INDEX OF CONTENTS.

JULY TO DECEMBER, 1895.

- A**
- ABERDEEN University, agricultural department in, 553; agricultural teaching in, 334
- Aberia caffra, fruits of, 737
- Abies hybrid, 685
- Abney House, Boarne Ead, 240
- Abnormal Cattleya flowers, 495
- Abraxas grossulariata, 553
- Acer Lorbergi, 586
- Achimenes lanata, 456
- Adhatoda cydoniaefolia, 578
- Advertisements, old-time, 488
- Æcidium nymphæoides, DC., 96, 135; *Æ. chenopodii*, 135
- Ærides Sanderianum, 206
- Æschynanthus Hildebrandi, 324
- Africa, Aristolochia elegans in, 369
- Agave americana, flowering at Woodstock House, 244
- Agaveatrovirens, 544; *A. Kewensis*, 330
- Agricultural Gazette, 332
- Agricultural returns, 524; teaching in Aberdeen University, 334
- Agriculture, railway companies and, 493; the British Association and, 332
- Ailanthus bark, 619
- Alberta magna, 484
- Allotments, the Manchester Royal Botanic Society in regard to, 364
- Alsiœmerias, 91, 687
- Amasonia erecta, 132
- Amber, English, 429
- America, fruit-growing in, 395; flora of North, 740; cultivation of the Licorice-root in, 737
- American Apple-crop of 1895, the, 641; notes, 152
- American nursery, quantity of worked trees in, 770
- Amphiteca nigripes, 642
- Anemone japonica, monstrous, 526
- Aogora, Tragacanth and Persian berries in, 365
- Angræcum pellucidum, 158
- Annals, 608
- Anona Cherimolia, 577, 619; in Constantinople, 734, 757
- Anthraxite coal as a manure, 73
- Anthurium, bracteate forms of, 73; hybrid, from Ghent, 73
- Aphides on Lettuces, 526
- Apiary, the, 212
- Apios tuberosa, 501
- Apogamic Ferns, 211, 271, 305
- Aponogeton distachyon var. Lagrangei, 215
- Apple, a black diseased, 685
- Apple, Ben Davis, 582; Blenheim Orange, history of, 749; Cox's Orange Pippin, 684
- Apple crop of 1895, the, 641; culture, 519; fruit, second crop of, 526; grafts on Pear stocks, 131; Newton Wonder, 710, 746; the Spitzenberg, 268; trees trained on a roof, 270; in shrubberies, 719; with skin black, 620; with flower at side, 430
- Apples, best varieties of, 555; colour in, 556; Nova Scotian, 334; popular varieties of, 587; prices of, 499; in Normandy, glut of, 716
- Apricots from standard trees, 247
- Aquatics, cultivation of, 69
- Araucaria imbricata, 74; at Bourne-month, 217
- Arauja albena, and moth-catching, 246; *A. sericifera*, 211
- Arbicultural Society, the Royal Scottish, 387
- Aristolochia clypeata, 484; *A. elegans*, 452; *A. elegans*, in Africa, 369; *A. gigas* var. *Sturtevantii*, 518; *A. longifolia*, in Hong Kong, 306; *A. unguifolia*, 44
- Arnold arboretum, the, 461
- Arnold, Matthew, as a lover of flowers, 738
- Archieokes, 9, 648
- Arundina bambusaefolia, 388
- Ash, the orange-berried Mountain, 361
- Asparagus culture, lecture on, 655
- Assimilation and respiration in vegetables, 132
- Assimilation in plants, 329
- Aster corymbosus, 372
- Aster field, an English, 484; *A. Maackii*, 391; plants, failure of, 216
- Asters, China, 152; hybrid, 620; supposed natural hybrid, 526
- Astilbe Lamoinei, 358
- Attar of Roses, the adulteration of, 333
- Auricula, the, 643
- Australia, frozen flowers from, 682; horticulture in Western, 678
- Australian flowers, 301; timber, 335
- Azalea indica alba at Penrice Castle, 129
- Azaleas at Walton Lea, Warrington, 65
- B**
- Bamboos and the past winter, 17; hardy, 186
- Bambusa Metake, 747
- Bananas at Hampton, 706; the cultivation of, 240
- Bankfield, Odontoglossums at, 90
- Barbarea vulgaris, 217
- Bard, lines to a minor, 79
- Bark from Ailanthus, 619
- Baroda State Gardens, retirement of Mr. Henry from, 675
- Barron's, Mr., retirement, 133, 158, 161, 186, 214, 244, 246, 270, 304, 335, 337, 371, 372, 400, 682, 712; a national testimonial to, 494, 526, 746
- Basket, Seasell's patent Orchid-, 748; West's improved Orchid-, 306
- Bateman's, Mr., garden, sale at, 130
- Battersea Park, Palms at, 650
- Bauhinia Galpini, 452
- Bean, the Climbing French, 246, 272, 304, 652; kidney, dwarf Parisian, 167; the Carob, 264
- Beech, round-leaved, 18
- Begonia disease, 304, 337, 544, 586
- Begonia Gloire de Sceaux, 720; *B. × Mrs. J. Heal*, 585; *B. incomparabilis ×*, 680, 715; the tuberos-rooted, 267
- Begonias at Messrs. Ware & Sons, 464
- Belgium, notes from, 162, 182, 298, 391
- Bellis perennis, 206; "The Bride," 131
- Belvoir Castle, notes on the herdiness of some plants at, 38
- Benefit and Provident Association, United Horticultural, 501
- Bentley Priory, the gardens at, 556
- Berlin Industrial Exhibition, 1896, 770
- Berlin notes, 424, 610, 708
- Berlin, the International Exhibition at, 45
- Bermuda Lily, 304; introduction of the, 271
- Bible, plants of the, 735
- Birmingham Botanical Gardens, 156
- Black Currant × Gooseberry hybrid, 218
- Bletia Shepherdii, 154
- Bommer, the late J. E., 17
- Book-learned gardener, the, 616
- BOOKS, NOTICES OF:**—A Garden of Pleasure (*E. V. B.*), 130, 215; Agriculture, Practical and Scientific (*Jas. Muir*), 717; A History of Gardening in England (*Hon. Alicia Anherst*), 733; Amateur Orchid Cultivator's Guide-Book, 2nd edition (*H. A. Burberry*), 618; Biology Notes (*J. - Brown, Robert, memorial to, 493
- Brunsvigia Josephina, 460
- Budding-knife, a new, 306
- Bud-growth, 246
- Bulb garden, the, 454, 708
- Bulbs in water, 774
- Bulbophyllum Medusæ, 486
- Bull's, Mr., nursery, corridor at, 160
- Barbank, Luther, an American hybridiser, 391
- Barford, group of Cattleyas at, 428; Orchids at, 326
- Bateshire, horticultural features of Rotheray and, 291
- Batter-market, and the fat from the Cocoa-nut, 491
- C**
- Cacti, giant, at Kew, 190
- Calcutta Royal Botanic Gardens, 96
- Californian notes, 334
- Calochortus varieties and their culture, 14
- Cambridge Botanic Gardens, notes from, 518, 643
- Campanula mirabilis, 616; *C. nitida*, 335
- Camposema erythronioides, 642
- Canada, flowers of the North-west Prairie in, 67
- Cannas, 106; at Chiswick, 71; improved varieties of, 293; in Italy, 362; Italian, 703
- Carnation, the development of the, 210
- Carnation diseases, 72
- Carnation, Duke of York, and others, 74
- Carnations, 191; and Picotees, 8, 644; attacked by grubs, 685, 748; at Eaton Hall, Chester, 371; at the National Society's Show, 134; lecture on, 103; Marguerite seedling, 161
- Carrot, Veitch's Scarlet Model, 425
- Carvopteris Mastacanthus, 486, 612, 684
- Cassiobury Park, the gardens at, 355
- Castanea vesca, female replacing male flowers in, 218
- Catsetum Christyanum, 618; *C. tabulare* var. *brachyglossum*, 454; *C. tabulare* var. *rhinophorum*, 44
- Cattle poisoning by the Common Yew, 160
- Cattleya, a malformed, 705; *C. aurea*, 454; *C. Bowringiana*, 640, 672, 746;

- C. *candida*, 486; culture at Stand Hall, 454; C. *Dowiana anrea*, 388; C. *elongata*, 422; flowers, abnormal, 495; C. *Gaskelliana*, 206; C. *granulosa*, 180; C. × *Hardyana*, 154; C. *Hardyana*, var. *Lindenii*, 36; C. *labiata*, 519; C. *labiata*, albino varieties of, 762; C. *labiata Mossii*, 90; Mendel's, malformed, 35; *Mossii*, Linden's *Champion*, 188; with double growth, 526; C. *Schilleriana Dulcotensis*, 154; C. *velutina*, 180; C. *Warszewiczii*, 360
- Cattleyas, a list of hybrid, 10; at Laeken, 672; group of, at Burford, 428
- Ceanothus *Gloire de Versailles*, 392
- Cedar of Goa, the, 430
- Cedar of Lebanon at Tapley, 17; large, 134; a large, at Beechwood Park, 272; some historic, 526; C. *Libani* blooming out of season, 620
- Cedrus *Deodara*, struck by lightning, photo of, 218
- Cephalotaxus *drupacea*, 717, 747
- Cerantonina *Siliqua*, 264
- Cereus *giganteus*, 330; C. *triangularis*, 421
- Ceropegia *Sanderstonii*, 643; C. *stapeliiformis*, 643
- Chalmersford, syllabus of the summer school of horticulture at, 361
- Chelone *barbata*, 488
- Chemistry, protoplasmic, 330
- Cherimolia, fruits of the, 737
- Cherry, the *Lutovka*, 462; *Morello*, culture, 592; trees, pyramidal sweet, 74
- China Asters, 152
- China, opium and morphia in, 334
- Chinese insect-wax, 365
- Chiswick, the Royal Horticultural Gardens at, 233, 522, 620; cost in maintenance, 246, 272; inspecting committee, the, 300; new superintendent, 586
- Chiswick Carol, a, 750
- Chiswick trials, the, 304, 336, 371, 463
- Chiswick vegetable show, 271, 300, 307
- Chou de Burghley, 463, 556
- Christmas plants and flowers at, 742; Christmas Roses, 736
- Chrysanthemum *Boule d'Or '95*, 498
- Chrysanthemum exhibition, the National, 552
- Chrysanthemum, food requirements of the, 181, 272, 305, 486
- Chrysanthemum Golden Wedding, 643, 684; M. *Chenon de Leché*, 683, 720; maximum and its allies, 327; × *Princess May*, 295
- Chrysanthemum, about, 495, 580, 546, 618, 652, 706; finishing the blooms of, 422; grafted on *Anthemis*, 688; in the East of London, 553; late-flowered varieties of, 720, 775; National Society's Jubilee celebration, 492; propagation of, 677; taking the buds of, 64
- Cider, Messrs. Gaymer & Son's, 132
- Cider-making, the industry of, 130, 355
- Cineraria, origin of, 17, 89, 134, 186, City corporation markets, 302
- Clematis *Davidiana*, 293, 336; and C. *graveolens*, 501
- Clematises as useful climbers, 303
- Clerodendron *fallax*, 710; C. *trichotomum*, 210, 642
- Climate and its influence on the origin of root crops, 451
- Cochliodas, 360
- Cocoa-nut, fat from, 491
- Cocos *auriculata*, fruits of, 620, 685, 737; C. *leiospatha*, 620, 685, 737
- Cœlogyne *cristata* in a wire basket, 45
- Colchester Roses, 22
- Collector, an Orchid, 335
- Collinson, Peter, 5, 36
- Collooney, hardy plants at, 642
- Colonial notes, 2, 68, 456, 749
- Colour in butterflies, 682
- Colours in flowers, 744, 748
- Compasses, Low's group of, 218
- Conservatories, grouping for effect in, 298
- Convolvulus *macrostegius*, 405
- Coombe Court, Kingston-on-Thames, 36
- Coomber, retirement of Mr. W., 583
- Co-operative Festival, National, 242
- Cordylina *Banksi*, on Stewart Island, 613
- Cornell University, subjects of teaching at, 189, 494
- Cornus *canadensis*, 643
- Coryanthes *leucocorys*, 154
- Cotton Plant in America, 45
- Cow Parsnip, the, as fodder, 685
- Crab, the uses of, in the garden, 432, 499, 500, 556, 587, 620, 684
- Crabs in the garden and wood, 584, 719
- Crataegus *mollis*, 453
- Crinum *purpurascens*, 330; C. *roozenianum*, 132
- Crops for the garden, rotation of, 399; rotation of, 38, 367, 464
- Cucumbers, winter, 738
- Cultoghey, Perthshire, notes from, 434
- Cultural Memoranda, 12
- Cupressus *squarrosa* (*Retinospora*), 360
- Currant, black, pest, 101
- Cycas stem producing branches, 722
- Cyclamen culture, 684
- Cyclamens, German and British, 610, 652, 708
- Cycnoches *Haagsi*, 485
- Cymbidium *giganteum*, 424
- Cypripedium *Charlesworthii*, 424; hybrid, peculiarities in, 620; C. *insigne*, with peloriated sepals, 763; C. *Kimbballianum*, 154, 265, 292; C. *Lebandyanum* ×, 90; C. *Littleanum*, 36; C. × *Lord Derby*, 245, 271; malformed, 135; C. *selligerum*, 206, 641
- Cypripedium, origin of the slipper in, 748
- Cyrtopodium *Andersoni*, 126; C. *Woodfordi*, 612
- D
- DAHLIA, *Cactus*, Mrs. Wilson Noble, 367
- Daisy, the double-flowered, 206, 336, 376
- Daphne *indica rubra* at Berkeley Castle, 684
- Darlington, the public park at, 424
- Darmstadt exhibition, 64
- Davidson, Mr., presentation to, 650
- Dell, Orchids at The, 577
- Dendrobium *cruentum*, 91; D. *Hildebrandii*, 93; D. × *illustris*, 15; D. *Phalœopsis* var. *hololenca*, 396
- Dendrobium, red-flowered, 337, 371
- Deodar struck by lightning at Kew, 190
- Deutzia *Lemoinei* ×, 389
- Devonport People's Park, 553
- Diacrium, the species of, 640
- Diatæa in foliage leaves, 463
- Dichorisandra *thyridiflora*, 643
- Diospyros *Kaki*, 577
- Dipladenia *amabilis*, 620; D. *boliviensis*, 643
- Diplosis *pyrivoræ*, 556
- Disa *grandiflora*, 215; at Joldwynds, 179; in Edinburgh Botanic Garden, 183; D. *kewensis*, 273
- Disease in Begonias, 544, 586; the spot, of Orchids, 419; of Carnation, 72
- Diseased Parsnip, 526; Pear, 526
- Dormant period in plants, the, 675
- Doryphora *sassafrasæ*, 245
- Dresden, the coming International Horticultural Exhibition at, 748
- Drill-Hall meetings, regulations at the, 587, 618, 619
- Drink, a tasteful summer, 303
- Droitwich, a park for, 7
- Droseras, and their cultivation, 267; in Scotland, 101
- Dryas *octopetala*, 643
- Duchatre, the late M., 73
- Dunedin, Streatham Hill, 426
- Dyer's, Mr., address to the Botanical Section of the British Association, 328
- E
- ECCREMOCARPUS *scaber*, 392
- Edinburgh Botanic Garden, 456; plants in flower at, 37, 721
- Egypt, gardening in, 44
- Elder, a new golden, 458; the red-berried, 210
- Elmet Hall, Leeds, 40
- Embankment gardens, Charing Cross, 99, 715
- Epidendrum *Godeffianum*, 424, 640
- Epping Forest and the Commissioners, 71; report by the Commissioners upon, 648; the treatment of, 680
- Etrichium *strictum*, 336, 372
- Essex Summer School of Horticulture, 73
- Eucharis *grandiflora*, 716
- Eucomis *punctata*, 501
- Eugenia *malaccensis*, 132
- Eufalia *japonica*, 685
- Eupatorium *serotatum*, 265
- Evelyn, Jno., 575, 772
- Evelyn Park, the, Deptford, 577
- Events of the year, 768
- Examinations in horticulture, 70
- Exhibiting, prizes and point values in, 305
- Exhibitions, judging at, 336; a question relating to international horticultural, 709
- F
- FASCATED *Lilium speciosum*, 301
- Fern hybrid, a bi-generic, 365; apogamic, 211, 271, 305
- Fernery, a British, 746
- Ferns in pots, 639
- Fibres, vegetable, 682
- Ficus, a, strangling a Mango tree, 327
- Figs in pots, early, 500
- Finger-and-toe in Turnips, 618
- Fire tree, a, 488
- Flies attacked by a fungus, 18, 135, 685; and plant-lice, 266
- Flies, dead, adhering to Barley, 620
- Flora, the, of the Amour littoral, 676; of Kashmir, 646
- Floriculture in Hanley, 645
- Florists' flowers, 7, 64, 325, 422, 643, 677, 708, 739
- Flower garden, the, 13, 41, 69, 96, 126, 157, 184, 213, 241, 269, 298, 330, 363, 395, 426, 459, 490, 520, 551, 582, 614, 647, 678, 711, 741, 766
- Flowering shrubs, the use of, 748
- Flowers, as food, 762; preserved for winter, 761
- Flowers, sacred, 483; sexuality in, 428
- Food requirements of the Chrysanthemum, 272, 305, 486
- Food requisite for the Tomato, 235
- Foods and drinks, vegetable, 498
- Forester, the education of the, 581, 612
- Forestry, 39, 165, 387, 367, 487, 581, 612, 739; in Scotland, the promotion of, 493
- Fossil-tree, a Welsh, 521
- France, notes from, 292; the Institute of, and its relation to botany and horticulture, 492
- French Horticultural School at Versailles, 261

BRILLIANT ILLUMINANT.
In casks, carriage paid, 8d. per gallon.
ANDREW POTTER, Melbourne Works, Wolverhampton. Maker to the Queen and Prince of Wales.

GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 12 ounces as a winter dressing for Vines and Orchard-houses trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s. from the Trade. Wholesale from **PRICE'S PATENT CANDLE COMPANY (Limited), London.**

C. BEESON'S MANURE.—Composed of Blood and Bone. The best Fertiliser for all purposes. Sold in tins, 1s., 2s. 6d., and 5s. 6d.; also in air-tight bags, 4 cwt., 8s.; 1 cwt., 10s. Full directions for use sent with each tin and bag. 1 cwt. and above sent carriage paid, cash with order.
O. BEESON, Bone Mills, St. Neot's, Hunts.
"12, Knowle Road, Brixton, London."

"I have tried this fertiliser on various garden crops, and I am able to say that it is an excellent Manure for Vegetables, Flowers, Vines, and Fruit Trees."

"A. B. GRIFFITHS, Ph.D., F.R.S.E., F.C.S."

J. WEEKS & CO., Horticultural Builders to Her Majesty, H.R.H. the Prince of Wales, H.M. Government, Admiralty Dept., War Dept., Royal Hort. Soc., Royal Botanic Soc., Parks and Public Buildings, Patentees of the Duplex Upright Tubular Boilers, King's Road, Chelsea, S.W.

London County Council.
 TO NURSERYMEN and BULB GROWERS.
THE LONDON COUNTY COUNCIL is prepared to receive **TENDERS** for the SUPPLY of BULBS for the various Parks and Gardens. Parsons desiring to submit tenders may obtain a copy of the specification, form of tender, and other particulars, at the Parks and Open Space Sub-Department, County Hall, Spring Gardens, S.W. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Tenders are to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, and marked "Tender for Bulbs." No tender will be received after 10 o'clock A.M., on Friday, July 19, 1895. Any tender which does not comply with the printed instructions may be rejected. The Council does not bind itself to accept the lowest or any tender. **H. DE LA HOOKE**, Clerk of the Council, Council Hall, Spring Gardens, S.W., July 4, 1895.

TENDERS are invited for the **ERECTION** and **HEATING** of a **CONSERVATORY** to be erected in the **WEST END PARK, WOLVERHAMPTON**, in accordance with plans and specifications which may be obtained from **THOMAS H. MAWSON**, Park and Garden Architect, Windermere, on a deposit of 10s. 6d., which will be returned on receipt of *bona fide* Tender. Tenders are to be addressed to the Chairman of Floral Fête, Town Hall, for receipt on July 16. **N.B.**—The Conservatory is to be erected on the puttyless glazing system.

EDINBURGH SCHOOL OF RURAL ECONOMY.—SESSION 1895-96. **BOARD OF MANAGEMENT** appointed by the University Court, the Highland and Agricultural Society, the Town Council of Edinburgh, and Contributing County Councils. Chairman—The Right Hon. J. P. B. Robertson, Lord Justice-General. **COURSES OF INSTRUCTION** are provided both in **DAY** and **EVENING CLASSES** for **FARMERS, GARDENERS, FORESTERS**, and others interested in Rural Economy. The **SESSION** begins in **OCTOBER** and ends in **MARCH**. Fees Specially Moderate. Copies of the Syllabus may be had from **THE SECRETARY** of the University Court, Edinburgh.

Fifty Nurseries, Market Gardens, Florist and Seed **BUSINESSES** to be **DISPOSED OF.**
MESSRS. PROTHEROE AND MORRIS' **HORTICULTURAL REGISTER** contains full particulars of the above, and can be obtained, gratis, at 67 and 68, Cheapside, London, E.C.

FOR ORCHIDS and GARDENERS to grow them, apply to **SANDERS**, St. Albans. The finest stock of Orchids in the World.—30 minutes from St. Pancras.

SPECIAL TERMS TO THE TRADE.

THE CELEBRATED XL ALL VAPORISING FUMIGATOR.

The Cheapest, Most Simple, and Best Fumigator in existence. A Liquid Compound simply Evaporated from a Small Copper Cup by the Agency of a Spirit Lamp.

Prepared in Bond, from Duty-Free Tobacco, by Special Permission of the Hon. Board of H.M. Customs.

One Fumigation with this clears houses of insects for double the length of time that can be accomplished by the use of any other Fumigator. Note the remarkable saving of expense:—

Compound

For using in the Fumigators.

Bottle.	Enough for cubic feet.	s.	d.
No. 1	40,000 ..	24	0
No. 2	20,000 ..	13	0
No. 3	10,000 ..	6	6
No. 4	5,000 ..	3	3

PATENT.

Showing a cost for fumigating of only 8d. per 1000 cubic feet of space.

Fumigators

(Will last for Years).

To do 5,000 cubic feet of space at a time, 2s. each.

To do 2,000 cubic feet, 1s. 9d. each.

The following is a Specimen from hundreds of Testimonials:—

From W. & G. DROVER, Nurserymen, Trinity Street, Fareham, June 26, 1895.

"Your XL All Vaporising Fumigator we have tried in our Gardenia and Orchid-houses, and it eclipses everything—so simple any youth may use it. We have given our Stephanotis-house several turns, and now there is not a mealy-bug to be seen there."

Beware.—Inferior imitations of the Compound are reported to be in the Market.

Every label on the bottles and tins of the genuine article bears my Registered Trade Mark, No. 175,113, with Vine-leaf and Monogram. When this is not on the label the compound is not genuine. Don't be imposed upon, and probably have your plants destroyed or injured.

To be had from all Nurserymen, Seedsmen, Florists, and Sundriesmen; or, direct from the Sole Proprietor.

SATURDAY, JULY 6, 1895.

PETER COLLINSON.

IT may be fairly questioned whether the annals of horticulture contain a more anomalous an individuality than that of Peter Collinson, who did more to encourage the cultivation of exotic plants during the earlier half of the last century than any other man, and who never wrote a book! It is more than passing strange that this restless and enthusiastic cultivator should have fallen into the great obscurity which surrounds his name and his work; for even the memoir of him in the *Dictionary of National Biography*, by the late Robert Hunt, F.R.S. (vol. xi., pp. 382-3), is far from satisfactory, one or two of the most important sources of information concerning him being entirely overlooked. Posthumous fame is more often than not the only species of gratitude vouchsafed to men who have done much on behalf of their country; but if the *post-mortem* eulogies of Peter Collinson have been few, faint, and far between, he enjoyed the much more substantial and satisfying advantages of an exceedingly wide repute and appreciation during half a century of his long and busy life.

Peter Collinson was born at the paternal estate of Hugall Hall, or Height of Hugal, near Windermere Lake, in the parish of Staveley, about ten miles from Kendal, Westmoreland, on January 14, 1693-4. His parents were members of the Society of Friends, and were engaged in business as mercers. At a very early age Peter developed a passion for natural history, and when quite a young man had secured the friendship of the leading naturalists of the day—Doctors Derham, Woodward, Dale, Lloyd, and Sir Hans Sloane. The Earl of Bute was another distinguished naturalist who encouraged Collinson; and it was at the suggestion of the latter that Admiral Sir Charles Wager systematised his search for illustrative examples of natural products during his voyages—a considerable portion of the collections thus formed passed into the possession of Sir Hans Sloane, now an integral part of the British Museum. Collinson naturally experienced no difficulty in becoming a Fellow of the Royal Society—in his time, as present, the most exclusive of the learned bodies in this country—and was elected December 12, 1728, at the unusually early age of thirty-four years. He was an exceedingly diligent and useful member, not only in supplying the Society with "curious observations" and materials for discussion, but in promoting and preserving a most extensive correspondence with learned men in various parts of the world. His diligence and economy of time are described as such that, "though he never appeared to be in a hurry, he maintained an extensive correspondence with great punctuality; acquainting the learned and ingenious in different parts of the globe with the discoveries and improvements in natural

history in this country, receiving the like information from the most eminent persons in almost every other."

The most noteworthy of Collinson's correspondents were Cadwallader Colden, of New York, and Benjamin Franklin, of Philadelphia. The latter communicated his first essays on electricity to Collinson, in a series of letters, which were afterwards published,* and which will be found in the collected editions of Franklin's works. In 1730 a subscription library was set on foot at Philadelphia, and Collinson not only encouraged the movement by making several very valuable presents to it, and by procuring others from his friends, but he voluntarily undertook the commission to purchase a quantity of books—a task which he performed to great satisfaction for over thirty years. At the same time he transmitted to the directors or committee of the library, accounts of every new European improvement in agriculture and the arts, and every philosophical discovery, among which, in 1745, he sent over an account of the new German experiments in electricity, together with a glass tube, and some directions for using it.

A few months ago a very important series of long and interesting letters from Colden to Collinson, and a few from Franklin also, came into the market at Sotheby's, and realised very high prices. A few extracts from these letters will be valuable for future reference, although botanical matters formed but one of the many subjects dealt with in these epistles.

Writing to Peter Collinson from New Haven, in Connecticut, on June 26, 1753, Benjamin Franklin, *inter alia*, condole with the former "on the death of good Mrs. Collinson." "I do not," he says, "offer to comfort you by arguments drawn from philosophy or religion, such will readily occur to a person of your understanding and piety. Natural affections must have their course. The best remedy of grief is time." A contemporary has noted on the fly-leaf of this letter the following somewhat unpleasantly candid opinion:—"There was no occasion of any philosophy on this ever-to-be-lamented occasion. P. C. had few feelings but for himself, the same principle that led him to deprive his son of his birthright, when that son lay in the agonies of death, and knew not what he put his hand to, supported P. C. in the loss of the best woman in a manner that did no honour to his feelings, his gratitude, or his humanity." How far the charge made in the anonymous annotation to this letter is true, it is now impossible to say; but unsupported evidence of this kind is not of serious value.

From 1749 to 1757 Peter Collinson sent to and received a large number of exceedingly interesting letters from Cadwallader Colden, Lieutenant Governor of New York, author of *A History of the Five Indian Nations*. In the earliest of these, dated from New York, July 18, 1749, Collinson was asked to view "a chamber fire-engine, with long leather pipes, such as I am told are likewise used to water gardens, and cost about £5, if from experience they are found to answer the end for which they are designed;" and also 200 lb. weight of red Clover seed." A letter dated again from New York, March 17, 1753, Colden refers at length to botanical matters, one of the sentences being:—"I sent by last packet to Dr. Fothergill a description of a new genus, with a drawing of the plant by her [his daughter Jenny], which we have called *Filmaurea*." In another letter, dated August 11, 1764, contains the following interesting paragraph:—"In some of

your former you informed that you had the true Scammony from Alyayso growing in your garden. I am confident it will agree well with this climate. I should be glad of some of the seed to be sent so as to sow it next spring, and some of the seed of the true Hellebore. Dr. Whytte in his last letter informs me that the *Colchicum autumnale*, or Meadow Saffron, is found to be an extraordinary *Ducrelia*, and effectual in Dropsies. I wish to have it, as I think it is not a native of this country."

Only two letters appear to have been preserved out of the many which must have passed between Peter Collinson and Richard Richardson, the equally enthusiastic naturalist; these have been printed by Dawson Turner in his *Extracts from the Literary and Scientific Correspondence of Richard Richardson*, 1835. Neither appears to be in Collinson's handwriting, and were probably dictated by him to a secretary. The earlier of these is dated August 12, 1742, and deals chiefly with the death of Lord Petre, but it contains several horticultural items, which will be

Petre appears to have thoroughly entered into the spirit of their culture. He describes the great stove house of Lord Petre as "the most extraordinary sight in the world." All the plants, he goes on to say, "are of such magnitude; and the novelty of the appearance strikes every one with pleasure. The trellices all round are covered with all species of Passion flowers, which run up near 30 feet high: the creeping, great flowering *Cereus* blows annually with such quantities of flowers that surpries every one with their beauty, and at the same time perfumes the house with their scent." He does not tell us of the size of the great stove, but the lesser one measured 60 feet long and 20 wide, and "is full of a vast variety of all species of tender exotics." *W. Roberts.*

(To be continued.)

PARASITES.

At a seasonable time towards the end of last year (*Gardeners' Chronicle*, December, 1894, pp. 745-6), I contributed a few notes to this journal on the biological peculiarities of certain species of *Viscum* and *Loranthus*, having, at a previous meeting of the Linnean Society, exhibited a number of specimens of various plants parasitical on the stems and branches of other woody plants, in illustration of these peculiarities. A prominent feature in that exhibition, though one merely alluded to in the article cited above, consisted of specimens of Australian *Loranthus* and some of the plants on which they prey, exhibited to demonstrate the striking resemblance in the foliage of the parasite and that of the host. In some instances the resemblance are so close that a superficial examination is insufficient to detect the presence of the parasite when not in flower. The biological significance of this phenomenon has been interpreted in the sense of advantage to the parasite, though apparently without any very good reason, for they are in need of no special protection to ensure their existence and reproduction. Indeed, as I have already pointed out, several of those species parasitic on plants having similar foliage, grow equally as well on plants having totally dissimilar foliage. Bearing on this subject, Mr. F. Turner, F.L.S., Botanist to the Department of Agriculture, Sydney, has a very interesting article in the *Proceedings of the Linnean Society of New South Wales* (vol. ix., pp. 557 to 560), on exotic trees and shrubs affected by Australian *Loranthus* and *Viscum*. He gives a list of twenty-seven foreign trees and shrubs that have become hosts for native parasites; yet only a small number of the latter have been observed to attach themselves to introduced plants—only three in fact, out of about twenty-five of the *Loranthaceæ*. They are, *Loranthus celastroides*, *L. pendulus*, and *Viscum articulatum*. The last is a leafless Mistletoe with broad, flattened, jointed branches, and one of the most widely dispersed species, occurring almost throughout India and Malaya, and extending to China, Japan, and Polynesia, growing on a great variety of plants; yet Mr. Turner states that he never saw it growing on any native Australian tree except *Doryphora Sassafras* (*Monimiaceæ*). He had also seen it growing on cultivated Peach trees, but on no other exotic. In the Kew Herbarium, however, there are Australian specimens recorded as parasitic on *Pilocarpus* (*Rutaceæ*), *Exocarpos* (*Santalaceæ*), and *Baloghia* (*Euphorbiaceæ*). In the Sandwich Islands it is common on *Acacia Koa*; in Japan and China, on *Eurya* and *Camellia*; and in India and Malaya, on a variety of trees and shrubs belonging to various other natural orders.

Curiously enough, the *Loranthus* that most closely mimics or resembles, if the reader would rather, the native host plants, is the one that most commonly preys upon exotic plants belonging to a variety of natural orders. This is *L. pendulus*, which is common on some species of *Eucalyptus*, *Santalum*, *Acacia*, &c. It, and *L. celastroides*, between them, have been observed growing on twenty-six exotic trees and shrubs belonging to thirteen natural orders. Among the trees and shrubs on which they prey I may name the Tulip, Orange, Apple, Pear, Locust, Plum, Whitethorn, Olive, Elm, Plane, Alder, Walnut, Oak, and Willow—a sufficiently diverse variety.

FIG. 1.—PETER COLLINSON.
(From Nichols' *Literary Anecdotes*.)

read now with interest. For example, he says, "the *Laurus indica*, Aldini, is nowhere to be sold; the seeds of it were sent to Mr. Brewer, fresh, but they have not come up." And again, "Mr. Gordon has also had flower *Obeliscotheca* (*Rudbeckia hirta*, L.) with a red flower; he is the only gardener now left that has a good stove; but now Lord Petre is gone, I am afraid all stove plants will go down. . . . I tell you of a curiosity that I saw at Captain Goff's, an East India director, the true Tea-tree in great health. It was brought two or three years ago, a present, from China, to his wife. It is an evergreen, and is housed with the Orange-trees, for it grows on the more northerly parts of China and Japan, about the latitude of forty degrees north." According to Miller, the Tea-tree was not imported into England before 1768, which is, therefore an error.

Four years later, April 4, 1746, Collinson again favoured Richardson with another of those long and gossiping letters which are now such valuable contributions to the history of gardening. His fears about the decline in stove plant culture, consequent on the death of Lord Petre, proved unfounded, for Lady

* These letters were published in three parts, under the title of *Experiments and Observations in Electricity*, in London, in 1751, 1753, 1754, Collinson undoubtedly acting as editor of the pamphlet.

In connection with the existence of parasites parasitic on other parasites, I mentioned in my article referred to above that there was an authenticated record in Bentham's *Handbook of the British Flora* of *Viscum album* growing on *Loranthus europæus*, for which I could find no other authority. I have since found a more definite record of the fact in Pollini's *Flora Veronensis* (iii., p. 176), where the author, after enumerating a number of trees on which *Viscum album* grows, continues:—"Atque etiam alius speciei parasiticæ, scilicet *Loranthi europæi*; nunquam vero super *Quercum* species." *W. Botting Hemsley.*

USE AND ABUSE OF POTASH IN FRUIT GROWING.

ATTENTION has been called by Prof. W. E. Britton in the *American Agriculturist* to the use of the fertiliser potash in orchards. The author says, an excess of nitrogen usually tends toward wood production and an increased growth, at the expense of the crop of fruit. Potash and phosphoric acid, on the other hand, are the elements specially suited to promote the general vigour of the tree, and increase the quantity and improve the quality of the fruit.

The experience of many large fruit growers favours the use of potash in manuring orchards. It is most commonly applied in the form of muriate of potash, from 200 to 300 lb. per acre being considered an economical dressing, if the orchard receives an application each year. Kainit may be used instead of muriate of potash, but double the quantity must be employed, as this salt contains a much smaller percentage of soluble potash, and it is only about one-third of the price to purchase.

Professor Britton is inclined to think that the practice of applying potash or phosphoric acid exclusively is sometimes carried a little too far, and thinks that if a complete fertiliser were used, it would in many cases give better results.

The result of experiments on the fertilising of Peach orchards at the New Jersey station shows the greatest yield of fruit per acre where muriate of potash and nitrate of soda combined were applied; but potash gave much better results than either nitrate of soda or phosphoric acid alone. Potash seemed to promote a certain vigour and thrift which were lacking in trees deprived of them.

A later report from the same station confirms this experience, and says, "potash has proved the most valuable of the single elements, the net gain being greater than where farmyard manure was used." The largest net gain, however, came from using a complete fertiliser.

Mr. S. D. Willard, a well-known western New York horticulturist, says:—"In order to have good hard wood, healthy leaves, and well-developed buds, we must rely upon potash and phosphoric acid."

Potash was once thought to be a remedy and preventive of Peach-yellow, but experiments show this to be without foundation. In a recent bulletin from the Cornell Station, Professor Bailey says: "I believe that the keynote to the proper fertilising of Peach orchards is potash and phosphoric acid, and not nitrogen; wood-ashes, muriate of potash, bone fertilisers—these are some of the money-makers for Peach trees. Potash is generally the most important element to be applied directly to orchards, particularly after the trees have reached bearing age."

One of the best sources of potash for orchards is wood-ashes, but this material is so often in America weakened by leaching that it cannot be confidently recommended when in that condition. Forty to fifty bushels to the acre is a good dressing if the ashes have been kept dry. Muriate of potash is perhaps the best and most reliable form in which to secure potash at the present time. Commercial samples generally contain from eighty to eighty-five per cent. of muriate of potash, or about 50 per cent. of actual soluble potash. An Apple orchard in full bearing and upon loose soil may receive as high as 1,000 lb. of potash per acre, but a normal and economical application is from 500 to 700 lb. (1881) *Am. Hort. Soc. Trans.*

Thus it is seen that in a majority of cases an application of potash benefits an orchard in bearing condition. This fact points towards one of two suppositions, (1) that the soil is generally deficient in potash; or (2) that potash is beneficial when present in excess of the requirements of the crop. At first thought, a deficiency of potash in the soil seems improbable, when chemical analysis shows that the total contents of the first 8 inches of a fertile soil gives nearly 20,000 lb. of potash per acre, 3,521 lb. of nitrogen, and 4,400 lb. of phosphoric acid. The soil then contains over four and a half times as much potash as it does of phosphoric acid, and more than five and a half times as much potash as it does of nitrogen.

Much of the potash present in the soil becomes available to plants so slowly, that it has to be assisted in rendering it more soluble by some other agent, or by an application of ready-formed potash.

The ashes of fruit trees contain a large percentage of potash, and it is also present in considerable quantities in the fruit. It may be mentioned that some prominent fruit-growers fail to note any benefit derived from potash alone when applied as a fertiliser to orchards, and some claim an injury from its effects. This fact supports the first supposition referred to above, but is fatal to the second.

Soils differ, and it is likely that we shall find potash very beneficial on some soils—perhaps, on most soils, while useless on others; before applying large doses we should use it in a small way and note its effect. It is also thought that potash applied as a fertiliser improves the quality and flavour of the fruit; it certainly tends to maturation and to the production of sugar. *J. J. Willis, Harpenden.*

THE ROSARY.

ROSA WILLIAM ALLAN RICHARDSON.

I READ somewhere within the last few days a severe condemnation of this Rose, stating that it was so fugacious as not to be worth growing. Surely the writer could have never seen this charming Rose in free bush form, or climbing up into a tree, ascending a church-tower, or clothing a house-gable in a half-wild and free state. The exquisite form and great variety of colour in the buds and expanded flowers, the beauty of the leaves, and the prodigality of the bloom, surely atone for its lack of substance and of staying powers. With the exception of *L'Idéal*, we have nothing in the same style among our Roses [*Janne Desprez, Ed.*] And William Allan Richardson seems to me worthy to rank with *Gloire de Dijon* and *Homère* for the production of striking and telling effect around the house or in the landscape. No Rose can produce similar colours or such fresh and fascinating results as William Allan Richardson.

THE EXTREME HARDINESS OF ROSA RUGOSA AND ITS VARIETIES.

Sussex seems to have been highly favoured in the matter of the safety of its Roses this year. From all I have seen and heard of the two counties, Suffolk has been hit much harder by the frosts of February than Sussex. The county has doubtless a warmer climate to start with, and has more and greater undulations of surface than Suffolk, and few things are more potential in affording changes and ameliorations of climate than are hills and valleys. Rosarians, in localities less favoured by nature, rejoice with "A. P." and others who have written in hopeful terms of the Rose harvest already begun in Sussex. And we can all find one pleasure in common, and that is the extreme beauty and perfect hardness of *Rosa rugosa* in all its varieties. The only change that I have noted in this striking Rose this year is in the colour of the foliage. I have noticed this change before, but not to the same extent. In some cases, almost entire plants have become almost golden. The change of colour in the leaves has not affected the bloom, which is plentiful as usual. *Rosa.*

A PARK FOR DROITWICH.

DROITWICH, though situated in an agricultural district, finds its chief support in the manufacture of salt. But this trade is becoming precarious in some respects, because the making of salt in the town is not so great as it once was. Many of the houses appear to be losing their support also, and are leaning in every direction. The churches are like the houses, mostly out of the perpendicular, and the High Street has lost grade.

The town is becoming better known on account of the brine baths that were provided by Mr. John Corbett, of Impney, who built up a gigantic salt industry in the town and at Stoke Prior, four miles nearer Bromsgrove. These baths are rightly becoming famous for their curative and alleviative properties in rheumatism, sciatica, gout, and kindred complaints. Numerous visitors realise the value and importance of a prolonged course of baths, and take up their residence for weeks and months, according to the necessity of their case. The town, though small (about 4000 inhabitants) is well provided with hotels and boarding-houses.

To meet the requirements of visitors, Mr. Corbett has provided a beautiful park in a central position, and within a short distance of the hotels. The site, covering nearly 12 acres, was formerly an orchard, the fruits being chiefly Apples, Pears, and Medlars. Many of the trees are 100 to 150 years old, and of immense size. The ground is slightly undulating, and has a slope to the west, north, and east. Mr. Davies, the head gardener at Impney, has availed himself of the natural advantages offered by the lay of the land, and has produced, after his own plans, a park which is at once beautiful, interesting, and unique.

A few of the fruit trees have been removed for artistic reasons, but most of them are retained, Roses, Wistarias, Clematis, Brambles, Honeysuckles, Virginian Creepers being planted near them, so as to grow up into the crowns, where they will in course of time form pictures of floral loveliness. Then imagine the glory of the Apple blossom, of the ripening golden fruit in autumn, and the feast of Roses in summer. A wide carriage-way encircles the park, and in one part is carried in a straight line through what is an avenue of Apple trees. Wide footpaths intersect, without marring the appearance of the central area, and skirt the boundary. In suitable positions are a large flower-garden planted with the usual kinds of bedding plants, a Rose garden, and an American garden with masses of Ghent Azaleas, *Andromedas*, *Rhododendrons*, *Ericas*, and other plants. Conifers and other evergreens are planted in masses about the sward, and are used for masking undesirable objects and the intersecting points of walks and roads. Seats and summer-houses are plentiful. *J. Udale.*

FLORISTS' FLOWERS.

RANUNCULUS ASIATICUS VARIETIES.

THOUGH the Pansy, Tulip, Auricula, &c., are now the subjects of reviving interest, Ranunculuses, the favourite flowers of my boyhood's days, seem to be more and more neglected. Yet no flower is more beautiful or perfect in form, they excel most other flowers in the symmetry of their shape, their brilliancy, and variety of colour; so that a bed of fine Ranunculus is a most attractive object. I have no doubt there are still some amateurs to be found who cultivate Ranunculuses from whom a choice collection could be obtained. The once famous collections of the Rev.—Tyso, Messrs. Lightbody and Waterson, are, I presume, now defunct. It is not a difficult flower to cultivate, although all kinds of soil and situations are not equally adapted to the requirements, and it has numerous insect enemies.

I do not now propose to go fully into its cultivation, but to say a few words on soils and the raising of seedlings. In selecting a situation for a bed choose a moist tolerably rich soil, not too fully exposed to the sun. Prepare the ground by deep

trenching, and add to the garden soil a portion of manure from an old Cucumber-frame, with one-fourth loam—mix these well together, and prepare the bed some length of time before planting, in order that it may settle firmly; plant the roots in the end of February in rows about 9 inches apart, and from 3 to 4 inches in the row. Use a marked dibber, so that the roots may be all planted at one uniform depth, and cover the roots from 1 to 1½ inches deep. Should the weather prove very wet or frosty before the plants come up, protect the beds with straw, mats, or some suitable material. When the plants commence to show bloom, give plenty of water between the rows, but never water over the plants, which is one cause of failure; when in flower protect them with an awning from sun and wet, and when the foliage is nearly withered about six weeks after flowering, select a fine day and take the roots up. Place them in a room where there is plenty of air to dry gradually. After they are once dry they must be kept so, as the least damp would mould them. The best time for sowing the seed is the middle of October or early in January, in boxes or pans, covering the seed very lightly. They should be kept in a cool frame during frosty weather, and at all times should have constant exposure to the light. In May, plunge the boxes or pans up to the rim in the open ground, where they have only the morning sun; water them almost daily until the grass withers, then let the boxes become quite dry. About the middle of July take them up, gradually dry them, and keep them in a box of dry sand. In February they should be planted and treated in the same way as the old roots. Edward Bennett, Lyne, Chertsey.

THE CARNATION AND PICOTEE.

I fear the time has come when I must be classed with the old florists; and yet during all the years it has been my pleasure to cultivate the Carnation, I never knew a season anything like the present. It has been most trying to the show varieties of Carnations and Picotees. The scarlet and crimson bizarres have suffered most, next the flakes, and then the choice florists' type of Picotees. The yellow-ground Picotees have also felt the effects of the wet, cold autumn, and of the severe frosts in January and February. All the self Carnations are doing well, and will flower very strongly.

In the first place the layers did not form roots well, and many of them did not produce any at all; this necessitated late planting out or potting up, and almost before the plants became established severe frosts set in, and the roots were thoroughly frozen, those in 60-sized pots in frames were as hard as iron, and although the plants were not killed outright they were very badly crippled. Indeed, plants were sent to me as late as May in a dying state, the cause of which I had every reason to believe was owing to the effects of frost upon them in February. One good effect of the frost is the destruction of the weakly growing varieties; it was certainly a testing time, plants which passed well through a winter like the last may be regarded as vigorous enough for anything. Nothing in Carnation culture is more remarkable than the different degrees of vigour and hardiness of varieties. Many persons have an idea that the selfs are hardy, free-growing varieties, and that the flakes, bizarres, &c., are delicate things, only fit for greenhouse culture. There is no doubt that plants of the scarlet bizarre section are more slender in growth than the others; but it does not follow that they are less hardy in constitution, or that they will not stand the frost so well in winter. Indeed, the bizarres and flakes do much better in the county of Durham out-of-doors than they do in Essex; sufficient proof that it is not altogether either frost or wet that injures them. The degree of vigour in a Carnation is to a certain extent determined by the colour of the flowers, as may be seen by the greater vigour of certain sports from the bizarres. The maroon colour in scarlet bizarres, or the purple in crimson, giving the strongest growth; and yet in selfs the white-flowered Carnations are as vigorous, and sometimes, indeed,

they have greater vigour than the scarlet or crimson-coloured varieties.

Plants of differing degrees of vigour require as different treatment. One season the young gardener who had charge of my plants, gave the entire collection a good dressing with a rich compost in May. This answered admirably for all the varieties that made short stumpy growths, causing them to grow much longer. Those of very vigorous constitution, and which produced long-jointed layers, spindled up for bloom to an alarming extent, causing considerable loss. In a dry season, such as this, a rich surface-dressing is a great aid to the plants. Watering has been much needed everywhere in the south; but watering is of little use unless the plants can have a mulching of decayed manure, and if a thorough soaking is given once in a week, that will be much better than giving a small quantity daily, but never sufficient to well saturate the ground. Anyone can observe the effect of watering on hard, thoroughly dried ground, by examining it after the water has been applied for a few hours; it will be quite dry about 2 inches below

Fig. 2.—HEDYSARUM MULTIJUGUM: TO SHOW HABIT.

the surface, unless the surface has been loosened. The treatment of pot-plants requires much thought on the part of the gardener, as some varieties make quite three times as many roots as others, and it is safe to say that plants require three times as much water, and if the cultivator is not careful to water each, with due regard to its requirements, the results cannot be altogether satisfactory. The time for layering is now at hand, and the soil ought to be prepared for it. This may consist of equal portions of loam, leaf-mould, and sand. A little of the surface-soil ought to be removed, and this prepared material put in its place, carefully trimming and cutting the layers with a layering-knife. Any blooms that have a tendency to burst will be greatly helped by the calyx being supported with an indiarubber ring. The thrips have been troublesome this year, but there is no better way to deal with them than by putting the plants in a greenhouse and fumigating them. It is astonishing how much mischief this little insect can do to the flowers, it quite spoils them if left undisturbed. Green-fly, which does as much harm to the layers as thrips do to the flowers, may be killed also by fumigating. The plants in one garden I visited this year had been attacked by a black aphid, and, unobserved, it had spread consider-

ably over the plants, attacking the blooms in preference to the layers, this was also destroyed by fumigating; if these pests appear before it is time to remove the plants into the Carnation-houses, the best way to keep them down is by syringing, and also dusting with tobacco-powder. J. Douglas.

TREES AND SHRUBS.

HEDYSARUM MULTIJUGUM.*

We are indebted to Mr. Lynch, of the Cambridge Botanic Garden, for the opportunity of figuring this attractive hardy shrub. It is a native of Southern Mongolia, and was described by the lamented Maximowicz. Our illustrations (figs. 2, 3) show a leaf and a portion of the inflorescence of the natural size, together with an outline showing the general character or habit of the plant. The herbaceous portions are covered with a thin covering of appressed setose hairs. The height is 2 to 5 feet; the branches are ascending, slender, rigid, angular, striate; the pinnate leaves are somewhat distant, 80 to 90 mill. long, the pinnae are alternate or opposite, sixteen to eighteen in number, ovate-acute, apiculate, 10 to 15 mill. long. Stipules deltoid, acuminate. Flowers numerous, in erect racemes, with very short pedicels. Calyx oblique, tubular, slit on the upper side, limb nearly entire. Standard violet, with yellow blotches on the middle of the inner surface, 2 cent. long. Wing obliquely oblong, with a long claw; keel of two oblique halberd-shaped stalked petals. Stamens curved, nine and one. Ripe fruit not seen.

The plant above described is a handsome hardy shrub, which has, we believe, been distributed from the Cambridge Botanic Garden. We have not compared Mr. Lynch's plant with authentic specimens in the herbarium, but we may point out that our present plant does not entirely correspond with Regel's figure in the *Gartenflora*, t. 1122, wherein the flowers are described and figured as rose-coloured.

COLONIAL NOTES.

A TOWN GARDEN IN NEW ZEALAND.

A PERCH of ground in the centre of a town, although a small one, is not a very encouraging place to operate on horticulturally, but a mixed collection all doing well may interest some of your readers in other parts of the world. In one corner is a bush of *Aloysia citrodora* from Chili, and deemed a fit associate for even a Queen of Spain. In another corner is a dead Willow, up which are racing in friendly rivalry a Clematis, a Devonian Rose, and the white Sweet Pea Mrs. Sankey, all of European origin. Alongside a fence are the following Tea Roses, also from Europe:—Marie Van Houtte, Madame Lambard, Madame de Watteville, The Bride, and close by, the Rev. T. C. Cole. Not far from these is a Cantua dependens, another South American subject, and if there is one plant more than another in this vegetable kingdom which deserves admiration, it is this. On the other side fence are Camellias from China, which do better planted outside in the shade in these regions, an indication that they are natives of a temperate climate, and flourish as undergrowth in woods. Here also are Japanese Chrysanthemums, including Etoile de Lyon; bulbs from the Cape of Good Hope and other countries above the equator, as Freesias, Ixias, Ranunculi, Scillas, Antholyzas, and Schizostylis, and the Trumpet Lily. Another plant which insists upon being seen is the Coral tree (*Erythrina Crista-galli*), from the cooler parts of Brazil. That grand ornamental Grass *Elymus condensatus* from British Columbia is here, but requires more room than I have for it; so is *Prunus ilicifolia* from California. Both these were sent me by Dr. Franceschi, and *Lavatera assurgentifolia*. About the middle of this plot of ground is a pendent Willow,

* *Hedysarum multijugum*, Maximowicz, in *Bull. Acad. Sci. St. Petersburg*, xviii. (1851), 464.

with a rustic seat underneath inviting your leisure. Not far from this Willow is a miniature rock-work, smooth stones being unsuitable, as they attract and retain the sun's heat-rays to a destructive degree, in the centre of which is an *Æthionema grandiflorum* from Asia Minor or the Levant, and nestling underneath this is the modest *Campanula fragilis*, and a native *Adiantum*, which, true to itself, refused to grow in pots; and also the Ivy-leaved Cyclamen, an autumnal-flowering variety; and that indispensable plant to all rockwork, *Cerastium tomentosum*, is amongst them, but the purity of its flowers attracts the snails. The climbing Gourd of Central America is very ornamental, but requires abundance of water. With the exception of a few minor subjects, all have been noted that are in this enclosure. . . . Our own native flora has a decided objection to being removed from its natural associations, as if afraid of contamination with the outside world, particularly that part above the equator—no inducements can reconcile them to any new conditions of life; ten times out of twelve they positively pine away and die. The prevailing colour is white, as in *Clematis indivisa*, *Convolvulus sepium*, *Ranunculus Lyalli*, *Ourlia macrophylla*, the Mountain Primrose, after the way of Japonica, but with whorls of pure white flowers; *Plagianthus Lyalli*, one of the dwarf ribbon-trees, with clusters of lovely white flowers springing from the sides of its branches, which at first sight resemble a Tydea. Then there are many species of *Veronica*, *Olearia*, *Pittosporum*, *Cordylina australis*, the latter a common feature everywhere, all with white flowers, and many others, discovered within the last twenty years, many genera of plants hitherto unknown, owing to the difficulty of getting into their native wilds. For the information of those of your readers who are unable to understand what being lost in a forest means, let them for a moment imagine themselves in an immense area of densely-wooded country, consisting of evergreen trees, shrubs and Ferns of all sizes and ages, many square miles in extent, and far away from any human habitation, the prostrate trunks of trees in all directions rotted with age, the stems and branches of climbing plants impeding progress at every step, Mosses and Lichens hanging 2 or 3 feet long in their silvery gurb, fitfully lighting up the gloom. Add to this the oppressive, dank atmosphere. You shout (or cooey) for help, but the sound seems mockingly re-echoed by the native birds; in attempting to extricate yourself you are found taking a circuitous route; it is then you feel what the words "impenetrable" and "despair" really mean, and what it is to be lost in a bush or forest. Yet there is an inexplicable fascination in the perilous position.

THE ARTICHOKE.

This plant is of Greek origin, and the ancient Greeks engaged in its cultivation; still more so the Romans. The Greeks called the Artichoke *Cynara*, as did also the Romans. Pliny, combining it with the Apullean word *sclarea* (Cardoon) called it *asclaria*, otherwise *Carduus*, and the Italians of the middle ages *Articocco*, from which our modern term *Carcinoffe* is derived, which points to the similarity existing between the form of the cones of *Pinus pinea* and the closed flower-head which afford so well-flavoured and wholesome a food. But as all the parts of the Artichoke are pleasant eating—roots, leaf-stalks, stems, and flower-heads, so the Neapolitan of to-day calls it still *Cardoni*, and the head especially *Carcinoffe*. The true Artichoke is without doubt not Italian, but of Greek and oriental origin; yet we find the later Greeks praising the Artichokes of Sicily for their special good quality, and this is true of them at the present time. That the bee-attracting, gigantic, handsome flowers which spring from the delicious bud attracted also the ancients, whose only trouble was the numerous prickles, which are sought for in vain in the best varieties of to-day.

There were in ancient times many different forms; and, as has been said, the Sicilian varieties were

celebrated. The Spanish Artichokes are dark purple—almost black; and the further north it is grown, in rainy, foggy climates, the violet colour disappears, and is replaced with green or grey-green. The Spanish Artichokes are, like the Cardoons, upright and tall, the buds hidden from view, and the ribs of the leaves of fleshy consistency, as in the Cardoon. Pliny extolled the Carthaginian Artichokes for their great size, and those of Mauritania for their excellent flavour.

In the present age, the Artichokes of Naples and the Campania, in size, tenderness, good flavour and fruitfulness, excel all others, even those of other parts of Italy, and it is believed that these fine forms of the plant originated in northern Africa. The ancients gave much attention to the cultivation of the plant, and we are told that large quantities of manure and diligent stirring of the soil were required to render the buds tender-eating, and increase the fruitfulness of the plants as well. It is a maritime plant, and loves proximity to the ocean; it should, therefore be chiefly grown on the coast; and with the ready means of transit found in most European countries, there would be no difficulty in sending the produce inland. The ancients increased the plant by means of the side-shoots or suckers, which the root freely produces.

In the spring, the surface of the Campania, covered by enormous Artichoke fields, astonishes the traveller, who sees it for the first time with the abundance and beauty of the plants. No other vegetable can compete with it in productiveness and value, rivalling Asparagus in flavour and wholesomeness, and in the simplicity of the methods of cultivation. The profits of the Artichoke-grower are enormous, exceeding anything obtained in France or Germany for vegetables, even such a good paying crop as Asparagus.

In Italy the plant rests during July and August, allowing the land to be inter-cropped with some quick-growing plant. When the heat of the summer is past, and the autumn rains begin to fall, the plant commences to grow anew; this is the best time to remove the side-shoots (suckers), and transplant them. These shoots soon push roots into the soil, and to grow fast, and may be depended upon to produce heads the coming year. In November, the plant being in full growth, is well dressed with manure. To do this, the leaves are bundled up together, and trenches are made at the side of the plant, and pig-dung-water is poured into them; over this is placed half-rotten stable-dung, and the earth is returned over all in the form of a ridge. In about four weeks another application of liquid manure is made, and it does no harm if this be followed by another in January. There are varieties in Italy which produce heads at Christmas-tide, and some that grow the whole year; but the usual harvest period is from the end of February to the middle and end of July; in Sicily earlier, and in northern Italy later. The heads are cut with a stalk and a neighbouring leaf before the purple flowers expand, and tied in bundles for the market. Some special varieties are of the size of a child's head, and some have a spiny calyx, these being the best flavoured. The plant is of use to man and animals from the root upwards, and the dried stems are used for fuel. *Extract from Wiener Illustrirte Garten-Zeitung.*

VEGETABLES.

PEA CANNELL'S ENGLISH WONDER.

Those who have not as yet grown this Pea should do so. As a dwarf-growing Pea it is one of the best in commerce, and in gardens of limited area, and where stakes are not obtainable, as is often the case with amateurs in town districts, a Pea like this is a boon. In height it is about 1 foot, and requires but 15 inches space from row to row. The quantity of pods produced is simply astounding. The advantage of this variety over American Wonder is the excellent way the pods fill. I have before me two pods, a fair sample of many; one measures barely 2½ inches long without the stalk, and contains seven extra large Peas. The second pod is just 2½ inches long, and has eight Peas closely packed inside. If this Pea contained all these points of advantage, and was of indifferent flavour, I should not appreciate it even then, regarding, as I do, flavour as being of the first order. Cannell's English Wonder has no fault as regards flavour, and it is an acquisition in every respect. Sown on February 23, it was ready for use June 7. E. M.

Fig. 3.—HEDYSARUM MULT JUGUM: FLOWERS BLUE. CAMBRIDGE BOTANIC GARDEN. (SEE PAGE 8.)

A LIST OF HYBRID CATTLEYAS.

THE following list has been compiled by Mr. CHAPMAN, gardener to R. I. MEASURES, Esq., in the same manner as was followed in the list of hybrid Cyripediums previously published. Of this latter list, copies can be had on application to the EDITOR, it being understood that the proceeds are given to the two Gardening Charities. This list of hybrid Cattleyas is made up to May 1, 1895.

HYBRID CATTLEYAS.

Table with columns: Offspring, Parents, Raiser, &c. Lists various hybrid Cattleya varieties such as Aclandii-Loddigesii, Alberti, Arthuriana, etc., along with their parentage and raisers.

NATURAL HYBRIDS—CATTLEYAS.

Table listing natural hybrids of Cattleyas, including Batallian, Brymeriana, Cupido, Hardyana, etc., with their parentage and raisers.

GARDEN HYBRID.

Table listing garden hybrids, specifically Epidendrum ciliare x Lælia anceps, raised by Sander.

HYBRID CATTLEYAS.

Table listing various hybrid Cattleya varieties with columns for Offspring, Parents, and Raiser, &c. Includes varieties like Bowringiana x Dowiana, etc.

HYBRID CATTLEYAS—(Continued).

Table listing continued hybrid Cattleya varieties, including Luddemanniana (speciosissima) x Dowiana, etc., with parentage and raisers.

HYBRID LÆLIO-CATTLEYAS.

Table listing hybrid Lælio-Cattleya varieties, including Amesiana, amœna, Arnoldiana, etc., with parentage and raisers.

NATURAL HYBRIDS LÆLIO-CATTLEYA.

Table listing natural hybrids of Lælio-Cattleya, including Albanensis, amanda, elegans, etc., with parentage and raisers.

HYBRID LÆLIO-CATTLEYA.

Table listing hybrid Lælio-Cattleya varieties, including C. Aclandii x L.-C. elegans, etc., with parentage and raisers.

A LIST OF HYBRID CATTLEYSAS—(Continued).

Table listing various Cattleya hybrids under the heading 'HYBRID LÆLIO-CATTLEYA—(Continued)'. It includes columns for Parents, Offspring, and Raiser, &c., with numerous entries such as C. Dowiana x L. crispata, C. Mendelii x L. xanthina, etc.

Table listing various Cattleya hybrids under the heading '[SOPHRO-CATTLEYSAS—(Continued)]'. It includes columns for Parents, Offspring, and Raiser, &c., with numerous entries such as Sophronitis grandiflora x Loddigesii, L. crispata x L.-C. x Dominiiana, etc.

NURSERY NOTES.

SWISS NURSERY, FARNHAM, SURREY.
Not in the ordinary acceptation of the term is this a nursery, because it seems to be more generally utilised for the production of seed crops, and in this direction very likely it presents some features of interest that ordinary nurseries lack.

article, by the way, has to be brought about 6 miles, from Aldershot, at a cost of 10s. per cartload. Even on this apparently dry elevated spot Violas do well, a long row of old plants of the pretty Countess of Kiotore presenting a charming sight.

are grown, but only as old pot-plants, dwarf bushes, just to furnish cuttings, as these, when rooted, are sold in great quantities. They root in shallow boxes, filled with the surface-sand from the heath, with remarkable ease.
The chief subjects of the houses, however, are Tomatoes, Melons, and Cucumbers; of these latter, huge crops of seed-fruits have already been taken off from January plantings, and other plants have taken their places, to give a second crop.

the plants being about 2 feet apart; they are, as are the Cucumbers, trained up beneath the roof on wires. Melons and Cucumbers sometimes are grown in the same house, getting almost identical treatment. There are just now, perhaps, thirty or more varieties of Melons being grown. All have good, even-sized, handsomely-netted fruits; none are big, or ungainly, or small. Every one is presentable, and they hang thickly. The largest crop of any one variety is Eclipse, a green-flesh, of great beauty and of high flavour.

Tomatoes of all the best sorts are grown, both as erect or upright plants, and trained to wires under the glass. A fine new 100-foot house, having plants put out in rows of four on each side, and 3 feet apart, seems to present as admirable a structure for the purpose as can well be conceived. The sorts are Conqueror, very early; Perfection, Mitchell's Hybrid, A 1, Ham Green Favourite, Best of All, Abundance, Frogmore Selected, &c. There are no unduly large fruits. A good smooth, medium-sized sample, firm, and richly coloured, is most esteemed. This house is very light, has ample ventilation, and the plants are in perfect health. About 12 cwt. have already been taken from it, and fully 8 cwt. more fruits are maturing now. Tomatoes are grown for market, and so far the return for good samples seems to have been most satisfactory. Mr. Mortimer's exhibits at the Drill Hall and elsewhere fully show that he is a first-class cultivator. *A. D.*

CULTURAL MEMORANDA.

PROPAGATION OF RESTIO SUBVERTICILLATUS.

The propagation of this rare Cape plant, I believe, has hitherto been effected by the division of the roots and rhizome, and by this method the trials have often been attended by failure. Lately, roots were noticed about the nodes of the stem, apparently springing from the base of the young growths, but only upon stems of not less than two or three years old. Several stems were taken off and cut up, leaving about a couple of inches of old stem with the node in the centre; these were put into thumb pots and placed in a handlight where they were shaded from the sun in an intermediate temperature. Here in about a month's time the plants in some cases began to root, and when root action is once set up the growth is vigorous. As the plant in a small state would be useful as a decorative plant on account of its long feathery plume-like stems, it should soon become more generally known in our gardens. Grown in a cool greenhouse, it soon forms a very large plant if encouraged, and for planting in large structures is always pretty and attractive. *R. L. Harrow.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

HINTS ON WORK IN GENERAL.—Owing to the drought, gardeners in most parts of the country will be heavily handicapped in this department, and in some districts crops will have been left unthinned in the hope of rain coming so as to render the work possible. Where rain has fallen and the land is moistened, the thinning should be forthwith completed. Other crops, such as Salsify, Scorzonera, Turnips, Beetroot, late Onions, and Cauliflowers, will need heavy applications of water at the root and syringings of the foliage. Go over the plantations of Cauliflowers at short intervals of time, protecting the heads by breaking down a leaf or two over them. For show Cauliflowers I would not recommend this as general practice, and certainly not in the case of Autumn Giant, the heads of which variety are a long time in coming to perfection, and breaking down the leaves sometimes late in the light at the sides. It is a better method to gather up the leaves near the tops, and tie them loosely together, not crushing them. This allows of an examination of the head by removing the tie.

Another, but more costly way, is to use two thicknesses of calico which fit close, keep out damp, and the heads readily develop underneath them, and keep perfectly white. Sufficient care is, I think, not taken by some cultivators, or we should not see so many badly-coloured Cauliflowers in August on exhibition tables. The best way to keep full-grown heads is to stand them in an erect position in a cool, rather dark shed or cellar, with the roots in damp soil. Do not crowd them together. If the roots are plunged in water, as is sometimes advised, the curd soon opens. Do not be over-desirous of size in Cauliflowers, but cut or lift them when the curd is firm and white.

BROCCOLI.—Carefully prick out the best plants from the seed-beds when large enough to handle, the plants being more easily looked after in these small beds until we get rain than when planted in the quarters. I do not advise early planting, or on soil that is loose or very rich. It may not be amiss to describe my method of procedure with Broccoli in 1894-5, as it was generally a disastrous year for them. Our hardest frost was 35°, or 3° below zero. The seed was sown on May 24 and June 13. The majority of the plants put out were of the June sowing. These plants were planted direct from the seed-beds.

CELERY.—The main crop of Celery should now be planted, affording the plants one good watering to settle the soil. Damp them overhead after hot days.

THE SOWING OF SEEDS OF COLEWORTS.—A sowing may now be made of Colewort and early-heading Cabbages for autumn use, making other sowings of the same in the course of a fortnight.

HERBS.—The cutting of herbs for drying should take place as soon as any kind shows flower, if later than this the leaves drop. Parsley should be gathered in quantity for drying whenever it is plentiful. When dried and bottled there is a great saving of green Parsley for flavouring purposes effected.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

PLANTS IN FRAMES.—By this time of the year *Freesia* bulbs should be thoroughly ripened, and may be shaken out of the soil, the large-flowering ones being put on one side for potting. The smaller bulbs, so as to economise space, may, when the suitable time for starting them arrives, be planted in boxes. The *Bride* (*Gladiolus Colvillei*), and other varieties of *Gladiolus* cultivated in pots should be placed in the open air as soon as the flowers have faded or are removed. Afford weak manure-water occasionally to them till the growth begins to die down, when clear water only may be afforded, and then very sparingly.

NERINES should be examined, removing decayed leaves, and cleaning the plants generally. Those which are showing for flower should be separated from the rest, and the soil afforded a thorough watering. The stock of *Nerines* should be examined every few days, for no sooner is a flower-spike visible than the plant needs water at the root.

SALVIAS may be removed from the frames and potted on in their flowering pots. Good loam and leaf-soil with plenty of well-decayed manure will suit them. After re-potting, place them out-of-doors on a coal-ash floor, syringing the foliage daily, and affording plenty of water at the roots when the pots are permeated with the roots. Let the plants be provided with neat stakes before they become tall, or damage by wind or heavy rain may occur.

MIGNONETTE.—If large pots of Mignonette are required in the early winter months, seed should now be sown, three or four seeds being placed in as many 60-pots as may be considered sufficient for the demand. These should be filled with loam, leaf-soil, and finely-broken old mortar. Make the soil very firm before sowing, and cover the seeds to the depth of a quarter of an inch, and place the pots out-of-doors on the north side of a wall. Mignonette

succeeds if kept partially shaded during the summer, and the soil never allowed to become dry. A few of the best varieties for winter are golden Queen, Miles' Hybrid Spiral, Parson's White, Garraway's White, and Matchet, the latter being sown a little later and kept in smaller pots; the habit of the plant is very dwarf and bushy.

HERBACEOUS CALCEOLARIAS.—Sow the seed in shallow pans filled with sifted loam and leaf-soil, previously moistened thoroughly, scattering it thinly on the surface. Do not cover the seeds at all, but after pressing them into the soil place a bit of glass over the pane, and keep shaded till the seedlings appear, when more light and air should be gradually afforded.

VALLOTA PURPUREA.—This plant, as soon as the flower-spikes push up, requires abundance of water at the roots, and a slight top-dressing of Clay's or some other fertiliser. Sickly plants should be shaken out of the soil, the bulbs washed in water, and repotted in turfy loam, leaf-soil, and wood-ashes or charcoal in the proportion of one shovelful to one bushel of soil. Remove the flower-spikes from all weakly bulbs. The plants should be lightly shaded till they are firmly established.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

FURNISHING BLANK SPACES ON TRAINED TREES.—It sometimes happens that unsightly blanks occur on Peach and other trained trees, owing to had attacks of blister or some other cause. The symmetry of the tree may be restored and fresh main branches secured if desired by inarching, and the operation should be performed now or during the next two months, when the young shoots attain the requisite length and firmness. Suitable growing shoots should be inarched on to the bare portions of the older branches. The method of operation is much the same as in ordinary budding, but in addition a transverse cut has to be made at each end of the longitudinal slit in the bark, which should be on a clean healthy branch, and about 1½ inch in length. Raise the bark carefully with the handle of a budding-knife, then take a thin slice of bark and wood from the young shoot on the side to be joined to the stock, and place the growth thus prepared under the bark, afterwards binding it closely, yet not too tightly, with soft matting, or budding cotton. When the union is effected, which, under favourable conditions, will be in the course of a month or two, the young branch should be half cut through below the junction, and after a further interval of a few weeks, it may be severed entirely.

REMOVING SNAGS FROM PEACH-TREES.—Look over and remove snags of dead wood from Peach, Nectarine, and Apricot trees, paring such off closely and neatly with a sharp knife, so that the wound will heal over before winter. Young newly-planted, and other trees that may have been cut back require special attention at this season in this matter, such snags, in addition to being unsightly, form harbours for insects later on, and are otherwise injurious.

RASPBERRIES are generally looking well this season, and there is every prospect of a good crop. See that all fruiting canes are properly secured to wires or other supports, and protect from birds by fixing nets well above the plants, which is best done by erecting a light framework of wood sufficiently high to allow room to walk under, then stretching nets over all. If surface suckers have been removed, and only sufficient for next year's requirements have been reserved, this will admit more light and air to the crop of fruit now maturing, and it will strengthen the growth of those reserved for future fruiting. If it be desired to form new beds from surplus suckers, these may be stopped at a foot in height, so as not to interfere with permanent canes.

PROTECTING RED AND WHITE CURRANTS.—Lose no time in protecting Red and White Currants by netting if birds are troublesome. First make sure that all are free from caterpillars or aphids. If caterpillars are present, the best remedy is hand-picking; whilst aphids may be destroyed to a great extent by first taking off and destroying all infested tops, afterwards thoroughly washing the trees with clean, soft-water, applied with force from the garden-engine.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

RAISING ROSES FROM SEED.—The cross-fertilisation of Roses is not much understood or practised in this country by amateurs; it is, however, a most interesting occupation. In our uncertain climate, the plants operated upon should either be grown under glass or in a sheltered part. The flowers selected as seed-bearers would require to have the stamens removed with a pair of finely-pointed scissors before the pollen has become mature. General Jacqueminot is a variety which should be fertilised, or the pollen used to fertilise others, in about four hours after expanding; and in determining the time, a good deal of attention is required, for if the pistils are not nearly matured, they will not be in a condition to be fertilised. The petals are then gently pulled off, the stamens cut away, and the pollen applied to the stigma of the seed-bearing flowers by the aid of a camel's-hair pencil, or by gently rubbing them with the bloom of the fertilising sort. Very double flowers do not make such good seed-bearers as the less double ones, and they possess less pollen. After the operation the fertilised flowers should be enclosed in fine netting to ward off flies, &c. The ripe seed-pods or hips when gathered should be buried in damp sand until the beginning of the year, and then sown in pots or boxes placed in gentle heat. The seedlings appear in a few weeks, and will require carefully potting and planting out when all danger of frost is over.

PLEASURE GROUNDS—Grass lawns that have become browned by the recent dry weather should not be mown very closely. Raise the knives in the machine well up, and remove the grass-box, so that the cut grass may remain as it is scattered about by the machine; it will then assist in keeping the lawn green. If the lawn has not been mown for some time owing to the drought, it will be well to mow it lightly over with a sharp scythe before the lawnmower is used on it again. Grass-edgings should be kept tidy by clipping with the edging-shears, and narrow verges of grass in dry situations require to be well watered during dry weather.

SHRUBBERY BORDERS AND BEDS should be frequently hoed and raked, to give them a tidy appearance. Gravel walks and drives which are made with materials that become very loose during dry weather should be watered and rolled. Keep them clean from weeds by hand-weeding, or by applications of a weed-killer, which is a much cheaper process in the end than using hoe and rake to them, especially where large gravel is used. The watering of trees and shrubs that were planted late in the season should be continued during dry weather.

ROSEMARY (ROSMARINUS OFFICINALIS).—Seedling plants of this useful sweet-scented under-herb that were raised in the spring should be planted out into sheltered situations against walls or other places where they are likely to stand well through the winter. They are unable to stand the winter in the north in exposed places, or on cold, wet soil. They may be propagated by cuttings struck in gentle heat, or by layering. The present time is a good one to make layers from the old plants into a light, rich, well-drained soil. There is a great demand in most gardens for this very valuable plant.

LAVENDER (LAVANDULA SPICA).—This popular sweet-scented plant requires a warm, light, loamy soil; it is easily increased by seeds sown in gentle heat in the spring, or by layers of it put down now, and planted out in August or September, when it has become well rooted. It should then be planted in rows about 3 feet apart, or it may be planted in shrubby borders in places where it can get the full sunlight. It requires well-drained soil, and in northern districts shelter from north and east winds also. The flower-spikes should be cut when the bottom part of the spike begins to turn brown. If they are long enough, they should be tied tightly just below the flowers, then turn up the stalks, and tie the ends to form a protection for the flowers, which will last much longer if tied in this way.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

PINES.—As the fruits are cut from the plants, the old foliage may be shortened back to allow the suckers to develop as much as possible. Keep the roots in a moist condition, and syringe overhead and

between the pots during bright weather, allowing a little manure-water to collect at the base of each sucker to encourage new roots. Only sufficient shading should be afforded to prevent the young foliage being damaged, plenty of light and a fair amount of ventilation being necessary to promote sturdy growth. In the meantime clean some 6 inch pots, and prepare a good heap of compost, ready for potting up the suckers as soon as these are large enough. The compost will be all the better if prepared some time before required. Turn it over well several times, so that the whole be thoroughly mixed, and let it consist of good turfy loam, spent Mushroom dung, crushed charcoal, and sharp sand, with a slight dusting of soot. Keep the soil covered with mats to prevent it becoming dry. The pots should have one large crock at the bottom, and a few finer ones placed over; or what is better, a sprinkling of broken oyster shells. The house or pit in which the young stock of plants is to be wintered should be thoroughly cleaned, and the plunging material renewed to ensure a steady bottom heat of about 85°. Smooth Cayennes should be induced to throw up a few fruit in succession from now onwards, so as to keep up a regular supply during the autumn and winter months. Commence to feed the plants as soon as there is the appearance of fruit, and encourage growth by giving plenty of heat and moisture. Fruit in different stages should be kept in an upright position, as the beauty of a good fruit is often destroyed by allowing the crown to grow on one side.

MELONS.—The hot weather has caused these to turn in quickly; and where successional crops are not following closely, shading should be afforded to those changing colour, to retard them as much as possible, and as the flavour of the fruit improves by being allowed to become thoroughly ripened on the plant, it is better to shade the roof-glass than to cut the fruit before it is ripe and store away in a cool place. Later crops in different stages of growth should be frequently dressed with fresh loam, and well supplied with moisture at the roots, and the foliage kept regularly syringed in hot weather. Seed may still be sown to raise plants to supply fruit during September and October, but the houses in which these are to be planted must be thoroughly cleaned and fresh soil afforded, or it is likely they will prove a failure from the attack of red-spider, and the poorness of the soil that has produced a previous crop.

WINTER TOMATOES.—These were recently potted into small 60's and placed on ashes in a cold pit. To ensure plenty of fruit during the winter, the plants must be grown well during the summer months. As soon as ready, these plants will be put into 6-inch pots, and again placed in the cold pit, until established, when they will be stood on ashes in a sunny position. By the end of the present month they will be ready for the fruiting-pots, which will be 10-inch ones. In the final potting a space of several inches should be allowed, so that the plants may receive several top-dressings as the fruit swells. The plants should be staked and placed in a sheltered place, but one open to the sun. All side-shoots must be kept pinched, and each plant grown on the cordon system. By the end of September the plants will be from 4 to 6 feet high, with clusters of fruit in different stages of growth, the whole length of the stem. Avoid too rich a soil when potting, as it is best to feed the plants after the fruit is set. Keep the roots well supplied with moisture, but should a period of wet weather set in, see that the drainage is free, and the pots should be stood on a couple of bricks.

CUCUMBERS.—A few plants may be raised now to supply fruit during autumn and early winter, and thus save to a great extent those plants intended to yield fruit from December onwards.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorset.

CATASETUMS, MORMODES, AND CYCNOCHES.—These singular and interesting Orchids now growing rapidly, enjoy strong heat and a clear light whilst growing; and a capital place for them is in the East Indian-house, where they may be suspended from the roof with their foliage about an inch or two from the glass. The flowers appear as the bulbs get matured, and until the growth is fully made up abundant watering is required by the plants. After flowering is past, the plants should be exposed to

full sunshine, and be plentifully supplied with water at the root till the new pseudo-bulbs are ripe and the leaves fallen. *Cyrtopodium Andersonii* and *C. punctatum* will require similar treatment, but these flower during the spring months, the spikes appearing in conjunction with the young breaks.

BROUGHTONIA, SANGUINEA, ETC.—A very striking Orchid now in bloom is this species, which is worth adding to any collection. The colour of its flowers is deep red, and these last for a long time in good condition. It succeeds when fastened on to a wooden raft or block, with a little sphagnum-moss about it, and suspended from the roof of the Mexican-house. The same kind of treatment as that afforded to the other inmates will suit its requirements. Another beautiful species which usually does well in the Mexican-house is *Odontoglossum citrosum*. Its flowering season is now over, and the young growths are on the move. Any plants that require fresh material or more space should be at once attended to. Baskets are preferable to pots for this plant, as when suspended the racemes of blossom are seen to better advantage. They should have a light position, and water carefully afforded till the new growths have made some progress, or decay may result if the roots are not in full activity. When established, abundance of moisture is necessary, the plants being placed in nearly full sunshine, and a good overhead syringing administered at closing-time every day. If the plants must be grown in the shade, less water at the root will be required, and syringing may be dispensed with. *Barkerias* require exactly the same kind of treatment, and now that these plants are in full growth, the young shoots should be frequently examined for mealy-bug, which if not kept in check will disfigure them.

EPIDENDRUM RADICANS, which has been in flower for several months, should have the flower-spikes removed, the plants having started into growth. It is a plant of a scandent habit, and the shoots should be tied around a few neat stakes, keeping the young growths well up towards the light. Throughout the growing season, it should be kept moist at the root, and frequently syringed overhead. *E. radicans* may be easily propagated by taking the offshoots which appear on the old growth and flower-stems, and inserting them thickly around the edge of a flower-pot, in well-drained sphagnum-moss.

EPIDENDRUM STAMFORDIANUM is now starting new growths from the base of the current year's spikes. It is a species that has baffled numerous cultivators, and from the information which I have received from Mr. C. Payne, who for a long time successfully cultivated the splendid specimen exhibited at the recent Temple show (see *Gardeners' Chronicle*, p. 687, with fig.), the principal cause of failure appears to have been through affording it too much heat and moisture. The plant, when it came under Mr. Payne's care about a dozen years ago, was a very little piece, with only a few pseudo-bulbs, and he put it into a small shallow pan, affording it plenty of drainage, elevating the plant well above the rim, and using as compost two parts of rough fibry peat to one of sphagnum-moss. It was placed in a light moist corner of an intermediate-house, where, with careful attention as to watering, &c., the plant soon began to grow luxuriantly, and it has continued to grow and bloom well up to the present time. During growth, and until the flower-spikes became well advanced, abundance of water was always afforded, but as the flowers commenced to open less water was afforded, and at no period was the plant allowed to become quite dry. The proper time to re-pot *E. Stamfordianum* is about the time that growth recommences. I may mention, that according to Mr. Payne's recommendation, I have placed several small plants which for years past have been gradually deteriorating, in such a position as above indicated, and they already appear to appreciate the change.

ROSES.—3656 Rose blooms were staged, as we learn from the secretary, in competition at the National Rose Society's Southern Show. The total above given does not include the Roses exhibited in the section for garden Roses, and in the decorative classes. With the exception of those at Birmingham in 1890, and Chester in 1892, this was the largest provincial exhibition that has yet been held by the Society.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, JULY 9 { Royal Horticultural Society's Committee, at the Drill Hall, James Street, Westminster.

SHOWS.

SATURDAY, JULY 6 { National Rose Society, at the Crystal Palace.
London Pansy and Viola Society, at the Crystal Palace.

TUESDAY, JULY 9 { Wolverhampton Floral Fête (three days).
Ipswich Horticultural and Rose.

WEDNESDAY, JULY 10 { Rose Shows at Chelmsford, Farnham, and Hitchin.
Reigate Cottage and Horticultural, at Redhill.
Royal Botanic Society, Evening Fête.

THURSDAY, JULY 11 { Bath Rose and Begonia, Workshop Rose, Woodbridge Rose, Helensburgh Rose, Great Malvern (Hareford Rose).

SALES.

TUESDAY, JULY 9 { Established Orchids at Protheroe & Morris' Rooms.

FRIDAY, JULY 12 { Imported Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.3.

Messrs. R. WALLACE & Co., of Colchester, send us a box of cut flowers of some of their varieties of this lovely genus. Their markings are so delicate and so intricate, their shades of colour so nicely graduated, that a verbal description is more than ever inadequate to convey an idea of their beauty and variety. There are still many who care little for the significance of all this variety and beauty; to them the flowers are beautiful, and that is enough. But the real plant-lover finds in them an added interest, and is able, in some degree, to invest the material with the spiritual. Taking the flowers before us, it is obvious that all this variety of colour and spotting is connected with the fertilisation of the flowers by insects, and we do not doubt but that adaptation to purpose directly or indirectly governs the whole arrangement. It is curious also to observe how the same end is accomplished by various means. Thus, in most of the flowers before us there are "eye-spots," and fringes of coloured hairs to attract and entangle the insect guest, perchance to bar the passage to undesirable visitors. In all such flowers, so far as we have seen, the stamens and the ovary are pale-coloured and relatively inconspicuous, but in one labelled *C. splendens atroviolaceus*, the flower is self-coloured, pale lavender, thinly besprinkled with whitish hairs, with no eye-spots or blotches, and no fringe or pad of densely-compacted hairs, such as are met with in the other forms. On the other hand, the stamens and the ovary are of a rich purple colour!

What the insects are which visit these flowers in their Californian homes, and what precise variations occur in the mechanism of fertilisation, we do not know; growers might, with advantage, record what takes place here, and who are the visitants. This matter is not merely one for the

physiologist or botanist, it is of direct practical importance also. A curious illustration of this fact is given us by Messrs. WALLACE, who find that one particular form, *C. venustus* var. *citrina* is injured by a leaf-cutter bee. The insect destroys nearly all the flowers of this variety, and, to a less extent, those of the similarly-coloured *C. luteus*. Why the insect should thus manifest a preference for yellow, and take no heed of flowers of other colour, is a mystery to be solved. Messrs. WALLACE ask for a remedy, but short of covering the flowers with a net, which would be very objectionable, we do not see how the enemy is to be circumvented.

Calochortus differs from Tulips or Lilies, though allied to both. On handling the bulbs for the first time, one marvels most of all at the prodigality of blossoms that keep following each other in rapid succession from the tiny bulbs or root-stock. By growing a fair collection of these plants in early, mid-season, and late varieties, these bulbs may be had in succession from April to the end of July. These bulbs are quite hardy under proper cultural conditions. Planted in cold, wet, or crowded herbaceous borders, where the struggle for life and growth is incessant, and the survival of the strongest only the bitter end of so many brilliant hopes, the *Calochortus* might not come to much. The best place for them is a thoroughly drained, dry border, facing and also sloping south, and raised 1 foot or so above the surrounding surface. The soil should be compounded of sea-sand, leaf-mould, and road-grit in about equal proportions. Sandy loam might compensate for the absence of sea-sand and road-grit, where neither is easily available; but the former is the compost for *Calochortus* at Colchester.

It is good practice to take up the bulbs in the month of August, and replant again towards the end of October or the beginning of November. The plants make little foliage, and produce almost a forest of flowers. They are greatly helped through the blooming season, and especially through such droughts as we have had this season, by good thorough waterings every alternate day. Many choice collections of these showy bulbs were exhibited at the Colchester Rose show, containing some of the choicest varieties.

Though most of the earliest had faded at the time of our visit on July 2, the following were among the best in the different sections. Earliest: *C. albus*, *C. amoenus*, *C. pulchellus*. The mid-season bloomers: *C. Benthami*, *C. cœruleus elegans*, *C. lilacinus*, *C. Tolmei*.

The latest section are the tallest and the most showy, the flower-stems rising to a height of 2 feet in some of the varieties, one flower-stem showing a dozen or more blooms, some, such as one of the largest *venustus oculatus* being 4 inches across the cup. The following, among others, were beautifully in bloom in Messrs. WALLACE'S nursery on July 2:—*C. luteus*, *C. l. concolor*, *C. splendens atroviolaceus*, *venustus oculatus*, *v. citrinus*, *v. purpurascens*, *v. roseus*, *v. vesta*.

Messrs. WALLACE sum up the cultural procedures best adapted for these plants as follows:—"Early planting [in September, October] to a depth of 3 inches in a light porous soil, sunny position, protection from heavy winter-rains, but no coddling, plenty of water whilst in full growth, and thorough ripening of the bulbs either by taking them up or by placing lights over them." We should be glad to hear the experience of those who have cultivated the plants in pots.

The following notes on the flowers submitted

to us may serve to convey some notion of the colouring of the varieties, though nothing but a well-executed coloured illustration can suffice to convey any adequate idea of their beauty:—

C. splendens atroviolaceus.—Flowers upwards of 3 inches across. Sepals linear-lanceolate acuminate; petals pale lavender, with a small purple blotch at the very base, elsewhere self-coloured, thinly beset with white hairs; filaments deep violet, ovary glaucous, pale violet.

C. citrinus.—Flowers upwards of 3½ inches across; sepals oblong-acuminate aristate, greenish externally, with a small eye-spot in the centre of the inner surface; petals canary-yellow, with a median purplish-brown squarish blotch; claw with numerous fine radiating linear spots, and a central crescentic band of orange hairs pointing downwards; stamens yellowish; ovary green.

C. luteus.—Flowers upwards of 2½ inches across. Sepals oblong, tapering acuminate, green, convex externally, yellowish internally, with a few purplish-brown streaks and lines; petals canary-yellow, with no blotch, but numerous small radiating purplish lines in the centre, and a broad crescentic tuft of orange hairs pointing downwards; filaments and ovary yellowish.

C. oculatus.—Flowers upwards of 4 inches across. Sepals broadly oblong acuminate, greenish internally, with a central purplish-brown spot edged with canary-yellow; petals creamy-yellow with a central blotch as in the sepals, but larger, claw with numerous minute radiating purplish lines or spots, and provided with a crescentic band of orange-brown hairs; stamens cream-coloured; ovary glaucous.

C. venustus pictus.—Flowers upwards of 4 inches across, sepals recurved acuminate, aristate, spotted and blotched on the inner surface. Petals creamy-white, blotch irregularly wedge-shaped, reddish-brown, surrounded by a thin band of pale yellow, claw with reddish-brown spots and hairs, and a central circular pit. Stamens pale pink. Ovary greenish.

C. Vesta.—Flowers upwards of 4 inches across, sepals broadly oblong, aristate-acuminate, recurved, greenish, finely spotted on the inner surface; petals pale lavender, with a central reddish-brown, square blotch, surrounded by a halo of yellow, claw marked with minute reddish spots, and with a ring of gold and brown hairs midway between the blotch and the bud. Filaments and anthers cream-coloured. Ovary glaucous, pinkish.

C. roseus.—Flowers upwards of 3½ inches across. Sepals green, oblong, acuminate, aristate, with a small purplish blotch within at the base; petals cream-coloured, with two oblong blotches, one above the other in the middle line, the upper pale, the lower rich chestnut-brown; claw with a central squarish pad of yellowish hairs, and numerous fine reddish-brown radiating streaks; anthers and ovary pale.

Professor HUXLEY.

THE death of Professor HUXLEY entails the loss of one of the most industrious, persevering, and clear-headed students of science and philosophy in our times. His work is remarkable, not only for quantity and diversity but also for excellence. These are qualifications which will be best appraised by his colleagues, but his lucidity of exposition, his disinterestedness, directness of purpose, and we are afraid we must say his pugnacity, gained him the ear of the public. It is as the great apostle of Darwinism or rather of "evolution," that he is best known. DARWIN himself was the most modest and retiring of men, shrinking from publicity, averse from controversy, and considerate to his opponents to a fault. Such a man was considered "fair game" for the wielders of ridicule, and an excellent target for the heavy artillery of those who, eminent in their own department, considered that they should have the monopoly of orthodoxy in matters of natural science also. Understanding nothing of the

subject, except at second-hand, fearful of assaults that would never have been made, they assailed the author of the *Origin of Species* and his book with a virulence and one-sidedness which seems unaccountable to the generation which has grown up since and takes the general principle of evolution as a "working hypothesis" as a matter of course. For the condition of things that existed at the time, HUXLEY was just the right man. Generally well read in science, literature, and philosophy, exceptionally familiar with the details of his subject, clear in logic, incisive

DENDROBIUM × ILLUSTRÉ (*chryso toxum* ♀, *Dalhousieanum* ♂).—Even so far as can be judged by its first inflorescence, secured after something like ten years careful tending, in this showy hybrid we have a remarkable instance of the good work of the hybridist in producing new garden plants. The species crossed are as dissimilar as they can well be, and have little in common, except that they both inhabit Burmese territory. *D. Dalhousieanum* was first introduced in 1837, and *D. chryso toxum* some ten years later. The former has tall terete stems, leafy when young, and the latter clavate pseudo-bulbs, bearing a few leaves at the top, and yet in Messrs. VEITCH'S hybrid the amalgama-

lip being purple. It is a remarkably interesting and beautiful plant now; when it was exhibited by Messrs. JAS. VEITCH & SON at the meeting of the Orchid Committee of the Royal Horticultural Society, June 25, it received a First-class Certificate.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will be held in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, July 9, when a special show of Roses will be an attractive feature. At 3 o'clock, Mr. FRANCIS DARWIN will deliver a lecture on "The effects of Darkness on the forms of plants."

FIG. 4.—DENDROBIUM × ILLUSTRÉ: FLOWERS YELLOW; LIP PURPLE.

in speech, he rushed into the fray, and the railers and vituperators soon found they had an antagonist who could, when necessary, use their own weapons with overpowering efficiency. One may regret that each party did not keep to its own department, and we must deplore the unscientific temper that was manifested, but we must remember the provocation, and bear in mind that the means used were at the time the only ones that could be appreciated.

HUXLEY, though a naturalist in the broad sense of the term, contributed little to botanical, and nothing to horticultural literature. His paper on Gentians, in the *Journal of the Linnean Society*, is suggestive rather than practical.

tion of the two is distinctly traceable, the swollen stems and fleshier leaves indicating *D. chryso toxum*, while the way in which the leaves are borne, and the characteristic light line on the sheath covering the stems, point as conclusively to *D. Dalhousieanum*. The flowers also in form merge the two parents, and it will not be too much to say that as *D. Dalhousieanum* often has ten or twelve flowers on a spike, and *D. chryso toxum* often two dozen, a sufficiently fine inflorescence, so far as number of flowers go, may be expected from the hybrid on its gaining strength. A curious circumstance is the resemblance in some particulars which *D. x illustre* bears to *D. albo-sanguineum*, although its flowers are thicker in substance, and of a clear, shining straw-yellow, the markings on the downy

FLORAL DECORATIONS AT WINDSOR CASTLE.—

As befits the residence of royalty, on the occasion of a visit from a foreign potentate whom Her Majesty wishes to honour, the art of the gardener is nearly always called in to aid in imparting an appearance of gaiety to the rich appointments and furnishing of the State apartments at the Castle. And such was the case when, on Her Majesty's reception of the SHAHZADA on Tuesday last, we had the pleasure of inspecting the floral decorations. Mr. OWEN THOMAS, the royal gardener, has a good eye for effect, and whilst not striving in the least after eccentricity in arrangement, as is the habit of some, he attains very satisfactory results by the use of a few species of plants and flowers instead of a multiplicity, and by the avoidance of any undue crowding.

The general scheme of arrangement was one precisely adapted, as regarded some parts of it, to the summer season, namely, to fill up the fireplaces with plants, to flank all doorways with small groups, and make assemblages of plants in spaces that admit of its being done by their remoteness from the customary lines of traffic through the various saloons. The only departure from these ideas was that remarked in St. George's Hall, which will be noted further on. The grand staircase, with its white marble statue of GEORGE IV., and bronze figures of naiads, was beautified by a group of tall Palms, standing apart from, and a little lower than the statue, the foreground being filled in with Codiaums (Crotons), which have foliage with yellow colours predominating, such being considered more cheerful-looking in the half-light than the richer-coloured varieties. Other plants consisted of pink Hydrangeas, yellow-flowered Marguerites, Liliun longiflorum, and besides these a finishing of Adiantum, Panicum variegatum, and the like. Sprays of the variegated-leaved Lonicera and Ivies possessing small foliage hung down over the solid, low walls of the staircase; and on the top of them were disposed Hydrangeas, Cape Pelargoniums, more yellow-flowered Marguerites, and the seldom-used Hamea elegans, profusely-flowered sprays or plants of Rosa Félicité-Perpétue, clothing the small pillars, which gave a finish to the head of the stairs. The wall behind was slightly masked by slender Palms, as far as regarded the large bare spaces between the lancet-shaped windows. Small groups were disposed on either hand a little further on under the arch, beneath which is the approach to the ante-room. In this room the large *fanteuil* was topped with a cluster of gay-coloured Caladiums of moderate size, surmounted by a nice specimen of Pandanus Veitchii. A doorway was here masked by a fine piece of Alocasia metallica, some Palms, Codiaums, and Kalosanthes coccinea, with a bordering of Pilea muscosa, Ferns, Selaginella denticulata, Isolepis, and other dwarf plants. The vestibule leading from this to the next one—Nelson's room, so called from a white marble bust of the hero perched on a piece of a mast of the *Victory*, was flanked on each side of the two doors with Palms, and a few flowering plants of a kind to sufficiently light up the rather darkened place. An imposing group, consisting of Lilies, Kalosanthes, Marguerites, and Codiaume, filled the fireplace in the Nelson-room, and a smaller group was arranged on the opposite side. St. George's Hall is entered from this last apartment, and is lighted by eleven very high windows, all on one side. In each window was hung a basket of cut flowers of one variety, the baskets being literally covered in every part with them; and the flowers—long sprays and spikes—consisted of a white variety of Intermediate Stock (spring-sown, as Mr. THOMAS remarked); Cassia corymbosa, the only yellow flowers employed for this purpose; Sweet Pea Her Majesty, a deep pink, profuse-flowering variety, which filled five of the baskets, and the stocks also five. The window-seats were filled up with much the same kind of material as that previously noted, with the addition of Gloxinias, Hydrangea paniculata, the white blossoms and graceful habit of which render it an almost ideal plant for indoor use; Spiraea Aruncus and S. Bumalda, Dracenas with coloured leaves, Francoa ramosa, Gladiolus The Bride, with Ferns, Isolepis, &c., as a finish. A group of Palms, Codiaume, Dracenas, and miscellaneous subjects made an effective filling for the enormous fire-place, which finds a place on the side of the Hall opposite the windows. Some tall, slender Palms at a doorway, and flanking the throne, completed the design of the decorations. A capital method of showing off the flowering sprays of Bougainvillea was remarked, which being new to me, may be deserving of mention. A Kentia or some such species of Palm about 5 feet in height is selected, and into the axil of each leaf a long flowering shoot of Bougainvillea spectabilis is stuck, the whole forming a very pretty kind of floral fountain.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The fifty-sixth anniversary festival dinner of the Gardeners' Royal Benevolent Institution took place on the evening of Friday, June 28, in the Whitehall Rooms of the Hôtel Métropole. The Duke of FIFE presided, and the numerous company included Sir TREVOR LAWRENCE, President of the Royal Horticultural Society; and Messrs. G. A. DICKSON, N. N. SHERWOOD, W. GIBBS, T. ELLIS, Ed. STERN, G. J. BRACKENRIDGE, DAVID SYME, G. MONRO, Jas. WEBBER, T. F. PEACOCK, F.S.A.; G. W. DAWES, W. J. JEFFRIES, E. W. CATHIE, G. BISHOP, &c. In proposing the toast of "Continued Success to the Institution," the Chairman said that in these days, in spite of universal depression, enormous sums were spent every year in charity, and last year in London alone there was disbursed by the different societies and agencies which existed for the purpose no less a sum than £5,200,000, to say nothing of the very considerable sum which could not be calculated that flowed along the hidden channels of private benevolence. But, unfortunately, these huge sums did not bring about the beneficial results which we all desired, because there was not sufficient concentration in charitable effort, and because there were too many societies doing the same or similar work. His remarks, however, did not apply to the Gardeners' Benevolent Institution, for it was, he believed, the only society of its kind in Great Britain. Its principal object was to assist the aged and infirm by means of pensions, and it inculcated the admirable principle of self-help by giving preference to those who had subscribed to its funds. Now-a-days it seemed as if all parties in the State had agreed to do that which was regarded as thoroughly unsound by the old Whig school in which he was brought up, namely, to establish a system of State-aided pensions. But the Gardeners' Benevolent Institution had been doing for many years for the gardeners what the State now proposed to do for everybody. The life of a gardener was not entirely a bed of Roses. Many had to toil unceasingly at all times of the year, and in all weathers, and the result of their toil was to provide us with some of Nature's choicest gifts. But misfortune sometimes overtook them, and it was to meet cases of this kind that that Institution was established nearly sixty years ago. Since then pensions and gratuities had been granted to the amount of £65,000, and at the present moment 156 persons were receiving the assistance of the Society, 77 of them being men, and 79 women, while there were many pressing cases on the list waiting for election. The toast, which was heartily received, was responded to by Mr. G. A. DICKSON of Chester. Mr. W. J. JEFFRIES of Cirencester gave the toast of "Horticulture," which was acknowledged by Sir TREVOR LAWRENCE. The Secretary, Mr. G. J. INGRAM, having announced subscriptions amounting to over £1900, including £30 from the Duke of FIFE, £105 from Messrs. ROTHSCHILD, 10 guineas from ALFRED DE ROTHSCHILD, Esq.; and £10 from the Hon. WALTER ROTHSCHILD, £21 from N. SHERWOOD, Esq., and £25 from Messrs. JAMES VEITCH & Sons; the proceedings closed with the toast of "The Chairman," proposed by Mr. N. SHERWOOD. The Duke of WESTMINSTER has increased his annual subscription to the Institution, of which he is President, to £15 15s.

UNIVERSITY COLLEGE, LONDON.—On the evening of the 27th ult., the President and staff of this Institution gave a largely attended and brilliant *conversazione*. The scientific and engineering departments of the College, and the Slade school of fine arts were all in gala array. The department of botany was well to the fore, and its exhibits included superb collections of plants from well-known growers. Messrs. JAMES VEITCH & SON sent an interesting collection of insectivorous plants, hybrid Orchids, and other plants. The hybrids, being grouped with their parent forms, made a particularly interesting exhibit. Messrs. WM. PAUL & SON had a fine display of Roses in the south cloister, the flesh-coloured Clito, Duke of York, Hon. Edith Gifford, and the yellow Medea being particularly admired. A large

collection of Cactaceæ and other succulents did full justice to Messrs. HENRY CANNELL & SONS; whilst Messrs. B. S. WILLIAMS & SON and Mr. T. S. WARE both sent attractive and well-selected exhibits. In the botanical laboratory was a group of portraits of former members of the botanical staff, including a large crayon portrait of the late Prof. JOHN LINDLEY (lent by his son Lord Justice LINDLEY), a head in oils of Professor D. OLIVER, and photographs of Professor F. O. BOWER, Dr. D. H. SCOTT, the Rev. GEORGE HENSLOW, Professor F. E. WEISS, and others. Here also was a selection of old flower-drawings by EHRET and Madame MÉRIAN, large photographs of forest vegetation (lent by Dr. D. MORRIS, Assistant Director, Royal Gardens, Kew), and photographs of plants at Kew, by Mr. F. A. BRIDGE. On the tables were exhibits of physiological interest, and a few slides of fossil plants from the collection of the late Professor W. C. WILLIAMSON. Of special note were the large models of dividing cell-nuclei exhibited by Professor J. B. FARMER; they are likely to be of great help to the student of minute cell histology. The laboratory had been very skilfully decorated by the lady students of the department, and the banks of flowers which they had arranged, and which were illuminated by the electric light, were singularly effective, as also was a tank of white and yellow Water-Lilies. A series of living Ssaweeds and other aquatic plants, shown as transparencies by this department were much admired, Ulva, Laminaris, Cladophora, and Uricularia, were perhaps the most beautiful. Other botanical exhibits included photographs and tables illustrating the fixation of free nitrogen (lent by Sir HENRY GILBERT, F.R.S.); plant skeletons, by Mrs. HODKINSON; and artificially-coloured flowers, by WM. BROCKHANK, Esq., F.L.S. In the Slade school we noted an effective combination of flowers, statuary, and Chinese lanterns; and in the physical lecture-room, Argon and Helium, the main output of the chemical department of the college during the session, were on view. The soirées was attended by several thousand guests, including many well known in literary and scientific circles.

ROYAL BOTANIC SOCIETY.—At a meeting of the council of this society, held on Saturday last, it was decided to open their gardens in Regent's Park to the public on every Monday in July, August, and September, at an admission fee of 1s.

AN OUTING OF THE NATIONAL AMATEUR GARDENERS' ASSOCIATION.—On Saturday, June 22, in response to an invitation from H. HUCKS GIBBS, Esq., upwards of 150 members of the National Amateur Gardeners' Association paid a visit to Aldenham House, Herts, for the purpose of inspecting the gardens. The headquarters of this Society are in London, and meetings are held the first Tuesday in every month at the Memorial Hall, Farringdon Street. In order to promote the objects the Society have at heart, visits are made during the spring and summer months to various gardens and nurseries. The parent Society numbers between 400 and 500 members, besides branches in different parts of the country. The visitors, among whom were a number of ladies, were met on their arrival by Mr. BECKETT, the head gardener at Aldenham, and some amateurs resident in the neighbourhood, and conducted by him round the lovely gardens.

HERBACEOUS PLANTS.—Now that these are in full season, we hasten to announce the publication of a *Hand List* of herbaceous plants cultivated in the Royal Gardens, Kew. We must defer further notice, but may mention that it may be obtained at the Royal Gardens, Kew, at the cost of one shilling.

THE NEWCASTLE-ON-TYNE HORTICULTURAL SOCIETY.—The summer show of this society will be held in the Recreation Ground, North Road, on Wednesday, Thursday, and Friday, 24th, 25th, and 26th inst. This year additional prizes are offered for groups, dinner-table, and fireplace decorations, and also for vegetables. The council are also prepared, as we are informed, to give increased facilities to attractive trade stands.

THE ROYAL GARDENERS' ORPHAN FUND.—The monthly meeting of the committee took place at the Horticultural Club on the 27th ult., W. MARSHALL, Esq., presiding. The following special donations were announced:—From the William Thomson Memorial Fund, £65 13s. 2d.; Mr. J. T. Anderson, £1 5s.; Messrs. J. Laing & Sons, Forest Hill, £1 1s.; R. I. Menares, Esq., proceeds of sale of third edition of "Cypripediums Hybrid Species," £7 10s.; and Mr. A. Stirton, Wrexham, 5s. A cheque was drawn for the children's quarterly allowances, which now amounts to £204 10s.; and the gardeners about the country who do not yet subscribe to the Fund or support it in any way should make a note of the fact that so large a sum is paid annually to assist in the maintenance of the orphan children of dead gardeners.

THE ORIGIN OF THE CINERARIA.—We have some further remarks to make on this subject, but defer them for the present. In the meantime, we observe that our colleague *The Gardeners' Magazine* "conclusively proves" [to his own satisfaction] that the evidence in favour of hybridity will not bear examination. An important statement of fact from Mr. KELWAY is published in the same journal, to the effect that he, Mr. KELWAY, raised the florist's Cineraria in 1837, by selection from seedlings of *C. cruenta*. If the records are to be relied on, this is ten years after DROMMOND'S experiments, but this, of course, does not invalidate Mr. KELWAY'S statement. We shall also have to refer later on to the alleged hybrids that have appeared in the Cambridge Botanic Garden, and in that of Mr. POË.

M. RODIGAS.—Some of the Belgian papers give full details concerning the compliments paid to M. EMILE RODIGAS, the Director of the School of Horticulture at Ghent, on the occasion of his completing thirty-five years as a professor. Many of us in this country are also familiar with the unceasing labours of M. RODIGAS, his accuracy of perception, his impartiality, his powers as an administrator, and some of us are fortunate enough to reckon him as a personal friend. MM. BUAVENICH, PYNABERT, RODIGAS, and VAN HOLLE, constitute the "four-leaved Trefoil," a body to whose joint efforts for more than thirty years no small part of the progress of Belgian horticulture is due. The stalk of this four-leaved unity is Count DE KERCHOVE DE DENTERGHEM. *Floreat semper diuque floreat.*

NATIONAL HORTICULTURAL SOCIETY OF FRANCE.—At the last meeting of the Orchid Committee of the National Horticultural Society of France, Mr. JACOB, Orchid Foreman to the Baron ED. DE ROTHSCHILD, Armainvilliers, showed a magnificent group of new hybrid Cattleyas. I noticed amongst them a particularly interesting plant, Cattleya Armainvillea alba (*C. Mendeli* × *C. gignea*), petals and sepals large, pure white; lip broadly open, crimson; pure gold yellow at the base. Another plant of the same cross had the divisions slightly flushed with clear rose. A splendid thing is *Laelio-Cattleya Jacobiana* (*Laelia purpurata* × *Cattleya Mendeli*), the division of the flower white, tinged with rosy-mauve colour; the front lobe of the lip dark crimson-purple, and the base nearly white. A fine *Laelio-Cattleya Canhamiana*, raised from *L. purpurata* × *C. Mossiae*, was shown; the parentage is certain, and the plant is exactly the same as the one obtained at Messrs. VEITCH & SONS. Mr. PAGE, gardener to Mr. LEBAUDY, Bougival, exhibited a very handsome new hybrid Cypripedium; the parents are *C. laevigatum* and *C. Haynaldianum*, and the plant which resembles *C. Parisii*, received the name of *C. Lebaudyannum*: scape with six flowers, each having its dorsal sepal emerald-green at the base, vertically streaked with brown; petals twisting, pale green at the base, and vinous-purple at their extremity; the whitish inferior sepal is very large and arched. This plant received a first-class certificate. *Georges Truffaut.*

THE LATE M. J. E. BOMMER.—We have received a biographical notice by Prof. LEO ERREBA of the

late J. E. BOMMER, whose name is so well known in connection with his monographs on Ferns. M. BOMMER, it will be remembered, was a native of Brussels, and his death took place last February.

HOME CORRESPONDENCE.

THE STRAWBERRY, SENSATION.—This Strawberry has turned out well with us this season. Planted on a border by the side of Noble, it has ripened its fruit as early as that variety, and the fruit is very much finer in appearance, and of better flavour than that variety. What its merits may be for pot-work I cannot say, but I intend to give it a trial next season. If we could only get some of the British Queen flavour in the large early Strawberries, what an acquisition it would be! *W. S. Hurlstone, Parkfield, Hallow.*

BAMBOOS AND THE PAST WINTER.—Mr. Bean's instructive paper on the subject of Bamboos and the past winter, is most interesting. His conclusions are fully borne out by our experience here. As regards Canon Ellacombe's suggestion, that the severe winter has actually been of service to his Bamboos, I should rather be of opinion that the great shoots to which he alludes are due to the wet summer of 1894, which greatly encouraged root-action, and, consequently, the stem-buds which are formed on the rhizomes. Tsan-chikee, which he mentions as being killed, is not hardy, and would die in any ordinary English winter. It is supposed not to be a native Japanese plant, but a degenerate form of one of the giant tropical Bamboos, partially acclimatised in Japan, but doomed to certain death here. Its position in Japan would be analogous to that of the Japanese and Chinese Bamboos in this country. We can grow them, but in a dwarfed form; and if they were to be carried to a still more unfavourable climate, they would perish altogether. *A. T. Fraun Mitford, Batsford Park, Moreton-in-Marsh.*

THE CINERARIA.—As authentic records are wanting upon the early history of the subject, a few experiments ought to be made with the view of ascertaining the value of the two conjectures. If it originated by the crossing of *cruenta* and *lanata*, it was evidently not designed, and it may be said that our greenhouse Cinerarias came by chance. A few plants of *Cineraria cruenta* when in flower should be isolated, so as to make sure against their becoming pollinated with other Cinerarias; seeds should be saved from such a stock, the seeds sown, and the plants when in flower carefully examined for variations. Then a few plants of *Cineraria cruenta* might be pollinated with the pollen of *Cineraria lanata*, and *vice versa*, saving the seeds, and raising plants from them, and watching the results. As far as my experience goes, the seeds of *Cineraria cruenta* are not abortive, as is stated in the *Botanical Magazine*, for a plant which was in flower in these gardens a short time ago has produced several seedlings, many having sprung up from the surface of the soil of the pot in which it was grown, also from the seeds gathered from the plant. And I can endorse Mr. Drommond's remark, that "the flowers retain their beauty until the very day the seeds are scattered." It may be that our plant had become pollinated by the florists' Cinerarias, which were in bloom at the same time as *C. cruenta*. These seedlings from *C. cruenta* which we have will be watched with interest, to note whether any variation takes place from the parent plant, and I will send you a note upon the subject in due season. Mr. Douglas has expressed a wish for a plant of *C. cruenta* and *C. lanata*. I shall be pleased to send him a plant of the latter and two or three seedlings of the former for experimenting upon, if he is not already supplied. *Wm. Harrow, Botanical and Horticultural Society's Garden, Sheffield.*

CEDAR OF LEBANON AT TAPLEY.—The height of this tree is about 50 feet. Its top is large and flat. It was planted in 1825. *W. T. T.*

RED WATER.—I have in my garden a small pond of about 500 square yards area, with an average depth of about 2½ feet. It is contained in a cemented basin, and is supplied by means of a hydraulic ram from a deep spring a quarter of a mile distant, the water of which is especially pure and bright. In each spring time for some years past the water of this pond has turned a deep blood-red colour, in

which state it remains for some months, and then becomes clear again. Upon microscopic examination it appears that the colour is due to numberless red-coloured organisms, which, according to Prantl and Vines, are referable to *Hæmatococcus*. I do not know whether this red water is often seen and well known, but as it is very unsightly, I should be extremely obliged to anyone who would tell me if there be any means of destroying the growth, or of preventing its recurrence. *S. Courtauld, Booking Place, June 26.*

SQUIRRELS.—The note of Dr. Morris regarding the injury to scarlet Chestnuts by these sprightly little thieves is very interesting. I have known them injure the shoots of the Scotch Fir in the same way; here they eat the green cones of that tree by hundreds, but fortunately they do not injure the trees. Their power of adapting themselves to altered circumstances is most extraordinary. I believe they disposed of at least a bushel or two of my Parsnips during the last winter, and now they eat my Strawberries by wholesale and bite the nets to pieces. Last season Apples and Plums were annexed in large quantities. During the winter one little fellow came regularly every morning on to the sill of my breakfast-room window. It gave us great pleasure to see him sit and munch up pieces of bread which were provided for him. The most extraordinary freak I have ever heard of squirrels is the following: I have a bell to summon my workmen, which is hung in a little cage about 15 or 20 feet high. The other day, when the time came for ringing the bell, a squirrel was found sitting by the bell, his mouth full of frayed hemp, and the rope bitten in two. We presume he found the soft hemp suitable for lining his nest, and my bellman had to climb up to fix another rope. Query: Did the squirrel find the rope frayed, or did he manufacture a soft wadding from the rope? *Charles Noble.*

HEAVY THUNDERSTORM.—A short note of what happened at Edge last week may interest some of your readers. At 4 p.m. on June 26 a thunderstorm suddenly collected in the sky after a brilliant and scorching day. About a thousand flashes of lightning, all within five or six miles, occurred in an hour, during which I estimated that nearly 2 inches of rain fell. At one time I counted over thirty flashes in a minute. Thirteen large trees—there may be more yet to be discovered—were struck within about half a mile of my house, twelve Oaks and one Ash, six of these were within 300 yards of the house. At five o'clock the storm had all passed over. The next day, June 27, at half-past twelve, we had another sharp thunderstorm, lasting an hour, a fall of large hail, lasting twenty minutes, completely demolished every open flower in the garden, and many of the plants. The Rhubarb leaves are a curious sight, looking as if they had been used for ride targets. A few cattle were killed in the neighbourhood, but, as far as I have heard, no human beings. *C. Wolley Dod, Edge Hall, Malpas, June 29.*

STORM IN YORKSHIRE.—The storm of June 26 was the worst the oldest man in Mirfield could remember. The hail was as big as marbles, and in my garden of nearly 2 acres in extent, Peas, Beans, Strawberries, Raspberries, and all vegetables, flowers, and everything else, were completely destroyed, and nearly every pane of glass in the house was broken. I am by no means the only one who has suffered, but when a man is depending on his garden, it is a serious thing. *D. Brown, Nab Nurseries, Battyeford, Mirfield.*

VICOMTESSE HÉRICART DE THURY STRAWBERRY.—The engraving, p. 775, well represents this fine variety at its best. This variety was a favourite with Mr. Wildsmith, of Heckfield Place, for early forcing, and none could be obtained that was better for ripening in the middle of February—in fact, he regarded it as being the best Strawberry for forcing or out of doors. Its flavour is excellent, and in this respect it is only second to British Queen. It is a splendid cropper, but unfitted for market, the berries being smallish, and its flavour does not make up for its want of size. About Liverpool the Vicomtesse was always a favourite variety, it going there under the name of Garibaldi. So little is it known out of private gardens that in this district, where at least 1000 acres are devoted to Strawberry culture, I do not know a single instance of its being grown for market. It is a very free grower, and a very hardy plant, with ample foliage, which is short-stalked, if the bulk of the old leaves are removed when fruiting is over. *E. M.*

OLD AND NEW VARIETIES OF STRAWBERRIES.—

There is nothing new to be said as to old sorts, and I intend to confine my remarks to new introductions, to their value as forcers, and to the best methods of imparting flavour to the fruits. Of new varieties mention should first be made of the variety Stevens' Wonder, figured in *Gardeners' Chronicle*, p. 271, and certificated by the Royal Horticultural Society on March 12 this year. I have not grown it, and am therefore unable to speak of its merits as a forcer, but I was certainly impressed, as were others, by its size and fruitfulness, and by the quantities Mr. Stevens had sent to market. The fruits are of large size, in colour a pale red, with a solid pulp, and of nice shape. It was noted that most of the fruit on the plants shown on that occasion were of one size, small ones being few. This point is a great gain, as some well-known varieties furnish two or three fine fruits, and a number of small ones, and in these days when everything must be large, such small fruit is not profitable. It is distinct in growth, and remarkable for the small size of its leaves and short leaf-stalk, which is another gain in a forcing variety, as the plants may be placed closer together. Another novelty that I am pleased with, and which promises to become a standard forcer, is Royal Sovereign, which has been a sufficient length of time in cultivation to have its qualities tested. It is a good forcer, and its rich, brisk, pure flavour is a strong point in its favour. This is a variety that has a future, and one that will be largely employed as a forcer. I am glad to note the old practice, once very general, of standing the plants in saucers, or on decayed manure, is little practised. It was the cause of much poor insipid flavour, as might be assumed, free drainage being as essential as a free circulation of air in obtaining the perfection of flavour. High shelves in forcing-houses are not good places in which to stand the plants. After April is out the soil soon gets dry, giving acidity to the fruits, and the surrounding aridity favours red-spider. Doubtless, it was with the idea of abating these two evils that the saucer and layer of manure were thought of. The late-forced plants are much better accommodated on a cool hard coal-ash bottom, in pits or frames, giving much less trouble in regard to red-spider and in the matter of watering. The only trouble incurred is in raising the bunches of fruit by means of crutches made out of forked twigs, so as to bring them up to the light, and to a part where there is free current of air. Returning to new varieties, I may say here that I intend to grow Royal Sovereign largely, for besides being a good eating fruit it packs grandly; the seeds covering the fruits so completely that at the end of a long journey by railway the fruits appear quite perfect. The variety was recently praised by the Fruit Committee of the Royal Horticultural Society as a forcer, and for its brisk flavour and fruitfulness. Another novelty is Ganton Park, which I like very much; it is the best forcer of the trio which Mr. Allen recently gave us. It may not in flavour equal Express of India, which is the best-flavoured of the three; still, it is excellent, without insipidity, with pulp that is very firm in texture, and is a handsome dark-coloured fruit, in shape between conical and cockscomb, and a prolific bearer. It may be forced so as to fruit in March, following Vicomtesse H. de Thyry or La Grosse Sacée. It will certainly please the grower. A novelty that I have grown this season is May Queen; it was raised near Chiswick, and forces splendidly; and although bearing a resemblance to Sir J. Paxton in shape, is much earlier, of better flavour, and larger. It is a free bearer, and of good flavour. A new variety, sent out by Laxton Bros., named Leader, is a fine fruit, somewhat resembling Royal Sovereign in shape and colour. It is said to be a cross between Noble, which has nothing but size to recommend it, and Latest of All. To get the best results in Strawberry forcing, strong runners should be obtained as early as possible from plants that have been deprived of their flower-trusses. *G. Wythes*.

INULA HOOKERI.—Flowers bearing this name were certificated lately by the Royal Horticultural Society. They were exhibited by Mr. George Paul, and I believe the plants came originally from my garden; anyhow, I have distributed during the last ten years, through Mr. W. Thompson of Ipswich, enough seed, called *Inula grandiflora*, to stock every garden in England. A question has been raised whether the certificated flowers belonged to *I. grandiflora*, *I. Hookeri*, or *I. glandulosa*, and I will therefore tell what I know about them. *I. grandiflora* (Willdenow) and *I. glandulosa* (Willdenow) are described as Caucasian plants in *Boissier's*

Flora Orientalis vol. iii., p. 188; and *I. grandiflora* (Will. and Boiss.), and *I. Hookeri* (Clarke) are described as Himalayan plants in *Hooker's Flora of India*, vol. iii., p. 294. I have grown *I. glandulosa* for twenty years. I first had it from the garden of the lead-works, Chester, and at that time it was little known in nurseries. *I. Hookeri* was given to me about ten years ago, I think from Kew. It is taller, growing 5 feet high; the rays of the flowers are shorter, but the disc as large, and the stems and crowns more robust, the leaves broader, and less tapering at the base. I had never observed fertile seed on *I. glandulosa*, but *I. Hookeri* at once began to make seed, which I sowed, and reared hundreds of plants, which corresponded exactly to neither parent. I sent some of the flowers to a distinguished botanical establishment, sorting them as No. 1, 2, 3. They were returned as No. 1, *I. grandiflora*; No. 2, *I. glandulosa*; No. 3 *I. Hookeri*. Now, the last two names were certainly the only species of the kind I had ever introduced into my garden, and I was glad to have created *I. grandiflora* for myself, and I adopted the name; as, on careful comparison with the characters of *Boissier* and *Hooker*, they fitted well enough. The moral I draw is that, though I will not dispute that these three species may exist in their own home as wild plants, their progeny in gardens becomes quite undistinguishable, and that a series may be picked out from the seedlings, representing the characters of all the three species. The same story applies to kindred species in other genera—such as *Papaver orientale*, Linnæus, and *P. bracteatum*, Lindley, and several others. *C. Wolley Dod*, *Edge Hall, Malpas*.

PHILADELPHUS, BOULE D'ARGENT.

THIS, the "silver ball" *Philadelphus*, was raised from *P. Lemoinei* X by M. Lemoine. *P. Lemoinei* X itself is a hybrid between *P. coronarius* and *P. microphyllus* (fig. 5, p. 19). The flowers of the hybrid were impregnated with pollen of a double-flowered form of *coronarius*, and the result is, this double-flowered form with large white flowers having the perfume of *P. microphyllus*. It was much admired at the last meeting of the Royal Horticultural Society, where it was shown by Messrs. T. Cripps & Sons, Tunbridge Wells.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JUNE 25.—Present: Mr. McLachlan (in the chair), Dr. Bonavia, Prof. Müller, Prof. Church, Mr. Wilson, Mr. Lynch, and Rev. G. Henslow, Hon. Sec.

***Primula scotica*.**—Mr. Wilson exhibited a pot containing some seedling plants, in blossom, of this North British species, which is found in pastures of Orkney, Caithness, and Sutherland. The flowers are homomorphic, not having the stamens and pistils of different lengths as in most other *Primulas*.

***Round-leaved Beech*.**—Mr. Jackman exhibited small trees of *Fagus sylvatica*, with the leaves small, entire, and round. As the trees exhibited an erect form, with short branches, it would seem to be the result of some check to growth, the form of the leaf representing a less developed state than that of the ordinary type of tree.

***Prehistoric Hazel*.**—Mr. Colinette of Guernsey forwarded some Hazel wood found in peat near the coast of Guernsey, containing also flint implements, stone rings, and pottery, presumably neolithic. No Hazel is now known to be indigenous to Guernsey.

***Flies attacked by Fungi*.**—Mr. McLachlan exhibited specimens of *Melanostoma scalare* attached to flowering stems of a grass, *Glyceria fluitans*. They were received from Mr. Ralph C. Bradley of Sutton Coldfield, who writes as follows:—"Whilst collecting in Blackrook Bog, Sutton, on June 16, I came across an extraordinary phenomenon. For a space of about a dozen square yards, the flowering stems of *Glyceria fluitans* were covered with a large number of dead *Melanostoma scalare*, whose bodies were very much distended by a fungoid growth similar to that seen on the house-fly in the autumn. Some stems bore thirty to forty specimens, and fresh victims were constantly being added. I also found two flowering stems of Dock covered with the dead bodies in a similar manner. The flies were to be found only on the flowering part of the stems, and not on any leaves or herbage. Why *M. scalare* should be the only species attracted to the stems and attacked in this manner is very curious, as swarms of other insects were flying about, but did not seem to be tempted to join them in the least." They were forwarded to Kew for investigation.

RICHMOND HORTICULTURAL.

JUNE 26.—Under brilliant skies and in oppressive heat the twenty-first of the grand summer exhibitions of this popular suburban society was held in its accustomed place, the Old Deer Park on the above date. During the afternoon the show was, as usual, visited by the President, the Duke of Teck, and by the Duchess, and there was a large and very dressy attendance. The secretary, Mr. Capel Smith, and his active assistant, Mr. Bagnall, merits all praise for the successful attendant on the exhibition.

The exhibits were, as usual, in four marquees, and all were filled, in some respects to too great an extent, so great was the anxiety to have a place. Generally, plants were greatly in excess of last year, and those, because there was no competing show, and flowers are early, were not only in splendid form, but were in great abundance.

Plants.—We have never seen so many trade groups here before as this year. Mr. H. J. JONES, Lewisham, had a truly grand group of Begonias, set in Asparagus and Ferns. Messrs. J. FRED & SONS, Norwood, had a pretty group of foliage and flowering plants. Messrs. W. CUTBUSH & SONS, Highgate, a wonderfully fine group of Malmaison Carnations. Messrs. J. VEITCH & SONS, Chelsea, a superb collection of dwarf pot Roses, with cut blooms, very fresh indeed. Messrs. C. LEE & SONS, Hammersmith, a charming lot of variegated trees and shrubs. Messrs. FROMOW & SONS, Turnham Green, pretty Acers, &c. Mr. W. THOMPSON, Sheen Nursery, Richmond, a nice group of Palms, Acers, and other decorative plants. Messrs. J. LAING & SONS, Forest Hill, Begonias, Caladiums, Gloxinias, &c. Mr. G. MAY, Upper Teddington, Carnation Uriah Pike, set in Lillium Harrisii. Mr. PIKE, Acton, had this Carnation also. Messrs. JAS. CARTER & Co., High Holborn, arranged in Fern a brilliant and beautiful group of Gloxinias of superb form and colours. Mr. W. ICETON had, in the centre of the tent, a group of Palms and other foliage plants. Messrs. FROMOW, a group of tender foliage plants; and Messrs. CANWELL & SONS sent a fine collection of Cactaceans plants. Finally, of honorary groups in the plant tent, Mr. WYTHE, gr. to Earl Percy, Syon House, Brentford, sent a good group of foliage and flowering plants.

Decorative Groups were few; the best, a very beautiful one, from Mr. H. E. FORDHAM, easily took 1st place in the larger class; and Mr. J. F. MCLEOD, Isleworth, and Mr. W. FARR, gr. to ANDREW PEARS, Esq., Roshampton, were 2nd and 3rd. Mr. Fordham employed, amongst other things, Gypsophila, with good effect. In the small groups, Mr. PORTHURY, gr. to W. N. TROY, Esq., Roshampton, was 1st; and a far more effective one from Mr. WANT, gr. to Sir F. WIGAN, Sheen was 2nd.

Specimen plants were few, so far as flowering stuff was concerned, the only six in bloom coming from Mr. A. Offer, gr. to J. WARREN, Esq., Crawley, well-bloomed, medium-sized, the best a *Bougainvillea glabra*. Mr. Offer also had the best six foliage plants in large Crotons Williamsi and Queen Victoria, *Athurium magnificum*, *Dieffenbachia Bowmani*, *Cycas revoluta*, and *Kentia Belmoreana*. Mr. W. FARR, having a large *Asparagus plumosus*, was 2nd. The best six Caladiums, well-coloured plants, but not large, came from Mr. SIMMONDS, gr. to W. CUNARD, Esq., Twickenham. Mr. MCLEOD having also medium-sized, richly-coloured plants with noble leafage, was 3rd; tall greenish plants from Mr. WANT, coming 2nd.

Mr. J. SMITH, Isleworth, had the best six *Coleus*, smallish pyramids. Mr. C. TURNER, Slough, had the only group of large-flowered *Pelargoniums* in small pots, very bright and effective; as also the only specimens, good plants for the season, wonderfully kept. Of these Gold Mine, Prince Leopold, and Comtesse de Choiseul, were fine. He also had the only six fancies, The Shah, Princess Teck, Ambassador, &c., being good. Mr. WATTS, gr. to H. LITTLE, Esq., Twickenham, was the chief exhibitor of zonals, having six superbly-flowered plants; also, six capitally-flowered Ivy-leaf varieties. The same exhibitor had the best six *Orchids*, very good pieces of *Vanda teres*, *Cattleya Mendeli*, *Lælia purpurata*, *Cypripedium Veitchii*, &c.; Mr. W. H. YOUNG, Orchid grower to Sir F. WIGAN, being 2nd, his lot including good *Cattleya Mendeli*, *Dendrobium Dearii*, &c. Mr. WATTS also had a fine group of *Orchids* of good variety, *Cattleyas*, *Lælias*, *Miltonias*, &c. Mr. PORTHURY showed the best nine *Begonias*; Mr. MEATON, gr. to J. B. HILDITCH, Esq., Richmond, the finest nine *Gloxinias* in one class; and Mr. H. FORDHAM the best nine in another class.

Roses.—These were in wonderful force. There were six entries in the class for forty-eight trebles, the honours falling to Messrs. PRIOR & SONS, Colchester, who had their fellow tradesmen Messrs. F. CANT and B. CANT, 2nd and 3rd. In the class for twenty-four trebles, Messrs. G. A. H. BIRCH, Peterborough, were 1st with beautifully fresh, though rather small flowers; Messrs. PRIOR coming 2nd, and F. CANT, 3rd. Of good flowers were A. H. Williams, Duchesse de Orleans, Fisher Holmes, Dr. Andry, Gustave Pignanneau, Marie Baumann, Comte Raimbaud, Horace Vernet, Prince C. De Bohan, Victor Hugo, Xavier Olibo, Alfred Colomb. Mrs. J. Laing, Susanne de Rodocanachi, Pride of Waltham, Madame E. Verdier, La France, François Michelon, Heinrich Schultheis, Madame G. Luizet, The Bride, Merveille de Lyon, Souvenir de S. A. Prince, Catherine Marmet, Marie Van Houtte, and Lady M. Fitzwilliam. Messrs. BIRCH had the best twelve trebles; Mr. F. CANT coming 2nd; and Messrs. PRIOR, 3rd.

With twelve H.P.'s, one variety, J. G. FOWLER, Esq., South Woodford, was 1st with fine Mrs. J. Laing; Mr. B. R. CANT coming 2nd with Madame G. Luizet; and Mr. G. MOUNT, Canterbury, 3rd, with Marie Baumann.

The best twelve Teas, one variety, came from Messrs. PRIOR,

the variety *Caroline Kuster*; Mr. F. CANT being 2nd with *Marie Van Houtte*.

In the open amateur's classes, Mr. J. G. FOWLER was 1st with twenty-four blooms, Mr. R. E. WEST, Reigate, being 2nd; and with twelve blooms, E. RUTTER, Esq., Halliford, was best, flowers very bright and good, Mr. WEST again coming 2nd.

Hardy Flowers were in immense abundance, beyond all previous experience—far too many, and far too crowded. The following trade firms had large collections: Messrs. JAS. VEITCH & SONS, J. PEED & SONS, C. JACKMAN & SONS, T. BARR & SONS, R. BOX, Croydon, DOBBIE & SONS, Rothessy, chiefly *Violas* and *Sweet Peas*; JAS. CARTER & CO., J. CHEAL & SONS, Crawley; T. S. WARE, Tottenham; R. WALLACE & CO., Colchester, &c. In the competition for twenty-four bunches, Mr. W. PRICHARD, Chritchurch, was 1st, and Mr. G. H. SAGE, gr. to Earl DYSART, Ham House, was 2nd, Messrs. PAUL & SONS being 3rd. With twelve bunches Mr. SAGE was an easy 1st. How effective were these bunches thus set up as compared with the dense masses crowded into the trade collections! Some limit should be put on these.

Waite, gr. to the Hon. Col. TALBOT, Esher, was 1st in the Society's collection for twelve kinds, also taking the Veitch Memorial Medal. He was also 1st in Messrs. Sutton & Son's class for six dishes; whilst Mr. Wilkins, gr. to Lady THEORA GUEST, was 1st with nine dishes for Messrs. Jas. Carter & Co.'s prizes; Mr. Jas. Gibson, gr. to E. H. WATTS, Esq., Devonhurst, Chiswick, came 3rd in each case. We cannot here particularise the varieties shown, but both in these classes and in the cottagers' section they were first rate.

NATIONAL ROSE EXHIBITION AT GLOUCESTER.

JUNE 27.—This was a most successful meeting. In almost all classes the competition was numerous, and in many it was exceptionally close. The Mayor, accompanied by the sheriff and several of the council, also the Mayor of Cheltenham, opened the show. Good as Windsor was last season, the present

among these after the most perfect specimen, *Comtesse de Ludre*, was removed. Mr. B. R. CANT, Colchester, was a capital and close 2nd, and had the following very good:—Earl of Dufferin, *Comtesse de Nadaillac*, S.-M. Rodocanachi, A. K. Williams, Her Majesty, *Caroline Testout*, La France, Dupuy Jamin, and Lady Mary Fitzwilliam.

Seven competed in a class for twenty-four singles, Messrs. TOWNSEND & SON, Worcester, winning with a good stand, among their best flowers being *Rubens*, *Marie Rady*, *Charles Lefebvre*, and *Gustave Piganneau*; the 2nd prize stand, from Messrs. COOLING & SONS, Bath, was larger, but not so well formed.

The strongest class was that for twenty-four varieties, three trusses of each, ten competing with remarkably close stands. Messrs. R. HARKNESS & SONS were 1st, showing in superb form; Mr. B. R. CANT, Colchester, was placed 2nd, his lot being particularly bright and clean, but smaller.

Mr. B. R. CANT, Colchester, was well in front for twelve singles of any H.-P. Rose, and staged a dozen beautiful Lady Mary Fitzwilliam; Messrs. TOWNSEND & SONS, Worcester 2nd, with Mrs. J. Laing.

AMATEURS.

There was a very strong and close competition in an extra class for twelve single trusses, open to all amateurs irrespective of the number of plants grown. The Rev. J. H. PEMBERTON, Havering-atte-Bower, was 1st with a good stand Ulrich Brunner, Gabrielle Luizet, Horace Vernet (a grand bloom), Marie Beaumann, Earl of Dufferin, Gustave Piganneau, &c. Mr. E. B. LINDSELL, Hitchin, a close 2nd, had younger flowers, and in all probability a couple of hours later in judging would have seen these two redoubtable growers in reverse positions. Some sixteen or seventeen lots were staged.

A class for twenty-four distinct, singles, was also very strong, Mr. W. DREW, Ledbury, being successful. This stand contained a bloom marked "seedling," but which was far too nearly like *Marie Rady* in every respect. It was a good bloom. Others that deserve mention were *Innocents Pirola*, *Marie Verdier*, S.-M. Rodocanachi, and Her Majesty. Mr. E. B. LINDSELL, Hitchin, was 2nd with a remarkably good example of *Comte Raimbaud*, while Her Majesty, Duke of Wellington, Marie Beaumann, and Horace Vernet were also grand.

A class of eighteen single trusses, distinct, open only to growers of less than 2000 plants of recognised exhibition varieties, found Mr. J. PARKER, Hitchin, a good 1st. His best blooms were La France, Gabrielle Luizet, *Innocents Pirola*, and *Duchesse de Vallombrosa*. Mr. E. MAWLEY, Berkhamsted, was 2nd, and had Horace Vernet in splendid condition.

In a class of six distinct, three blooms of each, eleven competitors turned up. Mr. E. B. LINDSELL, Hitchin, was 1st, having very bright and clean flowers. Mr. WALTER DREW, Ledbury, made a good 2nd.

Twelve single trusses, distinct, for growers of less than 1000 Exhibition Roses, 1st, Mr. CONWAY JONES, Hucclecote; 2nd, Mr. O. G. ORPEN, Colchester; 3rd, Mr. JAMES PARKER, Headington. The best bloom in this class was a splendid *Comtesse de Nadaillac* in Mr. Parker's stand, the *Innocents Pirola* in Mr. LANGTON'S, and the beautiful *Souvenir d'Elise Vardon* in that of Mr. Conway Jones, also being remarkable.

A class for amateurs growing less than 500 plants, six singles, distinct, went to Mr. G. MOULES, Hitchin; Mr. H. P. LONDON, Brentwood, was 2nd.

An extra class, open only to those entitled to compete in the two preceding, produced eight competitors. Four varieties, three blooms of each, were shown here. Mr. O. G. ORPEN, Colchester, was 1st; Mr. CONWAY JONES, Hucclecote, was 2nd.

For six blooms of any Rose but a Tea or Noisette, and open to all amateurs, a very even and good half-a-dozen of Horace Vernet won for Mr. E. B. LINDSELL; Her Majesty taking 2nd for Mr. W. DREW.

In a class of twelve bunches, distinct, Mr. H. V. MACHIN, Gateford Hall, Workshop, was 1st with very pretty bunches.

TEA AND NOISETTE SECTION.

Very seldom have we seen better Teas. Messrs. D. PRIOR & SONS and Mr. F. CANT'S lots were indeed grand.

The premier class of twenty-four single trusses, distinct, Messrs. D. PRIOR & SON, Colchester, were 1st, their back row consisting of *La Boule d'Or*, *Niphotos*, *Rubens*, *Ethel Brownlow*, *Catherine Mermet*, *Madame Margottin*, *Ernest Metz*, and *Comtesse de Nadaillac*; middle row: *Souvenir d'Elise Vardon*, *Maréchal Niel*, *Alba rosea*, *Madame Hoste*, *Souvenir d'un Ami*, *Souvenir de S. A. Prince*, *Madame Cusin*, and *Innocents Pirola*; the front row being *Edith Gifford*, *Francisca Kruger*, *Madame de Watteville*, *Caroline Kuster*, *The Bride*, *Amazone*, *Marie Guillat*, and *Marie Van Houtte*. The 2nd prize lot of Mr. FRANK CANT contained the Silver Medal Tea in *Edith Brownlow*, and also extra good examples of *Madame Cusin*, *Edith Gifford*, *Caroline Kuster*, and *Corinna*.

Twelve distinct singles were well shown, Mr. L. TRESSIEDER, Cardiff, being 1st with *Catherine Mermet*, *The Bride*, and *La Boule d'Or*, at their best; Messrs. TOWNSEND & SONS, Worcester, 2nd.

AMATEURS.

Open class, irrespective of number of plants, for eighteen distinct, single trusses, seven very excellent stands were put up. Mr. O. G. ORPEN, Colchester, winning with grand flowers of *Cleopatra*, *Madame H. Jamin*, *Fran cisca Kruger*, *Madame Cusin*, *Maréchal Niel*, *Souvenir d'un Ami*, and *Madame de Watteville*. The 2nd prize stand, from the Rev. A. FOSTER-MELLIAR, Sproughton Rectory, Ipswich, was but little behind, and contained a superb bloom of *La Boule d'Or*, to which the Silver Medal was awarded.

Nine single blooms, for growers of fewer than 500 plants, brought out eight lots, Mr. R. H. LANGDON, Hendon, winning with *Ernest Metz* and *Innocents Pirola*, extra good; Mr. W. BOYES, Derby, was 2nd.

FIG. 5.—PHILADELPHUS BOULE D'ARGENT: FLOWERS WHITE, FRAGRANT. (SEE P. 18)

FRUIT AND VEGETABLES.

The best six dishes came from Mr. W. FORD, gr. to W. H. ELLIS, Esq., Hounslow, who had good *Black Hamburg* and *Foster's Seedling Grapes*, *Hale's Early Peaches*, *Brown Turkey Figs*, &c.; Mr. SAGE was 2nd, having very good *Grapes*, *Lord Napier Nectarines*, *Figs*, &c.; Mr. OSMAN, Otter-shaw Park Gardens, coming 3rd. In the open class for *Black Grapes*, Mr. FORD was again 1st, but was so close run by Mr. OSMAN, that some thought the latter's bunches the best. Mr. W. Tidy, gr. to W. K. DAVEY, Esq., Stanmore, had the best *White Grapes*, in smallish bunches, with good berries, of *Duke of Buccleuch*; Mr. OSMAN being 2nd, with *Buckland Sweetwater*. In the local class, Mr. BURTON, gr. to Sir J. D. PAUL, Twickenham, was 1st with *Hamburgs*, and Mr. MEATON had the best whites in rather rough *Muscad of Alexandria*, Messrs. W. & E. WELLS, gr. Mr. Thompson, showed good *Black Hamburg* and *Madrasfield Court Grapes*, with *Peaches*, &c., not for competition. Mr. McLEOD had the best *Melon* in the Countess, also the best *Peaches* in pale-coloured *Alexandre Noblesse*; Mr. FARNS being 2nd. Mr. SIMMONDS had good *Lord Napier Nectarines*, and Mr. SAGE good *Angusta Nicaise* and *Gunton Park Strawberries*. Mr. McLEOD'S *Early Lyons Cherries* were very fine. *Sutton's Perfection Tomatos* from Mr. FORD and Mr. SAGE were first rate.

Vegetables were, for the season, exceptionally good. Mr.

southern show was considerably in advance of it. Great courtesy and hospitality was shown to the National Rose Society from all sides. The quality of the Roses was first-class, not an indifferent stand being staged.

NURSERYMEN'S CLASSES.

In the premier class for forty-eight distinct single trusses there were eight competitors, the 1st prize going to Messrs. R. HARKNESS & SONS, Bedale, Yorkshire, for a most beautiful and even collection. In the back row were *Charles Darwin*, *Suzanne-Marie Rodocanachi*, *Caroline Testout*, *Gustave Piganneau*, *Captain Christy*, *Comte de Raimbaud*, *François Michelon*, *Ulrich Brunner*, *Maurice Bernardin*, *Marie Verdier*, *Captain Hayward*, *Lady Mary Fitzwilliam*, *Alfred Colomb*, *Mrs. John Laing*, *Marie Beaumann*, and *Her Majesty*. Second row, *Duke of Fife*, *La Boule d'Or*, A. K. Williams, *Comtesse de Nadaillac*, *Charles Lefebvre*, *La France*, *Dupuy Jamin*, *Pride of Waltham*, *Sir Rowland Hill*, *Madame Hoste*, *Comtesse de Ludre* (*Medal H.P.*), *Souvenir d'Elise*, *Horace Vernet*, *Jean Ducher*, and *Madame V. Verdier*. Front row, *Madame E. Verdier*, *Fisher Holmes*, *Etoile de Lyon*, *Countess of Rosebery*, *Madame G. Luizet*, *Duchesse de Morny*, *Catherine Mermet*, *Senateur Vaissa*, *Marie Rady*, *Francisca Kruger*, *Dr. Andry*, *Earl of Dufferin*, *General Jacqueminot*, *Nerveille de Lyon*, *Duchess of Bedford*, and *Queen of Queens*. It would be difficult to choose

In a class of six singles, for growers of less than 500 plants, Mr. G. MOULES, Hitchin, was a capital 1st; Mr. R. F. HOBBS, Worcester, 2nd.

An extra class of six trebles, open to all amateurs, was won by the Rev. A. FOSTER-MELLIAR, Ipswich; Mr. CONWAY JONES, Hucclestone, was 2nd. Six trusses of any Tea or Noisette, Souvenir d'Elise Vardon was here for the Rev. FOSTER-MELLIAR; while 2nd was taken by Edith Gifford, for the Rev. F. R. BURNSIDE.

OPEN CLASSES.

For twelve varieties, three of each, some of the grandest Teas we have seen were put up. Mr. B. R. CANT, Colchester, being 1st, with La Boule d'Or, Madame Cusin, Innocente Pirola, Madame de Watteville, Edith Gifford, and Ernest Metz in particularly good form.

Twelve trusses of any Tea or Noisette brought a dozen of Marie Van Houtte in its prettiest form, Messrs. D. PRIOR & SON, Colchester, taking 1st.

GARDEN ROSES.

These were not quite so extensively shown as usual. In a class for nurserymen, of thirty-six bunches, distinct, with not fewer than three, nor more than six trusses to a bunch, Mr. C. TURNER, Slough, was 1st, with very pretty trusses of rugosas, Crimson Rambler, Persian Yellow, Mosses, macrantha, Polyantha, Hébé's Lip, and Moschata alba among many others.

The amateur's classes of these were good. For eighteen bunches, Mr. A. TATE, Leatherhead, was 1st; Marquis of Salisbury, Hébé's Lip, Crested Moss, Gloire de Rossmanes, Rosa Mundi, and macrantha were his best.

For six bunches, not open to the exhibitors in the preceding classes, the Rev. J. H. PEMBERTON was a capital 1st, having a peculiarly semi-double form of Polyantha, the old Red Provins or Provence, multiflora simplex, Rosa Mundi, &c. Mr. J. OUGH, Hereford, was 2nd.

OPEN CLASSES.

A display of Roses, not to exceed 6 feet by 3 feet, in which any Rose may be shown and arranged to individual taste, was very pretty, but not so striking as several lots we have seen. Mr. H. WHITEHEAD, Heathville Nursery, Gloucester, was 1st, with an arrangement of Roses forming the letters N. R. S., the society's initials. Edith Gifford, Marie Van Houtte, and Lamarque, formed these letters in like order, while the whole was surrounded with various other Roses, but too formally arranged. We hope this silly practice will not find favour. A good box of Turner's Crimson Rambler was included here.

Three trusses of any new seedling or distinct sport did not provide a startling novelty, Pride of the Valley was the only one shown, no award being made. It looked far too much like a pale indifferent Mrs. Jno. Laing.

LOCAL CLASSES.

These were good, but the excellent quality and enormous number from other districts, not to mention the fact that the strongest growers also went into higher classes, considerably detracted from their beauty.

Mr. CONWAY JONES, Hucclestone, won the Silver Cup for eighteen distinct single trusses; and Mr. T. A. WASHBOURN, Hucclestone, was placed 2nd.

Mr. J. F. FULFORD won the Silver Medal for twelve varieties; Mr. GAMBIER PARRY was 2nd.

A Challenge Plate, presented by the Rev. F. R. BURNSIDE, for twelve Teas or Noisettes, went to Mr. T. A. WASHBOURN; Mr. E. C. HOPTON being 2nd.

Mr. CONWAY JONES also won the Silver Medal for six Teas or Noisettes, Mr. T. THORPE, Hilldrop, near Gloucester, taking a similar honour for twelve trusses; while the lot for six singles was won by Mr. G. PRATT, 39, Park End Road.

The Corporation of Gloucester presented a silver salver for twelve distinct singles, which was won by Mr. CONWAY JONES; the 2nd went to Mr. C. BROWN, Saint's Bridge House.

A silver medal for twelve singles, grown by cottagers, was presented by T. THORPE, Esq., and won by Mr. E. C. HOPTON, Hucclestone. For six singles, Mr. J. MIDDECOTE, Malson; Mr. F. BIRCHER, Hucclestone; and Mr. A. MICHELL, Coney Hill, won in like order.

A bronze medal and money was won by Mr. E. POOLE, Upton, St. Leonards.

Among the cottagers, Mr. F. W. BOLTON had the best single truss in Mrs. Jno. Laing.

SILVER-MEDAL ROSES.

The Silver Medal for the best hybrid perpetual in the nurserymen classes, was awarded to Messrs. HARKNESS & SONS, for Comtesse de Ludre; that for Teas or Noisettes going to Mr. F. CANT, for Ethel Brownlow.

In the amateurs' classes, Horace Vernet won, for the Rev. J. H. PEMBERTON; and La Boule d'Or for the Rev. FOSTER-MELLIAR.

A good lot of hybrid Sweet Briars came from Messrs. KENNES, WILLIAMS & CO., Salisbury, who staged all the older kinds except Meg Merrilies. They now had some that are not yet in commerce, the best of which is undoubtedly Jeannie Deans, a bright and semi-double variety.

DEVON AND EXETER HORTICULTURAL.

JUNE 28.—The 181st exhibition of this Society was held on the above date, the day being wet and unfavourable. The summer exhibition is usually held in August, and it is fifteen years since the last Rose show took place. The entries promised great

things, many of the well-known exhibitors having entered, but only a small number put in an appearance. This not only caused great disappointment, but also much inconvenience. The quality was generally fine, Tea Roses being excellent.

ROSES.

In the nurserymen's class, for forty-eight distinct, Messrs. CURTIS, SANFORD & CO., Torquay, were 1st; and Messrs. D. PRIOR & SON, Colchester, a good 2nd. In the winning exhibit were Ernest Metz, Jean Ducher, Victor Hugo, Maman Cochet, Captain Christy, Xavier Olibo, Madame Cusin, Star of Waltham, Black Prince, Alfred Colomb, Marie Baumann, and Suzanne-M. Rodocanachi, the blooms being distinguished for fine form and colour.

In the twenty-four distinct, Mr. JOHN MATTOCK, New Headington, Oxford, was 1st; Messrs. ROBERT VEITCH & SON, Exeter, 2nd; and Messrs. JARMAN & CO., Chard, 3rd. In the twenty-four distinct (three trusses of each), Messrs. D. PRIOR & SON were 1st; Messrs. CURTIS, SANFORD & CO., 2nd. In the winning collection were Souvenir de S. A. Prince, Her Majesty, A. K. Williams, Marie van Houtte, Horace Vernet, and Madame Gabrielle Luizet. In the 2nd lot were Margaret Dickson, The Bride, Jean Ducher, and Innocente Pirola, all very good indeed.

For the eighteen Teas or Noisettes, Messrs. D. PRIOR & SON were 1st; Messrs. CURTIS, SANFORD & CO., 2nd; and Mr. JOHN MATTOCK, 3rd. Messrs. PRIOR & SON had good examples of Comtesse de Nadaillac, Madame Hoste, Hon. Edith Gifford, Caroline Kuster, Souvenir d'Elise Vardon, Cleopatra, and Marie Van Houtte. Messrs. CURTIS, SANFORD & CO. showed a very fine bloom of Souvenir d'un Ami.

In the open classes, Messrs. PRIOR & SON were again 1st for twenty-four Teas or Noisettes, Mr. J. MATTOCK 2nd, and A. HILL GRAY, Esq., of Bath, 3rd. The prize exhibit had excellent blooms of Madame Lambert, Madame Bravy, The Bridesmaid, Innocente Pirola, Catherine Mermet, and Marie Van Houtte. The latter was superb in this and several other classes.

For twelve blooms of any light H.-P.'s, Messrs. PRIOR & SON were 1st with Her Majesty, as nearly perfect as it is possible to show them. Mr. WALTER DREW, Ledbury, came 2nd with the same variety, a magnificent lot.

For twelve blooms of any dark H.-P.'s, Messrs. CURTIS, SANFORD & CO. were well 1st with a grand box of Marie Baumann. R. N. G. BAKER, Esq., of Heavitree, Exeter, 2nd, with a very fine lot of Ulrich Brunner.

A. HILL GRAY was 1st for twelve Maréchal Niel of magnificent colour; and PRIOR & SON took premier place for twelve of any other Tea or Noisette, with a good box of Caroline Kuster. For six bunches of garden Roses Messrs. PRIOR & SON were 1st, and JAMES JERMAN, Esq., The Bungalow, Exeter, 2nd.

In the amateur classes, Mr. WALTER DREW took premier honours with thirty-six fine blooms, among which were Dingée Conard, Marchioness of Londonderry, Marie Finger, C. Testout, Ulrich Brunner, Caroline Kuster, Thomas Mills, Her Majesty, and Etoile de Lyon. In this collection, the bloom of Marchioness of Londonderry was awarded the Medal for the best H.P. in the show. R. N. G. BAKER was a good 2nd.

For the twenty-four blooms, R. E. WEST, Esq., of Reigate, was 1st, with a fine lot; and A. HILL GRAY, 2nd.

For twelve sorts, three trusses of each, Mr. WALTER DREW was 1st.

For twelve Teas or Noisettes, A. HILL GRAY had in his winning lot Reine du Portugal, Souvenir de S. A. Prince, Ernest Metz, and Souv. d'Elise Vardon.

Mr. R. N. G. BAKER took premier place for six of any one sort of Tea or Noisette, with a fine stand of Princess of Wales. The class for twelve Teas or Noisettes, distinct, three trusses of each, was won by Mr. A. HILL GRAY, with a fine lot.

Mr. N. G. BAKER took honours for the best Tea or Noisette in the show, with Comtesse de Nadaillac.

MISCELLANEOUS PLANTS AND FLOWERS.

In hardy herbaceous flowers, some excellent bunches were shown, particularly fine being a bunch of Thalictrum aquilegifolium. Pelargoniums in trusses were good, but Pansies very poor, and the 1st prize was withheld. Fuchsias and Pelargoniums in pots were fair, especially the latter.

The groups were not at all up to the usual form at the Exeter August shows, they sadly wanted colour and variety. The 1st prize group, W. BROCK, Esq., Parker's Well, Exeter (gr., Mr. W. Rowland), was an easy 1st. The twelve Gloxinias, 1st prize for which was awarded to Mrs. A. D. SIM, Knowle, Exeter (gr., Mr. A. Williams), were very good indeed.

FRUIT.

Fruit was indifferently shown in most classes, Grapes were fair, Melons uneven, but Strawberries were splendid. For Black Grapes other than Hamburgs, Trentham Black was the winning sort, and in White Grapes, Backland Sweetwater. The 1st in Gooseberries was Golden Drop, but the competition in these classes was not keen. The class for four dishes of Strawberries was won by H. HAMMOND SPENCER, Esq., Teignmouth (gr., Mr. Foster), with Sensation, Waterloo, Commander, and James Veiton, all first-rate. The two dishes were won with Sir Joseph Paxton and President, and the one dish class by Miss DBEW, Kenton, with a grand exhibit of Sir Joseph Paxton. Mrs. A. D. SIM showed a fine dish of Ruby Castle Currants.

VEGETABLES.

In vegetables, premier place was again taken by Sir JOHN SHELLEY, Bart., High Sheriff of Devon (gr., Mr. R. Mavis), with a grand collection of eight varieties, consisting of Veitch's Model Carrot, Duke of York Potato, Gradus Pea,

Veitch's Midsummer Day Cauliflower, Veitch's Red Garden Globe Turnip, Perfection Tomato, Veitch's Exhibition Broad Beans, and Canadian Wonder Dwarf Beans. The 2nd prize collection was also good. Veitch's Perfection, Veitch's Gem, and Blendworth Perfection Cucumbers were well shown. Perfection Tomato, Model Carrot, Mammoth Co's Lettuce, Red Garden Globe Turnip, Early Puritan Potato, and Mein's No. 1 Cabbage, were prominent among the winning dishes.

TRADE EXHIBITS.

In the Nurserymen's exhibits were some very good things. By far the largest exhibit was that of Messrs. ROBERT VEITCH & SON, who, in addition to a good general collection, showed some new hybrid Water Lilies, a grand box of Carnations, and a rich collection of alpine and rock plants.

Messrs. RANDALL & SON had a good miscellaneous collection, as also had Mr. W. B. SMALE, Torquay, this exhibitor showing good Petunias, and Double Shirley Poppies, with three Chrysanthemums, Charles Davis flowering out of season. Mr. W. J. GODFREY, Exmouth, had good Carnations, amongst them being Goldmide, Sunrise, and Primrose League. Four new and well-coloured Coleuses were also in this stand, and a good assortment of cut flowers. Mr. J. WALKER, Mount Radford; Messrs. JARMAN & CO, Chard; Messrs. BEACHY & CO., King's Kerswell, also exhibited; as did the Jadoo Company, who had a large stand of well-grown specimens, grown in Jadoo, from the conservatories of Colonel Halford Thompson.

WINDSOR, ETON, AND DISTRICT ROSE AND HORTICULTURAL.

JUNE 29.—The annual exhibition of this society was held on Saturday last in the private grounds of Windsor Castle. Roses were by far the strongest classes, and in the most important of these the quality of the blooms was excellent. There was not much competition in the plant classes, and the three tents that had been provided were not more than furnished. We would suggest to the committee that on another occasion the names of the exhibitors should be more plainly written. Considerable trouble and error might thus be saved the spectators, while it would also be convenient if the addresses of exhibitors were included on the cards.

ROSES.

We have already said that the quality of the Roses was good, and this was particularly the case in the three first open classes. Mr. BENJ. R. CANT, Colchester, was 1st for thirty-six distinct single trusses, and the most noticeable in his stand were Ulrich Brunner, Gustave Piganneau, Madame G. Luizet, Marchioness of Downshire, White Lady, Lady Mary Fitzwilliam, Marchioness of Dufferin, and A. K. Williams. Messrs. HARKNESS & SONS, Badale, Yorks, were 2nd. Their blooms were smaller, but they were of capital colour and nice in form; Messrs. PRIOR & SONS, Colchester, were 3rd in this class, but won in that for eighteen Teas or Noisettes, which included very fine blooms of Catherine Mermet and Souvenir d'un Ami.

The third open class—three trusses each of twelve distinct varieties—fell to an amateur, and to win he had to beat splendid blooms from the trade. The Rev. J. H. PEMBERTON, Havering-atte-Bower, Romford, Essex, had large full blooms, and of excellent colour; Messrs. HARKNESS & SONS were 2nd, and Mr. B. R. CANT 3rd. The National Society's Silver Medal for best Rose in the show was awarded to a capital bloom of Marchioness of Dufferin, exhibited by Mr. FRANK CANT.

Amateurs.—The Rev. J. H. PEMBERTON was 1st for eighteen distinct Roses, and a splendid bloom of Marie Baumann gained the National Society's Silver Medal for best Rose exhibited by an amateur. Others in the stand were also very good. The Rev. J. H. PEMBERTON, won, for six single trusses of one kind, with Caroline Testout; and H. V. MACHIN, Esq., Worksop, for twelve Teas or Noisette, in not fewer than eight varieties; R. E. WEST, Esq., Reigate, was 2nd. The quality in this class was not remarkable.

Local Classes.—There were six classes open only to exhibitors within ten miles of Windsor, and the 1st of these—for eighteen single trusses—was won by N. L. COHEN, Esq., Englefield Green (gr., Mr. A. Sturt); also the class for twelve single trusses. In the 1st class, A. GILLEAT, Esq., Slough, was 2nd; and Miss BAILEY DENTON, Wingfield, took a similar position in the other. Six single trusses were best from Mr. JOHN-SON, Manor College Gardens; and Sir ROBERT HARVEY, Bt., was 1st for six single trusses of any H. P. or H. Tea. N. L. COHEN, Esq., with Innocente Pirola, was 1st for the same number of any Tea or Noisette; and the Dowager Duchess of Sutherland for six Teas or Noisettes in distinct varieties. Mrs. F. HENEAGE and Mrs. IRVING were 1st respectively for a basket of Roses, and for six bunches of garden Roses, distinct, open to local ladies only.

OPEN TO MEMBERS ONLY.

Pot Plants.—The winner of the 1st prize for an effective group of miscellaneous plants, arranged in a circle 12 feet by 6 feet, was Sir ROBERT HARVEY, Bart. (gr., Mr. Gillies), whose group, composed wholly of dot plants with a groundwork of Ferns and Gloxinias, contained some rather uncommon flowers. The 2nd prize went to HENRY GOLD, Esq. (gr., Mr. D. Phillips), who had also a tasteful exhibit.

Sir R. HARVEY (gr., Mr. A. Gillies), was 1st for six specimen plants and for six plants for table decoration, having fairly good plants in each case. The Hon. C. S. IRBY, with four specimen Fuchsias, and Mrs. J. HENEAGE (gr., Mr. Guttridge), with six usual Pelargoniums, were 1st in these classes.

grown from seeds supplied by them; and Mr. HOLLAND, Vine Nurseries, Lee, exhibited groups of miscellaneous plants.

Cottagers' Exhibits.—The produce from cottagers, arranged in one of the tents, was very satisfactory.

KEW NOTES.

PHILADELPHUS LEMOINEI X.—Of the Mock Oranges now in bloom, there is not one possessing more attractive qualities than this. It is a hybrid, having been raised by Mons. Lemoine of Nancy, by crossing *P. coronarius* with *P. microphyllus*. In leaf characters, stature, and size of flower, it is intermediate between its parents, but besides being quite distinct, it is superior as a garden plant to either of its parents. Whilst it is larger and more showy than *P. microphyllus*, it has purer white flowers than *P. coronarius*, and their delicate, almost pine-apple like fragrance is much to be preferred to the heavy perfume of that species. A circular bed about 14 feet across in the Arboretum at Kew filled with this plant is now in perfect condition, and makes one of the most charming masses of flower to be seen in the garden. The shoots made last year are 2 to 2½ feet high, each one an erect columnar mass of pure white, fragrant blossom. Mons. Lemoine sent out this hybrid some seven or eight years ago, but its exquisite beauty is far from being as generally known as it deserves to be.

ROSA MULTIFLORA (SYN. R. POLYANTHA).

For the past few weeks this Asiatic Rose has been the most effective of all the species in flower. The blossoms individually are small (scarcely 1 inch across), but they are produced in such profusion that their want of size is no defect, but adds rather to the distinctive character of the species. A large mass of it is grown in the Rose collection at Kew, and it occurs in various other parts of the grounds. Most strikingly, perhaps, is its beauty seen in the Bamboo garden, where it is planted on a bank and allowed to clamber over old tree-roots, forming huge mounds of white flowers. Its small flowers, whose fragrance may be detected many yards away, its cone-shaped, numerous-flowered trusses, and the fimbriated stipules at the base of the leaf, render the species an easily recognised one. The long, arching shoots grow to a length of 8 or 10 feet in one season. It is a native of China, Japan, and Corea, but although the double-flowered variety has been known in England since the early years of this century, the true single-flowered type was introduced as lately as 1875. A fine specimen is figured in the *Gardeners' Chronicle* for November 26, 1887, under the name of *Rosa polyantha*.

SPIRÆA BRACTEATA.

If not one of the very latest additions to the genus, this is at least one of the most uncommon of *Spiræas* in English gardens. It is a very pretty species, of compact habit, growing to a height of 2 or 3 feet (perhaps more eventually), with abundant obovate or almost orbicular leaves, which frequently have a few shallow teeth near the apex, and are of a peculiarly rich, lustrous green. The flowers are pure white, and fragrant, and are borne on short, cone-shaped corymbs. The name *bracteata* refers to a bract midway on the stalk of the flower; on the lower ones it is large and leaf-like, becoming smaller and smaller towards the terminal flowers of the corymb. According to Professor Sargent, this species is a native of the mountainous regions of the main Island of Japan, and among other places is found on the slopes of *Fuji-san*. It appears to have been first introduced to Europe by Von Siebold. A flowering shoot is figured in the *Gardeners' Chronicle* for February 28 1885, as *S. media* var. *rotundifolia* alba. It may be increased by means of cuttings taken as soon as the wood has become fairly firm. [See also Hemsley in *Gardeners' Chronicle*, June 16, 1894, p. 746. Ed.]

GENISTA VIRGATA.

Although a native of Madeira, this beautiful *Genista* passed through the frosts of last February with scarcely any injury—a marked contrast to the

behaviour of several other leguminiferous plants, amongst which are natives even of our own country. A good many years ago some scores of plants were put out in the wild semi-wooded part of Kew Gardens nearest Richmond. Although the soil here is the poorest sand, these plants have succeeded well, some having grown into large spreading bushes 8 to 10 feet high, and even more across. It is, in fact, the largest of all the hardy *Genistas*. Every July these bushes are crowded with racemes of bright golden yellow flowers, and amidst the surrounding greenery these masses of glowing colour are particularly effective. The leaves are small, lanceolate, and not divided. It was introduced as long ago as 1777, and was figured by Lindley in his *Botanical Register* in 1844, but still remains quite an uncommon plant. During the last few years it has, however, been planted more extensively. W. J. B.

COLCHESTER ROSES, 1895.

It was with many misgivings that I turned my head towards Colchester on the early morning of June 20. I had seen many Roses cut hard by the frost of February, and had many sorry tidings about others. And now the opportunity had come to test the condition of the Roses in their great and ever enlarging home in East Anglia. To this end I was to assist as judge at the Colchester Rose, Flower, and Fruit Show. Lunch among the Roses, and with rosarians at Mr. Frank Cant's, and walk through as many Rose gardens as possible. A glimpse at the Roses in this show was most encouraging.

The Colchester Rose and Horticultural Society was specially favoured this year by the weather, though a soaking shower passed over the tents about 12 o'clock. It also enjoyed the warm patronage of the ex-Mayor, Henry Goody, Esq., and of the present Mayor, E. Egerton Green, Esq., the President of the Horticultural Society, who has been indefatigable in his efforts to make the Rose show one of the chief features of the year. In this, assisted by the Mayoress, who presented four Medals for the four best Roses, he has admirably succeeded, and he crowned the edifice, as it were, of his other gifts by devoting his personal service on the day of the show, and granting the Society the use of his beautiful grounds at East Hill House, near the Castle.

So far as the trade were concerned, the Colchester growers won and held the field for prizes among them, courteously changing places among themselves, but resisting the ingress of outsiders. Mr. Benjamin Cant, the veteran grower, and founder of the Rose industry, was 1st for thirty-six, and Mr. Frank Cant and the Messrs. Prior & Sons winning the other chief prizes.

Among amateurs there was a wider competition, though a very creditable share of prizes were also won by Colchester growers, such as the present Mayor with the energetic secretary of the society, Mr. C. G. Orpen. The winners of the four silver medals presented by the Mayoress were Miss Pemberton for a grand bloom of *Horace Vernet*, Mr. O. G. Orpen for the best Tea, *The Bride*, Mr. Frank Cant for a beautiful bloom, *La Fraicheur* an award rather severely criticised. Mr. Wilson Marriage had the fourth medal for the best dozen Roses.

Among other fine Roses at Colchester on the 20th were *Maréchal Niel*, *Madame Casin*, *Souvenir de S. A. Prince*, *Catherine Mermet*, *Jean Ducher*, *Comtesse de Nadaillac*, *Belle Lyonnaise*, and *Marie Van Houtte*. Among perpetuels, the following, among others, were good for colour, size, form, quality:—*Horace Vernet*, Mrs. John Laing, *Duchess of Oxford*, *Dr. Andry*, *Dupuy Jamain*, *La France*, *Marie Baumann*, *Madame Gabrielle Laizet*, *General Jacqueminot*, *Prince Arthur*, *John Hopper*, *Earl Duffryn*, *Senateur Vaisse*, *Duke of Teck*, *Duke of Edinburgh*, *A. K. Williams*, *Charles Lefebvre*, *Grandeur of Cheshunt*, *Lady Mary Fitzwilliam*, *Marie Rady*, &c.

And now, after a most successful meeting of rosarians, and a most hospitable lunch at Braiswick, we are free to face with thousands and tens of thousands of Roses, and Briars of all possible sorts

and sizes. Almost the only mark they bear of having passed through a semi-arctic winter is that the majority of the Roses are a week, perhaps two, behind time. Hence, had the show been a fortnight later, Colchester's best would have been yet more brilliant and perfect than on June 20.

Without exaggeration, the Colchester Roses were without speck or flaw of any sort. On examining acre after acre, not a sign of mildew nor speck of rust were seen, nor a bud bored, nor a leaf browned, nor burrowed by caterpillars or maggots. And yet the persistent drought and the ever-present north-east winds, are held to be the most potent factor in the production of disease. Neither has the trade in Colchester the means nor the will to adopt artificial watering. But they fight the drought through liberal, deep culture, and a loose surface-mulch of frequently-hoed soil.

It seems that but few of the Roses had had their heads or roots protected last winter, and it was marvellous to see such survivals of standard perpetuels, and dwarf Teas—acre after acre, in well-filled rows, in robust health and highest vigour. The Rose grounds in and around Colchester vary somewhat in character and aspect, and in some portions the standard Teas were hit very hard, and the dwarfs cut to the ground. Others covered their standard Teas with Pea-straw, and these were saved; and the enormous brakes of the latter, in robust health, rushing into bud, were worth a journey of a hundred miles to see in these times, when we hear such depressing reports of the wholesale slaughter of the innocent Roses in February, and the lingering, enfeebled life of yet larger numbers ever since. D. T. F.

Obituary.

S. A. WOODS.—We regret to hear, through the *Journal of Horticulture*, of the death of Mr. Woods of Osberton on the 26th ult. from poisoning. It appears that the deceased has suffered from gout, and from nervous depression. On the morning of his death he was in great trouble about his Grapes, and asked his wife to go and see them, remarking, "I know I shall go mad." Shortly after this he took a bottle of "Wasp Destroyer," which resulted in his death. Mr. Woods, who was fifty-one, has been gardener to the Foljambe family for eighteen years, and has given great satisfaction.

ALDERMAN MASTERS.—The death is recorded in the *Evesham Standard* of this well-known market gardener, at Evesham, at the age of sixty-eight. The deceased gardener was thrice Mayor of his native borough. A few years ago he was Secretary to the Fruit Pests Committee, a committee of investigation which made experiments as to the best methods of destroying fruit-pests; and before the revision of rates, Mr. Masters was one of a deputation who laid the views of the gardeners before the President of the Board of Trade. In every particular connected with the market gardening industry the deceased brought to bear an exceptional degree of intelligence and perseverance. *Journal of Horticulture*.

ORCHID-BLOOM in variety

touching the berries with the hand, or hair of the head will cause it. There is no remedy, and all rusted berries should be cut out as soon as noticed.

MILDEW ON VINES: In Trouble. Beyond doing what you have done, you might place saucers about the house filled with water in which flowers-of-sulphur have been mixed, which will give off sulphurous fumes inimical to the mildew. The spots on the berries that you remark, are the dead patches of mildew. The skin thus affected has lost its vitality, and cannot expand as the berry grows in size, the consequence being that the skin will be ruptured, and the berry decay. When mildew attacks the fruit that is inevitable.

NAMES OF PLANTS: W. T. T. *Ilex polycarpus*, Japan, Bixaceae, diceous, *Halesia tetraptera*.—*Marshall*. Leaf of Poplar, *Populus monilifera*, the Canadian Poplar probably.—*G. T. D.* *Hyoocyanus niger*, Henbane.—*J. A.* *Rosa polyantha*—*Bog-Cotton*. 1, *Hymenophyllum tunbridgense*; 2, *Aspidium spinulosum*; 3, *Eriophorum polystachyum*; 4, *Cotyledon umbilicus*; 5, *Stellaria graminea*.—*W. H.* *Magnolia glauca*.—*A. M.* 1, *Potentilla fruticosa*; 2, *Spiraea confusa*; 3, an evergreen Oak; 4 *Orchis pyramidalis*; 5, *Orchis pyramidalis*; 6, *Orchis maculata*.—*Ribes*. 1, *Epidendrum ocnidioides*; 2 *Dendrobium Pierardi*; 3, *Pelargonium tomentosum* (Peppermint-scented *Geranium* of gardens); 4, *Sedum Sieboldi*; 5, seed in flower; 6, *Bougainvillea spectabilis*; 7, *Gesnera bulbosa*, often called *aplendens* in gardens.—*J. S. U.* *Kalmia angustifolia*.—*J. A. M.* *Pendulous tree*, *Planera Richardi*; *Rosa viridiflora*, the green Rose; the other plant not recognised.

PEA: S. R. H. & Co. The Purple Podded, a variety of the Marly.

TENNIS LAWN: G. G. 39 feet by 36.

TESTIMONIAL: Merton. It belonged to you, and you should not have parted with it. You may claim it, but the difficulty will lie in obtaining possession, if your late employer should object to give it up.

TOMATOS: A. W. E. Refer to recent numbers, where you will find the disease mentioned under the head of "sleepy disease."

VINES: S. A. The fungus is called *Cladosporium viticolum*. Burn all infested leaves, and next season spray with a dilute solution of Bordeaux Mixture at intervals of a fortnight, during the growth of the leaves. *G. M.*

VINES NOT GROWING: W. W. They will do no good, the Vine being above all things a sun-loving plant, and by your own showing the sun cannot shine on the vinery or the border for more than four hours a day. Fancy what that means in cloudy weather. All your endeavours to carry out a proper mode of cultivation will be fruitless.

VINES AND MEALY-BUG: N. Z. Having failed to extirpate the pest by means of the old recipes, why do you not give Richards' XI All Vaporiser a trial. It will not do harm to the Grapes or anything else, and it is deadly to every kind of insect.

WHITE-FLOWERED ROSA RUBOSA AT KEW: L. G. G. The plant mentioned is the variety *Blanc double de Coubert*.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

increased to the extent of 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

GARDENERS AND OTHERS WANTING SITUATIONS.
 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements
 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

RICHARDS' NOTED PEAT.

GARDENER (SINGLE-HANDED), REQUIRED

IMMEDIATELY.—A experienced man, to grow Table Plants for use in Hotel, and look after and keep in order Hotel Gardens and Lawns (assistance for Mowing); small Vinery, Stove, and Greenhouse. Only a steady, sober, industrious man need apply. No booby.—Full particulars, and wages required, to Mr. LORD, Proprietor, West Cliff Hotel, Folkestone.

Head Working Gardener.

REQUIRED a very trustworthy and respectable married Man (without encumbrance), as HEAD WORKING GARDENER, with three men under him. Must have an excellent character and thoroughly understand Early and Late Forcing and Gardening in all its branches, and Hay-making. Age from 30 to 40. Total abstainer preferred. Wages, 25s. and cottage, but no extras.—Apply, in first instance, by letter, to Mr. HOLT, Waratah, Chislehurst, Kent.

WANTED, thorough good SECOND, where Produce is Grown for Market.—Well up in Tomatoes, Chrysanthemums, &c. Inside and Out; total abstainer preferred. Capable of taking charge in absence of Gardener.—Particulars, age, and wages to A. J. BROWN, Gardener, School of Handicraft, Chertsey.

WANTED, as UNDER GARDENER, a young Man, about 18 or 20 years, to attend to two Cows and usual work in the Garden.—Apply, stating wages required, room on the place, to GARDENER, Springwood, Dartford, Kent.

WANTED, a GARDENER and WIFE, under 40, the latter as Cook, to take charge of small Cottage-house. No family. Apply by letter.—R. L., 11, Manchester Square, London, W.

WANTED, a PROPAGATOR and GROWER Expert in Tea Roses, Ferns, and General Stock of Soft-wooded Plants; two or three assistants.—Apply, stating age, experience (not less than twelve years' Nursery practice), references, and salary expected, to STORRIE & STORRIE, Nurserymen, Dundee.

WANTED, for a Market Nursery, a PROPAGATOR and GROWER of general Pot Stuff, Tomatoes, and Cucumbers. Situation permanent to a man of ability. Must produce first-class references.—State age, wages required, &c., to TURNER BROS., Nurserymen, Garston, Liverpool.

WANTED, for a small Nursery, a PROPAGATOR and GROWER of General Market Staff. Must be able to keep a good supply of Plants and Flowers all the year round. Good Tomato-grower, and well up at Wreaths and Bouquets. None but thorough capable men need apply, and must not be afraid of work. State age and wages. Abstainer preferred.—WM. RATRAY, Ash Vale Nursery, near Aldershot.

WANTED, a GROWER.—Must be experienced in Cucumbers, Chrysanthemums, and general Market Work. Permanent place, and good wages to a thoroughly trustworthy man.—State age, character, experience, and wages expected, to GROWER, Messrs. Thyne & Paton, Seedsman, Dundee.

WANTED, a young MAN that understands how to Grow Stove Plants, Ferns, and Orchids for Sale. Permanent place in large Nursery. Only those who understand the above, and of good character, need apply.—S. C. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, an OUTDOOR FOREMAN. Must have thorough knowledge of General Nursery Work, and be well up in Fruit Trees, Roses, and Rhododendrons. Age not to exceed 45, and the highest references required as regards character and capabilities.—Apply to W. BARRON AND SON, Elvaston Nurseries, Borrowash, Derby.

WANTED, AT ONCE, two experienced ROSE BUDDERS. State wages and references to TOWNSEND AND SONS, Rose Growers, &c., Lower Broadheath, Worcester.

WANTED, good all-round MAN, help given. Wages 20s. with cottage. Age about 30. Married, without children, preferred.—Apply by letter, stating references, W. P., The Arches, Sutton, Surrey.

WANTED, ONE or TWO young MEN, experienced in Budding and Training.—State wages required, &c., to GRO. COOLING AND SONS, Nurserymen, Bath.

WANTED for the Hardy Florist's Flower Department (Carnations, Pansies, Herbaceous, &c.), a young MAN of not less than seven years' Nursery training.—Apply, stating age, experience, references, and salary expected, to STORRIE & STORRIE, Nurserymen, Dundee.

WANTED, at once, good Budder for Roses and Herbaceous Stuff, also good Inside Man for Soft-wooded Staff.—M. PAYNE, Weston-in-Gordano, Clevedon.

WANTED, Young MAN as IMPROVER, Indoors, must have been used to growing for Market. Wages 15s. per week.—Apply to Messrs. PERKINS & SONS, Warwick Road Nurseries, Coventry.

WANTED, a smart COUNTER-HAND, accustomed to the Bulb Trade. Salary, 21s. per week.—Apply by letter to B., 12, King Street, Covent Garden, London.

WANTED, an INVOICE CLERK and BOOK-KEEPER.—Must be neat writer, quick, and accustomed to the Bulb and Plant Trade. Salary, 25s. per week.—Apply by letter only, B., 12, King Street, Covent Garden, London.

WANTED, a Smart SHOPMAN in a General Seed, Nursery, and Floral Business. Knowledge of Floral Trade. State wages and particulars to E. A. L., *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

WANTED, an ASSISTANT SHOPMAN, for Retail Seed and Bulb Trade.—State full particulars of experience and salary required, to HEWITT AND CO., 8, Worcester Street, Birmingham.

WANTED, a good COWMAN, on a Gentleman's Estate.—Married, without family, from 35 to 40, to look after a small herd of Jersey Cows, Pigs, &c. Wages 16s. a week. Good horse, garden, milk, firing, &c.—Apply to J. MARTIN, Barcote, Faringdon.

TO FLORISTS.—IMPROVER, a Young Lady seeks re-engagement. Would prefer Florist and Fruit business combined. Good reference from last situation.—E. F., 53, Station Road, Harlesden, N.W.

A GRAND SPECULATION, in these days of financial unrest, is a rare thing for people with spare capital to come across. It is, therefore, refreshing to know that in purchasing a box of HOLLOWAY'S PILLS, good value for money can be obtained. They never fail to give instant relief from pain, and no disease can long withstand their purifying influence. A few appropriate doses at the proper period will prevent many a serious illness. Their primary action is upon the blood, stomach, liver, kidneys, and bowels. Their secondary action strengthens the nervous centres. No drug can be so harmless yet so antagonistic to disorders caused by brain worry. The most perfect reliance may be placed upon their regulating and renovating virtues.

SALES BY AUCTION.

Friday Next.

By order of Messrs. W. L. Lewis & Co. Marvellous Importation of ONCIDIUM TIGRINUM, the grandest of all the autumn-flowering Oncidiums.

Also the rare and beautiful

ONCIDIUM CRISPUM GRANDIFLORUM, in magnificent masses.

Yellow and white forms of ODONTOGLOSSUM CITROSUM, O. INSLEAYI SPLENDENS, in fine condition; together with fine masses of the somewhat scarce O. HASTATUM.

Also very fine established plants, showing flower of CYPRIPEDIUM CHARLESWORTHII; fine healthy plants showing flower of C. EVENOR SUPERBUM (extremely rare), and C. NIVEUM, beautifully grown.

Two healthy plants of CATTLEYA REINECKIANA, C. HARRISONÆ, in sheath, and C. CITRINA.

CYMBIDIUM LOWIANUM VIRILE, LYCASTE SKINNERI ALBA, CYMBIDIUM (Seedling), C. giganteum x C. elegans; and others.

MESSRS. PROTHEROE AND MORRIS will

SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 19, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

Friday Next, July 19.

MESSRS. PROTHEROE AND MORRIS will include in their ORCHID SALE on FRIDAY NEXT, July 19, Two Plants of CATTLEYA DOWIANA, "ROSTIA," a supposed natural Hybrid between Dowiana and Skinneri, with orange petals, suffused with pink, and intense purple lip, with golden feathering.

A Grand Lot of CYPRIPEDIUM CAUDATUM WARSCEWICZII, collected on the Chirigui Mountains, on the precise spot where Warscewicz discovered this beautiful form. The flowers are very large. Sepals yellow with orange veins; petals often 30 inches long, rose-purple, the large rounded labellum rose-purple on the face.

Also a few Plants of an UNDESCRIBED CYPRIPEDIUM, discovered with the above; and a fine lot of EPIDENDRUM PRISMATOCARPUM, ONCIDIUM CHEIROPHORUM (the Canary Orchid).

The Rare Scarlet LÆLIA MONOPHYLLA, collected in a new locality at 5000 feet.

ODONTOGLOSSUM HALLII LEUCOGLOSSUM and XANTHOGLOSSUM, ODONTOGLOSSUM CIRRHOSUM KLAROCORUM, EPIDENDRUM BICOERNUTUM, and various other rare species.

On view morning of Sale, and Catalogues had.

Tuesday Next, July 16.

SPECIAL SALE—HUGH LOW AND CO. have pleasure in offering by AUCTION, through

MESSRS. PROTHEROE AND MORRIS, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY NEXT, 16th inst., at half-past 12 o'clock precisely, a superb importation of the lovely and effective DENDROBIUM PHALENOPSIS SCHRODERIANUM, without the slightest Reserve. This is, without doubt, the finest consignment of this indispensable Orchid that has ever yet been imported, and we are much pleased to offer such a valuable lot of plants. Our Collector has spared neither pains nor expense, only selecting the very best plants.

At the same time will be offered 250 plants of DENDROBIUM SPECIOSISSIMUM (Rolfæ), our recent introduction from Mount Kina Balu, and which has not yet bloomed in England. The flowers are extremely handsome, being pure white, like D. formosum giganteum, but with orange-red spots instead of yellow. The flowers are very sweet-scented, and leaves and stems are covered with black pubescence. It grows on Magnolia bushes, at about 4000 feet elevation, where Nepenthes Rajah is also found.

The Sale will include the lovely and wonderful BULBOPHYLLUM DEAREI, 300 newly-imported plants of CATTLEYA GASKELLIANA, CYPRIPEDIUM CHARLESWORTHII, all in bud and sheath; 150 imported C. LAWRENCEANUM, CÆLOGYNE DAYANA, ODONTOGLOSSUM ROEZLI and ALBUM, ONCIDIUM AMPLIATUM, and other Choice Orchids. By Order of HUGH LOW AND CO.

Preliminary Notice.

LÆLIAS, CATTLEYAS, new HYBRID SOBRIALIAS, NEW DENDROBES, CATTLEYA GIOAS SANDERÆ, &c.

Exning, Suffolk.

MESSRS. GRIFFITHS AND CHENNELL

are favoured with instructions from the proprietor, Mr. Thos. Jennings, to offer for SALE by AUCTION, in one lot, at the Rothsay House Auction Rooms, Newmarket, at 6.30 o'clock in the evening, on MONDAY, July 15, 1895, a Valuable FREEHOLD ESTATE (Tithe free and Land Tax redeemed), consisting of 16 a. 0 r. 31 p. (more or less) of good Accommodation Land of good soil, in a good state of cultivation, and now used as a Market Garden and Nursery Ground, being well planted with thriving trees; also a comfortable Dwelling-house, Barn, Potting-Sheds, Lofts, Stabling, Pump of good Water, and the usual Domestic Offices, and two red brick and slate built Cottages with good accommodation, and separated from the road by a dwarf brick wall.

The property, which is well situated, at the junction of the Exning and Fordham Roads, is within 2 miles of Newmarket, and is let on a lease expiring on September 29, 1896, to Mr. Robert Graham, at the low annual rental of £76.

Particulars and Conditions of Sale may be obtained of Messrs. A. H. AND A. RUSTON, Solicitors, Newmarket; and of the Auctioneers, Rothsay House, Newmarket.

Southend-on-Sea, Essex.

To FLORISTS, NURSERYMEN, MARKET GARDENERS, and OTHERS.

MESSRS. TALBOT AND WHITE are

favoured with instructions to SELL by AUCTION, at their Sale Room, Cliff Town Road, Southend, on SATURDAY, July 20, 1895, commencing at 4 o'clock precisely in the afternoon, the beneficial interest in the LEASE of the old-established NURSERY GARDENS, known as the "BEACH NURSERIES," Southchurch Beach (late Reed's), having an area of about 7½ Acres of Land, well stocked with choice Fruit Trees in full bearing, and showing well for the present season. The Premises include Two capital Dwelling-houses (one of which is let off, and produces £20 per annum); also, a Workman's Cottage, at present let at 3s. per week; extensive Vineries, 136 feet in length, planted with choice Vines, and heated by hot-water pipes; Peach-house, 59 feet by 12 feet; Greenhouses and Forcing-houses, Sheds and Out-buildings, and numerous useful Erections. The Land is held upon a Lease (14 years) direct from the Freeholder, at the very moderate rental of £50 per annum.

This attractive and excellent Nursery Garden has for many years been justly celebrated for its choice Grapes and other Fruit, and being within 1 mile of Southend, the demand for it is very great. A considerable business could also be done with Teas and Refreshments.

Printed particulars, with conditions of Sale, can be obtained of A. A. TIMBRELL, Esq., Solicitor, 24, Martin's Lane, Cannon Street, E.C.; of Messrs. TIMBRELL AND WILKINSON, Solicitors, Town Hall Chambers, Stratford, E.; or of the Auctioneers, Auctioneers' Offices, High Street, Southend.

Hammerswich House, Hammerswich, near Lichfield, STAFFORDSHIRE.

Large and Important UNRESERVED SALE of STOVE and GREENHOUSE PLANTS, ORCHIDS, CHRYSANTHEMUMS, &c.

MESSRS. POPE AND SONS have received

instructions from Job Evans, Esq. (who is removing to Torquay), to SELL by AUCTION, without the least reserve, on the Premises as above, on TUESDAY and WEDNESDAY, July 30 and 31, commencing each day at half-past 11 o'clock prompt, the whole of the STOVE and GREENHOUSE PLANTS, including fine specimen Lapagerias, Stephanotis, Maidenhair Ferns, Hoyas, Begonias, Bougainvilleas, Crotons, Asparagus, 100 Camellias, 80 fine Azaleas, specimen Allamandas, Dipladenias, &c.; sixteen very fine specimen Palms and Tree Ferns, also Gloxinias, Cyclamen, Euphorbias, Poinsettias, Geraniums, Fuchsias, Aloes, Ficus, Dracænas, Yuccas, &c.; also a very fine Collection of Orchids, 20 very fine Cælogyne, 100 Dendrobiums, 70 Odontoglossum Alexandræ, also Lælias, Cattleyas, Lycastes, Cypripediums, Oncidiums, Vandas, &c.; a large quantity of Garden Sundries, including Pots and Plants, Tools, Lawn Mowers, Marble and Iron Vases, &c.; two Marble Fountains, &c.

On view day before and mornings of Sale.

Hammerswich House is only five minutes' walk from Hammerswich Station; L. & N. W. Ry., and about 3 miles from Lichfield.

Catalogues now ready, and may be had free by post from the Auctioneers, at their Offices, 6, Phillips Street, Birmingham.

HUGH LOW & CO.

Have pleasure in offering by Auction,
through MESSRS.

PROTHEROE & MORRIS,

AT THEIR

CENTRAL SALE ROOMS, 67 and 68,
CHEAPSIDE, E.C.,

On TUESDAY NEXT, 16th inst., at half-past 12 o'clock, precisely, a superb importation of the lovely and effective

DENDROBIUM PHALÆNOPSIS
SCHRODERIANUM,

WITHOUT THE SLIGHTEST RESERVE.

This is without doubt the finest consignment of this indispensable Orchid that has ever yet been imported, and we are much pleased to offer such a valuable lot of plants.

Our Collector has spared neither pains or expense, only selecting the very best plants.

At the same time will be offered 250 plants of

DENDROBIUM
(ROLFE) SPECIOSISSIMUM

Our recent introduction from Mount Kins Balu, and which has not yet bloomed in England.

The flowers are extremely handsome, being pure white, like *D. formosum giganteum*, but with orange-red spots instead of yellow. The flowers are very sweet-scented, and leaves and stems are covered with black pubescens. It grows on Magnolia bushes, at about 4000 feet elevation, where Nepenthe Rajah is also found.

The Sale will include the lovely and wonderful BULBOPHYLLUM DEAREI, 300 newly imported plants of CATTLEYA GASKELLIANA, CYPRIPIEDUM CHARLESWORTHII, all in bud and sheath; 150 imported C. LAWRENCEANUM, CŒLOGYNE DAYANA, ODONTOGLOSSUM ROEZLI and ALBUM, ONCIDIUM AMPLIATUM, and other Choice Orchids.

BY ORDER OF

HUGH LOW & CO.

THE

Gardeners' Chronicle.

SATURDAY, JULY 13, 1895.

A GLOUCESTERSHIRE GARDEN.*

SINCE the publication, in these columns, some twenty years ago, of "A Year in a Lancashire Garden," there has been a succession of similar books. Some of these have been written with literary skill, but little knowledge of plants. Some have been more conspicuous for frothiness or sentimentality than for the advancement of knowledge. Rare, indeed, has been the combination of an expert's knowledge and the scholar's reading with the fluency of a ready writer. But this is what the reader will find in the present volume, and having found it, he will assuredly, in Dickensian phrase, make a note of it. The work owes its existence to certain papers published from time to time in the *Guardian*. As now collected, they form two series, one dealing with the aspects of the garden in each month of the year, and the other with various categories of plants and miscellaneous cognate subjects. The garden is, of course, that favoured one in a warm corner of Gloucestershire which has been the object of loving attention on the part of two generations of plant-lovers. It is necessary to bear this in mind, for such a happy combination of circumstances is rare.

Few things afford a better illustration of the character and proclivities of a man than does his garden. Tastes differ, opinions vary, natural intelligence and acquired knowledge are possessed in the most diverse degrees, and all these diversities become manifest in the garden. In some cases the plants exist for the sake of the garden, in others it is the garden that is the casket or the setting for the plants. No hard-and-fast line can be drawn between the two categories as they occasionally blend or overlap. When this does occur, the result is a combination of beauty and interest than which nothing more desirable can be imagined. The author of the present volume recognises this, for he states at the outset that "every garden has its own special and separate character, which arises partly from the tastes of the owner or his gardener, but still more from the situation, aspect, and soil of the garden." As a general statement this is, of course, true; but it is equally true in special cases, that the tastes and knowledge of the gardener cast their impress on the garden, even when the natural conditions are not propitious. Obstacles do but serve to bring out the skill of the gardener. The garden at Bitton is known by repute to so many that some account of it from the author's pen will be welcome:—

"It is not a large garden—the whole extent, including a good proportion of lawn, being about an acre and a half, and in shape a parallelogram, or double square. It lies on the west side of the Cotawolds, which rise about half a mile away to the height of 750 feet; and about fifteen miles to the

* In a Gloucestershire Garden, by Henry N. Ellacombe, M.A. &c. (Edward Aroold, 37, Bedford Street.)

south are the Mendips. These two ranges of hills do much to shelter us from the winds, both from the cold north and easterly winds and from the south-west winds, which in this part of England are sometimes very violent. I attach great importance to this kindly shelter from the great strength of the winds, for plants are like ourselves in many respects, and certainly in this, that they can bear a very great amount of frost if only the air is still, far better than they can bear a less cold if accompanied with a high wind. The garden, then, has this advantage of shelter. It has also the advantage of a good aspect, for though the undulations are very slight, the general slope faces the south; and it has the further advantage of a rich and deep alluvial soil, which, however, is so impregnated with lime and magnesia, that it is hopeless to attempt *Rhododendrons*, *Azaleas*, *Kalmias*, and a host of other things. It has the further disadvantage of being only about 70 feet above the sea-level, which makes an insuperable difficulty in the growth of the higher alpine. On the whole, the garden is favourable for the cultivation of flowers, and especially for the cultivation of shrubs, except those which dislike the lime."

This preliminary account is defective; the scene of operations is brought before us with more or less fidelity, but the warm colliery wall is not mentioned, nor is the water supply alluded to, and nothing is said as to the history of the garden, although its present condition can hardly be fully understood without some reference to its gradual progress in the past. As to the gardeners, the moving spirits, the entire book testifies to their devotion, their knowledge, their skill, their thankful appreciation. Canon Ellacombe in this volume takes us round his garden, chatting pleasantly the while on plants and their ways and apparent caprices, on soils and seasons, on the endless literary suggestions afforded by the subject.

As we go on our way with the author, there is no disturbing element, no inclemency of weather, no hurry, no train to be met; but there are the lawn and the noble trees, and the long series of plants of never-ending interest—there, too, is the genial and scholarly Canon at your elbow, full of garden-lore, botanic knowledge, and apt allusion. Hard by is the well-stocked library, where is ample means of "verifying references." Close at hand is the noble sixteenth-century church, but of this we must not speak further than to say that it adds additional beauty and interest to the scene. Citation from such a book is a difficult matter, but to show how observant its author is we may adduce the following passage:—

"As soon as it (the pistil of the Hazel) is fertilised a very curious thing happens, of which I know no other instance. The little flower is placed upon last year's wood, and if it were an Apple, or a Peach, or any other fruit tree, the perfect fruit would be there also. But the nut acts otherwise, it at once starts away from the old wood and forms behind itself a thin branch 4 or 5 inches long, at the end of which it ripens into a nut; and as it so travels it carries with it the bract in which the flower was formed, and which at last becomes the pretty cup in which the nut lies."

This fact must be familiar to many, but we do not remember to have seen any record of it. The course of proceedings is encephalic of a different interpretation, but the fact remains. "Uplifting" and "concrecence" are, of common phenomena in plants. The fertilisation of the Hazel is in many ways precocious. The two red styles are conspicuous enough at the time when the pollen is shed, but the observer may look in vain at that time for the ovules, or even for the ovary. They are not formed till long afterwards. The point is very curious, as bearing on the question whether or no the pollen does ever exert an influence on the various coverings of the seed, as well as on the embryo germ enclosed within them.

The temptation is great to dilate on other suggestive passages in Canon Ellacombe's book, on the germination of seeds, the forces called into play during growth, the numberless "mysteries" that

attract the attention of the observer, and incite him to attempt to explain them. The sources of interest are indeed endless, and their practical application not to be overlooked either. "From another habit of many plants I get," says the Canon, "another object-lesson, from which I learn that plant-life knows no rest." With the requisite limitations, this is a true statement of fact, but one generally overlooked by the gardener.

The gardener will find in the present volume numerous hints as to the cultivation of various plants, whilst the plant-lover, turning over its pages, will come upon passages which will keenly excite his sympathies. Read this and judge whether it does not express a great truth. Alluding to an unweeded garden, wherein "things rank and gross in Nature possess it merely," the author—a gardener, be it remembered, whose competence is above testimony, says:—"But I have almost an affection for weeds, a decided affection for some of them, and I have not much sympathy with those who say that a garden is not worth looking at unless it is as clean as a newly-swept floor; it is a counsel of perfection which I have no great wish to reach. A weed is but a good plant in the wrong place; I say a good plant advisedly, having a full faith that where Nature plants it, it fills a right place." Oh, the lessons to be got from weeds, if we would but turn them to account!

The passage above cited furnishes an illustration of the strengthening faith and cheery optimism which pervades the book, and renders it so delightful to read. The author finds always something in the garden to "lift him higher;" he owns he is not fond of frost and snow, but he recognises that they have their uses, and that we might be the worse without them, and with a thankful spirit he makes the best even of a garden in December. "To have a garden where nature and the climate do everything, and man is called upon to do little more than scratch the ground and gather the flowers and fruit, might be very pleasant from one point of view, but it would take away all that to me constitutes the real interest of gardening in its difficulties, and even its disappointments."

NEW OR NOTEWORTHY PLANTS.

DORYPHORA SASSAFRAS.*

This is a plant (fig. 6, p. 35) that finds no place in Nicholson's Dictionary, nor in any garden-list that we have examined, and which we may, therefore, conclude to be rare in cultivation. It was sent to us with a request that we would name it, from Mr. Thompeon, gardener to F. A. Newdegate, Esq., M.P., Weston-in-Arden, Nuneaton. Mr. Thomson also obligingly furnished us with the specimens from which our figure was taken. It forms a highly aromatic shrub, with opposite, shortly-stalked, coriaceous, elliptic-acute, remotely-serrate glabrous leaves. The flowers are shortly-stalked, solitary, or in groups of three, the buds surrounded by deciduous boat-shaped bracts. The perianth is about 30 mill. (say, 1¼ inch) across, spreading, with six leathery, whitish, hirsute, oblong-acute segments. The stamens are nine in number, each with a short filament, and two small rounded glands at the base of the anther. Anther two-celled, connective, prolonged into a long slender awn. In the flowers we examined the pistils were absent, or very imperfect; but they are described as numerous, free at the bottom of a cup-like receptacle. Each carpel has a long style, and its single cell contains a single ovule.

The plant, which would require warm-greenhouse treatment, is by no means unattractive when in flower, but its chief value consists in its very aromatic fragrance. It is a native of Eastern Australia, New South Wales, and Queensland, closely allied to *Atherosperma*, and belongs to the *Monimiaceæ*. M. T. M.

* *Doryphora Sassafras*.—Eglicher, *Jc.*, t. 10 (1838); Bentham, *Fl. Austral.*, v. (1870), 283; Bailey, *Cat. Plants Queensland* (1890), p. 39.

DENDROBIUM IMPERATRIX, KRÄNZLIN (*Reichenbachia*, vol. ii, part xii., p. 111, t. 95).*

"This new species is very similar to *Dendrobium Angustæ Victorisæ*, Kränzlin, and is one of the most stately in growth of all *Dendrobium*s. The stems reach to a height of 6 or 7 feet. The leaves are comparatively small, although in other *Dendrobium*s a leaf of 6 to 7 inches in length by 2½ or 3 inches in breadth would be considered as a rather considerable one. The flower-spikes rise from the axils of the upper leaves of the previous year, and very often exceed 2½ feet in length, carrying from thirty to forty flowers.

It is impossible to do full justice to such plants in the space at our command, but still the plate illustrates the charming delicacy of its blossoms better than a long description. The affinities may be briefly described as follows:—*Dendrobium veratrilobum*, A. Rich, has shorter and broader leaves, it is much smaller, and its racemes very seldom exceed 18 inches in length; the petals are larger, and the side-lobes of the labellum smaller. *Dendrobium Mirbelianum*, Gaudich, is also a smaller species, but very closely allied; it has a larger lip, the middle lobe of which is strictly lanceolate and acuminate, and the little spur is sharply incurved. *Dendrobium Angustæ Victorisæ*, Kränzlin, the most showy of the whole section, has petals with amethyst veins; the side-lobes of the lip are very blunt, and the three crests are frilled and denticulated not only in front, but on the upper side. The rest of the section is out of the question for comparison, as their petals exceed the sepals by twice their length, and also by other essential characteristics.

"This fine plant was discovered in German New Guinea, at Finchhafen, by Dr. Hollrung, and later on was collected by Mr. Wm. Micholitz, who found it, to use his own words, 'mostly on trees overhanging the beach. I found it is only seldom to be found;' and, he adds, 'it flowers probably in March—April.' The rainy season is not sharply defined, but it generally rains most from June till October. It should be grown in sharp heat, with plenty of sunlight, and after flowering receive a long, dry rest."

ORCHID NOTES AND GLEANINGS.

THE ORCHID HOUSES AT RAMBOUILLET.

WHEN visiting the fine establishment of M. Ang. Dallemagne, we were reminded that at that time more than 150 groups of Orchids had been transferred to the Bordeaux Exhibition, where they were very generally admired. The arrangement of the houses at Rambouillet comprises a winter garden in the fore-part, a large central house with, on both sides, and opening into it, four houses of similar size. This, in fact, is the plan of the establishment started in Brussels by the Horticulture Internationale. In the winter garden a magnificent *Kentia australis* springs from a large rock-work, on which various plants are growing. The central house is full of *Cattleya Warocqueana*, *Lælia purpurata*, &c., fine plants of unusual vigour; *Angræcum sesquipedale*, and *Vanda anavis* showed equally good health.

1st house: Importations of *Cattleya*, showing

* *Dendrobium imperatrix* (§ *Antenata*), Kränzlin.—Caulibus aggregatis maximis multi-articulatis late viridibus ad 2 m. altia ad 2 5 cent. diametro; foliis oblongis coriaceis, 15 cm. longis, 6 m. latis apice obtusis; racemis maximis multifloris 75 cm. longis vel imo longioribus; bracteis minutis pedicellis multo longioribus basi incrassatis 5–6 cm. longis; sepalis lateralibus a basi paulo latiore triangulis acutis in pseudocalcar minutum curvulum connatis margine undulatis, intermedio lineari undulato acuto; petalis paulo longioribus semitorcia linearibus antice paulum dilatatis obtusis labellum lateralibus rhombis margine laterali et anteriore denticulatis, intermedio vix expanso fere orbiculari margine valde undulato crispo acuto, disco lamellis 3 a basi in medium labii intermedii decurrentibus ibique in lamina erectas denticulatas subito abruptas ductis, lobis lateralibus pulcherrime venulosis; gynoostemii parte liberâ brevî tridentata æthæra plana antice minute pilosula. Nov. Guinea Ori-nt. Kränzlin, in *Reichenbachia*, vol. ii., tab. 95.

masses of buds. One plant of *C. Mendeli* had an unusually dark lip. 2nd house: *C. gigas* and *aurea*, growing splendidly. 3rd house: *C. Mossiæ* and *Trianaï* adorned the stages, and did admirably. Above the path, as in all the other houses, a triple row of hanging baskets and pots of Orchids was arranged. 4th house: Seedlings of *Cypripedium* and *Dendrobium*; also *Cypripedium*, *Phalænopsis*, a fine *Cattleya Mossiæ alba*, a splendid specimen of *Cattleya Rex* and *Vanda Sanderiana*. 5th house: *Odontoglossums*, especially *crispum*, un-

magne's horticultural establishment. Another and tenth house is full of *Cattleyas*, and in reserve, in a very cool place, are *Odontoglossum crispum*, *Cattleya* and various other Orchids destined for the approaching Congress at Bordeaux.

In a special kiosk is installed a machine worked by petroleum intended to draw up water for irrigating.

The entire buildings are surrounded by a fine fruit garden. The property was acquired by M. Dallemagne in 1892; in less than four years he has formed

in spite of the absence of the lip, are by no means unattractive—indeed, there is an increase of delicacy and refinement resulting from the absence of strong colour.

LÆLIA GLAUCA, *Bentham and Hooker, Lindenia*, t. cdlxv.

The *Brassavola glauca* of gardens. Flowers 5 inches across, fragrant, rounded in outline, stellate, segments oblong, straw-coloured lip projecting, white, with a purplish blotch, convolute at the base,

FIG. 6.—DORYPHORA SASSAFRAS. (SEE P. 34.)

usually well cultivated. One *Lælia purpurata* with an extra dark lip; a very beautiful *Odontoglossum aureum*. Remarkable also were the *Masdevallias* and the numerous examples of *Cochlidia Noetzliana* which, suspended, formed a charming arch of bloom. 6th house: *Odontoglossums* in excellent health. 7th house: *Odontoglossums*, among them many excellent varieties. 8th house: still more of *O. crispum*, as well as *Deporidium atropurpureum*; a remarkable *Cymbidium eburneum*; a graceful *Odontoglossum cirrosum*, and a flowering canopy of *Cochlidia Noetzliana*. In addition to these houses grouped together and showing the cunning of the master's hand, there is a ninth house which may be called the cradle of M. Dallemagne's

splendid collection of Orchids, which won him, at Paris last year, the *prix d'honneur* from the President of the Republic. *Ch. De B.*

ODONTOGLOSSUM CRISPUM.

A correspondent sends a spike of this Orchid bearing one perfect flower, whilst four others have the parts arranged in pairs cross-wise, thus the two sepals alternate with two petals and the lip is entirely wanting.

CATTELEYA MENDELI.

Baron Sir H. Schroder sends flowers of this variety showing the same condition of affairs as in the *Odontoglossum* just mentioned. We believe the plant throws similar flowers every year. The flowers,

anterior lobe broadly ovate acute. It is a native of Mexico, and requires to be grown in a cool house as a basket plant. It flowers in early spring.

LÆLIO-CATTELEYA VARJENEVSKYANA, Lindenia, t. cdlxvi.

A hybrid between *Lælia grandis* and *Cattleya labiata* Warneri. Segments rosy-lilac, anterior lobe of lip frilled rich carmine. It is dedicated to a Russian nobleman.

ODONTOGLOSSUM HALLI-XANTHINUM ×, *Lindenia*, t. cdlxvii.

A reputed hybrid between the two species named. Introduced from Ecuador by MM. Linden.

CATTELEYA HAEDYANA X VAR. LINDENI, *Lindenia*, t. cdlxviii.

A gorgeous variety, with deep rosy-lilac segments, lip blotched with golden yellow in the throat, with the anterior lobe slightly frilled, rich carmine-coloured.

CYPRIPEDIUM LITTLEANUM X.

In the current number of the *Orchid Review* are given a description and an illustration of a supposed natural hybrid in the collection of Mr. H. Little between the Bornean *C. Lawrenceanum*, and perhaps *C. Dayanum*, also Bornean.

ORCHIDS AT FAIR OAK LODGE.

Mr. W. A. Gillett, the owner of Fair Oak, near Eastleigh Junction, on the London and South-Western Railway, is a true connoisseur of Orchids, and he has got together an excellent collection of species and good varieties of these plants. He finds in his able and energetic gardener, Mr. Carr, an excellent cultivator. The gardener when he came to him fourteen years ago knew nothing of Orchids or their cultivation, and he is at the present time an instance of a man who by perseverance and a good share of common sense has become proficient as an orchidist. It would be difficult for anyone to find fault with the state of the plants under his care.

On the occasion of a recent visit to this garden I found in the cool-house numbers of plants of *Odontoglossum crispum*, one of this species having two spikes, 1 yard long, and carrying twenty-five blooms; of *Miltonia vexillaria* in noteworthy examples, namely, one with three new pseudo-bulbs and ten flower-spikes, carrying altogether seventy-three flowers of a large size and fine colour; *O. cordatum*, *O. Peacetorei*, *O. maculatum*, *O. citrosum*, *O. hastilabium*, *O. polyanthum*, and *Phalaenopsis*. The display of *Odontoglossum* was heightened by flowering examples of *Epidendrum vitellinum mejus*, *E. Godeffianum*, *Zygopetalum crinitum*, *Sophranitis grandiflora*, and *Masdevallias* in variety. Plants of *Ocycidium ampliatum majus* and *C. sphacelatum* showed, as grown here, their great usefulness as decorative subjects.

There was remarked a capital lot of plants (sixty) of *Dendrobium Phalaenopsis Schroderianum*, some of them with very dark-coloured flowers. *Dendrobium suavisimum* was observed in quantity, also a flowering plant of the somewhat rare *Lælia mejalis*. *Cypripedium Haynaldianum*, concolor, *Parishii*, *Lawrencianum*, *caudatum*, *Roetzlii*, *calurum*, *Warnerianum*, *bellatulum*, and a capital form of *niveum*, form part of the collection. A plant of *Calanthe Turneri nivalis* was making most satisfactory growth, as was also one of *C. Veitchii*. A specimen of *Cattleya gigas imperialis* gave promise of some good flowers shortly. Robust plants which had been in fine flower this season were remarked of *Vanda suavis*, *Cattleya Mossiae*, *C. Mendeli*, and *Lælia purpurata*. *E. M.*

PHALAENOPSIS LINDENI.

From the *Journal des Orchidées* for June 16, we take the following account of *Phalaenopsis Lindenii*, Lohér.:—"This new species was named in honour of M. J. Linden by the traveller who found it, and who gives the following description of it: 'Folia oblonga, abido-argentea, viridi-maculata; pedunculi purpurei, bracteis parvis acutis; perigonii phylla exteriora et interiora subæqualia, obovata subclavata, obtusa, albidia (versus nervum medium subrosea); labelli tripartiti lobi laterales subfalcati, oblongi-obtusai, versus basin anteriorem maculis aurantiacis; scutello vel callo bilobo aurantiaco maculato; lobus intermedius cordatus, rotundatus breviter acuminatus, striis quinque purpureis, basi albidus, medio superiori amethystinus.'

"The foliage of this species resembles a little that of *P. Schilleriana*, but the leaves of the former are much narrower, almost sword-shaped (*Gladiolées*); as to the flowers, they closely resemble those of *P. rosea*, but are much larger—nearly double. Furthermore, they are remarkable for the colouring of the lip, the anterior lobe of which is bright amethyst, with the base pale rose; this division is decidedly rounded, briefly acuminate, while in *P. rosea* it is

lozenge-shaped. M. Lohér noticed that no other *Phalaenopsis* grew in the spot whence this new species was taken."

PETER COLLINSON.

(Continued from p. 6.)

LINNÆUS was another of the many intimate friends and correspondents of Collinson. The great Swedish naturalist visited England, and a life-long acquaintance between the two men was formed. The British Museum contains copies of two letters which the English naturalist addressed to Linnæus, dated respectively 1739 and 1767 (2 Add. MSS., 23,545, ff. 140, 140b), the earlier of which runs as follows: "Dear Friend, I could not omit so convenient an opportunity by my worthy friend, Dr. Dillenius, to enquire after your welfare, and give you joy on your marriage. May much happiness attend you in that state. I am glad of this conveyance to express my gratitude for the particular regard shown me in that curious, elaborate work, the *Hortus Cliffortianus*. Something, I think, was due to me from the Commonwealth of Botany for the great number of plants and seeds I have annually procured from abroad, and you have been so good as to pay it by giving me a species of eternity, botanically speaking; that is, a name as long as men and books endure." The plant to which Collinson refers is, of course, the *Collinsonia canadensis*, which is figured in the above-mentioned work of Linnæus (Amsterdam, 1737).

The MS. department of the British Museum contains many hundred letters written by and addressed to Collinson, who appears to have been the guide, philosopher and friend of nearly all the celebrities, botanical and horticultural, of the period. There are many from the Duke of Richmond, who was living at that time at Goodwood, and who made extensive alterations in and additions to the gardens there. The subject of the present sketch was a frequent visitor, and so was his young son Michael. The letters which passed between them were of the most cordial nature; one of them, for example, ending thus:—"Adieu, my dear Peter, this cruel weather [the letter was written February 16, 1747-8], puts me quite out of all patience, but in frost, or snow, wet weather, or fine, I am, honest Peter, sincerely thine, Richmond." In another letter, his Grace remarks, "The small *Magnolias* are confounded dear, but I must have them, tho' I believe nobody else will be fool enough to buy any at that price." Collinson was also a frequent visitor at Holland House, in the early fifties of the last century. Henry Fox, the celebrated Lord Holland, father of the even more famous Charles James Fox, had not yet been elevated to the peerage; whatever may have been his failings as a politician—and there can be no question that he was an adventurer of a very questionable, and now, happily, obsolete type—his friendship for Collinson was genuine. Collinson was frequently at his house; an invitation to dine, in 1750, was backed up with the plea, "Lady Caroline has a thousand questions to ask you about flowers, and I not much fewer about plants." Another invitation in 1752 ran, "Will you dine here on Saturday? You shall be guarded home," is a very curious and interesting illustration of the dangers which attended foot-passengers in the suburbs of London at that period—for Holland House was not then surrounded by bricks and mortar, and even Oxford Street and Tottenham Court Road were country fields.

Peter Collinson's place of business was at the Red Lion, in Gracechurch Street. The name of his place suggests to us of to-day a public-house; but the fashion of numbering houses had not yet come into vogue, and, as a consequence, all the principal shops were distinguished by signs. From a very early age he lived at "Peckham, in Surrey," a very different place to what it has since become. It was here that he formed a very extensive botanical garden. Through his marriage with Mary, daughter of Mr. Bashell, of Mill Hill, Hendon, in 1724, he eventually came into possession of this place. The removal from Peckham thence, however, did not take effect until a quarter of a century afterwards.

He himself tells us, under date April 8, 1749, "removed from my house at Peckham, in Surrey; for two years was transplanting my garden to my house at Mill Hill, called Ridgway House," "ten miles from St. Giles's Pound, in Holbourn." The gardens at Peckham and Mill Hill had attained such a high celebrity that a publication of Collinson's catalogue appears to have been called for by some of the most distinguished naturalists of the time; and the reason for this non-compliance with their wishes is thus given in a letter of his, dated May 12, 1756, to Linnæus:—"You must remember I am a merchant, a man of great business, with many affairs in my head and on my hands. I can never pretend to publish a catalogue of my garden unless I had one of your ingenious pupils to digest or methodize for me."

Collinson began early to keep an alphabetical register of the plants which he cultivated. At his death in 1768 the catalogue, which had by himself been bound up with the seventh folio edition of Miller's *Dictionary*, passed into the possession of his son-in-law, John Cater, of Beckenham, Kent, and there it remained until 1809, nearly, if not quite, unknown. In the tenth volume of the *Linnean Society's Transactions*, Lambert gave some account of it. A quarter of a century later, Lambert obtained it, with Collinson's copies of the sixth and eighth editions of Miller, studded with notes and memoranda by Collinson. At Lambert's sale after his death, they passed into the possession of L. W. Dillwyn, who privately printed, in his *Hortus Collinsonianus*, 1843, all these notes, &c., and from which it appears that Collinson introduced 119 plants. It would be interesting to know of the whereabouts of these three editions of Miller, annotated by Collinson, although Dillwyn's exceedingly interesting and valuable excerpts doubtless include all of the notes which possess permanent value.

Collinson strongly urged the American colonists to cultivate flax, hemp, silk, and wine, which led to the cultivation of these industries in several of the States. Collinson was a liberal contributor to the collections of the British Museum; and, according to the late Robert Hunt, it was contemplated to appoint him as curator of the botanical division. This was not carried into effect, for what reason it is not now known. Collinson died while on a visit to Lord Petre in Essex, and enclosed in his will was a paper importing "that he hoped he should leave behind him a good name, which he valued more than riches; that he had endeavoured not to live uselessly, and that all his days he constantly aimed to be a friend to mankind." Dr. Fothergill wrote a privately-printed account of his friend in 1770, the British Museum copy of which once belonged to Sir Joseph Banks, which is reprinted in the collected edition of Fothergill's works, 1781. The original issue of this biography contains an exceedingly good portrait of Collinson, engraved by J. Miller; and this portrait, reduced from quarto to octavo size, with the details slightly altered, was reproduced by Nichols in his *Literary Anecdotes*, whence the illustration given at p. 6 is derived. *W. Roberts.*

COOMBE COURT, KINGSTON-ON-THAMES.

THE grounds here (the residence of W. A. Bevan, Esq.), are extensive and picturesque. They were laid out some years ago by Messrs. J. Veitch & Sons. From the terrace in front of the fine red-brick mansion may be obtained some fine landscape views, embracing a wide stretch of the Surrey hills. Grand masses of *Rhododendrons*, *Azaleas*, and other flowering shrubs are features here, and seen from the terrace when in beauty, they have a wonderfully fine effect. Some fine named varieties of *Rhododendrons* are grown, specially noticeable at the time these notes were taken being *John Waterer*, *The Queen*, *Francis Dickson*, and *Lady Palmerston*. *Kalmias* revel in the peaty soil, and the *Rhododendron* beds are edged with them. That handiwork of the Berberises, *B. Darwinii*, flourishes here, and the plants become covered with a profusion of the

orange-coloured blossoms. Some beds consisting of *Skimmia japonica*, golden *Laurnstinus*, and Irish H-ath, edged with *Euonymus radicans*, are quite remarkable.

Hollies were remarked as growing luxuriantly, some fine specimens in front of the house moved two years ago being specially noticeable. Some good specimens of *Abies Douglasii* shifted three years ago have also done well, making good growth. The various forms of *Cupressus* are attaining good dimensions. *Retinosporas* do not seem to take kindly to the gravelly sub-soil here, and some of the fine Sweet Bays were much cut during the past severe winter. *Cedrus Deodara* finds a congenial home here, as do the Oaks, Elms, and Piceas. On the lower side of the grounds, abutting on to Coombe Lane, a long line of closely-trimmed Limes gives an air of order and neatness characteristic of the whole place. A lake bordered by suitable trees is a very pretty and "restful" feature.

Some bold mixed beds of *Abutilons*, *Coleus*, *Zea japonica*, *Ricinus*, *Carnations*, &c., in proximity to

Apples and Pears, principally as pyramids promise good crops, the root-pruning to which the trees were subjected two years ago having had a beneficial effect.

Veitch's Extra-early Forcing Cauliflower is extremely early, and very dwarf. Sown the middle of February, cutting has been going on since May 28. Pea Veitch's Early Selected was ready for picking on June 3. A fine breadth of some 500 plants of that old but good Cabbage, Cattell's Reliance, stood the winter so well; ready first week in April.

Amongst Potatoes, Myatt's Ashleaf is much esteemed here, as is that fine-constituted variety, of excellent quality, Schoolmaster.

Peas are grown in 100-foot rows, as a large family has to be supplied, the principal varieties grown being the old but finely-flavoured Ne Plus Ultra, Veitch's Perfection, William I., Main Crop, Criterion, and Duchess of Albany.

A concluding note may be found in recording the fact that the whole place is well-managed by the gardener, Mr. Springthorpe. J. B.

FIG. 7. — A COMPOSITE PEACH: PART PEACH, PART NECTARINE.

the mansion will constitute attractive features a little later. The culture of the useful and beautiful herbaceous plants is being taken up. In the conservatory attached to the residence the usual foliage and flowering plants for decorative purposes in such structures were in remarkably good condition.

In a range of houses 100 feet long in three compartments, Pine-apple Nectarine was carrying a good crop. Roses on a back wall of this division do well in spring, exceptional top-light being obtained.

Black Hamburgh and Muscat of Alexandria are the favourite Grapes grown, and the crops are all that can be desired.

Two span-roofed houses, 130 feet in length, contain some well-fruited trees of Dr. Hogg, Royal George, and Early Louise Peaches.

The best forcing Strawberry is found in Anguste Nicaise, the picking commencing on April 1. White Ischia and Brown Turkey Figs in pots give promise of good fruiting. The favourite Melons are Countess and Frogmore Selected; Tomatoes, Ham Green, Frogmore Selected, and Perfection.

In the kitchen garden, a fruit-wall some 300 yards in length, is quite worthy of note. The Cherry-trees on this wall are in the best of health, and reaching to the top of the 9 feet wall, the principal varieties grown being May Duke, small, but carrying a good crop; Bigarreau Napoleon, Elton, Morello, Frogmore Bigarreau, Black Eagle, Old Bigarreau, and Early May, fruits of the latter being gathered early in May. On this wall some of the best varieties of Plums, Peaches, and Pears are also grown. Pears are, however, a scarce crop this year.

Coming to second early Peas, two varieties stand out prominently, Gradus and Daisy, the former introduced by Laxton and the latter by Carter. For earliness, Gradus excels Daisy, and, when true, it is really a grand Pea. It is a good bearer, has fine large pods of the Duke of Albany type, and is of fine flavour. Daisy (1½ to 2 feet) is one of the coming Peas; a wonderful bearer, the pods coming in pairs, and they are large and well filled; it is, moreover, of compact habit and comes among the first of the second-early section. Dr. Hogg is a good old second-early Pea, and holds its place pretty well. William I. is so apt to "sport" that growers are getting tired of checking its waywardness, and are inclined to drop its cultivation. Gradus is also said to have this fault, but I do not think that it deserves a bad name. A stock of it sent out this season in packets was as full of rogues as it well could be, but I have seen another stock which was almost free of them. Messrs. Dickson, of Chester, have a good early wrinkled Pea in Harbinger, which is somewhat after the style of Exonian, but it has not the deep colour of that variety, nor is it so early by one week. Notwithstanding its pale colour, it is a good Pea.

In a trial of Peas, they must, to arrive at accurate results, be all sown on the same day, on the same plot, and, from the beginning, be treated alike. To sow one variety on a border this year and another variety next year, is no trial at all. It is worse than useless, for often it is misleading. A. H.

VARIATION.

This fascinating subject receives a curious illustration in the specimen here shown (fig. 7). Mr. Thorne, who kindly sends it, described it as Early Dagmar Peach, with a stripe or band which is that of a Nectarine. Occasionally we see Peaches and Nectarines on the same bough, and an illustration of such an occurrence was given in our columns in 1891. When this phenomenon was first observed, the narrative was received with incredulity. An illustration of this is shown in the Kew collection of drawings, where is preserved a coloured drawing, accompanied by a document formally attested by a number of botanical and horticultural celebrities. Since that time a similar occurrence has occasionally been noticed, not only in Peaches, but in Apples and other fruit. Darwin, in his *Animals and Plants under Domestication* (1868), vol. i., p. 341, mentions several cases of the kind culled from horticultural literature. The earliest case on record, it appears, is one stated by Peter Collinson, whose life forms the subject of a notice in the present issue; and Sir James Smith in 1821 was the first to record the occurrence of fruit partly Peach, partly Nectarine, in character. Similar amalgamations are met with in Oranges. We have ourselves seen a fruit half Orange, half Lemon; see also Darwin, *loc. cit.*, p. 336.

PLANTS IN FLOWER IN THE ROYAL BOTANIC GARDEN, EDINBURGH.

MICHELIA FUSCATA, perhaps better known under the generic name of *Magnolia*, is now flowering very freely in the temperate-house, the delightful fragrance of its flowers being detected as soon as the house is entered. This fragrance should recommend it to a place in every greenhouse. The plant is about 8 feet high, of a shrub-like habit, with plenty of dark evergreen foliage. The axillary flowers are of a light purple colour, the fleshy corolla soon dropping, but they are produced for a long period of time. It is a native of China, and has long been in cultivation; it is easily propagated, and grows in rich loamy soil. Young plants flower freely.

Orthociphon stamineus is a native of India, Malaya, and some other tropical countries. Its flowers are very attractive, at the present time the most conspicuous part being the long filaments and style that project about 1½ inch beyond the bilabiate corolla.

potash than phosphoric acid is exported in the cereal grains, much more being retained in the straw; whilst the other products of the rotation—the roots and Leguminosæ—which are also supposed to be retained on the farm, contain very much more potash than the cereals, and comparatively little of it is exported in meat and milk.

Of lime, very little is taken up by the cereal crops, and by the roots much less than of potash; more by the Leguminosæ than by the other crops, and, by the Clover especially, sometimes much more than by all the other crops of the rotation put together. Of the lime of the crops, however, very little goes in the saleable products of the farm under the conditions supposed of a self-supporting rotation. There is, however, frequently a considerable loss of lime in land drainage.

The interpolated crops of rotation—the roots and the Leguminosæ—take up scarcely any silica; but the cereals take up a very large amount of it. Indeed, the large amount of silica taken up by these crops when grown under ordinary conditions, is as characteristic a chemical phenomenon of rotation as is the very large amount of lime taken up by Clover and other Leguminosæ. Very little silica, however, is lost to the land in the assumed saleable products.

Although the eventual loss to the land of mineral constituents is, in a self-supporting rotation, comparatively so small, the very fact that the different crops require for their growth, not only very different amounts of individual constituents, but require these to be available within the soil in very different conditions, both of combination and of distribution, points to the conclusion that, in any explanation of the benefits of an alternation of crops, the position, and the rôle of the mineral constituents must not be overlooked; and the less can it be so when their connection with the very important element—the nitrogen of the crops—is considered.

As to the nitrogen, it has been seen that, although very characteristically benefited by nitrogenous manures, the cereal crops take up and retain much less nitrogen than any of the crops alternated with them—in fact, the root crops may contain two or more times as much nitrogen as either of the cereals; and the leguminous crop, especially Clover, much more than the root-crops. The greater part of the nitrogen of the cereals is, however, sold off the farm, but perhaps not more than 10 or 15 per cent. of that of either the root-crop, or the Clover, or other forage leguminous crop, is sold off in animal increase or milk. Thus, most of the nitrogen of the straw of the cereals, and a very large proportion of that of the much more highly nitrogen-yielding crops, returns to the land as manure, for the benefit of future cereals and other crops. Indeed, it is, as a rule, only a comparatively small proportion of the very much increased amount of nitrogen obtained in rotation compared with that in continuous cereal cropping (chiefly due to the interpolated crops) that is lost to the land in the saleable products.

As to the source of the nitrogen of the so-called "restorative crops," it has been shown that certainly in the case of the roots it is not, as has sometimes been assumed, that such plants take up nitrogen from the air by virtue of their extended leaf-surface. Both common experience and direct experiment demonstrate that they are as dependent as any crop that is grown on available nitrogen within the soil, which is generally supplied by the direct application of nitrogenous manures—natural or artificial. Under such conditions of supply, however, the root crops, grass feeders as they are, and distributing a very large amount of fibrous feeding root within the soil, avail themselves of a much greater quantity of the nitrogen supplied than the cereals would under similar circumstances, this result being partly due to their period of accumulation and growth extending even months after the period of collection by the ripening cereals has terminated, and at the season when nitrification within the soil is the most active, and the accumulation of nitrates in it is the greatest. Lastly, full supply of both mineral constituents and nitrogen being at command, these crops assimilate a very large amount of

carbon from the atmosphere, and produce, besides nitrogenous food-products, a very large amount of the carbohydrates—sugar, as respiratory and fat-forming food for the live-stock of the farm.

The still more highly nitrogenous leguminous crops, on the other hand, although not characteristically benefited by nitrogenous manures, nevertheless contribute much more nitrogen to the total produce of the rotation than any of the other crops comprised in it. It is also certain that, at any rate, a large proportion of the nitrogen of these crops is obtained from the soil and sub-soil; though recent investigations have proved that some of their nitrogen, and sometimes much of it, may be derived indirectly from the free nitrogen of the atmosphere, brought into combination under the influence of micro-organisms within the nodules on the roots of the plants.

But independently of the benefits arising from the difference in the requirements and results of growth of the different crops, of the increased amount of manure available, and of the increased sale of highly-valuable animal products, there are other elements of advantage of considerable importance. For example, with a variety of crops, the mechanical operations of the farm, involving horse and hand labour, are better distributed over the year, and are therefore more economically performed.

Last, but by no means least, the opportunities which alternate cropping affords for the cleaning of the land from weeds is a prominent element of advantage. *J. J. Willis, Harpenden.*

FORESTRY.

THE NATURAL REGENERATION OF WOODS.

Few branches of British forestry probably are more neglected than the restocking of mature woodland by means of self-sown seedlings. Although it occurs more or less in every seed-bearing wood, yet we seldom, if ever, find any systematic methods adapted to bring it about in a uniform and satisfactory manner. It requires, of course, a certain amount of skill and judgment on the part of those who regulate the management of the wood previous to, and at the felling of the old crop; but beyond this, the establishment of a healthy crop of young trees by this means is as simple as raising a farm or garden crop by artificial sowing. Just as a seed-bed is prepared in the case of the latter, so must one exist for the reception of the seed which falls from the parent trees, and this is the requisite which is chiefly lacking in our woods.

A good forest seed-bed prepared by natural causes, differs with the species which are to occupy it. For the proper development of a seedling into a sapling, the seed must germinate upon matter which will support the plant after its stock of reserve material (stored up in the cotyledons or endosperm) has given out, and it must also be exposed to sufficient air and light for its leaves to carry on their work properly. In dense woods, especially when composed of shade-bearing species, a thick layer of raw, or partially-decomposed humus, existing, which is not sufficiently compact to retain moisture for any length of time, nor has it such an intimate connection with the soil beneath which would set up capillarity. Under these circumstances, a seed falling upon the forest floor may germinate, but invariably perishes from insufficient moisture and nutriment in the course of a few days. To effect the decomposition of this inert matter, the annual leaf-fall must be checked, and sun and wind allowed to act upon and hasten the decomposing process. For this reason, the felling of a wood which it is intended to regenerate naturally, is usually performed at two distinct periods. Two or three years before a seed crop is likely to occur, what is known as a "preparatory felling" is made, which removes about one-half, more or less, of the trees, and greatly reduces the leaf-canopy. This felling has a twofold object—the reduction of the humus-

layer, as already mentioned, and the exposure of the crowns of the remaining trees to the sun, so as to induce and favour the formation of flower-buds, and thus bring about a plentiful crop of seed. After the latter occurs and falls to the ground, a second felling is made in order to further lighten the canopy for the benefit of the seedlings which appear in the following spring. The extent of this felling depends upon the requirements and nature of the seedlings. In the case of shade-bearers, such as Beech or Hornbeam, sufficient trees may remain to form a light but fairly regular shade, as the former of these species is very sensitive to late frosts, and the seedlings are easily destroyed during the first year. Where the parent trees possess comparatively light crowns, as Oak or Ash, the same proportion may remain without interfering with the seedlings, for this canopy prevents the drying-up of the ground and baking of the surface, and thus favours the growth of the seedlings. After the latter are fully established, the remaining trees can be gradually removed, and the blanks which occur filled up by transplanting seedlings from the thicker parts.

In the case of Conifers of the Pine genus, heavier felling at the time of the seed crop is necessary, as Pine seedlings require plenty of light, and the preparatory felling is also of importance, as unless the radicles come quickly in contact with the mineral soil, a large proportion perish. With the Scots Pine, for instance, fifteen to twenty trees per acre are amply sufficient to provide the necessary seed, as the winged form of the latter enables it to be carried long distances by the wind. The development of this wing upon fine seeds furnishes an interesting field of speculation for the evolutionist, and those acquainted with the peculiarities attending the natural regeneration of this tree are able to recognise the enormous advantages which this wing confers upon the seed with regard to its distribution and conveyance to suitable localities for its germination. Whatever the reason may be, the fact remains, that both the germination of the seed and the growth of the seedlings occur most readily on sites which have never, or at least not recently, borne a crop of timber. On heathy moors, whether these be wet or dry, peaty or gravelly, this species quickly establishes itself, providing a few seed-bearing trees are within reasonable distance, and the heather is not too long and rank to prevent the seed reaching the soil. But under its own shade, or that of other trees, the Scots Pine fails to reproduce itself in a satisfactory manner; hence the necessity for means of locomotion other than those usually provided in the case of most other tree species.

The real secret of success in all cases of natural reproduction is the total suppression of undergrowth. Whether this consists of grass, brambles, or coarse weeds, a regular crop of any kind of seedling is impossible, and with some species the germination, under such conditions, of a seed becomes a rare occurrence. This suppression can only be effected by maintaining a close and unbroken leaf-canopy for several years previous to the preliminary felling. With light-demanding species a dense canopy is difficult to obtain, unless a mixture of some shade-bearing tree, usually Beech, is introduced either at the time the crop is planted or later on, according to circumstances. By such means a clear field is left for the seed of the legitimate crop, which are able to germinate and make a fair growth before weeds and coarse grasses get possession of the soil.

The chief obstacle in the way of natural regeneration, or the adoption of measures for securing it, is game cover. We have never been able to understand the precise difference between a crop of young trees from five to twenty years of age and a crop of nettles, brambles, bracken, &c., so far as their value as game cover for pheasants goes, especially when, as is invariably the case, a fair proportion of the latter are mixed in with the former. But this is a matter of which the layman is not qualified to judge, any more than of the character of the hand-reared pheasant. In the eyes of the inexperienced this bird appears to resemble a rather shy barn-door fowl, with just sufficient fear of man to keep twenty yards

or so out of his way. But we are given to understand that this bird is so painfully shy that the cracking of a dry stick, or the occasional sound of the axe is sufficient to drive it "out of the cover" (whatever destination that may be), a course which it seems loth to adopt before an army of beaters. *A. C. Forbes.*

ELMET HALL, LEEDS.

A VIEW of the picturesque rockery and other parts of the garden at Elmet Hall, the property of J. H. Kitson, Esq., was given in the *Gardeners' Chronicle*, April 28, 1894, and the issue of May 5 contained some account of the pretty and extensive gardens which are managed by Mr. T. Bonsall, the remarks on that occasion relating chiefly to the gardens outdoors. A recent visit found the establishment beautiful as ever, the rockery bright with large tufts of pretty alpine and other herbaceous perennials. Some large patches of the lovely dwarf blue *Myosotis rpicola*, the yellow and purple *Arnebia echioides*, of blue *Gentian*, species of *Edrianthus*, *Androsace*, *Lithospermum Gastoni*, and other plants of similar class being specially beautiful, and the herbaceous plant-garden for tall and strong growers formed on the site of the old kitchen-garden, a bewildering mass of varied colours. From the mansion beautiful views of hill and dale open up on all sides, and care is taken to preserve the continuity of the scenery from the very walls of the house to the vanishing point, the intervening space of garden and pleasure ground being arranged so as to merge into the distant landscape, and this object is mainly attained by keeping a large unbroken expanse of green lawn around the house, and making no provision for flower-beds containing *Pelargoniums* and other things usually denominated bedding plants, which are often allowed to mar what would otherwise be pretty views.

THE ORCHIDS.

In the glasshouses a collection of Orchids was commenced some time ago, and under Mr. Bonsall's skilful management the venture being successful, and the flowers found specially adapted for cutting for use indoors, additions have been made, until now a large number of plants of showy species are remarkably well grown, and occupy places in most of the plant-houses, as well as in those devoted entirely to Orchids. Perhaps the greatest success has been attained with the cool Orchids, the range used for their culture being at the present time filled with some hundreds of strong plants of a good strain of *Odontoglossum crispum*, chiefly established plants, though there was a batch of importations of the present year, which are making satisfactory progress. Some few other species of *Odontoglossum* were in flower; but *O. crispum*, in its various forms, is the favourite here as in most other gardens.

The Melon-house, with its good crop of fruits, is utilised for growing *Dendrobium Phalaenopsis Schroderianum*, of which there are many plants, and other species requiring a high temperature, and some of them were in bloom. Here, too, *Calanthe Veitchii* and others were being grown in quantity.

In the next, an intermediate-house, there was remarked a fine plant of *Coryanthes maculata* suspended at the entrance, the two pendent spikes bearing each three of the large fleshy and singularly-formed, light orange-coloured flowers; the plant, which is in a basket, was growing luxuriantly. In the same house in flower were fine plants of the bright *Oncidium ampliatum majus*, the rose and purple *O. Lanceanum*, *O. Cebolletii*, *O. flexuosum*, *Peristeria elata*—the Dove Orchid, *Cypripedium caudatum*, *C. philippinense*, *C. Lawrenceanum*, and other *Cypripediums*; and *Utricularia montana*. In the span-roofed range was a fine show of *Lælia purpurata* and *L. tenebrosa*, with a plant or so of the true *L. grandis*, some *Cypripedium bellatulum*, well-flowered plants of *Dendrobium Bensonæ*, *D. Pierardi*, and several handsome *Odotoglossum citrosum*. Here some of the plants were noticed to be standing on small brass turn-tables, which have the merit of possessing

holders for water in the lower division, the upper half on which the plant is placed, and which revolves easily, allowing the plant to be readily turned round for examination or to alter its position from time to time as may be found necessary, in order to cause it to grow equally on all sides. The need of some such an arrangement has long been felt by Orchid-growers, and some rather heavy revolving iron stands are in use; but these brass ones, invented and patented by Mr. Kitson, are a long way in advance of former things of the kind, and apparently difficult to improve on.

In the next house, the show of flowers was chiefly furnished by *Dendrobium*, *Cymbidium*, and *Madevallia Harryana*. There were in bloom a lot of *Lycaste Deppei*, some *L. aromatica*, covered with yellow flowers; a few handsomely-flowered plants of *Rodriguezia venusta* (often called *Barlingtonia fragrans*), the pretty *Phaius Owenianus*, *Nanodes Medusæ*, *Maxillaria Sanderiana*, &c.

MISCELLANEOUS.

In the large stove, a few *Phalaenopsis* were suspended among the *Nepenthes*; and of the latter, a specimen of *Nepenthes Curtisi* with two stems, displayed a curious dissimilarity in the form and colouring of its pitchers. The basal ones are of the ordinary form, and profusely blotched with dark red; the upper ones more slender, and perfectly green, without spotting. Some other good specimens of *Nepenthes* were *N. × Mastersiana*, which is undoubtedly the best of the *N. sanguinea* class, and a favourite everywhere; *N. Raflesiana*, and *N. Morgania*. Also in the house were some well-flowered specimens of *Clerodendron*, *Eucharis*, *Musa Paradisiaca*, fruiting; and other showy plants; and on the roof *Aristolochia elegans*, *Gloriosa superba*, and *Stephanotis floribunda*; at one end being a collection of *Stanhopeas* which are very healthy and in good condition to flower.

Passing through one well-cropped vinery we noted large bushes of *Rogiera gratissima* covered with flowers, and a quantity of *Streptocarpus* yielding a profusion of *Gloxinia*-like blooms. In the *Camellia*-house some *Lilies* were flowering, and in another vinery were *Ferns*, *Palms*, &c., and a nice display of *Gloxinias*. This lofty old-fashioned vinery range has the upper part enclosed, and fitted with staging and walk, the upper part being now used for growing decorative flower and foliage plants. Another range had a quantity of *Tea Roses* in pots and planted out; and other houses were filled with small *Crotons*, *Dracænas*, *Ferns*, &c., such quantities of which are continually in demand that Mr. Bonsall must exercise considerable skill and forethought in preparing the supplies in different stages, such as are in the Elmet Hall Gardens. *J. O'B.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

PLATYCLINIS FILIFORME AND OTHERS.—Amongst plants now in flower, *Platyclinis filiforme* may be considered a gem, its slender drooping racemes of small golden-yellow flowers being especially attractive. The flower-spikes are produced from the centre of the young breaks, which at this particular time are only partly developed; it is, therefore, necessary that the plant should have copious supplies of water afforded it until the pseudo-bulbs are matured. Overhead syringing is not advisable while the plant is in flower, but the leaves should be sponged instead. After the flowers fade, the plant should be placed in a hot, moist house, and be shaded from bright sunshine. The spring-flowering *P. glumacea*, and its variety, *vallida*, flourish under similar treatment, but now that growth is completed, they should be taken out of the warmest house, in which they had been hitherto, and placed in a shady part of the intermediate-house, there to remain till growth recommences. While at rest sufficient water should be afforded to preserve the bulbs and leaves in a plump condition, frequent syringing of the undersides of the foliage to ward off the attacks of insect pests, being carried out.

MISCELLANEOUS.—A sweet-scented and pretty dwarf-growing Orchid now in flower, is *Trichocentrum tigrinum*, whose cultivation is easy when the plant is suspended in a shallow pan on the shady side of the hottest house, using a very small quantity of peat and sphagnum-moss, for if the roots are much covered with compost they are apt to quickly decay, and the leaves to spot in a similar manner to *Oncidium Lanceanum*. The rare *Oncidium guttatum* should be grown under exactly the same conditions, both species while at rest requiring but a small quantity of water at the root to keep their leaves plump.

PACHYSTOMA THOMPSONIANUM.—This is another lovely little species that is now in bloom, and its flowers, if preserved from damp, will last a considerable time. It is a species that succeeds admirably in a shallow pan, hung up close to the roof-glass; and it requires almost the same kind of treatment as the deciduous *Calanthes*, but more shade than those. While in flower very little water should be afforded, and when at rest the plants may be exposed to a good deal of sunlight, and only just sufficient water afforded to prevent the shrivelling of the pseudo-bulbs. At all times judgment is required in watering the plant, the bulbs being very liable to decay. The rare *Eulophia guineensis* should be treated in the same way.

CATLEYA SPECIOSISSIMA, C. LAWRENCEANA, C. SUPERBA, AND C. SCHILLERIANA, now commencing to grow, should be placed in more warmth than others of that genus. To be successful in growing and flowering them, it is necessary, if the specimens are large, to stand them on inverted pots, thus bringing them up towards the light, smaller examples being suspended near the roof. *Cattleya speciosissima* should not be repotted at this season, but soon after the flowers fade; but any of the other varieties named may be repotted. During repotting or surfacing, care should be taken to make the potting material very porous, so that the material, whilst the plants are growing, will dry quickly, consequently stand in need of frequent applications of water. When watering any that are in full growth, afford enough even to saturate the entire mass of compost, and afford no more till each plant again becomes properly dry.

THE KITCHEN GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

MUSHROOM BEDS.—Horse-droppings may now again be collected for making Mushroom-beds under cover. The produce from these beds will follow that from the last beds out-of-doors. If Mushrooms are plentiful, and likely to be so, there is no necessity for haste in the matter of preparing materials. The stable-litter should have most of the long straw shaken out of it, and what remains should be mixed together and turned over every fourth day, spreading it out in a layer about 1 foot in thickness, so as to dissipate some of its moisture and rankness. The litter from horses fed with grass, Vetches, green Clover, Furze, &c., in considerable quantity is not of any use in Mushroom culture.

BUSSELL'S SPROUTS.—Another planting of this useful vegetable should now be made. These plants will not grow so tall as earlier plantings, on the contrary they will be sturdier and short-legged, and calculated to withstand the severity of the winter. A still later planting may be put out in about two weeks; these will give the latest pickings in the spring, and produce small, very solid sprouts.

BROAD BEANS.—The last sowing for the season may be made about this date, preference being given to early podders, as *Mazagan* and *Beck's Dwarf Green Gem*. All of the earlier sowings, if they consist of tall growers, should be topped when sufficient pods are set to form a crop. The pods of Beans for exhibition should be thinned, leaving only the more promising ones; and syringe the plants occasionally in the evening with soot-water, supporting the stems some kind of support if they are too weak to stand erect.

GARLIC AND SHALLOTS may be lifted when the tops show signs of decaying, spreading the bulbs out thinly in the sun to dry; and when dried, partially clean off the soil that adheres to them, and put them in store.

LEeks.—The present is a good time to plant the main crop of Leeks. I always plant them in trenches, like those made for Celery, two lines in a trench. So cultivated, they are easily protected in hard weather. Leeks will, however, grow

as fine if dropped into holes made on the flat, partly filling up the holes when planting the *Laeka* with fine soil. Afford the plants a good watering, to settle the soil about the roots. The holes will be quite filled up as time goes on by the hoeing that the land will receive. Those in trenches will be moulded up on the approach of winter.

PEAS.—The last sowing of dwarf late and early Peas should be made at this date; and then, if no early frosts come to cut them off, a few dishes of green Peas may be obtained at a very acceptable time. Afford the sowings a sheltered, warm situation.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

FLOWER BEDS should be kept neat and clean by removing decayed leaves, and the old flowering trusses of *Pelargoniums*, &c. Edgings of *Cerastium tomentosum*, Ivy-leaved and Manglei *Pelargoniums*, &c., should be neatly pegged out as soon as they require it, so that they may quickly form a good edging. The flower-spikes of these and other variegated varieties used for edging should be kept pinched off. *Calceolarias* and *Lobelias* should be kept thoroughly watered as long as the drought continues; and considerable care will be required in watering, staking, and tying tall-growing sub-tropical plants that are used as backgrounds to clumps. The show varieties of *Dahlias* should have the lateral shoots taken out, and the principal shoots thoroughly secured to sticks. Mulch the beds well with manure, and give liberal supplies of water. Earwigs are very troublesome, and quickly destroy the young growth and foliage if not carefully looked after. A small pot with a bit of dry hay or moss in it makes a good trap for earwigs, and it should be examined every day. Bedding *Dahlias* should be pegged down as soon as they require it.

PROPAGATION, &c.—The layering of *Carnations* and *Picotées* should now be proceeded with, especially of varieties that are scarce, and where the blooms are not required for cutting purposes. If large flowers are required, take out the lateral buds, and leave only the end bud on each spike, and when the pods start to burst, some protection should be afforded against rain in the way of hand-lights or canvas on tripods. Cuttings of *Carnations* and *Pinks* may now be taken and put in, six in a 48-pot, plunging them in a pit where there is some amount of bottom-heat; or the cuttings may be pricked out under hand-lights or in frames, and kept close and shaded till rooted. Cuttings strike best in sandy loam and leaf-soil of about equal proportions. Cuttings or slips of *Anriculæ*, *Sweet Williams*, *Pentstemons*, *Antirrhinums*, *Phloxes*, herbaceous *Pansies*, *Violas*, and *Wallflowers*, may also be struck in this manner.

ZONAL PELARGONIUMS.—Scarce varieties which may have been kept for propagating uses should now be increased as fast as cuttings can be obtained. Place the cutting-bed on a sunny border. When well-rooted and not before, place them thickly in boxes for storing under glass when the time comes for so doing. Cuttings may be taken as late as September.

SEED GATHERING AND SOWING.—Seed-pods of *Anriculæ*, *Primroses*, *Polyanthuses*, and *Pinks* should be gathered as soon as ripe, sowing the seed without delay in beds or in drills 1 foot apart. Old plants of the above may now be divided, the roots being shortened somewhat, planting them afresh in some rich garden mould. They soon make fine plants, flowering well the next year. Early-raised seedlings should be planted out, taking care that they do not lack water in dry weather. Old plants of *Pansy*, *Viola*, *Arabis*, *Alyseum*, *Ajuga*, *Aubrietia*, &c., may now be divided and replanted in soil enriched with decayed short manure, shading and watering them for a time. Afford attention to the planting out of seedling *Anemones*, *Aubrietia*, and *Wallflowers*, that will be required for planting in the autumn in the spring garden. Sow hardy annuals for spring flowering, viz., *Silene pendula*, *Escholtzia*, *Myosotis*, &c., pricking the seedlings out as soon as they are large enough to be handled.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

STRAWBERRIES IN POTS.—One of the chief matters connected with successful culture in pots is the securing of early runners, so that the plants may become completely established in the fruiting-pots before the autumn. It is a saving of labour to layer the runner on the fruiting pot, and many gardeners do so with good results, but it

needs much care in affording water, as the soil is apt to become sour before the season is over, and then the plant is sure to suffer in health. I have commenced layering different varieties in small 60's, and several thousands are required to cover our wants. The more promising plants will be selected as soon as they are rooted, potting them at once into 32's; those which remain being planted in a well-manured border, and by keeping the flowers picked off these plants, they will supply strong early runners another year. Where plants for furnishing runners for forcing have not been so treated, and the gardener has to resort to the fruiting beds, it is desirable to assist the old stools with several applications of manure-water, freeing the bed from weeds, and the plants of weakly and cramped growth. The most promising runners should be selected for layering, the pots being stood in each alternate space. Water should be afforded with a rose watering-can morning and evening until the runners are well-rooted, when they may be placed as soon as possible in the fruiting-pots. It is not a wise course to starve the young plant in a small 60-pot. The filling of the small pots should contain a small quantity of decayed manure as an aid to root action, and to prevent the soil becoming hard. If the layering has to be done on the fruiting-pots, these should be quite clean, and drainage good, a small quantity of soot being placed on the tops of crocks to prevent the ingress of worms. A compost of a retentive nature is best for the Strawberry, and very firm potting should be the rule. If the loam used is of a very heavy nature, one-eighth of its bulk in spent Mushroom-bed dung may be added, together with a sprinkling of wood-ashes, bone-meal and soot. Keen's Seedling is still one of the best as a first early fruiter, and may be followed by *Vicomtesse Héricart de Thury*, which, though small, is one of the richest-flavoured Strawberries grown. *La Grosse forcea* well, and produces fine fruit, but the flavour is not first-class. *Royal Sovereign*, a new variety, is an excellent forcer, and will become a favourite in time. President is not grown to such an extent in pots as formerly—it is, however, a useful variety, to follow the earlier ones. Where there is accommodation, a few hundreds of *British Queen* should be grown in pots, as these brought on slowly produce as fine fruit of the richest flavour about the same date as, and are preferred to, the first earlies growing on warm borders out of doors. *James Veitch* and *Auguste Nicaise* are varieties which produce fruit of large size when grown in pots, if not forced too early, and they receive plenty of ventilation.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

TABLE PLANTS.—Small plants of various species for the decoration of the dinner-table, where this kind of thing is largely carried out, must not be neglected at this season, for it is now more easy to find suitable houses for them than at some other seasons. The present is also a suitable season for propagating and preparing some of them for next winter. *Palma* deservedly rank high as table plants, and some of the best are *Geonoma gracilis*, *Cocca Weddelliana*, and *Areca Verschaffelti*. These should be kept in pairs in pots of various sizes, especially 60's. They do well in sandy loam in well-drained deepish pots. Crotons of telling candle-light colour may have the tips of well-coloured shoots cut off and struck singly in small pots. Suckers of *Pandanus Veitchii* may be detached and potted in sandy loam and peat. Ferns, in variety from spores, when potted up, are always useful decorative stuff. *Dracæna Cooperi*, *D. Guilfoylei*, *D. angustifolia*, *D. terminalis*, and *D. hybrida*; *Aralia Veitchi*, *A. V. gracillima*, *A. elegantissima*, *Casuarina ericoideae*, a particularly light and graceful plant, will also be found of service. Of flowering plants that may be grown on to the flowering stage in 60's are *Begonia*, *Gloire de Sceaux*, *Gloire de Lorraine*, *John Neal*, *Winter Gem*, and *Adonis*. Gesneras in variety should not be forgotten.

LILIUMS.—These plants will require to be top-dressed with rich loam, or loam, leaf-soil, and dry cow-dung, placing this well up and about the stem. They will also require to be plentifully supplied with root-moisture, and occasionally with manure-water, say, twice a week. Place a stout stick to each stem, and on the first appearance of "fly" fumigate the plants. If a few of these are placed out-of-doors, the flowering season will be much lengthened.

CHRYSANTHEMUMS.—In case the final potting has not been done, no time should now be lost in getting the plants potted. Those which were cut

down early in June will have now grown sufficiently for the gardener to distinguish which of the shoots may be left, and which rubbed off; about six shoots should be reserved; pot these last plants in 9 inch pots, and stand them on a bed of coal-ashes in full sunshine. Plants intended for the production of large flowers should be secured to stout stakes, or horizontally stretched lengths of wire placed a good distance apart. If posts or iron rods are driven into the ground about 15 feet apart, with a wire strand along the top, the *Chrysanthemum* stakes can be tied to this, and injury by the wind effectually prevented.

SOUVENIR DE LA MALMAISON CARNATION.

The young plants of this variety, if they were layered as advised on p. 653 of the last volume, will now be ready for potting into 60 pots. Much care will be required in separating the layers from the mother plants, or many of the roots will be broken off. Pot them rather firmly in a compost of loam, peat, leaf soil, and sand, place them in a cold frame, and keep rather close and lightly shaded till they have pushed roots into the new soil. Continue to layer shoots as the plants finish flowering, but reserve as many as may be required for potting on into large pots for early work.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

PEACHES AND NECTARINES.—The thinning of Peaches and Nectarines should now be completed. Continue to stop sub-lateral shoots at one leaf, and secure the young wood by tying or nailing it as growth advances, so as to afford the fruit the full benefit of air and sunshine. Syringe the trees frequently, to prevent red-spider finding a lodgment; an insect apt to be very troublesome under fixed glass coverings, especially if the trees do not get a sufficiency of water at the roots. Occasional soakings of sewage or other liquid-manure will be of great benefit now that the fruit is swelling, but it must not be applied too strong, nor yet in driblets.

STRAWBERRY PLANTATIONS.—As soon as the fruit is gathered from Strawberry plantations, cut off all runners not wanted for increase, together with old leaves, &c., and clear away all straw and other mulching material at the same time. The surface-soil should be loosened by hoeing, and if a mulching of rotten manure can be applied afterwards, it will be of great benefit to the plants, in strengthening and plumping up the crowns for another season. If the beds are to be destroyed, do this without delay, so that the ground may be utilised for winter crops of Broccoli, for which it is generally suitable without any special preparation. Three years, or at most four, is a sufficiently long time to allow Strawberries to remain on the same ground. After the third year, as a rule, the fruits deteriorate very much in size, and consequently in weight. If runners are to be layered in pots for new plantations, they should be layered at once, or if not convenient to do this on the ground, very good results may be obtained by taking runners that may have slightly rooted into the ground, potting into large thumbs or small 60 sized pots, and putting them at once into a frame; when by keeping them close after watering, and slightly shading for a few days, they will soon begin rooting freely, and may be gradually hardened off and planted as required; such plants answer perfectly for mid-season and late forcing if taken in good time. When rooted runners are received by post or otherwise from a distance, they should be treated in the same manner, for if ever so well-rooted they rarely make a satisfactory start when planted out without preparation. If any plants are to remain in the nursery beds throughout the winter to be planted out in the spring, they may be allowed to root into the soil between the rows. Take them up with a trowel when rooted, and plant in rows a foot apart, and 6 inches from plant to plant. Water well, and shade slightly for a day or two after planting.

HEDYSARUM MULTIJUGUM.—Numerous correspondents have written to confirm our doubt as to the identity of the plant sent from the Cambridge Botanic Garden under the above name, and figured in our last issue. Messrs. BARBER & SONS obligingly send specimens corresponding with the figure in the *Gartenflora*. We will endeavour in a subsequent issue to ascertain the true state of the case.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

SATURDAY, JULY 13—Royal Botanic Society.

SHOWS.

SATURDAY, JULY 13 { Wood Green Horticultural, Galashields Horticultural.
WEDNESDAY, JULY 17 { National Rose Society, at Derby; Waterford Horticultural.
THURSDAY, JULY 18 { Halifax Rose, Canterbury (Keat) Hospital Fête.

SALES.

TUESDAY, JULY 16 { Imported Orchids, from Messrs. Hugh Low & Co., at Protheroe & Morris' Rooms.
FRIDAY, JULY 19 { Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.4.

THE first of the three exhibitions of the National Rose Society was an unqualified success. For many years the National held two exhibitions, one metropolitan and the other provincial. A few years ago, however, an attempt was made to hold an earlier show of Teas and Noisettes in connection with the Royal Horticultural Society at the Drill Hall, as it was urged that the best blooms of these classes were past before the Crystal Palace show came on. The attempt was not a very successful one, and it was ultimately determined to supersede it, and to have three general exhibitions—Metropolitan, Northern, and Southern. Previous to this, Gloucester had asked for the provincial show to be held there, and the request had been acceded to. But then came the tempting request from Windsor to hold the first southern show there; and the fact that the show was to be patronised by Royalty, induced the committee to ask Gloucester to waive its claims for another year. It was, perhaps, an advantage to them that they did so; it gave all concerned more time for maturing their plans. The place was convenient, the tent an admirable one, while the courtesy and kindness of the secretary, and the hospitality of the Mayor and officers of the local Society, made everything move with the utmost harmony.

There are two classes of persons who visit exhibitions of this kind, those who are captivated by the brilliancy of the show who are perhaps ignorant of its real character, and therefore view it with an uncritical eye; to them the Roses are perfection, and they cannot understand how any fault can be found with them. There are those, on the other hand, who are hardened, so to speak, by the exhibiting of twenty years or more, and whose judgment is not influenced by what first meets the eye, but by a comparison with the results of former

years; they may be at times exacting, as when someone says that is the finest bloom of Horace Vernet that ever was seen, they quietly add "but don't you think the colour is a little gone?" Beautiful and bright as the Roses were on this occasion, they were perhaps somewhat wanting in size and solidity. There were no exceptionally grand blooms, and when one considers the terrible winter through which Rose growers have passed, and the long drought of the last two months which has so disappointed the hopes of gardeners and farmers, it is marvellous that on such a day blooms of such freshness could have been shown, more especially when they have had, as in many instances, to make a night journey on such a close and sultry night as that which preceded the show.

There has seldom been a more close contest than that which took place for the 5-guinea cup presented by the High Sheriff of Gloucester; and when ultimately the prize fell to Rev. J. H. PEMBERTON, no doubt could exist but that it was a hard fought and well won victory. The details of the fight were given in our last issue.

In such a season it was not at all likely that blooms of surpassing excellence should be seen, none concerning which you would say to a brother rosarian, "Have you seen Smith's splendid bloom of Marie Baumann, or Jones' grand Catherine Mermet?" and hence it happens that peculiar interest attached to the selection that would be made for the best bloom in the respective classes. Now, it very often happens that in the great race of the Derby the favourite on whom long odds have been laid are nowhere, while an outsider carries off the coveted prize. Last year at the Crystal Palace, for instance, Marguerite Bodet carried off the silver medal in the amateur's class for Dr. BUDD, and this year an equally little-known rose did the same for Messrs. HARKNESS in the nurseryman's class, for few people have heard of the Rose in question, Comtesse Ludre; this is a bright carmine red Rose, which was sent out by EUGÈNE VERDIER fifteen years ago, but has never, so far as we know, been exhibited before, and yet although there were fine Roses of well-known varieties, the coveted prize was awarded to it.

The curiosity which is always active as to new Roses was not destined to be gratified at Gloucester; there were no seedlings exhibited for competition for the gold medal for the best seedling, and amongst new Roses already in commerce there was hardly anything that merited special notice.

A beautiful yellow Rose was exhibited by Messrs. JEFFERIES & SONS, of Cirencester. It is a seedling between Cloth of Gold and Maréchal Niel, a beautiful soft yellow with good glossy foliage, and stout foot-stalk, more resembling Cloth of Gold than Maréchal Niel. The severe winter of last year tried it very much, but it is to be hoped that the raiser may be able to bring it forward at some later show; it is of rampant habit, and should it fulfil its present promise will be a valuable addition to what are called our climbing Roses.

Whatever interest may be taken in other exhibitions of Rose Societies throughout the country, there can be little question that they are all eclipsed by that taken in the great Metropolitan show held by the National Society at the Crystal Palace. Whatever doubts may have existed as to the suggestions by which amateur exhibits were regulated by the number of plants grown, it is unquestionable that though it may not have realized what some expected, it has given a stimulus to Rose exhibitions.

Everyone must have been struck by the immense improvements which have taken place in the arrangement of the show under the direction of the Garden Superintendent, Mr. W. G. HEAD. Instead of the long formal line of boxes stretching from end to end of the transept, the exhibition was broken up into groups containing a few classes, and this, as the boxes were mingled with growing plants, not only gave a pleasanter aspect to the exhibition, but also enabled visitors to move about more freely, so that it was possible at any time during the afternoon to get a sight of the flowers.

Conjectures, anticipations, and opinions have been freely indulged in, and as usual some of these were right and some wrong; thus, it was generally thought that it would not be a first-rate exhibition, and this, we think, notwithstanding the fine blooms exhibited by some growers, was the true state of the case. The flowers in most instances lacked substance, and, consequently, staying powers, those that were grown on heavy soils standing best. It was also expected that, owing to the character of the season, the northern growers would stand the best chance. It will be seen that this was not the case, the chief prizes both in the nurserymen and amateur classes going to southern growers. In comparing it with the exhibition held at Gloucester, the verdict we think would be that the Teas and Noisettes were better at the provincial exhibition, and the hybrid perpetuals at the metropolitan. As happens most times at a great show, the amateurs are fully abreast of the nurserymen in the excellence of their exhibits, and in fact the stand of Mr. LINDSELL's, in the Trophy Class, would, if there had been such a prize, have been awarded that for the best box in the show; it contained some grand blooms, the colour and freshness of which at such a season as the present were remarkable. It contained, moreover, a flower to which the Silver Medal of the National Rose Society for the best hybrid perpetual in the amateur classes was awarded; and it is somewhat remarkable that the award for the same prize in the nurseryman's class was given to the same flower in Mr. B. R. CANT's stand. No outsider this time came in to carry off the honours, and it is tolerably clear from the number of blooms exhibited and their excellence wherever shown, it must be regarded as "Her Majesty's" year. One could have anticipated that it would have been just the year for Comtesse de Nadsillac, but it was not so; very few good blooms of it were staged as far as we could see, and the Tea Rose which seems to have come out most conspicuously was Madame Cusin; for whenever shown, it had a richness of colour quite exceptional, and indeed, in one instance, where one of our most experienced growers had cut a grand bloom of it for his box, he would not allow it to be staged, because he considered it out of character.

It was anticipated that garden Roses would be somewhat deficient, and this proved to be the case. A most beautiful collection which won the first prize, came from Bath, and another from Dundee. In the same way, new Roses were not plentiful, and of these none of those from abroad seemed to attract any attention; neither was there anything very striking in the absolutely new Roses, namely, those which are not in commerce, and were exhibited for the National Rose Society's Gold Medal. None of them was adjudged worthy of the Gold Medal. The two exhibited by Messrs. DICKSON (one very similar to The Bride and another a pink rose), were highly commended; Messrs. COOLINGS'

Bladna is a large Rose, very full, somewhat in the style of Merveille de Lyon, but higher in the centre, but the texture of the petals was somewhat thin; this may have been owing in some measure to the season. Mr. WILL TAY-

and East Anglia has claimed the palm in the contest; rarely has greater pleasure been displayed among all classes of Rose growers and Rose exhibitors than when it was announced that the old warrior, Mr. BEN CANT had again

Mr. F. B. LINDSELL carried off the Challenge Trophy with a box of blooms, which, as has already been said, might be justly termed the best in the exhibition. Mr. O. G. ORPEN, from Colchester, carried off the Tea Trophy

FIG. 8.—CATASETUM TABULARE, variety RHINOPHORUM: COLOURS GREENISH-BROWN. (SEE P. 44.)

lor's was a high-coloured Rose, very sweet and promising, but unfortunately he had not complied with the schedule, thus the two exhibitions of the National Rose Society have passed without any additions to our Gold Medal Roses.

With regard to the chief honours of the day, they have followed, as far as nurserymen are concerned, the course of the last couple of years,

carried off the Trophy, together with the Gold Medal that accompanied it; while, as we have already said, the best blooms of H.P. was found in his box, for which he gained the Silver Medal. Mr. FRANK CANT's flowers were also exceedingly good, while Messrs. PRIOR & SON showed that they were determined to hold the place they had of late years aspired to. In the amateur classes,

as well as other pieces of plate. There were upwards of 100 exhibitors from all parts of the kingdom, and this it must be remembered is a very different thing from an exhibition of Chrysanthemums or Dahlias—you may stage both of these the day before in the stands in which they are to be exhibited, and the probability is, that unless some extraordinary mishap overtakes them, they

will be exhibited as they left their owners' garden; but not so the Rose, the long railway journey, or hot nights, may shatter half his blooms, and consequently he must bring with him a box of what he calls "spares," often containing twice the number that he actually requires, and with which he can replenish his boxes on the morning of the show. It is this enthusiasm which tends to keep the National Rose Society alive, and every year to extend its operations.

CATASETUM TABULARE, Lindl., VAR. RHINOPHORUM, Rehb. f.—The species is one of the most interesting of the curious genus *Catasetum*, and the interest in its curiously-constructed flowers is still further heightened by their extreme variability both in form and colour. The type was described by LINDLEY in 1840, and since that several distinct varieties have been recorded by the late Professor REICHENBACH in the columns of the *Gardeners' Chronicle*, three of the most distinct being one with greenish flowers, slightly blotched with light purple-brown; *C. t. brachyglossum*, which has a shorter lip and much broader callus than the type; and *C. t. rhinophorum* (described in the *Gardeners' Chronicle*, p. 358, Sept. 18, 1880), of which the author says, "the whole surface of the callus is broken in innumerable, irregular, transverse-toothed lamellæ, of white colour, with spots of 'burnt sienna,' thus making one think of a file—hence the name." The striking feature in *Catasetum tabulare* is the broad, fleshy table-like callus which occupies the greater part of the lip, the toothed or bristled margin of which is turned up around the raised table, thus forming a gallery which traverses how he may lead the insect promener to the setæ, which spring and release the pollinia. The colour of the large raised callus is usually white, and its surface is generally smooth, but in the instance illustrated it is rough and like the other parts of the flowers spotted with red-brown of various shades. The *Catasetums* are fast increasing in favour in Orchid collections, and as a consequence their habits and requirements are more closely observed than formerly, and their culture is now considered simple, if they be treated like other Orchids which lose their leaves and require a drier and cooler situation during the resting season. The plant from which our illustration (fig. 8) was taken was exhibited by Messrs. J. VEITCH & SONS, Royal Exotic Nursery, Chelsea, on June 25 last, at a meeting of the Royal Horticultural Society.

BLANCHING.—The announcement that Mr. FRANCIS DARWIN was to lecture at the Royal Horticultural Society aroused much interest. Mr. DARWIN was associated with his father in carrying out many of those experiments which have proved so stimulating and suggestive. On this occasion he chose for his subject the changes in form and structure connected with blanching or etiolation, and he showed that these changes are not to be considered of a pathological nature, but are the result of adaptation to adverse circumstances. The lecture was very clear and conclusive, but more fitted for the Scientific Committee than for the miscellaneous groups that constitute the "3 o'clock meeting." The publication of the lecture in the *Journal* will be awaited with interest.

THE ROYAL GARDENERS' ORPHAN FUND.—The usual Rose Fair in aid of the Royal Gardeners Orphan Fund, was held in connection with the Croydon Horticultural Society's show on Wednesday, July 3, and the amount taken for the sale of flowers was £7 16s 0d. Among the contributors of blooms were Messrs. F. SANDER & Co., HUGH LOW & Co., LAING & SONS, B. CANT, T. B. HAYWOOD, H. V. MACHIN, M. HODGSON, E. M. BETHUNE, W. MEASE, C. J. SALTER, J. SLATER, C. LANE, and R-v. J. H. PEMBERTON. Mrs. W. GUNNER again kindly undertook the sale of the flowers.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Worshipful Company of Skinners have

given a donation of £10 10s. to the funds of the Gardeners' Royal Benevolent Institution.

"DICTIONNAIRE PRATIQUE D'HORTICULTURE ET DE JARDINAGE.—The French translation by M. MOTTEZ of what has come to be known as *Nicholson's Dictionary*, has now reached its 39th part, which brings the work up to the letters Met. The translator has added to the original text, and enhanced its value. Additional illustrations are also applied.

STOCK-TAKING: JUNE.—Every day's experience in the matter of stock-taking tends to convince us that POPE, in his "Essay on Man," hit the mark when he wrote "Man never is, but always to be blest," for have we not been looking forward, not to a rash, but to a gradual rise in the values of both imports and exports—and have we not been doomed to a partial disappointment? All was going on nicely, when on came the Whitsun holidays and a parliamentary dislocation, and over go our calculations. But the fall this month is not a very large one, £345,095, or about 1 per cent. as compared with the Returns for June, 1894. Here is our usual extract from the Summary of Imports:

IMPORTS.	1894.	1895.	Difference.
	£	£	£
Total value of imports	34,229,679	33,884,584	-345,095
(A.) Articles of food and drink—duty free	13,414,987	12,585,318	-829,669
(B.) Articles of food and drink—dutiable	1,439,023	1,551,788	+112,765
Raw materials for textile manufactures	4,390,045	5,219,880	+829,835
Raw materials for sundry industries and manufactures ...	4,362,931	3,676,176	-686,755
(A.) Miscellaneous articles	1,110,635	1,213,218	+102,583
(B.) Parcel Post	96,893	70,371	-26,435

Wheat has increased by 334 240 cwt. over June last year, but this has had no effect on the price of the loaf other than to raise it: the price of Wheat on the market has gone up some 6s. in about as many weeks, and it would be interesting to note what the changes (and charges) have been during the past hundred years, but space will not permit. Tea shows a rise of £79,000, and £95,000 in coffee; spirits have gone down by £60,000. Other food supplies fell off some £830,000. Oats gained £144,000 from Russia; cheese shows a reduction—though the arrivals from Australia have nearly doubled. Butter from Australasia has gone down in quantity—also from France and Denmark. Timber shows a reduction of £780,000—last year's imports for the same period being exceptionally heavy. Textile materials were £30,000 over June, 1894; cotton went up £293,490; while flax increased by £266,405; wool went up £170,000. Manufactured articles, mainly silk stuffs from France, show an increase of £233,153—but leather and woollen manufactures foot up for about a third. Fruits, &c., now claim attention, and here is our usual excerpt:—

IMPORTS.	1894.	1895.	Difference.
Fruits, raw:—			
Apples bush.	38,196	50,556	+12,360
Cherries "	193,231	115,670	-77,561
Plums "	3,731	4,660	+929
Pears "	157	13	-144
Grapes "	4,036	3,035	-1,001
Unenumerated	245,697	155,451	-90,246
Onions "	328,548	318,021	-10,527
Potatoes cwt.	1,253,263	954,735	-301,528
Vegetables, raw, unenumerated value	£ 170,550	£ 199,746	£ 29,196

Some of these figures are well worth noting. To pass, it may now be agreed that the new Manchester market is a success; in one day 300 tons of foreign fruit were put up to auction, sold, and despatched to their final destination by rail. A few days since the same work

was done with some 14,000 packages of fruit, and we are informed that a new line of steamers—the Guelph—will be placed on the Australasian line, for the carriage of agricultural produce to Manchester.

THE EXPORTS

foot up at £17,800,100—a decrease of £109,055. Under the head of "manufactured articles," there is a gain of £485,000, of which £333,000 is due to arms and ammunition. Metals went down £245,721, telegraph-wire figuring for nearly all this amount. Cotton goods fell off considerably, but linens went up—America also buying largely in the woollen and worsted department. Coals fell off to the amount of £123,729. Manure fell away to the value of nearly £75,106. The exports for the six months show a loss of £106,117,516—the decrease being £765,959. We can only hope for improvement in our next report.

"THE BOTANICAL MAGAZINE" for the present month contains descriptions and coloured figures of the following plants:—

Senecio Huaitata, Bertero, t. 7422.—A noble *Senecio* from temperate Chili and Argentina. It is a tall herbaceous plant, with bold cordate-oblong leaves, somewhat woolly and a branching inflorescence, bearing numerous cream-coloured flower-heads, each about 1 inch in diameter. It is hardy at Kew, and flowered in that establishment in June last. It is allied to *S. sagittifolia*, already figured; the specific name is an adaptation of the appellation generally given to the plant by the Chilians.

Pyrus Cratægifolia Targioni, Tozzetti, t. 7423.—An Italian species, having more the appearance of a *Cratægus* than of a *Pyrus*. The leaves are like those of *P. torminalis*, but the inflorescence is lax, and the pedicels long and slender. Kew.

Aristolochia unguifolia, Masters, t. 7424.—A curious Bornean species, figured in these pages, 1880, vol. ii., p. 116, fig. 28.

Newwiedia Griffithii, Reichenbach, t. 7425.—A highly interesting plant, linking Orchids to Irids. The leaves are plicate, and the numerous white flowers borne in long erect dense spikes.

Rubus lasiostylus, Focke, t. 7426.—A Chinese species with pinnate leaves, snowy-white beneath, the nerves being of a pink colour. The flowers are in loose cymes, each about 1 inch in diameter purplish. Hardy at Kew.

MESSRS. W. P. LAIRD & SINCLAIR.—The annual outing of the employés of this well-known firm of nurserymen at Dundee, was held at Glamis Castle, on Wednesday, 3rd inst., a very enjoyable day being spent.

EALING HORTICULTURAL SOCIETY.—The annual show of this Society took place on the 3rd inst., in the beautiful grounds of Gannorsbury Park. The number of exhibits was not so large as usual—in fact, the shows of this Society do not compare favourably for some reason with its earlier exhibitions. In the principal class for a group of plants arranged for effect, the successful exhibitors were Mr. W. Roberts, gardener to J. Harrie, Esq., Braemar; and Mr. Long, gardener to E. P. Oakshott, Esq., Orchard Dene. For twenty-four distinct varieties of cut Roses, the 1st prize (only entry) was awarded to Mr. C. Turner, Slough. A good competition resulted in the prizes offered for eighteen Roses (not fewer than twelve varieties); 1st, Gold Medal of the National Rose Society, Mr. Edwards, gr. to W. Owen, Esq.; 2nd, Silver-gilt Medal, National Rose Society, Mr. C. Long; 3rd, Silver Medal, National Rose Society, Mrs. Bosey; 4th, Bronze Medal of National Rose Society, Mr. S. Lowe. An excellent display of garden produce was made by the cottagers of the district.

PRACTICAL GARDENING IN EGYPT.—Mr. WALTER DRAPER has been giving a course of lectures at Ramleh on this subject. The lectures treated of the following matters: Botanical classification of plants, climate and soil, trees and Palms, arrangement of a garden, the planting of shrubberies and borders, lawns and flower-beds, climbing plants, plants for windy and sheltered positions, Roses.

annuals, hedges, conservatories, specimen isolated plants, water-gardening and aquatics, potting, bulbs, Chrysanthemums, Cactus and succulents, garden economic plants, Vines, fruit-trees, pruning, grafting, and propagating. Mr. DRAPER, who is an old Kewite, has been appointed director of the government gardens at the Barrage, near Cairo. A book on *Gardening in Egypt* may shortly be expected from Mr. DRAPER'S pen.

ORCHID HYBRIDS.—We learn that Mr. HANSEN'S complete list of Orchid hybrids is in the press, and will shortly be issued.

THE COTTON PLANT is losing its popularity as a "safe investment" in the very heart of the cotton-growing States of America. Time was—some forty years since—such an assertion would have been laughed at. "You cannot do without American cotton" was the article of faith set up by growers and brokers on the other side of the Atlantic; starvation in Lancashire during the cotton famine shook the belief in many minds, and alterations in spinning and weaving machinery brought under subjection cottons of short staple; planters and capitalists took up the cultivation of the plant; and to-day, Lancashire is no longer dominated by New Orleans or New York. But planters in the Southern States kept on; and in the face of a steady fall in prices, opened up all over the world a market for cotton seed, cotton oil, and cotton cake. Of course, the same products can be placed on the market wherever cotton is grown, and capital can be utilised. Should it be desired to learn where cotton is grown at the present time, the intelligence can be had from the "market" columns recording sales in any daily paper any morning in the week. And it has come to pass, that it has been determined to reduce considerably the growth of cotton in America. The result of the special investigation set on foot by the Federal Government's Agricultural Department in 720 Cotton-growing counties in the United States shows that in eighty-eight there will be little or no change in acreage as compared with 1894; five report an increase up to 10 per cent.; two, an increase of from 11 to 20 per cent.; three an increase of from 21 to 30 per cent.; and three an increase of over 30 per cent.; 127 show a decrease of 10 per cent. and less; 250 a decrease of from 11 to 20 per cent.; 158 a decrease of from 21 to 30 per cent.; forty-four a decrease of from 31 to 40 per cent.; seven a decrease of from 41 to 50; and thirty-three a decrease of more than half. This decrease in acreage is not confined to any particular locality, but covers a widespread territory, embracing almost the entire area devoted to Cotton culture. The extraordinary low price of the staple gave rise to the agitation as to the necessity for reducing the acreage in 1895; this resulted in a convention this year, and a rise in prices is hoped for. Doubtless, much may be done in improving the varieties now grown, and so placing on the market the highest class of raw material. Meanwhile, the above noted facts are surely well worth record.

PELARGONIUM SPORT.—Mr. WALKER, of Wellfield, Leyland, sends us a truss of a very pretty flesh-coloured or rosy-pink variety of Pelargonium, which originated as a sport from "Mr. Povia." The flowers are very double, so that the sport seems well deserving of propagation.

THE INTERNATIONAL FRUIT, WINE AND VEGETABLE EXHIBITION AT BERLIN.—This exhibition, as we learn from an official announcement, which is to form a part of the more permanent one of the National Hygienic Society, will remain open to the public from July 1 to some date in September. It will be held in the old Reichstag buildings, which have been lent by the Prussian State Government for the purpose. The exhibition has created very general interest both in Germany and other countries. It will not be of the usual kind, as may be gathered from the programme, which furthers neither the interests of the producer nor of the consumer. On the contrary, it is intended to establish a well-

organised agency, whereby producer, and seller, and the wholesale buyer will be brought together to their mutual benefit, and that of the German people. An addition is made to Rule 13, which will make it possible for a visitor to the exhibition to take out the value of his entrance money in exhibited articles, by which it is hoped that the number of visitors may be increased at the same time that the exhibitor will be enabled to sell his goods more freely. Articles which are perishable, and which have not been sold by the exhibitor, will be sold regularly at public auction, for the benefit of the latter. The exhibition will serve, not only as a means of disposing of goods according to sample, but also as a market where the finer sorts of vegetables, Grapes, and conserved goods, wine, &c., can be ordered from the producers, and the carriage of the same by railway or post arranged for. Prospectuses and forms of application will be sent, post-free, from the office of the International Hygienic Exhibition, Berlin, W. Leipzigerstrasse, 4, upon application.

OXFORD UNIVERSITY: MATHEMATICAL HONOURS.—Many of our readers will be pleased to hear that Mr. J. HUDSON'S son has just passed the final public examination (Greats), taking first-class honours, thus repeating his success of 1893, when he took first-class honours in the first public examination (Mods.). He proceeded to his B.A. degree on Saturday last. He holds a scholarship at Jesus College, the said scholarship being renewed for another year, in order that he may take science as an additional subject.

JOHN WILLS.—As we go to press, we hear with great regret of the death of this prominent horticulturist on the 9th inst. Mr. WILLS was in his 61th year, and had been suffering from illness for a long period. In our next issue we shall allude more at length to his work in horticulture.

CAUTION.—The following letter tells its own tale:—Dear Mr. CANNELL, There is a rascal going about representing that he travels for you, and is selling to the unsuspecting people awful rubbish. He called here, of course after I had gone to town, and persuaded my wife to buy some wonderful Carnations, &c. The enclosed is the result, and they are all the same. It is rather clever to get a lot of labels printed, and then state that he represents a man so well known as yourself. H. P. B., Solicitor." One of the labels reads "Malmation, silvery edge Clove," the other "Turner's Masterpiece." The specimen enclosed was valueless.

PLANT PORTRAITS.

- AMORPHA CANESCENS, *Mehans' Monthly*, June.
- CANNAS.—1, SARAH HILL, red self; 2, MAURICE MUSSEY, orange-pink self, *Garden*, June 22.
- DENDROBIUM NOBILE NODILUS, *Illustration Horticole*, June 30.
- DIPLODENIA ATRO-PURPUREA, *Illustration Horticole*, t. 33.
- HUERNIA MAROCARPA, Schwernfurth, *Gartenflora*, July 1, t. 1418.

HOME CORRESPONDENCE.

THE SLEEPY DISEASE OF TOMATOS.—Due prominence has been given in your leading columns to the prevalence of the so-called "sleepy disease" in Tomatos, and to the cause thereof. I am a grower of this fruit for market of near upon a quarter of a century's experience, and my daily occupation from early morn till darkness sets in is amongst the plants; I therefore claim to have some little practical knowledge of that particular crop. Moreover, I have been sorely troubled and annoyed with the "sleepy disease" in question, hence the article ament the same interested me greatly. For the past eighteen months I have visited many gardens, collected information

by means of the local press, and experimented with a view of finding out the cause of this mysterious disease, and at last I venture to think I have solved the problem—at least in my particular case—though I may say not in the direction of that set forth by your correspondent in the article on the subject in question. I have no hesitation in saying that this disease is not in all cases due to the fungus *Fusarium lycopersici*, or any other of that nature. I certainly do believe that if such did really exist in the soil the plants would go sleepy, but in my case after several minnte examinations last year of every part of the roots, as also the soil, I came to the conclusion that fungus was not at the bottom of it. Moreover, there is no discoloration of the leaves or stem, no "delicate white bloom;" after a time, in fact, with the exception of the drooping of the leaves, the characteristics are dissimilar to that described in the said article. With a view of showing that fungi were not present in the instances which have come under my notice, I will just state that, say two plants planted in a box or pot, one will go off, and the other remain healthy and fruitful to the last. As recently as last week a large plant in a box with fruit of half size showed signs of drooping; it was at once pulled up. The soil was worked up, no fresh soil being added, and two young healthy plants put in. A few days after, the surface was covered with white rootlets. This is but one instance, as I have had many such, though I generally use fresh soil; but after reading your article, I thought I would test it, and prove conclusively whether the soil was at fault or not. Well, I really and fully believe that no more of this sleepy disease will ever trouble me, and to prove the same, I have with my own hands, and on the system which I will a little later on make public, planted a late 90-foot house with 300 plants as an experiment. They are now swelling their first trusses, and if no plants flag or droop by September 1, I shall have the satisfaction of knowing that the investigations I have made have not been in vain. I should say that the house that I have planted had many cases of this "sleepy disease" last year, and the soil is the same, so this will be a sure test of the fungus theory. P. F. *Le Sueur, Grand Vale, Jersey, June 23.*

HYBRID POPPIES.—In the *Gardeners' Chronicle* for June 15, Mr. W. Wilks says he does not believe there has been a true hybrid between a perennial and an annual Poppy. Like him, I have been trying to cross Poppies, and I have succeeded in crossing the double-flowered annual Poppy with the orange nudicaule Poppy, which is a perennial. The double-flowered annual variety was the seed-bearing plant, and I have about twenty seedlings, but only one has come with foliage and habit very much like nudicaule, and that only has flowered; the flower is the same shape as nudicaule, but a brick-dust red, quite distinct from nudicaule. The foliage has the glaucous shade, but not so much as the annual Poppy. The other seedlings which resemble the annual are not yet in flower, but they will open in a few days; they are only about 9 inches high, and I do not think that they will grow any higher, although they might do so another season, as they have only received two waterings this season, and no rain has fallen here since the end of March. As I have been crossing flowers and vegetables for several years, I have a fair idea of what a true cross should be. J. Lansdell.

CELOGYNE CRISTATA IN A WIRE BASKET.—I enclose herewith a photograph of *Cœlogyne cristata* grown in the conservatory of E. Wells, Esq., Wallingford, which will serve to show how admirably adapted this popular Orchid is for cultivation in wire baskets, and as a hanging plant generally. This specimen has been two years in a 7-inch basket, and has borne over 300 blooms this year. Its ivory-white blossoms were most acceptable early in April and May, and as its cultivation presents no difficulties, the *Cœlogyne* is a most useful and attractive plant for suspending from the roof of a cool conservatory. *Arthur Cooper.* [An evidence of very successful culture. Ed.]

YOUNG GARDENERS AND WRITTEN CHARACTERS.—I think young men have one great grievance to contend with, and that is being compelled to leave a place without a character, when no reason can be given for refusing to give one. I do not think I can do better than state my own case, which will help to show what I mean. For the past fifteen months I have been employed as a journeyman at a certain place, and I have done my utmost to uphold the good testimonials which I have received from previous employers. This spring I decided on making

a move, and asked the head gardener if he would get me into a nursery. His answer was "No." Later on, upon my leaving the place, I asked him for a character, which he also refused to give me, with the result that I had to turn out, and I am now fifteen months to the bad. Now, what I wish to know is, if such a thing ought to be? I think it is scandalous that young gardeners should be so treated; and what is more trying to anyone than to know that after having done his duty, a "character" is denied him? If gardeners would only act up to the motto, "Do unto others as you would have them do unto you," it would save a great deal of needless misery, besides giving young men much needed encouragement. H. M. C.

TOO MANY PANSIES.—It has been said with some truth, that we have too many Pansies, and too few really good ones. I have just opened the catalogue of a noted Scotch florist, and I find it contains 344 show varieties, selfs, yellow grounds, and white grounds; and including ten new varieties offered this season for the first time, enumerates the enormous number of 434 fancy varieties. Really this is ample proof that there are too many Pansies. An examination of other catalogues would no doubt show that it would be possible to make up a list of 1000 assumed distinct varieties of Pansies. As to how many really good ones could be selected from the lists I cannot venture to say, and I think it is doubtful if any substantial advance has been made in English show Pansies during the last twenty years. The fact is, the show Pansy is so closely restricted to a few types that repetition is inevitable. In the case of the self, the colour should be as uniform as possible, whether dark yellow or primrose, or in the case of the white self, excepting the central blotch, the absence of colour. The dark selfs admit of considerable variation from the deepest velvety maroon and velvety black, through bright claret, crimson, pale claret, mulberry, purple, and shades of violet to the palest tint; the yellow selfs vary a little in colour, the primrose selfs less, the whites differ in purity. Of course, those who are intimate with the varieties see small differences which escape the eye of the casual observer; still, in such numbers there must be considerable resemblance. Thickness of texture, circularity, flatness, smoothness on the edge, and the density and symmetry of the blotch, are the leading qualities. In the case of the dark selfs where the blotch is not clearly defined, there is yet a small eye just above it, and the clearness and vividness of the eye imparts life and light to the flower. There is great refinement in a stand of twelve or twenty-four show Pansies when the blooms are approximately perfect, fresh, bright, even in size, displayed well on the stand, and arranged—selfs, yellow grounds and white grounds—so as to afford the most effective contrasts. Much art and cultivated taste can be displayed in setting up a stand of show Pansies in the best manner, more, perhaps, than in the case of any other exhibition florist's flower I am acquainted with. That the English show Pansy has greatly declined as a cultivated flower in the southern parts of the country is abundantly shown at the exhibition of the Pansy and Violet Society, for very few are seen there, and those exhibited are brought up by the northern and especially by the Scotch florists. Years ago Hammer Smith and other suburbs had their Pansy shows, and many grew for competition. There were no fancy Pansies in those days, and the Viola, as we now know it as a bedding plant, was undreamed of. Then came that baleful time—more than a generation ago—when a kind of disease infested the show Pansy, and made it in southern parts extremely difficult to cultivate the show Pansy for any purpose, and the area of cultivation became greatly circumscribed, till it has become largely a midland and northern flower. We want a revival of the show Pansy; whether the Pansy and Viola Society will bring it about remains to be seen. The advent of the fancy Pansy came at an opportune time. Having more tenacity of life, being more vigorous in growth, and harder in constitution, it soon won its way into popularity. Untrammelled by the divisions of type which fetter the show varieties, it admits of great variation in colour and combinations of colour; but size of flower, stoutness of texture, smoothness, circularity, harmony in and brilliancy of colours, are all qualities for which the raisers strive. But there is yet a great amount of similarity in a stand of twenty blooms of distinct varieties, though there is enough of variation to admit of sharply-defined distinctive lines, but yet not so assertive

and self evident as in the case of the show varieties. But a list of 500 so-called distinct varieties is somewhat appalling. One-fourth of this number would be more than ample, and yet addition is much more certain than reduction. It is now a good time to sow some seeds of Pansies for summer and autumn display. Though seed of fine strains of the show varieties is not plentiful, still, with due care, it can be procured. Strains of fine types of fancy varieties are more plentiful. Seed sown in pans or shallow boxes in light friable soil, soon germinate in a gentle warmth or when kept close in a cold frame. If pricked off into other boxes, the seedlings soon grow into size for planting out, and if carefully moved with some soil adhering to their roots, quickly establish themselves. One secret in successful Pansy and Viola growing during summer, is to have a layer of good manure a little way below the roots, and given appropriate soil and an open spot, the Pansy will stand a chance of being seen at its best. R. D.

ONIONS.—The growing of Onions to a large size is considered by some gardeners as a great achievement, although they are unanimous in stating that big bulbs are neither economical in the using, or long keepers. An Onion that measures 9 inches to 12 inches in circumference will remain longer in good condition than one of 15 to 16 inches, and the former will be less ready to start into growth in the spring. At the middle of May this year I had a fine lot of Onions hanging in a cool-house, which had been hard frozen for a period of two months. The Onions of globular form, viz. Ailsa Craig, Cranston's Excelsior, and Brown Globe, were good till the present month. To meet all wants, it is my practice to grow Potato-Onions and Shallots, and to plant a quantity of bulbs which are least likely to keep late, early in the spring, on land that is in the shade. By this means the supply of green Onions is kept up all through the early part of the summer, a matter of some importance when the autumn-sown Onions are injured or destroyed. I made a new departure this season in Onion sowing, when about the middle of March I found the ground frozen to a depth of 2 feet, except about 9 inches from the surface. I pricked up the land, and sowed the Onion seed in drills. It came up in first-rate fashion, the drills having been covered with spent Mushroom-bed manure, but not trodden at first. M. Temple, Carron, N.B.

NEW USES FOR JADDOO FIBRE.—Ferns of many kinds have proved to do so well in this soil, that its great lightness in weight points to its use as very desirable in covering the walls of ferneries behind wire-netting, and also to much lighter netting being then necessary. The rapidity with which seedling plants throw out their roots into this material suggests the expediency of wrapping a small quantity of it round such plants when they are being pricked out, especially in such very dry weather as we have had lately. W. T., Bishopsteignton.

OUR POULTRY.

BY HARRISON WEIR.

(Copyright.)

(Continued from vol. xvii., p. 764.)

The Indian Game, as a coloured fowl, comes next, as of much excellence for "table purposes." It is of the Malay type, but with much shorter legs, and of a more sturdy appearance, and is apt, like the Malay, to be rather inclined to rest on the hocks or heel, thus showing in some degree its past ancestry. The flesh is firm, short in fibre and in quantity, that on the breast being somewhat dry by comparison with the old English Game, and in some cases is somewhat hard, owing probably to the almost entire lack of fat on that portion of the body; which defect, for defect it is, is somewhat atoned by the excess on the back and the abdomen. The feathers are short, hard, and close, and of varied colouring, some being very dark, while others are of a bright intense red, spangled with black, with black and golden hackle; others are of a rich bay colour, each feather being what is termed doubly laced with black. This is considered by some to be the proper "exhibition" marking, though many, like myself, much prefer the old style of "pheasant spangle," which gives a far brighter appearance. As to length of limb, there is also a growing tendency towards the Malay type, which is

much to be regretted, the short legs and thighs being far preferable as a quality for a table fowl. As layers they are very inferior to most other fowls, and incorrigible "sitters." As "fighters" in the poultry-yard, they are only surpassed by the Game and Malays.

The Langshan as a table-fowl has high claims for recognition as one of the best of our table fowls; in fact, for an "all-round" variety, it is scarcely equalled, with the exception of its black legs. Otherwise it is good, and is gaining steadily in the estimation of the public. I am not alluding to the long-legged, gawky, flamingo-type of birds that is now affected—what are termed Langshan fanciers—but the shorter-legged and far more compact sort. These square-made birds are more hardy, less liable to leg weakness, are more fleshy, and arrive at maturity much earlier than their "storky" brethren, and are in every way more desirable.

The breast meat of the Langshan is of the whitest description, and of a rich and excellent flavour. When well selected, and compactness of form sought for and obtained, it is often preferred by some to the coarser kinds of Dorking.

They are excellent layers, of fair size, and of high colour, varying from a deep brown-chocolate to red, and red-tinted pink, and spotted with deep chocolate. Though not large, the number is often surprising, laying often, as they do, twenty or more consecutive days. They are good mothers, and the chickens are hardy and easily reared, the early hatches withstanding the cold far better than most fowls.

The black-coloured variety is the most common, though now there are whites and blues claiming public notice and favour.

(To be continued.)

TREES AND SHRUBS.

MAGNOLIA WATSONI.

This comparatively new hardy Magnolia has lately been in bloom at Gannarsbury. The leaves are glabrous, obovate-oblancoate, tapering at the base into a longish petiole. The flowers, which are produced with the leaves, are 5 inches across, of a delicate cream colour, the three outermost segments obovate, spoon-shaped, somewhat fleshy, and of dull rosy-pink colour. A figure is given in the *Gardeners' Chronicle*, vol. xvi. 1894 p. 189.

SOCIETIES.

NATIONAL ROSE.

JULY 6.—The great annual exhibition of the National Rose Society at the Crystal Palace was held on the above date. There have been many despondent forecasts this season as to the inferior quality likely to be exhibited at this show, owing to the exceptionally inclement season with which growers have had to contend. If the worst of these forecasts were not fulfilled—and we think they were not—at the same time, there was no doubt a falling off in the quality as compared with last year. The extreme frosts in February, about which we have talked so long, had a killing effect in many districts, and it was particularly unfortunate that such an abnormal visitation should be succeeded by a hot season and long drought. Nevertheless, there were many stands of excellent Roses at the Palace on Saturday last, and individual blooms quite worthy the Society's Silver Medals were easily found, but unlike the exhibition in the previous week at Gloucester, there were many indifferent collections as well.

NURSERYMEN'S CLASSES.

Seventy-two distinct Single Trusses.—There were five competitors for the coveted Trophy and Gold Medal which accompany the 1st prize in this most important class. Each competitor had placed a stand of blooms of the greatest excellence possible in such a season, and, albeit, there were inferior specimens in every collection; there nevertheless were numerous instances of good quality, and the two blooms

judged worthy of the Silver Medal were each found in this class, one of them in Mr. B. R. CANT'S collection, and the other in that from Mr. FRANK CANT. First-place was awarded to Mr. B. R. CANT, Colchester; and 2nd to Mr. FRANK CANT, also of Colchester, who held the trophy during the year just ended. The blooms in the 1st prize exhibit were—*Back row*: Her Majesty (Silver Medal), Suzanne-M. Rodocanachi, Lady Mary Fitzwilliam, Marie Baumann, Caroline Testout, Duke of Fife, Marchioness of Dufferin, Ulrich Brunner, Alfred Colomb, White Lady, Boildieu, E. Y. Teas, Souvenir d'un Ami, Maurice Bernardin, Marie Finger, Madame Crapetel, Mrs. Jno. Laing, Countess of Oxford, Madame de Watteville, Xavier Oliho, Heinrich Schultheiss, Earl of Dufferin, Duchesse de Morny, Gustave Pignanneau. *Centre row*: Marquise de Litta, Beauty of Waltham, Luciole (a pretty bloom, with attractive bronze shading, but difficult to obtain in such condition), Mrs. Sharman Crawford, La Boule d'Or, Madame Henri Periere, Chas. Lefebvre, Marchioness of Londonderry, Marie Verdier, Marchioness of Downshire, Dupuy Jamin, Innocente Pirola, Duke of Edinburgh, Sultan of Zanzibar, Madame G. Luizet, Victor Hugo, Jeannie Dickson, A. K. Williams, Maréchal Niel, Dr. Sewell, Catherine Mermet, Horace Vernet, Souvenir de S. A. Prince, Dr. Andry. *Front row*: Ethel Brownlow, Reynolds Hole, Merveille de Lyon, Etienne Levét, La France, Captain Hayward, La Fraicheur, Duke of Wellington, Madame Cusin, Jean Souper, The Bride, Alfred Dumesnil, Marie Van Houtte, Fisher Holmes, Ernest Metz, Crown Prince, Comtesse de Nadaillac, Camille Bernardin, Margaret Boudet, Duke of Connaught, Countess of Rosebery, Comte de Raimboud, Marguerite de St. Amand, and Prince Arthur.

Mr. FRANK CANT was only a few points behind. In his stand were good blooms of Comtesse de Nadaillac (Medal), Her Majesty, Gustave Pignanneau, Marie Baumann, Madame de Watteville, Corinna, Victor Hugo, Captain Hayward, Duke of Connaught, Mrs. Jno. Laing, Horace Vernet, Charles Gater, Duke of Albany, Alfred Colomb, Ethel Brownlow, and Earl of Dufferin; 3rd, Messrs. HARKNESS & SONS, Bedala, York.

Forty distinct varieties, three trusses of each.—The exhibits in this class made a capital display, and the blooms in the 1st prize stand from Mr. FRANK CANT were very bright and effective. Those which appeared especially good for grouping in trebles were Victor Hugo (excellent colour), Pride of Waltham, Suzanne-Marie Rodocanachi, Duke of Fife, Ulrich Brunner, Marie Verdier, Duke of Connaught, Marguerite de St. Amand, Innocente Pirola, Comte de Raimboud, Baroness Rothschild, Salamander, and Mrs. John Laing. Mr. B. R. CANT was 2nd, and we noticed in his collection very good trebles of Prince Arthur, Mrs. Sharman Crawford, Heinrich Schultheiss, Duchesse de Morny, Chas. Lefebvre, Marchioness of Dufferin, A. K. Williams, Her Majesty, Mrs. Jno. Laing, and Merveille de Lyon. The 3rd position was secured by Messrs. HARKNESS & SONS.

Forty-eight, distinct, single trusses.—Messrs. PRIOR & SONS, Colchester, were 1st, and their best blooms were Suzanne-Marie Rodocanachi, Duchesse de Morny, Abel Carrière, Star of Waltham, Marie Baumann, Marie Verdier, Gustave Pignanneau, Horace Vernet, Maréchal Niel, Mrs. John Laing, Countess of Oxford, Bruce Findlay, François Michelson, Annie Wood, Constantin Petriakoff, and Ernest Metz. Mr. HENRY MERRYWEATHER, Southwell, who was 2nd, showed good specimens of Gustave Pignanneau, Comtesse de Ludre, Fisher Holmes, Chas. Darwin, Mrs. Jno. Laing, General Jacqueminot. Messrs. J. BURRELL & CO., Howe House Nurseries, Cambridge, were 3rd.

Twenty-four distinct single trusses.—The quality in this class for twenty-four blooms reigned very high, especially in the exhibit from Mr. JNO. MATTOCK, New Headington, Oxford. Capital were the following:—Dupuy Jamin, Duke of Connaught, A. K. Williams (very pretty and bright), Gustave Pignanneau, Her Majesty, Horace Vernet, Charles Lefebvre, Comtesse de Nadaillac, Duke of Bedford, and Mrs. J. Laing. The 2nd prize lot came from Wales, and were exhibited by Mr. STEPHEN TRESDEMER, Pwllcoch Nursery, Cardiff. The blooms were rather small, but pretty and bright nevertheless; those most attractive were Duchesse de Morny, Alfred Colomb, Lady Helen Stewart, Countess of Rosebery, Duke of Connaught, and Exposition de Brie. 3rd, Messrs. TOWNSEND & SONS, Lower Broadheath, Worcester.

Twenty-four distinct varieties, three trusses of each.—Messrs. D. PRIOR & SONS, who were 1st, showed excellent trebles of Constantin Petriakoff, Mrs. J. Laing, Heinrich Schultheiss, Alfred Colomb, Fisher Holmes, Duchesse de Morny, A. K. Williams, Marie Verdier, Xavier Oliho, Jeannie Dickson, Marie Baumann, and Her Majesty. Messrs. TOWNSEND & SONS, Worcester, were 2nd; and Messrs. GEO. COOLING & SONS, Bath, 3rd.

Eighteen bunches, distinct, exhibits to be staged in vases or other receptacles, instead of boxes.—This was an interesting class, because it afforded a little variation from the usual boxes and flat method of showing, and gave a little opportunity to growers to exhibit in a more tasteful manner. Exhibitors were not limited in their choice of varieties, but the space for each collection was not to exceed 6 feet by 3 feet. Messrs. PAUL & SONS, Cheshunt, who were 1st, had a pretty group, the sprays of flowers bearing good healthy foliage, shown in vases. The varieties chosen were General Jacqueminot (H.P.), Etienne Levét (H.P.), Jeannie Dickson (H.P.), La France (H.T.), François Levét (H.P.), Mrs. Paul (Bourbon), Paul's Cheshunt Scarlet (H.P.), Abel Carrière (H.P.), Heinrich Schultheiss (H.P.), Bacchus (a new H.P.), Caroline Testout (H.T.), Reynolds Hole (H.P.), Merveille de Lyon (H.P.), Alfred Colomb (H.P.), Suzanne-Marie Rodocanachi (H.P.), Countess of Oxford (H.P.), Captain Christy (H.P.), and Duke of Edinburgh (H.P.). Mr. GEO. MOUNT, of Canter-

bury, was 2nd in this class; his best were Fisher Holmes, Marie Baumann, Gabrielle Luizet, and Niphetos.

TEA AND NOISETTE SECTION.

Twenty-four distinct single trusses.—The principal prize in this section was well won by Mr. FRANK CANT, who has exhibited Teas very successfully this season. His collection in this class was of excellent quality, judged by the average merit of the exhibition. The blooms staged were the following:—*Back row*: Ernest Metz, Madame de Watteville, The Bride, Niphetos, Madame Cusin, Souvenir d'Elise Vardon, Comtesse de Nadaillac, and Innocente Pirola; *Centre row*: Catherine Mermet, Souvenir de S. A. Prince, Ethel Brownlow, Maréchal Niel, Souvenir d'un Ami, Hon. Edith Gifford, Maman Cochet, and Souvenir de Paul Neyron; *Front row*: Cleopatra, Francisca Kruger, Bridesmaid, Marie Van Houtte, Madame Jacquier, Rubens, Corinna, and Jean Ducher. Mr. B. R. CANT had blooms of smaller size, but otherwise they were good, being bright and fresh-looking. Madame Cusin was splendid; Devoniansia, Madame de Watteville, Ernest Metz, Innocente Pirola, Bridesmaid, Corinna, and Catherine Mermet were also noticeable. 3rd, Messrs. D. PRIOR & SONS.

Eighteen distinct single trusses.—There were nine entries for this class, and consequently the quality of the prize collections run very close. The 1st position was taken by Mr. JNO. MATTOCK, New Headington, Oxford. In his stand we noticed as the best specimens, Souvenir d'un Ami, Hon. Ed. Gifford, Adam, The Bride, Ernest Metz, and Catherine Mermet. Mr. HENRY MERRYWEATHER took 2nd, and he had good Catherine Mermet, Cleopatra, and Ernest Metz, &c., smaller in size than the first exhibit; 3rd, J. BURRELL & CO., Howe House Nurseries, Cambridge.

Eighteen distinct, three trusses of each.—There were five collections shown in this class, and of these the best was one from Mr. FRANK CANT. The stand contained several very fine trebles, but was nevertheless much marred by a few inferior specimens, such as those of Francisca Kruger. The best were Madame Cusin (very good), Catherine Mermet, Madame de Watteville, Souvenir d'un Ami, Rubens, Innocente Pirola, The Bride, Ethel Brownlow, Comtesse de Nadaillac, &c.; Messrs. D. PRIOR & SONS were 2nd with a fresh collection, bright and clean, but small, Maréchal Niel, Madame Cusin, Ernest Metz, and Corinna, were good; Mr. B. R. CANT was 3rd.

OPEN CLASSES.

Twelve trusses of hybrid Teas, not fewer than nine varieties.—The hybrid Teas are now fully recognised by the Society, and have a special class to themselves. The class is a popular one, and there were eight or more entries. The 1st prize was won by Mr. FRANK CANT, and the names of his varieties were Augustine Guinoiseau, La France, Viscountess Folkestone, Lady Mary Fitzwilliam, Caroline Testout, Kaiserin Augusta Victoria, Duchess of Albany, Grace Darling, Danmarck, Germaine Caillot, and La Fraicheur; Mr. B. R. CANT was a close 2nd; his La Fraicheur was excellent; Captain Christy and Kaiserin Augusta Victoria were also good. Mr. GEO. PRINCE, Oxford, who was 3rd, included a very fine bloom of Kaiserin Augusta Victoria.

Twelve trusses of any yellow Rose except Maréchal Niel.—This class was won by Mr. GEO. PRINCE, Oxford, with a stand of moderately-good Comtesse de Nadaillac; Mr. JOHN MATTOCK, who was 2nd, showed the same variety; and Mr. FRANK CANT, with Marie Van Houtte, was 3rd.

Twelve single trusses of any white Rose.—Mr. GEO. MOUNT won with good specimens of Merveille de Lyon; 2nd, Mr. GEO. PRINCE; 3rd, Mr. B. R. CANT.

Twelve single trusses of any crimson Rose.—With very bright, but slightly damaged blooms of A. K. Williams, Messrs. TOWNSEND & SONS were 1st, being followed by Mr. B. R. CANT, who had Gustave Pignanneau, and Mr. GEO. MOUNT, who had good Ulrich Brunner.

Twelve single trusses of any dark velvety crimson variety.—Mr. B. R. CANT and Mr. GEO. MOUNT were awarded equal 1st for two fairly commendable stands of Fisher Holmes. 3rd, Messrs. G. and W. H. BURCH, Peterborough, with Horace Vernet.

Twelve single trusses of any light Rose.—The 1st prize exhibit in this class was a stand of twelve blooms of Mrs. Sharman Crawford, and was perhaps the prettiest dozen Roses in the exhibition. Certainly the brightest of all the light varieties, it is at the same time pretty and attractive in tone. The blooms were shown by Messrs. ALEX. DICKSON & SONS, Newtownards, Ireland. 2nd, Messrs. D. and W. CROLL, Dundee, who had extra nice Mrs. Jno. Laing, and the same variety was shown by Mr. FRANK CANT, who was 3rd.

Twelve single trusses of any Rose except a Tea or Noisette.—There was considerable competition in this as in a few other of these single variety classes. Mr. FRANK CANT, who was placed 1st, had extra good blooms of Her Majesty, very full and bright; and Messrs. PAUL & SONS, Cheshunt, were 2nd with the same variety; while Mr. B. R. CANT, who had Marchioness of Dufferin, was 3rd.

Twelve single trusses of any Tea or Noisette.—Mr. B. R. CANT was 1st, with a dozen nice blooms of the lovely Madame Cusin; Mr. FRANK CANT was 2nd, trusting to Madame de Watteville; and Mr. JAS. MATTOCK obtained 3rd with Ernest Metz.

Twelve single trusses of Maréchal Niel.—This class was only poorly sustained. Messrs. PRIOR & SONS, were 1st, and Messrs. TOWNSEND & SONS, 2nd.

NEW ROSES.

The classes here were of more interest than last season, Messrs. A. DICKSON & SONS, of Newtownards, staging a good twelve of Mrs. Sharman Crawford, a Rose of great merit and

useful colour. Mr. F. CANT, Colchester, was 2nd, with Marchioness of Londonderry; and Messrs. PAUL & SONS, Cheshunt, 3rd, with Jeannie Dickson. Similar to last season, all three winning stands were raised by the Irish firm.

Twelve varieties, distinct.—Messrs. A. DICKSON & SONS were also 1st in this competition, showing Mrs. S. Crawford, Shamrock, Avoca (a Tea like Ernest Metz, but brighter), Captain Hayward, Marchioness of Dowshire, Tom Wood (a pretty Rose, between Madame Ousin and Souvenir de David in colour, but brighter and more full), Lady Moyra Beauclerc, La Fraicheur (good), Marchioness of Londonderry, Helen Keller, Mavourneen, and Muriel Grahame; the last is a good and promising Tea, with habit and form midway between Madame Bravy and Catherine Mermet. The colour is almost white, with creamy shading—an undoubtedly promising Rose. Muriel Grahame was also staged for the Gold Medal, as was Countess of Caledon. Mr. W. TAYLOR, Hampton, showed a new Rose called Robin Lyth, which we consider is too near to Fisher Holmes and Harrison Weir. The new Tea, Muriel Grahame, was decidedly the best of those now staged for the first time.

GARDEN ROSES.

These were not so good as usual, and, as at Gloucester, the hot season has evidently been too much for them.

Nurserymen: Thirty-six bunches, distinct.—Messrs. G. COOLING & SONS, Bath, 1st, having L'Idéale, W. A. Richardson, Cooling's Scarlet Perpetual, G. Regis, and Pepita being among the best. Messrs. PAUL & SONS, Cheshunt, and F. CANT, Colchester, were 2nd and 3rd with much the same varieties.

Eighteen bunches, distinct.—Messrs. TOWNSEND & SONS, Worcester, and Messrs. D. & W. CROLL, Dundee, were successful. The first-named had Madame Falcot, Madame Charles (good), Celine Forestier, and Isabella Sprunt; while Messrs. CROLL had a pretty bunch of Madame C. Brunners (Polyantha).

Amateurs:—A silver cup presented by the Rt. Hon. Lord Penzance for eighteen bunches of Garden Roses, was won by H. V. MACHIN, Esq., Worksp, who had very good bunches, but rather too cramped in arrangement. The 2nd prize stand from Mr. A. TATE, Leatherhead, was certainly the most admired and best set up stand; O. G. ORPEN, Esq., Colchester, was a good 3rd.

In an open class for twelve bunches of Roses suitable for button-hole flowers, Mr. J. MATTOCK, Oxford; Messrs. W. TOWNSEND & SONS, Worcester; and Mr. A. EVANS, Oxford, were successful; W. A. Richardson, Madame Falcot, Ma Capucine, L'Idéale, and Madame de Watteville, being the varieties most shown.

Nine bunches of Single-flowered Roses.—Messrs. G. PAUL & SONS, Cheshunt, met with no opposition; Moschata alba, Lucida, Bugosa, and Pissardi were the best.

Mr. MATTOCK, Oxford, had a very pretty lot in the "display of Roses" (open), and was followed by Messrs. TOWNSEND & SONS, Worcester.

MEDAL ROSES.

Bennett's Rose, Her Majesty, won the H. P. medals in both Nurserymen and Amateur Classes, and were exceptionally good throughout the show. Mr. B. R. CANT and E. B. LINDSELL, Esq., were the winners. A large, but rather loose, Comtesse de Nadaillac was successful among Tea and Noisettes, for Mr. F. CANT; and Maréchal Niel for the Rev. A. FOSTER-MELLIAR. The latter flower was also loose, but had once been magnificent.

AMATEURS.

The Champion Trophy Class, thirty-six blooms, distinct.—This class was open to all amateurs, and the coveted Trophy and Gold Medal went to Mr. E. B. LINDSELL, Hitchin, who staged some good flowers. His back row consisted of Her Majesty, S.-M. Rodocanachi, Mrs. Paul, Earl of Dufferin, Marchioness of Londonderry, Ulrich Brunner, Mrs. J. Laing, A. K. Williams, Merveille de Lyon, Charles Lefebvre, Madame E. Verdier, and Gustave Pignanneau; middle row, Duchesse de Bedford, Souvenir d'Elise, Dupuy Jamin, Caroline Kuster, Alfred Colomb, Gabrielle Luizet, Duke of Wellington, Duchesse de Morny, Fisher Holmes, Comtesse de Nadaillac, Madame Hausmann, and Mrs. Sharman Crawford; the front row being Catherine Mermet, Louis Van Houtte, Innocente Pirola, Prince Arthur, Abel Carrière, Dr. Andry, François Michelson, Duke of Connaught, Etoile de Lyon, Maurice Bernardin, Marie Verdier, and Dr. Sewell. Perhaps the worst flower here was Comtesse de Nadaillac, all of the rest being even better than those in the professional classes. The Rev. J. H. PEMBERTON, Havering-atte-Bower, was 2nd, his best being Her Majesty, Horace Vernet, Xavier Oliho, Duchesse de Bedford, and a peculiarly-striped Marie Verdier. T. B. HAYWOOD, Esq., Woodhatch, Reigate, was 3rd, with a very young and bright collection.

A piece of plate, given by Mr. Frank Cant for forty-eight singles, also went to Mr. E. B. LINDSELL, who put up much the same varieties as in the trophy class. Alfred Colomb, Louis Van Houtte, and Marchioness of Londonderry were extra good. Mr. WALTER DREW, Ledbury, made a close 2nd, and was followed by Mr. A. TATE, Leatherhead.

For twenty-four singles, J. GURNEY FOWLER Esq., South Woodford, Essex, was 1st, staging good examples of The Bride, Dr. Andry, Reynolds Hole, Harrison Weir, and A. K. Williams among others; Mr. W. BOYES, Derby, beating the Rev. A. FOSTER-MELLIAR, Ipswich, for 2nd honours. There was a particularly good Horace Vernet and Prince Arthur in Mr. BOYES'S stand, and a very full Merveille de Lyon in the Rev. A. F. MELLIAR'S.

For twenty-four, distinct, single trusses.—This division was open only to growers of fewer than 2000 plants of exhibition variety, and here W. C. ROMAINE, Esq., The Priory, Windsor,

flowers, named Barghley Pat; and Mr. WILLIAM CARMICHAEL exhibited some seedling Strawberries. A collection of vegetables, including Peas, Beans, Lettuces, and Cabbages, was exhibited by Messrs. BARR & SONS, King Street, Covent Garden, W.C.

Lecture by Mr. Francis Darwin.

The lecture by Mr. Darwin was on "The Effect of Darkness on the Form of Plants," and in commencing the subject Mr. Darwin said that before the phenomena of etiolation or blanching could be satisfactorily and conclusively explained more facts were required, and these facts were such as could be furnished by horticulturists. This was one reason that suggested the subject of the present lecture, that those engaged in horticulture might be induced to take an interest in the question and communicate the results of their experiments to the scientific world.

Mr. DARWIN then proceeded to say, that if a plant was subjected to continual darkness, the most striking effect produced was one of colour, the stem becomes white and the leaves yellow, but it was more particularly to the difference in shape a plant assumes under such conditions that he wished to speak on the present occasion, with a view to explaining that the abnormal growth which takes place is not a pathological condition, but rather the result of adaptation to environment or circumstances. If a Potato or seedling Bean be kept in darkness, an elongated stem will be produced, and but minute leaves formed. In the case of cereals, the leaves were elongated, not dwarfed. Light is essential to the nutrition of plants. So true was this that Stephen Hales and others in his day thought that light was a material food for plants, whereas it is now recognised as a necessity to assimilation only. In the absence of light the plant can abstract no carbon from the atmosphere. It had been held that etiolation was a purely pathological state in the plant, but this view is probably dead, except that Sachs still holds it. From such a view, Mr. Darwin wished to express his dissent, and to put forth a different one altogether. Mr. Darwin had worked at this question a good deal, and when about to publish the result of his research, he found that a Polish botanist, Godlewski, had also taken the same view.

The view of the phenomena which the lecturer favoured was, that it was merely adaptation, or response to a stimulus to overcome, or get the better of an accidental environment. The difference of the two theories was explained thus, rickets in a scrofulous child is produced by injudicious feeding [and hereditary endowment], but the symptoms do not in the least assist the child to escape from its malady, the condition is purely a pathological one. On the other hand, a Potato set, if deprived of light, will continue to grow as if it were under the soil, the energies of the whole plant will be thrown into producing a long stem, and this to the neglect of the leaves. A seedling Bean would do the same thing, viz., continue to grow as if it were seeking light through the soil, and not until the light—which in this case is the "signal of illumination" to the plant—is obtained will the growth be altered. The plant is deprived in the absence of this signal. The Scarlet Runner grows with a hooked plumule while under the surface, but on entry into an illuminated area, the point is soon straightened, but if light be withheld when the shoot is through the soil, the point remains hooked. The signal of light is necessary to remove this condition, which in itself, is an adaptation to circumstances, the hooked plumule being better able to pierce the soil without injury, than if it were straight. Mr. Darwin then spoke of the sensitiveness existing in the petals of the Crocus to changes of temperature, so much so, that if the temperature fell 1° Centigrade, a movement in the petals may be observed. By this means the pollen was protected against the effect of rain. A species of fungus called Coprinus, normally developed a stalk and a cap of considerable size, but if it be subjected to darkness, the plant will throw all its energies into making a long stalk at the expense of the cap, which will be very small. The stalk in this case is much lengthened in order to reach the daylight, where the spores may be disseminated. The gemmae or buds of Liverworts germinate only in the light; the gemmae remain inactive if covered with a few dead leaves. It was clearly adaptation that caused these gemmae to remain inactive for a short time, during which the temporary darkness may be removed, whereas did they germinate, they would do so, with the result that they would die.

In regard to flowering plants, if a Narcissus be deprived of light, the long scape it produces is another effort to get out of the darkness, where alone the pollen it carries can be made useful. If a plant has only radical leaves, the only chance is to extend these, the distribution of growth is altered in every respect, and in all plants. Mr. Darwin, referring to Sachs' classic paper of 1863, in which he refers to the Hop or Sweet Potato as cases of natural etiolation, said that from Sachs' standpoint this was not a happy word; but viewing all etiolation as adaptation, then these cases were clearly natural. A climbing plant, in order to escape from the earth line into the air, throws most of its energy into producing a long stem, and usually makes a small amount of other material only, which is exactly what occurs in all cases of etiolation. Facts were the food of all hypothesis, and for these he hoped he might look to horticulture.

WIMBLEDON AND DISTRICT HORTICULTURAL.

JULY 3.—The twenty-third annual exhibition was held on the above date, in the grounds of Draxmont,

Wimbledon Hill, kindly lent for the occasion by the President of the Society, T. E. Crocker, Esq. The entries were more numerous than in previous years.

DIVISION I.—OPEN TO ALL COMERS.

For a group of miscellaneous foliage and flowering plants, a very creditable arrangement gained 1st honours to Mr. A. Luff, gr. to J. F. SCHWANN, Esq., J.P.

In the class for four stove and greenhouse plants, in or out of flower, the leading prizes were secured by Mr. G. Hutton, gr. to — FRERE, Esq., and M. A. Methven, gr. to W. KEILER, Esq., Fernwood. Whilst for six foliage or flowering plants, creditable specimens gained the prizes for Messrs. Methven, Hutton, and Luff.

There was a keen competition in the class for four exotic Ferns, distinct, the prize-takers being Mr. J. Bentley, gr. to Capt. BOSWORTH, Roehampton; Mr. A. Luff, and Mr. G. Hutton.

In the class for four Fuchsias, distinct, open to all members, creditably flowered examples were staged by Messrs. Zonal Pelargoniums gave an effective bit of colouring to the show.

For twelve plants in pots not exceeding 6 inches in diameter, Messrs. Law, Bentley, and Chandler were the leading exhibitors.

Well-bloomed Gloxinias were staged by Messrs. Mills, Hutton, and Bentley.

Six well-flowered examples of Begonias were shown by Mr. A. Skeggs, gr. to Mrs. DAUN, Copse Hill. Mr. Skeggs again secured the premier position for four excellent Caladiums. Well-coloured Coleuses were exhibited by Mr. C. Bentley.

The class for twelve plants, suitable for table decoration, was a good one, the prizes going to Mr. McGregor, Mr. H. Alderman, gr. to — HATFIELD, Esq., Morden Hall; and Mr. J. Bentley.

The successful exhibitors in the classes devoted to specimen foliage and flowering plants were Messrs. Mew, Thornton, Chandler, McGregor, Methven, and Bentley.

The best twelve cut blooms of Roses were contributed by Mr. J. Bentley.

Well-finished examples of black Grapes (three bunches) were shown by Messrs. Bentley and Methven. Mr. A. Methven was 1st for three bunches of white Grapes. In the class for six Peaches, well-coloured fruits were staged by Messrs. Luff, Alderman, and Bentley, the last-named exhibitor securing the first position for six good fruits of Nectarines.

For thirty-six fruits of Strawberries, the leading exhibitors were Messrs. Alderman, Hutton, and Methven. Mr. Alderman again had 1st honours for four distinct kinds of fruit, followed by Messrs. Bentley and Luff.

A collection of vegetables, in six kinds, was excellent from Mr. Thornton.

In Division 2, for "single-handed" gardeners residing within the district, a group of miscellaneous foliage and flowering plants was creditably exhibited by Mr. T. Chandler.

In the division for amateurs not employing a gardener regularly, the 1st prize for six miscellaneous plants was taken by Mr. J. BROWN, Norman Road, Wimbledon.

The cottagers of the district made a very good display of vegetables, flowers, and fruit.

Messrs. THOMSON & SON, The Nurseries, Wimbledon, sent a beautiful collection of hardy flowers.

THE PEOPLE'S PALACE HORTICULTURAL.

JULY 4, 5, and 6.—The third summer show took place in the Queen's Hall of the People's Palace, on the above dates, and, both in extent and quality, was a considerable advance on the two previously held.

Not only was the spacious hall quite filled with exhibits, but the large winter-garden also. How heartily the East End Londoners have entered into the spirit of the thing was shown by the large number of groups of plants entered for a 36 feet, and also an 18 feet ground space, and also for 18 feet and 9 feet table-spaces; while collections of six and three plants, as well as many single specimens, were numerous; and there were Fern-cases, model gardens, fruit, cut flowers, and vegetables also. In the small greenhouses, mainly of homely construction, put up at the backs of their residences by the East End gardeners, capital specimens of Plumbago capensis, India-rubber plants, green Draenas, show and zonal Pelargoniums, Begonias (foliage and flowering), Gloxinias, Succulents, Lillies, and many other things are grown remarkably well, and they speak volumes for the care and attention given to them, not a few of the East End gardeners being engaged in the City all day. The favourite window-plants are Fuchsias, trained to wooden-trellises, very large, finely-grown, and flowered; Pelargoniums, Creeping Jennies, Aspidistra, Aralia Sieboldi, &c. In some of their back gardens can be seen planted out subjects that astonish one that they can be found to grow and bloom there. The favourite hardy annual of the East Ender appears to be Virginian Stock.

Prizes are offered for the best kept gardens, and also for window-boxes, and it was necessary for the judges to spend the best part of two days in visiting them, as they laid between Aldgate, Limehouse, the East India Docks, Stratford, Hackney, and Homerton. It is not too much to say some of the best kept gardens were found in the most unlikely places, and in order to equalize the competition, the gardens visited are divided into two sections: those in open and somewhat airy localities, and those in which they are more crowded, and the conditions of culture less favourable. It is so with the window-boxes.

Certain honorary collections of plants, &c., greatly helped the effect. From the Frogmore Gardens, Mr. THOMAS sent a very fine and imposing table of plants; from His Grace The DUKE OF FIFE, arranged by Mr. Osborn, the gardener at East Sheen Lodge, came another similar group; and also from F. A. BEVAN, Esq., Trent Park, Barnet (gr. Mr. W. H. Lees); Messrs. W. CUTBUSH & SONS, Highgate Nurseries; Messrs. W. PAUL & SONS, Waltham Cross (mainly Roses); also from Mr. HOLMES, Frampton Park Nursery, Hackney, a fine group on the floor; and some charming table decorations from Mr. J. R. CHARD. Round the sides of the hall was a very handsome group of plants from S. B. BOULTON, Esq., Copped Hall (gr. Mr. W. M. Wright); from the DUKE OF NORFOLK, and others; and so some very fine features were secured.

Lata in the afternoon, their R.H. The Duke and Duchess of York visited the show, accompanied by the Duke of Fife, the President, when an address was presented to Their Royal Highnesses, and the Duke of York declared the exhibition open. The members of the committee were then individually presented to Their Royal Highnesses, and they made a tour of the show, being much interested in what they saw. There is every reason to believe the exhibition proved a financial success.

CHERTSEY, WALTON, AND WEYBRIDGE.

JULY 6.—The thirtieth annual summer exhibition was held this year in the grounds attached to Oatlands Lodge. Stove and greenhouse plants formed a leading feature of the exhibition, and they were generally well grown.

For a group of 14 by 7 feet, five competed, and Mr. Ridge, gr. to C. SWINFEN EADY, Esq., Oatlands Lodge, was an easy winner. The 2nd place being taken by Mr. G. J. Cook, gr. to J. S. SASSOON, Esq., Walton, with a creditably arranged group. Mr. F. Hopkins, gr. to Mrs. WODDERSPOON, The Chestnuts, Walton-on-Thames, was 1st for a smaller group, with a capital arrangement; and 2nd, Mr. W. C. Pagram, gr. to J. COURTNEY, Esq., The Whim, Weybridge.

For six flowering plants, Mr. JACQUES was the most successful. Fine foliage specimens were best represented by Mr. OSMAN in six varieties, Mr. GARDNER winning a similar position for four. Exotic Ferns are usually seen in excellent condition here, this year proving no exception.

Caladiums, Achimenes, tuberous Begonias, Gloxinias, and Pelargoniums are well shown, the principal prizes being awarded to Messrs. PROTHERO, JACQUES, STEDMAN, and OSMAN.

For six table plants, 1st, Mr. HOPKINS, with bright-coloured examples of middle size.

Cut flowers made an effective display; especially Roses. Stove and greenhouse flowers were shown, the best by Messrs. JACQUES and OSMAN. Herbaceous flowers by Mr. G. VIGERS, Mole House, Horsham, in twelve varieties.

FRUIT was contributed in quantity, Mr. OSMAN had the best collection of six kinds; the best two bunches of Black Grapes, and dish of Cherries. Mr. GARDNER was 1st in the class for two bunches of white varieties, showing ripe Buckland Sweet-water. Mr. J. Buxton, gr. to J. A. FOSTER, Esq., Fernlands, Chertsey, took 1st prize for one dish of Waterloo Strawberries.

Mr. J. OSMAN was, as usual, invincible in the principal vegetable class, that for eight kinds, and he showed extremely well.

Messrs. BARR & SON, sent from their Long Ditton grounds, a charming collection of cut blooms of herbaceous plants, including many choice subjects.

IPSWICH AND WOLVERHAMPTON HORTICULTURAL EXHIBITIONS.

We have received reports of these important horticultural exhibitions just as we are going to press, we must, therefore, postpone their publication till our next issue.

NURSERY NOTES.

CARNATIONS AT THE ROYAL EXOTIC NURSERY, CHELSEA.

STRENUOUS efforts have been made to overcome the difficulties created by a great demand for plants and by the unusual heat of the season, and to furnish a creditable display of sample beds of Picotees and Carnations at this nursery. The results as regards the whole display reflect much credit on those responsible for this department, and we found on Wednesday a pretty show if not a "blaze of colour." The plants are dwarfier than in most years we remember to have seen them, and the "grass" is in the older varieties rather sparse, but fairly abundant in the newer ones, and especially is this remarked in those of Mr. Martin Smith's raising.

We will take these first, as they overtop all the others in height, and beat them generally in size, floriferousness, and freedom from burnt calyxes.

Cardinal Wolsey, a yellow ground flower of the Victory type, but superior in colour and form; Duke of Orleans, also yellow, but differing from the first-named: the flowers large and form excellent—it is

a vigorous grower. Hayes' Scarlet is a splendid self of vigorous habit; thus far the finest self of scarlet colour raised. King Arthur is likewise scarlet with a crimson tinge in it, the flower is large and the form very good; the grass is vigorous and broad, and habit good. Mephisto is a crimson self, resembling the old Clove, but deeper in the tint; the form of the flower leaves nothing to be desired. Miss Andrey Campbell is a vigorous yellow self, large and distinct. Miss Ellen Terry is one of the best of the white Carnations.

Of other raisers' varieties we remarked Cantab (Gifford), a very free border variety, with the fragrance of the old Clove; Germania, in large numbers: this is still one of the finest Carnations of its colour—yellow; Caro Roma, a beautiful purple self; Martin Cahuzac, a Continental variety—deep velvety crimson flower—most floriferous, of dwarf habit: a very nice variety; Mrs. Gifford, a fine white, very free, either as a pot or border variety; King of Scarlets, King of Crimson (Douglas, 1892), a neat flower, of fine quality; Alma Newman, of a shade of red, a free bloomer, and strong compact habit, height 2½ feet; Duchesse of Fife, a tender shade of pink, large, pleasing flower; Lady Nina Balfour, pink tinted with chamoise, erect petals, flowers of middle size, and well formed; Duchesse of York—a flower in colour resembling Souvenir de la Malmaison, very full, and of more than the usual size (Gifford, 1894); Duchesse of Portland, one of the best of the fancies; Rose Celestial; Joe Willet, a bright dwarf, very hardy scarlet self.

Many of the old favourite varieties were found in quantity, and there are colours and forms of flower, and habit of growth, to suit everyone's taste to be found in this very select collection. The Carnation is essentially a townsman's plant, and in this town nursery it may be seen grown in something very near perfection. A numerous collection of varieties of Picotees are likewise cultivated, but these pretty flowers always lose by being planted near Carnations, with their more exacting claims on the beholder's attention.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, BRIGHT SUN. Includes rows for various districts (0-10) with day-degree and rainfall data.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts— 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending July 6, is furnished from the Meteorological Office:—

"The weather was very unsettled and showery during the early part of the week, with thunderstorms in many places. After the middle of the period, however, a gradual improvement took place, and by the end of the week fair dry weather had again become general.

"The temperature differed very little from the mean, but was slightly above it in the north and east of Scotland, and below it in most of the English districts, as well as in the south of Ireland. The highest readings was observed as a rule on the 6th of July, and ranged from 71° in 'Scotland, W. and England, N.W.,' to 76° in the 'Midland Counties and Ireland, N.,' and to 77° in 'Scotland, F. and England, S.W. The lowest readings, which occurred mostly on the 5th or 6th, were rather low for the time of year, the thermometer falling to 45° or less, in nearly all districts, and to 40° or less in 'Scotland, W., England, S.W., and Ireland, N.'"

"The rainfall was less than the mean in the extreme northern and north-western parts of the Kingdom, as well as in the 'Channel Islands,' but in most other districts there was a slight excess.

"The bright sunshine varied greatly in amount in different localities. In 'Ireland, Scotland, N., and England, N.E. and S.,' the number of hours recorded was below the average, but in most other districts there was an excess, slight in many cases, but large in 'England, S.W. and the Channel Islands.' The percentage of the possible duration ranged from 16 in 'Scotland, N.,' and 23 in 'Ireland, N.,' to 43 in 'Scotland, W.,' 51 in 'England, S.W.,' and 67 in the 'Channel Islands.'"

MARKETS.

COVENT GARDEN, July 11.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

Table of market prices for 'COVENT GARDEN, July 11.' Includes sections for 'ORCHID-BLOOM IN VARIETY' and 'ORCHID-BLOOM IN VARIETY' with prices for various flower types.

Table of market prices for 'PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.' Lists prices for various plants like Adiantum, Aspidistra, Ficus, etc.

Table of market prices for 'FRUIT.—AVERAGE WHOLESALE PRICES.' Lists prices for Cherries, Figs, Grapes, Melons, etc.

Table of market prices for 'VEGETABLES.—AVERAGE WHOLESALE PRICES.' Lists prices for Beans, Cabbages, Cucumbers, etc.

NEW POTATOES. Home-grown now coming to hand freely. Samples generally are small. Price from 5s. to 6s. per cwt. French and Channel Islands, 5s. per cwt. J. B. Thomas.

FRUITS AND VEGETABLES.

BOROUGH: July 7.—Quotations:—Peas, 2s. to 2s. 6d. per bushel; Horseradish, 1s. to 1s. 3d. per bundle; Apples, Tasmanian, 6s. to 8s. per case; Gooseberries, 1s. 6d. to 2s. per half-sieve; Strawberries, 1s. 6d. to 2s. per peck; Currants, 2s. to 4s.; Cherries, 1s. 9d. to 2s. 9d. per half-sieve.

SPITALFIELDS: July 7.—Quotations:—Cherries, 3s. to 3s. 6d. per half-sieve; Currants, black, 3s. 6d. to 4s. per half-sieve; Broad Beans, 1s. 6d. to 2s. per bushel; Peas, 2s. 6d. to 3s. per bushel; Cabbages, 4s. to 5s. per tally; Carrots, 2s. to 2s. 6d. per dozen bunches; Turnips, 2s. to 3s. do.

STRATFORD: July 9.—The trade at this market during the past week has been brisk, there being plenty of buyers, and an abundance of all kinds of produce. Quotations: Cabbages, 1s. 6d. to 4s. per tally; Cauliflowers, 1s. to 2s. per dozen; ditto, 4s. to 8s. 6d. per tally; Turnips, 1s. to 1s. 6d. per dozen bunches; Carrots, 1s. to 1s. 6d. per dozen bunches; Mangolds, 10s. to 17s. 6d. per ton; Cherries, 3s. to 4s. per half-sieve; Black Currants, 4s. to 4s. 6d. per half-sieve; Red ditto, 2s. 6d. to 4s. 9d. per half-sieve; Gooseberries, ripe, 2s. to 2s. 6d. per half-sieve; ditto, green, 3s. to 3s. 6d. per flat; Strawberries, s. 6d. to 2s. 6d. per peck; Raspberries, 3s. to 4s. per dozen punnets; Tomatos, English, 4s. to 7s. per dozen pounds; Green Peas, 3s. 9d. to 5s. 6d. per bag; Windsor Beans, 3s. to 3s. 6d. per bag.

FARRINGTON: July 11.—Quotations:—Cabbage, 1s. 3d. per dozen; Turnips, 3s. to 4s. per dozen bunches; Carrots, 1s. 6d. to 4s. 6d. do.; Marrows, 3s. per dozen; Spring Onions, 3s. per dozen bunches; Cucumbers, 1s. 3d. to 2s. 6d. per dozen; Cherries, white-flesh, 4s. per half-sieve; do., black, 2s. 6d. to 3s. 6d. do.; Gooseberries, ripe, 2s. 6d. to 3s. do.; Currants, red, 2s. 6d. to 3s. 6d. do.; do., black, 4s. to 4s. 6d. do.; Pine-apples, 1s. 6d. to 2s. 6d. each.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending July 6, and for the corresponding period last year:—1895: Wheat, 25s. 7d.; Barley, 19s. 9d.; Oats, 16s. 4d.; 1894: Wheat, 24s. 6d.; Barley, 25s. 7d.; Oats, 19s. 6d.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

TOMATO FRUITS NOT SWELLING.—A correspondent sends the following:—"I should esteem it a great favour if you would kindly tell me the reason why the first two or three trusses of my Tomatos bear such very small fruit, no larger than Cherries, and quite ripe. The fruit seems to be swelling all right enough half-way up the plant, and making fine large fruit. Should I have stopped the leader, say, when it had got 4 feet high, to cause the lower trusses to swell off, and then let it grow again? My plants are 8 or 9 feet high now. In a later house I have 950 plants in, the bottom trusses are swelling off all right, and I never stopped them. My three earliest houses I planted got a check from some salt or something that had been in the manure unknown to me, and all turned black soon after they were planted. Would that be the cause? They have never suffered for want of water. Nurseryman."

Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

ASPARAGUS TENUISSIMUS: J. A. F. It does not reckon as a "flowering plant" in the ordinary sense of the word, as used by schedule-makers, and we think that your collection would be disqualified if this plant formed a part of it. Among foliage plants this species of Asparagus would be admissible.

BOOKS: A. B. Index Kewensis, Frowde, Amen Corner, London, E.C. Four vols., at 2 guineas each.—Foreman. There is no one book which treats directly of nursery gardening. Any good garden-

ing Manual such as My Gardeners, by Mr. H. W. Ward, Longford Castle Gardens; Hardy Flowers, by W. Robinson (Macmillan & Co., London); Stove and Greenhouse Plants, by B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway; The Nursery Book, by L. H. Bailey, The Rural Publishing Co., New York, or through a foreign bookseller in London. If you intend to grow only certain plants as Carnations, Chrysanthemums, Clematis, Dutch Bulbs, Tomatoes, &c., manuals on these and others may be obtained at the Bazaar Office, 170, Strand, W.C.

CARNATIONS: G. F. The plants are apparently affected with eel-worms. Nothing can be done except to turn out the soil and get fresh.

CATERPILLARS OF THE SAWFLY ON GOOSEBERRY: P. B. S. To guard against the recurrence of this pest, you should shovel away the whole of the soil beneath the bushes as far as the branches extend at the very least, and to a depth of 4 inches, charring it, or burying it deeply in the soil in some distant part of the garden, replacing it with fresh garden soil, or loamy soil from outside the garden. This may be done at any time from the present till the end of January. If it be done in frosty weather, there should be no haste in replacing the soil taken away, as exposure to hard frost is likely to do good by destroying any chance grubs that may have been left behind. A slight dressing of gas-lime at that time might also be beneficial in the same way. As you say, the quassia-water clears the bushes of the caterpillars, but it does not clear the soil of them.

CORRECTION.—For "tusan chikae," p. 799, in vol. xvii. of Gardeners' Chronicle, read "taisan chiku."

HOLLIES: W. C. The leaves are attacked by a saw-fly. Encourage the birds. We do not think any permanent injury will ensue.

LAWN DRESSING: M. B. Lawrence. At this season a mild kind of liquid manure may be used. In the autumn and winter a dressing of sifted clayey loam, with wood-ashes and sifted charred garden refuse, charcoal-dust should be applied regularly all over the surface, laying it on so that the tips of the grass can be just seen through it. The wood-ashes may be used in the proportion of one-tenth of the whole. Well-rotted farmyard or stable dung does good, but the effects are less lasting.

NAMES OF PLANTS: N. C. Veronica spicata.—A. J. B. 1, Peach-leaf-rotten; 2, Cherry, Late Duke; 3, Lychnis chalcedonica; 4, Galega officinalis alba; 5, Veronica spicata.—Kintore. Gentiana lutea, Lilium Hausoni.—H. C. W. Spurrey, Symphytum asperinum.—A. B. 1 and 2, forms of Dianthus carthusianorum; 3, Dianthus superbus; 4, Campanula grandis; 5, Campanula Hostii.—D. T. F. The so-called crown or mummy Pea, figured in Gardeners' Chronicle, p. 44, January 11, 1873, a fasciated variety. 1, Achillea Millefolium; 2, Orobanche minor; 3, Salvia verbenaca; 4, Myriophyllum verticillatum; 5, Prunella vulgaris; 6, Chenopodium bonus Henricus.—F. W. W. 1, Sedum album; 2, Sedum rupestre; 3, Sedum rupestre; 4, Campanula pulla; 5, Lysimachia nummularia; 6, Astrantia major.—Constant Reader. 1, Abutilon Megapotamicum, better known as A. vexillarium; 2, Ulmus campestris, variegated form; 3, Cœlogyne ocellata; 4, Dendrobium crumenatum; 5, Dendrobium mesochlorum; 6, Dendrobium chrysanthum.—Judy. Carnation W. Toby.—J. R. R. Lilium Martagon.—F. Y. 1, Colutea arborescens; 2, Euphorbia cyparissias.—J. T. The green form of Zebrina pendula, syn. Tradescantia zebrina.—T. R. Rosa lucida.—J. Heath. 1, Pteris longifolia; 2, Adiantum hispidulum; 3, Cyrtomium falcatum; 4, Asplenium bulbiferum; 5, Pteris cretica albobluata; 6, Asplenium trichomanes.—Germany (no letter). Dendrobium gratiosissimum; the other probably Phlox maculata var. candida.—S. H. W. The large Cattleya is C. Warscewiczii, commonly called C. gigas in gardens; the others, C. Mendeli and C. Mossii; No. 4 is also a good C. Mendeli; No. 5, Odontoglossum pulchellum, not Oncidium. The photograph duly came to hand. Many thanks.

NARCISSUS: J. H. T. The bulbs were subjected to bad treatment after they had flowered in January, 1893, the frost doubtless destroying the tender leaves grown in heat. They were weakened thereby, and failed to give strong offsets. The early forced bulbs should not be placed out-of-doors, and receive "no attention" till they are again planted. It is better practice to keep them in cold frames,

protecting them from frost, affording them water in moderation till the leaves mature, when they may be dried off, and the bulbs shaken out of the soil, and fully exposed for a week or two to the sun. A period of from one to two years should elapse before Narcissus are forced a second time. Your soil appears to be of a most unpromising nature, needing much amelioration by mixing it with garden refuse, burned earth, fine coal-ashes, strawy stable-dung, sand, &c. Cow-manure, either decayed or not, is of small value in such land, and to place it at the base of the bulbs in that or any other soil is a dangerous practice with Narcissus, which are plants that are injured by contact with manures. You would find decayed vegetable substances, leaf-soil, &c., much more suitable. Quick-lime would do your clayey loam some amount of good by its mechanical action if dug in before allowing it to slake. We do not think that the drought of 1893 caused any injury to the bulbs, the land being of too retentive a nature to be affected by it; or that the late severe winter was injurious. As you suppose, soot makes a good sort of top-dressing, containing, as it does, considerable quantities of sulphate of ammonia.

NARCISSUS, &c.: T. Bros. and W. W. The bulbs are affected both with mites and fungus, but the bulbs look so healthy that they may outgrow it with less manure.

PINKS: S. B. Your seedling white Pink is a little larger than "Her Majesty," and the habit you describe is an improvement.

SEWAGE DISTRIBUTION: D. W. C. McI. A broad feeding-canal should be made with puddled sides and bottom at the higher part of the field, to hold sufficient sewage to irrigate a large portion of the land. This should be made with a slight fall—say, half an inch in 20 feet. From this canal other smaller canals should proceed, at 12 to 15 feet apart at right angles, each being fitted with a sluice or penstock of an ordinary description in wood. It would be better to divide the field transversely with one or more feeding-canals, and make the intervening land quite level and true; then by allowing the sewage to run into the minor channels from the main feeder until it reached the top or the sides of these, or half an inch above them, the sewage would spread over the surface gradually and without any rush. By this system of shallow drains any part of the land could be saturated at will; and when sufficient moisture had been afforded, the supply must be cut off by closing the sluices. If the land is level, or nearly so, it will not be a difficult matter to irrigate it in the manner described. Very irregular or hilly land, which would cost heavily to level it and lay-out drains, could be irrigated by means of a collecting-tank and an underground system of iron pipes, the sewage being distributed from stand-pipes by means of a hose or a water-barrow.

TOMATOS: Treseder and W. W. Your fruits are attacked by a fungus known as "black spot." Remove each fruit as soon as the disease is noticed. Save seed only from healthy plants.—T. G. Your plants are affected with fungus. Burn all the affected plants at once, and spray the leaves with weak Bordeaux Mixture, taking care not to use it on any of the berries that are near the ripening stage.

TOMATOS NOT SWELLING: Nurseryman. Will you kindly send up samples of fruit from one plant that exhibits the undesirable peculiarity that you mention. We print your letter in another column, in the hope of eliciting the opinions of our readers.

TOMATOS SPLITTING: W. J. Excessive watering probably following on a period of drought. The same thing occurs in stone fruit, Melons, &c. We do not know anything of the peculiarity of Chemin Rouge.

TRUFFLES: G. E. E. There is a book in the French language by M. Chatin, which treats of the culture of Truffles. We would, however, advise you to make enquiries of the secretary of the Société d'Horticulture de France, Rue de Grenelle 84, Paris, who would be pleased to afford you information on the subject.

HILL & SMITH'S BLACK VARNISH,
 For Preserving Ironwork, Wood, or Stone.

REGISTERED TRADE MARK.

An Excellent Substitute for Oil Paint, at one-third the cost.
 This unrivalled varnish has for forty years given unbounded satisfaction, obtained a large consumption, and earned a high reputation throughout the kingdom. It requires no mixing, can be applied cold by any ordinary labourer, and dries in ten minutes with a perfect gloss. Fences periodically coated with it are effectually preserved from deterioration for an indefinite period.
 Price, 1s. 6d. per gallon at the manufactory, or 1s. 8d. per gallon, carriage paid to any railway station, in casks of 36, 18, or 9 gallons.
 Testimonial from CHAS. PATRICK, Esq., Cloughfold, Manchester (Numerous others):—"I have used your Black Varnish for upwards of twenty years, and find none to equal it in economy and quality."
CAUTION. EVERY CASK BEARS THE ABOVE REGISTERED TRADE MARK. Beware of Cheap Imitations.

HIGHLY IMPORTANT Sale of Orchids

BY ORDER OF
MESSRS. F. SANDER AND CO.,
St. Albans,

WITHOUT THE LEAST RESERVE.

CATTELEYA GIGAS, SANDERÆ, AND SANDERIANUM.

A FINE IMPORTATION OF PLANTS, IN PERFECT CONDITION.

We are pleased to be able to offer such grand plants. It is absolutely impossible to have a finer *Cattleya* than the one now offered. Although the major portion will probably turn out *Sanderæ* and *Sanderianum*, yet our Collector assures us that *Hardyanas* and *aureas* are among them. The *aureas* our man collected in flower are all offered in this Sale. (See Catalogue).

We fully expect plants will flower from amongst them similar to *Countess of Derby*, *Hardyana*, *Franconvillensis*, *Rochellensis*, *Hamar Bass's*, *Clarke's variety*, &c., &c.

Also a consignment of—

ODONTOGLOSSUM CRISPUM (SANDER'S TRUE PACHO TYPE).

Simply unapproachable for beauty.

These were collected from Mountains we have rented for the past eleven years, and from which all the very best varieties have been imported.

AT SO

DENDROBIUM STATTERIANUM,
D. PHALÆNOPSIS of FITZGERALD,
D. SUMNERII, and **D. MOOREANA**.

A new introduction will be included, besides

DENDROBIUM NOBILE,

Our FINEST LANG TANG variety.

CATTELEYA CITRINA,
LYCASTE SKINNERI, &c., &c.

MESSRS.

PROTHEROE & MORRIS

Have been instructed to Sell the above,

ENTIRELY WITHOUT RESERVE,

In their CENTRAL AUCTION ROOMS,
67 & 68, CHEAPSIDE, LONDON, E.C.

THE Gardeners' Chronicle.

SATURDAY, JULY 20, 1895.

A PRIMITIVE TOBACCO FACTORY.

CHINA is nothing unless she is primitive, and although the factory which forms the subject of these remarks is not exactly situated in Chinese territory, as it is in the Portuguese settlement of Macao, it is, to all intents and purposes, a Chinese factory, for it is owned and worked by Chinese. The premises comprise several large sheds with earthen floors, and one or two better built rooms, used as storehouses. The factory gives employment to several hundred Chinese men and women. I was accompanied on my visit by Mr. A. A. Pettigrew, a son of Mr. Pettigrew, of Cardiff Castle, who is at present (May) on a tour in the East. The tobacco is not grown at Macao, but at a place called Hokshan, about forty or fifty miles to the north-west of the former town, on one of the numerous mouths of the Sikiang, or Canton River. When the plants are properly dry, they are done up into bales about 2½ feet long, 2 feet wide, and 1 foot deep, and sent down to Macao in junks. On arrival at Macao, these bales are stored in the premises of the factory until such time as they are required for the manufacture of tobacco.

The first room we entered was devoted to stripping the leaves from the stalks, these being discarded in the manufacture. Women, sitting on the floor on their haunches, were busily engaged in this operation when we entered. The sight of us did not distract the women's attention, but several young children who were present on our arrival, scampered away to distant corners like mice into a hole. The dust from the tobacco leaves got into our noses and throats, and caused us to sneeze and cough, much to the delight of our celestial onlookers, as evidenced by the loud outburst of laughter which followed our discomfiture. Strange to say, we did not hear a sneeze or a cough from any of the Chinese whilst we were in the factory. After the leaves have been stripped from the stalks, they are carried into one of the sheds in large bamboo baskets by men, then spread on a wooden floor and damped with water. When sufficiently damp, they are made up into layers about 2½ feet long, 2 feet wide, and 2½ inches thick, and placed on boards. The next process is to make each layer into a solid cake. This is done in the following way:—About a dozen layers, with a board 1½ inch thick between each layer, are placed on the top of one another, and then pressure is brought to bear upon the whole lot by means of a lever of the second order, in the shape of a thick pole. One end of the lever is fixed firmly with strong ropes, and this constitutes the fulcrum; the weight or the resisting substance is the tobacco, and the power is applied at the other end of the lever by means of stout ropes, which pass round a wooden axle that is securely fastened to the ground.

When the tobacco leaves have been properly pressed, the cakes are taken out and cut crosswise into strips 4 inches wide, and the two ends cut off, as they are not sufficiently pressed. The next step is to tie half-a-dozen of these strips together by means of ropes. The next operation is to make the tobacco ready for use. This is done by means of a plane, very similar in shape to an English carpenter's plane. The strips of tobacco are stood up on end on the ground, and kept in position by boards made for the purpose. As the strips are only about 1½ foot high, the men have to work the plane in a half-stooping position, a most uncomfortable way of working from an Englishman's point of view. However, the Chinese do not appear to mind it, as they work away contentedly from morning to night. The shavings of the tobacco leaves are the tobacco ready for smoking. Every man puts his shavings, as he takes them from the plane, into small heaps, weighing about a pound each, enclosing at the same time a ticket with the name of the firm on it in the centre of each heap. These small heaps are then put into papers, the two ends of the papers being left open. The packets are then weighed, and a little more tobacco is added or taken away according to whether the packet is too light or too heavy. When the packets are of the proper weight they are put into another paper, both ends closed up, and then packed in boxes ready to be sent away. There is a good deal of order in the way in which the factory is worked. Women are only employed in stripping off the leaves from the stalks, men do all the rest of the work. There is one lot for damping and pressing the leaves, and another batch for cutting the pressed cakes into strips and tying them up ready for planing. The planers only make the tobacco and put it into heaps, a separate lot of men put it into the first papers ready for weighing. The men who weigh the tobacco pass it on to others, who put it into the second paper, and these finally hand it to the packers. The tobacco is of a dark brown colour, and is only used, so far as I know, by the Chinese. It has the reputation amongst them of being a particularly good brand, and the factory is said to be one of the largest in South China. It was very amusing to see the workers at 12 o'clock, as this is the time they take their mid-day meal. As soon as the clock struck twelve, everything stopped as if by machinery. In less than five minutes tables were produced from unlooked-for corners, basins of rice and other foods were placed upon them, and the men were busily engaged in emptying them by the aid of chopsticks. All the workmen took this meal in the same place as they had previously been working in. *W. J. Tutchet, Botanic Garden, Hong Kong.*

NEW OR NOTEWORTHY PLANTS.

THE GUADELOUPE CYPRESS.*

(*C. MACROCARPA* VAR. *GUADELOUPENSIS*, MAST.)

The late Prof. Serezo Watson described this fine Cypress as a distinct species, under the name of *C. guadeloupensis*, and perhaps rightly. It may

* *Cypripedium guadeloupensis*, S. Watson, in *Proc. Amer. Acad.*, xiv., 1879 (30).—"A widely-spreading tree, becoming 40 feet high or more, and 2 to 5 feet in diameter, with grayish-brown bark cleaving off in thin plates and leaving the thin inner bark with a smooth, claret-red surface; branches drooping, and branchlets very slender; foliage glaucous-green, the acute or acutish leaves very obscurely glandular on the back; cones globose, an inch or more in diameter, of 6 to 8, very thick, and strongly-bosset scales; seeds numerous, large, 3 lines or more. On Guad-loupe Island, off the coast of Lower California. Distributed as *C. macrocarpa* in Dr. E. Palmer's collection from that island. In cultivation about San Francisco, and likely to prove very valuable for ornamental purposes."

also, and, as we think, more correctly, be considered as a form of *C. macrocarpa*. The latter, known as the Monterey Cypress, has a very limited range of distribution on the Californian coast, and, to our thinking, the present is but an insular variety of the species, differing from the type more especially in its glaucous colour. It is true there is a considerable distance between Monterey in lat. 36° 4', and Guadeloupe, an island in 29° N.L., 200 miles from the mainland, with deep sea all around, but it is possible that intermediate localities may be found. At any rate, the presence of distinct characters is a common feature of plants growing on isolated islands. Our illustration (fig. 9) is from a specimen sent us by Dr. Franceschi, of Los Angeles, who can also furnish seeds. The illustration shows a portion of a spray with male flowers of the natural size, foliage and male flowers magnified. The cones are generally larger than here represented. For the sake of comparison we append a figure of *Cypripedium arizonica* (figs. 11 and 12), with a transverse section of the leaves of that species, and also those of *C. macrocarpa* (fig. 10). *M. T. Masters.*

FIG. 9.—THE GUADELOUPE CYPRESS (*C. MACROCARPA* VAR. *GUADELOUPENSIS*).

ENTEROSORA FAWCETTII, Jenm. n. sp.*

The only plant of this discovered was sent to me several years ago by Mr. Fawcett to determine. I saw at once that it was a true *Enterosora*, but it differed from the Guiana species in its much smaller size, hairiness and very slight sinuation of the margins. Having so little material (a single but fully mature plant), after noting the distinctions mentioned, I thought it best to leave it with E. Campbell, thinking it would soon be found again. It has not, however, been re-discovered. I therefore publish it, particularly

* *Enterosora Fawcettii*, Jenm., n. sp.—Rootstock pear-shaped, about one-eighth of an inch thick, oot, or very little, elongated, upright, densely coated with minute scales; stipites tufted, slender, brown, 3-4 inches long, densely clothed throughout with fine ferruginous hairs; fronds dull brown, simple, 3-4 inches long, 4-6 lines wide, coriaceous, linear-lanceolate, apex obtuse or rounded, tapering thence to the base, margins even or sinuated, upper surface slightly hairy, mid-rib covered by parenchyma, veins obscure, partly free, partly areolated; sori in single or partially double series, mostly medial, copious in the upper half of the frond, immersed in oblique slit-like cavities 1-2 lines long, which on maturation slightly open and reveal the erupting sporangia on the under surface. Jamaica, in woods at Rose Hill, St. Andrew Parish, on the slopes of the Port Royal Mountains.

as Mr. Fawcett, after careful examination of the specimens of *E. Campbelli* at Kew, writes me that he regards it, because of the characters just mentioned, as a distinct species. The Guiana plant has an elongated root-stock, which, though morphologically of similar character, is several times larger, quite glabrous, glossy, and bright coloured; more or less freely sinuated, occasionally forked at the top, and sometimes with a furcation, or jib-like extrusion on one or other side. The species now known are—*E. Campbelli*, Baker, slopes of Roraima, British Guiana; and *E. Fawcettii*, Jenm., Rose Hill, Jamaica. It is remarkable that this genus should have been discovered so late in the day in two well-explored countries, whose flora, fauna, and geology are so different, and which are so wide apart, much about the same time. Both species resemble in form closely *Polypodium trifurcatum*, L., which also grows in both countries, for which, without close examination, they would at once be mistaken. *G. S. Jenman, Demerara.*

HEMEROCALLIS AURANTIACA VAR. MAJOR, Baker.

This botanically comes close to the plant which I described in the *Gardeners' Chronicle*, 1890, vol. viii., p. 94, from the Royal Gardens, Kew, under the name of *Hemerocallis aurantiaca*, but it is larger in all its parts, and is the finest *Hemerocallis* I have seen. It has the firm, bright orange perianth-segments of the type, and like it, flowers later than *flava*, *Middendorffii*, and *Dumortieri*. The leaves are an inch or an inch-and-a-half broad, firm, and strongly ribbed. The perianth-tube is three-quarters of an inch, and the limb 4 inches long. The inner segments are 18 to 20 lines broad, and the expanded flower is 5 to 6 inches in diameter. It was imported from Japan by Meese. Wallace & Son of Colchester, and was exhibited at the Drill Hall on the 9th inst., where it obtained a Certificate. *J. G. Baker. (See fig. 14, p. 71.)*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT ROUNDHAY MOUNT, LEEDS.

The Orchid-house in Dr. Jessop's pretty garden near the fine Roundhay Park, are well situated, and their occupants have in Mr. Tyson, the gardener at Roundhay Mount, a careful and diligent cultivator. Seeing therefore, that Dr. Jessop himself takes a personal interest in his Orchids, it is not surprising that the collection affords a good example of successful cultivation. *Odontoglossum*, *Cattleyas*, *Lælias*, and *Dendrobiums*, are the species chiefly found, and in each department, uniform vigour, health, and freedom to flower are remarked. In the *Dendrobium*-house, the base of which is in part planted with foliage plants, *Palms*, *Begonias*, &c., the specimens of *Dendrobium Dalhousieanum* have made a grand show, one plant having nearly one hundred flowers. In addition, there were some beautiful plants of *D. transparens*, covered with their pretty blue-white and purple flowers; *D. Parishii*, and several of the 150 or so plants of *D. Phalaenopsis Schroderianum* which are here grown, were in flower. Some fine specimens of *D. thyrsoiflorum* and others of that class; together with a few *Phalaenopsis* added to the display.

In the block of span-roofed houses we found fine *Cattleyas* and *Lælias*, among the former being a large number of flowers on excellent varieties of *Cattleya Mceasia*; among these *C. M. marmorata* is a noble form of flower, with very large lip, that is marbled with rose and purple; *C. Schroderæ* is one of the most delicately-tinted and fragrant of *Cattleyas*; *C. intermedia* and other species were noted. Among the *Lælias*, *L. cinnabarina* was in flower, also a dark scarlet-coloured form of *L. flava*—a distinct and pretty variety. In the same house a fine plant of *Miltonia spectabilis radians*, and other *Miltonias* were remarked, a small stage being raised near the glass for *M. Roezii* and *M. Phalaenopsis*, both of which are in fine condition.

Passing to the group of *Lælia purpurata*, we found a good show of fine and dissimilar flowers—one

having enormous blooms. So beautiful are these forms of *L. purpurata* that they cause one to ask, when we shall get a new Orchid, either species or hybrid, which will be their equal? Another house had specimens in flower of *Cattleya Skinneri*, another old favourite difficult to excel; *Sobralia macrantha*, and the fine yellow *S. xantholeuca*; *Cattleya Aclandiae*, and a healthy collection of *Cypripediums*, among which *C. Rothchildianum*, *C. hirsutissimum*, some splendid *C. bellatulum*, *C. Godefroyæ*, *C. niveum*, *C. caudatum*, *C. Chamberlainum*, *C. Curtisi*, &c., were in flower.

The next house was occupied chiefly with *Cattleya Triandri* and other of the *C. labiata* class, some good *C. Mendelii* and *C. Schroderæ* being in bloom. An *Anguloa Clowesii* was carrying twelve flowers, a plant of *A. Ruckerii sanguinea* was very handsome, and specimens of *Dendrobium infundibulum* formed pretty objects. Overhead were sprays of *Odontoglossum citrosanum*, and some good plants of *Dendrobium Hildebrandi*, whose soft primrose-yellow flowers are always pleasing; *Saccolabium curvifolium*, a pair of *Rodriguesia venusta*, and some vigorous examples of *Vanda cœrulea*.

In the cool house a few fine spikes of *Odontoglossum crispum* and other *Odontoglossums* were noted, also some *Masdevallia Harryana* and *M. ignea*, *M. simula*, *M. bella*, *M. × Heathii*, and *Ada aurantiaca*; and in a slightly warmer house a fine display of orange-scarlet flowers on several strong specimens of *Epidendrum vitellinum majus*; *Oncidium concolor asperum*, with flowers as large as *O. splendidum*; a densely-flowered *O. cornigerum*, with six spikes; *Odontoglossum hastilabium*, and other *Odontoglossums*, and *Oncidium*s, and a healthy batch of *Miltonia vexillaria*. The conservatory was gay with *Lilies*, *Calceolarias*, *Pelargoniums*, &c.; and in the open garden, herbaceous and alpine plants fill the borders, and furnish the rockeries outdoors.

LUDDEMANNIA PESCATOREI.

We understand that the plant exhibited by Sir Trevor Lawrence under this name has since been determined to be a new species, and has been named by Mr. Rolfe—*Luddemannia triloba*.

TOMATO FRUITS NOT SWELLING.

In reply to the inquiry of "Nurseryman" regarding the above subject, vide p. 51 of the last issue of the *Gardeners' Chronicle*, I may say that continued observation in the cultivation of Tomatos has led me to the belief that no one cause in particular may be given for the non-swelling of the earlier fruits; but on the other hand that a variety of causes and circumstances combined, conduce to the same end. I believe one of the most prolific causes to be insufficient strength in the plants themselves, a circumstance in all probability due to the warm temperature necessary early in the year for the growth of these plants. Very frequently in the early stages the plants are allowed to become crowded, or a warmer closer temperature than is really needful or beneficial is afforded, and in either case the early trusses are generally of little use. But because the trusses are really put forth and the flowers expand, it does not follow that the wood is sufficiently mature to bring about the best results. In "Nurseryman's" case it is also in the "three earliest houses" that the non-swelling is most noticeable, a fact which appears to give weight to my view; while in the "later houses the bottom trusses are swelling off all right." Thus it would appear that the later-raised plants, with presumably less fire-heat and more sunlight and sunheat, have produced firmer, and therefore more fruitful, wood. Any foreign matter in the manure which would cause the plants to "turn black" in a few days after being planted would undoubtedly prove highly detrimental to the plants; but apart from this it is by no means uncommon for the two earliest produced trusses, when very low down, to be puny and small, while the third may prove of prodigious weight.

Light, again, is a most important factor, and all important so far as setting the fruits is concerned. For some eight or nine years past I have planted a row on each side of a wide house to go up the roof, trained near the glass. I have prepared the plants in various ways, sometimes planting from 4-inch and sometimes from 8-inch pots, with the first bunch already set, and some swelling the fruit. But at the side of the house there are 18 inches of brickwork before the wall-plate is reached, so that the first-set bunch will be about 9 inches below the wall-plate, and therefore in obscured light. Whether planted with plants out of large or small pots, this bottom truss is invariably a failure, but the first truss which receives full light is generally a large one. I have this season many notable instances of this. In the first 2-foot run of stem three trusses of flowers have appeared, the two first by reason of their position being always shaded, producing only puny worthless fruits; the third in full light, bearing from a

FIG. 10.—LEAF SECTION OF *C. MACROCARPA*. × 20. (SEE P. 62.)

FIG. 11.—*C. ARIZONICA*: SHOWING FOLIAGE AND CONES.

FIG. 12.—LEAF SECTION OF *C. ARIZONICA*. × 20.

dozen to eighteen fine fruits, weighing between three and four to the pound. This is not an isolated instance, but the invariable result noticed for some years past, and with different varieties. It demonstrates the great value of full light in obtaining a good set to begin with, and the fullest development afterwards. Wide houses, again, with several rows of plants across, are not conducive to a good set early in the season, unless abundance of space be given each plant; and a stinting of space is, I fear, the rule, involving loss of weight, and its consequent excess of growth of shoots.

Too much and too rich a soil, and too much moisture, are common causes of failure with Tomatos. One of the heaviest crops I have grown was planted in a cube of 6 inches of soil, on a greenhouse stage, with a thin layer of cow-manure on the bottom, the soil being beaten down firmly after the plants were put in. The stage was of corrugated-iron, and 3 feet 6 inches from the ground. The resultant growth was very firm, and abort-jointed, and fine bunches occurred in about every

7 inches of stem. The variety was *Chemin Rouge*, a splendid variety, that sets freely, and has fine bunches of fruit of a useful and uniform size. "Nurseryman's" plants, judging by their height at this early date, could scarcely have carried a good crop. But it will certainly not assist matters to stop the plants at 4 feet high, although such a proceeding would be quite right with a late batch, which may only have time to finish fruit at 4 feet high; but with a full season in view it is another matter. The extreme point of the growth is full of embryo bunches of flower-buds, and to remove the point at 4 feet high would only result in axillary growth, and such growths would attain a considerable length before they become fruitful again.

For some years past I have planted my earliest Tomato plants in January, the first batch rarely doing much good; they appear to set well, but seldom swell of a useful size, owing to lack of sunlight at this early date. I am satisfied if I get a good bunch on the stem at 18 inches from the ground, for if a bunch of rapidly-swelling fruit is got at that height, it tends to check growth usefully later on. Some growers bury a part of a rather tall stem by laying it on its side in planting, which I think is a mistake, since the Tomato, being a rampant grower naturally, is rendered more so by furnishing it with a greater number of roots in its early stages. A shallow narrow bed of rather poor and firm soil conduces greatly to a good early set; but the plants must not be neglected in any way, and once a good set is obtained, the plants benefit by liberal waterings, liquid manure, and a surfacing of fairly rich soil. Tomatos for planting in January should be sown at the end of September, and grown steadily on in as cool a temperature as is consistent with healthy growth, a long season of steady growth being an important factor in very early fruiting. J.

ROUND GHENT.

In the houses of M. L. De Smet-Davivier we noted recently *Anthurium M. Georges Montefiore*, raised from *A. Rothchildianum × sanguineum*. The spathe is rounded, the form charming, with blood-red spots beautifully shaded. The upper surface is covered with a cloud of dots, mixed here and there with spots. The lower surface is much more beautiful and distinct than the other, and bears large spots which almost entirely cover the whole surface. This is a very distinct *Anthurium*.

A fine specimen of *Aralia monstrosa*, which is becoming very rare, grows in the same house with a hundred pretty plants of *Livistona rotundifolia*, whose valuable decorative properties are well displayed. Few things are more charming than are these miniature Palms used for table decorations, baskets, &c. A very fine seedling *Croton* from *C. Disraeli × Hanburyanus* surprised me agreeably; the young leaves are very bright yellow in colour, exceedingly delicate, the end of the leaves and half the length of the borders of them are a pretty tone of green; the adult leaves are dark green, verging upon black, with the midrib and other veinings yellow, the petioles a fine shade of red. I noted a flowering specimen of *Tapeinotes carolina*, a fine old plant which deserves to be more widely grown.

M. L. De Smet-Davivier's garden suggested Italy, owing to the large numbers of *Bambusa aurea* there growing; these Bamboos should certainly take a more important place as plants for parks and gardens; they are also suited for indoor decoration.

At M. Jos. Boelen's establishment I admired a fine specimen of *Mitraria coccinea*, unfortunately much neglected now-a-days, and a good example of a variegated *Rhododendron*, the green centre of the foliage being surrounded by a yellow edge.

M. Ch. Vuylsteke has now some fine Orchids in bloom. I would mention *Mitroa vexillaria Empress Augusta Victoria*, of fine colouring; *Odontoglossum Harryanum*, with large flowers, the lips of which are of considerable size. The upper half is wide, and of an unusually pure white colour, the purple part of it veined with white, the yellow of the lower section of remarkable brightness.

The seedling *Odontoglossums* mentioned by me continue to grow well; they require special care, and dislike drought as much as they do excessive dampness. After seeing a fine *Cattleya gigas* I was shown a *C. Gaskelliana nobilis* with several flowers of a very delicate tint.

A plant of *Cyripedium Chamberlainianum*, which I have mentioned as flowering in the beginning of May, 1894, still bears two fine blooms on the same raceme, and there are buds promising future flowers. A specimen of *Odontoglossum Lindleyanum* deserves notice. It has twenty flower-stems with about six blooms on each; these 120 flowers are very bright in colour. Three fine samples of *O. minus* covered with flowers; *O. minus Holfordianum leriopertum*, an excellent variety with flowers of a very clear ground colour; *O. ornatum*, *O. elegantiae*, with a fine branching spike bearing flowers whose ground colour is greenish yellow, with a large spot on the sepals, and on each of the petals two small spots; and *O. macranthum* with very large flowers, complete my list of the Orchids now in bloom. *Ch. De B.*

FLORISTS' FLOWERS.

SOME NOTES ON TAKING THE BUDS OF CHRYSANTHEMUMS.

DOUBTLESS locality makes a great difference as to the best date for this operation, and the seasons make a great difference in results, so that the best calculations are liable to be upset in some particular. I like to get a good free growth for exhibition flowers, and allow the plants, with very few exceptions, to break naturally. As a rule, I have no trouble with the plants showing their crown-buds too soon; in fact, many of the incurved varieties are often too late, and this in a season like that of this year.

The best flowers of Queen of England I ever had were taken on August 4, 1891; the plants had grown very strong owing to having been kept indoors longer than usual during the very cold and late spring, but were not stopped in any way. In 1893 several of this class were cut back in May because they persisted in flowering instead of growing; they grew much weaker afterwards, as might have been expected.

I never find Lord Wolseley and Prince Arthur show too soon; in fact, the difficulty with these two varieties is to get them to show early enough. The best flower of Lord Wolseley I have had was from a bud taken August 23, 1892, and I find from my note-book three more buds were taken on August 30, and five on September 12 in that year; the latter, of course, were quite useless for exhibition. Last year five were taken on August 31, and did well; in 1890 the first three were taken August 26, and were good flowers.

The Princess of Wales family, in which I include Mrs. Heale, Violet Tomlin, Mrs. Coleman, and Miss Haggas, is very similar to the above in the matter of showing buds, &c.; many of the shoots during 1893 were not showing on August 31, and the flowers that set after that date are of no use for exhibition.

In 1893, I stopped Hero of Stoke, and such varieties early in May, and got a few very fine flowers in good time. I had not tried stopping before, and never got this family up to time previously, so that I am quite favourable to stopping these in any season; the best flowers I had were taken on August 31, some taken much earlier were quite useless, and I find them quite large enough for the centre row on the stands occasionally.

Lady Hardinge grew stronger and did better in 1893 than ever before, and the same may be said of Alf Lyne (buds taken August 7).

Madame Carrière showed bloom at every point in May, and had to be cut back like many of the Queen family. I afterwards got some fair blooms, but they were much inferior to those of the previous year when they were not cut down or stopped in any way.

The Japanese varieties in some instances show too soon, but as a rule they may be left to make a natural break. This section is not easily divided into families, and I will mention a few of the principal varieties.

Avalanche and Sunflower are classed together by some growers for stopping. I never find them show too early; my best flower of Avalanche in 1894 was taken July 29 with five others, and all of them did well; those taken later were much smaller.

Bouquet de Dame, taken on July 20, also August 9, were first-rate; Crystal Queen, taken on August 9 and August 22, were poor; Etoile de Lyon, taken on July 29, were almost white, but of good form; those taken August 22 and 31 were also good flowers, and perfect as regards colour—liberal feeding has much to do with the latter point in this variety.

E. Molyneux has almost failed this season. The plants were very healthy, and buds were taken on July 29, August 9, 22, 31; those on August 22 were the best, but were not full in the centre; in 1891, those taken on August 14 were first-class.

Florence Davis, taken on July 20, were very fine. L'Enfant des deux Mondes and its parent Louis Boehmer, should not be taken too early. Those taken on August 22 were the best here this season.

Mr. A. H. Neve, taken on July 20, was of no use whatever; others, taken on August 7, 15, 24, and 31, were all good, the latter having the most colour.

Viviani Morel had to be cut back early in May, owing to premature flowering; buds taken on July 20 and 28, gave fine large flowers, but without colour; others, taken on August 15, were perfect, but not so large as usual, owing to having been cut down.

W. H. Lincoln, taken on July 20 and 28, gave good large flowers, but pale in colour; and on August 15 proved the best date for this variety in 1893. *W. H. Divers.*

GERMANY.

AND THEY WERE NOT MISSED!—We read in Moller's *Deutsche Gärtner Zeitung* that the Darmstadt nurserymen and florists declined, to the number of thirty-eight out of forty firms there established, to take any part in a recent exhibition held by the horticultural society of that town; and, curious to relate, says the reporter, "nobody missed them." No one knew the reason for this wholesale non-participation on the part of the trade. Perhaps it was to show the Society that they were indispensable, and that without their assistance the show would be a failure. However, one good result of their refusal to show was a very lively participation of the nurserymen from a distance, and the show was rendered a much more interesting one than would otherwise have been the case.

A red *Maréchal Niel* Rose was shown. It is one of numerous seedlings raised by Dr. Müller, and is the result of a cross between *Maréchal Niel* and General Jacqueminot, a fact that is readily discoverable in the foliage and in the bloom, which is exactly similar to that of *Maréchal Niel*, excepting in colour—a beautiful deep red. Of all the seedlings from the selfsame seed-capsule, only this one possessed these striking attributes, the rest having a more or less resemblance to General Jacqueminot. This red *Maréchal* is not yet named; and may never receive a name from the raiser, who is no business man, but an amateur who finds his chief delight in the raising of new varieties; taking pleasure in them for a time, and then discarding them for a new favourite. He has the advantage over all others, in being in the sole possession of certain crosses of Roses which he can employ in obtaining still more remarkable results.

A YELLOW-COLOURED KAISERIN AUGUSTE VICTORIA ROSE.

We read that Mr. Peter Lambert, of Trèves, asserts that he has the above variety, but as yet it has not been exhibited.

A WHITE SPORT OF PAPA GONTIER ROSE.

Papa Gontier is essentially a variety for cutting for market, an almost perpetual flowerer, and very early in season. The sport possesses all the good properties of the type, and is likely therefore to be of great value to trade growers. It was found in the garden of a Frankfort-on-Maine nurseryman, and shown by Mr. C. P. Strassheim, of that city.

Papa Gontier is a vivid pink flower, centre buff, reverse of the petals reddish-purple. Raised by Nabonnand in 1882.

OLEANDERS.

These rarely cultivated plants, which are such excellent subjects for the decoration of apartments, were well shown in flower at Darmstadt by F. Classmann, Mayence. The vigorous healthy plants were abundantly flowered.

MARKET GROWERS AND SALESMEN.

THE memorable saying, "Something is rotten in the State of Denmark," has a manifest application to the fruit-growing community in Worcestershire. I have for some days been making an excursion through the rural districts of Worcestershire, and naturally I came in extensive contact with that industrious class known as the market gardeners. It is impossible to view without admiration the well-conditioned allotments which they hold, nor can you contemplate their energy without admitting that they are justly entitled to the practical sympathy and support of the British public. Strange to say, this, the season of "hope realised," is invariably acclaimed a season of dismay. They have watched the maturing process of their crops with glowing pride. Heaven for its bounty has been praised; but, alas! there remains a sting which warps and blunts their sense and enjoyment of human ecstacy. During the season these men despatch prodigious quantities of their produce to Manchester and other important northern markets. Here they come into the hands of commission agents, whose duty it is to sell to the general purchasing public. A few days later a return is forwarded to the sender, and it is this document, together with the accompanying pecuniary contents, that causes the grower the depression and heart-sickness to which I have referred. In almost countless instances the "proceeds" fail to meet the cost of gathering; in numberless others a balance remains against the grower, which he is expected to remit. These disappointments, together with sundry others of a like kind, are responsible for numerous and serious embarrassments which the market-gardening fraternity is perforce made to endure. Grievances of this character have so multiplied of late years that a serious problem confronts us. We must either kill the patient, long-suffering gardener, which would mean a huge national calamity, or we must cure the disease. It is deep-seated, some say, and on the surface ineradicable; but despite this the obstacles are not altogether insuperable. Let growers take heart of grace, show true manly confidence, and here, to a great extent, a solution of these disappointing experiences will be found. It has been suggested to me that the Government should be invited to appoint salesmen, who should be guaranteed a yearly stipend according and in proportion to their capacities. This stipend should be paid by the grant of a reasonable commission, together with payment of reasonable incidentals. I confess I do not like the principle. State interference would be cumbersome, and before it had been in operation long, it would be discarded as too costly and impracticable. Others suggest that the produce should be sold in the immediate home counties, but this contention is too absurd to be for one moment entertained. Large fruit-growing counties invariably have a yield tremendously in excess of local requirements; hence, it is apparent that a hard-and-fast rule of this nature would soon be regarded as infinitely worse than the present disease. The custom would be more honoured in the breach than the observance, and in the end, general demoralisation of the system would follow. The only effectual solution that the writer can discover in this: Let market-gardeners organise and form a sound association. Select from its membership honourable and capable men, and to these entrust your future success as growers. The difficulties that would at the outset bestrew their paths as salesmen would vanish entirely as time went on; mutual confidence, forbearance, and collective in-

terest would inspire them to succeed, and, that object attained, past miseries and disaffection would become effaced.—Yours, &c, INVE-STITATOR.

Powick, Worcestershire, June 29, 1895. *Manchester Guardian*, July 14, 1895.

AZALEAS AT WALTON LEA, WARRINGTON.

Our illustration (fig. 13) represents a profuse floral display in the conservatory at Walton Lea, and was taken from a photograph obligingly

There are some thirty varieties, among which were fine pyramidal plants of Duc de Nassau, 7½ feet high and 3½ feet in diameter, in perfect condition; Souvenir du Prince Albert, Stella, Duc de Brabant, Model, Flag of Truce, and Baronne de Vriere. The smaller plants consisted of Roi d'Hollande, Mdlle. Marie Planchon, Balsaminiflora, Illuminator, and others, all densely covered with bloom. The effect of such a display of plants, arranged as they were with good taste, was one calculated to leave a lasting impression on all who saw it. The conservatory was not the only house available to the public. They were allowed to walk

SPYE PARK.

WHILE on a visit last week to Mr. Perry, the gardener at this place, I was struck by the beauty of an extensive herbaceous border he had made and planted in the centre of the kitchen garden. This border runs east and west, and is about 130 yards long, and 8 feet wide. Choice Apples and Pears line both sides. This border forms a useful reserve of plants for cutting from, and there is nearly always something to be found in it of interest to the lover of plants. I noticed flowering profusely the lovely *Funkia grandiflora*, the odour of whose flower is very refreshing; *Achillea Ptarmica*, fl.-pl., so useful for

FIG. 13.—AZALEA-HOUSE AT WALTON LEA, WARRINGTON.

furnished by Mr. P. Wilkinson, Cliff View, Walton, Warrington. The following letter accompanied the photograph:—"For a number of years John Crossfield, Esq., of Walton Lea, has, at different seasons of the year, generously opened his gardens to the Warrington public, for the inspection of his varied collections of plants. On May 5 and 6 of the present year the public were so admitted to view the Azaleas, and some 5000 persons availed themselves of the privilege, myself amongst the number. The plants were arranged in the conservatory, a splendid span-roofed house 40 feet in length, 25 feet in width, and 20 feet in height, a temporary entrance being arranged to meet the necessities of the occasion. The plants were arranged in one large group in the centre and on borders about 4 feet wide, which run along each side of the house.

through the long range of plant and fruit-houses, one of them the famous Camellia-house 100 feet in length, and 15 feet 6 inches in breadth, containing splendid specimen plants of choice varieties. A good display of Orchids was likewise in bloom at the same time, and an admirable batch of herbaceous Calceolarias. Great credit is due to Mr. W. Kipps, the head-gardener at Walton Lea, who has for many years conducted the work in these gardens. It is impossible to visit these beautiful gardens without a feeling of indebtedness to Mr. Crossfield for his consideration of the Warrington townpeople, and I think in admitting them to his place he sets an example which many other possessors of fine gardens in the neighbourhood of large towns might follow with advantage to all engaged in horticultural pursuits.

cutting; *Chrysanthemum maximum*, growing wonderfully strong, with numerous flowers, which were of unusual size; *Henckera sanguinea*, *Bocconia cordata*, a tall *Cephalaria*, with straw-coloured flowers; *Epilobium*, flowering profusely; *Campanulas*, of various species; *Carnations*, *Mignonette*, *Dahlia*, &c. All the plants were growing with amazing vigour, and flowering profusely.

Choice Lilies, *Gladiolus*, which were showing flower very strongly, fill the spaces between the herbaceous plants.

Mr. Perry finds Cole's Blood-manure very beneficial to these subjects, and he uses it as a top-dressing for beds of Lily of the Valley, *Deutzias*, and *Spiræas*.

There is a good show of fruit generally; and the houses afforded a rare show of Grapes, Peaches, and Figs. *W. A. C., Compton Bassett.*

BOOK NOTICE.

PFLANZEN KRANKHEITEN DURCH KRYPTOGAMISCHE PARASITEN VERURSACHT. By Dr. Carl Freiherr von Tubenb. (Berlin, 1895.)

A work of nearly 600 pages of closely-printed matter on the subject of plant-diseases caused by parasitic fungi, may appear to many as, of necessity, either encyclopædic and too full of details, or superficial, and abounding in wordy treatment; as a matter of fact, whatever the faults of Von Tubenb's book, it avoids both the extremes mentioned. It is a very soberly written and fair digest of the voluminous literature which has appeared in Germany since De Bary's fine treatise on fungi started the series of works, of which Brefeld, Zopf, Hartig, Frank, and Sorauer are the most important, in a domain in which Berkeley was one of the best pioneers, as well as one of the hardest workers and clearest thinkers. Berkeley's chief work in vegetable pathology appeared in these columns.

It is a very common plan in German text-books to deal with subjects of this kind in two parts—"General" and "Special," and such is the case here. In the first part (*Allgemeiner Theil*) an attempt has been made to re-cast the usually-accepted classifications of the mode of life of fungi under the headings Parasitism, Mutualism, and Nutricism (for only by this barbarous equivalent can we consistently render the word chosen), and, we think, with but scanty success, for the efforts to draw sharp lines between the various stages of parasitism displayed by fungi of different species, or by the same species under different conditions, can rarely be maintained.

For instance, Von Tubenb substitutes for De Bary's classification of parasites and saprophytes into (1) Obligatæ Saprophytes; (2), facultative parasites; (3), obligate parasites; and (4), facultative saprophytes, the following (1), Pure Saprophytes; (2), Hemi-saprophytes; (3), pure parasites, and (4), semi-parasites, without in any substantial degree improving the classificatory value of the substituted terms. Indeed, his own account shows that the new terms break down as hopelessly as the old ones before cases like *Mucor* and *Penicillium*, which behave as if they were parasites on ripened fruits, or *Botrytis* forms which can penetrate young tissues when the mycelium has attained a certain degree of vigour, and accumulated sufficient poison or enzymes to start an entrance by nestling in the first few cells it is enabled to kill.

Nothing is gained here by calling the fungus a half-parasite instead of a facultative parasite; and indeed the latter term is the better, for it expresses more nearly the real state of the case. The further discussion of the mode of life of parasitic fungi is happier, and the author has brought together an interesting series of new facts, published since the treatment of these phenomena along similar lines by Zopf.

In the section on mutualism, again, we are driven to the conclusion that Tubeuf is striving after a refinement of terminology, which obscures rather than illuminates his subject. He regards the classical case of the symbiosis of Lichens as met by the term individualism, because the result is a living being "which in its form, life-requirements, and mode of living is completely new, and differs entirely from the two components." But this savours of a mere playing with words, and, we think, with words singularly ill-chosen to play with.

That the author is right in distinguishing such cases of symbiosis as those of the Lichens, Witches' Brooms, and so forth, from the cases of Mycorrhiza and the leguminous tubercles, may be at once conceded. He does this by laying stress on the view that in the latter one of the symbiotic organisms serves especially for the nutrition of its host—a.g., the fungus of Mycorrhiza is regarded as bringing organic food-materials to the root it dwells on or in, and the organism of the leguminous nodules is digested by the host plant.

The sections most interesting to the "practical man" will, no doubt, be the chapters v. to vii., dealing

with prediagnosis to infection, methods of combating the diseases, and the practical significance of fungoid diseases. The author insists on the hopelessness of individual efforts to combat diseases which are widespread over areas where apathy or ignorance prevent co-operation; and urges, with considerable force, the necessity for experimental stations, museums, and means for educating the public in the technical matters here concerned. He then enters into the prophylactic and therapeutic aspects of remedies and measures; and, among other illustrations of the efficacy of treatment thoroughly carried out, quotes the following, without, however, discussing the secondary effects. Of two parks in Munich, there is one where the leaves are always removed, whereas they are left on the ground in the other: as a consequence, *Rhytisma acerinum* never appears in the former, but is spread all over in the latter, a fact easily explained by the habits of the fungus. The treatment of wounds in trees, based chiefly on Hartig's results, also comes in for lengthy discussion.

The agriculturist and horticulturist will probably be disappointed to find so little said about spraying of foliage with powders and liquids, but the three pages or so devoted to the subject abound in good sense. Possibly, over-caution is noticeable about details, or it may be, the author has not fully considered the voluminous literature from America and elsewhere, or has not been able to make up his mind about the results. Rumm's experiments with Bordeaux Mixture, and his idea that the action is due to the copper and is electric in nature [so says the author; but Rumm concluded the action is probably chemotactic] are mentioned, and further on in the book, reference is also made to Frank and Kruger's recent attempts to show that some mysterious chemotactic action occurs to account for the decidedly beneficial action on Potatoes.

Our own opinion is, that much remains to be done along this line of investigation, but one piece of advice is perfectly sound, namely, that spraying must be done with the fullest knowledge possible of the habits of the fungus to be fought, and no mere dates or general directions for the application of these mixtures will suffice.

We may interpolate here what is not sufficiently dwelt upon in the book, namely, that what Rumm and Frank and Kruger find is that the copper-salts affect the host plant, apart from any action on the fungi, by increasing the chlorophyll and the manufacture of starch, by accelerating the maturity and weight of the fruit (Vine) and tubers (Potato), and by diminishing the rate of transpiration. On the other hand, experience alone can decide as to the effect of accumulating copper in the soil, and there is probably no question of greater importance for agricultural and horticultural committees who have experimental grounds and expert advice at their disposal, to investigate further.

In the special part, which comprises all but 120 pp. of the whole, the plan followed is the simple and effective one of taking the principal groups of fungi, and treating of their parasitic representatives. In the main, Brefeld's classification is followed. An interesting section on the Chytridiaceæ, in which fully acknowledged advantage has been taken of Fischer's and Schröter's recent monographs, opens the work, and then follow the Oomycetes, in which the far too short paragraph on the Potato disease will prove the most interesting. The fungus has no oospores, but the mycelium passes the winter in the tubers, a view combated by Böhm, who maintained that we are completely ignorant of the way it winters. This fungus has been found on *Solanum muricatum* in Ecuador, and has been infected into *Solanum caribense* and *Petunia hybrida*. It also occurs on the Tomato. The use of Bordeaux Mixture is recommended and defended.

Passing to the higher fungi, the Ascomycetes first receive attention, and a very complete account of the Exoascæ and Witches' Brooms, pockets, &c. produced by them is given; Sadebeck's recent work being laid under full contribution. The mildews (*Erysiphææ*) and Nectrias and other Pyrenomycetes

follow, including interesting but abort paragraphs on *Epichloë* and *Claviceps*. Under the Discomycetes, a considerable share of attention is given to Woronin's *Sclerotinia*; and Hartig's account of the Larch disease is accepted in its entirety. The advice given is, Larches in the low lands (i.e., as contrasted with its native alpine heights) should be planted only in airy situations, not in close plantations, and never in the neighbourhood of already-diseased trees.

The Ustilaginæ receive a very full treatment, based on Brefeld's work, and the section on Uredinæ is very interesting, owing to the large amount of attention this group has attracted lately at the hands of Erikson, Klebahn, Plowright, Tubeuf himself, and others.

The different varieties of *Puccinia graminis* are fully given according to Erikson & Henning's recent work (1894), which affords a new glimpse of the complexity of the problems of heterocism among these fungi. Similarly with the Gymnoangium forms, to which also a good deal of attention has been directed of late. Tubeuf has himself worked specially at these forms, and he here gives a very full account of the group, with lists of the varied results which different authors have obtained by sowing them on the various Pomaceæ on which they are heterocisms. This section is both interesting and important, and again serves to open up wide vistas in this difficult domain of mycology. Of course, the Witches' Broom on Silver Fir, &c., due to the well-known *Æcidium abietinum* receive attention; as do all the principal fungi which attack Conifers and other trees. Many of these latter, especially those which destroy timber, are Basidiomycetes, and Tubeuf has introduced photographic reproductions here—as elsewhere in the book—with marked success.

The systematic or "special" part ends with a short categorical treatment of the "fungi imperfecti," and phytopathogenic schizomycetes and Algæ.

On the whole, the author is to be congratulated on having produced a book which is decidedly in advance of any of its predecessors, and which must be regarded as the most complete compilation we possess on the subject. The style is clear, and the print excellent. Fault may perhaps be found with the inequality of the discussions; for instance, the Potato disease is disposed of in two pages, while more than twenty are devoted to *Gymnoangium*; but such a matter depends on the point of view, and it is not difficult to conclude that the author is especially interested in morphological questions. Be this as it may, however, there can be no doubt that the work is a useful and valuable contribution to science, and will be welcome in all botanical libraries. *H. Marshall Ward.*

THE HERBACEOUS BORDER.

SINGLE AND DOUBLE-FLOWERED PYRETHRUMS.

A USEFUL hint in regard to the above popular and free-flowering group of plants is that given by the Messrs. Kelway—now is the time to plant. Indeed, it is more than useful, it is valuable, and especially so to those who would have fine flowers for the year that follows. But the planting of such things in Midsummer, with the soil dust-dry in some districts, 2 or 3 inches deep, involves a certain amount of risk, and probable losses. The latter, however, may be reduced to a minimum by only planting well-established pot-plants, not starvelings, that have no vigour remaining, but such as have been specially prepared during the past spring for planting during the present season. There are many, I am aware, who adopt the rough-and-ready practice of dividing these Pyrethrums with a spade at any convenient time. My own experience goes to prove that there is nothing to be gained by planting large clumps of these plants, or even by cutting them in halves; on the contrary, such a practice invariably results in blossoms inferior in size, and these by no means represent the flowers in their best form. I have

tried several ways and different seasons, but find none so equal that of dividing the plants into small pieces of, say, three or four crowns each, and potting them into pots of large 60 size; then place them in a cold, close, well-shaded frame for a short season till new roots and fresh growth are both apparent. In a month, all being well, they will be ready for planting out again. This operation is best performed in the early spring, when about 4 inches of new foliage has been made, and when the dividing has been carefully done, the losses are very few indeed. Following this practice, I have propagated many thousands of these plants. In precisely the same manner these plants may be increased in summer-time after flowering is completed. At the latter date the plants should be cut down to within 6 inches of the ground, and when new leaves spring from the tufts, lift and divide them in the way recommended above. The plants resulting will be ready by the middle or end of August, and should be planted out without delay. Such plants, of course, will not be capable of producing results in the ensuing year equal to those earlier planted, and for this reason, and the saving of a season's bloom, the spring-propagated plants are much the best all round. If possible, get these into their permanent positions by the end of May or early in June. Autumn-planting for these Pyrethrums cannot be generally recommended, and on cold or clayey soils they frequently dwindle and die; and, singularly enough, on heavy soils, the plants frequently become a prey to a small black slug, that demolishes every leaf as soon as it appears. In this manner I have known whole beds to be wrecked during winter-time, the slugs working unobserved in the tufts, in defiance of the usual preventive measures taken to keep slugs in general in check. It is a good practice to surround the plants with coal-ashes, as a preventive of the ravages of slugs. When planting at whatever season, the soil must be deeply worked and heavily manured; and to secure the best results and finest flowers, divide and replant every two years. J.

THE ROSARY.

THE COUBERT DOUBLE WHITE ROSE.

We had occasion recently to mention this Rose as growing at Kew. It is a form of *Rosa rugosa*, of relatively dwarf stature, and large double flowers of great substance and snow-white lustre. From an article in the *Journal des Roses* by M. Grosdemange (November, 1894), it appears that this Rose was raised by M. Cochet-Cochet at Coubert, hence the Rose has been called "Blanc double de Coubert." It is a most desirable introduction, well suited for beds, shrubberies, or corners.

VARIORUM.

FLOWERS OF THE NORTH-WEST PRAIRIE.—

On this vast, this seemingly interminable prairie of the Great North-west Territory of Canada, the flowers are truly beautiful and various, and to the true lover of Nature are things of beauty and joys for five months of the year, from the time (May) when that sweet harbinger of spring, Anemone patens, puts forth its light blue cups, not sparingly but by thousands, till September, when the lovely *Gentiana acaulis* (?) and stately Sunflower are in full glory; the colour of the former being blue as the heavens above it, and the latter brilliant as the yellow sky round the setting sun. The season of these Anemones—here erroneously called Crocuses—is somewhat short, as the flowering is over, and the fluffy heads of seed ripen by the beginning of June. But this rapid maturity is not peculiar only to the Anemone, for all vegetation in this land of extreme heat and cold is the same; its appearance is sudden, and the growth to the ripening stage simply prodigious. As the Anemones fade away they are followed in rapid succession by several kinds of Ranunculus, all being

of a dwarf habit, none so tall as the familiar Buttercup of the meadows of the Old Country. Then appears, mostly on high ground, in compact clumps, a very low-growing plant, which bears a profusion of pure white, almost square-shaped flowers, which are evanescent, however, for they last but a week or so. At the same time may be found, growing in more humid soil, the yellow Lupin, its bright flowers being conspicuous from quite a distance. Where the land has been "broken" (ploughed), this plant is almost sure to appear, and continues flowering for several weeks; it produces seed freely. Never shall I forget the delight and surprise I experienced when I first came during a botanical ramble upon a fine clump of *Cypripedium*, bearing ten fully-developed flowers, and as I looked with admiration upon this lovely wildling, with its Orchid-like beauty, it seemed to me to be hardly possible, knowing that but a few weeks before the ground under its roots was frozen solid for several feet down, that it could retain its vitality in such trying circumstances—of such are truly the wonders of Nature.

Just now (June 25) the Roses and Lilies—of which latter, however, I have only met with one variety—are the most conspicuously beautiful; of the former, there are some so dwarf that they almost rest upon the ground, while others are several feet high, their natural growth having almost the appearance of trained standards. The colours of these Roses vary from the purest white to a dark rich red; some are variegated, like the old York and Lancaster, but all have about them a most delicious perfume. The fruit, which is produced in abundance, and of several shapes, from perfectly round to very long oval, while some of them are round, with the exception of the top, which is perfectly flat, somewhat like a Medlar. All of them become the food of the prairie chick, and the bluff partridge. The large oval fruit, when fully ripe, can be made into a very nice preserve; this I know from practical experience. The flowers are from 1 to 2 inches in diameter, the petals lying wide apart, so that when fully expanded they are quite flat. As I have said, I have met with but one variety of Lily, which in shape, size, and colour, though somewhat brighter and lighter, with brown spots at the base of the petals, much resembles the *Vallota purpurea*, but unlike that handsome plant, the leaves are all produced on the flower-stem, like most other Lilies.

Of Vetches, there are several varieties to be met with on the prairie, all bearing purple flowers, with one exception, which is white, and much larger; they grow from 1½ to 2 feet high. Then there is the "Fairy Flax," which, however, does not "open" till the month of May, for it does not come to us till June is half over, when its delicate, fragile flowers expand in great profusion. Of Violets, we have two varieties, the white and the purple, the flowers and foliage being much larger than those of the Old Country; but, alas! they have no fragrance to waste on the desert air, or awaken fond recollections in the heart of the lonely settler, for they have not even a suspicion of perfume. Then come the bold-looking, erect, handsome *Harpaliums*, their rich yellow and brown flowers forming a strong contrast to the elegant, lightly-poised flowers of the ethereal *Harebell*, which may generally be seen growing in close proximity to its more robust sisters. Two varieties of *Aquilegia* are to be met with here, a dwarf and a giant; the foliage of the former is simply exquisite, being quite as beautiful as Maidenhair Fern; but the flowers are insignificant. The tall giant variety is to be met with only in the "bluffs" (woods or bush), where it grows to the height of 4 and 5 feet; the foliage, though like that of its little sister just mentioned, is very much larger, and of greater substance, and although handsome, is comparatively coarse; its flowers, also, are no great attraction. The Daisy we have—not the "wee crimson-tipped flower," but a pure white, with several flowers on each stem, which is sometimes 4 or 5 inches long. Of elegant Meadow-sweet there is an abundance, scenting the air with its fragrance. *Pyrolas* abound in moist shady places, their round, broad, firm leaves, and charming Lily-of-the-Valley-like

flowers frequently covering the ground to the exclusion of all other plants. Auriculas, also, where the ground is humid, but exposed to the full sun, are to be seen by hundreds in one place; the foliage and flowers, the latter of a light purple with yellow centre, are smaller than the varieties in cultivation, but they have the characteristic of their petted sisters of being powdered. There are to be seen wide patches, extending several yards across, of a beautiful miniature white Everlasting-flower, which when gathered when just in full bloom, will remain fresh and firm for years. I have some such which I gathered four years ago, and they are as white and perfect as when first taken from the prairie. T. S. J.

PLANT NOTES.

HEUCHERA SANGUINEA.

In this very droughty season, the above pretty herbaceous perennial is exceptionally free in flowering. I recently observed a nice healthy batch of it growing with great freedom amongst the many useful things to be found at St. Clare Gardens, Kemsing, the seat of Sir Mark Collet which gave me a more favourable impression of the plant than heretofore. Its deep-red flowers on stems 1¼ to 1½ feet high had a quite charming effect in the mass. The gardener at St. Clare's spoke highly of it as a pot plant for the conservatory and greenhouse, and of his intention to grow a good number in pots another season. The plant is readily increased by taking the side-shoots and dibbling them into a sandy compost under a handlight, or by severing the young rooted shoots and planting them on a north border at about 1¼ feet apart, to be lifted and potted at a later date. A native of northern Mexico, introduced in 1832. H. Markham.

NURSERY NOTES.

ALLINGTON NURSERIES, MAIDSTONE.

For many years, with unwavering determination, Messrs. G. Banyard & Co. have been adding to their already extensive fruit nurseries, till at the present time it may be safely said to contain one of the finest collections of fruit trees in the world. The thousands of young trees, clean, healthy, and free of growth, found in the Allington Nurseries of the firm must be seen for their general excellence to be comprehended. The area under fruit trees is upwards of 100 acres, and the 20 acres recently added have been trenced two spits deep, and are well filled at the present time with healthy planting stuff. The trained Peach and Nectarine trees are examples of good management, and being worked on a free-growing variety of stock, any of them would, with due attention, quickly cover a large space on high walls or trellises. There are 50,000 trained trees in the nurseries, exclusive of cordons. Almost every known variety is kept in stock, but only the most approved varieties are extensively cultivated.

Apples were remarked as planted in "drifts," ranging from 30,000 to 70,000 in a drift, and the wood is vigorous, the foliage ample and of good colour, and in many instances well studded with flower-buds. In one square I observed 38,000 dwarfs worked three years ago, which were in most cases carrying a capital lot of fruit that promises to grow to a fair size. It is a matter of surprise how well these miniature trees fruit, and how bright the colour of the fruits, more so indeed than from some trees that are cultivated in pots. Plums and Pears are extensively grown, but the latter not in such large numbers as Apples and Plums.

One might reasonably have imagined that the drought would have crippled the growth of many of the young trees, but this is not so, the numerous fibrous roots penetrating the soil in every direction, enabling the plants to grow unchecked. Owing to

the regularity of the planting, a horse-hoe can be used between the lines of trees, and, as a fact, it is constantly at work, keeping a crumbly surface and killing weeds. This fine tilth preserves the moisture in the soil.

A fine plantation of Roses, consisting of some 10,000, was noted, which, as regards the Hybrid Perpetuals, passed through the winter without a plant being any the worse for the hard and long frost. The Teas suffered severely, especially those budded as standards, dwarfs escaping largely where covered with snow. Many new varieties of fruits from all parts are being grown for trial. H. M.

TREES AND SHRUBS.

HEDYSARUM MULTIJUGUM.

This plant has naturally a loose straggling habit. The leaves scarcely exceed 5 inches in length. The racemes are erect, loose, with fifteen to seventeen flowers, generally fewer; each flower is about $\frac{3}{4}$ inch long, violet or rosy-lilac, becoming blueish as it withers. The pod divides into three or four, flattened, orbicular disc-like segments thickened at the margins, and with tooth-like projections from the sutures, and from the centre of the valve of the carpel. We have now seen specimens from Messrs. Barbier, of Orleans, the Royal Gardens, Kew, and the Botanic Garden, Cambridge, all substantially alike, and in accordance with Regel's figure.

COLONIAL NOTES.

THE GOLD COAST.

We learn from the *Kew Bulletin* that Mr. C. H. Humphries has been appointed to succeed the late Mr. W. Crowther as Curator of the Botanic Garden at Aburi. Mr. Humphries has had three years experience in the tropical department at Kew, and had previously been with Messrs. Kelway & Sons for nine years.

SAINT LUCIA.

Mr. J. C. Moore has received the appointment of Curator of the Botanic Station, St. Lucia, West Indies. Mr. Moore was employed before entering at Kew at the gardens, Broadlands.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

FIG TREES: THINNING THE FRUITS.—It will be necessary where the fruits are numerous to thin them, so as to obtain good size and fine quality. First, those which are mis-shapen from any cause should be removed, then all undersized and late ones. Continue to remove superfluous shoots, so as to admit sunshine to the fruits, and to the shoots reserved for fruiting next year. All foreright shoots should also be cut away, and short-jointed, sturdy growth laid-in in sufficient number to duly cover the wall-space without crowding.

THE BUDDING OF STOCKS.—At this season budding may be performed if a number of suitable stocks have been prepared. The best buds will be found on half-ripened shoots of middle size, wood-buds, that is, such as will produce a shoot only, being taken. Such buds are readily distinguished from bloom-buds by their more elongated and pointed in shape. Be careful to choose healthy, free-growing shoots, and not to take them sooner than they are wanted for inserting in the stocks. Of course, if they have to be sent to a distance, the shoots should be bundled up in damp moss or the like, and when unpacked, they should be immersed in water for a few hours before making use of them. The budder must be provided with a pail or watering-can in which to place the shoots, standing the butt-ends in the water, having first cut off the blade of every leaf, but retaining the stalk. This latter will serve to protect the bud a little, and is useful as a handle wherewith the bud-shield may be pushed

into place. Having cotton, soft rafia, or Russian bast, cut into suitable—say, of $1\frac{1}{2}$ feet—lengths, one or two knives, and a bone, in readiness, select a suitable bud, and, commencing at its lower end, cut a slice of bark and wood about $1\frac{1}{2}$ inch, or slightly less, in length, with the bud occupying the middle point; then carefully remove the small portion of wood left in the bark by inserting the end of the knife-handle at the proper upper end of the bark, bend back the slip of wood, which, if the shoot be in a suitable condition, will readily separate, leaving no depression or pit beneath the bud. If a pit be left, the bud is useless. Having made the bud, cut a slit lengthwise in the bark of the stock about 1 inch in length, and at any desired height from the ground; make a cross-cut at the top of the slit, raise the bark a little on both sides with the knife-handle, insert the bud at the point where the cross-cut is made, and push it gently but firmly to the bottom of the slit, cutting off any of the shield which may overlap the cross-cut, and bind-in the bud firmly with bast or budding-cotton. The ligature will require to be loosened in about one month afterwards. The stock should not be cut back till the autumn or winter, when it may be removed all but about 6 inches above the bud; and in the following summer, when 10 or 12 inches of growth have been made, this snag may be cut off close to the young shoot.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

FERNS.—These plants should now be afforded water in abundance, it being almost impossible to afford too much if the pots are filled with roots, and the plants growing strongly. Weak manure-water, applied twice a week, will do them good; and some much diluted soot-water, now and again, will be found to keep the fronds of a good green colour, especially if applied to such as have not been repotted this year. When there is a large call for the fronds of *Adiantum consutum*, a good number of the plants should be placed in a frame facing the north, choosing those which have nearly finished their growth. This cooler treatment will tend to harden the fronds, and they will last much longer when cut than those not so manipulated. Tree Ferns should be examined occasionally for thrips, or the fronds will soon be spoiled. Sponging them with weak tobacco-water is one of the best and most effectual means of ridding the plants of this pest. [Vaporising with XL All is likewise safe, and a great saving of labour. En.]

ORANGE TREES.—Those trees which have set their crop of fruits may be freely syringed overhead, afforded liquid-manure occasionally, and ventilated freely. All rank shoots, and such as if left would tend to spoil the symmetry of the crown, may be cut-in. Any trees infested with aphid should be well fumigated, and the leaves cleaned by sponging with soapy-water; afterwards, occasional syringings will keep them clean. Scale is sometimes very disfiguring to the trees, and must be got rid of by washes. Trees that were not repotted or retubbed should be examined as regards the drainage, and top-dressed with rich sandy loam after removing the old soil. It will do the trees no harm, but rather good, if they are stood out-of-doors till the end of August. If they have been growing in shaded houses, it will be advisable not to put them at first in full sunshine, although they will be able to bear it after a week or two of exposure.

BAMBOOS.—If these are grown in pots, they may, if space be required in the conservatory for other things, be put out-of-doors, as for instance, in the sub-tropical garden, plunging the pots in the beds or in the turf, but finer growths will be made if they are left indoors. Bamboos require plenty of water at the root, and a top-dressing afforded every fortnight of Clay's Fertiliser and soot. Bamboos make good-sized bushes when grown in comparatively small pots; but if large plants are wanted, they must have good-sized pots, and the present is a good time for repotting. A suitable compost is made of fibrous loam, peat, leaf-soil, $\frac{1}{2}$ -inch bones, and charcoal. A few suitable species for pot culture are *B. arundinacea*, *B. mitis*, *B. striata*, *B. violascens*, *B. Simonis*, and *B. nana*.

SCENTED-LEAVED PELARGONIUMS.—These plants are general favourites, and very useful for conservatory and other uses. Small young plants may be potted into 48's and 32's and stood outside, and when the pots get filled with roots, stop the shoots by nipping off the points to give the plants bushiness.

FANCY, SHOW PELARGONIUMS, &C.—Put in cuttings of these, choosing for the purpose shoots that are half-ripened. In the cutting-pots use sandy loam and leaf-soil, and place them in a cold frame close to the glass, keeping the frame close until roots are made. The old plants, after the cuttings have been taken, should be stood in a sunny place out-of-doors, and kept somewhat dry at the root for a time, pruning them hard back towards the end of next month. A number of Ivy-leaved Pelargoniums may now be potted, and have three or four stakes put to each, around which the shoots may be trained. Keep the flowers pinched off till within a few weeks of the time that they are required to flower.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

CATLEYAS AND LÆLIAS.—In a representative collection of *Catleyas* and *Lælias*, there is scarcely a week in the whole year in which there is not some species or hybrid in flower. At the present time the *C. Eldorado* in variety is attractive. The flower-sheath he come up together with the new growth, and by the time the pseudo-bulbs are quite formed, the flowers have pushed up out of the sheath. The blooms, when open, have a delicious fragrance, and in a dryish atmosphere they will last in beauty for several weeks. While the plant is flowering it needs careful watering, as too much moisture afforded at this time causes the fleshy, half-matured growth to decay; and this not seldom ends in the loss of the plant. On the other hand, the plant should not be kept dry at the root, but should receive just as much water as will keep the compost slightly moist, and much less moist when the blooms are cut, and the new pseudo-bulbs fully made up. *C. Eldorado* and its varieties, *splendens*, *crocata*, and *Wallisii* have often been imported, but artificial cultivation does not agree with them for many years together. For several years past our plants have been grown with the Mexican *Lælia*, but their progress has not been quite satisfactory. When they began to grow last April they were experimentally placed in a warmer-house, where an even atmosphere is maintained, and kept more closely shaded than before. The result was that every plant, even those that were fast deteriorating, greatly improved, and scarcely a growth failed to produce flowers, the majority of which carried from two to four good-sized ones. On the completion of growth they will be placed at the least warm part of the *Catleya*-house. New roots will push out from the base of the flowering-bulb in a few weeks time, and the old roots subsequently throw out a quantity of short rootlets. It is at this time that repotting should be performed if any of the plants stand in need of it. *Catleya gigas*, *C. Dowiana*, *C. D. aurea* and *C. rex* may also be repotted soon after the flowers fade. After repotting any of these plants, water should be very sparingly applied, just enough to encourage the roots to grow and to preserve the old ones in health. When re-established gradual exposure to the sun's rays is necessary to mature the growth, and prepare the plants for their long rest, and unless they are properly ripened premature growth may result.

ARPOPHYLLUM GIGANTEUM AND SPICATUM.—Among Orchids that are not generally cultivated are these two species, which are attractive enough when seen with a dozen or more strong bloom-spikes. Both succeed in well-drained pots in a mixture of peat and sphagnum-moss, if accommodated in a light part of the intermediate-house and plentifully supplied with water.

MISCELLANEOUS.—A charming miniature botanical species now flowering is *Polycynis Lehmannii*. Its flowers have some resemblance to the Swan-neck Orchid (*Cynoches*), and its lip is prettily spotted. At the present time it is kept in the intermediate-house, growing in a hanging shallow pan with the ordinary Orchid compost to root in. In the cool-house, plants of *Epidendrum vitellinum* are starting into growth, and will be afforded fresh materials to root into without delay. They grow the best in small pots, in a mixture of peat and sphagnum-moss, the crown of the root being kept above the rim of the pot, the new growths turning black if they are in contact with the soil. *Lælia herpophylla* may also be repotted, keeping it with the *Odontoglossums* for the present. This and the preceding species grow best standing down upon the stage amongst other plants; when hung up, the dry currents of air which reach them through the top ventilators seem to act injuriously on them. An extremely beautiful

Orchid now in flower, is *Paaius Humboldtii*. Although coming from Madagascar, it does not always grow as satisfactorily under the treatment given to plants from that country, most of which like stove treatment. This species, on the contrary, succeeds in a shady part of the Cattleya-house. When in full growth, much water should be afforded, but no overhead syringing, or the young breaks become spotted, soon decaying. Yellow-coloured thrips infest the growths, doing much injury, and being minute, are not readily seen. It is good practice to dust tobacco-powder into the growths occasionally, or place the plants in a house which is being vaporised. Some growers prefer to use tobacco-paper for the destruction of thrips, but the tender leaves of the plant in question are sometimes injured by strong fumigation. Others occasionally dip the plants into some safe insecticide, taking care to shade them from the sun's rays for a few days afterwards.

THE FLOWER GARDEN.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

BULBS FOR THE SPRING GARDEN.—The time for ordering bulbs of the florist is now at hand. Single-flowered varieties of Hyacinth are the best for bedding purposes. Good reds and crimson of these are—Amy, La Reine des Jacinthes, Lord Macaulay, Veronica, and Robert Steiger. White: Grand Vainqueur, La Grandesse, Voltaire, and Grand Vedette. Blue: Baron Van Tuyll, Bleu Mourant, Charles Dickens, Marie, King of the Blues, and Uncle Tom. Yellows: Fleur d'Or, Heroine, and Ida. Porcelain-blue: Czar Peter, Grand Lilac, La Peyrouse, and Regulus. Double-flowered varieties for bedding are—Whites: Anna Maria, Jenny Lind, La Desesee, and La Souvenir d'Anvergne. Red, rose, or crimson: Alida Catharina, Bouquet Royal, Charles Prince of Sweden, Groot Vorst, Princess Louise, and Regina Victoria. Blue: Garrick, General Antic, and Oshello. Yellow: Goethe. Double and single-flowered Tulips for a bright display of colour are more satisfactory in the spring-garden than any other kinds of bulbs for beds, or for planting in patches of six or eight together in the herbaceous or shrubby borders. A few good early single varieties are Duc Van Thol various, and Artze scarlet; Brutus, orange-crimson; yellows, Canary-bird and Chrysochlora; reds, &c., Crimson King, Cramoisie superbe and Duchesse de Parme, red and gold; yellow and orange, Golden Prince; La Grandeur vermilion-coloured. Of Pottebakker there are several beautiful varieties. Proserpine, is beautiful dark rose; Queen of the Netherlands, rose; Queen Victoria, white and crimson, Royal Standard, white and cerise; La Reine, white; Thomas Moore, orange. Early double-flowered varieties are Agnes, scarlet; Arabella, carmine; Duke of York, dark rose with white border; Gloria Solis, reddish-brown with yellow edge; Grenadier, scarlet and gold; Imperator rubrum, scarlet-crimson; La Candeur, white; Lady Grandison, vermilion; Premier Gladstone, red; Purple Crown, blood-red; Queen Victoria, red and white; Rex rubrum, scarlet; Rose Blanch, white; Tournesol, scarlet and yellow varieties; Velvet Gem, crimson and yellow. Good late double varieties are alba maxima, white; Marriage de ma Fille, white flaked with red; Peony, gold-striped; Rosa mundi, rose; Yellow Rose, yellow, sweet-scented. Tulip Geaneriana should be largely planted for mixed borders.

CROCUSES.—In continuation of my list of last week, I now give a list of autumn, winter, and spring-flowering Crocuses. The flowers are attractive always, and especially those of the early spring, which appear at a time when flowers of other genera are few. If planted in the borders of herbaceous plants, or in the foreground of shrubberies, they may stand in clumps of twelve or twenty; for edgings of flowerbeds alone, or in conjunction with edgings of *Arabis alpina*, Ivy, &c., they always give a lively appearance. Good varieties of *Crocus versicolor* are, whites, Queen Victoria, Mont Blanc, Caroline Chisholm, Reine Blanche, Grand Conqueror; blue and purple, Margot, Prince Albert, David Rizzio, Baron von Brunn, Lord Derby, Lord Palmerston, Sir John Franklin, L'Unique, Oshello; yellow, Giant Golden Yellow, Old Golden Yellow, Cloth of Gold, Albion, Belle Lisette, Lady Stanhope, Miss Patte, President Grant, N° Plus Ultra, and Sir Walter Scott. Other species of Crocus are aureus, vernus, striatus, suaveolens, Imperati, odoratus, albiflorus, flowering at the end of winter, and onwards to March

and April. The autumn-flowering species are sativus, scrotinus, Pallatii, nudiflorus, and speciosus.

GALANTHUS NIVALIS AND NIVALIS FL.-PL., the double and single varieties of the common Snowdrop, should be largely planted in clumps by woodland paths, or under the shade of trees near drives. Choice varieties for planting in borders in the garden proper are *G. caucasicus*, *G. Elwesii*, *G. Imperati*, *G. latifolius Redoutei*, *G. robustus*, and *G. plicatus*.

ERANTHIS HYEMALIS.—The winter Aconite, the hardiest and earliest spring flower, is a useful plant for covering the soil under the shade of trees, and it is effective as an edging to flower beds. It is a plant of lowly growth that looks best when planted in masses together. It will grow in any kind of soil.

DAFFODILS.—No bulbous plants better repay the care and attention bestowed on it than Daffodils and Narcissus. The plants look well either as masses in beds, clumps in the borders, or in other ways, and they never fail to give satisfaction. The soil for Narcissus may be the ordinary soil of the garden, or it may be made up of loam and leaf-mould with quite rotten manure. The drainage should be thorough, or they will do no good. The land should be deeply stirred, and in manuring it, the manure should be put deep enough, not to be brought into contact with the bulbs; and before the latter are planted, it should be made quite firm. Planting may be done at depths varying from 4 to 6 inches, according to size of bulb. A few good trumpet Daffodils are bicolor, Horsfieldi, Empress, Grandis, Dean Herbert, cambrius, Colleen Bawn, Fred Moore, Johnstone, Madame de Graaf, princeps, Pseudo-Narcissus (the Lent Lily), Shirley Hibberd, Incomparabilis in numerous varieties, both single and double-flowered. Many other species and varieties are to be found in the bulb dealer's lists.

JONQUILS.—If these sweet-scented flowers are planted, it should be only in sheltered parts of the garden in beds of good rich soil. The best are the double and single-flowered Olorus, Campernelli major and O. C. minor.

FRUITS UNDER GLASS.

By RICHARD PARKER, *Gardener, Goodwood, Chichester.*

MUSCAT VINES.—Vineries in which are ripe Grapes, will require to be very carefully ventilated, otherwise the berries may be affected by rust, and this is likely to occur if they are cooled by air being allowed to circulate rapidly through the houses. If the borders where the berries commenced to colour were efficiently watered, and covered afterwards with straw, the Vines will require no more water till the crop is cut, but as the present season is a particularly hot and dry one, it would be well to examine the border occasionally, to ascertain if the soil is approaching dryness, a dry soil soon causing shrivelling of the fruit, and hindering the development of the young wood. As a shade to the Vines, a Strawberry-net may be fixed on to the roof to mitigate the fierceness of the sun's rays. If but a few bunches remain on the Vines, it will be advisable to cut these with several inches of wood, and bottle them; then theinery may be thrown open, and the foliage syringed daily. Later crops of Muscats should be assisted with abundant supplies of water at the roots. The borders should be mulched with cowshed manure, and afterwards afforded tepid water in quantity. Where the roots are in both outside and inside borders, the former should be lightly forked over, and manure and water applied as advised for the latter. Afford supports to the shoulders of bunches when necessary, using broad strips of matting for the purpose, and where necessary remove a berry or two to prevent a too great degree of compactness.

OTHER VINES.—The Madresfield Court Vines have, so far, given no trouble this season, the fine weather enabling us to afford ample ventilation. Continue to keep a gentle warmth in the pipes during the night, with a little ventilation on the top-lights.

LATE VINERIES.—The fruit of Lady Downes and Gros Colmar which has to be kept throughout the winter should be freely thinned. In many gardens the first-named variety will be at that stage when scalding is apt to take place. So far, I have not seen a trace of it yet; but theinery is freely ventilated during the day, and no water is made use of in theinery after 3 P.M., at which time the borders and walls are copiously syringed. A slight circulation is kept up in the pipes during the night, while at the same time a fair amount of top-ventilation is

afforded, which prevents moisture from settling on the berries. Keep all lateral growths pinched back, and treat the borders as advised for Muscats.

GENERAL WORK.—All fruit-houses from which the crops have been gathered should be thrown open, and the roof-lights removed where portable. Syringe the foliage copiously morning and evening, and see that the roots are well supplied with moisture.

THE KITCHEN GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

GHERKINS, VEGETABLE MARROWS, AND GOURDS.

—The soil between the plants should be forked up as the bine grows, and the latter should be thinned out whenever it becomes crowded. Ornamental Gourds and Pumpkins should have a piece of slate placed under the fruits, so that they may be kept clean. Remove the leaves shading the fruits of Pumpkins and Gourds, so as to afford them the full benefit of sunlight to give colour to the skin and ripen them perfectly. Afford heavy applications of manure-water occasionally when the fruit is swelling.

CARDOONS should not be planted in exposed situations, or the wind will break and injure the tall leaf-stalks. The plant will now require abundance of water at the roots, and syringings in the evening.

SALADS.—The seeds of Lettuces must be sown at intervals of a week or ten days, and batches of plants pricked out weekly. The land selected for the crops at this season should be such as does not get the whole day's sun, and which is in good heart. Radishes, Endive, and Mustard and Cress should be sown at short intervals. Radishes do very well on east or west borders, and in very light soils on situations facing north. Endive will grow almost anywhere, if care be taken not to spoil it by crowding the young plants together.

PARSLEY.—Continue to transplant Parsley whenever the weather is favourable for the job, remembering that one can hardly have too much of it. Transplanted in the present month, Parsley makes strong growth before the winter; and transplanted Parsley is, I think, better for withstanding frost than intransplanted. Plant 6 to 8 inches apart, and in some convenient place, where it may be readily covered in case of need.

CABBAGES.—If a bed of strong stocky plants be planted at about this date, they will afford heads for late autumn cutting. The planting should consist of early-heading, compact-growing varieties, and it should be frequently hoed to keep a loose surface, and afforded copious waterings in dry weather. Towards the end of the present month the first sowing of seeds of red Cabbage may be made broadcast in beds thinly, or in lines 1 foot apart, thinning the seedlings betimes, so as to obtain stocky short-stemmed plants.

SEAKALE.—The beds may be occasionally dressed with agricultural salt, applying it lightly just before rain. Do not let flower-heads develop, but cut them off at the ground-level when observed.

MISCELLANEOUS.—Clear off the remains of exhausted crops of all kinds, thus preserving a tidy appearance in the garden, and the land from unnecessary impoverishment. Wherever time admits of it being done, such land should be manured and dug in readiness for cropping.

GROWING AQUATICS.—Once upon a time the writer of this paragraph was invited to a nursery celebrated for its large business in connection with the growing of water-plants, or, as they are commonly called, aquatics. As the locality was far away from lakes or ponds, much curiosity was felt as to how the large quantity of plants was cared for. It was found that nearly everything was being raised in old kegs or barrels, sunk deep into the earth, and where water could be led into them by a hose or other methods. The hint may be taken advantage of by those who read of the beauty of aquatics, but do not have lakes or ponds of their own to grow them in. Old paint-kegs, or any vessels that will hold water, can be buried partly in the earth, filled with water, and seeds sown; or young plants planted in mud placed at the bottom of the water. Many of the smaller kinds of water-plants can be grown in this way without any serious difficulty. The vessels need not be water-tight. "*Mechan's Monthly*" for July.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER. Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, JULY 23 { Royal Horticultural Society's Committee, at the Drill Hall, Westminster.

SHOWS.

SATURDAY, JULY 20 { Rose Show at the Manchester Royal Botanic Gardens.

TUESDAY, JULY 23—Tibshelf Horticultural.

WEDNESDAY, JULY 24 { National Carnation and Picotee Society, at the Crystal Palace. Chesterfield Rose, Newcastle-on-Tyne Horticultural (three days).

THURSDAY, JULY 25 { Caterham Horticultural, Reckenham Horticultural. Surrey Horticultural, at Brockwell Park (two days).

FRIDAY, JULY 26 { Trentham and Hanford Horticultural and Rose.

FRIDAY, JULY 26 { Wellingborough Floral and Horticultural.

SALES.

TUESDAY, JULY 23 { Three direct importations of Orchids, for Unreserved Sale. Also a grand importation of Cattleya aurea, from Messrs. H. Low & Co.; and a fine lot of Orchids, from Messrs. F. Horsman & Co., at half-past 12 o'clock. Also, at 4 o'clock precisely, a splendid lot of Palm Seeds, Cannas, Freesias, &c.—at Protheroe & Morris' Rooms.

FRIDAY, JULY 26 { A grand selection of Orchids, from Messrs. F. Sander & Co.; together with Orchids in flower and bud, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.4

Examination in Horticulture.

The class lists of the last examination by the Royal Horticultural Society have been issued, and from them and the examiners' report we cull the following particulars. It may be mentioned that the candidates came from widely different parts of England and Scotland, a centre being established wherever a magistrate, or clergyman, or schoolmaster, or other responsible person accustomed to examinations, would consent to superintend one on the Society's behalf, and in accordance with the rules laid down for its conduct. No limits as to the age, or position, or previous training of the candidates were imposed, and the examination was open to both sexes.

' EXAMINERS' REPORT.

To the Council of the Royal Horticultural Society.

Gentlemen,—We beg leave to report that we have examined the papers of the candidates who offered themselves for examination in Horticulture in May, 1895. There were 169 candidates in all, varying greatly, as usual, in age, occupation, and in the means of instruction at their disposal.

Three hundred marks were allotted as a maximum, and all candidates who obtained 200 marks and upwards were placed in the first class. Those who received between 150 and 200 marks were placed in the second class; and those to whom 100 marks and upwards were adjudged were ranked in the third class. The remainder, who obtained fewer than 100 marks, were not classed.

In this way 12 candidates were adjudged worthy to be placed in the first class, 37 in the second, and 73 in the third class. The highest number of marks obtained was 260, by Miss A. U. GULVIN, of the Horticultural College, Swanley.

Considering the opportunities at the disposal of the candidates, the results may be considered satis-

factory. The effect of continuous systematic training is well exemplified in the class lists. On the other hand, many young gardeners and mechanics, who cultivate small gardens and allotments, but who have not had the opportunity of regular tuition and systematic study, have taken a lower place than they otherwise would have done, because they have failed to grasp the significance of the questions.

We have the honour to be, gentlemen, your obedient servants,
MAXWELL T. MASTERS,
JAS. DOUGLAS."
June 15, 1895.

We can only find room for the names of those candidates who were placed in the first class, but we may add that the full list will be published in the *Journal* of the Society.

Maximum number of Marks obtainable, 300. No. of Marks gained.

First Class.		No. of Marks gained.
1. Miss A. U. Gulvin, Horticultural College, Swanley	...	260
2. Mr. Geo. Butcher, gardener, 188, Wellfield Road, Streatham	...	240
3. Miss F. M. G. Moklethwait, Horticultural College, Swanley	...	220
4. Mr. Brown, Horticultural College, Swanley, Kent	...	215
4. Miss Alice Hutchings, Horticultural College, Swanley	...	215
4. Mr. J. Warner, School House, West Street, Dorking	...	215
4. Miss Madeline Agar, Horticultural College, Swanley	...	215
8. Mr. G. H. Cave, 16, Gloucester Road, Kew, Surrey	...	210
8. Mr. W. Bell, Knighton Road, Leicester	...	210
10. Mr. Edward Dumper, The Gardens, High Ashurst, Dorking	...	205
11. Mr. J. K. F. Jack, Horticultural College, Swanley	...	200
11. Mr. H. W. Gunston, Fressingfield, near Harleston, Norfolk	...	200

The questions put were as follows:—

Eight questions only had to be answered: four from Division A, including No. 5, which had to be answered by every candidate, and four from division B.

DIVISION A.—ELEMENTARY PRINCIPLES.

1.—(a). What substances do plants absorb by means of their roots? Explain the process of absorption by the root.

(b) What elements do plants obtain from the air, and by what agency do they obtain them?

2.—Explain the effect on flowering plants of an adequate, a deficient, or of an excessive, amount of heat.

3.—How are "cuttings" made? Describe the changes that occur during the process of "striking."

4.—What are the objects sought to be obtained in digging the soil?

5.—Write as full and orderly a description as you can of any plant in common cultivation, through all stages of its growth, from the germination of the embryo to the formation of the seed.

6.—What organs of the plant are represented respectively by an Onion, a Cabbage, a Potato, Beet, Turnip, and a Pea-pod?

7.—Describe the mode of growth of the common Mushroom.

8.—What is meant by "greenfly"? What is the best application to rid plants growing out-of-doors of this pest?

DIVISION B.—HORTICULTURAL PRACTICE.

9.—Name six of the best species of hothouse flowering plants, and give some of the general details of culture. Name some of the insect pests that infest such plants, and state the best method to be adopted for their destruction.

10.—Give general details for growing Peas, and the method of culture, time of sowing, &c., to give a supply for as long a period as possible. What is the use of the nodules on the roots?

11.—What is an alpine plant, as the name is generally understood in gardens? Describe the cultural

requirements of such plants, and the best way to propagate them.

12.—What is the original parentage of Cauliflower and Broccoli? Give the method of culture, and the best varieties to obtain a succession all the year round.

13.—Give some details of the culture of Grapevines under glass. Describe the diseases to which they are subject, and the insect pests which attack them, and their cure.

14.—What kinds of fruit trees and bushes are best adapted for culture in small gardens? Briefly describe the best method of culture, and arrangement of the trees and bushes.

15.—In a walled garden, what kind of fruit trees would you recommend to be planted on the four aspects—south, north, east, and west? What distance apart should the trees be? Suggest the best width of the borders and height of the walls.

16.—(a). What do you consider the best class of soil for fruit trees, and how ought it to be prepared for them?

(b). Is there any method of culture likely to prevent canker in Apple trees or gumming in Apricots, Cherries, and Plums?

A glance at the above extract from the class list is sufficient to show the great advantage afforded by training and systematic study. Even when candidates are approximately equal in their natural abilities, and knowledge of the subject, those that have been specially trained, as at Swanley, have the great advantage of being able to utilise their knowledge. We believe that many candidates fail, not so much from actual lack of knowledge as from want of care in reading the questions set. For the last two or three years candidates have, we learn, been asked to describe in their own way any plant they pleased, or sometimes a particular plant has been specified, such as a Potato or an Onion, the plant selected being always one with which candidates might fairly be expected to be familiar from constant handling or observation. Now this question is in many cases either shirked entirely, or the candidate gives the details of cultivation concerning which nothing is asked. This seems to show that candidates trust too much to knowledge derived from books or lectures, and that they do not use their own eyes or trust to their own powers of observation and inference.

OUR FRUIT REPORT.—Our tabular report on the condition of the fruit crop in Great Britain and Ireland, will appear in our issue for August 3. The remarks on the crops kindly furnished by our correspondents, will appear in subsequent numbers.

HAND LIST OF HERBACEOUS PLANTS CULTIVATED IN THE ROYAL GARDENS, KEW (sold at the Royal Gardens, Kew).—A useful list of alpine and herbaceous plants cultivated at Kew, and numbering about 6000 species. For the convenience of cultivators the list is printed on one side of the page only, leaving the other free for the addition of further entries or remarks. We notice nearly ninety entries of Lily names—itsself a refutation of the once-held opinion that Lilies could not be grown at Kew. Now, even other bulbous plants used for decorative purposes are grown at Kew by following the same plan that is adopted in Holland. The value of these hand-lists as furnishing a common nomenclature is very great. Moreover, the list necessarily includes the best kinds up to date, and thus supersedes the bulky catalogues which include all sorts, good, bad, or indifferent, in or often out of cultivation.

"THE KEW BULLETIN" for June and July, contains a variety of interesting matter. In addition to notes on more or less well known subjects, there are technical descriptions of newly-found plants in the Solomon Islands, the Transvaal, Natal,

Lagos, Somaliland, and southern Arabia. In an article on the Sugar Maple and its products, we are glad to see the editor retains the best known name, *A. saccharinum*. The "saccharinum" of LINNÆUS was, it appears, the species now better known as *A. dasycarpum*, Sir Charles Wager's Maple. *Gossypium Stocksii*, Masters, considered to be the origin

Street, Victoria Street, London. At 3 o'clock a paper by Mr. P. BROTHENSTON on "The Carnation in Scotland," will be read.

CANNAS.—We recommend all interested in these gorgeous plants to visit the collection now in bloom at the Royal Horticultural Society's garden at Chiswick;

ground—very fine. Some of the newer kinds sent out by Messrs. PAUL & SON are equal to those distributed by CROZY.

EPPING FOREST.—The Report from the Epping Forest Committee to the Court of Common Council has been published. It deals with the alleged undue

FIG. 14.—HEMEROCALLIS AURANTIACUS VAR. MAJOR. (SEE P. 62.)

of the cultivated forms of *G. herbaceum*, and previously only known from Sindh, has been discovered by Mr. BENT in southern Arabia. *Saranga sinuosa*, Hemsley, is the name of a very extraordinary Pandanus from the Solomon Islands.

THE ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will be held on Tuesday, July 23, in the Drill Hall, James

they will be well repaid for their trouble. Among the best varieties now in bloom are Séateur Montefiore, orange-bronze, edged with yellow; Paul Siegrist, rich crimson, thin yellow edge; P. Marquart, orange-pink self; Guillaume II., crimson self; Phœbus, orange-pink self; Comte Horace de Choiseul, glowing crimson self; Alphonse Bouvier, scarlet-crimson self, very fine; Star of 1891, orange-red; Antoine Barton, with red spots on a yellow

and unnecessary cutting of timber in the forest. "We fail to find," say the Committee, "justification for the attack that has been made; on the contrary, we discovered many instances of gross exaggeration." Attached to the report are reproductions of drawings which appeared in one of the daily papers on May 4, purporting to represent the state of certain spots in the forest on that day, together with photographs of the same spots two days later, May 6. Judging

from these photographs, "grosa exaggeration" is much too mild an expression. Another report from the Committee of Experts is expected shortly, so that it will be well to withhold further expressions of opinion.

THE BLACK RASPBERRY.—Specimens of this were shown by Mr. FARINI at the last meeting of the Royal Horticultural Society, and some were kindly supplied to us, and enabled us to identify the plant as *Rubus occidentalis*, Linn.* The species is very common in Canada and the northern United States, and has been in cultivation here since 1696. Mr. FARINI'S specimens are the result of selection and "interbreeding," [with which species is not mentioned, but probably cross-fertilisation, not true hybridisation, is intended]. Owing to the drought, the fruits which are now about the size of marrow-fat peas, are much smaller than usual. The canes are scandent, rooting freely at the tips, when in the early autumn, they bend over and touch the soil. The plants yield a prolific, but not a continuous crop. Fruiting laterals are formed at short intervals all along the stem. Cooked or raw, the fruit is said to be good eating, but it will have to be improved still more before it is likely to find favour with epicures uninterested in the history and evolution of fruits.

TOTTENHAM CHRYSANTHEMUM SOCIETY.—By the kind permission of Baron SCHRODER, the members of the above Society, to the number of fifty, paid a visit of inspection to the beautiful residence and gardens of The Dell, Eaglefield Green, on July 9. Many thanks are due to Mr. H. BALLANTYNE and members of the staff for kindness and courtesy in conducting the party through the extensive range of houses and grounds, and in doing all they possibly could to make the visit an enjoyable one. An excellent dinner and tea were provided at the "Sun Inn," Eaglefield Green. The first meal was presided over by H. HENDERSON, Esq., who proved a genial chairman. Drives were afterwards taken into the surrounding country.

ACADEMY OF SCIENCES.—Baron Sir FERDINAND VON MUELLER has been elected a correspondent in the botanical section.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The monthly meeting of this society was held at 25, Westgate Road, on Tuesday, July 9, Mr. MURRAY, gardener at Oakwood, Wylam-on-Tyne, presiding at an excellent attendance of the members. Most of the evening was spent in naming species and varieties, and discussing the various merits of hardy herbaceous plants, several collections of which were brought in by the members. Towards the close of the meeting, the members had an opportunity of viewing a facsimile of the "Magna Charta," provided by W. BRANDFORD, from which the secretary read extracts; also the warrant for the execution of Mary, Queen of Scots, and several other items of historic interest, which proved highly instructive.

NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).—I beg leave to remind your readers, writes Mr. JAS. DOUGLAS, Hon. Secretary, that the annual show of the above Society will be held at the Crystal Palace on Wednesday, the 24th inst. Upwards of £150 are offered in prizes. Amongst special prizes may be mentioned the Martin Smith prize for Border Carnations; the flowers "to be cut from plants which have been wintered without protection in the open border, and staged exactly as they are cut without dressing." The Turner Memorial Trustees give a handsome Silver Cup, value £5, for the best stand of twelve Carnations, bizarres, and flakes, distinct, and twelve Picotees

distinct—amateurs only. Another special prize (not in the schedule of prizes) will be given by Mr. ERNST BENARY, Erfurt, Germany, "The Ernst Benary Memorial Prize." A large Silver-gilt Medal is given by the firm in memory of the late much-regretted founder of the firm, Mr. ERNST BENARY, for the most meritorious exhibit, either of plants or cut flowers, by an amateur.

HORTICULTURAL CLUB.—The annual excursion of the members and their friends, to which ladies are specially invited, will take place on Tuesday, July 30. The members will meet at King's Cross, Great Northern Railway (Suburban), at 9.30, and proceed by 9.45 train to Finchley, to view Mr. PETER KAY'S graperies. Buses will be ready to convey the party, at 1.15, through Barnet to Hatfield, where the gardens, &c., will be open to the inspection of the members, under the guidance of Mr. NORMAN, the Marquis of SALISBURY'S head-gardener. Members will return by 8.45 P.M. train from Hatfield to King's Cross.

TEIGNMOUTH GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—A party to the number of thirty-six proceeded on Tuesday, the 9th inst., to Bicton, the seat of the Hon. MARK ROLLE, thence to Exmouth, visiting Bystock on the return journey. Arrangements had been made for viewing the groves and glasshouses of Bicton, but owing to some unforeseen obstacles the party after going out of their way about a mile and waiting about 1 hour, had to go away without having seen the object of their visit. Dinner was partaken of at Exmouth, Mr. F. HANNAF ORD taking the chair, being faced by Mr. SWAN, the gardener at Bystock. After a considerable amount of speechmaking, the party re-assembled, and drove to Bystock, the residence of J. P. BRUCE, Esq., which lies 2 miles from Exmouth. Here they were kindly entertained by Mr. BRUCE, after having inspected the various sights of the place.

CARNATION DISEASES.—Professor BYRON HALSTED, at the annual meeting of the American Carnation Society, indicated five diseases of the Carnation:—1, Rust; 2, Leaf-spot; 3, Black-spot; 4, Ring-mould; 5, Bacteriosis. Number 1 is produced by a fungus, *Uromyces caryophyllinus*; 2, by *Septoria dianthi*; 3 is not named; 4 is the *Heteroaportium echinulatum*; 5 is caused by a bacterium. We are familiar here with all these troubles, and also, quite as frequently, with eel-worm disease, caused by nematode worms, which is not mentioned in Professor HALSTED'S enumeration.

THE LATE M. DUCHARTRE.—Professor CLOS has published, from the *Bulletin of the Botanical Society of France*, his exhaustive note on the life and works of this distinguished and amiable botanist. The extent and diversity of his work as here indicated are very remarkable. His career was one of great difficulty at first; but he was never discouraged, and always seemed to place the interests of science before personal considerations. His work at the National Horticultural Society of France is known to some of our readers, and he discharged the duties of his secretarial and editorial office up to the day of his death. It is characteristic of the man, that when Paris was invested by the German army, DUCHARTRE was in the country. His course of lectures at the Sorbonne was announced to open on March 17. Entry into Paris was, as we know, almost impossible; nevertheless, DUCHARTRE succeeded in gaining entrance, and delivered his lecture as usual! The next day the Commune was proclaimed, but even this did not check the Professor's sense of duty. He continued till his work was stopped by ministerial decree.

GLADIOLUS FROM OFFSETS.—M. CROZY, sen., mentions, in the *Moniteur de l'Horticulture* for May 10, and on p. 112, a method of multiplying Gladioli which is little known. It consists in raising, under glass, Gladiolus bulbs, and, when the stems have attained a height of from 15 to 20 centimètres (5½ to 7¾ inches), in cutting these off quite near the starting-point without interfering with the base,

which, after the suppression of the principal stem will give birth to two, three, or even four new shoots, weaker than the first one, but which will, nevertheless, furnish bulbs to flower the following year. As to the detached shoot, it roots perfectly on a hot-bed, and by autumn forms a nice bulb of medium size. M. CROZY has, he says, practised this method of multiplication for many years, and has never had a mishap. *Journal de la Société Nationale d'Horticulture de France, May, 1895.*

HOOKE'S "ICONES PLANTARUM."—This publication, consisting of lithographic illustrations of plants, is mainly intended for systematic botanists, but frequently contains matter of interest to horticulturists also. In the June number we find figures of *Argostemma concinnum* noticeable, because it furnishes an instance of an annual plant terminating in a solitary flower—an occurrence so rare that but few instances are known, of course excepting those which are the obvious result of defective nutrition. *Rhododendron Hancockii*, Hemsley, t. 2381, is a native of Yunnan, and has large white funnel-shaped flowers, of such beauty that it is to be hoped it will soon be introduced to our gardens. *Brandia racemosa*, Hemsley, a Scrophularineous shrub, also from Yunnan, with rich red flowers, is also said to be a very desirable plant for introduction. The same remark applies to *Jasminum primulinum*, Hemsley, which looks like an enlarged variety of *J. nudicaule*. Like the preceding, it is a native of Yunnan.

"THE NATURAL HISTORY OF PLANTS."—This comprehensive work of KERNER, published in an English translation under the editorship of Prof. F. OLIVER, by Messrs. BLACKIE & SON, has now reached its fourteenth part. Nothing so comprehensive has been published since LINDLEY'S *Vegetable Kingdom*. But while classification was the leading, though by no means the exclusive feature of LINDLEY'S work, KERNER'S biology and physiology take a prominent but not an exclusive position. The book is beautifully illustrated, and as a cyclopædic book of reference is excellent. Perhaps it may be found convenient to give not only an index and an analytical table of contents, but also a reference to the principal authorities on the subjects on which the book treats. At present these references are wanting, and the student is not informed what or where is the authority for particular statements. As the work is so much more than a mere popular exposition, such an addition would be acceptable.

THE WEATHER AND THE CROPS OF 1894.—Mr. EDWARD MAWLEY'S report on the "phenology" of 1894 has been reprinted from the *Journal of the Royal Meteorological Society*. It will be remembered the winter of 1893-4 was not uniformly severe; the spring of 1894 was mild till the occurrence of severe frosts on May 21, 22. These ruined the fruit crops excepting Pears. The summer was generally cold, but the hay crop was good and well harvested. The autumn, as a whole, was mild and wet; corn ripened slowly, but the yield of both grain and straw was large. Oats furnished a larger crop than any on record. Potatoes were below average; fruit crops, as before said, deficient, except in the case of Pears. The returns upon which Mr. MAWLEY bases his conclusions number 113, from all parts of the country. New observers are wanted in south Ireland, and in north and east Scotland.

DR. SCHLICH'S "MANUAL OF FORESTRY."—The fourth volume of this excellent treatise is written by Prof. FISHER, and is devoted to the protection of forests against the incursions of man or his mismanagement. A second portion is devoted to the protection of forests against animals, birds, insects, weeds, frosts, winds, floods, shifting sands, acid fumes, and the like. The work is stated to be an adaptation of Dr. HESS'S work, *Der Forstschutz*, to the conditions and necessities of our country. The book, which is published by Messrs. BARNARDY, AGNEW & Co., demands a more extended notice at our hands in a future issue.

* "*Rubus occidentalis*, Linn., Black Raspberry, Thimbleberry. Glaucescous all over; stems recurved, armed like the stalks with hooked prickles, not bristly; leaflets three (rarely five), ovate, coarsely doubly serrate, whiteoak-downy underneath, the lateral ones somewhat stalked; petals shorter than the sepals; fruit purple-black (rarely a whitish variety), ripe early in July. Common, especially northward." *Asa Gray, Manual Bot. North United States, ed. 6, 1890, p. 155.*

THE SUMMER SCHOOL OF HORTICULTURE IN ESSEX.—The School of Horticulture, the particulars of which were given in some recent numbers of the *Gardeners' Chronicle*, is now in full swing, fifteen scholarships having been given by the County Council of Essex. Among the various places of interest visited by the students last week was Mr. SEABROOKE'S seed-farm at Chelmsford. The effect of the present drought on the size of many plants was most marked, and Mr. SEABROOKE mentioned that his William Hurst Peas which are usually some 2 feet high, were so short this year that the pods in ripening aprooted the plants which bore them. The Godetias were also stunted, and they were interesting from the manner in which variations and the difficulties of keeping varieties true were exemplified—matters previously noted in the case of Peas at Mr. CULLEN'S trial plots at Wittam. With reference to the trouble experienced in separating flower-seeds from the plants which bore them, it was learned that when threshing sweet-scented Stocks, veils of many thicknesses of material had to be used, as the dust given off had such a choking effect that the men feeding the machine were incapacitated in a few minutes, if unprotected. This effect is probably due to the short T-shaped hairs, with pointed ends, that cover the surface of these stocks. The party examined a plot of Spinach-beet in fruit which had been self-sown for six years; and also an empty space which had been planted thrice with Cabbages, only for them to fall a prey each time to the Turnip-leaf beetle, though generally speaking the county seems to be fairly free from injurious insects just now. Mr. SEABROOKE then kindly showed his collection of fruit trees, and gave a good deal of valuable information to the students concerning some of the varieties, also dwarfing stocks. Perhaps the most interesting point brought forward was Mr. SEABROOKE'S method, which he had picked up in America, of taking young stocks into the houses in winter-time, and, after grafting them in comfort by the fireside, of putting them carefully away until they could be planted out in the spring.

ANOTHER HORTICULTURIST AS JUSTICE OF THE PEACE.—After conferring with the Lord-Lieutenant of the County, Lord Chancellor HERSCHELL, before giving up his seals of office, appointed Mr. JOHN WATKINS on the Commission of the Peace for the County of Hereford. Mr. JOHN WATKINS is the proprietor of Pomona Farm Nurseries, Withington, near Hereford.

ANTHURIUM.—We have received from M. L. DE SMET-DUVIVIER, of Ghent, a series of interesting specimens of seedling variations of *A. Scherzerianum*. Taking them in the order in which they come, we find:—

A. S. Rosa Rooses.—A form with a cream-coloured spathe 8×4 cent., rosy-crimson at the base, and with a small central stripe of the same colour.

A. S. Madame De Smet-Duvivier.—Spathes about 12×9 cent., deep orange-crimson; spadix robust orange; a very handsome variety.

A. S. var. Duvivierana.—Spathe 10×6 cent., cream-coloured; spadix pale yellow.

A. S. var. Gandavensis.—Spathe 8×5 cent., orange-crimson; spadix slender.

A. S. var. amarantina.—Spathe 8×6 cent.; reddish-crimson; spadix slender.

A. S. var. atrosanguinea.—Spathe 7×4 cent., deep blood-red; spadix coral-red.

A. S. citron.—Spathe 7×5 cent., light orange-crimson; spadix citron-yellow.

SERIES WITH DOUBLE SPATHES.

A. S. var. bispatha.—Spathe 7×3 cent., rich red crimson; the second spathe somewhat smaller.

A. S. Prince Albert.—Spathe 6×3 cent., secondary spathe somewhat smaller, both dull crimson.

SERIES WITH MULTIPLE SPATHES.

These are forms wherein, in addition to the primary spathe, each flower, or a large proportion of them, is

subtended by a much smaller concave "spathella" (see fig. 15). These are the varieties now called "pomponate." We do not find this word in the Latin dictionary, but it is doubtless derived from the French "pomponner," pompon being an ornament worn on a soldier's cap. LITTRÉ tells us of a French saying "Avoir le pompon," which he interprets as "being in the first rank." The term pompon is applied to miniature Dahlias, Chrysanthemums, &c., but the application of the adjectival form pomponate is new to us.

A. S. pomponatum rubrum has a reddish-crimson spathe, 7×4 cent., and very numerous spathellæ of the same colour.

A. S. pomponatum album has a primary spathe, 8×5 cent., cream-coloured, with numerous spathellæ of the same colour; spadix yellow.

FIG. 15.—DRACATE FORM OF ANTHURIUM SCHERZERIANUM.

We are glad to see M. DE SMET acting on a recommendation often made in these columns when we have received these and other monstrous variations. Of *Anthurium Scherzerianum* we have now—1, simple-spathed forms (normal); 2, duplex-spathed forms with two or three spathes; 3, multiple-spathed or "pomponate" forms, with numerous secondary small spathes. As to colour, there are "self-coloured," "albedo," "spotted," and "striped" forms.

PUBLICATIONS RECEIVED.—Contributions to the *Queensland Flora*, by F. M. BAILEY, F.L.S., forming *Botany Bulletin*, No. 10, from the Department of Agriculture, Brisbane, Queensland, May, 1895, contains numerous descriptions of plants lately added to the flora of the colony; also, from the same department, *Bulletin* No. 5 (second series), devoted to *A Half Century of Notes for the Guidance of Amateur*

Fruit Growers, by F. M. BAILEY, F.L.S.—From the Cornell University Agricultural Experiment Station, Horticultural Division, *Bulletin* 84 (January), on *The Recent Apple Failures of Western New York*, by L. H. BAILEY.—*Bulletin* 86 (March), on *The Spraying of Orchards*, by E. G. LODGMAN.—*Bulletin* 87 (April), *The Dwarf Lima Beans*, by L. H. BAILEY.—And from the Entomological Division, *Bulletin* 93 (May), on *The Cigar-case Bearer*, by M. V. SLINGERLAND.—*Frutta Minora*, del Prof. A. PUCCI, Milano Ulrico Hoepli.—H. CORREYON, *Les Plantes Alpines et des Rocailles* (Paris, Octave Doin).—*Handbuch für Botanische Bestimmungsübungen*, von Dr. FRANZ NIEBENZU (Leipzig, ENGLMANN, *Plant Diagnosis*).—*Traité de Culture Potagère*, par J. DYBOWSKI (Paris, Masson).—*Petit Atlas de Poche des Champignons Comestibles et Veneneux*, par PAUL DEMÉE (Paris, PAUL KLINSIECK).—*Experimental Plant Physiology*, by Dr. WALTER OES, translated by D. T. MACDOUGAL (MOHAI & WILSON, Minneapolis).—*The New England Blossoms and their Insect Visitors*, by CLARENCE MOORE WOOD (Boston and New York: HOUGHTON, MIFFLIN & Co.). To some of these we must refer on another occasion.

MARKET GARDEN NOTES.

MR SHARP'S STRAWBERRY GARDENS AT KNOWLE, NEAR VIRGINIA WATER.—These gardens are famous for their Strawberries, and well known from the fact that they are open to the public, and anyone on payment of one shilling may eat as many as he chooses. A good many varieties are cultivated, including British Queen and Marguerite—the latter standing high in the estimation of visitors, although less firm in the flesh than other varieties. It is also Mr. Sharp's favourite variety, on account of the pickings lasting longer than others. Eugène and Oxonian were in splendid condition on the occasion of my visit; but for excellent cropping nothing could excel Comte de Paris, the crop of which was enormous.

There are one or two points connected with the cultivation of the Strawberry at Knowle I would like to mention, namely, no manure has been used for twenty years, although Strawberries have been grown on the same ground all that time. The soil is light and sandy, which soon falls to dust in dry weather, yet at 3 inches deep it retains a good deal of moisture, even in this dry season. The plants stand 2 feet from row to row, and 18 inches apart in the row, and they are allowed to stand from five to seven years before being renewed, and the plants notwithstanding looked healthy. Yet one could not help noticing the vigour of some Strawberry plants which had been planted on ground on which some weeds and litter had been burned, and the ashes strewed around. These patches were so conspicuous, that Mr. Sharp, jun., remarked on the way the Strawberry seems to revel in ashes and burnt refuse; and said that manure would be of some advantage for a change, and so for the first time for twenty years they have planted a portion of the young plants on manured ground. There is one advantage which plants grown without manure have—they do not throw many runners, and the land is not much infested with weeds. The perfume from these Strawberry gardens was so powerful, you could distinguish it some hundred yards before arriving at them, E. Bennett, Tyne, Chertsey.

HOME CORRESPONDENCE.

ANTHRACITE COAL v. SOOT AS A MANURE.—I have been waiting to see whether any of your readers would reply to the question under this heading, which appeared on p. 747 of the last volume, but I must have overlooked any reply, if such has appeared. I do not quite see how carbon *quâ* carbon in the form of coal-dust can be of so much use as soot, which I take it is used not because it is mainly carbon, but on account of its manurial value (ammonia) for one thing, and chiefly because of its odour, which tends

to disgust many of the insect pests, e.g., the Onion-fly. It would be interesting to learn whether carbon is a manure for plants. In the form of charcoal it is, no doubt, very useful, but then that is not because it is carbon, but on account of its power of attracting oxygen, and so helping to sweeten the soil. It is worth while mentioning, however, that a patented manure, many years old, was stated to be made of stone-coal (anthracite) and sulphate of iron, and it was said in testimonials to be useful. Personally, I do not think "G. S. H." will find anthracite "duff" a substitute for soot, which is valuable in more ways than one. *Saml. Ray*.

— In reply to the above (vol. xvii., p. 747), I do not think "G. S. H." would find "duff" of any value as a manure, unless his land be of a stiff clayey, or light calcareous nature. In these cases the application would have a mechanical effect, opening and lightening the clayey soils so that air could pass into them more freely; and darkening the colour of calcareous soils, which would make them warmer. On sandy soils it would be harmful if used. The value of "duff" as a manure—apart from its mechanical improvement—is not worth mention, there being only about 50 per cent. of nitrogen in an average sample, which is the only plant food it contains. The carbon is present in a mineral form and will resist decomposition; consequently, it would be years before the nitrogen became available for the use of plants. Soot is a good manure, for besides supplying plant food, it will improve the mechanical condition of all—except peaty—soils. The carbon in soot is present as organic matter, and can therefore readily undergo decomposition. An average sample of soot contains 4 per cent. of nitrogen, chiefly present as sulphate of ammonia, from 10 to 14 per cent. of sulphate, carbonate, and phosphate of lime, about 7 per cent. of chloride of sodium and potassium, and 25 per cent. of silicates of lime and magnesia, all of these being substances required by plants in their nutrition. *W. Dyke, Turnford, Herts.*

CARNATION DUKE OF YORK AND OTHERS.—When Mr. H. B. May sent out from Dyson's Lane Nursery this fine variety, he earned the thanks of all admirers of Carnations. When at its best the colour may be described as a brilliant shaded crimson, large, full, and finely formed; a good grower, which does not split its calyx. It wants but one more quality, that of fragrance, and then it would be perfect. In respect of the possession of this quality, the maroon-coloured Uriah Pike has a great advantage over it, and probably the latter is rather more free in blooming. But both are invaluable to any one who grows for cutting purposes. When are we to have a fragrant yellow self? I have never yet met with one that possessed fragrance. It may be coming, but it does not appear to have made itself known as yet. Germania would be perfect as a yellow self had it the clove scent of Uriah Pike. It is sometimes said that Germania is not a good grower, but I recently saw at the Royal Nursery, Slough, a number of two-year-old plants in pots, large in size, vigorous and free branching in growth, and remarkably free. Mr. Harry Turner said much finer flowers could be cut from such two-year-old plants than from yearling ones. *R. D.*

CHOICE HARDY RHODODENDRONS.—It is a pity that Messrs. Anthony Waterer & Son of the Woking Nurseries did not name some at least of the newer varieties they exhibited at the Drill Hall on June 11. Some of them, and especially the delicately-tinted pink and pale rose varieties, have yellow and orange blotches and spottings on the upper segments, which of late years have become considerably deepened in colour. One of the most striking of this type is Mrs. Pryce Lade, bluish or delicate pink, with a central bunch of rosy stamens, and orange blotch and markings on the upper segments. Lady Grimston is also very fine, and a good grower; it is flaked with carmine on a pale ground, and has striking top petals. A. B. Mitford is a large and finely-formed deep bright rosy-crimson variety, with dark spots on the upper segments. One of the most striking is picturatum, pink shaded with rose, the upper segments marked with large dark blotches, giving it the appearance of a Pelargonium. Some of the unnamed seedlings are also of fine character. *R., Ealing.*

EARLY PEAS.—I have read with interest the notes on early Peas by "A. H.," in your issue of the 13th inst. To gardeners, the new first early wrinkled varieties of Peas are of great value, being of superior flavour to those Peas which have round seeds. I have grown most of the wrinkled Peas, and find that

Harbinger, a variety sent out by Dicksons, Chester, last year, to be superior to any other that I know of, it being quite as early as Exonian; and although the pods are not of such a deep green colour as that variety, they are larger, which is a valuable point in an early Pea, and the Peas are of excellent flavour. The variety Gradus is a valuable second early wrinkled Pea, and when growers can depend upon getting it true to name, it will become a general favourite. The introduction of these fine Peas should lead to the extinction of inferior varieties. *M. G.*

PYRAMIDAL SWEET CHERRY TREES.—It is seldom that sweet Cherries are grown as pyramids in private gardens, a fact probably due to the unsatisfactory way in which they fruit, and to their liability to suffer from gumming. In gardens where wall space is abundant, and a western aspect can be devoted to these fruits, truly fine crops are obtained annually, and pyramids are not needed; but where wall space is not at hand, other methods have to be adopted for the production of sweet Cherries, and to my thinking, the pyramid seems the right sort of tree. It is, however, evident that the let-alone method will not do, and something more is needed than simply pruning and dressing to bring the trees into good fruiting. There exists in a garden not far from Maidstone a very fine lot of well-grown trees, which for the past four or more years have produced exceptionally heavy crops of large luscious fruit. The trees in question are planted moderately close together, so that in the fruiting season a wooden framework is easily placed over them, and over these some fish netting. This keeps the birds from the fruit. These trees are growing on the Mahaleb and Cherry-stock, and they are moderately pruned annually, so as to prevent a too free growth of the shoots. At these prunings some of the stronger roots are severed at a distance of 3 feet, measured from the stem, and as a consequence there is a mass of healthy fleshy roots at a short distance around the stems. During the growing season the young shoots are constantly pinched to assist in the formation of fruit-buds, &c., so that both at top and bottom the trees are much restricted—a practice some gardeners might regard as too severe. However that may be, a better and more fruitful lot of trees could not be wished for than these; and the pinching and root-pruning will be persisted in so long as the trees bear as freely as at present. Of the early varieties I may mention Frogmore Bigarreau, Early Rivers, Black Eagle, Kentish Bigarreau, Napoleon Bigarreau, and Elton; later ripening ones are Florence, Bedford Prolific, Black, and Tartarian. All of the Duke Cherries are well deserving attention of the gardener. *H. Markham.*

TOMATOS NOT SWELLING OFF.—The cause of "Nurseryman's" Tomato fruits not swelling, is either owing to imperfect fertilisation of the blooms, or to the plants, at an earlier stage, having received a check. As the fruit is swelling well further up the stem, and if there is plenty of light between the plants, and these are vigorous, I would advise the removal of all, or a large proportion, of the lower leaves of the plants, encouraging a shoot to grow from the base. This would soon clothe the bare stem, and if the variety is a free-setting one, fruit would in due course put in an appearance. This shoot could be stopped after showing three or four trusses. A similar case came under my notice a few days since, when visiting a friend's Tomato-houses; and, in this case, the plants were planted prior to the continued frost in February. The site is very low, and the soil, being cold, checked the proper extension of the roots; while the tops, being in a well-heated house, had, at the time, apparently not suffered. At present, the roots must be active indeed, as evinced by the vigorous shoots above, and a good crop will doubtless ensue. *P. F. Le Sueur, Grand Vale, Jersey, July 13.*

ARAUCARIA IMBRICATA.—On the terrace-garden opposite the south front of Alderbury Vicarage, Salisbury, is growing a remarkably good specimen of the Chili Pine (*Araucaria imbricata*). It was only 9 inches high when planted by the Rev. Canon Hatchings' gardener in 1851, now it is about 40 feet high, straight, and of handsome outline, and having a stem 3½ feet in circumference a few inches from the green sward, which is brushed by its branches. And when I say that the tree is bearing about thirty-five large flowers near the top, readers of the *Gardeners' Chronicle* will understand that it is in robust health, though one or two of the branches close to the ground show slight signs of distress—probably caused by the combined influence of the

unusually dry summer of 1893, and the equally exceptionally severe frosts experienced in January and February last, followed by the prevailing tropical weather of the last eight or ten weeks. Canon Hatchings, however, is of opinion that the distress referred to is owing to the fact of the roots having penetrated the sandy sub-soil—the natural surface soil being light, inclining to peat. This circumstance reminds me of an avenue of fairly good examples of *Araucaria imbricata* which I saw seven or eight years ago at Branksome Dean Park, Lord Wimborne's place at Bournemouth, which were then exhibiting proofs of declining vigour, and the natural soil and sub-soil at Alderbury Vicarage and Branksome Dean Park are, judging by appearances, very much alike. This being so, what practical inference are we to arrive at other than that the Chili Pine delights in a soil inclining to be peaty rather than otherwise, and which is well drained, and that so long as the roots are retained in this, and the tree being protected from the effects of north and east winds, so long will it make satisfactory growth. *H. W. Ward.*

VINE PERONOSPORA.—I send you a few mildewed Vine leaves and immature Grapes of the kind known as San Gioveto (the best quality used in making Chianti), as it may interest you to see the progress of the disease, and the effect of the Bordeaux Mixture upon it. They came from the *podere* attached to this villa, in which the Vines have been carefully medicated every year with the above mixture, since its introduction as a remedy. Nevertheless, this year the mildew made its appearance with the opening of the leaves quite early in May, and although the remedy has been applied three times already, and in doses of more than double the usual strength (that is, 2 kilogrammes instead of 1 of sulphate of copper to a quintal of water), the disease is by no means subdued. Of the four leaves sent, the top-most is one which opened early in the season, received its dose, and is cured. In the second one, the disease has been permanently arrested, but has not disappeared. The third leaf has been twice medicated, but the disease is still spreading. The fourth is a leaf of recent growth which has not yet been treated, which the fungus has attacked with extreme severity, and which would certainly wither. The effect on the fruit is such as I had not hitherto seen. As a rule the disease has appeared with us much later in the season, and its effect has been to prevent the Grapes maturing, leaving them light in colour and acid to the taste. Owing, I suppose, to the extreme humidity of the year, up to the end of June, the disease began early, with the result on the Grapes that you see. The Vines presented a great promise of fruit, but at least half of it did not flower, rotted at the stem, and withered. Thousands of fine bunches have gone that way even in this well-tended vineyard. My neighbours who have been less careful in this and previous years, have no fruit left at all. The Bordeaux Mixture proves itself to be a palliative of this, the most formidable enemy of the Vines which has ever yet appeared, I think, but far from being the complete cure too often claimed for it. That has yet to be discovered, and if it be not, the art of Vine-growing as a profitable industry may some day be as extinct as the Dodo. *Thomas C. Hayler, Florence.*

MONA'S PRIDE POTATO.—My experience with Mona's Pride has not been a very favourable one, and I have grown it three years in all sorts of ways. Better ones are as follows:—Star of Reading, which was sent to me for trial two years since, is a nice-looking tuber, early, a good cooker, and an abundant cropper. We have found fifty tubers at one root, the average number being thirty, an extraordinary number for such a small plant; the height of the haulm is about 1 foot. Myatt's Ashleaf is very good on our land. Daniele's Table King is a good variety, and I always cultivate a good lot of it, as it comes in so well after the above, and before white Beauty of Hebron. It is a good tuber, and much to be preferred to the pink variety, with the exception of white Beauty of Hebron. The others are all dug up, and done early. They were planted on March 12, and we began to dig them on May 23. I have about twenty more varieties, most of them new for trial, which I hope to report upon in a few months. *G. Howes, Merton Hall Gardens, Thetford.*

THE ROUND LEAFED SUNDEW.—It may not be generally known that the round-leafed Sandew (*Drosera rotundifolia*) occurs in the greatest profusion near the source of Brony Barn, Cullen, Banff-

POTATOS.

BOROUGH: July 16.—Quotations: Old, 40s. to 60s. per ton; New, 80s. to 120s. per ton. SPITALFIELDS: July 16.—Quotations:—Hebrons, 80s. to 100s.; Puritans, 90s. to 100s.; Snowdrops, 80s. to 100s.; Kidneys, 100s. to 120s. per ton. STRATFORD: July 16.—Quotations:—Old: 25s. to 40s. per ton. New: Beauty of Hebron, 80s. to 90s.; Kidneys, 90s. to 100s.; White Hebron, 85s. to 90s. per ton. FARRINODON: July 16.—Quotations:—New: White Hebrons, 5s. to 5s. 6d. per cwt.; Red do., 4s. 6d. to 5s. do.; Early Monarch, 5s. to 6s.; Puritans, do.; Jersey, 4s. to 5s. per cwt. LONDON AVERAGES: July 17.—New: Hebrons, 80s. to 100s.; Snowdrops, 80r. to 100s.; Early Regents, 80s. to 80s.; Early Rose, 75s. to 85s.; Jersey, 70r. to 90s.; Oberbourg, 65s. to 75s. per ton. Old: Mngnams, 30s. to 40s. per ton.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE (ACCOMULATED), RAINFALL, BRIGHT SUN. Rows include data for various districts like O, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, and *.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts— 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending July 13, is furnished from the Meteorological Office:—"The weather was unsettled and rainy in the extreme western and northern parts of the kingdom, but generally fair in all other localities, although some rain was experienced in nearly all places on Thursday or Friday. "The temperature was rather high during the earlier days of the period, but fell considerably towards its close, and the average for the week did not differ materially from the normal value. The highest of the maxima were recorded either on the 7th or 8th, and ranged from 80° to 82° over the greater part of England, to 72° in Ireland, and to 71° in the north and west of Scotland. The lowest of the minima were recorded, as a rule, during the latter part of the week, and ranged from 41° in 'England, N. and E.', 42° in 'England, S.W.', and 43° in 'England, E.', to 51° in the 'Channel Islands.' "The rainfall exceeded the mean in 'Scotland, N. and W.', and also in 'Ireland, N.', and just equalled it in 'England, N.W.'; but in all other districts there was again a deficiency. "The bright sunshine was in excess over the whole of England, as well as in 'Scotland, E.'; but in Ireland and the west and north of Scotland, the amount recorded was less than the mean for the time of year. The percentage of the possible duration ranged from 62 in 'England, S.', and 61 in the 'Midland Counties,' and from between 46 and 59 in the other English districts, to 20 in 'Ireland, N.', and 12 in 'Scotland, N.'"

TO A MINOR BARD.

Poet, who long hast tuned thy song In praise of Roses and of Lilies, And wreathed each line with Eglantine To please the lovely Amaryllis, The taste in flowers those lines embody Is just a little bit dèmodè. If thou wouldst write for our delight (And that of her whom thou adorest), No longer wait, but celebrate The latest triumphs of the florist! Why obstinately shut thine eyes To horticultural novelties? They flaunt themselves on hot-house shelves, With petals spangled, twisted, forked;— Surely the Muse will not refuse To recognise the modern Orchid! Should gazing on their glories tire thee, Their names alone must needs inspire thee. How sweet, my friend, to seize and spend The wealth these noble names supply us;— To sing of Masdevallias Of Zygopetalum, and Phaius, And, seeking for a rhyme to "blossom," To find it in "Odontoglossum"! Then there's Cymbidium and Oncidium, Lycaste with the purple lip, Calanthe, too, of gorgeous hue. . . . Then haste!—The vacant laureateship— (I've shown the way)—'tis thine to win it, So set to work this very minute! —Pall Mall Gazette.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

BRITISH WINES.—"C. H. I." wishes for some receipts for making wine from Currants, Raspberries, Gooseberries, and Plums.

"* Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday."

"* PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists varieties cannot, as a rule, be named."

ANNUALS FOR STANDING THE WINTER: W. Agrostemma cœli-rosea fimbriata, 3/4 foot; Alysum maritimum, 3/4 foot; Bartonia aurea, 1 1/2 foot; Calceola coccinea, 1 foot; Calliopsis Drummondii, 2 feet; C. coronata, 1 foot; Candytuft, white, lilac, and crimson, 1 foot; Chrysanthemum Burdigeum, 1 1/2 foot; Clarkia elegans, in variety, 1 1/2 foot; Collinsia, in variety, 1 foot; Erysimum Peroffskianum, 1 1/2 foot; Eschscholtzia californica, 1 foot; Gilia, in variety, 1 1/2 foot; Leptosiphon densiflorus, 1 foot; L. aureus, 1/2 foot; Lupinus nanus and others, 3/4 to 2 1/2 feet; Nemophila varieties, 3/4 foot; Shirley, Oriental, and Iceland Poppies; Sanvitalia procumbens, 1/2 foot; Silene pendula, 3/4 foot; Sweet Peas, 5 feet; Venus' Looking-glass, 3/4 foot; Virginian Stock, in variety, 3/4 foot. The above is an ample list for any but large gardens, and contains many very pretty plants. To make quite sure of having a display, it is prudent to make sowings in September in small 60-pots, and thin the seedlings to five or six in a pot. They should be wintered in cold pits or banked-up frames close to the glass, and protected from hard frosts, and well aired at other times. These may be planted out in March.

BOOKS: C. M. T. The Landscape Gardener, by JON. NEWTON, published by Hardwick & Bogue, 192, Piccadilly. Milner's Landscape Gardening, published by Simpkin, Marshall, Kent & Co., Stationers' Hall Court, London, E.C.—F. C. Heinemann, Erfurt. The American Florist Company's Directory. Price, 2 dollars. Chicago: Published by the American Florists' Co. It contains a list of Florists, Nurserymen, and Seedsmen in the United States of America, besides other useful matter.

CARNATION FAILING TO BLOOM: J. H. Caused by over-watering, probably. There is no disease visible. CARNATIONS: J. A. The appearances are probably due to the presence of eel-worms. They are derived from the soil, so that they are difficult to get rid of. CHRYSANTHEMUM BUDS: X. The crown-bud is the terminal bud of the main stem, and therefore is really the terminal bud proper. The terminal bud of the Chrysanthemum fanciers is the terminal bud of the side-shoots. It might be called secondary terminal bud to avoid confusion, the proper terminal bud being called the primary terminal.

EUCHARIS: W. J. They are affected by the bulb-mite, and there being no cure for the malady, you had better burn all the affected bulbs and make a new start with clean plants.

GRAPES: R. D. L. The spots are due to a fungus figured in the Gardener's Chronicle, July 21, 1894. Spraying with Bordeaux Mixture in the very young state would be serviceable.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number. S. 1, Leptoapermum ericoideus; 2, Spiraea sorbifolia; 3, Eryngium alpinum; 4, Hierochloa redolens; 5, Lilium monadelphum; 6, Centaurea scabiosa.—C. H. I. 1, Lychnis chalcedonica; 2, Galega officinalis; 3, Josticia carnea; 4, Althæa officinalis; 5, Clarkia elegans; 6, Stenactis speciosa.—W. Over. Cattleya granulosa, var. Dubussonii.—X. 1, Pyrus Sorbus, the true Service; 2, Spiraea callosa.—E. J. N. A very good variety of Stanhopea oculata—W. M. Dendrobium superbiens.—M. 1, Myrsiphyllum asparagoides, often called Smilax; 2, Phyllanthus niveus; 3, Cyrtomium (Aspidium) falcatum, a cold greenhouse or conservatory Fern; 4, Lastrea aristata variegata.—G. M., France. The flowers of Epidendrum were quite dried up on arrival, but they appear to be of the variable E. fragrans. The abnormal flower is very singular.—W. V. T. Gnevinia avellana, Proteaceæ, figured in the Gardener's Chronicle, July 12, 1884, p. 41.—H. Henkel. Dendrobium gratiotissimum, the other probably Phlox maculata var. candida.—Amateur. Lavatera trimestris.

PEACHES: R. G. H. Without seeing the trees we are unable to do more than make a guess at the cause of the evils complained of. We know how severely the sulphurous fumes of coke-ovens and burning pit-heaps affect the fruit trees at Lambton Castle; and it does not seem improbable that the proximity of the smoky district of Byker and the surrounding factories and collieries may have exercised a baneful influence on the trees.

ROSES: J. C. S. We do not undertake to name Roses.

SULPHIDE OF POTASSIUM: E. H. Kept by most chemists.

TOMATOS: W. J. The fruits have the "black spot," a disease caused by a fungus, Peronospora lycopersici. Cut off forthwith, and burn all affected fruits, and dress the plants with the Bordeaux Mixture.

VEGETABLE MARROWS DISEASED: J. L. We cannot tell from your description of the case what it is that causes the loss of the plants. Kindly send an entire plant, or, at least, leaves, shoots, and roots, for our inspection. In the meanwhile, employ the Bordeaux Mixture against it; of course taking care to wash all fruits before cooking them.

THE GARDENERS' CHRONICLE

PUBLISHER'S NOTICES.

GARDENERS' CHRONICLE TELEGRAMS.—The Registered Address for Foreign and Inland Telegrams is "Gardchron, London."

ADVERTISEMENTS.

SCALE OF CHARGES FOR ADVERTISING

HEAD LINE CHARGED AS TWO.

Table with 2 columns of rates for advertising lines, ranging from 4 lines (£0 3 0) to 14 lines (£0 8 0).

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, 2s; Half Page, 24 10s.; Column, 2s.

GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances

Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—Advertisers are specially requested

to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers,

and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

GARDEN REQUISITES.

"Paxton's Calendar," New Edition, "The Cottagers' Calendar of Garden Operations," Price 3d.; post-free, 3½d. 41, Wellington Street, Strand, London, W.C.

THE GARDEN.—All who desire the greatest amount of success and pleasure, certainly should, during the season, have a day at CANNELL'S (confirmative of this, see the last issue of the *Gentleman's Journal*). At no other Horticultural Establishment can the like number of Novelties, practical working, and interesting objects be seen, and so easily attained, as at Swanley and Eynsford. We cordially invite all to Come and See.

The Best Present for a Gardener. **VINES AND VINE CULTURE.** The most complete and exhaustive Treatise on Grapes and their Culture ever published. Third Edition just out. Price 5s.; post free, 5s. 6d. A. F. BARRON, Royal Horticultural Society, Chiswick.

PALMS, CORYPHAS and LATANIAS from Stores, 10s. per 100. Cash or exchange for Carnations, Pelargonium Cuttings, or Bedding Geraniums. F. ROSS & CO., Merstham, Surrey.

SUTTON'S FLOWER OF SPRING CABBAGE.—The finest variety in cultivation for spring use. Of compact habit, having few outer leaves, firm heads of excellent quality. Mr. J. Hounslow, Gardener to the Most Hon. the Marquis of Headfort, says:—"Your Flower of Spring is the best Cabbage I have seen. From seed sown last July I commenced cutting March 28. The quality is all that could be desired. Price of seed, 1s. per oz., post free."

SUTTON'S SEEDS GENUINE ONLY DIRECT FROM SUTTON AND SONS, THE ROYAL SEEDSMEN, READING.

DOUBLE WHITE PRIMULAS.—Strong plants, in 60's, 20s. per 100. Strong-rooted Cuttings, 10s. per 100. Cash with order. D. ANDERSON, Teddington Nursery, S.W.

BEGONIAS, Double and Single, for Bedding. Extra superb in quality. Selected large tubers. Also for Conservatory and Exhibition. Descriptive CATALOGUE free. B. R. DAVIS, Yeovil Nurseries, Somerset.

ROSES ON THEIR OWN ROOTS, FOR PRESENT PLANTING.

WM. PAUL AND SON respectfully invite attention to their magnificent Stock of the above, established in 5-inch (48-sized) pots. The Collection comprises the leading varieties of the Hybrid Perpetual, Tea Scented, Noisette, Bourbon, China, and Polyantha classes, including Crimson Rambler.

Price, 10s. 6d. to 18s. per dozen; 75s. to 120s. per 100.

The present is a most favourable time for planting, as it allows of the plants establishing themselves in the ground before winter.

Also a large General Stock of Roses in pots for Greenhouse Culture, Conservatory Climbing, &c.

PAUL'S NURSERIES, WALTHAM CROSS, HERTS

THE BEST & CHEAPEST FUEL for GREENHOUSE BOILERS, STOVES, & HEATING APPARATUS.

ANTHRACITE SMOKELESS COAL.

G. R. CARTER & SON supply their LARGE, NUT, or COBBLE COALS (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered by van, at any address within the 4 mile radius of Charing Cross; or in truckloads, at any Railway Station. This Coal is absolutely smokeless, and it requires much less attention than any other description of fuel, burning for twelve hours at least without any supervision, and giving from five to ten degrees more heat than Coke. Quotations on application to—

G. R. CARTER & SON, 53, 54, & 55, COAL EXCHANGE, LONDON, E.C.

H. J. JONES,
RYECROFT NURSERY, HITHER GREEN, LEWISHAM.

Messieurs LINDEN, L'HORTICULTURE INTERNATIONALE, PARC LEOPOLD, BRUSSELS, BELGIUM.

FIRST PRIZE (unanimously) for NEW PLANTS at the International Horticultural Exhibition of Paris, 1895, REVENGE, on the "MATCH" of the International Quinquennial Exhibition of Ghent in 1893, Messrs. LINDEN exhibiting, each time, only *their own introductions*.

The GRANDEST DISPLAY of ORCHIDS and NEW PLANTS in Cultivation.

ALL THE ENGLISH AND OTHER VISITORS AGREE THAT NOTHING IS TO BE COMPARED WITH THEM ANYWHERE ELSE!

"The nursery has become a model of its kind, and one in which every plant taken in hand is cultivated to perfection, is the least that can be said of the Orchid and new plant nursery of Brussels." J. O'B.—GARDENERS' CHRONICLE, April 28, 1894, p. 528.

MESSRS. LINDEN will be happy to quote price and size on application of anything they have in cultivation.

AMATEURS and NURSERYMEN visiting the Continent are specially invited to favour Messrs. Lindens' establishment with a call, when a cordial reception will be given them. English visitors will find an English welcome.

FOR COLONISTS.—Messrs. LINDEN beg to announce that, notwithstanding their numerous Collectors in Foreign Parts, they are always open to purchase FINE ORCHIDS from all parts of the world, and residents abroad are earnestly invited to correspond with them on the subject.

MESSRS. LINDEN, having a large staff of experienced Packers, the utmost reliance may be placed on their skill and care, and orders may be safely entrusted to them from any quarter of the globe.

THE **Gardeners' Chronicle.**

SATURDAY, JULY 27, 1895.

THE GARDEN CINERARIA.

ADDITIONAL evidence has now to be recorded which may be of importance in relation to the question as to the origin of the garden varieties of Cineraria (see pp. 588 and 655 of our last volume). At any rate, it has value independently of any specific application. In the first place, we have the positive testimony of Mr. Kelway in the *Gardeners' Magazine* for June 29. Mr. Kelway claims that the garden Cineraria originated with him in 1837. In that year he raised seeds from Cineraria oruenta, and amongst the seedlings observed several having a distinct ring of white round the disc (a feature, we may add, much more characteristic, so far as we have observed, of *S. Heritieri* than of *S. cruentus*). From these Mr. Kelway selected two, and from these two he raised other seedlings much improved in habit and in the shape of the bloom, and handed them over to Messrs. Webber & Pearce, of Merriott. Mr. Kelway, however, retained some himself, and their descendants now occupy several large houses. Mr. Kelway's plants then, are, in his opinion, pure uncrossed descendants from *S. cruentus*.

But nearly thirty years previously hybrid Cinerarias were in existence in Germany, to say nothing of others, which it is alleged were raised in 1824, and in subsequent years.

It may then be taken as established that there were in the early part of the century seedling variations from *S. cruentus*, and also that there were crossed variations in which some other species than *cruentus* was concerned. These facts suggest an enquiry as to the cause of the seedling variations; and secondly, an enquiry whether the Cinerarias as now grown originated exclusively from one or from the other category. The first subject is too vast and too recondite to be entered upon within the limits of a note, particularly as there is no direct evidence to be adduced. As a conjecture, we should think it very likely that seedling variations are the result of the dissociation of previously-mixed characters, the mixture having taken place perhaps ages since.

That the Cineraria, as we now know it, may have had a hybrid origin within comparatively recent times, is a hypothesis, which the facts now to be recorded show, is not to be summarily dismissed as unworthy of credence.

We have to thank Mr. Lynch, the Curator of the Cambridge Botanic Garden for specimens of a remarkable Cineraria which made its appearance in that establishment. Some plants of *Seneio Heritieri*, DC. (= *Cineraria lanata*, L'Herit.), were received, as Mr. Lynch informs us, from Kew, and, as it was desired to perpetuate the species, seeds were collected and sown in the ordinary way. Only one seedling came up, however, but this one showed a marked deviation from the type, and the colour of its flowers proved to be a red-purple self, with, in some particulars, much of the appearance of a poor-flowered common Cine-

aria, although quite different in other respects. Mr. Lynch was naturally much struck with these peculiarities, and knowing that the only allied plants in the house were some garden Cinerarias, which flowered at the same time, he naturally concluded that the seedling was a chance hybrid, in which the garden Cineraria, or male parent, strongly predominated; and this seems highly probable from an inspection of the specimens. It is, however, possible that the new comer may have been a seedling variation from a common Cineraria.

The Cineraria is too well known to require description, and it will suffice to mention its stout herbaceous stems, very large basal leaves, and auricled upper ones, in order to contrast it with those of the *Senecio Heritieri*, or supposed seed-parent, a figure of which will be found at plate 3987 of the *Botanical Magazine*. This latter is a half-shrubby plant, with slender white branches and cordate lobed leaves, ranging from about 1 to 3 inches in breadth, green above, densely white tomentose beneath, and the petioles without basal auricles. The corymbs are lax, the flower-heads over an inch across, and the ray-florets white, tipped with light red-purple, and somewhat stellate. The hybrid shows evidence of its descent from *Senecio Heritieri* in its white stems, and the dense tomentum of the under-side of the leaves. The stem, however, has become nearly herbaceous, and more than twice as broad as in the seed-parent, and the area of the basal leaves is four times as great. Some of the upper leaves are also auricled at the base, and the tomentum of the under surface of all the leaves is strongly suffused with that peculiar shade of red-purple to which the original *Senecio orientus* owes its name. The flowers have already been described. Thus, if this is, as seems to be the case, a seedling from *Senecio Heritieri*, a distinct advance has been made in the direction of the garden Cineraria, and as the circumstances are fully known, it seems clear that the pollen was derived from the latter—probably carried by bees, whose exploits in this direction will be familiar to every gardener.

Shortly after the receipt of Mr. Lynch's specimens, we were privileged to see another specimen, presumably also of hybrid origin. This came from J. T. Bennett Poë, Esq., who tells us that in his garden in the south of Ireland, as in the Cambridge garden, a Cineraria came up fortuitously in a flower-pot in a house where *C. Heritieri* was growing, together with sundry garden Cinerarias. The plant has been since cultivated by Mr. Poë, and is of dwarf habit, with long-stalked, cordate, irregularly lobed, roundish leaves, destitute of auricles, and thinly clothed with white down on the under surface. The inflorescence and lilac flower-heads with a white ring are like those of *C. Heritieri*, intermediate between those of that species and those of a garden Cineraria. Here, then, is presumptive evidence of the existence of two hybrid plants in the origination of neither of which did *S. orientus* directly take part, and both of which had a white ring, which is less visible in *cruentus*.

The plants are interesting and very instructive. They do not prove that our garden Cinerarias are of hybrid origin, but at all events they show, as we have already suggested, how easily a very few experiments might be made which would go far to settle the disputed points. As the true *Senecio cruentus* is now in cultivation, we would suggest that the authorities at Kew, as well as Mr. Lynch or others should, another season, endeavour to cross

it with *S. Heritieri* both ways, and carefully note the characters of the resulting hybrids, if such were obtained. A note by Willdenow is instructive in this connection. In 1809 he briefly described a Cineraria hybrida (*Enum. Pl. Hort. Berol.*, p. 893), which he stated was cultivated in the Berlin garden as *Cineraria cruenta*, but which differed abundantly in having flowers nearly as in *C. lanata* (i.e., *Senecio Heritieri*). The cross we have just suggested would probably yield this *C. hybrida*, and should certainly be attempted. We do not know if a dried specimen of this plant exists at Berlin, but if so we hope our Berlin friends will let us know what it is like.

Another important cross should be attempted, namely, one between *S. orientus* and *S. populifolius*—the latter species being also in cultivation. This might demonstrate the origin of *Cineraria lactea*, otherwise called *Senecio orientata* var. *lactea* (*Jacq. Ecl. Pl. Rar.*, t. 105), which De Candolle believed was a hybrid between *S. cruentus* and *S. populifolius*. It originated in the Jardin des Plantes at Paris, we believe, prior to 1813. We have had the good fortune to see a dried specimen of this plant, and having compared the plate cited with the two supposed species, we believe that De Candolle's judgment to be perfectly correct. The resemblance to *Senecio orientus* is unmistakable, yet it is evidently not a variety of that plant, for it is nearer to *S. populifolius*, and instead of the basal auricles of the former, has a few small appendages near the apex of the petiole, as in the latter. Two or three well-conducted experiments might prove the origin of these plants, which are believed to be in the direct line of descent of the garden Cineraria of to-day—we use the term in its ordinary sense, for, botanically speaking, the plant is not a Cineraria, but a *Senecio*.

Incidentally we may add, that seedling plants of *Cineraria cruenta* differ markedly in appearance from those of a garden Cineraria. We need not, at present, trouble the reader with a detailed account of these differences, hoping eventually to be able to examine seedling plants of *C. Heritieri* and other species.

Nor need we go further now into the vexed question of the origin of the garden plant; but in reference to a remark made at p. 588, it is only justice to our contributor, Mr. Rolfe, to state that his article was not written with any special reference to the question of hybridity, and that the figures and notes respecting the garden-plants were added by us after the manuscript had left his hands. It was a matter of current opinion that the plant then flowering at Kew was the wild original of the garden Cineraria. Mr. Rolfe accepted the current version, as we did ourselves, without critically examining the evidence in support of it or otherwise.

Reverting for a moment to the interesting plant sent us by Mr. Lynch, we may remark that it shows how quickly the characters of one parent may be partially obliterated, and we should not be surprised to find that a course of selection would complete the process without further crossing. Selection has made the garden-plant almost an annual—in actual practice at least, and this would tend to eliminate the shrubby character, and retain the herbaceous one. Mere superficial comparison of wild and garden plants is not absolutely conclusive of the matter. Who, for instance, ignorant of the history of the tuberous *Begonias*, could trace in many of them any sign of *B. boliviensis* or other species, well known to have taken part in the genesis of the race?

NEW OR NOTEWORTHY PLANTS.

ROSA WICHURAIANA.

ALTHOUGH this species was only introduced to Britain about three years ago, it already affords promise of being a valuable addition to the wild types of *Rosa* in cultivation. It is distinct from any other species, and is easily recognised by the perfectly prostrate habit, and by the peculiarly bright, almost glassy appearance of the leaves. A recent figure of it has been published in the *Botanical Magazine*, under the name of *R. Lucia*, but the typical *R. Wichuriana* is sufficiently distinct for the name to be retained in gardens. M. Crépin, a leading continental authority on Roses, and the author of the present name, still regards it, I believe, as being specifically distinct. It is a native of Japan, and belongs to the polyantha group. The leaves are quite smooth on both surfaces, the leaflets of elliptical outline, serrated, from $\frac{3}{8}$ to $\frac{1}{2}$ in. long, and varying in number from five to nine on each leaf. The stipules are not fringed, as in *R. multiflora*, but slightly toothed, and a pair of short decurved spines guard the base of each leaf. The flowers are pure white, and stand up above the foliage, which forms a dense covering, completely hiding the ground. The species flowered at Kew for the first time in 1893, and has proved a free-flowering and luxuriant grower. I measured a shoot made last year which was more than 12 feet in length. In the United States (from which country it reached us) it is highly spoken of, flowering so profusely as to give, at a distance, the effect of snow. It is well adapted for covering sunny slopes, mounds, &c., and may be commended to the notice of all who take an interest in the original types of *Rosa*. W. J. Bean.

ORCHID NOTES AND GLEANINGS.

CATTLEYA LABIATA MOSSIÆ.

A CORRESPONDENT kindly furnishes us with a flower in which, as not unfrequently happens, the floral parts are in two, thus the two outer sepals are crossed by two inner sepals, followed by four petals in a single whorl, two of the petals being of the form of the lateral petals, the other two being lips. The column is normal, but no ovary is formed.

From the Horticulture Internationale, Brussels, comes a flower of the same variety in which the lip is inseparable from the column, and greatly reduced in size.

CYPRIPEDIUM LEBAUDIANUM X.

A cross from *C. lævigatum* by *C. Haynaldianum*, raised by Mr. Page, gardener to Robert Lebaudy of Bongival. The influence of the pollen-parent is very perceptible. The description is given in the last number of the *Journal de la Société Nationale de France*.

ODONTOGLOSSUMS AT BANKFIELD, BRADFORD.

Henry Mason, Esq., in his pretty gardens in the Bingley suburb of Bradford, does not attempt to grow a collection of Orchids, but he grows a household of *Odontoglossums*, and his gardener, Mr. Midgley, perfectly understands their culture, and obtains satisfactory results. At the time of our visit, probably no other Orchid-house of equal size could have possessed a finer display of flower-spikes of the best varieties of *Odontoglossum crispum*, and, in a lesser degree, of other species. Many of the plants have been cultivated in this house for several years, and the progressive stages marked on their large plump pseudo-bulbs bespeak good culture. The house in which the plants are cultivated is a span-roof of rather low pitch, a path of moisture-holding York stone runs up the middle, and beneath the staging on each side rain-water tanks occupy the greater part of the floor. The staging is of iron, the lower one being constructed close, so as to hold water, and the ascending stage above it is of trellis woodwork, in order to elevate the plants at the point farthest from the path, and

inverted pots are also used for this purpose where found necessary. The shading is on the outside of the roof, and it is arranged to run on supports, which keep it well above the glass, so that in the hottest weather the house is kept at a comfortably cool temperature. These are points which are invariably to be found in any cool Orchid-house in which the plants thrive, and in spite of occasional attempts to improve on it, it is still the best pattern of a cool-house—the abundant tankage, which some Orchid-growers decri, being still one of the healthiest features in such house.

Among the large-flowered *O. crispum* at Bankfield not a single indifferent form appeared, while some were remarkable for their spotting. Among these were the handsome *Odontoglossum crispum Stevenii*, a fine form of the *O. Jenningsianum* class, with rose-tinted flowers blotched with purple; and several very handsome varieties of *O. Andersonianum*. Also in bloom were a few good plants of *O. polyanthum*, *O. triumphans*, *Cymbidium Lowianum*, and *Oncidium macranthum*, the whole making a fine display, and pointing to the advisability of growing one class of Orchids well, rather than a general collection in an indifferent condition.

In the Cucumber-house a bank of *Cœlogyne cristata* was remarked in fine condition, with a large plant of *C. c. alba* in the centre.

The Vineries and Peach-houses were bright with tuberos Begonias, Pelargoniums, &c.; and the conservatory was chiefly filled with large plants of Camellia and greenhouse Rhododendrons, with *Odontoglossum citrosanum* displayed on the roof. Mr. Midgley prides himself on his kitchen garden, which he keeps in perfect order; and in the flower garden the Roses were very fine, notwithstanding the severity of the past winter.

DENDROBIUM CRUENTUM.

This fine *Dendrobium* was originally discovered by Messrs. F. Sander & Co., on the West Coast of the Malay peninsula, and described by the late Professor Reichenbach in the *Gardeners' Chronicle* xxi. (1854), p. 604. It has always been scarce in gardens, and not until a recent importation by the same firm have good healthy specimens been obtainable. Its flowers, which are thick and wax-like in substance, are of ivory white tinged with green, the distinct keels at the back of the sepals being often of an emerald green colour. The lip is handsomely marked with crimson. As may be inferred from the locality in which the plant is found, its proper place is a warm and moist house; the only difference between the resting and the growing season being marked by withholding water for a time after the growths are fully made up. Now that good specimens are in the country (fig. 17) it proves a good grower, which had formerly been doubted.

THE ROSARY.

NOTES UPON NEW ROSES.

MUCH interest is felt by rosarians in the question whether certain new varieties of Roses are really acquisitions in the true sense, or merely possess some slight distinctive quality without sufficient merit to warrant their cultivation in the future. We never have too many really good new Roses, and it is all the more pleasing to find our home-raisers again so well in front of our Continental friends.

Without the least hesitation, the palm must go to the Messrs. Dicksons of Newtownards, Ireland. Many of us who saw their box of twelve distinct new Roses, which won at the National Rose Society's Show at the Crystal Palace, were much struck with the beauty of the flowers thereof. Usually one finds one or two fairly good flowers, the remainder being indifferent. But in this dozen there was good quality and pleasing variety. Our most experienced growers were loud in their praise; and I may also mention as an interesting fact, that

no fewer than ten of the twelve are of Messrs. Dicksons' own raising. But to get a little closer to our notes. Muriel Grahame, this is, as I adjudged it, a sport from Catherine Mermet, and no Tea-scented Rose of greater promise has been sent out for many years. We know of the fine qualities possessed by one of its parents and by its sister sport *The Bride*. Messrs. Dicksons told me that it is in every way a counterpart of Catherine Mermet excepting in the colour, which is a pale creamy-white, delicately flushed with very soft rose. The 600 miles journey that this variety had endured in trying weather for any cut Rose, impressed me very favourably, seeing that the bloom was staged in such a fresh condition, and I have little doubt that the card of Commendation will be replaced by the coveted Gold Medal upon its next appearance.

Countess of Caledon is a hybrid Tea, and a great addition to this class of Roses. It is a grand grower, of a perfectly distinct shade of colour, namely a pink and soft shade of rose combined, and as a decorative plant it is sure to be in good demand. A card of Commendation was also awarded here. Tom Wood is a Rose of a very pleasing colour, being of a deeper tint, and I should judge it to be also a much fuller

FIG. 17.—DENDROBIUM CRUENTUM

Rose than Madame Cusin. Lady Moyra Beanclore gave me the impression of Ernest Metz and Madame de Watteville combined. But the best and most consistent of all the new varieties, was Mrs. R. G. Sharman Crawford, a H. P. of extra merit. Whenever shown it has been a great attraction, not only because of its deep rosy-pink colour, which is distinct, but on account of the bold manner in which the blooms are borne, the base of the petals being much lighter than the tips, while on the outside they are shaded with pale flesh pink. The form is perfect, size good, and with me it has kept a certain freshness of shading that few other Roses could retain during the late sultry weather. This is a Gold Medal Rose, while the first prize and First-class Certificates it has won are very numerous. A box of twelve blooms was decidedly among the very best staged at the Crystal Palace. Like Mrs. John Laing, it has no fault, and will be equally indispensable in collections. Helen Keller (H.P.) has not yet won the Gold Medal, but it has secured almost a dozen First-class Certificates; it is a splendid grower and bloomer, after the style of Mrs. John Laing, but distinct from that variety. Mavourneen (H.P.) I have only seen twice, and it gave me the impression of resembling Helen Keller

and Mrs. R. G. Sharman Crawford combined; colour a silvery-flesh, with rose shading. I am told that its growth and freedom in blooming is remarkable.

Avoca (Tea) is somewhat like Ernest Metz for size and form, but it was still considerably brighter, after a long journey which necessitated its being cut upwards of thirty hours.

Marchioness of Downshire (H.P.), one of last year's Gold Medal roses, I did not think so much of as before, but the season has been against a Rose of this class. The colour is a satiny-pink, of great clearness, and with delicate rose pink shading. This is one of the most distinct Roses we have, and will yet be shown in grand form by those who possess it.

Marquise de Litta (H.T.) is a very peculiarly shaded form of La France (H.T.). It is a good grower and free bloomer; carmine-rose with a vermilion centre, the two shades blending in a unique and pleasing way. A treble at Gloucester, and several good singles at the Crystal Palace, stamp this as a promising H. Tea.

Clio, Sylph, Alistair, Stella Gray, Lorna Doone, Corinna, Duke of Fife, Shamrock, Captain Haywood, and Robin Lyth have pleased me most among the remainder. At Gloucester, Richmond, and the Crystal Palace by far the best of the new Penzance Briars was Jeannie Deane, a semi-double flower with very showy stamens. Its colour is brighter than that of the others, and the flowers are far less fleeting. A. P.

PLANT NOTES.

ALSTRÆMERIAS.

THE large clumps of these growing in the border on either side of the entrance to the Black Hamburgh-house at Gunnersbury Park came through the severe winter unharmed, the only protection afforded being a mulch of manure and leaves placed over the ground to the depth of about 6 inches. The position is sunny and hot, and, being on a slight slope, is perhaps favourable to the well-being of the tuberous roots. It would be interesting to know when the roots were first planted on this particular spot, and how many varieties were originally placed there. One thing is quite certain—that the original clumps have enormously increased, the tubers being pushed further and further afield as the seasons pass. They are never disturbed, but have reached the extreme edge of the border.

It has been remarked, that "Alstræmerias were at one time much more largely grown than they are at present, and the genus was represented in every garden." This, it is to be feared, is generally true; and yet many inferior subjects are grown in borders that do not possess a tithe of the beauty of the Alstræmeria. Exposure to the full blaze of the sun appears to be immaterial, so long as there is good cultivation, as is conclusively shown in the experience of the plant at Gunnersbury, where it occupies a spot quite shadeless during the hottest part of the day. Water is rarely given; the much economises the moisture in the soil, and the plants rarely suffer for lack of it.

It is not because any difficulty is experienced in obtaining plants that the area of cultivation has become so circumscribed. There are certain species and their varieties that are readily procurable, such as aurantiaca, orange-yellow, streaked and spotted with red, which is found to vary under cultivation, but all are very showy; aurea, golden-yellow, probably a variety of the foregoing; chilensis and its varieties, varying in colour from delicate rose to deep orange or red; oculata, a doubtful species, colour rose-purple; Pelegrina, purple and white, and its white variety, alba—perhaps one of the tenderest; paitacina, crimson and purple; and pulchra (tricolor), white, cream, and yellow. When planted, a compost of peat, leaf-mould, and sandy loam should be employed.

There appears to be no common name for the Alstræmeria, though one or two forms are known as St. Martin's flower; and the white form of Pelegrina

bears the name of the Lily of the Incas. This should have a specially warm spot if planted in the open, or, failing that, the protection of glass. *R. D.*

HYDRANGEA HORTENSIA VAR. LINDLEYI.

In Cornwall and Devon *Hydrangea Hortensia* is one of the showiest of hardy flowering shrubs; in Mr. Rashleigh's garden at Menabilly especially, it is used in great numbers and with admirable effect in partially shaded positions in the vicinity of walks and carriage-drives. Further north it is seen in great beauty, but only in favoured localities, or after unusually mild winters. Near London it rarely flowers outside, the winters being usually so severe as to destroy the terminal bud. The variety *Lindleyi* possesses this advantage, however; no matter how badly hit by frost, it pushes up shoots freely from the axillary buds on the previous season's growth, and as these (unlike the common *Hydrangea*) flower the same season, the loss of the terminal bud is of little account. The flowers of this variety are of a pale rose colour, appearing in flat corymbs, which measure 3 to 5 inches across, the outer row consisting of large-petalled, sterile flowers. The variety is abundantly represented in the collection at Kew, and is now in bloom there. Other hardy species that flower well are *H. paniculata*, *H. radiata*, *H. pekinensis*, and *H. arborescens*; but with the possible exception of *H. paniculata*, the plant under notice may be considered the best of the genus for outdoor planting. It is known also under the names of *H. rosea-alba* and *H. japonica*.

SYRINGA JAPONICA.

This Japanese Lilac has been described in glowing terms by horticulturists in the United States, and by visitors who have seen it in flower in that country. In England it has not been cultivated long enough for anyone to say with certainty what rank it will eventually take among hardy trees and shrubs, for it has not flowered above two or three times, and many Japanese deciduous things succeed much better in the United States than they do under our duller skies. It is, at any rate, perfectly hardy, and two small bushes were in flower at Kew during the early part of July.

Syringa japonica is a small tree of vigorous habit, which forms a distinct trunk. Its leaves are broadly ovate, very slightly downy, and pale green in colour on the lower surface, dark green and glabrous above. On the small specimens at Kew their texture and size resemble the common Lilac. The small white, slightly fragrant, flowers (about $\frac{1}{4}$ inch in diameter) are produced in large compound panicles; of about 1 foot in length at Kew, but on full-grown plants they are described as at least twice as large. The general appearance of this plant when in flower suggests a connecting-link between the Lilac and the Privet. The species is a native of the Northern Island of Japan, and was introduced to the Arnold Arboretum in 1876.

ROSA SETIGERA.

Although the wild types of *Rosa* are generally past their flowering season at this date, *R. setigera* is now at its best. It is a North American shrub, and is known there and here as the Prairie Rose. It differs from all other native species in its semi-candent habit. About a dozen plants arranged in a group are now making a pretty display in the Rose collection at Kew. In habit it possesses the vigour and grace usually associated with rambling Roses. The shoots are long and arching, and the luxuriant leafage, of a rich bright green, makes an admirable setting to the flowers. The leaflets number from three to five, and are remarkable for their large size, some being 3 inches long by $1\frac{1}{2}$ inches wide; the under surface and the petioles are covered with fine down. The flowers single, of a very bright shade of rose, measure 3 inches across, are devoid of fragrance, and come in dense clusters amid the foliage. The beauty of this species of Rose, and its valuable property of flowering late in the season, do not appear to be fully appreciated even in the United States, and still less in this country. *W. J. Bean.*

PRESERVING FRUIT.

CONSIDERING the increase that has taken place in fruit production within the last few years, and recognising that the preserving of fruit, so that it may come out perfect at the end of several months, must be of immense benefit to growers, who at the time the fruit is ripe often have to accept prices for it which do not pay the cost of gathering, we give the following extract from an excellent lecture upon the subject of the "Preserving of Fruit," given by Miss Maria Parloe, teacher of cooking, Boston, and delivered in connection with the Massachusetts Horticultural Society.

There are two ways, said Miss Parloe, of interpreting the word "preserving," as applied to fruit, the general understanding among housekeepers being that the fruit is cooked with a generous amount of sugar, the product being a rich compound of good-keeping quality. In its broadest sense, "preserving," when applied to food, means to save from decay by drying, canning, combining with a preservative substance, &c. It is the latter sense with which the lecture deals.

The most primitive method of preserving foods was by drying the raw article in the sun and air, and this is still practised to a great extent. Artificial methods are now used, but the sun develops in some fruits a flavour which is lacking when artificial heat is used.

Although nearly every Raisin grower in California has a drying-house, he resorts to it only when the sun fails him. In the case of Peaches, Apples, and Apricots, the fruit has a fresher and more appetising appearance when dried in the evaporators, and its commercial value is, therefore, greater. When drying fruit, it is important not only that it shall be sound and of good quality, but also that it shall be prepared quickly and dried rapidly. When all moisture is expelled, it will keep for years in a dry place.

The second method of drying is to cook the fruit a long time, reducing it as nearly as possible to a paste, spreading this in thin sheets, and drying in the sun or by evaporation. When free from moisture, this fruit can be packed in boxes and will keep indefinitely, and is suitable for transporting long distances, as for the use of armies or emigrants. When fruit dried by either of these two methods is to be used, it must be softened by the addition of water and cooking.

A third process of drying is to cook the fruit for a long time with sugar and water, and then partially dry it. In this case the sugar is largely the preservative agent, and the drying goes on only until no syrup drips from the fruit. With close packing in boxes or jars the fruit will keep well in any climate; hardening, of course, when exposed to the air for a considerable period. This fruit is ready for use at any time, but is more of a confection than a sauce.

These three methods enable all to have the Figs, Dates, Prunes, Apricots, Apples, Peaches, &c. of the world. In New England, where most of the fruits are preserved by canning, they are apt to lose sight of the enormous amount of wealth, health, and comfort that these methods of preserving represent.

The more modern process for preserving fruits, and by far the most useful and healthful, is that of canning. This seems to have been introduced to the French Government in 1810 by Appert. Since then it has been constantly improved. The destruction of germs, and the exclusion of air, are the principles upon which canning is based. The article to be preserved is cooked for a short time, and is then put in jars from which the air has been expelled by heating them to the boiling-point.

They are then sealed, and when cold, are set in a cool, dark place. If all the conditions be right, the heating of the cans and fruit thorough, and if the cans, covers, &c., be in perfect condition, the fruit will keep for an unlimited number of years, and when opened, will be found to have nearly all the freshness and aroma of newly-gathered fruit. Whilst this is true of the majority of fruits, it is not so of all. The Strawberry subjected to this process

will come out a pale, spongy, insipid thing; whereas the Raspberry seems to have its colour, flavour, and odour intensified. If, however, a generous amount of sugar be added to the Strawberry in the cooking, it will retain its shape, colour, and flavour.

It is an error to attempt to can the Strawberry without sugar, or with only a small amount. Neither can sugar be put to Strawberries and then the fruit allowed to stand, as with Pine-apple. The sugar seems to draw the juice out of the fruit and leave it a spongy mass.

Some fruits can be canned without heat or sugar. The jar should be packed full of the fruit and then placed under a faucet, having the water run in rapidly for a minute, that all the air in the jar shall be displaced; then seal, and put away in a cool, dark place. Perhaps not many kinds of fruit would keep if put up in this manner. Certainly, there can be no expectation of success with juicy fruit of any kind. Miss Parloe has, however, been successful with Rhubarb. Green Gooseberries and some kinds of Plums can be preserved in this manner. It seems to be a question whether the acid in these fruits does not have a good deal to do with the keeping quality. Many kinds of fruit can be mixed with their own weight in sugar, packed in jars, sealed and put away in a dark, cool place. They will keep well, and have the flavour of the fresh fruit. It has been found in the case of small berries put up in this manner that the seeds become harder and more noticeable than in the cooked fruit. Pine-apple should not be put up in any other way than this, as it comes out simply perfect.

The third method of preserving fruit is by cooking it with sugar. In this case sugar is largely the preservative; and where the sugar is added to the fruit, pound for pound, it is not necessary to seal the product. But the "self-sealing" jars are so convenient that most housekeepers prefer to use them rather than the old-fashioned stone jars. The French candied fruits are an example of another method of preserving fruit.

Having glanced at the various methods of preserving, the lecturer turned to consider some of the exact steps necessary to secure the best results. More fruit is preserved by the exclusion of air than by any other method. To be successful in this, certain things are essential. First, the fruit must be perfectly sound; next, every utensil used in the process must be absolutely clean; again, the cans must be perfectly air-tight; finally the cans and fruit must be made free from germs and air before sealing, and the canned fruit must be kept in a dark, cool, dry place.

As to the different modes of treating various kinds of fruit. It is known that when the germs are killed and the air is excluded, sugar is not necessary for the preservation of the fruit. But there are few kinds of fruit that are not improved by some sugar, because it fixes the colour and flavour, and gives much finer results. Some kinds of fruit require but little sugar for this purpose, while others are poor indeed without a generous amount. One has only to contrast the flavour and quality of the canned Peaches that are put up with and without sugar, to realise the great superiority of those with which saccharine matter has been used. Where fruits are too dry to give out enough juice to cover themselves generously, a light syrup should be used. But in the juicy fruits avoid water if possible. A good rule in the case of small berries is to allow one-third of a pound of sugar to each pound of fruit. There are people who would not care for more than half that amount of sugar, while others might like more. The following has been found a capital method for small berries: have twelve quarts of berries picked clean put three quarts into the preserving-kettle and on the fire. Heat slowly, and break up with a wooden vegetable-masher. Then turn the fruit into a piece of cheese-cloth and press out the juice. Wash the preserving-kettle, and put the juice and sugar into it, stirring until the sugar melts. When the syrup boils, skim it, and add the whole berries. Watch the kettle, stirring occasionally, until the preserve

boils, then skim, and cook for ten minutes longer. Fill the jars, and seal.

For fruit like Peaches, Pears, Plums, &c., make a light syrup in this manner:—Put into the preserving kettle 4 quarts of sugar and 2 of water, boil, and then skim well. Have the fruit pared, and cook it gently in this syrup until tender; then can, filling up with syrup. Quinces must first be cooked in clear water until tender.

In paring fruit, use silver-plated knives, and drop each piece as soon as pared into a bowl of cold water which has been made acid by addition of lemon-juice. This prevents the fruit from turning dark. Use earthen bowls and wooden or silver-plated spoons. Avoid any delay while doing this work.

To peel Peaches and Plums, put a little of the fruit into a wire basket, and plunge it into boiling-water for a few minutes. Take the basket from the boiling water, and plunge it into cold water for a few seconds; then turn it into an earthen dish, and peel with a silver knife. Save all the juice that falls into this bowl. When the work is properly done, the skin will peel off perfectly smooth. There is really less waste and less labour in removing the skins of fruit in this way than in the common way.

To fill the jars, have on the stove two pans partially filled with water. Let the water in one be boiling, but in the other not so hot but that the hand cannot be held in it with comfort. Put a few jars and covers in the cooler water, turning them now and then until all parts become warm, then put them in the boiling-water. This does away with all danger of breaking. When the jars have been heated in boiling water, drain, fill, and seal them at once. In filling the jars, be sure that they stand level, that the syrup has filled all the interstices between the fruit, and that it also runs over the top of the jar. Even with this overflowing of the syrup, it will be found that, after cooling, the can is not full; but if the work has been properly done, the fruit will keep all right.

Preserving with sugar, pound for pound, is not very extensively practised now, most people preferring the simpler and more healthful mode of canning with a small quantity of sugar; still, there are some fruits that are better when done in this way. There is probably no fruit more delicious than the Strawberry, either fresh or preserved, yet there is none about which the housekeeper feels more uncertain. It is something that cannot be preserved without plenty of sugar. The following has been found to give the greatest satisfaction. It is true the preserve is very rich, and cannot be eaten in large quantities, but it is better to have a little in perfection than a great deal of an unsatisfactory quality.

Sun-cooked Strawberries.—Use ripe and the finest fruits. Put them in the preserving-kettle with a pound of sugar to each pound of berries; first a layer of fruit, then a layer of sugar, and so on. Do not have the mixture more than 6 inches deep. Place on the fire, and watch. When the preserve begins to boil, skim carefully, and simmer for ten minutes. Now pour the fruit into meat platters, and place in the sun. After an exposure to the sun for twenty-four hours, put them up in jars or tumblers, and cover. It may be said, the sun does not shine twenty-four hours, but the fruit may be placed on tables by the windows in a sunny room, and let remain there for several days, or until it has had its full sun bath.

The Larger Fruits.—All fruits are prepared for preserving in sugar in the same way as for canning. Then a rich syrup is made—4 lb. of sugar to a pint of water—and the fruit is simmered in it until tender and clear. Such fruits as Quinces and hard Pears should be cooked until tender before being put in the syrup.

When the sugar should be added.—Some kinds of fruit are better for having the sugar added to them when partially cooked, while others should always have it added the moment they are placed on the fire. Again, one kind is better for standing for hours in the sugar, while others should not have

the sugar touch them until they are ready to go on the fire. There are a few fruits which are far better without sugar than with it. This is the case with the Prune, with which sugar should never be put, long slow cooking serving to develop a fine rich flavour. Cranberries, on the other hand, should have a pint of sugar to a quart of berries, and the sugar, water, and berries must go on the fire at once and be cooked rapidly for a short time, say twelve to fifteen minutes. No other method will give a satisfactory result.

Jelly-making.—In no department of preserving does the housekeeper feel less sure of the results than in jelly-making, so much depends upon the condition of the fruit. This is more pronounced in the case of small fruits than with the larger kinds.

FIG. 18.—DENDROBIUM HILDEBRANDII.

When Currants are over-ripe, or have been picked after a rain, the result of using them will be uncertain. An understanding of the properties in fruit which form the basis of jellies may help the housekeeper to a better knowledge of the conditions and methods essential to success.

Pectine, which forms the basis of vegetable jellies, is a substance which, in its composition, resembles starch and gum. It gives to the juices of fruits the property of gelatinizing. This property is at its best when the fruit is just ripe—better a little under-ripe than over-ripe. When boiled for a long time it loses its gelatinous property, and becomes of a gummy nature. These facts show the importance of using fruit that is but just ripe and freshly picked, as well as the need of care not to overcook the juice.

Canning Fruit Juice.—One form of preserves which is most useful, convenient, and wholesome should be more generally adopted than it is; namely, the canning of fruit juice for creams, ices, drinks, &c. Certainly every housekeeper ought to preserve enough of the juices of the Strawberry, Raspberry, Peach, Apricot, Grape, &c., for her own use. They can be preserved with or without sugar, although sugar is advocated. Boil for ten minutes, and seal while boiling hot. *J. J. Willis, Harpenden.*

DENDROBIUM HILDEBRANDII.

"This Orchid was first discovered by Mr. Hildebrand, superintendent of the S. Shan States, and some plants were sent to Messrs. Hugh Low & Co. Afterwards my men came across it, and without knowing what it was, I sent some to Messrs. Charlesworth, who identified it, and sold the plants. Its habitat is on the borders of Siam, a good way east of the Salween River, and some 300 miles east of Lake Inle." *R. Moore, in Orchid Review, June, 1895, p. 169.*

Mr. C. Leeson Prince, of the Observatory, Crowborough, Sussex, who kindly sent us the photograph of the plant (fig. 18), remarks as follows:—

"Just a year ago, I purchased of Messrs. Charlesworth & Co. of Bradford, a newly-imported plant of *Dendrobium Hildebrandii*, but the bulbs were in such an exhausted condition that I hesitated at first to buy it; especially as little appeared to be known respecting it. However, my gardener (Mr. Slater) has succeeded in flowering the main bulb, which is 18 inches long, and has produced nineteen blossoms from seven spikes.

"The sepals, five in number, are somewhat crimped, and the two lateral ones measure from $2\frac{3}{4}$ inches to 3 inches across, and are of a creamy-white colour. The lip measures exactly 1 inch at its mouth. When the flowers were fully expanded, now six weeks since, it was removed to an intermediate house, and at this date, June 1, 1895, the flowers are as fresh as at first.

"It has been the admiration of all who have seen it, and I think a large plant would be a fine subject for exhibition purposes, as I feel quite confident that it will prove to be very floriferous."

THE RELATION BETWEEN THE WEIGHT OF THE SEED AND THE GROWTH.

From *Agricultural Science*, the organ of the Society for the Promotion of Agricultural Science, issued in June, 1895, we extract the following passages from an article by Mr. B. T. Galloway, on the growth of Radishes as affected by the size and weight of the seed. The author says that:—"The influence of the size and weight of the seed on the growth of the plant has received considerable attention. While it is claimed by some that the size and weight of seed has no material effect on the product, the majority of those who have studied the subject take the opposite view, and have proved their claims by well-conducted experiments." The results of such enquiries are thus summarised at the end of the paper: "1. The large seed germinated more quickly and with more certainty, and produced marketable plants sooner and more uniformly than the small seed. 2. The small seed gave proportionately larger plants than the large seed, but in practice this does not warrant the use of the former. The practical conclusions that may be deduced from the experiment are:—1. That by the use of large seed from 85 to 90 per cent. of the crop may be brought in at the same time. 2. That practically all the plants thus grown being marketable, no ground is wasted. 3. That enough time is saved by using large seed to grow one additional crop during the season; in other words, if four crops are grown, using mixed seed, and waiting for all the plants to attain sufficient size for market, five crops can be obtained if large seed is planted. 4. That the only additional expense is the extra amount of seed needed, all the smaller ones being sifted out and

thrown away. The extra expense will average about 25 cents per pound of seed, and when it is known that a pound of seed will plant about 1500 square feet, the matter of extra expense becomes trivial."

NURSERY NOTES.

THE FERN NURSERIES, SALE.

THE collection of Ferns grown by W. & J. Birkenhead, is growing in importance every year. The firm, as is well known, make Ferns a specialty, and since the great Fern Conference held in London in 1890, at which they received the Gold Medal of the Royal Horticultural Society, they have been continually in the front at the principal shows in the kingdom. Since the writer last visited the nurseries quantities of houses have been built, and the general condition of the plants has improved greatly. There are now about 1400 varieties assorted in the various divisions, comprising stove, greenhouse, hardy exotic, British, and Filmy. A large portion of the British, hardy exotic, and greenhouse kinds is bedded out into nursery rows out of doors, thus giving one an opportunity of comparing out-door and in-door growth, and selecting the most enduring for outside ferneries, rock-work, and for plantation and garden-work.

Among the most beautiful to look at in the many rows out-of-doors is the division of Lady Ferns, chief among them being the setigerum group, in which the handsome cut pinnules traversing each other are conspicuous in *A. filix-fœmina* *Victoriæ* and the dwarf and striking *f.-f. grandiceps*. *A. f.-f. Vernonæ* and its crested form catch the eye, the pinnae are so wavy, and the pinnules crested, *Victoriæ* itself, apart altogether from the setigerum blood, is a grand variety, from its cross-sword-like pinnules, and it is beautifully dwarf and compact. Another little beauty strikes well among the group, *A. f.-f. digitatum tenue*, and do also the forms of *f.-f. congestum* and its dwarfier, more crested fellow, *congestum cristatum*. *A. f.-f. Kilmoryensis* is a pleasing green, making a stylish plant. These and others have partially suffered from the sharp frost of June 6, but are now recovering. Some more, particularly *Osmonda regalis*, are growing under a batch of standard Apple and Plum trees, but Mr. Birkenhead says they do much better out in the open, because the moisture stolen from them by the fruit-tree roots operates prejudicially; and, moreover, these bedded-out Ferns show to much better advantage in the autumn after the indoor ones are partially giving way.

In a lean-to house, these hardy British Ferns are in great exuberance. We noticed particularly a selected form of *Athyrium f.-f. setigerum* called *grandiceps* (Birkenhead, raiser), with tall upright fronds closely packed together, and much broader in pinnules than the normal form. Another gem is *A. f.-f. plumosum elegans*, so light in the green and arching in the pinnae; *A. f.-f. Todeoides* is like the *Todea* in habit. *A. f.-f. conglomeratum* is very heavily crested, and a capital rockwork Fern. There are one or two promising forms alongside of this of the same breed. *A. f.-f. Edwardsii* is another fine dwarf variety. *A. f.-f. acrocladon* has much-branched fronds, and is very heavily crested—like cockscamb, in fact. *A. f.-f. plumosum superbum* is the chief of its class, the fronds are of a fine lustrous green, and the crested form of *grandiceps* is one of the very finest of the plumose group. For specimen plant purposes these plumosums take front rank. *A. f.-f. Pritchardi* is abundantly distinct from its compeers, having long and narrow fronds, which are aptly likened to a waggoner's whip. The male Fern, *Lastrea filix-mas*, is represented in a good many varieties, probably the choicest being the crispy fronded *fluctuosa*, sometimes called *crispatisima*, abundantly distinct from the type. The pretty dwarfier grower *decora* is noticeable.

Among the Mountain Buckler forms we noted *Oreopteris ramo-coronata*, a much-branched and crested form, as its name shows, as in *Lastrea pseudo-*

mas cristata fimbriata, is much cut and beautifully crested, an admirable companion to the rare *ramo-aesima*. The *Pseudo-mas coronaria* (Birkenhead, raiser), is a striking form of this division. *Lastrea dilatata grandiceps* is a stylish-looking fine crested form of admirable greenery. *Polystichum angulare cristatum* is one of the most striking of its class; *P. a. plumosum*, as its name implies, has spreading feathery fronds, making a fine specimen—a worthy fellow to the beautiful *longipinnulum*. There is a particular form of *P. aculeatum*, whose young fronds are more than usually beautiful. *Woodsia alpina*, one of our rarest natives is doing well on a shelf in this house.

The span-roof houses are about 50 by 10 feet, and are closely shaded in the interior with a kind of scrim, they do duty for British Ferns in quantities. Some of the commoner forms are not to be despised even among varieties, although some of them require glass protection. For instance, *Asplenium lancifolium* was beautiful so grown. The *Scolopendriums* were a grand group, one named *fimbriatum* is deeply frilled and fimbriated, and shoots out to advantage; *cristolatum*, is abundantly crested, and makes a very striking plant. *Moonæ* is fully crested and fimbriated, and Clapham's *ramo-cristatum* is one of the boldest crested and freest growing of this admirable Hart's-tongue division; *Lastrea æmula*, and particularly *L. denæa*, are very compact and distinct, and smell like new-mown hay. *Polystichum congestum polydactylon* make fine ornamental pot plants. What a fine deep green the depending form of *Pteris depauperata* puts on in its maturing fronds, with the tassel-like crests weighing the fronds down!

Among the North American Ferns the Violet-scented Fern (*Lastrea fragrans*) is one of the most prominent, as it is one of the most popular, because of the fronds smelling like Violets. A few plants in a close house dispense abundant fragrance. *Phegopteris hexagonoptera* is a Beech-looking Fern, with captivating greenery, the pinnae deeply cut. The Japanese *Lastrea atrata* is distinct and noteworthy. For a stylish exhibition plant there is nothing to beat *Osmonda Claytoniana*. It grows about the same size as the Royal Fern, but the fronds are of a pure velvety green, the fertile fronds particularly commanding attention. *Oncoclea sensibilis* is another tall grower, with large prominent drooping pinnae, making a telling exhibition plant. *Adiantum pedatum* is such a useful plant for trade purposes, and one of the most beautiful too, that we cannot pass it over, seeing the quantity grown here.

Amongst greenhouse Ferns the British Maiden-hair (*Adiantum capillus veneris*) does best under glass. There is one grand form conspicuous with finely-crested fronds, and having the pinnae larger, named *daphnites*. Among the *cuneatum* batch we noticed the following of the rarer kinds: *grandiceps*, crested; *Ludemannianum*, also crested, and both evidently good growers; the beautiful *rubellum*, with its claret-tinted young fronds, and the stylish-looking *Veitchii*; *Balanium calcitum*, makes a fine specimen plant, and its deep sea-green fronds are telling. *Cheilanthes farinosa* is a very handsome silver Fern that does best in a cool climate; if the least degree coddled, it becomes infested with trips. *Davallia tenuifolia Veitchiana* makes a handsome specimen—so light and feathery. We noted the novel *Lomaria aspera*, rigid in the fronds, and so brittle, yet with pinnae standing erect, which makes it a very attractive plant. Another two novelties struck us, *Mohria thurifraga*, and its variety *achillæfolia*, beautifully cut and quite Achillea-like. The Chinese *Nephrodium* is an admirable Fern, and so is *N. odoratum*.

Amongst stove Ferns, we noted *Adiantum concinnum gracile*, the beautiful *Farleyense* in hundreds doing well, a new desirable-looking one named *Feei*, the white-striped *macrophyllum* remarkable too for its young, pink tinted fronds, an acquisition in its way, and a comparative novelty; and one more than usually telling, named *Weigandii*, a fine crisped form with pinnae overlapping each other, and of a good green shade. Amongst *Davallias*, suspended in cork baskets,

was the charming *fijiensis*, and a selected one, named *elegans*, sent out by Messrs. Birkenhead—a decided acquisition. The golden *Gymnogramma Martensii* is always to the fore; but a new one named *grandiceps* is even richer gold colour than the type, and being beautifully crested, beats it completely; the *Schizophylla gloriosa* makes a good basket Fern, with its fronds depending. *Onychium auratum* is a narrow-fronded species, green and gold, the fertile fronds golden. *Pteris aspericaulis* is distinct, with its red venation, and a pretty Fern to boot; and *tricolor* is grown in quantity, and will grow too. The plants, notwithstanding the heat, are all remarkably clean and well grown.

Filmy Ferns occupy a considerable space in the older houses of the nursery. They are in some cases planted out, in others in pots, all either in frames, or covered with glass with movable panes for occasional evaporation. Mr. Birkenhead says that with study and the proper management the moisture is the main factor towards successful culture. These beautiful gems are not everybody's plants, but the lover of Ferns cannot help peering at them with a longing eye. Chief among those that took our fancy were *Hymenophyllum attenuatum*, and the tapering *caudiculatum*, the dwarf and pretty nidum of the demiesium type; *Forsterianum*, a deep green; and *hirantam*, a woolly-looking subject; *pulcherrimum*, the pendulous *trifidum*, nice pieces of *Tan-bridgense*, and the equally pretty *Wilsoni*. Then in *Todeas* we would place at the very front *grandipinnula*, *Fraseri*, and *Moorei*; of course, *superba* is the best looking of its class, when well done, and the rest of the *Todeas* were going along well here. The *Trichomanes alabamense* is charming to look upon; *auriculatum* is also beautiful, and so is the lofty-looking *alatum*. Among others we noted *T. radicans* multitudinously cut, and deep green; *T. Lyalli*, and *parvulum* of the fan-fronded type; *T. r. dissectum cuneatum*, a fine wedge-looking fronded Killarney Fern; *scandens*, distinct and pretty; the beautiful *trichoidium*, which no collection is complete without, and the small-fronded *venosum*.

There are other things grown to supply the local trade, such as *Rhododendrons*, fruit trees, some alpine, some bedding plants, of sorts; but the chief article of commerce is the Ferns, of which the firm claims to have the most varied and interesting trade collection in the world, consisting of over 1400 different kinds. *Viator*.

CHOICE BULBS AT MESSRS. WALLACE'S, COLCHESTER.

Among other choice bulbs, besides the brilliant *Calochorti*, already noticed, fine collections of *Irisæ*, *Lilies*, *Brodiasæ*, &c., are grown. The *Iris* beds had been sheets of bloom, but were nearly over. Several of the beautiful and all too-seldom-grown *Brodiasæ*, however, which bloom from April to July, were still in flower. The following are among the best of these hardy bulbous plants, easily grown in any warm border, producing large heads of bloom, mostly in umbels, which last a long time in great perfection:—*Brodiasæ volubilis* is one of the most striking. This is a twining plant with very slender stems, reaching to a height of 4 or 5 feet, with beautiful rose-coloured flowers; it has this singular and unique peculiarity—the flowers continue fresh for some time after evergence from the plants. *B. capitata*, as its name implies, is such a striking contrast to *B. volubilis*, that it is difficult to realise that they are of the same genus; it has tall heads of purple flowers. There is also a choice white variety of this, which is very fine. *B. coccinea* grows 3 feet high on a thin wiry stem, and lasts more than a month in bloom. *B. lactea* and *B. lilacina* have mixed coloured flowers of white, green, lilac. *B. laxa*, rich umbels of blue flowers, one of the best. *B. peduncularis* produces fewer flowers on long pedicels, the umbels being over 15 inches across, flowers porcelain-white. *B. rosea*, a new species, with dwarf habit, with many flowers of a pale pink colour. *B. Howelli*, which is one of the earliest, was, I was told, one of the best, with large umbels of beautiful porcelain-white flowers, delicately streaked with blue.

This is hardly the season for a full feast of Lilies. But owing to the great variety grown, special culture and skill, visitors can seldom go away unrewarded. As grown here, *L. canadense* is quite distinct from *L. superbum*. The colour varies from yellow to orange, bell shaped, heavily spotted inside the flower; *L. nitidum* resembles a slender *L. Humboldtii*, a graceful bright golden-yellow Lily, spotted

which nothing more need be said. *L. dalmaticum* is quite distinct from the common though beautiful Martagon in several colours. It grows to a height of from 4 to 6 feet, producing three or more spikes, each spike carrying from one to two dozen of light or dark purple blooms. *L. pardalinum* var. *minor* is a small charming variety of a well-known much-prized species of Lily. It bears numerous

of the type, indeed, it was almost black, which appears to be an acquisition.

Here were to be seen many other bulbs and plants of great interest, one of the most beautiful, as it is sure to become whenever, in vases or bouquets, brilliant colours are desiderated, being the best of all *Heuchera sanguinea*. *D. T. F.*

"THE KYOTO INDUSTRIAL EXHIBITION OF 1895."

HELD in celebration of the eleven-hundredth anniversary of the city's existence. Written at the request of the Kyoto City Government by F. Brinkley. A very interesting work is the one before us, which, though brought out on the occasion of the Kyoto Exhibition, relates almost wholly to the ancient capital itself, and to its many interests and industries. It therefore forms such a guide as will tell visitors not merely about treasures actually staged for exhibition, but also of the woodrout sights and delightful surroundings of Kyoto; of the palaces, temples, districts, and cunning craftsmen famous for various branches of art: for ceramics, textiles, embroideries, metal-works, cloisonné enamel, and bric-à-brac. This handbook has the fascination associated with all books descriptive of Japan and her wonders, and has the great advantage of being free from the personal and imaginative passages which too often mar the accounts of enthusiastic travellers. Therefore, the praises bestowed upon Kyoto, the natives, and the arts and industries, are the more acceptable and credible. The city wherein seventy-seven emperors have held their court has still a renown of no small importance. "Kyoto," says Mr. Brinkley, "considered under its former aspect," as a centre of art and industry, "as the chief town of a highly civilised nation, is probably the least ostentatious city in the universe. Apart from its Buddhist temples, which are gorgeous and imposing, it may be described as a collection of neat but rustic dwellings, nestling among hills of the softest possible contours, brooded over by a wonderful crystalline atmosphere, and resonant with the gurgle of limpid streams that babble under its bridges and beside its thoroughfares. Its water, indeed, is one of the gentle city's richest possessions. For these rivulets possess bleaching and dyeing properties unequalled elsewhere throughout the empire, so that whoever desires a robe of pure white or of brilliant hue must go to seek it in the Western Capital (Saikyo). Kyoto is a city of gardens. The humblest dwelling has its tiny park, with miniature waterfalls, toy hills, and dwarf forests. Even to-day, although the tide of a ruder civilisation has disturbed the quiet current of old-time life, you may find the potter or enameller decorating his vases or building up his subtle tracery of many-hued designs, while the flowers and leaves which he copies look in at him through the windows of his workshop." This passage contains an explanation of the very essence of Japanese art. It is essentially a native gift, inspiration coming not from foreign sources, but from the every-day surroundings of those who have the eye to appreciate and the skill to reproduce them in all their picturesqueness. This Guide to the Kyoto Exhibition, while dealing avowedly with the city itself and the chief features of it, yet gives an excellent idea of some of the characteristics of Japan in general, which, however over-written or

FIG. 19.—CAMPANULA VIDALLI: FLOWERS WHITE.

(Shown at the Royal Horticultural Society's meeting, July 23. See report, p. 102, col. 2.)

with red, the same as *L. columbianum*. *L. Henryi*, the orange-yellow specimen, this is one of the tallest and most striking Lilies, growing under cultivation to a height of from 5 to 8 feet in good soil, and bearing from twelve to twenty richly-coloured flowers. *L. Krameri* is remarkable in character and colour, the latter being a beautiful pink—rare in Lilies. *L. Leichtlini* is very beautiful and graceful, the colour citron-yellow, richly spotted with purple. *L. longiflorum giganteum*, an improvement on *L. longiflorum* and *L. l. Harrisii*, being larger than either, than

small orange-coloured flowers, spotted black, the tips of the petals being at times stained of a crimson colour. *L. Parryi*, one of the most beautiful and fragrant of all Lilies; the colour a citron-yellow, spotted with chocolate-brown.

Among dwarf Lilies the following deserve special notice, viz., *Alice Wilson*, clear lemon; *L. Hermannii*, flowers large, of a rich crimson-mahogany colour, the finest in the *L. elegans* group; *L. Van Houttei*, flowers large, of a shade of crimson, a very fine Lily. There was also a darker coloured variety

over-sung, is ever new and ever original to him who looks upon it for the first time. And now, from April 1 to July 31, or for even longer time if the venture prove successful, Japan's arts and industries are in course of representation at the Kyoto Exhibition, which (to turn for a moment to the business portion of our hand-book) is located in buildings extending over 9 acres of ground, surrounded by a garden 40 acres in extent, and including an annexe devoted to fisheries. Altogether, the enterprise is an important one, and gives no mean indication of the wealth of resources, both actual and mental, possessed by the ingenious people who have originated and carried it out.

ÆCIDIDIUM NYMPHÆOIDES, D.C.

IN November, 1877, I found floating down the river Ouse, at King's Lynn, in considerable abundance, *Scirpus lacustris*, which had evidently been cut from the sides either of the river itself or from some tributary drain. The *Scirpus* was affected with *Puccinia Scirpi*, D.C., which at that time had not previously been observed in Great Britain. The Great Ouse at King's Lynn is a river of considerable size, and for some 14 miles above the town is tidal. It rises on the borders of Oxford and Northamptonshire, near Brackley and Towcester, and drains an area of some 2700 square miles. The prospect of localising the affected *Scirpus* was therefore not very bright. Various attempts, however, have from time to time been made. The *Scirpus* is abundant enough along the banks, and in various drains and ditches in the fens, but never was I able to come across the *Puccinia* in its natural home. The river to Denver and from Denver to Ely, and the extensive pits at Ely known as Russell Hole, were searched in vain. The *Puccinia* is doubtless an heterocœcious species, and as it is uncommon, there is little doubt, could it be found growing naturally, one would have little difficulty in making out its life history, as such a rare *Puccinia* is not likely to have its *Æcidiospores* on a very common plant.

During the past winter, 1894-95, I made an archaeological excursion to Earith, a small town in Huntingdonshire, situated a few miles from St. Ives, on the river Ouse. In one of the fen drains, the Old Bedford as it is called, an abundant growth of *Scirpus acutus*, affected with the *Puccinia*, so that I felt sure I should at last be able to make out its affinities.

In the *Botanische Centralblatt*, 1891, No. 27, Herr P. Dietel, in a *résumé* of the past ten years' work on the life history of the Uredines, states that Chodat's investigations show that *Puccinia Scirpi*, D.C. is connected with the *Æcidium* on *Villarsia nymphaeoides*. Early in the present month, July, 1895, I again visited the Old Bedford at Earith, and was rewarded by finding the *Æcidium nymphaeoides* in great profusion at the same place in which during the winter I found the *Puccinia* on *Scirpus lacustris*, thus confirming Chodat's statement. The *Scirpus* was also growing abundantly in the River Ouse, but all I examined were unaffected by the parasite, neither did I find any *Villarsia* in the river itself. Charles B. Plowright, M.D., King's Lynn, July 22, 1895.

INDIA.

CALCUTTA ROYAL BOTANIC GARDEN.

AMONG the principal improvements effected during the year 1894-95 in the garden, may be mentioned the entire remodelling of one of the conservatories, which has been laid out on a new and more artistic plan. The road running along the river bank from the engine-house to the gate of the Sibpur College has been considerably improved, and several small buildings and a glass-roofed house for certain Orchids have been erected by garden labour. Dr. King's singular talent for landscape gardening has enabled him, says the official memorandum, during the twenty-four years he has been in charge, to add greatly to the beauty of the garden by skilful grouping of trees and shrubs, and it now ranks high among similar institutions for picturesque scenery no less than for scientific completeness. Within the past year he has laid the public under a further obligation by bringing out a guide to the garden, the want of which had been long felt. The book contains a map, a description of the garden, and a brief sketch

of its history since its foundation in 1786, and copies can be had by purchase at the garden gates, and from Messrs. Thacker, Spink & Co., booksellers, Calcutta.

Of the Lloyd Botanic Garden at Darjeeling, there is apparently little or nothing to record. The report does not state how far it fulfils the purpose for which it was originally established, of bringing together in one place those specimens of the indigenous flora of the Eastern Himalayas which can be grown at the elevation of Darjeeling.

VEGETABLES.

ST. DUTHUS PEA.

THIS fine Pea, which was awarded a First-Class Certificate by the Royal Horticultural Society in Jubilee year (1887), has somehow remained but little known, which is, a great pity, seeing there are a very few better wrinkled Peas grown. It is well adapted for a last crop, continuing to bear till winter sets in. The haulm, pods, and seeds are of a dark green colour, and the production of ten Peas in a pod is quite a common occurrence, and hardly any pods have fewer than eight. The flavour is first-rate, and its cropping qualities everything that can be desired. Why it has not taken a stronger position among late marrow-fat Peas I do not know, unless it be that, owing to its peculiarity in remaining so long in a green condition, the seed ripens with difficulty. Although sent out six years ago, it is still sold in quart packets to the trade, I believe, which looks as if there was not much of it saved. It is a grand late Pea, though not so well known as it ought to be. A. H. [The sample of pods kindly sent by our correspondent fully bears out his statements. Ed.]

A NEW PEA, RENTPAYER.

Seeing the interest you take in good vegetables, I have sent you a sample of my new Pea, Rentpayer, which I think everyone will welcome, as it is what has been lacking. You will see it is a first-class Pea, growing 1½ to 2 feet, strong, and robust in habit. If you saw it growing, you would say you had seen nothing like it for crop. It is a cross between Duke of Albany and Little Gem. I intend to send it out this coming spring. H. Brownhill, Sale.

[The plant is all that our correspondent says of it, and the Peas, which number eight or nine in a pod, are large, dark green in colour, and of the Duke of Albany flavour when cooked. The variety partakes of the character of Little Gem in height only, in most other respects it is a Duke of Albany. Grown in fields, it would do without sticks, but in the richer soil of a garden it would need to have short ones. The pods show at the upper part of the stem for about 1 foot down it. Ed.]

A NEW AND GOOD PEA.

This description fairly applies to Sutton's Peerless Marrow-fat, a medium, maincrop variety, which has done remarkably well in the gardens at Devonhurst, Chiswick, this season. Mr. Gibson, the gardener there, describes it as the coming Pea in its section. It bears a large number of well-filled pods, the Peas being of good quality. From plants raised from seed sown in pots on March 25, and afterwards planted out, the first gathering was made June 20. The height of the haulm is about 2 feet. The earliest Pea at Devonhurst this season was that good variety, Ringleader, gathered May 31. J. B.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

SPINACH.—Continue to make successional sowings at regular intervals of time, choosing a cool, somewhat shady place, as it is a plant that soon runs up to seed in hot dry situations, and the poorer the ground the sooner it runs.

SALSAFY AND SCORZONERA.—If signs of running to seed are noticed, the flower-stalks must be removed, or the roots will be quite useless.

THE SOWING OF CABBAGE-SEED.—Cabbages being an important crop in the spring season, I recommend that at least two sowings be made—one forthwith, and another at the end of the month, or, in the warmer parts of the country, the first week in August. The earlier sowings are the more important in colder districts, and anywhere north of the

Humber. In early parts the later sowings are more to be relied upon. It is a mistake to put out large succulent plants which look well at the time, and yet will not stand the winter. A plot of ground should be chosen as the site of the seed-beds that is well exposed to sun and air, and the land should be well tilled but not over-manned unless it is known to be impoverished. Having dug and levelled, and tramped the land evenly all over, and raked off the stones, mark out the beds and sow the seeds very thinly broadcast if it is intended to transplant straight from the beds. Perhaps a better way is to sow the seeds moderately thickly, and prick out into other beds when the plants have made two pair of true leaves. Very early sowing and large plants result in the Cabbage bolting in the spring. Last season out of a bed of some thousands none bolted, and nearly every one withstood the frost, but they were netted to protect them from the ravages of the wood-pigeons directly the snow melted down sufficiently to allow the pigeons to reach them. Ellam's Early is excellent for first cutting, and the Heartwell Early Marrow, Battersea and Enfield Market are all good varieties of Cabbage. Seeds of all these were sown here on July 29. A good planting of Rosette Coleworts may now be put out for late autumn use.

CAULIFLOWERS.—A sowing of Cauliflower seed should be made when Cabbage seed is got into the ground. It is prudent to make three sowings, at intervals of about two weeks. The variety Early London, if it be true, and it is treated properly, is still my favourite all-round Cauliflower.

MISCELLANEOUS.—Any ground cleared of its summer crops may be planted with Cottagers' and Asparagus Kalea. Purple and White Sprouting Broccoli, and even Brussels Sprouts may be planted where the quantity got in is not deemed equal to the probable demand.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

BULBS FOR AUTUMN PLANTING CONTINUED.

—The single and double-flowered Anemones deserve to be planted extensively; the single varieties are the hardiest, earliest, and the more useful, and they may be obtained from the bulb dealers in fine mixtures or in named varieties. Some good single-flowered varieties are Masterpiece, scarlet; The Bride, white; Cœrules, blue; and Garibaldi, vermilion. The double and single-flowered late varieties have large and brilliant flowers, as have also the double French Chrysanthemum-flowered. Good varieties of doubles are King of the Scarlets, L'Eclair, King of the Blues, Feu Superbe, Thalia, Prince de Ligny, Ceres, Admiral Zoutman. Useful varieties for planting in the herbaceous borders for flowering in the autumn, are A. japonica, A. j. alba, A. j. elegans, and A. j. Lady Ardilaun; and for spring flowering there is nothing brighter or more useful than *Anemone fulgens*; also the yellow-wood Anemone, A. ranunculoides, and the purple and white pasque flower, A. Pulsatilla, A. P. alba, and the wood-wind flower, A. nemorosa, and its several varieties; the varieties of A. appendicula, A. a. alba, and A. a. rosea. Hepaticas should be grown in every garden; H. angulosa, H. a. triloba alba, H. cœrules, H. rubra flore-pleno, and several others.

SCILLA or Squills are amongst the brightest and prettiest of spring-flowering bulbs, *Scilla sibirica*, *S. bifolia* are the earliest to flower. *S. nutans*, and other good varieties are later, and all are good for planting in mixed borders or as edgings to beds of other plants.

FRITILLARIAS, including Crown Imperial Lilies, are showy plants for mixed borders. Some of the varieties are tall, others dwarf, and all are strong growers, but they do not require much staking. The variegated varieties are very striking when they do well; but they require good rich loamy soil, and should be planted in patches of 5 bulbs. Good varieties are F. Aurora, F. lutea, F. rubra, and F. r. variegata. *Fritillaria Melesgris*, having curious snake's-head-like blossoms, is of slender habit of growth.

GLADIOLUS COLVILLEI ALBA is useful for spring and early summer flowering, and should be planted in the autumn before the corms begin to grow, about 4 inches apart or in clumps in the herbaceous borders, or in parts of the garden that are sheltered from the colder winds. The flower-spikes are useful material for cutting, especially the variety G. C. rosea. A rich soil suits them, and the beds or groups should be mulched with short manure during the winter.

COLCHICUMS.—These bulbs should be largely planted in clumps in the herbaceous border, as the plants flower early, and give brightness to the garden just when it is required. Early varieties are *C. Bulbocodium persicum*, *B. robustum*, *B. vernalis*, and *B. v. Plantii*. The autumn and winter-flowering varieties are also very useful for borders or rockwork.

CHIONODOXA.—Glory of the Snow is a Scilla-like plant that looks well if planted in clumps with other spring-flowering bulbs. *C. Lucilia*, blue and white, and *C. gigantea* are good varieties.

FRUITS UNDER GLASS.

By RICHARD PARKER, *Gardener, Goodwood, Chichester.*

ORCHARD HOUSE.—The portable trees should be removed to a sunny place out-of-doors as soon as the fruits are gathered from them. By so doing the wood will become quite matured. The plants must be supplied with clear water at the roots, and the foliage syringed at least once a day in bright weather, if the pots can be stood upon a bed of coal ashes, or each on a piece of slate to prevent worms getting into them. Large fruits of Apples or Pears should be supported by strips of matting or pieces of open muslin or netting as they approach maturity. Reduce the amount of nutriment supplied to the trees as the fruits approach the ripening stage, but continue to syringe the foliage up to within a few days of gathering the fruit, and afford plenty of ventilation, so as to ensure the proper flavour. If birds or wasps are troublesome, all openings should be covered with light tiffany or canvas. In some cases it may be necessary to tie some of the foliage back to expose the fruit to the sun.

FIGS.—The main crops of Figs in cool-houses now approaching maturity will require abundance of moisture at the roots, and in the air. Continue to pinch the growing shoots at the fourth or fifth leaf, reckoning from the base of such shoots, retaining sufficient wood for furnishing a crop next season. Ripe fruit should be gathered daily in the early morning, placing them on fresh leaves, and putting them in a cool place, if not consumed forthwith. When the ripe fruits are gathered, the trees should be freely syringed, doing this less copiously if damp weather prevails, and in that event a slight warmth may be maintained in the heating apparatus at night. Any Fig trees or bushes requiring larger pots should be shifted during August, the roots then having time to take to the new soil before the end of the autumn.

POT VINES.—Those for early fruiting next year should have now completed their growth, the rest of the summer being required for the thorough ripening of the canes; and unless this takes place the Vines will be useless for early work. The ripening should not be hurried but gradual, and the plants must not be deprived of the amount of water required for the healthy development of the wood. They will not require any manual aids to growth after this date. The foliage of such Vines should be syringed once a day, more air afforded, and in bright weather artificial heat may be dispensed with. By maturing the vines in this manner for a few weeks they will be in a better condition to be stood out of doors later on.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Bursford, Dorset.*

AFFORDING WATER.—The chief work in the Orchid-houses during the rest of the month will consist of watering and shading the plants, and ventilating the houses. Owing to the external air having been very dry, I have been obliged in some divisions to depart from my customary rule of setting aside two days in each week for watering the plants, and have been obliged to examine them every day to ascertain if water at the root was necessary or not. Some Orchids, namely, *Cattleyas* and *Laelias*, do not suffer even if they are allowed to remain dry for a day or two—in fact, specimen plants that are in very large pots are all the better for being occasionally deprived of water for that length of time; whilst other species, as *Cypripediums*, *Calanthes*, *Habenarias*, *Phaius*, *Bolleas*, *Pescatoreas*, *Diseas*, and all kinds of plants growing on wood blocks soon show signs of distress. I would advise cultivators at the present season to carefully examine the plants in the early morning; and in affording water to those which are dry, let it be sufficient to wet every part, and to rush through the bottom-holes in the pots. Species which do not possess pseudo-bulbs, viz., *Phalaenopsis*, *Aërides*,

Saccolabiums, and *Vandas*, should be watered often enough to keep the sphagnum on the surface fresh and green.

DENDROBIUMS.—Plants of *Dendrobium* finishing their growth should be watered with great care, for if too much be afforded, they will begin to grow again; but such late-growing species as *D. fimbriatum*, *D. Brymerianum*, *D. Phalaenopsis*, *D. superbiens*, *D. taenium*, *D. Dalhousieanum*, *D. Parishii*, *D. clavatum*, *D. calceolus*, *D. albo-sanguineum*, and the evergreen section, *D. thyriflorum*, *D. densiflorum*, *D. suavisimum*, *D. chrysotoxum*, *D. Farmeri*, &c., should not be allowed ever to get dry till growth is complete.

CYPRIPEDIUMS.—The species and varieties of *Cypripedium*, viz., *C. insigne*, *C. Leeaanum* ×, *C. Spicerianum*, *C. Charlesworthii*, *C. Fairieanum*, *C. Schlimii*, *C. Arthurianum* ×, *C. barbatum*, and others which are inmates of the intermediate-house, may be copiously watered overhead two or three times every week, whether they appear to be dry or not.

ODONTOGLOSSUMS.—Taking the cool-house plants as a whole, they should be watered just often enough to keep the compost moist. The plants of *Odontoglossum* of the *O. crispum*, *O. Pescatorsi*, *O. triumphans*, and *O. luteo-purpureum* sections, having but little to do at this season, should not be kept in a saturated condition, or the old roots will decay, and the new growths just starting get soft and weak.

MASDEVALLIAS.—All the Chimæroid *Masdevallias* require to have their foliage well syringed, and to be frequently watered at the root; whilst those of the *Harryana* and *Veitchii* sections should be watered only when the compost has become dry. To all houses, except that one in which are the *Masdevallias*, plenty of air should be afforded, especially during the middle hours of the day, when the inside temperature may be allowed to get comparatively dry, damping them down morning and evening. The shading should not now be let down quite so soon in the morning as heretofore, and it should be withdrawn earlier in the afternoon, in particular in those divisions where the *Dendrobiums*, *Cattleyas*, and Mexican *Ochids* are placed.

PLANTS UNDER GLASS.

By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

POINSETTIA PULCHERRIMA.—Those plants which were the earliest raised from cuttings will now be ready for re-potting, and this time they should go into those pots in which they will flower. In order to ensure dwarf plants, they should be grown at no great distance from the glass, and never allowed to become crowded in their summer quarters. A good mixture of soil consists of loam, leaf-mould, and peat, with a small quantity of dried cow-dung. After re-potting them, place on a very slight hotbed, still close to the glass. If this be not available, then utilise a low pit into which heat can be turned in weather that is dull or cold. Keep the pit close until the roots have penetrated the soil, when fresh air must be admitted, gradually at first. Later-struck plants may also be re-potted, keeping these, however, still on the shelves in the stove, so as to hasten growth a little before putting them into heated pits or frames.

GLOXINIAS (SINNINGIA) SPECIOSA.—Young plants may be re-potted into 48's, or even larger pots if the tubers are large, keeping them in a genial growing temperature, when, if well looked after, they will make good flowering stuff for the autumn. The shift afforded them at this date will tend to increase the size of the bulbs, and the number of bloom next year. *Gloxinias* which have done flowering keep a little drier at the roots, and place them in cold frames, with a light shade over them to prevent scorching, and when the leaves have died down place the pots on their sides under the greenhouse or intermediate-house stage.

PRIMULA SINENSIS.—Any seedlings now standing in 60's should be repotted forthwith, and this time into 48's and 32's, using good loam, leaf-mould, dry cow manure, with a moderate quantity of sand. In performing the operation keep the soil close up to the collar of the plant, making it moderately firm, and if a plant is not steady, make it so with three short pegs. Place close to the glass in a cold frame, and afford the plants light shading in sunny weather, keeping close for a few days after potting, syringing the frame twice a day when the weather is sunny

FUCHSIAS spring-struck will require repotting, and the flowers to be pinched off them till the plants have acquired a good useful size. They may be placed outside in half-shade, and well syringed, especially the undersides of the leaves, where thrips are apt to lurk. *Fuchsias* treated in this manner make useful subjects for the conservatory in late autumn.

EAST LOTHIAN INTERMEDIATE STOCKS.—Sow a potful or boxful of each, according to needs, of the different coloured varieties for flowering in the spring, and place in a cold frame. A few of each variety may be brought into flower in the latter part of the winter by gently forcing them.

TREE CARNATIONS may be potted, and secured to green painted sticks. The first that were potted will have become established, and may therefore be placed out-of-doors in the full sun, and stood upon, or sunk up to the rims of the pots in coal-ashes. Flower-spikes must be removed as fast as they make their appearance, the syringe applied twice a day, and water carefully afforded, remembering that plunged plants require much less water than those stood on the surface. The tree varieties are not nearly so susceptible to disease as *Souvenir de la Malmaison*, and the two should be kept apart.

THE HARDY FRUIT GARDEN.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

THE SUMMER PRUNING OF FRUIT TREES.—Attention to the pruning of fruit trees at this season is of the first importance, not only as regards the development of the present crop of fruit, but of the shoots and fruit-spurs. It should be borne in mind that the fruit-buds cannot become fully developed without air and light; therefore, the disbudding and thinning of the shoots should be well carried out. If a tree is growing very vigorously, making a lot of strong rank wood, and there are no fruit-buds, it is advisable to thin these growths somewhat severely, in order to admit sunlight right up to the base of the remaining shoots, and in a few weeks later, say about the middle of August, give each of these strong shoots a twist about 5 or 6 inches from the base, not breaking them off, but letting the points hang downwards; this will tend to check the flow of sap and cause the back buds to plump up instead of breaking into fresh growth, which might be the case were the shoots cut back in the usual manner. Then, early in September, whilst the leaves are yet on the tree, take out a trench at a distance of 3 or 4 feet from the stem, and root-prune such trees, working underneath the mass of roots, and severing the taproots with a knife. Having done this, fill up the trench with a mixture of turfy loam taken from the sides of roads, or such like fresh, gritty material, and charred garden refuse. This will encourage a fresh growth of rootlets before the setting in of cold weather, the tree being pruned at the ordinary winter-pruning as usual.

EARLY PLANTING OF STRAWBERRIES.—Where Strawberries have been layered to afford an early crop of fruit next year, the layers should be planted forthwith. Choose a warm, sheltered position for the bed, which will be all the better for being deeply worked and heavily manured. Before proceeding to plant, tread the ground firmly. In planting, follow nature, and do not set the layers deep in the soil. *Black Prince*, *King of the Earlies*, &c., may be planted 1 foot apart each way for the first season, each alternate row being taken away when the first crop of fruit is gathered; or they may be planted at 18 inches apart each way in the first instance, which will be ample room for these rather small growers for several seasons. Mid-season varieties are generally rather stronger growers, and should be allowed 2 feet each way, with an extra 6 inches after every third row as an alley. The space between the rows may be utilised the first season by autumn-sown Onions or Lettuces. For the earliest crop the old *Black Prince* is yet hard to beat, *King of the Earlies* is a useful early variety, *Noble* is very early and prolific, and the fruit very large, but it is deficient in flavour; *Vicomtesse Héricart de Thury* is one of the best varieties for early forcing, and outdoors. For mid-season, *President* and *Sir Joseph Paxton* are well-tried and standard varieties. *Frogmore Late Pine* and *Waterloo* are good late varieties. Amongst newer ones are *Royal Sovereign*, which should take the first place, being of excellent flavour and nice appearance, and it is likely to be grown extensively; *Lord Suffield*, *Gunton Park*, and *Empress of India* are also of first-rate quality, and well worthy of a trial.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

THURSDAY, AUG. 1 } Bransford (Worcester) Horticultural, at Hopton Court.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.2.

National Rose Society.
Northern Exhibition at Derby.

THE curtain has fallen, for the third act of the drama has been played out in the Northern exhibition held at Derby on the 17th inst., and reported on in detail in our last issue. The short and feverish Rose season is now over, for although there may be one or two Rose shows still to be held, the Northern exhibition of the National Rose Society really closes the season.

The exhibition at Derby was, like those of the two which preceded it, far better than anyone anticipated, yet, upon the whole, not up to the average. It is difficult, and perhaps invidious to make comparisons when the circumstances are so very different, but, on the whole, it may be stated that Gloucester has held the palm for Tea Roses, those at Derby not being so good; while in the case of hybrid perennials they were better than at Gloucester, and probably about equal in quality to those at the Crystal Palace. The leading amateur was asked after the awards were made, whether he thought his stand of thirty-six was as good as those at the Palace; his reply was, "Certainly not!" and yet any one looking at the stand would wonder where any exception could be taken.

The exhibition was intended to meet the necessities of northern exhibitors, but they are few in number as compared with those in the south, and hence one need not be surprised to find so many, even of the chief prizes, being captured by southern growers. As might have been expected, Messrs. HARKNESS & SONS came out victorious in the chief classes, carrying off the Jubilee Trophy, the Gold Medal, together with the Silver Medal, for the best H. P., and various other prizes; some of their blooms were of first-class quality,

and the stands altogether were very even in excellence. It is difficult in such stands as these to select those flowers which take the first rank, but the blooms of Gustave Piganneau and A. K. Williams, which obtained the Silver Medal, Horace Vernet, Charles Lefebvre, Her Majesty, Rowland Hill, Suzanne-M. Rodocanachi, were of this character. It has been sometimes suggested that seventy-two is too large a number even for nurserymen, because there is always sure to be a certain amount of "tail," but it would have been very difficult to have picked out any in Messrs. HARKNESS' stand which deserved this opprobrious title; there were certainly none of them to which less than two points could be given, and most of them were worthy of three. Of course, this firm's position in Yorkshire, where the temperature is lower, and the rains have been more frequent, was in their favour, and it was the expectation of everyone that they would carry off the premier awards; they were near home, in itself a great advantage.

Unquestionably the great interest in the show was concentrated in the amateur classes, for there were to be competed for not only the Trophy and Gold Medal offered by the National, but the valuable special prizes offered by the Right Hon. Sir W. V. HARCOURT, the prizes offered by the Crown Derby Company, and the Piece of Plate offered by the Mayor. The first of these was won by Mr. E. B. LINDSELL of Hitchin, the second by Mr. BARKER, also of Hitchin; and the third by Mr. WHITTON of Bedale, a near neighbour of Messrs. HARKNESS. The Challenge Trophy and Gold Medal were awarded to Mr. LINDSELL, who thus holds the northern and southern trophy. It need hardly be said that the quality of Mr. LINDSELL'S flowers was very fine; beside those which obtained the Silver Medals for the best hybrids and Teas, both of which were in his stand of twenty-four, he had grand blooms of Horace Vernet, A. K. Williams, Count Raimbaud, Her Majesty, Ulrich Brunner, Earl of Dufferin, Catherine Vernet, Sir Rowland Hill (affording a most pleasing contrast by its deep colour to the other flowers in the stand), Marie Baumann, Fisher Holmes, Countess de Nadaillac (Silver Medal), and Alfred Colomb. It will be noticed how many of these were of the rich high colour varieties, which the Hitchin soil seems to produce so grandly. The second place in these contests was assigned to a northern amateur, Mr. H. V. MACHIN, of Worksop. His flowers were particularly fine, but wanted in some way the high finish obtained by the Hitchin amateur. Another rising amateur has this year made his mark, in the person of Mr. PARKER, of Hitchin, and a very excellent stand of his secured the Vase given by the Crown Derby Company, a prize which many of those competing would gladly have won. The Mayor's prize was awarded to Mr. WHITTON, of Bedale, Yorkshire, who a couple of years ago carried off the Jubilee Trophy; his flowers were of good form and excellent colour. Mr. WM. BOYES, of Derby, who has taken infinite pains in organising and carrying out the exhibition, and on whom the chief burden of it rested, was a successful exhibitor, but not so successful as he might have been had he not unselfishly sacrificed his time for the benefit of the Society. Tea Roses, as already said, were not of first-rate quality, although Mr. BURNSIDE again showed what an enthusiastic intelligence can effect under most depressing circumstances. Few men who had witnessed the destruction of their best plants by removal and the terrible frosts of last winter, and who had

planted them in March, would have ventured to compete; but difficulties do not deter him, and although his situation is in chilling contrast to that which he enjoyed at Chipping Camden and at Birch, he will not readily relinquish the high position he has held for some years as a Tea grower.

The position which Her Majesty took at the beginning of the season has been maintained to the close, the box of twelve exhibited by Messrs. ALEX. DICKSON & SON, and which carried off the prize for twelve blooms of the best light Roses was truly grand, clearly showing the variability of Rose blooming for Mrs. John Lsing, a seedling of the same raiser; the late Mr. Henry Bennett was nowhere seen in such form as last year, although most people consider it a better Rose than Her Majesty; but the same firm was awarded a prize for the best box of twelve new Roses which, with two exceptions, were flowers of their own raising. Conspicuous amongst them was Mrs. Sharman Crawford and Marchioness of Londonderry, others being Eileen, Con, Shandon, Killarney, Erin-go-bragh, Countess of Caledon, quite new; Lady Moyra Besnolker, quite new; and Shaugraun, the two which were not their own raising being Captain Hayward and Madame Jules Finger.

There could not be any doubt as to the excellence of the blooms which obtained the Silver Medals of the National Rose Society in the amateurs' class. Xavier Olibo (H.P.) was a fine bloom of a Rose not often seen in perfection, and to many, probably, the blooms of Horace Vernet and A. K. Williams in the same stand were considered, perhaps, slightly superior to it. The Tea in the same box, Comtesse de Nadaillac, was a fairly good one; but we have often seen this fine Rose in better condition—a statement which might be made of most of the Tea Roses in the show. Messrs. HARKNESS & SONS' A. K. Williams was a magnificent flower, of large size and of good colour; while Messrs. CROLL & SONS' Marie van Houtte was a splendid specimen of that lovely Tea.

Although no Gold Medal had been awarded at the two previous shows, Messrs. ALEX. DICKSON & SONS were again successful in obtaining that coveted award at this show, with Helen Keller, a pink Rose with a slightly purplish tint in it; it is a well built, solid flower, but it is questionable whether if Lady Moyra Beaulker, another of their flowers, had been exhibited in better form it would not have obtained a higher award than a Card of Commendation.

The collections of garden Roses attracted a good deal of attention, especially those exhibited by Mr. H. V. MACHIN, of Worksop, amongst amateurs, and those of Messrs. PAUL & SON, and Messrs. TOWNSEND, amongst nurserymen. In Mr. MACHIN'S collection there was a large number of the dwarf Polyantha section, while L'Idéale, Red Damask, and Camden were well shown. Messrs. PAUL & SON depended more largely on the new exhibition Teas, among which Madame C. Guinoisseau, W. Allen Richardson, Alistair, Stella Gray (somewhat in the style of this latter flower), added considerably to the beauty of the stand. In the display of Roses, Mr. H. V. MACHIN was again first, and his collection was a very fine one, but there is still a good deal to be done in this class. In one collection there was an attempt made to break through the dead level monotony usual in such arrangements, baskets and vases being used to break the level line which is usual in such exhibits; but this collection was spoiled by having two or three exhibition boxes with single blooms placed in the front—a few

CORRIDOR AT MR. W. BULL'S NURSERY, CHELSEA.

low vases containing the dwarf Polyanthus would have added considerably to the effect. It is evident that we have very much yet to learn in the æsthetic arrangement of groups of Roses—we call to mind a collection exhibited at the Drill Hall some two or three years ago by Mrs. EDWARD MAWLEY, of Berkhamsted, from which a good deal might be learned by those aspiring to direct taste in such matters.

It will thus be seen that the projectors of the Derby Show have reason to be satisfied with the result of their appeal to the Rose-growing public; and, although one may assent to the opinion of our champion amateur, that this has been a most disappointing season, we may at the same time add, that it was a far better one than the mournful complaints of growers after the hard winter, and again after the lengthened drought, had led us to anticipate—some even of those who drew these pictures coming out as if nothing extraordinary had happened to them.

A MEETING of the Syndicate of Belgian horticulturists, and one of special importance, is convened at the Casino, Ghent, on August 4, at 11 A.M., to consider, at the request of the Belgian Government, the question of the desirability of revising the Berne Phylloxera Convention. We have, from the first, protested against the futility of these regulations, and against the wholly gratuitous injury which has been inflicted, not only on commercial horticulturists, but upon amateurs desirous of transmitting plants from one country to another.

The Italian government has at length proposed a meeting of the nationalities concerned in the Treaty of Berne with a view to obtain the entire abrogation of so much of the convention as prevents the circulation of plants other than Vines. This subject was informally discussed by us with some of the Italian authorities so long ago as the Florence Botanical Congress, when the absurdity of the regulations was pointed out. This country has never assented to the convention, but our nurserymen have had, like others, to put up with the vexations and impediments uselessly created by that treaty. It is surely time they took steps to support their brethren of Belgium and Italy. We may fairly look to the authorities at Kew also to lend their potent aid in this matter.

THE generation of botanists that put its faith in "BABINGTON" is not yet extinct, nor indeed—such have been his services to British botany—will his name and his work soon be forgotten. The state of botanical teaching is wonderfully different from what it was when BABINGTON was in his prime, but he retained his Professorship at Cambridge under these altered circumstances till his death on the 22nd inst. in his 87th year, though he had, we believe, long ceased to take any active part in the duties of his office. He was of the stock of the Leicestershire BABINGTONS, but was born at Ludlow in 1808, and educated at St. John's College, Cambridge, where he passed the greater part of his life, assuming the duties of his Professorship on the death of Professor HENSLOW in 1861.

He is best known by his *Manual of British Botany*, the value of which as a field manual is attested by the fact that it ran through eight or nine editions. In it the "characters" are sharply contrasted, and special prominence is given to those points of most interest and value for classificatory purposes. Another and most

important characteristic of the book is the strenuous effort made to keep in line with the great European floras of KOCH and others, and to harmonise the nomenclature of British plants with that in use on the Continent. BABINGTON was very keen in discriminating slight differences, the value of which has been greatly enhanced since the general acceptance of Darwinian views of evolution. His tendencies in this direction led to his being classed among the "splitters" rather than the "lumpers," by a former generation less appreciative of the significance of minute differences. BABINGTON'S powers of analysis were also prominently shown in his study of British Brambles. He spared no pains in his efforts to disentangle the complications that arise in the study of these protean plants, and reduce chaos to order. He seems to have done this purely from the point of view of a systematic botanist without concerning himself greatly with the philosophical deductions which might be drawn from such materials. To aid in the discrimination of these plants, BABINGTON caused a large number of them to be cultivated in the Cambridge Botanic Garden. Not only was he a foremost authority on British plants, but he collected in Iceland and published his researches into the flora of that island. In addition, he was well known as an antiquary, and was one of the very oldest of our own contributors, though, of late years, we have had little or nothing from his pen. In social and private life, Professor BABINGTON was one of the best and most amiable of men.

THE TURNIP-FLY.—From the Board of Agriculture we have received a pamphlet treating of the Turnip-fly or flea (*Phyllotreta nemorum*), and of the best methods of coping with the pest. This fly is really a beetle, small in size, but capable, when found in numbers, of destroying rapidly entire crops of Turnips or Swedes. In view of this, and of the enormous expense entailed by losses on so large a scale, many methods of preventing the scourge are suggested. Amongst these are the sowing of Turnip-seed on a "stale furrow;" selecting vigorous, healthy seed; extirpating such weeds as Charlock and other Crucifers which encourage the beetles; and, in some cases, sowing Mustard with the other seed, as the former, germinating first, is devoured by them in preference. Drought is found to be more favourable to the beetles than is moisture of atmosphere and soil. Where the Turnip-fly already exists, the proposed remedies are dressings of soot, lime, paraffin, and other detergents; lightly rolling the ground, or pushing over it a "light wide framework upon wheels with well-tarred boards fastened upon it, so as to come just over the Turnip plants;" in this case the beetles, being disturbed, jump into the tar, upon which they soon accumulate in masses, and can be scraped off, and the boards re-tarred.

TOMATO DUKE OF YORK.—Messrs. FELLOWS & RYDER of Orpington have submitted specimens of a new Tomato under this name. The fruit is of medium or large size, handsome, symmetrical, of rich crimson-red colour, deep flesh, and full, slightly acid flavour. We presume the habit is good, and that it is a good cropper, as Messrs. FELLOWS & RYDER inform us they have seventy houses devoted to its cultivation. While there are so many Tomatoes of good quality, it is difficult to express an opinion, but in this case we have no hesitation in saying that, judging from the sample sent to us, this is a first-class variety. Its merits were recognised by the award of a First-class Certificate from the Royal Horticultural Society on Tuesday last.

"PHARMACEUTICAL JOURNAL."—This journal has always been remarkable for its efforts to forward the scientific development of Pharmacy. Its weekly numbers supply a condensed but accurate summary of scientific work in chemistry and botany. Quite recently a fourth series has been commenced, and

the size of the journal increased to quarto size. Everyone interested in such matters must sympathise with the unceasing endeavours on the part of the Society to place pharmacy on a proper basis.

SCOTTISH HORTICULTURAL ASSOCIATION.—A paper was read before the Association on the 22d inst., by Mr. M. CHAPMAN, Easter Duddingston, Portobello, on the "Gardens of Antiquity." Mr. CHAPMAN passed in review the gardens of Babylon, Egypt, Persia, Greece, and pointed out the principal causes of the great progress of horticulture in modern times.

ST. JOHN'S HORTICULTURAL SHOW.—The St. John's (Ipawich) Cottagers and Gardeners' Horticultural Society held their annual show of flowers, fruit, and vegetables on Wednesday, July 17, in the grounds of Mr. R. BOND (one of the vice-presidents), who had kindly placed them at the disposal of the Committee. In comparison with previous years, the exhibits were well up to the average, but, owing to the time of the year, were perhaps not quite so numerous. The prize list was divided into three classes—cottagers, gardeners, and amateurs—and in addition, numerous special prizes were offered.

THE JERSEY POTATO CROP.—The winter of 1894-95 was, we learn from a correspondent, keenly felt in the Channel Islands, and for the third year in succession a large quantity of seed Potatoes was destroyed by the frost. The loss of quite a fourth part of their Potato seed by this cause was nothing less than a calamity to the Jersey farmers. Moreover, the frost was so protracted, that planting was delayed for quite a month beyond the usual time. In the early districts, planting did not commence until the second week in March, whereas at the same date in 1894 the young plants were showing well above the ground. The growth this year was also slower owing to the greater coldness of the soil; and it was a general complaint that the Potato fields showed various "mises," owing, no doubt, to the planting of seed which had been injured by the frost, and which failed to germinate. The outlook from the first was therefore far from promising, and continued dry weather threatened general disaster. The early districts, as a matter of fact, fared very poorly; their yield was extremely light, and only for a very few weeks did prices continue at all remunerative. On the heavy lands, on the other hand, the tubers benefited greatly from a downpour on Whit-Sunday, and a heavy crop made amends, to some extent, for bad returns. Very soon, however, after the commencement of the English new Potato season, prices in Jersey fell to a ruinous figure. It is estimated that the value of the Potatoes exported from Jersey has this year not exceeded £300,000, whereas it reached almost £500,000 in 1894.

CLOVE CARNATIONS, STOCKS, AND ZINNIA IN THE EMSANKMENT GARDENS, CHARING CROSS.—The first of these have thoroughly established their fame here as hardy town flowers, flourishing in the midst of smoke. Masses of them in flower are pictures of vigorous health now in these gardens, and their handsome and fragrant flowers cannot fail to evoke warm admiration. The Stocks are even more charming as bedding plants, their fine massive build and great floriferousness, added to the variety of colour and fragrance, making them most desirable subjects, especially when planted in good numbers together. The dwarf strain of Zinnia elegans afford quantities of brilliant, telling shades of colour; they are, moreover, very lasting, if not permitted to bear seeds.

HORTICULTURAL MEETING AT GHENT.—At the Ghent meeting on July 9, the following awards were made:—Certificates of Merit *par acclamation*, to M. JULES HYE, for twenty specimens of *Cattleya Mendeli*, *Mossie* and *gigas*, all choice varieties, notable for the size and colouring of their flowers; to M. KUYLE, for *Phoenix humilis*, an excellent variety of *P. senegalensis*, leaves light bluish, a good market plant if seeds of it could be imported; to M. JULES HYE, for *Cattleya Arnoldiana* ×, a fine hybrid between *Lælia purpurata* and *Cattleya*

Waracewicz, lately obtained by Messrs. SANDER. Certificates of Merit (*à l'unanimité*) were allotted to M. JULES HYE for *Cypripedium Youngi*, which has long petals, quite covered with great black spots, exactly resembling those of *C. Veitchi*, whence this fine hybrid was raised; to M. PYNÆRT for a hybrid *Cypripedium* between *C. Stonei* and *Spicerianum*, the parentage was plainly shown, the new acquisition is very free-flowering, and easy of cultivation. Certificates of Merit were given to M. L. DE SMET-DUVIVIER, for *Pteris longifolia Marildii*, the fronds elegantly cut, the colour very distinct from that of other Ferns, a noteworthy variety for growing on a large scale; to M. JULES HYE for *Odontoglossum Wilkeanum*; to M. PETRICK for *Æchmea fulgens major*, a seedling from the old and popular *Æchmea fulgens*, but the bracts are much larger than in the type, and the colouring is brighter; to M. PETRICK, also, for *Tillandsia Sieboldiana*, a variety still very rare, and remarkable for its fine branching raceme covered with rosy-blue flowers or bracts. Certificates for Cultivation were awarded to M. JULES DE COCK for *Angræcum sesquipedale* with twenty flowers and buds; to M. JULES HYE for *Cattleya Mossiæ* var. *alba Wagneri*, bearing twelve well-expanded flowers; to M. L. DE SMET-DUVIVIER for *Promenæa citrina* with very numerous, small, golden yellow flowers; to M. SZEWEZIK for *Saintpaulia ionantha*, with fifty lovely blue flowers; to M. PYNÆRT, for *Cienkowiekia (Kämpferia) Kirki*, an interesting greenhouse plant, the flowers unfortunately are ephemeral, but recall in size, form, and colouring those of the beautiful *Miltonia vexillaria*. A Certificate for good cultivation was allotted to M. DE SMET-DUVIVIER, for a splendid specimen of *Adiantum Luddemannianum*, a variety reputed to be very difficult to cultivate, but this example was a strong and fine plant, with a hundred characteristic and young fronds. *Thunia Marshalliana* may also be mentioned, with twelve well-opened white flowers; and three imported specimens of *Cypripedium Curtisii*, quite distinct varieties, of which the one named *magnificum* is the most noteworthy. *Ch. de B.*

POTATOS CULTIVATED IN JADOO FIBRE.—

We have been allowed to see some Potato tubers and tops which were grown in Colonel THOMSON'S Jadoo Fibre. Without giving an opinion on the usefulness or otherwise of the fibre named as medium for growing Potatos, we are still enabled to allege that the Potatos had a nice clean appearance, free from wartiness and scabbiness, and they were weighty for their size.

CONSTANTINE FLOWER SHOW.—We learn from the *Western Mercury* that amidst the duet and din of politics in the Truro-Helston Division, Constantine Flower Show came as a welcome relief on Wednesday, the 17th inst. The attendance was large, though the dimensions of the show were on this occasion curtailed by the exclusion of a poultry department. During an existence of five years the Society has done much to promote interest in horticulture in the district it embraces, and this year's display in each section was worthy of high encomiums.

CUT FLOWERS.—An Association has been formed in Holland to endeavour to put a stop to the exportation of flowers cut from bulbs grown in that country. As this custom seriously interferes with the sale of cut flowers and bulbs in the London and provincial markets, it is felt by many of the principal English growers and bulb merchants that the time has arrived when steps should be taken to suppress this system by supporting the Dutch Association. A meeting will be held at the Hummum's Hotel, Covent Garden, on Friday next, July 26, at 8 P.M. C. H. M. A. ALDERSON, *Hon. Sec. (pro tem.)*

NATIONAL HORTICULTURAL SOCIETY OF FRANCE.—We noticed, says our Paris correspondent, at the last meeting of the Orchid committee a new and interesting *Stanhopea* raised from seed. Hybrid

Stanhopeas are still extremely scarce. Up to the present we have heard only of *Stanhopea Spindleriana*, raised by Mr. WEBER, gardener to Mr. SPINDLER, Berlin (*S. oculata* × *S. tigrina*). The new gain is a cross between *S. insignis* (Frost), and *S. oculata* (Lindley), and was shown by the fortunate raiser, Mr. MANTIN, president of the committee, at Olivet, Orleans. This plant, *S. Bellaerensis* × (Mantin), is exactly intermediate between its two parents; the flower is pale yellow striped with brown; The fertilisation took place in April, 1880, and the seed-pod ripened in April, 1889; the first flower opened June, 1891; three plants having already flowered are alike. *S. Bellaerensis* × obtained a First-

FIG. 20.—FRUITING SHOOT OF THE SPINELESS GOOSEBERRY.

class Certificate. Mr. MANTIN staged *Cypripedium Vigorianum* × (*C. barbatum superbum*, *C. aspericiliare*), the scape erect, flower large, of a fine rosy-purple colour, the upper sepal striped with purple. First-class Certificate. Mr. DOIN had a specimen plant of *Grammatophyllum Ellisiai* with six spikes; the plant was splendidly grown and excited general interest. Mr. DOIN is one of our best French Orchid amateurs. A well-flowered *Promenæa citrina* and a good many other varieties completed this interesting lot of Orchids. Unfortunately this year, the Paris Horticultural Exhibition took place at the same time as the Temple Show. Desirous to change this state of things, and to allow London and English nurserymen an opportunity to come at Paris next year, the "Bureau" of the Society decided that the show at the Tuileries should be held earlier in the future.

UNIVERSITY EXTENSION COLLEGE, READING.—

The awarding examiners in the Agricultural Examinations held under the authority of the Oxford and Reading Joint Committee have issued the following pass list: Certificate in Agriculture, John Francis Adams; Dairy Teacher's Certificate, Jane Foster; Diploma in Agriculture, first year's examination, passed in all subjects, Thomas Edward Gunter, Leyton Price Richards, and Charles William Thorp; passed in all subjects except biology, Claude Reginald Powell; passed in, all subjects except chemistry and physics, Edward, Thomas Brown; passed in biology and geology, Eric Dowson; passed in geology, Clement Hugh Weston Malet. The following were the examiners:—Professor E. B. Ponton, F.R.S.; Professor A. H. Green, F.R.S.; Mr. D. A. Gilchrist, B.Sc.; Mr. A. F. M. Druce, Mr. W. A. Glasson, M.A.; Professor J. W. Axe, Mr. E. Brown, Mr. W. W. Fisher, M.A.; and Mr. H. N. Dickson.

CORRIDOR AT MR. W. BULL'S NURSERY, KING'S ROAD, CHELSEA.

[SEE SUPPLEMENTARY ILLUSTRATION.]

Those of our readers who for reasons of business or pleasure have ever visited Mr. Bull's establishment for the sale of new plants, will have remarked the tastefully constructed range of buildings that skirts the King's Road. This block consists of a large central show-house well adapted for tree Ferns, Palms, Cycads, and similar plants grown chiefly for the beauty of their leaves and fronds. It was, however not built for any such purpose, being intended by Messrs. Weeks, the original owners and constructors, as a vinery, in which a great variety of Grapevines were to be cultivated, the fruit being sold in the London market. This was many years ago, in the infancy of commercial Grape growing, long antecedent to the extensive culture of the Grape as we see it now at Rochford's, Ladd's, and elsewhere.

We may be sure it did not remain a vinery after coming into the possession of Mr. Bull—he had other and more profitable use for so large a house.

The wings of the range consist of offices and two small lean-to plant houses.

In the rear are a number of span-roofed houses, in the longest and widest of which Mr. Bull displays in the height of the flowering season a wonderful array of rare and beautiful Orchids. Visitors to this part of the nursery must needs pass through the large glass house that forms the subject of our illustration, and will have noticed, perhaps only cursorily, the fine species of plants with which it is mainly filled, and that give it its appearance of tropical luxuriance.

Near the entrance from the street is a pair of *Encephalartos Vroomi* of great size, second only to some at Kew. *Encephalartos caffra* is also a fine plant. Some specimens of *Cycas revoluta* have stems two to three feet in height, and perfect crowns of deep green fronds. *C. circinalis* is found in splendid examples; and the door is flanked by some majestic *Dracæna australis*, of which there are many examples in other parts of the house. Specimens of the broad-leaved *D. a. lineata* also figure near the door; it is a very desirable variety for the cool conservatory. The more prominent Palms consist of the graceful *Seaworthia elegans*; *S. robusta* (*Rhopalostylis Baneri*); *Archontophoenix Alexandræ*, a beautiful and useful cool house species. *Areca sapida*, specimens with stems three feet high, and leaves measuring 10 feet in length; *Phoenix intermedia*, *P. reclinata* and *P. rupicola*, a most graceful species. A *Chamærops excelsa* has a height of 16 feet, and a *Corypha australis* is almost equally tall. Some fine specimens of *Arancaria excelsa* were noted; also *Catakidozamia Hopei*, a noble looking species. This by no means completes the list of Cycads and palms, but it will enable the reader to form an idea of the larger plants in the house. Of tree Ferns we remarked specimens of *Dicksonia antarctica*, the hardiest species, with tall stems,

which, together with the fine healthy crown of fronds, have a total height of 25 feet. *Cyathea Smithi*, a beautiful Fern, about 10 feet high.

Two admirable specimens—probably *Cyatheas*, which came from the Sandwich Islands, have a rachis covered with a thick brown tomentum, and stems respectively 2 and 4 feet in height.

The remainder of the plants on the floor of the house consist of smaller furnishing specimens of *Aspidiæta lurida*, greenhouse Ferns, *Aralias*, &c. Hidden from view at the sides of the house are glass frames filled with *Trichomanes* and *Todeas*, including *T. Moorei*, named after Moore of the Sydney Botanic Gardens; a very attractive filmy from Lord Howe's Island; also *T. superba*, an introduction of Mr. Bull's twenty-five years ago. Those persons who are interested in quaint-looking Cycadaceous plants would find here many plants not to be found in any other nursery in the country, and amongst them an ancient specimen of *Ceratozamia fusco-viridis*, a Mexican species introduced about twenty years ago.

mountains and on the banks of the burns had an attraction for me. It was there on the mountain-side that I saw the Sandews growing wild, and I was so interested in them, not having seen them before in the wild state, that the first night her ladyship arrived I dressed the dinner-table with *Drosera rotundifolia* and *D. longifolia*, which I found growing together with beautiful coloured clumps of sphagnum-moss. *J. Barnard, Mostyn Hall Gardens, Mostyn, N.W.*

RASPBERRIES.—Although the soil of Dover House Gardens is light and susceptible to drought, yet must Mr. McLeod have the highest commendation for the splendid crop of superlative Raspberry, which I saw there a few days since. The several rows of plants running across a broad garden square, were all trained to wire trellises, they were of an average from 6 to 7 feet in height, the canes having been only slightly shortened, and they hung with very fine fruit from top to the bottom. Superlative is so superb a variety, that it is quite displacing all others where cultivation is good. As the soil at Dover House is naturally so light and porous, as to render Raspberries fruitful, it is the rule to fork out a

early as the Ashleaf Kidney. The haulm, being smaller and weaker than that of the true Ashleaf, led me to suppose that it would be an even poorer cropper than that variety, which proved, on lifting the crop, to be correct. The tubers were about of a size, nice-looking, and fit for the best table, but of not by a long way so good as regards flavour as that prince of Potatoes, the Ashleaf. I am unable to understand why anyone should cultivate such a poor cropping variety, when there is nothing in point of flavour to recommend it. My first trial with it was also my last; still, there are cultivators whose verdict differs from mine, and who say that it is the best variety that they have. I wonder if their's is the true *Mona's Pride*, or a variety that merely bears a resemblance to that much vaunted Potato. The tuber of the true variety of *Mona's Pride* is very much shorter in its longer diameter than the true Ashleaf Kidney or *Marjolin* of the French, being sometimes almost round and flat, and there is no swelling about the eye, as is nearly always met with in the Ashleaf Kidney. With regard to the preparation of early varieties of Potato for early cropping, it may not be without use to mention the practice of the Parisian cultivators. They arrange the tubers e.g. uppermost as we do on wicker screens, and keep them in a dry frost-proof place until they are planted. When the time for planting in the open ground arrives (April), the screens are carried with the tubers upon them on to the ground to be planted, and the tubers are taken from them one by one and planted in the holes or furrows made to receive them. It is not asserted that this is a better method than our own, but at least it has the merit of being a very handy one for cultivators of large areas of Potatoes. Moreover, osiers are cheaper than boards, of which boxes are made. *Mona's Pride* Potato gained the 1st prize at the show of the Manchester and Liverpool Agricultural Society, held at Birkenhead in October, 1863, and the 1st prize at the County Kildare Horticultural Exhibition same year. It was raised by Mr. Rutledge, Douglas, Isle of Man. *F. M. F.*

— Referring to some criticisms, a few weeks ago, on my reference to the quality of the old *Mona's Pride* Potato, there must, of course, be local variations. I only called attention to a variety which, in this district, appears to be the best of all the earlier, both in crop and quality. *T. Fletcher, Grappenhall, Cheshire.*

GENTIANA PHLOGIFOLIA.—This is a plant to be recommended to gardeners as being one of the few *Gentians* which are both ornamental and easily cultivated. It is a native of the Carpathian Mountains, and owes its name to the supposed resemblance of its narrow lanceolate leaves to those of some of the herbaceous *Phloxes*. It is perennial and long-lived. A plant which has remained six or seven years where I first put it looks no older than it did five years ago, but has about a dozen divaricate stems a foot long, with numerous terminal umbels, which will take two months to flower out, and several axillary smaller umbels, so that each stem has in all thirty or forty flowers and buds. The flowers are bright blue, nearly as large as those of *G. septemfida*, but the stems are less leafy. *C. Wolley Dod, Edgely Hall, Malpas.*

MAIZE AND BLACK CURRANTS.—As a matter of local peculiarities, I may mention that we have here grown Maize over 11 feet high, with cobs $\frac{1}{2}$ lb. weight each, a record not easy to beat out of Cornwall, and yet many things which grow like weeds in other places, die out with us. What is popularly known as the "bob" in black Currants has been a pest here for many years; we have had to burn all our trees, and import others from the non-infested districts; after all the trouble and expense, I now hear of places where it is disappearing, or has disappeared entirely. Is this good thing purely local, or is the pest generally dying out? *Thos. Fletcher, Grappenhall, Cheshire.* [We fear not.]

THE WATERING OF DOG ROSES OR BRIARS FOR BUDDING.—From almost every quarter the cry grows louder, that the Briars die. And it is not alone or chiefly those that were planted last year. But the deaths seem even more prevalent among two-year-old plantations, or Briars that missed taking the bud last season. These old Briars are almost invariably the strongest, and this last phrase being interpreted means the softest wooded and the fullest of crude sap. And such fat and full-fed tissue, whether of rosewood, fruit trees, or aught else, is always the first victim to be stricken down, severely injured, or killed by frost. The majority of Briars are exceptionally

FIG. 21.—BUSHES OF THE SPINELESS GOOSEBERRY.

A SPINELESS GOOSEBERRY.

The plants shown in the accompanying illustrations (figs. 20, 21), were exhibited by MM. Letelletier, of Caen, before the Fruit Committee on Tuesday last. They are spineless varieties obtained from seed. The first spineless Gooseberry, according to the *Revue Horticole*, 1892, p. 180, was obtained as a chance seedling by M. Billard about 1860. About 1884, M. Ed. Lefort sowed the seeds of this variety, from which he obtained a race of spineless varieties, several of which are described in the *Revue Horticole* as above cited. The variety we figure is a dwarf form, very productive, and with the fruit of good flavour. It is the form described and figured by M. Carrière as *Madame Edouard Lefort*. The varieties are grafted upon *Ribes aureum*, but the scions soon become free. The advantages of a race of spineless Gooseberries need no pointing out.

shallow trench on either side of the row of plants, fill in with strong half-decayed manure, cover with soil, and tread in firmly. The centre space between the rows are also broken up deeply, as in that way renewed root activity is generated. Of course, no surplusage of summer growths is permitted. These are rigidly thinned out to what are needful, the stoutest being preserved, so that the intervening spaces between the rows are during the summer kept quite clean. It would be difficult to find a finer crop or finer sample of fruit than is seen here, and ample evidence is afforded that trellis training would be amply repaid if it were adopted in market culture. One row of plants as grown at Rosehampton, would give as much of fruit, and certainly finer and cleaner than can be got from three rows of short canes as grown in market gardens. Where, however, deep, fairly stiff and holding soil can be furnished, combined with the highest culture, even greater crops may be found. So far, the very best of fruit culture seems to exist chiefly in private gardens. *A. D.*

MONA'S PRIDE POTATO.—Allow me to add my mite of information to what has been given in these pages about *Mona's Pride*. It is now, I think, about thirty-two years ago since I grew this variety of Potato for the first time. The sets, a very nice shapely lot of tubers, on arrival from the nurseryman, were planted on a west border, in fairly good soil, in a garden on the South Coast, and the crop was ready to dig nearly as

HOME CORRESPONDENCE.

DROSERAS IN SCOTLAND.—Mr. Kelly's note on the Sandew (p. 74) reminds me of the time I was at Attedale, Loch Carron, Ross-shire, being then with the late Lady Brassey. As it was my first visit to the Highlands, the different subjects growing on the

late this year owing to heat and lack of rain, and the shoots of many of them to remain too short and weak to be fit for budding. There is only one effectual remedy for this, let them be heavily watered, soaking the soil at their roots with river-water, sewage, or horse-slops, failing heavy rains. I know a great many rosarians dread water more than drought among their Roses. I met one such to-day, who feared that none of his Briars would reach this season, and who simply returned the sceptic's smile at my advice of soak them through. Neither need we be much surprised at the slender faith of so many rosarians in the watering of either Briars or Roses. The work of watering has been so shamefully scamped in most cases as to warrant the common verdict that it does more harm than good. Surface sprinklings do so, without doubt. But soakings of sewage, slops, and soft-water, soon stimulate Briars into budding condition, and have helped many waning blooms with first prize stands. *Rosa.*

PEAS AND POPPIES IN RUSSIA.—In *Happgood's Russian Rambles*, p. 115, reference is made to a variety of *Pea* growing nearly 7 feet high, and producing pods 7 inches long and 3 inches wide; and of "double Poppies 6 to 7 feet high, with flowers the size of Pæonies, while the pods of the single Poppies were 9 inches in circumference." Is anything known of these varieties in England? *Thos. Fletcher, Grappenhall.*

LAW NOTES.

RE FREDERICK PENDLE.

At the Ipswich Court of Bankruptcy, held on Thursday, the 18th inst., before Mr. B. P. Grimsey, Registrar, the above appeared for public examination. The statement of the debtor (nurseryman, seedsman, and farmer, of Rendham) showed a deficiency of £149 Os. 3d., due to unacquainted creditors. In reply to the Official Receiver, Mr. F. Messent, the debtor said that he was at one time an apprentice to the late Duke of Hamilton's gardener at Easton, and that he afterwards went home to manage the nursery at Rendham for his father, who was in failing health. His father died in 1889, and he carried on the business as one of the executors until April, 1894. The members of the family then arranged that the property should be sold; it was put up to public auction at Saxmundham, and bought by his wife. One of the conditions of sale was that the nursery stock should be taken at valuation; and in order to meet this charge his wife mortgaged the property at the time she bought it. He (the debtor) had nothing to do with this transaction, and all he did afterwards was to manage the property on behalf of his wife. People with whom they dealt, he said, knew the position of affairs, although the invoice was sometimes made out to him, and sometimes to his wife. Finding himself in difficulties, the debtor fell into the hands of the advertising money-lenders. He borrowed £50 from the Bedfordshire Loan Company at 60 per cent. per annum, to be repaid in monthly instalments of £4 3s. 4d., and the balance in the following January. As security, he gave a bill of sale on his goods, or his wife's goods, although his wife had nothing to do with signing it. Four instalments, amounting to £16 13s. 4d., had been paid when he filed his petition, and as soon as the Loan Company heard of his failure they put a man in possession, and his goods were sold by auction. The Loan Company got a net sum of £56 in satisfaction of their claim, and full official charges were made in respect of the selling-up transaction. The Registrar said upon this point, that reasonable charges must, of course, be paid, but that in an instance of this kind the sheriff's officer, who was employed, had acted quite in a non-official capacity. With reference to the case generally, the Registrar said it seemed to be questionable whether the wife of the debtor, and not the debtor himself, was really the responsible party. More than that, the man had no right to give a bill of sale to the Loan Company on his wife's goods, so that the authority under which her goods were sold might really be invalid.

The Official Receiver said, however, that he supposed this question had nothing to do with him, and the Registrar assented.

The examination was adjourned. *Eastern Daily Press, 19th inst.*

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 23.—The usual fortnightly meeting of the Society was held on the above date in the Drill Hall at Westminster, and the number of exhibits though fewer than we have become accustomed to see at the Spring Meetings was considerable.

Orchids formed a less conspicuous feature in regard to quantity than usual, but hardy flowers were again exhibited largely, and there were extensive collections of Sweet Peas. New and rare plants were not wanting, and First-class Certificates were awarded by each Committee.

Fruit exhibits included large collections of Gooseberries and other miscellaneous subjects.

Floral Committee.

Present: W. Marshall, Esq., in the chair, and Messrs. J. Fraser, Owen Thomas, H. B. May, H. Herbst, R. Dean, R. Owen, G. Stevens, C. J. Salter, W. Bain, J. T. Bennett, P. & J. D. Pawle, H. J. Jones, C. E. Shea, Jas. Walker, H. Cannell, L. Spath, C. Noble, and G. Paul.

A large and comprehensive collection of hardy and perennial flowers was shown by Mr. M. PRITCHARD, Christchurch, Hants. Conspicuous among these were capital bunches of *Potentilla Wm. Rollinson*, and the pretty, though less showy, *P. Hopwoodiana*; large bunches of herbaceous *Phlox* were good; also several varieties of Perennial Sunflower, *Montbretia crocosmiiflora*, and others. *Platycodon grandiflorum*, with its large single blue flowers, was effective; and *Scabiosa caucasica*, and several *Centaureas*, were noticed, as was also a remarkably well-fruited spray of *sambucus racemosa* (Scarlet-berried Elder) (Silver Banksian Medal).

Another excellent exhibit of out-of-door flowers was from Messrs. PAUL & SON, The Old Nurseries, Cheshunt. This included flowering sprays of the purple-flowering *Asclepias Cornuti*, a fine bunch of *Boconia cordata*, the white *Lysimachia clethroides*, a good bunch of *Helipopsis scabra*, large, and orange-coloured variety of great effect in borders; and *Eryngium amethystinum* was well shown, and some first-rate varieties of herbaceous *Phlox*, &c. (Silver Banksian Medal).

Messrs. CANNELL & SONS, Swanley, Kent, exhibited a collection of Carnations in light bunches, and representing considerable variety, many of which were new seedlings. Cannell's Scarlet is an especially bright one, Duchess of Portland is a very pretty rose and white-coloured Carnation, and *Haidee Falbe*, a white flower flaked with rose, Messrs. CANNELL had also some capital sprays of *Canna Queen Charlotte* (Silver Banksian Medal).

Messrs. B. WALLACE & CO., Colchester, again exhibited a collection of sprays of Lilies. Conspicuous amongst the collection was *Lilium chalcidonicum*, the very bright sealing-wax coloured species. A First-class Certificate was awarded to *L. odorum* (*L. japonicum Colchester*). This is a species from China, much in the way of *L. japonicum Brownii*, for which it has been frequently mistaken. The flower is rather larger and thicker than *Brownii*, has larger anthers, and the interior is cream-coloured instead of white. *L. dalmaticum Catani*, *L. Thunbergianum*, *Calochortus luteus*, *C. l. concolor*, *C. Weidii*, figured in *Gardeners' Chronicle*, August 18, 1894, fig. 27, and *C. Plummere*, *Gardeners' Chronicle*, August 4, 1894, fig. 21, were also shown (Silver Banksian Medal).

A group of well-grown Achimenes in pots and pans was shown by Mr. W. C. WALKER, Esq., Percy Lodge, Winchmore Hill, London, N. (gr., Mr. Geo. Cragg) (Bronze Banksian Medal).

J. T. BENNETT POË, Esq., Holmwood, Cheshunt, exhibited three splendidly-grown plants of *Campanula Vidalii*. This is a bushy species, and the plants shown had six or seven spikes each, the height of which were about 4 feet. Fourteen to seventeen flowers are produced upon each spike. Flowers are pendulous, about 1½ inch long, white, with orange-coloured zone in the interior of base (see fig. 19, p. 95). Three very fine plants of *Streptosolen Jamesoni* were shown, which had been lifted from the open ground, and several plants of *Myrtus communis* var. *betica*. *Violas* in pots and sprays of good quality were exhibited by Mr. W. BAXTER, Florist, Woking.

Messrs. PAUL & SON, Cheshunt, exhibited plants in flower of *Clematis Viticella* × *Uniflora*, a lilac-coloured variety, and a large plant of the small leaved *C. flammula rubra marginata*. The flowers are also small, purple in colour, but the base and centre of each petal silver. *Cannas Comet*, *Souvenir de Crosby*, and Mrs. Fandell Phillips were shown in praiseworthy style by Messrs. Paul. Sweet Peas were very largely exhibited at this meeting, a collection of very great attractiveness being staged by Mr. HENRY ECKFORD, Wem, Salop, and others; by The Brookhampton Nurseries, Mr. W. E. TIDY (Manager), and by Messrs. DOBBIE & CO., Bothesay, N.B., and Orpington, Kent. Mr. ECKFORD's collection was extensive, and included upwards of 50 bunches. Awards of merit were recommended to Lady Grisel Hamilton, an excellent heliotrope or pale lilac-coloured variety; *Blanche Burpee*, a large flower of pure white; and *Mars*, a variety with extra large flowers of rosy purple, very bright and effective. Particularly noticeable amongst a whole lot of magnificent varieties were *Firefly*, very bright rosy crimson; *Venus*, flesh tinted with bronze; *Peach Blossom*, a soft pink-coloured flower; *Prince Edward* of York, crimson and rose; *Stanley*, very dark purple, and many others (Silver Flora

Medal). The exhibit from the Brookhampton Nurseries was staged amid Maidenhair Ferns, and included a large number of bunches, rather thickly disposed (Bronze Flora Medal). Messrs. DOBBIE had about fifty bunches of bright flowers in variety (Bronze Flora Medal).

Messrs. PEED & SONS, Norwood Road, West Norwood, staged a group of very choice *Gloxinias*, interspersed with *Ferns*, &c. (Bronze Flora Medal).

Messrs. JNO. LAING & SONS, Forest Hill, London, S.E., exhibited four large-flowered double *Begonias*: *Mrs. Peek*, cream-coloured; *Mrs. Hall*, yellow; *Madame de Falbe*, salmon-rose; and *Mrs. W. J. Bilney*, light apricot.

Mr. C. Herrin, gr. to Lady FORTESCUE, Dropmore, Maidenhead, showed a bunch of a border Carnation named *Dropmore Clove*, a good dark bloom with non-splitting calyx. A First-class Certificate was awarded to *Carduus eriophorus*, a species of Thistle, also shown by Lady Fortescue. This plant has a very ornamental character, its chief attraction being the large woolly heads that follow the purple flower. It appears to be a cultivated form of our English species.

From Mr. F. W. MOORE, Royal Botanic Garden, Glasnevin, were sprays of *Agapanthus minor* and *A. Mooreana*, *Crinum Powellii*, *C. P. alba*, and *C. yemense*, all from the open air.

Messrs. JAS. VEITCH & SONS, King's Road, Chelsea, showed a pretty little group of their Rhododendron javanico-jasminiflorum hybrids, nice, dwarf, well-flowered plants; and were awarded a First-class Certificate for *Davallia tenuifolia* Burkei from New Guinea. This is a very elegant variety, and the fronds are pendent as soon as made. For a basket it should be very suitable and pretty in the stove (Silver Banksian Medal).

Sir TREVOR LAWRENCE, Bart., Burford, Dorking (gr., Mr. Bain, showed some sprays of *Pentstemon hybridus grandiflorus* from seed sown on January 15, 1895. The blooms and sprays were alike magnificent, and an Award of Merit was recommended to the strain. Sprays of *Salpiglossis* in variety, and of excellent merit, were also shown, and a spray of *Gladiolus Dutreuil de Rhine* was recommended an Award of Merit. The blooms of this were of remarkable size, salmon-scarlet in colour marked slightly with silver.

Messrs. WM. CUTBUSH & SONS, Highgate Nurseries, London, showed some very fine Cockscombs named *Cuthush's Giant*; and G. A. FARINI, Esq., Forest Hill, exhibited some tuberous-rooted *Begonias*.

Messrs. WEBB & BRAND, Saffron Walden, were awarded a Bronze Banksian Medal for fine heads of excellent double Hollyhocks; and Messrs. SANDER & CO., St. Albans, exhibited a fine foliage *Begonia* named *Duke of York*.

Messrs. VEITCH & SON, Chelsea, showed sprays of *Pavia macrostachya*, and a collection of *Nymphaea* blooms. A First-class Certificate was awarded to *N. Marliacea chromatella*, and Awards of Merit to rose-coloured varieties of *N. odorata* and *N. Leydekerii*.

Messrs. T. CRIPPS & SON, Tunbridge Wells, showed some plants of the rare *Mutisia decurvens*, sometimes called the climbing *Gazanias*. It has excellent orange-coloured flowers. Also some flowering shoots of *Schnbertia grandiflora* (Bronze Banksian Medal).

Mr. R. P. BROTHERSTON, Tuninghame, Prestonkirk, sent some vigorous sprays of *Germania Carnations*. A large double-flowered yellow *Begonia* named *Marquis of Londonderry*, was shown by B. ARMITAGE, Esq., Hermitage Place, Norton, Stockton-on-Tees.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Secretary), E. Hill, H. J. Chapman, Sydney Courtland, De B. Crawshaw, T. B. Haywood, W. H. White, W. H. Protheroe, and H. M. Pollet.

Messrs. JAS. VEITCH & SON, Royal Exotic Nursery, King's Road, Chelsea, exhibited *Phalaenopsis* × *Ludde-Violacea* (Ludde-Violacea ♂, violacea ♀), the latest of the fine hybrids raised and reared by Mr. JOHN SADEN. This beautiful hybrid has the wax-like flowers of *P. Ludde-Violacea*, but the segments are broader and more equal. The colour is light rosy-purple with narrow wavy, closely-set bars of a darker hue across the sepals and petals. The base of the lip is yellow with some reddish markings, the front lobes bright crimson-purple (First-class Certificate). Messrs. VEITCH also again exhibited their singular *Dendrobium* × *porphyrogastrum* (*Dalhousieanum* ♂, *Huttonii* ♀), which, on this occasion bore several spikes of four and five flowers, of a pale pinkish-lilac colour (Award of Merit); and *Cypripedium* × *Carnusianum* (*Spicerianum* ♂, *Haynaldianum* ♀), *Dendrobium glomeratum* and *Miltonia vexillaria superba*.

Sir TREVOR LAWRENCE, Bart., Burford, Dorking (grower, Mr. W. H. White), exhibited *Habenaria rhodochela*, a pretty species of the *H. militaris* class, but with bright green, unspotted leaves, and clear orange-scarlet labellum. The plants shown exhibited very free growth and profuse flowering qualities (Botanical Certificate); also the pretty and fragrant *Epidendrum alatum*.

Messrs. F. SANDER & CO., St. Albans, staged a select group of Orchids, in which were the rare and singular *Angraecum Eicherianum*, a curious species, with fleshy, flatly-arranged dark-green leaves and large solitary flowers, bearing some resemblance to those of *A. eburneum*; the sepals, petals, spur, and base of the lip, is pale green, the broad apiculate front of the lip pure white (Award of Merit); *Dendrobium speciosissimum*, for which they obtained a Botanical Certificate at the last meeting, but which on this occasion secured an Award of Merit; *Cypripedium Kimballianum*, illustrated in the *Gardeners' Chronicle*, June 29, p. 801; the pretty *Eria latibracteata*, with erect spikes of rather large cream-white flowers, with the side-lobes of the lip and tip of the column

well-bloomed specimen of *Plumbago capensis*, which was placed before a tolerably good *Anthurium* and a *Stephanotis floribunda*.

Begonias were not very numerous, but the quality of several of the exhibits was quite satisfactory. The best four plants of these were staged by Mr. F. W. Price, gr. to H. C. CROWTHER, Esq., Broadelyot. Fuchsias, Coleus, Carnations, Dahlias, Petunias, and Roses were exhibited in small quantity, the quality generally fair, but calling for no special remark. There were several exhibits of very commendable Ferns, and the best four plants were staged by Mr. H. Cooper, gr. to C. M. HARRISON, Esq., Whitmore; and in another class Mr. R. SIMMONS, gr. to F. H. SIMPSON, Esq., Thornbury, had three fine plants of *Adiantum cuneatum*.

Fruit.—Though not very extensive, the fruit exhibits represented Grapes, Peaches, Nectarines, Melons, Gooseberries, and Currants. Mr. J. MUNRO was 1st for black and for white Grapes, and his bunches were of good quality, but neither the black Grapes nor his Muscats of Alexandria were quite ripe. The other dishes of fruits were generally of very satisfactory quality, particularly Red Currants, and some of the exhibits of Gooseberries.

Vegetables were exhibited with considerable spirit in the open classes in those limited to single-handed gardeners, and in others confined to amateurs. First prizes for collections were taken by Mr. MUNRO and Mr. F. W. PRICE, and Mr. WEBSTER was 1st for a nice collection of salad. Potatoes were not of more than average quality in the most cases, and the skins were not very clean. But Beans, Peas, and Turnips were good.

Table Decorations, &c.—One of the tents was nearly devoted to these and kindred exhibits, which were more than usually numerous. The winning designs exhibited considerable taste, but call for no special notice. Bouquets and similar florists' specialties were numerous; and to instance the desire that exists here to provide classes of interest to as many exhibitors as possible, there were mail-carts decorated with flowers, &c., the work of children only; and model designs of gardens and greenhouses were numerous. Some of these were good, but such classes usually bring exhibits of a very artificial and absurd character. Amongst some furnished window boxes there was one shown by Mr. F. SINCOCK, of very superior appearance. Nothing very novel was employed, but it was done well in detail.

Cottagers, and Miscellaneous.—There were twenty classes open only to cottagers, most of them for vegetables. Miscellaneous exhibits included groups of plants and hardy cut flowers from Messrs. JNO. LAING & SONS, Forest Hill; Crotons and other plants from Messrs. J. FRED & SONS, Norwood; and excellent group of choice Begonias from Mr. JNO. R. BOX, Croydon; and smaller exhibits from local nurserymen.

NEWCASTLE-ON-TYNE HORTICULTURAL.

JULY 24, 25, 26.—The annual show of this old-established society opened on Wednesday last. Taken throughout it fully maintained its previously high standard of excellence. Amongst plants the groups are beginning to form an important feature. The cut-flower classes were notable for the grand display of Roses, and also for the splendid exhibit of hardy herbaceous flowers, whilst Carnations and Pansies were remarkable for good quality. The decorative arrangements, as on previous occasions, were quite up to the average, making collectively a splendid display. Fruit, on the whole, was not as good as last year. It is pleasing to note that vegetables have been included this year, and it is hoped that this portion of the show will be further extended another year.

PLANTS.

The specimen classes for flowering plants were not so well filled, a fact to be regretted; for whatever may be said of the value of specimens in any other respects, it will be conceded that they will exhibit the gardener's cultural skill.

Mr. Nicholas, gr. to the Marquis of ZETLAND at Upleatham, was an excellent 1st for six different and distinct kinds, showing *Dipladenia boliviensis*, well flowered, and very healthy; *Allamanda grandiflora*, a good all-round plant; *Phenacoma prolifera* Barnesii, also good; *Erica verticosa* Bothwelliana, rather thin, but fresh; *Clerodendron fallax*, a grand specimen, with thirty flower-spikes (this fine autumnal species is worthy of more notice), and a well-bloomed *Stephanotis floribunda*. The next exhibit fell far behind this one.

Mr. NICHOLAS was also 1st for six exotic Ferns, showing two grand *Davallias*, *D. filiensis plumosa* fully 6 feet through, and very fresh; and *D. tenuifolia Veitchiana*, a graceful variety grandly developed; and other good plants were *Sadleria Cynathoides*, and *Dicksonia squarrosa*.

Mr. McIntyre, gr. to Mrs. PEASE, Darlington, was an excellent 1st for six foliage plants, having well-coloured Crotons in *C. Queen Victoria* and *C. angustifolius* (the latter in its best form); also *Phoenix rupicola* and *Cycas siamensis*, and a dwarf close-growing form of *C. circinalis*. Mr. NICHOLAS was a good 2nd, having the same varieties of Crotons, with a fine *Kentia Belmoreana*.

For three Crotons, Mr. McIntyre was also 1st, showing *C. Warreni*, *C. Barons James de Rothschild*, and *C. angustifolius*, all well-coloured; as well as being 1st for three *Dracaenas*, with well-grown good varieties. He was again 1st for four foliage plants, viz., *Croton Simtziamus* being one of his best.

The best four Ferns came from Mr. Jas. Woods, gr. to

E. HOPPER, Esq., Morpeth, his varieties being *Adiantum Farleyense*, extra fine; and *Thamnopteris australasica*, well developed. Mr. MCINTYRE followed with smaller examples.

Mr. WYLAM, Cramlington, had the best four flowering plants, his *Stephanotis floribunda* and *Allamanda Hendersonii* being well bloomed.

Mr. MCINTYRE was allowed a walk over in the class for a large group of 26 feet by 10 feet, taking the 1st prize with an arrangement which was broken up into smaller mounds, the flowering plants being brought, as we considered, too much to the front, otherwise it was effective.

Mr. JAS. WOOD was 1st for the smaller group, consisting of well-grown plants arranged on the old eloping model; the 2nd prize going to a thin arrangement from Mr. F. EDMONDSON, Green Market, Newcastle-on-Tyne.

Some very good freely-flowered Fuchsias were staged, the most successful exhibitors being Mr. ELLIOTT of Felling; and Mr. BALL of High Felling.

The table plants were of good character, but Lilies and Orchids were not shown so well as we expected.

CUT FLOWERS.

Of these the Roses were the most numerous, and of fine quality, the size and colour of the blooms being remarkable. Messrs. HARKNESS & SON, Bedale and Hitchin, were 1st for forty-eight varieties, with a very even and bright exhibit, the best varieties being *Her Majesty* (extra colour), *Alfred Colombe*, *Comte de Rimbaud*, *Earl Dufferin*, *Gustave Piganeau*, and *Séateur Vaise*. Messrs. COCKER & SON, Aberdeen, were a close 2nd, their best being *Gustave Piganeau* and *Captain Hayward*, both extra good.

BATTENSBY, Blaydon, came a good second, three of his best being *Veratrum viride*, *Spirea palmata*, and *Alstroemeria aurantiaca*.

Decorative arrangements.—Here Messrs. PERKINS, Coventry and Leamington, carried off the chief honours, being 1st for bouquets in two classes, also 1st for a basket, and for sprays and button-holes, all of these exhibits being in good taste and in no instance too heavy or excessively large.

Mr. SUMMERS, florist, Sunderland, was a very close competitor in the class for a hand bouquet, where in addition a bronze Banksian medal was awarded with the 1st prize, which was won by Messrs. PERKINS; the only fault being in the former an excess of size.

The best *Epergne* came from Mr. F. EDMONDSON, a recherché arrangement chiefly of Orchids. Mr. J. BATTENSBY also won 1st prizes for bouquets in the amateurs' classes with superior arrangements; whilst Miss EDMONDSON was a very successful exhibitor of *epergnes* and baskets.

Carnations, Picotees and Pinks were specially good, so also were the Pansies. Mr. CAMPBELL, Auchincloth, Blantyre, taking two 1sts for the latter (show and fancies). In all of these classes the competition was very keen.

FRUITS.

Mr. McIndoe, gardener to Sir J. PEASE, Hutton Hall, Guisborough, was 1st for both six and four kinds of fruit, there being no other competitor, the best dishes here were grand ones of Red Magdalen Peaches and Humboldt Nectarines, Transparent Gage Plums, and Black Tartarian Cherries; a large bunch of Bananas was included. The Grapes were scarcely so good as usual from this exhibitor.

In the single-dish classes, Mr. MCINDOE was again successful, taking 1st for a green-flesh Melon with High Cross Hybrid, and 1st for a scarlet-flesh variety, with Premier; he being also 1st with Red Magdalen Peaches; Mr. NICHOLAS followed very closely with the same variety.

For Nectarines, Mr. MCINDOE was 1st again with Humboldt; and for Cherries, with Late Bigarreau.

For four bunches of Grapes, not fewer than two varieties, Mr. J. Mark, gr. to J. C. ARKWRIGHT, Esq., Clitheroe, Lancashire, was 1st, with fine examples of Muscat Hamburg, large in berry; and Black Hamburg, also large—both varieties being well coloured. Mr. Tullett, gr. to Lord BARNARD, Raby Castle, came a good 2nd in this class, his Muscat of Alexandria being the best in the show.

Mr. Hunter, gr. to the Earl of DURHAM, Lambton, had the best Black Hamburgs, fine in bunch and finish. Mr. JAS. WOOD had the ripest and highest-coloured Muscat of Alexandria, but the smallest bunches; Mr. MCINDOE following, with much finer bunches. Mr. TULLETT had the finest *Madre-feld Courts*; Mr. MCINDOE being very close, with finer bunches, scarcely so ripe.

For any other white Mr. MCINDOE was easily 1st with well-ripened, clear-looking Duke of Buccleuch.

The Tomato competition was keen, and several splendid dishes were shown, Mr. MCINDOE again coming in 1st with *Invincible*, apparently a good selection of Perfection.

MISCELLANEOUS EXHIBITS.

These at Newcastle are very important, and were on the present occasion fully equal to anything before shown. From Messrs. LAING & SON, Forest Hill, S.E., came a grand display of Begonias (tubercus), in the finest varieties of both the singles and doubles now in cultivation. They embraced every shade of colour to be found amongst this section, several of the doubles, notably Mrs. Watson Armstrong, rich apricot buff; W. Clifford, deep rose; Duwager Empress Frederick, bluish; and Lady Wantage, rosy-buff. Some of the newer *Caladiums* and other plants were included, the Begonias having stood the long journey in the best possible manner.

Mr. DOUGLAS exhibited a choice selection of his seedling Carnations (cut blooms), the best being *Waterwitch*, Duchess of Orleans, a full primrose-yellow; Mrs. Eric Hambro, a pure white, of fine form; Braw Lass, form of *Haye's Scarlet*, deep rose colour; Mrs. Douglas, sulphur-yellow, rosy-pink edge; and Cardinal Wolsey, apricot-yellow, edged and flaked bright red.

Messrs. F. FELL & CO., Hexham, showed a most extensive group of remarkably well-grown *Conifers* in baskets, &c. These consisted of species of *Retinospora*, *Cupressus*, *Thuia*, and *Juniperus*, with some capital young plants of *Picea pungens glauca*. Cut hardy flowers were also included.

From Messrs. COCKER & SONS, Aberdeen, came additional cut hardy flowers, making a great show, including several kinds not often seen.

Messrs. KENT & BRYDON had a bright group of *Coniferae*, with *Acers*, &c.; and a somewhat similar exhibit came from Messrs. J. ROBSON & SONS, which was made brighter by well-flowered *Hydrangea paniculata grandiflora*.

Mr. J. BIRKENHEAD showed a large assortment of exotic Ferns, small plants in good character. *Violas* and *Pansies* came from Mr. S. FYE, Garstang, and other exhibitors. Mr. CUTHBERTSON, Rothsay, had a large assortment of hardy flowers; Mr. CAMPBELL, Blantyre, had *Malmaison* and other Carnations, the former of deep colour; Messrs. LAING & MATHER had Carnations; and from Mr. H. BROWN HILL, Sale, came a much improved race of the annual *Chrysanthemums*, a specially fine strain, with larger and finer formed flowers.

Obituary.

MR. T. H. RABONE.—It is with much regret that we hear of the death, on Saturday last, of Mr. T. H. Rabone, the well-known gardener at Alton Towers. In our present issue we can only

reproduce the photograph of the deceased gardener which was given in the Gardeners' Chronicle on October 14, 1876, in our series of British gardeners, but next week we hope to reproduce a few of the facts concerning his early life, then recorded by himself.

HENRI BAILLON.—The death of this accomplished and most energetic botanist is announced. He was born in Calais in 1827, and prosecuted his studies in Paris. For many years he acted as Professor of Botany at the Faculté de Médecine at Paris, and had the charge of the small garden belonging to that institution. Baillon's activity was truly extraordinary. A Histoire des Plantes in twelve volumes, a Dictionary of Botany in three volumes, innumerable memoirs and monographs attest his diligence. Nor were these works mere compilations, they were the result of actual comparative investigation and remarkable keen insight. Few, if any, botanists of our time had so clear and thorough a knowledge of flowering plants in general as Baillon. He attached great importance to organogeny as a key to deciphering the morphological characteristics and the natural affinities of plants. A quarrel with Decaisne and Duchartre was the occasion of a personal attack on those botanists, which for virulence and persistency has had no equal in our remembrance, and which led to protests from other botanists who deplored the unscientific violence of the critic.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (Daily and Accumulated), RAINFALL, and BRIGHT SUN. It contains numerical data for various districts over a period of days.

The districts indicated by number in the first column are the following: 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending July 20, is furnished from the Meteorological Office:—

"The weather during the early part of the week was fine in all the more eastern, central, and southern parts of our Islands, but changeable and showery in the west and north. After the 16th, however, unsettled weather spread gradually from the westward over the whole Kingdom, the rainfall of

the 18th and 19th being in many places very heavy. Thunderstorms occurred in several parts of England on the 19th, and thunder was heard in a few isolated places on the 18th and 20th.

"The temperature was slightly below the mean in all districts, excepting 'England, E. and S.,' where it agreed very closely with the normal. The highest readings were observed mostly on the 17th or 18th, and ranged from 81° in 'England, S.,' and 75° in 'England, E.,' to 69° in 'Scotland, N., Ireland, S., and the Channel Islands,' and to 67° in 'Scotland, W.' The lowest readings occurred at various times in different parts of the country; at one or two stations in 'Scotland, N. and E., and in Ireland, N.,' the thermometer fell slightly below 40°, but in the 'Channel Islands' it did not go below 45°, while in 'England, N.W.,' 49° was the lowest reading reported.

"The rainfall exceeded the mean in all districts, the excess being very slight in 'Scotland, N.,' but large over the central and southern parts of England. In the 'Midland Counties and the Channel Islands' the amount recorded was twice as much as the mean.

"The bright sunshine was less than the mean in most districts, the deficiency being very large in the 'Midland Counties.' In 'Scotland, E., England, N.E., and the Channel Islands,' however, there was a slight excess. The percentage of the possible duration ranged from 16 in 'Scotland, N.,' and 19 in 'Ireland, N.,' to 40 in 'England, S.,' and to 46 in the 'Channel Islands.'"

MARKETS.

COVENT GARDEN, July 25.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

OUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various flowers such as Arums, Asters, Bouvardias, Carnations, etc., with columns for s. and d.

ORCHID-BLOOM in variety

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various potted plants like Adiantum, Aspidistra, Calceolaria, Coleus, etc., with columns for s. and d.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for various fruits including Apples, Cherries, Figs, Grapes, etc., with columns for s. and d.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

POTATOS.

Market and prices about same as last report. J. B. Thomas.

SEEDS.

LONDON: July 24.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, thanks to the recent welcome showers, there is

now an improving demand for Trefoil and Rape, and more especially for Mustard seed; all these three varieties now offer us exceedingly tempting terms. New home-grown Rye is coming to market. Full prices are asked for yearling Winter Tares. There is no change in either Peas or Haricots. Bird seeds, at this quiet season, show no fresh feature.

FRUITS AND VEGETABLES.

BOROUGH: July 23.—Quotations.—Peas, 2s. 6d. to 3s. per bushel; Onions, 2s. 6d. to 3s. per bag; Horseradish, 1s. to 1s. 3d. per bundle; Apples, Tasmanian, 6s. to 8s. per case; Currants, 1s. 9d. to 4s. per half-sieve; Gooseberries, 1s. 6d. to 1s. 9d. do.

SPITALFIELDS: July 23.—Quotations.—Scarlet Runners, 3s. to 3s. 6d. per bushel; Peas, 2s. to 2s. 6d. do.; Carrots, 2s. 6d. to 3s. per dozen bunches; Turnips, 2s. to 2s. 6d. do.; Cabbages, 5s. to 6s. per tally; Marrows, 4s. to 6s. do.; Cucumbers, 2s. to 3s. per dozen.

STRATFORD: July 23.—Quotations.—The supply to this market during the past week has been good, and, with plenty of buyers, a brisk trade was done as under:—Cabbages, 2s. to 3s. per tally; Turnips, 2s. to 2s. 6d. per dozen bunches; Carrots, household, 1s. to 2s. per dozen; Mangels, 20s. to 24s. per ton; Onions, Egyptian, 5s. 8d. to 6s. per cwt.; Beans, Scarlet, 3s. 6d. to 4s. per sieve; do., Broad, 1s. 6d. to 2s. per bag; Peas, 5s. to 6s. do.; Cherries, 5s. to 6s. per half sieve; Berries, 2s. to 3s. do.; Apples, 2s. to 2s. 3d. do.; do., 3s. 6d. to 4s. per bushel; Marrows, 6s. to 7s. 6d. per tally; Cucumbers, 1s. 6d. to 2s. per dozen; Onions, Ports, 5s. 6d. to 6s. per case.

FARRINGTON: July 25.—Quotations.—Raspberries, 2s. 6d. per half-sieve; Gooseberries, 3s. do.; Cherries, 6s. 6d. to 7s. do.; Green Gages, 3s. to 4s. per basket (12 lb.); Plums, 2s. per box of 10 lb.; Cucumbers, 7s. 6d. to 8s. per dozen; Cabbages, 3s. to 3s. 6d. per tally; Carrots, 3s. per dozen bunches; Turnips, 3d.; Marrows, 2s. 6d. per dozen; Broad Beans, 1s. 6d. per bushel; Scarlet do., 2s. 6d. do.

POTATOS.

BOROUGH: July 23.—Quotations ranged from 80s. to 110s. per ton.

SPITALFIELDS: July 23.—Quotations.—Puritans, 110s. to 120s.; Hebrons (Bedford), 100s. to 120s.; do., Essex, 100s. to 110s.; Snitton's Regents, 100s. to 120s.; Yorkshirs Hero, 110s. to 120s. per ton.

STRATFORD: July 23.—Quotations.—Old: 20s. to 30s. per ton. New: Hebrons, 110s. to 130s.; Kidneys, 100s. to 120s.; Snowdrops, 110s. to 130s. per ton.

FARRINGTON: July 25.—Quotations.—White Hebrons, 110s. to 120s. per ton; Red do., 100s. to 110s. do.; Puritans, 110s. to 120s. do.

LONDON AVERAGES: July 24.—New: Snowdrops, 110s. to 120s.; Hebrons, 110s. to 120s.; Early Rose, 110s. to 12 s.; Puritan, 120s. to 130s.; Early Regents, 100s. to 110s.; Jersey, 90s. to 110s. per ton. Old: Magnums, 40s. to 50s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 90s. to 115s.; do., inferior, 50s. to 80s.; bay, best, 60s. to 95s.; do., inferior, 30s. to 60s.; mixture, 70s. to 92s.; and straw, 20s. to 38s. per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending July 20, and for the corresponding period last year:—1895: Wheat, 24s. 4d.; Barley, 18s. 6d.; Oats, 16s. 6d. 1894: Wheat, 24s. 6d.; Barley, 18s. 6d.; Oats, 19s. 7d.

VARIORUM.

THE INDIAN SHOT OR CANNA.—It has been stated that the only difference between a weed and a wild flower is, that it is a weed when it comes up where the cultivator does not want it. A wild flower, then, becomes a weed when growing in cultivated ground. One would hardly suppose that the Canna of our gardens, a beautiful wild flower of Florida, is often a great pest to the Floridan horticulturist, and is classed there as among the worst weeds. It seems it appears persistently in low ground, known to cultivators as hummock soil; its root-stocks grow so deep in the ground, that the plough does not turn them out, so that they grow up as bad as ever in newly-ploughed ground. The roots have to be dug out with a spade in order to get clear of them. 'Mechan's Monthly' for July.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

ELÆAGNUS EDULIS.—Can any reader say how the berries of this plant are made use of, so as to be edible? In their natural state no one would care to taste them more than once. V.

. Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

. PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists varieties cannot, as a rule be named.

BOOKS: *A Subscriber.* Grape-growing for Amateurs, by E. Molyneux. London: Upcott Gill, 170, Strand, W.C., price 1s.

BEECH: *E. M. B.* The occurrence of laciniated leaves on the Beech is not uncommon. It is an instance of bud-variation, or "sporting"; but whether it is a reversion to a former state of things, or an adaptation to new circumstances, no one can tell. The Fern-leaved Beeches of gardens have originated in this way, the "sport" being grafted on to a Beech stock, and thus propagated.

CARNATION: *G. W.* sends us flowers of Carnations in which the stalks are abruptly bent downwards. We do not know what the cause of the distortion is, but we suspect it may be the result of insect-puncture at an early stage of growth.

CHRYSANTHEMUMS DISEASED: *G. Harwood.* The plants are attacked by a minute mite which punctures the young leaves; the fungus Botrytis then settles on the wounds and spreads. Spray thoroughly, so that the buds are soaked, twice a week, with a deep-red solution of potassic permanganate. *G. M.*

DISEASE IN PLUM AND PEAR TREES: *T. W. O.* Neither cause nor cure is known. It is, however, known that the disease is contagious, therefore all dead trees should be burned, also branches, leaves, and fruit. The application of manure containing ammonia favours the disease. *G. M.*

GRAPE VINES: *G. W.* The disease is certainly not black-rot, neither is there any evidence of any fungoid disease. Not having the roots under proper control is undoubtedly the cause of the leaves and fruit going wrong. *G. M.*

HOW PEAT BEDS ARE FORMED: *G. F.* We cannot do better than give you the account by Spender in the *Transactions of the Bath and West of England Society*, of the formation of the peat-beds of Holland. "In the high lands peat is supposed to have been formed by the decay of vegetable life, chiefly that of moss and heather on the surface of the ground, which forms a mould that increases year by year until it has undermined the health of the trees, and having caused their fall, gradually covers them over with a yearly-increasing deposit. Ages afterwards the trunks are found several feet below the surface of the bed. The forests protected the growth of the moss and were destroyed by it. In the lower beds peat is formed by the decay of aquatic plants under water, which fall to the bottom and form layer upon layer. These are often found floating on the surface of the water. Floating peat-beds were at one time common in parts of Holland, but the modern Dutchman, less superstitious than the Romans, who were greatly alarmed by the floating forests of the Zuyder Zee, fastens these fugitive parts of his estate by ropes fixed to stakes fixed in more solid earth."

LICBEN: *G. W. W.* *Physcia ciliare.*

MEALY-RUG: *M. T. G. G.* Should use the XL All Vaporiser.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number. *W. H. D.* 1, Rose, garden variety; 2, *S. uccio artemisiifolius*; 3, *Veronica longifolia* var. *rosea*; 4, *V. longifolia* var. *alba*; 5, *V. nitida*; 6, *V. media*.—*J. A.* 1, *Galega officinalis* *alba*; 2, the Crown Pea (*fasciata*); 3, *Spiraea Lindleyana*; 4, *Eurybia argophylla*; 5, *Elæagnus pungens*.—*S. G. Jones.* *Alstroemeria aurantiaca*.—*W. T.* 1, *Cystopteris bulbifera*; 2, *Pteris chinensis*; 3, *Asplenium viviparum*.—*Campbell.* *Eupatorium cannabinum*.—*C. L., Berlin.* Specimens all quite withered. 1, *Cypripedium*, may be *bellatulum*, or one of the hybrids from that species; 2, *Vanda Bensoni*; 3, *Vanda hastifera*; 4, *Dendrobium bicameratum*; 5, *Dendrobium sulcatum*. These are probably the species sent, but the material is so bad that we cannot pledge ourselves to the correctness of some of the names.—*H. M.* *Tilia platyphyllos*.—*No Name.* 1, *Linaria cymbalaria*; 2, *Achillea Ptarmica*, double-flowered; 3, *Galium verum*; 4, *Linaria vulgaris*; 5, *Echium vulgare*.—*G. A.* 1, *Clitorea Ternatea*; 2, A variety of *Lathyrus sativus*, often erroneously called Lord Anson's Pea.—*A. F.* 1, *Acer Negundo variegatum*; 2, *Taxus baccata* var.; 3 and 4, *Juniperus virginiana*; 5, *Betula*; 6, *Picea excelsa* var.—*J. B. J.* A *Viola*, so far as we can make out from such a poor specimen.—*G. B.* *Chrysanthemum carinatum*.

PEAS: *A. B.* Something in the soil or the manure that has an injurious effect on them. Do other crops suffer similarly? In some places the grubs of cockchafer and wireworm do much harm to Peas.

ROSES: *Ross Florence.* Rose double Macartney, Marie Leonida.

TEST FOR LIME IN THE SOIL: *W. P.* Pour some strong sulphuric acid on to a little of the soil in an earthenware vessel, and if effervescence takes place there is lime present.

TOMATOS: *J. H. B.* 1, Curling of the leaf is frequent in some varieties; the lower part of the leaf grows disproportionately fat, probably from over stimulation. 2, Yes; was not the ammonia in too large proportion to the water? 3, Yes.

TOMATOS AND THE BORDEAUX MIXTURE: *Tompkins & A. K.* The formula has been given in these pages many times before, and we repeat it for your especial benefit. We think that every gardener should hang a copy of it in his potting-shed for reference in case of need:—Copper sulphate, 4 lb.; fresh unslaked lime, 3 lb.; water, 40 gallons. Place 6 gallons of the water in a tub or barrel, and hang in it 4 lb. of pulverised copper sulphate in some coarse sacking. Slake the lime in another vessel, adding water only as fast as it takes it up, and then pour together. Enough lime should be used to neutralise the free acid of the copper, as if this be not done, the foliage will be injured. To test this, get a pennyworth of yellow prussiate of potash at the chemist's, and place in a bottle of water. Add a few drops of this to the Bordeaux before it is diluted, and if it turns it brown the lime is deficient, and more lime should be added until the prussiate of potash has no effect. The above formula is as strong as Bordeaux Mixture can be used at any time, and if it is strained twice or thrice through canvas, it may be used in sprayers and pumps without clogging the nozzles. If fungi are not very troublesome, and when several applications are to be made at frequent intervals, 50 or even 60 gallons of water may be used. Always mix the Bordeaux in wooden, earthenware, or brass vessels, and the fittings of the pump, &c., should be of brass.

TOMATOS DISEASED: *Market Gardener.* The soil has nothing to do with it, nor the manure you have employed, although the excessive damp atmosphere which growers maintain in their houses favours the growth of minute fungus. The plant is much safer in a comparatively dry, warm house than in a moist one. See reply to *Tompkins*.

TOMATOS: *A. P. B.* The beginning of the Black-rot. Cut off all the affected fruits and burn them, dressing the plants with the Bordeaux Mixture. Can you send specimen of the beetle which gnawed into the fruit sent?

VARIETIES OF FRUITS FOR MARKETING: *Ignoramus.* *Red Currants:* Raby Castle or Victoria for late, and *La Hative* for very early use. *Red Ditch* if a sweet, rich fruit be wanted; and *La Fertile*, a

very heavy bearer, and large fruited. Prices about 20s. per 100; new varieties a little dearer than this. *Black Varieties:* The Ogden for early use, and *Le's Black* for general use. Price about 23s. per 100. Three varieties of Raspberry: *Falstaff*, large, excellent, red; *Baumforth's Seedling*, large, productive, red, 15s. per 100; *Superlative*, red, heavy cropper, 25s. per 100. If a yellow variety be grown, choose *Yellow Antwerp*, or for late use *October Yellow*. *Black or Purple Cooking Plums:* *Early Rivers*, unequalled for cooking and preserving. The fruit is very heavy, a bushel weighing from 70 to 80 lb., whereas other varieties seldom exceed 60 lb. Ripe at end of July. *Late Prolific*, equally productive and good, ripens three weeks later; *Wyedale* is a very late variety, ripening in October. If an early dessert Plum of a dark purple colour is required, choose *The Czar*; if a late dessert variety, one of the best to plant is *Monarch*, which is ripe late in September. Late and early varieties of any kind of fruit pay well. The prices of standards of Plums for orchards from £6 to £7 10s. per 100. Dwarf maidens about 12s. per dozen. Distances at which to plant red Currants, 6 by 8 feet apart. *Black Currants* rather more, say, 10 feet in rich deep soil; and 8 feet in that which is naturally poorer or shallow. Plums 14 feet apart if bushes; 20 feet if standards. Raspberries, if grown on stools throwing from eight to ten canes each, which will be bent over and tied to stakes fixed midway between the stools in the line of the plants, or a trifle more on one side of the line, which is better at 6 feet apart; or they may be planted at 2½ to 3 feet apart, and the fruiting canes restricted to six, the canes being then made self-supporting. The best Gooseberry for picking green is *Whinham's Industry*, or if for gathering when ripe as well, then choose *Hielander* or *Lancashire Lad*—price per 100 same as red Currants; distance apart also the same.

VIRGINIA CREEPER: *E. M.* *Vitis (Ampelopsis) hederacea.* It is said to have been introduced from Canada or the northern United States in 1629, and was originally called *Hedera quinquefolia*, under which heading you will find it in *Miller's Dictionary*. Of course it is no Ivy, but a Vine.

VINES: *J. W.* The shanking in other years was due to the roots having got low down in a border, which, owing to the great length of time that has elapsed since it was made, has become in an unwholesome condition. Your partial escape this year from shanked berries is due to the great amount of sunshine having warmed the soil to a greater depth than usual, and caused an excessive amount of transpiration from the foliage, and thus preserved, to some extent, a balance between requirements and supply. You should examine the border this year as soon as the crop is ripe, cutting the bunches and bottling them. If the border is found to be in bad order, make a new border with fresh soil, &c., and see that the drainage is well provided for, and the depth of soil does not exceed 2½ feet, raising the surface above the surrounding level, the subsoil being clay.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners Chronicle" has, since the reduction in the price of the paper,

increased to the extent of 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE GARDENERS' CHRONICLE

PUBLISHER'S NOTICES.

GARDENERS' CHRONICLE TELEGRAMS.—The Registered Address for Foreign and Inland Telegrams is "Gardchron, London."

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements

TO FLORISTS, &c.—situation wanted by a young Lady in the Florist's and Fruit Business; good experience.—BILLIMORE, Caversham, Reading.

ALL IS NOT GOLD THAT GLITTERS may be said about many brilliant prospectuses that are frequently issued to financiers; they often herald the formation of companies which go up like the proverbial rocket and come down like a stick. HOLLOWAY'S PILLS and OINTMENT, unlike such shaky ventures are the soundest investments in which people suffering from disease can entrust their money. They have the reputation of over half a century, and every day they return substantial dividends in the form of good health. No disease has yet disputed their influence when a fair trial has been given. They cure dysentery, diarrhoea, weakness, and liver and kidney diseases, whilst for skin diseases they have no equal. Sold by all chemists, &c.

NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

THE GARDEN.—All who desire the greatest amount of success and pleasure, certainly should, during the season, have a day at OANNELL'S (confirmative of this, see the last issue of the *Gentleman's Journal*). At no other Horticultural Establishment can the like number of Novelties, practical working, and interesting objects be seen, and so easily attained, as at Swanley and Eynsford. We cordially invite all to Come and See.

FOR ORCHIDS of every description at Reasonable Prices, and efficient men to cultivate them, apply to—

SALES BY AUCTION.

AUDENSHAW, NEAR MANCHESTER.

HIGHLY IMPORTANT SALE

OF THE

CELEBRATED BEECH LAWN COLLECTION

OF

ESTABLISHED ORCHIDS,

WITHOUT THE SLIGHTEST RESERVE, BY ORDER OF

W. R. LEE, Esq.,

Who is relinquishing their cultivation, in consequence of having Sold the Freehold estate.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL the above renowned Collection on the Premises, on TUESDAY, September 24, and TWO FOLLOWING DAYS, at 12 for half-past 12 o'clock precisely each day.

The Collection is justly celebrated for the large number it contains of plants of exceptional merit and rarity, the whole being in a most healthy condition.

Among the principal plants, the following may be specially mentioned.—

Table listing various orchid species such as Cattleya Mendeli, Cypripedium South-gateense, Dendrobium splendens, etc.

Also the GREENHOUSE PLANTS of Sorts, FERNS, the erections of Six Greenhouses, Saddle Boiler, 1400 feet of Hot-water Piping, chiefly 4-inch, Frames, Barrows, Lawn Mower, Garden Roller, Flower Pots, Garden Seat, Garden Roller, Thermophone, and other Sundries.

May be viewed by appointment any day prior to the Sales. Catalogues may be had of Mr. Thomas Billington, the Head Gardener, on the premises, and of the Auctioneers, Valuers, and Estate Agents, 67 & 68, Cheapside, London, E.C.

N.B.—The Orchids have been exhibited in London and Manchester, and have obtained many First Prizes, Awards of Merit, F.C.C.'s, Gold Medals, and extra prizes wherever shown.

New Yellow Cypripedium.

YELLOW FORM OF CYPRIPIEDIUM HARRISIANUM IN FLOWER (believed to be unique), also the beautiful CATTLEYA PATROCINI (R. A. Rolfe) in flower.

MESSRS. PROTHEROE AND MORRIS will have the pleasure of offering the above rarities by AUCTION at their Central Auction Rooms, 67 and 68, Cheapside, on FRIDAY NEXT, August 9, at 2 o'clock to the minute.

MONDAYS, August 19 & 26. THURSDAYS ,, 22 & 29.

DUTCH BULBS. SPECIAL TRADE SALES.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on

MONDAY, August 19 THURSDAY, August 22 | MONDAY, August 26 THURSDAY, August 29

large consignments of NAMED HYACINTHS, TULIPS, CROCUS, NARCISSUS, and other DUTCH BULBS, together with white ROMAN HYACINTHS and paper-white NARCISSUS received direct for Unreserved Sale.

These early auctions have been specially arranged in lots to suit the Trade and other large buyers.

The Auctioneers will be pleased to enter the names of intending purchasers on their permanent lists who may desire a regular supply of catalogues for these Sales.

Auction Rooms and Offices, 67 and 68, Cheapside, London, E.C.

Friday Next.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. F. Sander & Co., St Albans, to SELL by AUCTION at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, August 9, at half-past 12 o'clock, a great variety of:—

IMPORTED ORCHIDS,

including a Consignment of ODONTOGLOSSUM CRISPUM (the true Pacho type), Phaius asamicus, Cattleya citrina, in fine condition; Oncidium Russelianum, Oncidium incurvum, a grand cool-house species; Cypripedium Rothschildianum, Odontoglossum citrosatum, Oncidium Pelicanum, O. cæsum, O. tigrinum (scented), O. unguiculatum, Epidendrum vitellinum, LYCASTE SKINNERI; INDIAN CROCUSES; the Hornless Stanhopea; Cymbidium eboracum, the ivory-white, winter-flowering, scented Cymbidium; a DENDROBIUM SPECIES; an AERIDES, or SACCOLABIUM SPECIES, very distinct, and probably new; CYPRIPIEDIUM DAYANUM, Chysis aurea, Cypripedium exul, C. niveum, &c. Also, a number of DENDROBIUMS, including D. hedyotum, D. densiflorum, D. Farmerii, D. clavatum, D. Jenkinsii, D. cucullatum, &c.; also Epidendrum Parkinsonianum, and the attractive EPIDENDRUM CANDOLLEI, &c.

On view morning of Sale, and Catalogues had.

Framfield, near Uckfield, Sussex.

ALMOST WITHOUT RESERVE.

IMPORTANT to MARKET GARDENERS, FRUIT, CUT FLOWER, TOMATO, EARLY VEGETABLE, SALAD, and MUSHROOM GROWERS.

MESSRS. PROTHEROE AND MORRIS are instructed to offer for SALE BY TENDER, in TWO LOTS, the following FREEHOLD PROPERTY:—

LOT 1.—THE FRAMFIELD NURSERY, rich Meadow, &c., 14a. 1r. 13p.; nine newly-built Greenhouses, about 74,000 superficial feet, heated by about 10,000 feet of Piping, and Boilers; fitted with Tanks, &c.; with the valuable Vines, two Cottages, and numerous other Outbuildings.

LOT 2.—THE FREEHOLD BUILDING ESTATE, divided from Lot 1 by public footpath, and embracing an area of 12a. 2r. 3p., having 1500 feet of building frontage to existing roads.

Tenders will be received at the offices of Messrs. PROTHEROE AND MORRIS, Auctioneers, 67 and 68, Cheapside, London, E.C., up till 12 o'clock Noon, on Thursday, August 8, 1895.

Copies of particulars and Forms of Tender may be had of Messrs. VINCENT AND VINCENT, Solicitors, 20, Budge Row, Cannon Street, London, E.C., and of the Auctioneers above.

POULTRY AND BEE FARMS, ORCHARDS and NURSERIES.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 3, 1895.

MUSHROOM SPAWN.

THE general public, and even a good many gardeners, have but misty ideas as to the mode of growth of Mushrooms. If this is true with reference to the Mushrooms, it is even more so in regard to the spawn. Those who do know are not always successful in the "manufacture" of spawn, and sometimes experience disappointment in the growth of that purchased. The gardener has frequently to encounter two evils in Mushroom growing, one uncertainty of production, which may arise from bad or dead spawn, but is usually the result of want of care in regulating the temperature of the bed before or during spawning; the other the production of Mushrooms, indeed, but of Mushrooms intermixed with other fungi whose presence is not desirable, and might even be injurious. This evidently arises from the use of bad, that is of mixed spawn. The "spawn" represents the roots, stem and branches of a flowering plant, and it feeds upon decaying animal and vegetable matter, being, in fact, what botanists call a "saprophyte," and not a "parasite" on living plants. When this spawn is placed under suitable conditions of moisture and heat, it absorbs food, grows, spreads, and ultimately sends up into the light and air the stalked caps which represent the fruit or seed-vessel of an ordinary plant.

The would-be "manufacturer" would do well to visit a botanical laboratory where fungus "cultures" are undertaken, so that he might be able to see and realise what are the conditions under which fungi can be grown. "Culture" in a laboratory and culture for market, though dependent on identical principles, are necessarily different in detail. A French botanist, for instance, has succeeded in growing Mushrooms on glass-plates with the aid of certain chemical solutions, and without the aid of any manure whatever, the temperature being kept uniform. The advantages of such a procedure in cleanliness, certitude as to the species employed, and regularity of production, would of course be great. At present, however, this is only a laboratory experiment, and as such presents nothing remarkable to the student of fungi. Whether such procedures can be taken on commercial lines is another matter, and one that might well be investigated at Chiswick or some other experimental garden. In the meanwhile, we must go on in the old ways, and get the best spawn we can. The "manufacture" of Mushroom spawn may be looked on as a curious and out of the way sort of industry; but it is a very important one nevertheless, as those who pay a visit to Mr. Johnson's farm at Hanger Hill, near Ealing, may see for themselves.

Mr. Johnson, we may say, from such an inspection of his land and his crops as a daily journey through them for some years past has enabled us to make, is an excellent farmer, and one who apparently does not approve of grumbling and despair as remedies for

agricultural depression. Amongst other things he has a herd of 100 or more cows and these repay the attention bestowed upon them, not only by the milk they yield, but by the aid they afford in the production of virgin spawn. In Mr. Johnson's spawn-factory the bricks have the form of flat tiles 9 inches by $4\frac{1}{2}$ inches. They appear to consist of fine loam mixed with cow-manure and with fragments of spawn interspersed. When mixed, they are spread on the ground in the open air to dry, and then placed on racks in open sheds. There is so large a demand for this spawn, that some difficulty is occasionally felt in coping with it.

Mr. Johnson tests the value of his spawn by himself growing Mushrooms on a large scale. Long raised mounds of manure are formed in the open air, each 32 yards in length, and 2 feet 6 inches in height, and as much through at the base. The degrees of fermentation and heat are, of course, watched, and when the heat has decreased, say to 80–90°, and remains pretty uniform, the beds are "spawned" by the insertion at intervals of fragments of the bricks 3 inches square. The beds are moistened when necessary, and when the spawn has commenced to run, the beds are then cased with mould about $1\frac{1}{2}$ or 2 inches thick, and then covered with long litter, beneath which, in about six weeks, the fungi make their appearance. On the average, we were told, these beds have produced 19 lbs. of Mushrooms to the yard. The average price for the year has been 8d. per lb., or 12s. 8d. a yard. Four outdoor beds spawned in September last came into bearing a month later, and produced upwards of 2000 lbs. weight of Mushrooms by November, some being of extraordinary size. The weekly average gathering is upwards of 700 lbs. The beds are so arranged as to ensure a more or less continuous supply, one set succeeding another.

"City gentlemen" riding to town every morning by the District Railway from Ealing are puzzled to know what can be grown on those long mounds of earth, on which nothing green ever seems to make its appearance. We remember that years ago a very distinguished botanist, and one by no means unknown in the gardening world a generation ago, travelling to and from Kew *via* Putney, used to express his wonder in like manner at these mysterious mounds. That they contain buried treasure we hope we have made apparent.

The three beds shown in the photograph (fig. 24) produced at this gathering 508 lbs. of Mushrooms, or an average of $5\frac{1}{2}$ lbs. to the yard.

NEW OR NOTEWORTHY PLANTS.

CATTLEYA × JUNO. *hyb. nov.*, L. Barron.
(C. FORBESI × C. VELUTINA.)

This hybrid has been raised in the collection of C. G. Roebing of Trenton, N.J., where it was in flower June, 1895. In general appearance the flower may be likened to that of *C. velutina*, brightened; the growth reminds one of the other parent; altogether it is a decided acquisition in a section but little cultivated. Flowers $3\frac{1}{2}$ to 4 inches in diameter, borne erect on a three-flowered scape, highly fragrant; sepals and petals equal, light yellowish brown, irregularly and sparsely spotted with intense rose, undulate, recurved at the apex, flushed rose at the base, where they are narrowed almost to a claw. Lip prominent; median lobe semi-orbicular, white with rich heavy veins of

FIG. 23.—MUSHROOM CULTURE: MAKING THE "SPAWN."

rose; side lobes wrapped closely over the column, pure white flushed with rose on the margin; yellow-veined in the throat. Leonard Barron.

THE ROSARY.

A WHITE MOSS ROSE.

MR. NEWNHAM BROWN, of Reigate, has in his garden a white Moss Rose tree, which twice during this season has produced a flower half-white, half-red, all the others being white. The white and red do not melt into each other, but are sharply defined, one petal, in fact, being

half-red, half-white. According to Mr. W. Botting Hemsley, who writes in *Nature*, there are several varieties of Rose which "revert" or "sport" in this manner to the ancestral colour. The striped white and red "York and Lancaster" Rose is an example. Generally, the proportions of red and white are the same in any two flowers; but sometimes a pure pink—if not also a pure white—flower is seen. This reversion is ascribed to an imperfect blending of the parent stock; and as any vegetative bud of a plant is capable of producing any or all of the organs of the whole plant, or when detached from the parent plant or similar organism, it follows that in a cross-bred variety, which is not constant or "fixed," any vegetative bud may produce the cross or the parent forms.

FIG. 24.—MUSHROOM CULTURE: GATHERING THE CROP.

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS, AUGUST, 1895.]

The words "average," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality.

The counties are arranged in numbered groups, to correspond with those adopted in the Weather Reports of the Meteorological Department, and followed in our weekly Weather Tables.

** Fuller comments will be given in the following Numbers. See also Leading Article on page 128.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUMS FROM THE HIGHLANDS.

Flowers of *Odontoglossum crispum*, to the number of fifty, and cut from different plants, have been sent by R. Brooman-White, Esq., Arddarroch, Gairloch-head, Dumbartonshire, which afford an idea of the excellence of the strain which has been imported by him. While all are of good form, no two are exactly alike, some being pure white with a little red and yellow colouring at the base of the lip and the tip of the column. Some few have a decided sulphur-yellow hue, while others are almost entirely of a pale lilac colour. In all the varying shades of ground colour, spotting of either brown or purple appears, and in two of the flowers the inner halves of the segments are thickly sprinkled with very small red-purple dots. The variation in the different flowers is remarkable, and when they are ranged side by side it appears still more evident than would be the case if the plants were viewed as arranged in the Orchid-house. Mr. White says of them:—"We have had over 1500 spikes on our *O. crispum* this year, and not a single bad one among them, as I think you will agree when you see the blooms I send, which are a fair sample. From some cause, however, I do not think them quite up to the standard of last year, and several other growers have made the same remark about their *Odontoglossum*. Possibly the protracted hard winter may account for it. We grow our plants on open woodwork stages close up to the glass of the roof, and nothing could be more satisfactory."

A very remarkable *Cattleya Mendeli* with rose-purple petals almost as dark as the lip is also sent. If constant, it will be a distinct variety.

CYTROPIDIUM ANDERSONI, R. Br.

This Orchid is a native of Trinidad, and grows in open spaces fully exposed to the sun. The fusiform stems are some 2 to 3 feet in height, from which the plaited leaves die away after becoming mature. The plant flowers in April and May, from the base of the growing stem, and produces a scape some 3 feet in height, bearing a panicle of brownish yellow flowers. The centre of the basal lobe of the lip is quite yellow, with a crenulated and brownish margin. It is best grown in well-drained pots filled with vegetable refuse, dried cow-dung, and broken bricks, and requires plenty of water in the growing season. *Bulletin, Trinidad Botanic Garden.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

THE PINERY.—If arrangements have been made, as recently advised, as to bottom-heat, &c., for starting a fresh stock of plants, the suckers may be potted forthwith, so that they may become established in the pots before the end of the autumn. The suckers should be twisted off the old stool, and a few of the lower leaves stripped off, so as to expose

about 1 inch of the stem. A suitable size of pot is one of 6 inches in diameter. This size will be large enough for most suckers, though very strong ones may require rather larger pots. Dirty pots should never be used, and the drainage should be good. Place the suckers low down in the pots, and make the soil very firm about them. The loam used should contain a fair amount of sharp-sand or grit, its presence favouring the formation of roots. Plunge the pots up to the rim in a bed of Oak-leaves or tan, having a bottom-heat of from 85° to 90°, and if the plunging material be moistened by syringing its surface once or twice a day, and the air is also kept moist, the suckers will require but little water before they have made roots. A slight dewing of the leaves on bright afternoons will assist the suckers in forming roots. The house should be shaded in the middle hours of the day in sunny weather, but, as a rule, shading should not be much afforded. The suckers will not need to be much ventilated; still, a certain amount will be required by them on very hot days. The temperature at night may be kept at about 70°. Plants of the Queen variety intended for fruiting in June, 1896, should now be in full growth, and will require to be regularly afforded tepid water, and once a week a mild manurial aid to growth. The plants should not be much shaded, and what shading is used should be of very thin material; moreover, a fair amount of air should be admitted, so as to ensure a sturdy plant. Those plants on which fruits are swelling, but which have not begun to ripen, may have manure-water occasionally, and a brisk temperature with a moist air afforded them.

STRAWBERRIES.—The recent rains have greatly assisted rooting of the runners, and when it is seen that a sufficient number are well rooted, no time should be lost in placing them in the pots in which they are to bear fruit. The soil used should be a rich turfy loam, enriched by a one-third addition of decayed stable manure; and the pots should be clean ones, with a fair amount of drainage material carefully laid-in and covered with a handful of the fibry lumps of the loam. The potting should be done firmly, using a rammer, so as to get as much soil into the pots as possible, but leaving sufficient space for water. Place them in a partially shady place for a week, then remove them to one fully exposed to sunshine. They may stand close together for a time, affording them more and more space as the crown of leaves grows.

TOMATOS.—The batch of Tomato plants for affording winter fruit should be forthwith placed in their fruiting-pots, and stood in a sunny position. If a diseased Melon-house can be devoted to them, they may be planted out in the old beds, abundant ventilation being afforded.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

RANUNCULUS ASIATICUS.—For making a late display in the spring garden, the *Ranunculus* is a useful plant, the flowers lasting a long time in good condition. Many of them are fragrant, and all are useful for cutting. The plants require a rich soil, and to

be planted in sheltered situations. The double-flowered French Turban varieties have large flowers of bright colours, and they are good growers. Nica varieties are *Brutus*, *Empereur de Maroc*, *Florian*, *Grand Mastr*, *La Grandessa*, *L. Saltana*, *L'Etincelante*, *Lord Macanlay*, *Mont Blanc*, *Prince of Wales*, *Princess of Wales*, *Queen Victoria*, *Robert Bruce*, *William III.*, *Yellow Gem*, *Yellow Queen*. There are also the *Double Persian*, *Double Scotch*, *Double Turban* or *Turkish* varieties in fine colours.

BRODIÆAS.—These beautiful free-flowering bulbs deserve a place in every garden of spring flowers, being very hardy. The *Brodias* are useful for planting in clumps or beds, and for cutting. Suitable species are *congesta*, *coccinea*, and *vulbilis*.

LILY BULBS for planting in beds or borders should now be ordered from the florists, autumn-planting being the best for species of *Lilium* which are hardy. *Crocium aurantiacum*, the common orange Lily; *L. davuricum*, *d. erectum*, *d. fulgidum*, *d. grandiflorum* and *multiflorum*, *d. incomparabile*, *L. Thunbergianum atrosanguineum*, *L. pictum*, *L. Prince of Orange grandiflorum*, *L. Van Houttei*, *L. candidum*, *L. longiflorum* and the variety *Harrisii*; *L. neilgherrense*, *L. eximium*, *L. Martagon* or *Turk's-cap* Lilies, in several beautiful varieties, orange-yellow and scarlet-coloured; *Lilium tigrinum* and its var. *L. Fortunei*; and *L. aratum*, which is very satisfactory when planted in good rich, well-drained soil in a sheltered situation.

IRIS.—The brilliant varieties of English, Spanish, and Persian Iris, are excellent for planting in borders; also *Iris reticulata* and *rubro-cornuta*, whose flowers are fragrant, deserve a prominent place in the bulb garden. Then there are the German, Japanese, Siberian, and other beautiful varieties, which are deserving of cultivation.

TIGRIDIAS should be grown as "dot" plants by themselves among other plants, or in clumps or beds.

THE HERBACEOUS BORDER.—The rain and warmth now prevailing in this district (4 inches of rain since July 16) are causing rapid growth in all kinds of plants, and where tall annual species are planted for the sake of an autumnal display, much care will be required to preserve the herbaceous perennials from injury by over-crowding. Attention should be frequently given to weeding the land, and securing all tall-growing plants to stakes, &c. In some cases the fastenings made during the drought will require easing. Hollyhocks should have special care in this respect, the stems being apt to get injured by tight ligatures. Phloxes of the tall-growing species, perennial Asters, &c., should be made secure, and freed from dead leaves and flowers.

SHOW VARIETIES OF THE DAHLIA.—The plants will now be making strong growths, and regular and constant attention in the matter of staking and fastening will be necessary. If flowers are being grown for exhibition more than one stake will be required to a plant, in fact, it is prudent to put a stake to each main shoot, one flower only being allowed to each shoot, the side shoots and buds being reduced in number, those flower-buds that are of

perfect form being retained. For shading the flowers bags of light-coloured muslin are the best. The Dahlia beds should be heavily mulched with short litter, and manure-water afforded once a week. Dwarf, single, and double-flowered Dahlias, planted in masses, may be left to grow unrestrained; provided the beds are covered by them. Traps must be set forthwith for earwig, collecting the insects daily.

ROSES.—Plants which were cut down to the ground in the spring have, in many instances, made very strong growth, and it will be prudent in exposed gardens to fix them to short stakes, with tarred twine or willows. Most of our dwarf Roses that were hard pruned, made fine shoots, which flowered well. Keep the Rose-beds tidy by removing spent flowers, cut away thin flowerless growths, and shorten back those shoots of H.P.'s which have carried bloom, thus assisting the later blooming of the plants. Teas of strong growth and Roses on walls, hedges, or pillars should be trained so as to keep the shoots from injury by the wind, but should not be tied too stiffly, a certain degree of freedom being favourable to growth. Proceed with the budding of Roses, and look to the fastenings of buds put in some time ago.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorset.*

CYPRIPEDIUMS.—Of late years no *Cypripediums* have received more attention from our hybridists than the species *C. niveum*, *C. concolor*, *C. Godefroyæ*, and *C. bellatulum*, and so far as my recollection goes of the crosses already obtained, the characteristics of this section invariably predominate in each hybrid. Of the numerous crosses raised I may mention *C. Ayllogii*, Muriel Hollington, Gertrude Hollington, Tautzianum, Lawrebel, Concolours, The Pard, Aphrodite, and tessellatum porphyreum. There are cultivators who find the species more difficult to manage than most *Cypripediums*, but as regards the crosses they, as a rule, conform readily to cultivation, but should any one of them become unhealthy, much patience and close attention are required to bring them round. Any of these plants that are in need of rooting-space or fresh material in consequence of the old having decayed, should now have attention. As regards repotting, this should not be done more often than is absolutely necessary, because the roots are very brittle in their nature, frequently snapping off when disturbed in the least degree. Instead of turning well-rooted *Cypripediums* out of their pots, break the pot by gently tapping it, and pick out the rotten compost, and if this can be done without disturbing the drainage materials, there will be still less fear of injuring the roots. Place the entire mass in a larger pot, allowing plenty of space for filling up to two-thirds of its depth with pieces of chalk or limestone, or failing these, with pieces of tufa, bricks, or thick crocks. The plant should be kept on a level with the rim of the pot, which should be filled up with good fibrous loam, freely mixed together with the bits of limestone, &c., and a small quantity of sphagnum-moss. The repotted plants may be placed in a light part of the East Indian house, and shaded with thin scrim at all times. All of the above species and crosses need water in abundance at all times, especially when in full growth. Great care is needed to prevent water lodging in the centre of the growths or in the leaf-axils, where it causes the decay of the leaves; and instead of affording water with a can, it is best to dip them in a pailful of water, lowering them so as to just cover the surface of the compost, and allowing them to remain in the water sufficiently long to ensure saturation. Thrips infest the young foliage of *Cypripediums*, and do much harm, and the gardener needs to be always on the alert sponging the leaves, but taking care in so doing not to raise them higher than is necessary, or they will crack.

AERIDES.—Any plants which from exhaustion following the production of flowers or other cause have lost some or all of their lower leaves, may now be lowered in the pots, while those which have lost but a few may have additional drainage afforded, and the cone of sphagnum-moss raised up to the lowermost leaves. Any of the long fleshy aerial roots may be pegged down on to the surface of the moss, which in time they will root into, helping the plants to retain their leaves during the season of rest. It is necessary after disturbing the roots to shade the plants rather heavily for a time, frequently damping between the pots, and being very careful in affording water. The cool-growing *Aerides japonicum* and *Angraecum falcatum* should be kept in the least airy part of the

Odontoglossum-house till the commencement of the winter.

The pretty bright blue *Rhynchostylis* (*Saccobium*) *colestis* is a plant that attracts attention whenever exhibited, but it is one that is seldom seen in a flourishing condition, the cause of failure in most cases being that it is grown in too much heat. The *Cattleya*-house would seem to be the best place for it the whole year. It is now sending up its flower-spikes, and should be placed near to the roof-glass, and be thinly shaded. Cock-roaches often injure the young spikes; it is, therefore, a good plan to hang it from the roof, or stand it on a pot in the middle of a pan of water.

PLANTS UNDER GLASS.

By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

DUTCH AND OTHER BULBS FOR EARLY FORCING.—It is time that bulbs for forcing, if not for planting out-of-doors, should be obtained from the dealers, remembering that those who send early are often the best served. If Roman Hyacinths are grown, these should be the earliest to place in their pots, the bulbs soon beginning to make roots either in or out of the earth, entailing the loss of many roots if the potting be deferred. *Freesia refracta* has delightfully fragrant flowers, and the ordering of a number of the bulbs of this plant should not be forgotten. If they are potted early, and consist of continental-grown produce, they will show flowers much earlier than those which are of home growth. The soil which suits these, and indeed most other bulbs cultivated in pots and boxes for early flowers, is a friable turfy loam (passed through a half-inch sieve), two-thirds; leaf-mould, three-sixths; and dried cow-dung, three-sixths, with enough silver-sand to make the whole porous. The siftings from the loam may be used as a drainage-layer over the crocks, and in the case of *Freesias*, Lilies, *Brodias*, *Ixias*, and similar small bulbs, peat may take the place of the cow-dung. Bulb pots should be deeper than they are wide.

CHRYSANTHEMUMS.—The plants must have daily attention, looking out for black-fly, which is prevalent this year, dusting the shoots, &c., with tobacco-powder at night, and syringing it off the next morning. Mildew if noticed may be prevented from spreading by the use of flowers-of-sulphur used with a dredger. The fastening of the shoots must be attended to at frequent intervals. Any plants whose roots filled the pots, may be afforded weak soft-water, or a light dressing of Clay's or some other fertiliser, but it is not advisable to feed them over-much until the flower-buds are set.

CINERARIAS.—Continue to re-pot as the soil fills with roots, 3^{rs} and 2^{ds} being useful sizes in pots in which to flower them; but if plants larger than ordinary are desired, the main flower-stem, on commencing to rise, should be nipped off, the plants being shifted, and eventually coming into 16^s. If green-fly infests them, fumigation should be resorted to, or tobacco-powder be dusted on the lower sides of the leaves.

HERBACEOUS CALCEOLARIAS.—At this date another pan may be sown, keeping it rather close and shaded till the seeds have germinated. The first sown batch of seedlings should now be pricked-off into pans or boxes as soon as large enough to be handled, placing them close to the glass in a cold frame, affording a slight amount of shade in sunny weather.

CAMPANULAS.—Pricked-off seedlings may be potted into large 6^{os}, using loam, leaf-soil, cow manure, and sand. Place outside on coal-ashes and afford plenty of water at the root when established, syringing them frequently in sunny weather. Those that are in flower, if of exceptionally good quality, should be placed by themselves for seeding purposes.

SEASONABLE HINTS.—The boilers and hot-water pipes should be examined for defects, leaks, &c. Last winter will have severely tried many heating apparatus, and from the present time till the middle of August is a good time for carrying out repairs and renovations. In fact, it is good practice to empty them and clean old and new boilers of sedimentary incrustations, well washing them out.

THE KITCHEN GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

CELERY.—Where the space at command will permit of it being done, some rows of the dwarf red or white varieties sown in May or even later may

be planted. Such Celery, if not earthed-up much before the winter, will frequently go through the winter without much loss, turning in most usefully late in the spring.

TRIPOLI ONIONS.—The ground for this crop may now be prepared, preference being given to a piece of stiff soil that is well exposed to the sun. Although Onions do best in soil which is rather heavy, it should not be waterlogged. Before digging the land, afford it a heavy coat of stable-dung, and some fresh soot at the rate of one peck per square rod; and if it be light make it firm by tramping it evenly and regularly all over, doing this when the surface is dry. Another dressing of soot may be raked into the surface before the drills are drawn. The drills should not be a less distance apart than 1 foot, or deeper than 1 inch. Having sown the seeds, cover-in the drills, and again tread the land or pass a light roller over it. Sow about one-half of each variety in the second week in August, the other half being kept over for sowing in the last week. Very large-growing varieties of Tripoli Onions do not, as a rule, stand our winters, and a few varieties need only be grown to meet the home requirements. Nearly all the so-called "spring Onions" will withstand the frost of an ordinary winter, and they serve the same purpose as the Tripoli varieties. Early White Naples, Giant Rocca, and Giant Lemon Rocca, are useful Tripoli Onions.

SALADS.—A last sowing of Endive may now be made, planting out beds in a warm border of earlier raised Endives. Plant out Cos and Cabbage Lettuces at intervals of a week; sow Lettuce seeds and tie up such Cos varieties as may need it. Mustard and Cress, also Land Cress seeds should be sown, not forgetting a pinch of that of Dandelion.

THE HARDY FRUIT GARDEN.

By W. POSE, *Gardener, Highclere Castle, Newbury.*

RIPENING FRUIT APRICOTS AND PEACHES.—Trees with ripening fruits should be daily examined, and all which with a gentle pull part freely from the stem should be placed in a cool room on clean white paper. They will keep in good condition for three or four days. Peaches show the slightest bruise, needing therefore careful handling. It is desirable to place a sheet of wadding or some fine wood wool under the paper on which these fruits are laid. In most gardens the trees will have to be covered with muslin or hexagon netting when the fruit begins to get ripe, fastening it at the edges, so as to exclude wasps and flies. If ants are troublesome, some means should be devised for their extermination before this date. They may be trapped by smearing the insides of a few small flower-pots with honey or treacle, and laying about in their haunts. These should be examined two or three times a day, and immersed in boiling water for a few minutes. Fresh guano sprinkled about and over their nests will sometimes cause them to seek fresh quarters, or they may be destroyed by watering the nests with a fairly strong solution of soft-soap and petroleum.

OUTDOOR GRAPE VINES.—Grape Vines on walls should now have all the superfluous shoots removed entirely, the lateral growths being pinched at the points as may be necessary to ensure plenty of light being admitted to the principal shoots. The bunches should be placed close to the wall, and if they are intended for dessert, the berries should be thinned more or less according to the setting. For wine-making, thinning the berries will not be necessary. As soon as the fruit commences to ripen, it must be protected from the birds and wasps; the latter are especially destructive to the ripening fruit. Bags made of hexagon or muslin, drawn over the bunches, will save them. Earwigs should be trapped with bits of bean-stalks, or flower-pots hung about the trees, or laid at the foot, with a little dry moss at the bottom, with a boiled Potato or similar bait placed under the moss; these baits being examined every day, and frequently renewed. Keep a sharp look out for mildew, and on the first sign of it, dust the Vine with flowers of sulphur.

OPEN FRUIT QUARTERS.—Keep the hoe at work in the fruit quarters whenever the weather is dry, killing weeds and aerating the soil; bushes and others carrying heavy crops of fruit should be assisted with copious doses of liquid manure; and if a slight mulching of strong manure be applied beforehand it will prevent the soil being washed away from the roots that are near the surface.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER. Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE MONTH.

MEETINGS.

TUESDAY, AUG. 13 { Royal Horticultural Society's Committees, Drill Hall, Westminster.
TUESDAY, AUG. 27 { Royal Horticultural Society's Committees.

SHOWS.

SATURDAY, AUG. 3 { Royal Horticultural Society of Southampton, at Westwood Park (two days).
MONDAY, AUG. 5 { Northamptonshire Horticultural Fête, at Northampton.
Harrow Weald Horticultural Society.
Carshalton Horticultural Society.
Fawsley Cottage Gardening.
TUESDAY, AUG. 6 { Leicester Floral Fête, in Abbey Park.
THURSDAY, AUG. 8 { Taunton Deane Horticultural Society.
TUESDAY, AUG. 13 { Flower Show at Blagdon.
West Malvern Flower Show.
WEDNESDAY, AUG. 14 { Bishop's Stortford Horticultural Society.
Cardiff Horticultural Society (two days).
Eastbourne Horticultural Society.
Wiltshire Horticultural Society, at Salisbury.
THURSDAY, AUG. 15 { Martock Horticultural Society.
MONDAY, AUG. 19 { Felling Floral and Horticultural Society (two days).
Shrewsbury Great Horticultural Exhibition and Floral Fête (two days).
WEDNESDAY, AUG. 21 { Kingswood, St. George's, and West Gloucestershire Horticultural Society.
THURSDAY, AUG. 22 { Aberdeen Royal Horticultural Society (three days).
Lily Exhibition in the Manchester Botanic Gardens, Old Trafford (three days).
FRIDAY, AUG. 23 { National Co-operative Horticultural Show, at the Crystal Palace, in connection with the Eighth National Co-operative Festival.
TUESDAY, AUG. 27 { Brighton New Horticultural Society (two days).
WEDNESDAY, AUG. 28 { Reading Horticultural Society.
Bath Floral Fête (two days).
Harpden Horticultural Society.

SALE FOR THE ENSUING WEEK.

FRIDAY, AUG. 9 { Imported Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT OHISWICK.—63°.

The Fruit Crops. THE courtesy of our correspondents in all parts of the British Islands has enabled us once more to present a tabular statement indicative of the state of the fruit crops in the present season. The wide area involved, and the number of reporters, many of whom have obliged us in this way for many years in succession, afford guarantees that the report is a close approximation to the truth.

Taken as a whole, the report is singularly uniform in its character, and decidedly favourable. Apples promise to be abundant in all districts. Pears, unlike last year, are deficient. Plums are a medium crop. Cherries are, or have been, unusually abundant. To a less

extent this may also be said of Peaches. Apricots are much below average. Small fruits and Strawberries have been very plentiful, with the general exception of Raspberries; and Nuts yield a fair average.

These results may be seen in the following table, showing the number of records in each case, and the proportionate numbers of cases in which the yield is of an average character, or over or above the average:—

		SCOTLAND.			ENGLAND AND WALES.			IRELAND, ETC.		
		Ap. plee. (79)	Pears. (75)	Plums. (75)	Cherries. (77)	Peaches and Nectarines. (33)	Apricots. (43)	Small Fruits. (78)	Strawberries. (77)	Nuts. (11)
	Number of Records	30	37	35	34	19	13	26	24	8
	Average...	26	9	28	36	3	3	52	50	1
	Over ...	14	27	12	7	11	27	0	3	2
	Under
	Number of Records	269	114	108	131	114	41	79	83	105
	Average...	116	21	51	102	48	8	133	166	56
	Over ...	29	130	110	28	45	151	5	15	29
	Under
	Number of Records	33	21	27	19	16	11	21	20	11
	Average...	6	8	13	8	7	4	9	5	8
	Over ...	10	3	2	8	3	0	12	14	0
	Under ...	7	10	0	3	6	7	0	1	3

We must leave it to our meteorological friends to compare these results with the climatal fluctuations of the late autumn, winter, and spring. One thing seems clear, and that is, that the severe weather of early spring had no malign influence on our fruit crops, unless perhaps the deficiency in the Apricots is to be attributed to this cause. It seems also evident that local con-

ditions are less potent in affecting the general result over a large area than climatal influences. Fruit culture is extending in this country, and the discussions of the last few years have made it evident that, setting apart the inflated estimates of some persons, there remains a reasonable prospect of success open to those who know their business, and exercise industry, foresight, and care, without which no business can be profitable. In future issues we shall publish a series of comments on the fruit crops in various districts, with which we have been favoured by our correspondents.

WE are surprised at the great length of time that the specimens of these plants, which Messrs. VEITCH & SONS, Chelsea, exhibited at the Temple Show last May, have remained in bloom. During the period of two months which has elapsed since that show, other varieties of plants, which have some resemblance to them as regards their flower and stature, namely, Gloxinias, have come into flower and passed away; but the Streptocarpus continue to make a brave show, and promise to throw up bloom for some time longer. It is, therefore, a better "paying" plant for the gardener with a small amount of house-accommodation to grow, if it be a less beautiful flower than the Gloxinia. These self-same plants were wintered in low pits from which the frost on several occasions was scarcely excluded, but suffered no harm therefrom, as their past and present floriferousness amply testifies, which is another point in their favour. Moreover, they have been successfully used as bedding plants, and if in a dry border and protected by a thick mulch, they might even survive the winter in the open. These pits are at the present time planted with a generation of seedlings of Streptocarpus, the results of carefully determined crossings of the best of this year's flowering. We may therefore expect to have disclosed to us in the size, substance, and markings of the flowers some remarkable improvements on known varieties, much as these latter have hitherto responded to and rewarded the efforts of the cross breeders. We may say that the raising of new varieties offers no more difficulties, once a good strain is obtained, than in the case of Calceolarias or Pelargoniums, the same precautions holding good against self and chance fertilisation. The seeds may be sown when ripe, that is, in early autumn, or in the spring—better at the former season. The compost should consist of two-thirds peat, one-third loam, and plenty of sharp sand; size of pot large 60's or small 48's, so as not to have too many plants in a mass together, crowding each other to their detriment; and the drainage very small crooks placed over one large flattish piece to the depth of 1 inch. The seeds germinate in a moderately warm moist house or pit. The pots, when the seedlings have appeared, should be placed on a shelf pretty near to the glass, shading them only from hot sunshine. Pricking-off may be done at any time during spring and summer, with the proper precautions of keeping the plants close and shaded till re-established. As with other seedling plants, Streptocarpus should not remain in the pots in which the seed was sown till they get weak and drawn by being crowded together, but they should receive timely attention as regards pricking off. After staying in the pricked-off stage for a month or six weeks, they are fit to come into "thumbs," and when these are filled with roots, into still slightly larger pots, or to be planted

out in beds of soil in pits capable of being heated when necessary. If not planted out in this manner, the plants should continue to be repotted till they reach a small 32-sized pot, in which they ought to be left to flower. Plants of more than one year old will of course need, after they have been rested, to be potted into pots of larger size than this.

GROUP OF AZALEA INDICA ALBA AT PENRICE CASTLE.—The illustration (fig. 25), shows a group of *Azalea indica alba*, grown outside at Penrice Castle in the ordinary soil of the garden, to which a small quantity of leaf-mould was added

to open on the 5th inst. is postponed till the 22nd. Special facilities are offered to gardeners who may feel disposed to visit this the first special exhibition of Lilies held in the country. There will also be a special exhibition of Grapes.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Worshipful Company of Fruiterers have given a donation of £10 10s. to the funds of the Gardeners' Royal Benevolent Institution.

— H.R.H. Princess Louise (Duchess of Fife) and the Duke of Fife have graciously signified their interest in the work of the Gardeners' Royal Benevolent Institution, by adding their names to its list of Vice-Presidents.

MR. F. MOORE, of Glasnevin, has been elected a corresponding member of the *Société Nationale d'Horticulture* of France.

SHIRLEY AND SURROUNDING DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.—At the monthly meeting held on the 15th ult., Mr. R. D. SPENCER gave an interesting lecture on "British Herbs, and their uses." There was a fair attendance of the members, and at the close of the lecture a cordial vote of thanks was accorded to Mr. SPENCER. On the 17th ult., a large number of the members and their friends, numbering ninety-two, had what is hoped may prove to be the first of a series of annual outings. On

FIG. 25.—GROUP OF AZALEA INDICA ALBA, AT PENRICE CASTLE, SWANSEA.

when the plants were put out. They have now been planted five years, and, with the exception of a top-dressing of leaf-mould afforded after they have finished flowering each year, they have had no other attention. No protection whatever was afforded them during last winter, and whereas in other parts of the garden at Penrice Rhododendrons, Portugal Laurels, Wellingtonias, Taxodiums, and many other trees and shrubs have suffered severely, these are not hurt. The aspect of the border is west. The photograph from which the engraving was taken was kindly sent by Mr. MILNER, the gardener at Penrice Castle.

ROYAL BOTANIC SOCIETY OF MANCHESTER.—It will be seen by our advertising columns that the great Lily and Grape show which was announced

THE ROYAL GARDENERS' ORPHAN FUND.—The usual monthly meeting of the committee took place on the 26th ult., W. Marshall, Esq., in the chair. The following special receipts were announced: The Wimbledon Horticultural Society, sale of flowers at the annual show, £5 5s.; proceeds of Rose fair at the Croydon Rose Show, per Mr. G. W. CUMMINS, £7; Mr. W. A. MILLER, The Gardens, Underley Hall, box, £1 18s. 8d.; and Mr. C. HESSIN, The Gardens, Dropmore, box, 17s. 6d. The death of Mr. JOHN WILLS, a member of the executive committee, having been reported, the Secretary was instructed to convey to Mrs. WILLS the deep sympathy of the committee in her bereavement, and their profound regret on the loss of so noble a supporter of the fund, and of such a sincere and valued friend.

this occasion the Royal Gardens, Kew, were visited, and a most enjoyable day was spent in examining the great collections of plants from all parts of the world; we hope some experience was also gained. The President, Mr. W. F. G. SPRANGER, accompanied the party, and by his kindness and that of a few friends, the members were provided with luncheon and tea at the pavilion in the grounds.

AGRI-HORTICULTURAL SOCIETY OF MADRAS.—The last number of the *Proceedings* contains an account of the annual flower show, held on February 24, which seems to have been up to the average standard.

"**TRAITÉ DE CULTURE POTAGÈRE.**" Par J. DYBOWSKI (Paris: G. MASSON).—A second edition of Mr. DYBOWSKI's excellent treatise on market gar-

dening and kitchen gardening has lately been published. It contains in substance the lectures given by this well-known practitioner at the National School of Agriculture at Grignon. The plants treated on are arranged in alphabetical sequence, and not only are the details of cultivation explained, but the cost of production is minutely examined, and the best methods of packing and marketing supplied. Of course, the book is written for French readers mainly, but the treatise is so practical that much of what it contains may be turned to account here.

A GARDEN OF PLEASURE.—The author of *Day and Hours in a Garden*, has, in this new work, presented to the reader a fresh series of chapters on "The Garden" during the varying changes of the year. It is a discursive chronicle of garden progress, under the varying influences of the changing seasons. We shall take an early opportunity of alluding to it more at length. Mr. ELLIOT STOCK is the publisher.

"VORGESCHICHTLICHE BOTANIK DER CULTUR UND NUTZPFLANZEN DER ALTEN WELT AUFGRUND PRÄHISTORISCHER FUNDE." Von GEORG BUSCHAN (Breslau: MAX MÜLLER). Prehistoric Botany.—The origin of cultivated plants is a fascinating subject of enquiry, greatly facilitated of late years by researches into prehistoric collections, whether in the Egyptian tombs, Assyrian monuments, or in post tertiary geological strata of various nature. In the present volume the author collects the information derived from these several sources, and presents it in a form which will be very serviceable to students. He deals with the principal food plants, European trees, and miscellaneous plants of interest. The oldest traces of Vine-culture go back to the time of the builders of the Pyramids. In the neolithic and bronze periods, the Vine was also known; whilst a Vine is shown to have existed in the mid-tertiary period by the remains found in the brown coal formation. This fossil Vine is said to have had nearer resemblance to the American *Vitis cordifolia* of MICHAUX than to *V. vinifera*. It is to be hoped that a translation of this useful work may be published.

LETTER CARDS.—Messrs. LANOLEY & SON, George Street, N.W., have forwarded us some letter cards which enclose a small sheet of paper which allows much increased space for writing. They will be very convenient for tradesmen's orders, and most useful for travellers. Long-winded correspondents for the press are earnestly recommended to avail themselves of this device.

KEW GUILD.—We have received a copy of the *Journal of the Kew Guild* for 1895, the publication of which has been delayed on account of domestic bereavement. It seems to be as interesting as its predecessors, but we must defer fuller notice till another issue.

MIDDLESBROUGH FLOWER SHOW.—The fifth annual show of the Middlesbrough Floral, Horticultural, and Industrial Society, was held at Linthorpe on Wednesday, July 24. The show was pretty much on the same lines as last year, the size of the exhibition, number of entries, and quality of the specimens shown being about the same, and there was a good attendance considering the uninviting weather.

CIDER.—We are pleased to find that the National Association of Cider Makers is taking energetic measures to ensure more attention being given to the cider competitions at agricultural shows. The arrangements at present in vogue leave much to be desired, and consequently do not attract the more important makers to compete; nor can visitors be expected to evince much enthusiasm in the cider shed, where only a distant view of the casks and bottles is vouchsafed. The cider itself is tasted only by the judges. In order to utilise the experience of others, Mr. E. SAMSON, the Secretary, of 27, Clement's Lane, Lombard Street, E.C., is going to attend some of the cider competitions on the Continent, for this is one of those things they manage better in France.

THE WEATHER OF THE PAST SEASON.—Under the title of *The Weather of the Past Season* (1894), and its *Effects on the Garden*, a little brochure has been published by the Rev. Canon ELLACOMBE, containing the subject-matter of a paper read by him before the Bath Natural History and Antiquarian Field Club last December. The writer mentions the great difference in the climates of the years 1893 and 1894, and the effect of the variations in temperature of the latter season upon various plants. The general conclusions arrived at appear to be that great extremes of weather are always more or less injurious to vegetation, and that any variety of moderate weather, while favourable to most plants, is sure to prove prejudicial to some few of them, or to the development or retardation of certain of their organs or functions.

PROFESSOR EATON.—We regret to hear of the death on the 29th of June, of Mr. EATON, the recognised authority on American Ferns. Professor EATON, who was in his sixty-first year, had been Professor of Botany at Yale College for more than thirty years. He came of a botanical family, and a graceful tribute to his memory will be found in a recent number of *Garden and Forest*.

THE DANGER OF WEED KILLERS.—We would draw the attention of all who handle weed-killers to the exceedingly poisonous elements sometimes included in such preparations. Messrs. SPIERS & POND were recently fined £5 and £5 5s. costs for selling what was alleged to be a preparation of arsenic, without entering the signature and address of the purchaser. The preparation was sold as a weed-killer, and is said to have contained 75 per cent. of arsenic, and 25 per cent. of caustic soda, in all 2 lb. 13 oz., or sufficient to kill 6000 persons. Apart from the danger which might result to those buying such mixtures without due knowledge of their contents, there is no small risk involved if such violent poisons are left lying about in positions easily accessible to children and others ignorant of their nature or contents.

PHYLLOXERA CERTIFICATES.—Some communications have reached us referring to our recent note on this subject, and requesting us to do our utmost to get these vexatious restrictions removed, except in the case of Vines. Our powers are naturally very limited in such a case, but we have never hesitated in this matter from the first, and shall be pleased to support any scheme for the removal of these futile and obnoxious regulations. On the occasion when we placed ourselves in communication with the late Lord GRANVILLE on the subject, we received the usual polite "*non possumus*;" but times are changed, and if those interested will only combine and make their views known, the circumstances are now more propitious, as the foreign Governments at length are beginning to see how useless the rules are.

MR. BATEMAN'S GARDEN.—The sale of Mr. BATEMAN'S villa and garden at Worthing is announced for August 14. The garden, as we have had occasion to state more than once, is small, but unique in character, highly pictorial, and filled with the choicest hardy plants. It is to be hoped that this horticultural gem will fall into the hands of some appreciative possessor. That it should become an ordinary suburban villa garden again would be a very unfortunate occurrence.

AGRICULTURAL MACHINERY IN RUSSIA.—Some two years since we drew attention, in a "Stock-taking" paragraph, to the uncontradicted statement that the authorities at St. Petersburg had done a stroke of "imperial" business by importing from the United States a number of complete sets of agricultural implements—to encourage agriculture in certain districts much needing the same. This might have been termed walking over the heads of nations, parties to tariff arrangements with the Russian Government. Surprise was also expressed that the opportunity was not taken advantage of to stimulate engineering enterprise at home. After a time the opinion gained ground, especially among

manufacturers in Lincolnshire, that "this sort of thing" should be put an end to, and a chance given by the lowering of import duties to "outside" makers and vendors; but this opinion did not obtain hold in Germany, some capitalists there having entered into negotiations with the Russian Government for the acquisition of land on which to build factories for the production of the above-named implements, and such also as are required in horticulture. As to the success of the application we know nothing; but it is now stated that the existing tariff will be so modified as to nearly totally exclude foreign-made goods; and this "for the purpose of giving encouragement to native industry." Verily, the ways of some Governments are wonderful!

FLORA OF THE SEQUOIA REGION.—Mr. GEORGE HANSEN, of the Foothill Experiment Station of the University of California at Jackson, Amador County, California, has prepared for sale sets or single dried specimens of illustrations of the Flora of the Sequoia region. These plants will be of great service to students of the Flora of California. A pamphlet entitled, *Where the big Trees grow*, gives some interesting details in the form of letters to a correspondent, and comprises a complete list of the plants.

THE METRICAL SYSTEM.—The report of the select committee of the House of Commons recommends:—(a) That the metrical system of weights and measures be at once legalised for all purposes. (b) That after a lapse of two years the metrical system be rendered compulsory by Act of Parliament. (c) That the metrical system of weights and measures be taught in all public elementary schools as a necessary and integral part of arithmetic, and that decimals be introduced at an earlier period of the school curriculum than is the case at present.

NEW YORK BOTANICAL GARDEN.—The 250,000 dols. for an endowment fund having been all subscribed, New York city is to give 250 acres of land in Bronx Park, and 500,000 dols. for buildings, improvements, stocking up, &c. Efforts are still being made to increase the endowment fund by subscriptions to 500,000 dols. or more.

THE PLANTS NEAR THE NATIONAL GALLERY.—The Palms and Musae planted out on the narrow strip of turf in front of the National Gallery give a very welcome relief to the rather severe style of architecture of that building, affording a hint that might be acted upon with advantage in connection with other public buildings, where space allows of it being done.

THE GARDENS OF THE CITY OF PARIS.—The committee of the Paris Municipality, to which is entrusted the ornamentation and maintenance of the parks, squares, and gardens of Paris, the total area of which, reckoning only the lawns, plantations, flower-beds, and borders, is about 75 hectares (1 hectare = 2.471 acres), possesses nurseries, situated some in the Bois de Boulogne, others in the Bois de Vincennes, and the Fleuriste still at La Muette, at Passy, and the transfer of which to the Parc-aux-Princes is in progress. The nurseries supply a number of young trees for avenues and for ornament, about 2000 a year destined for the streets and walks, and about 50,000 woody and shrubby plants to be used in forming and refurbishing clumps. At the Fleuriste de la Ville, with its branches, the decorative plants necessary for furnishing the gardens are raised. The annual production of miscellaneous plants, raised for the decoration of the municipal gardens, amounts to more than a million of specimens. *Revue Horticole*.

LIVERPOOL WINDOW GARDEN ASSOCIATION.—In *The Liverpool Daily Courier* we read that the twenty-first annual exhibition of flowers and plants, under the auspices of this association, was held Monday, 22nd ult., in St. George's Hall. The number of exhibits surpassed that of last year, this year's total being 850. In the front-garden competition there were 129 exhibits, and the judges reported that there was a decided improvement in

the gardens. Mr. R. R. MEADE-KING, who usually supplied the prizes, intimated that in future, unless entirely new districts competed, the competition would not be repeated. Therefore entries from fresh parts of the city were invited, and the committee will have pleasure in sending competent judges to determine if gardens to be included in the competition are situated in a suitable neighbourhood. In the class for windows and window boxes, there were eighty-six entries, and the judges reported that in some of the districts the work was very good.

Chronicle on May 11, a correspondent, Mr. FRED. TURNER, F.L.S., &c., Sydney, New South Wales, June 15, 1895, obligingly writes as follows: "I notice you ask for information about the 'ti-tree' bark that is used for packing fruit. One of the 'ti-trees' ('Tea-trees') referred to is *Melaleuca leucadendron*, Linn., the thick spongy bark of which is easily peeled off in layers, and when cut up fine is as light, if not lighter, than cork dust, and makes good packing material. Several species of the genus *Melaleuca*, *Leptospermum*, and even *Callistemon*, are commonly called 'Tea-trees,' though for some

on wild flowers as they are found when growing, and is intended for the use of children of about the age of twelve years. The author aims at writing such books as shall prove interesting as well as amusing to little folk, and he is avowedly careful in his use of scientific terms and long names, lest, by their excessive use, he should disgust his readers. Those who like reliable information conveyed in an informal manner should appreciate Dr. COOKE'S style. The hand-book before us is written entirely in the form of dialogue, light enough considering the subjects treated of, and interspersed with quotations. Needless to say, the children ask most convenient questions, which lead up with supposed innocence to instructive answers, so gradually bringing out the information which "Uncle Matt" is evidently most desirous of imparting. The book contains a coloured frontispiece, various illustrations in the text, and is got up in a coloured cover likely to please youthful critics.

BLOTTING PAPER.—We have received from Messrs. R. CRAIG & SONS, samples of "an entirely new electric absorbent Spongia blotting paper." It is very good blotting paper, and the heavier qualities would do well for drying delicate flowers, mosses, &c.

FRUTTA MINORI.—Del Prof. A. PUGGI (ULRICO HOEPLI, Milano). A handbook containing careful descriptions and cultural directions relating, as the title tells, to Strawberries, Melons, Currants, Gooseberries, and Raspberries. The figures illustrative of the habits of the plants and of the fruits peculiar to various species are good and clear; bringing out the salient characteristics of each very distinctly. The little work may be recommended to those who read Italian, and who appreciate a small volume of convenient size for the pocket.

"THE HORTICULTURIST'S RULE BOOK," by L. H. BAILEY (London and New York, MACMILLAN & Co.).—An excellent manual, which should find a place in every nurseryman's office—indeed, in every garden library. It contains articles on the nature, preparation, and mode of application of insecticides, fungicides, notes on plant diseases, injuries from birds and various animals, weeds, lawns, cements, seed and planting tables, and we know not what besides. It is written for Americans chiefly, but nine-tenths of the book are equally applicable here.

"HISTOIRE DES PLANTES."—M. BAILLON'S remarkable work was nearly completed before his death. The last issued part contains the monographs of the Pandanaceæ, Cyclanthaceæ, and Araceæ. In the latter order M. BAILLON follows the indications of ENGLER, without, however, attaching the same degree of importance to the histological characters as the German Professor does.

BELLIS PERENNIS THE BRIDE.—A Daisy which is useful to the bouquet-maker and floral artist has been hitherto an unfulfilled want, but a strong variety, which will be sent out this autumn by Messrs. J. Lambert & Son of Trier, is said to answer every requirement of the florist (fig. 26). The blossom is semi-globular, of an enormous size for a Daisy, furnished with a tall stalk, and pure white. In the opinion of gardeners who have seen the plant it should prove of value in bedding-out, and, owing to its inability to produce seeds, will not become such a troublesome weed as other double-flowered Daisies. The agents for the sale of the plant in this country are Messrs. Cannell & Sons, Swanley.

NATIONAL CHRYSANTHEMUM SOCIETY.—A very enjoyable outing was experienced by the members of the above society on the 22nd ult., when a party of 140, including a number of ladies, paid a visit to the grounds of Barford Lodge, Dorking, by the kind invitation of Sir TREVOR and Lady LAWRENCE. Reaching there at noon, the company, after a short interval, sat down to dinner in a large tent erected in the grounds of the Barford Bridge Hotel, Mr. B. WYNNE, the chairman of the general committee, presiding. An excellent repast having been

FIG. 26.—A NEW DAISY: THE BRIDE.

M. ED. ANDRÉ.—The last volume of the *Garden* is dedicated to M. ED. ANDRÉ. The Editor has availed himself of the opportunity of enumerating the many titles to the honour and gratitude of horticulturists which M. ANDRÉ has won. M. ANDRÉ has, indeed, won a foremost place as a landscape gardener of the first-class, a traveller, a garden-director, a botanist, an author, and an editor. At the present time M. ANDRÉ, in spite of his work as a landscape-gardener, finds time to act as editor of the *Revue Horticole* in association with M. CARRIÈRE.

TREE BARK USED IN PACKING FRUIT.—In answer to an inquiry that appeared in the *Gardeners'*

unaccountable reason many persons of late years have erroneously called them 'Ti-trees.'"

APPLE GRAFTS ON PEAR STOCKS.—Mr. GAFNEY, writing in the *Agricultural Journal of the Cape Colony*, recommends the practice of grafting Apples on the Pear stock, especially with a view to circumvent the American blight, which, it seems, does not injuriously affect the Pear.

"THROUGH THE COPSE." Another Ramble after Flowers with Uncle Matt. (T. NELSON & SONS, London, Edinburgh, and New York).—This little book is one of a series written by Dr. M. C. COOKE

served and full justice done to it, the houses, gardens, and grounds were then visited, the whole of the glasshouses being thrown open to inspection, the condition of the Orchids and some charming floral features in the gardens calling forth well-deserved praise. Many then found their way to the summit of Box Hill, while others, at the kind invitation of Lady LAWRENCE, looked through the mansion, and at five o'clock the whole party assembled for tea on the lawn provided by Sir TREVOR and Lady LAWRENCE. Tea over, a meeting was held in front of the mansion, at which Sir TREVOR LAWRENCE presided as one of the vice-presidents of the society, and in the name of the members presented to Mr. ROBERT BALLANTINE, the late chairman of the committee, an illuminated address and a handsome silver inkstand, the first having engrossed upon it the resolution passed at the annual general meeting in February last, recording the thanks of the members for Mr. BALLANTINE'S great services to the society in that capacity, and the inkstand also bore a suitable inscription. Mr. BALLANTINE having replied, a hearty vote of thanks was passed to Sir TREVOR and Lady LAWRENCE, emphasised by three hearty cheers, and the company returned to town late in the evening, having experienced one of the most pleasant outings yet arranged.

CIDER.—The hot weather reminds us of a beverage which is highly acceptable at this season, and that is Norfolk Cider. Messrs. GAYMER & SON, of Banham, Attleborough, some months since sent us samples of various kinds for trial. All were fresh, clear, sparkling kinds, but the "driest" were to our taste the best. There is no doubt that with increased care in the manufacture, the quality of the cider may be greatly improved and rendered more uniform. Messrs. GAYMER evidently are abreast of the times in this respect. Tasting their cider in comparison with some of a similar quality from Devonshire, Norfolk took the palm.

VEGETABLE ASSIMILATION AND RESPIRATION.—Mr. F. FROST BLACKMAN publishes in the *Philosophical Transactions*, 1895, B, p. 503, an account of his experimental researches on this subject. The point specially to be determined was the channel through which vapours enter or leave the leaves; that is to say, whether through the cuticle or through the stomata. The general results are as follows:—

1. Under normal conditions, practically the sole pathway for carbonic acid gas into or out of the leaf is by the stomata.
2. In young leaves the cuticle seems to be more permeable to carbonic acid gas than in mature leaves.
3. If the stomata be mechanically blocked, an appreciable osmosis of carbonic acid gas may take place through the cuticle, provided that the tension of the carbonic acid gas be great enough.
4. The normal amount of carbonic acid gas in the atmosphere is not sufficient to produce any appreciable osmosis into a leaf with its stomata blocked; assimilation, therefore, cannot continue under these conditions.
5. The experimental optimum of carbonic acid gas for assimilation depends on the structural porosity of the leaf, so that, if this be reduced by blocking the stomata, even pure carbonic acid gas may not quite effect optimal assimilation.
6. To this, and not to the stomata being inoperative in gaseous exchange (which was BOUSSINGAULT'S view), is due the fact that, in concentrated carbonic acid gas, a leaf with its stomata open assimilates less than one with the stomata blocked.
7. In bright light a fully green leaf assimilates all the carbonic acid gas that it is forming by respiration, and none escapes from it. GARREAU'S demonstration to the contrary is only an expression of the imperfection of the conditions under which it was made.

THE EVOLUTION OF A LAKE.—Whilst Nature manages to create lakes of magnificent proportions in her own way, artificial lakes are usually less grand,

though in relation to surroundings often as bold and effective, and sometimes even more ornamental. There is to be seen just now on Mr. BERTRAM W. CURRIE'S fine estate of Minley Manor, North Hants, a good example of the process of evolution in lake formation artificially. The site is of a wild swamp-like character, and prior to the commencement of operations, about as unpromising a site for the creation of anything artistic as could well be conceived. The idea seems to have been Mr. CURRIE'S own, and the working of it out that of his bailiff, Mr. G. PROFIT. The water area, almost the whole of which is completed, though begun but some sixteen months since, is about 50 acres, but it looks to be fully double that expanse. The margin is of a most circuitous outline, the ground having been managed so that where highest capes or promontories have been retained, whilst on the lower parts numerous bays or recesses have been formed. This feature in the formation of so marked a kind that the entire circuit of bank can be hardly less than 3 miles. Some islands have also been formed, that will be planted next autumn, as also will the extensive margins. Footpaths and a turf carriage-drive will encircle the lake. On one bay a fine boat-house is being erected. The entire surface is now full of water that will in flood-time rise some 2 feet higher. The banks are of peat clods, solidly built, and into the curves Willow slips have been thickly inserted. The soil is of bog, sand, and clay. In a few years a large area of swamp will have been converted into a grand ornamental lake.

NEW PUBLICATIONS.—We understand that M. P. P. DÉREMAIN has just published a book entitled *Les Engrais, Les Fermens de la Terre*. The first part of this work is devoted to organic manures and mineral fertilisers, and the second to the fixation and utilisation of nitrogen in the soil. It is specially stated that the instruction given in this book is of a thoroughly practical nature, and that it is not merely thoroughly up-to-date, but also so worded as to bring its contents within the comprehension of all classes of readers. The publishing-house is La Librairie RUEFFET CIE., 116, Boulevard St. Germain, Paris.

COLONIAL NOTES.

JAMAICA.

The *Bulletin of the Botanical Department, Jamaica*, for June, 1895, contains, among other interesting matter, papers on "Coffee Peelers for Hand Power," and on "Coffee Separators." It also includes a chemical analysis of the Orange tree, potash and phosphoric acid being the chief constituents of the fruit, an article on "Pimento and its Insect Foes," as well as the result of some lectures and demonstrations given throughout the parish of St. Mary by Mr. W. Cradwick, who has travelled with the aim of instructing the inhabitants concerning the uses and properties of the plants possessed by them, of whose values they were often found to be utterly ignorant. By thus stimulating local enterprise and attracting attention to native resources, much good work is done in quarters hitherto neglected and unworked.

KEW NOTES.

UTRICULARIA RENIFORMIS.—A plant of this fine Bladderwort, obtained a few years ago from Messrs. F. Sander & Co. as *U. Humboldtii*, is now flowering at Kew, and, as I believe, for the first time in cultivation. It is a native of Brazil, Gardner having found it in 1837 in the Organ Mountains at an altitude of 5000 feet. Probably Messrs. Sander & Co. obtained it along with *Catleya labiata*. It has uniform leaves 5 inches wide on stalks 18 inches high, which spring from slender creeping rhizomes bearing hair-like roots and numerous tiny bladders. The flower-scape is more than 2 feet high, and it bears four or six pale lavender-coloured flowers

at the apex 1 inch long and wide, the apron-like lip notched and channelled in the middle with an inflated chin-like crest bearing two streaks of white, margined with purple, and the short hood-like upper segment is blotched with the same colour. The plant is likely to be more prized by botanists than by gardeners, for it is not so good a garden plant as *U. montana*. The *Roraima* species, *U. Humboldtii*, differs from the above in having spatulate leaves 4 inches wide on stalks 9 inches long, and a scape 12 to 18 inches high, bearing about twenty flowers, which open three or four together, and are of a rich purple-blue colour, fully twice the size of those of *U. reniformis*. Mr. Im Thurn, who collected *U. Humboldtii* on *Roraima*, says that it grows among rank grass in wet swampy parts, the flowers mingling with the grass, and its roots in the ground. Here it is far more beautiful than when in the water contained in the sheathing leaf-bases of *Brocchinia cordylinoides*, to which it is strictly confined in some parts of British Guiana. We have had it imported in plants of the *Brocchinia*, but it never did any good, although the host plant lived, and is now represented by fine examples in the collection of *Bromelias* at Kew.

AMASONIA ERRECTA.

This plant differs from *A. calycina*, introduced and distributed a few years ago under the name of *A. punicea*, in having larger broader leaves and shorter wider bracts coloured bright scarlet, while the flowers are nearly white with streaks of purple. An example of it is now in flower at Kew, and a figure of it will shortly be published in the *Botanical Magazine*. Mr. Sander, who imported this species from Brazil, says that it was described by his collector as being much more ornamental than *A. calycina*, but so far it falls short of that species in being more difficult to cultivate. It is described as forming a shrub 2 feet high, and as being common in woods near Rio. A specimen collected in British Guiana on mountains near Kaieteur is labelled as growing to 4 or 5 feet in height. Possibly we are wrong in keeping *A. erecta* in a hot stove.

CRINUM ROOZENIANUM.

This is a valuable addition to stove *Crinums*. It has already been fully described and figured in the *Gardeners' Chronicle*, and I refer to it here chiefly for the purpose of identifying it with the plant introduced from Jamaica by Mr. Worsley, and described by him in his *Notes on Amaryllidaceae* (1895), p. 8, under the name of "*C. Jamesense* = *erubescens*, var." The typical *C. Roozenianum* and Mr. Worsley's plant have lately flowered side by side at Kew, and they are exactly alike. One of the Kew plants bore an umbel of twelve white flowers, each five inches across, and deliciously fragrant. I can strongly recommend this *Crinum* as an easily-managed, free-flowering stove plant, first-rate in every point.

HIPPEASTRUM BRACHYANDRUM.

When Mr. Baker described this distinct and handsome species in *Gardeners' Chronicle*, 1890 (2), p. 155, we knew it only as having flowers "like *Amaryllis Belladonna* var. *blanda* in the upper half and coloured deep blackish-red in the lower half of the segments." Plants of it flowered in the open air at Kew, where it proved to be nearly hardy, and a figure of it was published in the *Botanical Magazine* last year, t. 7344. Seedlings raised at Kew from seeds ripened by the plant figured have just flowered; but in these the flowers are of a pale pink colour in the upper half, pale green in the lower half of the segments—the deep blackish-red colour having quite disappeared. Here is a striking colour variation in the first batch of seedlings raised from a good species introduced from Parana in South America by Mr. Bartholomew of Reading in 1890.

EUGENIA MALACCENSIS.

There is a fine specimen, 12 feet high, of this handsome tropical shrub in the Palm-house at Kew, which has borne annually for the last five years a crop of fruits. This year it has been exceptionally prolific, the lower branches being literally packed

with glossy purple-rose egg-shaped fruits, about 2 inches long. They are fleshy, and not unpalatable; I have tasted worse Apples, but they were very bad ones. The flowers are even more ornamental than the fruits, the large brush-like clusters of stamens, of a rich crimson colour, being the chief attraction. *W. W.*

POTATO-DIGGING IN IRELAND.

WHILST near Tipperary in 1892, Mr. W. G. Smith made the accompanying sketch of Potato-digging. It represents the very worst position for growing Potatoes, viz., a swampy bog. The plant in flower in the background is *Lythrum Salicaria*. On the left are rolls of peat from the position where the attempt was made to grow Potatoes. The stump in the foreground is that of a hog Oak *in situ*. The Potato-lifting was going on in rain and wind. The cottager and his daughter were clothed in rags, and both were helpless and hopeless. In travelling

made a practice of cutting everything they have in bloom—good, bad, and indifferent. It was pitiable to see poor little bunches of half-developed Anemones and Ranunculus forming a foreground to an exhibit, and these were only too representative of others. The crowded arrangement imparted an ordinary and monotonous appearance to the collections, and they lost much of their attractiveness and interest in consequence. The Council have such an ample choice of material with which to make this show that they should be eclectic; a certain number of bunches only being asked for, and these should consist of the best flowers in good condition at the time. The largest allowable number of bunches might be fifty, and these should be of good size, so as to adequately represent the plant; and there should be no duplicates. A limit being thus put to the number of bunches shown, the exhibitor should be required to effectively display them in such a manner that the individuality of each might be brought out. Further, where several varieties of one species are shown, or different species of one genus, they should be placed in juxtaposition for the purposes of comparison. This would make the Temple Show more

to be. It is a profuse cropper, some of the trusses producing from seven to nine full-sized Tomatos. It is very firm and solid, with flesh of good flavour and unusual depth, and very little seed space. Mr. Ryder informs me that he gets the best price for it in the market. This year he has planted twenty houses of this one variety, and here it can be seen in all stages of growth, both from seed and cuttings; in fact, Mr. Ryder tells me that he gets heavier crops from cuttings than from plants raised from seed. Amongst other Tomatos that are cropping freely with no signs of disease are Frogmore Selected, which is another good variety, of short-jointed, sturdy habit, and good-sized trusses of fruit, and which is likely to become a reliable market sort. Polgate is another variety doing well; but I fail to see any difference between this sort and Perfection, and Mr. Ryder tells me it is quite a fortnight later with him than Duke of York. Chemin, a French variety, is good, and fruiting freely; also Golden Sunrise, a yellow variety, carrying good trusses of large handsome fruit. All the above are growing side by side in one long house, to test their cropping qualities. Mr. Ryder never stops his Tomatos, but grows them on the single stem right over the houses. *F. London, The Gardens, Beechwood, Farnborough, Kent.*

GARDENERS' CHARACTERS.—I am glad "H. M. C." is calling attention (through your issue for July 13) to one of the most serious circumstances, namely, the refusal of employers to give characters. I have been gardening for seventeen years, and I find, generally speaking, the most promising youths and the most able men are those most unfortunate in this respect; consequently, they are prevented from following the occupation they were especially fitted for. I wish some of the candidates for parliamentary honours would make it a test question, so that it may be dealt with effectively in the House of Commons. *One Interested.*

THE HARDY-FRUIT PROSPECTS.—I think we shall be favoured with a very fine fruit season. The scarcest being Apples in orchards. These, upon some trees, are very thin, notably Blenheim and Ribston Pippins, Wellingtons, amongst the most useful varieties we have. Trees of Lord Derby, Warner's King, and some smaller varieties are loaded with fruit. Pear-trees have an excellent crop on the walls; have had to thin heavily, especially Pit-maston Duchess, Catillac, Marie Louise, Louise Bonne, Knight's Monarch, Doyenné du Comice, and Ne plus Meuris. Cherries are good. Peaches and Nectarines are an extraordinary crop. Out of curiosity, I counted 500 fruits thinned from a four-year-old tree of Sea Eagle. Apricots very good and large, the Shipley being the best. Plums are a wonderful crop, both Greengages, culinary, and dessert varieties, and we have had to thin them. Gooseberries, Raspberries, black, red, and white Currants are a good crop. Strawberries have been, and are very good—in fact, the best that I have had here for the last seven years. Cobnuts and Filberts are bearing heavily, and Walnuts very abundantly. The Quinces and Medlars have only a fair crop of fruits. A good rain would be very beneficial, as the rainfall for the last two months has been considerably below the average. We only had rain on six days in May and early June, and it practically did good only on three days, and the whole was under three-quarters of an inch. *W. A. Cook, Compton Bassett, in June.*

PLANT DECORATION.—Few men did more in their time to promote higher and more artistic taste in relation to plant decoration than did the late John Wills. It is perhaps poor praise to say of some of those beautiful efforts seen in days past at South Kensington, that they were revelations. Practically, Mr. Wills revolutionised our style of plant decoration; very likely, had he not done so, some one else would, but at least he was the pioneer, and immediately he found myriads of disciples. Still, he did not convert every one from their heavy stereotyped methods. Twenty years of persistent illustrations of the higher art in plant decoration by Mr. Wills or other able imitators have not sufficed to eliminate much of the old Adam of decorative effort from gardening, just because there are so many would-be gardeners or decorators who have no more care for taste, elegance, or harmony in plant decoration than has the merest tyro. Try all they may, they produce a jumble, or a mere stiff, formal bank of plants or flowers, and no more. Wills went to Nature for his conception of a plant group. If we conceive of tropical life, with its overhanging Palms and Ferns, and beneath its

FIG. 27.—POTATO DIGGING IN TIPPERARY.

by rail across Ireland, many scenes agreeing with this may be seen from the carriage windows. It is little use telling such "cultivators" that the Potato disease is caused by a *Phytophthora*, which reproduces itself by asexual spores, and that the aerial hyphae carry conidia whose contents sometimes differentiate as flagellate zoospores! The poorer cottagers of Ireland sadly need practical instruction in the best methods of growing and storing Potatoes. *Our Special Correspondent.*

than it is at present—a means of education. I thought Messrs. Kelway & Son's method of showing cut blooms of Paeonies capable of great improvement when exhibited as at the Temple—the petals of one flower largely overlapping those of another—the confusion was great. Surely blooms of *Pyrethrum* would be much more effectively staged in bold bunches, than as at present, dotted about singly on boxes of moss, with the utmost regularity. Then, the collections of *Begonias* were too crowded; they presented masses of colour it is true, but good varieties suffer by contact with inferior ones—and a crowd of plants is seen in but little order or methodical arrangement; and as collections grow in extent rather than diminish, and as tent space cannot well undergo expansion, the evil is likely to grow. Only let the novelty of the Temple Show wear off a little, as will certainly happen in a few years, and then, if the present methods of exhibiting continue, complaints will be heard of their sameness and monotony. Surely it is possible to introduce occasionally some change of feature; and no one would suppose that on the part of the eminent horticulturists of which the council consists, there is any lack of originality or capacity for designing and imparting some better features to future shows at the Temple Gardens. *R. D.*

TOMATO DUKE OF YORK.—I saw this last year, and thought it would be a valuable addition to our market varieties, and such it has proved itself

HOME CORRESPONDENCE.

THE TEMPLE SHOW.—Your editorial remark on page 654 of the last volume, in reference to the collections of herbaceous plants at the above exhibition, that "much more vigorous pruning is required," was a timely pronouncement. It is most important that much which is little better than floral rubbish be taken out of them, so that more space should be afforded for the really good and desirable things. At present, exhibitors seem to crowd into a given space as much again as there is actual room for, and the result is confusion, whilst the naming generally is so faulty, that it is difficult for visitors who may admire a certain subject to ascertain its correct name. There are far too many inferior things, for it does seem as if exhibitors

carpet of flowers and leafage, or even of our own woodland or forest scenery, with its panoply of leafage, and carpet of bracken or other undergrowth, we get a fairly good idea of the origin of his design. He, however, had at his disposal choice material, yet he never sought to make too much of his colouring, or fell into the common error of making everything subsidiary to floral effect. His larger groups were made so as to resemble glades and vistas, and they were always as cool and refreshing as they were beautiful, yet they were never gaudy. Disciples have since his day given to us at flower shows many charming groups, though only the few have stood out as real decorative artists. Too much of the beauty and taste we do see is rather imitative than natural, but we may be thankful for so much. Some day, perhaps, in these things the higher tastes may universally prevail. *A. D.*

LUCULIA GRATISSIMA.—This handsome shrub, when grown well, may be described as one of our best greenhouse plants. It thrives best when planted out in a bed in a mixture of fibrous loam, peat, and sand, and requires abundance of water during the summer months when it is making its growth. Opinions vary considerably regarding the pruning of *Luculias*, but naturally enough, if they are pruned well back after flowering, and the plants kept dry until growth commences, surely this must be the right way. We have two fine specimens here which were treated in this manner last winter, and which now present an appearance which justifies the said treatment. The propagation of *Luculias* is by no means an easy task, but the best method I know is to insert cuttings of young shoots into small pots about midsummer, place in gentle heat, and keep enclosed under a bell-glass. Seedling plants grow very rapidly, but seldom flower so well as those produced from cuttings. *Geo. Burrows, Warwick College.*

LARGE CEDARS OF LEBANON.—Apropos of the enquiry which appeared in these pages a few weeks ago, I may say that some of the finest Cedar trees in this country are to be found at Goodwood, Chichester. In an old book I have before me I find that in the month of April, 1760, the third Duke of Richmond planted 1000 Cedars in various parts of his domain, the plants being then four years old. Of course, in the period that has elapsed many have succumbed to gales and other mishaps, but many noble specimens remain, and appear to be in great vigour, forming one of the glories of Goodwood. One specimen in particular is a very grand one, and it is figured in Messrs. J. Veitch's work on the Coniferæ, though evidently the measurements given there are incorrect; as I find, by passing the tape round it to-day, the girth, at 3 feet from the ground, is 25 feet 8 inches. The tree has a diameter of crown, measuring from tip to tip, of 128 feet, and is more than 90 feet in height; it has a clear stem of 6 feet, from which spring a number of enormous branches, and the form of the tree is quite symmetrical. Three other large trees growing in close proximity to this one have clear stems of from 6 to 8 feet, and girths, at 3 feet from the ground, of 22 feet 2 inches, 22 feet 9 inches, and 21 feet 8 inches respectively. These trees have been measured from time to time, and a record kept; and the earliest I can find is 1857, when the second largest girthed 19 feet 7 inches; 1863, 20 feet 4 inches; 1892, 22 feet 7½ inches. *Rich. Parker, Gardens, Goodwood, July 8.*

SEEDLING FUCHSIAS.—The abundant rain is putting new life into vegetation, and the *Fuchsias* are making up for their hitherto tardy growth. I am sending a few blooms gathered chiefly from the open garden, of crosses of the *Fuchsia*, which you will observe differ much from the ordinary varieties in colour and shape of bloom; the growth is vigorous, and flowers are abundantly produced. No. 1 has coppery or dark foliage with veins in the leaf; No. 2 is a seedling of this year, and should prove a very telling variety, the colour being quite novel. August is the best month in which to see *Fuchsias* in bloom. *P. F.* [These blossoms were peculiar in the colour of the sepals and corollas, but that they are improvements in the best sense we can scarcely admit. *Ed.*]

HEAVY RAINFALL IN YORKSHIRE.—Heavy rain fell in this district from 9 A.M. on Thursday, July 25, until the same hour the following morning, and the depth of rain registered was 2.70 inches, which is the most that has fallen here in twenty-four hours in my recollection. The heaviest fall occurred in

the afternoon and evening, and was accompanied with thunder. Whether it was merely local I have not yet ascertained; but it is probable that such a downpour extended for a few miles around. The ground is thoroughly saturated, and vegetation in gardens and fields will be greatly benefited, especially the fruit trees. If we get fine warm weather, this will be the finest fruit year we have had for many years. *J. Easter, Nostell Priory Gardens.*

NATIONAL CARNATION AND PICOTEE SOCIETY (Southern Section).—I notice in the report of this society, the question is asked, for what purpose are Carnations shown with a single spray of foliage? The words are these: "Blooms of any single Carnation with a single spray of foliage were also shown. One can scarcely help asking, for what purpose, as they suggested nothing new in design or use." What does the *Gardeners' Chronicle* reporter want? The public has more than once been informed in these pages, that showing Carnations on cards is very bad taste indeed. It was, therefore, suggested that the blooms be shown as cut from the plant, with a spray of foliage; there was no other purpose. The Carnation is almost universally used as a coat-flower, and showing different varieties with foliage might suggest to those interested the best varieties for this purpose, and to those interested in the cultivation of Carnations, it would show the flowers just as they are. Varieties that split the calyx are no use to exhibit with a spray of foliage. *Jas. Douglas.*

RUBUS PHŒNICOLASIVS (WINEBERRY).—Within fifty yards of West Malling gas-works, in a private garden, the produce of which is sold in the town adjoining, we find a row of the Wineberry of the Japanese growing in the finest luxuriance, 5 to 6 feet in height, and clothed to the ground with its clusters of fruits like the specimen enclosed. The gardener informed me that three years ago he purchased a packet of Wineberry seeds for a few cents from the Continent. These were sown; and after waiting nine months, the plants here came up. Is it that the dry summer has been favourable to the growth of this plant? Seen as it is here growing, one cannot but think why it is not grown in the herbaceous border and in our shrubby borders, for its soft copper-colour tints of the stems, and the whiteness of the under-side of its Raspberry-like leaves, forms an object that the eye catches at once. My informant tells me it fruits abundantly, and that the Mulberry-like fruits are relished at the end of August, when they are either sold or made presents of by the proprietor. Propagation appears to be from seeds or layers; there do not appear to be many suckers from the bottom. *P. F. A.*

THE PHYLLOXERA LAWS.—It is to be hoped now that the Belgians [French] and Italians are meeting for the express purpose of expunging or moderating the obligations and restrictions hitherto imposed upon them by the Berne Convention many years ago, that England will now endeavour to free herself from these burdensome regulations, and not fail but hasten to throw her influence into the matter of securing the free exportation of plants into all countries. Nurserymen and cultivators of plants generally have been severely punished during the last fifteen years by these useless regulations, and probably for absenting ourselves from the above convention instead of attending it and showing the absurdity of including this country among those likely to spread the Phylloxera. Even the curators of our botanical gardens have since had their plants ruthlessly returned by Vine-growing countries, no matter how necessary or important for the well-being of mankind they may have been, and that too occasionally when the certificate had been duly signed by a commissioner for oaths. I hope the council of the Royal Horticultural Society and our botanical societies, as well as the horticultural trade generally, will lose no time in selecting an influential delegate to represent England at the meeting to be held on the 4th of this month, and in doing all that lies in their power to confine the restrictions, if any are imposed, to Vines only, so that our plants and bulbs may go free from all hindrances, and from useless expense and obligation. *H. Cannell, Swanley.*

CINERARIAS.—Mr. J. Miller, late of the Durdham Down Nurseries, Bristol, sent me up to Isleworth in 1833, to Mr. J. Willmot to learn market gardening, but asked me if I saw anything new or good to let him know, which I promised to do; and as I had a little leisure, I made a tour of all the nurseries of any note; Mr. A. Henderson was then famous for Cape Heaths, I remember. Of these,

Mr. Miller had about 110 species and varieties, so that was a place of interest to me; at Messrs. Lee's of Hammermith I saw some 200 or 300 *Fuchsia fulgens* just ready to be sent out at 21s. each, and so all round. Mr. Loddiges was then at Hackney, Mr. H. Low at Clapton. But it was at Mr. Knight's of Chelsea that I saw a whole house full of *Cinerarias* in full bloom, and one blaze of bright colour, mostly rose of various shades, some almost scarlet. I still remember it as a sight I had never witnessed before. Of course, the person who was showing me round saw my amazement. But I am not certain if he told me that they were crosses between *cruenta* and *populifolia*, or if it was only my conjecture. I have, however, the impression they were crosses, but this particular lot must have been several generations old even then; at least this was my impression, or I was told so, perhaps. *Cruenta*, as I knew it at the Durdham Down Nurseries, was of a much dwarfer habit than the one figured some little time since in the *Gardeners' Chronicle*, and had a larger flower, but *populifolia*, as I remember it, was a sort of half shrubby species, with shorter, wider petals, of a violet-purple hue. The above stated visit was in the spring of 1838, when Kew was quite a contrast to what it is now, and when the Horticultural Gardens at Chiswick were much larger than now. I have always thought that Mr. Knight was the first to work upon the *Cineraria*, and had no idea to the contrary. *George Lee, F.R.H.S., Clevedon.*

WHEAT-EAR PELARGONIUMS.

Mr. C. G. TERRY obligingly sends us a specimen of a zonal Pelargonium (fig. 28, p. 135), in which each flower of the truss is represented by a spike of densely packed linear green bracts, no trace of the flower being apparent. We have occasionally met in Pelargoniums with this malformation, which is identical with that in Sweet Williams and Carnations. Our forefathers used to speak of "Wheat-ear Carnations," and we may extend the epithet to Pelargoniums.

DEVON AND EXETER GARDENERS' ASSOCIATION.

THE fourth annual outing of the Association took place on Wednesday, July 24, when about sixty members started from Exeter in brakes, and visited Poltimore Park, Bradfield, and Knights-hayes. At Poltimore, Mr. J. Martin, the gardener, met the visitors, and conducted them over the gardens and grounds. Outdoor fruit has always been a feature at Poltimore, and the prestige is well maintained. Apples were particularly fine, abundant, large in size, and even now showing fine colour. The Grape Vines are well cared for, and are cropping heavily. The kitchen garden of 8 acres was in excellent trim. In the grounds the Lime tree avenue, of 1000 feet in length, which forms a delightful canopy of foliage, was worth going a long distance to see.

The avenue of *Cedrus Deodara* is a fine one, the trees averaging 65 feet in height, and about 10 feet in girth. Several of the trees were bearing cones, one having 100 to 200 on it. The *Wellingtonias* at Poltimore are well known. They were amongst the first planted in this country. One of them is 82 feet high, with a girth of 16 feet; and another is 85 feet, with a girth of 20 feet 6 inches. *Abies nobilis*, 56 feet, with a girth of 9 feet; *Pinus insignis*, 72 feet, girth 12 feet 6 inches; and *Pinus tuberculata*, 56 feet. This specimen shows the peculiarity of the variety in having its cones dotted all over the trunk and main branches. A few cones were found underneath the tree, but it was pointed out these had not dropped off, but had come down with fallen branches—*P. tuberculata* does not drop its cones. *Liriodendron tulipifera*, *Magnolia Soulangiana*, *Taxodium distichum*, and Hemlock Spruces are good here. Before leaving, Mr. Martin, by desire of Lord Poltimore, entertained his visitors to lunch.

Continuing the drive through the town of Col-lumpton, in which, in Col. Foster's garden—an old-fashioned one—there was pointed out a splendid clump of *Osmunda regalis*, quite 10 feet through, and

over 5 feet in height, flowering profusely. It was close to an old well, hence its vigour. The next halt was at Bradfield, where Sir William Walrond's agent (Mr. C. E. Hay) was waiting to give a hearty welcome to the voyagers. Under the guidance of Mr. T. Heath, the gardener, a tour of inspection was made. Grapes were found to be first-rate. Gros Colman, Black Alicante, Lady Downes' Seedling, Foster's Seedling, and Barbarossa, all very fine. Outside, Marie Louise and Winter Nellie Pear were showing heavy crops, and one or two Apple trees were well hung with Mistleto. In the grounds were remarked *Retinospora squarrosa*, 20 feet; *Salisburya adiantifolia*, 30 feet; *Sciadopitye*

another nine-mile drive was made to Knightsayes, Mr. J. Dickson, who came from Keir House, Bridge-of-Allan, only six months ago, was in waiting for his *confères*, and piloted them round. Everything in the fruit line that was in bearing was the very pink of perfection, Peaches and Nectarines on screens being masterpieces of cultivation. Grapes were equally good, Muscat Grapes splendid; indeed, the "glass" was about as well done as it could be. In the open, things were equally creditable. The crops and the tidy appearance of the place, taken as a whole, were such as to show that the race of Scotch gardeners is not a thing of the past.

A drive to Tiverton to tea, and a 15 miles drive

of the inner whorl was perfect, with a curved filament bearing a two-celled anther. The other two were absent.

Lavandula dentata Foliage.—Dr. Masters also drew attention to a peculiarity in the venation of the lobed leaves of this species, in that the "median" cord of each lobe was not central, but close to one side. From this a cord ran round the sinus, giving the appearance of the cords running from the midrib to the base of the incisions, instead of to the apices of the lobes. It recalled the arrangement in a leaf of the common Hawthorn, but this has median cords as well as cords running to the base of the incisions; or, again, that of the cords in the petals of the Compositæ, which run up between the petals and round the margins of the divisions. A very similar occurrence is in the receptacular tube and calyx-limbs of the Cherry, though here, too, each sepal-lobe has its proper median cord as well. Marginal cords are general in the calyx of *Salvia* and other Labiætes, and appear to be supplied for strengthening purposes.

Æcidium Nymphæoides, D.C.—Dr. C. B. Plowright forwarded specimens of this parasitical fungus, with the following observations:—"This *Æcidium* has been stated by Chodat to be connected with the Puccinia on *Scirpus lacustris*. In November, 1877, Puccinia *Scirpi* was found floating in the river Ouse at King's Lynn. During the past winter I found it on the Bulrushes (*S. lacustris*) in the 'Old Bedford' at Earith, Huntingdonshire. On revisiting the spot this July, the *Æcidium* on *Villarsia* was met with in great abundance. The *æcidial* cups occupy the upper surface of the leaves in the form of sufficiently obvious circular yellow spots. After the affected leaves have been removed from the water for a short time the mouths of the cups close by a process of inversion, as if they were immature; but when the leaves become thoroughly dry the cups again open. The *Scirpus* in the immediate vicinity of the *Æcidium* was affected with the uredospores."

Æcidium Chenopodii.—Dr. Plowright also sent specimens of this fungus, with the following remarks:—"In the summer of 1893 Mr. Herbert G. Ward found on the mud flats of Terrington, St. Clements, an *Æcidium* on *Suaeda maritima*. Shortly afterwards I met with the same fungus on the muddy shore on the opposite side of the estuary of the Great Ouse, near Babington Sluice. It was accompanied by uredospores and a *Uromyces* (*U. Chenopodii*, Duby) on the same plant. By some botanists this fungus is regarded as identical with *U. salicorniæ*, D.C., on *S. herbacea*. Doubtless the host plants are allied, but it does not, therefore, follow that the parasitic fungus is the same. *Salicornia herbacea* grows abundantly in the above-named localities, but hitherto I have been unable to find the *Uromyces* upon it, although it is a British species."

Flies attacked by a Fungus.—With reference to the specimens brought before the last meeting, it is reported from an examination made at Kew that "the fungus is *Empusa conglomerata*, Thaxter (a somewhat rare species), parasitic on Diptera, especially the larvæ and imagines of *Tipulæ*, *Dipter.*—Europe and United States. This is the first record for Britain."

Grapes Diseased.—With reference to the samples sent to the last meeting, the following report has been received from Kew:—"The Vines are attacked by a fungus called *Glæosporium ampeliphagum*, Sacc., a well-known pest in vineyards. The mycelium of the fungus is perennial in the branches, and passes into the new shoots as they are developed. The first fruits formed by the fungus in the spring are found on the old wood, and the spores carried by the wind or rain or syringing, reach the flowers and young fruit; the mycelium also travels along the tissues of the branches into the inflorescence. A mixture of equal parts of sulphur and powdered chalk should be applied to every part of the Vine, dating from the commencement of branch formation until the fruit is set. All shoots that are more or less covered with minute black specks should be cut away and burnt at once, as these are the fructification of the fungus."

Thornless Gooseberry.—MM. Letelletier et Fils forwarded from Caen some growing plants of this variety, from which they have issued some kinds raised by M. Ed. Lefort, of Meaux, France. The usual triple spines were either quite absent, or represented by mere rudiments only.

Potatoes grown in "Jadoo" Fibre.—*Jadoo* fibre appears to be peat-moss saturated with chemicals. The Potatoes were very clear, clean, and apparently thin-skinned, but small. The Committee could pass no opinion upon their value, as no information was received as to the composition of the material in which they were grown.

Sweet Williams, Sudden Reversion of.—Mr. Cannell sent some trusses, with small jagged-edged petals of a crimson colour, which had appeared among his long-selected beds of Sweet Williams, the margins of the petals being rounded and smooth. The form which, on its appearance, is never allowed to set seed, approximated to the original wild condition, as described by Gerard, this being apparently the only known form in his day (1597); but Lawrence (1726) describes many kinds, and observes that similar whole or self-coloured forms occasionally appeared. The following are quotations from these two authors:—Gerard (*Herball*, p. 479, A.D. 1597) figures and describes the "Sweet William" as of a "deep red colour," but gives no varieties of the broad-leaved kind. Lawrence in "A New System of Agriculture" (p. 423, A.D. 1726) says:—"There are two or three sorts of this pretty flower; and, indeed, the sorts are almost infinite if you nicely observe the diversity of stripes and colours, and the sportings of nature even in flowers on the same stalk, there being hardly to be found two exactly of the same sort, except they prove (as they do sometimes) self-coloured. The single ones differ only in the colour of their flowers, some are red and white prettily intermixt; others are mixt with a deep crimson, and from their seeds great varieties have been raised. There is also a double flowering kind of a beautiful red."

FIG. 28.—WHEAT-EAR PELARGONIUMS. (SEE P. 134.)

verticillata, 8 feet (a grand piece); *Abies grandis*, 65 to 70 feet (planted in 1871); and *Chamærops excelsa*, 12 feet, were noted. Near a comparatively recently-formed Arboretum were some subtropical subjects doing well. *Funkias*, *Osmundæ*, *Spiræa Lindleyana* (a grand shrub), and other such plants were most effective.

In the flower garden the Golden Yews were uncommonly fine. Some seventeenth-century English Yews planted on the site of an old chapel, dating back to May 17, 1332, were pictures of health and contentment, and were trimmed in the old-fashioned fantastic style. There is at Bradfield a fine avenue of *Cedrus Deodara*, and another of Oak.

Sir William Walrond, with his usual hospitality, had arranged for an excellent lunch for the party, and they having had a long drive and a long ramble, this was much appreciated.

Having again got the travelling inspectors aboard,

home, ended one of the most pleasant and instructive outings the Association has yet held. The arrangements, carried out by Mr. A. Hope (Hon. Sec.), Mr. W. Mackay (Hon. Treas.), and a committee, gave general satisfaction.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JULY 23.—Dr. Masters, in the chair.

Cypripedium Malformed.—Dr. M. Masters described a curious case received from Messrs. Sander & Co., in which the sepals were normal, but the two petals and lip were absent. The column was erect, terminating in three tabular stigmas, and bearing three petaloid, two-lobed, imbricated staminodes, on the edge of one of which was an anther. They appeared to represent the three outer stamens. One of the three stamens

nations, containing shades of bright scarlet to almost pure white. The plants were well grown and profusely flowered. He showed likewise a group of some hundreds of *Lilium longiflorum*, which were the admiration of all.

Messrs. VEITCH & SONS, Chelsea, staged one of the finest groups of plants the firm has ever sent to the Midlands, and comprised a collection of new Carnations, *Rhododendron jasmiflorum* well flowered; the newest *Nepenthes*, and *Caladiums*. New varieties of *Canna*, for which a Gold Medal was awarded. The same nursery firm staged a fine collection of fruit, and a collection of 100 vases of cut flowers.

Messrs. F. SANDER & Co., St. Albans, staged a choice collection of new plants, for which a Gold Medal was awarded. The group included a fine specimen of *Dracena Saederiana*, a new *Begonia*, *Alocasia Watsoniana*, *Eriocnema Sanderæ*, a fine new variegated plant; new *Palms*, *Orchids*, &c.

Messrs. DICKSON, Ltd., Chester, were awarded a Silver Medal for a collection of cut flowers, consisting of *Roses*, *Gladioli*, *Carnations* in variety, *Phloxes*, and other flowers of perennial plants.

Messrs. CUTBUSH & Sons, Highgate, had a Silver Medal for hardy cut flowers, including *Carnations*. Messrs. WHITE & SON, Worcester, a Silver Medal for thirty-six varieties of herbaceous cut flowers, *Gladioli*, *Gaillardias*, *Pompon Dahlias*, and their new *Petunia*, Brilliant.

Messrs. ECKFORD & Son, Wem, were awarded a Silver Medal for fifty varieties of Sweet Peas, arranged in vases with foliage.

Messrs. CLIBBON & SON, Altrincham, had a Silver Medal for a collection of cut flowers; Messrs. HILL & Co., Spotaeca, a Silver Medal for a collection of shrubs in pots; and Messrs. PRITCHARD & SON, Shrewsbury, a Silver Medal for a collection of eighty varieties of border Carnations.

HAMMERSMITH HORTICULTURAL.

THIS part of suburban London has, of course, its Horticultural Society, which doubtless contrives to keep up a love of gardening amongst its heterogeneous population. The district was once well dotted over with large residences in the times when rich citizens were not conveyed as now by rail and coach so far afield to their homes, and there are still existent legends of fine old gardens in and about Hammersmith. Did not the mother of the present President of the Royal Horticultural Society possess a garden but a short way from Hammersmith, that was famous for rare plants and good gardening; and Kensington, Chiswick, and Turnham Green were peopled with nurserymen, florists, and market gardeners. Who has not heard of the celebrated firm of C. & J. Lee; or of Salter of *Chrysanthemum* fame, who escaped with Louis Philippe's fine china dinner service in 1848, which he let select visitors behold in his parlour at Versailles Nursery, Hammersmith, down to 1869, for the deposed King gave it to him, after it was brought over to this country; or of Gleany, of Glendaniag; or of the famous Williams' *Boa Chrétien* Pear that has made people affluent both here and in the United States of America, and which was found in a Turnham Green garden? Many of the former owners of these gardens are dead and gone, and the land once theirs carries, alas, a crop of houses instead of fruits and flowers!

The Society held an exhibition (the eleventh) on Thursday, July 25, at which were groups of plants shown by amateur and professional gardeners. Mr. WOODHOUSE being 1st among the former, and Mr. BROMLEY among the latter. Nice exotic Ferns came from Mr. Addison, Mrs. LLOYD's gardener, Merton Lodge, Chiswick; and good *Fuchsias* were shown by Mr. BUTTERFIELD, a gardener.

Some non-competitive exhibits came from Messrs. C. LEF, of the Royal Vineyard Nurseries, and from Mr. PREWETT, Swiss Nursery.

CARNATION AND PICOTEE UNION.

JULY 27.—The annual show took place as usual in the garden of the Cottage, Stanley Road, Oxford, on the above date, under the management of Mr. Medhurst, son-in-law and successor of the late E. S. Dodwell. A fine lot of flowers were staged, and admirers of the flower came from various parts of the country.

Carnations.—As at the Crystal Palace, so here, Mr. Robert Sydenham, Birmingham, took the 1st prize in the leading class for twelve Carnations, there being six exhibitors; Messrs. Thomson & Co., Birmingham, were 2nd, with a stand only just below the other. Four other prizes were awarded. There were nine competitors with six varieties, Mr. C. E. Thurstan, Wolverhampton, being 1st, and Mr. A. R. Brown, Birmingham, 2nd, six other prizes being awarded.

Picotées.—There were five collections of twelve *Picotées*, Mr. A. W. JONES, one of the Birmingham amateurs, taking the 1st prize with superb blooms; Mr. R. SYDENHAM was 2nd; and four other stands received prizes. There were twelve stands of six *Picotées*: 1st, Mr. A. R. BROWN; 2nd, Mr. C. R. THURSTAN. Nine prizes were awarded.

Selfs, fancies, and yellow-grounds.—These were superb, and perhaps finer than were ever seen at Oxford. There were eight stands of twelve blooms, Mr. A. W. JONES taking the 1st prize with a splendid lot, some of the finest being *Gladys*, a pink self; *Stadgrath Bil*, y.-g. very bright; *Miss Audrey Campbell*, a yellowish self; *Germania*, very fine; *Janira*, and Mrs. R. SYDENHAM. Mr. R. SYDENHAM was 2nd, and six prizes were awarded in all. There were thirteen stands of six blooms: Mr. W. SPENCER, Jun., New Barnet, was 1st with a very fine lot; and Mr. A. R. BROWN 2nd; six other prizes being awarded.

Yellow Grounds only.—There were thirteen stands of six blooms: Mr. W. READ, the gardener at the Cottage, taking the 1st prize; Mr. A. W. JONES was 2nd, and so good were they, that nearly every stand received a prize.

Single blooms.—A large number of these were staged, and many prizes awarded.

Premier blooms.—The premier Carnation was C. B. J. S. Hadderley from Mr. R. SYDENHAM: the premier *Picotée*, *Madeline*, N. R. E., from Mr. A. W. JONES: the premier self *Germania*, from the same: the premier *Fancy*, *Firefly*, scarlet and maroon, a sport from S. B. C. H. Herbert, from Mr. C. F. THURSTAN; and the premier yellow ground, Mrs. R. Sydenham, from Mr. W. SPENCER.

An excellent collection of bunches of hardy plants were staged by Mr. B. LADHAMS, Southampton; *Dahlias* by Mr. JOHN WALKER, Thame, and Mr. T. ANSTISS, Brill; and seedling border Carnations of excellent quality from Mr. W. Hovell, gr. to G. H. MORRELL, Esq., M.P., Headington Hill; Certificates of Merit being awarded to each.

A large party partook of luncheon in the grounds under the presidency of the Mayor of Oxford.

FLOWER SHOW AT WELLINGBOROUGH.

JULY 28.—This exhibition took place in connection with the periodical meeting of the Northamptonshire Agricultural Society's show, and was the means of bringing together, in the classes open to all England, exhibits of a high order of merit. Handsome money prizes were offered for twelve stove and greenhouse plants, dissimilar.

Mr. J. CYPHER, nurseryman, Cheltenham, took the 1st prize with grand examples of *Kentia australis*, *K. Belmoreana*, *Lantana borbonica*; a magnificent *Croton Sunset*, *C. angustifolius*, and *Cycas circinalis*; a remarkably good plant of *Erica Austiniana*, *E. tricolor vera*, *Phenacoma prolifera*, *Barrisii*, *Ixora Williamsii*, &c. Mr. W. Finch, gr. to J. MARIOTT, Esq., Coventry, was 2nd, with a collection of similar character.

The best plant group came from Mr. W. VAUSE, nurseryman, Leamington; Messrs. H. & E. LACK, nurserymen, Wellingborough, were 2nd.

Mr. FINCH had the best six fine-foliaged plants; Mr. VAUSE taking the 2nd prize.

The best specimen plant was a magnificent example of *Zamia Vroomi*, some 16 feet in diameter, and having seventy to eighty finely-developed leaves, shown by Mr. C. WILKINS, Wellingborough; so large was it that accommodation had to be found for it in the open. Ferns were well shown in both divisions; in the open class by Mr. J. COPSON, Cottisatree, who was 1st; and in the gardeners' division by Mr. D. WALKER, Wellingborough. In the gardeners' division Mr. FINCH had the best six stove and greenhouse plants, all in flower; Mr. COPSON taking 2nd place. Foliage plants, *Caladiums*, *Gonolias*, *Fuchsias*, *Coleus* were good.

Cut Flowers.—The open class for twenty-four *Roses* brought a good competition, the Rev. J. H. PEMBERTON, Romford, taking the 1st prize, having fine examples of Mrs. J. Laing, A. K. Williams, Comte Rainaud, *Caroline Testout*, *Ernest Metz* (Tea), &c.

With twelve varieties of Teas, the Rev. E. G. KING, Gayton, was 1st, having good examples of *Princess of Wales*, *Madame Cusin*, *Marie van Houtte*, and *Hon. Edith Gifford*.

The best twenty-four bunches of cut flowers came from Messrs. T. PERKINS & SONS, nurserymen, Northampton. In another division for twelve *Roses*, some good cut blooms of *Zonal Pelargoniums* and double and single *Begonias* were staged.

Fruit in quantity was limited, but in quality good. The best collection of fruit came from Mr. HAYES, The Gardens, Castle Ashby, who had *Grapes*, *Pine-apple*, a *Melon*, *Peaches*, *Nectarines*, and *Gooseberries*. Mr. D. PERCIVAL, Wellingborough, had the best three bunches of *Black Hamburg Grapes*. Mr. J. CLIPSTONE, Dingley, was the only exhibitor of white *Grapes*, having *Foster's Sealing*. Some good *Peaches* were shown by Messrs. IRONS, SPRATTON and COPSON, also good early prolific *Plums*.

T. H. RABONE.

IN our last issue we confined ourselves perforce to the mere mention of the decease of Mr. T. H. Rabone, the well-known gardener at Alton Towers. A full account of his career up to the date of publication was given in our issue for October 14, 1876. From this it appears that Mr. Rabone was born in 1833. In boyhood and youth he served in the gardens at Wellesbourne Hall, Walton House, and Packington Hall. In the last-named place he tells us he had eleven fires to see to on a winter's night, but where he nevertheless educated himself by dint of perseverance. From Packington he went to Shrubland, and thence to Trentham, where he came under the tuition of Fleming. From Trentham he went to Barlaston, where the lessons he had learnt were turned to account, and he became a distinguished exhibitor, as also when he was at Hart's Hill and Woodseat. At the great Horticultural Show at Leicester he took the 1st prize for every dish of fruit he exhib-

ited, six in number. Thence he proceeded to Alton Towers, where he had the superintendence of the garden, the woods, and the estate generally. The closing paragraph of the autobiographical note, from which the above particulars are taken, ends thus—" . . . it may be that when you are dead and gone your memory will be recalled with gratitude and tears." How true this was of himself is shown by the following extracts from a local paper:—"The Earl of Shrewsbury came down specially from London on the 19th inst., on hearing of Mr. Rabone's serious illness, in order to see him and express his deep sympathy with the family. Telegrams were despatched and received several times each day from the Earl and Countess, and other members of the family. On hearing the sad intelligence on Saturday of his death, the Earl ordered the flag to be hoisted half-mast high on the Towers, and so it remained till after the funeral. All the blinds at the Towers were drawn, and the grounds closed till after the funeral. By all denominations the deceased was greatly respected. He was on the Board of Guardians for Chedale, was district Councillor for Farley, and a parish councillor. He was a Freemason, and Past Master of the Foresters' Lodge, Uttoxeter, and Past Provincial Grand Swordbearer, Staffordshire. The deceased, though a Wesleyan, retained the greatest affection and love for the Church of England, and was by his own request buried with the rites of the Church in the consecrated portion of the additional churchyard at Alton. The coffin was sent by Mr. Mynors, his lordship's agent at Ingestre, and was made on the estate there. The procession was headed by Mr. W. C. T. Mynors, representing the Earl, and Dr. Hall. At the church gates the body was met by the local clergy and dissenting ministers, and the Rev. R. Barrett (Wesleyan minister, Chedale), the Rev. W. C. Greene (vicar of Oakamoor), the Rev. C. J. Winaer (vicar of Market Drayton), the Rev. C. B. Tyrwhitt (vicar of Candon), and the Rev. W. T. Norton (Denstone College). On reaching the church, Mr. Barlow, his lordship's organist, played "O rest in the Lord." The mourners were the Rev. T. H. Rabone, Mr. Henry Rabone, Mr. Frank and Charlie Rabone, the Rev. R. Murphy, and a large body of tenantry and friends. Amongst those who sent floral tributes, numbering nearly sixty, were the Earl of Shrewsbury and Talbot, the Countess of Shrewsbury, Viscount Ingestre, Lady Viola Talbot, Theresa Countess of Shrewsbury, the estate workmen, the gardeners at Alton Towers and Ingestre, the servants at the Towers, and many others.

Mr. Rabone earned for himself the proud title of the gardener's friend. Letters from some of his "young men" are before us testifying to the essential goodness of the man and his kindness of heart. In *Dean Hole's Memories* is the following passage:—"Solace comes to you with the real enthusiast, who shares your admirations, your successes and disappointments, as though they were his own; who is as anxious to receive, as he is willing to give information; as grateful as he is generous. How quickly and happily the hours go, as in his garden, or in yours, or wherever your favourites grow, you suggest to each other new charms, new combinations, new methods of culture. I went to one of the most beautiful of our great English gardens, and meeting the head gardener, asked permission to walk through the grounds, and told him my name. To my momentary surprise he made me no answer, but turning to one of his men at work close by, bade him 'set the fountains playing.' That was his brotherly welcome; and it stirred other fountains beside those which suddenly arose and sparkled in their silvery sheen, and made my heart glad. In this delightful garden there stands a statue of the noble owner who reclaimed it from the waste, and underneath an inscription, 'He made the desert smile, and so our love of flowers and florists makes green spots on the path of time.' In this land of gardens the gardener has troops of friends, and even in places which the world calls desolate, he shall find companions to cheer him, so long as there are Lichens on the mountains, Ferns in the valley, or Algae on the shore.

'The wilderness and the solitary places shall be glad for him, and the desert shall rejoice and blossom as the Rose.'

Mr. Rabone rarely came among his Metropolitan colleagues, but he was well known among them as a good gardener and a most conscientious sympathetic man, ever ready to do good to others.

MR. A. F. BARRON'S RETIREMENT.

THE announcement that Mr. BARRON is shortly to retire from the direction of the hallowed gardens at Chiswick will come as a surprise to many and a shock to some. No doubt the Council of the Royal Horticultural Society have given the matter the most anxious consideration, and have convinced themselves of the expediency of the step in the interests of the Society and of Horticulture generally. Moreover, they cannot have failed to remember the prolonged and unique services which Mr. BARRON has rendered to the Society, and the retiring pension offered to him will doubtless be proportionate to the means at their disposal and to their sense of the value of his services. The older members of the Council have surely not forgotten the staunch, unwavering loyalty which Mr. BARRON displayed during those wretched years of the South Kensington management, when Chiswick was allowed to fall into a miserable state of disrepair. At that time the direction of the garden must have been a constant source of depression to the Superintendent, intensified as it was by an abiding sense of the precariousness of his position. This state of things has happily passed away. Chiswick has been put into good order, and horticulturists long to see it the exponent of progressive horticulture, and the trial ground for all that is promising and instructive. They do not care to see it competing with market-growers in the sale of Grapes, and they think the services of the staff might be more profitably employed than in growing for distribution among the Fellows plants which are readily to be purchased for a few pence at the nearest florist's.

But leaving these matters aside for future consideration, the one uppermost feeling in the minds of those who are familiar with the work of the Society is, that Mr. BARRON should not be allowed to retire without a tangible expression of goodwill and admiration on the part of those who have witnessed his efforts or benefited by his help. His name has been synonymous with staunchness and loyalty. Under circumstances always difficult, not unfrequently perplexing, and sometimes, as we have said, depressing, BARRON has set a fine example of steadfast devotion to duty, whilst outside his official duties his work as the author of the most popular book on Vine culture and his services to the Gardeners' Orphan Fund have given him a claim to the warmest acknowledgments on the part of his friends and associates. In this matter we feel we are but expressing the feelings of many others, for even before the matter was publicly known we have been in receipt of many letters, expressing the same views. It is needless to say that we shall feel it a privilege to co-operate in the matter and to assist in whatever may be determined upon.

NURSERY NOTES.

MR. DOUGLASS' CARNATIONS.

THE little station of Bookham on the L. & S. Western Railway, about 20 miles from London, and in one of the prettiest districts of Surrey, is but

little frequented except by school-children and others from the metropolis, who have found the place to be a suitable one for their annual excursion. Since, however, Mr. Douglas has commenced his nursery within five minutes' walk of the place, there have been attractions to the florists also, and these are likely to become stronger each season. It was Mr. Douglas' Carnations we journeyed to see last week, wondering as we did so, what kind of a display we should witness after the extraordinary character of the weather since Christmas. A peep into the first house to be seen, however, was sufficient to assure us that the result of unfavourable weather was not very evident, and after passing through two of these all filled with excellent pot plants, with large stout flower-stems much branched, and bearing countless blooms of striking quality, the conviction was forced upon us that the journey was little compared with the return to be found here, which was such an one that any admirer of these flowers would be satisfied with. Mr. Douglas has long been known as a raiser of new Carnations, and judging from the far greater number he has of seedlings this season, he will be better known in the future; but the varieties at present superior to any others of their sort are those which have been raised in the garden of Martin R. Smith, Esq., Hayes Common, and which are sent out by Mr. Douglas. Each of these admirable varieties is grown in numbers here, and from the abundance of bloom, the effect of each compared with the other can easily be noted. Mrs. Eric Hambro is the most meritorious of all. Its flowers are pure white, very large, being 3 inches in diameter, and of the most perfect form possible; the petals are flat, and the bloom nearly circular. This handsome new variety is one of the finest white varieties ever sent out, and the habit of the plant is strong and free-flowering. Lady Ridley will, perhaps, be equally admired; the flowers are not smaller than the one just described, but the form is not quite so perfect, and the colour is less pure, inclining to cream. Its habit, however, is very commendable, especially the stout fontetalks, which make the plant so erect in flower. A charming new rose-coloured variety is found in Sadek; the rose is rich and deep, rather peculiar in tint, and very pleasing. A large quantity of bloom was in perfect condition, and its erect and vigorous habit make it specially desirable. Bendigo has violet or bluish-purple flowers, grows less tall than many kinds, but in habit it is very sturdy, erect, and vigorous. Braw Lees has brighter rose flowers than Sadek, and they are of large size and good form. Some of the very largest had split calyces, but the occurrence was not frequent, and was not to be seen at all in cases of secondary or smaller blooms.

Only four new yellow-ground Carnations and Picotees are to be sent out during the coming season, and of these were noticed George Cruikshank and Cowlip. To speak of the last-named first, Cowlip is a yellow-ground Picotee, with edging of bright rose. It is a good grower, and we could detect no split calyces; the blooms are of commendable form, and apparently the variety is a late one, as there were fewer blooms expanded on these plants than on others. George Cruikshank is an excellent Carnation, of the type of Victory, and although distinct from Cardinal Wolsey, which was sent out last season, it is of the same type. It has a buff-ground, and is flaked with crimson or blood-red. The flowers are very large and extra full, calyces good. In addition to these that have not yet been sent out were the collection of the new ones of last season, such as Cardinal Wolsey, which we have just mentioned, Hayes' Scarlet, which is certainly the finest scarlet Carnation ever raised; Duke of Orleans, dark shade of yellow; Miss Audrey Campbell, brimstone-yellow; The Hunter, rich Ajricot-yellow; Corona, pleasing golden-yellow; Waterwitch, extra large, and of the most delicate blue; Mephisto, lovely crimson, and notably good form; and King Arthur, an exceedingly large flower, 5 inches in diameter, of scarlet-crimson, extra good for a border. Other good Carnations are Snowdon, a large white flower of rather

indifferent form, but valuable for a border; Endoxia, a large flatish flower of salmon-rose; Pride of the Garden, another rose-coloured variety, specially suitable for borders. These last three were raised by Mr. Douglas, as were also the following Picotees: Ladas, clear yellow ground with thin scarlet edge, good flower and stout petals; Mrs. A. Tate, yellow ground, edged and marked with rich red; President Carnot, yellow ground, heavily edged with rosy-scarlet, flowers of considerable size and good in form; Mrs. Douglas, one of the most attractive, having a pale yellow ground, with rose edge, and of very fine form; Mrs. Drafield, with yellow ground, is rather heavily edged with pale rose. A new velvety-crimson Carnation of exquisite form, named Henry Irving, and raised by Mr. Douglas, well deserves notice; and also a sport from the new yellow-ground Picotee Mrs. Gooden, which we think will be a valued one. Considerable work has been done in the nursery since we last saw it. Roadways have been made, and a dwelling-house is in course of erection. More space than heretofore has been planted with seedling varieties of Carnations; and in spite of a season remarkable for its lack of moisture, the whole collection looks healthy, the plants are well flowered, and there are many amongst them to which the future belongs.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, including London, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
- 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending July 27, is furnished from the Meteorological Office:—

"The weather was again dull and unsettled very generally, with frequent and heavy rain in nearly all parts of the kingdom. Thunder and lightning also occurred from time to time in almost all districts.

"The temperature slightly exceeded the normal in England, E., and the Midland Counties, as well as in the Channel Islands, and just equalled it in England, S. and S.W.; elsewhere, however, it was below the mean value, the deficit amounting to as much as 3° in Scotland, N. and E."

and 2° over 'Ireland.' The highest of the maxima were recorded on the 26th over England, but on varying dates in Ireland and Scotland; they ranged from 78° in 'England, E.,' 77° in 'England, S.,' and 76° in the 'Midland Counties,' to 69° in 'Ireland, N.,' and 56° in 'Scotland, N.'

"The rainfall just equalled the mean in 'Scotland, N.,' but greatly exceeded it in all other parts of the kingdom. In many districts the total fall for the week was about three times as much as the mean, while in 'England, N.E.,' it was more than four times the mean.

"The bright sunshine exceeded the mean in some parts of the north of Scotland, but was very little prevalent elsewhere. The percentage of the possible duration ranged from 34 in the 'Channel Islands,' and 32 in 'England, E. and the Midland Counties,' to 15 in 'Ireland, N.,' 14 in 'Scotland, N.,' and 12 in 'Scotland, E.'"

MARKETS.

COVENT GARDEN, August 1.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns 's. d. s. d.' and 'Orcchid-bloom in variety'. Includes items like Arums, Asters, Bouvardias, Carnations, Cockscombs, Endorhizas, Gardenias, Lappagerias, Lilium Harrisii, etc.

PLANTS IN POTTS.—AVERAGE WHOLESALE PRICES.

Table with columns 's. d. s. d.' and 'Fuchsias, each...'. Includes items like Adiantum, Aspidistra, Calceolarias, Coleus, Cyperus, Dracenas, Evergreen Shrubs, Ferns, Ficus elastica, Foliage plants, Fuchsias, Heliotrope, etc.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns 's. d. s. d.' and 'Melons, each...'. Includes items like Apples, Cherries, Figs, Grapes, Red Currants, Melons, Pine-apples, Peaches, etc.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table with columns 's. d. s. d.' and 'Tomatoes, Home-grown...'. Includes items like Beans, Cauliflowers, Cucumbers, Marrows, Mushrooms, Peas, Tomatoes, etc.

POTATOES.

Trade not nearly so good, and prices lower. Best samples from £4 to £5; good ordinary (amp. £). J. B. Thomas.

SEEDS.

LONDON: July 31.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report an increasing sowing demand for Mustard and Rape seed. Prices for both articles stand at a moderate level. Rather higher prices for Trifolium are reported from France.

The new English Trifolium comes cheap and good. New home-grown Rye and Rape seed are appearing. Haricots scarce. Peas unchanged. Bird seeds slow. Buckwheat offers at tempting figures.

FRUITS AND VEGETABLES.

BOROUGH: July 30.—Quotations:—Peas, 2s. 6d. to 3s. per bushel; Horseradish, 1s. to 1s. 3d. per bundle; Onions, foreign, 3s. per bag; Cherries, 4s. to 6s. per half-sieve; Currants, 2s. to 6s. do.; Gooseberries, 2s. to 3s. do.

SPITALFIELDS: July 30.—Quotations:—Carrots, 2s. 6d. to 3s. per dozen; Turnips, 2s. to 2s. 6d. do.; Marrows, 5s. to 7s. per tally; Scarlet Beans, 3s. 8d. to 4s. 6d. per bushel; Broad do., 1s. to 1s. 3d. do.; Cabbages, 2s. 6d. to 3s. 6d. per tally; Onions, Spring, 1s. 6d. to 2s. per dozen bunches.

STRATFORD: July 30.—Quotations:—The supply to this market during the past week has been good, and, with plenty of buyers, a brisk trade was done as under:—Cabbages, 2s. to 5s. per tally; Turnips, 2s. to 2s. 8d. per dozen bunches; Carrots, household, 2s. to 2s. per dozen; Mangels, 20s. to 24s. per ton; Greens, 4s. to 4s. 8d. per bag; Onions, Port, 5s. to 5s. 6d. per case; do., Dutch, 3s. 6d. to 5s. per bag; Apples, English, 2s. 6d. to 4s. per bushel; Cherries, 6s. to 5s. 6d. per half-sieve; Currants, black, 4s. to 5s. do.; do., red, 2s. 6d. to 3s. 8d. do.; Plums, foreign, 4s. to 6s. per basket; Peas, 1s. 6d. to 2s. per half-sieve; do., Millies, foreign, 2s. to 4s. do.; Tomatoes, English, 4s. to 4s. 6d. per peck; Scarlet Runners, 3s. to 3s. 6d. per bag.

FARRINGTON: Aug. 1.—Quotations:—Cabbages, 6s. per tally; Parsley, 3s. 6d. per dozen bunches; Carrots, 4s. do.; Turnips, do.; Currants, black, 8s. per half-bushel; red do., 6s. do.; Marrows, 2s. 6d. per dozen; Peas, 3s. 6d. per bushel; Scarlet Beans, 4s. do.; Apples, English, 3s. to 4s. do.; Tomatoes, 4s. to 4s. 8d. per 12 lb.; Grapes, 1s. to 1s. 3d. per lb.; Cherries, white, 11s. per half-bushel; black, 7s. to 7s. 6d. do.; Plums, 6s. 6d. to 6s. do.; Peaches, 7d. per box; foreign Grapes, 9s. per barrel; Green Gages, 4s. per basket (15 lb.); Pine-apples, 2s. each.

POTATOS.

BOROUGH: July 30.—Quotations range in price from 75s. to 120s. per ton.

SPITALFIELDS: July 30.—Quotations:—Snowdrops, 80s. to 100s.; Puritans, 90s. to 100s.; Hebrons, 70s. to 90s. Suttons' Regents, 70s. to 95s. per ton.

STRATFORD: July 30.—Quotations:—Beauty of Hebron, 80s. to 90s.; Snowdrops, 80s. to 90s.; dark soil, 70s. to 80s.; Dutch, 60s. to 70s. per ton.

FARRINGTON: August 1.—Quotations:—White Hebrone, 90s. to 100s.; Red do., 90s. to 100s.; Magnuma, 80s. to 90s. per ton.

LONDON AVERAGES: July 31.—Hebrons, 80s. to 100s.; Snowdrops, 80s. to 100s.; Kidneys, 70s. to 80s.; Early Regents, 70s. to 80s.; Puritans, 80s. to 90s.; Early Rose, 75s. to 85s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 90s. to 115s.; do., inferior, 50s. to 80s.; hay, best, 80s. to 95s.; do., inferior, 36s. to 60s.; mixture, 70s. to 92s. 6d.; and straw, 20s. to 38s. per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending July 27, and for the corresponding period last year:—1895: Wheat, 24s. 1d.; Barley, 19s. 10d.; Oats, 15s. 11d. 1894: Wheat, 24s. 8d.; Barley, 22s. 6d.; Oats, 20s. 5d.

TRADE NOTICE.

We understand that Mr. A. EVANS, head gardener at Lythe Hill, Haslemers, has begun business as a fruiterer, florist, and seedsman, in Haslemere.

ENQUIRY.

"He that questioneth much shall learn much."—BAOON.

"WELLINGTONIA."—Will any reader who is in a position to do so kindly forward to the Editor a few young cones or female flowers of Sequoia gigantea? They must be as small and young as can be obtained at this season; larger ones are of no service. Only a very few are required.

Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists varieties cannot, as a rule, be named.

ADDRESS: W. T. Published by M. Doin, Paris.

A RED-COLOURED CARNATION USED IN AUSTRIA AND SWITZERLAND FOR FILLING WINDOW-BOXES: Florist. Probably Carnation Margaret (Margarethen Nelke), large-flowered, dwarf of habit, but various in colouring.

BEAUTY OF BATH APPLE: Geo. Cooling. An excellent dessert fruit, pleasant in appearance and flavour.

CANNAS: A. W. M., Austria. The blooms reached us in such a withered condition that it was impossible to pronounce any opinion upon them, save that the flowers were smaller than those we are now accustomed to see.

SEEDLING CARNATION: G. B. A good variety, orange-pink, but we cannot say it is better than others.

CORRECTION.—Among the list of candidates placed in the First Class at the recent examination at the Royal Horticultural Society, the name "Micklethwaite" was erroneously spelt "Mucklethwaite."

FOREIGN WOOD AND NUTS: J. P. If you will kindly send your full address we will communicate with you by letter.

GRAPES: A. J. B. and A. S. Your Grapes are affected with "spot," the work of a fungus. Another year try the effect of spraying with Bordeaux Mixture when the berries are small.

GREENHOUSE FERNS FROM SPORES: J. W. Many species such as Pteris tremula, P. serrulata, P. aspericallis, Adiantum capillus-veneris, Asplenium, several species, viz., alatum, erectum, and flabellifolium; Cystopteris tenuis, Lomaria gibba, Nephrodium molle, Polypodium pectinatum, Scolopendrium in variety, Woodia obtusa, and others. In a damp house the spores germinate abundantly, and can be made to attach themselves to suitable substances, such as lumps of peat, soft bricks, porous plaster, and dead wood; or they may be sown in pans thinly, the pans being filled with sandy peat or peat and loam, over abundant drainage materials. Asplenium of some species, for instance, may be 18 months in appearing, and there should be no hurry to throw a pan of spores away; on the other hand, there are species which show the prothallia in a fortnight.

LACHENALIAS: T. T. The bulbs are attacked by a fungus—Sclerotinia bulborum. Leave all affected bulbs for fifteen minutes in a rose-red solution of potassic permanganate, shaking well so as to insure the wetting of every part. Afterwards dry in a current of air. G. M.

MELONS DISEASED: Ed. M. Phoma lagenicols, a minute fungus, is destroying the Melon plants. Wash the diseased parts with 1 part parasitic in 70 parts water, although it is probably too late to do anything with the present crop. Burn all diseased portions, and either change the soil or sterilise thoroughly before planting again. G. M.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—Constant Reader. 1, Campanula latifolia; 2, Deutzia crenata, double-flowered variety.—A. W. Mayer, Nied. Stanhopea tigrina.—Rio. Androsace lanuginosa.—W. J. Lysimachia thyrsiflora.—W. D. H. Staphylea pinnata.—X. Y. Z. Cuscuta epithymum, Lesser Dodder.—E. M. Echinopsium sp., perhaps E. Lappala. Look at the burs

with a magnifying glass.—*No name.* Eryngium alpinum, Chrysanthemum lacustre, Lobelia cardinalis.—*A. J. B.* 1, Inula sp.; 2, Riccarton Fuchsia; 3, Bocconia cordata; 4, Helianthus rigidus; 5, Chrysanthemum lacustre; 6, Stipa pennata.—*N. C.* 1, Achillea Ptarmica, double; 2, Centaurea moschata, Sweet Sultan.—*W. H.* Eria stellata.—*J. I.* 1, Polystichum vestitum; 2, Laetrea glabella; 3, Gymnogramma ochracea; 4, Gymnogramma (Dictyogramma) japonica variegata; 5, Pteris haastata; 6, Laetrea atrata; 7, Woodwardia radicans; 8, Doodia caudata; 9, Asplenium fœniculaceum; 10, Laetrea serra; 11, appears to be a weak, barren frond of Pteris tremula; 12, Pteris longifolia. You have sent double the number we undertake to name; a small contribution to the Gardeners' Orphan Fund would be a graceful compensation on your part for our trouble and time.—*F. Y.* Celsia cretica.—*Constant Reader.* 1, Maranta zebra; 2, Pandanus graminifolius; 3, Dieffenbachia nobilia; 4, Dracœna Lindenii; 5, Anthurium Scherzerianum.—*R. C. Filey.* Dendrobium Bensonsæ and Epidendrum fragrans.—*F. P., co. Monaghan.* The best form of Epidendrum fragrans and Bletia Shepherdii.—*W. Macdonald.* Your variety of Odontoglossum Uro-Skinneri is the finest we have seen. The flowers of Cattleya labiata Gaskelliana exhibit a curious departure from the normal form. We will refer to them at length in a later issue.—*S. Maddox.* We do not undertake to name florists' varieties of any plant.—*Disca.* Eryngium alpinum.

THORLEY'S POWDERS FOR HORSES AND MUSHROOM DUNG: *Head Gardener.* We have no experience in the matter, but we should suppose that if the horse-food consists of chaff, hay, Beans, and Oats, the manure would not be rendered unsuitable for making Mushroom beds. The litter from beneath horses treated medically should be discarded.

TOMATOS: *Burbach.* Your Tomato fruits are attacked with "Black-rot," caused by the fungus Peronospora lycopersici, but the damage to the foliage is due to the presence of another fungus, known as Cladosporium fulvum. The best antidote is the Bordeaux Mixture, the formula for making which was given in our issue of last week in this column.

VINE ROOTS DECAYED: *Market Gardener.* A soured soil, with water probably stagnant in it.

YELLOW RASPBERRY "BRIDE OR SUPERLATIVE": *J. Merryfield.* A fine vigorous plant, with large fruits that were however almost flavourless, from having been exposed to heavy rain for a long time. Send again when in better condition. There are too few yellow varieties in cultivation.

COMMUNICATIONS RECEIVED.—*D. Melville,* in good time.—*C. H. M. A. A., F. C. S., J. Mackinnon, E. D., E. J., F. W. S., G. W., W. M. W., W. S., D. T. F., W. B., H. M., R. L. H., F. R., Marywether & Son, C., H. C. F., F. de M., Gurosey, C. de C., W. M., E. de L. Contich, T. H. R., W. T. T., F. B., Otto Ballf., J. H. K., J. W., W. D., L. B., E. W. B., L. L., W. WHAT TIME IS IT?

It's time to give over thinking that there is any permanent energy to be derived from Alcohol. It's time you were turning your attention to a more profitable investment by sending 9 stamps to **NEWBALL & MASON, of Nottingham,** for a sample bottle of

MASONS EXTRACT OF HERBS FOR MAKING NON-INTOXICATING BEER

And thus obtaining for yourself the services of a permanent and rational invigorator.

That's what o'clock it is!

Of all Chemists and Grocers, 6d. and 1s. per bottle.

A 6d. bottle makes eight gallons.

THE SYDNEY MAIL, AND NEW SOUTH WALES ADVERTISER.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates

THE "WORCESTER HERALD," ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Rooks, and other property advertised in the columns of the "HEBALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for Terms.

SPECIMEN FREE. Price 2d. Published Friday for Saturday.

OFFICES:—72, HIGH STREET, WORCESTER.

Agricultural Economist.

An ILLUSTRATED MONTHLY MAGAZINE, of 52 pages and cover. Exponent of scientific and high farming; advocate of co-operation in agriculture, in the supply of farm requisites, and the sale of produce; organ of the Agricultural and Horticultural Association, the pioneer society for mutual supply of pure oilcakes, complete manures, reliable seeds, and implements on wholesale terms. Specimen copy free. Subscription, per annum, 5s., inclusive of postage. Single copies 6d. each, through all Newsagents.

Borough of Eastbourne.—Horticulture Class.

THE TECHNICAL INSTRUCTION COMMITTEE invite Applications from Qualified Persons for appointment as TEACHER of the HORTICULTURE CLASS, to be held in the evening in the Town Hall, Eastbourne, during the Session commencing October 1, 1895, and ending April, 1896. Full particulars of the terms offered by the Committee and Forms to be filled up may be obtained from the undersigned. Applications to be delivered to me not later than Friday, August 16 next.

H. WEST FOVARGUE, Town Clerk and Hon. Sec.
Town Hall, Eastbourne, July 30, 1895.

MESSRS. THOMAS CRIPPS AND SON beg to THANK the numerous APPLICANTS for their situation as TRAVELLERS; they have selected Mr. H. ENGLISH to be their representative.

MR. DAVIES of Impney desires TO THANK ALL APPLICANTS for FOREMAN'S PLACE, and to say that a man is NOW ENGAGED.

WANTED, a HEAD WORKING GARDENER, married, to live in Lodge (5 rooms). Must be thoroughly qualified and not afraid of work.—Reply by letter in first instance to E. T. PRESTON, Hayes Court, Hayes, Kent.

WANTED, a GARDENER (HEAD WORKING, and GENERAL FOREMAN), experienced in Orchard-house of Cordun Trees; also of Wall-fruit, Grapes, Melons, Cucumbers, Ferns, Chrysanthemums, and Flowers. Wife to attend to Dairy and Poultry.—Apply by letter only, in the first instance, stating ages, length of previous services, if he has a personal character, and from whom, and where he has had charge of, also how many children, if any, and wages required, to A. D., 5, Walbrook, London, E.C.

CAN any Lady or Gentleman thoroughly recommend, for permanent place, a really good, practical, WORKING GARDENER, experienced in all branches; Head over Foreman and a boy. Glass not extensive. Married man, no incurances. Good lodge provided; wife to attend to gate.—Reply, stating full particulars, FRANK RIBBY, Esq., Sansaw, Shrewsbury.

WANTED, a MANAGER, for a First-class Country Firm. Must be energetic, and possess a thorough knowledge of Wholesale and Retail Garden, Seed, and Bulb Trade; also the Compiling of Catalogues. Salary, £150. All replies treated as strictly confidential.—Address, E. O., *Gardeners' Chronicle* Office, 41, Wallington St., Strand, W.C.

WANTED, a young MAN for the Orchid Houses. Wages, 15s. per week. State age and references to ARMSTRONG, Gardener, The Uplands, Selly Hill, Birmingham.

WANTED, for an extensive Nursery near London, an OUTDOOR FOREMAN. Must have had good experience in the Propagating and Growing of Fruit Trees, and Hardy Trees and Shrubs, and in the Management of men.—Apply by letter, with all particulars, to WM. PAUL AND SON, Waltham Cross, Herts.

WANTED, an OUTDOOR FOREMAN. Must have thorough knowledge of General Nursery Work, and be well up in Fruit Trees, Roses, and Rhododendrons. Age not to exceed 45, and the highest references required as regards character and capabilities.—Apply to W. BARRON AND SON, Elvaston Nurseries, Borrowash, Derby.

WANTED, an additional BUDDER in the Fruit Tree Department. A permanent situation to a suitable man.—WM. PAUL AND SON, Waltham Cross, Herts.

WANTED, for Herbaceous Department on my West Wickham Nurseries, a good TRADE HAND as PROPAGATOR. Must have had good experience, and be well acquainted with novelties, &c. Wages 25s.—Apply by letter to JOHN E. BOX, Croydon.

WANTED, a strong, industrious young MAN, principally for Kitchen Garden and Lawn Work. Wages, 17s.—GARDENER, Oak Bank, Seal, Sevenoaks.

WANTED, in the North of England, a young WOMAN experienced in making-up Wreaths, Bouquets, &c. To a competent person a good situation is offered.—Apply, in first instance, to Mr. WM. DENMAN, 7, Catherine Street, Covent Garden, London.

WANT PLACES.

TO GARDENERS AND OTHERS
SEEKING SITUATIONS.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—
F. SANDER AND CO., St. Albans.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

MESSRS. CHARLESWORTH & CO., Orchid Growers, Heaton, near Bradford, can recommend a Man well up in Orchids, Grapes, Peaches, Melons, Tomatoes, and Chrysanthemums, and general routine of gardening.—For particulars apply to the Firm.

HILL & SMITH'S BLACK VARNISH,

For Preserving Ironwork, Wood, or Stone.

An Excellent Substitute for Oil Paint, at one-third the cost.

This unrivalled varnish has for forty years given unbounded satisfaction, obtained a large consumption, and earned a high reputation throughout the kingdom. It requires no mixing, can be applied cold by any ordinary labourer, and dries in ten minutes with a perfect gloss. Fences periodically coated with it are effectually preserved from deterioration for an indefinite period.

Price, 1s. 6d. per gallon at the manufactory, or 1s. 8d. per gallon, carriage paid to any railway station, in casks of 36, 18, or 9 gallons.

Testimonial from CHAS. PATRICK, Esq., Cloughfield, Manchester (Numerous others):—"I have used your Black Varnish for upwards of twenty years, and find none to equal it in economy and quality."

CAUTION. EVERY CASE BEARS THE ABOVE REGISTERED TRADE MARK. Beware of Cheap Imitations.

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
Dear Sirs.—It affords me much pleasure to inform you the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 8 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schröder.
B. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 10, 1895.

STREET PLANTING.

AVENUES in the country, if but once rightly planted on the right soil, and then left to themselves, are sure to reward succeeding generations. No country in the world boasts so many superb Beech, Birch, Oak, and Elm as does our own land. Our parks, royal and private, are one of the principal attractions for our American cousins, and not less for the dwellers in Europe generally, since a tract of country almost equal in extent to all England may be searched for in Germany or even in 'fair' France without finding one such vista through a double series of fluted columns as scores of our nobles' and even commoners' seats afford.

But the question to settle here is—how far can we succeed in cultivating avenues in a great city? Can we keep horses alive and well in mines? Time was when such an idea would have been ridiculed. To habituate them even to city life might well have been deemed a hopeless undertaking by those who knew them only in prairie freedom. But first by accident, and then by science, the one and the other doubtful point has been cleared up, and the tree has been found to be as ready to adapt itself to painful circumstances as was the horse.

It behoves us, however, to know precisely to what extent such conditions of life must be painful in the case of the tree, and what is nowadays being done to alleviate at once its own lot, and that of the human and equine denizens of the town. As regards the initial step towards the attainment of our object—planting—look at the splendid boulevards which have sprung into existence on or close to the site of ancient bastions in continental towns, such as Florence and Geneva. One might suppose that the planting of these was effected with no technical knowledge. But the fact is, that masonry rubbish, though valuable in admixture, is fatal in all but the wettest seasons to trees, even suburban; and unless precautionary measures are adopted during the levelling, great expense is afterwards entailed in removing the soil and refilling upon the planting sites. In some towns on the Continent, the pleasure-grounds authority shoulders all such expense, and co-operates with the street-building department in economising labour of this kind; and it is this fundamental preparation which, in unconfined places at least, amounts to a guarantee of future Champs Elysées.

Money will do almost everything. It is all but omnipotent; and the London County Council is proving that sufficient of it can be raised in London to execute any highly important improvement. If it be possible in London to widen streets, lying quite near the City, sufficiently to plant them with trees, it cannot be impossible in any other of our great centres to purify, moisten, cool the air for such unfortunates as must pursue their avocations throughout the hot months. The indispensable

widening of streets with a view to leafy avenues is doubtless costly, and may, in a few cases, be beyond the reach of the community, but for each noble tree-lined thoroughfare penetrating our most densely populated urban districts, there has been, and will ever be, a notable decrease in our doctor's bills—an advantage, to say the least, inversely proportionate to the outlay on such a street. To dweller and worker in the adjacent houses, equally with the pedestrian or the traveller by vehicle, the benefit is admittedly immense. This embellishment, this hygienic improvement of our towns, should be more cultivated by all local bodies as an "art of peace" of vast, if not of paramount, importance. Were the true economy of this art better understood by such authorities, the rates, even though slightly increased, would be more cheerfully paid.

It should become true of every city, that there be within it no important point of street-intersection from which no green leaf is visible. Where little has yet been done, it will be necessary to set aside annually the sum of £1300 for a town of 50,000 (this is an average sum, and must vary with the extent of pleasure grounds), and from £200 to £250 for each 10,000 additional inhabitants. Let a good gardener be selected—one to whom much freedom may safely be accorded in the management of all the public pleasure-grounds, as well as of the street plantation. Then, not even the poorest soil need present any real difficulty. The most arid sand, or the stiffest clay, no more imperatively than ordinary soils, must be trenched 3½ feet deep, and as wide, before planting. The difference in the former case (bad raw material) consists in the bringing-in of good soil to the extent of from one-third to one-half.

Some large German cities (Dresden and Magdeburg), having to deal with hungry sand, underlain only at a great depth by clay, have boldly inaugurated a system of underground watering, and this, though at present only tentative, has so far (some eight years) given good results.

The system may be briefly explained. The general city water-mains are tapped by a secondary shallow-lying conduit at the head of a street, and from this diverge the tree-feeders at regular distances of 8 feet, their contents discharging themselves slowly through a small bed of old mortar into the prepared ground. The whole system lies only 15 inches beneath the surface, is ventilated by upright open shafts at every 11 yards, and is, of course, emptied by a stop-cock in autumn.

Some fine trees occupying corners or paved square centres are deemed worthy of a separate system—viz., a conduit forming a square around them, with vertical as well as horizontal feeders, each one foot long, approaching the roots on all sides, and at differing depths.

Iron tubes are used throughout, and it is reckoned that these will do service for fifteen years, when the trees would be very strong, and could, perhaps, take care of themselves, if given liberal breathing and drinking space around their stems.

The average cost of tree up to two years, striking the average from all situations within the municipal limits, will be from 18s. to 20s. In small towns less.

As to the best kinds of tree for the purpose, one must, of course, be guided to some extent by knowledge of the locality, but seeing that "variety is the spice of life," and that the trenching must in all cases be thoroughly done, it is to be expected that six out of the eight, comprising Oak, Elm, Horse-Chestnut, Ash, Lime,

Maple, Plane, and Sycamore, find places in the interior; all the rest—the Service, the Mountain Ash, the Hawthorn (red and white), Beech and Hornbeam, Birch, Acer Negundo, black and silver Poplars, Willows, and shade Acacias, the smaller and more pendent trees, in the outlying streets and suburbs.

The laoniate Oaks bear town life almost, if not quite as well, as the favourite *Acer dasy-carpum*, which is at once the most attractive and the most tractable, as far as mere foliage goes. Other *Acers*, such as *picatum*, are much esteemed. *Æsculus*, of course, startles and delights us all in the spring with the grandest flourish, and the most handsome exhibit of its kind in the world; but the Ash, "queen of the forest," deigning also to reign here, outdistances the Horse Chestnut in autumn.

None of these trees, whatever their root advantages, will grow well under the shade of a solid phalanx of high buildings, unless planted at a minimum distance of 6 yards therefrom, and line a street of at least 12 yards between their rows. From the edge of the pavement they must be set back fully 24 inches, or they will, sooner or later, suffer serious damage from overlaid or swaying waggons.

The trees once planted, three gardeners are sufficient to take charge of as many as will be found in an average town of 100,000 inhabitants, unless underground watering be in vogue, when another will be required. The duties of these are the following:—

Spring: Bind the nurselings with list, and syringe. Stake substantially and fasten securely with strips of strongest sail-cloth (sometimes waterproofed), nailing the ends to the stakes. Place iron or basket-work screens around the stems. Whilst sap is rising, tar promptly all barked spots on trunks, including the torn bark edges. Dish the ground twice during the growing season above roots; or, in case of completed paving, lift gratings and remove rubbish. As summer advances, lop some lower boughs of all in vigorous growth, to drive them upward. Syringe as frequently as possible throughout their first year.

In winter, re-stake, re-tie, prune, lop, and see to leaders. In botanical and horticultural matters generally, England is now admittedly in the van of progress; but in forestry, as in urban tree decoration, she has yet to steal a march on some of her continental neighbours. Some few of our towns, of course, form pleasant exceptions. The general richness of our landscape, unrivalled in any country of the temperate zone, makes a treeless town more unsightly by contrast; and the extraordinary rapidity of our journeys—of our transitions from town to country, and *vice versa*—make the contrast yet more noticeable.

Let us yet again in this matter signalise ourselves. In every fresh step towards priority of merit, we shall ourselves reap all the advantage.

NEW OR NOTEWORTHY PLANTS.

TCHIHATCHEWIA ISATIDEA.*

The first thing the English reader will ask when he sees this impracticable name is how to pronounce it. M. de Tchihatcheff was a naturalist of foremost rank, whose work on the geography of Asia Minor is a standard production. To botanists, therefore, he is or was the bearer of

"A name which they all know by sight very well,
But which no one can speak and no one can spell."

* *Tchihatchewia isatidea*.—Boissier, *Flor. Orient.*, i. 310; Micheli, in *Revue Horticole*, August 1, 1895, p. 351, figs. 116, 117; Baillon, *Hist. des Plantes*, vol. iii., 1872, p. 261; Prantl, in *Engler u. Prantl, Die Natürlichen Pflanzenfamilien*, iii. Theil, 2 Abtheilung, p. 208 (1891).

In order to gain information as to the proper pronunciation, we applied to a Russian friend, from whose instructions we arrived at "Tchê-hatch-off," with a strong stress on the second syllable, as the nearest approach of which we are capable. The name was Latinised for botanical purposes as "*Tchihatchewia*!"

For our illustration (fig. 29, p. 151) we are indebted to Mr. Lynch, the Curator of the Cambridge Botanic Garden, in which establishment it flowered this year, as also in Mr. G. F. Wilson's garden at Weybridge. It is a Crucifer, native of the mountains of Armenia on the north side of the Euphrates, where it grows at a height of 5000 to 6000 mètres, and where it was discovered by Tchihatcheff. It was introduced into cultivation by Mr. Max Leichtlin, of Baden Baden. The plant is a dwarf biennial of tufted habit, with a fleshy tap-root, sessile, runcinate leaves, covered with stiff white hairs. The flowers are numerous, in close terminal panicles, 20 centimètres across; each flower is of the size of that of *Hesperia* (Rocket), rosy-lilac or rose-coloured, and fragrant. After flowering the flower-stalk is bent downwards, so that the silicle becomes appressed to the stem. It contains one or two black seeds. M. Marc Micheli describes the plant at length in the *Revue Horticole*, and gives analytical details with which our own sketches, taken from the Cambridge specimen, entirely correspond. M. Micheli says it is without doubt one of the prettiest rock plants yet introduced. It likes full exposure to the sun, and its stout stalks bear innumerable rose-coloured flowers, which contrast with the long white hairs of the leaves. It is quite hardy, having survived the last winter at Geneva without protection.

The plant is one of botanical interest, and appears to be rare. Bentham and Hooker, in their *Genera Plantarum*, say that they had not seen it, and copied the description of Boissier. The co-operation of horticulturists with botanists has here then, as in so many cases, been of special value to science. M. T. M.

THE FRUIT CROPS.

IN our last issue we gave a synopsis of the numerous reports as to the condition of the fruit crops we had received from all parts of Great Britain and Ireland. Taken as a whole, the report is uniform in its character, and favourable as regards both quantity and quality.

The season of flowering was later than usual, and there was a very general immunity from sharp frosts, although the temperature in most parts of the country was dangerously low, and frost of some severity was felt in certain localities in widely separated parts of the country.

The tabular matter already published does not allow of much detail being given, and the great degree of uniformity in the fuller reports we have received from the kindness of our correspondents renders it unnecessary to publish more than a selection of them.

O. SCOTLAND, N.

MORAYSHIRE.—The fruit crops look well, and as a whole they are three weeks in advance of last season; but the weather has been very unsteady; hot and cold in turns, and late-keeping varieties will profit greatly by a warm, dry autumn. *Wm. Ogg, Duffus House Gardens, Elgin.*

I. SCOTLAND, E.

ABERDEENSHIRE.—A few Apple trees on walls have a good crop, but standard trees are under the average, and the weather having been cold and dry when they were in blossom, growth is stunted, and the set was a poor one. Pears had very little blossom, but that which set is fairly good in appearance. Plums and Cherries, fair crops, are doing well. *John Forrest, Haddo House Gardens, Aberdeen.*

— This is not a fruit district at all; only a very few sorts are of any use here. We are very subject to late spring and early autumn frosts. Gooseberries, Currants, and Strawberries are an extra crop and of good flavour. *John M. Troup, Balmoral Castle Gardens.*

BANFFSHIRE.—The fruit crops, on the whole, are a fair average. Peaches and Apricots showed a fair percentage of blossom, but owing to the cold nights and badly ripened wood they set badly. Pears, on the whole, are a good average. Apples were most abundant with blossom, but have set very thinly; the very dry weather prevailing during the flowering seemed to exhaust them, and the fruits have dropped badly. Figs on the open wall, which usually do well, have suffered from the frosts of winter, the temperature having gone down to zero. Small fruits are all good, except Black Currants, which were thinned by the spring gales. *J. Fraser Smith, Cullen House Gardens.*

— The fruit this season with us is good everywhere, but Apples are almost a failure. Pears and Plums, although they suffered in the early part of the season by reason of drought, winds, and low temperature, are a good crop. *William Alexander, Mouniblairy House Gardens, Turriff.*

BERWICKSHIRE.—Our fruit crops are, on the whole, good. Trees healthy, owing probably to the scarcity of fruit last year. Bloom was very abundant, and

as a whole is a small crop. Plums have undergone a severe thinning. Pears only on young trees are a fair crop. I have seen a heavier set of Apples, but these will nevertheless be a large and fine crop. *R. P. Brookerston, Tynninghame, Prestonkirk.*

EAST LOTHIAN.—Pears and Apricots are not a heavy crop, but Apples, Plums, and Cherries are abundant and good. Lord Suffield, Keswick Codlin, Warner's King, Stirling Castle, Hawthornden, Blenheim Orange, Cox's Orange, King of the Pippins, and Worcester Pearmain are amongst the best of the Apples. The small fruits are an extra heavy crop, except Black Currants. All other sorts, especially Strawberries and Gooseberries, are plentiful. *Wm. McKelvie, Broxmouth Park Gardens, Dunbar, N.B.*

FIFESHIRE.—The crop of fruit in this district is extra heavy, and with recent rains the fruit will attain its normal size. The Apples are especially heavy, with the exception of Cox's Orange and Blenheim Pippins on walls and standards, and Ribston Pippin is thin on wall trees. Denyer's Victoria Plum is extra good, and the Damsons are the heaviest crop ever seen here—at least, within the

and caterpillar. Apple and Pear trees are looking clean and healthy, and are carrying fair crops of fine fruit. Plums, especially on walls, are fine. *Thos. Wilson, Glamis Castle Gardens, Glamis.*

MIDLOTHIAN.—The fruit crop is, on the whole, the finest we have had for many years. Apples are fully an average crop, and promise to be much finer in size and quality than usual. Pears, Plums and Cherries are bearing heavy crops of first-rate quality. Apricots, Peaches, and Nectarines are plentiful here, although scarce on open walls in some places in the district. Small fruits of all kinds are very abundant, particularly Gooseberries and Strawberries. The long and severe winter did no injury to the fruit trees, owing probably to the remarkable dryness of the atmosphere and absence of wind all through the storm. The spring was late, and very favourable for the fruit, which set thickly in April and May, and swelled freely with the rains, which came just in time in June to save the Strawberry crop. Trees have made a fine healthy growth, and so far have been very clean and free from insect attack. *M. Dunn, Dalkeith Gardens.*

— For months the fruit crops in this district have suffered from drought, and although growth was almost at a standstill, yet the fruit held on till the welcome rains came. I am glad to report that Apples and Pears, and all kinds of small fruits are now swelling and ripening an abundant crop of good quality. *M. Chapman, Easter Duddingston Lodge Gardens, Portobello.*

ROXBOROUGHSHIRE.—Owing to having had 6° of frost on June 13, the fruit prospects here were considerably altered. Apples, Pears, and Plums set very well, but the fruits of Plums and Pears fell off a good deal, and the Apple crop is falling a good deal at this date (July); still, on some trees there will be a good crop. Strawberries a very heavy crop and good (I had gathered 92 pints one day, and 113 pints another day). Raspberries good and clean. Black Currants good; I was able to gather 120 pints from the bushes, whereas last year I didn't get a pint, owing to the week's frost in May. Damsons are a very heavy crop. Cherry trees have been very clean of black-fly all the season, and all other kinds of fruit trees are clean and healthy. *John Page, Monteviot Gardens, Jedburgh.*

6. SCOTLAND, W.

AVRSHIRE.—The fruit crops in this district promised, in the early spring, to be very abundant. Trees and bushes were very clean and healthy, and covered with blossom, and fruits of all kinds set thickly; but they received a severe check in consequence of the long severe drought. Since the showery weather set in, all fruit trees have greatly benefited, the trees are getting clean and healthy-looking again, and the fruits swelling fast. *A. Wilson, Auchincruive Gardens, Ayr.*

— On the whole the out-door fruit crops are better than they have been for years. Plums especially are exceptionally good, and during my over forty years' experience I have never seen a crop to equal the one I have this year. *Richard Kitchen, Goodham, Kilmarnock.*

LANARKSHIRE.—I have been six years here, and have not previously seen such a heavy crop of small fruit, especially of Strawberries, as is the case here and in most parts of the county. Cherries are very little grown hereabouts; and Peaches, Nectarines, and Apricots are only grown out-of-doors in very favoured localities and under special care and management, as the district suffers much from late spring frosts. *William Castle, Blantyre Lodge Gardens, Blantyre.*

ARGYLLSHIRE.—The outdoor fruit crops in the gardens here are over average. Strawberries were an abundant crop, large and good. We commenced gathering Keen's Seedling on June 22. Plums on walls set so thickly that quite two-thirds had to be taken off. Pears on walls carry an average crop: Louise Bonne of Jersey, Madame Treve, Beurré d'Amanlis, B. d'Arenberg, and General Todtleben are heavily

FIG. 29.—TREHATCHEWIA ISATIDEA: FLOWERS ROSY-LILAC, AND FRAGRANT. (SEE P. 150)

we had little or no frost, only spells of sunless cold weather, which would account for much of the blossom not setting, and again the long drought later on had an equally bad effect, causing many of the fruits to drop off of such reliable sorts as Stirling Castle, Ecklinville, Pott's Seedling, Warner's King, &c. We have an over-abundant crop of Apples, and the fruit is swelling fast. We never had such fine crops of Gooseberries and Strawberries as this season, the rain just coming in the nick of time to save the crop. *John Cairns, The Hirscl Gardens, Coldstream, N.B.*

— The fruit crops are in general, in this district, very good, although slightly thinned by 6° of frost on June 13. Cherries have been the heaviest crop I have had in five years. Gooseberries are simply an enormous crop, many of the bushes lying quite flat on the ground under their heavy load, and all of splendid quality. I attribute the heavy crop of small fruits to be greatly due to the absence of bullfinches in spring, as usually they do great havoc amongst the buds. It is premature to say more about the large fruits than that they promise well at the present date. *J. Ironside, Blackadder House Gardens, Edrom.*

EAST LOTHIAN.—Small fruits of all kinds are this year an overflowing crop, and notwithstanding the drought, are large and of good quality. Some Apricots are well set, others almost bare, and the result

last twenty-three years. Gage Plums are scarce, although they escaped injury by spring frost. *W. Williamson, Tarvit Gardens, Cupar.*

FIFESHIRE.—Fruit trees of all sorts flowered most profusely, but owing to the very dry weather and 4° of frost on the mornings of June 13 and 14, Pears and Cherries suffered badly, and dropped a great many of their fruit. Gooseberries, Currants, red and black, Raspberries, &c., are a very heavy crop. Strawberries the same, of extra fine quality, and nineteen days earlier than 1894. *John Clark, Wemyss Castle Gardens.*

FORFARSHIRE.—The fruit crop is generally a fair one, Plum trees that were heavily cropped last season are thin in most cases. Gooseberry bushes are not much infested with red-spider, which was so bad two years ago; indeed, all fruit trees and bushes are more free from insects and healthier-looking than usual. Strawberries are a good crop, the rain just came in time to save the crop, which was ready ten days earlier than last season. *John Ruskin and British Queen, with Garibaldi, are our best this season. W. McDowall, Brechin Castle Gardens.*

— On the whole, the fruit crop is abundant, and of good quality; Strawberries especially are very abundant. Raspberry canes were damaged by the severe frost in February, the crop is consequently scarce, but of good quality. Gooseberries in the early part of summer were infested with red spider

laden. Apples on pyramids have good crops of fine fruit, and on bushes over average. Cherries sweet, and Morellos are laden; also Gooseberries, Raspberries, Brambles, red and white Currants, but black Currants are almost a failure. Peaches, Nectarines, and Apricots, are not grown out-of-doors. *D. S. Melville, Poltalloch Gardens, Lochgilphead.*

STIRLINGSHIRE.—Apple and Plum trees were never more severely attacked with gnats than this year, but these were got under by liberal applications of insecticides. The young growth is now vigorous and healthy, and most of the trees are well cropped. Small fruit-bushes are heavily laden with fruit, and have all along been vigorous and healthy; no insects have been seen on them. The fruit is unusually large, which we attribute to liberal manuring. *M. Temple, Carron House Gardens, Falkirk.*

WIGTONSHIRE.—Apples, Pears, Plums, and Cherries are all good crops, the trees healthy, and almost free from insect pests. Apricots and Figs are below the average; the latter suffered from the effects of the severe frost, which killed much of the fruiting wood. Gooseberries are heavy crops, but the trees are badly infested with caterpillars. Currants and Raspberries are good crops, and the fruit very fine. Strawberries were abundant, but owing to the hot weather were soon over. *James Day, Galloway House Gardens, Garliestown.*

(To be continued.)

AMERICAN NOTES.

ORCHIDS AT TRENTON, N.J.

(From Our Own Correspondent.)

ONE of the most interesting collections of Orchids at present in this country is that of C. G. Roebling, Esq., of Trenton, N.J. It bids fair to excel the position which it has already attained, and preparations are being made for extensive additions; four new glasshouses are being erected, all of which will be devoted to Orchids. Cypripediums, both species and hybrids, form no inconsiderable portion of the whole, but perhaps the chief feature is the large collection of white Cattleyas, to the collection of which Mr. Roebling has directed his full energies, and it is his desire to make his collection of the white Cattleyas as perfect as possible; with such an enthusiastic owner the time cannot be far distant when the Trenton collection will contain specimens of all the known "Albino" forms. It will no doubt be of interest to many to see the list of those already included.

Cattleya Trisraeli alba, forty-five bulbs, ten leads, and a grand variety; C. Gaskelliana alba, twenty bulbs, five leads, fifteen splendid blossoms; C. G. alba Trentonensis, very deep orange throat, six bulbs, two leads; C. Skinneri alba, ten bulbs, three leads; C. Mossiæ alba, twenty bulbs, three leads; C. M. alba Trentonensis, eight bulbs, two leads, a grand variety; C. Aclandiae alba, ten bulbs, one lead; C. Chocoensis alba, two plants, three leads each; C. Percivalliana alba, six bulbs, one lead; C. amethystoglossa alba, seven bulbs, one lead; C. Loddigesii alba, seven bulbs, two leads; C. Bluntii, five bulbs, one lead, part of original; C. intermedia alba, six bulbs, two leads; C. Schroderæ alba, four plants, four leads to best one; C. S. alba Trentonensis, grand variety, ten bulbs, three leads; C. E. dorado alba, ten bulbs, four leads.

Very marked advances on all other white varieties are C. Gaskelliana alba Trentonensis, C. Mossiæ alba Trentonensis, and C. Schroderæ alba Trentonensis.

The C. Gaskelliana has extremely rich orange in place of lemon in the throat; the C. Mossiæ has a nearly green throat; the C. Schroderæ has almost an entire orange lip, save a small white margin. They are three noble white forms, and are probably unique plants, superb in shape, and exquisitely pure, well qualified to bear the name of the home of this splendid collection of white Cattleyas.

The white Lælias include L. purpurata var., parent white, except a few faint lines in the throat,

two plants; L. majalis alba, sixty bulbs, nine leads, true; a splendid healthy specimen; L. anceps alba, Bull's original variety, two fine plants, three and four leads; L. autumnalis alba, twelve bulbs, four leads.

The climate of the district seems to be admirably adapted for the growth of Cattleyas. C. Rex here grows with an astonishing vigour, and in a short time there will be a wealth of blossom; nothing could be finer. One specimen has fifteen flowers from three growths, and the new bulbs and leaves are as large as those of the best grown Lælia purpurata.

C. gigas is represented by some fifty magnificent pieces, all in flower; one piece carrying twenty-eight, and had had more. Among the more distinct species of this variety is one named Lageri in honour of its discoverer, who introduced it and many other excellent forms, through Messrs. Pitcher & Manda. The lip in this variety is very broad, and of the most intensely deep purple-crimson; the remaining portion of the lip is very finely veined, and has no trace whatever of the characteristic yellow spots. The sepals and petals are also exceedingly rich; a plant of C. gigas Sanderiana was noticeable for the fine expanse of its lip. Also in flower was a new Cattleya hybrid, which is named Juno by request of Mr. Roebling; it is described elsewhere (see p. 118, *Gardeners' Chronicle*, August 3).

C. Hardiana, a splendid specimen with four leads, attracts by its graceful form and delicate colouring. Of hybrid Lælio-Cattleyas the one out of L. purpurata and C. Mossiæ known as L.-C. Canhamiana is very attractive. The finely frilled lip and the drooping petals having the peculiar twist of L. purpurata give it an air of distinction.

Lælia tenebrosa Roeblingiana was past its best, but it still stood a worthy reminder of what had been. Its colour, dark rose madder, sepals and petals with an almost black-purple lip, makes it quite free from anything else.

Cypripediums embrace such a host of forms (over 250, all select too) that it is not possible to enumerate the whole; only a selection can be given. Close attention is given the hybridizing in this collection, and hosts of young seedlings are to be seen everywhere, the work in hybridizing being largely carried on as checks on the operations of other hybridists. It is thought, and wisely too, that it is better to reproduce an acknowledged fine hybrid than to wander off into a multiplication of "novelties" of mediocre rank. However, at the same time work is being done along original lines, not only in this genus, but in Cattleyas, Lælias, Epidendrums, &c., and thriving under the skilful care given them by Mr. Henry T. Clinkaberry, who was formerly well known to English orchidists, some highly interesting results may be expected.

One of the most conspicuous of the Cypripedes is C. Gowerianum, with its dorsal sepal 2½ inches across, and finely spotted. Others are, to take them as they come, C. Rothschildianum, with four flowers; C. macropterum (Lowii × Veitchii), very elegant, with its clear rose-coloured sepals; C. Sanderianum, having had four flowers, the piece with six new growths; C. Smithii (Lawrenceanum × ciliolare), very rich in colour, well-balanced flower, with its pretty flat dorsal sepal; C. Chamberlainianum, in fine vigour; C. Curtisi; C. caudatum Wallacei (the albino form of the species) had five flowers; C. Brownii—a glorified leucorhodum—and a whole host of others. Other noticeable species are Cœlogyne pandurata with fourteen leads, C. Dayana in full flower; Dendrobium Farmeri, Lælia Arnoldiana, with four flowers; Brassavola acutis, Epicattleya guatemalensis, with fourteen strong growths; Dendrobium Falcoueri giganteum, with its showy flower larger than that of the largest noble; Epidendrum Watsoni, not often to be seen in these collections, because not sufficiently showy; and Epidendrum O'Brieni ×, which had been in flower for the last eight months, and still blooming profusely! That is the sum of the most noticeable forms at present in the collection. White Lælias, however, are a feature in their season, and must be seen later.

Odontoglossums are grown to a limited extent, but it is a struggle against the climate, which is too hot and too dry. All sorts of schemes are had recourse

to to modify the conditions—sinking the houses, putting them on the north side of the wall, &c., with the result that in this particular case there are fair signs of success. The same may be said concerning Miltonias, but the very circumstances which are detrimental to these groups give to the Cattleyas, &c., strength and vigour, which it is a rare treat to see.

The rapidity with which Cattleya and Lælia seedlings germinate here is very noticeable. Plants are plainly visible to the naked eye five and six weeks after sowing the seed; and, indeed, numbers have been put into tiny baskets six months from sowing. None but the finest varieties are being used in these crosses, of which over fifty have been sown already. *Leonard Barron.*

LÆLIA DIGBYANA.

KNOWN from the time of its introduction from Honduras in 1846 as Brassavola Digbyana, Lindley, a name which it still bears in most gardens even at the present day, despite the fact that its botanical features place it under Lælia and well separate it from the terete-leaved Brassavolae, the plant has always commanded a considerable amount of attention whenever its quaint fragrant greenish-white flowers have appeared. Of late years, additional interest has been taken in it on account of the opportunities which it gave the hybridist of producing novelties showy in appearance and striking in form. The first of these, and one which has been one of the most remarkable strides made by the raisers of hybrid Orchids, was the Lælio-Cattleya × Digbyana Mossiæ (fig. 31, p. 161), raised by Messrs. Jas. Veitch & Son between Lælia Digbyana ♂ and Cattleya Mossiæ ♀, and first flowered by them in May, 1889. The flowers are of a clear rose colour with a few crimson blotches on the lip, the tube of which is yellow with white veining and some small purple dots at its base. In the beauty of its fringed lip and the fragrance of its noble flowers it closely follows Lælia Digbyana, while in their colour and large size they resemble Cattleya Mossiæ. It is certainly one of the best of garden-raised Orchids, and it received a First-class Certificate at the Royal Horticultural Society on May 14, 1889.

The Lælia Digbyana of our illustration (fig. 30, p. 153), was flowered by Walter C. Walker, Esq., Percy Lodge, Winchmore Hill (gr., Mr. Geo. Cragg), and it received a tardy acknowledgment of its merits at the hands of the Orchid Committee at the last meeting of the Royal Horticultural Society, when it received a First-class Certificate.

CHINA ASTERS.

THE China Asters are amongst the best of all the annual garden flowers. They are of the easiest culture, most free of bloom, and comprise a multitude of forms and colours. They are therefore admirably adapted to profuse and generous effects in schemes of planting.

The evolution of the China Aster suggests that of the Chrysanthemum at almost every point, and it is, therefore, a history of remarkable variations. The plant is native to China. It was introduced into Europe about 1731 by R. P. d'Incarville, a Jesuit missionary in China, for [in honour of] whom the genus Incarvillea of the Bignoniæ family was named. At that time it was a single flower; that is, the rays or ligulate florets were of only two to four rows. These rays were blue, violet, or white. The centre of the flower (or head) was comprised of very numerous tubular yellowish florets. Philip Miller, the famous gardener-botanist of Chelsea, England, received seeds of the single white and red Asters in 1731, evidently from France; and he received the single blue in 1736. In 1752 he obtained seeds of the double red and blue, and in 1753 of the double white. At that time there appear to have been no dwarf forms, for Miller says that the plants grew 18 inches to 2 feet high. Martyn, in 1807, says that in addition to these varieties mentioned by Miller, there had then appeared a "variegated blue

and white" variety. The species was well known to American gardeners at the opening of this century. In 1806, McMahon, of Philadelphia, mentioned the "China Aster (in sorts)" as one of the desirable garden annuals. Bridgeman, a New York seedman, offered the China and German Asters in 1837 "in numerous and splendid varieties," specifying varie-

central florets of the head, and the production of the "quilled" flower. This type of Aster was very popular forty and fifty years ago. Breck, in the first edition of his *Flower Garden*, in 1851, speaks of the great improvement of the Aster "within a few years," "by the German florists and others," and adds that "the full-quilled varieties are the most

later days, and the many flat-rayed, loose, and fluffy races are now most in demand, and their popularity is usually greater the nearer they approach the form of the uncombed *Chrysanthemum*.

The China Aster had long since varied into a wide range of colours of the cyanic series—shades of blue, red, pink, and purple. I do not know

FIG. 30.—LELIA DIGBYANA, Bentham (1850): FLOWERS GREEN, LIP WHITISH. (SEE P. 132)

ties "alba, rubra, cœrulea, striata purpurea, &c." In 1845, Eley said that "China and German Asters" "are very numerous" in New England.

This name German Aster records the fact that the first great advances in the evolution of the plant were made in Germany, and the seed which we now use comes largely from that country. The first marked departure from the type appears to have been the prolongation or great development of the

highly esteemed, having a hemispherical shape, either a pure white, clear blue, purple, rose, or deep red; or beautifully mottled, striped, or edged with those colours, or having a red or blue centre." About fifty years ago the habit of the plant had begun to vary considerably, and the progenitors of our modern dwarf races began to attract attention. The quilled, high-centred flower of a generation or more ago is too stiff to satisfy the tastes of these

what its original colour might have been. The modern evolution of the plant is in the direction of habit, and form of flower. Some type varies—generally rather suddenly and without apparent cause—into some novel form, still retaining its accustomed colour. The florist fixes the variation by breeding from the best and most stable plants, and even other colours appear, until he finally obtains the entire range of colour in the species. So it happens

that there are various well marked races or types, each of which has its full and independent range of colours. The Comet type, now the most deserving of the China Asters, illustrates these statements admirably. The Comet form—the loose open flower with long strap-like rays—appeared upon the market about 1886 or 1887, with a flower of a dull white overlaid with pink. The pink tended to fade out after the flower opened, leaving the colour an unwashed white. The rose-coloured Comet next appeared, and the blue was introduced in 1890. The first clear white was introduced in America in 1892, coming from Vilmorin, of Paris, and the China Aster had reached its greatest artistic perfection.

The greatest desideratum yet to be attained in the China Aster is a pure yellow flower. There seems to be some general incompatibility between the cyanic and the xanthic, or yellow, series of colours. Yellow of a pure type has not yet been attained in the annual Phloxes, and many other plants which affect the blues and reds. Yet the Chrysanthemum and various other plants combine the two, and I confidently expect that the China Aster will eventually do the same. We already have distinct approaches to the yellow in the Lemon Gem, in which the flowers are suffused with a lemon-yellow tint, and in a yellow quilled variety introduced this year by Burpee as the Yellow Aster. This latter Aster is one of the crowned type, having a good yellow centre, and a border of whitish rays.

In the immense range of colour, form, habit, and season in the China Aster, the flower-lover can find almost any ideal which an annual Composite flower can be expected to satisfy. In earliness there has been a distinct advance in recent years in the introduction of the excellent French variety, Reine des Halles, which is known in this country as Queen of the Market. This variety blooms early in August at Ithaca, even when the seed is sown out-of-doors. One of the earliest forms of this type of Aster is Burpee's Queen of Spring, which will bloom by the middle of July if started in a frame by the middle of April. This Reine des Halles type of Aster was introduced in 1885 or 1886 by Vilmorin, although it had long been known in the Paris markets, but the stock was controlled by a few persons. This variety also has the freest and most wide spreading habit of growth, and the stems are so long that the variety is very useful for cut flowers. The Candelabra Asters are very like the Queen of the Market in habit, but are later.

In such a range of type, it is impossible to recommend any one of them as superior to all others. If one wants deep and glowing colours, I should recommend the Truffaut Asters, variously known as Perfection and Peony-flowered, and this type has a most beautiful pyramidal habit and a high-centred incurved comely flower. The shades of red are especially good in this type of Aster. Closely allied to this is the Semple strain, which has the distinction of being the only well-marked type of American origin. This type originated with James Semple, of Bellevue, Pennsylvania, who, by continued selection, has brought it to a high degree of perfection. The plant is a tall and robust grower, reaching 2½ and even 3 feet high, with long and strong stems, and very large flowers (often 3½ inches across) with incurved and often twisted rays. Two colours of this fine Aster are now fixed, the pink introduced in 1892 as Mary Semple, and the white, known as Semple White.

For myself, however, I should give the Comet Asters the very first place amongst all the various tribes. The habit is dwarf and compact, although free. But the great merit lies in the flat, soft, spreading long rays, which give the flowers a freedom and novelty of outline and substance which cannot be found in any other Aster. I am particularly fond of the great white Comet, and of the delicate shades of azure-blue. I should place the Truffaut, Semple, and Jewell strains of Asters—all of similar type—in the second place. The Jewell Aster, known as Apple Blossom, has no superior amongst the delicate shades of blush or pink. For

the third place, I should hesitate between the Washington and Chrysanthemum-flowered types. The Victorias are generally given a very high rank, and they are one of the most popular strains in England, particularly for pot-culture, but they have not behaved so well with me. They seem to be untrue and mixed in type, and last year many of them gave flat, open "eyes," or centres. Yet I should place the Victorias fourth or fifth in my list. Beyond these types, it would be difficult to single out one strain as superior to others for purposes of general cultivation. All of them have particular merits. The Queen of the Market is desirable for earliness, long stems, and graceful habit, and it is popular with florists. The Quilled Asters are now so far outnumbered by the flat-rayed section, that they may be almost classed with the curiosities. They are always useful for variety, and many persons admire their prim form. One of the best of these is the Victoria Needle, a variety which distinguished itself on our grounds last year by giving the latest blooms of any Aster. The Lilliput,—a slim-growing sort, with small stiff-petalled flowers—is also one of the favourites of the Quilled section. Reading Beauty is also an excellent Quilled Aster.

Another type of Quilled Aster is represented by the button-headed German Quilled, with its scant fringe of short rays. The best form of this is the Betteridge, an improved strain with large flowers.

Amongst the curious Asters are the Crown or Cocardeau, with a rim of dark colour, and a centre of white or light shades, the Harlequin or parti-coloured, and the many miniature or tufted sorts, some of which grow only 3 or 4 inches high, and bear a close bunch of small dense flowers. The very dwarf types are stiff and bunched, but they are often used for borders, and the plants can be lifted on the approach of frost, and put in pots, where they will continue to hold their flowers for three or four weeks.

It is impossible to construct a satisfactory classification of the China Asters. It is no longer practicable to classify the varieties by colour. Neither is it feasible to classify them upon habit or stature of plant, for several of the best marked types run into both tall and dwarf forms. Vilmorin, however, still divides the varieties into two groups, the pyramidal growers, and the non-pyramidal growers.* The most elaborate classification is that proposed by Barron, from a study of extensive tests made at Chiswick, England.† Mr. Barron has seventeen sections, but they are not co-ordinate, and they are really little more than an enumeration of the various types or classes. After considerable study of the varieties in the field and herbarium, I find the following scheme to be the most serviceable for my purpose:—

I. Flat-rayed Asters, in which all, or at least more than five or six rows of rays, are more or less prominently flat, and the florets open.

A. Incurved or ball-shaped Globe Asters.

B. Spreading or reflexed.

II. Tubular or Quilled Asters, in which all, or all but the two or three outer rows, of florets have prominently tubular corollas.

A. Inner florets short, outer ones longer and flat. Represented by the German Quilled.

B. All the florets elongated and quilled.—Condensed from an article by L. H. Bailey in the *Bulletin of the Cornell University Agricultural Experiment Station*.

ORCHID NOTES AND GLEANINGS.

CATTLEYA SCHILLERIANA DULCOTENSIS.

A BEAUTIFUL and distinct form of *Cattleya Schilleriana* is now in flower in the collection of W. Cobb, Esq., Dulcote, Tunbridge Wells. The flowers are large, and have sepals and petals of a rose-tinted

brown, with darker purplish-brown spots, and in these particulars it resembles other forms; but the broad reniform front part of the lip is of a rich crimson-purple, as clear and bright as that usually observed in *C. Warszewiczii*, and destitute of the whitish stripes or rays usually seen in the species. The only break in the colour of the lip is an almost imperceptible row of white dots inside of the fringed margin. The lip has a resemblance to that of *C. Aclandiae*, but it is of a darker colour. *J. O'B.*

BLETIA SHEPHERDI, *Hooker*.

Of the four species of *Bletia* recorded by Grisebach, this is probably the prettiest and at the same time the one most suitable for tropical cultivation. The Orchid is a purely terrestrial one, and thrives in the ordinary soil of the garden, and responds freely to the application of stable manure. In the floral section of the Royal Botanic Gardens we have a large bed containing some hundreds of this plant, which is now (April 18) in full flower.

It is probably a somewhat unique feature to see a bed of Orchids in bloom in the open air, with over a thousand well expanded flowers at one time. The flowers are, however, not developed at one season only, but are produced at intervals, though in smaller quantities, at several periods of the year, and the plant consequently serves as well for securing a supply of cut flowers as for flower garden decoration. *Bulletin, Trinidad Botanic Garden*.

CORYANTHES LEUCOCORYS.

A few years ago the members of the genus *Coryanthes* were thought to be difficult subjects under cultivation, but latterly, however, they are to be seen thriving and flowering very satisfactorily in some gardens, the improvements in the ventilation of Orchid-houses in recent times having probably something to do with the success attending the cultivation of these plants. *Coryanthes leucocorys*, a Peruvian species, is one of the handsomest and richest coloured of the genus, the large white helmet above the rich rosy-purple pouch of the lip being very remarkable. The yellowish sepals and petals are tinted with purple, and curiously folded. It has flowered with John Moore, Esq., Chardwar, Bourton-on-the-Water, who sends it for identification, and several specimens of it have bloomed with Messrs. F. Sander & Co., at St. Albans. *J. O'B.*

CYPRIPEDIUM KIMBALLIANUM.

A note under the above heading in the *Orchid Review*, August, p. 238, demands some notice.

It runs thus:—"A fine *Cypridium* is figured under the above name in a recent issue of the *Gardeners' Chronicle* (June 29, pp. 800, 801, fig. 125), where the note appears that it is 'supposed to be a hybrid between *C. Rothchildianum* and *C. Dayanum*'—a natural hybrid being intended. It will therefore be interesting to complete the history of the plant. It is in reality *C. præstans*, Rehb. f. (*Gardeners' Chronicle*, 1886, ii., p. 776), a New Guinea species, introduced by Messrs. Linden. It was afterwards figured in *Lindenia* (vi., t. 249) as variety *Kimballianum*, and ultimately became *C. Kimballianum*, through the omission of the specific name. When *Cypridium Rothchildianum* was introduced by Messrs. Sander it was recorded as a native of New Guinea, and Messrs. Linden immediately stated that it was identical with *C. Neoguineense*, which they had previously introduced. A flower from a plant purchased as one of the latter was afterwards submitted to us, and was certainly *C. præstans*, as was also one of *C. Kimballianum* from another source. It has also been re-described as *C. Gardineri*, of Guillemard, and confused with *C. glanduliferum*, Blume, another New Guinea species not in cultivation. The next thing is that *C. Rothchildianum* is not from New Guinea at all, but from Borneo. It is not a little curious that a New Guinea species should have to do duty as a natural hybrid between two Borneo ones, but after the above confusion one is prepared for almost anything, and the least we can do is to thus attempt to put matters straight."

The writer has failed in his laudable object, and only succeeded in introducing further confusion

* *Les Fleurs de Plaine Terre*, 4th ed., 856 (1894).

† *Journal Roy. Hort. Soc.*, xi., part i. 15 (1889); xii., part ii. 401 (1890).

into a subject complicated enough, but previously having no bearing on the present subject, viz., *Cypripedium Kimballianum*. The fact is, the writer of the note has "discovered a mare's nest," and seems to have jumped to conclusions and made erroneous surmises and statements.

There is, comparatively, little resemblance between *C. Kimballianum* and *C. præstans*, and it is therefore not necessary to point out the difference, but it may be said that the leaves of *C. præstans* are generally obtuse, fleshy, and shining plain green, while those of *C. Kimballianum* are acute, thin, and pale green, with a dark green reticulation, like those of some forms of *C. × Harrisianum*. In the flowers the colours are totally different, and in their structure they have little in common which would give the veriest novice an excuse for mistaking the one for the other. The extraordinary large cushioned staminode of *C. præstans* is a feature which places it away from any other species; its twisted angularly-extended petals are totally unlike the flat downward curved corresponding organs in *C. Kimballianum*, and in *C. præstans* the lower connate sepals are invariably larger than the upper—a very peculiar feature, while in *C. Kimballianum* the lower are not much more than half as large. *James O'Brien*. [Flowering specimens of *C. Kimballianum* before us are very considerably different from those of *præstans* as figured. Ed.]

CATTELEYA × HARDYANA.

A great number of fine varieties of this fine *Cattleya* are grown in the gardens at Tring Park, three of the most remarkable of which are *C. × H. marmorata*, whose petals are prettily marbled with crimson on yellow; *C. × Hardyana Laversinensis*, with petals of a rose-purple colour, showing white patches between; and *C. × Hardyana*, Tring Park variety, with sepals and petals wholly of a bright light tint of purple, the labellums in each case being of a dark velvety-crimson colour, veined with yellow, and velvety in texture. Two other varieties are in flower there at the present time, the flowers of each being distinct improvements on the form ordinarily seen in gardens, and they are fragrant. *J. O'B.*

STANHOPEA LOWII VAR. AMESIANA.

This variety, which proves to be one of the most beautiful, fragrant, and distinct of the new *Stanhopeas*, is now in flower in Major Joicey's gardens, Sunningdale Park, Berks. It is of the hornless section of *Stanhopea*, and its large, glossy, ivory-white labellum, and membranous white sepals and petals, constitute it a remarkably attractive flower. It was originally named *S. Amesiana*, but a comparison of the flower with that of *S. Lowii*, given in the *Gardeners' Chronicle*, December 2, 1893, p. 689, shows that it is a white variety of that handsome species. It flowers at intervals throughout the summer, and its flowers, which are fairly lasting, quickly succeed each other. It requires to be grown in a basket like all the other *Stanhopeas*. *J. O'B.*

HAMPTON COURT HOUSE.

As may be inferred by the readers of this note, Hampton Court House is in close proximity to Cardinal Wolsey's famous Palace, and it is in fact only separated from it by Hampton Court Green, both places the resorts of thousands of visitors. Very few, however, of the great crowd that visit Hampton Court have any idea that another beautiful garden is close at hand. Indeed, in the summer the place is so hidden by trees, that only here and there can a glimpse of the fine old residence be obtained. Hampton Court House, with its gardens and pleasure-grounds of some 9 acres in extent, is the property of Aug. de Wette, Esq., C.C., J.P. The main entrance is in a direct line with the London Road from Kingston-on-Thames, with the Hampton Court Green in its immediate front, and the wide expanse of Bushey Park behind and around it, and although in the very midst of life and gaiety, the occupants enjoy the utmost seclusion and quiet.

Once within the boundary, the visitor will not be

long in recognising, firstly, that Mr. De Wette is fond of gardening, and secondly, that special efforts are made to beautify the garden. It is by no means an every-day garden, with its series of flower-beds and borders, filled year by year with plants of a stereotyped order; but a garden rendered beautiful for the greater part of the year by grouping and massing a variety of plants with a view to effect; with this object, it is not surprising to meet with *Rhododendrons* in great numbers, also *Roses*, particularly the *Tea* varieties and hybrids from them. *Azalea mollis*, again, is an especial favourite here, great care being taken to select colours that will harmonise with those already planted. This is accomplished by periodical visits to nurseries in which *Azaleas* form a leading feature when the plants are in flower. This method is very generally followed when making selections of *Azaleas* and *Rhododendrons*. When a new bed is formed for them, the soil has careful preparation, and it is taken out to a good depth, a proceeding which accounts for the exceptional vigour and freedom of growth of the plants. Large banks of *Rhododendrons* form a very conspicuous feature, to say nothing of the many fine standards also to be seen elsewhere. For the most part the *Azaleas* occupy the lower parts of the undulating lawn, receiving shade from some distant Elms, and thus protected from direct sunshine, they last long in flower, and are seen to great advantage. Another charming feature is the Italian garden, in which there are a variety of subjects, mostly permanent in character. Being semi-circular in outline, and upon ground somewhat raised above the general level, views are obtainable. In a central position is a life-size statue called *Daw*, represented in the act of pouring *daw* on the verdure beneath. This garden is encompassed by a *Yew* hedge, with grassy steps here and there as approaches to the lawn. A low hedge of *Cupressus Lawsoniana aurea* constitute an inner circle, with handsome green vases at intervals filled with *Hydrangeas* in full flower, and immediately inside this is a narrow border, the chief occupants of which are *Retinopora squarrosa*, *Eionymus radicans variegata*, and green-leaved *Box*.

A series of beds in the centre on the lawn are filled with *Captain Christy Rose*, and others with *Marie Bauman*. The plants of the first-named are less than 2 feet high, very clean and vigorous, and teeming with buds and blooms. On either side of the grassy steps above noted, and in other equally suitable positions in this garden, may be seen some noble examples of *Golden Junipers*. Every one of these is a handsome specimen, about 10 feet high, well matched and furnished with branches and foliage, and well coloured. As an outer circle to the Italian garden, and approached from it, is the *Rose* garden proper, which contains a choice assortment of *Roses*, of which hybrid *Teas* and *Teas* predominate. One variety may be singled out as a noteworthy instance of a *Rose* for a very dry season on a light soil, viz., *Hon. Edith Gifford*. It is regarded by Mr. W. Neave, the gardener here, as the finest *Rose* of the season. Quite small plants of it were loaded with buds and blossoms, the latter opening perfectly. Festooning throughout this garden is *Clematis montana*, which early in the year is smothered with its snow-white wreaths of starry flowers. It is surprising this beautiful climber is not put to more extensive use in gardens, it flowers so freely, seeming to do best when left alone, or nearly so. For ascending and covering such things as *Wellingtonias* that have become disfigured, it has scarce any equal. In the centre of this *Rose* garden is a recess, from which the golden figure in the Italian garden previously alluded to may be viewed. Among the decorations here are some *Acer Negundo variegatum* standards, with *Clematis Jackmanni* rambling in the branches. In another part of the garden this species of *Acer* is used to form an arch over some circular beds of the bedding *Pelargonium*, *Henri Jacoby*.

The glass department consists of the usual forcing-houses, stoves, and plant-houses, in which a general assortment of the useful plants for table decoration

and cut flowers are grown. Among those grown for cutting are *Carnations*, represented by many hundreds of plants, both border and tree varieties. Indeed, *Carnations* are among the chief favourites of both Mr. and Mrs. De Wette, and apart from quantities of the leading varieties of commerce, are to be found numbers of varieties which have originated in these gardens. Quantities of seedlings are raised yearly, with the result that a strain of considerable merit is now established. Many beds are set apart for *Carnations*; appearances favoured a good display this season.

At the time of my visit, early in June, one house, containing about 600 plants of *Gloxinia*, made a beautiful display. Particularly noteworthy were the selfs, which can scarcely be equalled for size or solidity of bloom. Some massive whites, rich crimson-maroon, and crimson-lake selfs, were quite remarkable in their way. The shades of blue and mauve with the distinctive dottings and markings were very curious. *Elegans compacta* has flowers of a rich crimson-scarlet plush, with mottled tube; this is very free, carrying quite forty fully-expanded blossoms—most of the varieties were raised in the garden. Among the *Orchids* grown here are *Cattleyas*, *Cypripediums*, *Dendrobies*, *Oncidium*, and others; *Oncidium Lanceanum* being found a very useful flower for button-holes and the like.

Outside is a large and well-filled kitchen garden, every inch of space being occupied to meet the demand. Here and there among the trained *Apple trees* in the kitchen garden, the *Mistletoe*, very abundant in the *Limes* in the adjoining *Bushey Park*, finds a congenial home, and quite near to the ground. Quite a large border, between 200 and 300 feet long, is devoted to the bolder kinds of herbaceous plants; noteworthy among these being some fine, well-established clumps of *Pæonies* in variety, *Delphiniums*, *Oriental Poppies*, *Eryngiums*, *Pyrethrum uliginosum*, and such like. Beds are also devoted to some of the earlier flowering *Gladiolus*, *Blushing Bride*, *Prince Albert*, and *Colvillei*.

Not the least fine feature of these gardens is the conservatory, a fine building of considerable size, attached to the mansion. Some fine specimen *Palms* are to be seen here, notably *Areca spida*, fully 20 feet high, and in splendid plumage; *Areca Baueri*, some 30 feet high. *Tæsses*, with many others, together with some artificial rockwork, now beautifully covered with a variety of subjects, trailing and otherwise, all play their part in gracing this handsome building.

A garden like that at Hampton Court House, containing, as it does, so much that is beautiful and interesting, is rarely met with. It is obviously the outcome of much careful study on the part of its owner, ably assisted by his gardener; and from one end to the other the gardens are a pattern of good order and neatness, while the many instances of high-class culture that prevail testify to the ability of Mr. Neave. *E. Jenkins.*

THE SEED CROPS IN THE EASTERN MIDLANDS.

A VISIT to the seed-growing districts of Lincolnshire shows that taking one part of the country with another and striking a balance, the seed *Pea* crops promise to be better than in other parts of the country; the effects of the drought not having been so severely felt, as welcome showers fell in May and June, and during the early part of July. In the more southerly parts the drought was more severely felt, and the crops are in consequence less promising. It is early yet to make anything like an approximate forecast.

Beans.—In the seed-growing districts round Boston a full average crop of *Broad Beans* is expected; at the time of our visit the pods were filling well, the stalks green and healthy, with little appearance of the smother-fly. The *Harlington Windsor Bean* is the variety most grown about here, and especially for market, the white variety being preferred to the green. *French Beans* are a somewhat limited crop,

and Scarlet Runners also, but what are being grown look well. Cultivation for seed is more general in the counties of Bedfordshire, Kent, and Essex.

Cabbage.—As a market Vegetable, Cabbages are largely grown in the Boston and Spalding districts. The plants were injured during the winter, and there was at one time a lack of usable green stuff. Spring Cabbages were cut for market earlier than usual, and it being usual to sow large breadths of Rape in the autumn for sheep feed, the farmers took advantage of the dearth of vegetables, and when the Rape was in full leaf, the leaves were cut and sent to market, finding a ready sale. Plantations for seed appear only in small breadths, but they are healthy, though a good deal of the seed plant was injured by the frost; what remains is expected to yield well. The two leading varieties of Cabbage grown in the Eastern Midlands are the Early Rainham and the Offenham. Boston is famous for the high quality of the stocks of each.

Swede and Turnip crops for seed were also much damaged, and a large acreage destroyed. It was late in the season when the plants commenced to grow; numbers were sickly, and made no progress when the flowering time came. Swedes were found to be much cankered, and the bloom was damaged by the high winds which prevailed in April and May; at one time it appeared probable that a very small quantity of seed would be saved. The rains which fell early in June, however, were instrumental in freeing the plants of a good deal of insect life, and those plants which made a later growth promise now a fair yield of seed. Such samples of seeds already gathered duly winnowed, which we saw, were of an uneven character.

Mustard.—Not very many breadths of brown and white Mustard were sown, owing to the low prices prevailing for seed, the farmers fearing they may produce an unremunerative crop, and so add to their difficulties.

Potatoes.—The early varieties are very extensively planted in the Eastern Midlands, and up to moulding-up time the plants made a strong and even growth. Dry weather following proved prejudicial to the production of ample crops, though samples have proved fairly good, and prices are ruling somewhat high. The sorts chiefly grown for market are Myatt's Ashleaf, Early Paritan, Duke of Albany, Beauty of Hehrton, and Snowdrop. Myatt's Ashleaf furnishes the first crop, growers depending entirely upon this for an early supply, and enormous quantities are sent to all parts of the country from Boston and adjacent stations.

Peas for Market are largely grown in the fine loams found in the Eastern Midlands. For earliest crops the principal varieties are Earliest of All, Blue Alaska, and Harrison's Eclipse—practically three names for the same variety; and these are being replaced by early wrinkled forms of the William Harat type. To follow, come Telegraph, Improved Prizetaker, Harrison's Glory, and Prince of Wales, all dwarf in growth, as the fertile loam causes a vigorous growth of haulm; but the crops are heavy. These are the main crops; for later crops, Veitch's Perfection and Yorkshire Gem are grown. The attention of growers is being turned to the Early Wrinkled Marrows in course of distribution by Messrs. Sutton & Sons, of Reading, and it is expected some of the older sorts will be displaced by these improved types. *Pisum.*

BOTANICAL GARDENS, EDG-BASTON, BIRMINGHAM.

THESE gardens, so delightfully undulating, and so rich in trees and shrubs, well repay a visit at the present time. Since the welcome rains came, everything has brightened up wonderfully—freshness and beauty are on every hand, and the order observed everywhere is admirable, and reflects credit on Mr. W. G. Latham, the Curator. On the terrace the flower beds are becoming gay, while on the sloping bank the beds are not only elaborately planted, but they are effective with varying tints of foliage and flower. In the herbaceous department there is quite

a wealth of bloom, and the High Nettlefold alpine garden is fast becoming furnished. A more delightful lounge can hardly be met with so near that great industrial centre—Birmingham.

The show-house is gay with Fuchsias, which Mr. Latham employs with great effect. Some of the species are very striking, such as corymbiflora, now in full bloom; fulgens, triphylla, &c.; and of the decorative varieties, Rose of Castille Improved, Lye's Cuarming; Albion, a fine dark; Dr. Sankey, very distinct; and a few others are laden with bloom. There is a very fine example of Crinum Macowanii in full bloom; overhead Lapageria rosea and alba are in full bloom, and the huge double-white Camellia, as well as the species reticulata, are seen to be well set with buds.

In one of the greenhouses *Sigmaphyllum ciliatum*—the golden Vine of Brazil, is flowering abundantly on the roof; a very showy climber seldom seen. *Francoa ramosa* is represented by fine plants, the white flowers thickly set on branched inflorescences; *F. sonchifolia* has an unbranched spike of pink flowers, with a darker blotch near the base, the petals not quite so broad as those of *F. ramosa*. *Strobilanthus Dyerianus* deserves to be noticed as a very handsome-foliaged plant, its purple leaves glisten with a bright metallic lustre. *Crossandra undulatifolia* is a plant seldom seen, its reddish-orange flowers produced in spikes, and both distinct and attractive. A very curious plant is *Ceropegia Sandersonii*, from Natal, the flowers pale green, mottled and veined with darker green, with a peculiar translucent appearance, the five petals uniting to form an umbrella-like cap, which is ciliated along the margin with flat capillary processes. It is a vigorous-growing greenhouse climber, resembling an *Allamanda*. What is grown here as *Alonsoa acutifolia*, probably a form of *incisifolia*, is a somewhat dwarf-growing and free-flowering greenhouse shrub, with bright scarlet flowers, having dark centres. There is a collection of *Gloxinia*s that show fine quality, and tuberous-rooted *Begonia*s, of which there is a large collection, are superb and very attractive. *Passeiflora Raddiana* (kermesina) is flowering freely on the roof; *Impatiens Hookeri* is blooming finely on the stage, and plants of *Fuchsia triphylla* exceedingly gay.

In the stove-house, *Odontadenia speciosa* is still flowering; its bright yellow, orange-shaded, Dipladenia-like blossoms, are very showy; *Gloriosa superba* is very striking on the roof; and a huge blossom on a plant of *Aristolochia gigas* had a great interest for visitors. *Phalaenopsis Emeralds*, from Siam, had two spikes of flowers, though the plant is small; and the foliage of *Acalypha tricolor* is bold and richly coloured.

In the aquatic-house the *Nymphaeas* are flowering freely, and in all departments the most painstaking culture can be noted. At all seasons of the year, a pleasurable visit can be made to the Birmingham Botanical Gardens. *R. D.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorset.

DENDROBIUMS.—The deciduous *Dendrobium*s must be frequently looked over, as many of them are completing this season's growth, and have reached the stage when possibly they may start afresh; it is therefore advisable to go carefully over the plants, selecting those that have finished making their growths, and have the terminal leaf at the extremity of the bulb expanded, to be placed on one side of the house where more light and air can be admitted, and less moisture given them. They should also be gradually exposed to full sunshine, and until the leaves commence to turn yellow the plants should not be allowed to remain dry for long together. So soon as the plants have become used to the extra sunlight, and the new bulbs are fully developed, they should be removed to a cooler and drier atmosphere. They are perfectly safe if put in ainery or any other airy structure where at the present season the night temperature is about 55° to 60°. When fully exposed to the sun's rays, careful judgment should be

exercised in watering the plants, as the sphagnum-moss on the surface appears to be quite dry, when underneath it is not so, and if the roots are thus kept in a constantly saturated condition they will decay. Examine the plants day by day, and immediately any signs of the bulbs shrivelling are detected give them a thorough watering. Plants in small pots or shallow pans which have become pot-bound should be taken down and dipped in a pail of water to ensure a thorough soaking, but they must receive no more until the whole compost has become dry.

THUNIAS.—The *Thunias* which are now fully exposed to the sun are frequently attacked by red-spider and black thrips. These insects must be kept down, or they will soon establish themselves amongst other plants, and, as sponging of the leaves absorbs too much time, the best remedy is to lay the plants down on their sides over a tub or bath, and well syringe the foliage with strong nicotine-soap in the proportion of 3 or 4 oz. of soap to 1 gal. of warm soft water. Allow the plants to remain down for an hour, so that the insecticide may dry on the leaves. Afterwards the plants may be well syringed with clear water, and put back in their places.

HABENARIAS.—*Habenaria militaris*, *H. Susanna*, *H. carnea* and its pure white variety, *nivosa*, are now forming their bloom-spikes, and a sharp lookout must be kept to prevent thrips from disfiguring the buds. Nicotine-soap used at the rate of 2 oz. to the gal. of warm water is an excellent and safe cleansing mixture. Every care should be taken that the solution be thoroughly washed off immediately after dipping, and the plants protected from all sunshine for a few days.

CATTLEYAS, ETC.—Such plants as *Cattleya anrea*, *C. gigas*, *C. Rex*, and *C. Gaskelliana* are now commencing to root freely from the newly-made growths. Now is the best time to repot or to surface-dress those that require it. When repotted the plants should be placed at the coolest end of the Cattleya or intermediate-house, where they may obtain sufficient light and air to thoroughly harden their newly-made bulbs. Very careful watering is necessary until the plants are re-established, and only sufficient should be given to prevent the roots perishing. *Lælia purpurata*, *L. tenebrosa* and *L. cinnabarina* are starting to grow and may also be repotted now. The young breaks quickly send out a number of new roots, which will readily enter the fresh compost. Keep these *Lælias* well up to the light in the Cattleya-house, and give them liberal treatment in every way until growth is completed. In the cooler part of this house *Vandas* of the tricolor and *navis* section are now in full growth, and a decidedly moist atmosphere should be maintained around them, and the ventilators nearest to them may be opened whenever the external air is above 55°. They do not require to be saturated with water at the root, only sufficient being necessary to keep the sphagnum-moss fresh and green. The rare *Dendrobium Falconeri giganteum* will grow well under similar treatment, but a little extra sunlight is best for it. Red-spider is its greatest enemy, and must be kept down at any cost. In the *Odontoglossum*-house such species as *O. grande*, *O. Schlieperianum*, *O. Inceleyii* and its several varieties are making growth, and should be placed in the warmest corner. If they are not already repotted, this should be done before the flower-spikes show.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

SPINACH.—Prepare a piece of good ground in which to sow Spinach for early winter and also spring supply. The second or third week of August will be quite soon enough for early warm districts, but I would recommend two sowings (at the least) to be made at a week or so apart. The same date each season will not always prove to be the right one. Where this dish is very much appreciated, I would make three sowings. Choose, if possible, a piece of sweet, well-drained, mellow ground. If water is stagnant in the soil in winter, the frost will affect the crop greatly. The situation should be well exposed to sun, but not where frost is known to be extra severe. Sow in rows 15 inches apart, and directly the plants are 2 inches above ground, thin them at first to about 1½ inch apart, and before they become crowded again take out every other one, leaving them at 3 inches apart. The thinnings may be used for table, and these sowings should provide plentiful

pickings during October, November, and all through the winter, if a mild season. Soot is a good manure for Spinach. The Improved Victoria broad-leaved is quite equal to the old prickly variety for standing the winter, and produces a much better leaf.

BROCCOLI.—Look over beds previously planted and fill up any gaps that have arisen, dust the plants occasionally with soot or lime to keep vermin in check, and slightly earth up any that require protecting from the wind. A batch of late varieties may even yet be planted, and will prove of good service next spring, if the plants are good when put out. As these are dwarf and of compact habit, do not be tempted to plant them much closer than the larger-growing varieties; plenty of room must be given if they are to stand through a hard winter.

CARROTS.—If pits are not available for these, a sowing should be made now outside. It will furnish small roots for drawing young, and if a mild winter ensues, they will also be of service in the spring, but they must be sown in a warm sheltered position on good land free from wireworm.

GENERAL WORK.—Do not by any means let weeds ripen their seeds, but have them hoed up the first hot sunny day available. Such crops as Runner Beans, if bearing heavily, should be afforded liquid manure occasionally. Onions, Beetroot, young Cauliflower, Turnips, and almost all other root crops should be given a dressing of soot when rain is expected. Make liberal sowings of Orange Jelly and Chirk Castle Blackstone Turnips for winter use. The first wet day will afford an opportunity to string or tie in small bunches Garlic or Shallots. The Mushroom house too, should be cleaned of all refuse, and the walls be freshly washed with lime. Walks must be kept clean, and where box edging is used, this must be done by hoeing or hand weeding.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

LAWNS AND PLEASURE GROUNDS.—Since the recent heavy rains the turf on grass lawns has improved, and in places where it has been killed by the drought and brown patches are seen, a sprinkling of lawn grass seed should be sown, and a slight top-dressing of fine soil given with a small quantity of phosphate manure mixed with it, sweeping the turf well over after, and rolling it well. Newly-sown grass lawns should not be cut closely with the machine, but if they are mown several times over with the scythe the first season, the grass will be better for it. Continue to mow weekly with the lawn-mower old lawns that require to be kept in good order. Where the grass has not been mown during the dry weather it should be scythed over twice to take off the long bents of grass that the machine will not take. The present time is convenient to take out Plantain and other weeds and brushing soil into the holes made; keep grass edgings well clipped. Gravel paths and carriage drives should be kept free from weeds, and the accumulation of silt and rubbish about the openings of drains should be daily removed during stormy weather.

SHRUB BEDS AND BORDERS should be frequently hoed and raked until the falling of the leaves. During the next few weeks beds and borders of shrubs should be looked over and notes taken before the fall of the leaf in regard to the transplanting or pruning back of deciduous varieties that are growing too thickly. The autumn growth of Evergreen shrubs should be encouraged, and all the light and air possible given them. Evergreens are often injured by Lilacs and other quick-growing deciduous shrubs which shade them during the autumn months. The budding of double-flowering Thorns and other deciduous plants may now be done where the bark of the stock is in good condition. Evergreen hedges of Privet or Yew should be cut into the required shape, and edgings of Box, Ivy, and other evergreens trimmed. Ivy edgings of beds recently planted should have the shoots pegged down as they grow until they have formed a good edging, and old edgings of Ivy should be kept as free from weeds as possible. Care should be taken not to cut plants of Ivy growing as edgings or on walls at this season with the garden-shears; if the shoots require cutting a knife or pruning scissors should be used. No large foliage evergreen shrub should have the leaves cut, at this time of the year especially. Make secure strong shoots of Virginian Creepers and Clematis growing on walls.

PROPAGATING.—Cuttings of bedding Pelargoniums should be taken as soon as they can be obtained and struck in boxes out-of-doors in the full sun. Cuttings of Verbenas, Coleus, Iresines, and Alternantheras will strike freely in a closely-shaded pit or house, and if there is a little bottom-heat for them so much the better. Cuttings should afterwards be taken of Pentstemons, Antirrhinums, double-flowering Rockets, Lychnis, Veronicas, &c. These will strike very well in a bed under a cold frame and in pots under hand-glasses if shaded from the sun and given a light rich fine soil, with a good covering of sand.

SEED SOWING.—During the present month seed should be sown of annuals required for planting in beds during the autumn or early spring months, such as Saponaria calabrica, Nemophila insignis, Collinsia bicolor, C. grandiflora, C. verna, Limnanthes Douglasii, and varieties sulphurea and odorata; Silene pendula, Alyssum maritimum, Bartonia aurea, Candytuft, and Virginia Stocks. Brompton Stocks should also be sown on a sheltered border. Prick out Wallflowers as soon as they are ready, also Pansies, Violas, Anemones, and other seedling plants that are required for autumn planting.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

HEAVILY CROPPED TREES.—Fruit trees that may be carrying very heavy crops, or that have perfected their fruit and show signs of weakness, will be greatly benefited by a good soaking of liquid manure, or failing that, a top-dressing of fish manure, guano, or other good stimulant, which may be applied to the surface and well watered in. Timely attention to this matter will probably ensure a crop of fruit next season, other conditions being favourable, on trees that without such special assistance would require a season of rest to recover from the exhaustion consequent on heavy cropping.

RASPBERRIES.—As soon as fruit gathering is finished on Raspberry plantations the bearing wood should be cut clean away, and if more young canes are still left than are needed for next year's fruiting, these should also be thinned by cutting out the weakest. The remaining shoots should be secured to the trellis or other support, so that they may be fully exposed to light and air, and be safe from damage by high winds. Any loose manure left from the mulchings may be raked off, and the surface-soil thoroughly loosened by hoeing. If the surface-soil be left rough, it will be considerably sweetened. Should the canes be making only poor weak growth, they require to be assisted by good waterings of sewage or liquid-manure from the farmyard.

GATHERING EARLY PEARS.—Early Pears, such as Jargonelle, Williams' Bon Chrétien, &c., as they approach maturity, may be gathered a few at a time and laid on the shelves of a cool fruit-room for a few days until required for use. By growing these early sorts in different aspects, and gathering a few fruits daily as they approach the ripening stage, the early Pear season may be greatly prolonged.

PLUMS.—Plums now ripening must be afforded some protection against birds, and as far as possible from wasps, which are this year much too plentiful. A few trees of the choicest dessert kinds should be covered with hexagon or other fine netting, fastened closely at the sides so as to entirely exclude wasps. Many may be trapped and destroyed by hanging wide-necked bottles about the walls half filled with syrup, or a capital trap may be made with a couple of hand-glasses, standing the lower glass on bricks, one at each corner, and putting a few half-rotten Apples or other fruit inside as a bait; the other glass must be placed on the top, taking care to fit it nicely round the junction of the two glasses. Make a small hole at the top of the underlight so that they may ascend into the trap, from which they are not likely to return. No effort should be spared, however, in searching for and destroying every nest possible, as during a fine warm autumn they increase at an astonishing rate.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

IXORAS.—These plants will require plenty of water at the root, and a sprinkling of Clay's Fertiliser on the soil. Ixora plants in flower should be placed apart from others, the blooms being readily injured by the syringing afforded the flowerless section. In the absence of syringing, mealy-bug is sure to

increase, and in the case of the flowering specimens, the use of a small brush dipped in methylated spirits in its destruction is to be recommended. The paths and walls in houses where Ixoras are growing should be kept nearly always in a moist state.

CALADIUMS.—Plants of these started early in spring will have begun to show signs of maturity by the dying down of the leaves, and a little less water should be afforded them. If they have become shabby, place them beneath the stove-stages where drip will not reach them. When quite dried off, carefully take the tubers out of the soil and place them in boxes filled with dry sand or coconut fibre refuse, and store these in a place of not less warmth than 60° for the winter.

CYCLAMENS.—Sow at this season seed of Cyclamen, using shallow well-drained seed-pans filled with a mixture of loam, leaf-soil, peat and sand. Sow rather thinly, and not deeper than the thickness of the seeds. Place the pans in a cold frame, cover with a piece of glass, and keep them shaded till germination has begun. Cyclamen plants for flowering this winter ought now to be growing freely, and they will need to have water very carefully afforded, avoiding the extremes of too much dryness or the reverse. In bright weather the plants may be lightly syringed three or four times a day. To keep the plants from getting one-sided turn them round twice a week. If aphid or thrips appear on them, vaporise the house with Xl. All.

MIGNONETTE.—The main sowing for winter flowering may now be made, putting three or four seeds in large 60's. Place the pots in a cold frame till the seeds are up, when a partly shaded position outside will suit the plants best.

HUMEA ELEGANS.—As the young plants fill their pots with roots, continue to repot them, using good rich loamy soil, potting firmly, and do not afford water for a few days after re-potting. A cold frame is a suitable place for them until they are re-established, afterwards placing them out-of-doors, and keeping them there till it is no longer safe to do so.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

WINTER CUCUMBERS.—If not already done, no time should be lost in sowing seeds of suitable varieties of winter-bearing Cucumbers. I prefer to raise the plants at this season in the plant-stove, where there is a brick heat, and less fear of the young leaves being injured by red-spider. When Cucumber plants are raised in pits and houses containing old Melon and Cucumber plants, there is always a danger of this occurring. Sow the seeds in thumb-pots, and place these on a shelf near the roof-glass as soon as the seeds germinate. In the meantime a house should be prepared for their reception, so that they may be placed in their winter quarters at an early date, to become well established before the autumn commences. The house should be cleared of all the old soil, the woodwork scrubbed or painted, and the walls lime-washed twice. A hot-bed should then be made up of well-prepared fresh fermenting material—leaves and stable-dung—and hillocks of new, light soil prepared for the plants, which may be planted out when the heat of the bed has declined to 85°. After the plants have been put out on the hillocks they must be encouraged to make strong short-jointed shoots and leaves of firm texture, which can only be done by close attention to the ventilation, feeding, and affording enough warmth. Sufficient seed should always be sown to enable the gardener to have a few plants in reserve in case of accidents. For winter work I prefer the Cardiff Castle variety, a small-fruited kind that is more productive than many of the larger ones. Old plants should be cleared out as they become exhausted, and the houses thoroughly cleaned to receive other crops. This also applies to Melons and Tomatoes, so as to allow of the houses being painted. Now also is a good time to have the heating apparatus examined, as the fire may be dispensed with if necessary for a few days, to enable the workmen to make good all the bad joints. The work in the different departments at this season consists in freely ventilating all houses which have borne crops, and protecting ripe fruit from wasps and flies. I have found it necessary to place muslin over the ventilators, as wasps are very troublesome this year.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, AUG. 13. { Royal Horticultural Society's Committees, at Drill Hall, Westminster.

SHOWS.

TUESDAY, AUG. 13. { Horticultural Shows at Blagdon and West Malvern.
{ Bishop's Stortford Horticultural, Cardiff Horticultural (two days).
WEDNESDAY, AUG. 14. { Eastbourne Horticultural, Wiltshire Horticultural, at Salisbury.

THURSDAY, AUG. 15.—Martock Horticultural.

SALES.

TUESDAY, AUG. 13. { Imported and Established Orchids, at Protheroe & Morris' Rooms.
FRIDAY, AUG. 16. { Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62°.5.

At the meeting at Ghent convened to consider this question, M. l'Echevin BRUNEL presided. He briefly summarised the state of affairs since the enactment of the Berne Convention. The Italian Government has at length demanded the entire abrogation of the rules that have proved so futile and which have caused so much loss and inconvenience. It suggests a meeting of the signatories of the Convention to carry this into effect. The Belgian Government solicited the opinion of the Syndicate of Belgian nurserymen on the subject. In reply the Committee of the Syndicate expressed the opinion that nothing short of the entire abolition of the Convention would be satisfactory, and this opinion was received with general acclamation by the meeting. What steps the British nurserymen and those amateurs who have occasion to send plants abroad will take, remains to be seen. Hitherto they have preferred to acquiesce in submission rather than endeavour to free themselves from the shackles. They have an opportunity now of strengthening the hands of those who desire the abolition of the senseless prohibition, and it is to be hoped they will avail themselves of it.

WHERE heavy rains have fallen, on land warmed by the late tropical heat, most varieties of the Potato will have commenced to push out a second brood of tubers from those which are already well developed in the case of early and second early, and less so with late varieties. It is the natural consequence of a change from heat and drought to continued rainy weather, and nothing that the cultivator can do in garden or field will be of any avail short of lifting such varieties as are approaching maturity. These will include all early and second early varieties, which would be more injured by remaining in

the earth, than by storing them in a cool dark place that is fairly dry. The ordinary clamp will not do at this season, the weather at this season favouring sprouting in such store places.

In a season like the present, the advantages of wide planting become more apparent than usual; for the soil, being but sparsely covered by the shoots and foliage of the Potatos, is more rapidly dried by the sun. Moreover, should the disease attack them, the spores would chiefly fall on land under which no tubers are found. With crowded rows, say, from 2 feet for Ash-leaves, to 3 feet for the more robust of the early and second early, the tops cover the soil, and in the case of an attack of disease, the spores of the fungus actually fall on the ground beneath which the tubers lay, readily affecting them; in fact this method of planting affords no sort of protection against disease, but rather favours its spread.

If gardeners, and cultivators generally, would practise wide planting and the Jensenian mode of moulding up the stems, a double benefit would accrue in seasons like the present; the smooth, sloping sides of the ridges causing the rain to find its way to the furrows instead of soaking the former, the spores of the fungus, if any, taking the same route. All of this has been often repeated, but there are few who pay any heed to the voice of one crying in the wilderness. Our farmers will be found lamenting, as usual, the loss of money involved in a lessened crop of Potatos, a loss which in most cases is the natural outcome of a lack of precaution on their part. Of course it is, to some extent, a question of expense. Does it pay better to lose a large part of a crop, with some problematical advantage in higher prices being got for the remainder of it, or to follow Jensenian methods? That is a question for experts. The consumer will get what potatoes he wants and that are lacking at home from the foreign cultivator, and only our own growers will be any the worse.

The Hautbois Strawberry.

THOSE about to plant should not omit the Hautbois varieties. The species is more distinctly delicious than cross-bred varieties; and the buyer should therefore ascertain from the nurseryman or the friend who supplies the runners, if the sexes are fairly well mixed in the plantation from which they were taken. Failing to do this he may get plants all of one sex, or but very few of the other, with the result that the bed will produce little or no fruit. This may be a reason for the rarity of the species in gardens. The Hautbois succeeds on partially shaded borders, or on one at the back of a wall sloping to the north. In good soil it is a strong grower, and the rows should not be less than 3 feet apart. Once planted on good ground, and top-dressed annually with well-rotted stable-dung or leaf-mould, a bed of Hautbois Strawberries will continue in bearing for a dozen years. Sometimes the plants in old beds, if annually manured, run too much to leaf, and some discretion should then be exercised in the matter of dunging. There is nothing to be gained by frequently making plantations of this species, the plant seeming to succeed better when growing in thickish rows, which afford a good deal of shade to the fruits and the roots.

If a plantation appears to have seen its best days, the runners, which are sure to consist of a sufficient mixture of males and females, should be allowed to occupy the alleys, rooting all over them, but being thinned out where standing at a less distance than 6 inches apart. When the

fruiting season is passed, the old plants may be shovelled off, and the land where they stood double dug.

The varieties are the Royal Hautbois, one white, the other purple-fruited, and larger than any of the others, as well as being richer flavoured. Prolifio Hautbois (Balle Bordelaise) has small fruits, almost black on the sunny side, and on the shady side purple. The fruit has the peculiar flavour of the race.

ANGRÆCUM PELLUCIDUM (see Supplementary Illustration).—First introduced by Messrs. LODDIGES from Sierra Leone in 1842, and since that time occasionally imported, but only in small quantities, this beautiful species may be said to have never been generally cultivated. Although not having the large flowers of *A. seagipedale* and some of the other species, it has always been regarded as a plant of sufficient beauty to warrant its being more widely distributed in gardens when the enterprise of the collector sees fit to make a good importation of it. Our illustration, taken from a photograph of a specimen which has been growing for some years in one of the warm Orchid-houses in the gardens of Sir TREVOR LAWRENCE, Bart., at Burford, Dorking, shows to what beauty the plant may be made to attain by careful cultivation, its long sprays of opaque cream-white flowers depending from among the fleshy dark green leaves being graceful in the extreme. *Angræcum pellucidum* may be grown in a pot, but if so cultivated means should be provided for suspending it when in flower, or the spikes are apt to stop short and not display their full beauty. Generally speaking, it requires the same kind of treatment as the *Phalænopsis*—a warm moist atmosphere and protection from bright sunlight in summer.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will be held on Tuesday, August 13, in the Drill Hall, James Street, Victoria Street, Westminster. At 3 o'clock a paper by Mr. A. B. FREEMAN-MITFORD on "Hardy Bamboos" will be read.

MR. BARRON'S RETIREMENT.—In reply to numerous enquiries, we are in a position to state that, after the long vacation, steps will be taken to secure that a public recognition of Mr. BARRON'S long and loyal services to horticulture be made by his friends, and by those who value the conscientious discharge of duty under very difficult and depressing circumstances.

LEICESTER (AUGUST 6).—The great exhibition of Flowers and Fruits in the fine grounds of the Abbey Park commenced on August 6 amid sunshine and showers, and was a very successful show, likely to reconquer the Corporation for its large outlay, and the energetic organiser and superintendent, Mr. JOHN BURN, for the amount of labour and anxiety which he must have had before he succeeded in getting such a beautiful and harmonious display in the six great marquees in which the exhibits were arranged. At 1 o'clock the exhibition was opened by the Mayor, who, in his speech, which showed how truly he was a gardener in heart, touched on some of the exhibits, and especially on the praiseworthy display made by the cottagers and allotment gardeners, which he said formed one of the most satisfactory proofs of the beneficial results of these shows, which had now been running at the Abbey Park with increasing success for ten of the thirteen years which had elapsed since the skill of Mr. JOHN BURN had redeemed it from an unsightly marsh. A great crowd of visitors flocked to see the show, which embraced many very fine exhibits, two of the best being a grand display of Begonias by Messrs. WARE, and of Caladiums by Messrs. JOHN PEEB & SON. In our next issue we hope to give a fuller account of the show.

THE USEFULNESS OF GARDENING.—Speaking at the Hawarden Flower Show Mr. GLADSTONE remarked:—"You may depend upon it there is an

ANGRÆCUM PELLUCIDUM, IN THE GARDEN OF SIR TREVOR LAWRENCE, BART.

immense deal to be done in this country by drawing forth the bounty of old mother Earth in detail. It is all very well to talk about machinery—and there was a time when people used to think that the steam plough was going to drive hand labour out of existence—and undoubtedly in manufacture the advances of machinery have been astonishing; but as regards cultivation of the earth, as regards garden cultivation, as regards all small cultivation, depend upon it there is more room than ever there was for both adding to the store of the beautiful products of Nature, with the capacity of producing which Providence has bountifully endowed the soil, and likewise of increasing, and largely increasing and consolidating, the efforts and advantages of rural life. The use of gardens, the universal provision of gardens, is a matter of the greatest importance to the country. It is of the greatest importance also, and most desirable, that other small holdings, as they are called, should be multiplied; and I trust—I most earnestly trust—the day will come, and will soon come, when these holdings will be made universal."

THE ROYAL BOTANIC SOCIETY.—The fifty-sixth annual meeting of the Royal Botanic Society will be held in the Gardens, Inner Circle, Regent's Park, on Saturday afternoon, the 10th inst., at 1 o'clock. The meetings, writes Mr. J. S. RUBINSTEIN, Hon. Auditor R.B.S., 56, West Cromwell Road, S.W., have been held on the same date since the Society was founded in 1839, but if they were to take place at a more convenient period of the year, a much larger attendance of the Fellows would undoubtedly be secured, and it is thought by many that in this and in other matters the charter might now with advantage be revised. The business to be transacted includes the election of eight members of the Council, the presentation of the Council and auditors' reports, and the consideration of a resolution to be moved by Mr. J. S. RUBINSTEIN, congratulating the Society on the great success of the experimental opening of the Gardens to the public on the Bank Holidays and other days this year, and recommending the Council to admit the public to musical promenades to be given next season on the afternoon and evening of every Monday and Saturday.

TORQUAY DISTRICT GARDENERS' ASSOCIATION.—The third annual outing of the above Society took place on Tuesday, July 30, when about forty members proceeded in brakes to Ashburton, Buckland Drives, Widecombe-in-the-Moor, and Heatree. By the kindness of Mr. B. J. BASTARD of Buckland Court, the party were permitted, under the guidance of Mr. W. LEACH, the head gardener, to pass through the most choice parts of the grounds. The grandeur of the scenery commanded from the middle drive at this place is unsurpassed in Devonshire. Luncheon was had at Widecombe, and by the permission of Mr. J. KITSON, an inspection was made of a portion of the plantations recently made at Heatree. It was remarked that the Rhododendrons were exceedingly thriving, as were also such Conifers as Cupressus Lawsoniana, C. macrocarpa, Thuiopeis dolabrata, and many others. These did not appear to have suffered at all from the severe winter, in spite of the exposed moorland position. The party started on the homeward journey *via* Manaton, Becky Falls, and Bovey Tracey, an enjoyable day having been spent. Mr. F. C. SMALE (Hon. Sec.) was responsible for the arrangements.

COTTON, COFFEE, AND VANILLA CULTURE IN TAHITI.—Referring to the cultural industries of Tahiti, the British consul states that Cotton has always been the favourite culture of the native population, but owing to the extremely low prices that have latterly ruled, both locally and in Europe, its cultivation is being gradually abandoned. Tahiti Cotton no longer pays to produce, and it would be an excellent thing for the island and for some of its dependencies if the natives could be induced to undertake in its place the culture of Coffee, which grows in the island under the most favourable circumstances. The quality has been declared by European

and American experts in Liverpool and New York respectively to equal West Central American in aroma and in general quality. Coffee would be the ideal culture for the natives, but so far only a few of them have been induced to set out small patches, for the reason that as they only live for to-day, they cannot as yet be persuaded to undertake an enterprise from which a return can only be expected after the first three years. The one attempt made by any foreigner in this direction—a small plantation of seven acres, planted some three years ago—shows conclusively that this enterprise could be made to pay. The annual production of Coffee is at present 3 to 4 tons only. The cultivation and curing of Vanilla in Tahiti is being neglected in consequence of the inferior quality as compared with that of Mexico, Bourbon, and Seychelles, and the corresponding low price that it commands. A hope, however, is current in the island that the market value may be increased by the adoption of a more efficient method of curing the bean than that at present in use. The annual export of Vanilla is about 15 tons.

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT ASSOCIATION.—At the recent monthly meeting of the above Association, held at Shanklin, there was a good attendance of members and friends to hear a paper on the "Cultivation of Tuberous-rooted Begonias," by Mr. W. W. SHEATH, of Ventnor. Dr. GROVES, B.A., J.P., presided. The paper contained some valuable advice on raising seedlings, and their general cultivation. Begonia flowers were contributed by Messrs. CANNELL, LAINO, and BOX. The next meeting is to be held at Ventnor on September 7, when a paper on "Hardy Trees and Shrubs" will be read by Mr. C. SNOOK, late of Kew Gardens.

LILIES AT TWICKENHAM.—Mr. H. A. TRACY, The Orchid and Lily Nurseries, Amyand Park Road, Twickenham, grows Lilies extensively for cut bloom; he has been cutting for a considerable time, and there are still successions coming on that will lengthen out the season some weeks longer. The principal varieties grown in quantity are *Lilium longiflorum* var. *Harrisii*, *L. speciosum* var. *Melpomene*, and *L. s. album novum*, the last-named being considered the purest white, while *Melpomene* is the richest crimson variety of the fragrant *L. speciosum*. For forwarding to a distance the flowers are cut in bud just before they open, and at the end of the journey they open fresh and clean, and last a long time. The last few buds on the spikes are cut together with long stalks, and are much sought for use in indoor decorations.

FORCING LETTUCES IN POTS.—In a recent *Bulletin* of the New York Agricultural Station, we find a paper on this subject, of which the following is the summary:—The growing of Lettuce in pots is believed to have several advantages over growing it in benches, namely—1, by inducing a compact growth, and favouring early heading; 2, the plants are transplanted but once, that is, from the flats to the pots, so that the growth is not checked by a second transplanting; 3, plants may be marketed without disturbing their roots, and so they may be kept perfectly fresh for a long time—an advantage that is much appreciated by retail dealers; 4, as soon as a plant is removed from the bench, its place may be immediately filled with another potted plant, so that the entire bench-room may be kept constantly occupied. The method may be briefly outlined as follows:—The bench, 6 inches deep, is half filled with well-rotted manure, over which is spread 3 inches of soil. The soil is made of one part by measure of manure to three parts of rotted sod. Should the sod be from a heavy loam, it is made lighter by adding one part by measure of sand to three parts of sod. The plants are transplanted but once, and that is from the seed flats to 2-inch pots. The pots are plunged into the soil on the benches, so that the tops are covered with nearly half an inch of soil. The distance between the plants on the bench varies with the variety, but is usually 10 inches each way. Before the pot is plunged in

the soil, it is turned upside down, and the underside of the leaves thoroughly dusted with Tobacco to prevent attacks of aphid. The upper-side of the leaves is then dusted with Tobacco, and about a week later the plants are dusted again, being especially careful to apply the Tobacco thoroughly in the tender centres of the growing plants. As to the care of Lettuce under glass, it may be said that the house should be kept at a cool, even temperature, running a few degrees above fifty in the day, and remaining at fifty or a little below at night. Sudden fluctuations from high to low temperature, or *vice versa*, should be avoided. The plants should have plenty of fresh air, especially on sunny days, when the temperature is high outside. When the plants are watered overhead, it is best to select a time when the foliage will dry quickly. Avoid watering so late in the day that the plants will not dry before night.

VRIESIAS.—M. A. GRIESEN is publishing, in *Le Jardin*, some useful tables, giving the names of hybrid Vriesias obtained elsewhere than in France. The history of the discovery or production of each variety is briefly given, and M. GRIESEN is doing service in thus publishing the origins of the plants now, before, by cross-breeding, they have become too intricate to be traced.

HENNA.—The Henna plant (*Lawsonia alba*), which is a shrub found widely distributed throughout India, Persia, Kurdistan, Syria, Egypt, and Northern Africa, and which is so well known for the use of its powdered-leaves as an orange-yellow dye by the Egyptians from remote antiquity, seems to be somewhat extensively grown in the gardens outside the city of Tripoli, where it is said to be highly appreciated by the people as a dye. The twigs and leaves are gathered three times a year, the root, which is allowed to remain in the soil, reproducing the plant almost indefinitely. The Arab women use it to stain their feet and finger-nails, and it is said to be very efficacious in the cure of chilblains. Last year the value of the exports of Henna from Tripoli, chiefly to Tunis and Algiers, amounted to £3000. The mode of preparing Henna in the East is very simple, and consists of reducing the leaves and young twigs to a fine powder, to which sometimes is added a little Catechu. To use it—the powder is made into a pasty mass with hot water, and spread on the part to be dyed, where it is usually allowed to remain for a night before being washed off.

VALONIA.—The growth of the Oak plantations in the island of Zes, one of the Cyclades, is said to have increased in a remarkable degree of late, and a corresponding increase in the next crop of Valonia is anticipated. The acorn-cup contains a large proportion of tannin, and is considered in quality equal to that which comes from Smyrna. The average annual produce is from 20,000 to 30,000 quintals (one quintal equals 123·2 lb.), but on favourable occasions even double that amount is reached. Last year's produce was estimated at 25,000 quintals, valued at £10 260. About 15,000 quintals were sent to Trieste, 7500 quintals to Great Britain, 2500 quintals to Italy, and the rest to Syria.

THE EXPORTATION OF CUT FLOWERS FROM HOLLAND.—As was announced in our issue for July 27, a meeting took place at the Hummums Hotel, Covent Garden, on July 26 for the purpose of forming an association to oppose the exportation from Holland to this country of cut flowers by those who have sold bulbs for forcing to English growers. The meeting represented the horticultural trade, and a committee *pro tem.* was appointed to draft rules, &c., for the management of the association. It is proposed to call another meeting shortly, but in the meantime the committee desire that all who are willing to join the association should communicate with Mr. C. H. M. A. ALDERSON, Hilda Vale Road, Farnborough, R.S.O., Kent.

FLOWERING PLANTS OF NEW SOUTH WALES.—The Government of New South Wales is publishing a series of coloured plates illustrative of plants of economic value. The work is edited by Mr. MAIDEN, a sufficient guarantee of its excellence. Mr.

MAIDEN is assisted by Mr. CAMPBELL. The plates are characteristic, and the letterpress popular but accurate, including descriptions of the plants and indication of their uses. The Waratah, *Telopoa speciosissima*, *Eucalyptus corymbosa*, the blood wood, *Actinotus Helianthi*, the flannel flower, the *Acacia glaucescens*, the coast Myall, are the plants figured in the first part.

THE GREAT FAILURE IN TURNIPS AND MANGELS.—To meet the above, Mr. MAURICE MORIARTY, of Mallow, Ireland, writes:—"I have many hundreds of millions [!] of Cabbage plants in variety which I will give away to anyone who may send for them. Scotch and English seed merchants will not take them, being disappointed in not getting a special traffic rate, and farmers and others may as well have them as for me to plough them in."

HORTICULTURAL CLUB.—A very successful excursion was made by some of the members of the Club and their friends on Tuesday last; the first place visited was Claymar, Finchley, one of those extensive establishments which have of late years sprung up in the neighbourhood of London and other large towns for the purpose of growing Grapes and Tomatoes. It was a revelation to many of the visitors to see houses 450 feet long filled with Grapes, one house having seven tons of Grapes hanging in it. When they are ripe it must be a wonderful sight; at present they are just beginning to colour. The party, numbering forty-three, was hospitably entertained by Mr. PETER KAY at luncheon, after which they drove to Hatfield, where they were conducted through the park and gardens by Mr. NORMAN, head gardener to the Marquis of SALISBURY, who had kindly given permission to visit this noble place. Afterwards the members adjourned to the Red Lion, where dinner was served at 7 o'clock. There was an unanimous opinion expressed as to its being one of the most enjoyable excursions the Club had ever made, and the members were deeply indebted to Mr. KAY, who undertook all the arrangements, and under whose able management everything went off pleasantly.

HOME CORRESPONDENCE.

THE LATE JOHN WILLS.—All your older readers will endorse "R. D.'s" genial estimate of the character and genius of our departed friend. Our first friendship was formed over *Viola cornuta* and the pure white variety, the latter being still one of the most striking and useful. Though our paths lay in opposite directions through most of our lives, our friendship continued. It would be almost an impertinence to add a word to his great work, so well described by "R. D.," though only those who knew what table and room decorations were when Wills started can appreciate how much modern bouquetiers and decorators owe to Mr. and Mrs. Wills. But there was one feature in his character that I may be permitted to refer to in the *Gardeners' Chronicle*. Few men had more power of discovering ability, or were more desirous of pushing young men of talent to the front than Mr. John Wills. And not a few of those that he virtually made decorators hold high positions to-day either in the firm or other establishments of high standing in this new industry which Mr. and Mrs. John Wills may be said to have created on a broader basis and more artistic lines. D. T. F.

ST. DUTHUS PEA.—I was pleased to see a note in your paper of July 27 recording the excellence of this little-known Pea. I have cultivated it this season, and find it all that your correspondent

"A. H." says it is. It stands dry weather better than any other Pea, and even now the haulm is sound and green and pods fit for picking, although the seed was sown on March 19, at the same time as Sutton's Prolific. Since then I have sown Early Champion, Dr. Maclean, Veitch's Perfection, and other varieties; gathered their crops of pods, and cleared the ground of them, in one or two cases cropping it again. The dry season and a heavy stiff soil have mainly contributed to these Peas passing away so quickly. St. Duthus, however, has stood well. I find it rather longer in coming into use than some others, but when once the pods become fit for table it continues for a long time in bearing. The pods are well filled, eight or nine seeds in almost every one, of a deep green colour, and the flavour capital. As a mid-season variety it is, I think, very valuable. I have tried this season Veitch's Runner French Bean, sowing it at the same time as the ordinary Scarlet Runner, and this is proving a useful Bean, running well and producing a splendid crop of pods, tender and sweet-flavoured. Sutton's Epicure and Tender and True Bean are also very desirable varieties. The French Runner Bean I obtained from R. Veitch and Sons of Exeter. W. Swan, Bystock, Exmouth.

A RED MARÉCHAL NIEL ROSE.—I noticed a paragraph in your issue for July 20, p. 64, an abstract from one of the German horticultural papers, of a red Maréchal Niel Rose, raised by Dr. Müller, and the result of a cross between the above and General Jacqueminot. What a lovely Rose this must be, and what a great pity if Dr. Müller does not send it out for the use of the general public, and so put it within the reach of all. What a charming flower it must be if it have all the characteristics of the type! W. Bowles, Adare Manor, near Limerick.

CATTLE POISONING BY THE COMMON YEW.—In an article in the *Spectator* on the materia medica of animals about a fortnight ago, is a misstatement respecting animals and the leaves of Yew, which it is worth while to correct, because many people do not understand about the poisonous quality of Yews. In that article it is stated that animals which have constant access to Yew avoid eating it, knowing it to be poisonous. This is quite untrue. On the contrary, they habitually eat it and are very fond of it, and no one ever heard of their being the worse for it when they eat it in this manner. I have no doubt that it is to them a stomachic and promoter of appetite. Farm lads are sometimes prosecuted for killing farm horses by giving them powdered Yew leaves, and I find, on inquiring what they do it for, that they give it to make the animals eat their corn, when they are only getting corn and are tired of it. Now dried Yew leaves are undoubtedly more poisonous than green leaves fresh from the tree, and if they give the least bit too much of it, especially if the horses are not accustomed to eating Yew leaves, it is liable to kill them; but the leaves of the growing tree are also dangerous to animals which get access to them suddenly, and when they are not accustomed to them. All the cases of Yew poisoning that I have ever known or heard of have arisen thus. I know of many places where there are Yew trees in the pasture-fields and in the adjoining hedger, and any one who will take the trouble to look at such ones will see that they are habitually browsed by the cattle. I believe that the best safeguard against Yew poisoning is always to have Yew trees within reach of the cattle, and I therefore constantly plant Yew trees in the hedges of pasture-fields, or in the fields themselves. C. W. Strickland.

GLOXINIAS AT TRING PARK.—Few plants are more showy at this season than Gloxinias, when well grown; and the fine strain now obtainable from the leading seedsmen give varieties of much beauty. A houseful of them is one of the sights at the present time in Lord Rothschild's gardens at Tring Park. Mr. E. Hill, the gardener, has arranged the plants together with *Isolepis gracilis*, the latter also forming an edging to the stage on which they are placed. The strain is characterised by the brilliancy of the scarlet and crimson forms, and the great beauty of the spotted varieties, the spotting and marbling being in all shades of rose, crimson, and purple. The foliage is large and massive. Great cultural skill is required to bring so many Gloxinia plants to such perfection, but they are well worth the trouble. J. O'B.

RICHARDIA PENTLANDI.—As bearing on the remarks on yellow Richardias in their native habitat fur-

nished by Mr. Chas. Avra of Cape Town (*Gardeners' Chronicle*, June 22, p. 764), it will interest him and others to know that some of the tubers collected by him are sending up their rich golden-yellow spathe in Lord Rothschild's garden at Tring Park. Both the plain green-leaved and the spotted-leaved varieties, representing R. Pentlandi and R. Elliottiana, seem to have been collected together, for both appear in the batch received from Cape Town. The spathe, although seeming to differ slightly from those of the forms previously in cultivation, are very handsome, and in most of them a more or less dead purple eye is at the base of the spathe. Mr. Hill, the gardener at Tring Park, pots them in good rough soil, such as is generally used for bulbs, and grows them near the glass of the roof in an intermediate-house. J. O'B.

TABLE DECORATIONS AT THE NATIONAL CAR-NATION SOCIETY'S SHOW.—It appears to me that the committees of such a society as the above-named, when offering prizes for the best arranged dinner-table decoration, should certainly use more discrimination in selecting the judges, and should also word their schedule more explicitly, stating whether the object to be attained is quality of the blooms employed, or on the other hand the display of taste and skill in their arrangement. To my mind the judging in the decoration classes at the Crystal Palace on July 24 was most unsatisfactory, the verdict in almost every case being in favour of quality of flower, no matter how heavy or clumsy the arrangement. In class W., for the best arranged dinner-table, the 1st prize was awarded to an exhibit which, although containing some superb blooms, was arranged in such a manner that no person of taste would tolerate it on his dinner-table, the object evidently being to crowd on as many blooms as the table was capable of holding, totally regardless of the space required for plates, &c. I am unacquainted with the judges who were responsible for these decisions, and do not even now know their names, but am certain that however estimable they may be in other respects, they were totally unfit to judge in cases where taste and refinement are the necessary qualifications. I must apologise for taking up so much of your valuable space with these remarks, but it is a subject in which I, in common with many others, am deeply interested, and it is a cause of much regret to notice that the best exhibitors are being driven out of the competitions through the incompetency of the judges selected for the decision of the awards in these classes, as it is obvious that the skill necessary for this purpose is altogether different from that required in the growing of flowers, and might we not expect to find far more all-round satisfactory decisions coming from those who have had years of experience in this modern art of table decoration? F. W. Seale, Vine Nurseries, Sevenoaks.

SLUGS DESCENDING BY A LINE OF SLIME.—Some years ago I remember seeing in your columns a remarkable statement from an eye-witness that a slug let itself down from the glass by a rope made by its own slime to a subjacent plant. No remark was ever made by anyone upon it—perhaps no one felt equal to capping such a statement; possibly it was passed by as a fact, and need not be noticed further. I did not doubt the statement, and hoped some day to observe the same myself. To him (or them in this case) who waits all things will come (even what I am writing on, readers may say). To-day my gardener pointed out to me a slug he had killed after having so let himself down to a plant. The slug was nearly 3 inches long; he had crept up the glass, and did not know how to get to an *Odonoglossum cordatum* that hung 7 inches below him. He slithered all around himself on the glass, a patch of 2 inches in diameter, and then let himself down to the plant, touching the suspending wire in his descent. After he had alighted, the rope of slime still hung from glass to plant. This remarkable fact will now, on a second notice, perhaps elicit further corroboration from other observers. De B. Crawshaw.

THE SWEET LITTLE, DEAR LITTLE, SHAMROCK OF IRELAND.—Mr. Baylor Hartland wrote to you from Ireland in December last, saying that on some newly broken ground in his garden a crop of Shamrock had suddenly sprung up, and that he had harvested the seed for sale to Irishmen in America. He kindly sent me some seed, which has come to me as *Trifolium minus*. In my little work, *Tongues in Trees*, I stated that I had repeatedly planted so-called

Shamrocks, procuring them from Ireland on St. Patrick's Day, and that on arriving at maturity they had turned out to be different species of *Trifolium* or *Medicago*. My evidence was supported shortly afterwards by Mr. Colgan in the *Irish Naturalist*, who records obtaining thirteen undoubted Shamrocks

of my own raising and crossing. The seed was sown in the spring of last year, the seedlings were planted out in a border in the open as soon as large enough, where they remained ever since, and are now flowering; the border received no special preparation, neither have the plants received any special atten-

a very smoky and cold district, not at all favourable to the Carnation *J. Hughes*. [A remarkably fine lot of blossoms, large, the selfs of various shades of pink, rosy-crimson, white, palest flesh, primrose-yellow, and the scarlet flakes very full, with petals having great substance and purity of tints. We do not re-

FIG. 31.—LELIO-CATTLEYA X DIOBANA MOSSIE. (SEE P. 152.)

from various sources, eight of which proved to be *Trifolium minus*, five *T. repens*. I am afraid Irishmen must reconcile themselves to the belief that Shamrog, Little Trefoil, is a name common to all triphyllate plants found growing on March 17, and that the Irish Shamrock, like the Scotch Thistle, has no independent existence. *W. Tuckwell, August 3.*

SEEDLING CARNATIONS.—By to-day's parcel post I send you a box of Seedling Carnation blooms

tion. They were all raised from self-coloured flowers, and my object was to raise varieties with self-coloured flowers. I do not care for flakes, &c. Many of the flowers of the white varieties are very like each other, but the plants are very different in growth. All the varieties are very free bloomers, strong growers, and throw plenty of "grass." You will notice that the petals on some of the flowers are damaged, which is owing to the very rainy weather we have been having for some weeks past. Ours is

member to have seen finer flowers from an outside border. All of them are quite worth perpetuating. Ed.]

MR. A. F. BARRON.—Seldom has it been the lot of the *Gardeners' Chronicle* to create a deeper or more profound sensation amongst gardeners than was the case last week. To how many did the announcement respecting Mr. Barron's retirement from the direction of Chiswick Gardens come as a surprise, as

well as pain. Is the Fruit Committee therefore to be also deprived of Mr. Barron's estimable services, or may he continue to hold his post of secretary till the end of the year, and then become a member of the body of which he has so long been the secretary? To deprive that committee of advice and knowledge which no other man can give or possess, would indeed be a misfortune. I am sure that any suggestion to that effect would create amongst the members grave regret. It has been Mr. Barron's fortune to have earned far and wide a most distinguished reputation, especially as a fruitist, but his knowledge of vegetables is also unique, and this knowledge has always been at everyone's service. Whosoever follows Mr. Barron at Chiswick will find he has to occupy a difficult position. I am no believer in the idea that the man for the place cannot be found, but the best of men must naturally feel modest in entering upon the superintendence of Chiswick, and the other accessory duties—indeed, only one endowed with more egotism than wisdom would feel otherwise. Of course, in time courage and confidence will come, especially if the successor has the useful knowledge and other qualifications. Still, let the successor be who he may, our regret at the loss of so able and so worthy a superintendent and secretary will be very great. How far the Royal Horticultural Society may benefit or otherwise remains to be seen. A. D. [We have other letters to the same effect, but it is deemed better to defer publication till after the holiday season. Ed.].

WEED-KILLER.—I can fully confirm the statement in the note in last week's issue of *Gardeners' Chronicle*, respecting the caution there given of the poisonous nature of the weed-killer. Early in the past spring I ordered two drums of weed-killer from a well-known firm; the drums duly arrived at the station, where a cart was sent for them; but as the road where the mixture was to be used lay on the way home, the drums were dropped down, to be used the next day. There were several heifers in the enclosure, and my attention was called to these beasts licking round the drums, more especially on the top, where, with the jolting of the railway and cart, together with the hot weather, a little escape from the bung was observed. I immediately had the top of the drums covered with dry sand. Alas! one heifer died. It is an excellent mixture used for what it is prepared for. P. F., A.

NEW INVENTION.

THE PATENT STAMFORD HOE.

When hoeing the land amongst closely-ranked kitchen-garden crops, bedding plants newly put out, or the occupants of the herbaceous perennial border, the value of a tool which will not readily injure the stems and flower-stalks of the plants will be conceded by everyone having acquaintance with this kind of operation. The old-fashioned Dutch hoe, with its rectangular corners, was liable, even when used by careful men, to injure the plants, more especially when the blade was hidden from the view of the user by the leaves of the plants. With the hoe illustrated in fig. 32, p. 163, no such injury can be done, the free corners being done away with by the manner of fixing the blade to the bow. Moreover, this hoe can be used as a draw-hoe, by bringing the cutter at the back into play, which is done by the workman alighty lowering the handle and drawing to instead of pushing it away from him. The blade, being of steel, is very durable, and keeps a good edge for a long time. The patentees and makers are Messrs. Pick & Fountain, garden-tool makers, Stamford.

BELGIUM.

M. JACOB MAKROY ET CIE.

This firm is noted for the cultivation of many kinds of plants; thus, in the Fern-house, I noted some excellent little species and varieties, such as *Adiantum capillus-veneris* tenue, specially valuable in winter owing to its hardiness; *A. cuneatum grande*, a very pretty novelty, useful for floral decorations; *Pteris cretica* Wimsetti, very ornamental; *P. reginae*, exceedingly pretty; *Adiantum tetraphyllum acuminatum*; *A. mundulum*; *Pteris ludens*, with

large nect leaves; *Adiantum Bellum*, useful in winter; *A. tessellatum*, one of the finest of *Adiantum*; *A. Kerchovae*, resembling *A. Birkenheadi*; *A. rhodophyllum*; *A. tennesiense*, differing but little from *formosum*, and other varieties. A good plant newly put into the market this year, and useful for beds and borders, is *Ruellia Makoyana*; *Begonia* Duchess of York is also a satisfactory introduction.

Among the *Pandanus* in MM. Jacob Makroy's houses I noted *P. javanicus* fol. var., prettily variegated with white; *P. Baptisti*, very elegant, foliage velvety with a double yellow line along the mid-rib; *P. graminifolius*, and *P. cooesedena*. Much to be recommended is *Eucharis Lowi*, which is always valued for its useful qualities. Among the *Marantas* was *M. rosea picta* and *M. Louisa*. *Asparagus Sprengeri*, much used in Germany for decorating purposes; *Rhopala corcovadense*, also used as an indoor plant; *Allophila Malzinei*, an excellent Mexican Fern, and *Asplenium laxum*, deserves attention from plant lovers. *Vriesia splendens major* is an excellent plant, as is also *Nidularium rutilans* with its pretty rose tint; and so is *Rhodostachys andina*. A number of *Dracaena lentiginosa* were remarkable for the dark colour of the foliage. A new plant for out-door use which seems coming rapidly into favour is *Pyrethrum parthenifolium glaucum*; with its whitish or glaucous foliage, it might be likened to a *Gymnogramma* growing out-of-doors. Ch. De B.

A NEW HORTICULTURAL ESTABLISHMENT.

A new horticultural establishment has gradually been established in East Brussels, and is now quite completed, and already contains some thousand plants of *Cattleya* and of *Cypripedium*. It is MM. Linden who have started this enterprise, and we think that when it is open to them, plant-lovers will find much to interest therein. In this, a brief preliminary notice, I will only say that, built on the plan of the Horticulture Internationals, this place is of larger extent, is admirably arranged, and fulfils all requirements for the cultivation of Orchids. MM. Linden will cultivate choicer species of Orchids, and are preparing to raise some new varieties. For this purpose they are collecting considerable quantities of *Cattleya*, *Cypripedium*, &c., that they may make careful selection. Erected in an open situation, where there is no lack of fresh air, this establishment starts with every chance of success, and is sure to take a high place among Belgian nurseries. Ch. de B.

SEEDLING ORCHIDS.

BEING much interested in the hybridisation of Orchids, it has always been a wonder to me why so few seedlings ever came from the millions of seeds sown. Years ago I sowed a pod of *Cattleya Dowiana* × *C. Warszewiczii*, and a glorious crop of seedlings in due time appeared on the basket containing the mother-plant, for it was the surface of the basket that I considered the best place for seed as well as parent. They disappeared in a most extraordinary way. Healthy little embryos went in a day or two, and gradually all went. No one could imagine how they went so fast, and left so little trace behind. At last it dawned on me that the basket in which the plants are dipped is the ocean-grave of the seedling embryo. They have no root to hang on by, the plant when dipped makes waves up the compost, and the backlash carries the drowned seedling away, never again to be seen. The dipping rendered a disastrous death to the future hopes of the hybridist; it needs great care not to dip plants too deep that have seedlings on them. Seeds themselves float away by the million, and are no doubt put down as bad. To avoid all this loss, sow seed on prepared pots or pans, and do not let them ever get too dry, or the living seed will shrivel. I have to-day examined about sixty sowings, and I find invariably that the seed is germinating far better, when the peat on which it is contained a large proportion of earthy matter. Where it is very fibrous indeed, it does not hold enough water for the keeping of the seed plump, and it soon shrivels.

Care must be taken not to have peat too earthy, or moss too long, or the seeds will get covered by it. This is fatal, especially to *Odontoglossum* seed, which seems to like a hard bare spot to germinate upon. Water very carefully, so as not to flood the seed up the pot, and treat it as a delicate plant, with all the care and attention possible.

Some pods contain but very little good seed. I sowed one to-day, *L. anceps* × *L. Crawshayana*, that had but a few fertile seeds to thousands of chaff-scales. Under a strong lens it is very easy to see the good and bad seed: one contains veritable moisture and is transparent, the other is a silvery-looking skin. If a few more growers would carefully prosecute hybridisation we should soon have good results, even in *Odontoglossum*, hitherto the *crux* of the hybridist, and where lies the greatest field for future results. To raise hybrids when Nature cannot do it will be to unite Colombia and Mexico, a triumph that is worth trying for. De B. Crawshay.

SOCIETIES.

COTTAGERS, ETC., HORTICULTURAL, ST. OSYTH'S.

JULY 25.—I have already noted some of the finest Roses in the two fine lots of forty-eight blooms staged by the great growers, Messrs. Benjamin and Frank Cant. Among these were many blooms worthy of those great growers and of the district. But though liberal prizes were offered in the amateur classes, the display from these was not satisfactory. The Priory Garden and its products, so conspicuous alike in the show tents and in the garden, prove that most things, including Roses, may be well grown in this district, and it is hoped that the fine object-lessons by the trade will result in a vigorous effort next year to pull the Roses of amateurs up to something approaching high trade standards.

In other sections the St. Osyth show was well arranged, and richly furnished with creditable productions. The first section was devoted to cottagers, who had forty-seven classes devoted to them. In this section, too it was pleasing to find the Royal Horticultural Society of London offering through Mr. W. Watson the Bronze Banksian Medal of the R. H. S. to the cottager who wins the largest amount of money in prizes on the show day. Section 2 was devoted to children, who showed in four classes. Section 3 (amateurs) contained twenty-two classes devoted to fruit, vegetables, and flowers. Section 4 contained classes for a collection of fruits, and a collection of cut flowers, open to all comers. Section 5 was devoted to home industries.

Then there were many special prizes offered by the trade and others. Altogether the schedule of the Society is excellent and comprehensive, exactly suited to a village community, and other societies could obtain many hints from same were it before them. There seems abundant room in and around St. Osyth for the improved culture of flowers and window plants. Stocks seem almost the only flowers that are well done outside the Priory Gardens in which good culture, plenty and beauty everywhere prevails. D. T. F.

THE MIDLAND CARNATION AND PICOTEE.

JULY 31 AND AUGUST 1.—A splendid Exhibition was held in the Botanical Gardens, Birmingham, on the above dates. All the available space was occupied by exhibits of high merit, and if the Society continues to grow as it has done during the past few years, a larger place of exhibition will become necessary. Mr. G. W. Latham's resources were taxed to the utmost, but accommodation was found for all.

Eleven stands of twelve Carnations competed, some very fine blooms being staged, Mr. R. SYDENHAM, Birmingham, taking the 1st prize with excellent blooms of C.B. J. S. Hedderly, P.F. Gordon Lewis, C.B. Master Fred, R.F. Mrs. Rowan, S.F. Guardman, P.P.B. Sarah Payne, P.F. C. Henwood, S.B. C. H. Herbert, P.P.B. Fred Phillips, S.B. R. Lord, P.P.B. Seedling, and R.F. Rob Roy; 2nd, Mr. TOM LORD, also with some very good flowers.

There were ten stands of six Carnations, Mr. C. F. THURSTAN, Wolverhampton, taking the 1st prize with S.B. R. Houlgrave, P.P.B. Sarah Payne, and W. Skirving, S.F. Ivanhoe, S.F. Miss C. Grahame, and R.F. Cristagalli; 2nd, Mr. C. HEAD, Hedden Bridge.

The best twelve Picotees came from Mr. T. LORD, florist, Toimorden, who had refined blooms of H. Red E. Brunette, H. Ro. E. Mrs. Rogers, H.P.E. Zerlina, H. Ro. E. Little Phil, H.P.E. Mr. A. Chancellor, L.P.E. Esther, L. Ro. E. Blanche Heard, H.P. E. Muriel, H. Ro. E. Mrs. Sharp, and L. Ro. E. Campanine, L. Ro. E. Mrs. Gaggie, and L.P.E. Thomas William; 2nd, Mr. A. R. BROWN.

With six Picotees, Mr. A. W. JONES, Birmingham, took the 1st prize with the best stand out of nine, having H. Red E. Brunette, H. Ro. E. Mr. Burgas, H.P.E. Amy Robsart, L.P.E. Elizabeth, L. Red E. Mrs. Gorton, H.P.E. Muriel; 2nd, Mr. C. HEAD.

Yellow grounds were a great feature, and the blooms very fine, Mr. A. W. JONES taking the 1st prize with twelve superb blooms, having Romulus, Stadtrath Bail, Annie Douglas, Cardinal Wolsey, Almira, Mrs. R. Sydenham, Mrs. Whitbourn, Mrs. Douglas, The Dey, Ladas, Mrs. Dranfield, and Janira; 2nd, Mr. R. SYDENHAM.

There were ten collections of six blooms, Mr. A. R. BROWN being 1st with fine examples of Mrs. R. Sydenham, Mrs. Douglas, Ladas, Harlequin, Mrs. Gooden, and Mrs. Henwood; 2nd, Mr. E. HILL, Bulwell, Florrie Henwood, President Carnot, and Janira being very fine.

Selfs were very bright and effective, Mr. R. SYDENHAM taking the 1st prize with the best of eight stands, having Miss Audrey Campbell, Mephisto, Eudoxia, Coronas, Ruby, Theodore, The Pasha, Fire King, Uncle Tom, Annie Lakin, Rob Roy, and Abigal; 2nd, Mr. T. LORD, who had very fine Mrs. Gaskoin, Blushing Bride, and Gentle Jackie.

There were ten stands of C. Selfs, Mr. A. R. BROWN taking the 1st prize with Duc d'Orleans, Waterwitch, Uncle Tom, Miss A. Campbell, Mrs. Fred, and Hayes' Scarlet; 2nd, Mr. C. F. THURSTAN

There was a maiden class for six Carnations and Picotees, Mr. W. F. GOODFELLOW being 1st, and Mrs. HERBERT SMITH 2nd.

There were also classes for blooms dressed as little as possible, though how to exactly hit upon the amount allowed is not stated. The blooms, which represented all the types, were set up with their own foliage, each in a specimen glass. Some fine blooms were staged, and they certainly had a more natural appearance than the blooms in the previous classes, some of which were over-dressed. Four classes were devoted to these, and they filled a good space of tabling.

Of single blooms there was an immense array. The leading S.B.'s were R. Houlgrave, Arthur Mdburst, and Master Stanley; C.B.'s, Edward Schofield, Rifleman, and J. S. Hedderly; P. and P.B.'s, Fred. Phillips and Wm. Skirving; S.F.'s, Sportsman and Wm. Mellor; P.F.'s George Melville, Magpie, and Martin Rowan; R.F.'s, Mrs. Rowan and Cristigalli. Of Picotees: H. red E., Brunette and John Smith; L. red E., Mrs. Gorta and Thomas William; H.P.E., Muriel and Mrs. Opanshaw L.P.E., Summerhill, Pride of Leyton and Elizabeth; H.Ro.E., Mrs. Rogers, Campanine and Edith D'Ombra'n; H.S.E., Mr. S. Sear; Lt.R. or Sear.E., Favourite and Nellie. The best white selfs, Mrs. Lee and Mrs. Fred. The best yellow Germiaia and Miss A. Campbell. The best pink or rose seedling Ruby and Rob Roy. The best dark. Monceau. The best yellow grounds, Mrs. R. Sydenham and Mrs. Gooden. The best fancies, Romulus, Cardinal Wolsey, and Duchess of Portland.

Border Carnations in bunches, shown in four classes, were very effective, Messrs. THOMSON & Co. and Mr. H. W. WEGUELIN, Teignmouth, taking the leading prizes.

Carnations in pots were represented by admirably grown and bloomed plants from Messrs. R. SYDENHAM and THOMSON & Co. The best six plants of German origin competing for a special prize given by Mr. Ernest Benary of Erfurt, came from Mr. R. SYDENHAM, and well represented the celebrated Erfurt strain.

Table Decorations in Carnations made a very fine feature. For a dining table 6 feet by 3 feet, good prizes were offered. Capt. THEWLES, Kenilworth, was 1st, and Mr. W. F. GUNN, 2nd. Shower bouquets, Sprays, and Buttonholes were well shown.

Premier Flowers.—The premier bizarre Carnation was C.B. J. S. Hedderly, from Mr. R. SYDENHAM; premier flake, P.F. Geo. Melville, from Mr. A. R. BROWN. The premier H. edged Picotee, P.E. Muriel; light-edged red E, Mrs. Gorton, both from Mr. A. W. JONES; Y.G. Mrs. R. Sydenham, from Mr. A. R. BROWN; self, Germania, from Mr. A. W. JONES; faucy, Romulus, from Mr. R. SYDENHAM.

Miscellaneous Exhibits were numerous and very fine. Mr. H. J. JONES, Ryecroft Nursery, Lewisham, had a central stand of Begonias, admirably arranged. Next in order of merit came Mr. W. BIRKENHEAD, Sale, with an extensive collection of Ferns; and Messrs. KELWAY & SON, Langport, with Gladioli and hardy flowers. Collections of hardy flowers came also from Mr. J. H. WHITE, Worcester; Messrs. CLIBRAN & SON, Altrincham; Mr. W. F. GUNN, Olton, and Mr. AXTELL, Leamington, Mr. H. ECKFORD, Wem, had a collection of Sweet Peas; Messrs. THOMSON & Co., bunches of Carnations of an attractive character; Mr. JAS. DOUGLAS, Ilford, new Carnations; Mrs. W. SYDENHAM, Tamworth, a table of floral decorations composed of Violas, with stands of fancy Pansies; and Messrs. EDWARDS & SON, Nuttall, Edwardian arrangements in Ferns.

SOUTHAMPTON.

AUGUST 3 AND 5.—The show held on the above dates was quite one of the best held by the Southampton Royal Horticultural Society. Not only were the specimen plants of extra quality, and the groups arranged for effect splendid; but the cut flowers, fruit and vegetables were all equal to or beyond the average merit. The arrangements, as usual here, were of perfect order, and great credit is due to Mr. Fidge, the Hon. Secretary.

Flants.—For the best ten specimen plants, Mr. CYPHER, Cheltenham, was distinctly 1st; his collection was good

throughout, and it was well staged. Mr. J. Wilkins, gr. to Lady THEODORA GUEST, Inwood House, Henstridge, Bloodford, was a creditable 2nd.

Mr. CYPHER was again 1st for six specimens with a collection similar in point of quality to the larger one; Mr. WILLS, Florist, Winchester Road, Shirley, Southampton, was a close 2nd, his plants showing much cultural skill.

Prizes were offered to residents only in Hampshire for six specimen plants, and Mr. N. Blandford, gr. to Mrs. HASELFOOT, Moor Hill, Bitterne, won 1st honours with a very satisfactory collection.

Still another class was provided, for gardeners only. This class was for six specimens, and Mr. T. Hall, gr. to the President, Sir S. MONTAGUE, Bart., M.P., South Stoneham House, Southampton, worthily won 1st prize.

Ferns, in six exotic varieties, were best shown by Mr. Peel, gr. to Miss TODD, Sidthorpe Lodge, Shirley, Southampton. Fuchsias, Begonias, Pelargoniums, and Coleus made a bright display, the principal prize-winners being Messrs. J. WILCOX (Blandford), Mitchell, gr. to J. WILLIS FLEMING, Esq. (Chilworth Manor), and Mr. J. HALL.

Groups.—Miscellaneous plants arranged for effect in a space of 180 square feet made a good display, several excellent groups being set up. Mr. WILLS somewhat easily won the premier award with a light arrangement of suitable plants, about which there was not a semblance of crowding. Mr. E. Carr, gr. to U. A. GILLET, Esq., Fair Oak Lodge, Bishopstoke, was a good 2nd. In a smaller class Mr. PEEL won 1st prize, with a creditable collection of plants evenly disposed.

FIG. 32.—THE PATENT STAMFORD HOE.
(SEE P. 162.)

Cut flowers.—These formed a prominent section of the show. Roses were staged very creditably. Messrs. KEYNES, WILLIAMS & Co., Salisbury, won for both twenty-four and twelve blooms, with even, fresh, and highly-coloured specimens. Mr. WILL TAYLOR, Hampton, Middlesex, was a good 2nd.

In the class for twelve blooms, restricted to gardeners, Mr. J. West, gr. to J. WYGRAM, Esq., Northlands, Salisbury, won 1st place.

Stove and greenhouse flowers in a dozen trusses were best shown by Mr. Herbert, gr. to Mrs. MARSHALL, Crawley Court.

Herbaceous flowers were excellent. For twelve distinct varieties, Mr. B. LADHAMS, florist, Shirley, easily secured the leading award with massive bunches of choice kinds. Messrs. KEYNES, WILLIAMS & Co. won for both Show and Pompaon Dahlias; and Mr. LADHAMS was similarly successful with Carnations and Picotees.

Table decorations, epagnes, and bouquets, were well represented. For the former, Miss KATE GOLDING won with a creditably-arranged table; Miss HOBHY, Padnell Road, Southampton, 2nd. The best-dressed epagne was one from Miss HOBHY, and the best-arranged basket of flowers came from Miss G. HARPER, Blighmout, Southampton.

Fruit and Vegetables were thoroughly well represented. For a collection of six varieties there were seven entries. Mr. H. W. Ward, gr. to the Earl of RADNOR, Longford Castle, Salisbury, was an easy 1st for a good all-round collection; Mr. Ingelfield, gr. to Sir J. KELK, Tedworth, Marlborough, 2nd. For three bunches of Black Hamburg Grapes, Mr. J. Sanders, gr. to C. SLOANE STANLEY, Esq., Paultons, Romsey, was distinctly ahead of all others; Mr. W. MITCHELL, 2nd.

For three bunches of any other black variety, Mr. J. HALL won with fine examples of Madresfield Court; Mr. SANDERS 2nd, with same variety. Mr. MITCHELL had the best Muscat of Alexandria, Mr. WARD occupying a similar position with three bunches of Buckland Sweetwater, in a class for any other white.

Mr. Pope, gr. to Earl of CARNARON, Highclere Castle, Newbury, won for two bunches of any black Graps. The

single bunch class was well contested. Mr. MITCHELL winning for black, and Mr. WARD for white. Hardy fruit was well staged by Mr. WEST; Melons by Mr. WARD, and Mr. E. L. BROWN, Portland House, Salisbury; Peaches by Mr. G. Hall, gr. to Lady LOUISA ASHBURTON, Melchet Court, Romsey; and Nectarines by Mr. INGELFIELD.

For nine distinct varieties of vegetables, Mr. T. WILKINS won premier award, closely followed by Mr. POPE.

In the classes set apart for Messrs. SUTTON'S and WEBB'S prizes, Mr. POPE won both with good produce, Mr. WILKINS following. Other classes in this section were well filled.

Miscellaneous.—Mr. B. LADHAMS had a remarkably fine group of herbaceous cut flowers. Messrs. E. HILLIER & SON, Winchester, had shrubs in pots, also Apples, Pears, and Cherries, as well as a good collection of fruit in baskets.

Mr. W. H. ROGERS, Red Lodge Nursery, Southampton, had a handsome group of shrubs in pots.

Mr. DOUGLAS, Bookham, Surrey, a choice collection of his new Carnations.

Mr. J. Miles, gr. to F. PERKINS, Esq., Portswood, Southampton, two dozen dishes of hardy fruit.

ST. NEOT'S HORTICULTURAL.

AUGUST 5.—The thirty-first exhibition of this Society was held on the above date, and while horticulture is pre-eminently to the fore, the schedule of prizes includes other subjects interesting to country people, such as honey, farm and market garden produce, poultry, &c.

Plants.—In common with other societies there are fewer plants staged than formerly, but a local grower, Mr. G. Redman, gr. to J. H. GOODGAMES, Esq., Eynesbury, grows some very good specimens, his six plants in flower being attractive specimens of *Stachis profusa*, *Bougainvillea glabra*, *Stephanotis floribunda*, *Anturium Schzerianum*, *Clerodendron fallax*, and *Hydrangea hartsensis*. Mr. Redman had the only group arranged for effect—a very good one.

Some very good Balsams, much better than are usually seen, were staged by Messrs. REDMAN and J. JOHNSON, St. Ives. Tuberos Begonias were remarkably good, Mr. T. Lockie, gr. to A. J. THORNHILL, Esq., Diddington Hall, taking the 1st prize, and there were two equal 2nd prizes awarded. The best specimen flowering plant was *Stachis profusa*, admirably bloomed, from Mr. T. Lockie.

In the way of foliated plants Mr. REDMAN had the best four stove and greenhouse Ferns, staging fine specimens of *Adiantum Williamsii* and *Collisi*, a capital *Platycerium alaicorum*, and *Polypodium effusum*. Colens were represented by nicely-grown bushes from Messrs. LAST and REDMAN. The best ornamental foliated plant was a fine piece of *Yucca aloifolia*, from Mr. REDMAN; the best specimen Fern, a grand piece of *Nephrolepis exaltata*, from Mr. LOCKIE. Many plants of a creditable character were shown by amateurs.

Cut flowers.—Roses, usually a very good feature at this exhibition, were few, mainly owing to a violent hailstorm on Sunday evening. The best twelve blooms came from Mr. J. Stone, gr. to Mr. R. A. COCHRANE, St. Neot's. Mr. REDMAN had a fine stand of twenty-four bunches of stove and greenhouse cut flowers; and in the class for twenty-four bunches of cut hardy herbaceous and bulbous flowers the Rev. W. CROUCH, Gamlingay, staged one of the best collections we have seen for some time past, comprising two or three very fine and distinct *Phloxes*, *Helianthus Soleil d'Or*, *Lilium tigrinum*, *Eryngium amethystinum*, *Stachis latifolia*, a grand bunch of the white Everlasting Pea, *Alstroemeria aurantiaca*, *Physostagia virginica*, &c. Very good Dahlias for the season were staged; also Stocks, Zinnias, Marigolds, &c. The best twelve bunches of hardy herbaceous flowers came from Mr. W. LAST.

Fruit.—The best collection of eight dishes of fruit came from Mr. J. MYERS, The Gardens, Hinchingsbrook House—Peschies, Cherries, Figs, Melons, Apricots, &c., all good; Captain DUNCOMBE being 2nd. Good Black Hamburg Grapes came from Messrs. MOORE, St. Neot's. Dessert and culinary Apples, dessert and kitchen Plums, Cherries, Currants, &c., were all good.

Vegetables.—The best eight dishes came from Mr. T. LOCKIE; Mr. MYERS being 2nd, both excellent for the season. Mr. T. CLARK, Huntingdon, had six good dishes of Potatoes; Mr. MYERS' six dishes were only just inferior. Mr. LOCKIE had a brace of perfect Royal Windsor Cucumbers. Vegetables generally were good throughout. The hard-working Secretary, Mr. W. RATCHELOUS, is unwearied in his exertions on behalf of the Society.

NORTHAMPTON HORTICULTURAL.

AUGUST 5 AND 6.—The annual exhibition and show was held on the above dates. That it is a popular exhibition there can be no doubt, and this was clearly seen in the keen competition in the cottagers' classes, in which the productions were of the highest degree of excellence. The large plant classes contained many excellent exhibits, the groups being particularly fine; cut flowers were also good; but fruit, on the whole, was a little below the average. The arrangements were ably and efficiently managed by an enthusiastic committee and a hard working secretary.

Plants and Groups.—The largest plant class is that for twelve plants in an equal proportion of flowering and foliage. Mr. J. CYPHER, Queen's Nurseries, Cheltenham, showed very

strongly, and won a creditable victory. His best examples were *Erica obyata purpurea*, a grand specimen nearly 5 feet across, profusely flowered and well coloured; another of *E. Thompsoni* was even larger but a little thin, still a fine plant. *Ixora Pilgrimi* was well flowered, and was a fine plant; *Bougainvillea glabra* and *Stephanotis floribunda* were alike good; whilst *Statice profusa* was well coloured and quite fresh. Two magnificent Crotons were staged in *C. Queen Victoria* and *C. Sunset*, both being 6 feet across and superbly coloured; whilst in the background was an immense plant of *Cycas circinalis*, finely developed, this being flanked on either side by two capital Kentias. Mr. Finch, gr. to J. MARRIOTT, Esq., Coventry, came in a fairly good 2nd.

For a large group, a central arrangement to face every way and covering a space of 240 square feet, Mr. CYPRES was well 1st, the entire arrangement being most effective, and in good taste. The central plant was a graceful specimen of *Phoenix rupicola*, with long arching leaves. This plant was raised sufficiently to introduce a mound or undergrowth of Orchids and other choice flowering and foliage plants, whilst towards each corner, other and smaller mounds were grouped with either an elegant Bamboo or a graceful *Cocos* as a centre to each, these again being surrounded with Orchids, &c.

Between these and nearer the centre, were some well-flowered *Humea elegans*. No attempt was made to cover the entire space, the fresh green grass appearing here and there with an occasional well-flowered Orchid or a richly-coloured foliage plant. Mr. VAUSE, of Leamington, was 2nd, with a good group in which the best effect was concentrated in the central part, the outer parts being somewhat weak.

In the smaller group class there was only one exhibit, but it was deemed one that was worthy of the 1st prize.

For six stove and greenhouse plants, open to the county only, the competition was good, but the exhibits on the whole were not more than satisfactory in quality. Mr. COPSON, gr. to Mrs. PHIPPS, Collingtree Grange, was 1st, his best examples being *Acichmes longiflora major* and *Allamanda Hendersoni*; Mr. J. C. INNS, gr. to W. H. FOSTER, Esq., Sprattoo Grange, 2nd.

Some well-grown Ferns of moderate size were staged, the best coming from Mr. J. B. PALMER, Cliftonville; and the next best from Mr. COPSON. Zonal Pelargoniums were shown well, the plants of medium but useful size. *Coleus* and *Fuchsias* were very good, and the table plants also.

Cut Flowers.—A splendid box of stove and greenhouse flowers was exhibited by Mr. VAUSE, of Leamington, comprising several good bunches of *Ericas*, *Ixoras*, &c.; the best table decorations coming also from the same exhibitor.

For twenty-four single trusses of Roses in variety, Messrs. THOS. PERKINS & SONS, Kingshorpe Nurseries, Northampton, were 1st, the finest blooms in a very fresh and bright box being *Heinrich Schultheis*, *Her Majesty*, *Victor Hugo*, and *Duke of Edinburgh*. Messrs. JOHN PERKINS & SON, Market Square, Northampton, were 2nd.

The Rev. Dr. KING, Gayton Rectory, was 1st for twelve varieties of Tea-scented Roses, with excellent blooms—*Marie Van Houtte* and *Innocente Pirola* being the best; Messrs. THOS. PERKINS & SON followed. Rev. Dr. KING was again 1st for twelve varieties of any sections in the amateurs' class, showing an even box of fresh flowers.

For twelve bunches of hardy flowers, Mr. Cole, gr. to Earl SPENCER, Althorpe, was a capital 1st, with a well set up box, the best being *Yucca gloriosa* and *Lilium chalcedonicum*; Mr. KNIGHTLEY, Courteen Hall, showed well for the 2nd prize.

Mr. KNIGHTLEY was 1st for twelve bunches of stove or greenhouse flowers, *Eucharis Mastersi* and *Begonia odorata* being noticeable.

The best bouquet came from Messrs. YARDE & CO., Northampton, and Messrs. T. PERKINS & SON, the competition being very keen.

Some capital Cockscombs were shown, and the best were from Mr. J. T. FOSSEY.

Fruit.—The best collection of eight kinds was staged by Mr. Gilman, gr. to the Earl of SHREWSBURY, Ingestre, the exhibit being of first-class quality. Black Hamburgh Grapes. Lord Napier Nectarines, Hale's Early Peaches, and a good Queen Pine, were his best dishes; Mr. S. COLE, who followed, had good Muscat of Alexandria Grapes, the same kind of Nectarine, and Barrington Peaches.

In a class for Black Grapes, Mr. J. C. INNS won the 1st prize with Black Hamburgh Grapes; the bunches were well finished, and the berries large; Mr. COPSON followed with well-coloured Madresfield Court, berries rather small.

For White Grapes, Mr. Jordan, gr. to Viscount CLIFDEN, Holdeby House, was 1st with Muscats, fine in bunch and berry; Mr. COPSON being again 2nd.

Mr. S. COLE was 1st for a dish of Nectarines, showing very fine fruits of Pine-apple; Mr. COPSON again following. For Peas Mr. Miller, gr. to Sir E. LODER, Whittlebury Lodge, was 1st. Other kinds of fruit were not shown in great numbers.

Vegetables.—Mr. S. COLE had the best collection of twelve varieties, showing a remarkable selection; his best dishes were those of Autocrat Peas, Ailsa Craig Onion, Pragnell's Exhibition Beet, and Perfection Tomatos, both Celery and Carrots being also excellent. Mr. COPSON was a capital 2nd. Mr. S. COLE was again for nine kinds, in which the best of these found in the larger class again predominated; Mr. KNIGHTLEY in this instance being 2nd.

Miscellaneous Exhibits were staged by Messrs. THOS. PERKINS & SONS, who had tastefully made wreaths and an anchor, the finest new kinds of Sweet Peas (excellent), also cut hardy flowers, as well as a group of *Yucca gloriosa* in flower, with Acers, &c. Messrs. JOHN PERKINS & SON had highly coloured tricolor Pelargoniums, a good selection of cut Roses, two baskets of the beautiful variegated *Saxifraga sarmentosa*, and some good plants of *Lilium auratum*.

THE GARDENING IN HYDE PARK.

In some respects one notices improvements—or, at least, pleasing changes—in the subjects used in the beds in this park. It is not always the same, and it is the changes made in this way that alone make tolerable the tasteless arrangement of beds which skirt Park Lane. How delightful all this might be rendered if laid out in some less artificial manner, and dwarf evergreen shrubs and deciduous flowering ones were used amongst the beds. What a wealth of material ready to hand is lying idle in nurseries everywhere, which could be well employed in giving interest to the gardening here! There is too lavish a display of colour on the small area of turf—all gams, and no setting.

Commencing at Stanhope Gate and going north, we have a series of beds which were filled in early summer with Pansies, Sweet Williams, Dielytra, Aquilegia, Solomon's Seal, &c. Some of them are still in flower, being continuous since April and May. Aquilegia with a groundwork of Earl Beaconsfield Pansy made a very pretty bed, as did a bed of Solomon's Seal, and a carpet of mixed Pansies. A bed of crimson Stocks with a band of Pansies has been flowering for the past two months, and is still looking well.

Some of these early beds have been replaced by *Fuchsias* and large plants of *Pelargoniums*, which are now making a good show. These beds are backed up with groups of Palms, Bamboos, and Heliotropes, and have a picturesque look. At South Street gate, to the right and left of it, we come to nice groups of *Fuchsias*, the varieties used being *Mrs. Marshall*, light, and *Scarcity*, dark.

In the next section of beds we have two planted with some large standard *Fuchsias*, having a groundwork of *Palox decussata*, which give promise of looking well at a later date. A bed planted with *Roses* has done well, but owing to the dry weather its flowering period was cut short, and it has been replaced with *Erythrina Crista-galli*, now coming into flower. Some good beds of *Carnations* attract notice, showing their adaptability to this form of garden embellishment. Amongst the varieties doing well were noted—*Danger*, a good crimson; *Raby Castle*, pale pink; *Queen of Bedders*, a brighter pink; and the primrose-yellow *Germania*. *Alice Ayres*, a white with crimson edge, is doing well, but is not so telling as the varieties just mentioned. Next comes a bed of *Canterbury Bells*, which have made a good show, and bid fair to make another very soon, being full of bud again; a pleasing effect is produced here by an undergrowth of *Violas*.

A bed of mixed *Mimulus* has been making a good show, but has lately been removed and substituted with large plants of the oak-leaved *Pelargonium*, having the *Canary Creeper* and *Campanula pyramidalis* mixed with them—a very effective association.

Four beds of Ivy-leaved *Pelargoniums* having a carpet of *Viola Blue Bell*, with a band of white *Lobelia*, were remarkable for the pleasing colouring. Two beds of *Humea elegans* were novel and attractive. *Humeas* were once met with commonly, but gardeners have lost the art of growing the plants [owing to the disease which affects it. Ed.], but they must learn it again. *Plumbago capensis* with *Solanum marginatum* and *Begonia* as an undergrowth make a graceful bed planted together. Two small beds filled with crimson Stocks and *Mignonette*, of course always find admirers. Four round beds planted with tuberous-rooted *Begonia*s having crimson flowers, and stood about on a carpet of *Moneywort*, were attractive.

The next series of beds are planted in pairs, consisting of *Fuchsias*, *Begonia*s, and *Pelargoniums*. The *Fuchsia* beds consist of the varieties *Mrs. Marshall*, Empress of Germany, *Madame Cornelissen*, and *Scarcity*, and some of them are carpeted with *Ten-week Stocks*, *Begonia*s, *Violas*, and other small-growing plants. Some beds of *Pelargoniums*, having mixtures of blue *Cornflowers*, *Poppies*, *Golden Privet*, and *Statice Sawarowii*, &c., are very effective arrangements. On the left, going from

Monnt Street Gate to Grosvenor Gate, there are some beds filled with French varieties of *Canna*, which will make a good show later on. Two beds of *Heliotrope*, intermixed with *Nicotiana affinis*, look well. Here, again, we have a bed of *Plumbago capensis* and *Fuchsia Scarcity*, with *Begonia semperflorens*, and a carpet of *Alternanthera*, which looked well.

From Grosvenor Gate to the Marble Arch some of the beds were filled in early spring with *Dielytra* and *Pansies*, and two beds of *Doronicum plantaginifolium*, having mixed *Tulips* interspersed with the former, were excellent. Two beds of *Saxifraga umbrosa* (*London Pride*), with *Spanish Iris* intermixed, made a good-early show; the *Spanish Iris* coming on later gave an additional floral display. These beds have since been filled with *Fuchsias*, *Dracenas*, *Grevilleas*, *Ivy-leaved Pelargoniums*, &c., and are again making a fine show. One bed of *Petunias* must not be passed over—it is flowering splendidly—the hot weather is doubtless favourable to *Petunias* flowering so well.

Passing across the park to the dell, we have the usual imposing and tropical feature imparted by Tree Ferns, *Dracenas*, *Musas*, &c., overhanging the pretty little stream of water at the east end of the Serpentine. A mixed border planted with things too numerous to mention looks well at the present time. Coming on to the flower walk (*Kensington Gardens*), where flowers have been continuous since early spring, commencing with *Snowdrops*, *Hyalinths*, *Tulips*, *Narcissus*, *Chionodoxa*, *Scilla*, *Phlox arvensis*, *Wallflowers*, *Pæonies*, *Lilies*, *Delphiniums*, *Violas* and *Pansies*, which latter are still good, we have a walk presenting daily fresh features of beauty, interest, and attractiveness. A word of praise should certainly be given to Mr. W. Browne (the Superintendent) for his admirable arrangements this season. J. B.

SCOTLAND.

AN EDINBURGH NURSERY.

To the lover of horticulture, who finds himself on holiday in the queenly capital of Scotland, not the least interesting of the many interesting features of Edinburgh is its profusion of magnificent public gardens and extensive private nurseries. Among the latter, *Beechhill*, owned by the well-known firm of John Downie, and situated about a mile west of the city, on the Corstorphine Road, amply repays the trouble of a visit. The situation of the Nursery of itself has a peculiar charm for the eye that can appreciate the beauties of a delightful landscape in the environs of a busy city. From the slopes of *Beechhill* you might imagine yourself surveying the outlines of some sequestered scene, far from the turmoil of a thousand busy streets, though the heights and spires of the Northern Athens are almost within a stone's throw. In front stretches one of the most fertile plains in Scotland, affording a particularly rich mosaic of cornfield and meadow, and backed by the green slopes of the distant Pentlands. On the right lies the village of Corstorphine, with its venerable church-spire, and the wooded hill, whose summit, "Rest and be thankful," is one of the favourite haunts of the good folk of Edinburgh. To the left a glimpse is caught of *Arthur's Seat*, which you might mistake for the brow of some distant "Ben." As I have said, you might be 100 miles removed from the busy haunt of men, were it not that the 1 o'clock gun booming from the Castle rock, scarcely half-an-hour's walk away, reminds you that you are in the near environs of "Edinboro' town."

I have not come here to reflect or poetise, however, and after spending five minutes admiring the prospect, I am conducted into the *Begonia-house*, there to marvel at the effect produced by the skilful cooperation of Nature and man. The house is between 80 and 90 feet long, and it may convey some idea of the beauty of the interior when I say that the long platforms on either side of a broad passage are covered with a maze of magnificent blooms of exquisite variety.

The contents of the next house into which I am conducted are less dazzling. It contains a fine collection of healthy *Smilax* and *Humea elegans*. Its neighbour, the Palm-stove, is filled with many thousands of graceful specimens, ranging in size from 3 inches up to 12 feet; *Gloxinias* of the finest strain, *Eucharis*, *Adiantum cuneatum*, *Araucaria excelsa*, *Dracenas*, *Asparagus plumosus nanus*, *Caladinms*, *Cannas*, and other superior plants have each a house devoted to their culture, in order to supply the large demands of Downie's floral establishment in Princes Street.

The last house inspected is resplendent with a blaze of double *Begonias*; some of the blooms are truly magnificent. I cannot refrain from mentioning one from a seedling of Downie's own nurture. It bears the appropriate name of Mrs. Downie, and for size, compactness, and the purity of its white colour, would be difficult to surpass. Other specimens deserving special mention are Madame Cecil Godfrey, Lamartine, and La Baronne de St. Didier. One is not surprised to hear that these blooms are at present the most popular of flowers with the fashionables of Princes Street.

A stroll along the walks outside betrays at every step some interesting feature. A patch of healthy young *Planes* attracts attention from the fact that they are the offspring of a venerable sire, which is one of the sights of the village of Corstorphine. This relic of a bygone age is the remnant of a shady avenue that once led up to the old castle. Both castle and avenue have disappeared, and left this giant witness of the old world of a far-off generation. The feature about it is the remarkable colour of the young leaves in early spring, their glittering yellow is so singular as to strike the eye of the most indifferent passer-by. The old folks tell a story of a phantom woman dressed in white, with a bloody sword in her hand, who affrights the belated traveller, a tale which recalls a love tragedy preserved by tradition.

Other beds that tell of flourishing growth and careful management, and that catch the eye in passing, contain collections of Conifers, fruit trees, ornamental shrubs, East Lothian Stocks, *Antirrhinums*, *Pentstemons*, *Delphiniums*, and other herbaceous flowers. It is sufficient to say that the whole is a model of what a plant-rearing garden should be, and reflects credit on the general management of Mr. William MacKinnon. *Traveller.*

FORESTRY.

FELLING AND PLANTING PARK TIMBER.

"Be aye stickin' in a tree" was the advice given by the laird of Dumbiedykes to his son, and it is said these words of Sir Walter Scott led several estate proprietors to go in extensively for tree planting. However this may be, it is probable that the taste for planting has existed, and will exist, among all classes, independently of any ulterior motives than those ingrained in most members of the human race, from the inmate of a garret with his or her *Pelargonium* in a tea-pot, to the wealthy proprietor of a large estate, with his woods and deer-park. With this taste for planting is usually associated the desire to preserve what has already been planted by the owner or his predecessors, a sentiment which is constantly in evidence wherever trees or shrubs are to be found. We all know the ungainly *Araucaria* of the suburban villa, which the occupier thereof regards either as a type of arboreal beauty, or as a vegetable phenomenon, according as his inclinations run in an artistic or scientific groove. But while such incongruities are apparent to the most casual critic, cases may be constantly met with where the existence of a few trees blocks up or obstructs a picturesque view, the possibility of which has never been suspected. Such cases are more common in undulating than very flat or hilly countries, but in all parts of the country the functions of trees in

the composition of the landscape seldom receive a due amount of attention, although their planting is better attended to than their removal. Many of our most picturesque parks have, no doubt, been touched up by some able landscape gardener at one time or another, and bear evidence of their skill to this day, for the artistic creations of such men as Repton, "Capability" Brown, Kent, &c., are little more than fully developed even now. But while the art of the landscape-gardener has not altered so far as its principles go, nor has it advanced to any important degree during the last century, the ideas and productions of its followers are constantly in need of revision and modification. This arises from the simple fact that trees grow in size, while their surroundings retain their original proportions. The seedling of an inch grows in the course of a century into a lofty tree, creating a new feature in a landscape which may or may not be the better for it. We often find a site chosen for a mansion on account of the extensive view of the surrounding country which it commands, and where the immediate vicinity is bleak and bare nothing is more natural than the desire to remedy this defect by planting belts, clumps and single trees in more or less close proximity to the house. The effect of this work is at first scarcely perceptible, but later on, it is frequently found that some interesting feature of the landscape is shut out from the principal point of view. When this occurs before the trees have reached their full size, the removal of the obstruction is a simple matter; but when, as frequently happens, many years elapse before the view becomes obstructed, a conflict often arises in the mind of the owner as to whether a well-shaped tree or clump of trees, or the view behind it or them, shall be sacrificed. To the landscape gardener or impartial observer this question resolves itself into simply deciding whether the tree or the prospect behind is the greater feature in view before him. "A Primrose by the river's brim, a yellow Primrose is to him, and it is nothing more;" but the owner sees things in a different light. Familiarity does not always breed contempt, and the chief attractions of a home lie in the familiar objects by which it is surrounded. Every tree, building, or hedgerow is necessary to complete a picture which is always present to the native mind, and the removal of one of them is like parting with an old friend, or the snapping of a link which connects the old with the new. To the stranger, things appear as they are, devoid of all association, and every combination of lawn, trees, water, and sky, forms a picture, good or bad, as the case may be, and the landscape artist walks through a park in much the same way as a painter walks through a picture-gallery. These two independent points of view are usually brought into opposition when outside opinion is consulted respecting the improvement or alteration of any old and historic mansion or park which has been in the hands of the owner's family for several generations. When a property changes hands, the new owner invariably sets about alterations and improvements, which the old proprietor would regard as utterly spoiling the place, but in most cases true taste will content itself with as few radical changes as possible, and avoid any alterations which tend to destroy the general character of the spot. One of the most essential attributes of those who plant or fell for effect is the power of anticipating the result of their work when fully completed. This is the more easy to do in the case of felling than in planting as the function of the former is to remove existing defects, while that of the latter is rather to provide new features. The removal of trees may be desirable for several reasons, but apart from those cases in which they act as obstructions to the view, from a definite standpoint, the most monstrous instances are found in the case of belts, margins of woods, and dense masses of trees which give the landscape a heavy and somewhat monotonous appearance.

The belt is an element of most park scenery, and is usually provided with the intention of hiding the boundary line, or disguising the real limit of the park. This it often fails to do, owing to its narrowness,

uniform width, or unbroken continuity. A narrow belt is quite as effective in its early life as a broad one, but as the trees grow up, their lower branches die off or become thin in foliage, and we find a perforated and imperfect screen, the identity of which is only too apparent. By varying the width, so that some places are dense and impenetrable to the eye, and leaving a few gaps in suitable places, it becomes almost impossible to detect the boundary line at a reasonable distance, and relief is furnished to an otherwise long and unbroken surface of foliage. A common fault in a belt is its straight or comparatively straight outline, often produced by following too closely the fence it is intended to hide. This can also be remedied by varying the width, so that some parts project, and others recede from the general line. The same treatment is necessary in the case of margins of woods, but where this has been neglected in planting, the axe must be employed to break the outline where necessary. By cutting sharply into the wood in one or two places, so that the outline becomes prominently but not too frequently broken, a variation in light and shade is obtained which greatly improves its appearance.

A better effect is produced if the remaining portions are thinned, so that individual trees stand out here and there from the main mass, and thus obscure the exact boundary line between wood and grass. This, of course, must be done while the trees are still young, otherwise the unfurnished condition of the lower part of the trunks gives them an unsightly appearance when isolated, and the sudden exposure may also affect their health. In breaking a dense mass of trees such as a large clump, the same principles apply as in the former case. Instead of leaving single trees, however, it is better to leave them in twos or threes if the lower branches have been killed off by crowding, which is better for the health of the trees, and also does away with a good deal of the unsightly appearance which isolated trees with bare stems present. As many of the marginal trees should be retained as possible, as these will be well furnished, and hide those standing behind to a great extent.

The manner in which planting should be carried out in a park depends greatly upon the conformation of the ground. Where the latter is of an undulating character, the differences of level may be apparently increased by planting the tops of slopes and hillocks, and leaving the low ground comparatively bare. On flat ground, recourse must be had to groups and combinations in order to furnish variety, and thick planting usually gives a better effect than wide stretches of bare turf with nothing to attract the attention or form a sufficient background to the view. On such ground few finer effects are obtained than by following the type of the natural forest, with its alternating glade, thicket, and characteristic group, and in which the scene is constantly changing. Most of our finest parks are simply the remains of primeval forests, which at first were reserved as chases or sporting grounds, and later on enclosed and stocked with deer. This style of scenery, however, can only be artificially obtained in parks of large extent, or in which the head of deer or cattle is kept within due limits. Close grazing improves the pasturage, no doubt, but destroys the smaller plants and bushes which constitute a characteristic feature of forest scenery. This lack of small shrubs, Ferns, &c., gives a prim and neat appearance to a park which is not altogether displeasing, but is apt to destroy the perfectly natural aspect which many consider a park ought to possess. The judicious use of the ha-ha or sunk fence, and the planting of Backthorn, Holly, &c., which are secure from the attacks of cattle, might do much in breaking the even planes of sward below and the browsing line above.

The use of the clump in park scenery has often results in producing a bad effect. This is usually due to its being planted with a circular outline; and when, as is often the case, it is treated throughout as a plantation, it is entirely out of keeping with the surrounding ground. In our opinion, where more than half-a-dozen trees are wanted in

one place the clump should never possess an entirely convex outline. Crescences, triangles, and oblongs, &c., are all preferable to the circle, providing the sides are not too straight and regular; and a V Y, or star-shape, are all well adapted for providing a broken, irregular outline, with alternating projections and recesses. Many of these objectionable circular clumps were probably planted with the intention of gaining the most ground with the least length of fencing, and after the removal of the latter, giving the clump its final shape. But as this would naturally be out of the question until many years after planting, it is not surprising to find this part of the work neglected in many instances where the planter has not survived the completion of his task, and his successors have not entered into the spirit of his ideas. At the same time, the disfigurement of a picturesque park by these formal clumps of young Fir or Larch seems hardly justifiable under any circumstances. Where young trees must be planted for after-effect, and to replace deaths, a more appropriate way of doing it might surely be found, and the principles of strict economy (so seldom observed in *bond-fide* plantations) slightly departed from when occasion requires. By giving the clump its proper size and shape from the first, the branches of marginal trees are allowed to develop, and the effect at all stages of growth is greatly improved.

Generally speaking, planting individual trees in the park does not prove a success. A single tree may be either an overgrown bush or an arboreal giant, but it is only as the latter that it is much admired. On poor soils, or where at all exposed, a really good specimen tree is rarely seen, and the majority of isolated deciduous trees are short boled with "mush-room" heads. In such cases, a crown of foliage formed from two or three stems is usually more admired than the formal looking individual. Too many double-stemmed crowns must, of course, be avoided, and the existence of any well-shaped tree, however small, is always welcome. Combinations of different species, such as Scots Pine and Oak, Beech, Elm, &c., often give a pleasing effect, and a few Thorns, Hollies, &c., help to break the browsing line on flat ground. The chief object aimed at, whether in felling or planting, should be the providing of just that amount of variety which prevents monotony but does not destroy character. Abrupt changes, or a series of similar repetitions are always undesirable, the one attracting attention to their artificial nature, and the other proving far more monotonous than a constant, but characteristic type of scenery. *A. C. Forbes.*

were found scattered on the shore. As to the other plants, the history of their appearance upon the island seems to have been as follows: First, a thin film of a simple form of vegetable life, derived from floating germs, in the atmosphere, covered the panicle-stone, and, through chemical action, brought its surface into a condition fitted for the nourishment of Ferns and later of flowering plants. The seeds of these were brought by the winds and birds, and, as soon as the soil was capable of supporting them, they took root, and, bathed in the equatorial sunshine, began the work of clothing the barren island anew. Renewed attention has recently been called to the reappearance of vegetation on Krakatoa in connection with the general subject of the origin of the plants that inhabit islands. Nature shows herself entirely capable of conveying the germs of plant-life for long distances by means of the ocean and the atmosphere, aided by the birds. When man comes to her assistance the work goes on apace. Of eighty species of plants inhabiting the Laccadive Islands—which are simply the tops of a group of submerged mountain peaks in the Arabian Sea, half of whose inhabitants have at times been swept off by storm waves—it is believed that fifty-six have been introduced by man, eleven by the sea, two by the winds, and two by birds. Among the species not introduced by man is one of the finest trees of the islands, the Coco-Palm. There is nothing more impressive in modern science than the story of what has been learned of the gradual conquest of the earth by plants—for a real conquest it has been. *Christian Age, July 10.*

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the relation of degrees of temperature above or below 49° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

VARIORUM.
 THE ADVANCE OF PLANT LIFE.—When the tremendous volcanic explosion of August, 1883, occurred in the Straits of Sunda, half of the island of Krakatoa was blown away and every vestige of life was destroyed on the remaining half. The ground was buried under hot ashes and burning panicle-stone, varying in depth from 3 feet to nearly 200 feet. No vegetable germ could possibly have survived the catastrophe. Yet when Dr. Treub explored Krakatoa, only three years after the eruption, he found various species of plants flourishing there. It was shown that they could not have been carried there by human agency, because men had not visited the devastated island. The character of the new plants was such as to prove that they could not have been derived from the former vegetation of Krakatoa, even if any living remains of that vegetation could have existed in the burned and buried soil. The nearest land on which any plants grew was the island of Sibeis. Samatra is 20 miles and Java 21 miles from Krakatoa. Yet a dozen kinds of Ferns and several species of flowering plants and grasses were discovered by Dr. Treub flourishing on the shores and in the mountainous interior. That some of these forms of vegetation had been carried there by the ocean was indicated by the fact that seeds of littoral plants

were found scattered on the shore. As to the other plants, the history of their appearance upon the island seems to have been as follows: First, a thin film of a simple form of vegetable life, derived from floating germs, in the atmosphere, covered the panicle-stone, and, through chemical action, brought its surface into a condition fitted for the nourishment of Ferns and later of flowering plants. The seeds of these were brought by the winds and birds, and, as soon as the soil was capable of supporting them, they took root, and, bathed in the equatorial sunshine, began the work of clothing the barren island anew. Renewed attention has recently been called to the reappearance of vegetation on Krakatoa in connection with the general subject of the origin of the plants that inhabit islands. Nature shows herself entirely capable of conveying the germs of plant-life for long distances by means of the ocean and the atmosphere, aided by the birds. When man comes to her assistance the work goes on apace. Of eighty species of plants inhabiting the Laccadive Islands—which are simply the tops of a group of submerged mountain peaks in the Arabian Sea, half of whose inhabitants have at times been swept off by storm waves—it is believed that fifty-six have been introduced by man, eleven by the sea, two by the winds, and two by birds. Among the species not introduced by man is one of the finest trees of the islands, the Coco-Palm. There is nothing more impressive in modern science than the story of what has been learned of the gradual conquest of the earth by plants—for a real conquest it has been. *Christian Age, July 10.*

"The temperature was below the mean in all districts, the deficit amounting in most cases between 2° and 3°, but in 'England, E.' to 4°. Highest readings, which occurred at western times during the week, were below 70° in most of the western and northern districts, and very little above that point in any other parts of the kingdom. Lowest readings were also registered on varying dates, and were low for the time of year; in 'England, E.' the thermometer fell to 39°, and in 'Scotland, N. and W. and England, S.W.' to 38°. In the 'Channel Islands,' however, it did not go below 53°. The rainfall exceeded the mean in 'England, E. and S. and the Channel Islands, as well as in 'Ireland, N.,' but showed a deficiency in all other districts. In 'England, N.E. and N.W.,' the fall amounted to only half the normal. The bright sunshine was considerably less than the mean over the United Kingdom generally, but was slightly in excess of the normal in 'Scotland, E. and England, N.W.' The percentage of the possible duration ranged from 29 in 'England, N.W.,' and 28 in 'England, E. and the Channel Islands,' to 15 in 'England, N.E.,' and 14 in 'Ireland.'"

MARKETS.

COVENT GARDEN, August 8.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday by the kindness of several principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one week.]

SEEDS.
 LONDON: *Aug 7.*—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pool, Borough, London, S.E., write that to-day's market was scantily attended, with but little business passing. New Trifolium, both English and Foreign, is offering on reasonable terms. A few parcels of winter Tares, of fair quality, are now coming to hand. New Rye is cheap and good. There is no improved inquiry for Mustard and Rape seed. Barlecks scarce. Peas unchanged. Birdsseed continue slow. Hackweeds offers on tempting terms. Other articles just now attract but little attention.

FRUITS AND VEGETABLES.

BOROUGH: Aug. 6.—Quotations—Peas, 3s. per bushel; Morserah, 1s. to 1s. 3d. per bundle; Currants, 1s. 6d. to 2s. 6d. per half-sieve; Gooseberries, 1s. 6d. to 2s. do.

STRAFORD: August 6.—Quotations—The supply to this market during the past week has been good, and, with plenty of buyers, a brisk trade was done as under—Cabbages, 3s. to 5s. per tally; Turnips, 2s. to 2s. 6d. per dozen bunches; Carrots, household, 2s. to 3s. do.; Mangels, 15s. to 22s. per ton; Onions, Optoro, 5s. to 5s. 6d. per case; Apples, English, 2s. 6d. to 4s. per bushel; Plums, 3s. 1d. to 3s. 9d. per half-sieve; Cherries, 2s. to 3s. do.; Peare, 1s. 6d. to 2s. 1d. do.; Cucumbers, 1s. 6d. to 2s. 8d. per dozen; Scarlet Runners, 4s. 6d. to 4s. per sieve; do., Runners, 9s. to 10s. per bag.

SPIRALPICKLS: Aug. 6.—Quotations—Scarlet Beans, 3s. 6d. to 4s. 6d. per bushel; Peas, 2s. 6d. to 3s. do.; Turnips, 2s. to 2s. 6d. per dozen bunches; Carrots, do.; Marrows, 4s. to 5s. per tally; Cabbages, 2s. to 3s. do.; Apples, 3s. 6d. to 4s. per bushel; Seconds, do., 2s. to 2s. 6d. do.

FARRINODON: Aug. 8.—Quotations—Cabbages, 1s. 3d. per dozen; Carrots, 3s. 6d. per dozen bunches; Turnips, 4s. do.; Mint, 4s. do.; Marrow, 2s. per dozen; Scarlet Beans, 4s. to 4s. 6d. per bushel; Tomatoes, 4s. 6d. per box of 12 lbs.; Green Gages, 4s. per pad; Apples, 4s. per bushel; Raspberries, 7d. per punnet; Plums, 8s. per half-bushel; Cucumbers, 2s. per dozen.

POTATOS.

BOROUGH: Aug. 6.—Quotations ranged between 80s. and 120s. per ton.

SPIRALPICKLS: Aug. 6.—Quotations—Hebrons, 80s. to 70s.; Regents, 55s. to 70s.; Snowdrops, 70s. to 90s.; Puritans, 70s. to 85s.; Reading Giants, 60s. to 70s. per ton.

STRAFORD: August 6.—Quotations—Magnum, light soil, 60s. to 75s.; dark soil do., 50s. to 55s.; Hebrons, 70s. to 80s. per ton.

FARRINODON: August 8.—Quotations: Puritans, 80s. to 90s.; Moorachs, 80s. to 90s.; Red Hebrons, 80s. to 90s.; Imperators, 70s. to 80s.; Magnums, 60s. to 70s. per ton.

LONDON AVERAGES: August 7.—Hebrons, 80s. to 90s.; Snowdrops, 80s. to 100s.; Early Regents, 65s. to 75s.; Early Rose, 60s. to 70s.; Puritans, 60s. to 70s.; Kidneys, 60s. to 65s. per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending August 3, and for the corresponding period last year.—1895: Wheat, 24s. 2d.; Barley, 18s. 2d.; Oats, 15s. 9d. 1894: Wheat, 24s. 4d.; Barley, 21s. 4d.; Oats, 19s. 8d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week—Clover, prime, 90s. to 110s.; do., inferior, 50s. to 80s.; hay, best, 60s. to 85s.; do., inferior, 36s. to 60s.; mixture, 70s. to 92s. 6d.; and straw, 20s. to 32s. per load.

VEGETABLES.

NEW KIDNEY BEAN DWARF PARISEIN.

This is a dwarf French variety distributed by Messrs. Vilmorin & Co. of Paris last spring, and it is said by them that it has sprung up among the Paris market gardeners, and although it has become known but recently, its culture is spreading very rapidly in the vicinity of Paris. I have a few lines of it at my seed grounds at Bedford, where it has done well and pleases me greatly. It is of dwarf and compact growth, very early, and highly productive, the pods long, soon maturing, dark green in colour, streaked with black lines, and having tested it for table, I can pronounce it all that can be desired. The fact that the beans are darkly striped need not prejudice any one against it; it is characteristic of some older varieties, and the colour entirely disappears in the process of cooking. I think it must prove a very excellent forcing variety, as it commences to bear so early. We are indebted to Messrs. Vilmorin & Co. for several good things in the way of vegetables; not least among them being the Dwarf Parisien French Bean. R. D.

ENQUIRY.

"He that questioneth much shall learn much."—BAOON.

"D. W. C. M." would be glad if some of our correspondents would inform him what would be the best things to grow on land irrigated with sewage.

* * * Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who will know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

* * * PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florist varieties cannot, as a rule, be named.

ADDRESS OF THE GARDENERS' Royal BENEVOLENT INSTITUTION: Inquirer, No. 50, Parliament Street, Whitehall, W.C.

BOOKS: Asparagus. A trustworthy manual is one entitled Asparagus Culture, by Barnes and Robinson. Price 1s. 6d., post-free, of D. W. Morgan, 1, Little College St., Westminster, London, S.W.—PROPAGATION AND MANAGEMENT OF FRUIT, FOREST TREES, CONIFERS, &c.: W. H. B. The following would be of use:—Fruit Farming for Profit, by G. Bunyard, published by Frederick Bunyard, 20, Week Street, Maidstone; Cultivated Plants, by F. W. Barbridge, to be bought of D. W. Morgan, 1, Little College Street, Westminster, S.W.; and The Art of Grafting and Budding, by Charles Balcet, published by W. Robinson, 37, Southampton Street, Covent Garden. The Forester, by J. Brown, 6th edition, by John Niebet, published by W. Blackwood & Sons, Edinburgh and London, will tell you all about the management of forest trees, &c., in the nursery.

CARNATION PROPAGATION: R. M. P. You will find several methods described on p. 41, July 13. The stems should be cut half through, just below a joint at a point where the growth is fairly matured, but not woody.

COCKSCOMBS: R. M. P. The plant is an annual, and should be thrown away after flowering, if seed be not wanted.

DRACENAS: R. M. P. The stem should be half cut through just below a node, and then slit upwards for an inch or two, the slit being kept slightly open with a thin wedge. Moss may then be bound round the stem at that place, or a flower-pot cut in half vertically may be made to clasp the stem, being fixed to some stakes stuck into the soil, and fastened together with twine or wire. The pot may be filled with peaty soil, or peat and sphagnum-moss. The soil or moss should be kept moderately moist. When sufficiently rooted, separate the rooted portion and treat it as an independent plant.

EARWIGS ON NECTARINE TREES AND DAHLIAS: E. B. G. and B. D. These insects (Forficula auricularia) may be caught in small pots half-filled with hay, &c.; in lobster-claws, or, better still, in tubes made out of brown paper, pieces of the stems of Hemlock, Elder, and Broad Beans, one end being plugged. These should be cut into lengths of about 9 inches. In the case of Dahlias, Carnations, &c., hang the tube on the stake that supports the plant, the open end downwards. In the morning, take down the tubes, remove the plug, and blow the earwig into a vessel of hot water, replace the plug, and hang it again on the stake. In the case of fruit trees on walls, the tubes may be tucked under the shoots and branches.

FERTILISATION OF ORCHIDS: F. L. G. The Hague, John Murray, Albemarle Street, London. A few shillings.

FUNGI: T. J. H. The fungi you send are true Mushrooms.

FUNGUS DISEASES OF TOMATOES: Solanum. But little good would result from putting in your inquiry concerning these two well-known maladies. As a preventive means, use the Bordeaux Mixture—a formula for making it was given in a recent issue—not waiting till the disease has declared itself. It will not harm either the fruit or the leaves, and it will keep the plants healthy. Take care not to use it after the fruits begin to colour.

LARVÆ: W. Cann. None was found in the box.

LILIES: F. de L. The Lilies you mention might all be left in the ground if sufficiently protected. Your plants of L. auratum are probably attacked by the fungus which is so destructive to Lilies.

MUSHROOM GROWING ON GLASS WITHOUT MANURE: W. H. P. See Gardeners' Chronicle, August 19, 1893, p. 214. We have no further information.

NAMES OF FRUIT: J. W. S. Keawick Collin.—A. F. Pear Early Rousselet; Apple next week.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—B. P. We do not undertake to name florist varieties. Send your Carnations to a large grower.—A. F. 1, Cupressus, perhaps sempervirens; 2, Libocedrus decurrens; 3, Liquidambar styraciflua; 4, Pinus Latic var.; 5 and 6, next week.—F. C. S. Spiraea Lindleyana, and one of the American Oaks.—W. T. Leicester, 1, Sedum; 2, Anchusa italica; 3, 4, and 5, Erinus lychnides.—J. C. 1, Viola cornuta, white variety; 2, Geran um pratense; 3, Melilotus; 4, Sedum rupestre; 5, Linaria Cymbalaria; detached leaves, without a number, Alchemilla vulgaris.—J. W. 3, Thuya plicata; 4, Cupressus nutkaensis; 5, Rhus Cotinus. It is too risky to attempt to name the other scraps.—H. H. Cologny speciosa, Cattleya Eldorado. The little "Angracum-like plant" is Trichocentron albo-purpureum.—J. S. Montrose, 1, Laetrea filix-mas; 2, Cymotium caryotideum; 3, Platyloma rotundifolium; 4, Polystichum angulare deapperatum; 2 and 3 are not British.—W. J. R. The rose-coloured flower is Lælio-Cattleya x elegans, commonly known as Lælia elegans Turneri. The light one, Lælio-Cattleya x Schilleriana. Both are natural hybrids, occasionally imported with Lælia purpurata.—D. S. & Son, Cupressus Lawsoniana var.—C. Lincoln, Aesclepias syriaca.

SMALL FRUITS FROM NEWLAND: T. Coomber. Uncommonly fine fruits of red-fruited Currants, Cherry-red, and La Fertile; Ogden's Black and White Dutch Currants; Industry Gooseberries, and Superlative Raspberries. We have seldom seen finer, and the more remarkable from the fact that no artificial watering was performed.

SPOTTED PEACHES: J. A. The spots are not caused by any fungus growth. Cannot suggest the cause.

TOMATO FRUITS NOT COLOURING PROPERLY: H. Lee. There is no disease present in the fruit sent for examination, which is not in any way the worse for eating. G. M.

TOMATOES: Challenger. The constituents of stable and farmyard manure are, with the exception of the urine, too slow in their action to suit the short-lived Tomato plant; something more concentrated and readily available is required, and your plants are languishing for lack of it. Dung is particularly wanting in one important constituent of the plant, viz., potash. You must clear away the top-dressing of dung without much root-disturbance, affording a slight top-dressing of rather adhesive loam instead, and over this straw guano, or a manure consisting of nitrate of soda or sulphate of ammonia, together with potash and phosphoric acid. If you use manure rich in nitrogen and potash, but without the phosphoric acid, the ripening of the crop will be retarded. The amount of manure afforded need not exceed 2 oz. to the square yard, whether afforded in a dry or liquid state; and it will not be required more frequently, at least until the foliage and crop have increased, than once a week. As against the mildew, use the Bordeaux Mixture; see answer in this page under the heading "Fungus Diseases of Tomatoes."

WORMS ON LAWNS: W. E. R. Watering the turf with clear lime-water will bring them to the surface, when they can be gathered up. This proceeding will reduce their numbers, but we cannot imagine a lawn in good condition without worms, as they render it dryer by their burrowings, besides being the means of bringing the subsoil to the top, and thus helping to manure the turf.

COMMUNICATIONS RECEIVED.—H. Noble.—A. C. F.—E. B.—G. Thomas.—M. C.—T. Singleton, Currighmors, next week; kindly send the promised note on Cabbages.—W. H. A.—Harrison Weir.—A. D.—W. H. W., next week.—A. H.—B. P. B.—T. E.—H. N. B., Singapore.—Gardies Mitchell.—M. T.—J. J. W.—D. T. F.—R. L. H.—W. B. H.—E. B.—A. C. F.—J.—G. M. Ne.—H. M.—W. D.—C. J.—Sir T. L. J. J. M., New York.—W. C.—D. S. & Son.—B. B.—W. H. P.—W. J. B.—H. W.—C. S. & Son, Guernsey; many thanks and much sympathy.—G. B. T. F.—N. M.—C. N., Antibes.—E. A., Paris.—T. de M., Guernsey.—T. H.—T. R.—F. W. B.

If set across three Columns the lowest charge will be 30s.

Page, 28; Half Page, £4 10s.; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary rate.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances

Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—Advertisers are specially requested

to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers,

and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for Terms.

SPECIMEN FREE. Price 2d.

Published Friday for Saturday.

OFFICES:—72, HIGH STREET, WORCESTER.

FARMS, ESTATES, RESIDENCES.

Any one desirous of

Renting a Farm or Residence, or Purchasing an Estate, can have copies of the

MIDLAND COUNTIES HERALD

SUPPLIED FREE FOR SIX WEEKS,

on stating the purpose for which the paper is required, forwarding Name and Address, and six halfpenny stamps for postage, addressed, "Midland Counties Herald Office, Birmingham." The Midland Counties Herald always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to be Let.

BOTANY AND GARDENING AT
HARVARD UNIVERSITY.

EVERYONE interested in Botany and Horticulture must have heard of the famous room in the Botanical Museum at Harvard University, where the glass flowers are preserved. These models, which have been manufactured in Germany by a man and his son, named Blaschka, are composed almost entirely of glass. The colour is very largely in the glass itself, although some is placed on after the flowers are made. Where possible, the entire plant is reproduced life-size; in other cases a branch or a leaf and the flower cluster. The beauty and accuracy of these models are beyond belief, and in some cases it is difficult to distinguish between the models and living specimens, when they are placed side by side. Quite recently an American contemporary gave a short review of the botanical work at Harvard, from which it may be interesting to extract a few details. In 1842 Asa Gray was chosen Professor of Botany at Harvard University, and he soon set to work to improve the Botanic Garden. Asa Gray, it was said, did more than anyone else to introduce the laboratory method in botanical teaching. With him the study of Nature meant contact with Nature, and not what someone else had written about that contact. In 1873 Dr. Gray resigned his professorship, and one of his two assistants, George Lincoln Goodale, was appointed in his stead. The other, William Gibson Farlow, a few years later took charge of the work in cryptogamic botany.

At the present time the herbarium of phanerogams is located in the building at the Botanic Garden. A curator and two assistants are engaged upon the study of collections which are constantly being acquired. The Botanic Garden consists of 7 acres of ground tastefully laid out into beds. In these beds there are plants of 1500 native species, 1300 foreign species, and 400 varieties. In the greenhouses there are under cultivation about 2400 species and varieties. The arboretum is at Jamaica Plain, about 7 miles from Cambridge. It covers about 230 acres. By an arrangement with the city of Boston, this has been made a part of the metropolitan park system. The plan is to cultivate every species of tree and shrub which is capable of withstanding the severity of a New England winter. How well the Director has succeeded is attested by the fact that the Harvard or Arnold Arboretum, as it is called, is universally recognised as the finest in the world. The Arnold Arboretum has become one of the most charming places for certain studies of a general nature within reach of the public of Boston.

The Botanical Museum at Harvard consists of a collection of economic plants containing practically all the products used by man. It is interesting to note that New York will soon be in possession of a botanic garden of the first

order. The subscription pre-requisite to the issue of municipal bonds has now been completed, and it now only remains for the city to carry out its part of the agreement, by raising 500,000 dols. for building purposes, and by providing 250 acres of land in Bronx Park or other suitable place. It is hoped that other cities will soon follow the example of New York by enriching their park systems with an educational aid of the greatest value. Mr. G. L. Goodale, of Harvard University, in an article contributed the other day to *Science*, put very clearly the uses of botanic gardens. Formerly, they were largely used for the cultivation of medicinal plants and for the reception of species from distant lands. Now new phases of plant relations are being displayed in the larger botanic gardens. Geographical questions are asked and answered by skilful groupings of species. The bearing of climate on the structure, habit, and possibilities of plants is made prominent in an interesting fashion.

In fact there are numerous stimulating sights in a botanic garden if one only takes the trouble to look for them. We so often regard our American cousins as absorbed in the business of making dollars, that it is refreshing to find that they do not forget those higher pleasures which appeal to the intellect. The effect of the numerous Universities is beginning to be felt, and many young men are throwing themselves into some study instead of entering business and bowing down before the almighty dollar. It has been well said that as a means of mental discipline, as a source of knowledge becoming more useful each year, and as a study leading us closer and closer to the just appreciation of Nature and her laws, Botany is unrivalled. *H. C. F.*

NEW OR NOTEWORTHY PLANTS.

CATTELEYA FOWLERI × *

This is a very beautiful hybrid out of *Cattleya Leopoldi*, fertilised by the pollen of *Cattleya Hardyana*. The new plant has a rather slender habit. The bulbs are slightly compressed, with only a trace of ribs when young, the elder ones being somewhat, but not even deeply furrowed. The raceme of the two first flowering specimens bore two flowers, but it is to be hoped the plants will become more vigorous, and then the number of the flowers will undoubtedly increase. The flowers are in size very similar to those of *Cattleya Hardyana*, and from its father the plant has received the splendid labellum. The colour of the sepals and the larger and more tender petals are deep mauve-purple, whilst the middle lobe of it shows the most intense violet-purple. This new hybrid was raised by Mr. Maynard in the establishment of Messrs. Sander & Co., at St. Albans. It is named in honour of G. Gurney Fowler, Esq., Glebelands, South Woodford, Essex, and was shown at the Royal Horticultural Society on Tuesday last.

VARIETIES OF STRAWBERRIES AND NEW VARIETIES FOR FORCING.

Those who force the Strawberry in quantity and early, are always on the lookout for new varieties which have the property of setting well and are naturally early fruiters. My readers will not sup-

pose that I underrate the value of any variety not noticed in this note, for the Strawberry varies so much in different soils, and the variety that is a favourite with some gardeners is of small value to others. Take, for instance, *Vicomtesse Héricart de Thury*, a popular forcing variety; some persons object to it as being too small, and prefer a larger-fruited variety as having a better appearance, good flavour in so many cases being reckoned only of secondary value. The introduction of novelties and the favouring of old varieties of poor quality have to some extent caused the decline in public estimation of good forcers, viz., *Black Prince*, *King of the Earlies*, and others of small size noted for their good flavour. To show the interest gardeners take in this matter, it may be stated that three new varieties have been certificated this season, all of which were noted for heavy bearing, size, and general good appearance. The raising of new early varieties does not seem until recently to have kept pace with the demand, and numbers of the standard varieties have been in gardens for a long time. Mr. Laxton's variety *Noble*, brought out in 1887, was a great gain as an early fruit out of doors and for forcing. It is one of the most valuable varieties ever sent out, on account of its habit, which is vigorous, heavy cropping, and large fruit. I admit it has been condemned on account of its lack of flavour, but still it is one of the best early fruits ever raised, and we may, on that account, overlook the defect. The well known *Keen's Seedling*, a variety raised in this district as long ago as 1821, is a grand forcing Strawberry, but there are spurious varieties of it about. The original *Keen's* is a dwarf free-fruited plant, and it may still be classed as one of our best forcers, and I force 1000 plants of it every year, having, as I believe, the true variety. The finest flavoured Strawberry is *Myatt's British Queen*, raised in 1840, and it is even now one of the best for late forcing, although I am fain to admit that in Laxton's "*Latest of All*" we have its superior as regards cropping, size, and quality; and though I cannot say that it is good for forcing purposes, it is so as the latest cropper in the open. I was very pleased with it when forced, the quality of the fruit being all that one could wish, the only drawback being that a few of its fruits failed to ripen at the point, having therefore the same peculiarity as *British Queen*, one of its parents.

To come to what may be termed the latest addition to the forcers, and one that has made rapid advances in growers' estimation in a short time, *Royal Sovereign*, which, I think, will be a standard variety in gardens for a long time to come. In this variety there are size, quality, and great cropping capacity—three essential qualities of a forcing fruit. As an earnest of my appreciation of it, I may state that on July 29 we potted up a thousand plants. There are Strawberries with larger fruits than this one, viz., *Anguste Nicaise*, which has no equal in cropping and flavour. Even when hard forced, it does not lack flavour as others do. Out-of-doors in our porous soil it was very fine this year, and only three weeks later than *Noble*, which is one of its parents. It has got the wonderful vigour of the latter with the flavour of *King of the Earlies*—that is, a brisk Pine-flavour. It is excellent for early forcing, setting freely, the fruits well above the foliage, not low down among the leaf-stalks. As a fruit for sending long distances, it is one of the best, the pulp being firm in texture, well covered with seeds. Its colour is a bright scarlet, making a choice fruit for early spring.

Another new variety, and one which should be noted on account of its excellence as a forcer, is *Stevens' Wonder*, a variety which has been figured and described in these pages, noted for its wonderful cropping qualities early in the season. This I am only able to describe from seeing it in fruit, not having grown it, but I am going to try it for very early fruiting, and I have some plants well-rooted in the fruiting pots.

For mid-season forcing, the new *Gunton Park* is very good. It is one of the trio raised by Mr. Allan, of Gunton Park, and noted for their fine flavour. The fruits are large, dark crimson in colour, of a

brisk, pleasant flavour, and a good forcer for the season named.

There are others, such as *Competitor*, a fine fruit, with firm flesh, and though not recommended generally for forcing, I have found it to be good; not, perhaps, suitable for hard forcing.

This year two others noted for their size have come to the front, *Leader* and *Monarch*; the first is a grand fruit, of good quality, but the plant cannot be recommended for hard forcing. *Monarch* is equally fine, with Pine-flavour, and it promises well; and though I have not yet grown it, it should not be left out of a list of new varieties.

With regard to the forcing qualities of any variety, much depends on cultural treatment, and whether the forcing is early or not, on the means for forcing, results obtained being different with different growers. I will admit that I have a partiality for some of the old varieties, and so far my best early has been *Vicomtesse*, which is excellent as a first early, being very productive, free-setting, and of the best flavour. But one cannot force both old and new in quantity, and when the newer ones have been tested, some of the older kinds are allowed to drop. *Vicomtesse H. de Thury* (*Garibaldi*) has been nearly fifty years in gardens, so it has stood the test of time; and after trying *Royal Sovereign* for three years, we are growing less *Vicomtesse*, the new one having size, in which the older variety is lacking. My next selection is *La Grosse Sucrée*, a very fine Strawberry of the *Keen's Seedling* type, not a good traveller, but prolific, and of good quality; indeed, as regards crop, it may be classed as the best of the older forcing varieties. It bears a quantity of even-sized fruit, and soon turns in after setting. Many gardeners look upon this as being superior to all others. It does well in most soils, but I find it does not like too much exposure in winter, the leaves soon getting crippled. *President* and *Sir C. Napier* are too well known to need anything being said about them. The first is liable to mildew, but it deserves attention, and this pest may readily be checked.

I am aware many gardeners are not in a position to grow many varieties, neither do I advise it, as the new ones in any case will only be grown sparingly at first, and one can readily have Strawberries from February till June with a variety for each month, and my selection would be *Vicomtesse* or *Royal Sovereign*, followed by *La Grosse Sucrée*, or else the true *Keen's Seedling*, *President*, and *Sir Charles Napier*. It is not advisable to have great numbers of late Strawberries in pots in a season like the one we have just passed through, as fruit in the open can be had early in June. Again, *British Queen* does not thrive everywhere, and *Keen's Seedling* is apt to come barren. Some varieties do not thrive in certain soils, and in such the novelties should be tried. So far I have not known *Noble* to fail, and fruits ripened in a well-ventilated house are very superior. Hard forcing is often solely at fault. A few words as to culture at this season. The plants should now be in the fruiting-pots, and those who care to purchase small-rooted, potted-up plants, will be in a better position if they get them early. To obtain runners in quantity for next season, I am planting now, at 2½ feet apart between the rows, and half that distance in the row, in deeply-worked, well-manured land, a row of *Lettuce* or late *Colewort* being planted between the Strawberries, ground being scarce. These are cut by March. When growth commences, the flower-spikes are kept pinched off as they appear, and early runner-formation encouraged, the runners being fit to pot up much earlier than when the plants are allowed to fruit. After the runners are taken, every other plant is cut out with a hoe, some more nutriment afforded, and forked in, and the beds made neat for the autumn. These plants fruit grandly the following season, then being destroyed, as I am a great advocate for young plants. In potting, avoid excess of manure, and use good loam, a sprinkling of bone-meal, or spent Mushroom manure. Firm potting, a hard coal-ash bottom to stand the pots on, and plenty of sun, are essential points. The crowns may be thinned when growth is robust, and the roots should be protected

* *Cattleya Fowleri* ×, Sander and Kränzlin (*Hardyana* ♂ × *Leopoldi* ♀).—Bulbs 12 to 15 pollices longis, internodiis 5, supremo dimidium totius plantae æquante; foliis 2 oblongo-lanceolatis obtusis, squamâ simplici; racemo bifloro (in utroque specimine observato); sepalis lineari-oblongis obtuse acutis; petalis margine leviter undulatis oblongis subrhombicis obtusis duplo latioribus; labelli lobis lateralibus semiovatis obtusis conniventibus, lobo intermedio maximo quadrato in transverse rectangulo antice sinuato margine utrinque et antice crenulato undulato. Flores 5 poli. diametro extus et intus purpureo-violacei; lobi laterales labelli eodem colore, lobe intermedius pulcherrime violaceus.

in winter. The best winter protection is afforded by cold frames, the plants being bedded in cocoa-nut-fibre or coal-ashes. *G. Wythes.*

DISA GRANDIFLORA, ETC., AT "JOLDWYND."

A PLEASANTLY situated garden is Joldwynds, the residence of Lady Bowman, nestling on the south side of a hill near the pretty village of Holmbury St. Mary, about seven miles from Dorking. The visitor on entering the grounds will not fail, if he be an arboriculturist, to admire the fine specimen Bamboos

eminently, were large beds of brilliant-coloured Cannas. The white and pink Malope (*Malva grandiflora*) is planted thickly on each side of a long walk; also vigorous plants of the dark-blue-flowered *Primula* resembling *Alice Wilson*, which at the present time is a scarce plant. Besides these there were large masses of *Crinum Moorei*, whose large pink and white corymbs of flowers have a stately appearance.

THE ORCHIDS.

In the plant-stove a robust specimen of *Dendrobium Dalhousieanum* was noted remarkable for the size and substance of its growths, which are many—

specimen of *Maxillaria venusta*, with over thirty flower-spikes; besides a strong plant of *Mormodes pardinum unicolor*, with two strong spikes of its lemon-yellow flowers. In a cooler house, some fine specimens of *Masdevallia Schlimii* and *Odontoglossum cordatum* were noted, also in bloom *Cœlogyne ocellata*, *Anguloa Clowesii*, *Dendrobium Jamesianum*, *Lycaste Skinneri*, and *Masdevallia peristeria*. The cool-growing *Pleione humilis*, planted in shallow pans and hung close to the roof, appear to be suited with their position. In a moist shady corner of the house a healthy batch of *Pinguicula candata* was observed. Passing along into a Peach-house is a

FIG. 33.—*ARUNDINARIA NITIDA* IN THE BAMBOO GARDEN AT KEW. (SEE P. 186.)

(not the least affected by the severe frosts of last winter), the massive *Gunneras*, several fine plants of *Veronica Andersoni*, which at the time of my visit were full of flower, and the large beds and masses of *Rhododendron* plants. Having secured the guidance of Mr. F. Cornish, the head gardener, a stroll was taken round the very beautiful flower garden, whence a view is obtained over a lovely country, the view extending almost to the English Channel, and only divided from it by a range of the Sussex hills.

Of rare, or at least, uncommon plants, two fine bushes of *Desfontainia spinosa* were noted; the gay and beautiful *Tropæolum speciosum*, entwining itself around *Fir* and *Holly* trees in great luxuriance. Fine clumps of *Iris* grow thickly around a small lake, and in full bloom amongst others was *I. Douglasii*. Not far distant, and standing out pro-

some of them measuring more than 7 feet in length, the young stems now growing freely, indicate that they will eventually reach as far. A plant of *D. Dearei* was in bloom, and growing well; *D. chrysanthum* will be a pretty sight a few weeks hence; *D. thyriflorum*, *D. densiflorum*, *D. superbiens*, *D. formosum* and *D. heterocarpum* are doing well. These plants are hung from the roof, where they get plenty of sunshine. The plants of *Cœlogyne cristata*, *Phaius*, *Pleiones*, and the deciduous *Calanthes* give good promise of a fine display of bloom in their season. Suspended from the roof in the intermediate-house some well-bloomed plants of *Epidendrum vitellinum majus*, and a nice healthy specimen of *Epidendrum Parkinsonianum*, with eleven of its sweet-scented flowers were remarked. Standing upon the stage in the same house was a compact

remarkable specimen of *Iris Robinsoniana* in the best of health, but Mr. Cornish has not yet succeeded in flowering the plant.

Another small house is almost entirely devoted to the cultivation of *Streptocarpus*, of which at the present time there is a large quantity of young seedlings in bloom, many of them of sterling merit.

Seldom is that beautiful terrestrial Orchid, *Disa grandiflora*, seen so near to perfection under cultivation as here. At the present time there are over a hundred spikes in full bloom, a sight that we dare to say, unique in this country. The luxuriance of the growth, and the large strong flower-spikes, show that the conditions are very favourable. It may be stated that Mr. Cornish's success with this plant is not temporary, it being now many years since he received his first few.

plants at the Joldwynds, and it has been rapidly increased until at the present time the plants may be counted by the hundred. I have seen the *Dissas* for several years past noted how well they are being grown here, and I hope the success attending their cultivation will long continue. Success may in great measure be attributed to a cool evenly-balanced atmosphere, shade from strong sunshine, a well-ventilated house facing south, and the temperature of which in the winter frequently falling to 45°. The compost in which the *Dissas* are grown consists of good black fibrous peat, and chopped live sphagnum-moss, with the addition of a small quantity of coarse silver-sand.

A nice healthy specimen of the rare *Gerbera Jamesoni*, also South African, grows and flowers annually under similar treatment to that afforded to the *Dissa*. *W. H. W.*

PRESERVING FRUIT.

I HAVE read your article, p. 92, on this popular subject with much interest, and as lecturer on technical education I find few or no subjects more fruitful of suggestive questions. Neither does the British practice of fruit preserving as thus illustrated and elucidated differ very widely from the American as set forth by Miss Parloe in the *Gardeners' Chronicle* of August 3, and through other sources. As many doubtful and even faulty methods of fruit preserving, however, still prevail, you have rendered an important service to our rural industries by giving Miss Parloe's lucid lecture the wide publicity of your columns. The prizes now so generally given for jams, jellies, preserves, pickles, bottled and candied fruit, at cottagers' and other shows, exhibit at once the virtues and merits of our present modes of preserving fruit. The chief point wanting in many of these exhibits is some sure and certain object-lesson or standard of merit to which to appear or compare the local exhibits. Not a few of the latter are dreary failures in colour-quality keeping quantities. With the exception of Raspberries, it would often be difficult or impossible to tell at sight what fruit the preserves are made of; the whole are also as a rule seriously over-sugared and over-cooked.

The pace of improvement might be greatly quickened as well as improved were an object-lesson exhibited at village or other shows in the form of sample jars or bottles of preserves, pickled or canned fruits and vegetables from such makers as Cross & Blackwell, Chivers & Sons, and others. Almost every housewife prides herself on her jellies, her jams, pickles, green and preserved fruits. Nevertheless, it is comparatively rare that these come up to trade standards of excellency; and could this be generally reached, the rural districts would be the richer in consequence.

As I note the honoured name of Mr. J. J. Willis, Harpenden, under Miss Parloe's lecture, I presume that will be accepted as satisfactory authority of the soundness of the chemistry involved in the theory and practice of fruit preserving propounded by Miss Parloe. One of the most prevalent notions is, that fruit can hardly be over-cooked. The longer it is boiled in the sugar, the longer and sounder it will keep, has almost passed into an axiom among housewives and housekeepers. Boiling expels the watery juices, makes jelly and jam more thick and dense. The more dense the more sugar and solid matter, and the longer the sweets will keep. Yes, but pectine, which forms the basis of vegetable jellies, and gives to the juices of the fruits the property of gelatinising, may be boiled down into common gum or starch by excess of cooking. Hence there is a tide in the affairs of jelly-making which leads on to fortune, that is, long, sound, and sweet-keeping, and that is when the property of gelatinising is at its strongest, which will probably be found to be after a smart boil of a quarter-of-an-hour or twenty minutes. Will Mr. Willis confer another favour to the many he has already bestowed upon cultivators by laying down a time measure for the development

of the maximum properties of the gelatinising of fruit in the process of preserving them? Practically most of us are familiar enough with the simple test of setting our jams and jellies on plates to see if they are done. But scientific time formulas, so as to ensure sound keeping, without any risk of boiling fruit down towards decomposition, would be very valuable. Mr. Willis will excuse me for asking for further information about the use of lemon-juice to keep fruit white after paring.

In regard to sun-cooked Strawberries (p. 93), after many years experience of growing and preserving these fruits, my advice would be emphatically, do not follow Miss Parloe in this. Of course, the lecturer is writing on American sunshine. With our watery suns, I can conceive of no more likely process to fill Strawberry jam with fungoid germs that would hasten it into worthlessness and sheer rottenness, although it has been previously fortified with a pound of sugar to a pound of berries, and boiled for ten minutes. Unless Mr. Willis has something to say in explanation of the following paragraph, I hope no English jam makers will be tempted to try Miss Parloe's sunbath on this side of the Atlantic.

This, however, is almost the only paragraph in this very useful lecture that may not be read, marked, learned, and inwardly digested with pleasure and profit on this side of the water: "Sun-cooked Strawberries.—Use ripe and the finest fruits; put them in the preserving kettle with a pound of sugar to one pound of berries, first a layer of fruit, then a layer of sugar, and so on. Do not have the mixture more than 6 inches deep; place on the fire, and watch. When the preserve begins to boil, skim carefully, and simmer for ten minutes. Now pour the fruit into meat platters, and place in the sun. After an exposure to the sun for twenty-four hours put up in jars or tumblers, and cover. It may be said the sun does not shine for twenty-four hours, but the fruit may be placed on tables by the windows in a sunny room, and let it remain there for several days or until it has had its full sunbath." I repeat, do not. *D. T. Fish, Lecturer on Technical Education.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA VELUTINA.

This is one of the prettiest of its class, and still uncommon in gardens. It was first flowered by Joseph Broome, Esq., now of Suuny Hill, Llandudno, who then cultivated his Orchids at Didsbury, Manchester. It was supposed by Reichenbach to be a natural hybrid between *C. bicolor* and *C. guttata*, but there appears to be little to support that theory. A very fine example of it comes from H. Brittan Evans, Esq., Pembroke Road, Clifton. The sepals and petals are Indian yellow, spotted with chestnut-red. The base of the lip beneath the column is rich yellow, with some purple lines running into the white side lobes. The blade of the lip is white, with delicate rose veining. All the segments curl backwards when the flower is mature, which gives it a striking appearance; they are also delicately fragrant.

CATTLEYA GRANULOSA.

Several remarkable varieties showing extraordinary variation have been sent during the last few days. The showier is *C. granulosa gigantea*, sent for the second time by Mr. F. W. Moore, Royal Botanic Gardens, Glasnevin, Dublin. The large wax-like flowers have the sepals and petals of a lemon-yellow colour, the former with many, and the latter with a few bright purple spots. The front lobe of the lip is amethyst-purple, with a white fimbriation at the edge, and the side lobes are of a yellow colour on the inside and white outside. The flower is more than 6 inches wide, measuring across the petals, which have a width of 1½ inch. The second, named *C. granulosa Banneri*, is from Mr. John Edwards, gr. to G. Banner, Esq., Sherwood, Sefton Park, Liverpool. It is an extraordinary variety, with flowers which, in a Carnation, would be called flaked. The

lower sepals have the inner halves of a pale green hue, and the outer ones purple. The upper sepal is purple with a greenish band up the centre, and the petals have similar markings to the upper sepal, with the addition of a margin of a yellowish tint. The lip is yellow at the base, with a lilac blade streaked with purple.

The other remarkable forms flowered with Messrs. F. Sander & Co. at St. Albans, viz., *C. granulosa Dabuyssonii*, with clear yellow inepotted sepals and petals and richly-coloured lip; *C. g. princeps*, which in size most nearly approaches the *C. g. gigantea*, with the sepals and petals almost wholly of a rich vinous purple; and *C. g. Djancaana*, which a botanist would regard as the most interesting of them all, as its small flowers seem to indicate the starting-point of the species. Placing it and *C. g. gigantea*, they are difficult to reconcile as the same species, but the other three supply every link in the chain connecting them. *J. O'B.*

THE GLASNEVIN BOTANIC GARDENS.

ON the occasion of a recent visit to Dublin I found time to visit the Botanic Gardens of the Irish metropolis. The aquatic-house was alone worth a visit, so well is it filled with *Nymphæas*, many of which were in flower, including the following species and varieties, viz., *N. Marliacea*, *N. n. rosea*, *N. n. carnea*, *N. Laidakeri rosea*, and *N. odorata alba*.

The *Victoria Regia* tank in another house contained a specimen of this species with some leaves 3 to 4 feet across. In the same tank were plants of *Nelumbiums* and *Nymphæas* in great variety and perfect health. In the four semi-circular tanks here were more of these plants, the following being in bloom, viz., *Nymphæa stellata*, *N. s. parvifolia*, *N. s. Berlin* variety, *N. gigantea*, *N. gracilis*, *N. blanda*, *N. flava*, *N. dentata*, *N. Lotus rosea*, *N. L. Ortgiesiana*, and the large Tulip-like *Nelumbium speciosum roseum*.

The Orchid-houses contained more than one hundred species and varieties in bloom. All of these plants were in splendid condition—not an unhealthy one amongst them; and the general cleanliness and the tasteful arrangement of the plants bespoke the care paid to their cultivation by the Curator, Mr. F. W. Moore.

FRUIT AT GLEWSTON COURT.

THE cultivation of fruit is so thoroughly well done at this place as to merit a few notes in the pages of the *Gardeners' Chronicle*. Fruit is grown in great quantities for market, and the whole concern is conducted on strict commercial principles, based upon and coupled with sound, practical experience; in short, it is one of those rare places where the enterprising capitalist has made the successful experiment of fruit farming on suitable land very much more satisfactory financially than the old played-out system of corn growing and ordinary farming.

Mr. Lee Campbell, the proprietor, and Mr. Wright, his gardener, are each as enthusiastic as they are clever; moreover, they are just as ready and eager to impart information to any interested persons who choose to call. Such an object lesson, and such a fund of useful knowledge available, is invaluable. It should help to solve a portion of the agricultural depression, give employment to workers, supply better fruit to the consumer, as well as help to check the quantity of foreign imports, which drain the money from home industries.

Apple and Plum growing is a great success, but Pears are a failure. The plantation consists of about 10 acres, and contains about 6000 trees, and they were planted about twelve years ago. Apple trees stand at 9 feet, and Plums at 8 feet apart. The trees are now about 9 to 10 feet in height, and bushes occupy the whole ground between the trees. Every tree is a perfect specimen, so well have they been managed. There were about 600 Ecklinville Seedling in one block, and the crop on them is an enormous one, as every branch from the stem of the

tree to the extremity is a cordon of healthy fruit, and highly-coloured for the early part of the season. The thinnings from the trees were sent to the jam-makers, selling at 6s. per cwt. in the middle of July, the best-placed fruits being allowed to remain. Peasgood's Nonench, Golden Spire, Cox's Orange Pippin, American Mother, and many other varieties

were evidently benefited by these operations. Other orchards are found on the farm, but nothing that can compare with this one in the quality of the fruit.

Grapes are largely grown under glass, and the Vines are marvels of high cultivation. Three years ago when I saw the huge crop of Muscat of Alexandria in one of the houses, and the enormous crop

character within reach of the roots. Doubtless, some of these bunches will give a good account of themselves on some exhibition boards at a later date, and show what can be accomplished when science and practice go hand in hand. At all events, the crops and results are worth going 100 miles to see, and they would teach weightier lessons than some of the technical education lectures that we are expecting so much from in the future. It is the capitalist with enterprise as well as the worker that is wanted. *William Crump, Madresfield.*

FOREIGN CORRESPONDENCE.

FOOD REQUIREMENTS OF THE CHRYSANTHEMUM.

THE above subject was referred to by a correspondent in these pages on June 23, and continued July 7, 14, and 21, 1894, but as it is of great interest to cultivators, and as it has not been possible to get experimental evidence much before this time, it may be just the proper time to return to it now.

Has anyone acted on the advice given, and with what results? I had expected to hear something more about it during the Chrysanthemum season, but so far, nothing has appeared. Can it be that nobody has tried the artificial manures recommended, or have trials in all cases ended in failures, and are the results therefore withheld?

Being myself a cultivator of some 1500 to 1600 plants, mostly for cut flowers, and having only a light and poor natural soil for potting, I gave the question considerable attention, its appearance being only a short time before the final potting. Now, reliable and complete analyses of plants as that of Chrysanthemums, quoted at p. 778, *Gardeners' Chronicle*, vol. xv., are of the greatest interest and value to cultivators, but, of course, they do not give exact figures. We have got a complete analysis of the soil we are going to use at the same time, and as this is in most cases difficult to get, always takes a long time, and moreover is rather expensive, it will not often be at command, but then the plant-analysis only gives approximate figures, and serves as a basis for experiments. As such I considered it, and having in my mind earlier failures by using artificial manures in potting soil, I was on my guard.

The soil used for the final potting consisted of two-parts rather light and poor but fibry turf, two-parts compost from a well-decomposed rubbish heap derived mostly from the houses, cast-away plants, old potting soil, weeds, a little ashes and charcoal (I use firewood as fuel), &c., and one-part manure (from horses and cows mixed). This compost, well mixed and in good condition, I still considered rather poor, more so as I do not use very large pots (6 to 8 inch), and decided to add some artificial fertilizers.

Just at that time, Mr. Willis' paper appeared (vol. xv., p. 778), but for the sake of convenience I used my own mixture, having the following ingredients at hand.

- 3 parts Kainit (12 per cent. potash).
- 3 .. Basic slag (16 to 17 per cent. phosphoric acid).
- 1 .. Sulphate of ammonia (20 per cent. nitrogen).
- 1 .. Phosphate of potash (26 per cent. potash, 36 per cent. phosphoric acid).

This mixture gives the principal ingredients in the following proportion:—

	In Mixture.	In Ash.
Potash	12	16
Phosphoric acid	17	19
Soda	12	10
Chlorina	8	3
Magnesia	15	10
Nitrogen	4	0

besides this, there is sufficient lime and iron in the basic slag and sulphuric acid in the kainit. Considering that I had a good supply of nitrogen in the stable manure, and that my soil is rather rich in potash (resting on and originating from rocks rich in potash), I thought the mixture should be a good one.

The rate in which I used it was one part of the

*

FIG. 34.—ARUNDINARIA SIMONI. (SEE P. 186.)

are amongst those cultivated. Probably a mistake was made in planting too many varieties.

The soil—a very thin layer—is situated on the old red sandstone, and gently slopes towards the valley of the Wye with a S.S.E. aspect. Plums, too, are enormously cropped, Victoria being a great favourite, giving profitable and remunerative crops. During the late drought two steam-engines were employed to distribute water, a good soaking of the land being afforded (about 1,000,000 gallons), besides a dressing of muriate of potash and superphosphate; the trees

of Black Alicante in another, I predicted that such a crop would never again be seen on these Vines, as it looked like killing the goose which laid the golden egg.

Imagine my great astonishment the other day when I called to find that the crop was much heavier than before, decidedly better, the bunches long, with heavy shoulder; berries very large, and taking on a bright amber colour, no signs of shanking, but the foliage rich dark green, very luxuriant and gross; evidently there was plant-food of the right

mixture to about 400 parts of soil, this being considerable less than recommended by Mr. Willis, his prescription being one part of a similar manure to 250 parts of soil ($\frac{1}{4}$ ounce to 4 lb.). Mr. W. Dyke recommends (p. 74) ten times as much (75 ounces to 120 lb.), and still wants to supplement it later on with top-dressings. I should like to know with what result such a quantity can be used. The manure was well incorporated with the soil by turning it several times during the fortnight it was lying before being used.

During the first half of July, part of the plants were shifted into this soil, the other part being planted out in the open ground. During the next two months, I was not satisfied with the look of them at all. They made but little progress, the leaves were small and of a rather yellowish-green colour, still the plants were not really unhealthy, and they filled the pots well with healthy roots, but they lacked the dark-green colour and robustness of leaf and branches which plants in the open ground possessed. At the time they were housed (24 to 25 September), they were about 1 foot shorter than usual, and did not look promising at all.

But from that moment to the present time, October, 1894, they have done much better than expected. They commenced to grow at once (for this the warmer climate may in part account), showed buds well, and they have been flowering the whole of this month quite as well as any previous year, and I think they are somewhat earlier than usual, though I have only planted-out plants to compare with; these were lifted some days earlier with good balls, and planted in an old Cucumber bed in front of the same house in which the plants in pots occupy the middle. These planted-out plants got a serious check somehow (they had a few degrees of frost one night, but the plants in pots had the same and one night more without any injury), causing the first buds to remain undeveloped, and up to date, we have not cut a single flower from these, having cut about half the crop from the plants in pots, sorts the same, but they promise a rich and welcome late crop of small flowers.

The conclusions I draw from this experiment, and from some earlier ones in the same direction with other plants, is, that artificial manures (especially kainit and basic slag), are rather dangerous substances to use in potting soil, that I only just escaped failure when using the above mixture in proportion of 1 to 400, that the compost suits plants much better after some months than at first, showing that it is advisable to have such substances mixed with and well incorporated in the soil at least some months before using it for potting. But the good crop of flowers from rather miserable plants also shows that, at last, it was the right thing. Further, my experience confirms rather than otherwise, the general statement that manure rich in potash and phosphoric acid promotes fertility rather than growth, and tends to make flowering and fruiting earlier.

It is all very well to know that artificial manures, as the above, cannot with advantage be mixed with soil that is to be used at once, but it would be very interesting to know why. It is not precisely injurious to the roots, at least I could not, by frequent and close examination, detect any trace of injury. The only explanation I can suggest is, that by using these concentrated mineral salts we are sterilizing the soil, depriving it for a time of all that animal or vegetable life which otherwise decomposes, preparing and sweetening the soil, and making it more fitted for plant growth. I wish some bacteriologist could see his way to solve this problem, for to speculate, speak, or write about it is not of much use. I believe that in regard to harmfulness, there is a great difference between artificial manures of animal and those of mineral origin, these last being much the more dangerous. This would also account for the many related and trustworthy cases in which much greater quantities than the above have been applied with the best results. As examples of safe manures, I shall only mention bones for phosphoric acid, natural guano for nitrogen, and ashes (vege-

table) for potash. But mineral manures may also be safe if applied at the right time, and they are generally much cheaper than the others.

This event is a good answer to the question about theory and practice, and shortly put it is, that theory has here, without any caution being used, given a very dangerous advice, and your much blamed non-theoretical, but very practical gardeners, have one and all—at least it seems so to me—escaped a serious failure by not taking any notice of the advice given, preferring to stick to old tried methods until the new ideas have been put to the test. This is always safe, and perhaps it is the best way to go. We gardeners cannot all be masters of chemistry or other sciences relating to horticulture, but what we require are trustworthy middlemen, and these you have got in every branch of science—in this connection only to mention Sir John Lawes and Sir Henry Gilbert. But I am again entering on this intricate question, and it is not my theme on this occasion.

I cannot close these remarks on Chrysanthemums without mentioning that it is not with unmixed pleasure I always closely follow every Chrysanthemum event in England from beginning to end; it is interesting to search for new varieties, and very gratifying to see almost all those procured one year appearing again in most prize-winning stands the following season. But the pleasure is mixed. I am envious because I never saw a Chrysanthemum exhibition or an exhibition flower; we have not got exhibitions yet, and I do not think it would pay to grow such flowers here for the cut flower trade. "Don't speak about Chrysanthemums, then," I hear my more fortunate English colleagues exclaim. Still I, too, am glad to find many advocates of our mode of culture in England, and I always find great pleasure and profit in a house filled with hundreds of 3 to 5 feet plants in 6 to 8 inch pots, carrying some ten to twenty flowers, each measuring 3 to 5 inches in diameter, and in almost all the varieties that are to be found at your exhibitions. If I am surprised at anything concerning Chrysanthemum culture in England, it is the small number of varieties recommended for cutting purposes. I find that the varieties C. Davies, M. G. Grünerwald, Madame Ed. Rey, Col. W. B. Smith, Condor, Florence Davies, Gloire du Rocher, Jeanne Delaux, Marie Hoste, Miss Watson, William Seward, Vivian Morel, W. H. Lincoln, Bouquet des Dames, F. Marrouch, Madame C. Audiguier, Mrs. J. Wright, and other good exhibition sorts pay me as well as those so much recommended, and much better than do the incurved, pompon, and anemone classes. M. P. Andersen, Jönköping, Sweden.

OUR FRUIT TRADE.

THE Colonial and foreign fruit trade is growing into vast proportions, and in all fruiterers' shops, and in those of most respectable greengrocers also, at any time of the year may be found luscious fruits from lands far removed from this busy corner of the globe. No sooner is the Cape season over than in comes fruit from the Antipodes, from the Pacific borders, and sunny lauds and islands.

To-day good Oranges are being retailed in London streets at the rate of four a penny!—not dried-up rubbish, but toothsome spheres of sweetness. As to the Caps supplies, much has still to be learnt by those engaged in the trade. Some of the fruit sent to market are fine specimens, and reward the sender; most of the remainder ought never to have been placed here on sale. Good Grapes, Pears, Apples, &c., are certain to find a ready and profitable sale here, and just when they are wanted. The Australasian fruits now helping us to bridge over the term during which English Apples are practically non-existent, are in excellent condition, though they have to go to the wall in face of the grand collection of soft fruit now making beautiful the stands in every market, and in all retailers' shops. Of Tasmanian Apples, it is pleasant to be told by the highest authority that, "taking the season as a whole, the prices reached were very fair, and the

quality of the fruit was generally better than that of the previous season. The general condition of the fruit on landing was also better than usual." Year by year it may be noticed our friends at Hobart are themselves learning the lessons which experience teaches best. It is worth noting that the ship canal from the Mersey to Manchester is having some influence on the fruit trade of the district, and it is contended that the cost of distribution is lowered by carrying fruit direct to the wharf in Manchester. But be that as it may, all we have to notice is the fact that competition between Liverpool and Manchester must lead to enlarged supplies from all quarters of the globe, to the benefit of the consumers generally. In this connection it is interesting to observe that during the season just closing the North of England Fruit Brokers' Association has sold upwards of 220,000 packages, made up of fruits of all kinds, from all fruit-producing countries—there not being any kind of fruit imported into Liverpool which have not been seen at market in Manchester.

The great bulk of the trade done at Manchester has hitherto been in Valencia Oranges; but new fields of supply, we are told, are being formed in Italy, Sicily, Smyrna, Lisbon, and Seville; and efforts are now being made to procure trade in Canadian Apples; and so, after all, it may come to pass that all the year round we shall have a supply of fresh fruits from whence to draw comfort and health. E. C.

BELGIUM.

CHAMBRE SYNDICALE DES HORTICULTEURS BELGES.

THE last monthly meeting of this association was remarkable for the number and excellence of the exhibits. Certificates of Merit were awarded to M. Em. de Cock for *Anthurium Scherzerianum* var. *Adriani*, spathe sturdy, habit fine, colouring excellent; to M. L. De Smet-Davivier (*par acclamation*) for *Nerine Fothergilli*; the plant bore seven floral racemes, and was in a pot decorated with *Adiantum*. The effect was beautiful; the trusses of bright cinnamon-red flowers were very effective among a mass of pale *Odontoglossums*. A certificate was also awarded to M. Emile de Cock for *Griesebachia compacta* nana, very dwarf, sturdy and vigorous, very distinct; to MM. Alsberghe and Van Oost for twenty pots of tuberous *Begonias*, and 120 cut flowers of an excellent strain; the peduncles firm, flowers erect, and of colour as varied as distinct; to M. Bedinghans for *Agave Troubetzkoyana*, a fine example of a species' becoming very rare; to M. François Debois for *Spiraea Anthony Waterer*; to the same exhibitor and also to M. Dalliére for *Physalis Francheti*, both well known in England; also to the same exhibitor for *Aristolochia tricaudata*, a sturdy free-flowering plant, with very singular flowers and curious in colouring, especially remarkable for their very long tails. M. Debois also obtained a certificate for *Daphne Laureola atro-purpurea*, remarkable for the peculiar colouring of the leaves, which are dark purple merging into black; MM. Desbois and Pynaert obtained certificates for *Euphorbia Fournieri*, a plant which looks as if its pretty green leaves were growing on a Cactus; M. Szewczick with tuberous *Begonias*, cut flowers, in every way admirable. Other certificates were awarded to M. Jules Hye (*par acclamation*) for a *Cattleya Rex*, a splendid flower of this fine plant, and showing the value of the species; to the same exhibitor for *Lælio-Cattleya Proserpine* (*L. pumila* × *C. velutina*) also *par acclamation*; this fine Orchid resembles *C. velutina* in habit, and *C. pumila* in colouring; to M. Joseph Alaberge (*à l'unanimité*) for tuberous *Begonias*, last year's seedlings, vigorous, well-bloomed, the flowers erect and sturdy.

Certificates for good cultivation and flowering were allotted to M. L. De Smet-Davivier for *Adiantum macrophyllum albo-striatum*, a charming plant whereon the rosy-red of the young foliage is very effective among the adult fronds, which are streaked with white; to the same exhibitor for

FIG. 35.—PHYLLOSTACHYS VIRIDI GLAUCCENS. (SEE P. 186.)

Aralia monstrosa, a fine specimen with twenty-five glossy and healthy leaves, certificate awarded à l'unanimité; to M. Kuyk (also à l'unanimité) for *Eurya latifolia variegata*, a specimen of considerable vigour, and very healthy. Certificates were also awarded as follows: to M. Ch. Spae for *Rondeletia speciosa*, growing in a fine truss about 18 inches across, and well covered with pretty flowers of bright-red colour, with orange centres; to M. Bedinghaus for *Sollya heterophylla*, a pretty globe-shaped plant covered with hundreds of small china-blue, bell-shaped flowers; to M. Wyckaert for *Lycaste Deppei*, a well-bloomed specimen; and to M. Szawezick for *Gesnerias perfecta rostrata alba* and *lutea* in pots, and bearing quantities of charming flowers, and also for *Selaginella Enmeliana*, a plant measuring more than 18 inches across, very well grown, and very healthy. Ch. De B.

SCOTLAND.

DISA GRANDIFLORA.

EDINBURGH.—Every year as the flowering season of these plants come round, we are reminded of the great beauty of these Cape Orchids, and the amount of admiration expressed at the first sight by the visitors, bears testimony to the popularity of this species when well grown. In a large number of establishments where collections of Orchids are grown this one is omitted, oftentimes on account of failure in its cultivation, the reason of failure being difficult to account for—different degrees of humidity of the atmosphere, water, and other causes being brought forward as causes. But even in districts where it is known to succeed well it is not by any means commonly seen, but restricted to a few establishments. Here it grows with little more attention than that given to ordinary greenhouse plants, among which they are grown. The compost used is about three parts of roughly-broken peat and one of good fibry loam, with lumps of sandstone and charcoal about the size of Walnuts to keep the soil from becoming sour, owing to the large quantities of water required. Pots are used for potting, our largest specimen being about 18 inches in diameter, and nearly a foot deep, to allow of a large amount of drainage. In this compost the growths are strong, and the foliage firm and large, the stems bearing in some cases five flowers, from 3½ to 4 inches across. The plants require but little rest, the succeeding year's growth generally appearing soon after they have finished flowering. Just now for convenience our specimens are occupying a place in the succulent-house, where they are staged upon a bed of sphagnum, and enjoy full exposure to the sun and air, and receive copious supplies of water. The colour of the flowers is dark, and the substance good. R. L. Harrow, Royal Botanic Garden, Edinburgh.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

PINCHING LATE GROWTHS ON FRUIT TREES.—The heavy rains have generally resulted in an abundance of lateral and sub-lateral growth on most of the fruit trees, especially on those which are lightly cropped with fruit. Such growths should be shortened back to one leaf, the exceptions being the shoots of 2 or 3 inches in length, which show a plump terminal bud, and these need not be shortened, as the bud will probably prove to be a bloom-bud; but where such shoots on wall or espalier-trees stand out farther from the base than is desirable, they must be removed with the rest.

APRICOTS, STOPPING, ETC.—Continue to stop the foreright shoots, and remove overgrown spurs, old and bare branches, where such can be spared, training in young wood thinly, so that perfect ripening is ensured.

PEACHES AND NECTARINES, PINCHING AND TRAINING.—Any gross foreright shoots on these trees should be removed, all sub-lateral growths shortened back to one leaf, and any shoots which are likely to make too vigorous and long a growth may have the points removed. Train in the young shoots thinly, and take care to allow the fruits full

FIG. 33.—PHYLLOSTACHYS QUILLOI. (SEE P. 186.)

exposure to light and air by fastening back or removing any of the obstructive leaves and shoots. The best remedy for a too luxuriant growth is lifting the trees in the early autumn months before the leaves begin to fall; this, if carefully carried out, will not fail to hasten the ripening of the wood, and other conditions being favorable, ensure a crop of fruit the following season. Where these kinds of fruit trees are grown in dry situations or under broad glass copings, good waterings at the root must be afforded as required, frequently syringing the trees to keep red-spider in check.

CHERRIES ON WALLS, AND PYRAMIDS.—Cherries making a secondary growth must be kept closely stopped, such foreright and surplus shoots as may have been allowed to grow, being now shortened to three or four leaves. If the black aphid be remarked, dress the trees with quassia solution or other good insecticide without delay. See that all shoots for extending the trees are fastened securely, using as few ties for the purpose as are consistent with safety. Trees on walls that are healthy and strong and yet refuse to set a crop of fruit although flowering profusely, should have a good dressing of chalk or old mortar rubbish worked into the surface soil and about the roots early in the autumn, and in the spring when in flower. Afford them a thorough watering followed by a mulch. Pyramids and bushes that are making a lot of strong wood should be lifted early in September, and the check thus given them will be almost sure to result in speedy fruitfulness.

BUSH OR PYRAMID APPLES.—Pyramid and bush trees should be gone over, and surplus growth shortened to three or four leaves, taking note of varieties that fruit at the points of the shoots, namely, Cornish Gilliflower, Irish Peach, &c., which only need the removal of long, gross, or crowded shoots. Where summer pruning has been carried out, new growth will be again pushing, and this should be pinched back to one leaf. Take advantage of fruit on unnamed or wrongly-named trees to determine the variety, and label such securely.

THE FLOWER GARDEN.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

HUMEA ELEGANS.—Plants from seed sown in May or June will now be large enough to prick off into small pots filled with light, rich, loamy soil. After watering them, place them in a cool, shaded pit or house till well established, and afterwards afford them abundance of light and air, and a further shift into 6-inch pots in late September.

THE FLOWER BEDS will need constant attention in the matter of tidiness, and where the plants are too much crowded it will do them good to thin out the shoots somewhat, so as to admit the air amongst them, favouring the ripening of the wood and preventing loss of leaf. The flowers should be removed from *Cerastium tomentosum*; young edgings that are to remain for the winter should be pegged down closely.

VASES AND BASKETS.—Plants in vases and baskets should have daily attention, so as to keep the plants in a presentable condition. Do not rely on the rainfall for moistening the soil in these receptacles, as it has very little effect, the dense foliage throwing much of it off the soil. Afford the vases one or two thorough waterings in a week, according to the state of the weather. If the soil is very firm and hard, it should be probed with a pointed stick or piece of iron.

ANNUAL SUNFLOWERS should be staked before they get blown over. A very effective bed of flowers we have seen this season consisted of tall single and double Sunflowers sown in rows about 2 feet apart, then tall double and single annual Poppies sown broadcast over the bed with Shirley Poppies and various-coloured *Nasturtiums* round the edge.

VIOLETS.—In dry localities and light soils, Violets have suffered much from the ravages of red-spider, and it will be advisable to remove the leaves that are the most infested, and to syringe the plants frequently with clean water. top-dress the beds with some rich soil, and afford weak liquid manure once a week. Where Violets are planted on a border on the north side of a wall they are healthy and strong, and the varieties New York and Marie Louise are flowering freely. Some gardeners cut off the runners of Violets, but I let them remain, and ours are pulled to pieces in the spring, and they are not trimmed afterwards whether grown for flowering in the winter in frames or outside.

PINKS AND CARNATIONS that were struck in July will now be ready for potting or planting in

beds, and the sooner this is done after they are rooted the better will be the results, there then being ample time for them to get established before the winter begins. For wintering Carnations and Pinks, a 3-inch pot is large enough. In potting, put a few crocks only in the bottom, and a bit of fertilising moss at the bottom over them, and as a potting soil use turfy loam. Place the plants in a frame, and shade from bright sunshine for one week. When planted out, Carnations should have deeply dug well-manured ground. Pinks may be planted at 12 inches apart in beds of four rows each; Carnations at 15 or 18 inches.

CHRYSANTHEMUMS.—Beds of Madame Des-granges and other early autumn-flowering varieties should have liquid manure liberally afforded, and if the plants in the beds do not make a close mass, the plants that are at the sides and therefore exposed to the wind, should be secured to stakes. Much staking is not required, as they look better when growing unrestrained. Large-flowering varieties planted against walls or fences, should have the lateral shoot removed and the buds selected as soon as it is possible to do so. The securing of these to the fence, &c., should have careful attention, as the shoots are readily broken by the wind. It is a mistake to tie the shoots close up to the point, it being better to leave 6 or 8 inches from the end loose.

THE KITCHEN GARDEN

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

CELERY.—In most places the earliest and first planted Celery will be fit for being earthed up. The plants should first have all the shortest outside leaves pulled off, and this operation will reveal the hitherto concealed shoots round the stalk, which should also be removed. Having done this, gather up the leaf-stalks firmly and put a bast tie round them; afford a light dressing of salt and dry soot, and if the weather is dry a good watering, and wait till the plants are quite dry outside before earthing them up. A small earthing-up will suffice on this occasion.

POTATOS.—Early varieties generally will be the better for being lifted, including those which have been planted for furnishing planting sets. Change of land is always good for the Potato; and where moderate quantities of sets are purchased, it is generally found necessary the first year to grow them entirely for sets. Potatoes intended for sets should be carefully dug up, not bruised in any way, and thoroughly dried before they are stored. Before storing lay them thinly in an open shed exposed to the sun. The Potato store should be cool and dry, and quite frost-proof.

TOMATOS.—The moist weather will have caused much growth of shoots, which must be entirely removed, and the leaders stopped, the time being not any too long for the ripening of all the fruits now set. It will be as well, in the case of a very robust foliage, to cut it in half, so as to expose the fruit to the sun. This kind of lightening of the leaf-growth should be cautiously carried out, or the plants will be injured and greatly checked. I do not remember to have seen Tomatoes looking more promising than this year. Water at the roots will not be required unless it be by those which are growing in pots plunged in the ground. Keep those well secured to stakes that are growing in the open quarter.

PARSLEY.—Continue to transplant any young seedlings that are large enough to handle, and make another sowing. Let the lines be well thinned out, an operation that is often neglected. Where cold pits can be spared, Parsley may be pricked out, or Parsley-seed sown in them.

FRUITS UNDER GLASS.

By RICHARD PARKER, *Gardener, Goodwood, Chichester.*

THE POTTING OF STRAWBERRY PLANTS.—The potting of the plants required for forcing should be done without delay, and the removal of those which have been standing in a shady place since they were potted should be attended to, standing them on a coal-ash bottom in a part of the garden that has exposure to the sun all day long. This is a matter of importance, as by their remaining in the shade the pots might become water-logged. If the space at command is not sufficient to allow of the pots being stood on a floor of coal-ashes, they may be arranged in a double or single row at the sides of the garden paths, if precaution be taken to place

slates or boards for the pots to stand upon. Always afford plenty of room between the plants, so that the foliage may be properly developed. Strawberry plants should not be potted directly after heavy rain, as the soil in the pots is then in a saturated condition, and the ramming which is necessary would turn it into a kind of puddle, which when once it is dry might prevent the water passing freely through it afterwards. Neither should the potting-soil be too moist, or the result will be the same. If, when water is afforded, it does not pass quickly through the soil of any of the recently-potted plants, always turn the plants out of the pots, and replace them less firmly.

POT VINES.—If the Vines have been gradually hardened off by affording them plenty of air, they will now be in a condition for standing out-of-doors in a sunny and sheltered position, to thoroughly mature. The pots containing the Vines should be elevated on other pots or on brickbats, &c., and only enough water should be afforded them to keep the soil fairly moist. Grape-vines that were planted early in the year, and which bore fruit in May, should have the shoots shortened to three or four of the principal leaves, in order that the buds may be matured by sunlight and heat. The border must not be allowed to become dry, as the roots of these Vines are still in an active condition, and sustenance is very necessary in the later stages of growth.

MID SEASON VINES.—When the crop is consumed, all superfluous shoots should be removed as with pot-vines, so as to give the principal leaves full exposure. Outside borders that were heavily mulched during the hot weather, will be benefited by removing some of the mulch, and lightly digging the remainder into the border. Be careful not to touch the job if the border is in a wet state from recent rain.

PLANTS UNDER GLASS.

By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

WINTER-FLOWERING BEGONIAS.—These various species will require liberal watering at the roots, and occasional applications of liquid manure, most of them being benefited thereby whilst making growth. If the late-struck Begonias are allowed to remain in the large 60's they were potted into at first, they will make plants of good size, very useful for furnishing the dining-table or filling small vases. For the decoration of rooms there is nothing which surpasses *B. Gloire de Sceaux* and *Gloire de Lorraine*. I have had them indoors for six weeks at a time, and the plants flowered nearly as well in the rooms as in the stove.

DOUBLE-FLOWERING BEGONIAS.—These plants are easily propagated at this season if short flowerless shoots be selected. These should have the bottom leaves cut off, the shoots being cut square across at a joint. Insert them in numbers from five to six in large 60-pots in light sandy soil; place under hand-lights, and they will soon make tubers. The tubers should be allowed to remain in the pots till the spring. A light dewing should be afforded the cuttings on sunny days.

CELOSIAS should be potted on at once, affording moderate shifts; stand the plants in a light position in the stove, and syringe them frequently. When the pots are filled with roots, remove them to a cooler and drier place.

VIOLETS FOR GROWING IN FRAMES.—These plants should be kept clean and the land stirred regularly with the hoe, affording them a top-dressing of dry fresh soot. Remove runners as soon as noticed, and should the plants become infested with red-spider, as they will in light land, thoroughly clean them by syringing with soap-suds containing about 2 oz. of flowers-of-sulphur to the gallon. This should be done on two or three nights in succession, taking care to get beneath the leaves with the syringe.

BOUVARDIAS.—Those which are planted out will require but little attention except in the matter of stopping the growth of the shoots and loosing the ground occasionally. Bouvardias cultivated in pots will require attention in regard to re-potting. Keep this section close in cold frames after re-potting until again well-rooted, when the lights may be withdrawn. Bouvardias in pots should be syringed twice a day, and have the shoots regularly stopped until about six weeks before they are required to flower.

BERRIED SOLANUMS IN POTS will require a weak stimulant to growth now that the berries are growing apace, for this purpose Clay's Fertiliser sprinkled over the surface of the soil is as good a manure as can be used.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

MILTONIA VEXILLARIA.—Plants of this charming species will now be found in a sufficiently advanced state of growth to admit of their being repotted; but before this operation is begun, it will be advisable to make sure that the plants are free from the little yellow thrips which conceal themselves right down in the interior of the young growths. It is not easy to eradicate them with a brush or sponge, and being so minute many of them escape detection, and much mischief is done before they are detected. The best method of destroying these insects, and one that takes up the least amount of time, is to dip or wash the growths in some safe insecticide, and afterwards rinse them in tepid soft water. For this purpose I use nicotine-soap, at the rate of 2 oz. to 1 gall. of warm water; or, in a mixture, the new XL All liquid insecticide, both of which are effective destroyers. After using either preparation I would advise careful shading for a few days. *M. vexillaria* is a plant that forms numerous fibrous roots, which push their way just over and under the surface of the compost; and the plant should, therefore, have larger space afforded for the roots to ramble in than is generally allowed. The pots or pans should be filled to about three quarters of their depth with clean crocks, upon which should be placed a layer of sphagnum-moss; the plants should be well elevated above the rim of the pots, &c., as by so doing a greater amount of surface is afforded the roots to ramble in. Carefully spread the old living roots over the drainage, and work in amongst them a compost consisting of clean sphagnum-moss with a small quantity of fibrous peat, and a fair sprinkling of crocks broken small. Unhealthy plants and those having but few roots should have all the decayed parts removed, and be thoroughly cleaned in every part, and repotted into pots or pans much smaller than those they have hitherto occupied. After repotting the plants, afford water very sparingly, and use a fine rose watering-can when applying it, just enough being given to entice the sphagnum-moss to grow. When the new growths commence to freely make roots, and they lay hold of the sides of the pot, water may be gradually increased in quantity. The temperature of the cool-house will suit them until the nights become chilly, when they should be removed to the intermediate-house, choosing a position in it where air is freely admitted at all times. The late summer-flowering varieties, *M. v. rubella* and *M. v. superba*, are in some collections in full bloom, or they are just passing that stage; these will not require potting before the beginning of September, and for the present they should be kept with the older species in the Odontoglossum-house. The beautiful and distinct hybrid *M. Bleuiana* and its variety *nobilior*, which was obtained by crossing *M. vexillaria* and *M. Roezlii*, is now in full growth. It succeeds best throughout the year in the intermediate-house, where abundant light without sun can be afforded.

THE COOL-HOUSE.—There are several plants in this division which will require to be repotted or surfaced, the more important being the varieties of *Maxillarias*, which are amongst the most easily cultivated of Orchids, succeeding well with the Andean *Odontoglossums* at all seasons. Such species as *M. Sanderiana*, *M. Amesiana*, and *M. venusta*, should be grown in teak-wood baskets, as the flowers frequently appear in a downward direction. *Maxillaria Turneri*, *M. fuscata*, *M. grandiflora*, *M. Lehmannii*, *M. lepidota*, *M. tennifolia*, *M. luteo-alba*, and *M. picta* grow well in an ordinary flower-pot or shallow pan, and they should be firmly potted in a compost consisting of three parts of sphagnum-moss to one of peat, mixed with a moderate quantity of small crock-sherds. Plants of the new *Cochlioda Noetzliana*, *Mesospidium sanguineum*, *M. vulcanicum*, and many small-growing species of *Oncidiums*, may also be repotted as soon as growth re-commences. A charming plant now in bloom is the bright orange-scarlet *Laelia monophylla*. The plant does best when hung up to the roof in a damp shaded part of the intermediate-house. After the flowers fade, place the plants in the cool-house to remain there till cold weather sets in, when they must be returned to their former place. Unlike the majority of *Laelias*, this *L. monophylla* should be kept fairly moist at the root at all times. To those who are fortunate to have this *Laelia* in bloom I would advise them to utilize, if possible, the pollen of each flower for hybridising purposes, as no doubt something distinct as regards colour may be obtained from it, which would form a welcome addition to our collections.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—61°.5.

IN regard to this subject, we have been favoured with the following communication from the Director of the Royal Gardens, Kew:—"I do not propose to pursue this subject any further. My conclusions, and the grounds upon which they are based, are sufficiently stated elsewhere, and those who are interested in the subject may attach what weight to them they think proper. It was never, as far as I am concerned, more than a detail in a general argument.

"There are, however, two points in the article published in your columns for July 27, upon which I should like to make some remark.

"1. It is stated that it was 'a matter of current opinion,' [at that particular time], that the *Cineraria cruenta* cultivated at Kew 'was the wild original of the garden *Cineraria*.' I do not think that this is the case. The 'current opinion,' as far as I know, was that of the late Mr. THOMAS MOORE, who regarded the garden *Cineraria* as of hybrid origin, a view which I myself communicated, on his authority, to Mr. DARWIN. I re-introduced the wild plant from the Canaries, and it was the observation of the fact that, flowers apart, there was no material morphological difference between the wild and the cultivated plant, which led the Kew staff not to re-ventilate the current opinion but to revise it.

"2. No practical horticulturist would deny the possibility of raising hybrids between *Cineraria cruenta* and other species. We know something about hybrids at Kew, and do not engage in experiments without a definite object in view. The occurrence of actual hybrids of *Cineraria* has nothing to do with the matter. If the garden *Cineraria* is of hybrid origin, the problem to be faced is how is the elimination of all trace of any

but *Cineraria cruenta* parentage from the vegetative organs to be accounted for? Our solution has the merit of simplicity—there was no other parent.

"It is stated in the article that 'seedling plants of *Cineraria cruenta* differ markedly in appearance from those of a garden *Cineraria*.' It would be interesting to see a record of accurate observations of this. *W. T. Thiselton Dyer*."

Hardy
Bamboos.

MR. FREEMAN MITFORD's paper at the Royal Horticultural Society on Tuesday last proved one of the best and most interesting lectures that have been read before the Society. He had a grand subject and a novel one, and he handled it with the ease and knowledge begotten of enthusiasm and experience. It was by no means a compilation or a paper "made to order" or to fit an occasion. It is a matter for regret that it was not illustrated, either by specimens or by drawings. The Society, as too frequently happens in such cases, missed an opportunity. Nevertheless, when Mr. FREEMAN MITFORD's paper comes to be read in full in the *Journal* of the Society, there is no doubt it will give a great impetus to the culture of these graceful and singular plants, and the Bamboo-garden at Kew already furnishes an excellent object-lesson open to the community at large.

We are apt to associate Bamboos with something 'tropical, and dimensions too gigantic for an ordinary English garden. Mr. MITFORD's paper will do much to correct this imperfect judgment. Big Bamboos there are, and many of them far too gigantic and much too tender ever to find a place in British gardens, but Mr. MITFORD gave a list of between forty and fifty species and varieties, all of which are of suitable size, some dwarf, and adapted for carpeting the ground beneath trees, and all more or less hardy. Indeed, after a winter which has in many parts of our islands destroyed even the common Gorse, Mr. MITFORD is able to say that not one of the species entirely failed. Nothing worse than a severe check has occurred, a check resulting in the formation of a sheaf of small canes, but richly provided with luxuriant foliage.

Mr. MITFORD gave some excellent advice as to the necessity for not planting out the Bamboos till they have recovered from the effects of their removal from their native countries or gardens where they have been grown. When received, the roots should be soaked in water for twelve hours, and then potted. They should then be placed in a cool-house, and but little water given at first. In February the buds begin to swell, in March the leaves appear. Water should then be afforded freely. In May the pot-plants may be hardened off, and at the end of the month they may be planted out in their permanent quarters, which should be duly sheltered from their deadly enemy—wind. In handling the plants the greatest care should be taken not to injure the roots, nor the points of the shoots, which are very brittle. They should not be trodden in, but the roots well watered-in so as to enable them to get firm hold of the soil without risk of breakage. The soil should previously have been well double-dug. By preference it should be a rich loam, and the plants mulched with cow-manure. Wire netting may be provided to ward off the attacks of rabbits or pheasants. A little fern or bracken thrown over the stools in winter might be advisable. We need not follow Mr. MITFORD in his enumeration of the species, but refer the reader to Mr. BEAN's classification of hardy Bamboos, given in our volume

for 1894 (March), where the species cultivated at Kew and elsewhere are enumerated and described, with illustrative cuts, some of which we now reproduce as opportune to the occasion. *Arundinaria nitida*, fig. 33, one of the loveliest and hardiest, to quote Mr. MITFORD, was formerly called *A. khasyana*, under the erroneous impression that it was a native of the Khasya mountains, a hot steamy region not likely to afford many plants hardy enough to withstand our climate. The species, it appears, is really a native of the Chinese province of Szehuen, a very different climatal region.

This instance, among many more, shows the great advantage that accrues from the association of Botanical research and practical cultivation. The culture of those plants, as in the case of Orchids, will lead to an immense advance in our knowledge of the plants, and to the gradual establishment of a correct nomenclature, and at the same time the information gleaned as to the native countries of the plants will afford most useful hints to the cultivator.

Incidentally, we may mention a curious correlation alluded to, with becoming caution, by Mr. MITFORD, and that is the circumstance that all, or almost all, the species known to be hardy have the smaller veins in the leaves arranged in small but conspicuous squares, the venation being, as it is called, tessellate. Mr. MITFORD's paper was instructive and suggestive to a high degree, but as it will doubtless be printed in full in the *Journal* of the Society, we need now only counsel those of our readers interested in the subject to look forward to a future issue of the *Journal*. In the meanwhile we may refer them to Mr. BEAN's *Monograph* already alluded to, and to Mr. MITFORD's own communications to the *Garden*, and to our own columns.

At the conclusion of the lecture, some remarks were made by the chairman, Sir ALEXANDER ARBUTHNOT, and by Sir JOHN LLEWELYN. DR. MASTERS mentioned that *A. japonica*, better known as *B. Metake*, Hort., thrives well in one of the densest and most insalubrious London suburbs, and even under the shade of some old Lime trees, where little or nothing can be induced to grow.

MR BARRON'S RETIREMENT.—We are requested to give publicity to the following communication:—"In connection with the retirement of Mr. A. F. BARRON from his office of Superintendent of the Royal Horticultural Society's gardens at Chiswick, we understand that the Council have resolved to make him an allowance which is practically a retiring pension of £180 a year. *J. W.*"

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—On Wednesday last, through the kindness of A. MORDAN, Esq., a garden party was held in the grounds of Stone House, Reigate, for the benefit of the Gardeners' Royal Benevolent Institution. The weather being exceedingly fine, the grounds were visited by over 1000 persons. Amongst those present were Lady Jennings and party, Mrs. Simpson and family, the Misses Baxter, Mr. and Mrs. Mordan, Mrs. Lawder Eaton, Miss Mordan, Mr. R. E. West, Mr. Davidson, &c. In the evening, the grounds were beautifully lighted by fairy lamps and Chinese lanterns, especially the verandah, which was very effectively illuminated. The whole of the grounds and greenhouses were thrown open for the inspection of the visitors, many of whom were heard to remark on the admirable way in which the grounds were kept by the head gardener (Mr. G. Steer), who, it should be mentioned, ably carried out the general arrangements for the gathering. Dancing was carried on in the evening with much vigour. By this effort, the funds of the Institution will be benefited by more than £12.

FIG. 39.—A VIEW IN THE SUCCULENT-HOUSE AT KEW. (SEE P. 190.)

ARUNDINARIA SIMONI.—Mr. PRINWILL, of Probus, obligingly sends us flowers of the variegated form of this species. *A. Fortunei* is also in bloom in his garden.

A NURSERYMAN AS J.P.—Mr. GARRIES MITCHELL, nurseryman, Stranraer, has been appointed a J.P. for the county of Wigtonshire. He has acted as chairman of the parochial board for twenty-five years, chairman of the School Board of the Burgh, chairman of the governors of the High School, and chairman of the Parish Council. For forty years he has conducted an extensive wholesale and retail nursery business, and may be said to be the father of the nursery trade in Scotland. During a busy life Mr. MITCHELL has collected one of, if not quite the largest, libraries in the south of Scotland. The finest editions and copies of history, poetry, science, politics, and general literature, ancient and modern, many rare and curious works, numerous collections of beautifully illustrated and rare works of the finest specimens of the best artists, only to be found in a few hands.

MISSOURI BOTANICAL GARDEN—A copy of the sixth Annual Report has reached us. The garden, it will be remembered, was founded at St. Louis, in accordance with the will of the late Mr. SHAW, a merchant of English extraction, and the friend of ENGELMANN, ASA GRAY, and other botanists of his time. Prof. TRELEASE is now the Director. Among other regulations is one for the tuition and training of garden pupils. Two have completed their curriculum of four years, and received appointments as Curators of Botanic Gardens. The subjects taught have all direct reference to gardening, and are taught practically. The whole of the first year is devoted to manual labour, and half of each day through the remainder of the course. The scientific papers in the present volume include monographs or essays on *N. American Sagittarias* by J. G. SMITH; on *Leitneria floribunda*, by Dr. TRELEASE; on the dissemination of *Yucca*, by H. J. WEBBER; on the Mound flora of Atchison County, Missouri, &c.

EXPERIMENTAL PLANT PHYSIOLOGY.—Mr. D. T. MACDOUGAL has translated the little manual of Physiology prepared by Dr. WALLER OELS. It consists of directions for the performance by the pupil of more than a hundred experiments by means of which the principal phenomena of nutrition, geotropism, growth, movements, pollination, &c., are illustrated. The pupil is not merely to sit and take notes of a lecture, nor to read a book, but to work out for himself as far as circumstances permit the details of physiology. Such a course of training would be of immense value to young gardeners, and in these days of county laboratories is not altogether unattainable. Lecturers will find this little volume very useful. It may be had from MORRIS & WILSON, Minneapolis, or from WILLIAMS & NORGATE, Henrietta Street, Covent Garden, W.C.

"PETIT ATLAS DE POCHE DES CHAMPIGNONS COMESTIBLES ET VÉNÉNEUX" (*Etatle and Poisonous Fungi*), par PAUL DUMÉRIE (Paris, Librairie des Sciences Naturelles, PAUL KLINCKESIECK, 52, Rue des Écoles). This little hand or pocket volume is the third of a series devoted to natural history, and intended to accompany a collector in his walks as well as to be useful for reference in the study. The book before us contains descriptions by which many of the commoner fungi may be recognised one from the other. Some brief information concerning microbes and microscopic fungi which are more or less intimately connected with certain diseases, are also mentioned. There are thirty-six coloured figures of fungi included in this work, contributed by M. HENRI GILLET. The section relating to the micro-fungi is too brief to be of much service. The other portions of the volume may be commended to the notice of beginners. The figures are good, but contain no details concerning the spores.

FLOWERS IN SEASON.—We have received from the nursery of Messrs. LAING & MATHER numerous flowers of varieties of the Carnation, cut from plants

in the open ground, which are everything that those who admire this fragrant flower could wish, although that not easily pleased person, the Carnation fancier, would, we imagine, not think they were all up to show form. Of especial good quality were Dundas, scarlet; Mrs. Reynolds Hole, orange-fawn; Uriah Pike, dark carnation-red; William Wood, deep rose; Ketton Rose, and Duchess of Eife, old rose-pink in both cases; and Paul Engelheart.

PROPOSED PARK FOR HAMPSTEAD.—We learn from the *Journal of Horticulture* that a movement has been started by a number of influential residents in Hampstead to secure the estate of the late General FRASER as a park and recreation ground. The proposed park is situated by Finchley Road and West End Lane, and has an area of 13 acres. The grounds are finely laid out, and abound with flower-beds and winding paths.

THE TOMATO TRADE.—According to the *West Kent Advertiser* of July 27, Mr. JOHN WOOD, of Crockenhill, has been sending away nightly to the London and northern markets between 300 and 400 pecks of the finest kinds of Tomatoes.

STOCK-TAKING: JULY.—The holiday last week interfered with the publication of the Trade and Navigation Returns for the past month, so as to prevent the issue of our summary until to-day. The following is our usual excerpt from the "summary" table of Imports for the month of July:—

IMPORTS.	1894.	1895.	Difference.
	£	£	£
Total value of imports	31,835,553	35,128,142	+3,292,589
(A.) Articles of food and drink—duty free	12,267,448	13,050,232	+782,814
(B.) Articles of food and drink—dutiable	2,022,190	1,965,093	-57,097
Raw materials for textile manufactures	2,772,042	3,530,191	+758,149
Raw materials for sundry industries and manufactures ...	4,063,668	4,829,385	+765,717
(A.) Miscellaneous articles	1,076,218	1,103,739	+27,521
(B.) Parcel Post	49,602	79,661	+30,062

This shows a satisfactory state of things, as compared with last year, though it should not be forgotten that there was one more working day in the past month than in the same term last year. Animals, food and drink, textile materials, timber, ores of copper, &c., all show an increase—Wheat being in excess by over three-quarters of a million sterling. Russia showing a heavy increase, and America a heavy decrease, but sending an increased supply of Cotton. "Manufactured articles" are an increased quantity, chiefly in silk and cotton goods. Altogether, with a total import of £35,128,142 there is shown a gain of £3,292,589—or rather better than 10 per cent. The annexed figures as to the imports of fruits, &c., are, as usual, very interesting:—

IMPORTS.	1894.	1895.	Difference.
	£	£	£
Fruits, raw:—			
Apples bush.	55,362	57,988	+2,606
Cherries "	99,917	66,047	-33,870
Plums "	165,134	59,040	-106,094
Pears "	154,082	33,903	-117,178
Grapes "	6,500	45,238	+38,738
Unenumerated "	301,771	342,194	+40,423
Onions "	283,283	367,942	+84,656
Potatoes cwt.	570,773	593,382	+23,109
Vegetables, raw, unenumerated value	156,172	204,059	+47,887

These figures and the record as to imports convince us that time and circumstance are not inopportune in which to recall attention to the matter of light railways as eminently suited to the requirements of market gardeners and others. When railway charges were exciting so much attention in this column, we draw attention to the advisability of making cheap lines of communication between field, orchard, and

markets, extending the area over which the producer could spread his wares—to his own profit as well as to that of the consumer. It would appear that our Consular and other officials on the Continent were solicited by the commercial directorate of the Board of Trade to furnish such details as they could lay hands on bearing upon the subject; this was done, and the resulting reports were handed to the committee inquiring into the causes of the depression in agriculture. Now that the committee have overhauled the supply of information, the reports have been published, and we now learn that in the little kingdom of Belgium there are seventy-five lines, extending over 836 miles, six belonging to private companies, the remainder to the National Society of Local Railways. It is interesting to learn that their dividends have been steadily increasing. Agricultural products have benefited by the establishment of these lines of communication, the most remarkable feature being the culture of Beetroot, which has received a very noticeable impetus; and has in its turn given rise to the establishment of many sugar factories. In Prussia the light railways are thirty-seven in number, extending to some 480 miles; the German Government says of them that in general they appear to be well adapted to the development and improvement of agriculture, forestry, and their accessories, particularly to opening up new markets, and facilitating the carriage to and fro of manure and raw produce over a considerable area of country. Surely, enough has been given here to prove the case for the subject under notice. In the matter of

EXPORTS.

An excellent report has to be made; not in any article has a decrease to be noted—the column is a blank! In the month of July the exports footed up £20,559,486, being an increase of £2,160,950 over July, 1894. More than that, there is an increase to note in the seven months' comparison of £1,394,991. Nearly £800,000 of the month's increase is due to American business alone; and if the currency difficulties over there can be settled, there is no reason why a return of confidence all over the Union should not still further swell the tide of trade enterprise. There is no necessity to specify increases with an all-round rise, and there can be little doubt that home trade generally will expand, and hundreds of thousands be qualified to judge of the purchasing powers of money!

"JOURNAL OF THE KEW GUILD."—We have already alluded to the recent publication of the number for May, 1895, and may now give some indication of its contents. It opens with a portrait and brief memoir of Sir WILLIAM HOOKER, the first Director. What he did, how great was his courtesy, and how potent his aid to young gardeners and students, is held in grateful remembrance by the older generation, and it is well that the new comers should be made acquainted with the facts also. The main purpose of the guild, that of linking the Kew gardeners of the past with those of the present, seems to have been well accomplished, and no doubt the circulation of the present number will still further promote that co-operation and good fellowship which are so desirable. The items of Kew news have mostly been published already in the gardening papers, but it is very useful to have them collected in so convenient a form. The notes from far off members in all quarters of the globe are most interesting, and constitute a feature which we would fain hope may be much extended. Some notices of old Kewites who have passed away will be of interest to many who still hold their memory dear. There are some omissions which will probably be made good in subsequent issues. The list of old Kew men will prove very serviceable. We congratulate the promoters on the progress of the guild, and most heartily wish it all attainable success.

CATTLEYA MOSSIÆ, LINDEN'S CHAMPION.—We owe to the kindness of M. LUCIEN LINDEN the receipt of a fine illustration of a beautiful form of *C. labiata* var. *Mossiae*, called Linden's Champion. The bold undulate petals, the lip with a crimson

blotch edged with a white frill, and the throat streaked with gold and purple, confer an air of great distinction on this plant. It is one of many varieties, more than forty of which have been deemed worthy of being separately named.

THE BRITISH PTERIDOLOGICAL SOCIETY.—The annual meeting of this Society took place at Kendal,

them a splendid confluent form of *Lastrea montana* found by Mr. WHITWELL, which under successful culture had far surpassed the expectations of its discoverer, since when found it was merely caudate. A paper on "Fern Reproduction," by Mr. CHARLES T. DREYER, F.L.S., formed the basis of an animated discussion, dealing as it did with all the latest discoveries in this direction, some of which were quite new to the

On the Tuesday, as usual, a Fern-hunting expedition was organised to Clawthorpe Fells, where Mr. WHITWELL, the keen-eyed secretary, discovered a batch of attenuate *Lastrea montana* on the limestone formation, thus not merely bagging a good thing, but at the same time exploding the generally accepted theory that this species abhors lime, a fallacy the writer also discovered last year on the limestone at Carnforth, where the species grows abundantly and rankly in the very pockets of the outcrop.

CORNELL UNIVERSITY.—The following is the programme of the course of Horticulture given at this University:—

1. *Evolution of Cultivated Plants.*—Fall, i.e., autumn. Three days a week. A discussion of the current hypotheses of organic evolution as applied to the modification of plants, particularly of those in cultivation. Open to students in all courses who have taken courses 1 and 2 in Botany. Lectures. Professor BAILEY.

[2. *Landscape Gardening.*—Fall. Two days a week. A consideration of the principles of æsthetics as applied to natural scenery, with a critique of garden art. Given to students in agriculture, architecture, and others. Lectures. Professor BAILEY.]

This course will not be given in 1895—6.

3. *The Literature of Horticulture.*—Fall. One day a week. A seminary in the literature of the cultivation of plants in various parts of the world, with reviews of periodical literature. Professor BAILEY and Mr. LODEMAN.

4. *Greenhouse Construction and Management.*—Fall. Two hours; one hour of lectures, and one of laboratory work once a week, by appointment. Professor BAILEY and Mr. LODEMAN.

5. *The Botany of Cultivated Plants.*—Winter. Seminary course of one hour, by appointment. Professor BAILEY.

6. *Pomology.*—Winter. Three days a week. Lectures and other class exercises upon the cultivation of fruits. Professor BAILEY and Mr. LODEMAN.

7. *Propagation of Plants.*—Winter. Two hours, by appointment. A practical laboratory course in the multiplication of plants—grafting, budding, making cuttings, pollination, &c. Mr. LODEMAN.

8. *Olericulture, or Vegetable Gardening.* Spring. Two days a week. Lectures. Professor BAILEY and Mr. LODEMAN.

9. *Floriculture.*—Spring. Three hours. Lectures. Two days a week. One hour of laboratory work by appointment. Professor BAILEY and Mr. LODEMAN.

10. *The Theory and Practice of Sproyng Plants.* Spring. One hour course. Lectures and demonstrations. By appointment. Mr. LODEMAN.

11. *Handicraft.*—Practical work in the forcing houses and gardens, with familiar talks. Throughout the year. One to three hours, by appointment. Professor BAILEY and Mr. LODEMAN.

12. *Investigation Incident to Previous Courses.*—For graduates and advanced students. Throughout the year. Hours by appointment. Prof. BAILEY.

APPLE CULTURE.—Professor BAILEY sums up a report on the orchards of New York State, by the terse direction—

"Till,
Feed,
Prune,
Spray."

PLANT PORTRAITS.

- ANTHURIUM SCHERZERIANUM, *Bull. Soc. Toscan. di Orticultura*, July.
- CATLEYA MOSSIE AMENA, *Lindenia*, t. CDLXX.
- CYPRIPEDIUM "FELIX FAURE," a cross between *C. Godefroyae* and *C. callosum*, *Gardeners' Chronicle*, 1895. vol. xvii., p. 228; *Lindenia*, t. CDLXIX.

FIG. 40.—PHYLLSTACHYS KHUMASAQA. (SEE P. 186.)

FIG. 41.—BAMBUSA TESSELLATA. (SEE P. 186.)

on Monday, August 5, Bank Holiday, and notwithstanding the unpromising weather conditions, was very well attended. A number of very interesting new finds were exhibited by Mr. R. LLOYD PRÆGER, of Belfast, who read a most interesting paper relating to them and to the Irish hunting-grounds from which they had emanated, and in which so many close parallels have been found by him, and Mr. W. H. PHILLIPS of same city, to some of the rarest English forms. Mr. SMITHIES also showed a number of finds, among

members generally. A number of new members were enrolled, and the Society is in a flourishing condition, and deservedly so, since, thanks to the efforts of a coterie of true Fern lovers, mainly resident in the locality, a centre has been formed to which, once a year at least, the sincere admirers of our British Ferns may gravitate, exhibit their finds, exchange views, and in a practical fashion determine by the general experience of the members, the vexed question of nomenclature.

GIANT CACTI AT KEW.

SOME interesting additions have recently been made to the collection of Cacti cultivated at Kew, a consignment of big specimens having been obtained from Arizona with the assistance of Prof. J. W. Toumey, of the University of that State. The illustration (fig. 39, p. 187), represents the most striking of these specimens, which are arranged in a group in the middle of house No. 5. The two tallest stems are of *Cereus giganteus*, the most colossal of all Cacti, as it sometimes attains a height of 60 ft. In 1890 a fine stem of this species was obtained for Kew from California, its height being 15 feet, and its weight nearly half a ton. It flowered in 1891, and a figure of it was published in the *Botanical Magazine*, t. 7222. The new stems of this *Cereus* are 9 feet high, and each weighs about 4 cwt. The two large specimens arranged in the corners of the group are fine examples of *Echinocactus Wislizeni*, each weighing 4 cwt., and measuring 6 feet in height, and 3 by 2 feet in diameter. The deep ridges are clothed with tufts of stout spines, of which the central one is 3 inches long, hooked at the tip, and hard and rigid as bone. There are smaller specimens at Kew which, although they have been in the collection ten years, have not grown an inch in height, from which it may be reasoned that these large examples are probably hundreds of years old. Flowers are only developed on large plants; they are about 2 inches long and wide, and are succeeded by cone-shaped fruits 3 inches long, filled with small black Onion-like seeds. The juice of the stems is said to serve as a substitute for water when the latter is scarce, and instances have been known among the white trappers, where the lives of men have been saved by this plant. The stems are also used by the Indians as boilers, the fleshy inside being scooped out, and the tough skin is filled with vegetables and water, and placed on the fire. As there is a plentiful supply of stems in the desert regions where this is practised, the Indians do not trouble to carry this "boiler" about with them, but make a fresh one at each stage of their journeyings.

A still larger species than this is *E. Vinaga*, of which a very fine example was obtained for Kew years ago. Shortly after its arrival, it was described and figured by Sir William Hooker in the *Illustrated London News*. It was 9 feet high, and a yard in diameter, its weight being about a ton. It lived only a year or two, very large stems of Cacti being evidently bad to transport and re-establish, even in gardens near where they grow wild.

Opuntia arborescens, the Elk-horn Cactus, is represented in the group by two specimens, one on each side of the elegant Sedge-like *Restio subverticillatus* in the centre. This Cactus grows to a height of about 30 feet, branches freely, the main branches bearing numerous cylindrical branchlets, remarkable for their oblong tubercles and tufts of long needle-like spines, each enclosed in a loose thin straw-coloured sheath. The skeletons of this *Opuntia*, as seen in the desert places where it is wild, have a singular and startling appearance, being quite devoid of leaves, spines, and flesh, the white ligneous layers forming a hollow cylinder perforated with mesh-like holes. These skeletons are said to stand many years. There are examples in the museum at Kew, and also specimens of walking-sticks made from the stems of this species. *Opuntia fulgida*, another arborescent species with numerous branches and drooping cylindrical red-tinged branchlets, bearing short spines, is represented by two fine specimens.

Other interesting species included in this group are small stems of the new *Cereus Pringlei*, a nearly ally of *C. giganteus*, and *Opuntia arbuscula*, with slender twiggy branches, not more than half an inch in diameter, bearing thin sharp spines an inch long.

The large boulder-like object in front of the picture is an exceptionally fine specimen of *Hottentot's Bread*, *Testudinaria elephantipes*, which was imported from Natal for the Colonial and Indian Exhibition, and afterwards came to Kew. The col-

lection of Cacti now at Kew is richer in species than it ever was, and considering the large size of the house in which they are grown they are in good health. John Smith records that in 1839 a number of plants of *Cereus senilis* were introduced by a trader and sold at six guineas each. What a different story Mr. Sander of St. Albans can tell, for he sent twenty nice plants of this same Cactus to the auction rooms last week, and could not get a bid for one of them; they were afterwards bought to be distributed from Kew at the absurd price of 2s. each. A dozen plants of the recently-certificated *Echinocactus aureus* were bought at the same price. The newly-formed Cactus Society may in time work up an interest in Cacti among English horticulturists—they are certainly out of favour now. *W. W.*

KEW NOTES.

DEODAR STRUCK BY LIGHTNING AT KEW.—One of the finest Deodars at Kew, between the Palm-house and the temperate-house, was struck by lightning on Saturday evening last. The trunk is riven into large fragments, showing that the disruptive force must have been enormous.

BEGONIAS AT KEW.

After the heavy storm of Saturday last, and the drenching showers which have occurred since, it is pleasing to notice that the beauty of the small beds of *Taberous Begonias* near the Show-house, No. 4, is not at all impaired. One bed consists of *Taberous Begonias* of mixed colours, pink and white predominating. This is a very beautiful bed. Equally good are the beds of *B. semperflorens rosea*, *B. Crimson Gem*, and *B. Worthiana*.

HUNNEMANNIA FUMARIIFOLIA.

This is one of the gayest plants in the Kew rockery just now. It is an *Eichscholzia*-like plant, but growing to 18 inches or 2 feet in height, with glaucous very deeply divided leaves, and large cup-shaped canary-yellow flowers. It is a native of Mexico. In a sheltered situation it would form a fine plant for a bed, but as we learn from Mr. Irvine, it is not quite robust enough to stand full exposure to wind and rain.

SOLANUM WENDLANDI.

It is very remarkable how slow is the diffusion in gardens of fine plants when they do not happen to be sent out by the trade. For several years now the magnificent creeper above named has been grown at Kew, both in the Succulent-house and in the Water-Lily house. Thousands upon thousands must have admired its ample panicles of large bluish-violet flowers, which remain in beauty for many weeks, and yet we cannot call to mind ever having seen it in a private establishment. It was figured in our columns, September 16, 1893, but the flowers are often larger than those there shown.

HOME CORRESPONDENCE.

DUKE OF YORK TOMATO.—I grew a few plants of this novelty last year, and have grown some this year. It is a handsome, brilliant-coloured fruit, and if it have a fault, it is that it grows too large. I do not know another variety which produces such an even lot of fruit. *R. P. Brotherston.*

TABLE DECORATIONS WITH CUT FLOWERS, ETC.—Mr. F. W. Seale's strictures in your last issue, with reference to the floral arrangement of dinner tables, seem to me very just. It often happens that insufficient room is left for the dessert and candelabra; these should be the first consideration—the floral decorations ought to be quite subordinate. Most of the dinner-table arrangements I have seen at shows would drive the lady of the house and the butler to despair. The best judges of table floral decorations are ladies, with a butler as assistant. *T. M. Bulkeley-Owen.*

—Mr. F. W. Seale's remarks on the judging of table decorations at flower shows in the *Gardeners' Chronicle* of August 10, p. 160, are to

the point, and I hope that the subject will be well threshed out, as there is, to my mind, no part of horticultural exhibitions so unsatisfactorily judged as table decorations. Over and over again, I have seen prizes awarded to clumsy overcrowded arrangements which had nothing to recommend them but the quality of the flowers used, while taste and pleasing arrangements were passed over. I am quite ready to believe that the judges in these cases wish to be just, but I agree with Mr. Seale when he says "they are totally unfit to judge where taste and refinement are required," and I do think that injustice to all exhibitors, the greatest care should be taken to select judges who have proved themselves capable of judging of these qualifications. If we are to attain a high standard of excellence in this beautiful work, the skilful and artistic decorator must not be driven out of the competition. *R. Potter, St. Clere Gardens, Keming, Sevenoaks.*

TOMATOS.—Tomato-growing in the North appears to be greatly on the increase, not in market-gardens only, but in many private establishments. The fruits are used as freely as any other culinary vegetable, and many of the working-classes now value them as a useful and palatable food-adjunct. The price of the fruit from this cause is well maintained, and is not likely to suffer much for some time to come, the foreign supplies, in northern towns at least, not having increased proportionately to the demand. I have noticed that in the markets fine-looking fruit command a very high price compared with irregular fruit of smaller size. A good bright colour is readily noticed by purchasers. In gardens generally there are varieties which find favour, and grown year after year, cultivators making their own selections, and by such means the quality is improved. *Austen's Eclipse* and *Thomson's Excelsior* have stood the test as well as most in Scottish gardens, but among numerous trials given of varieties, *Frogmore Selected* takes a prominent position. It did well in this garden for early supplies, that is, from the end of April onward, and it is now in good condition as a late fruiter. The earliest fruits were obtained by me from *Acquisition*, a free-bearing variety of sturdy habit, good for pot-culture. *President Garfield* is very large; but it is coarse in the flesh, and not of handsome shape. In cool-houses, where Peaches, Figs, &c., are grown, I obtain fine crops of Tomatos from plants which are potted in rich soil, and allowed to root through the pots into fine loam. The pots are 7-inch, with holes in bottoms made large enough to allow the roots to get outside, and half plunged. Few laterals are formed, the clusters of fruit are close, and they are large and firm. *M. T. Carron, Stirlingshire.*

SLUGS DESCENDING (see *Gardeners' Chronicle*, August 10, p. 160).—The following correspondence will, I think, be interesting, especially as Darwin's letter is characteristic of his modesty, courtesy, and patient attention to details:—

"CHAS. DARWIN, Esq., F.R.S., &c.

"Sir,—I have observed that the small white slug has acquired the power of descending head foremost by means of a thread of slime from branch or leaf of the Vines in a hot-house here. One that I showed to a medical friend lowered itself from the moist end of a stick to a depth of 1 foot, and upon the leaf which was used to entice it being removed, the slug turned in the air and climbed up the thread of slime. It appears to have the power of exuding the slime and of twisting it into a thread as it descends. I shall be happy to forward one of these slugs if the subject be of sufficient interest to you. I am, Sir, Yours, &c., W. R., Sept 6, 1881."

"Down, Beckenham, Sept. 7, 1881."

"Dear Sir,—I thank you for your kindness in having written to me. My memory is not so good as it was, but I am nearly sure that I have read of slugs descending in the manner described, but not of their having ascended. I am so much occupied with another subject that I will not accept your obliging offer of sending me living specimens. It is just possible that the slug may be a foreign species introduced with plants in your hot-house. I think that it would be worth while for you to repeat carefully your observations, with measurements of height of ascent and descent, and then send an account (saying that you were not sure whether the fact was known) to *Nature*, published by Macmillan & Co., Strand.—With my thanks, I remain, dear sir, yours faithfully,

"CH. DARWIN."

I found on further experiment and observation that the small white slugs, measuring from 1 to 1½ inch in length, descended more than 3 feet from the Vines in preference to crawling down their rough stems, but that they could only ascend a few inches in a moist and warm vinery, when by repeatedly touching their heads they were compelled to climb up their own bodies to the thread by which they had been descending. The death of Mr. Darwin terminated my interest in the matter for a time, and I

have not hitherto published the result of my observations. The small white slug may be found in many gardens, and is, I think, a native of this country. *W. R., Streatham Hill.*

— In reply to De B. Crawshaw, Esq. (see *Gardeners' Chronicle*, August 10), I am aware that it is an expedient slugs often adopt when circumstances require it. I have seen them in the act many a time, especially amongst corn-stacks at harvest-time. For instance, the last load of Wheat taken up after the dew has settled on the straw late in the evening may remain on the waggon all night, and should the stubble be somewhat grassy, and slugs abundant, many of them would be located at the butt-end of the sheaves; this end would be placed outward on the waggon or on the stack, and in either case would soon get dry. The slugs which happen to be there find the surroundings uncongenial, and at once descend to the ground by means of a line made of slime. What a trouble these slimy creatures cause to the growers of Orchids I well know, for they can with their slime make a pathway over almost any firm surface, as well as descend through space, in search of a dainty morsel off an Orchid, or a hiding-place. *E. Blandford, Moor Hill, Westend, Southampton.*

— In reference to Mr. De B. Crawshaw's statement in your last issue regarding slugs descending on plants by a line of slime, may I be allowed to mention the fact that I have seen slugs descend that way on two different occasions, once at the Moat Nurseries, East Grinstead, and once at Holmwood Park, Dorking. At the first-mentioned place, the slug descended on to a Primula, and in the other on to a Cineraria. The slugs descended from 3 to 4 feet to get at these plants. *Foreman, Holme Grange Gardens, Wokingham, Berks.*

SLUGS AND WORMS.—In your last issue I notice Mr. Crawshaw has an article on slugs descending by their own slime. I believe that I was the first to draw attention to this fact in your own paper, as Mr. Crawshaw says no notice was taken at the time. I see also a note on worms in lawns. I have no worm-casts here. I have been conversant with gardens for many years (I shall be on September 10 next, eighty years of age), both in England and the Continent. At my last residence, Broomfield, near Chelmsford, and apparently somewhat similar soil, the roller had to be frequently cleaned. I attribute this to an earth slug which lives underground. I saw one dug up out of a flower-bed in the lawn with a small worm in its mouth. Dig where my men will, it is very rare to find a worm here. I should like to know if any one of your numerous readers have ever seen an earth slug, or have a garden lawn free from worm-casts. The slugs are largish, white in colour, and have horns. *Robert Warner.*

CARNATIONS.—I was much interested in reading the account at p. 138 of the Bookham Carnations, where, if anywhere, they are certain to be seen in good form. Readers in general will be pleased to know that they are equally satisfactory when grown along with the multitude of other things that every day engross the attention of the ordinary gardener, and that they are as well fitted for out-of-door culture as for growing in pots. Though all the sorts named in the report in question are meritorious in a high degree, there are some of such outstanding merit that one can hardly conceive of a garden in which sweet Carnations find no honoured place, or being long without some of them. In my opinion the most charming of all is that named George Cruikshank. This variety has not one bad quality, unless it be its too persistent habit of flowering. On that account I had the greatest difficulty last year in getting any stock of it, almost every growth spindling and forming flowering stems, which yielded till late in autumn flowers of the highest quality. No doubt Mr. Douglas will remember examples I forwarded him last October as being as fine as one could expect two months earlier. The Dey, which is not mentioned in your report, is almost as attractive; as a show flower it is, perhaps, better. Mrs. Eric Hambro, again, I should say, is the ideal white for show purposes; it is far superior to Niphetos, and the plant of strong and vigorous growth. I like Sadek very much, but when bloomed under glass, it lacks the rich glowing tint that the flower assumes when planted in the open garden. The plant is of perfect upright habit, with the flowers standing boldly up. Braw Laes I have not yet grown. With regard to Cowslip I have not found it late in flowering. I should term it a mid-season sort, not nearly

so late as Germanis, nor yet so early as Harlequin. It is a beautiful variety, and comes up fine in the open. This, with Harlequin, is an indispensable garden plant. The latter is wonderfully attractive, and the plant vigorous though dwarf of habit, and very floriferous. Henry Irving has also given much satisfaction. It is the darkest of all crimson sorts, and the blooms of exquisite shape and quite distinct in form from all others. Of the new yellow Carnations, the best of all for the open border is undoubtedly Corona; it is by far the most free-blooming of all Carnations. It also possesses the merit of being one of the earliest to flower; and though in some respects inferior to Germania, it is of greater value as a garden plant. Miss A. Campbell is also wonderfully fine, and some will no doubt give it the preference. Duke of Orleans, with the distinct hint of gold in its enormous blooms, is perhaps best suited for indoor culture. *R. P. Brotherston, Tynninghame.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 13.—The meeting of the Society at the Drill Hall, James Street, Westminster, on Tuesday last, was the occasion of an interesting and beautiful display of hardy flowers in season, including large quantities of Dahlias, Lilies, Gladioli, Gaillardias, &c., and of Orchids. A variety of fruit made its appearance; and we were glad to notice an absence of those enormous trade exhibits so common in recent years, and which serve no useful public purpose.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Fraser, J. Laing, C. T. Drnery, H. B. May, H. Herbet, R. Dean, G. Stevens, J. H. Pitt, R. B. Lowe, C. J. Salter, W. Bain, C. Blich, H. J. Jones, J. D. Pawls, C. E. Shea, J. Walker, J. T. Bennett-Pöe, H. Turner, and H. H. D'Oraibrain.

From the famous Fern nursery in Dyson's Lane, Upper Edmonton, Mr. H. B. MAY contributed a capital collection of Ferns that was rich in varieties of Pteris, Asplenium, Adiantum, Nephrolepis, Davallia, Platycerium, Acrostichum, &c. Of Pteris we remarked *P. cretica* Wimssetii, *P. serrulata* gloriosa, and *P. Beaurita* argentea. Of Adiantums, *A. cuneatum* variegatum, *A. plumosum*, and many others, the fine-looking *Nephrolepis davallioides* furcans, *Asplenium Baptisti*, and another much resembling it, but unnamed; *A. marginatum*, with bold fronds of a light green tint; *Oncidium auratum*, *Platycerium stemmaria*, *P. grande*, and *P. Willincki*, *Actinopteris radiata*, a singular-looking dwarf Fern with horizontally poised fronds; *Phlebodium Sporocarpium* glauca, *Adiantopsis radiata* and *A. dolabriforme*. *Polypodium trioides*, &c. (Gold Flora Medal).

A few varieties of Gaillardias in considerable numbers were shown by Messrs. KELWAY & SONS, Langport, Somersetshire. These flowers had chiefly rays coloured crimson as regards the basal part, with more or less of yellow at the tips. The crimson and yellow varieties were Vivian Grey, Vauqueline Gloire, and John Kelway; Gold-dust was of a very bright tint of yellow. They also showed fruiting sprays of *Rubus ponicolastus*, on which were abundance of fruits.

Messrs. CRIPPS & SON, Tuabridge Wells, showed *Asparagus Sprengeri*, which the committee wished to see again; and *Daphne laureola*, with purple foliage. A Clove Carnation of the true colour and scent, came from Mrs. TUDWAY, 17, Lower Berkeley Street. The habit of the plant is good, but the flower was, as seen, too small. A new *Viola*, W. Haig, a beautiful royal blue-coloured variety, came from Mr. CUTBERTSON, Rothsay, N.B.

Messrs. R. WALLACE & CO., St. John's Street, Colchester, exhibited a collection of bulbous flowers, including the following: *Tigridia grandiflora* lilacea, a very handsome variety, of a lilac-rose colour; *T. g. aurea*, quite as pretty in its way as the other; *Montbretias aurea* and *Etoile de Feu*; *Hemerocallis nurantica* major, a fine large flowered variety; *Lilium Henryii*, L. Lowii, L. Batemaniana, *L. auratum* platyphyllum; some varieties of *Gladiolus Lemoinei*, much improved in colour and size of flower and spikes. Altogether an interesting as well as brilliant group of plants (Silver Banksian Medal).

W. ROBINSON, Esq., East Grinstead, showed hardy Water Lilies, and leaves of great vigour and size (Bronze Banksian Medal).

Messrs. J. VEITCH & SONS, Royal Exotic Nursery, Chelsea, exhibited *Begonia scerifolia*, a foliage variety, with velvety leaves of a bronzy colour, speckled with a silvery colour, the main ribs of the leaf being of a light tint of green. The leaf is palmate, with deep rugged indentations on the edge. *B. Burkei* is a vigorous grower, the leaf green, with deep indentations, and leaf-stalk splashed with red colour. *B. decora* is a dwarf-habited variety, with dark-brownish leaves, and veins and ribs of a light-green tint; a pretty variety, even should the leaves exceed their present size.

THOS. WARE, Hale Farm, Tottenham, showed a collection of flowers of bulbous and herbaceous perennial plants, extremely varied as regarded the species and varieties (Silver Banksian Medal).

Mr. R. B. LOWE, gr. to Earl BROWNLOW, Ashridge Park, Berkhamsted, exhibited the seldom-flowered *Brunsvigia Josephina*, a south African bulb, with a flower-stalk 2 to 3 feet high, and a corymb of small scarlet flowers, which as they appear at the extremities of radiating pedicels 1 foot long, and numbered in this example sixteen, are very wide apart. The plant received a First-class Certificate. We heard that Mr. LOWE's success was due to leaving the bulb undisturbed for nine years, and affording it no water during the season of rest, that is, for a period of six months.

The Sweet Pea, Cupid, was again shown by Mr. BURPEE, Philadelphia, U.S.A. Mr. JAS. DOUGLAS, florist, Edenside, Great Bookham, showed Carnation Britannia, a fairly full pale-yellow variety.

Mr. MOARTHUR, nurseryman, Maida Vale, showed *Arisaema fimbriatum* and *Eucharis Gortoni*, the latter, a starry-flowered form, had been grown and bloomed in an ordinary greenhouse. From the same exhibitor there came a quantity of dwarf Bamboos and Lilies, including *L. auratum* and varieties of *L. speciosum* and *L. elegans*; these were arranged together, making a cool, pleasant-looking group (Bronze Banksian Medal). Several flowering plants of *Lxora Duffii*, to show size of bloom and the capabilities of the variety whilst quite young to produce good heads of flowers, were shown by Messrs. B. S. WILLIAMS & SON, Holloway, N.

Messrs. P. BARR & SONS, King Street, Covent Garden, showed an extensive collection of cut flowers of hardy plants, including Phlox, Pentstemon, Lilium, Lobelia cardinalis and *L. Milleri* (bright blue flowers); *Chelone*, *Heliopsis*, *Tritoma*, *Rudbeckia*, *Geothera*, *Agapanthus*, and *Bocconia cordata*. The collection bespoke the great resources of the firm in this direction (Bronze Banksian Medal).

Messrs. J. LAING & SONS, Stanstead Park Nurseries, Forest Hill, S.E., showed largely of *Codæum* (Croton), having small, well-coloured examples of the more novel varieties—Madame A. Bleu, Golden Ring, Memphis, Gordoni, Flambeau, Lady Hillingdon, and superbus. The *Streptocarpus* shown consisted of the varieties Baron Chandon, with violet segments and throat, with purple stripes running down the latter; Oxonian has a deep violet ground colour; the others were less distinct, although pretty enough. They showed also three varieties in white, yellow and crimson, of bedding *Antirrhinums* (Silver Banksian Medal).

B. RICKETS, Esq., Caen Wood Towers (gr., Mr. Bort), showed *Lilium auratum* Burtii, a variety with a crimson band on each segment. We doubt the propriety of attaching a Latin name to a mere garden variety.

From Sir THEODORE LAWRENCE'S garden, Burford Lodge (gr., Mr. Buin), came some stems and leaves of *Setaria alopecuroides*, furnished with greenish-brown plumes. The leaves are of considerable length, and a width of 1½ inches. *Montbretia Soleil Couchant* (Award of Merit), *M. Eldorado*, orange-coloured flowers; *M. Etoile de Feu*, *Anthurium Marie*, with a large white spathe, having a pink-coloured spadix and large leaf; besides these was a quantity of different species and varieties of *Anthuriums* in a cut state, and bunched together in one vessel. A Silver Flora Medal was awarded for the above-named cut flowers, &c.

Mrs. CRAWFORD, Gatton, Reigate (gr., Mr. Slogrove), showed a fine large flowering variety of *Lobelia cardinalis*, named Crawfordense, another example of an improper Latin varietal name.

A. B. FREEMAN-MITFORD, Batsford Park, Moreton-in-the-Marsh, showed the graceful Bamboo, *Dendrosalamus membranaceus*, receiving an Award of Merit.

Messrs. G. BUNYARD & Co., Old Nurseries, Maidstone, showed *Sorbus Aucuparia*, with yellow and red fruits, and a weeping variety of the last-named (Award of Merit).

A *Fuchsia* with yellow variegated foliage and good natural pyramidal habit, came from Mr. WITTY, Nunhead Cemetery, S.E.

Mr. W. H. BELCHAMBER, Rose Cottage, South Park, Reigate, exhibited photographs of bouquets of various kinds, mostly of artistic character, but some also showing what to avoid.

DAHLIAS.

This was the first occasion on which Dahlias put in appearance, and already new forms of the Cactus type are challenging attention. Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, had Arthur Cheal, vivid red, shaded with darker tint towards the centre, a fine and showy variety, singularly bright in colour (Award of Merit); Mrs. Gordon Sloane, brilliant orange-salmon, very pleasing and promising; Mrs. Wilson Noble, crimson, bright in tint, and good Cactus type; Mrs. Broughton-Stirling, bright reddish cerise, very promising; and Mrs. Montefora, bright scarlet. Evidently Messrs. Cheal & Sons have a good strain of seedlings of this type. Mr. J. WALKER, nurseryman, Thame, had a large collection of highly-developed show varieties, very fine indeed for so early in the season, among them being excellent representatives of William Rawlings, Mrs. J. Greaves, a yellow self, Miss Browning, as a pure yellow self, there being an absence of the white tip usually seen in this variety; John Walker, the finest white self; Miss Cannell, J. C. Reid, Royal Queen, Joseph Green, R. J. Rawlings, also a fine yellow self, and Maud Fellowes. Also a number of blooms of Cactus and decorative varieties, chief among the former being Delicata, Mrs. Douglas, Kathleen Pictor, Countess of Radnor, and Mrs. Peart. Mr. S. MORTIMER, Swiss Nursery, Farnham, Surrey, staged sixty blooms of Cactus Dahlias chiefly, in almost every case a row of three blooms of one variety; and among them the following were seen in very fine character, Lady Penzance, Apollo, Delicata, Bertha Mawley, and May Pictor, but all were very good. In a large group of cut hardy flowers, Mr. T. S. WARE had bunches of Pompon and other Dahlias, and a new Cactus variety bearing the name of Mrs. E. Beck, bright pale orange-red, with tubular florets, a fine form of the true Cactus shape (Award of Merit).

GLADIOLAS.

These flowers were represented by a very fine collection of ten dozen spikes from Messrs. KELWAY & SON, The Nurseries, Langport—to two of which, Earl of Cadogan (the individual flowers very large, the colour rose flaked with maroon on the petal edges), and Don José (purple flaked with dark), Awards of Merit were made. This last greatly resembles a variety named Shahzad, which they recently exhibited at Taunton, and for which they received a Certificate of Merit under this name. It is a little curious that two spikes should have been shown in London as at Taunton. Other fine new varieties were Lord George Hamilton, Robert Morrow, Duke of Devonshire (pale scarlet, with a white throat), Col. Welby, and C. T. Ritchie.

From Burford Lodge, Dorking, the residence of Sir TREVOR LAWRENCE, Mr. W. Bain brought a collection of new varieties, English, French, and American novelties, and chief among them Mrs. Beecher (American), a large, rosy-scarlet variety, with a white and purple throat (Award of Merit); and Dr. Sellen (American), bright scarlet with white throat. These two appeared to represent a strain of fine English varieties crossed with the best of the Lemoine type.

CHRYSANTHEMUMS.

The floral surprise of the day were the fine new forms of hybrid annual Chrysanthemums, all single-flowered, exhibited by Mr. HENRY BROWNELL, seedsman, Sale, and obtained by crossing *C. coronarium* on to *C. carinatum*. All the flowers shown, and there were several bunches of each, were cut from plants propagated by means of cuttings, in the same way that the double varieties of *C. coronarium* are propagated by the market growers for market purposes. Awards of Merit were made to the four following varieties:—Sunshine, bright clear yellow, with a golden disc, broad, flat florets, the flowers large, and of fine shape; Princess May, white, with deep yellow ring round an orange disc, florets broad, and of fine shape; elegans, pure white, with a yellow ring round a dark disc; and Chieftain, large bright yellow, with dark disc—very fine. Duke of York, a deep yellow self, also very fine, failed to obtain an Award. These new forms promise to be invaluable for cutting and decorative purposes.

Orchid Committee.

Present: F. W. Burbidge, Esq., M.A., in the chair; and Messrs. Jas. O'Brien (Secretary), A. H. Smee, W. Cobb, J. Douglas, T. W. Bond, E. Hill, J. Gabriel, C. Pilcher, W. H. White, H. Ballantine, H. M. Pollett, De B. Crawshaw, T. B. Haywood, Dr. M. T. Masters, F.R.S.; and Dr. F. K. Szellin of Berlin.

The meeting was a most interesting one, and it was marked by the presence of an unusual number of really good new hybrid Orchids. Foremost amongst these stood the handsome Cattleya × Fowleri (Leopoldi × Hardyana) shown by J. GURNEY FOWLER, Esq., Glebelands, South Woodford, and raised by Messrs. F. Sander & Co., St. Albans. The plant bore an inflorescence of two large flowers of firm texture, in colour of a clear rosy-lilac, except the broadly-expanded, crimped front lobe of the labellum, which was of a rich crimson-purple, the tips of the side lobes, which were white, bearing a blotch of the same colour. The plant received a First-class Certificate.

Equally good and interesting in its way was Cattleya × Eros (Walkeriana × Mosiæ) shown by Messrs. J. VEITCH & SONS, Chelsea, which also secured a First-class Certificate. The plant had the short swollen pseudobulb of *C. Walkeriana*, and flowers equal in size to Cattleya Mosiæ, and of the same warm rose hue; the labellum, which had the open form of *C. Walkeriana*, being crimson in colour and velvety in texture.

Another fine hybrid was Cyripedium × Massaianum superbum (Rothschildianum × superbiens), shown by THOS. STATTER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson). In form it resembles *C. × Morganii*, but the flowers have broader segments than that variety. The upper sepal was white with a greenish tinge and some purple lines; the petals ivory-white spotted with purple, and the labellum brownish-rose (First-class Certificate). The same cross was shown by Messrs. F. SANDER & CO., and Baron Sir H. SCHRODER, J. T. HOLMES, Esq., Beechen Cliff, Bath, showed the first absolutely pure white form of *Dendrobium Phalaenopsis*, which the Committee decided to name *D. Phalaenopsis* var. *hololeuca*, that already certificated as *D. P. alba*, having pink lines on the lip. This charming variety received a First-class Certificate.

Sir TREVOR LAWRENCE, Bart., Burford, Dorking (grower, Mr. W. H. White), staged a group of Orchids, remarkable alike for their rarity and good culture. One of the most interesting was *Polycypris Lehmanni*, with a spray of very remarkable and pretty flowers. The sepals and petals are reflexed, and in colour yellowish-white spotted with purple. The side lobes of the lip, which has a remarkable structure, are curled back beneath the slender green, purple-tipped column; the broader front lobe being white, spotted with purple, and covered with long, slender hair-like protuberances (Botanical Certificate). In the same group were *Laelia monophylla*, with over forty of its charming orange-scarlet flowers (Award of Merit); the pretty yellow-and-chocolate coloured *Maxillaria fausta*, with sixteen flowers (Award of Merit); three fine forms of *Phalaenopsis* *Esmeralda*, *Laelio-Cattleya* × *Exoniensis*, *Aërides Lawrenceæ* var. *Sanderiana*, *Dendrobium longicornu* (Botanical Certificate); *Calanthe natalensis*, *Vanda Hookeri*, *Polystachya odorata* (Botanical Certificate); the very singular hybrid *Cyripedium* × *Sanderielligeram*, and the noblest plant of *Saccolabium coeleste* yet seen, and which bore fifteen flower spikes (Cultural Commendation). The group was awarded a Silver Banksian Medal.

In the group staged by J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr., Mr. J. Davis), were also remarked some fine specimens. A grand plant of a noble form of *Vanda coerulea*, named Fowleri, with four spikes, bearing together about forty fine intensely blue flowers, secured a First-class Certificate, the fine old plant not yet having previously been so honoured. *Laelio-Cattleya* × *elegans* was also shown with ten flowers on a spike; and *Zygopetalum rostratum*, *Angraecum Scottianum*, *Catasetum Bungeorthii*, *Cattleya superba splendens*, *Cyripedium superbum*, *Demidoff* var., and others, were also well represented, the group securing a Silver Banksian Medal.

Remarkable for the fine quality of the plants and for artistic arrangement, was a fine group of *Odontoglossum Harryanum* and *Miltonia vexillaria*, staged by T. B. HAYWOOD, Esq., Woodhatch Lodge, Beigate (gr., Mr. J. Salter). The group was divided into three sections, each with a large and graceful *Cocos Weddelliana* in the centre. The middle and extreme ends consisted of *Miltonia vexillaria* and *Maidenhair Ferns*, the two side sections of a large number of excellent *Odontoglossum Harryanum* (Silver Flora Medal).

Baron Sir H. SCHRODER, The Dell, Egham (gr., Mr. H. Ballantine), showed a group of cut blooms of choice Orchids, including *Cattleya Hardyana*, Clark's variety; *Mormodes luxatum eburneum*, *Sobralia Lowii*, *Vanda insignis*, *V. tricolor insignis*, *V. Boxburghii*, *Rhyncostylis gutata*, *Aërides nobile*, *A. Sanderianum*, *Cyripedium Stonei platyanthum*, and a remarkable form of *Odontoglossum ramosissimum*, with a densely branched spike of white flowers having purple blotches at the bases of the segments only (Silver Banksian Medal).

Messrs. F. SANDER & CO. staged an effective group, consisting mainly of many forms of *Dendrobium Phalaenopsis* *Schroderianum*. With them were the beautiful *Odontoglossum Wattianum*, with cream-white violet-spotted labellum (First-class Certificate); *Cattleya Leopoldi*, Sander's var., one remarkable beauty (Award of Merit); *Calanthe Sanderiana*, *C. Lancheana*, *Cattleya × Kienastiana*, *C. × Prince of Wales*, *Laelio-Cattleya × elegans prasista*; the handsome *Cyripedium* × *Frau Ida Brandt* (*Ido grana* × *Youngianum*); *C. × Massaianum superbum*; *C. × vexillarium*, *C. × ananthum superbum*, *Cattleya aurea*, *Catasetum fimbriatum*, *Rodriguezia secunda*, *Miltonia vexillaria rubescens*, *Cirropetalum picturatum* (Silver Banksian Medal).

C. INGRAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), showed *Laelio-Cattleya* × *Elstead Gem* (*C. bicolor* × *L. xanthum*), a pretty hybrid, with yellow sepals and petals, and lip of the rich crimson-purple seen in *C. bicolor*, whose influence in its form was also distinctly traceable (Award of Merit); *Cyripedium* × *album* (*leucorrhodum* × *Schlimii*), and *Laelia* × *striata*, a supposed hybrid, but whose flowers were not fully developed. E. H. WOODALL, Esq., St. Nicholas House, Scarborough (gr., Mr. Hughes), showed a fine form of *Vanda coerulea* (First-class Certificate). Messrs. HEATZ & SON, Cheltenham, sent *Cyripedium* × *pendulum* (*Argus Moensii* × *philippinense*), an elegant and distinct hybrid. Admiral R. P. CATO, Hazelwood, King's Langley (gr., Mr. G. Day), showed *Eria stellata*, with fine spikes (Botanical Certificate). Messrs. B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, staged a pretty group of *Cyripediums*, the most striking being *C. × G. H. Rogers* (*insigne* violaceo-punctatum × *C. superbiens*), the ground colour of whose flowers was ivory-white, with markings of rose and purple; with it were *C. × Morganii*, *C. × orphanum*, *C. × vexillarium superbum*, *C. × Ashburntoniae* *expansum*, *C. × Harrisonianum superbum*, *C. tonsum*, *C. × ananthum*, *C. × Wallertianum*, &c. T. STATTER, Esq., received a Cultural Commendation for *Laelia crispa superbum* with eight flowers on a spike. F. HARDY, Esq., Tyntesfield, Ashton-on-Mersey (gr., Mr. T. Stafford), sent *Cattleya* × *Brymeriana* and *Laelia crispa*. F. W. MOORE, Esq., Glasnevin, Dublin, sent *Cattleya glandulosa giganteum*. S. G. LUTWICHE, Esq., Beckenham (gr., Mr. Paterson), showed varieties of *Cyripedium Godefroyæ* and *Zygopetalum stapelioides*. Messrs. HUGH LOW & CO. staged an effective group of Orchids, including *Catasetum purum*, *Cycnoches chlorochilon*, *Cyripedium Parishii*, *C. Charlesworthii*, *Cattleya Eldorado Wallisii*, *Saccolabium coeleste*, &c. R. BROOMAN-WHITE, Esq., Ardarauch, Garelochhead (gr., Mr. G. Roberts), sent a large form of *Odontoglossum Pescatorei*, and three singular varieties of *O. crispum*, one with a broad line on each segment being very remarkable.

Fruit Committee.

Present: P. C. Crawley, Esq., in the chair; the Rev. W. Wilks, Messrs. T. F. Rivers, G. Badyard, J. Saltmarsh, J. Cheal, A. Dean, J. Willard, J. A. Lang, J. Hadson, G. Wyther, W. Balderson, G. H. Sage, G. Reynolds, G. Norman, R. Fife, A. F. Pearson, and A. F. Barron, Secretary.

Earl PERCY, Syon House, Brentford (gr., Mr. G. Wythes), sent Melons *Excelsior*, which gave both white and scarlet-fleshed fruits, James Ranking, and Middlesex Hero, green-flesh. The latter was so good as to receive an Award of Merit unanimously. The parents are Hero of Isleworth and *Sion House*. The Messrs. ROTHCHILD, Gannorsbury House (gr., Mr. J. Hudson), sent Melons *Scarlet Hero* of Lockinge, and *Sutton Scarlet*, both very handsome. Messrs. G. BUNYARD & SONS, Maidstone had *Apple White Transparent*, fruits large, conical, white, and very handsome. This was tasted and found to be so excellent even for dessert purposes, that an Award of Merit was made. Miss HENDESSON, Outlands Park (gr., Mr. T. Taylor), sent very fine Princess of Wales Peaches, richly coloured (Cultural Commendation). Mr. E. J. PRESTON, Kelsey Park, Beckenham (gr., Mr. Webster),

had very fine samples of Red Currant Versailles, and late growths of Raspberries carrying a heavy crop of fruit (Vote of Thanks). Messrs. LAXTON BROTHERS, Bedford, showed Laxton's No. 1 Seedling Apple, from Early Julian and Mr. Gladstone. Mr. F. CLEAVER, Leamington Spa, sent a greenish seedling Apple Cleaver's Favourite. Mrs. ROBE, Rutland Gate, had bunches of *Crataegus speciosa* and of *Pyrus divaricata* in fruit, the latter having both yellow and red varieties.

From A. WATERHOUSE, Esq., Yatenden Court, Newbury, came seedling Peach Epicure, Mr. WAYTON, Hereford, had a box of Victoria Plums, and one of Gladstone Apples, each holding about 20 lb. of fruit, to show how much better it is to pack fruit in this way, the boxes being cheap and non-returnable. The Plums were first-rate, being neatly packed in layers, but the Apples had been broken open in transit, and thus were not seen as they should have been (Vote of Thanks).

Mr. J. BARGO, Highgate, sent a plant of Longpod Bean as a new variety. It was regarded as *Seville Longpod*.

Four varieties of Dwarf French Beans, grown at Chiswick, and awarded three marks there recently, viz., Longfellow, Dwarf Golden Butter, Extra Dwarf Early, and Flageolet Roi des Verts, had the Award of Merit confirmed, as also had Lettnecs not now exhibited, but each awarded three marks at the same time, and mentioned in the *Gardeners' Chronicle*, p. 136.

A First-class Certificate, recommended by the committee which met at Chiswick on July 26, was awarded to Rivers' Early Favourite Plum, also referred to on the same page.

An Award of Merit was given to alpine Strawberry Rouge amélioré, a long-pointed seedling variety of the *Le Quatre Saisons*' section, shown by Mr. J. HUDSON, Gannorsbury House Gardens.

A very interesting exhibit, from Mr. J. CULVERWELL, sent through Dr. MASTERS, was a hybrid Gooseberry, product of a cross between that fruit and the black Currant. The branches were spineless, the leaves Currant-like fragrant, and the fruits, small red Gooseberries, had quite a black Currant flavour. A vote of thanks was accorded for this interesting exhibit. No doubt more will be heard of it at some future day.

A Cultural Commendation was awarded to a collection of ten varieties of Plums from Chiswick Gardens, grown on the walls. These consisted of reds, Sultan, Curlew, Bittern, Late Prolific, and Heron; Early Transparent Gage, McLaughlin's Gage, Golden Esperen, Reine Claude, Comte Althanns, and Cochet Père, rich yellow.

Messrs. J. VEITCH & SONS, Chelsea, showed a fine collection of eighteen dishes chiefly early dessert Apples, numerous Plums, Cherries, Pears, &c., to which a Silver Knightian Medal was awarded. The Apples included Devonshire Quarrenden, Beauty of Bath, very handsome; Mr. Gladstone, Early Harvest, Paradise Pippin, Red Astrachan; the Pears, Benrè Giffard, and Jargonne. Plums were Czar, Frogmore Orleans, Old Orleans, Magnum Bonum, Strut, and Early Prolific, red; and Early Golden Drop, July Greengage, Transparent Gage, Mamelone, and the pretty St. Etienne, also some good alpine Strawberries.

Messrs. G. BUNYARD & SONS, had a splendid lot of Apples, some thirty-six varieties being wonderfully good so early in the season, getting also an award of a Silver Knightian Medal. Fine dishes of Gold Medal, Lord Suffolk, Pact's Seedling, Grenadier, White Transparent, Stirling Castle, Lord Grosvenor Northern Dumping, Old Hawthornden, Duchess of Oldenburg, Sugar Loaf, and Frogmore Prolific. Kitchen sorts gave great promise of what may be looked for at the Crystal Palace later, especially if fine weather would but come. There were also Beauty of Bath, Lady Sudeley, Red Juneague, Worcester Pearmain, Cardinal, Mr. Gladstone, Red Quarrenden, &c., and dessert varieties.

Messrs. T. RIVERS & SONS, Sawbridgeworth, also received a similar award for a good collection of fruit, including Apples, Plums, Cherries, &c. Good Apples were Stirling Castle, Ecklinville, Keswick Codling, Duchess of Oldenburg, Early Rivers Codlin, Cardinal, &c.; Plums, Grand Duke, Mallard, Monarch, Oullin's Gage, from indoors and outside, to show fitness for drying purposes; and of Cherries, Bigarreau, Monstreuse de Mezel and Emperor François, white; and Bigarreau Noir de Guben, and Géant de Hedelfingen, the latter obtaining a First-class Certificate for its rare and rich flavour.

Mr. EMPSON, gen. to VERE WINGFIELD, Esq., Amphil House, had a nice collection of Grapes, including some fair Muscat of Alexandria and hardy fruits; a small Silver Banksian Medal was awarded. He also placed before the committee seedling Grapes from Madresfield Court and from Gros Maroc, but both seemed to be too like their seed-parents to be regarded as distinct. It will be seen that the committee had a busy as well as a very interesting meeting.

LEICESTER.

AUGUST 6.—Promoted by the Parks Committee of the Leicester Corporation, who allotted the liberal sum of £200 to be offered in prizes, the tenth annual show took place in the fine grounds of the Abbey Park, on the above date. The attendance was very good, and nearly 20,000 persons passed the turnstile. That many of them were attracted in a great measure by the Gala held in the grounds in connection with the show, and by the choice music supplied by the four excellent bands in attendance, there can be no doubt; but the crowded state of the tents throughout the day amply proved that the fruits and flowers were the chief attractions. The schedule contained 136 classes, and as many of them were devoted to the exhibits of amateurs and cottagers

whose interests are the special object of the show committee, and whose entries were very numerous, it will readily be understood that an immense amount of work must have fallen on Mr. John Burn, the Curator, and the acting members of the committee. These gentlemen must be congratulated on having brought off such a successful show under somewhat trying circumstances, the weather being very changeable throughout the day.

The principal classes were allotted a marquee apiece, that devoted to Division A—plants being mainly occupied by the groups arranged for effect—which took up the whole of the middle of the tent. As at most large exhibitions, great interest centred in the competition for these groups (to occupy 100 feet), the 1st prize for which was £7. The coveted 1st fell to Mr. C. J. MEE of Nottingham, whose arrangement was perfect from an artistic point of view, and moreover, the plants used in it were for the most part rare, and eminently suitable. The centre was a noble Phoenix rupicola, and set up on little mounds of velvety green moss were Alocasia Sanderiana, Cocos Weddelliana, and other handsome foliage plants, and it was observable that the most was made of every plant in the matter of producing effect. Some of the other groups had ten times the number of plants than this one, but the quantity smothered any artistic effect. The 2nd prize went to Mr. ROGERS, Gipsy Lane Nursery; the 3rd to Mr. H. BLAKENY, Dunsmore, Longy; and the 4th to Mr. GEO. PERKINS, Belgrave Gate; all these being fairly good arrangements. Mr. C. J. MEE's exhibit also secured the 1st prize of £3 offered by Messrs. J. R. PEARSON & SON, Chitwell Nurseries, Notts, for the best exhibit of plants, fruits, or flowers, grown with the aid of their chemical manure.

For six exotic Ferns, Mr. BLAKENY, Dunsmore, secured 1st prize, with very fine specimens; Mr. C. J. MEE, Nottingham, 2nd; and Mr. WHAIT, Oadley, 3rd.

In the class for six stove and greenhouse plants, the specimens in competition were good and well grown, though not large. Mr. W. S. BOLTON, Barkley, secured 1st prize; Mr. C. J. MEE, Nottingham, 2nd; and Mr. G. BROWN, Stoneygate, 3rd.

Both for six single and six double flowered Begonias, Mr. JAS. WRIGHT, Granby Street, Leicester, took 1st, with excellent specimens in each class, and he performed the same feat in both classes for single and double zonal Pelargoniums.

Cut Blooms.—The National Rose Society was associated with the Leicester show this year, and in the Rose tent there was a very fine and fresh-looking display. Messrs. HARKNESS & SON, Bedale, who showed grandly, carried off premier honours for the prize for thirty-six Roses (open); Messrs. J. COCKER & SONS, Aberdeen, being 2nd; and Mr. W. H. FRETtingham, Beeston, 3rd.

For twenty-four Roses (open), Messrs. HARKNESS and Messrs. COCKER also maintained the same position.

For twelve Teas or Noisettes, Mr. H. V. MACHIN, Gateford Hill, was 1st; and for twelve Roses, of any one variety, Messrs. HARKNESS & SON were 1st, with fine blooms of Mrs. John Laing; Messrs. COCKER & SONS being 2nd.

In the bouquet tent, some very fine bouquets, wreaths, epergnes, &c., were shown, the Orchids, which were represented but very slightly in the plant classes, there being no class for them, showing up well in the made-up decorations. Messrs. PEARSON & SONS, Chilwell, took 1st, both for hand and for bridal bouquets.

Fruit.—Fruits were well shown, and the great prize for the best eight distinct dishes of fruit, three varieties of Grapes allowed, two bunches of each, one Pine and one Melon only, fell to Mr. J. H. GOODACRE, Elvaaston Castle Gardens; 2nd to Mr. W. MESSENGER, Woolverton Park Gardens, Ipswich; 3rd, Mr. J. READ, Bretby Hall Gardens, Burton.

Miscellaneous.—Carnations were well represented, and hardy perennials were good, the fine exhibit of Messrs. HARKNESS being a representative one. The vegetables and cottagers' classes were numerously competed in, and among the fine groups not for competition, and which were perhaps the most admired in the show, were the grand bank of single and double flowered Begonias, staged by Mr. T. S. WARE, Hale Farm Nurseries, Tottenham; and that of Caladiums arranged by Messrs. PEED & SONS, Norwood.

The fact that some of the amateurs and cottagers entered each in upwards of forty classes, proves the good work the Abbey Park show is doing, and the interest taken in it by those it is specially designed to benefit and instruct.

WELSHPOOL HORTICULTURAL.

AUGUST 8.—This society is to be congratulated upon the great strides it has made since it was first launched into existence three years ago, and it can be safely predicted of it now that it has come to stay, its management being in the hands of enthusiastic and old-experienced show-promoters.

The show itself, as regards exhibits, both competitive and non-competitive, was emphatically a success; among the latter, most deserving of special mention, was an arrangement of plants in a conspicuous position in the spacious tent from the gardens at Powis Castle; as an effect it was one of the finest things we have seen for some time. The fine tree Ferns, Crotons, Caladiums, Amaryllis, &c., with well-developed spikes of Humea elegans standing above the arrangement, formed miniature mountains, and in the corresponding valley were the popular Caladium argyrites, some nice plants of the new Dracaena Sanderiana, the exceedingly pretty Saxifraga sarmentosa, tricolor, superba, &c., whilst

the supporting poles of the marquee were literally clothed with Maidenhair Fern suspended in terra-cotta wall-pots. Another fine group deserving of mention came from the gardens at Llanelerwyd, Captain LOVELL being president for the year.

Competing groups were numerous and likewise good. Messrs. JONES & SON, Shrewsbury, taking 1st honours, followed by the Misses HOWELL, Rhiewport, Welshpool (gr., Mr. Jones), and Mrs. CURLING, Brooklands (gr., Mr. Mac-falane). The same exhibitors were successful in other plant classes, and in Roses, which were not numerously shown. Messrs. MURREL, of Shrewsbury, came 1st, and Messrs. DICKSONS 2nd. The small classes of cut flowers were well filled, and the quality good, floral arrangements, too, being in the open and amateurs' classes, decidedly good.

The fruit-ranks contained competitors as far off as Staffordshire, who divided the honours with the local growers. Mr. A. JOHNSON, Oulton Grange, Stone (gr., F. Lambert), won 1st for eight dishes, with a highly-meritorious collection. J. TAMS, The Heyes, Stone, was 1st for Hamburgs and Muscats, followed in each case by Mr. F. LAMBERT; other successes in fruit being gained by Mrs. CURLING, the Misses HOWELL, Captain PRICE, Mr. A. C. HUMPHREYS-OWEN, M.P., and others.

The same names were again conspicuous in the vegetable classes, with the addition of Dr. HAWKSWORTH, B. LI. KENTON, Esq., Oswestry (gr., Mr. Durnall), Sir P. P. JONES, Newtown (gr., J. Shute), and Captain DAVIDSON; and a word of praise should be added for the excellence of the exhibits in this department.

The amateur's and cottager's classes bore gratifying testimony in the generally high quality of the exhibits, to the value of such societies as this, in promoting the culture of edible and ornamental vegetation to the undoubted advantage of the public individually and collectively. Space will not permit other than a general notice of the many noteworthy exhibits, but mention must be made of a fine display of herbaceous cut flowers and of tuberous Begonias (for which special awards were granted) from Messrs. W. CLIBRAN & SON, Altrincham; an exhibit of plants by Messrs. DICKSONS, Chester; and a similar exhibit from Messrs. KERR & SON, Liverpool; a table of herbaceous blooms from Messrs. CURBUSH, of Highgate; a miscellaneous exhibit from Messrs. JONES & SON, Shrewsbury; and a large collection of sweet Peas from Mr. ECKFORD's gardens at Wem.

A word of credit is due to Mr. LAMBERT, the indefatigable gardener at Powis Castle, who has worked hard with Messrs. ADDIE and WARD, the secretaries, for the success of the show, and of congratulation to the society on having so noble and public-spirited a patron as Lord POWIS, who allowed the free use of his home park, with the run of the famous gardens, for their benefit. *Visitor.*

TAUNTON HORTICULTURAL.

AUGUST 8.—This was the thirty-eighth annual exhibition, and the society not only holds its own as producing the largest exhibition held in the west of England, but it every year attracts thousands to see it. It was stated that it was nineteen years the show had been held on a wet day; and this occasion proved no exception, the day was perfect up to 3 o'clock, then a slow drizzling rain set in, which continued until night. Despite this drawback, there was a very large attendance. The exhibition took place as usual in Vivary Park, which having now become the property of the town, has been laid out as a public garden, and very greatly improved, though not yet completed. As is usual, there were four very large tents quite filled with exhibits; also one for table decorations; and others for honey and bee appliances.

PLANTS (OPEN).

In the large plant-tent, which contained all the open classes, plants and cut flowers first claim attention, the sum of £20, offered as a 1st prize for twelve stove and greenhouse plants in flower, always bringing a good competition. As is usual, Mr. J. CYPHER, nurseryman, Cheltenham, was 1st, with very fine examples of Bougainvillea glabra and Sanderiana, the latter smaller in the brackets but very deep-coloured; Ericas tricolor rosea, Thompsoni, and obtusa purpurea; Allamandas nobilis and grandiflora; Phorocoma prolifera Barnesii, Ixora salicifolia, &c. 2nd, Mr. W. Rowland, gr. to W. BROCK, Esq., Exeter, who had much the same subjects.

With six plants, Mr. CYPHER was again 1st, having Ericas Austiniana and Aitoniana, Stephanotis floribunda, Bougainvillea glabra, Allamanda nobilis, and Statice profusa. Mr. W. ROWLAND was again 2nd.

The best group of plants arranged for effect came from Mr. ROWLAND, and had as a background Palms and the red-tinged Humea elegans. Bamboos were present, also gay-coloured Crotons and dwarfier plants, foliaged and flowering, forming the foreground. Mr. W. Peel, gr. to Miss TODD, Shirley, was 2nd.

Here was the finest display of large specimen Begonias we have yet seen. With eight plants comprising some fine double varieties, Mr. W. Thomas, gr. to W. MARSHALL, Esq., Norton Manor, Taunton, was 1st, and Mr. W. Bond, gr. to P. V. A. REED, Esq., Milverton, came 2nd; he had admirably-grown specimens of single varieties of high quality, compact in habit, but the flowers had become damaged in course of transit, which probably lost Mr. Bond the 1st prize.

Zonal Pelargoniums, both double and single, were well grown and flowered. Fuchsias were decidedly below what we

are accustomed to see at Bath. The best newly-introduced plant in bloom was Cypripedium Charlesworthii from Mr. W. THOMAS, and Mr. CYPHER was placed 1st with four Orchids; Mr. Murrell, gr. to A. H. MILTON, Esq., Clifton, was 2nd.

Foliaged Plants.—The best eight came from Mr. J. CYPHER, prominent among them were very fine specimens of Keetias australis and Forsteriana, Latania borbonica, Croton Sunset and Queen Victoria, &c. Mr. ROWLAND was placed 2nd. The latter had eight exotic Ferns, having in excellent condition Microlepia hirta cristata, Alsophila exoelsa, Lencostegia immusa, Adiantum assimale, and others, which were deservedly awarded the 1st prize, he being the only exhibitor.

Several classes for specimen stove and greenhouse plants found a place here, but though well grown and bloomed they do not require particularising.

CUT FLOWERS.

Those shown in the open to all divisions, found a place round the sides of the tent. Roses were decidedly good, the dark-coloured hybrid perpetuals largely preponderating. Messrs. HARKNESS & SONS, nurserymen, Bedale, were 1st with thirty-six and also with eighteen varieties; Messrs. TOWNSEND & SON, nurserymen, Worcester, taking the 2nd prizes in each class.

The best twelve blooms of show Dahlias came from Messrs. HARKNESS & SONS; Messrs. KEYNES, WILLIAMS & CO., nurserymen, Salisbury, taking the 1st prize with twelve facies, and also with nine pompons. Mr. A. A. WALTERS, nurseryman, Bath, was 1st with nine bunches of single Dahlias; and Messrs. TOWNSEND & SON with six bunches of Cactus and decorative varieties.

Phloxes were good, and bunches of P. Drummondii very pretty; the quilled and flat-petalled Asters showed traces of bad weather. Collections of twenty-four spikes of Gladioli were very fine; Mr. S. Bird, gr. to W. H. FOX, Esq., Wellington, was 1st; and W. H. FOWLER, Esq., 2nd. Carnations, Hollyhocks, and stands of double and single Begonias were also shown.

Hardy perennial and bulbous plants in eighteen bunches, were very fine. Messrs. HARKNESS & SON, as at Leicester, staging fine exhibits, six varieties of Tigris being especially fine; Mr. A. A. WALTERS was 2nd.

Mr. THOMAS had the best twelve bunches of stove and greenhouse cut flowers, very handsome examples being staged. Mr. Shelton, gr. to C. K. WAIT, Esq., Clifton, was 2nd.

AMATEURS' DIVISION.

Mr. ROWLAND was again 1st with a prettily-arranged group; Mr. T. ESSEX, gr. to C. E. J. ESDAILE, Esq., Bishops Lydiard, was 2nd. Mr. ROWLAND was 1st with twelve stove and greenhouse plants, and Mr. PEEL 2nd; but in the class for six the positions were exactly the reverse. In the class for four plants, Mr. PEEL was 1st, and Mr. BROCK 2nd; and the same with six foliaged plants.

Mr. PEEL had the best six Exotic Ferns, staging good specimens of a Gleichenia, Adiantum polyantha, A. cardiocloha, Davallia Mooreana, &c.

Mr. R. Huxtable, gr. to F. W. NEWTON, Esq., Taunton, was the only exhibitor of Hardy Ferns, and Mosses, taking the 1st prize.

Some fine specimens of Liliun speciosum were staged, and neat bushes of Fuchsias. Mr. THOMAS had the best six plants of single, and Mr. W. H. FOWLER of double Begonias. Some excellent specimens of Achimenes gained a 1st prize for Mr. ESSEX, they were Mauve Queen, Margarets, Perfection, and Ambrose Verschaffel, four excellent exhibition varieties. There were classes also for Coleus, Petunias, Gloxinias, Cockscombs, table plants, &c.

Cut flowers by amateurs were numerous and good, and Mr. THOS. HOBBS, of Bristol, is to be congratulated on beating Dr. BUDD, of Bath, with twenty-four, and twelve Roses; Mr. A. H. GRAY, Bath, being 1st with twelve Teas. Mr. W. H. FOWLER was 1st with twelve fine spikes of Gladioli; and Mr. THOMAS with six bunches of stove and greenhouse cut flowers. Asters were in plenty, as were Drummond's Phlox; there were Dahlias also, Mr. THOS. HOBBS taking the 1st prize with twelve blooms. Pelargonium blooms were very pretty, and Hardy Annuals very gay.

FRUIT.

Our record of the fruit-show is brief, owing to rain having driven the company to the tents and blocked the way to the tables. The best collection of eight varieties came from Mr. J. Lloyd, gr. to V. STUCKEY, Esq., Langport, who had a very fine lot, consisting of Madresfield Court and white Muscat Grapes, Bellegarde Peaches, Pineapple Nectarines, Moor Park Apricots, Hero of Lockinge Melon, Bigarreau Cherries, very fine indeed, and Jargonelle Peas. 2nd, Mr. H. W. WARD, The Gardens, Longford Castle, Salisbury. Mr. A. CROSSMAN, gr. to J. BRUTON, Esq., Yeovil, had the best four dishes; Mr. LLOYD taking the 2nd prize. Mr. WARD was the only exhibitor of two Pineapples. The best three bunches of Black Hamburg Grapes, very fine, came from Mr. A. CROSSMAN; any other black was well-finished Madresfield Court, from Mr. WARD; and he had the three best bunches of white Muscats; any other white being Buckland Sweet-water, from Mr. G. WEBBER, gr. to G. F. LUTTRELL, Esq., Dunster Castle.

Melons, Peaches, Nectarines, Apricots, dessert Pears, light and dark Plums, Apples (dessert and culinary), Cherries, and bush fruits, all made a brave display, the quality very good throughout.

TABLE DECORATIONS.

Were somewhat sparingly shown. There was but one dinner-table, that from Mrs. MACALISTER. Mr. H. B. CARVER had the best centre-piece, filled with dessert fruit; and Mr. J. CYPHER the best epergne. Bouquets and baskets of wild flowers made an attractive feature.

VEGETABLES.

These were so numerous that they can only be briefly referred to. Messrs. SUTTON & SONS, WEBB & SONS, and JARMAN & Co., as well as the Society, offered prizes for six dishes in four classes, and the 1st in each case was won by Mr. T. Wilkins, gr. to T. M. GUEST, Esq., Henstridge, Blandford. All these 1st prize collections were very fine indeed, and set up with admirable taste, and proved valuable object-lessons to young gardeners. Potatoes, in several classes, Onions, Cauliflowers, Carrots, Parsnips, Beans, Peas, Tomatoes, &c. were really superb. In addition, there was a large tent filled with very fine cottagers' productions in great variety, also wild flowers and honey.

MISCELLANEOUS EXHIBITS.

Messrs. JARMAN & Co., Chard and Taunton, had two collections, one consisting of Lilies, foliaged plants, and flowering also, Dahlias, Begonias, and other cut flowers; and a second one of cut flowers. Messrs. BEECHER, JENKINS & Co., Kingstewell, had Begonias, zonal Pelargoniums, &c. Mr. W. J. GODFREY, nurseryman, Exmouth, had his new Carnation, Reginald, in the way of Miss Joliffe, and regarded by market growers as an improvement upon it; also Wilfred Godfrey, a perpetual yellow-ground variety of decided promise; also Sweet Peas, zonals, &c.

Messrs. B. VEITCH & SONS, nurserymen, Exeter, had some very fine seedling forms of *Nemesis strumosa*, showing a wide range of new colours; also examples of their climbing French Beans, Dahlias, Carnations, &c. Messrs. KELWAY & SONS, nurserymen, Langport, had five boxes of *Gladioli*, among them some new varieties of great merit, Certificates of Merit being awarded to the Shahzada, dark crimson-purple, very distinct; Daisy Vane, pale yellow, very chaste; and Robert Morrow, pale rose; also Cannas, Gaillardias, and bunches of hardy flowers.

CARDIFF HORTICULTURAL.

AUGUST 14 AND 15.—This was the seventh annual show, and it must be admitted, despite the changeable season, the best the Society has yet held. The Sophia Gardens, in which the tents were pitched, looked fresh in the extreme after the heavy rains. Eleven tents were required to take the whole of the exhibits, including honey, and the show of vegetables throughout was very fine. The morning opened gusty, but rain held off, and a brilliant afternoon brought together a very large company.

STOVE AND GREENHOUSE plants are always a leading feature, and Mr. J. CYPHER took the 1st prize for an even collection which comprised *Bougainvillea glabra* and *Sanderiana*, *Ixora Duffii*, *Stipice Bougainvillea*, *Erica exquisita* and *Antoniana*, *Clerodendron Balfourianum*, *Allamanda Hendersoni*, *Anthurium Scherzerianum* and *Andranum*, &c. The 2nd prize was withheld.

In the amateur class for four specimens, Mr. J. GUNN, Llandaff (gr. R. McLeod), was 1st, having good examples of *Crinum giganteum*, *Bougainvillea glabra*, and *Cissia corymbosa*; Col. Sir E. S. HILL, M.P. (gr. T. Clarke), was 2nd.

Fuchsias were represented by some very fine plants, large, bushy, and well bloomed. Col. Sir E. S. HILL was 1st; and Mr. T. HILLARD, Cardiff, a working-man exhibitor, was 2nd, also with excellent specimens. Col. Sir E. S. HILL also had the best four in the amateur division; Mr. E. CASHMAN, Cardiff, 2nd.

Very good specimens of zonal Pelargoniums were staged, recalling something of the old days of the London Pelargonium Society, but there is a tendency to train them a little too severely. In the class for six specimens, Mr. T. HILLARD came in 1st; and Mr. J. OXENHAM, Cardiff, was 2nd.

In the class for four specimens, Mr. C. WALDRON, Llandaff (gr. H. Rex), was 1st with finely-grown and finely-bloomed plants; Major THORNLEY, Penarth (gr. E. Perall), was 2nd, also with capital plants. Tuberos-rooted Begonias were good, but not equal to those seen at Taunton; the best dozen came from Mr. J. L. THOMAS (gr. T. Malpas); Mr. E. LEWIS (gr. G. Wale), was a good 2nd. With six plants, Col. Sir E. S. HILL, was 1st; and Mr. A. W. WHITEFIELD, Cardiff, 2nd.

GROUPS OF PLANTS arranged for effect filled one tent. In that filling a space of 100 feet superficial, Messrs. CASE BROS., nurserymen, Cardiff, were 1st, the group arranged in the form of a circle, but bright, light, and graceful, showing excellent taste; Mr. B. CROSSING, Penarth, was 2nd; and Col. C. H. PAGE, Llandaff (gr. Mr. J. Hockley), 3rd. The best group occupying a space of 50 feet, came from Col. HILL, very nicely arranged; M. GUNN, Esq., Presswylia (gr. J. Styles), was 2nd. The best group occupying a space of 25 feet, came from Mr. E. LEWIS; Mr. C. WALDRON, Llandaff, was 2nd. In this tent were also arranged two fine groups of tuberos-rooted Begonias competing for the special prizes offered by Mr. T. S. WARE. Col. Sir E. S. HILL was 1st with a collection characterised by high quality; and Mr. J. L. THOMAS was 2nd, also very bright and effective. Some very good plants for table decoration were shown, all well grown, clean, and bright in appearance. Some very good *Gloxinias* took the 1st prize for Mr. E. LEWIS.

Fine foliaged plants came from Mr. CYPHER and Mr. W. J. BUCKLEY, Llanely (gr. W. Carpenter). The former was 1st with eight. He had *Kentias Forsteriana*, australis, and *Belmorana*, and *Cycas undulata*; and four charming *Crotons*—*Warreni*, *angustifolius*, *Queen Victoria*, and *Williamsii*, all finely-coloured.

The best eight stove and greenhouse Ferns came from Col. Sir E. S. HILL, a very fine lot, chief among them being

Woodwardia radicans, *Davallia Mooreana*, *Adiantum Farleyense*, *A. tenerum*, and *Microlepia hirta cristata*. Mr. JOHN GUNN was a very close 2nd; he had a splendid specimen of *Neottoptaris nidus*, *Davallia Mooreana*, *Gymnogramma chrysophylla*, *Adiantum Farleyense*, &c.

With four fine-foliaged plants Mr. A. PETTIGREW, Cardiff Castle Gardens, was 1st, having very good examples of *Cycas rotundata*, *Davallia Mooreana*, *Phoenix compacta*, and one other. Mr. J. GUNN was 2nd.

With four stove and greenhouse plants, Col. PAGE was 1st, also with very good specimens; Mr. O. H. BAILEY, Cardiff, took the 2nd prize. The best collection of British Ferns came from Mr. W. L. BLAKE, Cardiff.

CUT FLOWERS, both in the open and amateurs' classes, made a very fine display. Mr. S. TRESSIDER, nurseryman, Cardiff, was 1st, twelve varieties of trebles, having good blooms of J. S. Mill, S.-M. Rodocanachi, Mrs. J. Laing, Caroline Testout, Victor Hugo, &c.; 2nd, Mr. B. CROSSING, Penarth.

With twelve varieties of Teas, three blooms of each, Mr. S. TRESSIDER was also 1st; and Mr. B. CROSSING 2nd. With twenty-four H.P. Roses and eighteen Teas, the same exhibitors were again 1st and 2nd. Some of the best Teas were *Catherine Mermet*, *S. d'un Ami*, *The Bride*, *Bridesmaid*, *Medea*, *Marie Van Houtte*, *Franческа Kruger*, and the Hon. E. Gifford. The Silver Medal of the Royal Horticultural Society was also awarded to Mr. S. TRESSIDER, for his twelve trebles of Teas Roses.

In the amateur class for twelve Roses, Mr. E. G. GARRAWAY, Bath, was 1st; and Mr. THOMAS HOBBS, Bristol, 2nd. With twelve Teas, Mr. T. HOBBS took the 1st prize; and Mr. A. HILL GRAY, Bath, was 2nd. Messrs. KEYNES, WILLIAMS & Co., Salisbury, had the best twenty-four Dahlias; and Mr. TRESSIDER was 2nd, both decidedly good for so early a time. With twelve bunches of Cactus, Messrs. KEYNES, WILLIAMS & Co., were 1st, with Harmony, Earl of Pembroke, Bertha Mawley, Lady Penzance, Mrs. Barnes, &c.; Mr. W. TRESSIDER, 2nd. Dahlias were also shown by amateurs. Asters were shown in twelves, the Comet varieties preponderating. The only twelve bunches of hardy perennials came from Mr. G. GARRAWAY, Bath.

Gladioli, shown in twenty-four spikes, were good, Mr. B. MORROW, The Nurseries, Leominster, was 1st, and Mr. G. CLARK, Cardiff, 2nd.

Zonal Pelargoniums in bunches were finely shown by Mr. S. TRESSIDER; Mr. J. MOORE, Cardiff, was 2nd.

The best twelve bunches of stove and greenhouse cut flowers came from Mr. L. GUERET, Chepstow (gr. Mr. Chatfield); Col. PAGE was 2nd.

Annuals, shown in bunches of twelve, were very good indeed, Mr. A. PETTIGREW being 1st with some very fine bunches indeed of *Salpiglossa grandiflora*, *Malope grandiflora*, *Sweet Peas*, *Echsholzia crocea*, *Bartonia aures*, &c.; 2nd, Col. C. H. PAGE.

Herbaceous Phloxes were fairly good. The Silver Cup offered for twelve Carnations and twelve *Picotees* brought no competition.

TABLE DECORATIONS were a very fine feature, Messrs. CASE BROTHERS taking the 1st prize for a table arranged with flowers and fruit; Messrs. PHELPS & Co., Cardiff, were 2nd. In another class, Miss EVAN LEWES, Llandaff, was 1st, and Mr. A. PIKE, Cardiff, 2nd. The 1st prize in this class was a valuable sewing-machine, given by the SINGER MANUFACTURING COMPANY.

Bouquets were very good indeed. Mr. A. E. PRICE, Cardiff, had the best for the hand; Messrs. CASE BROS. was 2nd. Mr. W. TRESSIDER had the best Bride's, a beautiful one, which was also awarded the Bronze Medal of the Royal Horticultural Society; Mr. A. E. PRICE was 2nd.

Wreaths and crosses were enperth. It is doubtful if they are done better anywhere than at Cardiff. Mr. A. E. PRICE was 1st in both classes; Messrs. CASE BROS. was 2nd with a wreath; and Mr. W. TRESSIDER with a cross.

Buttons and lady's sprays were shown, and some pretty baskets and bouquets of wild flowers.

FRUITS filled a commodious tent. The best six bunches of Grapes came from Mr. VINCENT STUCKEY, Langport (gr. J. Lloyd), who had two of Black Hamburgh and Muscat of Alexandria, and one each of Lady Downes and Madresfield Court; Mr. P. A. CLIVE, Hereford (gr. E. Grindrod), was 2nd, having two bunches each of Black Hamburgh, Gros Maroc, and Muscat of Alexandria.

Mr. L. GUERET had the best three bunches of Black Hamburgh; Mrs. PICTOR-TURBEVILLE, Swansea, was 2nd. Mr. H. PITT, Abergavenny, was the only exhibitor of three bunches of White Muscat, taking the 1st prize. Mr. P. A. CLIVE had the best three black, any variety; Mrs. TURBEVILLE 2nd. Mr. PITT had the three best bunches of any other white, having Foster's Seedling; Mr. L. GUERET was 2nd, with the same. Single bunches were also shown.

Melons were numerous, being shown in three classes. The best six dishes of fruit came from Mrs. TURBEVILLE, who had Black Hamburgh Grapes, Pineapple, Nectarine, Golden Eagle Peach, Apricots, Figs, and Melons. Mr. C. LEE CAMPBELL, Glewston Court, was 2nd, also with a good collection.

Mr. H. PITT was 1st with two Pineapples, having a Queen and a Ripley Queen. Mr. W. J. BUCKLEY was 2nd with two fruits of Queen.

Dessert Apples were small, but nicely coloured. Mr. C. L. CAMPBELL had the best six dishes, staging Bed Astrachan, Worcester Pearmain, Lady Sudeley, Mr. Gladstone, Irish Peach, and Quarrenden. Mr. V. STUCKEY was 2nd; he had Ribston, Duchess of Oldenburg, Grand Richard, a very handsome conical-shaped Apple, conical in shape, pale yellow, streaked with bright red; Quarrenden, Early Margaret, and Beauty of Bath.

With six dishes of dessert Apples, Mr. G. GARRAWAY had a fine lot from five-year-old bash trees on the English Paradise stock, the varieties Queen, Ecklinville, Lord Suffield, Peasgood's Nonsuch, Pott's Seedling, and Warner's King; 2nd, Mr. J. BASHAM BASSALIG, who had Prince Albert and Bismarck, differing from the foregoing. The best dessert Apple was Beauty of Bath, very fine fruit of which took the leading prizes. The best culinary, were Peasgood's Nonsuch and Lord Suffield. Cherries, Currants, Peaches, Nectarines, Apricots, Plums, &c., were also numerous shown in single dishes.

VEGETABLES were very fine. The 1st of Messrs. SUTTON & SON's special prizes for six dishes went to M. S. WILLIAMS, Esq., Glyn Neath (gr. C. Foster), a very fine lot. This young gardener promises well to take high rank as a cultivator and exhibitor of vegetables. General LEE, Dinas Powis, was 2nd. General LEE took the 1st of Messrs. J. C. WHEELER & SONS special prizes for six dishes; Mr. T. RICHARDS was 2nd. The 1st of Messrs. WEBB & SONS' special prizes for six kinds went to Mr. W. MOORE, Wentoc; Mr. G. GARRAWAY was 2nd. Mr. E. REES, Merthyr, took the 1st of Messrs. JAMES CARTER & Co.'s prizes for the same number of dishes; Mr. A. THOMAS, M.P., Cardiff, was 1st with their Jubilee Runner Bean. Messrs. GARRAWAY & Co. also offered prizes for six dishes of vegetables, Sir E. S. HILL was 1st, and Mr. E. LEWIS 2nd. Messrs. WARD & Co. did the same; Mr. G. SHEWING took the 1st prize, and Mr. G. CLARKE the 2nd. But these are only a few leading features of a wonderful display of vegetables, the cottagers showing very finely indeed.

Miscellaneous exhibits were plentiful, and greatly assisted the show. A Gold Medal was awarded to Messrs. W. CURTIS & SONS, Highgate Nurseries, London, for a goodly group of plants arranged in excellent taste. Silver-gilt Medals were awarded to Messrs. DICKSONS & Co., Chester, for cut flowers; to Mr. W. BIRKENHEAD, Sale, for a large collection of Ferns; to Messrs. CLIBBRAN & SON, nurserymen, Altrincham, for a representative and unique collection of succulents; and to Mr. PHELPS, floral decorator, Cardiff, for various floral decorations. A Silver Medal was awarded to Mr. A. E. PRICE for Ferns; and a Bronze Medal to Messrs. EDWARDS & SON, Nattall, for Edwardian decorations in Ferns.

SHOW REPORTS, &c.

Owing to the great pressure on our space, several reports of Flower Shows, as well as remarks on the Fruit Crops, are unavoidably kept over till next week.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.; Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending August 10, is furnished from the Meteorological Office:—

"The weather during this week remained in a very unsettled state, with frequent falls of rain in all parts of the

Kingdom. Smart thunderstorms occurred from time to time, and those experienced on Saturday were very severe in many localities.

"The temperature slightly exceeded the mean in 'Scotland, N. and E.,' but was again below it in all other districts. The highest of the maxima were registered on the 10th, and varied from 75° in 'England, S.,' and 74° over our 'Eastern and Midland Counties,' to 85° in 'Scotland, W.,' and to 67° in 'Scotland, N.' The lowest of the minima occurred on the 8th, when they ranged from 38° in 'England, S.W. and Ireland, N.,' and 39° in the 'Midland Counties,' to 44° in several of the northern and eastern districts, and to 50° in the 'Channel Islands.'

"The rainfall exceeded the normal amount in all districts, the fall over England being about twice as much as the mean.

"The bright sunshine was again less than the mean very generally, but showed a slight excess at some of the Scotch stations. The percentage of the possible duration ranged from 39 in 'England, E. and the Channel Islands,' to 26 in the Scotland districts, 25 in 'Ireland, S.,' and 23 in 'Ireland, N.,'"

Italian Rye-grass are held at moderate rates. Bird seeds are for the moment neglected. There is no alteration in either Peas or Haricots. The Board of Trade Returns give the imports into the United Kingdom of Clover and Grass seeds for the first seven months of this year as 246,459 cwt., value £561,063, as against 198,867 cwt., value £502,417, for the corresponding period of 1894.

"* Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

"* PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

FRUITS AND VEGETABLES.

BOROUGH: Aug. 13.—Quotations:—Onions, 2s. 6d. to 3s. per bag; Horseradish, 1s. to 1s. 3d. per bundle; Apples, 2s. to 4s. per bushel; Currants, 2s. 6d. to 5s. 6d.; Gooseberries, 1s. 6d. to 1s. 9d. per half-sieve.

SPITALFIELDS: Aug. 13.—Quotations:—Carrots, 2s. to 2s. 6d. per dozen bunches; Turnips, 2s. to 2s. 6d. do.; Marrows, 5s. to 6s. per tally; Cabbages, 2s. 6d. to 3s. do.; Scarlet Beans, 3s. to 4s. per bushel; Peas, 4s. to 4s. 6d. do.; Apples, Keswick Codlin, best, 2s. to 2s. 6d. do.; do. Quarrenden, 3s. 6d. to 4s. do.

STRATFORD: August 13.—The supply to this market during the past week has been good, and, with plenty of buyers, a brisk trade was done as under:—Cabbages, 1s. to 3s. per tally; Cauliflowers, 1s. to 2s. per dozen; do., Bruce, 5s. to 8s. per tally; Turnips, 1s. 6d. to 2s. 6d. per dozen bunches; Carrots, household, 3s. to 4s. per ton; do., 1s. to 2s. 6d. per dozen bunches; Mangels, 2s. to 2s. 6d. per ton; Onions, Oporto, 4s. 9d. to 5s. 6d. per case; Plums, 2s. to 3s. per half-sieve; do., 4s. to 5s. 6d. per bushel; Green Gages, 4s. to 5s. per half-sieve; English Tomatoes, 3s. to 4s. per dozen lb.; Mushrooms, field, 3s. to 4s. per dozen lb.; Apples, 2s. to 6s. per bushel; Pears, 3s. 6d. to 6s. per bushel; Scarlet Beans, 3s. 6d. to 4s. per sieve; French Beans, 2s. 6d. to 3s. per sieve; Vegetable Marrows, 1s. to 1s. 6d. per dozen.

FARRINGDON: Aug. 15.—Quotations:—Apples, Quarrenden, 6s. per bushel; seconds, 4s. do.; Keswick Codlins, 4s. do.; Pears, 7s. 6d. per barrel; Green Gages, 6s. half-bushel; Victoria Plums, 5s. per half-bushel; Orleans do. 5s. do.; Grapes, English, 1s. per lb.; Tomatoes, 4s. per box of 12 lb.; Cucumbers, 2s. per dozen; red Currants, 2s. 9d. per peck; Raspberries, 6d. per punnet; Melons, 8s. per case (24); Cabbages, 1s. 3d. per dozen; Lettuces, 1s. 6d. per score; Carrots, 3s. per dozen bunches; Turnips, 3s. do.; Marrows, 1s. 6d. per dozen; Spring Onions, 2s. 6d. per dozen bunches; Mint, 4d. per large bunch; Parsley, 3d. do.

POTATOS.

BOROUGH: Aug. 13.—Quotations ranged between 60s. and 90s. per ton.

SPITALFIELDS: Aug. 13.—Quotations:—Pink Hebrons, 55s. to 80s.; Puritans, 50s. to 80s.; Regents, 55s. to 70s.; Kidneys, 55s. to 70s.; Reading Giants, 60s. to 70s. per ton.

STRATFORD: August 13.—Quotations:—Magnums, dark soil, 57s. to 60s.; do., Uplands, 60s. to 75s.; Snowdrops, 75s. to 90s.; Jeannie Deane, 75s. to 85s.; Beauty of Hebron, 60s. to 100s.; Imperators, 70s. to 75s.; Kidneys, 75s. to 80s. per ton.

FARRINGDON: August 15.—Quotations: Puritans, 90s. to 100s.; White Hebrons, 90s. to 100s.; Red Hebrons, 80s. to 95s.; Reading Giants, 70s. to 80s.; Magnums, 65s. to 70s. per ton.

LONDON AVERAGES: August 14.—Snowdrops, 75s. to 95s.; Puritans, 80s. to 100s.; Hebrons, 70s. to 90s.; Early Regents, 65s. to 75s.; Kidneys, 60s. to 70s.; Early Rose, 65s. to 75s. per ton.

BRAVE RESCUE ON OULTON BROAD.—A serious boating accident happened on Saturday, August 10, on Oulton Broad, in which Miss Lee Barber nearly lost her life. Miss Barber and her brother were having a sail up the Broad in their yacht, the *Talismão*, when a sudden breeze caught the sail and the yacht luffed over. Miss Barber over-balanced herself, and in falling into the water caught hold of her brother and dragged him overboard too. Mr. B. J. Monro, son of Mr. G. Monro, of Covent Garden Market, a visitor staying at 14, Wellington Esplanade, Lowestoft, was passing in a rowing boat at the time, and without hesitation, jumped into the water after Miss Barber, and managed to grasp her clothing as she about to sink for the third time. He then swam with her to a steam launch which was lying near, and also helped Mr. Barber on to his yacht.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

GARDENING IN THE CANARIES.—Would some reader kindly inform me in your correspondence column as to the state of gardening in either Madeira or the Canary Islands, and whether there is any opportunities for emigrants? *Madeira.*

TENERIFFE.—Wanted, the names of one or two seed firms in the island of Teneriffe. *F. Y.*

MARKETS.

COVENT GARDEN, August 15.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

Demand slow at about last week's prices. Supplies fairly good of all kinds. *J. B. Thomas.*

SEEDS.

LONDON: Aug. 14.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, as regards new Trifolium, buyers find that they can this season satisfy their requirements on extraordinarily low terms. Sowing Mustard and Rape seed are also exceedingly cheap. For new English winter Tares and Eye there is a good inquiry. White Clover seed, Trefoil, and

flowers.—*W. J. J.* 1, Spiræa; 2, Ceanothus azurea; 3, Calycanthus occidentalis; 4, Halimodendrum argenteum; 5, Elæagnus pungens; 6, Sciadopitys verticillata, the Umbrella Pine of Japan.—*R. J. H.* 1, Impatiens fulva; 2, Lysimachia vulgaris; 3, Ballota nigra; 4, Lapsana communis.—*W. E.* 1, Agatheia cœlestis; 2, Aubrietia deltoidea; 3, Veronica incana.—*K. L.* Gentiana aclepiadea, white var.—*A. M.* Polygonum orientale, Zelkova acuminata.—*W. C.* 1, Agrostis alba; 2, Phalaris arundinacea variegata; 3, Oxalis species; 4, Oxalis species.—*J. C.* should address the Editor, 1, Datura Stramonium, purple var.; Rhus Cotinus (Wig-plant).—*H. G. L.* Frankenia laevis.

NEW FRUIT: *W. H., Rochester.* The next meeting of the committees will take place on August 27. Write to Mr. Barron, Chiswick Gardens, for particulars.

NORTHAMPTON SHOW: *A. J. Nightingale.* Will you kindly state in what competition the error you wish corrected was made.

PEACH FRUITS DEFORMED: *A. P.* The fruits appear to have been squeezed out of shape by the branches which might, in some instances, have been prevented by loosening the latter from the shreds or ties that secured them; and those which could not be so freed, should have been taken off at the first thinning.

PEAS AND RUNNER BEANS: *G. F. G.* Gather the young perfect Beans and Peas, shred the former, and shell the latter, and put them into stone jars or wooden tubs, in layers, with salt sprinkled over each layer. French Beans should be put down whole. The salt tends to harden these vegetables, and they will require more cooking than fresh ones. The contents of the vessels will make a certain amount of liquor; if it be not enough to cover them, add boiled water. A floating top should be placed over them, and a clean boulder or piece of stone on that, to keep it under the water. If scum rises, clear it off with a clean cloth. Sauer Kraut is made in this way, only it is pressed more firmly into the vessel than is necessary with Beans and Peas.

SPIDERS IN VINERIES: *Captain.* Vaporise the vineries with Richards' XL All preparation. No harm will be done to the fruit, but every insect and spider will succumb.

THE FLORICULTURAL CABINET: *Enquirer.* Was published between 1833 and 1848, in ten volumes. A second series was issued in 1846. The book has an historic value.

THE HEAVIEST BUNCH OF GRAPES GROWN IN GREAT BRITAIN: *H. B.* The heaviest bunch of which we have any record was one of White Nice, shown by a Mr. Dickson at Edinburgh in 1875. It weighed 25 lb. 15 oz. See *Gardeners' Chronicle* for September 18 of that year.

VINES AND MILDEW: *Vine.* The cause is not always discoverable, although certain conditions of temperature and humidity will cause an attack, but not always. In some districts it is more common than in others. It may be communicated to plants under glass by mildewed plants out-of-doors. The cracking of the skin of the Grape is the inevitable result of mildew, which destroys the elasticity of the skin; and even when the fungus is killed by artificial means, there is no difference. You must cut out and burn every mildewed berry, and such leaves as may be spared, and then apply some of the advertised remedies, or the one we give to *G. F. G.* in this column. Keep the hot-water pipes warm, smear them with whitewash, into which a pound of flowers-of-sulphur has been mixed in a bucketful. Afford air by the upper ventilators, excepting in fine dry weather.

BARRON TESTIMONIAL FUND.—Received £1 1s from D. T. F. The sum will be handed over to the committee when formed.

 gallon cask, 45s.; forty-gallon barrel, 95s.

Cheap, only 1 part of Manure required to 50 of water.

Mr. W. H. LRES, The Gardens, Trent Park, New Barnet,
 the most successful exhibitor of Chrysanthemum Blooms
 during the season of 1894. This celebrated grower writes:—
 "I have used your new Liquid Manure on many things; this
 season with highly satisfactory results—especially on Chrys-
 anthemums. The 1st Prize Blooms which I exhibited at the
 Aquarium Show, on November 6, were reared to such perfection
 with this Fertiliser."

To be had (the same as all the other XL ALL'S), through all
 Nursermen, Seedsmen, Florists, and Saddriemen everywhere;
 or direct from the Sole Manufacturer, G. H. RICHARDS, Old
 Shot Tower Wharf, Lambeth, London, S.E.

COMMERCE, WITH ITS SPREADING WINGS, has traversed the globe many times, and binds nations together with the strong tie of mutual self-interest. Through its influence London has become the metropolis of the world, and her merchants have amassed wealth sufficient to make them the envy of princes. HOLLOWAY'S PILLS and OINTMENT have now become essential articles of commerce with all parts of the world. They have effected cures which have seemed miraculous, and given relief in complaints when all hope had been lost. In all known diseases their success has at all times been wonderful. In cases of disorders of the stomach, bile, liver complaint, indigestion, fevers, ague, &c., they act like a charm, as the cure is speedy and certain.

HILL & SMITH'S BLACK VARNISH,

For Preserving Ironwork, Wood, or Stone.

An Excellent Substitute for Oil Paint, at one-third the cost.

This unrivalled varnish has for forty years given unbounded satisfaction, obtained a large consumption, and earned a high reputation throughout the kingdom. It requires no mixing, can be applied cold by any ordinary labourer, and dries in ten minutes with a perfect gloss. Fences periodically coated with it are effectually preserved from deterioration for an indefinite period.

Price, 1s. 6d. per gallon at the manufactory, or 1s. 8d. per gallon, carriage paid to any railway station, in casks of 36, 18, or 9 gallons.

Testimonial from CHAS. PATRICK, Esq., Cloughfold, Manchester (Numerous others):—"I have used your Black Varnish for upwards of twenty years, and find none to equal it in economy and quality."

CAUTION. EVERY CASK BEARS THE ABOVE REGISTERED TRADE MARK. Beware of Cheap Imitations.

ANT. ROOZEN AND SON'S CATALOGUE for AUTUMN, 1895, now ready, contains Cultural Directions and full descriptive details of their immense Collections of New, Rare, and Fine BULBS and PLANTS (104 pages in English), and will, as usual, be sent post-free on application to their Agents, Messrs. MERTENS & CO., 3, CROSS LANE, ST. MARY-AT-HILL, E.C.; or themselves direct at OUYERVAEN, near HAARLEM, HOLLAND. N.B.—No connection with any other firm of the same name.

USE JADOO FIBRE for BULBS and AUTUMN POTTING, 8s. per 3-bushel sack. Special rates per ton. Obtainable through any Nurseryman. For further particulars apply to JADOO LIMITED, 54, High Street, Exeter.

Chrysanthemum Culture. STANDEN'S MANURE has produced the most satisfactory results, fully borne out by reports from the leading prize-winners throughout the kingdom. Prices, in tins, 1s., 2s. 6d., 5s. 6d., and 8s. each; in kegs, 1/2 cwt., 10s. 6d., 1/4 cwt., 18s., 1 cwt., 52s. each. CORRY & CO., Ltd., London; and all Seedsmen and Florists.

GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade, Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

J. WEEKS & CO., Horticultural Builders to Her Majesty, H.R.H. the Prince of Wales, H.M. Government, Admiralty Dept., War Dept., Royal Hort. Soc., Royal Botanic Soc., Parks and Public Buildings, Patentes of the Duplex Upright Tubular Boilers, King's Road, Chelsea, S.W.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 24, 1895.

THE ROSE GARDEN IN AUTUMN.

VARIOUS are the Rose gardens of England, in their characters and contents; and seldom do we come across what may be called an ideal one. Some are cramped by want of space, and, although their ambition may be great, they are unable to gratify it; others are formed to meet the wants of an exhibitor, and, while it is perfectly true that, if you want to grow Roses of first-rate character, you must be guided by the principles, and follow the methods adopted by that class of growers, we are fain to confess that they do not conform to any æsthetic ideas of garden beauty. There are others, again, in which no respect is paid to regularity; their owner does not know much about them, and tells you that he only wants a quantity of blooms, and it is in such gardens as these you are apt to come across flourishing bushes of Manetti. The grouping of Roses, that is, the employing a good number of the same variety, is one of the points on which, if there were space and means, one would very strongly insist. Sometimes one does come across beds of Mrs. John Laing and other well-known flowers, and the effect is very charming; but as it was not given to everyone in old times to get to Corinth, so there are heights in Rose-growing to which humble mortals cannot aspire. But there are some things which are common to all kinds of Rose-gardens, and suggestions which are applicable to all; and the Rose-grower as he looks round upon his garden may be thankful that such things as Roses in autumn can be written about—there was a time when we had nothing of the kind. Hybrid perpetuals (a very misleading name to be given to them) were unknown; there are many of them which, while they have a good bit of the hybrid, they have very little of the perpetual in them—but, nevertheless, there are many which give us blooms after the first flush of the summer flowering is over, leading us to pleasant reminiscences of the triumphs of the past, and cheering us with hopes of the future.

Then we were without those lovely Roses which Philip Noisette and the French raisers generally have added to our gardens in the beautiful Noisette and Tea sections; then a few of the Bourbon Roses were hailed with gratitude when such varieties as Souvenir de la Malmaison, Mrs. Bosanquet, and Sir Joseph Paxton favoured us with flowers. But now when we go out in autumn into our Rose gardens we are surrounded with lovely blooms of the many varieties of these classes which the last thirty years have added to our collections. Shoot succeeds shoot, and flower after flower opens, and until the cold grip of frost lays hold upon the bushes they never cease to enliven our gardens; it is true they are not brilliant in their colours, and so there is not the blaze amongst them that proceeds from a bed of hybrid perpetuals (indeed, we do not want that),

but it is the exquisite and delicate colouring into which no crudity or coarseness enters that constitutes one of their chiefest charms.

The extraordinary character of this season seems to be maintained throughout, and now a spell of hot autumnal weather has set in after the heavy rains which we experienced in the latter part of July and the earlier part of August, we seem to be assured of a plentiful supply of flowers. For the past few years I have adopted a plan which seems to me to thoroughly suit the Rose, namely, that of cutting out the old wood which has flowered and thus done its duty, for if the plants (of course, I am speaking of dwarfs), have done well, they will have sent up strong shoots, which will form the staple of blooms for next year. In fact, it is very much the same sort of treatment to which we subject our Raspberries, and for the same reason the old wood is useless, and its removal admits free circulation of air to the plants, and thus tends to the ripening of the wood. When these new shoots are very long, it will be necessary to stake them; but as one very much objects to such aids when they can be dispensed with, it may be sufficient, unless in very exposed situations, to top these long shoots, and thus not give so much play to the wind. In these suggestions I have had in view those dwarf plants which are cultivated in the orthodox style. Where it is intended to form large bushes, and get a quantity of flowers irrespective of quality, the plants may be left to grow more naturally, although the pruning-knife will be required to keep them, to a certain extent, in shape. Where mulching has been adopted in the summer months—a practice pursued by some, especially by those who have exhibitions in view—it will now be time to remove that unseemly addition to Rose garden. I have been into some Rose gardens from which all appearance of beauty was taken away, and the whole thing was suggestive of a farm-yard with Roses planted in it; if there be any of this mulching now remaining it ought to be removed. Roses on walls will now require some attention—long shoots will make their appearance; these ought to be nailed-in, and provision made for removing the old wood. Most of these wall Roses will probably be of the Noisette or Tea sections, and with which of these the Gloire de Dijon race is to be classed it would be difficult to say, for the origin of the illustrious mother of this family is obscure, it having come up accidentally in a walk of the garden of Mons. Jacotot at Dijon; but in all probability it and some of its progeny such as Madame Bérard, Bonquet d'Or, Belle Lyonnaise, Madame Trifle, and Beauté de l'Europe will be found amongst these wall Roses, for I can hardly call them climbers, because they do not climb. I never can speak of Maréchal Niel as a satisfactory Rose for a wall, the pendent habit of its bloom exposing simply the discoloured outside petals; in the same way, I think, objection must be taken to W. A. Richardson, not for the same reason, but because as far as my experience goes, it is apt to lose its brilliant colour and become simply a white Rose. Why it should do so I cannot understand, because I have seen it most beautifully coloured under glass, notably at Lord Brassey's at Normanhurst, where the heat would, of course, be much more intense than that on a wall. Some people, however, say that there are different strains of it, and that there are some which always will go white; if so, the sooner they are discarded the better, for it is useless in that form, while in its normal condition there is no greater favourite, especially with the ladies.

This month is that in which Rose growers take stock and consider what alterations they shall make, and what new varieties they shall obtain; a great taste for what are called garden Roses, and more especially the single or semi-double varieties, has been developed of late years. It would be a great pity if this taste were checked, but I think those who are contemplating an increase in their stock of these should in planting recollect that they are of a very fleeting character. The single Roses, with the exception of *Macrantha*,

which now and then gives a late bloom, are truly summer Roses; while Lord Penzance's hybrids of the Sweet Briar partake very much of the same character, and as yet, so far as I have seen, develop nothing of a tendency to second blooming, although I am informed that some of the newer varieties have more of this character. My own striped Briar, "Janet's Pride," which seems to be increasing in popularity, gave me last year a considerable number of second blooms, but it cannot be depended upon to do this; therefore I would say, to all who intend to increase their collection of these varieties, make up your mind beforehand as to how you are going to use them, and consider when you are planting out in your mind a Rose-garden for next year whether you are going in for effect, or simply for the enjoyment of the individual flowers.

I do not here enter on the subject of new Roses, which I think it would be well for our growers to add to their collections, because, until the announcements are made, we do not know what they may be. I speak, of course, of those raised by our home growers, for we have long ceased to feel much interest in the long, wordy and flattering descriptions of the foreigners, few of which now seem to find a footing on our shores, nurserymen and amateurs alike seeming to think they are not worth all the trouble of growing, propagating, and then perhaps throwing away; whereas in the case of our own raised flowers, we have many opportunities of seeing them, and are guided in our selections not by what we have been told, but by our own knowledge of them, either in their growing state or when staged for exhibition.
Wild Rose.

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM (PEDILONUM) GLOMERIFLORUM, Krzl., n. sp.*

The habit of the plant is promising, but the pale rosy flowers are comparatively small and insignificant. As they appear in dense clusters of 1 to 5 on each stem, the effect is rather agreeable, nevertheless the plant cannot be ranged among our garden beauties. It flowered at Messrs. F. Sander & Co., St. Albans, July last. *Dr. F. Kränzlin.*

ORCHID NOTES AND GLEANINGS.

AËRIDES SANDERIANUM.

FASHION has as strong a hold upon gardeners and their employers as upon ladies and their dresses. Even in the cultivation of Orchids, Fashion asserts her sway, and the beautiful and graceful genera, *Vanda*, *Aërides*, and *Saccolabium*, are now-a-days neglected. I send you a raceme of the lovely *Aërides Sanderianum* to prove, were it needed, that this genus is well worth taking pains with. Not only are the racemes and individual flowers beautiful, but the habit of the genus is very graceful, and the numerous species present marked distinctions. I may remark that Williams' *Manual* devotes only thirteen of its 800 pages for *Aërides*, while it allots ninety to *Cypripedia*! *T. L.*

CYPRIPEDIUM SELLOEUM.

Mr. W. Bull kindly sends a flower of this species with two lateral sepals, one petal median and opposite the lip. This reversion to a two-membered flower is not uncommon in Orchids. Was the ancestral Orchid of this nature?

* *Dendrobium (Pedilonum) glomeriflorum*, Krzl., n. sp.—Caulibus maximis crassissimis multiaarticulatis ad 70 cm. altis, 1—2 cm. diametro; foliis oblongo-lanceolatis, acutis; apicis glomeratis multi v. plurifloris, floribus inter minores generis; sepalis dorsali oblongo obtuso, lateraliibus multo majoribus semioblongis obtusis antice omnino liberis pseudocaulis obtusissimum globosum quam ovarium semilongum brevis formantibus; petalis quam sepalum dorsale paululum minoribus marginatis ciliatis; labello basi linearis oblongo margine ciliato ceterum integro excavato obtuso; gynostemio brevi valde carnoso trinque juxta androclinum emarginato obtuso; anthera plana antice retusa fere quadrata postice bilobata; pollinia generis; rostellis antice rectilineis, fovea stigmatica satis plava. Flores pallide rosei v. carnei, 8 mm. diametro. Habitat?

CATTLEYA GASKELLIANA.

To the courtesy of Mr. W. Macdonald, Pitlochry, we are indebted for some curious specimens of this plant. There were three flowers on the raceme, each one normal except that the inner half of each sepal was lip-like, thus affording an instance of partial petalody of the sepals. We understand the plant flowered in a similar manner last year.

THE DAISY, BELLIS PERENNIS:

YOUR illustration of Daisy The Bride recalls to my mind the once prominent part Daisies used to form in our spring bedding. The lovers of this flower will not have forgotten the great display of spring flowers at the late Mr. Quilter's grounds, Lower Aston, during the year 1873, in which the modest Daisy played so prominent a part. I have as vivid a recollection of it now as I have of the boiler trials, and the ladies falling over the muddy planks, scrambling to get a view of the Sultan of Zanzibar. Here the Daisy and Viola tried to outvie each other in quantity and attractiveness, but the Daisy took the lead. Nowhere was the Daisy to be seen in such quantities and perfection as at Aston; it not only formed long vandyked lines, zigzag and diamond beds, various other designs, but filled up in masses some of the most prominent places in the grounds. Now in some of our prominent public gardens where flowers are planted in the beds to make a spring display, the Daisy is not to be found, as, for instance, at Hampton Court, where nearly the only spring flowers are about three colours of Polyanthus, or bunch Primrose, more properly called; these are very well done, and make a good display, but every one gets tired of the same thing year after year. Now, if some of these beds were edged with Daisies, *Violas*, *Anubrietas*, &c., they would certainly prove more interesting and attractive. Even carpet-beds could be made of the different varieties of Daisies, which, I venture to say, would prove more interesting and be better appreciated than this one solid mass of bunch Primrose, as variety is charming at all times, and we have plenty of materials wherewith to make spring bedding charming. One would think that spring bedding is losing ground, for we hear very little of it now—even the three champion places, Aston, Cliveden, and Belvoir, are silent. Now the Daisy is a very important little thing in spring bedding, easy of culture, a general favourite, and can be adapted for almost any sort of artistic work; it is true we have not much variety in colour, but enough for most purposes required for so sturdy a little grower, and I would much like to see it more brought into cultivation again. I had a fine collection at both Osberton and Enville just formed when I left, and spring bedding was given up. I had, at the latter place, all the varieties I could procure, variegated and otherwise, and found ample colour and variegation with the aid of other things for all my requirements. It seems quite unnecessary to give any instructions as to its culture, being only a Daisy—but still a few remarks respecting it may not be out of place. The best soil suitable for the Daisy would seem to be a good alluvial loam, well drained—a too light soil is soon penetrated by drought. Propagation is best done in the spring by dividing the roots as soon as they have done flowering selecting a rather shady spot for their summer quarters. Numbers of Daisies are lost annually through not sufficient care being taken of them after their removal from the flower-beds to the reserve. Daisies are apt to degenerate if they are permitted to remain long unremoved; it is best to have them taken up every second year, planting them in fresh earth. For seedlings with a chance of variety, sow in spring, in a pan or box, prick off the seedlings into a bed in summer, attend to watering and weeding the plants, and by the autumn many of them will flower and continue doing so until stopped by frost, but will start again as soon as the milder weather will permit. From these plants the best should be selected and the remainder thrown away. *E. Bennett, Lyne, Chertsey.*

THE FRUIT CROPS.

[For Tabulated Summary, see p. 119.]

(Continued from p. 152.)

2. ENGLAND, N.E.

NORTHUMBRLAND.—The Apple crop is quite extraordinary, with the trees in splendid health. Pears on walls irregular. Plums on walls and in the open are very fine, especially Denyer's Victoria. Of Gooseberries, red Currants and Strawberries the crop is quite exceptional, finer than we have had for many years. *George Harris, The Castle Gardens, Alnwick.*

— Apples an average good crop. Stirling Castle, Ecklinville, Hanthouse, Domino, and a few other varieties are bearing heavy crops. Pears not so good. All small fruits are good. Strawberries and Raspberries are excellent; Raspberry Superlative is a first-class variety, it is the heaviest cropper of any I have tried, and it seems to withstand dry weather better than any other. Gooseberries and red Currants enormous crops. All trees and bushes are very healthy. *David Inglis, Howick Hall, Lesbury, R.S.O.*

DURHAM.—Apples and Pears are about the average, on some trees none at all. This applies to the early flowering sorts, the cold east winds having cut off the blossoms. Strawberries were a bad crop, owing to the dry weather, and Raspberries are few, the severe winter having killed most of the canes. The greenfly and smut was very bad, but of late the thunderstorms have washed the fruit. *R. Draper, Seaham Hall.*

YORKSHIRE.—Strawberries in this district were a heavy crop, excellent in quality, and at this place they were ripe in abundance by the middle of June, which is very early for this district. Laxton's Noble was the first to ripen, and the crop of it was a heavy one, the fruits large, and owing to the dry weather the flavour was good. It is an excellent variety and stands the drought well. Next in the order of ripening was J. Ruskin, the crop heavy, but quality poor; Black Prince came next, a heavy crop, and excellent in quality; President and Sir J. Paxton were large and good, and the latter kept in bearing very well; Elton Pine, British Queen, and Aberdeen Favourite, were fine crops, of good quality, Morellos and sweet Cherries carry heavy crops; Apricots are a thin crop outside, but there is an abundant crop in our open shed. Of Pear-trees on walls, Easter Beurré and Beurré Diel have nice crops. Lord Suffield and Keswick Codlin Apples have good crops of fruit. *B. Wadds, Birdsall, York.*

— Strawberries have been an exceptionally heavy crop, the individual fruits large, and of excellent flavour. Apples will be plentiful with us, the younger trees bearing very heavy crops of fruit where they had shelter from the cold cutting winds which prevailed during the flowering time. Damsons are abundant, but the fruit is likely to be small owing to their great abundance. *J. Riddell, Castle Howard Gardens, York.*

— Apples showed remarkably good blossom, but were seriously affected by the cold winds and storms from the north and north-east about the middle of the month of May. In favoured spots Apples are, perhaps, above the average. Pears and Plums showed only moderate blossom in this district. Cherries showed plenty of blossom, but the cold clayey nature of the soil is not adapted to their successful cultivation; only Morellos do well. Apricots, the heavy crops of which so exhausted the trees during 1894, and the growth being made late, did not get ripened. Small fruits are excellent, except black Currants, which are almost a failure. *J. P. Leadbetter, Tranby Croft Gardens.*

— The cold, wet, sunless autumn of 1894 has left its mark on the fruit crops of 1895. In spring the first surprise was the almost total absence of Apricot bloom. Pears and Plums did not carry nearly their usual amount of bloom, and it was small and weak, not setting well; a few trees on walls with a south aspect are bearing heavy crops. Apples bloomed fairly well, but the crop is not in

proportion; the earlier varieties appear to be carrying the best crops. Strawberries most abundant and good. Gooseberries, Raspberries, red and white Currants extra good. Black Currants not so plentiful, but clean and good. *William Higgin, Stanwick Gardens, Darlington.*

— The very hot and dry spring weather has much benefited all outdoor crops of fruit. Apples are looking uncommonly well, especially free-growing culinary varieties, which is rather remarkable after the plague of caterpillar we had; but thanks to the use we made of the garden hose, we cleared this plague off. Pears, too, are promising well, also Plums, Cherries and Strawberries. I never saw more or better fruits, but the latter, through continued heavy rain, rotted ere they ripened. *J. Robert Dawes, Temple Newsam.*

— Apples in this district are a good average crop. A few kinds, viz., Lord Suffield, Keswick Codlin, Prince Albert, Nonsuch, Yorkshire Greening, Easter Pippin, Greenup's Pippin, and Tower of Glamis for instance, are carrying heavy crops. Pears are a fair average crop, both on walls and standards. Plums have fair crops, and a few have full crops. The Gooseberry bushes were dreadfully infested with caterpillars of the sawfly; I never saw them so bad before. Of Strawberries, President and Vicomtesse H. de Thury were by far the best out of many varieties. *J. Hughes, Wentworth Woodhouse Gardens.*

CAMBRIDGESHIRE.—The fruit crops here are, with the exception of Plums and Apricots, very good. Apples are the best crop that has been for some time. Pears were sadly thinned by the cold winds, and are nothing near a crop. Plums also suffered from same cause and through the drought. Gooseberries and late Strawberries are very small. Peaches and Nectarines are, as usual, very good, although a lot of the unripened shoots were killed by the frost. Apricots were spoilt from the same cause. Quinces are a crop. Taken on the whole, it is the best fruit crop that has been for some years. *J. Hill, Babraham, Cambridge.*

— The fruit crop in this district is good on the whole, with the exception of Pears; Lane's Prince Albert being by far our best cropping Apple, Ecklinville Seedling coming next. The red-spider is a very bad plague in most gardens hereabouts on Gooseberries, the result of neglect, there being plenty of water in this district, and any ordinary force-pump on wheels, with a small pipe and a tap to regulate the quantity of insecticide, would answer. I find petroleum the best thing to dress the trees with, and in its passage through the pump and a few lengths of the hose it becomes well mixed with the water. It is fatal to the black Currant-bud mite. *Wilson C. Smythe, Upwell House Gardens, Wisbech.*

ESSEX.—Apples are remarkably good, the trees clean and healthy. The great drought stopped the growth of these and all other large and small fruits, but all are now going on healthily. The Strawberry crop was exceptionally good, and all small fruits abundant, but they suffered greatly from drought, and on that account Gooseberries lacked flavour. *Jas. Douglas, Great Gearies, Ilford.*

LINCOLNSHIRE.—Apples upon the whole are a good average crop, although in some cases it is a very partial one, the severe storms of May 17 and 18 having greatly damaged the blossom and foliage where exposed to the full force of the wind. Pears are a very light crop; Apricots, scarcely any of the trees suffered much during the winter; and Peach and Nectarine trees on a south-east wall are bearing abundantly. All trees are now making good and healthy growth, not having suffered so much from the drought here as in some localities. The rainfall for June was 2.70 inches. The Gooseberry-caterpillar is very troublesome. *E. F. Hazellon, Brocklesby Park Gardens.*

SUFFOLK.—The Apple crop in this district is not only under the average, but is very partial. Here and there a tree carries a fairly good crop, while on others not a fruit is to be seen. I consider the

failure is entirely owing to the continued frosts and cutting winds that prevailed during the flowering period, as all the trees were masses of bloom. Pears are thin, but the fruit promises to be good. Apricots are a failure. Peaches and Nectarines are very good. Plums thin, but Cherries are a good crop, both dessert kinds and Morellos. Strawberries were excellent. All small fruits are very abundant. *H. Fisher, Flipton Hall Gardens, Bungay.*

— Apples variable; most old trees well clothed after months of dropping, which pulls the crop up to an average. Pears much whipped by winds, as well as checked by drought. Plums decidedly scarce; few blooms, which set fairly well. The only full crops of the Plum family are Bullaces, the black, where grown, being as heavily laden as the common Bullace. Peaches and Nectarines are a full average, but Apricots are thin. Gooseberries, Currants, Raspberries, extra crops, smaller than usual from lack of rain. Walnut trees much injured by the February frosts; very few Nuts. *D. T. Fish, Bury St. Edmunds.*

— The severity of the winter months, coupled with the low night temperatures which continued up to the end of April, had a disastrous effect on fruit crops; the growth of fruit trees was slow and weak, on Apple trees there was a prevalence of insects which riddled the young leaves, Pears also suffered, then drought set in, and during the months of May and June only nine-tenths of an inch of rain fell. In some cases Apples that appeared to have set freely in spite of unfavourable conditions now dropped off, strewing the ground, and those left refused to grow larger. Pears also fell off, but at an earlier stage. Strawberries suffered greatly on light soil, the fruit was small, and almost cooked on the plants when ripe. Cherries have been clean and good. Plums are a short crop, and Apricots almost a complete failure. *John Wallis, Orwell Park Gardens.*

— The fruit crop of 1895 promised to be an exceptionally good one, but the long continued drought was disastrous to early Pears, and most of the fruits dropped. Marie Louise, Doyenné du Comice, Beurré Diel, and later varieties of Pears are likely to be very good. Apples, especially the culinary varieties, are a fair crop and very good. *H. Rogers, Rendlesham Gardens, Woodbridge.*

4. MIDLAND COUNTIES.

BUCKINGHAMSHIRE.—Although the drought interfered in some degree with the Strawberry crop, in other respects it did but little mischief. Among notable subjects in this department, the early varieties of the Peach demand a remark. Early Beatrice, Early Amsden, Waterloo, and Alexander have produced excellent crops of fruit of good size and quality—in fact, they ripen outside even before our good old early varieties with the assistance of glass; these are, therefore, an acquisition sufficiently great to be appreciated. *G. T. Miles, Wycombe Abbey.*

— Generally speaking, the fruit crops of South Bucks are well up to the average. Apples in some districts are over average; here we have a fair crop. Of orchard trees Quarrenden, King of the Pippins, Cox's Orange Pippin, Dutch Mignonne, Wellington, Fearn's Pippin, and Starmer Pippin are heavily laden, while Blenheims and Ribstons and some others are very thin. Of a number of bush-trees on the Paradise stock, Lord Grosvenor and Grenadier, two early cooking Apples, invariably crop heavily, and this year look remarkably well. Other kinds also bearing good crops are Eclinvile, Pott's Seedling, Lord Derby, Warner's King, Cox's Pomona, Cox's Orange Pippin, Worcester Pearmain, Prince Albert, Stone's Apple, Ribston, and Bramley's Seedling. Pears on walls and bush-trees are scarce, while a few orchard-trees, Beurré Clairgeau, Louise Bonne of Jersey, and Autumna Bergamot are cropping heavily. All varieties of Peaches and Nectarines have required a considerable thinning of fruits, but notwithstanding the long spell of drought look remarkably well; this latter remark applies to all fruit trees. Apricots are rather under average crop. Plums and Cherries good. Small fruits and Strawberries very good, although the latter suffered

somewhat from the dry weather. Nuts are very plentiful throughout this district. *Chas. Herrin, Dropmore, Toplow.*

Plums and Apples a very heavy crop, trees clean and healthy. Among early Apples bearing freely are Irish Peach, Mr. Gladstone, Lord Suffield, and Seaton House. Among Strawberries, Royal Sovereign, British Queen, Laxton's Latest of All, and Waterloo have been very fine. *J. Smith, Mentmore, Leighton Buzzard.*

Apple Lord Suffield, Lord Derby, King of the Pippins, Cox's Oranges Pippin, and Blenheim Orange are very good here; in fact, the Apple crop is decidedly a good one. The following varieties of Pears are carrying good crops, viz., Comte de Lamey, Pitmaston Duchess, Beurré Clairgeau, Vicar of Winkfield, Black Worcester, Marie Louise, Easter Beurré, Louise Bonne of Jersey, Glou Morceau, and Doyenné de Comice. *F. Capp, Wezham Park Gardens, Slough.*

CHESHIRE.—Apples are very good crops, more especially the following useful varieties:—Lord Suffield, Lord Grosvenor, Grenadier, Hawthornden, Cellini, &c., which are overladen with fruit. Pears are very good crops, too, Marie Louise, both on the walls and in the open, being full of fruit. Victoria Plums are so heavily loaded with fruit that the branches require support, other kinds fair. *Robt. MacKellar, Abney Hall Gardens, Cheshire.*

With the exception of Apricots, which are almost a failure here, the fruit crop is a most satisfactory one. Apples are a very full crop, the fruit remarkably clean, and the trees free from blight. Plums and Damsons are also a full crop, in some cases, trees of the latter have suffered a great deal from spider. Pears are much below an average crop. There was very little bloom in the early spring, doubtless accounted for by the heavy crops carried last year, and this remark applies to Apricots as well. Strawberries have been a very heavy crop, and of excellent quality. With me, Royal Sovereign has established its claim as a first-class second early variety for pots, as well as outside. Cherries and small bush fruits are an abundant crop. Old brakes of Raspberries suffered somewhat severely from the frost, but younger brakes have carried enormous crops; and out of a number of varieties, I find Superlative the best. *N. F. Barnes, Eaton Hall Gardens.*

DERBYSHIRE.—Apples and Pears, favoured with magnificent weather whilst in blossom, set a prodigious crop, but the long-continued drought thinned them considerably, and advantageously. Pears, however, are still a very heavy crop, particularly such varieties as Jargonelle, Beurré de Capiaumont, Easter Beurré, Vicar of Winkfield, Williams' Bon Chrétien, &c. Our heaviest crop of Apples are Gravenstein, Keswick Codlin, Emperor Alexander, Cellini, and Northern Greening. Our newly-made Strawberry beds suffered terribly through the exceptional severity of the winter, hundreds of plants being killed outright. *Ben Ashton, Glossop Hall Gardens.*

The present season is one of the most fruitful we have had for many years, both in gardens and orchards; the trees are literally loaded with fruit, and considering the long spell of dry weather we have experienced, the trees are wonderfully free from insect pests. *J. Bottrell, Sudbury Hall, Derby.*

LEICESTERSHIRE.—The Apple crop on standard trees is heavy in this district, especially of the varieties Blenheim Orange Pippin, Wellington, Queen Caroline, Duchess of Oldenburgh, Kentish Fillbasket, Lord Suffield, and Pike's Pearmain. Pyramidal trees have fair average crops of Duchess of Oldenburgh, Domino, Pott's and Bramley's Seedling, Prince Albert, Frogmore Prolific, Newton Pippin, Braddick's Nonpareil, Lord Lennox, Waterloo, Fearne's Pippin, Golden Russet, and Irish Peach. *Alfred Hamshere, Beau Manor Park Gardens, Loughborough.*

Apple trees are remarkably healthy this year, and the fruit is swelling well. Some of the trees are without fruit, owing to inclement weather,

and severe attacks of insects last season, which weakened them considerably. Pears set well, but have fallen much since from maggot and other causes. All bushes are clean and healthy, but Gooseberries were severely attacked by caterpillars during the late dry hot weather. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

The crop of Apples this year is particularly good, pyramid trees on Paradise stocks being heavily laden, and require severe thinning. Bismarck, Seaton House, Lord Grosvenor, Stirling Castle, Frogmore Prolific, Prince Albert, Cox's Pomona, Potts' Seedling, Warner's King, Tyler's Kernel, and The Queen (Saltmarsh) are amongst the most noticeable. Of orchard standards, Keswick and Manx Codlins, Ecklinville Seedling, Queen Caroline, Winter Hawthornden, and Bramley's Seedling are the best. Amongst Pears on the walls, Marie Louise, Passe Colmar, Beurré Sterckman, Winter Nelie, and Louise Bonne are the most productive. Raspberries, Gooseberries, and Red Currants are abundant. Strawberries have been a phenomenal crop, but the bulk were soon over, owing to the drought. All fruit trees are clean and in good condition. *Danl. Roberts, Prestwold Gardens, Loughboro'.*

OXFORDSHIRE.—The unripened shoots on the lower parts of Peach trees were killed by frost, but the crop nevertheless is a good one. Amaden's June, Alexander, and Waterloo Peaches were ripe on July 24. Strawberry President was particularly abundant and fine. Fruit trees of all kinds have kept remarkably clean this year. *G. Stenton, Park Place Gardens, Henley-on-Thames.*

Fruit trees this year are, on the whole, almost free from green-fly, the severe winter probably having destroyed their eggs. Considering how scarce Apples were last year, it is remarkable that we should have another bad year following, for although early varieties are plentiful enough, the later and main croppers are very deficient. The trees had scarcely any blossom; perhaps the cold wet summer had most to do with this failure. *A. J. Long, Wyfold Court.*

SHERPESHIRE.—Apples full crops, though partial in places, some trees loaded and others bare, many falling through drought. Pears are thin and small. Plums especially plentiful on walls. Damson trees are breaking down with the weight of their crops. This year's rainfall for May was 0.60, for June, 1.0. Last year it was for May, 3.04, and for June, 2.4, these figures speak conclusively as to the drought. *A. S. Kemp, Broadway, Shipnal.*

In this district Apricots are the only fruits that are a partial failure, which considering the crops of the past two years is not surprising. Apples are a heavy crop, and the trees very healthy. Many varieties are grown, and all are good. Unfortunately a hailstorm of unusual severity passed over this neighbourhood on July 21, damaging the Apple crop badly, cutting and bruising the fruit. Pears are a good crop, Marie Louise better than last season. Peach and Nectarine trees are bearing good crops. Plums have not required so much thinning, but the trees have a full crop. Small fruits have been abundant and good, but caterpillars have been bad on Gooseberries and Currants on north walls. Strawberries have been very plentiful, and Laxton's Noble, President, and Waterloo, are the varieties that do best and keep up a long succession. This season we are discarding Sir Harry, Lord Napier, Vicomtesse Hélicart de Thury, Elton Pine, and Serling. *S. Backhouse, Onslow Gardens, Shrewsbury.*

STAFFORDSHIRE.—The Apple crop in this district is the best we have had for some years, such varieties as Keswick, Lord Suffield, Manx Codlin, Cellini Pippin, Small's Admirable, and Stirling Castle, being so loaded with fruit, it would almost pay to thin them. Pears are a good average crop, and promise to be good in quality; the same may be said of Plums. Cherries have also been very good; and Strawberries excellent both in crop and quantity. Noble, that has the character of being deficient in flavour, has been very good this year, could not wish for better flavoured

fruit. Gooseberries and all kinds of Currants have been plentiful and good. *John Wallis, Keele Gardens.*

It is the first time I have been able to give you such a good report of the fruit crop generally from this district. Almost every Apple tree is loaded with fruit, free from blight, and where proper thinning has been done a good harvest may be looked for; in many cases old dwarfed, moss-covered, and Ivy-bound Apple trees, that have been struggling for existence for years past, are wreathed with small fruit this year. Pears on wall are good average crop and quality, standards are remarkably healthy and good. Cherries, small fruits, and Strawberries (under good cultivation), have been all that could be desired. Some of the causes of past failure other years have been caused by late spring frost. I must also add that birds have been responsible for a great deal by taking the buds in winter and spring, the frost since winter has greatly reduced their number—less buds were taken this year than usual. *H. G. Wilks, Sandon Hall Gardens, near Stone.*

WARWICKSHIRE.—The wealth of blossom on all fruit trees and bushes, except Apricots, has more than fulfilled expectations, for the abundance of fruit matured and maturing has not been equalled for many years. Apples of most varieties usually grown are almost breaking the trees, Plums also requiring to be propped up. The drought of May and June told on the size of Strawberries, but the quantity and quality quite compensated for that. *A. D. Christie, Rayley Gardens.*

(To be continued.)

ROOT PROPAGATION OF SHOW AND FANCY PELARGONIUMS.

A CAPITAL method of propagation, but one that is not much known, is by means of root-cuttings. As soon as the flowering season is past—say, in July or August, the plants are turned out of their pots, the stronger roots cut off, the whole of the soil shaken clean off, and the root-mass washed in water to make them clean. After this is done the plants should be repotted in fresh soil. By this repotting, the gardener is rewarded by a number of fine large roots, which can be removed without inflicting the least injury to the plants. The stronger roots should be placed in cutting-pots, the thicker end just appearing above the surface of the soil. The best kind of soil for the cuttings consists of peat and decayed hot-bed manure. The cuttings should be lightly watered-in, and afterwards occasionally sprinkled. Of course, they must at first be put into a frame, and kept close, and shaded, but as soon as growth appears, ample ventilation must be afforded. Shoots begin to appear in fourteen days, and as a rule several of them appear on each piece of root. When these shoots have reached a desirable length, the point may be taken off and treated as a cutting, if further increase be required. The rooted plants should be repotted when the cutting pots get full of roots, and at such a depth that the point of origin of the shoot or shoots comes below the surface of the soil.

LILIUM PARRYI.*

At one of the recent meetings of the Royal Horticultural Society, flowering specimens of the above-named citron-yellow, fragrant Lily (fig. 42, p. 209) were shown by Messrs. Wallace of Colchester. As the

* *Lilium Parryi*, Watson, *Botanical Calendar*, vol. ii. (1889), p. 165. Elwes' Monogr. genus *Lilium* (1890), tab. 49. "But small, somewhat rhizomatous, of numerous thick-jointed scales about an inch long; stem slender, glabrous, 2-5 feet high, 2-10 flowered; leaves usually scattered, sometimes the lower in a whorl, linear obcordate, 4-6 inches long by about half an inch wide, mostly acuminate; flowers pale yellow, sparingly and minutely dotted on stout pedicels about an inch long; segments 3 inches long or more, 5-6 lines wide, somewhat spreading above, or the lips at length recurved; stamens and styles a little shorter; anthers oblong, brownish, 3 lines long; capsule narrowly oblong, acutish, nearly 2 inches long, by 6 lines in breadth.—*Proc. Davenport Academy*, li. 183, t. 6, 6, and in a marsh in San Geronimo Pass in the coast ranges of San Bernardino county; first collected by Dr. C. O. Parry in July, 1876, in flower."

plant is as yet little known, we append the following particulars taken from Elwe's noble monograph:—

“Extract from Dr. Parry's account of the plant:—

“In one of my last botanical excursions in the vicinity of San Bernardino in July, 1876, I accepted an oft-repeated invitation to visit the intelligent brothers J. F. and F. M. Ring in their mountain

sion of the South Pacific Railroad. In one of these mountain nooks the Messrs. Ring have located a Potato ranch, the elevation of over 4000 feet giving a sufficiently cool, moist climate, while the adjoining mountain-slopes afford an extensive summer cattle-range long after the herbage of the lowlands has dried up.

np with rank Willow and Alder growths, and occasionally expand into small meadows of coarse grass and sedges.

“On all the steep gravelly slope adjoining, there was the usual display of Californian evergreen shrubbery, including the Heath-like *Adenostoma* (which, under the name of 'chamisal,' is largely

FIG. 42.—LILIUM PARRYI: FLOWERS CITRON YELLOW, FRAGRANT. (SEE P. 208.)

retreat near San Gorgonio Pass. Leaving the broad and picturesque basin of the Santa-Anna Valley near the emergence of the stream from the rugged mountain-wall of the San Bernardino range, our route, after crossing Mill Creek, hugged the foothills bordering the Upper Yucaipa valley; thence, by a more rapid ascent in a nearly direct easterly course, we reached an elevated bench scattered with Pine and Oak groves, overlooking the broad sweep of the San Gorgonio Pass, now traversed by the eastern exten-

“In scattered groves of *Pinus Coulteri*, the ground was strewn with the massive cones of this peculiar species, its dense scales armed with formidable hooked spines. Many of the cones were fully 6 inches in diameter, with a length of 9 inches.

“The few perennial watercourses here met with are mostly confined within deep and inaccessible ravines; but more frequently scanty springs ooze out from beneath deep layers of porous strata, and spread out into boggy marshes, generally choked

used for fuel), the Holly-leaved Cherry (*Prunus ilicifolia*) exhaling a strong odour of bitter almonds, the *Heteromeles arbutifolia*, with glossy varnished leaves, and a prevalent form of 'California Lilac' (*Ceanothus crasseifolius*), with thick leathery foliage. The dull green hue which everywhere characterises the moorish growth, is at this time of year partly relieved by brilliant scarlet festoons of *Pentstemon cordifolius* trailing over adjoining bushes, or the less showy blossoms of *P. ternatus*.

"But what soon attracted more exclusive attention was a conspicuous yellow Lily growing abundantly on the boggy ground adjoining Messrs. Ringe's house, and sharing with the Potato-patch the care and attention of the undisputed possessors of the soil. Though not so showy as some other members of the Lily family in this region, there is a grace displayed in its large drooping flowers, surmounting a slender stem beset with narrow scattered leaves, which are occasionally crowded at the base into a distinct whorl."

TREES AND SHRUBS.

SAMBUCUS RACEMOSA, RED-BERRIED ELDER.

This plant stands out well at the present season as an object of beauty, with its clusters of coral-red berries; and so fond are the birds of the ripe seeds, that plants from the voided seeds are found all over the garden, and in some instances in exactly ideal positions. For instance, we have several large specimens growing among trees, Box towering well above them, and I think that a better groundwork could not be found for the Elder than the Box. Our stock of plants is also increased by cuttings put in during the autumn.

SAMBUCUS NIGRA FOLIIS AUREIS.

This is another capital garden shrub, and well adapted also for planting near the margins of woods and at the sides of the approaches to the mansion. It should be severely cut back in the spring if it is to look its best. The plants at this place grow in peat beds among the Ghent Azaleas, and the foliage of these colours well.

SAMBUCUS NIGRA VAR. FOLIIS LUTEO-MARGINATIS.

This is a variety of the common Elder, which I can recommend for planting in a shrubbery or on the edge of woods. It retains its variegation when planted in partial shade, in fact it grows satisfactorily under the shade of trees. [As does the type. En.] *Herbert May, Markree Castle, Sligo.*

RUBUS LASIOSTYLUS.

The number of Rubi known to botanists has been very considerably increased by the explorations of Dr. A. Henry in China, but our knowledge of most of these new species is at present dependent on herbarium specimens. *R. lasiostylus*, however, a species discovered by Dr. Henry in 1888, in the province of Hupeh, China, is now in the living collection at Kew, having been raised from seed. It flowered for the first time in June, 1894, and has recently been figured in the *Botanical Magazine* (t. 7426). The flowers are small, and the petals of a bright reddish-purple. They are, however, very fugacious, and whatever value the species may possess from the horticultural standpoint, lies in its being an addition to the white-stemmed kinds, of which we have already three or four in cultivation—*lencodermis*, *biflorus*, &c. The stems of this new species are at present 4 feet high, thickly armed with prickles, and covered with a bluish-white bloom which rubs off at the touch. The leaves are pinnate, the leaflets sharply and irregularly serrated, and the mid-rib and petiole armed with short spines. Having stood the winter of 1894-5 with no protection of any kind, and quite uninjured, it may definitely be included among perfectly hardy shrubs. *W. J. B.*

CLERODENDRON TRICHOTOMUM.

The only species of *Clerodendron* of truly shrubby habit that is hardy in England is *C. trichotomum*. It is a native of Japan, and is found in various parts of that country. Although it is said to have been first introduced in 1800, it is far from being as extensively cultivated as its beauty and distinctness from all other hardy shrubs entitle it to be. It grows to a height of 10 to 15 feet, the wood being soft, and the branches largely composed of pith. The large, broadly ovate leaves are soft and of a flaccid texture, entire or slightly toothed, and, like

many of the *Clerodendrons*, emit a disagreeable odour when bruised. The flowers appear during the months of August and September, and are produced in loose terminal cymes. The corolla is white, the lower part being tubular, but the upper part divides into five spreading, oblong segments, and measures $\frac{1}{2}$ inches across. Surrounding the corolla, and making an effective contrast to it, is the purple-red calyx, which is inflated, and traversed by five ridges. The species is easily increased by means of suckers and root cuttings. *W. J. B.*

MAGNOLIA GLAUCA.

Whilst the American representatives of the genus *Magnolia* never display that magnificent wealth of blossom which renders the Asiatic species and hybrids the most lovely of spring-flowering trees, they possess sufficiently good qualities to make them indispensable to every garden with space enough for their development. They flower, too, when their allies from China and Japan are long past. Just now *M. grandiflora* and *M. glauca* claim most attention. The latter is somewhat hardier than *M. grandiflora* and its flowers, although much smaller, have a more exquisite, if less powerful, fragrance, suggesting at once a delicious fruit, and a bunch of Tea Roses. The flowers are never seen in great numbers at one time, but a single shrub will keep up a succession of them for ten or twelve weeks. Each flower is from 2 to 3 inches in diameter, and cup-shaped, the colour a soft creamy-white. In some localities in the United States this *Magnolia* attains the dimensions of a small tree, with a well-formed slender trunk, but in Britain it rarely gets beyond the shrubby state. It usually retains a large proportion of its foliage throughout the winter, but different plants vary a good deal in regard to the persistence of the leaves, some, even in mild seasons, becoming almost bare. The leaves are oblong, smooth, and glossy-green above, but vividly glaucous beneath. The species has been in cultivation in England over 200 years. There is a fine variety of it known both as major and as *Thompsoniana*. It has larger leaves and flowers than the type, and is equally fragrant. *W. J. B.*

THE DEVELOPMENT OF THE CARNATION.

By the merest accidental circumstance a visit was paid recently to the gardens of Mr. John Garnett, nurseryman and florist, at Bowness-on-Windermere. Here we fortunately encountered the arboreal and genial proprietor, whose extensive stock of every description of flowering plants is a rare sight to be seen, cultivated on what appears to be little better than rocky barren ground; but the reverse is the case, though the blue, ragged limestone of the district projects above ground in every direction, and thus forms a grand nesting place for an immense collection of rare and other Ferns. But Mr. Garnett figures most prominently as a breeder and raiser of Carnations, of which there are many hundreds of different varieties growing in the open in a light soil, which evidently overlies a rocky foundation. The richness and purity of the productions prove that the ground is well adapted for the purpose, many of the blooms measuring $4\frac{1}{2}$ inches in diameter, and showing good sound calyces and brilliancy of colour, in which many of the tints of the rainbow can be discerned. Mr. Garnett's great aim for some years past has been to produce a blue Carnation, and he considers that he is now on the brink of success. Many scores of blooms were pointed to as possessing the skyblue tint on the fringe of the petals, but it is inside one of the glasshouses that the coming flower is carefully tended.

The great difficulty, as Mr. Garnett explains, was to obtain the proper combination of opposite colours for a foundation to work upon, which is an entirely different process to that adopted by the artist; but after continued perseverance his efforts have been rewarded by a single bloom of pure indigo-blue, showing only the faintest shade of violet on the calyx.

This plant differs considerably from the rest of the stock, and has but a weak and rather sickly appearance; but Mr. Garnett is firmly convinced that if he can retain it and induce it to produce prolific seed, that by a cross with another variety upon which he has already fixed, but of which he did not reveal the name, he will meet with the result which he seeks, and in the course of another remove or two will be able to produce a bright blue Carnation.

Many other experiments which he has made in hybridizing have produced remarkable and beautiful effects; and a short time previously he had despatched two or three single flowers to the Carnation and Picotee Union for inspection, though not with a view to competition. A letter just received from the secretary and treasurer, Mr. Arthur Medhurst, showed that these had attracted the attention of the judges, as in reference to them the following was embodied in the judges' general report:—"The seedlings show good blood, and are decidedly promising; but as it is a rule to give certificates only in cases of two or more blooms of one variety being shown, no award of certificate could be made on this occasion without infringing the rules." *J. W.*

KNIPHOF'S BOTANICA IN ORIGINALI, 1758—1764.

The name Kniphof, as commemorated in the genus *Kniphofia*, is not unfamiliar, but comparatively few persons will know anything of the history of the man who was the author of the work of which the above is the abbreviated title. An uncut copy of this rare and curious botanical book has lately been added to the Kew library. It is interesting historically, both on account of its being a record of plants cultivated at that date in Germany, and chiefly, in all probability, at Erfurt, as it was there the author resided, and also on account of its being one of the earliest, if not actually the first, work of considerable extent, in which the process of nature-printing was employed to illustrate plants. It would appear that D. Brückmann, a contemporary of Kniphof, was really the inventor, if it may be so termed, of this method of representing plants, as there is a published letter by him on the subject addressed to Kniphof, dated 1733; but this is not in the Kew library. The title is, *Sendschreiben an J. H. Kniphof, die Art die Kräuter nach dem Leben abzuzeichnen und also compendiöse Herbaria picta zu machen, vorstellend*. The full title of the work in question is, *Botanica in Originali seu Herbarium Vivum in quo Plantarum tam Indigenarum quam Exoticarum peculiari quadam operosaque enchiresi atramento impressorio obductarum Nominibusque suis ad Methodum Illustrum nostri aevi Botanicoorum Linnæi et Ludwigi Insignitarum elegantissima ectypa exhibentur. Opera et Studio Johannis Godofredi Trampe*.

There are two foolscap folio volumes containing 1202 figures, one on each leaf, besides a number introduced on the title pages of the twelve parts in which it was issued, for the purposes of embellishment, making a total of 1250 species represented. Figure 545 is missing. The Kew copy is probably unique in being coloured, the colouring being most likely the work of a private person, for there is no mention of coloured copies by any of the bibliographers. The colouring is generally well and effectively done, though in some instances it is to some extent neutralised by the too intense blackness of the print. This copy first belonged to J. G. Menn, M.D., Professor Publicus Primarius at Cologne, who seems to have acquired it in 1764, the date of the publication of the last part. Subsequently it must have passed into English hands, as some person has written, in a very neat hand, the English names of many of the plants.

The arrangement is alphabetical, with the Linnean names of the first edition of the *Species Plantarum*, and references to the pages of that work, as well as the *Systema*, and Ludwig's *Definitiones Generum Plantarum*. The "specific phrases" of the *Species Plantarum* are also reproduced.

**STREPTOCARPUS LAING'S
MULTIFLORA.**

IMPROVEMENTS are taking place with rapidity in the size of the flowers, and in the colouring of *Streptocarpus*. The plants now vie in beauty with *Gloxinias*, and in general usefulness and length of

A MOTH-CATCHING PLANT.

The following curious story of a well-known plant appeared a short time since in the *Detroit Free Press*, under the title of "A Moth-catching Plant." The plant in question, the *Araujia albena*, or as it is now known as *Araujia sericifera*, is described by

immense numbers of white or pinkish flowers, which have a very agreeable scent. These flowers attract innumerable moths. On a summer evening a hedge of *Araujias* will be covered by a perfect cloud of moths, and in the morning there will not be a single flower that does not imprison one or two, and sometimes as many as four, insects, of various sizes and genera. The action of the *Araujia* is purely mechanical. The calyx of the flower is rather deep, and the receptacle for its sweet juices is placed at its base. Attracted by the powerful scent, and the prospect of honey, the moth dives down the calyx and protrudes its proboscis to reach the tempting food, but before it can do so, the proboscis is nipped between two strong, hard, black pincers, which guard the passage, and once nipped, there is no escape for the moth, which is held as in a vice by the extreme end of the proboscis, and dies miserably. The rationale of the process is not yet explained. A plant of *Araujia*, covering a space of 10 yards in length, will destroy many hundreds of moths every night, and consequently prevent the ravages of fifty times as many larvæ. It is however a singular fact that in New Zealand, where the plant has often been cultivated for the express purpose of destroying the detested Codlin-moth (*Carpocapsa pomonella*), that wily insect declines to enter the trap.

FIG. 43.—STREPTOCARPUS MULTIFLORA.

time that a plant will remain in flower greatly excel those plants. The variety depicted in our illustration (fig. 43), was exhibited by Messrs. John Laing & Sons, Forest Hill, at the Royal Horticultural Society's meeting on Tuesday, July 9, of the present year. The flowers are of a bluish-purple ground colour, with purple lines in the throat. There were thirty open flowers borne by the plant, which was growing in a 5-inch pot.

our contemporary as a native of South Africa, when it is, in fact, a native of Peru. It is, however, stated to have been introduced to New Zealand quite accidentally about seven years ago, and since then to have been extensively propagated there on account of its effective service as a killer of destructive moths. Wherever the climate is mild the plant is an exceedingly free grower. It twines and climbs with great luxuriance, and produces

APOGAMIC FERNS.

ALTHOUGH the discovery of apogamy, or the power of the Fern prothallus to produce the spore-bearing generation by simple budding, instead of through the interaction of the antherozoids and archegonia, dates back some twenty years, a practical application of the knowledge then gained and published by its discoverer, Professor Farlow, and subsequently by Professor A. de Bary, appears only now to come into question when the hybridising and crossing of species and varieties is being conducted on a systematic basis. We have been led to this conclusion by the fact, that for the purpose of obtaining a created *Cyrtomium*, we made not long since several sowings of spores of *C. falcatum* and *C. caryotideum* mixed with spores of *Lastrea pseudo-mas cristata*, thinking that, as these two species were very closely allied, the chances of a cross were great. Pending, however, the appearance of the young plants, a study of the literature of apogamy in connection with the curious prothallus illustrated in your column (November 10, 1894), of which more anon, led us to De Bary's discovery, set forth in the *Botanische Zeitung*, July 19, 1873, and the following numbers, of the fact that precisely *L. f.-m. cristata* and *C. falcatum* are invariably produced apogamously, that the first curiously enough justifies its common name of male Fern by never bearing archegonia, while the second only produces these sparingly and never perfects them—buds, and buds only, being produced in both cases. Obviously, therefore, a cross is impossible. Unfortunately for the ordinary Fern cultivator, the development of Ferns in this asexual way, demands the utmost skill of the microscopist for its determination, since the Ferns so produced usually spring from precisely the same parts of the prothallus as those yielded sexually, and being of exactly similar appearance cannot be discriminated from them by ordinary observation. Hence if such pitfalls are to be avoided as the one we have described above, the would-be hybridist must look to the specialist in microscopic dissection to help him, and we think renewed research in the line of De Bary's investigations would well repay the trouble. In the first place, although De Bary tested a considerable number of Ferns, and found the large majority capable of normal, i.e., of sexual reproduction, thirty-six indeed as against three (*Pteris cretica*, *Lastrea filix-mas cristata*, and *C. falcatum*), yet in those days the possible discoveries in connection with abnormal varieties were almost entirely ignored, and of the thirty-nine Ferns named by De Bary, only three are abnormal, of which, as it is noted, one, *Lastrea filix-mas cristata*,

is constantly apogamous, though the normal uncreated form is not so, the apogamy being thus correlated with the tasselling, a point to our mind of great importance. The folly of applying the term of "garden varieties" to many of our abnormal forms is seen in this connection, since De Bary alludes to *L. filix-mas cristata* as such, and assumes, therefore, that the date of origin can be ascertained, while, in point of fact, it was found wild, and is as purely a natural product, i.e., as independent of human cultural influences as the common normal form.

Another point is, that the crested male Fern has been found as widely differing and altogether independent sports in various parts of the British Isles, the whole of the three sub-species, *L. propinqua*, *L. filix-mas*, and *L. pseudo-mas*, having afforded examples. We ourselves found a splendid form of *L. f.-m. polydactyla* near Kilmarnock, and a thorough *L. f.-m. cristata* at Kilrush in Ireland. Mr. Dadds found examples at Ilfracombe, Dr. Willis near Chard, and extreme forms have been found elsewhere. Now it is here that the Fern specialist should go hand in hand with such investigators as De Bary, in which case we should probably know, as we now do not, whether apogamy is always correlated in this species, i.e., in all three sub-divisions with *cristata*, or in a relatively varying degree, or not at all. A point also would have been that various sub-varieties exist, and did then exist, which are the reputed offspring, and in themselves bear evidence of being so of the identical *L. f.-m. cristata*, which is in question. *L. f.-m. cristata angustata* is one of these, and more recently, that lovely silken form, *L. f.-m. cristata fimbriata* has been raised, while a dense narrow-crested form raised by Messrs. Lang of Kirkcaldy, bears every evidence of being a cross between *L. f.-m. c. angustata*, and one of the dwarf forms of the same species. From these facts, it is clear that within this single section of the various crested male Ferns, there are ample possibilities of further light being thrown upon apogamic reproduction, since though we have no reason to assume apogamy is a bar to variation any more than other bud-forming phenomena, yet the reputed crosses point distinctly to exceptions which De Bary failed to find.

Our British Fern varieties, we are convinced, are replete with possibilities, their diversity of form being, as we know, attended occasionally by such modifications of reproductive energy as were quite undreamt of. Externally, they form a chapter of wonders to any one who cares to study them, and it would be strange indeed were this diversity all skin-deep only, leaving nothing for that deeper research which we suggest.

Reverting to the curious prothallus mentioned above, the two horns developed therefrom bear at present two similar *Athyria*, thus, at any rate, affording an instance of true apogamy in that family, the normal form of which, as well as *A. f.-f. Frizelliae* were found by De Bary to be normally fertile. In this case the phenomenon appears in a different form altogether from any noticed by him, the seats of the bulbils being far removed from the archegonial sites, or from any projection such as he observed in the indentation of the prothallus. Each Fern shows three fronds, one developed, and bearing no less than ten pairs of pinnate pinnae, instead of the usual much simpler primary frond. Roots, however, are only now forming, and the plants are consequently of very slow growth. One very curious feature is that the horns bearing these plants, and which were at first sharply pointed, are now in both cases dilating at the tips, the stronger of the two forming a distinct fleshy prothallus. A second prothallus in the same batch developed a similar but smaller horn direct from the upper surface; a bud appeared on this in precisely the same fashion as the others, but the resulting plant, also an *Athyrium*, is of very different form, promising to be well crested, while the others are plain. Nothing at all akin to this case has, we believe, been noted or recorded hitherto. *Chas. T. Druery, F.L.S.*

PLANT NOTES.

STOCK PRINCESS ALICE AS A BEDDING PLANT.

This comparatively new variety of Stock is a decided advance and improvement on older varieties, and forms a very beautiful subject for bedding purposes. It is of snowy whiteness, perfect habit, and a continuous bloomer. Raised in heat in March, and planted out early in May, it blooms from June until cut down by frost. Large beds have been planted in the grounds under my charge this season, having a broad edging of "Croton-leaved" Beet or scarlet Verbena, and the effect is charming. It also seems to me to be more powerfully fragrant than other Stocks. *W. H. Aggett, Bermondsey, S.E.*

THE APIARY.

THE TREATMENT OF ROBBER BEES.

It is easy to prevent bees robbing each other's hives, if the hive of the robbers can be ascertained. Search should be made for it, and when found fumigated with musk or camphor, so as to give the bees living in it a strong smell, by which the bees in other hives will know, and be warned against them. It is also good to give the robber bees some work to do in their own hive by strewing the floor with chaff, sawdust, &c.; and to turn the robbed stocks to face in another direction, or place them elsewhere. Placing the hive of the robbers in a cool, dark cellar may also be recommended. If the bees then acquire better behaviour, they will have forgotten their robber habits. If the robbers are the property of a neighbour, he should be requested to put these regulations in force.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

THINNING THE CROWNS OF ORCHARD TREES, ETC.—Now is an excellent time to operate on the tops of orchard or other standard trees that may have failed to fruit, or on early kinds that need it after the fruit has been gathered, in taking out superfluous wood, and so admitting a little sunlight and air to the interior. It is necessary to proceed cautiously with old and hitherto neglected trees, as thinning in their case may easily be over done, and the remedy is then sometimes worse than neglect. While the foliage is on the trees, it is easy to see where to thin out branches with advantage to the tree, and by taking out a few small ones here and there, or a larger branch occasionally when deemed necessary, in a few years many trees now practically worthless might be annually bearing fairly remunerative crops of fruit. It is a good plan the first year to take out all crossing and interfering branches; this, with shortening a few overgrown spurs here and there, will often be sufficient for one season, and it should be followed by a good dusting with quicklime as soon as the leaves have fallen. This, if applied whilst the trees are damp, will destroy lichens and mossy growths, and conduce to the health and well-being of the trees.

PREPARATIONS FOR PLANTING.—Those who contemplate planting to any extent should make a point of visiting some good fruit nursery at this season, and select the trees required to be sent as soon as the leaves fall. It is always more satisfactory to the purchaser if he can select his trees, as he then knows exactly what to expect from the nurseryman when the time comes to plant. It will be well, too, to prepare the ground at once, if it can be so managed. When a border or quarter is to be planted, the ground should be trenched at least two spits deep, making sure that the drainage is good; and if not, the land must be thoroughly drained. If some good turfy loam can be obtained, for placing round about the roots when planting, all the better; if not, a heap of compost should now be got in readiness, which may consist of road-scrappings, decayed and charred vegetable refuse, wood-ashes, or the like, which should be put into a heap and turned two or three times. If wall fruit-trees are to be planted, the

stations may be prepared by trenching and draining, but the holes should not be left open. It is well to preserve all old mortar, plaster, &c., for mixing with the soil in which stone fruits are to be planted, as well as for working-in round the roots of existing trees which may require it.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

REPAIRS AND MAINTENANCE.—At this season the heating-apparatus should be overhauled, and put into order for the winter season. The boilers should at least be cleared of sediment, if nothing else be done, and the doing of this will empty the pipes of water, but they should not be left empty. If the boilers have manholes or openings that are large enough for a scraper or iron chisel to be used, the incrustation which is sure to take place with ordinary water at points where the fire is hottest, can perhaps be removed. This will enable the boiler to do its work more efficiently, and save the material of the boiler from being destroyed by the action of the fire. Loose joints in the hot-water pipes must be made good; valves oiled, and overflow and feed pipes put in good order. The fire-bars, fire-lumps, flues round and over the boilers, and ash-pit doors should receive attention. The hard frosts of last winter must have severely tested the heating capacity of many a boiler, and proved the inefficiency of others, and now is the time to make provision for another winter. Unless an Orchid grower has an apparatus that will maintain the right degree of warmth in his houses, the plants must suffer in health. Some persons are under the impression that so long as the pipes are as hot as they can be that is sufficient, but it is a mistake, for the plants quickly deteriorate when pipes have to be kept fiercely hot on purpose to warm the air of the house. It is better to furnish water and keep them moderately warm. When this kind of work is to be carried out the plants should be allowed gradually to become dry. I allude to those species which occupy the hottest houses. If during the performance of the work any of the plants appear to suffer from dryness, water may be afforded in about one-half the usual quantity.

CATASETUMS, MORMODES, ETC.—Particular attention should be given to plants of *Catasetums*, *Mormodes*, and *Cycnoches*, which having bloomed, have finished growth for the season, in the matter of maturing that growth by sun-heat. Such plants should be placed where they may obtain uninterrupted sunshine, and the atmosphere is drier and less close than the houses they have hitherto occupied. Whilst the leaves remain fresh keep them supplied with water at the root. When the growth is properly matured the plants will go for a very long period uninjured, without receiving any moisture at the root. So soon as the leaves turn of a yellow colour, the water supply must be gradually reduced, and when they drop, discontinued entirely. If the pseudo-bulbs keep plump-looking no more water will be required before the plants begin again to break. *Cyrtopodium*, *Lisochilus*, *Cyrtopora*, *Thunia*, *Bletia*, and the deciduous *Eulophias* may be similarly treated. As regards all of these species, it is certain that the treatment afforded during rest is as important as that during their growth.

THE KITCHEN GARDEN

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

BOX EDGINGS.—From now onwards, these edgings may be trimmed; and in order to give slugs and other creatures but little covert, the edgings of Box should be kept to about 2 inches in height, and the same in width at the bottom, and 1 inch at the top. When Box is cut at this season, new leaf growth has time to mature, and is, therefore, not browned by frost, which is the case with late trimming. Repairs may now be made, although the spring is a better time for lifting and dividing the plants. Box, to look nice, should be kept true to line whether curved or straight, and cut very evenly at the top and sides.

THE COLLECTING OF SEEDS.—Seeds of Spinach, Borecole, Turnip, Broccoli, and Cabbage may be gathered as fast as they become ripe, or the entire plant pulled up by the root. Lay the seed out in the sun on cloths or trays. Do not collect seeds when damp with rain or dew. Turn the seed-heads over occasionally, and in about a fortnight they should be quite ready to be threshed or rubbed out. In rainy weather, and during the night, the seeds ought to be placed under cover. Open sheds and early vineries are good places for drying seeds of all kinds.

CARDOONS.—The earliest plants are now ready for blanching. For this purpose procure hay-bands—not musty ones; and when commencing the job, put a strip of wide bast around the leaf-stalks, to keep them better together, and then wrap them in hay-bands, being careful to place each coil close to the next one, so as to shut out the light.

FENNEL AND ANGELICA.—Fennel and Angelica may be sown at this date, instead of in the spring, some gardeners fancying that autumn-sowing gives stronger plants. Sow the seeds thinly on a piece of ground, in an open place.

ONIONS.—In some parts of the country the Onion crop is still in full growth, but as soon as the majority of the bulbs show signs of the tops falling over, a man should go with a wooden rake and press over the tops generally, and in ten days afterwards, if the weather is sunny, the crop should be lifted, and the bulbs laid out in a dry shed or on sheep-hardies, &c., in the open. When dry, twist off the leafy part and the outermost skin, and store in a cold, dry room. Keep the spring and autumn-sown produce apart; in fact, the different varieties should be stored in according to their use at different seasons. If the bulbs are roped, that job can be done at leisure.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

PRUNING.—The advantage of pruning the different kinds of fruit trees soon after the crop is gathered, and before the foliage falls, is not so generally known as it should be. The gardener who prunes then, is in a better position to see what quantity of wood is required to properly furnish a given space, and the removal of superfluous growth gives that of the current season a good chance of thoroughly maturing, a very essential condition for good fruiting. Peach and Nectarine trees should have all of the weakly or unfruitful wood cut out; and it may be necessary to cut back some of the stronger growth where crowded, as in all cases sufficient space must be allowed for the full development of the leaves. Care must be taken to retain young fruitful wood in sufficient quantity at the base of the tree. Some of the stronger shoots on these fruit trees in the earlier houses may also be shortened back, and any growths that were tied across others, so as to enable the sun to reach the fruit, may be loosened, thus exposing all parts to the action of direct sunshine. In the case of the Cherry, Pear, and Apple, whose shoots were pinched, so as to compel the fruit-spurs to form on them, these will in the course of a few years become crowded, and the foliage very dense, by pruning these trees at this season it will be an easier matter to see which fruit-spurs ought to be removed to enable light to penetrate the crown.

FIG-TREES.—These will require but little pruning at this season if they were properly managed during growth, still, it may be desirable to cut back weak shoots, but not the extremities of the main ones, as it is on these that the earliest fruits form.

WATERING.—Water should be copiously afforded to Peach and Nectarine trees, dryness at the roots at this season often causing bud-dropping at a later date.

SYRINGING.—Continue the syringing of fruit trees and Vines twice daily during hot weather, and where possible, the roof-light may be taken off the houses.

TOMATOS.—Plants that have been placed in their fruiting-pots should not receive much water at the root; the stem should be secured to a stout stake, and the side growth removed—pulled out. Utilise any spare lights during rainy weather, to keep the plants dry.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Brixall Gardens, York.

FLOWER GARDEN ARRANGEMENTS FOR NEXT SEASON.—The present is a good time to decide upon any alterations that may be required to be made in the bedding-out next season, and the number of the plants needed to fill the beds. It is always a good thing to make some alteration in the arrangements of the colours, so as to impart freshness to the scene. The fashion of using plants so as to give masses of colour is disappearing in favour of less vividness, by the use of plants of varied habit, foliage, &c.

DAHLIAS.—The various show, fancy, pompon, Cactus, and the varieties of single and decorative Dahlias, might be more employed than at present in the beds in the flower garden proper. We possess in these plants beautiful colours which are not to be found in any other summer-flowering plants. Dahlias, moreover, are plants easily propagated, and stored when out of bloom. The double and single varieties of Cactus Dahlias being particularly attractive, should be largely used in beds and borders, or in the kitchen garden for cutting purposes. Good varieties are H. Cannell, Dr. Masters, Lady Marcham, Mr. A. W. Tait, Marchioness of Bute, Rayon d'Or, Harry Freeman, Claxton Harlequin, Mrs. John Arnold, Matchless, Mrs. A. Peart (grand), and Duke Alexia.

PROPAGATION.—For some few weeks to come, the propagation of hardy and half-hardy subjects will require unremitting attention. Pelargoniums struck in the early autumn flower more satisfactorily than those raised in the spring, and the cuttings strike freely out-of-doors up to the middle of the month of September.

CENTAUREA CANDIDISSIMA.—If side shoots be taken off old plants, they will strike freely when inserted in pots filled with sandy soil, placed in a warm house and shaded for a fortnight. For affording cuttings, it is necessary to keep some plants in pots, and if the plants are kept somewhat dry, they make numbers of side shoots suitable for cutting. When the Centaurea is required to make a specimen plant, several years elapse; but for an even batch of small plants for making panelling or edgings, seedlings raised in February are the more suitable.

FUCHSIAS.—Cuttings of the varieties which stand an ordinary out-of-doors winter, viz., Riccartoni, Meteor, Corallina, and Elegans, should now be struck in slight bottom-heat under a hand-glass or in pots. Fuchsia Riccartoni is a very useful plant in shrubberies and as solitary plants on the turf, and in some districts it will stand our winters well and grow to a great height. It can be increased by offsets and division early in the spring.

SALVIA FULGENS AND S. PATENS.—Cuttings will strike in a moist, warm frame if carefully shaded at this season. Salvia patens being tuberous-rooted may be lifted and stored away for the winter after it is cut down by frost.

SUCCULENTS.—The propagation of Sempervivum, Mesembryanthemum, Sedum, Kleinia repens, &c., should be now pushed on. These cuttings should not be inserted as soon as made, but the cut surface allowed to become dry. Place cuttings in a pit or frame in moist soil, but afford no water for a time, and no shading.

TUBEROUS-ROOTED BEGONIAS.—Cuttings strike freely in boxes or pots in an airy frame, affording them but little water, and not depriving them of light and air, their treatment generally being that of the zonal Pelargonium.

MISCELLANEOUS.—Heliotrop, sweet-scented Verbena and Cape Pelargoniums used in bedding, Ageratum, Lantana, Hydrangea, Verbena, bedding Tropaeolum Miss Clibran and Scarlet Bedder, are plants which may now be struck from cuttings. Koenig variegata is a useful plant for edgings, and variegated Alyssum saxatile deserves to be used more than it is. It strikes and grows well, and is most useful for summer edgings; also Nierembergia gracilis and rivularis, beautiful for edgings of small beds, and for filling baskets, but seldom seen now. Besides these, Gazania splendens, and Agatheae celestis, a pretty blue Marguerite, and Mangle's variegated Pelargonium, and the varieties of Anagallis, crimson, blue, and white; Lobelia speciosa in variety, are plants required to be kept as stock, cuttings of which should now be rooted. All of them strike readily on a slight bottom-heat, carefully shading them whilst the sun shines, and keeping the light close, except for an hour in the morning to dissipate moisture and dry the leaves. To keep the young plants stocky, the cutting-pots must be not more than 6 or 9 inches distant from the glass. When it is seen that any potful of cuttings is rooted, remove it to a more dry frame.

HERBACEOUS BORDERS.—Seedling perennials and biennials raised last month should be transplanted from the seed-beds to the borders in places reserved for them. Dig in some rotten manure before planting them, place a small stake against

each to save them from being trampled upon, and afford a watering. The present is a good time to plant permanently prepared offsets of various hardy herbaceous and perennial plants, as they will be enabled to get established before the season of growth comes to an end.

SOWING SEEDS.—The seeds of Sweet Peas, Digitalis, Delphinium, Antirrhinum, Pentstemon, Poppy, Mignonette, &c., should now be gathered, and dried in the shade. Our Sweet Peas, that were sown in pots and transplanted, have been very beautiful objects, the varieties being Countess of Radnor, Princess Beatrice, Mrs. Gladstone, Captain of the Blues, and others.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

NERINES (GUERNSEY LILIES) will require watering in every case, and those which have not exhibited signs of flowering will scarcely do so now. Nerines do not flower satisfactorily if disturbed at the root; but if it is a necessity to increase the stock of the plants, any potfuls that are much crowded with bulbs may be shaken out, divided, and the bulbs re-potted separately in flower-pots of 3 to 4½ inches in diameter. The compost employed in potting should consist of turfy loam, leaf-mould, and sand, and a small quantity of finely-broken charcoal. The pots should be thoroughly well crocked. Very little water will suffice for these newly-potted bulbs, and a light syringing overhead will be beneficial. Bulbs that need no re-potting should be top-dressed with the above compost, or afforded a little of Clay's Fertiliser in the proportion of a teaspoonful to each 32-sized flower-pot.

FANCY PELARGONIUMS.—Old plants will now be ready for being pruned hard-back to well-ripened wood of the current year. After pruning, place them in a common frame close to the glass, and when they commence to break, shake the soil from the roots, turn the latter slightly, and repot them in pots of the same or smaller size, pressing the soil with moderate firmness. Replace in the frame, syringe regularly, and afford air at the top and bottom of the lights. Cuttings of these varieties which were put in at the beginning of last month, being rooted, will be ready for potting into 3-inch pots. A suitable soil will consist of turfy loam and leaf soil, with a small quantity of sharp sand if the loam be heavy.

COLEUS.—The present is a good time to strike a quantity of cuttings for stock purposes, as these keep better through the winter in small pots, than older and larger plants. Moreover, they do not occupy so much space. Coleus cuttings strike almost anywhere now in a little bottom-heat. They keep perfectly throughout the winter, if placed on a shelf close to the glass in the stove.

PINKS.—In case the quantity of Carnations for winter and spring flowering is limited, some of the older plants of the Pink should be potted up, planting them in a cold frame and keeping close for a few days. The plants soon make fresh roots, and may then be stood outside. Before hard frosts set in place them in cold frames. They may be gently forced into bloom, commencing in January. Suitable varieties are Mrs. Sinkins, Ernest Ladhams, Her Majesty, Mrs. Lakin, and Mr. J. M. Welsh.

A NEW PENCIL.—The Blaisdell Paper Pencil Company, Philadelphia, U.S.A., has introduced a kind of pencil, the lead of which is seen, on examination, to be covered with many very narrow strips of paper. The pencil never needs cutting in the ordinary sense of the word, but, to expose more lead, all that is necessary is to make a small slit in the paper near the lead, thus raising a tiny flap. By gently pulling and unwinding this, working towards the point, a spiral of paper is twisted off, and a length of the lead is laid bare. This process can be repeated as required, till the pencil is too short to be used at all, and is less laborious, and is more certain in results than is cutting with a knife. The lead is excellent in quality, and keeps a good point. In appearance this pencil always resembles an ordinary cedar pencil, the "uncut" end of it being covered with red glazed paper, which increases the likeness, and is pleasant to handle.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, AUG. 27 { Royal Horticultural Society's Fruit and Floral Committees.

SHOWS.

TUESDAY, AUG. 27—Brighton New (two days).

WEDNESDAY, AUG. 28 { Reading. Bath Floral Fête (two days). Harpenden.

SALES.

MONDAY, AUG. 26 { Special Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, AUG. 27 { Sale of the Wilson Collection of Orchids, at Protheroe & Morris' Rooms (two days).

THURSDAY, AUG. 29 { Special Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

FRIDAY, AUG. 30 { Imported Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—60°·7.

Watering. THERE is probably no one operation in the whole routine of gardening that is more thoughtlessly carried on than that of watering. The individual requirements of particular plants are little thought of, and "watering" is administered indiscriminately to each and all alike. Where there is a mixed collection to be dealt with, the difficulties in adjusting the supply to the needs of the individual are, no doubt, great, but in market establishments, where large quantities of one plant are grown, and where a house or houses are set apart for the exclusive cultivation of some particular subjects, the difficulties are materially lessened, though not overcome. In any case it is most important to gain a knowledge of the principles which govern the relations between the growing plant, the amount of water it receives, and the period at which it receives the supply.

That a plant needs water, suffers if it gets too little or too much, that it requires more at one time than at another, and that different plants vary in their requirements according to their conformation and structure, and the circumstances under which they are growing—all this, of course, is well known, though in practice it is often not remembered or acted on.

Again, the influence of excess or deficiency of water may affect not only the individual plant, but may determine variations in the productiveness of the plant, and induce variations in the number, size and vigour of the seed and its contained embryo. In reference to these matters, the *Revue Scientifique* for July 6 publishes a report of a thesis prepared by M. EDMOND GAIN, and presented to the Paris Faculty of Science. The general character of this thesis may be gleaned from what has already been said, but it may be of interest to add a brief summary of the conclusions at which M. GAIN, a well-known author on agricultural chemistry, has arrived, as they

are of great practical importance. There is, says M. GAIN, an alternation in the requirements of plants for water. Continuous deprivation or continuous supply of water are alike contrary to the physiological requirements of plants. In all M. GAIN's experiments those plants which were supplied with water at the two critical periods—the commencement of the unfolding of the leaves, and the beginning of the flowering period—and at no other time, did as well as those provided with a continuous supply of water during the whole period of vegetation. Further, the experiments of M. GAIN showed that this influence of moisture is not felt equally by all the organs: it has a greater effect on the aerial than on the subterranean organs. The result of this differing influence is shown in the fact that plants grown in dry soil have thicker roots than plants in damp soil, though the stems may be equal in weight. This is in accordance with the well-known fact that plants of very dry countries have frequently roots which are very large in comparison with the weight and height of their aerial parts.

With regard to the influence exercised by the greater or lesser quantity of water on the propagation of the species, the researches of M. GAIN have established the two following facts, relating, the former to seeds, the latter to the tubers:—

1st. The humidity of the soil favours and greatly augments the number of fruit and seeds, but drought induces the formation of larger and heavier seeds. On damp soil a plant yields smaller seeds, which, consequently, tend to bring about the degeneration of the species.

2nd. The number of the tubers is but little influenced by the variation in the retentive powers of the soil for water, but on damp soil the plant yields larger tubers. There is then an increase in weight; the polarity of these tubers is, however, not much marked, and they are consequently less perfect than those which have been submitted, in the earth, to relative dryness.

It may be repeated that moisture perceptibly increases the immediate yield, but tends to the formation of imperfect reproductive organs, which produce less vigorous plants. This is to the advantage of the individual, but to the detriment of the conservation of the species. The practical inferences are obvious.

VIEW IN THE GARDENS AT BOSAHAN (see Supplementary Illustration).—The accompanying illustration represents one of the many charming bits of scenery to be found round Bosahan, the Cornish seat of Mr. PENDRYVES VIVIAN, situated about 6 miles from Falmouth, on the Helford River, and commanding lovely and extensive sea and land views. The mansion was completed, and the grounds and gardens laid out in 1837. The *Ginnera manicata* here depicted was a small nursery plant five years ago; it now measures 24 feet through, 12 feet high, and averages about 8 feet across the leaves. It is planted adjacent to a pond, and seems to be quite at home, retaining its handsome appearance until quite late into the autumn, and is simply covered over with its own leaves as a protection from frost when winter sets in. Amongst the many half-tender plants found here may be mentioned *Eucalyptus globulus* (as note the large one to the left of the illustration), *Cordyline australis* and *C. indivisa*, *Embothrium coccineum*, and Palms, including *Chamærops Fortunei*, *C. excelsa*, and *C. humilis*, some of which have attained a height of 10 feet; also *Raphia flabelliformis*, *Sabal Blackburniana*, and *Phoenix rupicola*; these exist out-of-doors all the year round, and so far with marked success. In one of the little glens may be seen a clump of some twenty-seven Tree Ferns (*Dicksonia antarctica*), varying from 2 to 10 feet high, which were imported direct from New Zealand about six

years ago, which are now looking as fresh and green as if they were under glass. As showing the mildness of the climate, it may be mentioned that 10° of frost was the maximum we had during last winter, which was elsewhere considered quite an exceptionally hard one. *Thomas Crawford*.

MR. BARRON'S DISMISSAL.—As the circumstances connected with the dismissal of Mr. BARRON have become known, a feeling has arisen that the Council has committed a blunder by appointing, unknown to their own garden committee, a number of private gardeners to visit and report on the condition of a garden, the objects of which are so different from those of which they have cognizance. That the Council should have taken such a step, and further that they should have dismissed their Superintendent also without consulting the Chiswick Board, shows something more than a want of courtesy. The treatment accorded to Mr. BARRON is also felt as a slur on the community of which he is so distinguished a representative. That such a result should have been, as we believe it was, unintentional, only shows the gravity of the blunder. In the meantime the warmest sympathy is felt for Mr. BARRON.

— We learn that at a meeting of the Fruit Committee held at Chiswick last week, it was resolved, after discussion, to invite the members of the committee to attend a special meeting of the body to be held at Chiswick on September 10, to consider the desirability of this body promoting a special testimonial to Mr. BARRON from the members in recognition of his long and valued services to the committee as its secretary. It is proposed that contributions be restricted to past and present members of the committee, and that under no circumstances should the proposed testimonial conflict with any other originated from the general body of fellows of the Royal Horticultural Society. A meeting for a similar purpose will be held at the "Windsor Hotel," on Tuesday next, at 3 P.M.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will be held on Tuesday, August 27, in the Drill Hall, James Street, Victoria Street, Westminster. At 3 o'clock a paper by Mr. C. F. BAUSE, on "Codiaums and Dracænas," will be read.

GREAT GRIMSBY FLOWER SHOW.—The first horticultural show at this town was held under the auspices of the Great Grimsby Gardeners' and Amateurs' Mutual Improvement Society, and took place on Thursday, August 8, in the Vicarage grounds. The opening ceremony was performed at 2 P.M. by Mrs. G. MARSHALL, who was supported by Mr. G. Marshall, Mr. and Mrs. Jack Sutcliffe, Councillors H. J. Curry, W. Goodwin, and others. Much of the success of the undertaking was due to the untiring exertions of the secretaries, Messrs. J. L. Robinson and F. Isle. The treasurers are Messrs. J. Norton and W. Williamsmith. Special features of the show were the groups of miscellaneous plants. Cut flowers were excellent, especially the Roses sent by Messrs. Pennell & Son, nurserymen, of Lincoln. Fruit was well, if not very abundantly shown. There was an open division, which included groups, stove and greenhouse plants, table plants, Ferns, Tuberosus Begonias, Dahlias, Coleus, Gloxinias, and Fuchsias; cut flowers, under various headings of the flowers in season, as Asters, Gladiolus, Marigolds (dearly loved in the North), Carnations, and Picotees; bouquets of various kinds; fruit of almost all kinds; also vegetables. An amateurs' division, in which the more limited means and appliances of the grower, who is not a "gardener," are taken into account. This division included plants, cut flowers, fruit, and vegetables; and, finally, there was the division in which cottagers (and, we suppose, allotment-holders) competed, and which was open to residents in the borough only. This is a division, the items of which require considerable extension, so as to admit of greater variety of produce being grown, the provision for fruit being very meagre.

VIEW IN THE GARDEN OF A. PENDAWES VIVIAN, ESQ., BOSHAM, CORNWALL.

CHISWICK—The garden is now looking particularly well. The collection of *Phloxæ* is a sight to be seen, whilst the beds of *Zinnias*, *Tea Roses*, *Begonias*, and other plants are remarkably good. The fruit crops are generally satisfactory. Some of the houses are full of *Fuchsias* and *Cannas*, so that a visit just now will well repay the gardener.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The monthly meeting of this society was held at their room, 25, Westgate Road, on Tuesday, August 13, Mr. LAKE, North Dene, Gatehead, presiding over a good attendance of members. The secretary, Mr. J. ELLIOT, Jun., read a paper on the *Cyclamen*, in which he recommended sowing the seed in July and August, or as soon as it was ripe, in preference to the spring. A discussion followed, in which many took part.

MR. SOWERBY.—Coincident with the retirement of Mr. BARRON from Chiswick comes news of the withdrawal of Mr. SOWERBY from the management of the garden at the Regent's Park, with which he has so long been connected. Mr. J. B. SOWERBY succeeds to the post vacated by his father.

WOBURN EXPERIMENTAL FRUIT FARM—A party of forty agricultural students attached to the summer college of the Bedfordshire County Council, visited the above farm on Tuesday, August 20, by permission of his grace the Duke of BEDFORD and SPENCER PICKERING, Esq. They were conducted over the grounds by the manager, Mr. CASTLE, and the general scope of the experiments already commenced was explained. Much interest in the work was evinced by the visitors, who were chiefly schoolmasters engaged in the county, and who are qualifying for teaching classes under the technical education department.

HARDY PLANT COLLECTING.—In the columns of the *Garden*, Mr. BURBIDGE advocates the formation of a club or co-operative society for the purpose of defraying the expenses of resident collectors in various countries. In this way the services of consuls, missionaries, and traders could be utilised. An organising secretary is needed, and the services of a competent botanist to indicate likely countries and desirable plants, and to identify them when received are also desirable.

ADDITION TO THE LINCOLN ARBORETUM.—The formal ceremony of opening the new portion recently added to the Lincoln Arboretum took place on Wednesday afternoon, August 14. The piece of land, about an acre in extent, was purchased by the late Mr. NATHANIEL CLAYTON, to prevent the building of houses overlooking the mansion and grounds known as Eastcliffe, and last year was presented to the Corporation by Mr. N. C. COCKBURN, his grandson, on the understanding that no building, unless it be a lodge, should be erected thereon. The land has been handsomely laid out with flower-beds and trees. Inside the entrance-gate is a granite slab setting forth that the land was the gift of Mr. N. C. COCKBURN. The cost of the work is about £1000. At the opening ceremony, Mr. G. H. PACK, chairman of the Arboretum Committee, presented the Mayoress, Mrs. A. W. HALL, with a silver-gilt key, which fits the lock to the entrance gate. She then declared the new portion open, and votes of thanks to the donor of the land, to the Mayoress for her services, and to Mr. H. E. MILNER, of Westminster (who furnished the design), were passed. *The Yorkshire Daily Post*.

APONOGETON DISTACHYON VAR. LAGRANGEI, ANDRÉ—This is a seedling variety, raised at Oullins (Rhône) by M. LAGRANGE. It differs from the type in its larger leaves, purple on the under-surface, and in the floral bracts being of a dull rose-colour. A coloured figure is given in the *Revue Horticole* for August 16.

RUBUS CAPENSIS—In the *Garden* for Aug. 17 is an illustration of this interesting species from

a photograph received from Mr. BURBANK, Santa Rosa, California. The leaf is palmately 5-lobed and rugose, like a Mulberry-leaf. The fruit is purplish and of excellent quality. It is supposed it may be the *Rubus* of which STANLEY speaks as growing in places in tropical Africa.

WINTER IN NEW SOUTH WALES—Britons are apt to think that the right to a peculiar and changeable climate, and the habit of making it the topic of everyday conversation, is exclusively their own. Our correspondence with all parts of the world often puts us in possession of information proving that, in neither particular, are they different from their brethren in what are considered more favoured climes, for everywhere peculiar weather looks in at times, and those experiencing it think it is fair game to talk or write about. Writing from New South Wales under date July 8, 1895, our correspondent, "J. H. K.," says:—"I think this is the most severe winter I have experienced in this country during the long time I have been here. Every morning during the past week there have been 8° to 9° of frost, and consequently some of our shrubs have suffered, *Allamanda nerifolia* and the *Melastomas* in particular. The *Bougainvilleas* are uninjured. I am surprised to find what a hardy old thing *B. speciosa* is. Several large pieces growing in my garden have been repeatedly frozen, not only this season, but previously, and come out quite unharmed. My experience is, that the more exposure it gets the freer it blooms.

PETER LAWSON & SON, LIMITED.—At the ordinary general meeting of the shareholders of this company, held on Thursday, August 15, within the registered office, No. 1a, George IV. Bridge, Edinburgh, the report as issued to the shareholders was unanimously adopted, recommending a dividend of five per cent. per annum on the paid-up capital, free of income tax, should be paid on September 2, and that the balance of £4683 0s. 3d. be carried forward to next year's account. The retiring directors, JAMES S. EASTES, Esq., Ashford, Kent, and ANDREW PATERSON, Esq., C.A., Edinburgh, were re-elected.

DISA GRANDIFLORA.—We have had sent for our inspection by Mr. H. BAILEY, the gardener at The Briars, Reigate, some flowers of *Disa grandiflora* which are of an astonishingly large size, most of them measuring on arrival 5 inches from the tips of the sepals to that of the lip. As cut flowers, these *Disas* are admirable, lasting in water for quite one week. Mr. BAILEY has been successful in flowering these plants for the past twelve years.

"BOTANICAL MAGAZINE."—The August number contains coloured figures and descriptions of the following plants:—

Prochyanthes Bulliana, Baker, t. 7427.—This is the plant described by Mr. BAKER in our columns in 1884, ii., 328, as *Bravoa Bulliana*. As a genus, it is intermediate between *Polianthes* and *Bravoa*, having bell-shaped purplish flowers, curiously bent downwards in the middle. It is a native of Mexico, and flowered at Kaw in 1894.

Saccolabium Mooreanum, Rolfe, t. 7428.

Spiræa bracteata, Sabel, t. 7429.—A Japanese species, which has been called in gardens *S. media* or *S. rotundifolia*, or *S. rotundifolia* var. *media*. We hope the nomenclature may now be considered settled.

Pyrus sikkimensis, Hook. f.—A Himalayan Crab-apple flowering at Kaw, and presumably introduced from Sikkim by Sir JOSEPH HOOKER.

Pleurothallis Scapha, Rehb. f., in *Gardeners' Chronicle*, 1874, vol. ii., 162.

MELON GROWING AND ARTIFICIAL MANURE.—The gardener at Minstead Manor forwards a photograph of a Melon-house under his care, to show the effect of the Chelsea Manure. The manure, he says, soon takes effect, and he was enabled to cut 175 fruits from fifteen plants on which it was used, the total weight of which was 4 cwt. 1 qr. 2 lb.

M. J. VESQUE.—We hear with great concern of the death of M. JOLIEN VESQUE, one of the most accomplished botanists of France. M. VESQUE paid great attention to physiological botany in its application to agriculture and gardening. The relation of minute structure to function and the adaptations to altered conditions were studied by him with success. One of his latest works was a volume of the *Suites au Prodromus*, devoted to a *Monograph* of the *Guttiferae*, in which the anatomical structure of the leaves is made use of as a "character" to be utilised with others in the discrimination and delimitation of species. We have no doubt that similar monographs will in future be compiled.

THE SUPPLYING OF BULBS TO THE LONDON PARKS.—Messrs. JAMES CARTER & Co., seed merchants, 237, 238, 246, and 97, High Holborn, London, W.C., have again been honoured with the commands of Her Majesty's Commissioner of Works to supply the bulbs for the Royal Parks of London; and they have also received a similar favour from the London County Council for the parks, gardens, and open spaces under their control.

BOOK NOTICE.

A GARDEN OF PLEASURE. By E. V. B. (Elliot Stock.)

The pleasant articles in our columns descriptive of a Buckinghamshire garden, and reprinted under the title *Days and Hours in a Garden* are still held in fresh remembrance. The present volume is of a similar character. Its records pertain mostly, if not entirely, to the same garden, and they are framed in the same refined, sympathetic, and original way. They are not meant to be criticised, but merely to be read and enjoyed. One or two points we may be permitted to allude to, and first as to the gracious remembrance of the gardener.

"And now, departing not from the custom which holds with letters as with prefaces, and by which the last word is wont to be the most important, a word must be said for the Chief Tiller of the garden, in whose hands lies the responsibility of success or failure. Perhaps there may not be many who would choose a gardener on such lines as these; not many would, so to speak, take the candidate into the garden, and pointing to a Cabbage or a Currant-bush, give the order thus:—Dig a hole and plant that Currant head downwards, and if forthwith the man did as he was told without a word, engage him on the spot! Yet I believe such imperiousness does exist, and then is fatal to the garden. We may love dearly our flowers; we may know (or think we know) everything about them, and call them all by their names. We may believe we are Master, and that things being done entirely under our directions, everything will grow, and all will be well. Yet nevertheless nothing will grow, nothing will be well unless the gardener is also in a sense, on his side, master. When his worth is ascertained, give him a free hand over all affairs which come specially under his control. Give him a living interest in the garden by letting him exercise his taste (subject always to yours) in planting and in arrangement of colors, &c., and by showing your own constant interest in it; and if the man be possessed of good intelligence and Experience, if his heart is in his work, if he has it in him to Succeed, succeed he will. The garden and the gardener will grow, as it were, to understand one another, and you to trust and understand them both, while your content and gladness in the garden will increase and grow with the years' increase. . . .

"And here a grateful tribute must find place, for the gardener, JESSE FOULK by whose rare skill this plot grew into a Garden of Pleasure, whose ceaseless care has maintained its charm for three and twenty summers, and who completes the Thirtieth year of his devoted service on the 22nd of May (1895), with which well-omened date I close my Preface."

With such reciprocal good feeling all ought to go well, and generally does go well, in spite of the contrarieties that always will arise in the best regulated of gardens, from causes beyond the control of master or man. To one other subject we may refer, in the hope that the authoress may clear the matter up.

With reference to the introduction of the Pine-apple to this country, there are some discrepancies. "E. V. B." here tells us that John Tradescant lived once at Dorney Court, near Maidenhead:—

"There is some tradition that there he presented his Pine-apple to Charles II., and it is not many years since a little wayside public-house near retained still the sign of a Pine-apple. The [Pine-apple] was the first grown in England. At Dorney Court there is an old engraving which represents Tradescant kneeling before the King in a garden presenting his Pine-apple."

So far "E. V. B." But according to Johnson's *History of English Gardening*, it was John Rose, gardener to Charles II., at St. James's Palace, who presented his Majesty with the first Pine. "There is a portrait of Rose in oils at Kensington Palace, representing him giving the first Pine-apple cultivated in England to Charles II., whilst that monarch was on a visit to Rose's mistress, the Duchess of Cleveland, at Downey (sic) Court, Buckinghamshire." John Evelyn says he saw the first Pine-apple presented to the King in 1661, and twenty-seven years later he was privileged at the Banqueting-house to taste a piece from His Majesty's own plate; but apparently he was not courtier enough to fall into ecstasies over it.

A copy in water-colour of the picture in Kensington Palace above referred to, was in the library of the Royal Horticultural Society even so lately as the time when the Lindley Library was housed in the nearly inaccessible shed at South Kensington, but, unfortunately, it has disappeared, and we believe it has not been seen since the transfer of the books from South Kensington to Victoria Street. It may be that this Pine was not grown here, but in Holland.

In any case, we have Tradescant and Rose, St. James's Palace, Kensington Palace, Downey Court, and the Banqueting-house, all mentioned in connection with the first Pine grown in this country. It is not likely that both the gardeners and all the localities mentioned were concerned in the matter. What, then, is the true version?

It is probable that there is some confusion between the Pine imported from Barbados and elsewhere, and that which was really ripened under an English sun. It is also on record that another Charles, that is Charles V., was offered a Pine-apple, but refused it, and declined to taste it. Better authenticated cases of Pines presented for Royal acceptance are that weighing 9 lb. 4 oz., and presented in June, 1820, to his Majesty George IV. by John Edwards, Esq., of Raedla, Glamorganshire. In 1821 another fruit of the same variety, and weighing 10 lb. 8 oz., was grown at Stackpool Court Gardens by Mr. Buchan, gr. to Lt. Cawdor, and forwarded by the Royal Horticultural Society to his Majesty. This fruit was served up at dessert at the coronation banquet.

Our author's book has rendered us disservice. It is permissible to be so in due season. Let those interested in gardens who want a pleasant book to stow away in their portmanteau for perusal during vacation hours not forget this *Garden of Pleasure*.

RAVENS COURT PARK, HAMMERSMITH.

Amongst the smaller suburban parks under the control of the London County Council, this (about 35 acres in extent) certainly ranks as one of the prettiest and best kept. The grounds here, when in the possession of the late George Scott, Esq., were laid-out by the famous landscape-gardener, Repton, who made great improvements. A very fine avenue of Elms leading to the house (now converted into a Free Public Library) is a feature of the place. This was formerly the Manor-house, and was called Ravenscourt, a capital mansion, built in the style of the French architect, Mansart.

The place has interesting horticultural associations, for opposite to one of the main entrances to the Park once lived Louis Weltjie, Esq., at that time a famous grower of Auriculas; his name is still perpetuated in Weltjie Road. Not a stone's-throw from here lived, too, one who in his day made himself famous by his culture of Dabbias and Celery—to wit, the late Charles Lidgard, of the Old Thatched House. Hammersmith will always be noteworthy from a horticultural point of view in connection with the very old firm of Lee.

Returning to the Park, it is a great boon as an open space to the inhabitants of Hammersmith, with its beautiful flower beds, stately trees, winding walks, and sequestered seats, and lake. Several

improvements have recently been carried out. An addition to the lake has been made by carrying the water round some large trees, forming an island which has greatly improved its appearance, and will give increased facilities for skating.

The rough piece of ground adjoining the main road has been laid out in beds and shrubberies, the bare places between the newly-planted shrubs being filled up with a good selection of Canterbury Belle, Carnations, and various bedding plants, edged with *Viola*, making quite a bright and pleasing display. One long border was very gay with an edging of *Viola picturata*, a profuse bloomer. The effect produced by these mixed borders is far preferable to the formal lines so often seen. A great advantage possessed by the mixed system is, that as the plants go out of flower they can be replenished without much trouble from the reserve-ground, not necessitating the taking up whole lines of plants.

Pelargoniums are not used in any of the beds, but in the mixed borders *Fuchsias* were largely used for beds, and dotted on the grass; how effective and graceful they are used in the latter way! A very large scroll-bed (of which we give a sketch, fig. 44) was an effective feature, being done in a free-hand design, representing a trailing stem with leaves. The main stem or scroll was composed of *Alternanthera versicolor*, the large leaves were done with *A. magnifica*, small leaves with *A. aurea*, the groundwork being *Sedum glaucum*.

Several beds were edged with a very profuse blooming dwarf white *Alyssum*, which I have not seen before. The rockery here is getting established, and is a source of interest when its various occupants are in flower. It should be mentioned that the park is well managed by Mr. W. B. Gingell, who has effected several much-appreciated improvements since he took charge some five years since.

Other plants used in the design are *Kleinia repens* for the larger leaf-veins, *Alternanthera anrea* for the smaller ones, *Echeveria secunda glauca* for the edging; whilst *Herniaria glabra*, green *Sempervivum* and *Mesembryanthemum cordifolium variegatum* are also used in places which the limited size of our illustration does not permit us to indicate specially. *J. B.*

HOME CORRESPONDENCE.

A NEW VARIETY OF GOOSEBERRY.—I have sent you a few Gooseberries for your inspection, which I have named White Warrington, the result of a sport. Never having seen any myself before, nor anyone about here, I think they will be a great acquisition, as every gardener knows the good qualities of the Red Warrington. I have two nice bushes, and have had them for six years, and they always keep the same. Please let me know if you have ever seen or heard of any before. *L. Dow, Newbyth, Prestonkirk, N.B.* [It is identical in shape of berry, hairiness, and flavour to the Red Warrington, and is likely to become as great a favourite as a dessert variety as that one. The skin is fairly tough, as in the red variety, and the berry should be as good a keeper. *En.*]

PRESERVING FRUIT.—In reply to the various queries of Mr. D. T. Fish in the *Gardeners' Chronicle* of August 17, p. 180, upon the subject of preserving fruit, I beg to submit the following replies:—1. The time for the development of the maximum properties of the gelatinising of fruit in the process of preserving them should not exceed one hour. The time must of necessity vary according to the juiciness of the fruit. 2. The maximum time for the development of fruit jelly should not exceed twenty minutes. In a discussion which followed the delivery of Miss Parloa's lecture, she repeated her remarks about pectine, to impress upon the minds of the audience the fact that much cooking of fruit in making jelly tends to impair the quality of the jelly; and that in many cases the product is not jelly, because that principle in the fruit had been expelled by the cooking, leaving a thick syrupy fluid. 3. With regard to the use of Lemon juice to keep fruit white after paring, it would appear that the acid forms an organic compound on the outside of the fruit which prevents the discolouring. 4. It is most probable that sun-dried Strawberries are a luxury denied to English housewives. *J. J. Willis, Harpenden.*

SLUGS AND WORMS.—The animal which Mr. Robert Warner mentions in your issue of the 17th inst. under the name of the "earth-slug" is evidently a *Testacella*, which is the only British genus of slugs which have an external shell (which is situated at the end of the tail), and which feeds on live worms. The large black slug, *Arion ater*, is reported to eat worms, but my observations during more than fifty years incline me to the belief that *Arion ater* wants somebody to catch and kill a worm before he could make a meal of it. *W. T., Bishopsteignton.*

SLUGS DESCENDING BY A LINE OF SLIME.—The several communications in your last two numbers are very interesting, but only confirm what has long been known to students of British mollusca. If Mr. Da B. Crawshaw will kindly send me the next specimen he may find alive, I shall be pleased to identify it for him. I suspect it may prove to be *Limax arborum*, as I have caught this species coming down from a tree in Knole Park, Sevenoaks, within a mile of Mr. Crawshaw's house. Other slugs known to descend and climb, are *L. agrestis*, which is creamy or pale grey, and about 1 inch long; and *L. Sowerbii* (formerly known as *L. carinatus*), which is chocolate-coloured, has an orange keel down the middle of the back, and is 2 inches long. Both these species are common at Sevenoaks. *W. Thomson, Bishopsteignton, South Devon.*

FAILURE OF PLANTS OF SUMMER-FLOWERING ASTERS.—I send herewith two or three Asters which have gone to the bad. Can you tell me in your next issue the cause, and, if possible, the remedy? I have only lost about a dozen plants in this way. They are perfectly healthy one day, and next morning they look as if the leather-grub had been doing his worst, but I have not been able to find the culprit. I am told that a gentleman in Spalding, whom I know very well, paid no less than £5 this year for Aster seed and plants. He has a very extensive garden, and I have but a small one; notwithstanding this, however, I have at the present moment perhaps the finest show of Asters in the district. It is very annoying to have your plants go off just as they are coming into bloom, and I hear that his plants have served him the same trick. Any information or advice will be thankfully received by *Robert King*. [An expert to whom we sent the plants writes:—"The plants are perfectly free from all forms of fungoid disease, and I cannot suggest any cause for their peculiar behaviour. *G. M." En.*]

BEDDING ARRANGEMENTS IN ST. JAMES'S PARK.—On entering the park from the entrance on the western side of the Horse Guards Parade-ground, on the left will be seen some groups of plants on the grass, consisting of *Dracænas*, mixed *Fuchsias*, and *Heliotropes*, which now look very well. Going further west, we come to a mixed border of *Fuchsias*, *Heliotropes*, *Cannas*, *Marguerites*, *Nicotiana affinis*, *Pentstemons*, &c., furnishing a grand appearance. Here are also five beds (three circles and two oblongs); the oblong beds are planted with Ivy-leaved *Pelargoniums* *Ryecroft Surprise*, with a carpet of mixed *Violas*. Three circles:—The centre bed is *Fuchsia Marinka*, having a carpet of *Alternanthera major*; the two end beds looking very good, being planted with *Fuchsia Mrs. Rendell*, having a carpet of *Alternanthera major*, and some dot plants of *Abutilon Boule de Neige*. At the rear of these beds is a large circular bed, planted with mixed sub-tropical plants, which are doing well. Still further west is a dell having plants of *Musa Ensete* and *Palma*, plunged in the grass, and presenting quite a tropical appearance. Most of the borders in the park have their margins planted with the usual summer bedding plants. Bold massive groups of *Iris*, *Polygonum*, and other plants at the edge of the ornamental water give the park quite a unique and effective finish. In the square near the Houses of Parliament there are some beds which at the present time are doing well; they are planted with *Fuchsias*, *Pelargoniums*, *Cannas*, and *Eucalyptus*. Considering that they are surrounded by dusty roads and other unfavourable conditions, it amply demonstrates what can be done in a gardening way in what may be called the heart of London. *J. B.*

THE DOUBLE ROCKET.—Of this old inhabitant of our gardens there are three varieties, as far as my own knowledge goes—viz., the true double white, which one finds in Lancashire, Yorkshire, and the north, which does not appear to do well in the southern counties; the taller and more robust-growing French white, the flowers of which when they

age becomes tinted with pale lilac; and the double purple, which is inferior as a decorative plant to either of the foregoing. A fourth might be added—the double yellow-flowered *Barbarea vulgaris*, which is known in some localities as the double yellow Rocket. The first three appear to be getting scarce plants, they were scarce fifty years ago, and it sometimes does badly, and hence it appears to be worn out. I do not believe that the plant is worn out; any loss of vigour may, I think, be owing to improper culture or neglect. The double Rocket is a plant that declines in health as soon as it is neglected, and there is no doubt but that the fine specimens sometimes met with in cottage gardens are potted plants, and therefore well looked after. Of methods of propagation, that by means of cuttings is preferable to division of the roots in September. The advantage of propagating by cuttings is that the plants have more time to establish themselves before inclement weather sets in. Cuttings should be taken when the shoots are 10 to 12 inches in length, dividing them into three joints in length, the

some flattering notes I made last year of the fine trees seen in the Bournemouth Cemetery. These were pictures of health, verdure, and beauty, with no trace of the rusting or dying off the lower branches that so often mars the symmetry and beauty of *Arancarias*. The lines along each side of the main walks were in robust health, and specially green and flourishing. It seems a mistake to call any number of lines of Chili Pines avenues, as most of us associate the name with lines of overarching verdure and beauty, and it would be impossible for *Arancarias* to form such avenues, however high or wide they might grow. Nevertheless, regular lines or ranks of stately *Arancarias*, or groups or masses of them, where they do as well as around Bournemouth, Bicton, and a few other places, have a striking and a very original appearance. Possibly, Mr. Ward is right about the soil being somewhat light sandy peat about Bournemouth. The common Scotch and other Firs thrive well in it, and so does the *Arancaria*. And yet I have seen the Chili Pine do well on loams of various textures. Provided the latter is well drained, fairly dry, a moist genial atmosphere has

that were in water on the counter, viz., Lottie Eckford, Emily Henderson, and Princess Beatrice. The first being white tipped with blue, the second a well-known white, and the third a deep pink. [He did what he undertook to do, although the flowers were changed into other glasses, and correctly naming each of the three varieties by its fragrance only. The manner in which the testing was done is given in the words of an onlooker, and is too long for us to insert. Ed.] I do not give this through egotism to the readers of the *Gardeners' Chronicle* as being anything wonderful, but venture to suggest that colour in flowers may have something to do with perfume. In Roses, for instance, the rich crimson are always the richest in odour. [How about *Maréchal Niel*? Ed.]; and I think Rose-growers may, blindfolded, be able to do with Roses what I did with Sweet Peas. Certainly the one called Cardinal, in scarlet, is to my mind, almost the finest in perfume, excepting Princess Beatrice, a rich pink. The variety Emily Henderson is the weakest, but the best of whites. What say your readers? *Wm. Bayler Hartland, Ard Cairn, Cork.*

FIG. 44.—CARPET-BED, RAVENSWORTH PARK, HAMMERSMITH. (SEE P. 216.)

terminal bud being taken out, otherwise it may become a blooming shoot. A bed for the reception of the cuttings should be prepared under a wall, or better still, in a small frame; and a compost for them to be inserted in, made up by mixing three-parts of good mellow loam with one of sharp sand, taking care the latter is in quantity near the surface. The cuttings should be inserted with two eyes or buds below the surface; a good sprinkling is then given, the light placed on the frame, and the cuttings shaded from the sun, water being afforded as may be required. When treated in this way, cuttings rarely fail to root. An old gardener, who was very successful with the culture of the double Rocket, states:—"Where it is wished to grow this plant in a high state of perfection, care should be taken that no manure whatever forms a part of the soil in which they are planted, as it will cause a strong exuberant growth, and materially diminish the chances of propagation, either by cuttings or division." The double Rocket does well in a good fresh loam, with which a little leaf-soil may be mixed if thought to be too heavy; in such the plants will grow stocky, they will throw up many stems, and bloom in thick dense spikes 1 foot or so in length. Some of the old growers who made a pet of this plant would allow their plants to bloom but twice only, considering they had reached their highest stage of perfection when they flowered the second time. A few cuttings should therefore be struck every year, so that a succession of plants may be assured. *R. D.*

ARAUCARIA IMBRICATA AT BOURNEMOUTH.—Mr. H. W. Ward's remarks about the fine Chili Pines at Banksome Dean Park, Alderbury Vicarage, in the *Gardeners' Chronicle* for July 20, reminds me of

probably more to do with its verdure and health than any particular soil. At Castle Kennedy in Scotland, as well as in other genial places throughout the United Kingdom, fine *Arancarias* may be met with. But in East Anglia, the climate seems too dry for it. I had, however, a fine specimen under my care for some years at Glevring Hall near Woodbridge; this was said to be one of the earliest imported. For many years it continued a picture of health and beauty. No surface care, however, nor top-dressing could stop the bottom branches from rusting off. This fine specimen, however, was on heavy loam. Others on lighter soils, however, followed its example after a time, and the majority of the Chili Pines in many moist localities. Even at Bicton in Devon, under the skilful culture and planting of the late Mr. James Barnes, so distinguished for his cultivation of this and other hardy and semi-hardy trees and shrubs, and where the *Araucaria* grew so freely, and coned so well, that not a few began to see in it a future source of food grown in these islands, not a few of the fine stately trees became more or less ragged. And Mr. Barnes' bold venture of growing and ripening Pine-apples in the open air is about as likely to be realised as the successful culture of the Chili Pine to the highest perfection of symmetry and verdure. *D. T. F.*

COLOUR AND PERFUME IN SWEET PEAS.—Have any of your readers observed how different are the perfumes of Sweet Peas? Some of them have that of the Rose, all more or less quite distinct from each other. The white varieties are particularly weak in odour, while the scarlets and pinks are very strong. To-day I ventured to suggest to a few friends, and my warehouse assistants, that I could blind-folded tell the names and colours of three very distinct varieties

LAW NOTES.

THE NATIVE GUANO CO. v. HIBBERD.

IN the City of London Court, before Mr. Commissioner Kerr, the case of the Native Guano Co. Ltd. v. Hibberd was heard, in which the plaintiff company, of 29, New Bridge Street, E.C., sought to recover from the defendant, Mr. Henry Hibberd, gardener, Grange View, Batley, Hants, the sum of £3 for guano supplied. Mr. James Welfare appeared for the plaintiff company. The defendant said the reason he declined to pay for the guano was because the material which was sent to him turned out to be different to what it was represented he should have. He had to give it a trial before he knew what it was like, and so he had broken into it. As soon as he found out what it was really like he wrote to the plaintiff company and disputed his liability. Mr. Commissioner Kerr said it might be useful to the defendant and others to know that when he received goods which were not according to the representation he should at once return them, and on no account keep them on his premises. He had been telling people so for a long time, but they did not seem to pay attention to what he told them. The defendant might bring an action for damages if he liked, but in future he must see that he received the right stuff. For thirty years he had been warning people against the advertised stuff which were continually sold. The only thing he could do was to find for the plaintiffs for the amount claimed, and give them the costs of the litigation.

A QUESTION IN THE SEED TRADE.

Messrs. Toogood & Sons, seedsmen, were summoned before the Southampton magistrates on Tuesday for selling seeds improperly described. Mr. E. J. Trustram prosecuted, and Mr. Page defended. The question raised was whether the seed trade generally was allowed to sell a particular kind of seed which has been named after the original producer, or whether the inference should be gathered that in consequence of that seed having a particular producer's name, it must necessarily have been produced by him. Mr. Shephard, seedsman, of Stockbridge stated that after many years' trial he had produced Shephard's Kale, which was registered as a trade-mark, and which he supplied to farmers only, and not wholesale. He had never supplied any to Messrs. Toogood, and the seed sold by them was inferior to his. He claimed that there had been an infringement of his trade-mark, and that when a personal name was put to a seed it was supposed to be grown by that person. He would not swear as to the custom of the trade, but only as to Kale. After formal evidence of purchase, it was agreed to adjourn the case until September 11, counsel stating that the case was so important that it might go to the House of Lords. It was intimated there was a perfect defence, and that the defendants had only followed the custom of the trade. *Times*.

LOW'S GROUND-COMPASSES.

As the ground season will soon be upon us, when many will be busy renovating old and laying out new gardens, permit me to direct the attention of your readers to this useful patent of Mr. Low, for many years the gardener to the Duke of Grafton at Easton Park. In this position Mr. Low has had much experience, not only in the furnishing of the flower-gardens, but has likewise had much practice in remodelling and making the major portion of them on new and more graceful lines. The character of the garden, as well as of the mansion, almost necessitated formal or geometrical treatment, and all who have had any experience in such work know what material help may be derived in the laying-out of flower-beds and borders from reliable compasses 4 feet long with a radius of 6 feet to 6 inches or less. This necessity as usual became the mother of this most useful invention, which I have found to do readily and well all the work promised for it, and more than is promised in Mr. Low's prospectus. They are superior to any others I have used for landscape-work, in their neatness, fixity, certainty, and durability. As seen at a glance by the woodcut (fig. 45, p. 219), the staff shows the patent compasses at rest, posing or reposing. A sight-staff for the forming of perpendiculars, B, shows them at work with the left leg resting on a solid base, and the right fixed to any given radius by the slender connecting-rod, secured in position through the small thumb-screw on the opposite or describing leg; the compasses also secure fixity of depth and certainty of radius. The square block, pushed into the ground, with its brass-furnished hole, for the stable leg, securing the first, and the connecting-spline and thumb-screw the second. What these two conditions are, and how much they mean, can only be thoroughly understood by those who have had to lay out difficult and delicate designs with common compasses.

As to durability, both legs are shod with brass, and the wood is of the best, and thoroughly seasoned. For setting out small holdings, allotments of fruit, flower, or vegetable gardens, walks, measuring the distances between fruit trees and bushes, or other crops, setting out smalls, these compasses form the handiest of all measuring-rods. *D. T. F.*

SOCIETIES.

ROYAL HORTICULTURAL
Scientific Committee.

August 13.—Present: Dr. M. T. Masters, in the chair; with Mr. McLachlan, Mr. Burbidge, Mr. Weathers, and Rev. G. Henslow, Hon. Sec.

Black Currant × *Gooseberry*.—A fruiting specimen of this hybrid was sent by Mr. CULVERWELL. It was previously received and described in the minutes of the Scientific Committee for June, 1890. The fruits are small, and have a very slight taste of the Black Currant. The bark reveals the scent more distinctly, while the skin of the fruit has the glandular hairs of the latter mixed with the ordinary hairs of the Gooseberry.

Lilies Diseased.—Specimens of the foliage of *L. Lowi* and *L. nepalense* were received from Messrs. WALLACE, of Colchester, attacked by apparently the too common "Lily disease" fungus. Bordeaux Mixture is suggested as the best remedy. He observed that the disease in his garden only attacks the Lilies received from Burmah. It was formerly thought that burning was the only means of extermination; but experience has shown that the bulbs may not be at all injured, and that as the disease may be very prevalent one year and very scarce the next, it will be better in future to leave the bulbs, only destroying the aerial portions attacked.

Lime and Bees.—A spray of a Lime tree was received from Mr. F. ENOCK of 21, Manor Gardens, Holloway, to be named. It proved to be *Tilia petiolaris*, D.C. He also observed that numerous dead bees were found under the tree, suggesting that the honey might be of a poisonous nature. In a communication from Kew, whither the specimen had been sent, it is observed:—"We have long noticed at Kew that bees are killed after visiting the flowers, and quite a circle of dead bodies are found under the branches every summer." Mr. McLachlan remarked that this occurrence has been long known to entomologists, and by the watching of the trees by Mr. E. SAUNDERS he found that the death of the bees was caused by the attacks of tomits, apparently by extracting their honey-bags.

Lettuces attacked by Aphides.—Plants received from the Chiswick Gardens showed the roots to be badly infested by these insects. They were forwarded to Mr. G. B. BUCKTON for further examination.

Potatoes Diseased.—A communication was received from Mr. ASHLEY, Elmcroft, Staines, stating that "the leaves appear to be spotted with brown, where holes appear; the leaves subsequently curl up. The disease occurs in patches, and gradually spreads. It is not confined to one sort of Potato alone. I noticed the same disease on some early Potatoes about two months ago, and washed the leaves with very weak paraffin and water. [This seemed to stop it." Having been forwarded to Kew for examination, the report is as follows:—"The young leaves are in the first instance punctured by an insect; the wounds made are the points afterwards attacked by a microscopic fungus—*Macrosporium Solani*—which completely destroys the tissue, hence the holes in the leaves. Spraying with Bordeaux Mixture will destroy both insect and fungus; but if a solution of very weak paraffin has proved effectual it would be wise to continue its use. The great point in spraying, whatever solution is used, is to thoroughly wet the leaves. A little soft-soap mixed with the liquid assists in doing this."

Photo of Cedrus Deodara Struck by Lightning.—Mr. WEATHERS exhibited a photograph, taken at Kew at 7 A.M., August 12. It represented a *Deodara* which was shattered by lightning on the night of August 10. The main trunk is cleft in twain almost to the base, while large splinters and branches are scattered about. The wood is perfectly sound, and shows no signs of charring. The tree was about 30 feet in height.

Cuscuta vesca, Female replacing Male Flowers.—Mr. HENSLow exhibited specimens of this exchange of sex, as being particularly abundant on a Chestnut-tree this season; a probable result of the climate, as it is well known that external conditions often decide which sex shall predominate when a plant is naturally bi-sexual. He alluded to experiments by Mr. Meehan, Hoffman, and his own, in which seeds of bi-sexual plants gave rise to various proportions of males and females, according as they are sown very thickly or thinly.

Fruit Committee.

August 16.—Present, at Chiswick, were H. Balderson, Esq., in the chair; and Messrs. J. Willard, G. Wythes, J. Hadson, Mr. Fife, A. Dean, W. Farr, J. Cheal, and J. Smith. The committee's attention was first drawn to the Tomatos in pots, of which there is in various houses a very large and well-grown collection; very few, however, are really new, and none seemed to show anything specially meritorious beyond what can be seen on established varieties. The following had previous awards of three marks or of certificates, granted at the Drill Hall, confirmed:—

Golden Princess, fine deep golden fruits, very handsome and prolific; Tennis Ball, fruits freely produced in good clusters, medium-size, round, rich colour, and pretty; Comet, large, handsome, smooth, round red fruits; Sutton's Dessert, smallish fruits, borne in clusters, scarlet; and Sutton's Golden Nugget, a counterpart of the previous one, fruits rich yellow, both abundant fruiters as dessert varieties; Frogmore selected, a large handsome free-fruited variety, scarlet colour; Duke of York, recently certificated at the Drill Hall, also having fine scarlet fruits; Chemin, a well-known scarlet-fruited variety, and the better known Conference. Two sorts not previously noted, were Sutton's Early July, an improved open-air, and the cherry-shaped, a very old sort, fruit small, round, scarlet, and borne in racemes, specially mentioned for its high flavour as a dessert variety. Each had three marks awarded.

Runner Beans next came under notice, those of British stocks being generally excellent; whilst Continental varie-

ties seem to have suffered from the cold rains. Of the Scarlet or rough Runner types, Sutton's Prize-winner, a splendid long green Bean; Sutton's Al, also good; Leviathan a splendid cropper and handsome sample, all scarlets; and Capp's White Runner, a fine and very prolific white-flowered variety, had each three marks awarded. Of smooth runners the only ones regarded as worthy of special notice were Sutton's Tender-and-True, and Veitch's Climbing French Beans, previous awards being confirmed; the committee, however, seeing these two Beans growing here together under precisely similar conditions, came to the important conclusion that they are absolutely identical, they all the same leave to others to determine under which of the above names the variety shall henceforth be recognised.

The adjoining trial of Cabbages was then inspected, there being a first-rate growth on all. Of the dwarf early varieties, the best stocks were Improved Nonpareil, from Messrs. NUTTING & SONS, and Messrs. J. VEITCH & SONS, both of which received three marks. A better dwarf Cabbage could hardly be found anywhere. Of succession varieties, the best were Sutton's Earliest, Barr's Best of All, Vilmorin's Express, and Les Etampes, all of which the committee regarded as of the same stock, and a first-rate one. This is probably the best mid-season Cabbage in cultivation.

Red Cabbages were also noted, the stocks of Benary, Vilmorin, and Sutton's Dwarf being the best, also very dwarf, early, and compact. A final decision as to the merits of these will be given at a later meeting, when the Potatoes will have to be examined. Of these there is a large trial, but, like Potatoes everywhere, the growth is excessively strong. A few early Turnips were also examined, but were regarded as of no special merit.

CHARLWOOD AND DISTRICT
HORTICULTURAL.

August 7.—Charlwood is a village lying near to Crawley, on the verge of the boundary of Surrey and Sussex, and near to the fruit nurseries of Messrs. Cheal & Sons. For several years past a small cottagers' show has been held, this year it took the form of a district show, extending its operations over a wider range, and prizes were offered for the first time for gentlemen's gardeners' competition. So good was the exhibition that it promises well for the future, and with Mr. Joseph Cheal as general director, there is a useful future opening before the Society. A large number of country people came to see it, despite the threatening weather.

Tables of plants, occupying a space of 12 feet superficial—afaireure obviously copied from the Brighton shows—were an excellent feature. Mr. Thos. Sparks, gr. to A. A. DOROTHY, Esq., taking the 1st prize; the 2nd going to Mr. Dancy, gr. to C. GORDON SLOANE, Esq. This is a very useful class, as it is a means of education for young gardeners. Some useful table plants were shown. Mr. Davis, gr. to J. COVELL, Esq., taking the 1st prize, though all shown were rather too large; he also had the leading prize for six quarter-specimen Ferns, well-grown, and very healthy. One often sees in country districts something of exceptional quality, and it was the case in the class for six Coleus in which special prizes were offered by the Hon. H. CUBITT, M.P., as Mr. Dancy had six plants, admirably grown and coloured bushes of distinct varieties, that were a great deal better than anything we saw at Leicester on the previous day; some rather larger plants, also well grown, took the 2nd prize, but the exhibitor's name did not transpire.

Mr. N. Tanner, gr. to Mrs. BROUGHTON STIRLING, Lovell Heath Lodge, had six very good double flowered Begonias, which took the 1st prize. Plants were also shown by amateurs. Cut flowers formed a strong point. With twelve varieties, Mr. E. Brown, gr. to M. W. MORRIS, Esq., a young gardener who promises well as an exhibitor, had African Marigolds, Chrysanthemums, Coreopsis coronata, Plectranthus, Begonias, &c., all in good character; Mr. DAVIS was placed 2nd.

The special prizes offered by C. G. SLOANE, Esq., for twelve bunches of Cactus and decorative Dahlias brought a good competition, and Mr. E. BROWN, who has already made his mark at the Crystal Palace Dahlia show, was placed 1st with excellent blooms of Delicata, Gloriosa, Mrs. Peart, Lady Penzance, R. Cannell, Matchless, Bertha Mawley, Juarezii, &c.; Mr. G. DANCY came 2nd, having rather more of the decorative varieties. With six bunches Mr. BROWN was again 1st, having in good character Mrs. Douglas, Matchless, R. Cannell, Lady Penzance, Delicata, and Beauty of Wilts; Mr. DANCY was 2nd, his best bunches being R. Cannell, Bertha Mawley, Mrs. Peart, and Keyerith.

Asters were somewhat sparingly represented, the weather having told upon the blooms.

FRUIT was invited by special prizes from Mrs. BROUGHTON-STIRLING; for six dishes, Mr. DAVIS taking the 1st prizes with Black Grapes, Peaches, Plums, Melons, &c. Mr. DAVIS had the best two bunches of Black Grapes; Mr. SPARKS was 2nd. Mr. DANCY had a very fine lot of twelve Tomatos, Mr. DAVIS was placed 2nd.

That vegetables are well grown hereabouts was conclusively shown in the high quality of not a few which were staged. Mr. BROWN took the 1st in Messrs. CHEAL & SON'S special prizes for six dishes of vegetables of their own stocks, and he had very fine Cauliflowers, Carrots, Potatoes, Peas, Onions, and Scarlet Runners; Mr. SPARKS was 2nd.

G. O. M. HERRON, Esq., also offered special prizes for dishes, shown by amateurs. Mr. PETERS was 1st, and Mr. GREENFIELD 2nd.

In the amateurs' division, Mr. W. GREENFIELD was 1st with a plate of Potatoes, and also with six varieties of fruit.

In the way of miscellaneous exhibits, Messrs. J. CHEAL & SOX put up a large collection of hardy cut flowers, pretty Violas in bunches, Cactus, Pompa and single Dahlias, Gladioli, &c., with Begonias in pots, Palms and Ferns at the back, a very fine feature. Mr. F. FRANK HUDSON, Gunnersbury House, set up three charming Epergues, arranged with fine good taste, some of the new hardy water Lilies from America being specially attractive; and Mr. SPINKS, florist, Horley, had a collection of cut blooms of various types of cut Dahlias, all of which were highly commended.

STOKE POGES FLOWER SHOW.

AUGUST 7.—This show was held in the grounds of H. HOWARD-VYSE, Esq., Stoke Place, near Slough, on the above date. The horticultural society of this place was started in quite a small way, but it has now attained considerable importance. On this occasion the groups of plants arranged for effect were very good, and with a few other exhibits, filled a large tent.

The groups were of semi-circular form, to cover 10 feet square, and the 1st prize was well won by Mr. PAGE, gr. to H. HOWARD-VYSE, Esq.; he had a centre Palm, a Kentia, with beautifully-coloured Crotons and Enlalias, Francoa ramosa, Oncidium flexuosum, and Lilies, with a groundwork of Adiantum and Caladium argyrites. Mr. E. JOHNSON, gr. to A. GILLIAT, Esq., was a good 2nd; and he had some very fine white Campanulas in his group, good Gloxinias and Lilies, and Francoa ramosa, with a groundwork of Maidenhair, edged with Panicum variegatum. 3rd, Mr. CAPP, gr. to Sir C. PIGGOTT, Wexham Park, whose plants were good, but the arrangement rather heavy.

For six kinds of fruit, Mr. JOHNSON was 1st; and in the vegetable classes this exhibitor held the same position both for eight and six kinds, with splendid produce.

Mr. KEMP, gr. to W. BRYANT, Esq., Stoke Park, arranged a fine group of plants, not for competition, his *Panacratium* being especially fine; and Mr. TURNER, Slough, had a good display of cut Roses and herbaceous flowers.

SEVENOAKS HORTICULTURAL.

AUGUST 7.—The twenty-eighth show of this society was held in favourable weather on the above date in Knole Park, and was of the usual character, nothing apparently being of especial merit or out of the ordinary run.

There were plant-groups in which Mr. GIBSON, gardener at Halstead Place, was the winner of the 1st prize; a specimen-plant class with Mr. SUTTON, gardener at Chevening Park, as the best man; Mr. HATTON took the lead in a miscellaneous collection of plants, and one of Ferns.

Roses, Asters, cut flowers of the stove, greenhouse, and open border were shown. Mr. SNOW was the lucky exhibitor of the best six dishes of fruit in as many kinds; and Mr. TAYLER, of Forest Hill, S.E., had the finest Black Grapes; and Mr. OSMAN, Chertsey, the best white ones.

Vegetables, table decorations, &c., and special prizes, including Messrs. H. CANNELL & SONS' "Star of Honour" for the best twelve distinct dishes of Vegetables, and a box of cut flowers, was won by Mr. R. EDWARDS; and a Cottagers' side complete the more important exhibits.

WILTS HORTICULTURAL.

AUGUST 14.—With fine weather, and in the place for holding the show, the Wilts Horticultural Society's annual exhibition was especially favoured this year. The site of the show was located in the grounds of the Bishop's Palace at Salisbury; and the Committee and the Hon. Secretary, Mr. C. G. Wyatt, are to be congratulated upon the well-merited success attending the show.

As usual, Mr. CYPHER secured the higher awards, including that for twelve stove and greenhouse plants. His very fine plants consisted of *Stephanotis floribunda*, *Ixora Williamsii*, *Erica Austriana*, *Clerodendron Thomsonianum* var. *Balfourii*, *Statisia profusa*, *Phenacoma prolifera* Barnesii, two grandly-flowered plants; *Codiaeums* *Sunset* and *angustifolium*, beautifully coloured; *Kentias* *Fosteriana* and *australis*, *Cycas circinalis*, and *Latania borbonica*. Mr. THOMAS WILKINS, gr. to Lady THEODORA GUEST, Inwood House, Henstridge, and Mr. WILLS, Shirley, securing 2nd and 3rd prizes respectively.

The 1st and 2nd prizes for nine stove and greenhouse plants, five to be foliage and four in bloom, went to Mr. W. PEEL, gr. to Miss TODD, Shirley, and Mr. WILLS; *Codium* *Queen Victoria* and *C. Johannis*, *Kentia Fosteriana*, and *Ixora Williamsii* being the more noteworthy exhibits.

The competition between Mr. WILKINS and Mr. HALL, gr. to LOUISA LADY ASHBURTON, Melchet Court, Romsey, in the class for six distinct exotic Ferns, was severe, the prizes, after a considerable amount of time had been spent considering the plants and the awards to be made, were at last given in the order in which we place the names. *Davallia fijiensis plumosa*, *D. Mooreana*, and *Adiantum cuneatum* were the best in Mr. WILKINS' lot.

Six *Tuberous-rooted Begonias*, shown by Mr. A. ROBEY, gr. to Captain H. GREENWOOD, Harnham Cliff, Salisbury, were a long way in advance of those staged in that class, this being the sixth year in succession that Mr. Robey's *Begonias* have

taken 1st prize at the Wilts Horticultural Society's Show. These plants consisted of well-grown and finely-flowered double and single-flowered varieties, the foliage being ample, and the flowers large and fine in every respect. Mr. BEDFORD, Harnham Nurseries, Salisbury, came into the 2nd place with fairly good plants. The last-mentioned exhibitor was far in advance of other competitors in the class for six *Fuchsias*, staging sized pyramidally-trained plants, fresh-looking, in regard to the foliage, and well-flowered.

Groups of miscellaneous plants, arranged for effect, form an important feature in most shows of any standing. The groups arranged this year at Salisbury fairly eclipsed all previous endeavours in this direction; they were light, and quite devoid of formality in most cases. Of the groups arranged in the open and gentlemen's gardeners' classes, central plants consisted of Palms, backed up with smaller ones—*Codiaeums*, *Dracaenas*, *Tuberoseae*, *Bridal Wreath*, *Francoa ramosa*, *Caladium argyrites*, *Cattleyas*, *Oncidium incurvum*, &c., being advantageously employed in most of the winning groups, on a groundwork of Maidenhair Fern, the whole being, as a rule, edged with *Panicum variegatum*, and small plants of Maidenhair Ferns; plants of irregular heights and diversified habit and colour of foliage and flower being arranged with telling effect by Mr. WILLS; Mr. Carr, gr. to W. A. GILLET, Esq., Bishopstoke; and Mr. A. ROBEY, in the open class, and by Mr. CARR, Mr. PEEL, and Mr. ROBEY, in the gentlemen's gardeners' class, and who took the prizes

FIG. 45.—LOW'S GROUND COMPASSES. (SEE P. 218.)

in the order in which their names appear in both of the classes. Mr. BEDFORD had also creditable groups, which in both classes covered a semicircle of 12 feet radius. A nice flowering plant of *Dendrobium formosum* giganteum showed off to advantage in Mr. Robey's group.

In the principal class confined to amateurs, Mr. PEARCE, High Street, Salisbury, won the Five-guinea Cup given by the Mayor of Salisbury, in a fairly good competition; the plants arranged in a semicircle of 10 feet radius, had been carefully selected and judiciously arranged. Mr. SCAMMELL, gr. to G. R. KENDAL, Esq., Wilton, took 1st place in a smaller group class.

FRUIT.

On the whole, fruit made a good show. Mr. H. W. WARD, Longford Castle, Salisbury, secured the 1st place for a collection of eight kinds, with good full bunches of Madresfield Court and Muscat of Alexandria Grapes, good in berry, and of excellent colour; Hero of Lockinge Melon, Prince of Wales Peach, fine in size and colour; Brunswick Figs, Apricots, Clapp's Favourite Pear, and medium-sized Pitmaston Orange Nectarine. Mr. Inglefield, gr. to Sir JOHN KELK, Bart., Tedworth, Marlborough, 2nd, had very fine Late Admirable Peaches, Pine-apple Nectarines, and medium-sized bunches of Black Hamburg Grapes, fine in berry and colour, in his collection. Pine apples were not extensively shown, Messrs. WARD and HALL taking 1st and 2nd prizes in the order of their names, the former showing a good-sized fruit of Smooth-leaved Cayenne, and the latter a medium-sized fruit of the Queen.

Grapes, especially Black Hamburgs, were well represented. Three large solid bunches of Muscat of Alexandria from Longford, fine in berry and colour, easily secured the 1st place. Black Hamburg Grapes that were good in bunch, berry, and finish, gained 1st position for Mr. J. Chalk, gr. to G.

READ, Esq., Westwood, Salisbury, and he was closely followed by Mr. Mitchell, Chilwell Manor, Romsey, who had bunches slightly smaller, but more compact, otherwise fine in all respects.

Madresfield Court Grapes were excellently shown by Mr. SMITH, gr., The Palace, Salisbury; by Mr. WARD, and Mr. WARDEN, gr. to Sir F. H. BATHURST, Bart., Clarendon Park, Salisbury. Three bunches of Mrs. Pearson, of fine size and handsome outline, but requiring a month or six weeks to make perfect, secured the 1st place for Mr. Gardener, gr. to Col. H. S. BATES, Twyford, Winchester, in the class for any other white Grape than Buckland Sweetwater and Foster's Seedling.

Plums made a good class. A dozen fine fruits of Guthrie's Late Gage, perfectly ripe, shown by Mr. WARD, took 1st prize, while grand fruits of Late Admirable Peach gained a like distinction for Mr. INGLEFIELD; and a dish of Elruge Nectarines, staged by Mr. SELMAN, Pyt House, Lisbury, gained a similar award.

Apples were well represented. W. Falford, gr. to Earl NELSON, Trafalgar Park, Salisbury, who was 1st for three dishes of dessert varieties, staging grandly coloured fruits of Beauty of Bath, Early Harvest, and Red Astrachan; while fine fruits of The Queea, Toddington Seedling, and Lord Suffield gained chief honours for Mr. SMITH.

Collections of Vegetables, consisting of twelve kinds, made a good show. Mr. WILKINS was 1st for an admirable collection. Mr. R. WEST, Northlands, Salisbury, was the most successful exhibitor in the cut flower classes, which for the most part were well filled with generally first-rate exhibits.

Non-competitive Exhibits were contributed by Messrs. KEYNES & Co., who arranged a grand lot of Dahlias, &c.; Mr. LADHAMS, Shirley, had a collection of herbaceous flowers; Mr. BEDFORD had miscellaneous plants.

BISHOP'S STORTFORD HORTICULTURAL.

AUGUST 14.—The annual exhibition of this Society was held in the grounds of the Grange, Bishop's Stortford, by permission of J. Barker, Esq. The schedule is a very comprehensive one, the classes were well filled, and the groups of plants here, as elsewhere, formed an interesting feature. Altogether it was an excellent show.

There were five groups, and the best was from the gardens of Sir JAS. BLYTH, Bart., Wood House, Stansted (gr., Mr. W. J. Richardson); conspicuous as a background to the group were tall Campanulas, Lilies, Caladiums, &c., upon a carpet of Adiantums. Groups of single and double-flowered Begonias are always a nice feature at this show, and one tent was set apart for them.

C. GOLD, Esq. Jun. (gr., Mr. D. Patmore), was 1st; and W. SMITH, Esq. (gr., Mr. R. W. Kent), 2nd. Other classes were set apart for Begonias in bloom, Mr. D. PATMORE winning most of the prizes. Of the four groups of six foliage plants, the best one came from Sir JAMES BLYTH's garden. The best group of six Ferns were from the gardens of Colonel G. B. ARCHER HOUBLON, J.P. (gr., Mr. B. Calvert). The best Gloxinia, fine in size of bloom, were from W. HOLLAND, Esq., Plantation House (gr., Mr. W. A. Dunnage).

The best single and double zonal Pelargoniums were from U. TAYLOR, Esq., and were handsome, well-grown specimens.

Mr. D. PATMORE exhibited well-grown *Fuchsias*. The groups of autumn-flowering *Chrysanthemum* deserved a special notice. The winning collection consisted of five dwarf plants, with large and handsome flowers. Mr. B. CALVERT was 2nd, with a very commendable lot. In the Rev. J. MENET's collection (gr., Mr. T. Lodge), the varieties were *Madame Desgranges* and its yellow and primrose sport.

Table decorations were of the usual standard of excellence. No fewer than twenty-six tables were set out in competition for one set of prizes. Miss JESSIE CANNING won the 1st prize with an arrangement of Poppies, a few spikes of *Gladiolus The Bride*, with small flowers of a single variety of *Helianthus*; 2nd, Miss BAILEY, with an arrangement consisting entirely of monthly Roses; 3rd, Mrs. ROUTLEDGE, with a table of Sweet Peas.

FRUIT, ETC.

The best Black Grapes were from the garden of Colonel ARCHER HOUBLON; and the best white from those of Sir JAMES BLYTH, Bart. Colonel ARCHER HOUBLON's gr. had also the best collection of fruit; and Sir JAMES BLYTH's gr. the best Peaches. The best Nectarines were from Sir JAMES BLYTH's garden. Apples, Pears, Plums, Cherries, and small fruits were generally fine fruits in every point, though some were not ripe.

Quantities of cut flowers were exhibited, especially fine being *Phlox Drummondii*, from E. H. WATTS, Esq.'s garden; single and double Zonal Pelargonium trusses were very creditable, the best were from C. GOLD, Esq., who also had splendid French Marigolds, but even these were surpassed by wonderful African Marigolds. *Phloxes*, *Asters*, *Hollyhocks*, *Violas*, *Roses*, and other flowers were very attractive.

Collections of vegetables.—Salads, Tomatoes, &c., were very fine, showing that the gardens at Bishop's Stortford are not one whit behind their brethren in the county of Kent.

The cottagers' produce filled a good-sized tent, and was well worth close inspection. Potatoes, Carrots, Peas, Beans, &c., were abundantly and well exhibited.

Messrs. VEITCH of Chelsea exhibited a group of choice plants, in which *Dendrobium Deseai*, and the distinct-coloured *D. glomeratum* were conspicuous; Mr. RUMSEY of Waltham Cross had fine Roses; and Messrs. PAUL & SON of the Old Nurseries, choice herbaceous plants.

WESTON-SUPER-MARE.

AUGUST 15.—The Weston-super-Mare and East Somerset Horticultural Society held its eighteenth annual show of plants, fruits, flowers, and vegetables, in the Grove Park and Glebe Field, on the above-mentioned date. The exhibition was, on the whole, a good representative one, and redounded to the credit of the Honorary Secretaries, Messrs. Thomas & Webb, and the inhabitants of this pretty sea-side resort.

PLANTS.

In this section Mr. J. CYPHER'S plants formed the chief attraction, and secured for the veteran cultivator six 1st prizes in the respective classes for twelve stove and greenhouse plants, in as many varieties, six flowering plants, and six foliage plants, distinct varieties to be shown in each case. Specimen foliage (stove), and specimen flowering (greenhouse), and for the best specimen of new and rare plants in the show, represented in a well-grown and finely-coloured plant of *Codiaeum Reidii*. The more or less prominent plants in Mr. CYPHER'S exhibits were *Kentias Fosteriana* and *Belmoreana*; *Latania borbonica*, *Codiaeum Queen Victoria* and *Sunset*; *Stephanotis floribunda*, *Bougainvillea Sanderi*, and *Ixora Pilgrimii* (included in the twelve stove and greenhouse exhibits), *Erica nblata purpurea*, *E. Marnockiana*, *Rondeletia apocyna*, and *Clerodendron Thompsonianum* var. *Balfouri*, being the most conspicuous among his six flowering plants; while the most prominent in the half-dozen foliage plants were represented by good specimens of *Codiaeum Johannis*, of fine size and good colour; *C. Baron Rothschild*, *Cycas revoluta*, and *Latania borbonica*. Next to Mr. CYPHER came Mr. W. RYLAND, gr. to W. BROCK, Esq., Parker's Well House, Exeter, a successful exhibitor in the plant classes, who beat Mr. CYPHER in the class for a specimen (stove) flowering plant, with *Stephanotis floribunda*.

FRUIT formed an important feature in the show, the twenty classes devoted to it being pretty well contested, and the exhibits generally were of great merit. Mr. H. W. WARD, gr. to the Earl of RADNOR, Longford Castle, Salisbury, being the most successful exhibitor, he taking six 1sts (for collection of eight kinds, viz., a Pineapple, Madresfield Court Grapes, Peaches, Figs, and Pears, Clapp's Favourite), and two 2nds, with excellent all-round produce. Mr. LLOYD, Langport, and Mr. CROSSMAN, Yeovil, were also successful competitors, and both showed well. The awards were not quite so satisfactory in the classes for Black Hamburg and Muscat of Alexandria Grapes as they were in other eighteen classes.

The cut flowers and vegetables were fairly well represented, but the individual exhibits call for no special notice here, further than to say, that Mr. GARAWAY, Bath, took two 1sts, including one for a collection of eight kinds, and Mr. CROSSMAN, four 1sts for vegetables. The Onions of the latter were the finest in the show, but they were, unfortunately, overloaded by the judges.

MAIDENHEAD.

AUGUST 15.—The annual exhibition, held on the above date, was in every sense an unqualified success. Although in a manner it is a local show, a much larger area is embraced than obtains in most instances. The competition throughout was very keen, no fewer than twelve competitors entering for the Messrs. SUTTON'S prizes for collections of vegetables, and nine or ten for the large collection of fruit, other classes being particularly well filled under these heads; whilst for groups, there were ten entries in the two classes, and five for Tuberosa Begonias. This speaks well for the enthusiasm displayed in horticulture around Maidenhead, the Society being evidently a popular one with exhibitors. The executive deserve every support for the admirable manner in which the varied details are carried out.

PLANTS, &c.

In the large group class the competition was exceedingly keen between Mr. AITKEN, gr. to Col. MEEKING, and Mr. PHILLIPS, gr. to H. GOLD, Esq., resulting in an equal 1st being awarded to each; two closer or more similar exhibits are rarely ever seen, this being largely accounted for by the fact that the last-named gardener was for some time foreman to the former. *Oncidium flexuosum*, *Fraucea ramosa*, *Lilium lancifolium* var., and *Campanula pyramidalis* alba were to be seen in each, whilst in the first-named there were *Paucratiums* in addition, and in the latter *Celsia cretica*, both being employed to good effect; well-coloured *Crotons* were very telling in each case. Mr. WOOD, gr. to Lord BOSTON, Hedsor, followed in this class with a bright group.

In the smaller group-class the competition was also keen, Mr. GRESWELL, gr. to A. GOLD, Esq., being placed 1st with a light and well-balanced exhibit; Mr. RICHARDSON, gr. to G. HERRING, Esq., who followed, had also a good group, very near to the first, the colours being well blended.

For twelve fine foliage plants in 8-inch pots (a most sensible and useful class) the competition was again keen, Mr. AITKEN winning with well-grown bushy plants in good colour and variety, *Acalypha Macraea* told well, as did *Codiaeum Johannis*, *Ficus elastica variegata*, and *Dieffenbachia Bausei*. Mr. GILLIES, gr. to Sir R. G. HARVEY, was a near 2nd, his best being *Codiaeum Prince of Wales*, very bright, *Dracaena Baptisti*, and *Cocos Weddelliana*.

For six stove and greenhouse plants.—Mr. AITKEN was

easy 1st, his best being *Allamanda Hendersoni*, *Clerodendron Balfourianum*, and *Codiaeum Queen Victoria*. The last-named was also 1st for a specimen-plant in flower, with a beautiful example of *Eucharis amazonica*, and also for a foliage specimen with *Codiaeum Queen Victoria*, an immense bush. Mr. J. SMITH, Clewer Nurseries, being a good 2nd in the former instance with *Stephanotis floribunda*, very fresh; and Mr. GILLIES in the latter, with an enormous example of *Alocasia gigantea*.

Mr. Goodman, gr. to Miss HAMMERSLEY, was 1st with large, healthy, and well-flowered tuberous Begonias; and Mr. RICHARDSON 2nd, with plants nearly as good. Another good exhibit in this class of the choicest kinds, with large blooms, but the plants much smaller, came from Mr. Fulford, gr. to F. D. LAMBERT, Esq.

Mr. Hopkins, gr. to Major RICARDO, had an excellent exhibit of six Fuchsias, and was awarded the 1st prize, Mrs. Rundle and Charming being two of the best.

From Mr. PHILLIPS came a grand half-dozen zonal *Felargoniums*, the plants quite a counterpart of each other in size and profusion of bloom, with the individual trusses of unusual size. The varieties were White Perfection, double; Mrs. Gordon, deep scarlet with white eye; Neila, deep pink; Hermia, deep cerise; Lady Chesterfield, bright salmon; and Olivia, dark cerise. The plants measured fully $4\frac{1}{2}$ feet through.

The best set of table plants were from Mr. AITKEN, dwarf, and in good character; Mr. J. W. RICHARDSON following.

Cockscombs, from Mr. HOPKINS, were very fresh and lively developed. The *Gloxinias* shown by Mr. J. FULFORD were well-flowered and fresh, the plants of medium size. A class was provided for *Streptocarpus*, the first occasion on which we have noted this introduction; one collection only, and these of medium merit, was sent by Mr. C. YOUNG.

The class for another favourite one, and some exceedingly bright and well-grown plants were staged, these being chiefly tall pyramids, the best came from Mr. T. GRESWELL, who had capital varieties.

Cut Flowers.—This section is divided into two distinct divisions, one for the trade only, and the other for private growers. In the former of these the best box of Roses, bright and fresh, was sent by Mr. F. J. FLETCHER, Lowbrouk, Bray; Mr. J. WALKER, Thame, following a good 2nd.

With Dahlias, Mr. WALKER was 1st, showing blooms quite up to exhibition standard, fresh and bright; in this instance Mr. J. R. TRANTER was 2nd, he, too, showing well.

Zinnias are always shown well at this exhibition. Mr. WALKER again winning, with Mr. TRANTER 2nd; the positions being reversed for Asters, which were extra good.

In the latter or amateur's division, the best box of Roses came from Miss B. DENTON, Windfield; two other good stands being presented from Mr. PAXTON and Mr. FULFORD. Dahlias were scarcely enough advanced. Mr. MUNT, of Slough, had the best twelve show kinds, and Mr. H. DIDDAMS, gr. to J. C. WOOTTON, Esq., the best dozen Cactus varieties. The Asters on the other hand in this division were remarkably good, several stands being put up. Mr. C. YOUNG was 1st and Mr. J. HANCH, gr. to J. B. WEATHER, Esq., 2nd. Zinnias were specially fine here, better than in the trade class, the two best stands being very close in point of merit, Mr. C. MILLS, Windsor, was 1st; and Mr. C. YOUNG, 2nd.

FRUIT.

There was an abundant competition in this division, and the standard of excellence ruled very high. Mr. AITKEN was 1st for six dishes, showing first rate Muscat Grapes, fine Royal George Peaches, Countess Melon, and Lord Napier Nectarines. Mr. GOODMAN came a close 2nd, but was weaker in Grapes, having, however, very fine *Souvenir du Congrès* Pears, Brown Turkey Figs, and Dagmar Peaches. Mr. Mowbray, gr. to Hon. H. C. LEGGE, also staged well for the 3rd prize.

For four dishes, there was also an abundant competition, Mr. D. PAXTON being 1st, Peaches, Nectarines, and a good Melon being the best dishes. Mr. F. COLE, gr. to Sir G. RUSSELL, was well up for 2nd place.

With four dishes grown in the open air, Mr. D. PAXTON again won, showing fruit well ripened and of high colour, Brown Turkey Figs, Jefferson Plums, Strawberry Pippin Apple, and Moor Park Apricot being his choice. Mr. GOODMAN, who followed closely again, had very fine Old Windsor Pears, and Red Astrachan Apples.

Black Hamburg Grapes were a strong class, Mr. F. COLE winning with large, well-coloured bunches, carrying a dense bloom; Mr. G. HOPKINS was 2nd, with smaller, but well-finished bunches.

Mr. F. COLE won again with any other black, Alicante being his choice, the bunches again of extra size, with a dense bloom (Madresfield Court at this season is a decidedly better Grape in such a class); Mr. OSMO, gr. to S. J. BAKER, Esq., was 2nd, he also showing a late Grape.

With Muscat of Alexandria, Mr. MOWBRAY won handsomely with very fine large tapering bunches, well ripened; Mr. F. COLE in this instance having to be content with 2nd place.

For any other white, Mr. MOWBRAY was again to the front with Foster's Seedling; the same kind from Mr. GOODMAN being 2nd. An exhibit of Mr. PEARSON in this class was staged too late, otherwise it would have been a formidable one.

With six Peaches, Mr. Johnston, gr. to A. GILLIAT, Esq., was 1st, the variety being Bellegarde, highly coloured; Mr. AITKEN taking 2nd with Royal George.

The best Nectarines were Hamboldt, shown by Mr. R. CAWTE, gr. to Oakley Court, handsome fruit; and the 2nd best, Lord Napier, from Mr. AITKEN.

A strong competition in the class for one Melon, resulted in Mr. GOODMAN being placed 1st with Pine-apple; Mr. JAS. WOOD was 2nd, having Beauty of Sion.

The finest Plums were a dish of Jefferson, from Mr. GOOD-

MAN; whilst one of Kirke's, by Mr. HOPKINS, was 2nd; both of these exhibits combined good appearance with quality.

Dessert Apples were shown best by Mr. GOODMAN, who had Red Astrachan, fully ripened; Mr. JOHNSON was 2nd, with that popular and rising variety, Beauty of Kent.

Culinary Apples were well advanced, the best being Peasgood's Nonsuch, from Mr. Davis, gr. to H. ADAMS, Esq.; Lord Suffield, very good, was placed next in point of merit, from Mr. E. JOHNSTONE.

Charries (Morellos) were well shown, the 1st prize going to Mr. OSMAN; and the 2nd to Mr. CAWTE.

VEGETABLES.

Amongst several exhibits of Cucumbers, the best brace was found in Royal Windsor from Mr. J. WOOD; and the best Onions in Ailsa Craig, from Mr. GOODMAN, whilst Perfection, as an exhibition variety, was invincible, Mr. W. H. AUSTIN having the finest dish.

It was, however, in the special class for a collection of vegetables where the greatest feature in this division was to be seen, the prizes being offered by Messrs. SUTTON & SONS. Mr. G. GOODMAN won the 1st place in an highly creditable manner with good produce, staged effectively, his choice being Autumn Mammoth Cauliflowers, large, but firm; Perfection Tomatos, good; new large Intermediate Carrots, very clean; Satisfaction Potatos, excellent samples; Lemon Rocca Onions, large; and Autocrat Peas, a fine sample. Mr. G. LANE, gr. to Miss RIDGE, was very close for 2nd place, with a similarly good choice; and Mr. G. WORSFOLD, an excellent 3rd.

For the special prizes for six distinct kinds offered by Messrs. WEBB & SONS in the next class, Mr. G. STONELL, Bourne End, was 1st, Duke of Albany Peas and Ailsa Craig Onions being his two best dishes; the bad staging of this exhibit detracted in a measure from its good appearance. Mr. D. PAXTON was 2nd in this class with good dishes.

Messrs. J. CARTER & SONS also offered special prizes for six dishes; here Mr. C. YOUNG, gr. to Rev. J. CONEX, was 1st in another close competition (a few marks only separating the 1st and 2nd exhibits); his best dishes were Perfection Tomatos, Ailsa Craig Onions, extra fine; Autumn Mammoth Cauliflower, Autocrat Peas, and Satisfaction Potatos; Mr. R. CAWTE, who came 2nd, had a very even exhibit.

In other special vegetable classes, wherein the prizes were offered respectively by Mr. BROUGHTON and Mr. W. H. TITT, the two best lots were shown by Mr. R. HERBERT and Mr. J. KNIGHT.

In a special class for tuberous Begonias, wherein the award was a Medal offered by Mr. R. OWEN, the best exhibit came from Mr. J. W. RICHARDSON, the plants dwarf and stocky.

Table Decorations, &c.—The best set of decorations was put up by Mrs. HERRIN, Dropmore Gardens, very light and artistic; the 2nd best by Mrs. BECKETT, in which hardly enough material had been employed.

Mrs. BROUGHTON was 1st with a bouquet, the arrangement excellent. The best single epergne was that arranged by Mrs. THOMPSON.

Miscellaneous exhibits came from Messrs. J. LAING & SONS, Begonias and plants; Mr. FLETCHER, fruit and flowers; Mr. SUCH, cut flowers; Mr. PHIPPEN, wreaths, &c., very tasteful arrangements; Mr. BROUGHTON, plants and flowers; and Mr. CHAS. TURNER, Dahlias and Roses, a First-class Certificate being awarded to Cactus Dahlia Beatrice, of very distinct colour, a deep pink. J. H.

TROWBRIDGE HORTICULTURAL AND FLORAL.

AUGUST 21.—This was the forty-sixth annual exhibition of what is probably the oldest horticultural society in the west of England—one which for nearly half a century has held an annual exhibition at Trowbridge. It was, as usual, held in the town's field adjoining the railway station. Owing to the season, the show displayed a little falling-off in a few respects; the Fuchsias were neither so numerous nor fine as possible, but any deficit in this respect was compensated for in the classes for stove and greenhouse plants, which were very fine; the Begonias also, the collections of Ferns, and the fruit and vegetables were very good indeed.

PLANTS, &c.

In the open-to-all division, the best nine stove and greenhouse plants in flower came from Mr. H. MATTHEWS, gr. to Sir W. R. BROWN, Bart., Trowbridge, who had very fine examples of *Ixora coccinea* and *Pilgrimii*, *Allamanda Hendersoni* and *nobilis*, *Ericas Austriana*, *Eweriana*, *elegans*, and *retorta* major; *Dipladenia amabilis*, and *Rondeletia speciosa* major. 2nd, Mr. G. TUCKER, gr. to Major W. P. CLARK, Trowbridge, whose best plants were *Allamanda Hendersoni*, *A. nobilis*, *Bougainvillea glabra*, *Lapageria alba*, *Stephanotis floribunda*, and *Erica Turbuli*.

In the amateurs' class for six specimens, Mr. H. MATTHEWS was again 1st, having very good examples of *Dipladenia Brearleyana* and *amoeba*, *Stephanotis floribunda*, *Allamanda nobilis*, *Ixora amabilis*, and *Erica Turbuli*; 2nd, Mr. G. TUCKER, his leading plants being *Bougainvillea glabra*, *Allamanda nobilis*, and *Statisce profusa*.

With three plants, Mr. TUCKER came 1st, having *Lapageria rosea*, a fine piece of *Eucharis amazonica*, and *Rondeletia speciosa* major; Mr. POCCOCK, gr. to J. P. HADEN, Esq., Trowbridge, was 2nd.

We have said there was a falling off in Fuchsias, still some very good plants were staged. Mr. G. TUCKER had the

best six specimens; they were dark varieties, Doge's Favorite, very fine—a grand old variety, Final, and Charming; light, Arabella, Marginata, and Harriet Lye. Mr. H. POCOCK was 2nd.

With four plants, Mr. TUCKER was again 1st, having Final, Beautiful, and Charming, dark; and Arabella, light. Mr. H. POCOCK was again 2nd.

The best specimen plant was a finely-grown and bloomed Allamanda Hendersoni, from Mr. S. Bishop, gr. to F. APPLE-GATE, Esq., Bradford-on-Avon; Mr. H. MATTHEWS coming 2nd, with a piece of *Yaada cœrules*, having eight or so fine flowers.

The best six Achimenes, nicely grown and bloomed, came from Mr. G. PYMM, gr. to Mrs. GOULDSMITH, Trowbridge; Mr. TUCKER was 2nd. With six Gloxinias, Mr. TUCKER was 1st; and Mr. C. RICHMAN, gr. to G. L. PALMER, Esq., Trowbridge, 2nd. Begonias made a fine feature, with six plants of single, Mr. G. TUCKER was 1st; and Mr. G. PYMM, 2nd. With six double-flowered varieties, Mr. C. RICHMAN was placed 1st, having really superb specimens, finely grown and bloomed.

The best group of plants to fill a space of 50 superficial feet, came from Mr. G. PYMM, arranged with remarkably good taste; Crotons, Lilies, Orchids, and other flowering plants made up a charming arrangement, with a mixture of foliaged subjects; Mr. A. Strugnell, gr. to W. H. LONG, Esq., M.P., Rood Ashton, was 2nd.

Some excellent specimens of zonal Pelargoniums were staged by Mr. G. TUCKER, and others; they and Fuchsias were also remarkably well shown by cottagers.

Mr. G. PYMM had the best four Orchids; the genus *Phalaenopsis* was well represented.

The best new plant was *Cypripedium Chamberlainianum*, from Mr. H. MATTHEWS; Mr. C. RICHMAN being 2nd with *C. Charlesworthii*; a nice plant of *Browallia speciosa major* was also shown.

Of foliaged plants, the best nine came from Mr. H. MATTHEWS, who had very good specimens of *Crotons Weismanni*, *Reidii*, and Baron James de Rothschild, *Pandanus Veitchii*, *Asparagus plumosus*, *Dracaena Cowperi*, and others; Mr. G. PYMM came 2nd, his leading plants being *Croton mirabilis*, *Acalypha tricolor*, and *Cissus discolor*.

The best fifteen specimens of Ferns and mosses came from Mr. GEO. TUCKER, who had excellent examples of *Gymnogramma sulphurea* and *G. peruviana argyrophylla*, *Adiantum concinnum*, *peruvianum* and *gracillimum*, *Dicksonia antarctica*, *Gleichenia rupestris*, *Davallia Mooreana*, and *Selaginella Wildenovii*, 2nd, Mr. H. POCOCK, whose best specimens were *Aleophylla excelsa*, *Gymnogramma chrysophylla*, *Adiantum Farleyense*, *conestum*, *grandiceps*, and *gracillimum*.

Coleus are always well grown at Trowbridge, the best six came from Mr. H. MATTHEWS, who had in very fine character, Mrs. C. Hart, *Lady Dacre*, *Beckwith's Gem*, and Mrs. Sheriff, 2nd, Mr. Jas. Hiscox, gr. to E. B. RODWAY, Esq., Trowbridge.

Cut Flowers were, as usual, a strong point, Roses taking the lead. With twelve trophies Mr. J. MATTOCK, nurseryman, Oxford, was 1st, having excellent blooms of Ernest Metz, *Souvenir d'Elise Vardon*, Mrs. J. Laing, Hon. Edith Gifford, *Catherine Mermet*, *The Bride*, and *Charles Lefebvre*, with others. 2nd, Messrs. GEO. COOLING & SONS, nurserymen, Bath, also with good blooms.

With twenty-four varieties, Messrs. J. TOWNSEND & SONS, nurserymen, Worcester, were 1st, having capital examples of *Ulrich Brunner*, *Fisher Holmes*, *Devoniensis*, Mrs. J. Laing, *Madame de Watteville*, *Francis Kruger*, *Lady Sheffield*, and *Duke of Edinburgh*; Dr. BUDD, Bath, was 2nd.

With twelve trophies in the Amateur division Dr. BUDD was 1st; and Mr. A. H. GRAY, Bath, 2nd. With twelve blooms the positions were reversed, Mr. GRAY was 1st, and Dr. BUDD 2nd. Mr. H. MATTHEWS had the best twenty-four bunches of cut flowers, chief among them were *Valotta purpurea*, *Allamanda Hendersoni*, *Bougainvillea glabra*, *Poinciana pulcherrima*, *Aristolochia elegans*, &c.; 2nd, Mr. G. Shelton, gr. to W. K. WAIT, Esq., Clifton.

Messrs. KEYNES, WILLIAMS & CO., Salisbury, had the best twenty-four Dahlias, and Mr. GEO. HUMPHRIES, Chippenham, was 2nd, both having very good blooms indeed; and the same exhibitors were severally 1st and 2nd with twelve fanatics.

With twelve blooms, Mr. GEO. COOPER, Chippenham, was 1st, and Messrs. J. CRAY & CO., nurserymen, Frome, 2nd. The only exhibitor of twelve bunches of single Dahlias was Mr. T. Smith, gr. to THOS. CARR, Esq., Tiverton, who was placed 1st with excellent varieties well-staged. With twelve Pompons in bunches there was a capital competition; Messrs. J. CRAY & CO. were 1st, and Messrs. KEYNES & CO., 2nd.

With twelve bunches of Cactus varieties, Messrs. CRAY & CO. were again 1st; they had *Mrs. Peart*, *Delicata*, and *Lady Penance*, very good; Mr. T. CARR was 2nd also with a good selection.

Quilled and flat-petalled Asters were very good, the fine Comet varieties taking a prominent position. *Gladiolus* spikes were shown in twelves; Mr. F. HOPKINS, Bath, was 1st, and Mr. J. J. YOUNG, Wilton, 2nd. *Pansies*, *Carnations*, and *Picotees* were very creditable for the season; *Hollyhocks* better than we have been accustomed to see them.

Bunches of hardy annuals made a fine feature, *Salpiglossis*, white Sweet Pea, purple *Jacobus*, *Malope grandiflora*, and a few others being very fine. Mr. GEO. GARRAWAY took the 1st prize. *Epergnes*, *Bouquets*, those of wild flowers, especially wreaths, &c., were a very pleasing feature.

FRUIT.

The best twelve dishes came from Mr. G. PYMM, who had Black Hamburg and Muscat of Alexandria Grapes; Royal George and Exquisite Peaches; Lord Napier and Humboldt Nectarines; Apricots, Bon Christian; Pears and Melons, all very good; Mr. STRUGNELL was 2nd also with

Black and White Grapes, Diamond and Bellegarde Peaches, Humboldt and Downton Nectarines, Figs, &c.

With six dishes, Mr. H. W. WARD, The Gardens, Longford Castle, Salisbury, was 1st, having Black Hamburg and Foster's Seedling Grapes, Sea Eagle Peach, Moor Park Apricot, Figs, and Melons; 2nd, Mr. T. Evry, gr. to Captain SPEN, Chippenham.

The best two bunches of Black Grapes were Hamburgs, from Mr. J. Gibson, gr. to Earl COWLEY, Chippenham; Mr. J. Wright, gr. to H. O. WILLS, Esq., Bath, was 2nd.

The best two bunches of white Grapes other than Muscats were Buckland Sweetwater, from Mr. ATWELL; and Mr. WARD was 2nd with the same. The best two bunches of black Muscats were well-finished Madresfield Court, from Mr. GIBSON; Mr. ATWELL was 2nd with the same.

Mr. W. Carpenter, gr. to A. R. BAILEY, Esq., Frome, had the best two bunches of white Muscate; Mr. T. Hodges, gr. to J. FORTH, Esq., Bath, was 2nd. There were plenty of Melons. Apricots were represented by fine Moor Park. Plums, green and red, were very good. The best two dishes of dessert Apples were Beauty of Bath and one unnamed, from Mr. G. GARRAWAY; Mr. R. O. HALL was 2nd, with Beauty of Bath and Kerry Pippin.

The best two dishes of culinary Apples were Peasgood's Nonsuch and Warner's King, from Mr. STRUGNELL; Mr. A. H. NEWMAN was 2nd, with Peasgood's Nonsuch, and Lord Suffield. There was a very large competition with Apples, bearing testimony to the fact that there are some very fine fruit in this district.

Messrs. GEO. BUNYARD & CO., Maidstone, had a large collection of culinary and dessert Apples, chief among them Pott's Seedling, Frogmore Prolific, New Hawthornden, Warner's King, The Queen, Northern Dumpling, Yorkshire Beauty, Transparent, Shilling Castle, Domino, Lady Sudeley, Red Quarrenden, Cardinal, Irish Peach, Williams' Favourite, Duchess of Gloucester, Worcester Pearmain, Beauty of Bath, Early Julien, Kerry Pippin; a special Certificate being given in recognition of their high quality.

Mr. W. NEWMAN, Bath, had the best centre-piece of flowers and fruit; Mr. J. Atwell, gr. to J. B. BRAIN, Esq., Clifton, was 2nd.

SHROPSHIRE HORTICULTURAL.

AUGUST 21.—This Society held its annual great show in the Quarry, on the above date, in semi-tropical weather, and once more it is our pleasing duty to congratulate the committee and the able Hon. Secs., Messrs. Adnitt and Naunton, upon the result of their combined efforts to make the twenty-first annual show superior to all shows of the kind hitherto held by the Society. The show was one of such magnitude and the individual exhibits so uniformly good, that with the space at our command we cannot do more than mention the more important exhibits, with the result that many deserving exhibits cannot herein be referred to.

PLANTS.

We may here remark that the twenty-eight scented-leaved Pelargoniums exhibited by our clever correspondent, Mr. James Hudson, gr. to Mr. LEOPOLD DE ROTHSCHILD, Gunnersbury House, Acton, London, excited a good deal of attention from visitors, all the more so owing to the fact that the plants were staged with admirable effect in the open, having one of the largest tents for a back-ground. Bearing in mind the attention the exhibits commanded, it may be of interest to the readers of the *Gardeners' Chronicle* to give the names—*Radula major*, flat-trained, and about 9 feet in width; *filicifolium odoratum*, a fine plant; *Quercifolium* Mrs. Douglas, Q. minor, Lady Plymouth, *Fumariolia*, a variety not often met with; *Pheasant's-foot*, a fine plant; Mrs. Kingsbury, *Rollison's Unique*, extra-fine; *crispum*, Fair Ellen, Aurora, *Pretty Polly*, extra good; *Lothario*, Prince of Orange, *Attar of Roses*, a rare variety; *Countess of Devon*, *denticulatum minor*, a variety that deserves to be more extensively grown; *denticulatum*, a fine plant; *Blandfordensis*, *Lady Mary*, Little Gem, a good plant; *Fragrance*, of fine size; *Scarlet Unique*, extra large; *Major Clarke*, *Shottesham Pet*, and *tomentosum*, a really fine lot, which richly merited the Gold Medal which was awarded to the collection.

Prizes amounting to £25 and £20 were offered for twenty stove and greenhouse plants in bloom or foliage. Mr. CYPHER, Cheltenham, was 1st for a good all-round lot of large, well-grown plants, the most prominent being *Statiche profusa*, *Ixora Williamsii*, *Rondeletia speciosa major*, *Erica obtusa purpurea*, *Bougainvillea Sanderi*, *Crotons Sunset* and *Queen Victoria*, &c.; Mr. Finch, gr. to JAS. MARRIOTT, Esq., Coventry, was a creditable 2nd.

Mr. CYPHER was also 1st for four Crotons, showing fine plants of *Thompsoni*, *Sunset*, *Queen Victoria*, and *Chelsoni*; Mr. FINCH being 2nd. The last-mentioned exhibitor was 1st for six flowering plants, showing good plants of *Erios Marnechiana*, *E. ioniana turgida*, and *Ixora Williamsii*, good; Mr. CYPHER was 2nd.

Messrs. JAMES VEITCH & SONS, Chelsea, showed a grand lot of *Caladiums* and *Pitcher-plants*, and a Gold Medal was awarded to them.

GROUPS.

As usual, these formed a feature in this show, several good arrangements being put up for the liberal prizes offered, £20, £10, and £12. Mr. CYPHER was a decided 1st, his exhibit consisted of a series of novelties having central plants of *Palms*, *Humes elegant*, *Bamboos*, *Dracaenas*, backed up with

brightly-coloured *Crotons*, *Caladiums*, and *Orchids*, including several nice pieces of *Dendrobiums*, *Phalaenopsis Schroderiana*, and *Cattleyas*; the central middle arrangement partaking of an effectively-constructed arch. Mr. EDWARDS, *Seestwood Lodge*, Notts, was 2nd; and Mr. FINCH was a creditable 3rd.

Mr. JOHN COWEN, Liverpool, had a fine group of dwarf *Roses* in pots, mostly *Teas*, which attracted a good deal of attention, and well deserved the Silver Medal which was awarded to it. Messrs. FRITCHARD & SONS had an extensive collection of miscellaneous plants, well-grown stuff, to which a Gold Medal was properly enough awarded.

Mr. EDWIN MURRELL, Portland Nursery, Shrewsbury, was awarded a Silver Medal for *Begonia*; as also was Mr. DAVIS, of Yeovil, who as usual had a fine array of cut blooms of the newer double and single-flowered tuberous-rooted *Begonias*.

Mr. BIRKENHEAD was awarded a Gold Medal for an extensive collection of Ferns of decorative size and height; Messrs. SMITH, Worcester, obtained a Silver Medal in recognition of their exhibit, as also did Messrs. MYERS, Shrewsbury; Messrs. BIDDLE & Co. receiving a similar award; as also did Messrs. HEWITT, Solihull, Edgbaston. Mr. ECKFORD, Wem, gained a like distinction for a grand collection of Sweet Pear, of varied and beautiful shades of colours.

Messrs. CUTBUSH & SONS, Highgate, had a grand and varied lot of plants arranged for effect. And Messrs. CLIBRAN & SONS, of Altrincham, had a good assortment of herbaceous flowers, and an extensive display of Cactuses, including good *Gasteria Croucheri* and *Echinocactus Leeanii*; the Messrs. DICKSONS also contributed good collections of decorative plants and cut blooms, and herbaceous flowers. Mr. JAMES CYPHER secured premier position for six Orchids in flower, distinct, well-flowered species.

CUT FLOWERS.

These made a grand display in themselves. Mr. EDWIN MURRELL, Portland Nursery, Shrewsbury, had a grand exhibition of *Roses* arranged in various ways—standards, arches, &c., to which a 2nd prize was awarded; Mr. RALF CROSSING taking 1st for a good arrangement in this class.

Dahlias were staged in large quantities, the quality being also of a high order. Messrs. KEYNES, WILLIAMS & CO., Salisbury, were easily 1st for a grand lot of blooms, including all the leading varieties.

Ball bouquets and bridal bouquets, Messrs. JONES & SONS, Shrewsbury, were 1st for grand exhibits, composed mostly of *Orchids*, and well arranged; Messrs. PERKINS, Coventry, taking 2nd in a good class. The last-mentioned firm secured premier position in the class for a display of floral arrangement on a space 12 feet by 5 feet. This exhibit contained a variety of good designs, and choice *Orchids* were employed in the several arrangements. Messrs. JONES & SON and Mr. J. E. CHARD taking 2nd and 3rd.

FRUIT.

The Society having attained its majority this year, special prizes were offered in the schedule for a collection of twenty-four varieties, to be staged in a space of 10 feet by 4 feet; *Lycopodiums*, and other trailing plants; Ferns and foliage being permitted to be used for effect: 1st prize, £20; 2nd, £15; 3rd, £10; 4th, £5. Four good lots were staged, each exhibitor taking a prize. Mr. GOODACRE, gr. to the Earl of HARRINGTON, *Elvaston Castle*, Derby, was a good 1st, staging good full bunches of *Gros Maroc*, *Muscat of Alexandria*, solid, well-coloured bunches; *Barbarossa*, good in size, and beautifully coloured; and *Ester's Seedling Grapes*, *Royal George*, *Princess of Wales*, and *Barrington Peaches*, large, even, well-coloured fruits of each variety being shown; *Moorpark* and *Hemskirk Apricots*, *Victoria Pine-apple* and *Elrue Nectarines*, of grand size and colour; *Washington* and *Kirk's Plums*, *Jargonelle Pears*, *Lady Sudeley Apples*, two fine fruits of *Hero of Lockinge* and *Countess Melons*, medium-sized *Queen* and *Cayenne Pines*, and *Bon Christian Pears*, all being arranged to the best advantage in a groundwork of moss, backed up with small *Palms*, Ferns, variegated grasses, and fringed with variegated *Eucalyptus* and *Sunilax*. Mr. MCINDOE was a creditable 2nd, his collection including fine dishes of *Clapp's Favourite*, and *Souvenir du Congrès Pears*, *Magnum Bonum Plums*, *Brunswick* and *Negro Largo Figs*, *Stirling Castle* (highly coloured), and *Violette Hatve Peaches*, and grandly coloured *Spenser Nectarines*. W. Edwards, gr. to the Duke of ST. ALBANS, *Eastwood Lodge*, was a good 3rd; and Mr. H. PITT, *Abergavenny*, was a fair 4th. It is to be hoped that the society may see its way to offer these liberal prizes annually, and to insist upon fewer plants being employed in the arrangement, so as not to detract from the appearance of good fruit.

In the class for eight dishes, Mr. MCINDOE secured premier position with a good all-round lot of fruit. His lot included good *Gros Maroc* and *Muscat of Alexandria Grapes*, and a grand fruit of *Melon*, *Mammoth Elrue Nectarines*, and *Stirling Castle Peach*, grand *Negro Largo Figs*, and *Souvenir du Congrès Pears*; and Mr. GOODACRE was a good 2nd—seven lots were staged.

In the class confined to *Salop*, five good lots were staged, nine dishes. Sir C. H. ROUX, Boughton, Ludlow, taking 1st, his collection containing good *Black Hamburg* and *Buckland Sweetwater Grapes*, and *Pine-apple Nectarines*.

Grapes.—Three hundred and nineteen bunches of high quality were staged in the various classes. In the class for six bunches of black Grapes, in three varieties, seven good lots were put up. Mr. Craven, gr. to J. GRANT MORRIS, Esq., Liverpool, was placed 1st for *Madresfield Court*, *Black Hamburg*, and *Black Alicante*; Mr. J. W. RAINES, *Rock Ferry*, was 2nd, his half-dozen bunches including fine specimens of *Mrs. Pince*, large in bunch and berry, and fine in colour for the variety; Mr. Lambert, gr. to Lord HARELEC, was placed 3rd for really fine exhibits.

FARRINGTON: August 22.—Quotations: White Hebrons, 75s. to 85s.; Red Hebrons, 75s. to 85s.; Puritans, 70s. to 80s.; Brucea, 60s. to 70s.; Magnams, 55s. to 65s. per ton.

LONDON AVERAGES: August 21.—Snowdrops, 70s. to 80s.; Hebrons, 65s. to 75s.; Early Regents, 55s. to 65s.; Puritans, 70s. to 80s.; Kidneys, 55s. to 65s.; Early Rose, 55s. to 65s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 90s. to 115s.; do., inferior, 50s. to 80s.; hay, best, 80s. to 95s.; do., inferior, 36s. to 60s.; mixture, 70s. to 92s. 6d.; and straw, 20s. to 38s. per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending August 17, and for the corresponding week last year:—1895: Wheat, 24s. 6d.; Barley, 19s. 3d.; Oats, 16s. 1d. 1894: Wheat, 24s. 5d.; Barley, 16s. 5d.; Oats, 18s. 9d.

England, E. and S., and Ireland, N., and being somewhat below it in the other districts.

"The bright sunshine was deficient over the Kingdom as a whole, but exceeded the mean in England, S. and S.W., and in the Channel Islands." The percentage of the possible duration ranged from 69 in the 'Channel Islands,' and 58 in England, S.W., to between 18 and 24 in 'Ireland,' and to between 16 and 25 in 'Scotland.'"

* * * Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

* * * PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florist's varieties cannot, as a rule, be named.

A MONTH'S WARNING: G. S. DOMESTIC AND MENIAL SERVANTS, with regard to these, there is a well-known rule, founded on custom, that their contract of service may be determined at any time by giving a month's warning, or paying a month's wages, and this, although they be hired at so much a year. A head gardener at £100 a year wages, who resided in a detached house belonging to his master, has been held to be a menial servant, and entitled to a month's warning only. Nolan v. Ablett, 1835. This case was argued before four judges in Banco, and is reported as a leading case. They decided that as the gardener resided in a detached house intra mania he was a menial or domestic.

A NEW VINE-BORDER: Gardener. The chief constituent is good turfy loam freshly cut, and any of the ingredients you name in moderate proportions may be mixed with it. The bones should be broken finely—say, half-inch, and may be employed at the rate of one-ninth of the whole of the loam, that is, 3 cubic feet out of the 27 cubic feet constituting a cubic yard (one-horse cartload). Charcoal and lime-rubbish should be used in smaller proportions. The border should be afforded ample drainage, and the outlet drains given a rapid fall, so as to clear themselves rapidly. The border should not be more than 2½ feet deep, and at the first not more than 6 feet wide.

BULBS LEFT IN THE GROUND: D. T. H. They ought to have been lifted when ripe, say June and July. They have now made growth, and would be injured, but not killed, by removal.

CARNATIONS: J. Cobban & Son. The colours are as good and clear as any that we have noticed this year, but in size the blooms have often been exceeded by others sent for our inspection.

CORK FOR CATTLEYS, LELIAS, AND DENDROBIUMS: Amateur. Not so suitable as pots or pans for the first or second; but they would grow fairly well if you can secure some lamps of a proper kind of Orchid peat and Sphagnum-moss about them, so that their roots do not suffer from rapid fluctuations of moisture and aridity. The Dendrobium if properly secured with Sphagnum-moss should grow satisfactorily.

CORRECTION.—Northampton Horticultural Show Report, August 10. Instead of par. beginning "Some well-grown Ferns," p. 164, read "The best six Ferns were staged by Mr. W. Pearce, gr. to Sydney Loder, Esq., Floore House, Weedon, who was awarded 1; Mr. Copson, gr. to Mrs. Phippis, Collingtree Grange, 2; Mr. J. B. Palmer, gr. to R. Turner, Esq., Cliftonville, Northampton, 3."—Re "Fruit at Glewston," p. 180, fifth and sixth lines from bottom, it should read "The trees are 9 to 10 feet high, and being the same in diameter, they occupy the whole of the ground."

CYPRIPEDIUM UNHEALTHY: A Subscriber. It is difficult to say what causes the brown and unhealthy appearance seen on the leaf of Cypridium sent. It appears to be of stunted growth, and it may probably have been kept in a too dry and sunny situation. To better its condition you must arrange for a freer growth in future. Plants in such condition may often be brought round by being turned out of their pots, washed top and root, the

latter free from all the old potting material. Then re-pot in small pots, using equal parts of loam-fibre, peat, and sphagnum. Place in a healthy growing house, and water reasonably with rain-water.

DENDROBIUM LEAF TURNING BROWN: Amateur. The effect of too much heat and moisture and a close airless house. Under these conditions most Orchids grow weak and delicate, and fall a prey to both animal and vegetable parasites. Afford more air, less shade, and let the house get dry at least once a day for a few hours.

GAS LIME: Constant Reader. Use about as much as will cover the land from sight. You may use more of it if the land is going to remain uncropped till the spring.

HARDY ANNUALS: D. T. H. Sow now seeds of all those you mention excepting the Canary Creeper, the hardiness of which, even in your county, is doubtful, and Sweet William, which is best sown in early summer to flower the next year. Sweet Williams raised from seed sown at this date would flower in the height of summer, and would last but a short time.

HORTICULTURAL EXAMINATION SYLLABUS: J. W. W. Apply to the Secretary of the Royal Horticultural Society, 117, Victoria Street, Westminster.

INSECTS ON ROSE-BUSH: T. A. The caterpillar is that of Amphidacys betularia, commonly known as the "Pepper-moth." It feeds on a variety of trees and shrubs, but is seldom so abundant as to be considered an "injurious insect."—Jones. The mass consists of the cocoons of a minute Hymenopteron insect, the larva of which to the number of several hundreds, had fed in the interior of the body of a caterpillar of some kind, which it is impossible now to recognise. R. McL.

IVY CUTTINGS: Constant Reader. The cuttings, half ripened shoots, may now and later, be put into moist, sandy, manured soil, in partial shade. The variegated varieties strike best under hand-glasses.

"KEW BULLETIN": J. M. T. Any bookseller, or from Eyre & Spottiswoode, East Harding Street, Fleet Street, at 4d. a part. The post-office nearest the main entrance is that on Kew Green; but there are others!

LILIES: L. C. L. Humboldtii, L. Parryi, and in warm situations, L. longiflorum, are hardy with slight protection. L. Harrisii is a greenhouse plant reverting to L. longiflorum, L. Kramerii is rarely kept long under any system. H. J. E.

LOBELIA ERINUS CUTTINGS: D. T. H. They will strike at this season in a close frame, either planted in pots or on a bed of loamy soil covered with a layer of sand. If a slight bottom-heat can be afforded, the striking would be quick. The length of a cutting 2 to 3 inches.

MIGNONETTE: D. T. H. Gather any of the capsules when the seed is seen to be either dark brown or black. Do not pluck the entire ripe of seed-vessels, as there are sure to be many unripe seeds therein. Look over the plants every third day for ripe seeds. Dry in the shade.

NAMES OF FRUITS: W. J. Holmes. Pear: Ronselet de Stuttgart.—F. Hughes, 1 and 5, Duchesse of Oldenburgh; 3 and 6, Red Astrachan; 2 and 4, not recognised.—R. McDougall. Specimens sent not yet developed, so cannot determine with safety. Nos. 1 and 2 may be Cellini; others not recognised.—G. Albert James, 20, not sufficiently developed; 21, Cox's Orange Pippin; 22, Lord Grosvenor.—Carlton, 1 and 3, not recognised; 2, Waltham Abbey Seedling; 4 and 5, Duchess of Oldenburgh; 6, Rosemary Russet.—Biddles, Small Pear, not recognised; worthless.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—C. Pyrus floribunda, Nicholson (Malus floribunda, Sieb.), Japan.—G. H. S. 1, Alstrœmeria picturata; 2, Lythrum salicaria; 3, Lysimachia vulgaris; 4, Asclepias sp.; 5, Linaria purpurea; 6, Hyocyamus niger; 7, Calceolaria.—R. T. H. 1, Sturtia pentagyna; 2, Laurus Sassafras; 3, Acer creticum.—Alpha, 1, Catalpa syringifolia; 2, Oncidium Gardneri, Lindl., Gardeners' Chronicle, xvi, p. 86; 3, Eupatorium (Conoclinium) ianthinum.—R. M. 1, Zebrina pendula, greenhouse; 2, 3, Zebrina pendula var. tricolor, stove; 4, Panicum variegatum; 5, leaf only; 7, Centaurea moschata, hardy annual; 8, Scabiosa atropurpurea, hardy. Why send wretched acrapa, badly packed and num-

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, BRIGHT SUN. Includes sub-columns for Day-deg. and 10ths Inch.

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending August 17, is furnished from the Meteorological Office:—

"The weather continued unsettled and rainy in all parts of the Kingdom during the earlier half of the period, with occasional thunderstorms over England. Towards the middle of the period, however, a gradual improvement set in, and at its close the weather was fine and bright in nearly all places.

"The temperature was slightly above the mean in most districts, but only just equalled it in England, E., S., and S.W., as well as in the Channel Islands." During the greater part of the week the daily maxima were considerably below the normal for the time of year, but on the 17th the thermometer rose to between 77° and 79° over England, 73° and 78° in Scotland, and 71° and 74° in Ireland. The lowest of the minima were recorded about the middle of the week, and ranged from 36° in Scotland, E., and 38° in the Midland Counties, to 50° in England, N.W., and 53° in the Channel Islands.

"The rainfall varied a good deal in different parts of the Kingdom, the amounts exceeding the mean in Scotland

bered?—*H. May*. We should refer both to *Inula Hookeri*.—*H. M. E. Mentha aquatica*. The Secretary to the Gardeners' Orphan Fund is Mr. Archibald F. Barron, Royal Horticultural Society's Garden, Chiswick, W.—*J. C. Linaria reticulata* var. *aureo-purpurea*.—*G. S. Rochea falcata*.—*A. Brothers*. *Stactis latifolia*.—*A. L. Amorphophallus bulbifer*.—*W. K. L. 1, Rudbeckia laciniata*. L; 2, *Rudbeckia californica*, A. Gray.—*F. P. Dendrobium chrysanthum*.—*Constant Reader*. 1 and 2, Not found; 3, *Dendrobium chrysanthum*; 4, *Dendrobium formosum*, very good; 5, *Dendrobium Findlayianum*; 6, *Pholidota imbricata*; 7, *Polypodium vulgare* var. *cambricum*; 8, *Polystichum angulare proliferum*. *L. B. G. Stanhopea tricornis*, *Maxillaria Mackayi* var.

ORCHIDS: *S. H.* 1. The cause of black spots on the leaves of *Epidendrum vitellinum* is probably owing to its being grown in a too airy and sunny house. Although not wanting a high temperature, it likes a genial warmth, tolerable shade, and plenty of water when growing. Afterwards, any greenhouse will do until the next growths begin. 2. The *Peristeria aspera* (fresh imported) may bloom at any time. We saw it in flower about five weeks ago. 3. The appearance you mention in *Dendrobium thyrsiformum* seems to indicate weak growth, not grown rapidly enough at the proper time, and then reated. Hence the new growth pushes forth before the previous one is fully made.

PEAT: *Amateur*. It is not the right kind for Orchid culture, but would suit Heaths. Get Peat for your Orchids that has a silky pleasant feel, and little or no sand in it, but which has plenty of decaying roots of Ferns, &c. It should be in a partially decayed state when used.

RATING: *Montana*. Glasshouses in which fruit, flowers, and vegetables are grown for sale, are to be rated at only one-fourth value. See Purser v. The Worthing Local Board, in *Gardeners' Chronicle*, vol. i., 1887, p. 422.

RHUBARB: *H. L.* Certainly Rhubarb is not a cultivated form of the common Dock.

TO DRIVE AWAY ANTS: *G. T. C.* and *G. A.* Find their nests, and pour carbolic acid diluted with twelve times its bulk of water into them. Petroleum, sulphur, guano, gas-tar, lime-water, are all effectual in driving them out of their haunts. More than one application may be necessary.

TROPEOLUM SEED: *D. T. H.* The fleshy covering is always fresh and green when the seed falls, but it soon dries up, and may then be rubbed off and the seed stored in paper-bags in a cool, dry place.

TOMATO DISEASED: *W. W.* The spores of the fungus were floating in the air, and conditions of warmth and moisture being favourable, they attached themselves to your plants. These sorts of enemies of plant-life abound everywhere, and the gardener cannot do better than apply preventive remedies before an attack occurs. See our issue for August 10, and many others this year.

WINE BEERY: *W. T. T.* *Ribes phoenicolasium*.

GARDENERS AND OTHERS WANTING SITUATIONS.
26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale. Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.
Publishing Office and Office for Advertisements
41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

ROBERT WARNER & Co. Engineers, 27, Jewin Crescent, E.C.
Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail ceared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schröder.
