced it, and by that time they have consumed what diseased honey they took with them.

26. How, then, can a bee-tree become diseased? By the bees from the tree robbing some diseased colony.

27. In a locality where foul brood exists, if all diseased colonies are treated, is there not great danger from diseased bee-trees near by? No. A diseased bee-tree will soon have no live bees, and the squirrels and bee-moths will soon dispose of everything in the tree. This I have also proven in several cases.

28. Are any of the drug treatments a sure cure? No. They only check it for a time.

29. Is there any sure-cure method? The McEvoy treatment cures every time, if carefully followed.

30. What is the real cause of foul brood? It is hard to tell. We know conditions where it produced disease.

31. If my bees are diseased what will it cost to cure them? and can I expect anything from them the same sea-

son? In Wisconsin it costs the bee-keeper about 25 cents per colony; also my board for one or two meals, if I help him. We save the wax, honey, hives, and bees, losing only the brood at the time of treating. I take as my baggage a latest improved wax-press, and it is freely used. Every bee-keeper should have one. In an apiary I inspected the first of July every colony was more or less diseased. I gave instructions what to do; the owner did as directed; I returned 23 days later—hives full of combs and brood, and 48 finished sections per hive. Basswood bloom.

32. If there is no disease in our part of the country why do we need any one to inspect our bees? You do not know the condition of your neighbors' bees—no, not so well as your bees do. There is too much exchanging among bee-keepers, and buying queens and other supplies from strangers.

33. Should every State have legislation on foul brood? Yes. If so, and the laws are enforced, the disease would soon be gone.

34. How can legislation be secured? Very easily. All join your State Association, and through that you can get what you ask for. Of course, all such will belong to the National Bee-Keepers' Association.

A Member—Will bees that are diseased by foul brood show more viciousness, and more easily attack a person that raps on the hive?

Mr. France—No, sir, I think not; if anything there will be a tendency, I think, the other way.

(Continued next week.)

## Contributed Articles.

### Emptying Unfinished Sections and Using for Baits.

BY G. M. DOOLITTLE.

I QUITE like that department of "Our Bee-Keeping Sisters" in the American Bee Journal. It is all of it good reading, very interesting, and a help to the men as well as to the women. But there is a sentence on page 199 that I cannot understand, and when I do not understand a thing I am almost sure to ask, "Why?" The sentence is this:

"We want our sections all emptied in the fall, as we use them for bait-sections, and would consider them spoiled for that purpose if the honey was allowed to candy in them, as it will be sure to do if left till spring."

Now what I want to know is, *Why* would Miss Wilson consider bait-sections spoiled because honey had candied in them? Will she please tell us in her department, and then we can all know of this matter?

With the exception of one year, I have always left my partly filled sections till spring to be cleaned out, and if they are spoiled for baits for this reason, I did not know it. And the honey always candies in them to a greater or less extent, the same as she hints at its doing in Illinois.

One year I tried the "robbing" plan in the fall, and supposed I followed the directions given for this job to a T, but when I came to overhaul the supers I found fully one-fourth of the combs in them so torn that they were practically spoiled as far as their being of any use for baits. I then decided that I would follow my old plan of having them cleaned in the spring; and now Miss Wilson tells me they will be spoiled if I do this.

One of the reasons for my leaving them till spring is that the bees are *always* sure to clean them, and that without tearing the combs in them, by placing them over almost any colony of bees; but if so placed in the fall they will often fail to clean them, and so I have to remove them partially cleaned when I come to prepare the bees for winter.

The second reason why I leave them for spring is, that I can at this time feed any colony which may be short of stores, and to do it in a way that will stimulate brood-rearing to such an extent that I often gain more from the brood thus reared (when turned into bees for the honey harvest) than the honey would be worth for any other purpose. With the fall "robbing" plan we cannot feed the colonies we want to; in fact the larger part of the honey thus fed is gotten by just the colonies which do not need it at all.

The way I do this spring feeding to have sections cleaned out is to put a sheet of enameled cloth, the size of the top of the hive, over the frames, and on this placed a "bee-quilt," so that the enameled cloth will be kept warm, and thus drops of water will not form on the outside, as it will if only the enameled cloth is used, on cool nights.

This enameled cloth has one of the front corners turned up so that a few bees can pass through at a time, and on this is set a super of wide frames—to the number used when full, lacking one—and these are spread about a bee-space apart. On this super is set the super of part-filled sections, the sealed part of which has the sealing broken with a wire hair-brush, or by passing a table-knife flatwise over the capping. This allows the honey which drips from the broken cells to fall down on the wide frames, and then dripping down through them and over them on to the enameled cloth below, to an extent sufficient to rouse the bees to great activity; and the carrying of the honey causes them to feed the queen, and she in turn lays lots of eggs, while the excitement of the whole keeps the brood-chamber up to that point of heat at which brood-rearing is carried on to the best advantage.

Opening hives a week after they have been so treated, I have found them with more than doubled brood, and thought I was doing a nice thing in this way. But Miss Wilson says not.

The combs are left on till I want them for use, when this super of cleaned sections is raised up (as we do in taking off filled supers), a bee-escape board slipped under, and the next day or two the whole is taken off free from bees; and, so far as I can see, in perfect condition in every way. And why should this not be so? Why are they not cleaned as perfectly as by the fall robbing plan? Allow me to ask Miss Wilson if she has tried bait-sections cleaned in the fall and those cleaned in the spring, side by side in the supers during the next honey harvest? If so, could you detect any difference between those cleaned in the fall and those cleaned in the spring, after both were filled with new honey? I have tried this, and I could not detect the least particle of difference in any way, shape or manner.

Can't the bees clean sections or the cells of the honey-comb as clean in the spring as in the fall? They always do, so far as I know. Can't they clean them CLEAN and free from honey, whether candied or otherwise, in the spring, summer, or fall? I know it has been claimed that all the candied honey is not cleaned out, and hence the new honey in spring-cleaned sections is tainted by the old candied honey, and thus the new is made to candy in the combs. But all of my experience goes to prove that such claim is a fallacy?

Did Miss Wilson say what she did, from a belief in this old assertion, taking it for granted that it was true? or has she other reasons for the sentence quoted? If other reasons the whole bee-fraternity stands "agape" for those reasons.

I consider this thought, that no section should be used after honey has candied in the cells of the comb therein, as a relic of the past, when it was asserted by some that the whole section once having been worked in by the bees so as to store it partly full, was fit for nothing hence forward but to melt up the comb and make fire-wood of the wood part. I fought such advocacy of waste, at the time, as did others, and supposed the whole idea had been dropped, till I noted that sentence from the pen of Miss Wilson.

Now if spring-cleaned sections are just as good as those cleaned in the fall, bee-keepers want to know it. From my own experience, by testing the two side by side several different times, I say they are. What substantial proof can be given saying they are not? It is not sufficient to say we have known honey to candy in them. So have I known it to candy in newly-built combs, and those fall-cleaned, and in some seasons quicker than in others. But I have never known of it candying any quicker in the sections which were cleaned in the spring than in those cleaned in the fall. If the spring-cleaned are just as good, there is much advantage in leaving the part-filled sections to be cleaned at that time, as all bee-keepers will readily see without my taking time to enumerate the advantages here more than I have done in the above.

There was a time when it was said that comb foundation in sections was of little advantage unless it could be put in the same *right fresh from the mill*, and immediately on the hives. This I fought also, and proved by testing the fresh and that four years old, side by side, that the bees accepted one as quickly and as readily as the other; and everybody now purchases foundation at any time of the year when most convenient, which is a help to them and the manufacturers, much above what it would have been to

have clung to a fallacy repeated o'er and o'er, first made by some one who only *guessed* that he was telling the truth. And I expect that this matter of *only fall-cleaned sections* will turn out the same way when *careful experiments* are made along this line.

## Sulphuring Honey to Protect from Bee-Moths.

BY D. M. KITCHAM.

**I** OFTEN notice in the American Bee Journal references to fumes of sulphur having injurious effect on honey-comb and not killing the larvæ of bee-moths. As I have acquired some experience of value to me on this subject, I will give it to benefit other readers.

There seems to be a difference of opinion among bee-keepers in using the fumes of sulphur to kill the larvæ of the bee-moth, while others object to its use on account of coloring the comb and thus reducing its value when placed on the market.

In 1870 we had four apiaries that averaged 55 colonies each, and at that time we used a four-pound box containing two combs, and after taking the boxes of honey from the hives and keeping it from the larvæ of the bee-moth until sold was to me a disappointment, one way or the other. If we sulphured it, it looked yellow, green and white—rain-bow like—didn't please the eye, and brought less money. If we did not use sulphur the larvæ of the bee-moth made many boxes unfit to place on the market.

But in sulphuring we noticed some of the combs yellow or green, while other combs remained white and free from color. This set us to thinking that there was a right way and a wrong way of doing things. We worked hard to find the right way, for we believe it pays well to learn which way that is.

After experimenting a great deal, and learning nothing of value, one morning, very early in the wee hours, I awoke with my head full of "bee-biz." And it appeared to me the damp or wet combs only were colored by the fumes in sulphuring. So that very morning we took 20 boxes of honey and placed them on the table near an open window so the wind would blow all about them, and left them there until 2 p.m. Then they were taken to the house used for sulphuring and placed on the racks. Then 20 boxes of honey was selected that was damp, or "sweating," as it is called, and placed in the house on racks opposite the other 20 first taken there.

The house used for sulphuring was 6 feet square and 7 feet high. A hole was dug outside, extending under the house, and bricked up, and this is where 24 ounces of brimstone was burned for one hour. Then the door was opened, with the results obtained.

Since that experiment we have not had any colored comb or section honey damaged by the larvæ of the bee-moth. It was a success.

Please gently inform Dr. Miller that it will kill them every time. (Page 695—1901). Say, Doctor, what about those fellows an inch long? My boys say if we would let them grow to be that size our combs would all have a "veil" over them.

Wayne Co., N. Y.

## Starting and Managing Out-Apiaries.

BY C. P. DADANT.

"Will you please tell me whether you think it will pay me to start an out-apiary about three miles from my home yard? Can I profitably keep 50 colonies in each place? I like the bee-business and have succeeded in wintering my bees for ten winters with a loss of only 3 or 4 colonies, and have now 48 colonies in the cellar. Don't you think it will be a good honey-year? I produce only extracted honey.—T. L., Fayette Co., Iowa.

I believe it will always pay a man to keep bees in a fairly good country, if he likes the business and enjoys it. Even if he hasn't much liking for it, if he has determination and is not afraid of the stings, and is careful and industrious, he can make bee-keeping pay.

When I was a boy I had no liking for bee-culture. The stings proved exceedingly painful, and although my father was always at his bees and spent a goodly portion of his time watching them and overhauling them, I often asserted that I would never be a bee-keeper. But when I became 18 years old, my father happened to take sick with hay-fever during the very best honey-flow that I have ever seen. He asked me to go to the bees. So I fixed myself up and sum-

moned my courage and went to work. What I saw in the apiary during the few hours of that day's work made a bee-keeper of me. The hives were literally running over with honey. Some colonies that had no supers had managed to find their way into the cap and had built snow-white combs running the entire length of that cap and those combs were shining with honey. Hives that had been provided with supers, probably because their colonies were stronger, had those supers full; one or two colonies had begun work under the bottom-board, and two or three swarms, harvested a week or so previously, had their hive-bodies about full and were ready for supers. I went to work with a will, tried to follow instructions as to the proper handling, and found it was pleasant work, after all.

I must remind you, however, that bees are very much more peaceable when harvesting large quantities of honey than at other times, so I did not become too much discouraged at first with stings, and after awhile I had become so inoculated that the stings were no longer dreaded.

From that day on there were two bee-keepers in our home, instead of one. But I did not have the patience of investigation that my father had. I was willing, however, to work under his instructions. We had a big crop that year, but the following one was bad. Still we kept on, and within three or four years we had enough bees to make it necessary to start an out-apiary.

Our aim has always been to keep about 80 colonies in one spot. Whenever the number exceeded this quantity, we began colonizing in a new apiary. We usually started with from 20 to 35 colonies in the new place, increasing by artificial or natural swarming as occasion offered. We used a few small hives at first, but gradually changed them into larger ones. Little by little we increased until we became possessors of six apiaries, numbering between 400 and 500 colonies. But we have long since decreased from that number. Other things demanded our attention, and we were compelled to trust the handling of the bees to other hands.

There is an undoubted profit in handling bees on a large scale. We have had several crops that have netted us, all labor paid, from \$2,500 to \$2,800 in honey and wax. The outlay is small, but it takes a determination to attend to the work, at the proper time and in the proper way.

Some men never succeed with bees because they lack the knowledge of some of the most simple requirements, or because they do not employ good judgment. For instance, I have seen a bee-keeper, whom I had thought a practical man, take three combs out of a hive of bees and return them wrong end foremost and improperly placed. That is, in replacing the combs in the hive he put the honey at the front, when it should be at the rear—the place where the bees usually put it so as to defend it against intruders; and he placed a comb of brood on the outside of the cluster, separating it from the others with a comb of honey. It was at a season when the brood should be kept together so as to be cared for easily, the weather being cool. Either this man had no judgment, or he was unaware of the necessary precautions in handling bees. This is seemingly a trifling matter, but it constitutes the difference between the successful apiarist and the unsuccessful one. If you have kept bees for ten years and have succeeded well, I will vouch these small matters have caught your eye, that you know how and when to open your hives, and that when you leave an apiary for a week or more, you can feel reasonably sure that nothing will suffer in your absence unless some accident happens. That is one of the requirements in the establishment of an out-apiary. We cannot be there continually, and at each visit the hives must be left in such shape that we may be confident that there will be no robbing of a weak colony, no starving of a destitute one, nor any lack of room in the supers during a heavy flow.

Of course the bees must be located near some house, so that possible swarms may be harvested. But I see that in one of the best honey-producing sections that I have ever visited (in Colorado), they do not think it necessary to put their bees near a house. The out-apiaries there are most usually placed in the middle of an orchard, or in some corner of a field, or under some cottonwoods, without any attention, except from the owner, who comes to them from time to time.

The production of extracted honey in an out-apiary is a very good method, and I will speak on this matter in some future article.

1903 PROSPECTS AS A HONEY-YEAR.

Do I think this will be a good honey-year? Yes, I do, as much as I may be able to judge. The white clover has

not been so bright and as plentiful as it is now for 12 to 13 years. But, for all that, we can never be sure of a good season ahead of time. The causes that make the nectar to appear in the blossoms are beyond human knowledge thus far. We all have an indistinct idea that it takes warmth, moisture and an atmosphere charged with electricity. But predictions on the weather—the one who says the least is the best prophet, because he runs the least risk of making a mistake.

Hancock Co., Ill.

## Don't Let Swarms Get Into a Mix-Up.

BY WM. M'EVROY.

LAST season was the worst one ever known in Ontario for many swarms rushing out at the same time, and all clustering in one great cluster. Where this takes place it uses up much of the bee-keeper's time in putting things to rights, and delays all his other work, which needs very prompt attention, and ends the season with many dollars short in his honey crop.

Last summer I saw the swarms coming out of eleven of my colonies at the same time. I called my help and we very promptly covered ten of them with quilts, and sheets, and left the one that had the most bees out go on and alight, which it did; and before they had half clustered four more colonies started swarming, and these were just as promptly stopped by covering them with quilts which went down to the ground, and hung out about a foot from the hives; and under these quilts the bees rushed out of their hives pell-mell for a few minutes, and then returned back into their hives.

As I keep all my queens' wings clipped, and finding the swarm up the tree not returning, I knew that it must have a young queen with it, and at once hived that swarm, and promptly took the quilts off the 14 colonies so as to let in the field-bees that were coming home hunting for their hives. I then went to work, and divided the bees and made a swarm from each of these 14 colonies, which I had prevented from swarming, and secured a good yield of honey. I hit on this method over 25 years ago, and have practiced it every since, and it has been worth many dollars to me.

Ontario, Canada.

## Association Notes.

### The Foul Brood Bill in Illinois.

Reports from Springfield are very encouraging. Pres. Smith and Sec. Stone, of the Illinois State Bee-Keepers' Association, are on the ground, and go to see some of the lawmakers every week or two. If the bill becomes a law we can thank the few bee-keepers who have personally labored with their representatives in the Legislature.

As we understand the situation now, the Legislature of Illinois will adjourn about May 1, and between now and then we will probably learn our fate. The most serious danger that threatens us is that our bill will be smothered by a multitude of other bills in the rush of the last days of the session. But we have done all we could. The fact that the two Associations have joined hands in efforts for the bill, may have enough weight with the Legislature to cause favorable action.

Let me sound a note of warning: Don't any of you break your hearts if we fail. This may be only the opening wedge to break into a success in the next meeting of the Legislature, in 1905. Then we can go at them with an added force from our experience of the present.

I wish to say right here that less than a dozen have taken enough interest to subscribe money in aid of our bill. Possibly less than 100, all told, have written to the members of the Legislature and given any thought to the matter. And there are 35,000 bee-keepers in Illinois! If we fail, can you guess why?

HERMAN F. MOORE,

Chairman Foul Brood Committee,  
Chicago-Northwestern Bee-Keepers' Association.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### The Spring and the Bees.

This has been rather an unusual spring. March 7 we took out some 20 colonies of bees, let them have a good flight, and carried them back into the cellar again. March 13, we took out 20 colonies, and left them out. March 19, the thermometer stood at 75 degrees, and we took all the rest out. Really, the weather was so warm that they might just as well have been taken out two weeks before, although we have had two or three snow-storms since.

One day the thermometer stood at 76, and the bees were having a lovely time bringing in such large loads of pollen, and the next day the ground was covered with snow.

Taking it all in all, I am glad we took them out when we did, although it might have been better to have carried the weaker ones back to the cellar during the storms. The time for bringing the bees out of the cellar, as well as the matter of returning, is rather a troublesome question to decide. Who can tell just what is best?

Our bees wintered finely, and came out in good condition as far as we can judge from outside appearances, considering they were put into the cellar under very adverse circumstances. On account of having a furnace put in they were obliged to leave the bees out until December. They were carried in the 8th and 9th, after the thermometer stood at 8 degrees below zero.

We have not done any overhauling yet, because for a month past everything else has been set aside for the tabernacle meetings, led by Rev. W. A. Sunday, with audiences of 800 to 1200, resulting in more than 200 conversions.

April 21 picked a dandelion in blossom. Pretty early for Illinois; but everything is early this year.

### The Chayote as a Honey-Plant.

Have any of our bee-keepers had experience with the chayote? Not the coyote belonging to the genus canis, whose name is so similar to that of the tropical plant, but the chayote, *Sechium edule*, the vegetable pear.

However, it is on account of the chayote's value as a bee-plant, and not in regard to the edible qualities of its fruit that I am chiefly interested. But as to any personal knowledge concerning this Mexican vegetable, I have that yet to learn, though if all goes well my experience will not be afar off, inasmuch as I have planted the seed early this month, keeping, of course, the buried treasure indoors, until all danger of frost is over, before transplanting.

Although a plant of the tropics, the chayote can be grown in cool latitudes, it is said, therefore I hope it will take kindly to Indiana soil. The instructions state that it requires a somewhat sheltered situation, and something to climb upon; also, that it is the universal practice to plant the entire fruit instead of extracting the seed, and planting it alone.

The United States Department of Agriculture, Division of Botany, published a Bulletin by O. F. Cook, concerning the chayote. It contains a number of plates, and is a beautiful and interesting pamphlet, and, as far as known, this paper is "the first adequate account of the nature, culture, and economic value of this promising member of the squash family."

Regarding its value as a bee-plant, the Bulletin states: "As in other vegetables of the squash family, the stamens and pistils are in separate flowers, pollination taking place through the agency of insects. To attract these the flowers of both kinds, but especially the pistillate, yield abundant nectar, which is secreted in ten glands, two at the base of each of the lobes of the corolla. In most of the countries into which it has been introduced bee-keeping has not been a regular industry, and the value of the chayote as a source of honey has not been noticed, but the reports of experimenters in New South Wales contain very emphatic statements on the subject:

"When the plant is in flower I have noticed that the vines were swarming with bees, and as flowers are scarce

in the autumn the plant will no doubt be valuable as a honey-producer.'

"It has long been known that the flowers of this family are rich in honey, but from the standpoint of the bee-keeper they have been considered of little importance because seldom accessible in sufficient amount, though in the United States fields are recognized as good bee-pastures. The chayote seems to make up by numbers what the flowers lack in size, so that the yield of honey may be larger than in related plants. In addition to this there is the fact that Secchium is a perennial bloomer in the tropics, and in the subtropical regions has a very long season."

KATE V. AUSTIN.

## \* The Afterthought. \*

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, O.

### SELLING LIGHT-WEIGHT CASES AND SECTIONS OF HONEY.

The Chicago Convention seemed to have quite a discussion about the honesty of selling light-weight sections and cases. All right. Let there be more such discussions. In the long run daylight is apt to have a wholesome effect upon naughty deeds. Here's a chunk of wisdom to help things along: Some practices are essentially and incurably wrong. Some practices not necessarily dishonest are objectionable because they lend themselves to dishonesty so easily. The good man may yield to the latter because he has to; but at the former kind the good man stops off. If he is found doing them his title of "good man" gets a bad dent in it. The paternal desire to make other people be honest as well as ourselves is good within certain bounds, but has been known to be carried too far. Page 164.

### KINKS IN FORMING NUCLEI.

Two good items not universally known on forming nuclei: Make them toward the close of several days of bad weather, and the bees will not go home nearly so badly. Mixed bees from several colonies do not go home so badly as is the case when the bees are all from one colony. The last item is something of a curiosity, and is worthy of study to find out why. Doolittle, page 165.

### A POETICAL MIX-UP ABOUT HIVES.

When Mr. Aikin gets into the thick of the fight defending his new hive he slumps into poetry and says—

"Mr. Doolittle kicks  
About a few sticks."

Yes, and there's the Styx, across which our bees might be landed by a few ill-fated kicks—the pranks of new inventors—"if we don't watch out." I fear Mr. Aikin, in his defense, ignored the weakest point—brood-nest pushed across the sticks only a few days ago, and lo, here comes a long, cold storm with winds. I rather fear the brood-hive will recross the sticks, and the exposed young brood below cross the Styx. Page 166. (Please don't allow yourself to lose that concluding rhyme.)

### KINGS NOT ENCOURAGED IN THIS "LOCALITY."

Name of the king of Finland wanted, eh? And Dr. Miller hadn't even the grace to say, "I don't know." Knew all about the king of Finland, of course, but couldn't let a child in the apicultural kindergarten be wandering from the subject so. Page 168.

### FORMALIN VAPOR FOR FOUL BROOD.

It's not a thing to rush into in a headlong manner, but up to date the power of formalin vapor to extinguish all germs of foul-brood seems one of the most promising new things. Promises to be better than destruction of the combs at any time, and immensely better on the numerous occasions when bees are disinclined to build on account of poor honey-flow. Page 180.

### FEDDING SOUR HONEY TO BEES.

As to the problem of working over soured honey, it seems to be granted by all that it may be fed in warm weather as a supply for hungry brood. Possible, of course, but may we not have been too hasty in assuming that it

was profitable? If a man should stand up and call that a very unprofitable thing to do, how could we refute him? When damaged honey is fed to bees with the idea of making them renovate it and store it as surplus, I think this is the way they proceed:

They take it into their stomachs, fly around with it, eject the greater portion as urine, and finally store the lesser portion as sound, or nearly sound honey. (Reason why so few find "feeding back" profitable.) Now is it not probable that they do this same thing in breeding-time before any of it actually gets to the brood? And may they not wear themselves out in the process more than the amount of food saved will pay for? Put it, if you please, at the rate of ten old bees worn out for nine young ones reared. Bees in mid spring are precious things, and we want to figure close on them.

When we heat damaged honey some of the badness is evaporated out, or foamed out; but the acids stay in—and so I fear do most of those things of mean taste which the chemist has not got around to name yet. Good honey has a remarkable power to disguise bad flavors. So this is what takes place—I guess—in the cooking down; we get rid of the alcohols and muclages and part of the water. Then the thickened honey—that part of it not damaged—disguises to some extent the other bad things. Not very satisfactory.

Honey and virtue and beautiful snow

Better not soil in the first place, you know.

Page 181.

## Questions and Answers.

CONDUCTED BY

DR. C. O. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

### Questions by a Beginner.

1. How can I put a swarm of bees into a hive with all those frames in it? If I would move the frames over while dumping the bees in, they would come out before I could put the frames back and cover the hive. My hives are chaff hives.
2. How does the queen-cell look when the bees are going to swarm? Does it look any different from the other cells at any time?
3. Will the scent of sulphur hurt the bees? Will they stay in the hive?
4. Where is the queen when the bees cluster in a bunch on a limb? Where does the queen stay in a hive?
5. How can I tell when other bees are robbing mine? How can I stop them?
6. Where do I clip the queen's wings? Will a pair of sharp shears do it?
7. When is the best time to put on sections, before the bees swarm, or when they first start out in the spring?

PENNSYLVANIA.

ANSWERS.—1. If a swarm is gently dumped right on top of the frames the bees will go down of themselves without moving the frames. But it may be better to put the swarm at the entrance of the hive and let them run in.

2. A sealed queen-cell looks like a peanut at all times.
3. It will do no harm.
4. The queen may be anywhere in the bunch on the limb, and in a hive generally on or near the brood.
5. Catch a bee as it is leaving the hive, crack it open, and if it has honey in its sac it's a robber belonging to you or some one else. One way to stop robbing, if you can stop it at all, is to pile a lot of hay or straw at the entrance and sides clear to the top of the hive, and keep it thoroughly wet.
6. Yes, almost any scissors will do—sheep-shears would be too large—and you may cut off half or more of the wings on one side.
7. Put on sections when the chief honey-flow begins—in your region about as soon as you see white clover in bloom.

### How to Detect Foul Brood.

I have been reading the American Bee Journal for about three months carefully, and Prof. Cook's book, and have been noticing particularly what is said about foul brood. I have 9 colonies of bees; I bought 4 colonies in the winter, and have been suspicious of one colony for some time, for fear they have foul brood, on account of the different odor in the hives. They fly out and work as strong as almost any of the rest. What is the best way to know whether they have foul brood or not? How long will a colony live after it gets foul

brood? and how long will it take others to become infected, sitting side by side of them. What shall I do with them if they have it? Please explain as plainly as possible, as I am beginner.

MISSOURI.

**ANSWER.**—This letter illustrates what was said in this journal editorially not very long ago, when it was urged that every one should study up carefully in advance the subject of foul brood. You will find in your text-book answers to most of your questions more full than it is possible to give in this department.

Look on page 475 in Cook's "Bee-Keeper's Guide," and after reading the instruction there about the holes in the cappings and the springing back of the rotten larvae you can make a pretty safe guess as to whether you have foul brood or not; whereas I can't tell a thing about it from the information you have given.

A colony may live a few months or several years after it has foul brood, and it will take the other colonies as long to contract the disease as it will take them to get the least drop of honey from the diseased colony. You will do well to send 25 cents to the office of the American Bee Journal to get a special pamphlet on foul brood.

### Varieties of Bees—Feeding.

1. It would be of interest to see in the American Bee Journal what an Italian bee is, where the Carniolians, Goldens, Moore's and Holy Lands first originated, and what the different natures of each strain of bees are.

2. To stimulate early brood-rearing, is it necessary to feed every day, or would one good feeding a week be sufficient, where feeding on the bottom-board inside of the hive? IOWA.

**ANSWERS.**—1. Yes, a few of the readers of these pages would be interested to read all about the different races of bees, but thousands of them would say, "We don't want space taken up with that, for we all have it in our text-books." This department is only supplementary to the text-books, and not intended to take their place.

2. If flowers are not yielding and weather is warm, the natural harvest will be more nearly imitated by a little every day, or every other day, than by one feed a week.

### Feeding Sugar Tainted with Kerosine.

I put 35 colonies in my cellar last fall, which came out all right. I have 100 pounds of sugar that I would like to feed them, but it has had kerosine-oil spilled on it. What can I do with it? MASSACHUSETTS.

**ANSWER.**—A very little oil will likely do no harm. If much, mix some sugar with water, half and half, let settle and skim off the oil; if still too strong for the bees to take, I don't know of any remedy.

### Queenless Bees—Wiring Foundation.

1. I have 2 colonies of bees that are queenless. If I should give them a frame of brood and eggs from another colony would they rear themselves a queen?

2. Last year I used full sheets of foundation in brood-frames, and had a good deal of trouble with the foundation breaking down when the bees got on it. I had it wired crosswise of the frames, too. It seems to buckle above the wires. What would be the objection to wiring the frames up and down, then the foundation would not buckle, would it? KANSAS.

**ANSWERS.**—1. Yes, but it is not likely that the queen would be the very best, and probably you will do better to unite with one of your weaker colonies that has a good queen.

2. I wonder if you had the foundation fastened to the top-bar. Yes, I have had hundreds of frames wired vertically, and no buckling, although nowadays horizontal wiring is generally preferred. For my own use I prefer vertical slits.

### Transferring—Beginner's Questions.

1. I bought 7 colonies of bees late last summer, and they were in bad condition. The hives are old and rotten, and the comb is old and black. The first warm days this spring they came out and all seemed to be at work, but later all but one colony seemed to be sluggish and lazy. Would it be best to put two colonies in one hive?

2. Would I better transfer them to new hives? If so, when is the best time? and when shall I proceed?

3. Will they always work when they have a queen? and will they ever work when they have none? Some of my colonies are not at work yet; when I open the hive there seems to be lots of bees.

4. A notice in the Journal reference is made to a text-book. Where can I get one? I know I am green, but I will learn.

5. My bees are alive with ants, and they also have moths. What would you advise? TENNESSEE.

**ANSWERS.**—1. As you say later on that there are plenty of bees in the hives, it is hardly advisable to unite. Possibly there is nothing for them to do—no flowers to be had.

2. It would be better to have new hives than rotten ones, but old, black combs are as good as new ones. If the hives are frame hives, and the frames are of the right kind, merely lift the frames into the new hive. Otherwise transfer as directed in your text-book. You can

transfer in fruit-bloom; or perhaps it will be better to wait till the colony swarms, hive the swarm in a new hive, and 21 days later break up the old hive.

3. When there is nothing for them to work on they may lie idle; if pasturage is plenty they will work, queen or no queen, but a queenless colony seems little inclined to hustle like the others.

4. Now you're a man after my own heart to ask a question like that. Between you and me, I feel badly many a time when some beginner asks me a question and I'd like to tell him all about it, but it's something that's explained more fully in the text-books than it can possibly be done in this limited department, and if I should answer it here some new subscriber would want the same question answered inside of three months, and I'd have to keep answering over and over questions that none of the other readers would care anything about. So I'm glad you're after a text-book. There are several of them, and you can get one from any publisher of a bee-paper or from any supply dealer. Perhaps it would be just as convenient for you to get one from George W. York & Co., 144 E. Erie St., Chicago, Ill., publishers of this journal. I'll ask the editor to tell me more particularly either here or elsewhere, about the text-books and their prices. But let me caution you about one thing: He publishes the book "Forty Years Among the Bees," and you may think from what he says that you ought to buy that. Don't you do it. At least not for your first book. One of the others will be better, and then it will be all right for you to get "Forty Years" as a second book. [See the book list on page 239.—ED.]

5. Strong colonies will clean them out, and Italians are much better than blacks.

### Painting Hives with Bees in Them.

Would the odor of fresh paint affect or anger the bees if I painted the hives while the bees are in them? IOWA.

**ANSWER.**—No, unless you jar the hives. A few bees might stick to the paint.

### Questions on Queen-Rearing.

As I wish to rear one hundred or more queens this season for myself, and as I see there is a difference in thoughts presented by such men as G. M. Doolittle, E. Gallup, Henry Alley and others, I feel that a few questions will be appreciated by those who are interested in the subject of rearing queens for themselves—queens that will be the best that it is possible to rear, not having any "missing link" whatever in any.

1. If the only way to rear extra-good queens is by natural swarming, and by natural superseding, then has not man reached a limit beyond which no further progress is possible?

2. Almost all seem to agree that there are three things necessary in order to rear long-lived, prolific queens whose workers are sturdy and long-lived. These three things seem to be, plenty of animal heat or sunlight; plenty of royal jelly; and to be started out and kept laying continuously and to the full capacity during the first season. It is a well known fact that swarms usually issue on the sealing of the first queen-cell, thus taking away one-half or more of the bees in the hive, and would not the queen hatched out, in case the weather became cool, be lacking the proper amount of heat required to produce a good queen? And especially so if the cells were on the end of the frame, or at the bottom, as they usually are?

3. Does any one know that the royal jelly is any different when supplied at natural swarming time, and that supplied at other times?

4. Does the queen lay a different egg at natural-swarming time than she does at any other time?

5. Does any one know that the egg she lays in an embryo queen-cell is any different from any other worker-egg?

6. Is the umbilical cord attached to the cell during the whole life of the larva, or is it thrown out after the larva has partly developed? Has any one ever found such a cord for the first three days after hatching?

7. Is there not considerable in keeping the queen laying to her full capacity during the first of her laying season? Is that not one of the reasons why so many are not prolific when kept in a nucleus for some time after commencing to lay? WISCONSIN.

**ANSWERS.**—1. I don't know just what chance there is for further progress, but I believe, with a good many others, that just as good queens can be reared outside of natural swarming and superseding.

2. I suppose all are agreed as to the need of plenty of heat and food, but I think many believe it necessary to have a queen laying continuously to her full capacity during the first season. Usually the weather is so warm at swarming time that there is little trouble about heat, but some time a cool time may come. Sometimes you will find a dead larva or pupa in one of the lowest cells, but there are always enough cells in the warm parts of the hive.

3. I think it is known to be the same.

4. No.

5. I think it is known to be the same.

6. I don't believe there is any umbilical cord either before, or after the first three days of life.

7. I don't know, but I doubt the importance of it.

**Queenie Jeanette** is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical beekeeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

### What Yon Yonson Thinks

Vel, my goodness, ay feel kine of sorry for Peter Peterson, coz he is struck wid prosperity plenty bad. Mebby it's cause he rot too much confidence. He bean work for Ole Peterson for 40 days, an he git 40 dollar, an he haven plenty mony, an now he tank he iss yust som smart somnobody, an he yust lurn to talk merican like nutting. It coms yust so natural for Peter to lurn merican som to ete cabbage. My goodness, Peter say ven he only been in Unity State for tree monts he could talk merican in tree different langvize, and he tank he iss a dandy feller. He say to Ole Peterson, he don't goan to milk his cows any more, so if Ole vont dom cows milkt he can yust do it self. Vel, Ole he don't lak das, so he say, "My goodness, Peter," he say, "ef you don't goan to do da work, den ay goan to turn you off." But Peter he don't care, he say if Ole Peterson turn him off den he goan to quirt. An he don't goan to work for him any more. Dat's vot Peter sed.

An he say he vont for Yon Yonson to lurn him how to keep bees. Vel, Peter iss som purty smart feller, so mebby ay hire Peter to help drive da bees das summer. Peter vil be youst da feller for brush-svartuing, only ay iss kine of frade dat mebby eider da bees or Peter is liable to abscond; but if ay can keep Peter an' da bees togeder long nuif den if Peter don't ketch on, mebby da bees ketch on to Peter. An Peter is good for bout 500 revolutions per minit, in case oxidet.

Peter he say he vont to keep yon svarm on sbare, an he goan to sho me bow to git lots of hunny. "Vel," ay say, "if you promis not to lide becine da potatis box agin, den you can have yon svarm on sbare. An ven yon colony of kine of black bees, dom is kine of kross, so mebby you git more dan your share; but ay vil give dom new quveen so dom soon vil be all clover bees," ay say, "an' dom vill all have long tungs."

Vel, Peter say he don't kar vot kine of tungs dom got, or if dom is tung-tied, or even got glas eyes, but he don't vont yon shal have any longer stings dan iss absolutely necessary.

Now, Peter, he don't vas married yet, but he got awful nice girl vat live along da telephone line. Ay tel Peter if he don't vouch out he soon goan to be ole batch, an dom say ole batchers don't live so long as young ones. Vel, Peter he say he don't believe da married mans live any longer, but mebby it seems lots longer, he say, cause dom have more trouble.

But Peter he tank it is fun to call up his girl on da telephone an kine of mak love. New, it iss gainst da rules to do any sparken on da telephone, cause you know da soums kine of silly; but ven da boys along da line listen to Peter, dom has more fun dan Peter, so ve don't vas enforce da rules on Peter yet.

Now, Peter's girl, Christina, she live on different line, so he hav to call up Central. Vel, da boys along da line dom kine of put up job on Peter, an ven Peter call up Central an say, "Give me Christina, please," den Central girl she ring, but ven da hotel da nigger cook, so purty soon she say, "Hello, sah!" "Hello, Christina?" Peter say, "How is you feeling das evening?" "Oh, fine, fine," she say. "Is yo Sambo?" she say. "No, it don't vas any rainbow in vinter," Peter say, "but mebby ve goan to hav som more snow," he say, "an mebby ay goan to com' round tomorrow nite an' tak you slay ride, an ve go to church," he say.

"Bies yo dea' hart!" she say. "Yo is de bestes nigger in town." "My goodness," Peter say, "ay don't vas any nager. Seems to me your voice don't vas soon natural," Peter say; "yo musta hav bad cole, ay hope you don't vas sick."

"Hoo is yo?" she say. "Is you Sammy?" "No, ay don't vas Santa," Peter say. "It don't vas time to hang up yours stocken now." he say. "Santa Claus is vay up in Alaska now," Peter say. "Do ay talk lak Santa Claus?" he say. "Santa don't vas got his phone connected yet," Peter say. "but ven

YON YONSON.

## FROM MANY FIELDS

### Bees Wintered Well.

The bees have wintered well. I have four yards. The season is much farther advanced than usual. White clover appears to be in abundance, and dandelions are opening, but the cool winds prevent bees from working; in fact, I think we are losing quite a few bees from their eagerness to work. They fly out when too cool, and become chilled after they can return to the hive.

H. G. QUIRIN.

Lucas Co., Ohio, April 9.

### Prospects Good.

Bees are in the best shape this spring that I ever had them at this time of the year. I have some booming stock to breed from. Prospects are good for a good year.

D. J. BLOCHER.

Stephenson Co., Ill., April 13.

### Results of the Season of 1902.

My last year's report is, (spring of 1902), 45 colonies, increased to 59 by division the latter part of August, and got 250 pounds of comb honey and 3900 pounds of extracted. I sold the most of it at home for 15 cents per pound for the comb and 9 cents per pound for the extracted. I lost 2 colonies in cellar-wintering, and the remaining 57 colonies are in good condition. I took them out of the cellar March 17, and March 18 they carried in natural pollen; but, besides, I used about 60 pounds of ryeflower which they carried in.

The outlook for the coming honey crop is fair, on account of almost all the fields that are not plowed being covered with white clover. I had no natural swarms last year.

Dodge Co., Wis., April 14. Wm. SEITZ.

### Bees Starving.

Bees are starving all over this part of the country. Many will spring dwindle because of no breeding last fall. I don't know my loss yet, but it will not be more than usual.

JOHN C. STEWART.

Nodaway Co., Mo., April 14.

### Experience with Bees.

I have received the American Bee Journal regularly since I subscribed for it, and I am well pleased with it, as well as with the book which contains so much bee-information.

I commenced keeping bees about five years ago, and in 1901 I, with most other bee-keepers, met with almost an entire loss, the bees, seeming to have had the dysentery, all well died leaving plenty of honey, which would have wintered them. When we came to examine the honey we found it strong and watery, unfit for use in any way.

In 1902 I bought 5 colonies with which to start a new apary. In November I placed them in the cellar for winter, all well provided with winter stores, and wintered very nicely.

The first part of last season (1902) being a wet one the bees scarcely made enough to keep them, but cast some strong swarms. The season closed with a good flow of beautiful honey. One large swarm was hived June 26, which filled the lower chamber and 48 one-pound sections of surplus. I sell all my comb honey at 18 to 20 cents per pound.

**THE FRED W. MUTH CO.**  
HONEY AND BEE-KEEPERS' SUPPLIES.  
Front & Walnut Sts., CINCINNATI, OHIO.

Please Mention the Bee Journal when writing Advertisers \*\*\*\*\*

I have Italian bees, and use the Langstroth hives almost entirely. They were well provided for the long, cold winter, and have thus far done nicely, and all are in a healthy condition. In November I packed the bees in a shed well banked and darkened; heretofore I have wintered them in the cellar with nearly as good results, only I find my colonies damp at times, causing some colonies to sweat and mold.

Although my apiary is not very large there is much room for it to grow. There are not many bees kept near where mine are, the nearest apiary consisting of about 50 colonies, being three miles southwest of here.

I think I will get my bees late a tight next week if the weather is suitable.

I consider it a great pleasure to take care of my bees. I study every article pertaining to bee-culture; still we must work and experiment with them ourselves, as there is nothing in any line of business like real experience. There is a great deal in keeping an apiary neat and clean, keeping the hives well painted and well arranged in some clean, shady place. **OREN S. REED.**  
Fayette Co., Iowa, March 21.

**Two Years of Failure—Outlook Good.**

The last two years were failures here, but the outlook is good for this season. There is lots of white clover. The weather is cool and rainy. Plums are in bloom. **W. D. HURT.**  
Cass Co., Mo., April 9.

**Quite a Loss in Wintering.**

There is quite a loss in bees here this winter. We had any amount of honey-dew last fall, and a severely cold winter. I think these were the cause of the loss. Prospects are fair for a good honey crop the coming season. **G. W. VANGUNDY.**  
Uinta Co., Utah, March 23.

**Hand Crushed and Stung.**

While moving part of my bees to an ordinary I got my hand smashed, and at least 100 stings about my head and face. A defective bridge was the cause of the trouble. My hand is very painful, but no bad results from the stings.

Bees are booming to-day, the weather is fine, and prospects flattering. **ELLIS CO., TEX., MARCH 8.** **LON ROSSON.**

**Bees Coming Out Fine.**

Bees are coming out fine this spring, and the indications are that they will find plenty of nectar this season. The first pollen came in on St. Patrick's Day—March 17. **F. KINGSLEY.**  
Thayer Co., Nebr., March 31.

**Unfinished Sections.**

In reply to Mr. Bevins, on page 235, I would say that I did not intend that method for fall feeding, as I scarcely ever feed in the fall; I prefer building for strength, and also using the best-billed combs to fill up with.

Now I am nearing the 72 mark in age, and have owned and handled bees since I was 18 years old, and believe the bees I own now are similar in character to all others, and I could never get them to carry down honey as you, Mr. Bevins, recommend. It has been my experience that however strong they were, if in the fall some of them come out both short in stores and weak in numbers. These are the ones that need close attention, and the ones I feed with my unfinished sections, and it is the only method I have ever found successful.

You say that you want the bees to have access to the honey in the sections at all times. If you do, why do you place anything between them? Why not set your super on as usual? With me the cloth did not work at all, but with the board I have no trouble.

As to the use of the firmer chisel I think it by far the handiest tool in the business. No matter if it does mangle, you will have new crowding which will surely be white and new. Doubtless you will smile again on reading

this, for no doubt you are one of these old, worthy veterans, and think there is no way like your own. That is all right—I am bordering heavily on that line.

You will plainly see the reason why I speak of the circulation through the hive if feeding in the spring, as the weather is not to be depended upon at all times in regard to heat and cold. Some have said honey in unfinished sections would candy. I have never had any trouble that way, and even if I did I would scrape off down to the septum, and that would relieve the matter.

Now, Mr. Bevins, we will have no quarrel, but we must be near you. I would refer you to 28 Epistle of John, 1st chapter, 12th verse.

A. Y. BALDWIN.  
DeKalb Co., Ill., April 13.

**Wintered All Right.**

My bees have wintered all right, and have clustered out on the hives some.

Look for a good yield of honey. My bees swarm very little. I have not had a natural swarm for four years. I have kept bees for 40 years, and think I have learned something about bee-keeping, but I do not know it all yet. I have no increase in colonies.

HENRY BEST.  
Carroll Co., Ohio, April 9.

**Using Veils—Bees in Germany.**

Over seven years ago I started to keep bees, and at that time looked upon myself as an expert bee-keeper, but I found out that I had more to learn than I could possibly crowd into my head in one year. It is: past seven years, and I do not know it all yet.

One thing I found out, and that is, that I could hardly follow J. M. Young's remarks about bee-veils, on page 215. I am for a bee-veil, and a good one at that. I am not a particle afraid of bees, but I don't care a bit what some one else thinks when they see me go to work with them with my face protected with a good veil. Please remember I had some experience in the line of walking among the hives without face protection. I had a three month long getting on my eyes cured which was affected with the sting of a bee.

On page 216 I read something about bee-keeping in Germany; as Mr. Hasty expected, locality had something to say. It is a matter of fact that in the southern part of Germany they use houses, with few exceptions, for their bees; and in the northern States they use the straw-hive; and in later years the improved hives, and change places with the bees according to the flowers in the different localities.

Now, Mr. York, I can not help getting a

little "poke" in at you and your "York's  
Honey." I had, last season, an average of 85  
pounds of No. 1 comb honey, sold it at 12 1/2  
and 15 cents a pound, and every section had  
my name stamped on it. Please do not get  
mad, but I would not have left it off even if I  
had to take the honey back, if I sold it to you.

I have 18 colonies of bees in fine shape on  
the summer stands. The weather is warm,  
and the bees are busy carrying in pollen and  
building up for the expected clover honey-  
flow.

I hope every bee-keeper in this land will  
find himself well paid, at the end of this com-  
ing season, for all his trouble and stings.

Lewis Co., Mo., April 4. **JOS. KELLER.**

## How Far Bees Go for Honey.

Allow me, for the many bits of information  
I derive from the American Bee Journal, to  
give in return my little item of knowledge.

One writer says he has noticed that bees do  
not go more than a mile from the hive for  
honey. I am in a position to be quite sure of  
what I say—I am the only one with bees in  
this section of British Columbia. A man 13  
miles away got some bees last year; previous  
to that time there were no bees within 40  
miles of me. Before the 13-mile neighbor got  
his bees mine were the only ones in the coun-  
try, and they were seen on gooseberries in a  
garden 3 miles away, or more than 2 miles as  
the crow flies, or rather, as the bee flies.  
They were also seen in another direction  
about 3 miles away, as the bee flies. In each  
case, also, they had to fly over principal hills  
to get to these gardens; so I am sure they go  
more than a mile, or even 2 miles in search of  
honey.

My 5 colonies appear to be in good shape,  
but as soon as I have peeped into the hives I  
will write more fully. **H. BEER.**

British Columbia, March 30.

## Good Prospects for Clover.

I got my last 8 colonies out yesterday, and  
they all seem to be in good condition. I lost  
one colony out of 219, and that was queenless;  
all the rest are alive at this time.

We have the best prospects for white clover  
in 10 years. **N. STAININGER.**

Cedar Co., Iowa, April 9.

## Some Wintered Well, Others with Loss.

My bees came out of winter quarters very  
strong—I have never seen them as strong in  
the spring during the long time I have kept  
bees. I hope for a good year. Lots of bees  
around here starved during the winter, and  
more will follow this spring. Those that  
were cared for in the fall and had been fed are  
in good shape. **HENRYMAN LUEDDERS.**  
Garver Co., Minn., April 7.

## Results of Wintering.

EDITOR YORK:—I must admit that you  
editors are generally a blessing, nevertheless  
you are at times a bother, which the follow-  
ing will show:

In the January number of the Rocky Moun-  
tain Bee Journal, Editor Morehouse called me  
a terrible name, and tells how many colonies  
of bees I am to commence the honey season  
with in 1903; and all this without my knowl-  
edge or consent, else I should have insisted  
on his leaving out the estimate as to how  
many colonies I would have in the spring.  
And now you tell the public that it's assuring  
a great deal on the part of Mr. Gill to tell  
how many he will have left in the spring, and  
this without giving me any chance to explain.  
Well, as You Yonson would say, "You both  
been awful nice fellers," so I am going to let  
you off this time.

To help Mr. Morehouse out a little in his  
predicament I will say that I have been quite  
fortunate in wintering 800 of the best col-  
onies, the loss having been only 5 percent.  
But of 400 that were in poor condition last  
fall the loss was about 30 percent. Bees that  
were in prime condition have wintered as  
well as usual the past severe winter. But as  
there was a greater percent of bees in poor

condition last fall than usual, I think, on the whole, that the loss has been greater than for a number of years in Colorado.

The outlook for what we have is certainly very favorable, and now if we are faithful unto a few things we may be made ruler over many.

M. A. GILL.

Boulder Co., Colo., March 30.

**CONVENTION NOTICES.**

**Illinois.**—The spring meeting of the eastern part of the Northern Illinois Bee-Keepers' Association will be held at the residence of James Taylor, in Harlem, Winnebago Co., Ill., on Tuesday, May 19, 1903. All interested in bees are cordially invited to attend.

B. KENNEDY, Sec.

**Minnesota.**—The Fillmore County Bee-Keepers' Association will hold its spring meeting in Preston, beginning the evening of April 29, and continuing over the 30th. Mr. N. E. France, General Manager of the National, will attend the meeting, exhibit the workings of a German wax-press, and make the meeting generally interesting in answering questions and giving instructions in up-to-date apiculture. Mr. France will also speak on the following subjects: "The Busy Bee," "Foul Brood and How to Cure It," "Illustrated by Samples and Charts," "Marketing Our Next Hooney Crop," "Buying Supplies in Car-Load Lots Next Year," "Benefits of the National Association to Its Members," and "The Benefits of a Honey Exchange." C. D. Hitchcock will speak on "Fishing for Comb Honey;" E. A. Crowell, on "The Value of Good Queens Over Poor Ones, and How to Get Them;" "The Value of Text-Books and Bee-Papers," and "Marketing Our Next Hooney Crop," by members of the Association.

The Question-Box will be a prominent feature of the meetings. Questions will always be in order, and will be freely answered.
