CLERK requires a Situation.—Many years' experience in Book-keeping and general office work in the Nursery and Seed trade; good references.—Particulars to F., *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

WONDERS WILL NEVER CEASE, we are told; but it cannot be denied that HOLLOWAY'S PILLS are the greatest wonder of modern times. They correct bile, prevent flatulency, cleanse the liver, and purify the system, strengthen the stomach, increase the appetite, invigorate the nerves, promote health, and reinstates the weak to an ardour of feeling never before experienced. The sale of these Pills throughout the globe astonishes everybody, convincing the most sceptical that there is no medicine equal to HOLLOWAY'S PILLS for removing the complaints incidental to the human race. They are indeed a blessing to the afflicted, and a boon to those who suffer from disorders, internal or external. Thousands of persons have testified that by their use alone they have been restored to health, after other remedies had proved unsuccessful.

Isleworth.—Special Trade Sale.

ANNUAL SALE of thousands of beautifully-grown young CONIFERS and GOLDEN EUONYMUS, for immediate Potting, Window-boxes, or for Growing-on. By order of Messrs. Chas. Lee & Son.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION on the Premises, the Wood Lane Nurseries, Isleworth, 5 minutes' walk from the Isleworth Station, L. & S.W.R., and 20 minutes' walk from Osterley Park Station, District Railway, on THURSDAY, September 19. Fuller particulars will appear.

SALE OF ORCHIDS and BULBS, on FRIDAY NEXT, September 6.

By order of Messrs F. Sander & Co., St. Albans. MESSRS. PROTHEROE and MORRIS have received instructions from Messrs. F. SANDER & Co. to SELL by AUCTION, at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, September 6, at half-past 12 o'Clock, A VARIETY of IMPORTED ORCHIDS and BULBS. A fine Consignment of CYPRIPEDIUM INSIGNE MONTANUM, from the same locality which yielded C. f. Sanderi, &c., will be offered. The plants are in fine order; many fine masses are included. Also DENDROBIUM NOBILE, LANG TANG TYPE, from the Lang Tang Mountains, which have yielded all the most beautiful varieties. The plants are in fine condition, and new varieties may be looked for. DENDROBIUM DALHOUSIEANUM. LÆLIA FLAVA, a beautiful, compact-growing Orchid. CATTLEYA CITRINA. LÆLIA LUCASIANA, a dwarf, bright-flowered Lælia. DENDROBIUM CUCULLATUM. DENDROBIUM STATTERIANUM, a gem among Dendrobies, easily grown, and very beautiful. ONCIDIUM PELICANUM. CYPRIPEDIUM BELLATULUM, a fine consignment, many fine clumps are included. A Chysis species. LÆLIA AUTUMNALIS ATRO-RUBENS (true), the finest and darkest form. DENDROBIUM MOOREANA, boxes of Miscellaneous ORCHIDS, &c. Also EURYCYLES CUNNINGHAMII (the Brisbane Lily), white flowers, easily grown. BESSERA ELEGANS, scarlet, or scarlet and white flowers, very effective. HEMANTHUS KALBREYERII, AMARYLLIS SPLENDENS, together with many ORCHIDS in Flower or Bud. On view morning of Sale, and Catalogues had.

SALES BY AUCTION.

MONDAY, WEDNESDAY, and THURSDAY NEXT. DUTCH BULBS — DUTCH BULBS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on MONDAY, WEDNESDAY, and THURSDAY NEXT, September 2, 4, and 5, at half-past 12 precisely. ORCHIDS,

AN IMPORTATION OF THE BEST

EAST INDIAN SPECIES

Has just reached me in Fine Condition, amongst which are the following fine Orchids—

AERIDES LAWRENCEÆ.

This species and A. Sanderianum rank as the two most lovely of the family, the long drooping racemes are noted for their brightness of colour, the size of flowers and delicious odour. Received First-class Certificate, September 9, 1884.

AERIDES SANDERIANUM.

"T. L." in the *Gardeners' Chronicle* (August 24, 1895), says:—"I send you a raceme of the lovely *Aerides Sanderianum* to prove, were it needed, that this genus is well worth taking pains with."

The plants offered are in grand condition.

VANDA SANDERIANA.

A very limited importation of this NOBLE ORCHID, which is admitted to be one of the finest in cultivation. Nearly all the plants were established before being shipped; consequently, there will be a minimum of uncertain plants. Many of the plants are in pots, and root-action is evident in many cases. All the plants are well furnished with foliage.

A GIGANTIC SPECIMEN, THE LARGEST IN EUROPE,

is among the importation of this Vanda. It is in fine health, and WILL BE ON SHOW at the Nursery during the coming week.

VANDA LOWII.

A few plants of this lovely Vanda.

PHALÆNOPSIS SCHILLERIANA.

Some fine sound plants, practically established, and sure to make good specimens in a short time.

CYPRIPEDIUM STONEII.

Collected by an experienced man, who saw many fine forms in flower.

GRAMMATOPHYLLUM

MEASURESIANUM.

In fine masses. This handsome Orchid should be extensively grown. It received a First-class Certificate in May, 1891.

DENDROBIUM DEAREII.

A fine importation of this beautiful white winter-flowering Dendrobe.

DENDROBIUM BICIBBUM.

Many of these plants were seen in flower by the Collector, who writes that there are exceptionally good varieties.

AERIDES QUINQUEVOLNERUM.

In good plants.

DENDROBIUM UNDULATUM.

With tremendous pseudobulbs.

A FINE NEW PALM,

CYRTOSTACHYS LAGGA.

A Plant of graceful habit, with stems and leaf petioles of bright red colour; it is known by the natives as

"THE SEALING-WAX PALM."

Six of these Plants have arrived, and are, of course, well established healthy Plants. This is entirely NEW TO COMMERCE, and is RARE.

Fuller particulars and quotations from—

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 31, 1895.

CHISWICK.

A VISIT to the Garden after the recent storms enabled us to judge of its condition—and what did we find? Cleanliness in every part, walks firm and well rolled, although the marks of the storm of Thursday evening, Aug. 22, showed themselves in a saturated soil, and a little silt accumulated at the margin of the turf; the lawns vividly green, showing plainly that if the mown grass was taken away, something was added in winter or spring to maintain the fertility of the soil. That was quite as it should be. In the glasshouses also were found capital crops of Grapes, and Fig-trees which had borne good crops, but were now going out of fruit for the season.

But perhaps it will be better to take the glasshouses *seriatim*, beginning with the more modern one near the entrance to what may be called the reserve-garden. Last year, and for several previous years, we believe, this house, originally planted with Vines, chiefly Muscat of Alexandria, has accommodated during the summer months trials of Tomatos, and enormous crops have been gathered each year, and sold to defray in part the expense of up-keep. Now, the Vines demand the whole of the space, and no more Tomatos are grown therein. This is the first year in which the Vines have carried a full crop. The number of the bunches is about 600, and the weight 900 lb.; and those who know the market prices for fine Muscats, can calculate their value when fully ripe, say in about a fortnight from the present time. The Vines, from reasons of economy, were trained on wires under the central part of the vinery, and a cane is being carried from each Vine down the two slopes of the roof, so that every part of the roof will be utilised. Nothing could be better devised in culture than the Vines in this house. The older corridor vinery held equally well-cropped Vines, but owing to the Vines being trained against the back wall, and upright glass front, one could not take in the whole crop at a glance. The colour and finish of the Grapes in this case will be capital.

In what some consider the white elephant of the Society—the big vinery—there is a well-distributed crop on the forty-four-year-old Vines, not in any point differing in appearance from former years. To account for the good condition of these Vines, the border must have been made with great judgment and a careful selection of materials, or else the roots must have wandered into the adjacent well-manured ground. Some of the gardeners, it being a showery day with dull skies, were employed in searching for decaying berries, and easing the berries where crowded. It was all right here, but it is a matter for regret that the resources of an experimental garden should be devoted to the cultivation of Grapes to be sold as in a commercial undertaking; but having the vinery, perhaps no

better use can be found for it than to produce Grapes. At any rate, it is money-producing, and that may be a sufficient excuse, although experimentally it has now little value.

Having inspected the state of the Vineries, always considered the crucial point in a gardener's management, and a test of his abilities, we found everything looking as well if not better than in some former years; other houses were visited, viz., the Peach-house in the inner quadrangle. Here the trees had furnished an early crop of fruit, and we saw nothing but healthy vigorous plants which were being gradually matured by sun and air. Standing outside was a lot of young Peaches, Nectarines, Plums, &c., which having done their work for the season, were being ripened off, the house they had stood in being furnished with Tomato plants with fruit approaching ripeness. Most accommodating plant this—if you do not know what to do to fill the house, put some Tomato plants in it; and if you cannot consume the fruits, you can always find purchasers for them. There is no waste of garden appliances and conveniences at Chiswick, but every house is put to some kind of useful purpose.

In one house only American varieties of the Tomato are growing, and but few differences were noted between these and those usually grown in English gardens. The house in which these varieties are placed is a Messrs. Skinner, Board & Co.'s patent, with a curvilinear roof of small span, galvanised iron ribs fixed at very wide distances apart, the glass panes resting on strained wires, and secured by metal clips. It seemed to need fuller ventilation when the doors were closed; but it suits the Tomato, which is a heat and sun-loving plant.

The houses set apart for flowering plants were the Canna-house—well furnished with these beautiful, combined flower-foliage subjects. They were quite small stuff when received in the spring, and have had to spend their energies in making leaves and roots, and, as a consequence, there is not quite so much flower on them as older roots would have thrown. The selection is a choice one, and well worth an inspection. The side benches are furnished with varieties of *Pelargonium peltatum* (Ivy-leaf), now past their best, but which have been particularly beautiful this season.

In another house was found a collection of profusely-bloomed *Fuchsias*, including good new varieties and old favourites. Another house contains *Balaams*, *Celosias*, *Cockscombs*, and *Bouvardias*; some pits are filled with zonal *Pelargoniums* for flowering in the winter, besides a quantity of miscellaneous plants of small value, for distribution amongst the fellows—much of it dear as a gift. Its propagation and culture seems to take up a good deal of time and labour which might be more usefully employed. It is the fly in the amber.

Let us now turn to the fruit trees on the walls. To us, these have always seemed to be the weak point at Chiswick, and especially was this the case during the years of misery, when the resources of the Society were expended in that children's playground at Kensington Gore. The trees were then starved of the needful manure and loam, although the superintendent was too good a gardener to neglect the customary winter and summer pruning. Since better times have set in, in the Society's affairs, the trees have improved, and excellent crops of Plums, Peaches, and Nectarines; a fair one in the majority of cases of Pears, and some very heavy crops on certain varieties that usually can be depended upon to crop well, viz., Williams' Bon Chrétien, Souvenir du Congrès, Louise Bonne, Madame Treve, and Belle-sime d'Hiver.

The Apple crop generally is a heavy one, especially on the lesser pruned standard and half-standard trees, and on the restricted bushes on Doucin and Paradise stocks. It is needless to specify varieties where nearly all have cropped well—still, mention

must be made of a row of trees of Blenheim Orange Pippin, planted twenty years ago, and worked on every known kind of stock, which have a full crop for the first time. There is a fact worth knowing in regard to this variety, viz., that no kind of stock will hasten its coming into bearing. The other grand crop is that of Cox's Orange Pippin, which was never finer than this year. The aged pyramidal Pears are, in numerous instances, bearing very well; and of Plums, capital crops of Pond's Seedling were remarked on standard trees. In fact, it is a record year for hardy fruit at Chiswick.

There are extensive trials of Cabbages, Lettuces, Turnips, Runner and dwarf Kidney Beans, Potatoes, Endives, Spinaches, Sweet Peas, Asters, Phloxes, bedding *Begonias*, including the small-flowered effective *elegans* type; of Dahlias of the so-called "Cactus" forms supplied by the larger growers.

To give the reader an idea of the extensive character of these trials, it may be mentioned that about 500 varieties of Phlox were planted from English, French, and German growers, the height, colours, time of beginning to bloom, being duly noted. Of Turnips there are 37 varieties; Spinach, 20; Cabbage, 76; Lettuces, 39; Beans, 74; Peas, new and old, 59; Potatoes, 70. The amount of clerical labour entailed in recording all the more essential points in connection with these trials is very great, especially as every report has to be written out three times. One rubs one's eyes on hearing this, and asks whether copying-presses have been invented. The writing of labels for seed-beds and plantings takes up a great amount of time. These trials, so far as they go, benefit the purchaser, or at least they are instituted with that intent; but instead of being published in a form easily accessible to the owners or cultivators of gardens, they are published long after date in the Society's *Journal*, which appears at uncertain intervals; hence they lose the merit of opportuneness, and become, as a consequence, of relatively small value.

The out-of-doors floral decorations are well worthy of notice at the present time. They consist chiefly of a series of beds, circles, and parallelograms, of various dimensions, arranged on each side of the long walk which leads to the great vinery. There were beds planted with old stock-plants of *Fuchsias*, flowering abundantly; beds of *Fuchsia fulgens*, an old inhabitant of our greenhouse, but seldom employed out of doors, although in the warmer parts of the country it grows well and flowers charmingly.

Begonias, both tuberous and other, are planted in numbers, sometimes one variety being used in a bed, and in other cases several of them are grown together for the sake of readily estimating their effects as bedders, testing the comparative height of the plants, and various other points which it may be desirable to ascertain. There are beds of the glowing reds, crimsons, &c., of the large-flowered tuberous-rooted section obtained from the best sources. Beds of *Begonia semperflorens* in red, pink, and white, and very clearly these varieties showed their value as bedders; the varieties, *Duchess of Edinburgh*, pink, and *Reading Snowflake*, white, were admirable. In the case of these *semperflorens* varieties, the blossoms are small, very numerous, and obtained from all parts of the plant, and being of a uniform colour there is no dull side of the petals to be seen in dull weather, as is the case with the large-flowered *Begonias*. Old plants of *Bouvardia* in variety are turned to good account, being planted out in mixtures of other plants. They were masses of flower. *Cassia corymbosa* planted in circular beds has a pretty effect, the amount of bloom on them being considerable. The same may be said of *Plumbago capensis*, the plants of which are covered with their light blue flowers, so different in tint from the other occupants of flower-beds.

It was remarked what a pretty edging plant is *Sedum Ewersii*, when covered with its numerous dull pink-coloured flowers. *Canna indica*, in the newer varieties, was noted in flower; but, like those in pots, the plants are not of sufficient age to flower

well this season. A bed or two of *Zinnia elegans pumila*, consisting of a few distinct-coloured varieties about 1½ foot in height were noted. This strain is decidedly better than the usual lanky one seen in gardens, yet not so dwarf as *Zinnia Haageana*. Other beds consisted of *Asters* in variety, single-flowered *Petunias*, and yellow *Marguerites*.

The beds of Tea and Noisette Roses were affording a quantity of bloom, although these were but very small plants when put out at a late part of the spring. It was easy to see what the plants were like before the storm of Thursday had dashed their flowers, for a time at least.

It is said, we believe, that the cost of keeping up Chiswick is out of proportion to the results obtained, but that is a point very difficult to gauge, seeing the multitude of plants dealt with, and the far-reaching nature of the results of the trials and methods of culture, when at length these have been dribbled out to the horticultural public.

No comparison instituted with a private garden is possible, except perhaps in such elementary matters as digging, mowing, tree-nailing, and pruning, and the like matters, which are the same in all gardens. At Chiswick, the cost, time and labour involved in the distribution of plants to the Fellows is very considerable, all manure must be purchased, coals and coke bought at town prices, water specially paid for, rates and taxes are heavy, and labour more highly paid than in country places.

In making comparison between the cost of conducting Chiswick and a country establishment, these are points which ought to receive due consideration. Who but the Superintendent himself and his coadjutors have any notion of the labour of recording the trials above-mentioned? moreover, there is the loss of labour from the garden which every meeting at the Drill Hall entails; the gathering and packing up of fruit, flowers, and plants, for which there is nothing to show. The Superintendent has also to act as cicerone to visitors, foreign and native, and everyone is courteously received, as should be the case, and shown round. Every time an individual is taken away from gardening operations proper, there is a distinct loss to the garden in money and time, and this cannot but add to the expenses at the present juncture.

NEW OR NOTEWORTHY PLANTS.

CHLOROCODON WHITEI.*

To M. Naudin of Antibes we are indebted for specimens of this greenhouse climber (see fig. 48, p. 243). It is an *Asclepiad* with slender, twining, cylindrical branches. Leaves petiolate, opposite at distant intervals. Petioles about 3 cent. (1 inch) long, slightly puberulous, channelled on the upper surface. Stipules forming a band connecting the base of the two petioles, and dividing into several unequal linear blunt lobes. Leaf-blades about 15 to 18 cent., by 10 to 12 cent. (say 6 + 7 + 3 = 4 inches), nearly glabrous, rounded at the base, oblong entire, shortly and abruptly acuminate, venation arcuate reticulate, areolæ broadish, irregular, squarish, or oblong. Upper surface of the mid-rib provided near the base with a few linear, lanceolate, membranous, deciduous scales. Inflorescence axillary, shorter than the leaves, cymosely branched, many-flowered, pedicels spreading dichotomously, branched with minute bracteoles, ultimate pedicels 15 mill. long, rather shorter than the expanded flower. Calyx of five spreading, ovate acute, shortly acuminate green segments about 5 mill. long. Corolla 20 to 25 mill. diameter of five ovate oblong, fleshy imbricate segments free nearly to the base, greenish, externally rich violet within, becoming black. Corona of five fleshy scales alternating with the petals, each three-lobed, lateral lobes short oblong obtuse, median lobe prolonged, nearly as long as the

* *Chlorocodon Whitei*, J. D. Hook., *Botanical Magazine*, t. 5598.

petals, deltoid acuminate. Filaments broad, white, membranous, infolded over the ovary, and adhering to the pentagonal disc-like stigma. Pollen-masses linear, club-shaped, glandular at the end. Pollen granular. Ovary two-lobed, with a short style and large disc-shaped stigma.

We append a translation of Mr. Naudin's letter:—"It is now some years ago that you sent me some seeds of *Chlorocodon Whitei*. I duly raised them, one plant, growing on a wall, has become very tall, is many feet in height, and at the present time is covered with flowers and will probably produce seed. The heat just now is torrid, and the sunshine of Antibes rivals that of Natal or the Cape of Good Hope. I thought that you would be interested in seeing a specimen of my plant, and send you a piece of it, which I hope will arrive in a fresh condition. In the *Botanical Magazine*, t. 5898, *Chlorocodon* is figured. The flowers there are rather different in coloration to those on our plant, which is atropurpureous, but without the yellow at the tip of the petals. *Chlorocodon Whitei* is a fine decorative plant, is worth cultivating as a climber in any Orange-growing district such as France and North Africa. Thus, it grows perfectly at Oran, whither I some time ago sent some seeds to a plant-lover fond of acclimatizing plants. *Ch. Naudin.*"

POLYPODIUM (PHEGOPTERIS) TRINIDADENSIS, *Jenm., n. sp.*

Stipites, 6 to 9 inches long, void of vesture, slightly channelled, brownish-green; rachis similar; fronds pinnate, chartaceous, pale green, naked, 1 to 2 feet long, 1 foot or over wide, not reduced at the base and very slightly at the apex, terminating in a simple linear-ligulate unlobed pinna, conform to the lateral ones; pinnae spreading horizontally, almost sessile linear-ligulate, 5 to 6 lines, width 9 inches long, finely serrato-acuminate, the base truncate, not widened, slightly contracted in the lower ones, the margins uniformly throughout sharply dentate (or bi-tridentate); veins copious, simple, close, grouped, running to the margin, terminating in the serrations; sori copious, medial on the veins, forming two or three rows, no involucre observable.—Trinidad; communicated by Mr. Hart.

At first sight this might be mistaken for *Polypodium flavo-punctatum*, Kaulf. (*Aspidium rotundatum*, Willd.), a plant very common in Trinidad, but which on comparison is seen to be very distinct. The pinnae are narrower in this, they are uniformly free at the base, slightly narrowed there, with a terminal one to the frond, simple, only serrated, just like the lateral ones, and the translucent spots are quite absent; whereas *P. flavo-punctatum* has pinnae twice or thrice as broad, with copious translucent spots, the upper pinnae roundly lobed along the margins, freely translucently spotted, the upper two-thirds broadly adnate and decurrent on the rachis, passing gradually into the lobed apex of the frond, there being no distinct terminal pinnae. Plumier's figure, Fil. t. 38, is a very good figure of *P. flavo-punctatum*, and shows clearly how distinct these two species are. *G. S. Jenman, Demerara, July 30.*

FOOD REQUIREMENTS OF THE TOMATO CROP.

THE Tomatos of present cultivation are all referred to two species—*Lycopersicum esculentum*, embracing the great mass of varieties; and *L. pimpinellifolium*, the Currant Tomato. The former has two main types, var. *cerasiformis*, the Cherry Tomato, and var. *vulgare*, embracing the ordinary market Tomato.

A moderate estimate of the yield of ripe market Tomatos per acre when grown out-of-doors in the United States is 10 tons; with proper management, 15 tons per acre are often secured. If planted 4 feet apart each way, there will be about 2700 vines to the acre, weighing, after the last picking, somewhere about 8700 lb.

The roots, according to a single observation, will weigh about 1350 lb. Taking 10 tons as an average

yield, and calculating on the basis of the figures just given, a Tomato crop takes from the soil, in pounds per acre:—

	In Fruit.	In Vines.	In Roots.	Total.
Nitrogen ...	28	28	3	59
Phosphoric acid	11	6	1	18
Potash	53	44	4	101

Dr. E. H. Jenkins, of the Connecticut Experimental Station in the *American Agriculturist* of May last, reckons that one-half of what is taken up by the plants from the soil is returned to it again in the vines and roots. That is, taking it for granted that these are returned to the land as manure. These facts furnish a general guide to the proper fertilisation of Tomatos. On the one hand, the soil must be expected to supply a part of the crop's requirements from its inherent fertility; on the other hand, by no means all of the soluble fertilisers applied will be available to the crop for which it is directly used. It is quite doubtful if more than a half or two-thirds of the applied fertiliser is taken up by the crop for which it is immediately employed. Lawes and Gilbert in their experiments at Rothamsted, reckon only about 40 per cent. of the manure applied as being recovered in the increase of crop the first year of its application.

Owing to the immense demand during recent years for the Tomato as a market vegetable, the chemical composition of the plant has been thoroughly investigated. It appears that the Tomato is not an exhausting crop as compared with several other garden products, always provided the baulm or its equivalent in manure is returned to the soil.

The percentage composition of ripe Tomatos, and of the vines after picking, calculated from all American analyses, according to Dr. E. H. Jenkins, is given below:—

	Ripe Tomatos.	Tomato Vines.
	Per cent.	Per cent.
Water... ..	94.75	83.61
Organic matter	4.80	13.40
Mineral matter	0.45	3.00
Nitrogen	0.159	0.321
Phosphoric acid	0.057	0.066
Potash	0.263	0.499

A safe rule is in the first place to make sure of an excess of available potash in the soil by applying a potash manure liberally, and this for two reasons. First, because the crop requires almost twice as much potash as any other ingredient; and, secondly, because nitrogen, the most expensive element of plant-food, can only have its full effect when available potash and phosphates are present in excess in the soil. Moreover, any excess of potash over the crop requirement will not waste from the soil by drainage, but will be retained in combination by the soil for use in future crops. The Rothamsted experiments show that when potash is deficient in the soil, the growing plant, of whatever description it may be, becomes much more sensitive to adverse conditions of soil or season, and is more readily attacked by disease, especially mildew and other fungoid growths.

Wood-ashes contain a large percentage of potash, and where obtainable will be found an excellent manure for Tomatos, because not only do they correct any acidity in the soil, but they favour nitrification, and they supply carbonate of lime, of which a Tomato crop requires at least 50 lb. per acre. A small amount of available phosphate will in most cases be sufficient for a successful Tomato crop.

Having made sure of an excess of lime, phosphate, and potash salts in the soil, nitrogen should be used freely, but economically; a small quantity given frequently is much better than a large dose applied all at once. Whether Tomatos are grown for retail market or otherwise, it is very desirable to get as

early maturity as possible. Applications of soluble forms of nitrogen, and particularly of nitrates, seem to increase the yield of fruit without retarding maturation, and even hasten it provided there is sufficient heat at command. In various trials it has been found that the use of some quickly acting form of organic nitrogen with the more soluble ammonia or nitrate is safest.

The New Jersey Horticultural Station, as the result of five years' exact experiments, proposes the following general method of manuring for the Tomato. 1. Where land has been heavily fertilised or manured for the previous crop, apply evenly over the soil from 200 to 300 lb. of nitrate of soda per acre, one-half at time of setting the plants, and the remainder from three to four weeks later. 2. Where the land is light and sandy, and has not been heavily manured, apply broadcast, and harrow into the soil before setting the plants 500 lb. per acre of a mixture made up of two parts of superphosphate, and one part of muriate of potash, and 150 lb. of nitrate of soda.

It must be remembered that the foregoing suggestions are for Tomato crops grown out-of-doors, in a much warmer and more sunny clime than our own; they are given, therefore, not by any means as rules for English gardeners to follow, but as a possible help to the grower who ought to know better than any one else what his soil needs, and in what it is relatively deficient. *J. J. Willis, Harpenden.*

THE HERBACEOUS BORDER.

PENTSTEMON BARBATUS.

IN point of beauty this plant and its varieties are some of the best hardy perennials. The tall spikes of flowers of a rich shade of scarlet are very effective when the plants are grouped together in a bed or border, and they continue flowering profusely for a long time. Indeed, it not infrequently blooms in early summer and in the autumn, and is therefore a good subject for the flower garden. This remark applies to the best forms of the plant, and not to the variously dingy-coloured varieties sometimes seen in gardens. One of the handsomest forms is *P. barbatus Torreyi*, a North American plant, with spikes of scarlet flowers, 4 feet high. Another fine form is *P. b. antwerpensis*, somewhat taller than the former, also possessing scarlet-coloured blossoms. A charming bed can be made of these plants and the white-flowered *Tigridia grandiflora*, with a band of golden *Viola* for an edging, planting the latter amongst the *Pentstemons* in February or March. These *Pentstemons* are readily increased by division early in the year, or by cuttings in the autumn; the former will generally be sufficient for all ordinary uses, and the divisions soon make strong plants. Where a large number of plants is needed, the young shoots at the base may be partly covered with soil, into which roots will quickly push. By doing this in the early autumn the plants will be well rooted for division the ensuing February; these would flower in the summer following.

SPIRÆA FILIPENDULA, FL.-PL.

IN this plant we have a perennial of easy culture, dwarf habit, combined with freedom in flowering, and neatness of growth. From a compact cushion of Fern-like foliage issue a number of pure white flowers, arranged in corymbs, and they continue to push up for several weeks in succession. The plant is well suited for growing in masses where an early summer display is the aim. Though not usually employed as a pot-plant, it is nevertheless a very suitable subject, and it may be partly forced into bloom if necessary. Plants required for the latter purpose should, however, be potted-up in August or September of the preceding year. In common with other species of *Spiræa*, it should be planted in a moisture-holding soil, and though succeeding fairly well in light soils in sunny spots, it is never quite satisfactory in them. The plant is increased by division performed in the autumn or spring

Plant it firmly in not over-large pieces, and unless in a moist spot, divide every two years, to maintain the stock of plants in full vigour.

SPIRÆA VENUSTA.

This is a beautiful plant for a moist soil, in which it alone will grow satisfactorily. If the soil of the garden is not naturally moist, this *Spiræa* should be planted in rather heavy soil in a shady spot. In a boggy situation it grows from 4 to 5 feet high, and produces very large cymes of bright-coloured flowers, but is of slower growth than most *Spiræas*. Propagation is by division and seed, but for the former a large specimen is required, and by the latter method some of the seedlings may be of little value, still some bright forms may perchance be obtained. These seedlings should be planted, if possible, at the side of a stream or lake, where they would make quick progress, and at the same time economise labour. In such a position even the inferior varieties would be desirable plants. *J.*

THE ROSARY.

TWO MODES OF MULCHING ROSES.

THERE are those who would object to apply the term "mulch" to any wet substance, such as sewage, manure-water, pond-mud, &c.; the word usually carrying the meaning of a coat of some loose, light, porous material placed on the surface to arrest loss of moisture by evaporation, and heat by radiation as well. But in a larger sense we may mulch with manure-water as well as litter. Even the residuum of the liquid manures or sewage may form in themselves, or be made to acquire, most of the physical properties of mulches through allowing them to accumulate on the surface, or much better still, loosening them up and mixing them with the earth beneath through frequent hoeing. In its modest meaning, anything applied or done to the surface with a view of adding to or holding more fast the moisture and food in, and keeping the heat or drought out, is a mulch, the more porous the more potent the mulch. And the efficacy of the liquid mulches is doubled by stirring the surface with the hoe or scarifier, as soon as the surface is sufficiently dry to allow treading upon it. I have been so fortunate as to have seen both these methods of mulching in active operation in this centre of the Rose industry in the course of the past few weeks. If asked to say which was best, I should prefer to answer, both. Few have used manure-water of all sorts—house and yard slops sewage—more for Roses, than I have done, for many years in different counties with various soils, and such prompt-acting surface-mulches have been my chief stimulant for Roses. There has been, I trust, not a little sound science, assuredly much useful sentiment, as well as success in thus converting and transferring such dangerous substances into lovely Roses. Hence, on looking in at Messrs. Prior & Sons' a few weeks ago, and finding them at the sewage again, I felt something like an old hunter on which I was mounted by the stud-groom in my younger days by mistake, and which compelled me to follow the hounds for my first and last ride almost at the head of the hounds, I sniffed the sewage from afar, and have seen and felt—smelt—its results in the quality—odour, and prizes received for these sewage Roses since I saw them get their last feast of savouries for the season a few weeks since.

The cheapest and perhaps the best of all dry mulches is also in full vogue at Colchester, gangs of men are employed to maintain it in full efficiency. Rosarians have no faith in the robber mulches of weeds, so popular among distressed cultivators of various sorts. Such mulches live for themselves alone, making poor sorts poorer, dry soils drier, reducing the diet which should go to feed useful crops into smaller and yet smaller returns. Whereas by keeping the hoe and the scarifier in active motion robber-weeds disappear. The strength, moisture and food in the soil are husbanded, the surface protected

from cracking and rending, and fresh supplies of food and moisture brought up from lower depths through sustaining the potent force of capillary attraction. At Colchester and other places the practical result of keeping a loose surface may be seen in tens of thousands of Roses that have withstood the drought without any other help from the cultivator, which look so vigorous and beautiful, as if they had all that the most ambitious Rose could desire.

Strawberries in many districts where the produce is a record one this year teach the same lesson. Not a few of the very finest crops have had no water. But as a penny saved is a penny got—or more, so is every drop saved, conserved through surface mulches, a drop or more saved. Fortunately for the Strawberry crops and plants it is not at all hard to mulch to keep the fruit clean, and such mulches, whether of litter, fibre, moss, straw, chaff, tell later, and keep the roots cool and moist as well as the fruits clean—thus paying the cultivator compound interest on the labour and money expended on mulches. *D. T. Fish.*

ALEXANDRA PARK, MANCHESTER.

This park is situated on the south side of Manchester, and is much freer from smoke and the noxious vapours which the smoke causes, than any of the other parks surrounded by the city. It is much more extensive, too, covering an area of 60 acres, which opens up scope for landscape gardening design. In this respect it seems to vie with most others in having spacious promenades and drives, cricket, football, and lawn-tennis compartments, surrounded on the margins with plantations of trees and shrubs, which, when clothed with foliage, completely shut out the rather handsome villa tenements to be seen on two sides of the square. There are, in addition, avenues of trees, with alternate green Hollies between, to brighten up a little the winter aspect; and then the crowds of flowering shrubs, commingled with, and confronting the deciduous trees, together with the patches of annuals that give forth their flowers in summer and autumn, make altogether a very pretty picture.

A spacious entrance gate, with suitable lodges, has been erected, and to the right you face an avenue of Limes, something about 700 yards long, verging upon a spacious artificial lake, and right in front of you is a raised terrace in which there is ample scope to practice in no end of designs of summer and carpet bedding. The promenade between this is a spacious one, asphalted, dressed and surfaced to please the eye, and is of considerable breadth, so that treading on the grass is seldom, if ever, resorted to. What struck me particularly was the capital order maintained, showing no stint of want of keeping, and the eye lines, whether straight or on the terrace promenade, or of sweeping curvature, as alongside the walks and drives, were unexceptionally pleasing.

The principal trees doing best here were the Limes, a tree which you will hardly see in a decent state of health in any of the other parks; the Ash, of which there is a fine avenue here, but being planted too near the Limes, they are sadly encroaching one on the other, and thus spoiling both. The Sycamore is doing fairly well, but is subject to rust in its early stages of growth. Other trees, such as the Thorns of sorts, particularly the plain-leaved Thorn, is as good as can be. The Rowans make capital companion low-growing trees, and are now covered with multitudes of their scarlet berries—a great temptation to youngsters, as well as blackbirds and thrushes; meantime they are loaded, and give a brilliancy most desirable indeed to the mixed border.

Another capital fellow-tree to the two previously-named families is the Service-tree, only in summer its leaves get blackened with smoke; in spring, there is no better wind tree, in respect of showing its hoary underneath surface. Young's Weeping Silver Lime is in quantity, and a most beautiful tree it is for individualising in a park; its great leaves, twice the dimensions of those of the type, are also white underneath, and look nicely in the distance

under the influence of a breeze. Weeping Ash also do splendidly—indeed, all these pinnated-leaved trees and shrubs help to cast a dash in a sombre landscape.

Foremost among trees of a suffruticose character, not often seen about towns, is the Sumach (*Rhus Coriaria*). Its grand pinnated leaves, like great Fern fronds, stand out in relief, and how splendidly it does here planted out among ash-gray rocks! It shoots out in all directions, coming up from the running roots as they meander among the stones. It is much used, commercially-speaking, in the dyeing industry; its leaves are collected when growing, then dried and ground. The Sicilian Sumach is the best for dyeing, containing about 20 percent. of tanner's matter. It shoots far freer even than *Berberis aquifolium*, and a most beautiful patch it makes allowed to take its natural course from the main stem. The Superintendent deposits lots of plants, and sets them down throughout the mixed tree borders. *Robinia pseudo-acacia* is also doing well in standards. *Rhamnus Frangula*, although it requires support, makes a good subject, because of the yellowish-green of its leaves contrasting well with other deciduous trees. The Catalpa is doing in sheltered positions, and so is the *Salisburia adiantifolia*, with its deeply-cut, irregular-outlined leaves. Those purple-leaved trees, such as the Beech and the Plum, do not stand out ornamental throughout the year, and have in early autumn a sombre, dying aspect.

The shrubs that do best are the *Rhododendron*, first and foremost among them for border work is Cunningham's White. It is as hardy as Couch, and is bristling with buds. All the *Ponticums*, and many of the earlier pushing hybrids have suffered from the sharp frosts of mid June. The leaves are as if bronzed in the middle, green round the margin—it is just possible many of them may die off as the season ripens growth up. Wherever they have been planted in exposed positions, the wind and the frost together have played sad havoc, always barring Cunningham's White. *Andromeda floribunda* is an indispensable town plant, and so is *Skimmia oblata*. Really these two plants seem to defy smoke and frost down towards zero—the lowest reading here was 2° and 3° of frost; of course, those *Azaleas* which brighten borders with their flowers in spring and their leaves in autumn, are largely grown, and well they do. *Berberis japonica* is worth making a special note of, it is good looking to begin with, and is much harder than the common *Aquifolium*.

These mixed borders are composed largely with such ornamental plants as Snapdragons, Centaureas, Sweet Sultan, the Summer-flowering *Chrysanthemum*, the Shirley and Iceland Poppies. The latter are by far the most useful, as they are not so fugacious as the Shirley, and they keep longer when cut. The *Helianthus* in several varieties are useful, stalwart plants, the newer forms of them bursting out, and flowering freely, although their flowers are not so large. The largest one is a capital fellow for the Japanese Auratum Lily. Tobacco-plants, too, make splendid furnishing for mixed borders, because of their elegant habit, and large light-green leaves. One of the most striking beds in a detached position on the grassy parterre was one of seedling *Antirrhinums*. Nothing was more captivating in the park, because of the great variety of colours, challenging the rainbow in fact, and the dwarfness and compactness of the strain. *Pentstemons*, too, dealt in this way were effective. Carnations, singular to say, were nearly all killed off last winter; fresh relays have been planted. *Clematis Jackmanni*, too, is very prolific of flowers, and makes fine contrasting plants to others; it is always beautiful near the green grass, and it is green and lovely in this park, too, so cloely is it clipped with the mowing-machine. The Rosary has been a success this season; the plants do well in the preserved enclosure.

The summer bedding is one blaze. One might condemn it as too formal, but when you see all the variety which we have described above, there is room for this class of ornamental gardening. It will not do to abandon it altogether; the people about towns delight in a mass of gaudy colours, and the least

informed of them look upon gardeners who do not make a show of this kind in the parks for which they are practically paying the up-keep, as unfit for their work. The great breadth of beautiful greenery as a groundwork here shows up the designs to great advantage. It might be as well to give the names of a few plants and varieties that were doing superbly:—Crystal Palace Gem Pelargonium was particularly effective and free in habit; Veenvius still ranks high among bedding scarlets; Mrs. Fenn is of a fine

is telling among other subjects. Lobelias in wet sunless seasons, are apt to run to growth without producing flowers. The selected one here, named Royal Blue, is a gem for its indigo tints and for its profusion of flowers, this mixed with and surrounded by Centaurea ragulina, kept the eye on it—the softness of the grey and the brilliancy of the blue being quite eye-pleasing. A most effective combination here is the usual Calceolaria and Pelargonium, then a great broad band in front of Gageana splendens variegata

planted out. This shows what a labour proper flower-gardening requires.

But carpet bedding, to do it well, requires ten times more work, although the material may not generally require the same winter "coddling." There are some pretty bits, chiefly ranged along the promenade, of this sort of work, and the weaving of it together involves skill to begin with, and time to finish. It does not do to make it too squat. The prettiest bit of bedding was where the thistle-looking *Chamaeopence diacantha* was dotted down on a groundwork of golden *Lysimachia*, and varied *Sedums*, with dot plants of *Echeveria Peacockii*. The *Gnaphalium lanatum*, the deep olive-green *Herniaria glabra*, various *Mesembryanthemums*, *Stachys lanata*, and the Golden Thyme, were all in use in more or less designs, and these things arrest the attention of the visitors. If anything, the beds were too squat; some relief would have been desirable, particularly in the centre of the various designs, with *Agaris*, *Aralias*, *Centaureas*, or such-like individuals. As it was, it was one sheet of colour from end to end of a parterre quite 500 yards long, but fortunately the beds were broken in their outline, relieving geometrical-outline formality.

The bowling-green is largely taken advantage of, and is nicely adorned with sloping banks, their tips filled with miscellaneous flowering plants, and there are suitable band-stands and shelters, and gymnastic-grounds for boys and girls apart, the whole under the superintendence of Mr. Henry Cross, and in first-rate order of keep. *Viator*.

PANDANUS VANDERMEERSCHII.

THE accompanying illustration (fig. 46) represents a plant of the Screw Pine, *Pandanus Vandermeerschii*, in fruit, growing in the Palm stove here. It is 13 feet high, with two side-branches, each extending to about 8 feet from the main stem. The fruits are borne on the side-branches, and are of a trigono-globose shape, 9 inches long and 8 inches in diameter at the base. The fruit first made its appearance in July, 1894, and as yet shows no signs of ripening. As I am led to believe that the fruiting of the *Pandanus* in this country is very rare, perhaps this note may prove of interest to your readers. *Thos. Wilson, Glamis Castle Gardens.*

WISTARIAS.

THE genus *Wistaria* is one of a great number showing the close relationship that exists between the flora of North America and that of Northern Asia. Of the species known, one comes from the United States, and the rest from China and Japan. The generic name (sometimes erroneously spelt *Wisteria*) was given in honour of Caspar Wistar, an American scientist, who flourished about one hundred years ago. The species vary in habit, from shrubs of comparatively dwarf stature, to strong-growing climbers large enough to envelop big trees. No climber ever introduced has served its purpose better than the common *Wistaria*, the flowers being unsurpassed either in beauty or abundance, and the plant itself being of exceptionally vigorous growth, and quite hardy. It is undoubtedly the finest of all the *Wistarias*; but the other species flower at a different season, and they have sufficient merit to make it worth while to pass the genus in review, especially as they are but little known in gardens. Botanists differ in their estimates of the number of species in the genus, but there are at least three—*chinensis*, *multijuga*, and *frutescens*—whose identity is well established, although Mr. Hemsley places *multijuga* under *chinensis*. Two others—*brachybotrys* and *japonica*—are figured by Siebold in his *Flora of Japan*, but they are scarcely known in gardens, and the latter is now looked upon as a *Milletia*.

W. chinensis.—This fine species was introduced from China about the year 1816. There is no hardy climber in English gardens that attains to so large a size as this, specimens being not uncommon whose

*

FIG. 46.—PANDANUS VANDERMEERSCHII.

roseate hue; and Henri Jacoby is a large brilliant truss; Master Christine, a telling pink; Violet Hill, also, is a fine nosegay Geranium. Among Golden Bronze there was nothing more—if, indeed, so effective as Mrs. Quilter; the habit is dense, and the leaf is the perfection of form, whilst the colouring beats most of the older ones. Marshal MacMahon is an effective bronze. There were many others, but these were the cream of the group.

Among *Violas*, the best standing of the violet colour is undoubtedly Blue Perfection. Most *Violas* in dry weather curl up their flowers; this one is least affected in that way, and its colour

mixed with the prolific-flowered blue *Lobelia* and edged with *Echeveria*. The orange flowers in day time resting in the green and white leaves of the plant, and the blue and the other primary colours told exceedingly well without being out of colour and in bad taste. Yellow is an everpleasing colour, and should be sparingly used in all flower garden combinations, the designer here had evidently his eye upon that point in planning his arrangements. A few beds of Harrison's Musk set among purple leafage was highly effective—it would have been more so but the *Iresine* was not up in colour, neither were the *Alternantheras*, which are less even than when

branches have a spread of 200 feet to 300 feet. Its vigour is equalled by its floriferousness, and a fine specimen in flower is one of the most beautiful floral pictures an English garden can show in early summer. The leaves are of a pale green colour, and consist of nine or more leaflets, which have a few flattened hairs scattered over the upper surface, but confined on the lower side to the veins. The flowers are borne in racemes, sometimes considerably over 1 foot long; they are large, papilionaceous, and of a pale bluish-purple, fading off to almost white in parts of the flower. Grown in tubs as a standard, this *Wistaria* may be used for spring-forcing in the greenhouse, pruning back each year after flowering. Out-of-doors it may be used in a variety of ways. It is admirably adapted for covering walls, pergolas, arbours, &c., and may also be planted so as to climb over trees that can be spared for the purpose. There are now several varieties of this plant in cultivation. Var. *flore-pleno* has double flowers; alba is white, and is also represented by a double-flowered form; var. *macrobotrys* has flowers of a paler shade than the typical form, but its chief distinction is in the long racemes. There is also a form with variegated leaves; but, with the exception of the double-flowered variety, which remains longer in bloom, the typical old plant is the best. The white-flowered varieties are beautiful, but do not flower so freely.

W. multijuga.—In the *Index Kewensis*, this plant is referred to as *W. sinensis*, but from the point of view of horticulture, there can be no doubt as to the desirability of keeping up the present name—indeed, this is done in the recently-published *List of Hardy Trees and Shrubs at Kew*. It is not of the same value as *W. sinensis*, but it does not come into competition with that species, as it flowers two or three weeks later. It was introduced from Japan about twenty years ago, and being frequently met with there in a cultivated state, was for long considered indigenous to that country. It is now thought to be most probably a native of China or Corea. The character which, besides its later flowering, distinguishes it from *W. sinensis*, is the extreme length of its racemes. Ordinarily, these are at least 2 feet long, and the Hon. W. F. D. Smith, at the Temple Show of 1894, showed racemes a yard in length, grown in his garden at Henley-on-Thames. The flowers differ also in being more sparsely arranged, in having shorter pedicels, and in being smaller. In colour they are most frequently a blend of blue and white, the proportions of each colour varying in different plants; there is one variety, known as alba, with flowers wholly white. The leaves are more numerously divided than in *W. chinensis*, and the leaflets, which are smaller, are bright green, and glabrous on both surfaces. In this country, at any rate, it does not flower so freely as the better-known species, and where space can only be afforded for one of them, it should not have the preference.

W. brachybotrys.—It is doubtful whether this plant can be admitted as a distinct species. I have not seen it under cultivation, but judging from the various figures that have been published, it is, most probably, a form of *W. chinensis*, which is now known to be a native of Japan as well as China. Siebold discovered it in Nagasaki, and figured it in the *Flora of Japan*, t. 45. It was introduced by him to the continent about 1830, and flowering subsequently in the Botanic Garden of the University of Ghent, was figured in the *Flore des Serres*, t. 830. Although met with occasionally under cultivation in Japan, Siebold observes that he saw it once only in a wild state, and then in a spot where it covered the whole side of a hill. The flowers are produced in April in racemes that are much shorter than those of *W. chinensis*; they are of a deep purplish-blue, and mingled with the tender green of the foliage, are very effective. The foliage is like that of *W. chinensis*, but the plant is dwarfer.

W. japonica, syn. *Milletia*.—This species is scarcely known in this country outside botanic gardens. It was found by the Kew collector, Richard Oldham, in Nagasaki, Japan, in 1862, but had previously been

known to Siebold, who figured it in the *Flora of Japan*, t. 43. In the accompanying text, he says "the clusters of white flowers hanging from the tops of the bushes and trees form a magnificent sight, giving to the vegetation an aspect of wild beauty." In spite of this, however, it can only be described as one of the least ornamental of *Wistarias*. The racemes are small, as are also the individual flowers compared with those of *W. chinensis*. It flowers in July and August.

W. frutescens.—This, as before stated, is the one species found out of Asia, being a native of Florida and other southern United States. It is a climber like *W. chinensis*, but is not so strong a grower. The leaves are of a rich bright green, with the leaflets not so numerous as in *W. multijuga*. The under-surface and the midrib of the leaf, as well as the young branches, are covered with down. The racemes vary in size from 3 inches to 6 or 8 inches in length, the flowers being a pale bluish-purple. There is, however, a white-flowered variety, and also one named *magnifica*. The latter has racemes sometimes more than 1 foot long, and as described by American horticulturists, is a much superior plant to the typical form. It flowers later, and is, on the whole, well worth cultivation as an ornamental climber. In the racemes of *W. frutescens* the flowers are much more closely packed than in the Asiatic species.

Little need be said in regard to cultivation. *Wistarias* are amongst the most amenable of hardy plants, thriving in any soil that is of fairly good substance, and moist. In the early stages they may be helped by top-dressings of manure applied in spring. When planted near trees over which they are intended to climb, a large pocket of good loam should be provided, and they should be planted in such positions that light and rain can reach them. Some fine effects are produced in Mr. Anthony Waterer's nursery at Knap Hill, where *Wistaria chinensis* has been allowed to clamber over Pine-trees and Laburnums. In the latter case especially, the simultaneous flowering of the two things, and the intermingling of the yellow and purple racemes, makes a beautiful picture. All the species may most readily be propagated by layering—seeds being only produced in years of exceptional brightness. In 1893, for instance, *W. chinensis* ripened a fair quantity of seed. *W. J. B.*

BOOK NOTICE.

MANURES AND THEIR APPLICATION.

In no department is the average gardener more deficient than in the knowledge of manures and their proper application; we, therefore, welcome a useful and cheap little treatise upon this important subject by Mr. W. Dyke,* which is, in fact, the substance of a lecture delivered to the Chesham, Wormley, and District Horticultural Society, May 9, 1895, but revised and given in fuller detail.

The author does not claim that there is anything new in his little work, his idea being to give to those whose duty or pleasure it is to cultivate the soil some idea of the different kinds of manure in use, their action when applied to the soil, and the quantity likely to produce the best results generally.

It is wonderful and instructive to see to what nice shadings of adaptation this preparation of food for plants has during recent years been carried. Here is a soil, rich in organic matter, on which we wish to raise a crop of flowers or fruit, but because of the very abundance of organic matter, there will be an overgrowth of wood and foliage—a splendid show of greenery, but little blossom or fruit. We ask, through the agricultural chemist, what the trouble is? He shows us that potash enters largely into the fabric of the wood, and phosphoric acid largely into the formation of the fruit, and it is maturation we are after. So we give the plant a food containing 10 or 12 per cent. of soluble phosphate, with a

* Published by William Cate, Bouverie Street, E.C., price 6d. post free.

liberal amount of potash, and the tree or flowering plant gratefully responds to our thoughtful kindness in asking it what food it needed or preferred.

The pamphlet before us will assist the practical gardener in his study of manures, as to what they are and what they do. It is divided into two sections, under the heading of "General Manures," those which contain all the ingredients required by plants for their nutrition; and "Special Manures," those containing one or more (but not all) of the necessary constituents of plant-food.

A few corrections in the work are necessary, to which we should like to call attention. The poisonous element in sulphate ammonia is sulphocyanate.

The quantity of nitrate of soda recommended to be applied is from 1½ to 3 cwt. per acre. This we consider is too much for most garden products. From ½ to ¾ cwt. per acre is as much as the majority of garden plants can take; otherwise quality is sacrificed for quantity. The keeping quality of Onions is greatly deteriorated by large dressings of nitrate soda. Soot is a very variable manure; it contains but little nitrogen, and from 1 to 4 per cent. of ammonia.

Blood, after being dried, is a valuable manure; it contains from 78 to 79 per cent. of organic matter; 7 to 9 per cent. of ash ingredients; about 12 per cent. of nitrogen; from 1 to 1½ per cent. of phosphoric acid; and about ¾ or 1 per cent. each of potash and lime. From some carefully-conducted experiments in Belgium by Professor Petermann, it was found that the fertilising power of nitrate of soda was greater than that of dried blood, and especially so on light land. According to Petermann's results, by far the best results with dried blood were obtained on clayey soils, whether the manure was used alone or in combination with phosphates and potash.

The quantity of nitrate of soda recommended for lawns, 25 per cent. of the mixture, is certainly an excess; if more than 5 to 10 per cent. of nitrate soda is used in a lawn mixture, the coarser quality of herbage will be found to come too prominently forward; and as the lawn will require under stimulating dressings of manure more frequent cutting, deterioration and exhaustion will the more quickly follow.

OUR POULTRY.

BY HARRISON WEIR.

(Copyright.)

(Continued from p. 48.)

In my last I note an omission. Speaking of the Langshan, three words have in some way been omitted. The sentence should read "they are excellent layers, the eggs being of fair size," &c. As stated, the black variety is the most common, though there is no reason whatever why other colours should not be produced, though the Langshan Club has, I think, very unwisely given its opinion that any other colour is not desirable, nor can such be of the true breed. I remember years ago seeing among a flock of Rocks two pure white birds; would the committee of the Langshan Club have the hardihood to say that these were not true bred Rocks or white Blackbirds, which are not very uncommon, were not true bred ones. In breeding animals or birds, especially those entirely domestic, white or blue is by no means an unnatural substitute for black, and therefore to my thinking, it betrays a very narrow-minded conception of the breed or variety of fowls called the "Langshan," when it is asserted that only the black variety are the true, while the white or blue are decided by the club to be cross-bred. In this matter, I entirely differ with the committee of the Langshan Club, of which I am an honorary member.

Again, I most seriously differ with them when they state in their "points of excellence," that the plumage should be "tight." I have paid great attention to the peculiar style of these birds ever since they were first imported by Major Croad in 1872, and by others afterwards, and I am bound to say that I have never

seen an imported bird "tight-feathered." Some have been what is termed close-feathered, which is a very different thing. The Langshan Club also insist on long legs; this is also contrary to my experience of the imported birds, as is also that of being long in the back. In fact, the Club has materially altered the shape of the Langshan for the worse, both in appearance and utility, the long-legged birds being much later in coming to maturity than the short, square, compact, or even medium-legged breed, of which I have kept many, bred direct from imported birds; therefore, if any of my readers feel any inclination to keep Langshans, I would most strongly advise them not by any means to purchase any of the stork-built sort; select the short,

They are most excellent foragers when they have the opportunity, and range far and wide, "keeping about" until long after sundown. The principal fault is, I think, their being feather-legged, which is rather prejudicial when the grass is long and wet, though they are less injured in this way than some of our English breeds. I am most decidedly of opinion that this breed would have taken a very much higher position and hold on the public estimation if it had not been for the course taken by the Langshan Club insisting on the long leg, the long back, and the tight feathering worn, of which points the best imported birds possessed; nor can the majority of poultry-keepers be persuaded that very long-legged birds are either profitable, useful, beau-

that some of the hens would lay two eggs in one day, or rather three eggs in two days. Now after being made a bird of "mostly feathers," the production of eggs is by no means equal to that of many other fowls.

Though so beautiful in colour as the "pupus fawn" now is, the flesh is but of poor quality, and long in fibre, but juicy; the skin coarse, thick, and yellow, the fat of a golden yellow and somewhat oily, which is generally found in abundance in the abdomen, sometimes to the weight of three to four pounds in very large fowls; the heart is long and thin, and by no means fleshy; the wings also are small, while the thigh and legs are of extraordinary size, and full of muscle, but by no means dry or sinewy; with some the Shanghaes are in favour as large-sized table fowls, while with others they are held in little or no esteem. But this has not been always the case, for on their first importation about 1847, columns were written in their favour, not only as egg producers, but as large rich-flavoured juicy table fowls, though the genuine epicure never could discover in them anything meritorious in this respect, but predicted that the crossing of these with our English birds would result in much deterioration, which prophecy has, unfortunately, proved correct.

(To be continued.)

PRESTON MANOR, BRIGHTON.

WITHIN the memory of the present owner, the time was when scarcely a carriage came within sight but which was bound either for the manor or a neighbouring estate; now a frequent bus-service passes the gates. At that time, strangers in the neighbourhood were objects of curiosity—now the thousands of visitors and excursionists who flock to the fine grounds of Preston Park and gardens (once part of Preston Manor), make strangers a part of the surroundings, at times perhaps too evident, but the £50,000 or so which the owners of the Manor House had for the portion forming the beautiful public park should afford, at least, some solace for their invaded privacy.

Approached by a short drive beneath stately old trees, the mansion, standing on rising ground, presents its old-fashioned front, which is not remarkable for architectural beauty. The other face of the building, to which a tower has been added, and which is clad with Ivy, is very quaint and pretty, and standing on the terrace a very charming garden-scene presents itself. The whole of the centre of the view is of verdant green lawn, to the left is a terrace with beds of scarlet Pelargoniums edged with blue Lobelias and of other bright flowers, the background being an Ivy-clad wall above which rears the quaint old tower of Preston Church, which is also covered with Ivy, and flanked by ornamental trees, a bank of Yews and Euonymus forming a base to the tower in harmony with it and the other objects around. At the end of the green-sward runs beds of flowers, and on the right the pretty walled-in gardens, in which are mingled fruits and hardy flowers, after the manner of gardens in the olden time, and which it is the delight of Mrs. Macdonald to maintain. Here are Apple, Pear, and other fruit trees, some of them perhaps a good deal behind the times in quality, but beautiful nevertheless. Beside the grassy or gravel walks which here and there intersect the gardens are numerous clumps of Roses, "ancient and modern"—single and double; masses of perennial Sunflowers, single and double; Phloxes which must date from the very earliest crosses of the species; long stretches of Lily of the Valley, beautiful and fragrant in their season; and of Violets and other fragrant flowers, and among them patches of annuals, which help to make a brilliant display. Among the shrubs, Calycanthus præcox is in bloom, and the Weigela, &c., very pretty and effective.

In one of the sheltered gardens a large quantity of grand plants of *Richardia æthiopica* (Arum Lily), some of which have ten or twelve crowns, is planted out, and a fine lot of neat plants of *Azalea indica* are well set with buds.

FIG 47.—LÆLIC-CATTELEYA FOWLERI: ROSY-LILAC; LIP RICH CRIMSON PURPLE. (SEE P. 192.)

square-built forms, which not only are better table fowls, being finer in the fibre of the breast-meat, but they are also better layers, and the eggs are generally more fertile. I have taken much pains for many years in inspecting the stock of imported and imported-bred birds belonging to Miss Croad, of Poling, near Arundel, and have found these the most desirable, in comparison to those recommended as the proper size and form by the Langshan Club. I have noted also those Langshans imported by Mr. Thompson, and of late have seen the stock of Mr. Lambert, also bred from imported birds.

The Langshan, coming as it does from a somewhat cold country, is naturally very hardy, and is a most excellent winter layer, so that the chicks with proper attention can be easily raised in the early part of the year; or, if necessary, in the latter part, so as to have early or spring chickens of good size and quality.

tiful, or elegant. As I have said before, do not have the long-legged, stork-like "selection."

There is another Asiatic breed, erroneously called the Cochin, instead of Shanghae, which is its proper name, the breed being unknown in Cochin-China. This is a large, coarse bird, and now far too much bred for feathering, without any reference to usefulness; and though such is the case, it must be admired as almost "a work of art," so wondrous is the fluffiness, length and lightness of the plumage, the beautiful buff colour that have been obtained by careful matching, and for their beauty unsurpassed, while the leg feathering is produced in such quantity as to almost hide the shape of the lower parts of the body; but this has not been obtained without sacrificing some of the most valuable qualities it previously possessed, not the least of which is its excellence as a winter layer of highly-coloured eggs in quantity, it having been not infrequently alleged

The glass-houses are in keeping with the rest of the garden, but of them it may be said that more modern structures would be an advantage. As it is, in the hands of Mr. H. Naylor, the gardener at Preston Manor (formerly with Mr. Beckett, at Aldenham, and Mr. Hill, at Lord Rothschild's), the best that it is possible to make of them is assured. In one of the vineries is a good show of tuberous Begonias; in another house a fine display of zonal Pelargoniums, the great bushes of *P. Raspaill* having bloomed from last autumn until now, and are still good.

A little house of Maidenhair Ferns has the walls covered with Ferns, and is a very pretty object; and in other houses and frames are a fine batch of Tuberoes just coming into bloom, and various other things for autumn and winter flowering.

Somehow, there is a charm about these old-fashioned gardens, and an interest in the plants in them, which is lacking in modern, and what are called well-kept gardens.

CLIMBING PLANTS AT THE ABBEY PARK, LEICESTER.

The cultivation of a general collection of plants under glass is not an object at these fine public gardens; but the winter garden, in which are some splendid specimens of *Dracæna australis*, has a good selection of greenhouse climbers on its roof, some or other of which are in bloom all the year round, and are specially useful in assisting in making an effective display when the house is arranged with the 2000 or so specimens of *Chrysanthemums* which Mr. Burn grows for the purpose every year, and which, with the setting of drooping climbers overhead, and the graceful heads of the *Dracænas* among them, present a far more beautiful appearance than do most other arrangements of *Chrysanthemums*.

At the time of the great flower show (August 6), more or less in bloom on the roof and pillars were several kinds of *Passiflora*; *Lonicera sempervirens*, *Clematis indivisa lobata*, *Trachelospermum jasminoides*, *Swainsonia galegifolia*, and *S. g. alba*, *Tecoma jasminoides*, the charming sky-blue *Plumbago capensis*, and the white *P. capensis alba*, with large bouquet-like heads of bloom; *Cotæa scandens variegata*, and the bright-blue *Sollya Drummondii*, a very pretty old plant, but rarely met with now.

ABNEY HOUSE, BOURNE END.

The pretty river-side residence of Miss Hamnerley, on the banks of the River Thames, about midway between Maidenhead and Great Marlow, is well known to frequenters of the district, and the well-kept grounds form a noticeable feature to pleasure-seekers. The house itself, or, at least, the whole of the south front and roof, has been, until quite recently, covered by a fine specimen of *Aristolochia Siphon*, the handsome foliage in the summer making it an object of great beauty. Alas! it is now dead—from what cause seems uncertain; but the floods of November last, which almost reached the plant, and must have saturated the soil about the roots, followed by the severe winter, seems to be the probable cause of the loss of this fine specimen.

The pleasure-grounds are not very extensive, and Conifers generally do not flourish, although there are some healthy *Sequoia gigantea* which seem to like the moist situation, and are fast growing into good specimens. Begonias were the most attractive feature of the bedding, several beds being filled with distinct colours, flowers erect, and one mass of bloom. The strain is Owen's Imperial, and it is one that is well adapted for bedding-out purposes.

The glass-houses are numerous, the most conspicuous being a fine orchard-house, which really prompted the writing of these notes. Having seen the excellent dishes of fruit staged by Mr. Goodman, the gardener, both at the Maidenhead and Reading shows, in past years, I called recently to see it at home, the above-named orchard-house being quite in the locality. It is a span-

roofed structure about 120 feet long and 30 feet wide, running north and south. Inside there are three beds, one on either side and a central one, with a path running round about 6 feet from the sides. The trees on the east border are planted out and trained about 12 feet up that side; the remainder in central and west borders are bush trees of Peaches, Nectarines, Plums, and a few Pears growing in pots plunged in the soil of the borders. From these trees abundant crops of fine fruits are annually taken. The pots are perforated ones, mostly of 14 inches in diameter, and the roots are allowed to work through the holes in the side into the soil. For some years past they have been annually lifted bodily (at pruning time), nearly all the roots cut away that have passed through the sides and bottom, and replunged, adding a small quantity of newly-prepared soil around the sides to encourage fresh root-action. They are not taken out of the pots. Great care is also taken to keep the soil moist at all times, a most efficient water-supply being laid on, and water is easily and quickly applied by means of a hose. Frost is not excluded, and although the house is fitted with two rows of 4-inch hot-water pipes, the water is run off, and fire-heat is not applied until after the trees begin to move in early spring. While the fruits are swelling, the trees are occasionally fed with diluted sewage, used in a perfectly clear state.

Many varieties of the Peach are grown, the earliest to ripen being Alexander and Waterloo, which are followed by Amsden June and Hales' Early. Some very heavily-cropped trees were Dagmar, Condor, Crimson Galande, Dymond, Sea Eagle, Nectarine, Princess of Wales, and Osprey Peaches, and of Nectarines, Lord Napier, Humboldt, and several of Rivers' Seedlings; Hamboldt is an especial favourite, and puts on a beautiful colour. Some splendid samples of Plums were ripe: Oullin's Golden Gage was superb, also Kirke's Belle de Louvain, Jefferson, and Belgian Purple. Some 600 dozens of good dessert Peaches and Nectarines have most years been gathered, besides abundance of Plums, and the whole forms one of the most successful examples of orchard-house culture to be found in the country, of which Mr. Goodman may well feel proud.

In a greenhouse I noted a fine plant of *Bougainvillea glabra* trained under the roof and flowering most profusely. It was planted in a box in a small house adjoining (in which *Eucharis* plants are grown), and the rods taken through the brick wall into the cool greenhouse, where it annually produces an abundance of its bright floral bracts.

The kitchen garden was looking remarkably well, and vegetables generally are well grown. I noticed some wonderful samples of Ailsa Craig Onion, which should find a high place on the exhibition table later on; while Peas, Beans, and Cauliflowers, were well represented, notwithstanding the drought, an unlimited water supply at high pressure being within reach of all parts of the garden from stand-pipes fixed at regular intervals. C. H.

VARIORUM.

THE CULTIVATION OF BANANAS.—The Banana is becoming a regular article of consumption in Europe, and large quantities are now shipped hither, principally from the Antilles, where this fruit is cultivated on a large scale. It has always been in great request in the United States, and, judging from the quantities now to be seen in English fruit shops, it will soon win its way to public favour here in the same way that the Tomato has already done. There is an immense Banana plantation in Cuba, covering an area of 50 square miles, and in it 3,500 persons are employed in cultivating and gathering the bunches of fruit produced by 2½ millions of trees, the transport of which has necessitated the creation of a fleet of twenty-six steamboats. From Jamaica, where the Banana tree has almost entirely taken the place of the sugarcane, Bananas are now exported to the annual value of about £400,000; and at Honduras, Costa Rica, and the Hawaiian Islands, their cultivation is extending more and more. At Costa Rica alone, there are already

about 350 plantations, containing over a million trees. It is a very lucrative industry, and is conducted with a very small outlay in the way of working expenses, a damp soil and plenty of irrigation being the two principal requirements. Nine months after planting the young trees begin to bear, and from that time forward a certain number of bunches may be gathered almost every week, the reproduction of fresh trees going on continually in the meantime by means of numerous shoots and off-sets. The crops are very abundant, and a grove covering, say, an area of 1500 square yards, will yield from 6000 to 8000 bunches in one year, some individual bunches being worth from 2s. to 2s. 6d. a piece. The fruit when gathered is carried on rails to the nearest port of shipment, and taken on board steamers of about 1000 tons capacity, and each one capable of containing some 20,000 bunches. Besides being consumed in its natural state, however, a very excellent flour is also made from the Banana in many places, by desiccating the fruits after depriving them of their sheath, and then reducing them to powder. This delicious little comestible, indeed, is the object of a much more extensive trade than is, perhaps, conceived by occasional consumers of it in this country. *Western Morning News.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

PINES.—Suckers that were recently potted will be making roots, and care will be required in order to maintain the soil in a fairly moist condition. More water than is necessary is dangerous, as it may cause the base of the sucker to decay. Syringing overhead must also be done sparingly, to prevent moisture collecting in the centre of the plants. Should bottom-heat decline below 80°, the plunging material should be rammed together firmly, and fresh tan or leaves added to raise the temperature to 85°. Only sufficient shade should be afforded at mid-day to prevent the leaves being scorched, reducing it gradually, so that by the middle of next month, when the plants are well rooted, it may be dispensed with altogether. It is not too late to put in suckers if sufficient were not forthcoming previously; indeed, if more are now put in, it may cause a better succession of ripe fruit.

CUCUMBERS.—Plants that were recently planted out to produce a winter supply must be kept growing freely, stopping the shoots at every other leaf, so as to have the base of the trellis evenly covered with healthy shoots, at the same time removing all the fruit and male blooms as soon as seen, by which means strong plants will be produced before the autumn. Additional rich porous soil should be given at intervals of a week in small quantities, adding with it charcoal, lime rubble, or burnt-earth to keep the whole from becoming sour. The plants should be syringed regularly with tepid rain-water, and plenty of water used about the floors, &c., so as to ensure a growing atmosphere. Ventilate carefully during bright days, and avoid an influx of cold air, or a sudden change of temperature. Weak stimulants may be afforded, but in the case of plants that have to stand the winter, it is not desirable to promote a very gross growth at this season. Keep a night temperature of from 70° to 75°; and during the day of from 8° to 10° higher; and if the temperature of the house is dependent as much as possible upon solar heat, so much the better.

SOILS.—Now is a good time to get under cover a good supply of the different kinds of soils for winter use, and a good heap of compost, which will be required next month for different kinds of fruit-trees in pots, and for the renewal of Vine or Peach borders, should be prepared, and protected from rain.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

GLOBE ARTICHOKE.—Plantations consisting of the oldest stools may now be cleared of the old fruiting stems, carefully detaching all decaying leaves at the same time. Afterwards give a good dressing of rotten manure. Young plantations made in the spring as advised, should now provide plenty of heads of a deep green colour. Always cut them before the colour loses its freshness. Heads may be kept fresh and fit for use for several days, if the

stems are plunged in damp moss or water, in a cool, moist room. For late autumn cutting, the plants should receive occasional soakings of manure-water, and be syringed after hot days with tepid soot-water.

CABBAGE AND CAULIFLOWER.—Make another sowing of each of these for standing through the winter; those of the first sowing will now be ready for pricking out, and this should be attended to at once. A planting of Coleworts may still be made, if necessary.

ENDIVE AND LETTUCE.—Make frequent plantings of each of these, and be prepared to protect the former if a severe winter ensue. Frequent plantings of Lettuce should be made for winter use, and a border facing west, sheltered by a hedge or wall, is one of the best sites for these plants. Good batches of strong plants should also be put out weekly on a piece of good land, well exposed to sun and air, for cutting from until Christmas. Some of the plants should also be put into frames.

MUSHROOM BEDS.—In order to have a winter supply of Mushrooms, materials for making the beds must now be gathered without delay. After trying various ingredients for mixing with the manure in order to make it go further, such as tan, leaves, loam, &c., I find the latter to be the best; but if plenty of good droppings can be procured for the trouble of collecting them, these are all that is required. Leave in all the short litter to mix with the droppings, and let them be spread out in a dry, open shed, turning them every third day or so. In about ten days they may be thrown together in a heap, and turned every third day, so that they may gradually become sweetened. The materials may then be placed in the Mushroom-house, well treading them down, and making them very firm when of the required thickness, which should not be less than 1 foot. When the heat declines to 80°, it may be safely spawned. The bricks of spawn may be laid on the beds to soften one day before it is used, and great care should be taken in spawning the bed to be sure that the pieces inserted do not lie hollow. The covering of the bed should consist of good loam, of about 1½ inch in thickness, and if this is from a meadow known to produce good Mushrooms, so much the better; it should be beaten tolerably firm, and in winter the loam should be warmed before it is used.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

DENDROBIUMS.—By this time a few plants of the evergreen section of Dendrobium, including *D. swainsonium*, *D. chrysotoxum*, *D. Farmerii*, *D. thysiflorum*, *D. densiflorum*, &c., will be finishing their growths; but as these species continue to root for some time after this, do not allow a lower temperature than that of the Cattleya-house. To plants that have completed their growth, the supply of water at the root must be gradually lessened, so that the bulbs may become hardened, but they should not be kept too dry whilst the roots are active, or they will probably start a second growth, which generally is weak, and the new growth made in the spring will also be weak and poor. The hot summer has benefited such Dendrobiums as *D. Phalaenopsis*, *D. superbiens*, *D. Goldiana*, *D. bigibum*, *D. Bensoniae*, *D. taurinum*, *D. undulatum*, *D. secundum*, &c. These plants should now be in the hottest house, and if grown as they should be in small pots, and these have become filled with roots, they will take almost unlimited supplies of water. In cases where the plants can be allowed a corner of the house to themselves, they should be allowed all the light and sunheat possible. If it be possible to afford the plants full sunshine, let them have a liberal supply of fresh air during the middle hours of the day, and about 2 P.M. close the house and syringe the plants well amongst the leaves, which will cause the growths to come on freely and make strong vigorous bulbs. Some plants of *D. Phalaenopsis* have already completed their growths, and are sending out bloom spikes. When the flowers are fully open, arrange the plants in that part of the house where the ventilators are more or less always open, or if convenient in the Cattleya-house, the drier atmosphere of which would suit them better.

BARKERIAS.—The species of *Barkeria*, as *B. Lindleyana*, *B. elegans*, *B. Skinneri*, and *B. cyclotella* are worthy of attention, their pretty and large flower-spikes in proportion to the size of the plant, presenting a gay appearance during the dull season.

They succeed well under treatment similar to that given to *Dendrobium Phalaenopsis*.

CALANTHES.—In order to obtain strong flower-spikes, and to secure clear and bright flowers, we fill up the room on the south side of the East Indian-house, recently occupied by the deciduous Dendrobiums, with the most forward plants of the deciduous Calanthes. The plants should be elevated well up to the roof-glass, and so arranged that each obtains its share of sunlight. During the middle hours of the day when the sun is bright, only a very thin shading is needed, but if exposed to the sun in the early morning, and again in the afternoon, the bulbs will finish up strongly. In the extra light the plants will dry quicker, and will require plenty of water at the roots, and an alternate waterings with liquid manure-water will be beneficial. The *Rognierii* section of Calanthes are only about half-way through their growing season, and should therefore be treated the same as the others were when in full growth.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

ROSES.—Attention should be given to the ligatures of budded stocks, loosening these if they are causing any ribbing of the rind. Buds may still be inserted in stocks that were not in a fit state for budding at an earlier date. The recent rains will have rendered the bark easy to raise. The present is a good time to thin out the blind, weak, and flowerless wood of such varieties as give late bloom; and those growing strongly and making a good deal of wood will also be benefited, as it will enable the strong shoots to become well ripened. Some of the best of the shoots that are removed will make cuttings, and such should, whenever possible, be taken off with a heel; and they should be straight, and from 7 to 9 inches long. Insert them in well-drained, sandy loam, in rows at 12 inches apart, and 6 inches between the cuttings, making them firm in the ground, which should be dug over as the cuttings are put in. If there are many cuttings it is an expeditious method to dig a space, trample it firmly, then cut down a trench with a perpendicular face, and lay the cuttings against it with their tops about three buds above the ground-level, and proceed as before, and so on till all of the cuttings are put out. A border facing west is a suitable one for a cutting bed. Cuttings of Teas, Chinas, and Bourbon Roses should be placed in pits or frames where they can be protected from frost. Where frames and a mild bottom-heat can be commanded, the propagation of Roses is rendered more certain. The cuttings for this method of propagation may be 4 or 5 inches long, and they may be dibbled into 6 or 8 inch pots filled with sandy loam. These pots of cuttings should be placed in a cool, shaded house for a time, that is, till the wounded ends are calloused, and then plunged in gentle bottom-heat. When rooted, pot them off in small pots, and keep under glass till the spring. If a new rosetry or new rose-beds have to be made, the work of getting the ground in readiness for them should be soon taken in hand. The best kind of soil is a strongish loam, and if the staple is not of this nature, some heavy loam should be mixed with it. A rose-bed should have a depth of at least 18 inches, be well drained into a dry well, if the land is not naturally or artificially drained. If the subsoil be clayey, it may be burned, or wheeled away; stable-dung, crushed bones, and light loam should be added to loams that are very tenacious, and strong loam and cow-dung to that which is sandy and light. Hybrid perpetual Roses should be planted early in the autumn, not waiting till every leaf has fallen, if the shoots are well matured. When the planting is finished, mulch the plants with half-rotten stable manure. Notes may now be taken of alterations to be made in the rose-beds. Old rose-beds should be replanted during the autumn, the ground having been heavily manured and deeply trenched. If any fresh plants are introduced, they should be kept by themselves. Make secure any long trailing shoots of roses before the usual autumn gales come; and apply sulphur or other mildew antidotes if mildew be present on any of the roses.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

GATHERING AND STORING OF FRUIT.—Fruit-storing will soon become general all over the southern parts of the country. The fruit-rooms should be thoroughly cleaned and sweetened in

advance, the tables and shelves thoroughly washed with hot soap-suds, and the walls lime-washed, using freshly-slaked lime, to which a handful of flowers-of-sulphur is added, and it is best applied whilst in a hot state. This lime-wash will effect a speedy clearance of insects and their eggs, and free the rooms of fungus-germs. Before the fruit is taken into the room, the latter should be thoroughly dry. Every description of fruit should be handled with care, for however hard an Apple or Pear, for instance, may be, they are readily bruised, and bruises always tend to early decay. A little soft hay should be put into the bottom of the gathering-basket. A mistake often made is to gather fruits when they are supposed to be large enough, without taking fitness into account. As a guide, a fruit may be cut in half—if the pips are brown, the crop may safely be gathered; or those which on being raised, part readily from the spur, may be taken first, others being left for future gathering, it being seldom that all the fruits are ripe at one and the same time. Early varieties of Pears should be placed on different aspects, and some of them on pyramids or standards in parts of the country where these succeed, so as to lengthen the season as much as possible. Gathering a crop from a tree at various times, as advised, has also the same effect.

PEACHES AND NECTARINES.—The Peach and Nectarine trees should be examined daily, and all fruits gathered which part easily from the shoots, laying them on clean soft paper or cotton-wool in a cool room till required for the dessert. Continue to expose all fruits to full sunlight by tying back or taking away overshadowing leaves. As soon as a tree is bare of fruit, afford it a washing with the garden-engine, so as to clear off red-spider and other insects, and at the same time remove copings of glass where these are employed. Choice varieties of dessert Plums may be gathered and placed in a dry airy room till wanted, as these fruits will keep in good condition for some days, and they improve in flavour by being kept a day or two after being gathered. Bees, wasps, and flies are very partial to ripe Plums, and storing them in a room, the windows of which are covered with fine netting, is a better way of preserving the fruit than leaving it on the trees till required for use. Of course the trees can be covered with netting, but everyone does not possess this rather expensive stuff.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

STOVE.—Plants of *Pancreatium fragrans* that need fresh soil may be potted on, or divided as soon as they have finished flowering. Use a compost of turfy-loam, leaf-soil, cow-manure, and sand, and include a good quantity of charcoal, which will help to keep the soil sweet under the abundance of water the plants require during their growing season. Plants which do not require re-potting should receive frequent dressings with some well-tried fertiliser or farmyard manure-water while making their growth. *Ipomoea* should now be placed in their flowering-pots, and they are very bright and pretty-looking during the late autumn if trained on wires where they will obtain plenty of light. Put in a batch of *Tradescantia* cuttings for furnishing purposes during winter, and as they root very freely the old stock may be thrown away. Pot on young plants of *Dracenas*, *Palms*, *Codiaeums*, *Pandanus*, &c., that are pot-bound. Take cuttings of *Strobilanthes Dyerianus* frequently, as this plant has far better colour in a young state. Winter-flowering *Gesneras* should be afforded a small quantity of weak manure-water if the pots are filled with roots, and they should be placed in a rather dry position near the glass where the syringe is not likely to reach them, for should the leaves get damped, disfigurement will soon follow. *Achimenes* which have gone out of flower should be allowed to become a little drier at the roots, and when the growth has died down, placed underneath a greenhouse stage or in the potting-shed, where frost can be excluded.

PLANTS IN FRAMES.—Continue to repot Chinese Primulas, Cinerarias, and herbaceous Calceolarias as they become ready, and if infested with fly, they should be taken into the greenhouse, and there fumigated. It is a dangerous practice to fumigate any tender plants standing in low frames, the leaves being very liable to get scorched or otherwise injured. If the weather should become cool or the air very moist, mild warmth should be afforded such plants as the double-flowered Primulas, *Poinsettia pulcherrima*, *Libonias*, *Epiphyllums*, *Scutellarias*, &c.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR SEPTEMBER.

SHOWS.

TUESDAY,	SEPT. 3	{ National Chrysanthemum Society's Early Show at Aquarium.
THURSDAY,	SEPT. 5	{ Paisley Horticultural Society (two days).
FRIDAY,	SEPT. 6	{ National Dahlia Society, at the Crystal Palace (two days).
TUESDAY,	SEPT. 10	{ Royal Horticultural Society's Exhibition of Vegetables, at Chiswick.
SATURDAY,	SEPT. 14	{ Galashiels Horticultural.
THURSDAY,	SEPT. 26	{ Royal Horticultural Society's Great Show of British grown Fruits, at the Crystal Palace.

SALES.

MONDAY,	SEPT. 2	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	SEPT. 3	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	SEPT. 4	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	SEPT. 5	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	SEPT. 6	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.
SATURDAY,	SEPT. 7	{ Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—59°.5.

The National Co-operative Festival.

THE eighth National Co-operative Festival took place at the Crystal Palace on Friday and Saturday last, the preliminary meetings dealing with the economic and international aspects of the subject having been held in London on the preceding days. One of the chief of many characteristic features of the annual gathering at the Crystal Palace is a gigantic flower show, held under the auspices of the Agricultural and Horticultural Association—a large trading concern conducted upon co-operative principles. That the subject of co-operation is a powerfully attractive force is seen from the fact that some 70,000 persons visited the Crystal Palace on Saturday last.

From a horticultural point of view, the flower show must be considered to have been a distinct success. The time has well nigh passed for contrasting the enormous extent of the display of last week with the two early exhibitions held in the conservatory of the Royal Horticultural Society's gardens at South Kensington; but the growth in a few years has been surprisingly great. The display on this occasion had to be confined to the eastern portion of the nave of the building owing to the other half being occupied, but it overflowed into the aisles and courts on either side. Owing to the restricted space the exhibition appeared smaller than in previous years, but the tables were most inconveniently crowded, classes unavoidably overlapping each other, and creating some confusion. There was a marked increase of entries in all the leading classes, and some idea of the enormous amount of detail connected with such an exhibition is shown by the fact that there were 1823 entries of vegetables; 1209 of cut flowers; upwards of 500 of plants in pots; a con-

siderable number of fruit; in addition to those of table decorations, ladies' and childrens' exhibits, farm-produce—for there are farms conducted upon co-operative principles, &c. What all this means in the way of clerical work and close attention to details, can be grasped only by those who undertake such work, and can thus know something of the burden of labour imposed upon Mr. GEORGE WAUGH, the Director of the Flower-show, and his staff of assistants.

Looking along the tables, here and there could be noticed an apparent diminution in the numbers of exhibits, but these related to subjects influenced more particularly by the long period of drought so generally felt, and which preceded the grateful July rains. In other classes there were marked additions; and let it be recorded, the average quality was decidedly high. If any exhibits fell below it, it may be safely assumed that they were the productions of new exhibitors who had not mastered the knowledge of the qualities in vegetables which gain prizes, or who were led to think that mere bulk without corresponding symmetry would find recognition by the judges.

Plants showed a noticeable advance in size and finish, the largest of course coming from places within a reasonable distance from the Palace. Many of the specimens are becoming too large to be placed upon tables where they are above the line of sight, and should hereafter find places on the ground floor, so as to be seen to advantage. Fuchsias, zonal Pelargoniums, Begonias (flowering), Petunias, Musk, Lilies, Coleus, Ferns, and others, were in many cases satisfactory examples of cultural skill, and annuals in pots were specially attractive, though there appeared a doubt whether some Stocks, and Asters especially, had not been grown in pots and lifted from the open ground for the occasion. There were fine examples of Mignonette, Coreopsis, Godetia, Shirley Poppies, Canarybird-plant, Convolvulus minor, Phlox Drummondii, &c., well-proportioned, and well-bloomed. Bunches of flowers, and especially of annuals, were pleasing features, and it was seen that the small posies of a few years since had given place to bouquets of finely-grown and tastefully-arranged blooms. Sweet Peas were much in evidence, the beautiful new varieties of Eckford's raising especially; African and French Marigolds, the varieties of Malope grandiflora, Linum grandiflorum rubrum, Zinnias, annual Chrysanthemums, blue and yellow Cornflowers, were all most attractive. Some features introduced to the schedule this year for the first time, in the form of bunches of blue, crimson, and yellow annuals, were decidedly instructive, having a certain educational value, as only one variety of flower could be placed in a bunch. Some exhibitors place several varieties of one species in a bunch, imparting to it a confused appearance; whereas, where only one variety is used, as was observed in the case of the Sweet Peas, their attractiveness is enhanced.

Fruit, largely exhibited by the gardeners of members of the Association, was in many cases of excellent quality; Grapes, Melons, Peaches, Nectarines, and Figs—worthy of any exhibition. Culinary Apples were very fine; the dessert varieties in not a few instances brilliantly coloured; Plums in many sorts, and bush fruits were well represented. Object-lessons in staging are always instructive at an exhibition of this kind, and it is creditable to the exhibitors of fruit that they were plentifully supplied, and instruction drawn from them.

Of Vegetables there was no lack, as the number of entries showed. Potatoes showed in

some instances the usual finish seen at a co-operative exhibition; but Beet was here and there coarse. Of other leading vegetables there were excellent illustrations; Runner Beans were very good, and Peas in good character. It is matter for regret that district collections—North, North-western, Midland, &c.—were absent almost entirely, except in the metropolitan district, and thus prevented the institution of comparisons. Some of the exhibitors on Saturday are leading growers of vegetables for show, and so high quality was represented; while the staging of the exhibits was perfect. Herbs were largely shown, and formed an instructive feature, though they were much crowded.

So large has the show become, and so keen the competition, that it is now found necessary that the judging of the exhibits be extended over two days, and so the competitive contributions in certain sections are staged on the first day, and the remainder on the second. This is advantageous in many ways, and particularly so in this—that something fresh and bright is secured to gladden the eyes of the concourse of people who attend on the second day; while it materially relieves the pressure associated with a one-day show. Let it be recorded, to the credit of the co-operators, that, despite the enormous throng, there was an entire absence of confusion, or of anything approaching disorder. Great credit is due to Mr. EDWARD OWEN GREENING, the chairman of the Festival, for the smoothness and regularity observed in every department. An important leader in the co-operative movement, a man of business resource and principle—he has led on this great annual gathering from small to huge proportions; seeing in it a force making for the public weal, and the bettering of the condition of masses of people.

The Exhibition at Shrewsbury.

GREATER success even than formerly attended the exhibition of the Shropshire Horticultural Society on the 21st and 22nd inst. at Shrewsbury. For many years past this large gathering has been recognised as one of the most imposing displays of the year, and its capacity for growth and extension has been apparent from season to season. Whilst many horticultural societies have been subject to temporary, and, in some instances, perpetual financial embarrassment, the one in question has not only been free from such experience, but, on the other hand, it has, after duly discharging its own liabilities, been able to benefit various institutions in the town to the extent of many thousands of pounds.

There can be little doubt but that much of the Society's financial success has resulted from the inclusion by the committee of various attractions in connection with this floral fête, which have nothing whatever to do with horticulture, but which, by appealing to a very different section of the community have increased the attendance and therefore the receipts to a very important extent. But apart from the help that has been gained from variety entertainments (which we, as horticulturists, would be pleased to see the Society strong enough to abandon), there has been no limit to the interest and help extended to the Society by the whole community in whose midst the exhibition is held. The work of the committee also, with the help of two indefatigable secretaries, Messrs. ADNITT and NAUNTON, has been conducted without friction, and on excellent business principles. These facts help to explain the success of the twenty-first exhibition, when a sum of about £800 was offered for competition, and there were as many

as 2300 entries, being, it is said, 400 more than on previous occasions.

If we compare the exhibition for a moment with the important one annually held by the Royal Horticultural Society in the Temple Gardens, there are features in either case that

sentent there, and therefore the two exhibitions have little in common with each other.

One of the most prominent and at the same time one of the most pleasing features at Shrewsbury, is the collection of groups of miscellaneous plants arranged for effect. Indeed,

around the foot, grasses and Ferns and flowering plants were intermingled in a charming manner. The cones towards the front of the group, like small mounds, each furnished in the best possible taste, and other features of the arrangement that we cannot now notice, were beyond

FIG. 48.—CHLOROCODON WHITEI. (SEE P. 234.)

A, Calyx; B, base of flower; C, flower bud; D, Stamens incurved and adhering to stigma; E, Plan of transverse section of flower;

F, Lobe of corona, 2 central, 1 and 3 lateral; G, Stamens inflexed, one reflexed to show the pollen mass; H, Vertical section through centre of flower; ST, stigma.

are wanting in the other. In extent, we think the display at Shrewsbury is larger; the tents are enormous, and they are filled. It would be impossible during August to obtain such an exhibition of Orchids as is seen each season at the Temple, even if Shrewsbury was a convenient place to send them to, which it is not. As a matter of fact, Orchids are barely repre-

sented there, and therefore the two exhibitions have little in common with each other. One of the most prominent and at the same time one of the most pleasing features at Shrewsbury, is the collection of groups of miscellaneous plants arranged for effect. Indeed, we have never seen a more tastefully-arranged and attractive display of this kind than that for which the first prize of £20 was awarded to Mr. J. CYPHER, of Cheltenham. In the place of a central cone, such as appeared in all the other exhibits in this class, Mr. CYPHER had placed a rustic arch, from the top of which sprang a graceful Palm, whilst in suitable pockets and

criticism, and if the back of the group had been more bold, the whole would have been perfect. Mr. EDMONDS, the gardener to the Duke of St. ALBANS, Bestwood, Nottingham, and other exhibitors in this class, were well worthy of praise also.

The collection of twenty stove and greenhouse plants from Mr. CYPHER represented in

almost every instance the highest cultivation possible, and could hardly be over-praised; and other classes for specimen plants were equally well filled. *Coleus* in the form of pyramids were very good, and *Dracænas*, *Caladiums*, *Fuchsias*, *Begonias*, and *Pelargoniums* were all exhibited satisfactorily.

Fruit is usually shown well at Shrewsbury, and it was good on this occasion, but we are likely to see fruit of equal or superior quality at the Royal Horticultural Society's exhibition at the Crystal Palace in September. It may be useful, however, to draw attention to the important class in which prizes amounting to £50 were offered for a collection of twenty kinds of fruit, arranged to produce the best effect, by the addition of Ferns and other plants of an ornamental character. Several of the exhibits, and especially that from the Earl of Harrington's garden, possessed very much more attraction to visitors than the collections would have done had they been staged in the usual manner. Pine-apples were exhibited as growing, Melons were suspended on invisible supports, and interspersed with trailing plants, whilst hard fruits were on moss, and the softer ones on suitable foliage—the whole forming a beautiful picture. Might not this idea be adopted and extended in connection with the Crystal Palace exhibition on a future occasion? It may be objected that fruits so arranged are not so easily compared with other samples, and the judging is rendered difficult. But this obstacle will have to be overcome in the case of fruits and flowers alike if we are to make our exhibitions more attractive and less monotonous than they are. If horticultural shows are to become self-supporting, and independent of extraneous enticement, which is very desirable, they must be arranged so that they will appeal to the persons who enjoy striking effects as well as to specialists who study the exhibits in detail.

Cut flowers, artistic floral arrangements, exhibits from prominent members of the horticultural trade in the North and in the South, and vegetables also, furnished ample occasion for remark; but in regard to these, we must refer our readers to the hastily-prepared report published in our last issue.

Mr. BARRON'S Retirement.

THE retirement of Mr. BARRON from the direction of the gardens at Chiswick continues to excite keen interest. The more that is known of the circumstances, the stronger becomes the feeling that the Council has, we doubt not, quite unwittingly, and without the least desire to act otherwise than considerately and honourably, committed a very serious error in judgment, in the way in which it has carried out what it deemed to be expedient. It is felt that an outside irresponsible committee, appointed by the Council, should never have consented to act as it did, and probably the members would not have done so had they been in the least aware of the consequences of their action.

Granted that Chiswick does not fulfil all the duties of a modern experimental garden such as the requirements of the times demand, and admitting that much that is done there is inconsistent with the more legitimate objects of the Society, the fault surely lies with the Council, and not with their executive officer.

The letters that we have received bear emphatic testimony to the intensity of the feeling aroused, and show that an explanation on the part of the Council is an absolute necessity. Till such an explanation is forthcoming, and till the names of

the committee and the details of their report are made known, we are naturally loath to "apply the torch to the heather," as one of our correspondents puts it. He, like some others, urges that there should be no delay in doing this, and that he is ready to do it! Such a step, however, would be manifestly unjust to the Council, whose explanation is not before us; and injurious to the Society, on which account we would counsel a more prudent course. We believe that a Council meeting is called for Monday next, for the purpose of considering the question, and till then it is well to reserve further expression of opinion.

In the meantime, we may add that a protest has been entered by the Chiswick Board, and that a preliminary meeting of horticulturists, presided over by Dr. MASTERS, has been held for the purpose of devising the most appropriate means of expressing sympathy with Mr. BARRON, and of testifying the admiration felt for his loyalty and faithfulness in the discharge of his duties, respect for his abilities as a horticulturist, and esteem for his qualities as a man. The circumstances attendant upon Mr. BARRON'S retirement were designedly not discussed on this occasion, the business of the meeting being confined to the objects above-mentioned. At this preliminary meeting a Committee was formed, "with power to add," and a further meeting was convened for September 10. Among those present on this occasion were—Messrs. Baker, Barr, Comming, Gilbert Beale (Carter & Co.), Gordon, Herbst, Laing, May, Miles, Masters, Marshall, Pollett, Smees, Spicer, Turner, Weeks, Wynne. Messrs. Sutton & Co., Messrs. James Veitch & Sons, Mr. Burbidge, Mr. Malcolm Dunn, Mr. D. T. Fish, Mr. W. Robinson, and others wrote expressing their sympathy with the objects of the meeting. Mr. MARSHALL and Mr. B. WYNNE consented to act as secretaries, and a sum of about £100 was at once promised by those present, it being understood that the amounts subscribed should not be made public, but only the names of the donors. When the permanent committee is fully formed we shall revert to the subject.

"LES PLANTES ALPINES ET DES ROCAILLES" (Alpine Plants), par M. H. CORBEYON, Directeur du Jardin Alpin de Genève. (Paris: OCTAVE DOIN, 8, Place de l'Odéon.) This is a small book, the purport of which is threefold, viz., to supply descriptions, cultural directions, and hints on the acclimatization of alpine plants. It is but natural that the cultivation of alpine plants in any one situation must, if it is to be successful, be guided by knowledge of the varying localities and circumstances under which the plants grow naturally. By studying the altitude, soil, aspect, and climatic conditions of their original habitats, some alpine plants can be acclimatized, but in no other way. M. CORBEYON appends to his book a list of the most important alpine plants which succeed under cultivation, giving also brief descriptions of each, and hints for cultivating in accordance with the rules above-mentioned, and with his own experience in acclimatizing. Various illustrations supplement the cultural directions.

SHORTIA SCHOOL.—Some of our readers will remember the history of the *Shortia*, how it was discovered by MICHAUX, and not found again till within the last few years, how by some the plant was looked on as mythical, how it furnished one of many proofs of ASA GRAY'S sagacity. All this is told in the *Chronicle*. And now we find from *Meehans' Monthly* that a school called the *Shortia* School has been established in North Carolina out of the proceeds of sales of the plant. Very well—but let the scholars be taught not to exterminate the plant, but rather how to cultivate it.

THE "TROPICAL AGRICULTURIST."—The fourteenth volume of this periodical (published at Colombo, Ceylon, by Messrs. A. M. & J. FERGUSON) is now completed. The periodical furnishes monthly a valuable summary of information essential to planters in all tropical countries. Accuracy and straightforwardness are conspicuous features in its management, so that the fourteen volumes constitute a veritable encyclopædia on the subjects of tropical agriculture.

CHESHUNT, WARMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The fortnightly meeting of this flourishing society was held on Thursday last. Mr. WM. HARRISON presided, and there was a good attendance of members. After the minutes had been read, Mr. W. L. YATES delivered a lecture on the cultivation of the Peach and Nectarine. At the close, an interesting discussion ensued, relating to diseased branches caused by gumming; on mauling, and on blistered foliage. Mr. H. RASMUSSEN gave details of the culture of Peaches in France, together with the names of varieties. A hearty vote of thanks was accorded Mr. W. L. YATES for his lecture. The next meeting will be held in St. Mary's Hall, Cheshunt, on September 5, when Mr. JAMES DOUGLAS, F.R.H.S., will read a paper on the Carnation. Mr. GEORGE PAUL will preside, and will be supported by the leading gardeners of the district.

DAHLIA SHOW AT THE ROYAL AQUARIUM.—The Annual Dahlia Show is to be opened on Tuesday next, and continued on Wednesday and Thursday, at the Royal Aquarium, Westminster. The entries are very promising, and the show will include Gladiolus and early-flowering varieties of the *Carysanthemum*. All types of the Dahlia will be on view, but special interest is attached to the "Cactus" varieties, of which there will be a special exhibit. The Gladiolus will be more than equal to last year's display, and the National Chrysanthemum Society have arranged for an extensive exhibition of the early varieties.

HAILSTORM AT HARPENDEN.—A terrific hailstorm occurred at Harpenden, Herts, about 4 o'clock on Thursday morning, August 22, doing an immense amount of damage to property; some of the hailstones being 2 inches across. Mr. PHILLIPS, owner of a number of glasshouses, had one side of all of them completely riddled, hardly a sound pane of glass remaining; while Mr. PURROTT, who owns about 104,562 sq. feet of glass, had also a great amount of it broken, and much damage done to Grapes, Cucumbers, and other stock. All the glass broken was 21 oz. Both nurserymen had wisely insured in the Nurserymen's Hailstorm Insurance Corporation, 1 & 2, King Street, Covent Garden, W.C.

THE ROYAL PARKS AT STOCKHOLM.—Mr. MILNER is entrusted by H.M. the KING OF SWEDEN, with the laying out of a park of 1100 acres. The plans have been approved, and work has been commenced, with an English foreman to superintend the workmen.

AGAVE A ERICANA.—Mr. USHER, of Woodstock House, Golder's Green, Hendon, obligingly sends us a photograph of a fine *Agave*, 25 feet high, now coming into full bloom, and placed against a background of trees, is singularly effective.

"THE LADIES' GALETTE."—This little paper is, as its name suggests, chiefly devoted to topics interesting to ladies. Gardening notes are included, and in the issue for Aug. 24, we notice paragraphs upon bulbs for winter flowering, and upon decorated house-fronts. The price of the journal is now only a penny weekly, and Messrs. COLLINGRIDGE are to be congratulated upon the general appearance of it in this smaller size, and upon its success among many competitors.

BOTANIC GARDEN, MANCHESTER.—The bedded-out plants at Manchester Royal Botanic is now brilliant in the extreme. The few fine sunny days have forced the flowers into a mass of floral

beauty. One is pleased to see that the powerful contrasting or, we ought to say, killing colours of yellow and scarlet, yellow particularly, is toned down. Most of the arrangements we came across, and the yellow overpowers all other combinations. How pleasing it is to see here the old soft lemon-coloured *Calceolaria amplexicaulis* in some of the groups! indeed, we have not one among the novelties to compare with it. It is a bit rambling in growth, certainly; but resting in *Centaurea ragusina*, or some other proper thing to act as a frill, it is more than captivating—only we must not have too much of it. The *Antirrhinum* here, too, are most striking, as they are floriferous, and how easy to get! a shilling

under the presidency of Mr. B. LADHAMS, F.R.H.S., the lecturer on this occasion being Mr. J. MILES, gardener to Mr. W. PERKIN, J.P., Portswood House. Practical hints were given by Mr. MILES on the time to gather fruits, and the most convenient methods of doing so. He gave a description of his especially-built fruit-room, in size 40 by 12 feet; and drew attention to the necessity of good ventilation and the maintenance of a temperature of about 40°. He touched lightly on the colouring of Apples. A lively discussion on packing fruit for transit followed the lecture; and at the close a hearty vote of thanks was accorded the lecturer. A good display of fruit and flowers was made by the members.

instinct to make use of the slime from their body either as a means of escape or for the purpose of obtaining food. C. Woolford, *The Priory, I.W.*

DORYPHORA SASSAFRAS.—The interesting note on the above over the signature "M. T. M." in your issue of July 13, invites an additional word or two. The plant will be found in Messrs. Jas. Veitch & Son's *Catalogue of Greenhouse Plants*, indicated as having ornamental foliage. I procured a plant from that source three years since, and from its not being listed in the stove section, placed it in a conservatory. It has made but little growth, and is found to need repotting. I am glad to adopt "M. T. M.'s" advice, and have removed it to the intermediate-house. *Doryphora sassafras* is mentioned in Lindley's *Vegetable Kingdom* (1847) as follows: "The wood of *D. sassafras*, called *Sassafras* in New Holland, is said to smell like Fennel." I must point out an error into which Messrs. Veitch have fallen in giving "*Sassafras officinalis*" as a synonym of *D. sassafras*. The *Sassafras* wood of medicine is derived from *Sassafras officinale*, Nees (*Laurus Sassafras*, Linn.), growing over extensive districts of the United States. Baltimore is the chief mart for its distribution. R. Reynolds, *Leeds*.

KNIPHOFIAS.—I have now some most distinct and beautiful hybrid *Kniphofia* in good bloom. *Lachesis*, clear apricot-yellow; *Sirius*, deep orange; *President Cleveland*, very fine spike, and a free bloomer; *Aurantiaca*, one of the largest heads and freest bloomers of all my plants, producing nineteen heads this year. I hope also to bloom shortly for the first time the *Leichtlinian* hybrid *Triumph*, said to be the handsomest of them all; and also the pretty little species *Nelsoni*, which bloomed with me last year in the second year from seed. I have also noticed a curious fixed difference in the order of opening of the different hybrid *Kniphofia*; those in which the blood of *K. Aloides* predominates, all commence to open at the bottom of the spike, and go on upwards. Those in which the blood of *K. Leichtlini* is strongest reverse this order, and commence to open at the top of the spike as *Leichtlini* always does, while the hybrids of *K. comosa* commence to open in the middle of the spike and go on up and downwards. W. E. G., *Queenstown*.

GIANT LETTUCES.—I saw recently such very fine Paris White Cos Lettuce, of what is known as Milton's Superb White strain, growing in the gardens at Maiden Erlegh, Reading, that I asked Mr. Turton to weigh one. A good example was, therefore, twisted out of the ground and put on to scales, when it was found to be 4½ lb. in weight. The stock was very true and even throughout, and presented unquestionably some of the finest and most solid Lettuces I have seen. The same firm's Favourite Cabbage Lettuce also showed not merely remarkable size, but surprising solidity; the hearts were of the size, roundness, and almost hardness of a good Drumhead Cabbage. Those who want bulk in salading will find these varieties to give them all they may desire. A. D.

CYPRIPEDIUM × LORD DERBY.—Owing to an error of mine, this plant was certificated (F.C.C.) on August 13, 1895, by the Royal Horticultural Society's Orchid Committee as *Cyp. × Massaianum superbum*. To-day (August 27) I was able to correct the error, and the plant was named as above, the name given it by its owner, T. Statter, Esq., being now restored to it. It came about in this way. A cut spike of two grand blooms came before the committee, named "*Cyp. × Lord Derby*" = *C. Rothschildianum* × *C. superbiens*. I consulted my records, and saw the entry of this parentage, only reversed, against *C. × Massaianum*. I informed the committee, and we then had a plant and a cut spike of *C. × Massaianum* brought for comparison from groups in the hall. Mr. Statter's hybrid was infinitely the finest, and "*superbum*" was added to its proper name (according to my entry) of *Massaianum*. Some discussion as to the parentage of *Cyp. × Massaianum* ensued, but not sufficient to prove I had made an error. The plant was booked. On returning home, I consulted more records, and found the error. I had written "*superbiens*" instead of "*superciliare*." This materially altered the case; and now opened another complication. *Cyp. × W. R. Lee* (A.M., August 14, 1894), was the result of *Cyp. superbiens* × *C. Elliottianum* (which is synonymous with *Rothschildianum*). I at once wrote to Mr. Statter, explaining the case, and stating that now the name again must be altered, for reverse crosses were regarded the same one as the other. Mr.

FIG. 49.—POLYCYGNIS LERMANNI.

(From a photograph by Mr. Lawrence. For description, see p. 192; general colour yellowish-white; spotted purple; lip, white fringed.)

packet of seed will furnish a good bed; and now that we have such as is seen here, a dwarfness obtained from proper selection, the colours are quite like the rainbow, and although there is a little formality, it is not nearly so pronounced as in any of the *Pelargonium*, *Calceolaria*, or *Lobelia* groups. There is an easiness of contour that pleases the practised eye. The *Pentstemon*, too, are in evidence here, and what a glorious display they make! True, Mr. FINDLAY does not introduce these into his formal bedding groups; he has them in detached beds in the grass, but acting as foils to the formality of these serpentine designs, which show off to advantage the low-growing hero of bedders. These old-fashioned flowers catch the eye, and even are useful because they can be knifed away for bouquet work without affecting congruity.

SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.—The monthly meeting was held at the Parish Room, Shirley, Southampton,

HOME CORRESPONDENCE.

SLUGS DESCENDING BY A LINE OF SLIME.—It is now some fifteen years since Mr. Warner called attention in the *Gardeners' Chronicle* to the fact that slugs have the power of letting themselves down from a plant or rafter by means of a glutinous matter which they exude from their tails. I remember at the time some were inclined to smile at this assertion. I had seen the same kind of thing myself, and I will remember calling my employer's attention to the fact when at Dawnside, as a slug was descending over a *Masdevallia*; and it is quite clear, in my mind, that while at Highbury, Birmingham, I saw a slug on the flower-spike of an *Odontoglossum*, and in order to prove if tobacco would prevent them crawling up the spikes, I placed a piece of "sbag" tobacco on each side of the slug, and after going to and fro a few times, it let itself off very slowly by the slime from its tail. Your correspondent mentions that no one made any remark upon this question when first it was mentioned; my excuse is, that I accepted it as a well-known fact, and believe that slugs (some kinds, at least) have the power and

Statter's reply was good-natured in the utmost, he being very disappointed that his proffered compliment to Lord Derby had been upset. We decided together to try and correct it at to-day's meeting, at which I explained the whole matter, and for comparison we had the spike of Lord Derby, and Mr. Macfarlane's admirably executed painting of it, and Cyp. x W. R. Lee. This latter plant Mr. Statter told us was dead. Therefore there was not another plant of the same parentage that had bloomed which was alive. The committee appreciated this fact, and it was carried unanimously that "Cyp. x Lord Derby" be Mr. Statter's hybrid's name. This action of the committee enabled me to escape from a position assumed by taking a false entry to be correct, when it was the reverse. (Moral. The whole of the members of the committee ought to keep records and check one another. Perhaps say my readers, "If they were all like Crawshaw, it is a providential thing they do not"—*vide* this case in point.) *De B. Crawshaw, Rosefield, Sevenoaks, Kent, Aug. 27, 1895.*

CHISWICK.—May I ask if it is a fact, as stated by Mr. Peter Barr in a contemporary this week, that what he calls a "starvation allowance" of £1624 15s. 1d. is the amount spent on Chiswick gardens (some 12 acres in extent) annually? I offer no comment on the disposal of this sum, but would like to say that I have known, and know now, the annual expenditure of some of the best kept and most expensive private gardens in the country, and the above figure is from two to three times more than what is usually allowed to pay all expenses, in proportion to extent; while most gardens at the present time cost probably much less even than that, while much is expected, considerable reductions made on such reduced allowance by stuff sold, and no "assistant students" thrown in to help for which nothing is charged. Few of our big gardener's real friends would think of going into hysterical lamentations over a pension of £180 a year under these circumstances. *Head.* [Our correspondent is evidently not aware of the circumstances of the case, and in particular of the large amounts spent in repairs and renovations necessitated by previous neglect. *Ed.*]

WHY ARAUJIA ALBENS DOES NOT CATCH THE CODLIN MOTH.—In the number of the *Gardeners' Chronicle* for August 24 is an article on the moth-catching habits of *A. albens*, which I presume is the same plant as *Physianthus albens*, [yes] often alluded to, and probably more than once figured in these columns. The article concludes as follows:—"It is, however, a singular fact that, in New Zealand, where the plant has often been cultivated for the express purpose of destroying the detested codlin-moth (*Carpocapsa pomonella*), that wily insect declines to enter the trap." The colonists seem to have argued somewhat in this fashion:—Here is a plant, the flowers of which catch moths by grasping them by the tip of the proboscis, and holding them till they die. *C. pomonella* is a moth; therefore, the flowers should catch it. It does not appear to have occurred to them that there are moths and moths. And if they had compared the mechanism in the tube of the flower with the mouth-parts of the insect, they would have seen at once how utterly impossible it is for the *Araujia* to catch the *carpocapsa*, inasmuch as the latter has no proboscis capable of penetrating even the shortest distances down the long tube of the former. Possibly, however, as the story is given at second-hand, it may be intended for a joke. *R. McLachlan.*

WHITE WARRINGTON GOOSEBERRY.—It may interest Mr. Dow to know that his discovery of a white-fruited sport on the Red Warrington is not the first that has been observed and perpetuated. In the horticultural department of the *North British Agriculturist* for 1850, p. 554, is found a very interesting article from the pen of the late Mr. William Gorrie, relating his discovery of a similar sport in a Perthshire garden, as also an editorial note from the late Mr. Charles McIntosh, of Dalkeith, detailing the excellent quality of the fruit. I may also state that an annual supply of cuttings was forwarded to the Messrs. Lawson, Edinburgh, by Mr. Gorrie, and the writer being one who assisted in stocktaking for some years in the fruit department there, in 1856 some hundreds of fine saleable plants then existed; on enquiry some years afterwards, I ascertained that the variety had degenerated in growth as to be incapable of propagation, and for nearly forty years I have not known of it being either in commerce or cultivation. I hope Mr. Dow's sport will have a more permanent existence. *Scotland, East.*

THE RECENT SHREWSBURY SHOW.—The committee which controls the fortunes of this really wonderful horticultural exhibition recently published a list of all the numerous gifts they had locally made from their surplus funds, amounting in value to several thousands of pounds. All honour to them. But looking over this list, I failed to notice any donation being made to either of the great Gardening Charities. I trust there can be no harm in respectfully inviting attention to the needs of these charities, and to point out how valuable and helpful they are to gardeners who so largely help to create those magnificent shows for which Shrewsbury is so famous. Possibly it is but needless to invite the committee's attention to the Gardeners' Benevolent and Gardeners' Orphan Funds to secure as a memento of the brilliant success in every way which attended their recent show, of handsome donations to each fund, and thus identify the Shrewsbury society more closely with horticulture. *D.*

POTATO DIGGING IN IRELAND.—Your artist correspondent on p. 133, of August 3, gives a very hopeless looking sketch of poor Pat digging his Potatoes. I have been through Tipperary as well as a good many places in the south of Ireland, and have come across a few such cases, but your readers must not be misled and think that all Potato patches or the people who till them are all alike. A friend of mine living near Tipperary, told me that the land in that county is some of the best he has ever tilled and pastured in Ireland, and his crops and cattle showed it. Potatoes, as we know, are the chief food of the working classes in England, Scotland, and Ireland; every cottager and peasant who rents or owns some land, grows them. The varieties grown are Flounders and Champions, and no one can persuade them to grow any other varieties. The Potato disease is not known to them by any scientific name, and all they know is that the tubers are bad, and they never try a remedy against the disease, although a few that I know have tried the sprayer, but they said that it broke down the tops too much, and would not try it again. I have found in Ireland that the poorer the land the better the Potato crop. I have the finest crop this year I ever had, the land having had no manure for three years, and I have seen no trace of disease up to the present date, but rotation in cropping has, I think, a great deal to do with this. *T. S.*

BUD-GROWTH.—On some of my Rhododendrons I notice that at the ends of the shoots both flower-buds and leaf-buds have been formed during the summer, the flower-buds being terminal, the leaf-buds lateral. Nothing uncommon in this, one may say; but what is interesting is, that the leaf-buds have lengthened into shoots, whilst the flower-buds remain buds. Why should growth go on in the one and be arrested in the other, the period of formation and the conditions being the same in each case? *X.*

THE WEATHER AND FRUIT TREES.—The past dry summer and recent abundant rains have produced a curious effect on an Apple bush (Stone's Pippin) growing in the orchard at this place. About one-half of the number of branches are loaded with fruit, and in consequence have made little growth, except extension. The branches carrying no fruit made short growths, studded with flower-buds, which matured during the dry weather. Since the rains came these have developed, and the tree now presents a picture of flora and pomona such as I have never seen before, every branch being either loaded with fruit, or wreathed with bloom and tender leaves, being in about equal proportions, the tree has a charming effect. The fruit-buds on other trees in the same orchard show no sign of moving. *M. Webster, Kelsey Park, Beckenham.* [A similar condition of things is to be witnessed at the Royal Horticultural Society's Gardens at Chiswick, where a quarter of Apple bushes, transplanted late in the spring, were, as a consequence, at a standstill during the warmest part of the summer, and they are now full of blossom, and making a little new foliage. *Ed.*]

VEITCH'S CLIMBING FRENCH AND BUTTON'S TENDER-AND-TRUE BEANS.—In the report of the Fruit Committee meeting held at Chiswick on the 16th inst., it is stated in the second paragraph (p. 218), that the committee having seen the above-mentioned "two Beans growing here (Chiswick) together under precisely similar conditions, came to the important conclusion that they are absolutely identical, but that they all the same leave to others to determine under which of the above names the variety shall henceforth be recognised." As the raiser of "Veitch's Climbing French Bean," I should

like to mention that the decision of the Fruit Committee (the correctness of which I do not for a moment question) raises a very delicate, but all the same, a just and important, question; in fact, a series of—shall I say—serious questions, inasmuch as the Bean which the Fruit Committee decided on the 16th inst. to be identical with "Tender-and-True" was, as a matter of fact, sent to Chiswick for trial, together with a full description of its habit, &c., in April, 1885 (six years before "Tender-and-True" was submitted to the Royal Horticultural Society for trial at Chiswick), and for which I received the official receipt, signed by the chairman, and dated, I believe, April 9, 1885. And this being the only communication received by me from the Royal Horticultural Society in reference to my then Climbing Canadian Wonder Bean (now Veitch's Climbing French Bean), and seeing that no mention was made of it in the autumn report of novelties tried at Chiswick in 1885, the question very naturally, and justly, arises as to what became of the "Climbing French Bean" sent to Chiswick for trial in April, 1885, and which, ten years later (1895) is pronounced by the Fruit Committee of the Royal Horticultural Society to be identical with one (Tender-and-True) to which that body had granted a First-Class Certificate at Chiswick on Sept. 3, 1891? And now it seems that the name under which the variety is henceforth to be recognised is left to others than the Fruit Committee of the Royal Horticultural Society to determine—that is to say, the question as to which name the commercial right of priority belongs has to be determined. The answer must be obvious enough to all who take the trouble to read the above facts. A reference to the counterfoil of the Chiswick "Record" of seeds, &c., received for trial in April, 1885, will conclusively settle the question of "commercial right of priority." As registered in the book referred to will be found "Climbing Canadian Wonder Bean." Ten years have I kept the above-mentioned facts from the horticultural press, and had it not been for the turn which events have recently taken, probably I should never have referred to the matter in print. *H. W. Ward, Longford Castle, Salisbury.*

MR. BARRON'S RETIREMENT.—Had Mr. Barron's resignation been voluntary, the mere authoritative announcement that he had resigned, and that his services were to be rewarded by the Council with a liberal pension for life, might have fitly closed what to very many must have proved a painful incident. But if he has virtually been hunted out of the office he has for so long enriched, then the gardeners of the country are entitled to the fullest explanation from the Council. In your first notice (August 3, p. 138), after referring to the innumerable difficulties and precariousness of Mr. Barron's position for many years, you state in true and forcible words, which all loyal horticulturists will heartily endorse, "this state of things has happily passed away. Chiswick has been put into good order, and horticulturists long to see it the exponent of progressive horticulture, and the trial-ground for all that is promising and instructive. They do not care to see it competing with market growers in the sale of Grapes, and they think that the services of the staff might be more profitably employed than in giving for distribution among the Fellows plants which are readily to be purchased for a few pence at the nearest florists." These words are true, and in them some of us read a probable cue to the resignation of Mr. Barron. But a writer in the *Gardeners' Chronicle* such illusions, and makes matters so bad, that the continued silence of the Council would prove a serious blunder. It seems impossible that such a society should have acted in the manner here described, and should any such report so obtained and signed have reached the hands of the Council, one might have expected that they, of all men, would have felt that the proper place for it was the fire. I fear the Fellows, and especially the fraternity of private gardeners, will not now be satisfied until they know who appointed this special committee of espionage—and without the knowledge of the Garden Committee, the names and addresses of this private committee of private gardeners, and whether or not the Garden Committee of the Royal Horticultural Society has also retired in consequence of this indignity heaped upon it? *D. T. Fish, August 19.*

— The dismissal of Mr. Barron, forsooth! The gardeners of the country would as soon have expected to have heard of the dismissal of the Council of the Society! I am always loth to condemn either side before I am fully informed of the whole details on both sides, but the question has now assumed such an aspect that it cannot possibly be set at rest

without the fullest disclosure of the reasons for the procedures taken by the Council, and the names of the persons who prompted that body to act as it has done. A.

— Having read the comments which have recently appeared in the horticultural press on Mr. Barron, the superintendent of the Royal Horticultural Society's garden at Chiswick, to-day I visited and criticised the work which was being carried on in the experimental gardens of the society. I was much struck with the great improvement in the condition of the place and in the cultivation of the plants, the success of which is due to Mr. Barron. A few years ago, when I was on the council with Mr. Veitch, just after the society's fortunate expulsion from South Kensington, and when we all hoped that its pernicious influences had been buried for ever, the council was compelled from lack of funds to starve the garden, the houses were dilapidated, and the place was very much under-manned. To-day I found the houses for the most part in good working order, although two or three would be better if replaced by more modern structures. The collection of Apple and Pear-trees I have never seen in better condition, and it contrasts favourably with my own. I saw no evidence of blight. Of course, in such a large collection there always must be some trees which are out of health, and which require to be renewed. The collection of Figs looked well; I know of no place where such a collection can be found. Those interested in Grape cultivation should make a study of the collection. The hardy annuals and herbaceous stuff looked grand, and so did the plots allotted to the seed trials. I cannot conceive the reason why the council should have called upon Mr. Barron to resign. He is a man who is known to every horticulturist whose opinion is worth having, to be straight and unbuyable, a quality absolutely necessary to give confidence to the trader and amateur. Those who are intimately acquainted with the idiosyncrasies of gardeners, know the value and the rarity of these qualities. If it is true that the Chiswick, the Fruit, and the Vegetable Committees who visit many times in the year the gardens, and who are responsible for its management, have not been consulted by the Council on this matter, and that outsiders have been called in to report, the council have passed such a vote of censure upon the members of these committees that no man with a spark of self-respect could continue to serve upon them, and it is for them to resign *en bloc*. If it, however, means a new departure in the management of the gardens, the fellows should have been consulted and made acquainted with the proposed new scheme. If it is intended to attempt to make the gardens a profitable undertaking, a sort of bastard market-garden, the Mixens and the Pouparts would very soon knock the bottom out of such a competitor. If, however, it is intended to convert the gardens into a third-rate nursery for the sale of cheap plants, the Bunyards and the Pearsons can tell the Fellows that such a scheme must result in failure and bankruptcy. But should the council desire to make the gardens into a public resort for nurse-maids and their followers, such as is to be found in London squares, the sooner the society gives up these gardens the better, for to apply the subscriptions of the fellows to either of these purposes would be little better than obtaining money by false pretences. It is my intention, as an owner of an experimental garden, and one who for over twenty-five years has some slight acquaintance with the work which can be successfully carried on in such a garden, and one who loves horticulture for horticulture's sake, at the first opportunity I have determined to ask for definite information as to the council's remarkable and unintelligible action. Should the answers which I receive be not satisfactory, I shall feel it my duty to submit such resolutions for the consideration of my brother horticulturists as the answers may seem to necessitate. I feel that for the society to lose the services of Mr. Barron, who has still many years of useful work left in him, would be nothing less than a disgraceful job, and would be prejudicial to the best interests for the advancement of horticulture in this country. A. H. Smea, *The Grange, Carshalton*.

APRICOTS FROM STANDARD TREES.—I am sending you some specimens of Apricot grown on a standard tree in the middle of my garden less than six miles from Charing Cross. In the exceptional year, 1893, the tree bore over 600 fruits, and this year it has done very well; and even last year, in unsatisfactory weather, there was a fair crop, for although the fruit did not mature to the extent one

could have wished, it made excellent preserve. Possibly, if the attention of fruit-farmers is called to the subject, the thousands of pounds which are paid annually to the foreigner for this fruit may be kept in the country. My tree, which was brought from France, thrives well in the London clay, and always has been very healthy, and has never had an ounce of manure or a particle of attention. What more could the farmer want? *B. G. Jenkins, West Dulwich, August 26.* [The variety sent by our correspondent was that capital early one, the *Breda*. Ed.]

KÖLREUTERIA PANICULATA.—This Chinese tree is well adapted for pleasure-grounds, owing to its pretty Acacia-like foliage and yellow-coloured inflorescence. I recently saw the tree in perfection in the grounds of Mr. H. J. Selwyn, Eastwood House, near March. The tree stands on the lawn near the residence, and is about 30 feet high, with a head of about the same width, and on every shoot (and there are thousands), there is a beautiful panicle of flowers, 1 foot long. A close examination of the flower reveals a tinge of red in the centre. It is not a tree of rapid growth like the *Ailanthus*, but the stem of this specimen is quite 5 feet in circumference at 3 feet from the ground; and I have lately measured the stem of a *Kölreuteria* growing here, which was planted fifty years ago, and find it to be 3½ feet at 3 feet from the ground; the specimen seen at March will therefore be of considerable greater age. *A. Harding, Orton Gardens, Peterborough.*

ROSE MRS. W. J. GRANT (SYN. BELLE SIEBRECHT).—Herewith we enclose you Messrs. Siebrecht & Wadley's letter, correcting the statement made by them in your issue of June 15, which we will be glad if you will insert in your next issue. On February 24, 1893, this firm wrote to us saying that they wished to change the name of the Rose from Mrs. Grant to Mrs. Cleveland, and that they hoped we would not oppose them. We replied on March 8 as follows:—"With regard to your desire to change the name from Mrs. Grant to Mrs. Cleveland, we cannot offer any serious objection, although we would feel sorry that such should be done." *Alex. Dickson & Sons.*—As per request of Messrs. Alexander Dickson & Sons of Newtownards, Ireland, and in justice to them, we wish to correct our statement in our letter of June 15 as to the re-naming of Rose Mrs. W. J. Grant. We said at the time of purchasing the Rose we had Messrs. Dickson's consent to change the name. In this we regret we were in error. It was in the month of March following (1893) that we received written permission from Messrs. Dickson. *Siebrecht & Wadley.*"

SOCIETIES.

ROYAL HORTICULTURAL.

August 27.—An ordinary meeting of the committees of the Royal Horticultural Society was held on Tuesday last in the Drill Hall, at Westminster. Hardy and half-hardy flowers and annuals were exhibited largely, and included first-rate collections of Asters and Gladioli, and some novelties in Dahlias. Orchids were not very numerous, but an interesting display was present. Before the Fruit Committee were exhibited large collections of Apples, Pears, and Plums, but there were few first-class novelties, the only awards being for a new dessert Apple, and an ornamental Crab.

Floral Committee.

Present: W. Marshall, Esq., chairman; and Messrs. O. Thomas, J. Frazer, C. T. Drury, H. Herbst, J. Laing, R. Owen, G. Stevens, J. H. Barr, Geo. Nicholson, C. E. Pearson, G. Gordon, H. S. Leonard, H. Cannell, J. D. Pawle, J. T. Bennett-Peck, H. Turner, G. Paul, C. Blick, and H. B. May.

Mr. M. PRITCHARD, nurseryman, Christchurch, had a pretty group of hardy flowers, in which were very fine blooms of Gaillardias, large sprays of *Lobelia cardinalis* variety, Robert Parker, of excellent colour; *Kniphofia* (*Tritoma*) *Pfitzeri*, a large bold variety, recommended an Award of Merit. *Lilium tigrinum splendens* and *L. t. plenum* were well shown; the pretty but seldom seen *Astrantia Biebersteini* was noticed; and *Eupatorium purpureum*, varieties of *Helianthus*, and many other good things were included in this exhibit. *Scabiosa caucasica alba* was recommended an award of merit (Silver Banksian Medal).

Messrs. PAUL & SON, the Old Nurseries, Cheshunt, had a collection of herbaceous Phlox in variety, most of them with large flowers, exhibiting considerable variety in colour. A variety named African was rather distinct, by

reason of its suffused rose-and-white flowers. Messrs. PAUL & SON had many other interesting things, including several varieties of *Hibiscus syriacus* or *Althaea frutex*. A panicle of the very dwarf-growing *Crassula rubicunda*, was shown; the flowers are very small and red, and the underside of most of the leaves are of a similar colour. *Crassula Cooperi* also shown, has white flowers, and is extremely dwarf. Varieties of *Crataegus* and *Rosa* in fruit, a good variety of *Keria japonica* in sprays, and other plants were included. Messrs. PAUL & SONS were also recommended an Award of Merit for *Robinia neo Mexicana*, a spray of which was shown with short rather dense spikes of rosy-lilac coloured flowers (Silver Flora Medal).

An excellent collection of *Phrynium variegatum* plants were shown by Mr. J. OUVREARD, Child's Hill, Kilburn. The plants were in 7-inch pots, large, bushy, and capital in colour; also some fine plants of *Maranta major*, with green leaves, and about 2 feet high (Bronze Banksian Medal).

From Messrs. HUGH LOW & CO., Clapton, were exhibited some nice plants of *Erica mammosa*, *E. elata*, a variety that keeps on flowering for three months if the shoots be not stopped, as is usual with *Ericas*; *E. verticillata major*; *E. cerinthoides coronata*, &c., in flower, and were very pretty. The last-named deserves special mention, by reason of its large, highly-coloured blooms, and its distinct and dark-coloured foliage. An improved form of *Allocasia Lowi* was likewise shown, in which the large veins are whiter, the under-side of the leaf deeper purple colour, and the leaf broader than in the ordinary form.

There were a few exhibits of new Dahlias staged, and these included a stand from Mr. CHAS. TURNER, Royal Nurseries, Slough. Varieties in this exhibit to which an Award of Merit was recommended were Douglas, a neat, fair-sized Pompon of very dark crimson; Purty, also a Pompon, white, with a little cream about the centre; Nerissa, a charming little Pompon, of very delicate rose colour; and Fabio, scarlet petals, and yellow at the base. Large show varieties similarly honoured were Mabel Stanton, clear full yellow, good form, a little flat in centre as shown; and Dante, a large and distinct variety, dark crimson with purple reverse, which is very apparent. Among Cactus-flowered varieties which received Awards, were Beatrice, rose-coloured, a comparatively flat bloom; and Leonora, of warmer colour, and the petals recurved towards the centre—a very pretty and attractive flower. Many other good varieties in each section were included in Mr. TURNER'S collection.

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited a dozen fine blooms in three varieties. These were all large-flowered blooms. Le Colosse, red; Siam, a flaked variety, crimson, purple, and white; and Grand Duc Alexis, handsome white, with slight light purple on the young petals, which in this variety remain tabular.

Another collection was from Mr. G. HARRIS, Scad's Hill House, Orpington, Kent, who had a dozen very nice blooms, in four varieties.

Messrs. J. PEED & SONS, Norwood Road Nurseries, S.E., staged sprays of a Pompon variety, named Tom Peed, a rosette of pale red with buff reverse.

A box with a dozen and a half plants of *Saxifraga sarmen-tosa tricolor superba* was exhibited from the Royal Horticultural Society's Gardens at Chiswick.

Hybrid Fuchsias in sprays of considerable variety were shown by Mr. PHILIP FRY, Addington Green, West Malling, and were of some interest.

There were very large exhibits of Asters from Messrs. VEITCH & SONS Royal Exotic Nursery, King's Road, Chelsea, and from Messrs. DOBBIE & CO. The large and splendid collection from Messrs. VEITCH & SONS had been lifted from the ground, and put into pots. The different sections were fully represented, German Emperor, in white, blue, red, and other colours, various coloured varieties of the Peony-flowered Perfection type, crown or Cocardeau Asters, with white centre; Pompon imbricated, dwarf Chrysanthemum-flowered, rose-flowered, Jewel Asters; Peony flowered globe Asters, &c. A few plants of the Diadem Aster had a number of small blooms, something like large Daisies, white and red florets mixed; and a good batch of a rose bedding Aster was good (Silver Flora Medal).

Messrs. DOBBIE'S collection from the nursery at Orpington, Kent, contained very good blooms in quality, and there were sprays of most of the sections above noticed. A pretty show of Comet Asters was made also, and the colours generally were commendable (Silver Banksian Medal).

Messrs. KELWAY & SON, Langport, Somersetshire, staged one of their remarkable exhibits of Gladiolus sprays in great variety, the spikes excellent, and the flowers large, and finely coloured. From a number of attractive novelties, the following were recommended Awards of Merit: Kate Rose, a bloom of the largest size, open, white with reddish-purple base, the same colour extending along centre of bottom petal; Brantford, an exceeding rich crimson, very glossy; and Dolops, very large, richly-coloured flower, and prettily-marked throat (Silver-gilt Flora Medal).

Mr. J. F. McLeod, gr. to J. P. MORGAN, Esq., Dover House, Roehampton, Surrey, staged a magnificent group of Crotons, remarkable alike from the exceptional cultivation the plants exhibited, and the representative character of the varieties, many of which are recent ones. Broad, medium, and narrow-leaved varieties were arranged with a view to obtaining the best effect, and were liberally interspersed with *Adiantum cuneatum*. Among the most telling broad-leaved varieties were Reidii, Mortii, Andreanus, and albicans. The narrow and medium-leaved varieties were more largely shown, and we noticed very pretty plants of *Aigburthiensis*, *Golden Bieg*, *picturatus*, *Lord Chelmsford*, *Lairgü*, *Nestor*, *angustifolius*, *Mrs. Dorman*, and many others (Silver Flora Medal).

Mr. T. S. WARE, Hale Farm Nurseries, sent a large number of varieties of *Lilium auratum*, including flowers of the old

type, and others with blood red stripes along the petals in greater or less degree. Also a spray of *L. nepalense*, and a few good varieties of Dahlias.

From Messrs. H. CANNELL & SONS, Swanley, Kent, was exhibited a collection of Cockscombs, and a good number of sprays of varieties of Cactus Dahlias. A rare lot of Cannas in pots of some of the best varieties, and some excellent plants of seedling double Begonias were also shown by Messrs. CANNELL (Silver Flora Medal).

A very extensive group of hardy flowers came from Messrs. P. BARR & SONS, King Street, Covent Garden, London. We noticed many excellent varieties of herbaceous Phlox, Gladioli, Marigolds, Pyrethrums, Helianthus, Galliardias, and other reasonable plants (Silver Flora Medal).

An Award of Merit was recommended to the ornamental Crab, *Jno. Downie*, shown by Messrs. GEO. BUNYARD & Co. and Messrs. JAS. VEITCH & SONS. The fruit is conical in shape, and highly coloured.

For Messrs. KELWAY & SON'S prize, offered for the best collection of twelve British-raised Gladioli *gandavensis* vars., there was only one competitor, namely, C. F. THOMPSON, Esq., Llandaff, Cardiff (gr., Mr. Mann), who was awarded the Medal offered.

Orchid Committee.

Present: Dr. M. T. Masters, in the chair; and Messrs. De B. Crawshaw, T. Statter, J. Jacques, E. Hill, H. M. Pollett, W. H. White, J. T. Gabriel, H. J. Chapman, T. W. Bond, W. Cobb, A. H. Smee, and H. Ballantine.

An interesting if not a great number of exhibits occupied the labour of the committee on this occasion, although there were not many of extraordinary merit amongst them.

From Messrs. J. VEITCH & SONS, Royal Exotic Nursery, Chelsea, came the following: *Cattleya Eldorado* alba, an entirely white-flowered variety, excepting the throat, which is yellow on the inside; several pieces of *C. Dowiana*, nicely bloomed; *Miltonia vexillaria superba*, in colour a rosy-lilac, therefore novel as regards its shade of colour; *Laelio-Cattleya Proserpine*, out of *Cattleya velutina* × *Laelia pumila* var. *Dayana*. It has sepals and petals of lurid purple, a rich purple lip, passing to a light tint at the apex, and furnished with white lines at the base. The following *Cypripedium* were shown, *Chas. Canham* = *C. villosum* × *C. superbum*, *C. tonsum superbum*, a flower mainly green in colour, save for a buff suffusion, and the dorsal sepal is tipped with white, and lined with light brown—it is a striking variety; *C. Warnhamiense* = *Phillipense* × *C. Curtisi*, chiefly distinguished by having the sepals of the latter; *C. oenanthem superbum* = *C. insignis Maulei* × *C. Harrisonianum*, a flower of rich shades of brown, as seen in the lips and petals, greenish-purple in colour as regards the dorsal sepal, which has purple lines, and an edge of white; the lower sepal is green, with purple stripes running through it perpendicularly, a distinct and pleasing variety. In this collection, a plant of *Vanda Sanderiana* with extra large-sized flowers, was remarked; the rare *Grammatophyllum Rumphianum*, bearing a drooping spike a yard in length with greenish flowers sparsely arranged on it—the latter are two inches in width, greenish-yellow, with irregular brown blotches. A plant of *Cœlogyne Veitchi*, having white flowers with buff-coloured remains of the envelope remaining attached to the footstalks (An Award of Merit). For the entire exhibit, a Silver Flora Medal was awarded.

Messrs. H. Low & Co., Clapton, showed *Dendrobium speciosum*, described in these pages (March 9 last), a small plant, with two or three flowers; *Cynochos chlorochilon*, in male and female forms, interesting but not beautiful; *Bolbophyllum Dearei*; *Cypripedium Charlesworthi* unicolor, the colour of the lip being the same as that of the sepals and petals, instead of brown; a good form of *Laelia elegans*; a beautiful flowered spray of *Odontoglossum Harryanum*, the best variety of it, with the white lip which turns yellow with age.

Messrs. W. L. LEWIS & Co., Southgate, had small groups of Orchids, amongst which were noticed *Cypripedium Charlesworthi*, *C. Evenor superbum*, a flower with a fawn-coloured ground colour; petals thickly spotted with purple, and the lip near the orifice furnished with brown striation. They showed *Miltonia spectabilis virginialis*, all parts of which flower are white, excepting the base of the lip which is purple. It may improve with age, but at present it is not apparently of much merit. *Cattleya gigas*, *C. Harrisoniae*, *Habenaria Suzanne*, and *Odontoglossum Lindleyanum*, were among the other objects shown by this firm.

EDWARD WOODALL, Esq., Scarborough (gr., Mr. Hughes), showed a grand piece of *Odontoglossum coronarium*, Salt's var., receiving for it a Cultural Commendation. The same exhibitor had a magnificent panful of *Vanda cœrulea* of the best type of the species, the flowers measuring 4 inches across, and there were seven well-furnished flower-spikes. Some *Cypripedium* were likewise shown.

A splendid dark-coloured form of *Laelia elegans* *Oweniae*, with a lip of the richest purple, was shown by THOS. STATTER, Esq., Manchester (gr., Mr. R. Johnson). His other plants consisted of *Cattleya guttata Leopoldi*, *C. Rex*, *Laelia elegans* *prasiata*, *L. e. excellens*, each differing from the type; *Laelio-Cattleya Nya* = *L. crispata* × *C. gigas*; *C. Gaskelliana* *alba*, *C. aurea*, *Dendrobium Phalaenopsis Schroderianum*, flowers of fair size, the colour light, approaching white; *Laelio Cattleya callistoglossa* = *L. purpurea* × *C. gigas*, and *L. elegans* *Chel-seensis*, the last-named receiving an Award of Merit; and the group was awarded a Silver Flora Medal. Another plant of *Laelia elegans* came from F. HARDY, Esq., Tyntesfield, Ashton-on-Mersey (gr., T. Stafford), viz., *L. e. Turneri*. From the same amateur came *Laelio-Cattleya Hardyana*, the reverse cross of *L.-C. callistoglossa*, *C. gigas* *Sanderiana* having been

used instead of *C. gigas*. The flower is of rosy-lilac in the sepals and petals and tube, with a lip of an intensely rich shade of purple and of velvety texture.

Messrs. F. SANDER & Co., St. Albans, showed a group of Orchids. There were *Habenaria canna* var. *nivosa*; F. Herdy's variety of *Cattleya aurea*, paler than the type, for which a First-class Certificate was given; *C. a. Statteriana*, *Miltonia vexillaria* var. *rubella*, *Burlingtonia pubescens*, the white and the rose-coloured varieties of *Dendrobium bractescens*, *D. cruentum*, *D. Phalaenopsis Schroderianum* in variety, and *Laelio-Cattleya Fowleri*. For an illustration of this beautiful cross between *C. Leopoldi* and *C. Hardyana*, see fig. 47, p. 239. A Silver Banksian Medal was awarded the exhibitor.

D. B. CRAWSHAW, Esq., Rosefield, Sevenoaks (gr., Mr. Cooke), received a Cultural Commendation for a plant of *Odontoglossum Uro-Skinneri*, with two fine flower-spikes.

Messrs. B. S. WILLIAMS & SON, Paradise and Victoria Nurseries, London, N., showed a small group, consisting of *Pachystoma Thomsonianum*, white, with a narrow, elongated lip of a purple tint; *Odontoglossum Krameri*, a flower of pale lilac, &c.

From the gardens of Sir TREVOR LAWRENCE, Bart. (grower, Mr. White), came *Dendrobium Hookerianum*, a plant with a pleasing inflorescence of lemon yellow-coloured flowers, having a dark purple blotch at the base of the fringed lip (Award of Merit). Other plants consisted of *Steuroopsis Phillipinense*, a plant with buff-colour blossoms of starchy shape, springing from the leafy nodes of the stem, the lip narrow, and strap-like, and pale lilac in hue; *Oncidium hæmochilum*, *Catasetum Bungei*, with unusually large flowers, for which last a Vote of Thanks was accorded.

A. H. SMEE, Esq., The Grange, Wallington (gr., Mr. Cummins), showed a form of *Catasetum fimbriatum*, *Eranthis grandifolia*—a remarkable bloom of a creamy-white tint, whose petals, sepals, and lip at the extremities turn of a primrose-yellow hue as the flower ages (Botanical Certificate).

CHAS. INGRAM, Esq., Elstead, Godalming (gr., Mr. Bond), showed *Laelio-Cattleya Charles Darwin* = *Laelia Turneri* *Elsteadensis* × *Catt. maxima* (an Award of Merit). The bloom has light purple-tinted sepals and petals, and an intense purple coloured lip, which is spread out fanwise, and is frilled at the edges; at the sides of the throat are bands of a yellow hue. The parent plants were shown, and the child is a decided improvement on them. From the same exhibitor came *Laelio-Cattleya Elstead Gem*, sepals and petals orange-coloured, tube white exteriorly, and lips a rich purple colour (an Award of Merit for this last).

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. W. Wilks, T. F. Rivers, G. Bunyard, H. Pearson, G. W. Cummins, T. J. Saltmarsh, J. Veitch, A. Dean, J. Wright, J. T. Miles, J. Willard, W. Farr, C. Herrin, H. Balderson, F. Q. Lane, and G. Norman.

Mr. J. W. Miller, gr. to Lord FOLEY, Ruxley Lodge, Esher, staged a collection of fruit, including several commendable Melons, a nice lot of Brown Turkey Figs, some Yorkshire Beauty Apples, and a large dish of excellent Hemskirk Apricots (Vote of Thanks).

Mr. Owen Thomas, gr. to H.M. the QUEEN, Royal Gardens, Frogmore, exhibited a meritorious collection of Plums in thirty-eight varieties. Of large red fruits, we noticed *Victoria*, *Autumn Compote*, and *Pond's Seedling*; of purple kinds, there were *Archduke*, *Fellenburg*, *Prince Engleheart*, *Kirke's*, *Large Black Imperial*, *Diamond*, and others; also *Jefferson's*, *Belle de Septembre*, *Coe's Golden Drop*, *Magnum Bonum*, *Lawson's Golden Gage*, *Damsons*, *Bullaces*, &c. Mr. Thomas also showed a pair of nice-looking short Cucumbers, named *Frogmore Prolific* (Silver Knightian Medal).

An extensive collection of first-class fruit was exhibited by Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, which included Apples, Pears, Plums, &c., in variety. Among two dozen dishes of culinary Apples, we noticed *Stirling Castle*, *Lord Derby*, *Lord Suffield*, and *Beckinville Seedling* as commendable. Dessert kinds were represented by *Duchess' Favourite*, of very high colour; *Devonshire Quarrenden*, *Lady Sudeley*, *Early Strawberry*, *Early Joe*, *Kerry Pippin*, *Yellow Ingestre*, and *Worcester Pearmain*. There were several dishes of Pears, including *Fondante de Cuerne*, *Beurré d'Amanlis*, *Fondante d'Automne*, *Souvenir du Congrès*, &c. Plums were shown in a large number of varieties, generally of excellent quality. Several dishes of Peaches from trees in pots were good, and included *Barrington*, *Crawford's Early Violet*, and others. An Award of Merit was recommended to an ornamental Crab Transcendent, some very attractive fruits of which were exhibited together with sprays. The fruits are uncommonly highly-coloured, and are much less conical in shape than the variety *John Downie*, also Certificated. Two new Apples were also shown, *Beauty of Moray*, a green culinary variety; and *Temple's No. 1*, a high-coloured dessert variety. Neither of these were certificated. Messrs. VEITCH's excellent collection was awarded a Silver-gilt Knightian Medal.

Messrs. S. SPOONER & SONS, Honnslow, contributed a collection of fruit in fifty dishes, including an excellent lot of Apples and Pears; also a few dishes of Plums, &c. (Silver Banksian Medal).

A golden-coloured Tomato and plant named *Edmonscoote Favourite*, was shown by R. DAVIES, Esq., Edmonscoote House, Castle Hill, Ealing, W. (gr., Mr. Wickenden); and a free-bearing French Bean named *Syon House Prolific*, was shown by Mr. G. Wythes, gr. to Earl PERCY, *Syon House*, Brentford, Mr. A. G. Hookings, gr. to W. H. HARFORD, Esq., Almondsbury, also showed a very free-bearing Bean, with large coloured pods, and some of *Ne plus Ultra* for comparison.

A brace of Cucumbers named *Eames' Hybrid* was shown by Mr. F. K. EAMES, Twickenham. New Melons were exhibited by Earl PERCY (gr., Mr. Wythes), and Earl DERBY, Knowley (gr., Mr. Robt. Doe), but no awards were made.

Messrs. H. CANNELL & SONS, Swanley, Kent, sent two dishes of a good Perfection type Tomato named *Cannell's King*; and Mr. W. Rapley, gr. to H. GRIMLING, Esq., Harrow Weald House, Stammore, showed a dish of *Sutton's Perfection* Tomato grown out-of-doors; the quality was very good. A medium-sized Pea called *Selected* was exhibited by Mr. THOS. McCLEURE, Hartley Grange, Winchfield; and from Mr. W. POTTEN, Camden Nurseries, Cranbrook, were some fruits of *Malus baccata fructu maximo*, a large form of the Siberian Crab.

Messrs. GEO. BUNYARD & Co, Maidstone, were recommended an Award of Merit for a rather large dessert Apple named *Williams' Favourite*. The fruit as shown is conical, very highly coloured, the colour extending almost over the entire surface, flesh tender and sweet.

Fruits of a seedling Peach came from the gardens of Sir T. D. ACLAND, Killerton, Devon. In appearance the fruits resembled *Royal George*, but it was a clingstone.

Lecture on Codæums and Dracænas.

In the afternoon a paper by Mr. C. F. Bause on the "Culturs of Crotons and Dracenas" was read by Mr. Geo. Bunyard.

The writer first dealt with *Crotons*, and recommended a night temperature during winter of 60°, and in spring about 5° or 10° higher. Many of the varieties may be grown without shading, but during the summer most of them would require a slight and removable shade at mid-day. Syringing during the summer months was a very important operation, and should be done in a thorough manner in order to keep red-spider at bay. Drought at all seasons is highly injurious. A good potting compost for the plants would consist of two parts good rich loam, one part leaf-soil, and some sand. The plants should never want in the least for water, and they should always be given a very light position. The usual method of propagation was by cuttings, which should be made with a clean cut by a sharp knife directly under a node. The pots should be plunged in Cocos-nut fibre or other suitable material in the propagating-case, and the material kept damp at a temperature of from 75° to 80°. When potting the cuttings off, a lighter soil should be used than that recommended for established plants. The ringing process also might be used with advantage. Seeds of *Crotons* should be sown as soon as ripe.

Dracenas.—The different types were alluded to briefly, and the particular uses to which they would be advantageously put. Thrips and red-spider were enemies which have to be fought, and it was necessary to syringe the plants very thoroughly once each day. The roots should be kept in a regular state of moisture, and the plants watered whilst moderately moist. For potting, a compost might be used of two parts fibrous loam, one part leaf-soil, and one part peat. The *Dracenas* were propagated by roots, cuttings, stems, and seeds. Varieties of the *Goldiana* type should have the top cut off and grown, and the stem would continue to break, when each growth might be taken off and struck. *Indivisa* and *australis* varieties were usually raised from seed.

SHIRLEY.

AUGUST 21.—The present was the thirtieth summer show held by this society, and was in every way a success. Groups of miscellaneous plants arranged for effect were a feature, so well were they done.

Mr. WILLS, nurseryman, Shirley, gained the premier award; Mr. Peel, gr. to Miss TODD, Shirley, 2nd. Specimen stove and greenhouse plants were numerous and good. For six, Mr. AMY, gr. to Hon. Mrs. ELLIOTT YORKE, Hamble Cliff, Southampton, won easily; Mr. WILLS 2nd. The best Ferns came from Mr. G. Hall, gr. to Lady LOUISA ASHBURTON, Melebot Court, Romsey. Mr. Mitchell, gr. to J. WILLS FLEMING, Esq., Chilworth Manor, won for tuberous Begonias. Mr. Wilcox, gr. to Col. W. SINKINS, Aldermeer House, Shirley, had the finest *Fuchsias*, really good examples.

Cut flowers were bright and varied. For twelve Roses, twelve show, six Cactus, and six Pompon Dahlias, and twenty-four Asters, Mr. West, gr. to J. WIGRAM, Esq., Northlands, Salisbury, won in all the classes referred to. Mr. LADHAMS won for twelve spikes of *Gladiolus*—really good examples they were.

FRUIT was an important feature of the show. For six dishes Mr. MITCHELL won with an even and good collection. Mr. WILCOX had the best Black Grapes, Mr. MITCHELL the finest White, both representative of the kinds staged. Mr. HALL, Peaches and dessert Apples. Mr. AMY had a good Melon, and secured 1st prize.

Vegetables were especially numerous. For a collection of six varieties, Mr. RUSSELL, Nursing, was easily 1st; and for the prizes offered by Messrs. TOOGOOD & SONS, Mr. Holloway, gr. to A. BROWN, Esq., Shirley, secured the leading award.

BASINGSTOKE.

AUGUST 22.—In the grounds at Eastland, belonging to Mrs. Millar, the annual summer exhibition was held, and was in every way a success. Plants formed an important feature of the show.

For twelve specimens, Mr. Bowerman, gr. to C. HOARE, Esq., Hackwood Park, Basingstoke, was an easy 1st, his

flowering plants exhibited much merit. Mr. T. Weaver, gr. to W. O. GILCHRIST, Esq., Oakley Park, Basingstoke, was 2nd.

Groups of miscellaneous plants arranged for effect were meritorious, Mr. BOWERMAN taking the lead in this class. Mr. Best, gr. to F. D. LEYLAND, Esq., The Vyne, Basingstoke, 2nd.

Mr. WEAVER won the premier award for exotic Ferns with healthy examples. Mr. BEST had the best table plants and tuberous Begonias.

Mr. RUSSELL, gr. to W. BRADSHAW, Esq., Audley's Wood, Basingstoke, was 1st for Coleus and Fuchsias, both meritorious exhibits.

Out flowers were shown in quantity, and made a bright display. Mr. NEVILLE, gr. to F. W. FLIGHT, Esq., Twyford, Winchester, won the premier award for twenty-four and for twelve blooms of Roses, with particularly bright and fresh blooms. This exhibitor also won for twelve show Dahlias. For twelve bunches of any kind of flower, Mr. WEAVER was distinctly 1st; and Mr. RUSSELL won in the herbaceous class.

Ladies made a creditable display of flowers in a separate tent.

FRUIT was shown in good quantity. For a collection of six varieties, Mr. F. Cole, gr. to Sir G. RUSSELL, Swallowfield Park, Reading, won with a good all-round collection; Mr. BOWERMAN following. Mr. COLE also won for three bunches of Black Hamburgh Grapes; Mr. OMAN, gr. to J. G. BAKER, Esq., Ottershaw Park, Chertsey, was 2nd. In the class for any other black Grape, Mr. OSMAN staged well-finished Alicante; and Mr. COLE was 2nd. In the white Grape class, Mr. BOWERMAN won with Muscata.

Harrington Peaches won for Mr. BOWERMAN premier award for one dish; he was also 1st for a green-fleshed Melon. The finest Nectarines were staged by Mr. Holdaway, gr. to Lieut.-Col. MAY, Hawfield, Basingstoke.

Apples made a large display. For three dishes, dessert varieties, Mr. BEST won; and for a like number of kitchen varieties, Mr. DAUNCEY, nurseryman, Hook, was easily 1st.

For three dishes of Plums, Mr. Fulford, gr. to the Earl of NELSON, Trafalgar House, Dorset, won with choice kinds.

Vegetables are always well staged here. Mr. BOWERMAN won 1st prize in each of the three collections of six varieties, with superior produce; Mr. BEST, and Mr. Kneller, gr. to WYNDHAM PORTAL, Esq., Malshanger Park, coming next in their respective classes.

Mrs. LADHAMS, Shirley, made a grand display with a large bank of herbaceous flowers, arranged in an effective manner; a smaller yet choice collection also coming from Mr. G. JACKMAN, Woking.

MANCHESTER ROYAL BOTANIC LILY AND FRUIT SHOW.

AUGUST 22 to 26.—An exhibition where Lilies form the chief feature is altogether a novel one. To Mr. Bruce Findlay must be voted the credit of bringing together such a variety of Lilies in flower, that it is not the lot of the general public, and even of many gardeners, to have seen. Moreover, nearly the whole of them were shown in pots, a matter of cultural importance, and an object-lesson to all who inspected them, presenting an imposing array, set in the sloping, undulating banks of the annexe, a building eminently fitted for displaying to the best advantage pot-plants of every description. The floral scene was amplified by splendid assortments of Gladioli, and border cut flowers in posies of every hue. The fruit was not a large exhibition, and was not particularly notable, with the exception of some well-coloured bunches of Muscat Grapes. The opening-day was a propitious one, but the attendance was not such as a charming exhibition of this kind ought to have commanded.

LILIES.

By far the finest lot of Lilies came from Messrs. R. WALLACE & Co., Colchester. The auratum section comprised some beautiful forms, among which we noted the magnificent ruby-banded variety, rubro-vittatum in several lots, the gorgeous broad-segmental platyphyllum, so prominently banded and spotted, and the plants bearing short stems carrying good-sized flowers, the white form of this under the name of Virginale, is an imported gem, with its minutely spotted flowers and prominent golden band down centre of each segment; then Wittai, as white as speciosum album itself, only having a faint yellow band down centre of segments. Batemanii is one of the most striking of the Icolirion type, bearing glowing apricot flowers, almost unspotted. Among the speciosum group Melpomene is a superb variety, making a splendid exhibition plant, the vivid crimson-purple blotches and the white margins renders this form one of singular attraction. Speciosum album was in several varieties, the Kratzeri form being pure white, and the album having prominent golden anthers. This group is always a telling one, and although the numbers generally were limited because of the season, they still take front rank in Lily mixtures. Longiflorum giganteum was very prominent, even beating for quality the ubiquitous Harrisii. The chief novelties and varieties were L. Henryi, called the orange-yellow speciosum. This seems to be a gigantic grower, and a very free flowerer, some of the spikes bearing twenty flowers, and carrying good foliage; the flowers were represented grown under glass, and out in the open, the latter mode emphasizing the orange colour. The groups of this species here commanded

general attention and observation. L. Leichtlinii is a very charming Lily of the Martagon group; colour, yellow ground, covered with purple spots. L. nepense is a pretty combination of brownish-crimson and citron. Another of the funnel-shaped section, named Lowii, is striking in having its interior covered with purplish spots. L. tigrinum Fortunei giganteum is a gigantic form of the type, bearing larger flowers, and in greater number than the type. The old double Tiger Lily always tells well in a group. This firm also showed a new form of Hemerocallis, under the name of Aurantica major, which received a First-class Certificate. The collection, as a whole, obtained the Society's Gold Medal, and it richly deserved it.

Mr. HUDSON, from Kilburn, showed over a hundred pots, comprising chiefly forms of auratum and speciosum, the white ones being less numerous than the coloured-spotted ones. It was an effective group, however. Mr. FINDLAY put up a large group, mostly of the auratum and speciosum breed, and in the course of a few remarks he made at the luncheon, he advised all gardeners not to try and force speciosum Lilies, because they would refuse to be conjured into flower under the influence of the pressure of artificial heat. As an instance of the wisdom of his observations, we saw a house in the garden range completely filled with Lilies which in another fortnight would be a blaze of beauty, but nothing short of sunshine and time would effect the evolution of the flowers. Messrs. J. & R. THYNE, Glasgow, sent a very good lot of L. auratum, in which the large platyphyllum were represented, also some good rubro-vittatum.

GLADIOLI, ETC.

Next in importance to the Lilies were the Gladioli, particularly those from KELWAY & SON, Langport. There were hundreds of them, and all clean and beautiful. Among the very best were Mr. J. Eyton, white, shaded rose; Lord Rothschild, scarlet, crimson shaded; Empress of Germany, white, with rose venation; Rev. H. H. D'Ombraïn, cerise and white throat, splendid substance; Mr. Fowler, crimson, with yellow citron, crimson, good form; Fiducius, crimson, deeply shaded centre; Maori Chief, mulberry, crimson blotch; Duke of Edinburgh, rose and purple-white throat. Among new ones we noted as best—Acis, marbled scarlet and purple, very stylish; Mus, deep velvety, crimson shaded, fine substance; Milus, beautiful shining heliotrope, with whitish base; Mano, maroon-crimson, tender, of grand form and substance; Pine, orange-scarlet, purple lines; and Madame Calve, shaded orange and ruby blended. This firm also exhibited a splendid lot of Gaillardias, of which Vampire may be said to be the chief; and the free-fruited Japanese Wineberry, Rubus phoenicolasius. This makes a handsome plant, with fine ovate acuminate leaves with a profusion of rich scarlet berries crated together, of prominent vinous flavour. Along with this among others were the showy yellow-flowered Rudbeckia laciniata, and the intense blue in long spikes of Veronica longifolia subsessilis.

Messrs. BARR & SON had several Lilies in their collection, the double-flowering Tiger Lily not being the least effective of them; and the fine orange-scarlet Montbretia crocosmaeflora, along with Lobelia Queen Victoria, a brilliant form of the fulgens type.

Mr. ANTHONY WATERER sent out sprays of the new Spiraea Anthony Waterer in rather pretty ruby-coloured thyrses. Messrs. DICKSON, BROWN & TAIT sent a lot of cut Gladioli, set among nice dwarf greenery. Messrs. DICKSON & ROBINSON had a very good assortment of H. P. and Tea Roses; among the latter, Madame Hoste, a yellow, was very prominent. Mr. JOHN KIRSON, Altrincham, had a miscellaneous lot of hardy border flowers, nothing so fine as the varied Snapdragons which are again coming to the fore.

Mr. FRANK LAW, Sale, put up a grand assortment of cut flowers, such as he supplies daily to the Manchester bazaar trade. They were arranged on a central bed, in which Kentia Fosteriana was the fountain-like apex—and beautiful they looked. They comprised Gladioli, the best market flower in that way being the scarlet Brenchleyensis, then Phloxes, particularly the late white; various kinds of border Chrysanthemums, the charming white Mignon Aster, then which it has no rival for purity and form; fine posies of varied Zinnias, yellow Papaver, and also the deep pink variety, more beautiful when cut than to look at them in the plants; Germania Carnations, of fine sulphur colour; also a new border one, very double, and of good form—cerise, called Mrs. Frank Law; Mrs. Sunkias Pink is also a favourite, and the Sweet Sultans and Coreopsis, and Gaillardias; and Centaureas forming a group for brilliancy of these simple border flowers that may be equalled in the other departments of Flora, but could not be excelled.

FRUIT

Comprised collections of ten sorts, Mr. Goodacre, gr. to the Earl of HARRINGTON, had good Muscat and Black Hamburgh Grapes, a Queen Pine, Bellegarde Peaches, Elruge Nectarines, a good Victory of Bath Melon, Downton Plums, and Jarzonelle Pears. Mr. W. Wallis, gr. to R. SNEYD, Esq., Keele Hall, was 2nd with, among others, Pearson's Golden Queen and Black Hamburgh Grapes, Walburton Peaches, Golden Drop Plums, and Negro Largo Figs. Mr. Slade, gr. to the Duke of NEWCASTLE, was 3rd, having Muscat and Hamburgh Grapes, a small Pine, and several other dishes, of which the Hero of Lockinge Melon was the best.

For the best twelve bunches of Grapes, Mr. GOODACRE was 1st, with a showy lot, beautifully finished, but the bulk of them having smallish berries. The Muscats here were good, considering the time of year, being of fair size, good colour, and proper form; there were five bunches of them in the collection; then good-berried bunches of Gros Maroc; fair-sized bunches, finely-finished, of Barbarossa, but berries small; and a pair of Alnwick Seedling.

Mr. Elphinstone, gr. to S. M. MUNDAY, Esq., Shipley Hall,

had also a remarkably good lot, many thinking that the prizes should have been reversed; but on close examination the judgment appeared to be perfectly sound. This lot also comprised four good bunches of Muscat of Alexandria, two of Alnwick Seedling, two of Madresfield Court, and two of Black Hamburgh. The bunches were smallish and so were the berries, but the finish and the staging were without blemish.

Mr. Tillett, gr. to Lord BARNARD, Baby Castle, had very good Muscat of Alexandria. For six bunches of Grapes, Mr. ELPHINSTONE and Mr. GOODACRE exchanged positions, the former grower having 1st, with three good bunches of Muscat of Alexandria and three Madresfield Court, the latter exhibitor having also prime Muscats, fairly good Foster's Seedling, and Madresfield Court. Mr. Richardson, gr. to J. E. PLATT, Esq., Cheadle, had fairly good Muscats and Gros Maroc. An extra prize was awarded to Mr. WALLIS, Keele Hall, for his six bunches.

Obituary.

MONSIEUR LIÉVIN SPAE-VAN DER MEULEN.—We regret to hear of the death of Monsieur LIÉVIN SPAE-VAN DER MEULEN, Treasurer of the Syndicale des Horticulteurs Belges, who died at Ghent on August 23, 1895.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, BRIGHT SUN. Rows list districts 0-10 and their respective weather statistics.

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.: Channel Islands.

MARKETS.

COVENT GARDEN, August 29.

Table showing COVENT GARDEN market prices for various goods like Arms, Asters, Bonvardias, Carnations, Chrysanthemums, Eucharis, Gardenias, Gladioli, Lapageria, Lavender, Lilium Harrisii, Lilium laucifolium, Maidenhair Fern, Margerites, Orchid-bloom, etc.

— Guernsey ..	1 6-2 0

POTATOS.

Trade very dull. Supplies heavy. Prices lower, £3 to £1 being fair average prices. J. B. Thomas.

SHOW REPORTS, &c., DELAYED.

An unexpected demand upon our space unfortunately compels us to keep over until our next issue reports already in type of exhibitions held at Bath, Brighton, and other matter.

Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

ANTS: G. T. C. The means of destruction may be applied at the present time. When it is seen by digging into the nests that the ants are dead, the former should be dug into, and the earth containing the eggs scattered on the surface of the ground. Domestic fowls, pheasants, &c., would soon then make a clearance of these.

ASTERS: Will your correspondent R. King (p. 216) be good enough to send me one of his diseased Asters with roots and soil adhering, also name and address, as I am deeply interested in the matter, and may possibly be able to give him information. L. Davies, Rosecroft, Hambledon, Hants.

BAMBOOS: J. R. Bambusa has the spikelets arranged in fascicles, and the flowers have six stamens. Arundinaria has many flowered spikelets arranged in branched spikes, without any enveloping leaf, and the stamens are three. The canes are cylindrical, with numerous buds at the joints, as pointed out to us by Mr. Bean. Phyllostachys has loosely paniced one-flowered spikelets, surrounded at the base by a large leaf, stamens three. The canes are flattened or grooved on one side, and only two shoots proceed from each node. Thamnocalamus is not essentially distinct from Arundinaria.

BOOKS: E. Tremeller. Handy-book of the Flower-garden, by D. Thomson (W. Blackwood & Sons, London & Edinburgh) will afford the information needed. The later edition costs 5s.—MARKET GARDENING, &c.: J. N. C. Tillage and Implements, by W. J. Malden, published by G. Bell & Sons, York Street, Covent Garden. The New Potato Culture, by E. S. Carman, Rural Publishing Co., New York, or through a foreign bookseller. Kitchen and Market Garden, by various writers,

published by Macmillan & Co., Bedford Street, Covent Garden. Market Garden Husbandry, by W. H. Ablett, published by Chapman & Hall, 11, Henrietta Street, Covent Garden.

CÈPES OR CÈPES: Inquirer. The edible species or cep blanc is Boletus edulis; the poisonous species are the cèpe noir, B. areus; and the cèpe faux, B. luridus. There is no known method of cultivating them.

CORRECTION.—In the report of the proceedings of the Royal Horticultural Society's Fruit Committee, at p. 218 last week, Tomato Early July should have been credited to Laxton Brothers, instead of to Sutton & Sons.—Hammersmith Horticultural Show, Gardeners' Chronicle, August 3, p. 137. Mr. A. Salter writes to say that his father did not escape with a fine China dinner-service, as there stated, and which the King Louis Philippe presented to him. We had no desire to impute dishonesty to the late Mr. Salter, or that he performed anything more than a friendly action towards the King.

"FLORA OF TASMANIA": The widow of the late eminent botanical artist, Mr. W. H. Fitch, desires to dispose of this valuable work. It is in parts, but the first one is missing.

FUNGUS ON PINK: A. L. Didymium apumarioides; one of the slime-fungi has overrun the Pinks, but it is not a parasite, and will do no harm, and will soon entirely disappear. G. M.

GARDENERS' ORPHAN FUND. A subscriber to the Gardeners' Chronicle begs to enclose a post-office order for £1 for the orphans of gardeners, in consideration of the Editor's kindness in naming her wild flowers. H. M. E. The amount has been received with very many thanks, and is in the hands of the secretary.

HANDLING A SPADE OR OTHER TWO HANDED TOOL: Spadesman. When the left hand is used lower down the handle than the right, the user is said to be "left-handed," notwithstanding that he is, where one hand only is brought into use, a right-handed man.

JUDGING AT FLOWER SHOWS: R. C. W. 1. The group contest being for plants in pots, the cutting-off of the Bamboos and using the stems, &c., as decorative material should have disqualified the exhibit. 2. Distinct species were doubtless meant by the framers of the schedule, and he who showed two Acalias was rightly put out of competition. 3. Cycads are not Palms.

LETTUCES FOR FORCING: W. D. The black-seeded Crisped Tennis Ball, white; Golden Tennis Ball, but this variety soon bolts; and Tom Thumb. Sow in October on hotbeds, and grow entirely in frames or hand-glasses. We cannot give you any information about prices; consult our market reports of last winter.

MANURE: C. H. W. If your land is light, let the manure be fairly decayed before using it, but if it be heavy, you may dig it in when half-decayed. In any case, do not let it lie about in heaps, but cover it with soil, banking it up as you would Celery. Pour sewage or house-slops into these, which will aid the rotting.

MEALY BUG IN VINERIES: N. Z. We should be inclined to depend on Richards' XL All Vaporiser for the destruction of "bug." It is cheaper than hand-labour, and much more efficient, doing no harm to the fruit, although we might hesitate, for obvious reasons, to its use in vinerias where ripe fruit is hanging; more than one application would be required. Could you not wait till the crop is consumed or put into bottles, when you could perhaps find a way to make the house airtight before using the vaporiser; in the meantime, using methylated spirits and a camel-hair pencil to kill "bug" wherever seen, especially about the bunches.

MEASUREMENT OF CUBIC CONTENTS OF GLASSHOUSE.—A LEAN-TO: F. W. W. First find the area of a cross-section of the house up to the angle which the roof forms with the upright front wall or lights, and then that of the angle formed by the roof, and a line drawn from the wall-plate horizontally towards the back wall of the house. Having found these measurements, add them together, and multiply the total by the number of lineal feet in the length of the house, and you will have the contents in cubic feet.

NAMES OF FRUITS: J. C. B. 1, not known; 2, Duchess of Oldenburg; 3, Ravelston Pippin.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—

W. M. Prunus Pisardi. There is no fungus or insect on the Begonia, so far as we see. Is there not some defect in the method of cultivation?—N. C. 1, Linaria Cymbalaria; 2, Senecio viscosus; 3, Chenopodium polysperum; 4, may be leaf of Spiræa Ulmaria; 5, Nicotiana rustica. Specimens withered, numbers detached mostly, figures nearly obliterated by damp. We do the best we can under the circumstances.—Correspondent. Both Acer are forms of the Norway Maple, Acer platanoides, L.—H. M. E. Platanna orientalis, variety acerifolia—often called the London Plane, as it is so commonly planted in London. We never heard it called Indian Plane.—W. T. H. Gypsophila elegans.—A. H. Dasylirion acrotrichum.—G. H. S. 7, not recognised, flowers perished; 8, Leptospermum bullatum.—T. H., Ickley. The flower represents a very fine variety of Odontoglossum coronarium. It is much to your credit that you have been successful in growing it for so long a time, and flowering it.—M. 1, Lastrea rigida; 2, Lastrea recurva; 3, Nephrodium molle; 4, Nephrodium molle corymbiferum; 5, Pteris longifolia; 6, Blechnum polypodioides.—H. F., Leeds. 1, Catasetum Gnomus; 2, Brassia caudata; 3, Rodriguezia pubescens.—Lymington. Amaryllis reticulata, an almost evergreen stove species.—J. M., Peebles. Cattleya Harrisoniana.—C. T. 1, Polygonum Persicaria; 2, Æthusa cynapium; 3, Polygonum aviculare; 4, Polygonum Convolvulus. The shells were utterly crushed.—W. P. Rhamnus Frangula.—X. Y. 1, Phyllanthus nivosus (Euphorbiaceæ); 2, Myrsiphyllum asparagoides (Liliaceæ). We have no idea why it should be called Smilax, beyond the fact that there is a remote resemblance.—Munches. 1, Cornus mas variegata; 2, Echinium vulgare; 3, Phacelia tanacetifolia.

PACKING GRAPES FOR TRANSIT: G. H. C. For best manner of packing Grapes, either for market or private consumption, we would refer you to Gardeners' Chronicle for Sept. 27, 1890, p. 363, where various methods are fully described, and a few illustrated.

PHYLLANTHUS NIVOSUS: X. Y. Stove treatment at all times. Soil for potting, sandy loam of a fibrous nature, and similar peat, nodules of sandstone or porous red brick, dried cowdung or other mild manure, and well drained pots. During the summer season it does well in a house which is kept rather moister than dry, doing well with Aroids, such as Philodendrons, and the like. To get the white mottling of the leaves as good as possible it should not be densely shaded or overpotted, and it should not be placed far from the glass. In the winter it usually loses some of its leaves. Prune it if you like before active growth begins.

TOMATO: W. R. One of the diseases caused by fungi, repeatedly figured and described in these columns. You can do nothing now, but next season apply Bordeaux spray early to the foliage and very young fruit. Be careful not to use it too strong; refer to recent back numbers for further detail.—Ubique. The appearances are consistent with some check to growth at a certain stage of development. There is no insect or fungus visible. The conditions too common, but the cause is not clear.

WORMS IN THE GARDEN: C. H. W. Use clear lime-water; keep ducks, or, better still, bantam chickens.

WORMS ON LAWN: W. E. R. The answer appeared on August 10, see p. 167.

COMMUNICATIONS RECEIVED.—P. W., Russia.—E. H. R., Harlem.—G. B., Maidstone.—W. G. S.—H. B.—T. S. W.—J. S.—G. C.—J. O'B.—S. M.—W. L. A. Y., with thanks.—B. Calvert.—Subscriber, Worsop.—R. M.—J. H.—W. R.—H. W. W.—W. Kelly.—R. J. L.—A. C. F.—W. Turvey.—J. F. S.—W. M.—J. W. G.—E. C. S. (next week).

SPECIMENS RECEIVED.—B. L., Southampton; many thanks, next week.—J. V. & Sons; best thanks.—E. F.

PHOTOGRAPHS RECEIVED.—Sutton & Sons, with thanks.

DIED.—On the 16th inst., at Shoji, Yokohama, Japan, HERBERT WILLIAM, eldest son of WILLIAM BROCKBANK, of Brockhurst, Didsbury, aged thirty-three years.

—On the 23rd inst., at Bienne, Switzerland, suddenly, MARY ANNE FRANCES, widow of JOHN LLOYD-WYNN, Esq., of Coed-Coch, Denbighshire, and 7, Eaton Place, S.W., aged eighty-four. Extracts from Times.

ODONTOGLOSSUM CRISPUM.

MAGNIFICENT IMPORTATION OF 9000 PLANTS.

OUR MR. HUGH COLLINS, who is collecting for our Firm, finding that nearly all the best varieties had been gathered in the old grounds round Pacho, which have been picked over for so many years to supply the ever-increasing demand for this most lovely Orchid, has, with a staff of men, penetrated further into the woods, where it is believed no collector has ever been, and has despatched this grand lot of plants. He says there are numerous natural hybrids amongst them. He saw large numbers of these plants in flower. There are a number of wonderful large and distinct-looking pieces amongst them. Private buyers and the trade are cordially invited to inspect and choose their own purchases, or we will dispatch splendid value for £5, £10, £20, £30, £50 orders. Plants from 2s. to 20s. each. This is a cool-house Orchid. Instructions for growing will be sent with each order.

COLLINS & COLLINS, Orchid Importers, Cumberland Park Nurseries, Willesden Junction, London.

**HILL & SMITH'S
BLACK VARNISH,**
For Preserving Ironwork, Wood, or Stone.

An Excellent Substitute for Oil Paint, at one-third the cost.

This unrivalled varnish has for forty years given unbounded satisfaction, obtained a large consumption, and earned a high reputation throughout the kingdom. It requires no mixing, can be applied cold by any ordinary labourer, and dries in ten minutes with a perfect gloss. Fences periodically coated with it are effectually preserved from deterioration for an indefinite period.
Price, 1s. 6d. per gallon at the manufactory, or 1s. 8d. per gallon, carriage paid to any railway station, in casks of 3, 18, or 9 gallons.
Testimonial from **CHAS. PATRICK, Esq., Cloughfold, Manchester (Numerous others)**—"I have used your Black Varnish for upwards of twenty years, and find none to equal it in economy and quality."

CAUTION. EVERY CASK BEARS THE ABOVE REGISTERED TRADE MARK. Beware of Cheap Imitations.

PAINTER and GLAZIER.—A young man seeks re-engagement in a Gentleman's Garden as above. Can be well recommended.—S. WILKINSON, Hall Works, Henham Hall, Wangford, Suffolk.

THE END OF THE CENTURY draws near, and somehow the fact impresses one and makes one think. On the threshold, as it were, of the twentieth century, we pause and take a glance back over the years that are gone. How much has happened during this now dying century! What wonders have been given to the world! The power and use of steam, the electric telegraph—these and many others are the discoveries of the nineteenth century. But that which will cause the closing century to stand out above all that have gone before and all that are to come, is the fact that in its earlier half was discovered a priceless blessing to mankind—those universal remedies—HOLLOWAY'S PILLS and OINTMENT.

Friday Next.

A small lot of healthy, growing, fresh imported tubers of the **LARGE GOLDEN YELLOW CALLA** (*Richardia Pentlandii* and *R. Elliottiana* type).

The tubers come from new ground, and the collector asserts that they will be of the finest large spotted type ever imported, in growth and size of spikes resembling the common white Calla, but differing in the rich golden hue of the flowers, many of them having also a glowing purple blotch in the centre. The small lot offered are the sole survivors of the collection.

Also a fine lot of rare **EASTERN AUSTRALIAN DENDROBIUMS**, just arrived in fine condition, and including **DENDROBIUM LINGUEFORME**, a charming species with elegant sprays of white fragrant flowers; **DENDROBIUM TETRAGONUM**, **D. TERETIFOLIUM**, and three plants of **GIANT OYNOCHES**.

Also **IMPORTED ORCHIDS** consisting of *Angraecum superbum*, *A. species*, *grammatophyllum species*, *G. Ellisii*, and *Phajus species* (another property).

MESSRS. PROTHEROE AND MORRIS will include the above in their **ORCHID SALE** on **FRIDAY NEXT**, September 13, at half-past 12 o'clock. On view morning of Sale, and Catalogues had.

Isleworth.

ODONTOGLOSSUM CRISPUM.

MAGNIFICENT IMPORTATION OF 9000 PLANTS.

OUR MR. HUGH COLLINS, who is collecting for our Firm, finding that nearly all the best varieties had been gathered in the old grounds round Pacho, which have been picked over for so many years to supply the ever-increasing demand for this most lovely Orchid, has, with a staff of men, penetrated further into the woods, where it is believed no collector has ever been, and has despatched this grand lot of plants. He says there are numerous natural hybrids amongst them. He saw large numbers of these plants in flower. There are a number of wonderful large and distinct-looking pieces amongst them. Private buyers and the trade are cordially invited to inspect and choose their own purchases, or we will dispatch splendid value for £5, £10, £20, £30, £50 orders. Plants from 2s to 20s. each. This is a cool-house Orchid. Instructions for growing will be sent with each order.

COLLINS & COLLINS, Orchid Importers, Cumberland Park Nurseries, Willesden Junction, London.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 7, 1895.

THE NATIONAL HORTICUL-
TURAL SCHOOL AT VERSAILLES.

IN the year 1874 a National School of Horticulture was established at Versailles, on the site of the old kitchen-garden. The creator of this kitchen-garden was the famous John de la Quintinie, about whom it may be interesting to give a few details. Born at Poitiers in 1626, Quintinie early showed that he had a strong inclination for the study of agriculture and horticulture. He began his gardening career as manager of the gardens belonging to Tamboneau, the then President of the Chamber of Accounts. He is said to have applied himself to so intense a study of the operations of nature that he soon became famous all over France. He made many curious and useful experiments. He was the first who proved it useless to join fibres to the roots of trees when transplanted, and he discovered a sure and infallible method of pruning trees, "so as to make them not only bear fruit, but bear it in whatever part the owner chooses, and even produce it equally throughout all the branches, which had never before been tried, nor even believed to be possible" (*vide Chalmers' Biographical Dictionary*, vol. xxv.).

Quintinie came to England in 1673, and during his stay here paid a visit, at Wotton, to Mr. Evelyn, who prevailed on him to communicate some directions concerning Melons, for the cultivation of which Quintinie was remarkably famous. These directions may be consulted by those who are interested in the history of gardening in the *Philosophical Transactions* of the Royal Society for 1693. It is said that either Charles II. or James II. made Quintinie an offer of a considerable pension if he would stay and take upon him the direction of the Royal Gardens, but he preferred to serve his own King, Louis XIV., who made him "Director-General of all His Majesty's fruit and kitchen gardens."

The architect Mansart it was who designed the kitchen-garden, the "Potager," as it is termed in French, but unfortunately, although he chose a spot that was in harmony with the general appearance of the gardens and park, he made the mistake of not thinking about the effect the site and the nature of the soil would have on the vegetables and fruits. He had constructed the orangery at the south of the palace, and in front of this astonishing edifice a Swiss regiment had dug the lake which still bears the name of the "Pièce d'eau des Suisses." Much of the soil of the kitchen-garden was formed from the earth thrown up by these works, and it was not as good as La Quintinie would have liked to have seen. Moreover, the kitchen-garden was in a place where had been formerly a deep pond, and it was necessary to fill up the place of this pond.

In Quintinie's book entitled *Instruction pour les jardins fruitiers et potagers*, one can read of the difficulties he had to contend with in bringing

the Versailles kitchen-garden to that state of perfection for which it was renowned. The garden was begun in 1678, and was not completed till 1683.

The enclosure placed under Quintinie's direction contained twenty-nine gardens, separated by walls running in different directions, thus giving opportunities for different treatment of the various plots. One is struck while going over the gardens by the happy idea of the organiser, which was to surround the large squares in the middle by terraces, so as to protect the plants against the wind, to reflect the heat of the sun, and to afford large surfaces for fruit-walls.

Quintinie was a great authority on all kinds of fruit-trees, but the Pear was evidently his favourite. In the east of the Potager may be seen two magnificent Pear trees planted by Quintinie himself in 1685—one of these trees, more than 200 years old, is nearly 30 feet high.

Louis XIV. was very proud of his "Potager de Versailles." He liked to take walks in it, and would interest himself in the cultures. He was a very heavy feeder, and, as the chronicle tells us, he liked to have Asparagus in December, Radishes and Lettuces in January, Cauliflowers in March, Strawberries in April, fresh Peas in May, and Melons in June. Quintinie exerted himself to satisfy his royal master, but it will easily be imagined that it was not always easy to do so. When the great gardener died in 1688, the king is reported to have said that he had experienced a great loss which he never expected to have repaired. A statue of Quintinie now stands in the gardens which he created.

The *École Nationale d'Horticulture* occupies the buildings, gardens, and other places where were once the kitchen gardens of the kings of France. The establishment is split up into different sections, the whole occupying a space of some 24 acres. Part of this space is taken up with kitchen gardens; besides these there are the plots for fruit trees, experimental culture beds, greenhouses, an orangery, a winter garden, a school for the botanical students, &c. There is also a little model nursery.

The object of the school is to train gardeners, and to instruct them in the theory and practice of horticulture; to provide teachers of horticulture for the practical and normal schools of agriculture, to train professors of horticulture and landscape gardeners, to turn out well-educated agents for public or private offices—in a word to provide for all those who may need it an efficient education in all branches of horticulture.

The students who have satisfied the Minister of Agriculture as to the conditions of admission, and who have passed the preliminary examinations, receive a three years' training at the school. The theoretical teaching includes the following courses:—the laying out of gardens and the construction of greenhouses, instruction in physics, meteorology, chemistry, geology, mineralogy, the culture of early vegetables, horticultural zoology and entomology, ornamental arboriculture and the reproduction of vegetables, pomology, floriculture, botanical work, the care of fruit trees and methods for getting early fruit. Besides these special studies, the pupils are instructed in English, mathematics, topography, drawing, &c.

The pupils are not simply gentlemen-gardeners, engaged in book-work and in looking at results and practical work, but they are expected to work with their own hands, and thus acquire considerable dexterity of manipulation.

The School of Horticulture is provided with excellent materials for instruction, including a library, a laboratory for horticultural research,

a meteorological station and fine collections, which include plant-albums, herbaria, specimens of seeds and woods, a little museum of useful and noxious animals, models of implements, casts of fruits, &c.

The creation of this school was due to the initiative of the late P. Joigneux, an eminent agriculturist and a deputy, and its organisation to the late Auguste Hardy, who was one of the first horticulturists in France. To-day it is under the direction of M. Nanot.

For many facts in the above sketch we are indebted to an article that recently appeared in *La Nature* over the signature of E. Hennebert, H. C. F.

NEW OR NOTEWORTHY PLANTS.

CATASETUM FEROX, *Kranzlin, n. sp.**

If not beautiful, this is certainly a very striking plant, in habit rather like the other *Catseta* we have in our stoves. The spike bears about twenty flowers of dirty-green colour outside, and pea-green inside, more or less spotted with small purplish spots. The sepals and petals are of about the same size and form, growing in a sort of helmet as in some other *Catseta*, *Catsetum purum*, Nees, for instance (= *Catsetum inapertum*, Hook.). The most peculiar part of these flowers, and the one by which they can easily be distinguished from other species, is the lip. This part is rather small for a *Catsetum*, and looks very like a lower-jaw with a prominent chin and teeth; on both sides there are two rows of molar teeth, not very long and prominent, but broad and stout; a little behind the top is a row of six; very prominent incisors, the middle ones coherent except at the apex. The plant was introduced by Messrs. F. Sander & Co., St. Albans, and flowered in midsummer. *F. Kranzlin.*

LINOSPADIX MICHOLOTZII, *Ridley, n. sp.†*

I have received, through the kindness of Mr. Micholitz, specimens of a very remarkable new Palm, a species of the small genus, *Linospadix*, from the mountains of New Guinea. Seeds of the plant have been sent to Mr. Sander's establishment at St. Albans. The genus *Linospadix* is typically Papuan, though the original and best-known species, *L. monostachya*, Wendl., is a native of Northern Australia. The present species is unique in its genus in being quite stemless, the wedge-shaped leaves rising erect from the ground in a large tuft; they are upwards of 4 feet in height, narrowed into a petiole at the base, and broadening upwards, and end in a pair of long acute points. The spadices are extremely slender and elegant, and are remarkable

* *Catsetum ferox*, Krzl., n. sp.—Habit omnino *Catsetorum* minorum, racemo elongato plurifloro; bracteis triangularibus quam ovaria multo brevioribus; sepalis lanceolatis acuminatis cum petalis paulum latioribus galetis, labello crasso postice margine serrato antice saecato mentum formante leviter sulcato, lobis lateralibus nullis margine atrinque incrassato infra multituberculoso (quasi dentes molares referente), lobo intermedio nullo, dentibus 6 quorum mediani quique majores mediani 2 coaditi infra ante limbum anteriorem saeci; gynostemio alto sepalis fere equante anthera longe mitrata, cirrhis longissimis ad marginem anteriorem saeci deconcurrentibus; pollinia generis. Flores inter minores generis 2.5 cm.—3 cm. alti, sepalis sordide viridis; petala late viridia purpureo-punctata, labello late viride albo-marginatum. *F. Kranzlin.*

† *Linospadix Micholitzii*, n. sp.—Acaulis caespitosa. Folia elongata erecta cuneata basi in petiolis attenuatis, apicibus profunda bifidis, laciniis 10 pollicibus longis acuminatis, glabra, carina crassiuscula et nervis elevatis (ad 22) subtus brunneofurfuraceis exceptis, 3½ pedes longa, 6 pollices lata. Spadices erecto-nutantes, gracillimi; pedunculis 1½—2½ pedes longis, speciebus singulis ad 10 pollices longis vix incrassatis brunneofurfuraceis, unisexualibus. Flores spiritaliter dispositi minuti, masculi bini in foveis ½ pollicis longi; bracteis minutis. Sepala ovata inaequalia obtusa imbricata. Petala 3 lanceolata obtusa. Stamina 6. Flores feminei singuli in foveis. Sepala ovata obtusa cuneolata. Petala paulo longiora late ovata obtusa. Stigmata breviuscula lata crassa recurva. Drupa oblonga ½ pollicis longa, ½ pollicis lata, stigmata terminali, rubro, pericarpio tenui extus carnosio, intus fibroso; albumine aequabili, duro; embryo basilari.—Mountains of New Guinea, Coll. Micholitz. *H. N. Ridley, Singapore.*

in being unisexual, the male and female flowers being on different spadices. The fruit is oblong, about half an inch long, bright red, the albumen of the seed white, and very hard. The plant inhabits the wet ravines of the higher slopes of the mountains.

THE FRUIT CROPS.

[For Tabulated Summary, see p. 119.]

(Concluded from p. 208.)

5, SOUTHERN COUNTIES.

BERKSHIRE.—Notwithstanding the drought, which prevailed more or less up to July 18, I am able to report in this district one of the best all-round crops ever seen; and having had copious rains (since above date to July 31, 4.60 inches), I have every confidence that a good crop is now assured, although smaller in size than usual, through drought. Apples are a very heavy crop; names need not be given, as nearly all here are carrying heavy crops, in a collection which includes over 200 varieties. Pears a fair crop, rather under average, but will, I anticipate, be of fine quality, as the fruit is clean, free from rust, and now swelling rapidly. Cherries were an extraordinarily heavy crop, and fruit large; trees making good growth, and free from black-fly, which is usually very troublesome here on walls. Peaches and Nectarines, good crops, and trees looking well. I have been gathering good-sized Peaches, of fine colour, from south walls, since July 16, variety Alexander. Apricots, average crop, of nice clean fruit. Plums, medium crop, of good quality. Damsons, heavy crops. Strawberries were a good crop, but only by persevering with thorough watering for several weeks; fruit firm, and of good size; James Veitch proved a good variety here this season, and of better flavour than usual. The appearance of the beds, after severe frost in spring was deplorable—not a leaf left, and I had doubts whether many of the crowns were not killed outright; however, when growth commenced, they soon recovered, and showed strong bloom. Unfortunately, May was very dry and hot when fruits were set and swelling and this checked the crop considerably. Only 36 inch of rain fell here during May. Small fruits are abundant. Gooseberries formed a remarkably heavy crop. Raspberries were plentiful, but the fruits rather small. Nuts: Filberts average crop; Walnuts the heaviest crop I ever saw, and the branches are already bending with the weight. *Owen Thomas, Royal Gardens, Windsor.*

DORSETSHIRE.—The Apple trees and bushes give promise of a very fine crop, and the best of them are Annie Elizabeth, Beauty of Kent, Bismarck, Brownlee's Rasset, Devonshire Quarrenden, Dutch Mignonne, Irish Peach (very fine), Kerry Pippin, Keswick Codlin, Lord Suffield, Margil, Northern Spy, Reinette du Canada, Ribston Pippin, and Warner's King. The best Pears are Beurré Rance, Beurré Dial, Glon Morceau, Marie Louise, Williams' Bon Chrétien, Thompson's Seckle, and Catillac. Raspberry Superlatives should be more known, as it is a very fine variety, and a heavy cropper. Strawberry Royal Sovereign, fruits of which were ripe here on May 29 on a south border, in point of earliness is equal to Noble, and much superior in quality. *Thos. Denny, Down House Garden, Blandford.*

HAMPSHIRE.—Apples are an average crop on the whole, some varieties, as for instance, Lord Suffield, Lord Grosvenor, Warner's King, Blenheim Orange, Cox's Orange Pippin, and Stirling Castle; Mère de Ménage, Irish Peach, King of the Pippins, and Devonshire Quarrenden, are bearing heavily; others, such as Ecklinville, Lady Sudeley, Bismarck, Lady Henniker, and Golden Pippin have a very thin crop. The trees are very healthy, and free from insect pests of any description. Cherries were remarkably good, May Duke, Governor Wood, Elton, and Bigarreau Napoleon were the most satisfactory varieties. Strawberries have borne immense crops of fine fruit, Royal Sovereign and Sir Joseph Paxton especially. Raspberries suffered from the frost. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

— Apples are large and early, but many of the fruits dropped, I think for the want of rain; good crops on Keswick Codlin, Lord Suffield, Blenheim Pippin, Hawthornden, Cellini, and Irish Peach. Pears, good on the walls, but the fruits have dropped badly from the cold nights and want of rain. Plums good on walls, and very early. Peaches, a fair crop, the trees clean, and look well. Damsons, splendid crop. Strawberries were a bad crop. Raspberries, on the contrary, were a good crop, but suffered from drought. *Wm. Smythe, Basing Park Gardens, Alton.*

KENT.—Apples and Nuts are the crops of the season, and the rains we have had will assist them greatly in swelling out. Pears are rather thin in this district. *W. Craik, Hothfield Place, Ashford.*

— Apples, especially early kinds, are very plentiful, later kinds more scarce; the fruits promise well, although many have fallen through drought. Blenheims are very good indeed; Lord Derby, Warner's King, and many others well laden. Pears short, but promise to be of good size and quality. Plums scarce. The dry weather has been all in favour of Cherries, and fine fruits have been marketed. Peaches and Nectarines plentiful, but will be rather smaller than usual through drought. There have been heavy crops of Strawberries, but the season short; late kinds did not grow so large, though good-flavoured. Currants good. *H. Markham, Mcreworth.*

— Apples form a splendid crop around here, almost all the well-known varieties are cropping remarkably well. It is really surprising how well the fruits have developed during the drought. Blenheim Orange on large trees are carrying very heavy crops. Worcester Pearmain, Irish Peach, and Quarrenden are found to be amongst the very best for marketing, being sold at the foot of the ladder, and generally realise good prices. Cox's Orange Pippin is cropping heavily, and necessitates a great deal of thinning to encourage fair size and quality. The old Ribeton Pippin is bearing well. In reference to this Apple, I find it necessary to thin to a single fruit, on account of the stalks being so short that they push one another off before they have finished growing. Amongst some of the newer varieties I am fruiting this year, and which strike me as being good croppers are—Swedish Reinette, with a beautiful bloom; Barnack Beauty, colours well, an immense cropper; and Bramley's Seedling. This latter is fruiting well on the Paradise. Where it can be done, the fruits should be thinned, as poor samples this year are not likely to be of much use for marketing purposes. Damsons are a very good crop, but Plums varying. Peaches and Nectarines are a grand crop. I am calculating to grow about 12,000 this year. I gathered my first fruits on July 22 from a west wall—the variety was Alexander. *G. Woodward, Barham Court Gardens, Maidstone.*

MIDDLESEX.—Apples are most abundant, almost every tree bearing a full crop. Fruit rather small, but the late heavy rains will benefit them much. Plums on walls were quite a sight. Early Favourite is a variety that was ripe on July 20, and is especially to be recommended as a first-class fruit for dessert. *A. F. B., Chiswick.*

— Fruit crops on the whole are a fair crop in this neighbourhood, but the dry weather told heavily upon the bush-fruits and Strawberries, and where water was not supplied the crops of these are light and small. Plums in many places are a failure. Victoria seems to be the principal sort bearing well this season; the trees are very free from blight, so are the Cherries. Cherries and Peaches have ripened very early this season. Good Waterloo Peaches were gathered out-of-doors on July 14. *W. Watson, Harefield Place, Uxbridge.*

— The prolonged frost caused a late bloom, with the result that most fruits are plentiful. Apples and Pears at one time promised a very heavy crop, but the great heat and the drought have caused many fruits to drop. Apricots are thin, but good. I never saw Peaches and Nec-

tarines more healthy, or bearing better crops, but such trees have, during the drought, required much attention. Cherries were all one could desire. Plums a small crop, but the trees look well. Strawberries were very good, and very early; Royal Sovereign and British Queen are varieties that have given splendid crops. Currants and Gooseberries good and plentiful; but most small fruits in this district suffered much from drought. *G. Wythes, Sion House Gardens.*

SURREY.—With the exception of Pears, all the fruit crops here are most satisfactory. Apples (especially on young trees) have required severe thinning. Damsons are heavily laden. Strawberries were of large size and good flavour. We commenced picking Noble on June 14, and finished with Latest of All on July 16. Caterpillars have been more than usually troublesome on the Gooseberry bushes; and owing to the continued drought, red-spider has made its appearance on many of the fruit trees. *G. W. Cummins, The Grange, Wallington.*

— Apples are looking well, and promise to be a heavy crop, especially Grenadier, Stone's, Peasgood's Nonsuch, Lord Suffield, Lord Grosvenor, Wellington, Allen's Everlasting, Prince Albert, Lord Derby, and Oldenburgh, kitchen; Cox's Orange Pippin, Brownlee's Ruseet, Blenheim Orange, Kerry Pippin, and Mother, dessert. Red Currants and Gooseberries were very fine in quality. Raspberries suffered much from frost, but the fruit was very large. *C. J. Salter, Woodhatch Lodge Gardens, Reigate.*

— On some trees there are very heavy crops of Apples, on both old and young trees; others have few and some none, in the same locality. Pears not so good. Plums very thin. Young orchards in high cultivation, making splendid growth. I never saw Peaches on walls looking better, both in fruit and foliage; small fruit of all sorts plentiful and good, with the exception of Raspberries, which are very small. *W. Miller, Ruxley Lodge, Esher.*

SUSSEX.—Plums in this district suffered much through the severity of the frost during last winter, particularly those in exposed places, the consequence being a short crop. Many of the Damson trees were almost killed by the frost, Frogmore Prolific suffering the most. Apples are an abundant crop, but the fruit is small for the time of year. Pears on trees in the open are a very partial crop, and Cherries were never more abundant, or of finer quality. Peaches are small, owing to the dry weather; and the same may be said of Apricots and Nectarines. Strawberries have been very abundant. Black Currants were the heaviest crop we have ever grown. *H. C. Prinsep, Busted Park.*

WILTS.—Apricots, Peaches, and Nectarines, on which the blooms were protected from frosts, set immense crops of fruit, thereby necessitating severe thinning of the latter. Apple trees in orchards are heavily laden with fruit of good quality, as also are espaliers in kitchen gardens, including trees of Annie Elizabeth, Red Astrachan, Beauty of Bath, Juneating, Irish Peach, Stirling Castle, Keswick Codlin (a never-failing cropper), Emperor Alexander, Duchess of Oldenburg, Ecklinville Seedling, &c.; the trees, too, are in good condition. Plums and Pears generally are under average. Gooseberries, heavy crop. Currants and Raspberries average. Walnuts are a heavy crop, and the same may be said of Filberts and Cob nuts. Altogether, the fruit crops of 1895 may be stated as being highly satisfactory. *H. W. Ward, Longford Castle, Salisbury.*

7, ENGLAND, N.W.

LANCASHIRE.—Fruit trees are clean and healthy. Apples and Pears are a good crop, although many of the fruit dropped in consequence of the drought. Damsons are very plentiful, and other kinds of Plums are as good as I have seen them. Gooseberries and Raspberries had heavy crops, and the fruit of the latter sold at 5s. per dozen quarts. Strawberries abundant, and secured without much loss from wet. Growers for market in this part confine themselves to Barnes' Prolific, presumably a

local variety. *W. P. Roberts, Cuerdon Hall Gardens, Preston.*

— Apples small through drought. Pears plentiful on walls and trained trees. Damsons are a very heavy crop, a circumstance that occurs about once in seven years. *B. Barham, Croxteth, Liverpool.*

WESTMORELAND.—Apple and Pear trees are very clean, and the good bearing varieties have excellent crops considering the sunless summer we experienced last year, and the unusual amount of east winds and frosts this season. *W. A. Miller, Underley Gardens, Kirkby Lonsdale.*

8, ENGLAND, S.W.

CORNWALL.—Fruit crops are very good on the whole, the only deficiency being in Raspberries and Gooseberries; Peaches, Nectarines, Cherries, and Currants especially being good. Strawberries were an immense crop, and very fine, Sir Joseph Paxton and Laxton's Latest of All being the best. *Alfred Read, The Gardens, Port Eliot, St. Germans, R.S.O.*

— The Apple crop in East Cornwall is under average, but many varieties are carrying a good crop, and the fruits are large and clean; Blenheims, Cox's Orange and King of Pippins being the best. Pears are good, and, at present, show no signs of cracking. Strawberries have been splendid; in spite of the heavy crop, the late fruits swelled up well, Latest of All on a north border giving us some grand fruits. Cherries also have been very fine, the dry season suiting them on our heavy soil. Bush fruits abundant and good. *Charles Page, Boconnoc Gardens, Lostwithiel.*

— Apple-trees gave promise of abundant crops early in the season, but fully two-thirds have fallen, many of the trees being left without a single fruit, the result, I think, of the severe and prolonged easterly gales. Cox's Orange, Starmer, King of Pippins, Mère de Méuage, and Stirling Castle, appear to have stood best. Pears are numerous enough, but promise to be very small. This is not a good Cherry district, but they have been exceptionally good with me this year. Peaches and Nectarines are a grand crop. Plums are a complete failure. Medlars and Quinces are very good. Bush-fruits are all good, and grown under permanent wire-net, which is much less trouble than old fish-net, and less expensive in the long run. When I first adopted it ten years ago, I was told that caterpillars would never allow me to have a fruit, but a little helibore powder soon destroys them, and they have given less trouble than under the old plan, though the birds are not allowed inside the wire, winter or summer. *Wm. Sangwin, Trellisick Gardens, Truro.*

DEVONSHIRE.—The fruit crops are all alike good, and up to or beyond a full average. All stone fruits, especially Victoria Plums and Damsons, are a full crop. The same of Peaches, Apricots, &c., and an almost entire absence of aphid and other insect life, and blotched leaves. The result is a very satisfactory promise for another year. Walnuts and Filberts most abundant, and far in excess of what is ordinarily seen. *James Enstone, 38, Temple Road, Exeter.*

GLOUCESTERSHIRE.—The fruit crop generally in this district is the best I can call to mind for some years. The trees are particularly free from all kinds of insects, and have made good, clean growth. We escaped the frost of June 15 which proved so disastrous in some parts of the country. *Thos. Arnold, Cirencester House, Cirencester.*

HEREFORDSHIRE.—The fruit crops in this district are generally very good, and, considering the very dry weather during early summer, is of good quality. The blossom was very abundant, but the grub has been very bad in some parts. *Frank Harris, Eastnor Gardens.*

— Fruit crops generally are good, and the fruit clean, excepting Apricots, which are very much spotted and unkind. Strawberries have been a heavy crop, and the dry weather was favourable for keeping the fruit when ripe. *Thos. Spencer, Goodrich Court Gardens, Ross.*

MONMOUTHSHIRE.—Strawberries were a good crop and of good quality. Both fruits of all kinds were remarkably good in every way. Plums are a good average crop, Victoria, Early Transparent Gage, Kirke's, Jefferson's, and Coe's Golden Drop are heavy bearers. Pears are partial, the best crops being upon west and south walls, those on east walls, excepting Marie Louise, are thin; the crops on pyramid trees are also partial. Cherries are good, particularly May Duke and Morellos. Apples generally have suffered from caterpillars where no means have been adopted against them. Amongst the best croppers are the following:—The Queen, Gascoigne's Seedling, Grenadier, Lane's Prince Albert, Sandringham, Schoolmaster, Tyler's Kernel, Warner's King, Cellini, Brownlee's Russet, Cox's Orange Pippin, King of the Pines, and Worcester Pearmain. *Thomas Coomber, The Hendre Gardens, Monmouth.*

I do not remember observing such an absence of blight among the fruit crops generally. Apples and Pears are good in various localities, whilst in others there are scarcely any, but on the whole an average crop will be secured. Small fruits are very plentiful and clean. *John Lockyer, Pontypool Park Gardens.*

SOMERSETSHIRE.—I never have seen a better crop of fruit all round than this year. The spring was most favourable, not having any late spring frost, and we had glorious summer weather, which has had a good effect on all kinds of fruit. I never remarked Apples getting high colour as early as they did this season. Apricots are grand. *James Crook, Forde Abbey, Chard.*

WORCESTERSHIRE.—A very satisfactory hardy fruit season, taken collectively, the trees being both clean and healthy, aphid and winter-moth larvae having given very little trouble. Apples of all kinds are heavy, clean crops, already highly-coloured. Apricots bloomed sparsely, but the quality is very good. Raspberry canes were injured by the severity of the frost in January. Pears are a very thin crop, although the trees gave an abundance of strong, perfect flowers. The fruit apparently set well, but the blossoms must have been unobservedly attacked about the flowering period by the insidious Pear-midge, *Diplosis pyrivora*, as the young fruit dropped off in shoals when about the size of a cob-nut, and when opened they were found to contain scores of the midge larvae. How to prevent future attacks is a problem yet unsolved, and is a question of the very greatest importance to fruit growers as well as to ourselves. *William Crump, Madresfield Court, Malvern.*

The Apple crop is a good one, and the trees are healthy, and clearer of caterpillars than has been the case for several years past. The Pear crop in orchards and in the open, as might be expected, is light, after the enormous one of last year; but on the walls there are large crops of fine fruit. Plums and Damsons, as a rule, are average crops. Cherries have been most abundant and good. Apricots are very partial, and in my own case a complete failure. This I attribute to the wet, sunless autumn, and to the subsequent severe frost, and also to the fact of their being in a somewhat low and damp situation. I began gathering good-coloured examples of Early Alexander Peach on July 13. Strawberries, Currants, and all bush fruits, with the exception perhaps of Raspberries were abundant. Walnuts, and the common Hazelnuts are plentiful. Fruit trees of all kinds are this year remarkably free from aphid or any other insect pests. *John Austen, Witley Court Gardens, Stourport.*

WALES.

CARDIGANSHIRE.—Small fruits have been very good; in fact, we have never had better crops. Apples are a very heavy crop, the branches have to be supported on many trees. Pears are about average crop, and very promising. Strawberries were very good, although the season was a short one. *R. G. Williams, Crosswood Park, Aberystwyth.*

DENBIGHSHIRE.—Apples had an excellent appearance until the terrific thunderstorm of July 26, when they were severely peppered with ice-hail, much of it measuring 1 inch in diameter, after which half the crop fell, but plenty still remain, though much marked by the bruising of the storm. We registered 30.6 in 45 minutes; nothing like it has occurred here within memory. Bush fruits of all sorts were excellent, and their season was prolonged by the late rains. Cherries were good crops, and of good flavour. Apricots are extremely thin. Strawberries were very abundant; Noble has done splendidly, being early and large; Sir Joseph, very fine; Dr. Morère, a French Strawberry, of excellent merit for packing, large, flavour good; John Ruskin was very good—in fact, all sorts, excepting President, which we shall now discard. Victoria class of Plums are heavy crops, but Gages are thin; Damsons excellent. Birds have been less troublesome than for years. The long frost has done good service in clearing away much of the American blight. Frost cleared off all weak fruit trees and bushes. *P. Middleton, Wynstay Gardens, Ruabon.*

GLAMORGANSHIRE.—Apples and Pears are an abundant crop in this district. In the gardens here the trees have had to be propped up to keep the branches from being broken by the great weight of fruit. Plums are an average crop, and the trees are freer from aphid than usual, notwithstanding the long-continued drought we experienced during early summer in this locality. Strawberries were very good considering the dryness of the season. *A. Pettigrew, Castle Gardens, Cardiff.*

Apples are an exceptionally heavy crop, and very clean. Pears, average, but such varieties as Winter Nellie, Glou Morceau, Louis Bonne, Chaumontel, Thompson's, and Doyenné du Comice, are carrying heavy crops. Strawberries have been most prolific, and very fine, and the flavour all that could be wished. Plums are quite an average crop, and very clean. Cherries I never remember being so plentiful. All small-fruits have been very plentiful, with the exception of Gooseberries, these have been quite a failure in some gardens. *R. Milner, Penrice Castle, Swansea.*

MONTGOMERYSHIRE.—Very heavy crop of Plums, Gooseberries, and Apples. All fruits are clean and healthy and abundant, with the exception of Apricots. *John Lambert, Powis Castle.*

PEMBROKESHIRE.—Apples are a very heavy crop the weather being fine and dry when the trees were in bloom. Pears are a very light crop, the trees having been fruiting freely this past two seasons, they appear to be exhausted to some extent. Plums, especially Victoria, Jefferson's, Prince Eaglebert, and Damsons are a good crop. Small fruits were all good, with, strange to say, the exception of Gooseberries, which were rather a light crop. Raspberries were very good, where the canes were not injured by the winter's frost. *Geo. Griffin, Slebeck Park, Haverfordwest.*

IRELAND.

CO. DUBLIN.—Apples and Pears are a light crop, but of good quality. Peaches and Nectarines are a good crop. Apricots better than they have been for some years. Cherries very good. Small-fruit of all sorts heavy and good, except Black Currants, which were a small crop, and poor in quality. *G. Smith, Vice-Regal Gardens, Dublin.*

GALWAY.—Notwithstanding the exceedingly dry months of April, May, and June, we never had a more plenteous crop of all kinds of fruit, the quality has also been all that could be desired, and with a moderately fine autumn, Apples and Pears are sure to finish off well. *John Cobban, Garbally, Ballinasloe.*

KERRY.—Apples promise an abundant crop. Pears are rather thin; there was plenty of bloom, but a cold east wind blew most of the time they were in flower. Plums are good. Gooseberry, Currant, and Raspberry crops were excellent, and we have had an abun-

dant crop of Strawberries. *Geo. M. Breeze, Kenmare Gardens, Killarney.*

KILDARE.—The fruit crops, excepting small fruits, are much below average. The blossom was abundant, and appeared strong, and apparently the light crop is the effect of imperfectly-ripened wood. I am inclined to think that the Apple trees have not recovered from the effects of the heavy crops they carried two years ago. The fruit of Apples and Pears are small, and require more heat. *J. Wyke, Bishop's Court, Straffan.*

With the exception of Apricots, all fruits are plentiful and of extra good quality, and, owing to our strong-holding soil, we had no necessity to water, which, as a rule, does more harm than good. Pears are a very heavy crop. Raspberries are the finest crop I have ever seen. Strawberries also were extra good, and lasted over a long period in spite of the dry season. Fruit trees of all kinds are very healthy and clean. *Frederick Bedford, Straffan House.*

KING'S COUNTY.—The fruit crops collectively are good in this district. Owing to the severe winter the trees were a month later than usual in expanding their blossoms, consequently they escaped the spring frosts which so often destroy our fruit crops, and a good set was the result. Pears are the only exception here, they being but a very indifferent crop, and small and late. *T. L. Hart, Birr Castle Gardens, Parsonstown.*

LONGFORD.—The fruit crop has been on the whole very good; not for many years have I seen the Strawberries so good in quantity, size, and flavour. Small fruits also very fine. *J. Rafferty, Castle Forbes, Longford.*

CO. WATERFORD.—Apples are very good this year, both early and late varieties. Annie Elizabeth is loaded with fruit; this variety never fails here. Hollandbury also bears well, and is a noble-looking fruit. Strawberries never did so well with me as this year. *Thos. Singleton, Curraghmore, Portean, Ireland.*

WICKLOW.—I have visited a good many of the leading gardens in this county, and in almost every place I saw a capital crop of bush-fruit, Apples, Pears, and Strawberries; but Apricots are very scarce. *Levi Childs, Kilruddery Gardens, Bray.*

CHANNEL ISLANDS.

JERSEY.—Plums, which promised well, have been affected by the drought, and are a light crop. The yield of Strawberries was poor on light soils, but abundant on the heavy land. Many Fig trees were destroyed by last winter's frost, but those that survived have generally an abundant crop. *Correspondent.*

GUERNSEY.—Apples have no doubt benefited by the abnormally light crops the trees carried last year. Pears also are good. Stone fruits, however, are far from a success, probably from want of real maturity in last season's wood-growth. Strawberries were a great success, and stood better than could have been expected with such dry weather. The younger beds, however, did much the best, and scarcely felt the drought. Raspberry-canes were much damaged by the severe and extraordinary long frost we had last February. *Chas. Smithson, Caledonia Nursery, Guernsey.*

ISLE OF MAN.—With a few exceptions, the Apple and Pear crops in this district are very poor. Gooseberries, Raspberries, and Currants were very plentiful, and of fine quality. Strawberries very good, but soon over, owing to the long spell of dry weather. *James Murphy, Cronkbourne Gardens, Isle of Man.*

THE CAROB BEAN (CERATONIA SILIQUA).

This is exported in very large quantities from Naples, being sent in bulk to Russia and Germany, but the pods are packed in barrels for the American market. They are used a good deal in Italy, and are said to be an excellent horse-food. The trees are described as being of two kinds, called respectively the "Honey Carob" and the "Red Carob," the former being the scarcer of the two.

[EUPATORIUM SERRULATUM.*

We are indebted to Mr. W. E. Gumbleton for the specimen from which our illustration (fig. 50) was taken. The plant is a native of Uruguay and Rio Grande do Sal, Brazil. It was described long ago by De Candolle, and afterwards by Baker in the *Flora Brasiliensis*. It was introduced into cultivation by M. Ed. André from Uruguay. It is a shrubby plant, 5 to 6 feet high, and the flowers are a rosy-lilac. Our illustration and

ORCHID NOTES AND GLEANINGS.

NATURAL HYBRID MILTONIAS.

FLOWERS of two very singular, distinct, and pretty Miltonias come from Mr. John Cowan, Managing Director of the Vineyard and Nurseries, Garston, Liverpool, accompanied by the following note: "Herewith are two flowers labelled A. and B. of plants received from our collector in Brazil as natural hybrids of *Miltonia candida grandiflora* and

folding over the column; white with a purple disc, and with traces of the fine slight ridges seen in *M. candida* at the base of the lip, but with the bi-lamellate crest of *M. cuneata* still more pronounced. The column is hooded and tinged with lilac. The flowers are much firmer in texture than those of *M. candida*, and traces of the two reputed parents are evident.

Variety B. is essentially the same in the main points, but the sepals and petals have the chestnut-brown barred with the yellow markings of *M. candida*, and more distinct traces of that species appear in the

FIG. 50.—EUPATORIUM SERRULATUM, DC : FLOWERS ROSY-LILAC. FROM THE GARDEN OF W. E. GUMBLETON, ESQ.

the description and figure in the works cited below preclude the necessity of giving fuller details now. In this country it must probably be grown as a greenhouse plant, but we are informed by Mr. Gumbleton that after keeping it under glass throughout the winter he placed the plant in the open ground, where it has formed a good-sized bush, too large to be conveniently moved. It will be interesting to ascertain if it will survive the winter under such conditions.

* *Eupatorium serrulatum*, D. C. Prod., v. 147; Baker in Martius *Flora Brasiliensis, Compositae*, p. 318. Ed. André in *Revue Horticole*, July 1, 1894, c. ic. color.

M. cuneata. The plants in appearance certainly bear out the suggestion. We shall be glad of your opinion of the flowers."

The flowers seem to point conclusively to the correctness of the collector's suggestion. The variety marked A. has the sepals and petals as in *M. cuneata*, but slightly broader, and exhibiting in a marked degree the peculiarity of that species, in the flatly displayed sepals and petals being abruptly turned backward and upward at the tips. Colour wholly light chestnut-brown with a slight purple shade, and with yellow tips and narrow yellow margin. Lip irregularly ovate, flat, with up-turned sides, but not

irregular margin of the lip, which is rather more turned over the column at the base than is the variety A. Both are very pretty and highly interesting varieties. J. O'B.

CYPRIPEDIUM KIMBALLIANUM.

The September number of the *Orchid Review* (p. 271) contains the following further note respecting *Cypridium Kimballianum*, written in reply to Mr. O'Brien's remarks at p. 154 of our issue of August 10, which seems to clear the matter up:

"At p. 238 of our last issue some remarks were made respecting *Cypridium Kimballianum*, and

the circumstances under which *C. præstans* has received four additional names were pointed out. We have since discovered that there are two *Cyrtopodiums* bearing the name of *C. Kimballianum*, and that both are included in the above-mentioned note. We therefore hasten to say that the reference to the *Gardeners' Chronicle* figure—the supposed hybrid between *C. Rothchildianum* and *C. Dayanum*, which may be termed *C. Kimballianum* No. 2—must be excluded from our note, which will then only apply to the original *C. Kimballianum*, otherwise *C. præstans*. Of this second *C. Kimballianum* we have now seen a leaf and flower, through the kindness of the editor of the *Gardeners' Chronicle*, and it certainly does appear to combine the characters of *C. Rothchildianum* and *C. Dayanum*, and as both are Bornean, it may be a natural hybrid between them. Mr. J. O'Brien comments on our note to the effect that the writer has 'only (the italics are ours) succeeded in introducing further confusion'—in short, has 'discovered a mare's nest' (*Gard. Chron.* for August 10, p. 154). It is true we did not discover that there were two *C. Kimballianums*, but we certainly cleared up the complex history of the original one. And what of the other? A figure was given, with the solitary statement that it was supposed to be a natural hybrid between *C. Rothchildianum* and *C. Dayanum*. There is no description, and nothing to warn one that it is not the plant hitherto known as *C. Kimballianum*. As a matter of fact, it is not permissible to call a second plant *C. Kimballianum* before the first is disposed of. However, we have now disposed of the first and cleared the way for the second, but it must be written with the sign of hybridity added, thus: *C. × Kimballianum*. We regret the error, but our readers will now be able to see how we 'jumped to conclusions,' and apportion the blame. It now remains to add a brief description of *C. × Kimballianum*: the dorsal sepal is $2\frac{3}{4}$ inches long by $1\frac{1}{2}$ broad, whitish-yellow, with seventeen to nineteen purple-brown lines. Petals nearly flat, 4 inches long by eight lines broad at base, narrowed to an acute apex above; strongly ciliate; whitish-yellow, lined with purple-brown towards apex, but the nerves only spotted near the base. Lip $2\frac{1}{2}$ inches long, purplish. Staminate obcordate, with a tooth in the sinus, purple-brown, pubescent all over. Leaves strongly tessellated. In most respects the plant approaches *C. Rothchildianum*, but the marbling of the leaf, the hairs of the petals, some of which are $2\frac{1}{2}$ lines long, and the shape of the staminate, all show the influence of the other species. The hairs of the staminate must have come from *C. Rothchildianum*, but those of the petals can only have come from *C. Dayanum*. If it is a wild plant, it is a most interesting one, for there can be little doubt as to its parentage."

THE ROSARY.

THE MULCHED ROSE-GARDEN.

It was a real pleasure to read a word of protest from so capable a rosarian as "Wild Rose" in the *Gardeners' Chronicle* for August 24, against the prevalent but nasty practice of applying malodorous manures to roses. Many who are not exhibitors do it, and thus render the Rose-garden, if not the whole of their garden, untenable during the months of May and June—the most lovely season of the year in any garden.

Nearly all of this objectionable feature of champion Rose culture can be easily got rid of by well manuring the land with pig, cow, or horse-dung in a rotten condition, and in no other way should manure ever be applied, unless the soil be of a close retentive nature, when half-decayed manure may be applied. This should be dug in after the spring-pruning is finished, and not just round about the plants, but all over the beds, so that the roots are compelled (as they do readily) to search for it away from the immediate vicinity of the root-stock. The extra degree of moisture which is always present in the soil where rich moist manure lays, is what lures the roots from home, and this search for moisture is most active during a period of hot dry weather. If the plants require further nutriment during the months of June or July, when perhaps from excessive waterings the dug-in manure may have lost some of its active principles, the ground should be drawn together

in ridges or heaps, and some more manure spread over the roots, but not in contact with them, the soil being immediately returned over it, and made level and neat-looking with a rake. The manure may be ever so offensive when thus applied, it is soon deodorized when brought into contact with the soil, and especially if the latter be dry. Moreover, there is no straw and litter to offend the eye, or blow about the garden. The usual advice given, to lay on a mulch, and sprinkle some earth over it, ostensibly to keep it in place, will not do; observant eyes see through the trick, if the odour does not reveal its presence. The same when applying strong liquid manure; it is better to draw drills with the hoe, pour the liquid into these, and close them in again. This is a method which the Chinese gardeners adopt, not from any ideas of the cleanliness of the practice, which is far from them, but because they have found out the utility of shutting up the fertiliser in the earth, instead of letting it lose its virtue, as it would do, by exposure. Voidings of animals of nearly all kinds and horse-slops can be so buried in little drills, and rendered innocuous, as well as useful, as plant-foods. The method is applicable to any kind of gardening *in petto*: as, for instance, to Dahlias, Hollyhocks, Carnations, Pansies, herbaceous perennials, vegetables of all kinds, fruit-trees, Tomatos, and Strawberry-plants. In regard to salads and Strawberries, it is a method of application that seems eminently desirable, as, by careful use, the manure, whether liquid or solid, need not touch any part of the plants.

Whatever be done in the way of manuring Rose-beds, it will not do for the cultivator to neglect the stirring of the soil with the Dutch-hoe. The hoe should always be run through the beds after rain, which cake the surface, and in a general way, once in a fortnight or three weeks.

FUNGUS ON FLIES, AND PLANT-LICE.

A SPECIAL interest attaches to those species of fungi which attack living insects, on account of the experiments which have been made in inoculating some of the most pernicious of garden pests, and producing artificially a destructive epidemic. When these experiments have been sufficiently repeated and confirmed, the result will be that the destinies of the plant-lice will be in the hands of the horticulturist, and this would in itself be sufficient to invest all the details of this phase of parasitic life with abiding interest. The small group of fungi to which these particular species belong has been called the *Eutomophthoraceæ*, and they have an affinity with the fish-moulds, or *Saprolegniæ*, by reason of a form of conjugation and the production of zygospores. In former times, and for a long while, the only representative known in this country was the mould which attacked house-flies in the autumn, and fixed them in death to the window-pane. On the Continent a few other species soon came to be known, but at the present time not fewer than forty or fifty species have been described, of which one has this summer been detected at work upon myriads of flies, in the Midland counties.

The character of these fly-moulds has been very fairly made out by a series of carefully-conducted examinations, which are embodied in a *Monograph*, published by Professor Thaxter, in the United States. At first they attack and absorb the whole internal economy of the insects, and then the conidia appear like a mouldy or powdery mass on the surface of the insects, varying a little in mode according to the different species.

The *Eutomophthoraceæ* are distinguished by the production of internal hyphæ of considerable diameter, and with fatty contents, which at length emerge from the host and produce whitish masses, bearing at their extremities large conidial spores, which are violently discharged into the air, and propagate the disease. In addition to this method of asexual reproduction, there is another which terminates in the development of thick-walled resting

spores, which may be either sexually produced or zygospores, or asexual and azygospores. These finally germinate and produce conidia, which infect new hosts. Infection takes place from contact of one of the conidia, which adheres to the surface of a healthy insect, and germinates there, whilst the germinating thread enters the body. Conidia absorbed with the food do not appear to produce infection. After the germinating thread enters the body of the insect, it grows rapidly, and produces "hyphal bodies" of variable size and shape, which are constantly reproduced by germination, until the body of the host insect is more or less completely filled with them, and the natural contents of the body absorbed. Each of these hyphal bodies is capable of developing one or more threads, which are simple or branched, and proceed directly into the outer air, where they become conidia-bearers, producing conidia at their extremities. These conidia are formed by constriction, and are at first contained within a mother cell, which, when mature, is ruptured, and the conidium is ejected to a considerable distance. The conidia themselves vary in form and size in the different species, but are mostly hyaline, and their contents contain fatty globules. The discharged spore adheres to any object with which it comes into contact, and if it chances to find a suitable host, proceeds to germinate at once; but if it fails to find a suitable host, it then forms a secondary conidium, and makes another effort at dispersion. If the second conidium fails, a third may be formed from the second in a similar manner to that in which the second was produced from the first.

The "hyphal bodies" already referred to as producing conidia-bearers, may also be concerned in the production of resting-spores, either with or without conjugation in the body of the host. Asexual resting-spores are either formed by the conversion of a hyphal body directly, or by budding from the hyphal body. They are usually spherical, with thick cell walls of three layers. Sexual resting spores or zygospores,* are produced as a result of the conjugation of opposite threads, by a method which reminds one of the conjugation of the filamentary freshwater algæ! The mature resting spores are spherical, mostly smooth, and scarcely coloured.

The original and most ancient species of this family is *Empusa muscæ* on house-flies, to which was subsequently added, as an inhabitant of this country, *Empusa culicis* on gnats, &c.; and this was followed lately by the identification of *Eutomophthora aphidis* on various species of plant lice. Last of all has now to be added *Empusa conglomerata* on a dipterous fly (*Melanostoma scalaris*), which have been found attached to the flower-spikes of a grass in myriads near Birmingham. The species which is of most interest to our readers is that which attacks aphides, and it is in that connection that these observations are made. Dr. Thaxter says that his first acquaintance with *Eutomophthora aphidis* was in a greenhouse during 1886. In this situation it acted as a decided check to the multiplication of the aphides, yet did not spread with sufficient rapidity to render "smoking" unnecessary. He further states that "in one case he observed a large Hop-vine, some 20 feet high, completely covered with aphides, which were killed off by this fungus in about two weeks, the affected hosts being fastened to the under sides of the leaves, and to the younger shoots in vast numbers. The destruction of colonies of aphids by this species or by *Empusa Fressenii* seems to be the rule rather than the exception, and is at least of very common occurrence."

It becomes a practical question whether the encouragement, and even the artificial spread of this fungus amongst colonies of aphides may not be a powerful agent in the future for the destruction of plant-lice. The difficulty at the present time is the rare appearance of the parasite in this country, and consequently the rare possibility of obtaining the diseased insects, in order to place them in the

* See also *Vegetable Wasps and Plant Worms*, by M. C. Cooke, for further details. 8vo. London, 1892, pp. 10 to 12.

healthy colonies; but there is the consolation that every extension and distribution of the fungus will help to spread the epidemic, and carry destruction into the haunts of the plant-lice, as a retribution for their past history. *M. C. C.*

DROSERAS AND THEIR CULTIVATION.

THAT these plants do not receive a more popular share of the attention of horticulturists is much to be regretted; and to account for this neglect is difficult, the plants being of easy culture, and taking up but little space. Not only is the genus of interest on account of the insectivorous nature of the foliage, but when well grown the plants are pretty and attractive. The members of the genus in cultivation are few, and greenhouse treatment suits them, if frost be excluded. They are mostly natives of the Cape of Good Hope, Australia, and New Zealand; while those species found in Britain are easily procured. The plants should occupy a stage where they may be fully exposed to the sun, and where the air circulates freely around them. But although they succeed in an exposed situation, they must be kept damp about the roots, and perhaps the best material upon which to stand them is a shallow bed of sphagnum moss, this retaining moisture for a long time. Water should be copiously afforded, never allowing the compost round about their roots to become dry, and then the secretions from the glands which give the plants their characteristic beauty will be copious. If large masses are desired, it will be found advisable not to disturb them every year, but simply to top-dress them with peat and sphagnum-moss, which, with the addition of sand and broken charcoal, forms the potting material. If single crowns are taken and potted singly, and if of the larger growing species, shifted into larger pots during the summer, larger leaves will result, but when seen growing together in clumps they look at their best; and in the case of *D. binata* and *D. dichotoma*, this is particularly the case. Propagation of the two above mentioned species and *D. capensis* may be effected by division of roots. If the roots of these are cut into lengths of about an inch, placed upon sand, and covered slightly with sphagnum-moss, young plants are soon produced. In raising from seed, finely-chopped peat and sphagnum, with a good addition of sand, should be used. The seeds should not be covered or allowed ever to become dry, and when large enough to handle the seedlings should be pricked-out in pans. As growth towards the autumn ceases, they require a little less water, but sufficient must always be afforded to keep the compost moist, and the roots and buds plump, or shrivelling will take place, and a weakened growth will result the following year.

The following are amongst those most generally cultivated:—*Drosera binata*, a native of Australia and New Zealand, leaves seldom more than 1 foot in height, which are once dichotomously branched, the numerous tentacles being of a dark red colour, the glands secreting very copiously; this is one of the best in cultivation, and when seen in the sun it is a very attractive plant, and usually captures a fair number of insects. *D. dichotoma* is said to be synonymous with the above, but is always a distinct-looking plant with its stronger twice-forked leaves, and lighter-coloured tentacles. It is the largest species in cultivation and makes a good painful, or single specimen; pinching off the flowers imparts great vigour to the foliage. *D. capensis*, as its name implies, is a Cape plant, with a short erect stem, and leaves about 3 inches in length, and a quarter of an inch in width; the tentacles are light red, and longest at the margins. *D. filiformis*, a North-American species, has long leaves, and flowers of a purple colour; the leaves spring from a small bulb-like bud. *D. spatulata* has a rosette of leaves with light-red tentacles and purple flowers, and is a native of Australia and New Zealand. *D. Burkeana* and *D. ramentacea* are South-African species, and are like miniature forms

of *D. spatulata*, but of a much deeper red colour. *D. auriculata* possesses a slender stem with small leaves, carrying long, lightish-coloured tentacles. Others which should be included are *D. peltata*, *D. anglica*, *D. intermedia*, and *D. rotundifolia*, the three latter natives of Britain. *Drosophyllum lusitanicum*, although included generally with these plants, will be found to thrive in a compost of fibry loam and broken crocks. Until thoroughly established, they will need more care in watering. As soon as possible after germination, the small seedlings should be placed in thumb-pots, as if allowed to stand in the seed-pots, less success will be made in their transference. *Roridula*, which are the giants of the genus, were growing here some few years since, when plants attained the height of between 5 and 6 feet. Lately seeds of *R. Gorgonias*, received through the Royal Gardens, Kew, have germinated, and although only about 1 inch high, already show the glands upon their leaves. This, so far as is at present known, under cultivation enjoys a rather higher temperature than many of the *Droseras*, but with a better knowledge of the genus and its requirements, it may perhaps be found to grow as an associate of these plants. The well-known North American Venus Fly-trap, *Dionæa Muscipula*, is very abundant, and succeeds well under the same conditions as afforded the other genera of this order, and is now forming its remarkable leaves. *R. L. H., Edinburgh Botanical Garden.*

THE TUBEROUS BEGONIA.

THE following extracts are taken from a paper read at the Shanklin Literary Institution on August 3 by Mr. W. W. Sheath. After giving a brief history of the origin of the tuberous Begonia and its gradual evolution, Mr. Sheath detailed his methods of cross-breeding and seed-saving, and then went on to consider the method of

PROPAGATION.

The Begonia may be propagated by cuttings as well as from seeds, and this process is usually followed in the case of named varieties (single or double). The cuttings can be taken when the plants start in spring, as in the case of *Dahlia* cuttings, about 3 inches in length, or when the plants throw side-shoots later in the season, but where possible, they should be taken with a heel. Insert the cuttings round the sides of small pots in light sandy soil. I have found a half-spent hotbed a good place in which to strike them, where the bottom-heat would be in excess of the top-heat, and not too moist, as they frequently damp in too moist an atmosphere, or on shaded shelves in warm houses. They soon form roots in a suitable position, and also a bulb at the base of the cutting. If cuttings were taken in spring, they would make flowering plants at the end of the summer, but later-struck cuttings would not need repotting, but should be left in the pots they were struck in until the following spring. In any case, plants from cuttings are not so vigorous as healthy seedlings.

Sow the seed from the middle of January to the middle of March, to obtain flowering plants the same year, or they may be sown in the summer and allowed to remain in the seed-pans or boxes until started the ensuing spring. The following method is that to be recommended:—

The soil in which to sow the seed should consist of two parts loam to one each of leaf-mould and sand, and heat it sufficiently to destroy roots and seeds, or insects the soil may contain.

Drain the pans thoroughly, and fill to within an inch of the top with the compost, and make perfectly smooth and level, then give a good watering, and allow the soil to drain well before sowing the seed. Sprinkle the seeds evenly and thinly over the surface, and then crumble enough dry sand to keep the seeds from blowing away, but do not cover them entirely. Place sheets of glass over the pans, and also cover with paper for nine or ten days, so that the seeds be in semi-darkness; put in gentle hot-bed, or in a temperature of 60° to 70°, turning the glass daily to prevent the evaporated moisture from dropping

on the seed. Examine the seed-pans, and if they show any signs of dryness, immerse the pans in water until the moisture is seen gently to percolate the surface, not allowing it to float over the top, or the seed would be displaced.

In about three weeks the seed should have germinated and be showing above the soil, but be careful not to allow the sun to shine fully on it at this stage, or a few minutes would suffice to ruin them. As soon as the young seedlings show the first leaf, they must be pricked off. Prepare pans or boxes similar to the seed-pans, making the surface smooth and moist, and with a notched stick or label make a small hole in the soil, and lift the seedlings carefully and drop in holes about an inch apart, gently pressing the soil to them. It is quite necessary to do this, as sometimes they damp off rapidly, especially if the surface of the soil is at all green. It is a tedious affair, but will repay all the trouble bestowed on them in such a small estate, and can be done in evenings with advantage. Water gently with a fine rose to settle them, and place in a warm, moist temperature, and shade from the sun, as near the glass as possible. As soon as they touch each other they should be again pricked out or potted in small pots, and kept warm until they make a fair growth, when they will bear more air and light, and gradually harden off to the greenhouse or frame. If required for pots, shift on into larger ones as required; but if for planting out, keep in the boxes and plant out the first week in June.

POT CULTURE.

The soil for pot culture should consist of the following ingredients (for the first potting): 2 parts friable loam, 1 each of leaf-mould, sand, and well-rotted manure; for the larger pots, use 3 parts loam in a rougher state, 2 parts leaf-mould, 1 part of thoroughly decayed cow-manure, if obtainable, or other well-rotted manure, powdered charcoal, and enough sand to keep the whole porous.

If required to flower in May, they should be started in January, in a temperature of 60°; but for ordinary summer display, March would be soon enough. Drain the pots in the ordinary way, using sizes according to the size of the bulbs, allowing an inch or more outside the bulb to the sides of the pot, pressing the soil gently for the first potting, keeping the crown of the bulb level with the soil, not much water being required before they start into growth. The top of the bulbs is sometimes hollow; where this is the case, water must not be allowed to lodge there, or they will soon decay.

As soon as the roots begin to run round the sides of the ball of soil, they will require a shift into a pot one or two sizes larger, bury them an inch deeper than in the previous potting, and press the soil more firmly.

Unless plants of large size are required, this potting would be sufficient, and plants can be kept growing late in the season, when the pots are full of roots, by the application of liquid manure in a weak state, such as soot and cow manure, immersed in bags in a tub of water, and used in a clear state.

Avoid artificial or strong manures either mixed in the soil, or as a top-dressing, as, unless used by experienced hands, they will soon do harm to the plants.

A good light airy greenhouse, shaded from strong sunlight, will suit the plants when in bloom, or they will accommodate themselves to almost any light airy position, whether in the conservatory, cold frames, or the cottage windows, and may be termed air-loving, light-loving, and moisture-loving plants.

After the flowering season is over, ripen the bulbs by withholding water gradually, and after the tops are died down, they may be laid on their sides, under greenhouse stages, in the pots they have been grown in, covering over with slates or something to keep the drip from the pots, or in a dry frost-proof cellar or room.

BEDDING.

The Begonia has a great future before it as a bedding plant, as it can be used in so many ways with such good effect. Only a small space is required to

store a great quantity through the winter season, and thus heated glass structures are not required to preserve them as they are for most bedding plants.

Seedlings are best for bedding, making robust and free-growing plants, and these can be raised easily and in great numbers. Prick out into boxes and transplant in frames, or in sheltered places outdoors.

I generally plant out in frames, and after the plants are well into growth, throw off the lights entirely, when they will flower freely in the autumn.

If certain colours are required, now is the time to select them, and if any choice varieties present themselves, they can be marked for pot culture the following season, or taken up and carefully potted whilst in flower.

In autumn, previous to the occurrence of cold nights or heavy rains, the lights can be put on to hasten the ripening of the bulbs, and should be taken up when turning yellow at the top, or before frosts appear.

I like to dry the bulbs thoroughly after taking them up, and then to store them thickly in cutting-boxes, crowns uppermost, with some fine dry soil under and over the bulbs. Keep in a dry place, which does not fall below 40° in winter. A great quantity can be stored in this way, as the boxes, if of the same size, can be piled one on the other.

In March, look over the tubers, and discard any that may be decayed, and lay the rest in boxes on several inches of fine soil, such as two parts fine loam, one part each of leaf mould and sand, giving the bulbs room enough to transplant, with a ball of earth at bedding-time, and just covering the bulbs with soil.

I find here in the south on the undercliff those for bedding do not require to be started in heat; and if put into pits or houses where heat can be turned on in cold and frosty weather, they will be quite forward enough by the end of May. Care is required in the watering of these, as in the case of potted plants, to avoid water settling in the crowns.

In preparing the beds, fork in light and gritty soil, such as leaf-mould, road-grit (if the staple is heavy), and well-decayed manure (cow-manure if the soil is of a sandy nature). In the last week of May, if the weather is fine, they can be safely bedded out from the boxes, which are preferable to potted plants, as they lift from the boxes, with a mat of fibrous roots, and if carefully handled receive no check. Never let them suffer for want of water. When in full growth they revel in a good drenching, as last year, 1894, being a wet season, Begonias stood out in their glory, whilst the zonal Pelargoniums made but a poor show. They continue to flower until the autumn winds and frost put an end to further growth, when they must be taken up and dried off, as directed with the frame seedlings.

I may here mention that Begonias make a good effect when used other ways than in the mass, such as an oblong, oval, or round bed, dotted with Cannas, or as a groundwork to subtropical beds, when these are planted thinly and edged with bicolor and tricolor Pelargoniums, edged with Lobelia or Pyrethrum, or both; also in larger beds, where pyramid Fuchsias are planted some distance apart, leaving room for Begonias all round, edging with Golden Feather, and Lobelia as an outside finish.

INSECTS.

The Begonias are not much subject to insect pests, but greenfly is sometimes troublesome if grown in too much heat, or in too close an atmosphere. Pot-plants are sometimes infested with a kind of rust on the stems and leaves, which some growers say is a fungus, but I have found it more prevalent when in too much heat in spring, also by sudden changes of temperature, or draughts, by imperfect drainage—in fact, by anything that would cause a check in their growth, this rust causing the blooms and foliage to curl, and to be very brittle, snapping off at the least touch. When such is the case, stand them out in the open air, and if not too far gone they will partly recover themselves.

A small maggot or grub sometimes does much mischief by eating the bulbs underneath, and if not

detected or destroyed will soon ruin them. It is the same grub often found eating double Primulas, Cyclamen, and Echeveria retusa. It is the larva of the Otiorhynchus sulcatus, a brownish, hard weevil, about half an inch in length, and when disturbed, closes itself somewhat, and appears inactive. It can be caught at night when feeding. It will also eat the shoots and bunches of the Vine, &c.; and if in any quantity they do a great deal of mischief. The grub also gets into the Vine and Peach borders, and eats the roots.

FRUIT REGISTER.

THE SPITZENBERG APPLE.

The Spitzenberg Apple always brings a better price per barrel than others, and the question was recently asked of the conductors why it was that, as this Apple brought a higher price, more of them were not grown, and by thus well stocking the market with them, bring the price down. This is a question which could be answered only by those who grow this Apple. Some say that the reason why it is grown at all is that it comes into market at a time when other varieties are scarce; while others contend that the peculiar flavour, so grateful to most tastes, is what gives it more appreciation. It does seem that only orchardists can answer this question. *Meehans' Monthly for August.*

BEURRÉ CLAIRGEAU PEAR.

Among the higher classes of fruits, as well as among Strawberries and other small fruits, there are changes in popularity from one variety to another, often without any apparent reason; while there are some that continue in popular favour for a long time. Among Pears, one of the comparatively old varieties, known as Beurré Clairgeau, is still in as much demand to-day as it ever was, and is one of the standard winter Pears. Its large size has recommended it, as well as good colour and comparatively high flavour. *Meehans' Monthly for August.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorset.*

LÆLIA PUMILA.—The dwarf-growing *Lælia pumila* and its varieties *Dayana* and *præstans* are very charming little plants when in flower. All of them are best cultivated in small shallow pans, and suspended close to the roof-glass. A small quantity only of peat and sphagnum-moss is requisite for them to root in, and this should always be kept fairly moist, but now that the plants have commenced to grow, and until this is completed, increased supplies should be afforded. Through the summer the plants have been in the cool-house, but it is now advisable to remove them to a light position in the intermediate-house. The white scale is very hurtful to them, and whenever it appears the pest must be immediately eradicated.

MASDEVALLIAS.—The majority of *Masdevallias* are amongst the most easily cultivated of Orchids, and if well grown they form a very prominent feature in the cool-house. Such showy and brilliant-coloured varieties as *M. ignea*, *M. Veitchiana*, *M. amabilis*, *M. Mundyana*, *M. coccinea*, and others, have a splendid effect when arranged with the lighter shades of colour in *Odontoglossums* of the crispum type. The dwarf species, as *M. Estradæ*, *M. Wageriana*, *M. Wendlandiana*, *M. Armini*, *M. racemosa*, *M. caudata*, *Shuttleworthii*, *M. hieroglyphica*, *M. ionocharis*, and the handsome hybrids, *M. Courtaldiana*, &c., form lovely objects when covered with their small but pretty flowers. These dwarf-growing plants should be grown with their leaves close to the roof-glass, and must never be allowed to become very dry at the root. Instead of suspending them we find that they succeed better when placed upon a raised staging in a light position, where the atmosphere can more easily be kept moist. Contrasting greatly in growth with these dwarf varieties, is *M. macrura*, which has large thick fleshy leaves, and is a veritable giant of the genus. This beautiful species should at all seasons be kept at the warmest part of the house, but if the temperature fall much

below 50° during winter this plant, and *M. tovarensis*, *M. ephippium*, *M. Trochilus*, *M. gargantua*, *M. Schlimii*, and *M. elephanticeps*, should be placed at the coolest end of the intermediate division. Seldom do we see a collection of *Masdevallias* free from black marks and spotted leaves. The principal cause of this is that the plants have had too much moisture at the roots or in the atmosphere during autumn and winter. Even in the summer they should not be kept in a saturated condition, but be allowed to become nearly dry each time before they are again watered. This practice should be specially observed during the next six months. Another cause of "spot" is a low and uneven temperature during the same period, perhaps at a time when the atmosphere of the house is at saturation point. The nearer the night temperature during winter is kept to 50° the better, but during exceptionally cold weather, when much fire-heat becomes necessary, it may be allowed to drop to 45°. Should the external air be above 45°, the ventilators ought always to be freely used, and at other times also a little air should be admitted.

TIME TO RE-POT.—Repotting is best done at this season, but it may be done in February if preferable. Previous to this operation it is important that water should be withheld from the plants for a few days, that the roots being drier may be less injured. It is not necessary to re-pot large healthy specimens annually, unless there is insufficient pot-room; but if the compost has become decomposed, this may be carefully picked out, and fresh material substituted. Overgrown masses that are bad in the centre must be divided and potted-up afresh, or they may be carefully separated, and put into small pots for propagating purposes. All the strong-growing *Masdevallias* make many roots, and require proportionate space for their development. The pots should be two-thirds filled with drainage, and for placing round the plants use good fibry peat and living sphagnum in equal proportions, intermixing it with a handful of crocks. Keep the base of the plants about level with the rim of the pots, and carefully work the compost between the roots. Pot moderately firm, but not so hard that the water cannot pass rapidly through the whole mass. The critical time with *Masdevallias* is just after repotting, it being an easy matter to over-water them. For a few weeks water very sparingly, and as each plant becomes re-established, gradually increase the supply. The dwarf-tufted varieties already mentioned, and the small but botanically interesting species, as *M. gemmata*, *M. mucosa*, and others, succeed in comparatively small pots or shallow pans; and such species as *M. leontoglossa*, *M. platyglossa*, and *M. swartzii*, which produce their quaint flowers in a downward direction, require baskets. The yellow-flowered *M. Daviitii*, *M. Veitchiana*, and *M. Cheloni* × frequently send up stray blooms during autumn, which, if not required by the hybridist, should be removed, so that the plants will give more flowers in their proper seasons.

THE HARDY FRUIT GARDEN.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

SELECTION OF PLUMS FOR PLANTING.—When making a selection of Plums, intending planters should not fail to include Rivers' Early Favourite. As an early dessert Plum it is a grand acquisition, ripening early in July, and being moreover excellent in flavour. A few other good dessert Plums I will mention in the order in which they ripen:—Early Green Gage, The Czar, Oullin's Golden, Dennison's Superb, Haling's Superb, Green Gage, Bryanston's Gage, Purple Gage, Transparent Gage, Jefferson's, Kirke's, Washington, Coe's Golden Drop, Late Green Gage, Monarch, Reine Claude de Brahy, Blue Imperatrice, Ickworth Imperatrice, Late Rivers, Grand Duke. A selection of good cooking varieties should include the following:—Early Rivers or Early Prolific, Early Orleans, Gisbornes, Victoria, Diamond, Prince of Wales, Pond's Seedling, and Belle de Septembre.

STRAWBERRY PLANTATIONS.—All Strawberry planting should now be completed for the season. If this has not been done, it will be best to put the plants into nursery rows, and put them into permanent quarters early in the spring. Young plantations now becoming established should be well watered till they have a firm hold of the soil, and are growing freely, then keep the surface well stirred with the hoe, which, besides checking weeds, will tend to render the young plants more robust and healthy by the admission of warmth and air to the soil. Do not neglect to cut away runners from these young plants, and the old plantations should be

thoroughly cleaned, and all partially-decayed leaves removed. This will give a neat appearance, and be beneficial to the plants, by exposing the younger leaves and crowns to the hardening influence of sunlight and air.

WATERING FRUIT BORDERS.—If there be a continuance of the dry weather all fruit borders will require a thorough soaking of weak manure-water, or sewage, as soon as the fruit is gathered, more especially under walls and in dry warm localities. This will greatly assist trees that may be partially exhausted by heavy cropping, and do much towards restoring their vigour. In some instances also trees perfecting their crops may be much benefited by good waterings of liquid-manure, this being especially needful in the case of late Peaches and Pears. Grape-vines, too, where the roots may be on dry borders or under warm walls, should be encouraged by waterings during the early part of September, should dry weather prevail.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

THE CONSERVATORY.—Should this structure require painting, the work should be undertaken as soon as is possible, that the smell of the paint may have time to depart before it is necessary to keep the house closed. If, however, repainting is not needed, the house should be overhauled and thoroughly cleaned. Remove and gradually dry off Achimenes and Gloxinias that have flowered. Thin out the shoots of any climbers that have finished flowering, to obtain as much light as possible. Of course, Bignonias, Lapagerias, Bougainvilleas, Lasiandras, &c., must be left until later. Wash all the stages and pots, and see that every plant is perfectly clean before being brought into the house. Azaleas should be laid on their side and thoroughly syringed with tobacco water or some good insecticide in case of any thrip. Large Palms, Oranges, Musas, Camellias, Azaleas, &c. in large pots or tubs that have been standing outside, may then be brought in, the soil loosened, and a top-dressing of Clay's fertiliser given them. A few of the early Chrysanthemums of the Madame Desgranges type, which are showing their buds, should be brought in before the flowers open; also Lilium lancifolium, late Fuchsias, Vallotas, Celosias, &c., to make the house look as bright as possible through the autumn.

MIGNONETTE.—Put late plants of Mignonette into their flowering pots, and pinch out all flowers to encourage the plants to emit side shoots. Keep them constantly tied, and place them in a little lighter position to harden the wood. Syringe two or three times daily. Plants intended for earlier use, and which are now full of roots, should receive plenty of manure-water. A sprinkling of soot and Clay's Fertiliser mixed together, will keep them green and healthy. These should still have the flowers picked off until about a month before they are required.

CHRYSANTHEMUMS must be kept regularly tied, and will now need disbudding, which must be done carefully. All suckers should be removed, and the soil pricked over, and the plants given a top-dressing of good loam, leaf-soil, and sand, with the addition of a quantity of bone-meal and soot. Syringe every few days with clear weak soot-water, which will keep the foliage a good colour and help to prevent injury by earwigs, which are very abundant this year. Plants affected with mildew should be placed by themselves, and be dusted with flowers-of-sulphur.

TREE OR WINTER-FLOWERING CARNATIONS.—Carnations will need to be kept regularly tied, but stopping should now be discontinued. If green-fly has made its appearance, the pest should be checked at once, or the plants will be disfigured and will not flower satisfactorily. Syringe the plants at night, and dust a little tobacco powder in the points of the shoots, syringing this off the following morning. When tying the plants, a sharp look-out should be kept for disease, as this generally appears on the old grass, and can be kept in check by cutting it clean out and burning the affected parts. The Carnation-house should be thoroughly cleaned, and the stages and shingle washed, and it is a good plan to give the house a thorough syringing with paraffin-and-water a week or so before the plants are brought in.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

POTTING FRUIT TREES.—Where such fruits as Peaches, Nectarines, and Figs are grown in pots for

the production of early crops, the repotting of these plants must be done at once. The sooner this is done when growth is completed, and before the foliage falls, the better, as new roots form quickly during the present month, and the trees will be thoroughly established before they are again placed in the forcing-house. It may not be necessary in some cases, when the trees are in a healthy and fruitful condition, to repot the plants, a surface dressing of fresh material being all that is required. In such cases, as much of the old soil should be removed with a sharp-pointed stick as possible without damaging the roots, replacing this with good fresh loam, to which has been added a dusting of crushed bones, some mortar-rubble, and wood-ashes. Ram the compost quite firm with a potting-stick, and make sure the drainage is quite perfect, at the same time dislodge any worms by watering with lime-water. Trees in an unhealthy state should be turned out of their pots, and the roots carefully examined, cutting away any portions that are decayed, and removing all soil that has become sour. After doing this, it may be better to repot the trees into smaller pots for a season, and water carefully until new roots are formed. Good drainage and firm potting are two essential points to be observed. After potting, the plants should be placed on bricks or coal-ashes, watered carefully, and syringed overhead during bright weather. Some protection will be required during wet weather to prevent the soil becoming saturated with water before the roots are active. Apples, Pears, Plums, and Cherries will require similar treatment, but as these are not forced so early as the former, these may be left until later in the month.

VINE AND PEACH BORDERS.—Much of the old soil may be removed from the borders in early houses, and the borders extended or top-dressed, as the case may require. The compost used should be in a fairly moist condition, and consist of the same material as recommended for trees in pots, but in a rougher state. Avoid farm-yard manure, which is more valuable as a top-dressing during the growing season than as an ingredient in the compost. The border should be beaten with the back of a fork to make it quite firm. Continue to keep the foliage healthy by syringing frequently.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

CELERY.—The Celery crop has advanced rapidly of late, and that portion intended for use until Christmas, is quite ready for a preliminary earthing-up. When it has been well cleaned and tied, apply to the soil, along each side, a sprinkling of salt to kill slugs and other pests. Sandringham Dwarf White, and white varieties generally, are preferable for early work, but red ones appear to me the better able to withstand the winter. Provided strong sturdy plants are at hand, a late batch may still be put out, and will be likely to be of use in the spring.

GHERKINS FOR PICKLING should be gathered in dry weather as they become fit. Do not allow them to get too big, but try to obtain a large quantity ready to cut at the same time. When the plants are exhausted, have the heaps of manure well mixed by turning, that it may be ready for garden purposes.

CHILLIES AND CAPSICUMS required for pickling purposes, if planted out in cool frames, may have the lights placed over them to assist the ripening process. If they are outside in a favourable border, they may be carefully lifted and potted, and put in heat under glass. Plants growing through the summer in pots will produce an abundance of fruit, without any trouble in regard to ripening.

SPINACH.—Another sowing may be made of the improved round-leaf variety for winter use. Allow plenty of room between the rows, and do not sow too thickly. Spinach is frequently ruined during its early stage, owing to the crop being insufficiently thinned. Use plenty of soot as a dressing for this crop.

FRENCH BEANS.—Make another sowing of these in heated pits or frames. Beans like a slight bottom-heat from leaves and litter, but the material must be well prepared first, so that the heat will last until the crops are finished. If the pits have not already been washed with hot lime, and the woodwork newly painted or well scrubbed with soft-soap and water, this work should be first performed. Let the manure settle well down before adding the soil for the Beans to grow in. The compost may consist of

good loam four parts, leaf-soil one part, burnt refuse and mortar-rubble one part, and spent Mushroom-bed manure one part, with a little soot and bone-meal added. Well mix this together, and put it in the pits to warm before sowing the Beans, which may be put in rows not nearer to each other than 2 feet. Choose varieties having dwarf, compact tops. If Beans are to be grown in pots inside during the winter, preparations for them should now be made. Provide good drainage, and leave space for a top-dressing. Afterwards when thinning the plants, put five in an 8-inch pot, which is a very convenient size for use. Cool frames or pits will be a suitable place for them to be placed in at present. Grow them as hardy as possible, but as the cool nights and damp weather approach, afford a little covering at night, and a little fire-heat also.

TOMATOS on walls or trained to sticks should have all side-shoots removed and some of the leaves shortened back, to expose the fruits to the sun and air as much as possible. Look over the plants frequently and remove all fruits that are colouring, and place them in a light airy house to ripen.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

PLEASURE-GROUNDS AND FLOWER BEDS.—Grass lawns should be given close attention in regard to mowing, sweeping, and rolling frequently. If a heavy lawn-mower is used, there may be no occasion to roll, but otherwise the appearance of a lawn is very much improved by a heavy roller. For large lawns there is none better than a good-sized water-roll, the weight of which can be regulated as desired. Take out Plantain and other weeds from the grass, either by digging with a knife, or a boy may take a bottle of sulphuric acid and a thin iron rod, which should be dipped into the acid and then thrust into the centre of the weed. The operation requires care, however, that spots of the acid are not dropped about. The iron should only be wet; it does not want a drop of liquid on the end of it. Flower-beds are now looking well, and every endeavour should be made to maintain this department as attractive as possible by weeding beds and borders, trimming edgings and by the removal of decayed flower-stems and leaves. When cuttings are taken from Pelargonium-beds, it should be carefully done, so that the beds are not left untidy. Small beds of Pelargoniums ought to be cut little or none, and if a quantity of plants are put out in a reserve garden to furnish cuttings, so much the better. Rhododendrons, Azaleas, Kalmias, and other American plants which have suffered from the drought, will be greatly helped by thorough soakings of water. Old flower trusses should be taken off, and everything done to help them to complete their growth. Gravel walks and roads require frequent hand-weeding, for the use of the hoe and rake on gravel should be avoided as much as possible. Notice should be taken, while the leaves are still on the trees, of deciduous trees or shrubs that require thinning. The arrangement of trees and shrubs around a mansion or villa residence requires much taste and forethought; overcrowding should at all times be avoided, and deciduous trees and shrubs are better planted at a little distance, the preference being given to bright-foliaged evergreen shrubs and coniferous plants, which will give warmth and colour during the winter months.

FORMATION OF NEW PLEASURE-GROUNDS.—The formation of new pleasure-grounds, or contemplated additions to old ones, should be arranged for now, staking out the approach roads, paths, and shrubbery sites as soon as possible, that the work may be taken in hand during the autumn. The making of new paths is an expensive operation, and their courses through parks and woodlands should be well considered before commencing on the work. The width of carriage-drives should be sufficient to allow carriages to pass each other and turn without difficulty. Regarding their formation, the bottom should be well drained, and the depth of road material not fewer than 12 inches. The bottom may be made of chalk, free-stone, or ballast, with 6 inches of granite above it, and about 3 inches of fine gravel at the top. The surface must be made so that water will get quickly away. Foot-paths do not require to be made so deep, but the same material should be used, and good drainage given. The cleaning out of ornamental water-courses and ponds must be completed before the fine weather is over.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication. — All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, SEPT. 10 { Royal Horticultural Society, in the Gardens at Chiswick, in connection with the show of vegetables.

WEDNESDAY, SEPT. 11 { Royal Caledonian Horticultural (two days).

SALES.

MONDAY, SEPT. 9 { Tenth Great Annual Unreserved Sale of Pot Plants at the Dyson's Lane Nurseries, Upper Edmonton, by order of Mr. H. B. May, by Protheroe & Morris. Dutch Bulbs at Protheroe & Morris' Rooms.

TUESDAY, SEPT. 10 { Great Annual Unreserved Sale of Winter-blooming Heaths and other plants at the Burnt Ash Road Nurseries, Lee, Kent, by order of Messrs. B. Maller & Sons, by Protheroe & Morris. Dutch Bulbs at Protheroe & Morris' Rooms. Orchids at Protheroe & Morris' Rooms.

WEDNESDAY, SEPT. 11 { Great Annual Unreserved Sale of Winter-flowering and other plants at the Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris. Dutch Bulbs at Protheroe & Morris' Rooms.

THURSDAY, SEPT. 12 { Great Annual Unreserved Sale of Heaths, Store and Greenhouse Plants, at the Brimsdown Nurseries, Enfield Highway, by order of Mr. John Maller, by Protheroe & Morris. Dutch Bulbs at Protheroe & Morris' Rooms.

FRIDAY, SEPT. 13 { Great Annual Unreserved Sale of winter-blooming Heaths, at the Longlands Nurseries, Sidcup, by order of Messrs. Gregory & Evans, by Protheroe & Morris. Dutch Bulbs at Protheroe & Morris' Rooms. Orchids at Protheroe & Morris' Rooms.

SATURDAY, SEPT. 14 { Dutch Bulbs at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—58°.4

Apple trees trained on a roof, and other fruits.

A correspondent, writing from Scotland recently, remarks on some Apple trees which he had seen trained over the roof of a cottage in that country, and on the rarity of such an occurrence in these islands. It is perhaps one proof the more of the manner in which we neglect our opportunities, and let in the outsider, with his well-ripened, high-coloured, nice-looking fruits. There are only two reasons why our country cousins should not utilise the walls of brick, wood, &c., of their barns, stables, and dwellings, in growing, not only the tenderer varieties of Apples and Pears, but Grapes, Figs, Peaches, Apricots, the finer dessert Plums, the Lawton, and other American Blackberries, and those reasons are the lack of secure tenancy in the case of those who rent houses and land, and the want of compensation for improvements. It may be alleged that the average farmer, and cottagers and villagers generally, lack the requisite knowledge; but that will, we hope, soon be altered by the peripatetic lecturers of the various County Councils. And we ought soon to have a body of

young folk in all parts of the country, who having attended these horticultural courses, will be quite competent to afford advice on the management of fruit trees to those who need it, and also perform the necessary operations wherever it may be desired. Indeed, there seem to be openings in this line which would, in a short time, give employment to many a man and woman too, who now hardly knows, in the crowded state of nearly all industries, what to turn his or her hand to, to earn the wherewithal to exist in comfort. We have the jobbing gardener, but he is too often a "puir silly body," with a very small amount of the necessary knowledge. In the matter of fruit trees and bushes he is either a ruthless pruner, pruning without knowledge, or he sniggles here and there, and makes thickets of them. Roughly speaking, all the kinds of fruits we have named, can be readily grown in soil that is well-drained, and fairly fertile by Nature or art, in the country south of a line drawn from King's Lynn to Chester, the Grapes, Figs, and Peaches, having south or east walls; and Pears and Apples, and perhaps, Figs and Apricots north of that line, with protection during the winter for the Figs, and in the spring for the last-named when in blossom.

We have received the following communication from the Council of the Royal Horticultural Society relating to the circumstances connected with the retirement of Mr. BARRON from the management of the gardens at Chiswick:—

Mr. BARRON'S Retirement.

"Royal Horticultural Society,
"117, Victoria Street, S.W., Sept. 2, 1895.

"The Council of the Royal Horticultural Society have read with surprise and regret the remarks which have lately appeared in some of the horticultural newspapers with regard to Mr. BARRON'S retirement. The Council have for some time had before them the desirability of making considerable changes in the gardens at Chiswick, and in the early part of this year they determined to initiate these changes in the near future.

"Fully aware of the value of Mr. BARRON'S services for upwards of thirty years, recognising that he had well earned and thoroughly deserved a retiring pension, and anxious to show him every consideration, the Council felt that at his age they could not fairly place upon him the burden of such a re-organisation as they contemplated; and they considered that they were consulting his best interests as well as those of the Gardens in offering him retirement on an allowance of £180 a-year.

"In replying to the council's communications, Mr. BARRON thanked them for their generous recognition of his claims, accepted their proposal, and tendered his resignation from Jan. 1, 1896. The Council are glad to know and to be able to assure the Fellows of the Society that he is perfectly satisfied.

"Having acted justly and generously towards Mr. BARRON, as they believe and to his satisfaction, the Council deemed the matter settled, and were themselves intending to promote a testimonial to him on his retirement, when they found that steps in that direction had already been taken.

"The Council regret to find that they are charged with discourtesy towards the Chiswick Board. The charge rests on their appointment of a special committee to advise them as to the future of the Gardens without communication with the board. They freely admit that it would have been advisable to have conferred with the board on the appointment of this committee. To any members of the board who may have felt themselves slighted at their omission to do so, they offer a frank expression of regret. They need scarcely say that the omission was due to an oversight, and not to any intentional discourtesy.

"By order of the Council,
"W. WILKS, Secretary."

THE TESTIMONIAL TO MR. BARRON.—We have received the following from Sir TREVOR LAWRENCE, Bart.:—"While I cannot but think it unfortunate that the proposal to present a testimonial to Mr. BARRON on his retirement from the service of the Royal Horticultural Society should be mixed up with an attack on the Council, I should be sorry were this to prevent anyone from subscribing to a well-deserved recognition of the work of an old and valued servant of the Society. I have pleasure in enclosing my own subscription, and trust that all will unite in promoting an object which cannot fail to secure complete and general sympathy.—TREVOR LAWRENCE."

—We have been requested to state that in consequence of several members of the Fruit Committee having expressed a desire to be associated by their contributions with the general testimonial that has been inaugurated, the proposal to present a special one from the Fruit Committee to Mr. BARRON as Secretary will not now be proceeded with, as it could only have merit if shared in unanimously. It is, however, the earnest wish of the promoters, that on his retirement from office the Council should still seek to preserve Mr. BARRON'S unique knowledge to the committee by offering him the position of a life membership of that body, with which he has been so long and so honourably connected.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will be at Chiswick Gardens on Tuesday, Sept. 10. Prizes are offered in forty different classes for vegetables, and a good show is anticipated. In addition to the vegetables, however, the usual collections of hardy plants, Orchids, cut flowers, fruit, &c., will be received at Chiswick, and any new or rare specimens will be examined by the various committees, which meet there at twelve o'clock noon. At half-past one there will be a vegetarian luncheon arranged by A. HILLS, Esq., President of the Vegetarian Federal Union; and at three o'clock a lecture on "Garden Manures," by Mr. W. G. WATSON, will be read. Exhibits may be removed at six o'clock.

SYDNEY BOTANIC GARDEN (see Supplementary Illustration).—We are indebted to the veteran curator of the Sydney Botanic Garden for the accompanying illustration of a group of Palms, with a mass of the blue *Nymphæa stellata* in the lake in the foreground. The Water-Lily had forty-one flowers open at the same time within a space of 4 feet in diameter. *Nymphæa stellata* is a tropical species, but M. LATOUR MARILLAC has enriched our gardens with a whole series of lovely varieties quite hardy in this country.

THE "JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY."—The last number of the *Journal* completes the nineteenth volume, and is a worthy successor to those that have preceded it. It contains most of the papers read at the Drill Hall meetings in the spring, including Mr. BARRON'S revision of recent work in the genus *Primula*, and Dr. MORRIS' excellent account of the plants and gardens of the Canary Islands, a substantial addition to our knowledge. The *Journal* reflects credit on the Society, and secures for the country Fellows a return for their subscription that they would not otherwise obtain.

DEVONSHIRE TECHNICAL INSTRUCTION COMMITTEE.—Mr. CHAS. BRAY, horticultural lecturer to the East Suffolk County Council Technical Instruction Committee, has been appointed instructor of horticulture by the Devonshire County Council, and will enter upon his duties at the end of the month.

NATIONAL CHRYSANTHEMUM SOCIETY.—A meeting of the general committee took place on the 26th ult., Mr. B. WYNNE in the chair. The Secretary, having announced the death of Mr. ARTHUR WORTLEY, who in the early days of the old Stoke Newington Chrysanthemum Society had filled the office of Secretary, the following resolution was unanimously passed:—"That this committee place on record an expression of the sorrow with which it has heard of the recent death of Mr. ARTHUR

PALMS AND LAKE WITH BLUE WATER-LILY, SYDNEY BOTANIC GARDEN.

WORTLEY, formerly Secretary of the Stoke Newington Chrysanthemum Society, to which office he was elected in 1851, and bears in grateful remembrance his services to the Society, and to the Chrysanthemum in that capacity, and also as an old cultivator and exhibitor of the 'golden flower.'" It was further resolved that a copy of this resolution be sent to the relatives of Mr. ARTHUR WORTLEY. Mr. GEO. WALKER, Paddington, and Mr. W. A. HOLMES, son of the late Secretary to the Society, were elected to vacancies on the general committee; and Mr. J. MCHATTIE, The Gardens, Strathfieldsaye, to a vacancy on the Floral Committee. A schedule revision sub-committee was appointed to revise the schedules of prizes for September, October, and December. The Jubilee celebration sub-committee, appointed to prepare a scheme for the proper celebration of the Jubilee of the Society in 1896, made a report, and the same was accepted, a committee being appointed to carry out the same. Twenty-three ordinary members and two Fellows were elected.

THE EFFECTS OF LIGHTNING.—During one of the recent severe thunderstorms, three Scotch Firs on the outskirts of the wood, about 50 yards from my cottage, were struck by lightning. As I have never before heard of several trees being thus struck at once, I send a few particulars, which may be of interest to your readers. The trees, measured from centre to centre, form an obtuse-angled triangle, whose sides are 17 feet 6 inches, 12 feet, and 10 feet respectively. The largest of the trees is 50 inches in girth at 3 feet from the ground, and the smallest 28 inches. The trees vary very considerably (more than 10 feet) in height, and they are surrounded by other Fir trees, many of which are more lofty than these. The injured trees are marked in the usual way by vertical lines, from which both the outer and the inner bark has been stripped. There are no signs that the lightning has passed from tree to tree, and I presume that one discharge has become separated over this considerable area. It would be interesting to learn whether similar instances of the effects of lightning have been recorded in this country. GILBERT R. REDGRAVE, Assoc. Inst. C.E., Grove Dale, Abinger, August 26. *The Times*.

THE WORLD'S WHEAT CROPS.—The Hungarian Minister of Agriculture at Buda-Pesth, on Friday evening published the aggregate results of the data obtained from the reports of the various consuls, agricultural specialists, and other correspondents, concerning the world's Wheat crops for the season 1895. The total production of Wheat in the import countries (that is, the countries which have to supplement their home productions of cereals by imports from abroad) is estimated at 264,160,000 hectolitres, or 749,422,000 bushels, and the production in the export countries is estimated at a total of 582,200,000 hectolitres, or 1,651,701,000 bushels, making the total Wheat crop of the world this year 846,360,000 hectolitres, or 2,401,123,000 bushels. The Minister has also amended the estimate published at the end of August last year of the 1894 crops, by increasing his then estimate of the total yield of 872,780,000 hectolitres, or 2,476,000,000 bushels, by 55,000,000 hectolitres to 928,000,000 hectolitres, or 2,632,736,000 bushels thus making this year's world's crop of Wheat 82,000,000 hectolitres, or 232,000,000 bushels, smaller than that of last year. *Agricultural Gazette*, August 26.

THE NELUMBIUM IN EGYPT.—Readers who recall the interesting notes on this subject published in these columns in the spring from the pens of Dr. BONAVIA and Mr. FLINDERS PETRIE, will be interested in the following extract from *Garden and Forest* of Aug. 21:—"The purpose of this note is simply to call attention to the fact that in the Abbot Collection of Egyptian Antiquities, now the property of the New York Historical Society, and on exhibition in the rooms of the Society in the City of New York, there are specimens of the leaves of *Nelumbium speciosum*, obtained from Egyptian tombs, wonder-

fully well preserved after the lapse of twenty or thirty centuries."

INTRODUCTION OF THE BERMUDA LILY.—The Bermuda Lily was first brought to America from the Island of Bermuda in 1876, by Mrs. THOMAS P. SARGENT, Assistant Purchasing Agent of the Pennsylvania Railroad. When she was leaving the island, in the spring of that year, two friends residing there gave her a few of the Lily bulbs. Upon her arrival at her home she presented some of them to Mr. ROBERT CRAWFORD, a near-by florist, who about a year later sold the increase to Mr. WILLIAM HARRIS, of Philadelphia. He began growing the bulbs, and offered them to the public, with the addition of his name, as *Lilium Harrisii*. Mrs. SARGENT was an invalid for many years. Her home in the suburbs of Philadelphia was a centre for all that is lovely in plant growth, and her life was as beautiful and beneficent as the choice flowers with which she surrounded herself. *Vick's Magazine*. [We want to know now how the Japanese Lily came to be cultivated in Bermuda?]

BICOLOR PLUM.—Through Mr. LADHAMS, of Shirley, near Southampton, we have received purple and yellow Plums taken from the same tree. It appears that the occurrence has happened two years in succession. The case is similar to the occurrence of black and white Grapes on the same Vine, and of Peaches and Nectarines on the same shoot, and is probably due to a separation of previously mixed characteristics, but what causes the sudden change is quite unknown.

THE CEDAR OF GOA.—The last part of the *Boletim da Sociedade Broteriana* contains a Portuguese translation of Dr. MASTERS' paper on the Cedar of Goa by Professor HENRIQUES. The Professor adds a note that the structure of the slab of wood found beneath the surface of the soil in the Azores island is identical with that of *Juniperus brevifolia*; and microscopical specimens which he has been kind enough to submit to us amply bear out his opinion. *Juniperus brevifolia* in the island of S. Jorge attains a height of over 3 metres, and the trunk a circumference of 1 m. 30 c.

PUBLICATIONS RECEIVED.—*The Amateur Orchid Cultivators' Guide Book*, 2nd edit., by H. A. BURBURY. Published by BLAKE & MACKENZIE, Liverpool.—*Analytical Key to the Natural Orders of Flowering Plants*, by FRANZ THONNEA. Published by Messrs. SWAN, SONNENSCHNEIN & Co., London.

HOME CORRESPONDENCE.

APOGAMIC FERNS.—It is with surprise that I learn from Mr. Drury's paper on apogamic Ferns (*Gardeners' Chronicle*, August 24), that *Nephrodium (Laetrea) paleaceum* var. *crisatum* (Crested Male Fern), is according to De Bary, destitute of archegonia, and therefore that varieties cannot be raised from its spores. The original plant was found at Charleston, in Cornwall, and as far back as 1857 the late Mr. James, of Vauvert, gave me fertile pinnae, and from these some hundreds of plants were raised. I gave a pinna to Mr. Clift, of Bessall Heath, and from these there must have been nearly a thousand seedlings. Between 1862 and 1863 a large number of seedlings were raised at Highfield House, and amongst them were varieties Belfer and Winstanly, the latter described in *Our Native Ferns*, in 1869. Other crosses were made subsequently, notably with *variegatum* (a normal but variegated variety of *N. Filix mas*); in this batch of several hundred plants every seedling was crested, and had more or less the characters of *crisatum*. Mr. Wollaston of Chiselmhurst, Mr. Sim of Foot's Cray, Mr. Clapham and Mr. Glass of Scarborough, Mr. Willson of Whitby, Mr. Fox of Bristol, and Dr. Lyell of Newbury, all raised plants of this Fern. Mr. Sim raised one known as *crisatum-angustatum*, and Mr. Lyell several distinct congested forms; although apogamic, nevertheless archegonia must have been present, or no varieties could have resulted. In 1890 I had a pan of *Scolopendrium prothalli* in which the whole of them merely developed into thorns, eventually forming a bunch of thorns, and afterwards producing several curious fronds, but they reverted to thorns,

and are now all dead. Quite recently botanists told us that it was impossible to cross *Ferax*, and also that only one plant sprung up from each prothallus. From 1867, year after year, this was pointed out to be incorrect, but it was nearly twenty years before Fern crossing was acknowledged; and, as regards plants from a single prothallus, two, three, four, and five have resulted, and further by dividing and sub-dividing a prothallus nearly 100 plants can be produced, and moreover, these divisions can be continued until some of them have none of the original prothallus; after this, new generative organs are formed, and much more prolific in offspring. *E. J. Lowe, F.R.S. P.S.*—Additional information on the varieties of *Nephrodium paleaceum* can be found on p. 90 of *Fern Growing*, and p. 138 of *British Ferns and where found*. *E. J. L.*

CYPRIPEDIUM × LORD DERBY.—Referring to the paragraph in *Gardeners' Chronicle*, p. 245, on *Cypridium × Lord Derby*, in which Mr. Statter is said to have written that the plant "W. R. Lee" being dead, there was not another plant of the same parentage that had bloomed which was alive. I beg to say that I have such a plant, its parentage being *C. superbiens × C. Elliotianum*. The plant bloomed and was shown at the same Royal Horticultural Society's meeting at which "W. R. Lee" received an Award of Merit. I showed my plant under the name of "C. Mabellaianum." I obtained it from Messrs. Sander as a seedling, it is still alive and doing well, although I do not think it will flower again this year. *Walter C. Clark, Orleans House, Sefton Park, Liverpool*.

WASPS.—These pests have only just made their appearance in force in my garden in the Fen district of Lincolnshire. Last year they took the whole of my early Peas fully six weeks before the present date. It often happens that they make their nest in a thatched roof or stack, in which case fire is out of the question; under these circumstances, and indeed in most others, my plan is as follows:—Take a wide-mouthed bottle, with a closely-fitting cork, through which pass a short piece of glass tube; to the top end of this tube an india-rubber tube about 2 feet in length is attached. Sulphide of iron is placed in the bottle, and just covered with water, the end of the india-rubber tube is inserted into the hole, which leads to the nest, and packed round with damp clay or earth to prevent the escape of gas, strong hydrochloric acid is then poured into the bottle, and the cork at once inserted. Sulphuretted hydrogen is generated, and not a wasp will be left alive in ten minutes. Sulphuretted hydrogen is the gas which gives the smell to a rotten egg, and in its concentrated form, as thus applied, is a deadly poison to all organic life. I took four nests last year by this means in a little more than half an hour, and one was in a thatched roof covered with Ivy. Of course, the operation should be conducted at night, when the wasps are all at home. *R. K.*

CHISWICK VEGETABLE SHOW.—Kindly permit me to suggest to all who may be engaged in the work of judging the vegetables at Chiswick on Tuesday next, that some effort be made, not merely to have all the judgments in harmony, but also that standards of excellence be also, so far as the respective exhibits will allow, be set up. The proposed code of judging, which includes instructions as to the standards of excellence in vegetables, is unfortunately not yet ready. Were it available, much help towards securing the desired result might have been furnished. Failing that, and knowing how severely judgments by the Royal Horticultural Society are criticised and utilised as standards elsewhere, the present opportunity to exhibit higher and consistent ideals in relation to size, form, quality, &c., is so important that it can hardly be too fully utilised. In no description of produce at exhibitions does there seem to be found in making awards more diversity than in connection with vegetables. At Chiswick, apart from these collections, there are separate classes for twenty-eight kinds, affording ample scope for the selection of the best forms and highest quality. The opportunity is so good a one that it cannot be more worthily utilised. *A. D.*

TOMATOS AT MR. W. LAWRENSEN'S NURSERY, EAGLESCLIFFE FARM.—I had the pleasure to look over these nurseries recently, and some of the Tomatos which I saw growing there were to my mind perfect. Mr. Lawrenson, who believes in doing things well, has now obtained, through years of careful selection, three distinct varieties of Tomatos, which are grown under exactly similar treatment as some other crack varieties, and which have outdistanced the latter by far. All are very

free setters, bearing large clusters of even, good-sized, handsome deep fleshy scarlet fruit, the lowest bunches lying almost on the rim of the pots. The clusters are borne on sturdy short-jointed single rods 7 to 8 inches apart—the height of the rods is about 8 feet. Mr. Lawrenson informs me that the yield per plant, when all are ripened off, is 12 to 14 lb. This is a good performance for spring-sown plants, grown in 9-inch pots, and merely set on a thick sod 15 inches square. Of course, the plants are well supplied with manurial aids to growth. I have never, during many years of experience in Tomato culture, seen anything to equal these Tomatos at Eaglecliffe, and I am glad to hear that Mr. Lawrenson intends to send seed of them out next spring. Tomato growers who have now to compete with foreign cultivators of Tomatos sending over very large quantities, will welcome varieties which can be thoroughly depended upon for sure cropping, as a good many of my friends will have found out by now that Tomato growing is not all profit. *Experientia docet.*

THE LARGE CEDAR TREE AT BEECHWOOD PARK, HERTFORDSHIRE.—Seeing the account of large Cedars in your issue of August 3, I am reminded of a fine specimen which now stands in Beechwood Park, Herts, the seat of Sir Egbert Sebright, Bart. The height of it is close upon 100 feet, and the circumference of the stem, 5 feet from the ground, is 29 feet. I feel sure Mr. Freeman, the gardener there, would be pleased to corroborate my statement. *G. Shepherd, The Lilies, Aylesbury.*

"THE SWEET LITTLE, DEAR LITTLE, SHAMROCK OF IRELAND."—Referring to Mr. Tuckwell's note on the above in your issue of August 10, I must, as an Irishman, express the opinion that he is mistaken in his idea that "Shamrock is a name common to all triphyllate plants found growing on March 17." Anybody who has seen the careful searching in the fields a few days prior to March 17, will have noticed that in gathering specimens of the national badge, the Irishman does not always pick up the first trifoliolate plant he meets, but that with the greatest care he proceeds to select what he regards as the true species, which, he will tell you, is known by its small, perfectly green leaves, and wiry much-branched stems, characteristics which are certainly more marked in *Trifolium minus* than in any other species. Living, as I have always done, in the south of Ireland, I have many times watched my neighbours Shamrock-gathering. I have had Shamrocks brought to me by people who professed to know the real plant, and have often examined the sprays sold in the streets and shops for sending to friends abroad as well as those worn on St. Patrick's Day, and as a result, am convinced that for Irishmen, in the south at any rate, there is but one true Shamrock, and that is, without doubt, *Trifolium minus*. *T. repens* and *Medicago*, I believe, are used only in mistake by those who are not observant enough to notice that there are more kinds of Trefoil than one, and I have seen such an individual wearing *T. repens*, laughed at for his ignorance in decorating himself with "Clover." That *T. minus* is regarded throughout Ireland as the Shamrock by those whose interest it is to know it, is, I think, fairly demonstrated by the fact that flowering specimens of it are offered for sale during the summer months to tourists by the guides and peasants at Killarney; and also by the fact that in Dublin, Belfast, and Cork, the manufacturers of Christmas and St. Patrick's Day cards on which sprays of natural shamrock are mounted, so far as I have observed, invariably use this species. While Irishmen are patriotic enough to seek for and wear the Shamrock, Mr. Tuckwell need not fear that they will share his belief that any other plant will do as well as the pretty little one known botanically as *Trifolium minus*. While on the subject of national emblems, perhaps Mr. Tuckwell or some other correspondent would kindly inform us which of the native thistles is the typical Scotch plant, or which of the twenty species and eighty-three varieties of British wild Rose enumerated in the *London Catalogue of British Plants* (9th ed.), we are to regard as the floral emblem of old England. *R. A. Phillips, Cork, August 22, 1895.*

FOOD REQUIREMENT OF THE CHRYSANTHEMUM.—I have read Mr. M. P. Andersen's remarks on the above subject, which appeared on p. 181 in your recent issue. Your correspondent, in telling us of his experiment with Chrysanthemums, exhibits some lack of knowledge of the subject. He tells us:—"I have got a complete analysis of the soil," which he calls light and poor, and yet, further on,

he says:—"My soil is rather rich in potash," and this, together with the remark that it is a fibry turf, naturally leads one to suppose the soil is not so poor after all. Be this as it may, I for one should like to have seen its analysis. Another point I noticed in connection with the soil was the quantity of rubbish he mixed with it (two parts out of five); surely this substance would not improve it very much, for although this is a good thing to put on land or mix with border soil, it cannot be recommended for pot plants, especially such vigorous growers as Chrysanthemums. But to return to the question which concerns us most, i.e., the use of artificial manures. I noticed your correspondent used an entirely different manure to that recommended either by Mr. Willis or myself—with what result? He says:—"The plants made but little progress, the leaves were small and of a yellowish-green colour." And why? Because they were lacking one of their most essential food constituents, viz., nitrogen. "If the plants have not a sufficient supply of nitrogen in the soil, it can be detected by a lack of vigour in their growth; the plants look hard and stunted, the leaves are of a pale yellowish colour, and the growing point is weak" (p. 6 of *Manures and their Application*, by W. Dyke). But then your correspondent will perhaps say, did I not give them 4 per cent. of nitrogen in the mixture I used? Yes, that is quite true, but who, with the most elementary knowledge of manures, would mix two substances like basic slag and sulphate of ammonia together? The caustic lime contained in the slag (about 50 per cent.) would at once combine with the sulphuric acid which is united with—and holds—the ammonia, liberating the latter as a gas, which would then escape into the atmosphere and be lost. Mr. Andersen says he "has a good supply of nitrogen in the stable-manure." He evidently does not know that 1 ton of farmyard-manure only contains 12 lb. of nitrogen, and this chiefly as organic nitrogen. The nitrogen in the stable-manure and fibres of the turf could only become very slowly available for the use of the plant, and in my experiments with Chrysanthemums I have found there is nothing which stimulates their growth like nitrate of soda and potash. A nitrate I have recently used for experiment changed the colour of the foliage from a pale yellowish-green colour to a very dark olive-green in three days. The nitrate in question is ammonium-nitrate, which contains twice as much nitrogen as nitrate of soda. Care must be taken when using this substance, or the plants may be injured. If plants be overfed with artificial manures, they would not have the appearance as described by Mr. Andersen, as their foliage would look very dark green; this can soon be remedied by keeping the soil rather dry for a time. Your correspondent thought his mixture was in accordance with the requirements of the Chrysanthemum. But why, when giving us the analysis, did he omit to say that the mixture also contained 29 per cent. of sulphuric acid and 19 per cent. of chlorine? The plants only require 4½ per cent. of the former and 3 per cent. of the latter ingredients. The chlorine would most probably unite with lime, forming chloride of lime, a substance very injurious to vegetation. Your correspondent asks, "What result such a quantity of artificial manure as I recommended would have?" Why did he not try its effect as recommended, and report the results? and not try something entirely different, and then say "theory has here without any caution being used, given very dangerous advice." It would have been so had he proved the quantity was too strong for the plants, but from experiments I have carried out with Chrysanthemums I can say that the quantity can be used with safety, although it might be advisable to use lesser quantities with very fertile soils. In conclusion, I think, the past thirteen years of practical experience has taught me not to recommend anything I have not tried myself and found beneficial. There are very few plants which will stand with advantage so much feeding as Chrysanthemums, providing the mechanical condition of soil be well looked after. *W. Dyke, Turnford, Herts.*

VEITCH'S CLIMBING FRENCH AND SUTTON'S TENDER-AND-TRUE BEANS.—It seems a great pity that the Fruit Committee of the Royal Horticultural Society should have raised the question as to whether Messrs. Robert Veitch & Son or Messrs. Sutton & Sons have the prior claim to the name of this Bean, and then left it to others to decide. However, there need be no difficulty in the matter, for the official receipt of the Royal Horticultural Society granted to Mr. Ward in 1885 establishes, beyond ques-

tion, precedence in favour of his Bean—now in the hands of Messrs. Veitch. As Messrs. Sutton's Bean was not mentioned in the Chiswick Report until 1891, there is a priority in favour of the Exeter Bean of six years. It cannot matter one jot to the committee, as a whole, to whom shall be awarded the right of naming by virtue of priority, but it does matter in the interests of horticulture that fair play shall obtain in all its transactions. As there is to be a large gathering of vegetable growers at Chiswick on September 10, perhaps that would be a suitable occasion on which to set at rest the question at issue, for then, probably, there may be a fuller meeting of the committee. *H. E.*

PRIVATE GARDENS AND GARDENERS versus CHISWICK.—With the temperate remarks of your leader, p. 244, on Mr. Barron's retirement, no one can find fault, for if a wrong has been done, it should be righted; but as much cannot be said of the closing paragraphs of the leader on p. 234, where comparisons are instituted between Chiswick and private gardens that cannot tend to promote that sympathy from the craft that the writer claims for the cause he pleads; while his ignorance of the duties of gardeners in private places shows that he, at least, is no judge. I gather from his remarks that the only things about which gardeners in private places are able to form an intelligent opinion about, are "such elementary matters as digging, mowing, tree-nailing, and pruning, and the like matters;" while the things they know nothing about, but which it appears handicaps Chiswick, are the loss of time attending meetings, the labour of noting trials, gathering and packing fruits, flowers, and plants, conducting visitors round, &c., for all of which the superintendent has "nothing to show." This will amuse gardeners in places of any pretensions, where a large establishment is never off their shoulders from January to December, who have to grow and pack fruits, flowers, and vegetables almost daily with scrupulous care (having cooks and confectioners as well as employers to study instead of only "Fellows"), and send to London and to shooting-lobges or wherever their employers happen to go—who at home have daily to set aside men to serve the house with the same, not to mention the laborious ice supply by half-tons at a time, nor the large portion of each day the men are taken off to fill vases and dining-rooms with cut flowers and plants, watering them, &c., before a stroke can be done in the garden proper in work involving foresight, skill, taste, and judgment. In addition to these, throw in a school, and a church or two, an agent's garden and vinery, half-a-dozen lodge gardens, and several gardens of employer's friends, absorbing annually some thousands of plants, involving lists and correspondence on almost every horticultural topic, and you have some idea, and no exaggerated one, of work in private gardens for which there is nothing to show. We expect, as a matter of course, visitors by the hundred, and often at a time rendering zoning in the grounds, bazaars for charitable objects monopolising the staff's time, cricket grounds, tennis courts, and the fire-brigade drilled half a day every two weeks, which are nothing. No! the plea on this head for any society's garden had better be abandoned, because it is trash, and it is a pertinent question, if the plea even had any force, why gardeners from private places have usually been appointed to Chiswick, and why men like Thompson, McEwan, and others succeeded so well? I say nothing about the work most gardeners perform outside, "digging and mowing," &c., the experiments they carry on without fee or reward, the facts they are continually recording in the *Gard. Chron.* and elsewhere, and their record in the annals of horticulture generally, where comparisons would be dangerous. Some of your correspondents are inconsistent. I say nothing about the wisdom of employing private gardeners under present circumstances to inspect Chiswick, but as it is admitted that Chiswick is chiefly devoted to growing fruit, &c., for market, and to testing vegetables, fruits, and flowers, for private gardens, the choice in such a case would certainly be limited to gardeners or market gardeners, or both. You are right in stating in your note appended to my letter last week, that I am, perhaps, not aware how the money has been spent at Chiswick, but I know how far a pound will go in a garden, and I will throw in say, one-third of the £1624 for the renovations and repairs mentioned—a very liberal annual allowance—and which would leave about £90 per acre for management, fuel, and sundries, &c.—an allowance

which I have never known to be granted in the best gardens, except, perhaps, where the hot-houses and early forcing were much greater than usual, and the fuel bill high; and enquiry will, I feel sure, prove as

which at present centres in this part of the Arctic regions, the results, especially as to the movements of the ice, are of much importance. From the account which has been forwarded to the Royal

west coast of Novaya Zemlya, trending towards the north-west, and several days were spent in cruising along the edge of the heavy ice to the south-east. Every likely bight in the pack was entered, and in some cases these indentations were followed for 20 to 30 miles, but invariably heavy polar ice barred the way, and the yacht had to return to open water. Coal running short, the vessel bore up for Vardö to refill. The members of the expedition were landed on the Murman coast of Russian Lapland, near Sviatoi Nos, where they went into camp. A week was spent there profitably in ornithological, botanical, and geological investigations. On the return of the yacht from Vardö, a second attempt was made to reach Novaya Zemlya. The pack was again met with in about the same meridian as before, but, a fortunate lead showing, the vessel ran some 40 miles through the pack, and found a space of open water about the centre of Goose Land. Unfortunately, a dense, impenetrable pack of 8 to 10 miles in width was jammed against the shore, and this formed a connection with the main pack off North and South Goose Capes; in fact, the vessel lay in a large water-hole. An attempt was made to press the yacht towards North Goose Cape, in the hope of open water being found in the direction of Möller Bay, which resulted in the little vessel being nearly beset in the pack; but eventually the large pool of open water off Goose Land was regained. The wind now shifted to the south-east, and the lead by which the yacht had entered closed entirely. The pack came up from the direction of Mezhdusharsky Island, and hour by hour the water-pool contracted. Again coal had begun to run short, when, fortunately, a good lead opened to the south-west; a run was made for it, and, after passing through forty miles of dense pack on either side, open water was reached, the yacht running down to the island of Kolguev, with the ice in sight all the way on her port side. A landing was effected on Kolguev on July 5, and the members of the expedition went into camp near the mouth of the Kriva river, on the south-west side of Kolguev. The *Saxon* returned from Vardö and took the party off on July 16. Good results were obtained in Kolguev in various branches of natural history, and a series of interesting photographs were taken. During the stay of the party in Kolguev the weather was very bad, the temperature seldom rising above 35° Fahr., with fogs and bitter cold winds from north and north-west; part of the time the pack came down and girdled the west side of the island. Kolguev was left on July 16, and a third attempt was made to reach Novaya Zemlya. A marvellous change had occurred in the conditions of the ice. The impenetrable pack which a fortnight previously stretched from Kolguev to Novaya Zemlya had altogether disappeared, and the *Saxon* reached Kostin Shar on the evening of July 17, without encountering a piece of ice worth mentioning. Stoppages of some days were made at several anchorages in Kostin Shar, notably in Nekhvatova Bay, the final anchorage being at the head of Bielusha Bay, near South Goose Cape. The Samoyed settlement in that locality was visited. A considerable river which enters the north-east of Bielusha Bay, was explored. The *Saxon* returned to Vardö on July 30, and to England on August 12, after an interesting and adventurous voyage. *Times*.

FIG. 51.—DISA KEWENSIS X: COLOUR ROSY-CRIMSON, PURPLE SPOTTED. FROM THE ROYAL GARDENS, KEW.

D I S A K E W E N S I S X
(UNIFLORA X TRIPETALOIDES).

OUR illustration (fig. 51) represents *Disa Kewensis* X, the first of the pretty hybrid *Dias* raised in the Royal Gardens, Kew, and which annually make there one of the most beautiful displays made by any of the members of the Orchid family. The culture of these plants appears to have attained perfection at Kew, and the fact that the plant here represented flowered there in eighteen months after the seeds were sown, is ample proof of it. As will be seen, the plant is most floriferous. The flowers are bright rosy-crimson, with small purple spots on the galea; and also, especially in the mature flower, often similar spotting on the other sepals.

much. Experimental work is neither more expensive nor more harassing than private gardening, to say the least. *Head.*

NOVAYA ZEMLYA.

An expedition, organised by Mr. H. J. Pearson, left England in the end of May with the intention of visiting Novaya Zemlya. In view of the interest

Geographical Society, we learn that the members of the party were Mr. H. J. Pearson, Mr. C. E. Pearson, the Rev. H. H. Slater, and Colonel Feilden. Leaving Vardö in the steam yacht *Saxon* on June 14, a course was laid for Nameless Bay, in the north-west of Novaya Zemlya. The ice conditions in Barents Sea were found to be extremely unfavourable. Impenetrable pack was met with about 80 miles from the

SOCIETIES.

ROYAL HORTICULTURAL OF ABERDEEN.

AUGUST 22, 23, 24.—Thanks to the generosity of the Aberdeen Town Council, the Royal Horticultural Society of Aberdeen were able this year to give a very fine display in Duthie Park. In point of numbers the exhibits were superior to anything previously got together. The total entries amounted to 2021 as compared with 1375—in fact, 650 more entries than at any previous show. The various sectional displays were laid out in large marquees.

FRUIT AND VEGETABLES.

The number of exhibits in these classes was far greater than entered last year. The entries in the fruit section were more than tripled—392 as against 129. The exhibits were very meritorious, especially in the sections devoted to Grapes and Gooseberries. Owing to the time of year, that favourite berry in Aberdeenshire—the Strawberry—did not occupy the prominent place it usually fills in local shows. The Grapes were very fine, and Mr. W. HUTCHINSON, Balmadie, Mr. G. DUNCAN, Arbroath, and Mr. A. REID, Durris, are to be congratulated on the excellent specimens they sent forward. Currants and Apples were good, but there was nothing remarked of exceeding merit. Vegetables were excellent in all classes. Mr. George Milne, gr. to Lady GORDON CATHCART, Cluny Castle, took the blue riband in this division with a magnificent basket of vegetables; Mr. JOHN DALGARNO, Pitgaveny, Ellon; and Mr. THOMAS MIDDLETON, gr., Monymusk House, being 2nd and 3rd respectively. In the same competition for market gardeners, Mr. A. PATERSON, Ruthrieson, Aberdeen, was 1st. In the other sections of this division, Mr. REID, Urie House, Stoechaven; Mr. JOHN DALGARNO, Elgin; Mr. JOHN DAVIDSON, Outseats, Pitmaxton; and Mr. ALEX. GRIGOS, Fairfield, gave a good account of themselves. The amateurs and working-classes showed very fair products in this division.

POT PLANTS AND CUT FLOWERS.

These divisions constituted the prettiest items, and considering the backwardness of the season, were splendid. The sections for stove or greenhouse plants were well filled, the entries being 282 against 156 last year; cut flowers 620 against 533. Among professionals, Mr. John Proctor, gr. to Sir WILLIAM HENDERSON, Devanha House, Aberdeen, took the premier place for a group of plants (Orchids excluded), arranged for effect on the ground in a circle of 10 feet diameter, defeating many competitors. Mr. REID, Durris; Mr. JOHN DUTHIE, Trinity Cemetery; and Mr. KENNEDY, Wallfield, followed in same order.

Orchids were well represented, Mr. JOHN PROCTOR, Devanha, and Mr. GRIGOR, Fairfield, taking the chief prizes. Such a display of Ferns has not been seen for a long time, those specimens sent by Mr. A. GRIGOR, Mr. PROCTOR, and Mr. GILLESPIE, Aberdeen, being much admired. Mr. PROCTOR, it may also be mentioned, carried chief honours for the best eight stove or greenhouse plants, for the best group of plants, for Orchids, and for four Ferns from the stove or greenhouse, dissimilar. Mr. Robb, gr. to Mr. MURRAY, Glenburnie Park, Aberdeen, was 1st for Pelargoniums and Begonias; and Mr. Strachan, gr. to Mr. JOHN FYFE, Beechgrove, Aberdeen, received similar honours for his display of Fuchsias. The amateurs and working classes also showed well here. The cut flowers were a capital show.

Among the prize-takers were Mr. A. GRIGOR, for Orchids; Mr. REID, Urie House, for ladies' sprays; Messrs. T. MAVER & SON, Aberdeen, for wreaths and crosses. Mr. John Fraser, gr. to Mr. COUPES, Craigmacknacker, for the best twenty-four H.P. Roses, and Tea Roses. Mr. REID, Urie House, for twelve H.P. Roses, dissimilar; and Mr. JOHN WILSON, Montrose, for the best twelve Dahlias.

Among nurserymen, the Roses, as usual, gave rise to keen rivalry between those two eminent firms, the Messrs. COCKER, Aberdeen, and the Messrs. COLL, Dundee. For Tree Roses, the Dundee men sent the local firm to the right-about; but for H.P.'s, the positions were reversed, the Messrs. COCKER's display in this section being very beautiful. Among the other nurserymen who were very successful may be mentioned the names of A. WESTLAND, Banchory; MAVER & SON, Aberdeen; ALEX. GILES, Aberdeen; and Mr. ROBERT BURNS, Aberdeen.

A feature of the show was the displays sent for exhibition by Messrs. BEN REID & CO., Aberdeen; Messrs. W. SMITH & SON, Aberdeen; and Mr. JOHN FORBES, Hawick. The Messrs. REID & CO. had a magnificent display, and one which was much admired by the visitors; while Messrs. SMITH & SON and Mr. FORBES in their display did equally well.

BRIGHTON AND SUSSEX HORTICULTURAL.

AUGUST 17 AND 28.—A very fine exhibition rewarded the efforts of the committee of the Brighton and Sussex Horticultural and Mutual Improvement Association, on the occasion of the fourth annual exhibition, under the new management. The huge dome, and the spacious Corn Exchange adjoining,

were filled with exhibits, and, in addition, two spacious marquees were erected on the lawn, and they were quite full. Mr. Rupert Miller, the Assistant Secretary, was, as usual, very active, and the staging committee got through their work in good time, and the judging commenced at an early hour.

Groups.—There were three exhibitors in the class for a group of plants arranged for effect, to fill a space not exceeding 150 square feet. The best was from Mr. GEO. MILES, Victoria Nursery, Brighton; it was singularly light and graceful. Mr. H. J. JONES, Rye-croft Nursery, Lewisham, was 2nd, with a very imposing group, composed of Begonias of excellent quality, admirably arranged with Ferns and foliage of Asparagus plumosus.

The next class was for a miscellaneous group, occupying 80 feet. This was won by Mr. E. Meachen, gr. to Mrs. ARMSTRONG, Woodgrove, Witheane; prominent was a mass of Bougainvillea, surrounded by plants usually found in groups of this character. Mr. G. Sims, gr. to C. J. INWOOD, Esq., Dyke Road, Brighton, was a very good 2nd.

Groups of Ferns were delightful, the best came from Mr. J. Adams, gr. to the Rev. Sir C. SHEFFERD, Bt., Combe Place, Lewes, a masterpiece of effective grouping; some finely coloured examples of Adiantum, A. Farleyense being used with minor Ferns. Mr. G. MILES, Victoria Nursery, was 2nd. This is a class other societies might copy with advantage.

PLANTS.

Mr. A. Offer, gr. to J. WARR-N, Esq., Handcross Park, Crawley, was 1st for six stove and greenhouse Ferns, with fine examples of Davallia polyantha, D. Mooreana, Cibotium Schiede, Dicksonia antarctica, Adiantum cardiophyllum, and a grand piece of Microlepia birta cristata. Messrs. W. MILES & CO., West Brighton Nursery, were 2nd.

The best specimen flowering plant was Stephanotis floribunda from Mr. G. Fennell, gr. to E. CAZALET, Esq., Fairlawn, Tunbridge Wells.

Tables of flowering and foliage plants, 8 feet by 4 feet, were very effective, eight of them being placed under the dome. Mr. J. Turner, gr. to Sir GREVILLE SMYTH, Wick Hall, was 1st with a very graceful arrangement; and Mr. G. MILES, 2nd.

Tables of Begonias, 4 feet square, were also very effective, several of them finding a place in the Corn Exchange. The 1st prize went to Mr. F. FAIR, gr. to E. CLOWES, Esq., Clayton Wickham, Hassocks; Mr. W. HEAD, The Dive Nursery, Horsham, was 2nd.

Here were the collections of eight stove and greenhouse plants. Mr. E. MEACHEN was placed 1st with a fine piece of Lantana borbonica, grand examples of Croton Queen Victoria and Prince Waldeck, Anthurium crystallinum, Bougainvillea glabra, Allamanda Hendersoni, Stictis fimbriata Gilberti, and Ixora javanicum. Mr. OFFER was 2nd.

Groups of six Croton were represented by small but finely-grown and brilliant-coloured specimens; Fuchsias and zonal Pelargoniums by nice examples of moderate size.

The best six Orchids came from Mr. G. Duncan, gr. to C. J. LUCAS, Esq., Warnham Court, Horsham, who had Dendrobium formosum giganteum, Cattleya Dowiana, C. Mossiae, Odontoglossum Wilckeanum and Alexandrae, and Oncidium Fabae. Mr. B. Garnet, gr. to R. G. FLETCHER, Esq., Mount Harry, Preston Park, was 2nd. Such foliage plants as Palms, Coleus in the form of well-grown and coloured specimens, exotic and British Ferns, the former small but admirably grown; and table plants were all well shown.

Cut Flowers were a great feature, the Cactus Dahlias in particular commanding general praise. The leading classes occupied a commanding position on the platform under the dome, but the light was bad and the judging difficult. Boxes of cut stove and greenhouse flowers were very attractive; the winner of the 1st prize for twenty-four bunches had large and imposing bunches, though set up in a somewhat formal manner. Boxes of twelve varieties were also good. Messrs. PERKINS & SON, nurserymen, Coventry, had the best twenty-four Roses, among them a magnificent bloom of Black Prince, which they appear to grow in the finest condition; but though it was sent out some twelve years ago, it is rarely seen. Mr. T. W. YOUNG, Rose-grower, Eastbourne, was 2nd; some good blooms being shown by both exhibitors.

With twelve Roses, Mr. H. Harry, gr. to Mrs. EVERSFIELD, Denne Park, Horsham, was 1st; and Mr. Lawrence, gr. to T. WEST, Esq., Tunbridge, Horsham, 2nd.

With twelve Teas, Mr. G. W. PIPER, nurseryman, Uckfield, was 1st; and Mr. H. HARRY 2nd, some very good blooms being staged.

Spikes of Gladioli were in good condition, the individuals in the 1st prize twelve of good length, clean, fresh, and the quality excellent.

The best forty-eight Dahlias came from Mr. S. MORTIMER, Swiss Nursery, Farham; Mr. F. W. SEALE, nurseryman, Sevenoaks, was 2nd.

With twenty-four Dahlias, Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, were 1st; and Messrs. PERKINS & SONS, 2nd.

For twelve blooms, the 1st prize went to Mr. J. STREDWICK, Silver Hill, St. Leonards; Mr. J. DAWSON, of the same address, being 2nd. Pompon Dahlias in twelve bunches, each of ten blooms, were very fine, and the same with six bunches.

Bunches of single Dahlias in 24's, ten blooms in a bunch, were very striking. Mr. F. W. SEALE was 1st, and Messrs. J. CHEAL & SONS, 2nd, with very little to choose between them, but we thought the latter had erred somewhat on the side of size. In the class for six bunches, there was no competition.

Cactus Dahlias were very numerous. Mr. SEALE was 1st with twelve bunches, Delicata, Matchless, Lady Penzance, and other popular varieties being in their best form. Mr. S. MORTIMER was 2nd. For six varieties also, there was a keen competition; and Messrs. J. CHEAL & SONS' special prizes for nine bunches, three of each, was numerously contested.

Collections of herbaceous or bulbous flowers brought some fine contributions. Mr. W. Manton, gr. to Mrs. CLIFFORD BORER, Pickwell, Boving, was 1st with fresh examples in good condition; Mr. G. H. SAGE, The Gardens, Ham House, Surrey, being 2nd. With twelve bunches, Mr. F. W. SEALE was 1st; and Mr. W. E. Anderson, gr. to S. COWELL, Esq., Preston Park, 2nd. Collections of twelve bunches of annuals Zinnias, Asters, quilled and flat-petalled, were also shown.

In the way of floral decorations, Messrs. S. PERKINS & SON took the 1st prize with one bride's and one hall-room bouquet, done in their usual excellent style; Messrs. SCRIVENER & CO., Floral Hall, Watford, came 2nd. Wreaths or a device were also shown.

There was a considerable number of centre-pieces, with natural flowers and foliage. Mrs. JOHNSON, Saldenville, Worthing, set up a charming light arrangement composed of light grasses and Ferns, and pink and heliotrope-tinted Sweet Peas; Miss L. HUDSON, Gunnersbury House, Acton, came 2nd.

FRUIT.

Of fruit there was a remarkable display, perhaps one of the best seen in Brighton in late years. There were several collections of eight dishes. Mr. GORE, florist, Polegate, was 1st with finely finished Gros Maroc and Muscat of Alexandria Grapes, Barrington Peaches, an unnamed Nectarine, and Bon Chretien Pears, Moor Park Figs, and one other; 2nd, Mr. W. Taylor, gr. to C. BAYOR, Esq., Tewkesbury Lodge, Forest Hill.

The best three bunches of Black Hamburgh Grapes came from Mr. T. M. LE PELLEY, Valley Vineries, Ruper, very fine indeed. The best three bunches of any other black Grape were Gros Maroc, very finely finished, from Mr. T. Ambrose, gr. to E. BLENNIRON, Esq., The Farm, Broadheath. The best three bunches of white Grapes were superbly-finished Muscat of Alexandria from Mr. W. TIDY. Grapes were also shown as single bunches.

Melons were plentifully shown, and the tasting process must have been a tedious one. The two best dishes of Peaches were Dymond and Bellegarde, from Mr. G. Goldsmith, gr. to W. E. HUBBARD, Esq., Leonardale, Horsham; Mr. H. Harris, gr. to Mrs. EVERSFIELD, being 2nd. Mr. Goldsmith had the best two dishes of Nectarines in Elruge and Pine-apple. Mr. Coles, gr. to H. F. WALKER, Esq., Balcombe, was 2nd with Prince of Wales and Downton. Pears, both dessert and stewing, were very good.

Apples were in grand form, there were many entries for four dishes of culinary varieties, Mr. WILL TAYLOR, was 1st with superb fruits of Ecklinville, Lord Suffield, The Queen, and Warner's King.

Mr. MARTIN had the best four dishes of dessert Apples staging Astrachan, Worcester Pearmain, Queen, and Irish Peach.

Single dishes were also shown in plenty; also Plums, Cherries, Figs, &c.

Among vegetables, Potatoes were numerous, and collection decidedly good.

Miscellaneous Collections.—A very fine group of Lilies and other plants, also a superb collection of Apples, were from Messrs. BALCHIN & SONS, Hassocks Nurseries.

From Messrs. VEITCH & SONS, Chelsea, came one of the features of the show—a very fine group of Pitcher Plants, &c., and some beautiful Streptocarpus from seed sown in January last. A Gold Medal was awarded.

Mr. J. CHARLTON, Tunbridge Wells, had a collection of Dahlias, &c.; and Mr. WILL TAYLOR some cut Roses.

BATH.

AUGUST 28.—The Bath Floral Fête and Band Committee were fortunate in having fine weather for the holding of their annual show in the Sydney Gardens on Wednesday. The show, on the whole, compared favourably with its predecessors, and much credit is due to the Hon. Secs., Messrs. R. F. Pearson and W. Jeffery, for the excellent arrangements made under their supervision in the various sections of the show for the staging of exhibits.

PLANTS.

Fuchsias are always given precedence at this show. In the class for nine plants in as many varieties, there were only two lots put up, these being really grand plants in every sense they were about 9½ feet high, 4½ feet through at the base, and well furnished from bottom to top with healthy foliage, and grandly flowered, the varieties represented being Charming, Bountiful, Doel's Favourite, Final (dark); Arabella, Lustre Improved, Margareta, Harriett Lye, and Mrs. Rundel (light). Mr. George Tucker, gr. to Major CLARK, Trowbridge, was 1st with the above; Mr. MARSH was 2nd.

In the class for six plants in six varieties, two lots were put up. Mr. James Lye, gr. to Hon. Mrs. HAY, Market Livington, Wilts, was a good 1st; Mr. Snell, gr. to Mrs. COUNSELL, Weston, was a good 2nd.

In the class for twelve ornamental foliage plants, six stove and six greenhouse, Mr. CYPHER was easily 1st, and showed well. Mr. CYPHER was also 1st in the class for one specimen foliage plant, with a fine Croton Chelsou. Messrs. GEO. COOLING & SONS had the best specimen of Lilium auratum.

Mr. CYPHER had the best eight plants of ornamental foliage, showing plants of Cycas revoluta, Croton angustifolium,

Queen Victoria, Mortfontainensis, &c. The same skilful grower took chief honours for six Heaths; Mr. TUCKER being a creditable 2nd. The last-mentioned exhibitor secured 1st for a specimen flowering greenhouse plant, with a good Statice profusa; Mr. CYPHER taking a like honour for a specimen stove flowering-plant, with Ixora Duffii.

Mr. H. POCKOCK, Trowbridge, was 1st for three stove plants, distinct, showing a very finely-flowered Ixora Williamsii, I. coccinea, and Lapageria alba. Mr. CYPHER had the best six stove and greenhouse flowering plants, showing, among others, Bougainvillea Sanderi, Clerodendron Balfourianum, and Erica Turbulla; Mr. W. TUCKER being a very good 2nd.

Coleus were well shown by Mr. DENTON and Mr. C. GRIELOW, the plants, flat-trained, being highly coloured.

For twelve exotic Ferns, Mr. TUCKER was 1st, with an even fresh lot of plants, including excellent plants of Davallia hemiptera, Adiantum gracillimum, and Dicksonia antarctica; Mr. POCKOCK, was 2nd. Mr. BAILEY, Frome, had the best six plants including good-sized Davallia Mooreana, and Adiantum Farleyense. Mr. J. H. HOLMES had the best specimen Fern in a fine plant of Davallia polyantha (D. variegata).

Groups arranged for effect, on a space not less than 100 square feet, were shown by four competitors. The contest lay between Mr. CYPHER, Cheltenham, and Mr. CATER, Bath, both having very good and effective groups. Choice Orchids of suitable varieties and size told well in Mr. Cypher's arrangement, which was placed 1st.

CUT FLOWERS.

The classes devoted to cut flowers were filled. Mr. Baird, gr. to F. H. FOX, Esq., Wellington, was 1st for thirty-six spikes of Gladiolus, showing a fine lot; Mr. HALL was 2nd. Mr. SAMUEL TITTLE, Taunton St. James, was 1st for twelve spikes with good well-grown specimens.

Mr. GEORGE HUMPHRIES, Chippenham, had the best twenty-four show varieties of Dahlias with a solid, fresh-looking lot of blooms.

Mr. THOMAS HAWKINS, Soundwell, was 1st for twelve blooms; Messrs. J. GRAY & Sons, Frome, being 2nd. The last-named exhibitors took 1st for nine blooms, and Messrs. KEYNES, WILLIAMS & Co., Salisbury, were placed 2nd.

In the class for single Dahlias, shown in bunches, Mr. THOS. TRACKLE, gr. to THOMAS CARR, Esq., Tiverton, was 1st, with a good exhibit.

Roses made a fine show. Mr. GEORGE PRINCE, Oxford, was 1st for twenty-four single blooms, distinct, showing a grand lot for the time of year, including Louis Van Houtte, Reynolds Hole, Hon. Edith Giffard, and Duke of Edinburgh; Mr. STEPHEN TRESEDER, Cardiff, was a creditable 2nd. Mr. HOBBS, Bristol, had the best twelve blooms, in single trusses; and Dr. BUDD, Bath, was 1st for twelve Teas, with excellent blooms.

Cactus Dahlias were well exhibited by Messrs. KEYNES, WILLIAMS & Co., Salisbury, and were much admired.

FRUIT.

On the whole this made a good display, though in the class for a collection of twelve dishes only one lot was staged, viz., that from Mr. Nash, gr. to the Duke of BEAUFORT, Badminton, Chippenham, who was justly awarded the 1st prize.

The chief class for Grapes was one for eight bunches in four varieties, and only three lots were put up in competition. Mr. GIBSON, gr. to Earl COWLEY, Draycote House, Chippenham, was 1st; and Mr. S. HODGES, gr. to JAMES FORTH, Esq. Bath, 2nd. The 1st prize collection contained grand bunches of Gros Maroc, Black Hamburg, fine in berry and colour Buckland Sweetwater (one bunch), and three fine examples of Madresfield Court.

There were twelve stands of three bunches of Black Hamburg. Miss MARRIOTT, Bath, was an easy 1st, showing specimens large in bunch, berry, and splendidly finished; Mr. GIBSON was 2nd.

Three stands of two bunches of Muscat of Alexandria were staged, and Mr. W. CARPENTER, gr. to A. R. BAILEY, Esq., Frome, was well 1st, as he also was for any other white.

Mr. NASH was a good 1st in any other black class, with weighty, well-finished bunches of Black Alicante, fine in shape and berry.

Melons were fairly well represented. Twenty-one fruits of red and green kinds were shown. Mr. JONES was 1st for a green-flesh, with Hero of Lockinge. Mr. W. STRUGGELL, gr. to the Right Hon. W. H. LONG, Rood Ashton, Trowbridge, had the best scarlet-flesh in Carter's Blenheim Orange.

Peaches were not extensively shown. Mr. Pymme, gr. to Mrs. GOLDSMITH, Trowbridge, had the best dish of nine, with good even fruits; and Mr. CARPENTER had the best six.

Nectarines were best represented. Mr. John Wright, gr. to H. C. WILLS, Esq., Kelstons Knoll, Bath, had the best nine, showing extra fine fruits of Stanwick Elruge; Mr. Coombs, gr. to J. W. LANGDON, Esq., Freshay, was 2nd.

Plums were largely shown, and on the whole the quality and size of the fruits were good.

Of Cherries, there were nine good dishes put up, Mr. JONES taking the premier position with very fine Morellos.

Pears were plentifully shown. Mr. J. GIBSON was a good 1st; and Mr. WILKINS, gr. to Lady THEODORA GUEST, Inwood, Henstridge, was 2nd.

Apples made a fine display, a good length of staging being devoted to them. Mr. E. D. BOURDILLION, Wells, had the best three dishes of dessert varieties; Mr. G. GARAWAY, Bath, taking 2nd place.

Vegetables were well represented. Mr. COPP, Sherborn, was 1st for Messrs. Webb's special prize for six kinds, and for Messrs. Sutton & Son's prize for a similar collection. Mr. WILKINS was 1st for the Society's class for twelve kinds, and the quality of his produce was very good.

Non-competitive Exhibits.—Messrs. GEO. BUNYARD & Co., Maidstone, had a collection of fifty varieties of Apples, the fruits being of fine size, clean, even, and many of them beautifully coloured. Messrs. GEO. COOLING & SONS also had a good collection of Apples and Pears.

SANDY HORTICULTURAL.

AUGUST 29.—The Sandy show was held on the above date, and financially, as well as in other respects, the result was a very favourable one. Horticulture forms but a section of this exhibition, where there are classes for dogs, cats, poultry, cage birds, pigeons, and other specialties. However, the horticultural part of the schedule included classes for plants, fruit, vegetables, and market garden produce, and a good exhibition was made of these.

In the open classes for plants, Mr. J. CYPHER, Cheltenham, well won 1st place for ten stove and greenhouse plants in flower; and Mr. W. FINCH, Coventry, also showed creditably. The best group of plants arranged for effect was the exhibit from Mr. W. VAUSE, Leamington; and he was followed by Mrs. ASTELL, Woodbury Hall. Mr. W. J. EMPSON had the best six plants suitable for table decoration.

In classes excluded from the competition of nurserymen, Mr. W. J. EMPSON took 1st place for four foliage plants, distinct; and Mrs. ASTELL was 1st for six stove and greenhouse plants in bloom, and for six stove and greenhouse Ferns.

Other classes for plants in the open section, also for amateurs and cottagers, were very numerous, and a good display of commendable quality was made.

The competition for the best collection of eight distinct kinds of fruit, Pine excluded, was won by Mr. G. R. ALLIS, gr. to Major SHUTTLEWORTH, Old Warden Park, Biggleswade, and the collection of six kinds by Mr. W. J. EMPSON. Both these exhibitors also figured largely among the winners in other fruit classes.

Vegetables and cut flowers were considerable features, and altogether the exhibition was large.

Obituary.

MRS. R. I. MEASURES.—We regret to have to announce the death, on the 2nd inst., of a long illness, of Mrs. Measures, the wife of R. I. Measures, Esq., of Cambridge Lodge, Flodden Road, S.E.

MISS JANE SAUL.—On the 2nd inst., at her residence, Bow Lodge, Bow Road, Miss Jane Saul, in her eighty-eighth year.

MARKETS.

COVENT GARDEN, September 5.

[We cannot accept any responsibility for the unjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

OUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Flower name, s. d. s. d., s. d. s. d., s. d. s. d. Rows include Arams, Asters, Bouvardias, Carnations, Chrysantheums, Pansies, Gardenias, Gladiolus, etc.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Fruit name, s. d. s. d., s. d. s. d., s. d. s. d. Rows include Apples, Grapes, Melons, etc.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Plant name, s. d. s. d., s. d. s. d., s. d. s. d. Rows include Adiantum, Aspidistra, Asters, Chrysantheums, etc.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Vegetable name, s. d. s. d., s. d. s. d., s. d. s. d. Rows include Beans, Cauliflowers, Cucumbers, etc.

POTATOS.

Trade very dull. Supplies heavy. Prices lower, £1 to £1 being fair average prices. J. B. Thomas.

SEEDS.

LONDON: Sept. 4.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that there is now a moderate steady sale for Trifolium incarnatum; prices continue at the abnormally low level previously noted. Winter Tares are still limited, alike in supply and demand; quotations show no noteworthy change. Seed Rye continues exceedingly cheap. Clover and Grass seeds meet at present with no speculative attention. New sowing Rape seed is now unusually low-priced. There is nothing doing in Mustard. Smyrna telegrams describe the market there for Turkish Canary as hardening. Peas and Haricots are without alteration.

FRUITS AND VEGETABLES.

BOROUGH: Sept. 3.—Quotations:—Carrots, 1s. 9d. to 3s. per dozen bunches; Horseradish, 1s. 3d. per bundle; Onions, 3s. 6d. to 4s. 6d. per cwt.; Apples, 2s. to 4s. per bushel; Pears, 3s. to 4s. per case; Plums, 2s. to 3s. per sieve.

SPITALFIELDS: Sept. 3.—Quotations: Cabbages, 3s. to 4s. per tally; Collards, 2s. to 3s. per tally; Carrots, 1s. 6d. to 2s. per dozen bunches; Marrows, 1s. 6d. to 2s. per tally; Turnips, 2s. 6d. to 3s. per dozen bunches; Apples, Keswick Codlins, 2s. to 2s. 6d. per bushel; do., Councilors, 2s. 6d. to 3s. do.

STRATFORD, Sept. 3.—Fair supplies of all kinds of fruit and vegetables, and trade a bit firmer, as under:—Cabbages, 1s. 6d. to 3s. per tally; Cauliflowers, 1s. to 2s. per dozen; do., 5s. to 8s. per tally; Turnips, 1s. 3d. to 2s. per dozen bunches; Carrots, household, 1s. 6d. to 2s. per dozen bunches; do., bag, 26s. to 40s. per ton; Mangels, 15s. to 19s. do.; Swedes, 17s. to 20s. do.; Onions, English, 70s. to 80s. do.; do., Dutch, 2s. 9d. to 3s. per bag; do., Ghent, 2s. to 2s. 6d.; do., Port, 4s. 6d. to 5s. per case; Apples, English, cookers, 1s. 6d. to 3s. per bushel; do., dessert, 2s. to 4s. 6d. per bushel; Watercress, 6d. per dozen; do., 5s. per pad; Plums, ordinary, 1s. 6d. to 2s. 3d. per half-sieve; do., Victorias, 2s. 6d. per half-sieve; Damsons, 1s. 9d. to 2s. 3d. per half-sieve; Greengages, 3s. 6d. to 4s. 6d. per half-sieve; Tomatos, English, 2s. to 3s. per peck; foreign, 3d. to 1s. 3s. per case; Cucumbers, French, 1s. 6d. to 2s. 6d. per dozen; do., field, 3s. to 6s. per dozen; Beans, Scarlet, 1s. 3d. to 1s. 9d. per bushel; do., 2s. 6d. to 3s. 6d. per bag; Beetroot, 2s. to 2s. 6d. per dozen bunches; Celery, 10s. to 12s. per dozen bunches; Parsley, 1s. 3d. to 1s. 6d. per dozen bunches.

FARRINGTON: Sept. 5.—Quotations:—Cabbages, 4s. per tally; Cauliflowers, 2s. per dozen; Marrows, 1s. per dozen; Turnips, 2s. per dozen bunches; Carrots, 3s. per dozen bunches; Onions, Egyptian, 4s. per bag; Cucumbers, 2s. per dozen; Lettuces, 1s. 6d. per score; Sage, 2s. per dozen bunches; Parsley, 3d. per bunch; Mint, do.; Tomatos, 3s. per basket of 12 lb.; Apples, cooking, 2s. 6d. to 3s. per bushel; Ingestres, 6s. per bushel; Plums, Victorias, 3s. 6d. per half-bushel; do., Orleans, 2s. 6d. per bushel; Damsons, 2s. 6d. per bushel; Green Gages, 6s. per half-bushel; Mushrooms, 6d. per pound.

POTATOS.

BOROUGH: September 3.—Quotations ranged from 55s. to 90s. per ton.

SPITALFIELDS: September 3.—Quotations:—Puritans, best, 60s. to 70s.; Bruces, 50s. to 60s.; Reading Giants, 45s. to 60s.; Snowdrops, 80s. to 70s.; Suttons' Regents, 60s. to 80s. per ton.

STRATFORD: Sept. 3.—Quotations:—Magnus, dark soil, 35s. to 45s.; do., light soil, 55s. to 65s.; Reading Giants, 55s. to 70s.; Snowdrops, 55s. to 75s.; Hebrons, 65s. to 75s.; Regents, 60s. to 75s. per ton.

FARRINGTON: Sept. 5.—Quotations: Snowdrops, 70s. to 90s.; Hebrons, 80s. to 90s.; Puritans, 70s. to 90s.; Early Regents, 55s. to 65s.; Early Rose, 60s. to 70s.; Imperators, 55s. to 65s. per ton.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending August 31, is furnished from the Meteorological Office:—

"The weather was unsettled and showery in nearly all parts of our Islands during the first two or three days of the period; it subsequently became very fine and dry over England, but continued very unsettled in the extreme north-western and northern parts of the kingdom, with frequent and heavy rain. "The temperature just equalled the mean in 'Scotland, N.' and 'England, S.W.,' but slightly exceeded it in all other districts. The highest of the maxima were recorded during the middle or latter part of the week, when the thermometer rose to 7° in 'England, S.,' 76° in 'England, E.,' and to between 70° and 73° in most other districts. The lowest of the minima were registered on the 25th, when they ranged from 35° in 'England, S.W.' (at Llandover), 38° in 'Scotland, N.,' and 39° in the 'Midland Counties,' to 43° in 'England, N.E. and N.W.,' in the 'Channel Islands,' however, the lowest reading was 51°.

"The rainfall was less than the mean over southern, central, and eastern England, as well as in the 'Channel Islands' and 'Ireland, S.,' but exceeded the normal amount elsewhere. In 'Scotland, N. and W.,' and in 'Ireland, N.,' the excess was very large, the fall in 'Scotland, N.' being more than three times as much as the mean.

"The bright sunshine was less prevalent than during the preceding week, but again exceeded the mean over the greater part of England. The percentage of the possible duration ranged from 80 in 'England, E.,' 58 in 'England, S.,' and 55 in the 'Channel Islands,' to between 18 and 21 over Ireland, and to only 13 in 'Scotland, N.'"

NOTICES TO CORRESPONDENTS.

•• Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

•• PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

BOOKS: F. T. C. 1, *Practical Forestry*, by A. D. Webster, is published by Wm. Rider & Son, Ltd., 14 Bartholomew Close, London, E.C. 2, *Johnson's Gardeners' Dictionary*, published by G. O. Bell &

Sons, York Street, Covent Garden, London.—Urgent. We know of no such list, but probably you will obtain the information you require from *The Garden Annual*, published at 37, Southampton Street, Strand, W.C.; or from *The Horticultural Directory* published at the *Journal of Horticulture* Office, 171, Fleet Street, E.C.

CARNATIONS: J. F. S. The plants are affected with eel-worms. Burn the plants, char the soil, and make a new plantation elsewhere in the garden. Be careful about any new loam that you may introduce from pastures, as it is sometimes swarming with eel-worms.

CELOGYNE CRISTATA: Constant Reader. If the plants of *Celogyne cristata* are quite satisfactory where they are, you had better let them remain there. When the flower-spikes appear, they should be removed to the most airy part of the house.—W. W. Hard water will sometimes cause the tips of the leaves to turn brown, and present the appearance shown on the foliage sent. But your leaves are small and narrow, and point more to degeneration of the plants than any other cause. Probably yours have small crowded pseudo-bulbs. In time they would improve if broken up and repotted, and a liberal allowance of rain-water given them when growing. Tolerable shade and a free but not draughty ventilation is necessary.

FLAVOUR IN PEACHES: A. M. Your fruits of Peaches and Nectarines are but poor specimens, and they arrived somewhat bruised. If liberal culture is given and the fruits are of fair size, there need be no difficulty in regard to flavour. Keep the fruits well exposed to the sun, and give an abundance of air.

FLOWERING HABIT OF LÆLIA ANCEPS: Amateur. In the usual course the flower-spikes proceed from the tops of the pseudo-bulbs of *Lælia anceps*. Even when an abnormal growth appears to indicate that the plant is flowering from the base of the pseudo-bulb, examination invariably shows an incipient pseudo-bulb at the base of the flower-spike. The flower-spikes often show on the growing pseudo-bulb, but they take long to grow and expand their flowers, and by that time the pseudo-bulbs have reached their full size. The production of a good quantity of healthy roots, if the plant also looks well in other respects, is evidence that the situation in which it is placed is suitable. You cannot be sure that the plant will flower until you have seen the spike, and even then it may not come to maturity.

FREESIA CORNS: Constant Reader. If the *Freesia* corns are thoroughly dried-off and ripened after flowering, the largest of them should be re-potted for flowering. Put the smaller ones in pans by themselves to increase in size.

HANDLING A SPADE OR OTHER TWO-HANDED TOOL: W. H. W. See answer to same question in our last issue.

HERBACEOUS PLANTS: W. Price. We are not prepared to say which nurseryman has the largest collection of these plants. Each of those you mention keeps excellent collections, though perhaps neither may have just the plant you require. If they have not, however, most likely they would procure it for you.

MUSCAT GRAPES: Constant Reader. The dreaded "soot," *Gæsporium laticolor*. Collect all affected berries, and burn them.

NAMES OF FRUITS (see notice under Names of Plants): A. B. Nectarine Pine-apple.—F. W. G. 1, decayed; 2, Green Gage; 3, not known; 4, Kirke's; 5, Jefferson; 6, Duchesse d'Angouême Pear.—T. B. 1, not known; 2, New Hawthornden; 3, Crimson Queening; 4, Rosemary Russet.—W. Cann. Pear Jargonelle; Apple Beauoi.—E. W. W. Pear Bellissime d'Hiver; 1, Ribton Plopin; 2, Tower of Glamis; 4, Gloria Mandi; 5, New Hawthornden; 6, King of the Pippins; W. Parker. Pear Williams' Bon Chrétien; Apple Golden Spire.—T. G. F. 1, Belle de Louvain; 2, Kirke's; 3, Washington; 4, Belle de Septembre.—D. C. Foreman. Apples: 1, Hawthornden; 3, Domelow's Seedling. Pears: 1, Uvedale's St. Germain; 2, Beurré d'Aremberg; 3, Josephine de Malines; 4, Louise Bonne of Jersey; 6, Beurré Rance.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—Jas. Hamilton. *Calyptegia pubescens* (*Convolvulacæ*).—J. F. S. *Dioscorea argyrea*.—A subscriber. 1, *Sedum glaucum*; 2, *Sedum rupestre*;

3, *Sedum Sieboldi*; 4, *Sedum spurius*; 5, *Rhodiola rosea*.—E. J. W. 1, *Hæmanthus albidus*.—W. T. 1, *Vanda Roxburghii*; 2, *Woodwardia radicans*; 3, *Polypodium aureum*; 4, *Polystichum angulare*; 5, *Doodia blechnoides*; 6, *Pteris longifolia*.—W. W., *Aberfeldy*. *Eria bracteata*.—J. J. J. *Browallia elata*.—L. C. H. *Lilium tigrinum*.—W. Smith. *Colutea arborecens*.—H. B. 1, *Anthericum lineare variegatum*; 2, *Davallia bellata*; 3, *Carex variegata*; 4, *Adiantum elegans*; 5, *Erigeron speciosus*; 6, *Muhlenbeckia complexa*.—C. L. 1, *Cyrtomium caryotideum*; 2, *Adiantum decorum*; 3, *Adiantum Waltoni*; 4, *Adiantum tenerum*; 5, *Adiantum Williamsii*; 6, *Lastrea tenericaulis cristata*.—E. H. *Epipactis latifolia*. *W. M. Hæmanthus coccineus*.—A. G. 1, *Cyperus longus*; 2, *Dracæna congesta*; 3, *Panicum pilcatum*; 4, *Begonia riciniifolia*; 5, *Dracæna fragrans*; 6, probably *Browallia* sp.: send flowers.

PHALÆNOPSIS LEAVES DAMAGED: A. H. M. The yellow and spotted leaf sent is not eaten by any insects. The indented appearance is caused by degeneration, decay and collapse of the cellular tissue between the outer cuticles of the leaf. It is not an uncommon occurrence for *Phalænopsis* which have been previously healthy to go like yours after a severe and protracted winter like the last, and during which much artificial heat had to be maintained. A check to root-action through being cold and wet sometimes produces similar results. If the crowns of the plants are sound, and the roots good, you will doubtless bring them to health again.

PRESERVING AMMOBIUM, XEBANTHEMUM AND OTHER EVERLASTINGS: F. C. S. The first-named is best treated as an annual, raised on a hotbed in March or April, and pricked out in the open air in May. If pure white blossoms are desired, cut the flowers with short or long stalks before the yellow disc becomes visible. The long-stalked flowers are hung up in the sulphuring chest, and the short ones are laid on a lath framework for the same purpose. The acid used is sulphurous acid. The sulphuring chest is a stoutly-made, air-tight, quadrangular wooden cupboard of any desired dimensions, provided with a very close-fitting fall-door in the front, furnished with an indiarubber cushion all round the edges, so as to keep in the fumes. There should be an air-hole or holes provided in the top and near the bottom, which can be closed with a kind of damper. It is furnished with narrow wooden ledges on which to rest the drying-frames of bars from which the grasses, flowers, &c., hang in small bundles, or upon which short ones are laid. Only wooden nails should be used in its construction, or if screws be used the heads must be deeply countersunk and protected by a close-fitting wooden plug. Any flowers or grasses bleached in the sun should be finished by placing them in the sulphuring chest, first dipping them in river or rain-water to increase the effect of the sulphur by greater absorption. For a chest 1 yard high by 30 inches broad and 18 inches deep, about 100 grammes of sulphur is required. It should be ordinary brimstone, finely broken or powdered, and it must be put into a metal or earthen vessel and lighted with a fusee made from a strip of canvas or cotton cloth dipped in melted sulphur. So long as the air is admitted by the air-holes the sulphur will burn and the fumes spread all through the chest, and when the latter is filled, as will be evident by the issue of the fumes from the air-holes, the damper should be closed, and the burning sulphur removed and extinguished by covering with a bit of cloth. The flowers must remain in the chest twenty-four hours, and then air should be admitted by opening first the upper air-holes and then the lower. Bine and red flowers will appear on opening the chest, a snow-white, and white flowers should have the stalks and calyces of a grey tint. The bleaching by sulphur injures flowers much less than bleaching by chlorine. In the case of bundles of flowers not losing their red or blue colours entirely in the middle part of the bundles, the bundles must be opened out, and the operation done again till the desired result is attained.

COMMUNICATIONS RECEIVED.—E. J. B.—N. E. B.—Dr. Kriozlin—*Frankfurter Garten Zeitung*—Mertens & Co.—A. D.—W. D.—E. F. B.—R. S. & J., Ltd.—R. D.—R. W.—R. K.—W. E. B., Grenada.—J. V.—W. M. B.—A. P.—H. W. W.—J. B.—A. H.—M. T.—W. C., Jamaica.—A. G.—C. E.—W. R.—J. F., and others.

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
Dear Sirs.—It affords me much pleasure to inform you the 25 ft. Annular Sail covered Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schröder.
B. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne.

THERE IS NOW
A CERTAIN AND SAFE REMEDY IN
THE XL ALL MILDEW WASH.

Kills Mildew and Insects at the same time.
Does not Mark or Stain Fruit, Flowers, or Foliage.

PRICE:—
1 gallon, 12s. 6d.; ½ gallon, 6s. 6d.; 1 quart, 4s.; 1 pint, 2s. 6d.

A Report selected from many:—
From Mr. JOHN MADDOX, Bryn Glas Gardens, Newport, Mon.
"I have now given your Mildew Wash a good trial, and find it the very best remedy yet introduced, being most effective in killing the Mildew and Green-fly at the same time, and without the slightest injury to the foliage of the Roses. It is clean and most simple to use, and the smell is not objectionable.
"Like all your other XL ALL's, it is just what is wanted, and one feels thankful that they are all come at last.
"P.S.—One application is sufficient."
To be had (the same as all the other XL ALL's), through all Nurserymen, Seedsmen, Florists, and Sundriesmen everywhere; or direct from the Sole Proprietor, G. H. RICHARDS, Old Shot Tower Wharf, Lambeth, London, S.E.

SAVE HALF THE COST.

Is admitted by the leading Nurserymen to be the Best Quality obtainable in the Trade.

Consumers should Buy Direct from the Owner of these Celebrated and Extensive Pits, which contain a practically inexhaustible supply of Splendid Sand, and thus save half the ordinary cost.

NURSERIES, Long Ditton, Surrey (Surbiton Station, S.W. Railway)

BARR'S DAFFODILS AND BEAUTIFUL 'ENGLISH AMATEUR' TULIPS.

AUTUMN, 1895.

BARR'S DAFFODILS were Awarded the only GOLD MEDAL at the Second Great Daffodil Conference, 1890

THE HOME OF NARCISSUS CYCLAMINEUS.

This unique Daffodil was found wild in its largest development in wet meadows. Rev. G. Watson, L.R.S., has discovered it annually since its introduction; Rev. M. Erskine, late of Wight, grew it two or three years ago in meadows, and then in four years in the flower border; Mr. O. H. Cammell, Hatherly, has it happy at the foot of a rockery, and still more flourishing naturalized in grass, where it is freely increasing; at Kew, Mr. Downer reported successful culture; Dr. Foster, of Cambridge, has grown it in his garden (about March) since 1860, and each year it has improved, and is now increasing; Mr. F. W. Sherfield has grown it successfully since 1868 in pots, frames, outdoors against a warm house, and finally over his garden, but no records the flowers are larger; Mr. Oswald H. Mearns, of Poole, has it growing freely and luxuriantly on the exposed top of a rocky bank; Mr. T. H. Burroughs, Stamford, has, since 1862, grown successfully Curvicaulis Citrina in this pure stock in the ground, fixed with peat and kept constantly wet, we have tried this mode of culture on a large scale successfully.

BARR & SON,

KING STREET, COVENT GARDEN, LONDON.

Nurseries—LONG DITTON, SURREY. A few minutes from Surbiton Station (S.W.R.) Visitors invited to the Nurseries during Spring, Summer and Autumn to see the Grand Collections of DAFFODILS, LILIES, PANSIES, PASTORAL SUPPLIES, MICHAELMAS Daisies, and other HARDY PLANTS, and to see the BARR'S DAFFODILS SILVER CUP & MEDALS for 1890 and BARR'S PRIZE MEDALS for TULIPS.

BARR'S Gold Medal Daffodils, 1895.

GROUP OF BARR'S DAFFODILS (Reduced from natural size). No. 1, M. J. Bessley; No. 2, J. Watson; Queen of Spain; No. 3, Brooker; J. B. M. Cree; No. 4, London Daffodil; No. 5, Cyclamineus.

BARR'S SILVER DAFFODIL CUPS. FOR LONDON, BIRMINGHAM, EDINBURGH, & DUBLIN.

Friday, September 20, 1895.
SALE OF ORCHIDS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. F. Sauder & Co., St. Albans, to **SELL** by AUCTION, on FRIDAY NEXT, September 20, at half-past 12 o'clock, at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., a quantity of IMPORTED ORCHIDS, including fine consignments of **CATTLEYA ELDORADO SPLENDENS** in fine condition. The rose, orange, and purple blossoms of this splendid species render it very attractive and effective. There can be but little doubt but that the varieties **VIRGINALIS**, **CARNEA**, **CONSPICUA ORNATA**, &c., will flower from among these plants.

GRAMMATOPHYLLUM MULTIFLORUM TIGRINUM in fine order. This grand Orchid produces its beautiful showy flowers in large racemes, often to the number of sixty or seventy. Also **LÆLIA MAJALIS**, the "Flor de Mayo" of the Mexicans. This noble Orchid ranks among the finest of all. Its large and lovely flowers are always attractive. Also **CATTLEYA CITRINA**, **LÆLIA LUCASIANA**, **DENDROBIUM STATTERIANUM**, an easily-grown beautiful Dendrobe, most useful for Cut Flower work, &c.

CYPRIPEDIUM BELLATULUM, A fine batch. Many very fine plants are included. Also **CATTLEYA SUPERBA**, a really superb Orchid, with large deep rose and rich magenta-crimson blossoms. **ODONTOGLOSSUM LÆVE**, **ONCIDIUM UNGUICULATUM**, **DENDROBIUM PHALÆNOPSIS SCHRODERIANUM**, **CYPRIPEDIUM DAYANUM**, **DENDROBIUM NOBILE**, Lang Tang var. In addition fine bulbs of **EURYCYLES CUNNINGHAMII** (the Brisbane Lily), **BESSERA ELEGANS**, and **HÆMANTHUS KALBREYERII** will be offered. The bulbs are in fine order.

Full descriptions, &c., are given in the Catalogue.

Tuesday Next.
MESSRS. PROTHEROE AND MORRIS will include in their ORCHID SALE on TUESDAY NEXT, September 17, a good Collection of NEWLY-IMPORTED ORCHIDS, comprising a small but good lot of **Vanda Sanderiana**, among which is the Grandest Specimen in Europe; **Aërides Sanderianum**, **Phalænopsis Schilleriana**, **Cypridium Stouei**, among which are some good forms and distinct plants; **Aërides Lawrenceæ**, **Anoctochilum Dawsonianum**, **Dendrobium Deareii**, specially good sound stuff; **Dendrobium bigibbum**, **Grammatophyllum Measuresianum** and **speciosum**, **Aërides**, probably new, from new district.
On view morning of Sale, and Catalogues had.

WEDNESDAY NEXT.

NURSERYMEN, ABERDEEN.

TO BE SOLD, pursuant to an Order of the High Court of Justice, Chancery Division, made in an action, **Bennett & Another v. Corbridge** (trustee of the property of John Burchell, a Bankrupt), 1895, B. 181, with the approbation of Mr. Justice North, the Judge to whom the action is attached by Mr. Walter William Read, the person appointed by the said Judge, at The Mart, Tokenhouse Yard, in the City of London, on Tuesday, September 24, 1895, at 2 o'clock in the afternoon precisely, in One Lot, the Valuable and Very Compact FREEHOLD ESTATE, known as "LITTLE CANONS," situate in the Parish of Great Parndon, Epping, in the county of Essex, consisting of a capital Residence, Farm Buildings, and Stabling; 8 Greenhouses, heated by Hot-water Piping and Boilers; Bailiff's Cottage, Packing-house, and Outbuildings; Gardens, three Productive Orchards, together with 51 acres 1 rood and 4 poles (or thereabouts) of Park-like Pasture, Market Garden, Orchard, and Woodlands.

Particulars, with Plan, and Conditions of Sale, may be obtained of Messrs. SAUNDERS, HAWKSFORD, AND BENNETT, Solicitors, 68, Coleman Street, Bank, E.C.; at The Mart, E.C.; and of Messrs. W. W. READ AND CO., Auctioneers and Land Agents, 1, Queen Street, Cheapside, E.C.

Dated this August 12, 1895.

ALFRED RAWLINSON, Chief Clerk.

MONARCH PLUM;

100,000 FRUIT TREES, 2,500 of the new late Plum, Monarch, are included, 1 to 3 years; several thousands of the first early dessert Apple, Beauty of Bath; about 30,000 Apples, Pears, Plums, and Cherries; 25,000 Baldwin Black Currant, 15,000 Gooseberries and Red Currants, 25,000 2-year Connover's Colossal Asparagus, 25,000 of NEW EARLY STRAWBERRY, LAXTON'S ROYAL SOVEREIGN; 20,000 Hop Sets, 50,000 spring Cabbage plants, 50,000 Cos Lettuce plants, 50,000 Drumhead and Thousand-Head Cabbage, &c.

Catalogues may be had of the Auctioneers, 67, Cheapside, London.

ABSOLUTELY
WITHOUT RESERVE

MESSRS.
PROTHEROE
AND
MORRIS

Have received instructions from

Mr. W. HORNE,
PERRY CLIFFE,
Near Rochester, Kent,

To hold the
NINTH ANNUAL
GREAT
FRUIT TREESALE

On the Premises, on
Wednesday, Oct. 23, 1895,
At 11 o'clock.

HIGHLY IMPORTANT ANNUAL CLEARANCE SALE.

By order of Mr. R. GÜLZOW,

Who is obliged to dispose of a portion of his Stock for want of space, as every season several houses are devoted entirely to the forcing of Lily of the Valley in enormous quantities.

16,000 ASPARAGUS PLUMOSUS NANUS.

This is the true stock, which differs from the original type in not being of such a climbing habit of growth. It is very useful for all kinds of decoration, and particularly well adapted for cutting purposes, and is always in great demand.

Also **STATICE PROFUSA**, **CUPHEA LLAVEA**, **CARNATION LIZZIE MACGOWAN**, **EURYA LATIFOLIA**, **BELLA**, **LITTLE GEM**; **FICUS ELASTICA VARIEGATA**, &c., &c.

MESSRS. PROTHEROE AND MORRIS will **SELL** the above by AUCTION, on the Premises, the Melbourne Nurseries, Bexley Heath, Kent, close to Bexley Heath Station, and Bexley Station, S.E.R., on FRIDAY NEXT, September 20, at half-past 12 o'clock. May be viewed any day prior to the Sale. Catalogues may be had at the Nurseries, and of the Auctioneers, 67 and 68, Cheapside, E.C.

N.B.—A conveyance will meet the trains at Bexley Heath Station, to take up intending Purchasers to the Nurseries.

500 DRACÆNAS (COLOURED).

Fine healthy plants, to 4 feet high.

200 COCOS WEDELLIANA.

In the best possible condition.

FOR SALE, a small valuable long leasehold NURSERY, 6 miles from Covent Garden. Seven large Greenhouses, well stocked; two Vineries, Cucumber-house, Plant-houses, five-roomed Cottage. Low Ground Rent. Lease eighty-six years to expire. Eighty-five feet Glass. Facing main road. All particulars of **FLORIST, 11, Dafforne Road, Tooting, Surrey.**

EALING.—To **FLORISTS, GROWERS, JOBBING GARDENERS.** Excellent Premises, About $\frac{1}{2}$ of an acre of good garden ground (formerly Castle Bar Nursery), filled with valuable fruit trees; new, spacious six-roomed house attached, repairing lease. First-class neighbourhood. Rent, £40 per annum.—Apply
4, Ripley Villas, Castle Bar Road, Ealing.

SOUTHPORT.—Gentleman's 13-roomed Detached HOUSE, all modern conveniences, with Vineries, 120 by 18, containing about 200 young Canes in full bearing; 6 other Glass-houses, Frames, &c.; Top and Bottom-heat; Gardens, and Stables. Sold cheap. Left owing to ill-health.—Apply, **HATCH, Southport;** or **BATEMAN, Woodlands, St. Mary Church.**

To Nurserymen and Florists commencing business. **HAMPTON-ON-THAMES, ON THE MARLING PARK ESTATE,** free from London fogs, a deep rich loam, the favourite neighbourhood for Growers, **FREEHOLD LAND FOR SALE,** on easy system of payment. Excellent sites for residences.—For full particulars apply to **Mr. FREDK. G. HUGHES (Surveyor), the Estate Office, Hampton-on-Thames.**

GARDEN TO LET, south aspect, 2 acres, on slope, 2 miles from Bath.—3 Hot-houses and 19 Vines; 10 Frames, celebrated for Strawberries, from which £28 was realized this year; good water-supply; sleeping accommodation for single man. Rent £35 yearly; if taken at once one quarter's rent remitted.
Address, **L., Mr. Scott, Seymour Street, Bath.**

SOLD BY ALL SEEDSMEN.

THERE IS NOW A CERTAIN AND SAFE REMEDY IN THE XL ALL MILDEW WASH.

Kills Mildew and Insects at the same time.
Does not Msrk or Stain Fruit, Flowers, or Foliage.
PRICE:—
1 gallon, 12s. 6d.; ½ gallon, 6s. 6d.; 1 quart, 4s.; 1 pint, 2s. 6d.

A Report selected from many:—

From Mr. JOHN MADDOX, Bryn Olas Gardens, Newport, Mon.
"I have now given your Mildew Wash a good trial, and find
it the very best remedy yet introduced, being most effective
in killing the Mildew and Green-fly at the same time, and
without the slightest injury to the foliage of the Roses. It is
clean and most simple to use, and the smell is not objectionable.
"Like all your other XL ALL'S, it is just what is wanted,
and one feels thankful that they are all come at last.
"P.S.—One application is sufficient."

To be had (the same as all the other XL ALL'S), through all
Nurserymen, Seedsmen, Florists, and Sundriesmen everywhere;
or direct from the Sole Proprietor, G. H. RICHARDS, Old
Shot Tower Wharf, Lambeth, London, S.E.

GISHURST COMPOUND, used since 1859
for Red Spider, Mildew, Thrips, Greenfly, and other
blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as
a winter dressing for Vines and Orchard-house trees, in lather
from cake, for American blight, and as an emulsion when
paraffin is used. Has outlived many preparations intended to
supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on
wet ground. Boxes, 6d. and 1s., from the Trade.
Wholesale from PRICE'S PATENT CANDLE COMPANY
(Limited), London.

Well known as the cheapest, safest, and best of all Insecticides
for Killing Vermin on Plants, Animals, and Birds.
Used by every Orchard Grower of any note all over the World.
A Pamphlet on its use, with full directions for Cleaning Plants,
&c., sent free on application.
Half-pints, 1s. 6d.; Pints, 2s. 6d.; Quarts, 4s. 6d.; Half-
gallons, 7s. 6d.; Gallons, 12s. 6d.; Five Gallon Drums, 10s. 6d.
per gallon, carriage paid. Manufacturer:—**E. G. HUGHES**,
Victoria Street, Manchester. Sold by all Seedsmen.

MENDELI.**

MESSRS.

PROTHEROE & MORRIS,

WILL SELL BY AUCTION,

At their CENTRAL SALE ROOMS,

67 & 68, CHEAPSIDE, LONDON, E.C.,

ON
TUESDAY NEXT, SEPT. 17,

At half-past 12 o'Clock, a fine importation of

CATTLEYA MENDELI,

Just received, ex R.M.S. "Para."

The plants which will be offered have been collected from entirely hitherto unexplored localities, and therefore new and distinct forms may most reasonably be anticipated.

At the same time will be offered fine Imported Plants of—

**CATTLEYA
GASKELLIANA.**

Also CYCNOCHES CHLOROCHILON, in Flower or Bud; CYPRIPEDIUM CHARLES-WORTHII, selected varieties in Flower; DENDROBIUM PHALÆNOPSIS SCHRODERIANA, the new Kina-Balu D. SPECIOSISSIMUM (Award of Merit, July 23), and the rare Lælia-like SCHOMBURGKIA HUMBOLDTI.

Also will be included, 10 fine growing plants of the new and beautiful

ALOCASIA LOWI "GRANDIS,"

Which gained an Award of Merit, Royal Horticultural Society, August 27, last.

By ORDER OF—

ROSES IN POTS

For Forcing and Greenhouse Culture.

All leading Tea-scented and H.P. varieties can be supplied in 5 and 8-inch pots, from 18s. to 42s. per dozen. Climbing kinds at same prices.

Extra fine plants, 60s. per dozen.

BULBS—BULBS

HYACINTHS, TULIPS, NARCISSUS,
for pots and borders.

LILIES, CROCUS, and all other Bulbs can be supplied, of the best quality, at very reasonable prices.

Descriptive Catalogue Post-free on Application.

"LECTURE ON THE HYACINTH."

Delivered by Mr. WM. PAUL, before the Royal Horticultural Society, price 6d., post-free.

**PAUL'S NURSERIES,

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 14, 1895.

BUTESHIRE.

BUTESHIRE, with its ancient capital of Rothesay, "the acknowledged Queen of Scottish Watering and Wintering places," contains much to interest the horticulturist. Rothesay, with its beautiful bay, forming a semi-ellipse 1½ mile across the mouth, is undoubtedly one of the finest and best sheltered bays on the west coast of Scotland. Five centuries ago its palace was built in front of its even then old castle, and it had for its first visitors the Kings of Scotland, who, during the summer months, and also sometimes during the winter season, resorted to it for the purpose of enjoying its delightful climate, its translucent waters, and its beautiful scenery. There is no record of the building of the castle, which still survives in the square in the centre of the town. The first mention of it in history is in 1228. It must have passed through many vicissitudes in troublous times; it was seized by Cromwell's troops when they invaded Scotland, and on leaving it they destroyed a portion of the walls. It was subsequently taken by the Earl of Argyll in 1685, and afterwards burned by one of the Earl's brothers. For some time previous to that the castle had been occupied by the Marquis of Bute's ancestors, who, after the burning, and till the erection of Mount Stuart, his lordship's Buteshire residence, five miles away, resided in a house in the High Street.

The meteorologist records that the range of the thermometer in Rothesay is about 18° fewer than the average of Scotland, being 15° warmer in winter, and 5° cooler in summer. This is principally caused by the fact that Bute consists of comparative low land, surrounded with seawater, which latter is a great deal warmer than the atmosphere in winter, and somewhat cooler in summer. The influence of the warm Gulf Stream in winter is remarkably exemplified by the infrequency and mildness of frosts, the rarity of snowstorms, and the quickness with which snow melts when it does fall. Owing to the land being so little elevated, much less rain falls here than in the surrounding parts of Scotland. The high hills of Cowal, Ayrshire, and of Arran on every side break the rain clouds, the contents of which, in many cases, are discharged on them whilst scarcely a drop falls in Bute. For the same reason, this favoured island has a singular immunity from thunderstorms—the thunderclouds being attracted or broken by the high hills surrounding it. The absence of fogs is remarkable—attributable, it is thought, to the Buteshire farms being well drained, and that there is no tendency for an excess of damp to remain in the land or in the atmosphere.

Pleasant walks abound about Rothesay, and throughout the island they form some of the chief attractions of the place. The Marquis of Bute has most liberally constructed paths

through the woods on the heights above the town, which form delightfully shaded and sheltered walks, affording charming glimpses of the bay and surrounding hills. Here come the townspeople in the evenings of week-days during summer, and it is a favourite walk on the Sabbath evening after kirk. The English visitor is struck with the quiet peacefulness of the Sunday in Rothesay, no vehicle plying for hire on land, and no boat upon the sea. Every public-house is closed, and no element of discord is heard in the public streets. What would inote to a revolution in London, is here acquiesced in, and more—appreciated.

The horticultural features of Rothesay are many and interesting. Various shrubs and plants, regarded as tender in colder parts, are hardy during the winter, though violent storms in November last, accompanied by scathing winds, and followed by the keen frost in February, left their mark on many things, the *Euonymus*, in particular, having become very brown. Many fine trees are to be found here, but near the coast, they show the effects of rough winds. Evergreens are plentiful, and they give the line of the shore a furnished appearance at mid-winter. The neighbourhood of Rothesay is famous for the fine quality of the Strawberries and Gooseberries grown there; considerably over 100 acres of land being devoted to the growth of the former fruit. The overflow after supplying the wants of Rothesay, finds a sale at Glasgow and elsewhere. Flowers are grown extensively in the gardens abutting upon the Meadow Walk. The road between the gardens has on either side lofty and wide-spreading trees. Two magnificent Ash trees of great age, which from time immemorial adorned this walk, were known as "Adam" and "Eve." "Adam" has succumbed to old age, but his consort, "Eve," is still quite vigorous. There are some very fine examples of Ash in the neighbourhood of Rothesay.

At Southbank, about 3 miles from the town, resides William Spencer, Esq., who possesses an admirably-furnished place, where there are several glass erections, a select collection of Orchids, Ferns, and other foliaged plants; indeed, all that one could desire to see associated with such a charming residence. In the grounds are attractive beds of Begonias and other flowering plants. Everything is in excellent order. The gardener is Mr. James Lornie, whose work commands our praise. A few miles farther the visitor leaves the shore, and on the higher ground comes to the entrance to Mount Stuart, the seat of the Marquis of Bute, the owner of most of the land in Buteshire. The mansion stands in the centre of a richly-wooded spot; it is a new erection, a handsome Gothic structure occupying the site of the old mansion which, with all its art treasures and beautiful and costly decorations, was destroyed by a fire which took place in 1876, but fortunately, many valuable pictures—most of them family portraits—were saved.

The grounds about the mansion are very extensive and of great beauty; at their lower portion, they terminate in a bank or cliff near the sea. Two avenues, one of Limes and the other of Beech, are wonderful arboreal features. At certain points, lovely and picturesque walks and drives radiate from a centre, opening up charming vistas. There must be miles of roadway and pathway under the trees, and at every point some wealth of natural beauty is perceived. The skill of the landscape gardener has assisted Nature in shaping the lines of woody grounds of indescribable charm. The visitor feels that in the hands of Mr. Michael Heron, the gardener at Mount Stuart, the grounds and gardens are in safe keeping. Kitchen and fruit gardens, with plant-houses, attest to his devotion to his duties.

Not far from Rothesay, indeed on the outskirts of the town, resides Mr. James Dobbie, now in his seventy-eighth year, hale and hearty, and still devoted to his garden, spending the evening of his life in comfort and happiness. He lifted many vegetables, Beet, Turnips, and Leeks in particular, and many

flowers from low to high levels of quality; and he considers his work is not yet completed. While filling municipal office, he was an enthusiastic florist, growing Panais, Hollyhocks, &c., and joining in the fray on the exhibition stage. His enthusiasm led him to resign his ordinary avocation and start a florist and seed business in Rothesay, now finding rapid expansion in the hands of his successors Messrs. Cuthbertson, Birnie, and Fyfe. The business of Dobbie & Co. has become an important industry in Rothesay, and they are among the largest employers of labour. Mr. Alex. Lister, a famous Pansy grower and exhibitor, has a nursery here; he is a raiser of very fine fancy varieties, a grower and exhibitor of Dahlias, Carnations, &c. Near him is Mr. Michael Cuthbertson, who has an extensive collection of hardy plants, and like his neighbours, makes a speciality of Panais and Violas. And when the visitor is at Rothesay, it is impossible he should forego a steamboat trip through the renowned Kyle of Bute. On his way, he calls at Tigh-na-bruaich, a Gaelic word signifying "the house of the brae," and here, near the shore, Mr. Andrew Irvine, another famous Pansy grower, has a nursery. R. D.

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM SANGUINEUM, Rolfe, n. sp.*

A CRIMSON-FLOWERED *Dendrobium* is certainly something novel. No such species has before appeared in cultivation, so far as I have been able to discover, and if such an one has ever been described, I have failed to find it. Its existence, however, is now proved, and the merit of its discovery belongs to Messrs. Hugh Low & Co., of the Clapton Nursery, where the first flower expanded a few days ago. The plant has been submitted to Kew for determination, and has received the above name, in allusion to its unusual and brilliant colour. It belongs to the section *Clavipes*, and has slender stems about 3 feet long, with a fusiform thickened part, some 3 to 4 inches long, and with eight ridges near the base, in which respect it resembles *D. crumenatum*, Swartz. The flowers are solitary in the upper axils, and about an inch long, both the sepals and the broader obovate petals being crimson, except at the base in front, where they are marbled and spotted with the same colour on a whitish ground. The lip is small, much undulate in front, and whitish, with some purple lines and spots. It was introduced from Labuan, North Borneo, and will probably require similar treatment to other Malayan species. Unfortunately, the flowers do not last very long, a peculiarity common to several species of the group; but if the plant should prove easy to cultivate, and as floriferous as *D. crumenatum*, a good plant would be a very striking object. The flower produced is the first one after importation. In any case, it is a very interesting discovery, on account of its unique colour. R. A. Rolfe.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM URO-SKINNERI, CRAWSHAY'S VAR.

ALTHOUGH imported many years ago, *Odontoglossum Uro-Skinneri* is a rare plant, and fine varieties of it are always noteworthy. One of the

* *Dendrobium sanguineum*, Rolfe.—Stems slender, 3 feet high, with a thickened fusiform part near the base, 3 to 4 inches long, and with eight ridges. Leaves (very young) linear-oblong. Flowers solitary in the upper axils. Pedicels 5 lines long. Sepals lanceolate-oblong, subobtus, 3 lines broad; dorsal one 11 lines long, lateral ones 14 lines long. Petals spatulate-obovate, subobtus, 11 lines long, 5 lines broad. Lip 3-lobed, 8 lines long, 1½ lines broad; side-lobes small, erect; front-lobe oblong, obtuse, undulate; disc with thickened median line. Mentum saccate-oblong, 3 lines long. Column stout, 1 line long. Sepals and petals crimson in front, passing towards the base to whitish, spotted and marbled with crimson; wholly crimson behind. Lip whitish, with the front lined with purple, and the lines terminating in purple-brown spots at the margin; callus yellow. Native of Labuan, N. Borneo. R. A. Rolfe.

largest and best is in the possession of De B. Crawshay, Esq., at Rosefield, Sevenoaks. From the tip of the upper sepal to the apex of the lip the flower measures 2½ inches; the petals are ¾ inch wide, and the lip 1¼ inches across. The sepals and petals are pale greenish-white, evenly spotted with purplish-brown, the lower sepals being also flushed with purple. The lip is white, densely spotted with light rosy-lilac. Striking features in the flower beyond its size are the breadth and even arrangement of the segments, and the uniformity of their spotting.

CYPRIPEDIUM KIMBALLIANUM, Hort. Sander, Grey, in *American Gardening*.

With reference to the statement made by the writer in the *Orchid Review* (*Gardeners' Chronicle*, Sept. 7, p. 266), in explanation of his error respecting this plant, to the effect that there are two plants named *Cypripedium Kimballianum*, it would be well if he gave reference to the work in which the first one, which he calls *C. præstans*, was published. In his original note, he refers to *C. præstans Kimballianum*, which is properly figured and noted in the *Lindenia*, vol. vi., and it appears to be straining matters to drop the specific name, and thus set up a bogey in order to have the honour of knocking it down.

Cypripedium Kimballianum, as illustrated in the *Gardeners' Chronicle*, formed the text of the note in the *Orchid Review*, and there was no excuse for bringing in the other species mentioned, the statements about which are ancient history to Orchid growers.

The voluntary description of *C. Kimballianum*, too, given (*Gardeners' Chronicle*, Sept. 7, 1895), was equally unnecessary. The plant was properly described by Mr. Grey in *American Gardening*, and courtesy demands that the work of our American cousin should be recognised. J. O'B.

FRANCE.

M. GASTON CHANDON DE BRIAILLES is well-known as a lover of plants, especially of Orchids and Caladiums. His fine garden is well cultivated by his gardener, M. Dauvinat. Going through the houses, we noticed a new seedling Caladium named *Triomphe d'Épernay*. This variety is of dwarf and compact habit, with stout petioles, and leaves of a fine dull rose colour; it will soon become popular, and be used for the same purposes as are *C. minus erubescens* and *C. argyrites*. We were surprised to see two plants of *Agave americana* in full bloom, in tubs 2 feet square. The flower-spikes measure a foot in diameter at the base, and are nearly 8 yards in height, bearing numerous branches, with heavy umbels of yellow flowers, the whole plant suggesting an immense chandelier, was an unusual sight.

At LEMOINE'S Nursery, at Nancy, which establishment is as well known in England as on the continent, we admired a good collection of *Cannas* in bloom, and a splendid lot of *Phlox*, carefully selected for seed, the collection of dwarf white and rose varieties were excellent. We cannot say too much about the *Gladiolus*. The plants are only beginning to flower; thousands of spikes will soon be open, nearly all the blooms are extremely large, covering the spike, and the colours are brilliant and clear. Some blue and light purple varieties deserve special mention. Enormous quantities of *Montbretia* are here to be seen, amongst them many good new seedlings.

Another successful horticulturist is M. CROUSSE of Nancy. His tuberous *Begonia*s have for some time proved their superiority at many exhibitions, and their cultivation is successful owing to the care taken in selecting and saving good varieties only. Flowers, single and double, measuring 5 or 6 inches across are not uncommon, and the erect habit of the plants double their value. One interesting plant was noticed in this nursery, a hybrid *Streptocarpus*, *S. Wendlandii* × *S. controversus*, the plant is not yet named, but will soon be described, it seems to be free-flowering and quick growing. We hope, when describing this hybrid, to give also a photographic reproduction of it.

A well-known firm is that of BALTET FRÈRES, at Troyes. There we admired a splendid collection of Pear and Apple trees, and were particularly interested with the new process used for the cultivation of Pear trees in the chalky soil of Champagne. Young plants of *Cratægus Oxyacantha* are obtained from seed; this species will thrive in any calcareous soil even, if this is not deep. When these plants are established, *Cratægus Carrièrei* is grafted upon them, and the next year grafts of good varieties of Pears are inserted on the *Cratægus Carrièrei*. We saw the trees; some Pears were on them, though growing in such soil as Pear trees would never thrive upon. *Polygonum sachalinense* is here extensively grown; it has even been utilised for human food, and M. Baltet told me that the flavour of boiled *Polygonum* was much like that of Spinach.

Our visit to Troyes took place on July 28 last, and we were astonished to see on the walls some beautiful

Clapton, had *Dendrobium speciosissimum*, but the flowers were not in sufficiently good order to be appreciated.

At the VEGETABLE COMMITTEE a fine batch of twenty-five distinct varieties of Cucumber was staged by M. Vilmorin, and the floral committee voted a First-class Certificate to *Tillandsia Sieboldiana*, a beautiful and rare Mexican plant, little known in cultivation, and characterised by vermilion-red floral bracts, perpendicular to the spike, staged by M. Truffaut of Versailles. *George Truffaut*.

A FINE VINE.

THE following details respecting a Black Ham-burgh Vine in these gardens may be of interest to some of your readers (fig. 52). The Vine is twenty-five years old, and stands in the centre of a house 54 feet long by 13 feet wide, which it completely covers

Castle Gardens), who wrote of them, testifying to their excellence when cultivated under glass. I have grown them only to a limited extent in pots in orchard-houses, but could easily appreciate the fine flavour which the fruit would attain when grown in warmth and given abundance of air. Even on a south wall, the improvement of flavour is great compared with that of fruit from a northerly aspect. In size the Morello Cherries I have seen in Wiltshire and around Bath were finer than I have seen anywhere. In a Scottish town Morello Cherries have been produced in quantity on an old tree whose roots were firmly embedded in soil under the pavement, and where moisture must have reached the roots with difficulty. These Cherry trees never required pruning, though in hot, dry quarters, during the summer months, the foliage always remained healthy, and the fruit was very dark in colour.

On a south-east wall, where the soil about the roots of Morello Cherries is composed of strong loam and lime-rubbish, crammed as tightly together as possible, and where a road with much traffic passes over the border, there are heavy crops of Morello Cherries every year, and during the present season the crop required to be thinned. It is of great moment to cultivate the trees so that little pruning is necessary, and the natural spurs and short growths then formed render the trees safe from canker. On a north wall, and one due east, we do not always get heavy crops, and the fruit is more acid than on the trees facing south-east. This year many of the trees, for want of time (by reason of the continuous late frost), were left untied, and with little pruning. These mostly set heavy crops of fruit; but we never at any time had to contend so much with grubs, hand-picking was done, and this was followed up by applications of soft soapy-water, in which was mixed hellebore-powder. While in north aspects in Scotland I should be inclined to train Morello Cherries close to walls, in positions where sun had full power, I should prefer allowing the wood to grow outward somewhat, and by attention to keeping the roots in very firm soil, with plenty of lime in it, the growths would be short and fruitful.

§ An object-lesson on the good culture of Morello Cherries I once had at the Royal Gardens, Windsor, many years ago, when on a visit to the late Mr. Rose. The young-bearing wood was short, and allowed to hang from main branches untouched. The crop of fruit was immense. Though good Morello Cherries can be grown in quantity on standard bush-trees in some places, those fruited on such in Scotland are very poor. *M. Temple, Carron, N.B.*

FIG 52.—VINE AT HACKTHORN HALL, LINCOLN.

ripe Nectarines. We soon learned that the fruit was a quite new variety raised from seed by Mr. Lucien Baltet, who has given it his own name. This Nectarine, which is of a fine deep colour, is a seedling of the *Précoce* of Cronsels, which directly resulted from a seedling of *Amsden Peach*. The curious fact so often commented upon of a Nectarine being raised from a Peach stone was, in this case, absolutely borne out. We found the new Nectarine, L. Baltet, of delicious flavour, and so also thought the members of the Fruit Committee at the last meeting of the Society in Paris.

LÆLIO-CATTLEYA ANDREANA, &c.—A very good plant, shown to the ORCHID COMMITTEE (Paris) lately, was a hybrid between *Cattleya bicolor* and *Lælia elegans*. This *Lælio-Cattleya*, named L.-C. *Andreana* by the raiser, M. Maron, gardener at M. L. Farnier's, Marseilles, is quite a distinct variety. The flower is rather larger than that of *C. bicolor*; the divisions are of a creamy-rose colour, the lip presenting an unusually long middle lobe of a dull magenta colour. The upright pseudo-bulb is cylindrical, with two leaves; the variety seems free-growing; it was first sown in 1890. Mr. Low, of

It springs from a single upright stem, the girth of which is 1 foot, and which sends out two horizontal branches in opposite directions. From these descend ten smaller branches, which follow the slope of the roof. The Vine is always very clean and healthy, and is now bearing 390 bunches of well-coloured Grapes. I should be interested to know if there are many larger Vines in private gardens. *E. W. Cracroft, Hackthorn Hall, Lincoln.*

NOTES ON MORELLO CHERRY CULTURE.

SELDOM is the crop of Morello Cherries in a private garden larger than necessary, there being so many ways in which the fruit can be used. We do not use the fruit for dessert much in this country, but I believe it is so used in southern Europe, and also in Britain if the fruit has been grown under glass. The trees are, however, more often planted at the foot of walls with northern aspect than elsewhere, yet when they are grown under clear glass, exposed to full sun, the fruit is much changed in flavour. I think it was Mr. Knight (when at Floors

PLANT NOTES.

IMPROVED VARIETIES OF CANNA.

Two houses full of these plants at the Royal Horticultural Society's Gardens, Chiswick, are now looking remarkably well. They combine fine ornamental foliage with blossoms, which rival *Gladioli* in their beauty, and they last in good condition much longer than the latter. These plants require liberal treatment, and a certain amount of protection in order to flower them perfectly in this country. If nothing else was to be seen at these gardens, the *Cannas* alone would be worth a visit; but I noted many other interesting and instructive things in the brief time at my disposal.

CLEMATIS DAVIDIANA.

This plant is at present flowering well in the borders at the Royal Horticultural Society's Gardens, Chiswick, and its sweet-scented lavender-coloured flowers compel one's attention. It appears to require a warm climate, as it does not succeed half so well with me at Belvoir, although it is growing in a sheltered position. Such a beautiful plant is well worthy of a place under glass, where space admits of it, and if specimen plants were in fashion, it would prove a good thing for exhibition purposes. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

PANCRATIUM CANARIENSE.

Those who have before them the recently-issued part of the *Journal of the Royal Horticultural Society*, in which is an extremely interesting and important account of "the Plants and Gardens of the Canary Islands," by Dr. Morris, the Assistant-Director at Kew, may be interested to know that *Panocratium canariense* is now flowering in the Botanic Gardens at Cambridge. It is one of the three species of bulbous plants said to be specially noteworthy, the other two being kinds of *Romulea*. As a garden plant it is decidedly pretty, but without much showiness. It is quite a distinct plant, most nearly allied, perhaps, to *P. maritimum*, though smaller in all its parts, except for the longer scape, and in common with all the other species that has white flowers. In a 6-inch pot we have one flowering bulb with several others, which bear ensiform glaucous leaves about 14 inches long. The scape exceeds 2 feet, and supports an umbel of a dozen flowers, two or three of which open at the same time. The perianth segments are narrow, and spread about 2½ inches; the staminal cup is broadly campanulate, with a diameter of 1½ inches. This specimen is placed in an intermediate-house, and flourishes with usual treatment. *R. J. L.*

BROWALLIA SPECIOSA MAJOR.

This charming greenhouse plant was seen in excellent character at the recent exhibition of the Trowbridge Horticultural Society. The foliage and flowers alike are much larger, bolder, and more striking in appearance than those of the well-known form of *B. elata*. It appears to be very free, and the deep hue of blue in the flowers makes it valuable for associating with other plants in the decoration of the greenhouse. It is one of the novelties introduced by Messrs. F. Sander & Co., and it gained an Award of Merit from the Royal Horticultural Society in 1894. It only requires to be known in order to be widely grown.

PELARGONIUM (DECORATIVE) MADAME CHARLES KOENIG.

The value of this variety for cutting purposes is shown by the fact that Mr. W. Richardson, the manager at Messrs. Balchin & Sons' nurseries at Hassocks, has cut during the space of twenty weeks as many as 12,050 trusses from 230 plants, and they are still full of buds. Mr. Richardson considers it to be the finest of the white-flowered decorative varieties, and in his experience there is none other so free-flowering. That is one reason why it is grown so largely at the Hassocks nursery; another is, that it is in great demand.

FUCHSIA COCCINEA.

Whether or no this represents the original species which Mr. James Lee purchased at Wapping so many years ago I cannot say with certainty, but I call attention to it for the purpose of saying what a pretty shrub it makes in the open border. I saw little bushes of it at Messrs. J. Cheal & Sons' Lowfield Nurseries, Crawley, a few days ago, forming a part of the second line of a mixed border, and very pretty it was, and singularly free. I think this species, mingled with *Agathea cœlestis* and a white *Viola* like *Sylvia*, or the tinted *William Niel*, would make a charming combination for a summer bed. I presume the plants at the Lowfield nurseries had passed through the rigours of last winter without any harm to the root stock. *R. D.*

CHRYSANTHEMUM × PRINCESS MAY.

In our issue for August 17, special mention was made of a very fine collection of new single-flowered hybrid annual *Chrysanthemums*, which were exhibited by Mr. Henry Brownhill, seedsman, Sale. We now give an illustration of one of the best of these (fig. 53, p. 295), known as *Princess May*. The flower is white, with a deep yellow ring round an orange disc, the florets are broad, and the flower of excellent shape and decorative value. These hybrids, obtained by crossing *C. coronarium* with *C. carinatum*, may be propagated by means of cuttings.

BOTANICAL SECTION OF THE BRITISH ASSOCIATION.

THE annual meeting of the association is in progress at Ipswich. The public business was opened on Wednesday by an address from the President, Sir Douglas Galton, who gave an account of the progress of science generally during the last sixty-five years, prefacing it with a few remarks on the career and personality of the late Prof. Huxley. On Thursday the business of the several sections began. The Botanical Section was opened by an address from Mr. W. T. Thiselton Dyer, C.M.G., the Director of the Royal Gardens, Kew, the substance of which we give in part in the following columns.

RETROSPECT.—I confess I found it a great temptation to review, however imperfectly, the history and fortunes of our subject while it belonged to section D. But to have done so would have been practically to have written the history of botany in this country since the first third of the century. Yet I cannot pass over some few striking events.

BAUER AND ROBERT BROWN.

I think that the earliest of these must undoubtedly be regarded as the most epoch-making. I mean the formal publication by the Linnean Society, in 1833, of the first description of "the nucleus of the cell," by Robert Brown.* It seems difficult to realise that this may be within the recollection of some who are now living amongst us. It is, however, of peculiar interest to me that the first person who actually distinguished this all-important body, and indicated it in a figure, was Francis Baner, thirty years earlier, in 1802. This remarkable man, whose skill in applying the resources of art to the illustration of plant anatomy has never, I suppose, been surpassed, was "resident draughtsman for fifty years to the Royal Botanic Garden at Kew." And it was at Kew, and in a tropical Orchid, *Phaius grandifolius*, no doubt grown there, that the discovery was made.

It was, I confess, with no little admiration that, on refreshing my memory by a reference to Robert Brown's paper, I read again the vivid account which he gives in a footnote of the phenomena, so painfully familiar to many of us who have been teachers, exhibited in the staminal hair of *Tradescantia*. Sir Joseph Hooker† has well remarked that "the supreme importance of this observation, . . . leading to undreamt-of conceptions of the fundamental phenomena of organic life, is acknowledged by all investigators." It is singular that so profound an observer as Robert Brown should have himself missed the significance of what he saw. The world had to wait for the discovery of protoplasm by Von Mohl till 1846, and till 1850 for its identification with the sarcode of zoologists by Cohn, who is still, I am happy to say, living and at work, and to whom last year the Linnean Society did itself the honour of presenting its medal.

The Edinburgh meeting of the Association, in 1834, was the occasion of the announcement of another memorable discovery of Robert Brown's. I will content myself with quoting Hofmeister's‡ account of it. "Robert Brown was the discoverer of the polyembryony of the Coniferae. In a later treatise he pointed out the origin of the pro-embryo in large cells of the endosperm, to which he gave the name of corpuscula." The period of the forties, just half a century ago, looks in the retrospect as one of almost dazzling discovery. To say nothing of the formal appearance of protoplasm on the scene, the foundations were being laid in all directions of our modern botanical morphology. Yet its contemporaries viewed it with a very philosophical calm. Thwaites, who regarded Carpenter as his master, described at the Oxford meeting in 1847 the conjugation of the Diatomaceae, and "distinctly indicated," as Carpenter§ says, "that conjugation is the primitive phase of sexual reproduction." Berkeley informed me that the announcement fell perfectly flat. A year or two later Suminski came to London with his splendid discovery (1848) of the archegonia of the

Fern, the antheridia having been first seen by Nägeli in 1844. Carpenter* gave me, many years after, a curious account of its reception. "At the Council of the Ray Society, at which," he said, "I advocated the reproduction of Suminski's book on the Ferns, I was assured that the close resemblance of the antherozoids to spermatozoa was quite sufficient proof that they could have nothing to do with vegetable reproduction. "I do not think," he added—and the complaint is pathetic—"that the men of the present generation, who have been brought up in the light, quite apprehend (in this as in other matters) the utter darkness in which we were then groping, or fully recognise the deserts of those who helped them to what they now enjoy." This was in 1875, and I suppose is not likely to be less true now.

DARWIN, HUXLEY, HOOKER.

The Oxford Meeting in 1860 was the scene of the memorable debate on the origin of species, at which it is interesting to remember that Henslow presided. On that occasion Section D reached its meridian. The battle was Homeric. However little to the taste of its author, the launching of his great theory was, at any rate, dignified with a not inconsiderable explosion. It may be that it is not given to the men of our day to ruffle the dull level of public placidity with disturbing and far-reaching ideas. But if it were, I doubt whether we have, or need now, the fierce energy which inspired then either the attack or the defence. When we met again in Oxford last year the champion of the old conflict stood in the place of honour, acclaimed of all men, a beautiful and venerable figure. We did not know then that that was to be his farewell.

The battle was not in vain. Six years afterwards, at Nottingham, Sir Joseph Hooker delivered his classical lecture on *Inular Florae*. It implicitly accepted the new doctrine, and applied it with admirable effect to a field which had long waited for an illuminating principle. The lecture itself has since remained one of the corner-stones of that rational theory of the geographical distribution of plants which may, I think, be claimed fairly as of purely English origin.

HENSLOW.

Addressing you as I do at Ipswich, there is one name written in the annals of our old Section which I cannot pass over—that of Henslow. He was the Secretary of the Biological Section at its first meeting in 1832, and its President at Bristol in 1836. I suppose there are few men of this century who have indirectly more influenced the current of human thought. For in great measure I think it will not be contested that we owe Darwin to him. As Romanes has told us: "His letters written to Professor Henslow during his voyage round the world overflow with feelings of affection, veneration, and obligation to his accomplished master and dearest friend—feelings which throughout his life he retained with no diminished intensity. As he used himself to say, before he knew Professor Henslow the only objects he cared for were foxes and partridges." I do not wish to overstate the facts. The possession of "the collector's instinct, strong in Darwin from his childhood, as is usually the case in great naturalists," to use Huxley's‡ words, would have borne its usual fruit in after life, in some shape or other, even if Darwin had not fallen into Henslow's hands. But then the particular train of events which culminated in the great work of his life would never have been started. It appeared to me, then, that it would not be an altogether uninteresting investigation to ascertain something about Henslow himself. The result has been to provide me with several texts, which I think it may be not unprofitable to dwell upon on the present occasion.

In the first place, what was the secret of his influence over Darwin? "My dear old master in *Natural History*" (*Life*, ii. 317), he calls him; and to have stood in this relation to Darwin§ is no small matter.

* *Loc. cit.*, 141. † *Memorial Notices*, 13.

‡ *Proc. R.S.*, xlv., vi.

§ As I shall have frequent occasion to quote the *Life and Letters*, I shall insert the references in the text.

* *Misc. Bot. Works*, i. 512. † *Higher Cryptogamia*, 432.

‡ *Proc. Linn. Soc.*, 1887—88, 65. § *Memorial Sketch*, 140.

Again, he speaks of his friendship with him as "a circumstance which influenced my whole career more than any other" (i. 52). The singular beauty of Henslow's character, to which Darwin himself bore noble testimony, would count for something, but it would not in itself be a sufficient explanation. Nor was it that intellectual fascination which often binds pupils to the master's feet; for, as Darwin tells us, "I do not suppose that anyone would say that he possessed much original genius" (i. 52). The real attraction seems to me to be found in Henslow's possession, in an extraordinary degree, of what may be called the Natural History spirit. This resolves itself into keen observation and a lively interest in

to be looked at again; or perhaps writes a paper on some obvious phenomena which he could have studied with less fatigue in the Palm-house at Kew.

The secret of the right use of travel is the possession of the natural history instinct, and to those who contemplate it I can only recommend a careful study of Darwin's *Naturalist's Voyage*. Nothing that came in his way seems to have evaded him, or to have seemed too inconsiderable for attention. No doubt some respectable travellers have lost themselves in a maze of observations that have led to nothing. But the example of Darwin, and I might add of Wallace, of Huxley, and of Moseley, show

history in the University previous to his taking up his residence there." The Professor of Botany had delivered no lectures for thirty years, and though Sir James Smith, the founder of the Linnean Society, had offered his services, they were declined on the ground of his being a Nonconformist.*

As to Henslow's own scientific work, I can but rely on the judgment of those who could appreciate it in relation to its time. According to Berkeley,† "he was certainly one of the first, if not the very first, to see that two forms of fruit might exist in the same fuogua." And this, as we now know, was a fundamental advance in this branch of morphology, Sir Joseph Hooker tells me that his papers were all distinctly in advance of his day. Before occupying the chair of botany, he held for some years that of mineralogy. Probably he owed this to his paper on the Isle of Anglesey, published when he was only twenty-six. I learn from the same authority that this to some extent anticipated, but at any rate strongly influenced, Sedgwick's subsequent work in the same region.

BOTANICAL TEACHING.

Henslow's method of teaching deserves study Darwin says of his lectures "that he liked them much for their extreme clearness." "But," he adds, "I did not study botany" (i. 48). Yet we must not take this too seriously. Darwin,‡ when at the Galapagos, "indiscriminately collected everything in flower on the different islands, and fortunately kept my collections separate." Fortunately indeed; for it was the results extracted from these collections, when worked up subsequently by Sir Joseph Hooker, which determined the main work of his life. "It was such cases as that of the Galapagos Archipelago which chiefly led me to study the origin of species" (iii. 159).

Henslow's actual method of teaching went some way to anticipate the practical methods of which we are all so proud. "He was the first to introduce into the botanical examination for degrees in London the system of practical examination."§ But there was a direct simplicity about his class arrangements characteristic of the man. "A large number of specimens . . . were placed in baskets on a side-table in the lecture-room, with a number of wooden plates and other requisites for dissecting them after a rough fashion, each student providing himself with what he wanted before taking his seat."|| I do not doubt that the results were, in their way, as efficient as we obtain now in more stately laboratories.

The most interesting feature about his teaching was not, however, its academic aspect, but the use he made of botany as a general educational instrument. "He always held that a man of no powers of observation was quite an exception."¶ He thought (and I think he proved) that botany might be used "for strengthening the observant faculties and expanding the reasoning powers of children in all classes of society."** The difficulty with which those who undertake now to teach our subject have to deal is that most people ask the question, What is the use of learning botany unless one means to be a botanist? It might indeed be replied that as the vast majority of people never learn anything effectively, they might as well try botany as anything else. But Henslow looked only to the mental discipline; and it was characteristic of the man and of his belief in his methods that when he was summoned to Court to lecture to the Royal family, his lectures "were in all respects, identical with those he was in the habit of giving to his little Hitcham scholars";†† and it must be added that they were not less successful.

This success naturally attracted attention. Botanical teaching in schools was taken up by the Government, and continues to receive support to the present day. But the primitive spirit has, I am afraid, evaporated. The measurement of results by means of examination has been fatal to its survival. The teacher has to keep steadily before his eyes the

FIG. 53.—NEW MARGUERITE CHRYSANTHEMUM × PRINCESS MAY: WHITE, WITH A YELLOW RING. (SEE P. 294.)

the facts observed. "His strongest taste was to draw conclusions from long-continued minute observations" (i. 52). The old natural history method, of which it seems to me that Henslow was so striking an embodiment, is now, and I think unhappily, almost a thing of the past. The modern university student of botany puts his elders to blush by his minute knowledge of some small point in vegetable histology. But he can tell you little of the contents of a country hedgerow; and if you put an unfamiliar plant in his hands he is pretty much at a loss how to set about recognising its affinities. Disdaining the field of Nature spread at his feet in his own country, he either seeks salvation in a German laboratory or hurries off to the Tropics, convinced that he will at once immortalise himself. But "cælum non animus mutat;" he puts into "pickle" the same objects as his predecessors, never

that the result is the fault of the man and not of the method. The right moment comes when the fruitful opportunity arrives to him who can seize it. The first strain of the prelude with which the *Origin* commences are these words: "When on board H.M.S. 'Beagle' as naturalist, I was much struck with certain facts in the distribution of the organic beings inhabiting South America." But this sort of vein is not struck at hazard or by him who has not served a tolerably long apprenticeship to the work.

When one reads and re-reads the *Voyage*, it is simply amazing to see how much could be achieved with a previous training which we now should think ludicrously inadequate. Before Henslow's time the state of the natural sciences at Cambridge was incredible. In fact, Leonard Jenyns,* his biographer, speaks of the "utter disregard paid to natural

* *Memoir*, 175.

†† *Ibid.*, 99.

‡‡ *Memoir*, 149.

necessity of earning his grant. The educational problem retires into the background. "The strengthening of the observant faculties," and the rest of the Henslowian programme must give way to the imperious necessity of presenting to the examiner candidates equipped with at least the minimum of text-book formulae reproducible on paper. I do not speak in this matter without painful experience. The most astute examiner is defeated by the still more astute crammer. The objective basis of the study on which its whole usefulness is built up is promptly thrown aside. If you supply the Appleblossom for actual description, you are as likely as not to be furnished with a detailed account of a Buttercup. The training of observation has gone by the board, and the exercise of mere memory has taken its place. But a table of logarithms or a Hebrew grammar would serve this purpose equally well. Yet I do not despair of Henslow's work still bearing fruit. The examination system will collapse from the sheer impossibility of carrying it on beyond a certain point. Freed from its trammels, the teacher will have greater scope for individuality, and the result of his labours will be rewarded after some intelligent system of inspection. And here I may claim support from an unexpected quarter. Mr. Gladstone has recently written to a correspondent:—"I think that the neglect of natural history, in all its multitude of branches, was the grossest defect of our old system of training for the young; and, further, that little or nothing has been done by way of remedy for that defect in the attempts made to alter or reform that system." I am sure that the importance and weight of this testimony, coming as it does from one whose training and sympathies have always been literary, cannot be denied. That there is already some revival of Henslow's methods, I judge from the fact that I have received applications from Board schools, amounting to some hundreds, for surplus specimens from the Kew museum. Without a special machinery for the purpose I cannot do much, and perhaps it is well. But my staff have willingly done what was possible, and from the letters I have received I gather that the labour has not been wholly mispent.

MUSEUM ARRANGEMENT.

This leads me to the last branch of Henslow's scientific work on which I am able to touch, that of the arrangement of museums, especially those which being local have little meaning unless their purpose is strictly educational. I think it is now generally admitted that, both in the larger and narrower aspects of the question, his ideas, which were shared in some measure by Edward Forbes, were not merely far in advance of his times, but were essentially sound. And here I cannot help remarking that the zoologists have perhaps profited more by his teaching than the botanists. I do not know how far Sir William Flower and Professor Lankester would admit the influence of Henslow's ideas. But, so far as my knowledge goes, I am not aware that, at any rate in Europe, there is anything to be seen in public museums comparable to the educational work accomplished by the one at the College of Surgeons and the Natural History Museum, and by the other at Oxford.

I have often thought it singular that in botany we have not kept pace in this matter with our brother naturalists. I do not doubt that vegetable morphology and a vast number of important facts in evolution, as illustrated from the vegetable kingdom, might be presented to the eye in a fascinating way in a carefully-arranged museum. The most successful and, indeed, almost the only attempt which has been made in this direction is that at Cambridge, which, I believe, is due to Mr. Gardiner. But our technical methods for preserving specimens still leave much to desire. Something more satisfactory will, it may be hoped, some day be devised, and the whole subject is one which is well worth the careful consideration of our Section. Henslow at least effected a vast improvement in the mode of displaying botanical objects; and a collection prepared by his own hands, which was exhibited at one of the Paris exhibitions,

excited the warm admiration of the French botanists, who always appreciate the clear illustration of morphological facts.

OLD SCHOOL OF NATURAL HISTORY.

If the old school of natural history of which Henslow in his day was a living spirit is at present, as seems to be the case, continually losing its hold upon us, this has certainly not been due to its want of value as an educational discipline, or to its sterility in contributing new ideas to human knowledge. Darwin's *Origin of Species* may certainly be regarded as its offspring, and of this Huxley* says with justice: "It is doubtful if any single book, except the *Principia*, ever worked so great and rapid a revolution in science, or made so deep an impression on the general mind." Yet Darwin's biographer, in that admirable *Life* which ranks with the few really great biographies in our language, remarks (i. 155): "In reading his books one is reminded of the older naturalists rather than of the modern school of writers. He was a naturalist in the old sense of the word, that is, a man who works at many branches of science, not merely a specialist in one." This is no doubt true, but does not exactly hit off the distinction between the kind of study which has gone out of fashion and that which has come in. The older workers in biology were occupied mainly with the external or, at any rate, grosser features of organisms and their relation to surrounding conditions; the modern, on the other hand, are engaged on the study of internal and intimate structure. Work in the laboratory, with its necessary limitations, takes the place of research in the field. One may almost, in fact, say that the use of the compound microscope divides the two classes. Asa Gray has compared Robert Brown with Darwin as the "two British naturalists" who have, "more than any others, impressed their influence upon science in the nineteenth century."† Now it is noteworthy that Robert Brown did all his work with a simple microscope. And Francis Darwin writes of his father: "It strikes us nowadays as extraordinary that he should have no compound microscope when he went his 'Beagle' voyage; but in this he followed the advice of Robert Brown, who was an authority on such matters" (i. 145). One often meets with persons, and sometimes of no small eminence, who speak as if there were some necessary antagonism between the old and the new studies. Thus I have heard a distinguished systematist describe the microscope as a curse, and a no less distinguished morphologist speak of a herbarium having its proper place on a bonfire. To me I confess this anathematization of the instruments of research proper to any branch of our subject is not easily intelligible. Yet in the case of Darwin himself it is certain that if his earlier work may be said to rest solely on the older methods, his later researches take their place with the work of the new school. At our last meeting Pfeffer vindicated one of his latest and most important observations.

The case of Robert Brown is even more striking. He is equally great whether we class him with the older or the modern school. In fact, so far as botany in this country is concerned, he may be regarded as the founder of the latter. It is to him that we owe the establishment of the structure of the ovule and its development into the seed. Even more important were the discoveries to which I have already referred, which ultimately led to the establishment of the group of Gymnosperms. "No more important discovery," says Sachs,‡ "was ever made in the domain of comparative morphology and systematic botany. The first steps towards this result, which was clearly brought out by Hofmeister twenty-five years later, were secured by Robert Brown's researches, and he was incidentally led to these researches by some difficulties in the construction of the seed of an Australian genus." Yet it may be remembered that he began his career as naturalist to Flinders' expedition for the exploration of Australia.

He returned to England with 4,000 "for the most part new species of plants." And these have formed the foundation of our knowledge of the flora of that continent. Brown's chief work was done between 1820 and 1840, and, as Sachs* tells us, "was better appreciated during that time in Germany than in any other country."

MODERN SCHOOL.

The real founder of the modern teaching in this country in both branches of biology I cannot doubt was Carpenter. The first edition of his admirable *Principles of Comparative Physiology* was published in 1838, the last in 1854. All who owe, as I do, a deep debt of gratitude to that book will agree with Huxley† in regarding it as "by far the best general survey of the whole field of life and of the broad principles of biology which had been produced up to the time of its publication. Indeed," he adds, "although the fourth edition is now in many respects out of date, I do not know its equal for breadth of view, sobriety of speculation, and accuracy of detail."

The charm of a wide and philosophic survey of the different forms under which life presents itself could not but attract the attention of teachers. Rolleston elaborated a course of instruction in zoology at Oxford in which the structures described in the lecture-room were subsequently worked out in the laboratory. In 1872 Huxley organized the memorable course in elementary biology at South Kensington which has since, in its essential features, been adopted throughout the country. In the following year, during Huxley's absence abroad through ill-health, I arranged, at his request, a course of instruction on the same lines for the vegetable kingdom.

That the development of the new teaching was inevitable can hardly be doubted, and I for my part am not disposed to regret the share I took in it. But it was not obvious, and certainly it was not expected, that it would to so large an extent cut the ground from under the feet of the old natural history studies. The consequences are rather serious, and I think it is worth while pointing them out.

In a vast empire like our own there is a good deal of work to be done and a good many posts to be filled, for which the old natural history training was not merely a useful but even a necessary preparation. But at the present time the universities almost entirely fail to supply men suited to the work. They neither care to collect, nor have they the skilled aptitude for observation. Then, though this country is possessed at home of incomparable stores of accumulated material, the class of competent amateurs who were mostly trained at our universities and who did such good service in working that material out is fast disappearing. It may not be easy indeed in the future to fill important posts even in this country with men possessing the necessary qualifications. But there was still another source of naturalists, even more useful, which has practically dried up. It is an interesting fact that the large majority of men of the last generation who have won distinction in this field have begun their career with the study of medicine. That the kind of training that natural history studies give is of advantage to students of medicine which, rightly regarded, is itself a natural history study, can hardly be denied. But the exigencies of the medical curriculum have crowded them out; and this, I am afraid, must be accepted as irremediable. I cannot refrain from reading you, on this point, an extract from a letter which I have received from a distinguished official lately entrusted with an important foreign mission. I should add that he had himself been trained in the old way:—

"I have had my time, and must leave to younger men the delight of working these interesting fields. Such chances never will occur again, for roads are now being made and ways cut in the jungle and forest, and you have at hand all sorts of trees level

* *Proc. R. S.*, xlv, xvii.

† *Nature*, x, 80.
History, 142.

* *Loc. cit.*, 139, 140.
Memorial Sketch, 67.

on the ground ready for study. These bring down with them Orchids, Ferns, and climbers of many kinds, including Rattan Palms, &c. But, excellent as are the officers who devote their energy to thus opening up this country, there is not one man who knows a Palm from a Dragon-tree, so the chance is lost. Strange to say, the medical men of the Government service know less and care less for natural history than the military men, who at least regret they have no training or study to enable them to take an intelligent interest in what they see around them. A doctor now-a-days cares for no living thing larger or more complicated than a bacterium or a bacillus."

But there are other and even more serious grounds why the present dominance of one aspect of our subject is a matter for regret. In the concluding chapter of the *Origin*, Darwin wrote: "I look with confidence to the future—to young and rising naturalists." But I observe that most of the new writers on the Darwinian theory, and, oddly enough, especially when they have been trained at Cambridge, generally begin by more or less rejecting it as a theory of the origin of species, and then proceed unhesitatingly to reconstruct it. The attempt rarely seems to me successful, perhaps because the limits of the laboratory are unfavourable to the accumulation of the class of observations which are suitable for the purpose. The laboratory, in fact, has not contributed much to the Darwinian theory, except the *Law of Recapitulation*, and that, I am told, is going out of fashion.

The Darwinian theory, being, as I have attempted to show, the outcome of the natural history method, rested at every point on a copious basis of fact and observation. This more modern speculation lacks. The result is a revival of transcendentalism. Of this we have had a copious crop in this country, but it is quite put in the shade by that with which we have been supplied from America. Perhaps the most remarkable feature is the persistent vitality of Lamarckism. As Darwin remarks: "Lamarck's one suggestion as to the cause of the gradual modification of species—effort excited by change of conditions—was, on the face of it, inapplicable to the whole vegetable world" (ii. 189). And if we fall back on the inherited direct effect of change of conditions, though Darwin admits that "physical conditions have a more direct effect on plants than on animals" (ii. 319), I have never been able to convince myself that that effect was inherited. I will give one illustration. The difference in habit of even the same species of plant when grown under mountain and lowland conditions is a matter of general observation. It would be difficult to imagine a case of "acquired characters" more likely to be "inherited." But this does not seem to be the case. The recent careful research of Gaston Bonnier only confirms the experience of cultivators. "The modifications acquired by the plant when transported for a definite time from the plains to the Alps, or *vice versa*, disappear at the end of the same period when the plant is restored to its original conditions."*

Darwin, in an eloquent passage, which is too long for me to quote,† has shown how enormously the interest of natural history is enhanced "when we regard every production of Nature as one which has had a long history," and "when we contemplate every complex structure . . . as the summing up of many contrivances." But this can only be done, or at any rate begun, in the field and not in the laboratory.

A more serious peril is the dying out amongst us of two branches of botanical study in which we have hitherto occupied a position of no small distinction. Apart from the staffs of our official institutions, there seems to be no one who either takes any interest in, or appreciates in the smallest degree, the importance of systematic and descriptive botany. And geographical distribution is almost in a worse plight, yet Darwin calls it, "that grand subject, that almost keystone of the laws of creation" (i. 356).

I am aware that it is far easier to point out an evil than to remedy it. The teaching of botany at the present day has reached a pitch of excellence and earnestness which it has never reached before. That it is somewhat one-sided cannot probably be remedied without a subdivision of the subject and an increase in the number of teachers. If it has a positive fault, it is that it is sometimes inclined to be too dogmatic and deductive. Like Darwin, at any rate in a biological matter, "I never feel convinced by deduction, even in the case of H. Spencer's writings" (iii. 168). The intellectual indolence of the student inclines him only too gladly to explain phenomena by referring them to "isms," instead of making them tell their own story.

(To be continued.)

VEGETABLES.

VEGETABLES AT HIGHCLERE.

ALTHOUGH Mr. Pope, the gardener at Highclere, is noted for his success in exhibiting vegetables, it should not be assumed that the growth of produce for exhibition absorbs his whole interest. To a gardener of such experience and personal knowledge of vegetables, the testing of new varieties is an agreeable and interesting employment. To visitors this is an important item, as one is sure to see much that is new and interesting. When visiting Highclere just previous to the great Shropshire show, I had an opportunity of seeing some of the specimens in course of preparation for that meeting. The kitchen garden appears especially well adapted to vegetable culture, particularly in such a season as the present; the aspect is a westerly one, having a sharp slope in that direction. A dry summer exactly suits such a garden, for owing to the great depth of soil, and the cooler condition of the garden itself, consequent upon its aspect, the vegetable crops have positively revelled, even during the fierce heat. A tablet over one of the entrances to the garden discloses the fact that the garden has been in existence over 100 years.

Potatoes are made a strong point in collections of vegetables shown by Mr. Pope, for he rightly considers this vegetable the most important of all. Satisfaction is a favourite variety for exhibition, as it combines good form with a clean skin, and, what is more, its cooking qualities are of the highest. Sutton's Seedling is also a favourite, and it too combines all the qualities that make Potatoes valuable. Windsor Castle is esteemed highly, and so is Reading Russet and Prizetaker; the latter has excellent quality here. Mr. Pope does not believe in the crowding method of Potato culture. Abundant space is allowed them here, that they may make a full development of haulm and foliage.

Onions are remarkably well grown, not only for exhibition but as a crop for home use. For the former purpose, some magnificent bulbs were seen; many samples of Excelsior—a variety raised by Cranston—I noted that measured 18 inches in circumference, and it is regarded the finest Onion for exhibition in cultivation. It is sometimes thought that such Onions as these are useless for any other purpose; but this is an error—they will and do keep sound until April. The seed is sown in a gentle heat in January, and the plants are pricked off into boxes of rich soil, grown on gradually, and thoroughly hardened off before finally planting out. Although the weather has been both hot and dry, no watering has been done, but heavy mulchings of Mushroom-bed manure were employed. Anglo-Spanish and Lord-Keeper, too, are prized for exhibition.

The Main Crop varieties, which are grown in large quantity, are thinned but little, and the bulbs thoroughly wedged each other in the rows. Mr. Pope thinks highly of the Southport Red and Yellow Globe varieties, as they are deeply-formed bulbs, strong objection being taken to those that are remarkable only for width. Walker's Exhibition is an excellent cropper; Veitch's Main Crop is an established favourite, and so is Bedfordshire Cham-

panion, and the Wrocton; the latter has especially long bulbs. Giant Zittan is promising, and so is Sandringham. Messrs. Sutton's recent addition, Magnum Bonum, is flatter, but nevertheless promising. Celery culture here is remarkably good. The old-fashioned plan of blanching it with soil is not followed, but sheets of brown-paper are used. The latter is much better for exhibition purposes, inasmuch as it prevents slugs injuring the outer leaves. Abundance of rich food is required to grow really good succulent Celery in August and September. Standard-bearer, Laing's Mammoth, red and white, along with a dwarf-growing red variety, resembling Sutton's AI, are the varieties grown.

At Highclere, extra-large heads of Cauliflowers are not favoured, medium-sized closely grown, pure white heads are those selected; Magnum Bonum, Eclipse, and Autumn Giant, are the kinds preferred. Deep stirring of the soil, combined with heavy manuring, are the points to observe in growing Cauliflowers. Brussels Sprouts at the time of my visit were quite a yard high, the stems already packed with close fine heads. It is useless to expect a full crop of buttons if they are not formed before September is in. For the October and November shows, early sowings and liberal cultivation are the chief points to observe. Especially good are the Carrots; they are not over-large, but perfect in form and colour. The soil here is just suitable for this crop. New Intermediate is the variety depended upon. So well do they grow here, that Mr. Pope drew out of the ground but nineteen roots from which to select the eighteen he staged at the Southampton show in three collections. Mr. Pope grows the bulk of his Tomatoes in a low pit in shallow boxes, training them like Cucumbers under the glass, and smooth fruits of the Perfection type are those grown. Polegate he regards very favourably as being large enough and perfect in form, without the ugly dimple in the centre so objectionable in many varieties. Plants growing against a wall out-of-doors and at the foot of a Yew hedge were carrying very fine crops. I counted as many as two dozen fruits of Polegate upon one plant. The plants were strong, and a good size before planting; it is useless to have them otherwise for planting out-of-doors. Scarlet Runner Beans are much preferred to Kidney Beans. To get them early, Mr. Pope sows in good time, and grows the plants on under glass until they are 2 feet high and in bloom; they are then carefully planted in a warm site. From these plants good Beans are obtainable at the end of July. Ne Plus Ultra is the variety preferred.

Among Beet no variety finds favour for exhibition for the early shows like Pragnell's; and Cheltenham Green Top, or some one of the many dark-leaved varieties for later shows. Very many persons make the same mistake in growing Beet by sowing too early; the roots then grow coarse; medium-sized, richly-coloured examples are preferred. Amongst Cucumbers, Progress is esteemed, being a dark-skinned, straight-growing variety. For packing the vegetables to travel long distances, wood-wool is considered excellent, but dried sphagnum moss, too, is much used. E. M.

VEGETABLES AT READING.

At the autumn exhibition of the local society, vegetables are always shown in first-class form. At the recent exhibition, Messrs. Sutton & Sons offered valuable prizes for a collection of unlimited numbers. There were four specially meritorious collections in competition, each comprising about forty varieties, and a total of 160 dishes. The work of judging these collections was singularly difficult and lengthy, so comparatively even and so fine the average. Coarseness is rarely seen at Reading, quality dominates. The ultimate result was that Mr. Bowerman, gr. to C. Hoare, Esq., Hackwood Park, Baingtoke, was placed 1st; Mr. R. Lye, gr. to Mrs. Kingsmill, Sydmon Court, was 2nd; Mr. W. Pope, gr. to the Earl of Carnarvon, Highclere Castle, 3rd; and Mr. C. Waite, gr. to the Hon. Col. Talbot, Glenhurst, Esher, 4th. Literally, it was a battle of the best vegetable exhibitors in the kingdom, and one of which Reading might well be proud.

* *Ann. d. Sc. nat.*, 7th series, xx, 355.

† *Origin*, 428.

BELGIUM.

PLANTS AT THE ROYAL CHÂTEAU AT LAEKEN.

DURING a visit paid to Laeken lately, I noticed some fine seedling tuberous Begonias, very good and rich in colouring; some of the double varieties were very remarkable. There was a charming collection of Nægelia, as well as large and fine specimens of Sonerila, new this season. Some Streptocarpus filled two stages of a house, where they were intermixed with some fine tuberous Begonias in full bloom. There were some pretty new varieties of Streptocarpus from Messrs. Veitch, and those raised at Laeken are numerous and good.

An unusual and admirable variety, which we compared to a fine Pentstemon, deserves mention. The ground-colouring was purple, the throat had a white ground with very dark and effective veining; there was one white spot at the base of the lower mid-rib, just at the spot whence springs the lateral lobe—in fact, the whole flower is most effective. There were many seedlings of Anthurium Andréanum with large spathe; in some the spathe were very dark, in others the veining were very distinctly marked.

In the Orchid-house, in spite of the unfavourable season, I noted Odontoglossum Harryanum with six flower-stems; Oncidium incurvum with fourteen floral trusses and quite 2000 buds; these branches are trained along iron wires, which trace out a royal crown; this will be very fine when in full bloom. One *Lælia crispata* with a fine well-spread and waved lip, with a dark ground, bore six flower-stems and thirty-eight flowers and buds. Six specimens of *Cattleya Rex* bore altogether forty blooms—one plant alone bore ten; *Dendrobium anaviesimum* with many trusses; and *Epidendrum vitellinum* with seven racemes. I noted, besides some fine *Cattleya gigas*, *Gaskelliana* and *Schilleriana*. I noticed one specimen of *C. Mossia* with 127 flowers, and a plant of *Odontoglossum Bictonense* with fourteen trusses each with fifteen flowers.

ORCHIDS AT BRUSSELS.

In spite of the unfavourable season, I recently found in bloom at l'Horticulture Internationale numerous fine specimens of *Phaius Humbloti* and *Lælio-Cattleyas*, a good *Cypripedium Morganii* × *Cattleya gigas*, numerous plants of *Catasetum Bungei*, and good varieties of *Cattleya Rex*.

M. Peeters has some fine dark varieties of *Miltonia Moreliana* and of *M. spectabilis*; the very beautiful *M. Peetersi*, *Rehb.*, the *M. Blunzi*, *Peetersiana* of Rolfe; the rare *Dendrobium Guiberti*, and a *Cypripedium Harrisonianum*, all greenish-yellow, very curious, but less pretty than the type. *Ch. de B.*

GROUPING FOR EFFECT IN CONSERVATORIES.

In many good gardens I have in wardly lamented the lack of taste exhibited in arranging subjects, indoors and out, frequently involving a waste of good material. When the opposite of this is seen, and good taste is evident, it is a pleasure to record the fact. A few weeks ago I visited the gardens of Osmaston Manor, near "romantic Ashbourne," in Derbyshire, and I was charmed with the beautiful effects which were to be seen in every department. The conservatory struck me as being an admirable exposition of tasteful arrangement. The structure was about 40 feet square, and the effect was made in the centre. There was no staging, but, on the other hand, there were small knolls of rockwork, so arranged over the surface as to form undulating slopes and miniature valleys. Selaginellas and Lycopodiums covered the stones, while here and there arose from this moss-like carpeting, *Dracænas*, *Colens*, *Begonias*, *Crotons*, *Catalpas*, and other richly-coloured foliage plants; while resting on the slopes were *Fattonias*, *Bertolonias*, *Peperomias*, with *Tradescantia* trailing in and around them. Standing up boldly at irregular distances were *Palms* of various kinds, and *Ficus repens* and

similar climbers covered the walls. The effect was most pleasing, and quite apart from the usual style of conservatory arrangement. Out-of-doors the same good taste was evident. Flower-beds gay with *Pelargoniums* had an ample setting of well-kept lawn, giving a soft, pleasing effect, instead of the too frequent garish display. Around the noble mansion runs an open corridor, facing the lawn, with a long series of arched pillars. In the centre of each, and hanging from the arches, were baskets of *Pelargoniums* flowering profusely.

In the vineries and other houses, the abundance and quality of the fruit and the condition of the trees spoke plainly to the skilful culture which obtained at this beautiful place—the out-of-door fruit, the vegetable garden, and the herbaceous border being worthy of equal note. Mr. Bardney, the gardener there, had some very good new *Carnations* in fine condition, and, indeed, the whole place is a credit to him. *Rambler.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

By BAILEY WADDIS, Gardener, Birdsall Gardens, York.

BEDDING PLANTS.—Complete arrangements for the filling of beds next summer, and then propagate the plants in the proportion required. The past summer has not been a favourable one for the flowering of *Pelargoniums*, the heavy storms of the last few weeks have dashed the flowers severely as soon as they have appeared; but, on the other hand, single flowering tuberous-rooted *Begonias*, *Dahlias*, and *Pentstemons*, have done exceedingly well, withstanding the rainstorms and sudden changes of weather. If *Begonias* planted in beds in the East Riding of Yorkshire during a season like the present one give satisfaction—as they have done in many cases—they may be safely planted in any other part of the kingdom. *Begonias* damaged by rain or winds quickly recover, and their bright green foliage accentuates every particle of flower. Cuttings of *Begonias* may still be put in boxes or pots of sandy soil, and placed in a warm-house or pit, and kept growing as long as possible.

PELARGONIUMS.—Cuttings which may be taken after this date and put in boxes or pots should be placed in frames or pits, from which the glass-lights are removed. Keep them in the open air as long as possible; but if the weather becomes wet and cold, the lights should be placed over them, at the same time tilting them up to allow abundance of air. The old varieties, John Gibbons and Amy Hogg, are still valuable as bedders; H. Jacoby has not done so well this season; *Vesuvius* and *West Brighton Gem* are good. The toning of colours in flower-beds is occasionally very well done. One arrangement of a long scroll bed planted with the following, and seen at its best, was excellent:—The edging was of seedling plants of *Centaurea candidissima*, the next broad band was planted with *Lobelia speciosa*, with *Henri Jacoby Pelargoniums* in the centre, dotted through with white *Cactus Dahlia Constance*.

BEDDING DAHLIAS have given much satisfaction; they are easy to cultivate, and they stand changes of weather better than most plants. Cuttings of the weak side-shoots may be struck in pots or boxes, and if kept growing for a time they will form small bulbs, that will be useful in the spring, if the variety is scarce. The show, Pompon, and *Cactus* varieties are now in full bloom, and are the most satisfactory of autumn flowers for the garden or for cutting purposes.

PENTSTEMONS for summer and autumn beds or for cutting purposes are invaluable; they stand climatic changes well, and their tall, free-flowering spikes of bloom are very effective. Cuttings of the side shoots should be struck in frames or hand-lights, that they may be protected during the winter. Excellent named varieties are *George Smith*, *Countess of Hopetoun*, *The Lady*, *Miss Arnot*, *A. Fowler*, *President Carnot*, and *Fairy*.

CALCEOLARIAS.—Cuttings should be taken from the green soft growth, and pricked out about 3 inches apart into frames, using well-drained sandy soil. Shade the glass with a little thin whitewash for a time. The frames should be kept rather close and moist, in order to keep the cuttings plump and fresh. With the exception of the variety *amplexicaulis*, *Calceolarias* have not done very well this season, and many people lost their plants in the

frames during the severe frost, through insufficient attention in regard to protection. They should be kept as cool as possible, excepting that frost should not touch them; a good thick turf-pit is the best place for them.

ANTIRRHINUMS for keeping through the winter should be struck from cuttings and kept in frames, in the same way as *Calceolarias*. In some districts during mild winters they stand very well in the open, but they must not be depended on in this way. Some fine beds of these have been seen this season of the named varieties.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorset.

ODONTOGLOSSUMS.—No Orchids are more worthy of general cultivation than the New Grenadan *Odontoglossums*. Most of them are easily managed, and yet sometimes they give more trouble than any other class; for when they once lapse into bad condition, it requires extra care and considerable time to restore them to health. One of the principal causes of failure is over-liberality in regard to water at the root; other bad causes are brought about by keeping the atmosphere of the house always in a saturated condition. The atmosphere should be allowed to become comparatively dry for a few hours during the middle of each day, so as to enable the plants to throw off any excessive moisture that may have accumulated about them, which otherwise will prevent sound growth. *Odontoglossums*, if watered like so many semi-aquatic plants, will assuredly lose many roots, and generally deteriorate. When watering, go carefully over the plants, and thoroughly water those only which are dry. Especially must this treatment be insisted upon during the autumn and winter months in the case of such Guatemalan and Mexican varieties as *O. nebulosum*, *O. Uro-Skinneri*, *O. Bictonense*, *O. grande*, *O. Inaleayii*, *O. hautilabium*, *O. pulchellum*, *O. Rossii*, *O. Cervantesii*, *O. maculatum*, *O. cordatum*, *O. Krameri*, *O. Oerstedii*, *O. Humeanum*, *O. aspersum*, *O. Reichenheimii*, *O. Galeottianum*, &c. Every amateur should make himself acquainted with the natural conditions and the different elevations under which the many species of *Odontoglossums* grow, as this information will greatly assist him in fulfilling their requirements under artificial cultivation. Where a representative collection of *Odontoglossums* is grown, there will be some that require potting at different seasons of the year; but there is no better time than the present for repotting the majority of the plants, especially varieties of *O. crispum*, *O. Pescatorei*, *O. trimumphæ*, *O. Hallii*, *O. Harryanum*, *O. luteo-purpureum*, *O. navium*, *O. polyanthum*, *O. nevadense*, *O. excellens*, and *O. gloriosum*. Plants which flowered early in the year are now growing freely, and the new breaks will be making a number of young roots, which, having fresh material to grow in, will become well-established before winter commences. A suitable compost for these plants consists of freshly-gathered sphagnum-moss and good fibry peat in equal proportions, to which may be added a moderate quantity of small broken crocks and charcoal. Too much trouble cannot be taken in preparing the moss, carefully picking out all the rubbish, and examining every particle for small slugs; if this be not done, much injury will result to roots and young flower-spikes. The pots used should be in proportion to the size of the plants, and over-potting must be studiously guarded against. The pots should be quite clean, and be three parts filled with clean crocks, over which a thin layer of moss should be spread to make the drainage secure. Pot the plants moderately firm, keeping the base of the bulbs just above the rim of the pot, and when the operation is completed, prick - in a few heads of living sphagnum over the surface. In going through the collection no doubt some plants will be found in bad health. These should be turned out of their pots, the roots well washed, and all decayed parts cut away. Then put the plants into pots just large enough to contain their roots. For a few weeks after repotting, it is advisable to afford water sparingly, giving just sufficient to induce the sphagnum to grow. Syringe well between the pots morning and evening, and admit as much fresh air as possible, especially when the outside temperature is about 50°. Freshly-imported *Odontoglossums* are, generally speaking, easy to establish, which is partly due to the care taken by the collectors to gather them in the proper season, and to their careful packing of the plants. Each piece should be potted separately in as small a pot as can conveniently be used, filling up the pot almost

entirely with crocks, and using a thin layer of peat and moss on the surface, packed tight enough to steady the plant. After the first growth is formed, and new growth commences, they should be transferred to larger pots.

FRUITS UNDER GLASS.

By RICHARD PARKER, *Gardener, Goodwood, Chichester.*

LATE GRAPES.—The fine weather of the past three weeks has proved very beneficial to late Grapes, permitting plenty of ventilation to be put on daily, and rendering but little fire-heat necessary. It is not wise, however, to dispense with fire-heat altogether, or the temperature of the house may fall too low towards morning, which will cause moisture to settle on the berries. Until the fruit is thoroughly matured, and the atmosphere of the vinery can be kept quite dry, a slight circulation of hot-water should be turned on the last thing at night, and at the same time a little air may be left on at the top of the house. By this means a more even temperature will be maintained, and this will greatly help to finish the berries perfectly. The bunches should be looked over at short intervals, and any crowded or bad berries removed, doing the work with care, so as not to destroy the appearance of the bunch. Keep lateral growth in check, that a free circulation of air between the main leaves and bunches may be obtained. Any watering that is necessary, should be done in the morning and during bright weather, so that the house may become dry again before evening. If the present hot weather continue, it will be necessary to damp the house down several times during the day; but in cases where the bunches are nearly ripe, the last damping should be done quite an hour before the house is closed, to avoid any steam collecting.

MID-SEASON VINES.—Plenty of ventilation and a dry atmosphere must be maintained in vineries where ripe fruit is still hanging, and a watchful eye must be kept for mice and wasps. Should any of the bunches show signs of shanking, cut the crop at once, and take steps to examine the roots, and if necessary, renew the borders without delay. Such work can be done much better at this season than in the spring, when so many other matters claim attention, and it is a great advantage to the Vines, as fresh roots form again quickly and no check is given to next season's crop of fruit. Young rods that have been trained between old Vines with a view to replacing the latter, should be exposed as much as possible to the sun, to ensure the wood being thoroughly ripened, particularly so if the growth made is very strong, or some difficulty will be experienced to induce the eyes to "break" evenly next spring. It is not necessary to cut out the old Vines altogether the first season, but so many of the spurs can be sawn off at the bottom of the Vines as will allow room for the young ones to carry four or six bunches of fruit next year. After the second or third year, the old Vines can be cut right out, and the young ones being well established, a season's crop will not be lost.

YOUNG VINES in pots, grown from eyes inserted in February, have made good growth, and may be now turned outside to rest as advised recently for fruiting canes. Water must not be withheld suddenly, but less moisture may be afforded as the foliage becomes yellow. Any lateral growth that may show should be pinched out.

STRAWBERRIES IN POTS.—Where these were placed closely together for convenience after potting, it is now necessary to afford them more room. Look over the plants at least once a fortnight, and pinch out runners and remove side-growths, so that only one crown may form. Keep the plants free from weeds, and water regularly. If the pots do not stand on slates or boards, they must be twisted round at least once a week to prevent roots forming in the ashes.

THE KITCHEN GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

ONIONS—Tripoli Onions sown as advised, being now nicely up, will be benefited by a careful hoeing and cleaning of any weeds that may have appeared since sowing, and a dusting of soot should be given them on the approach of rain. In late districts, Tripoli Onions may yet be growing, but they should now be taken up, dried, cleaned, and put away for present use. In early districts, they are probably all used up. Where Onions

are grown especially for pickling purposes, these may be pulled at once, carefully cleaned, dried, and sent in for use. Such Onions do not improve by keeping for any length of time, and should be pickled as soon as they are properly harvested. The general crop of spring-sown Onions will be nearing the ripening period. Very large Onions grown for show purposes may not be quite so fine in the neck as desired, but a sharp twist close down to the bulb may be given without disturbing the bulb; or better still, if time is not important, tie them tightly round the neck with a piece of matting. In regard to large breadths, the old method of beating them down with a besom is the quickest way, and is fairly effective. Onions for general keeping purposes should not be so thick in the neck as to require this operation. If they are left rather thickly in the lines as advised, they will have smaller necks and smaller bulbs, and among them will be any quantity of picklers that should be harvested by themselves. If the weather appears settled for hot, fine days, the crops of Onions will take no harm if pulled and laid out on the ground for a few days, placing them with the roots towards the sun to ripen. Afterwards dry them in a cool vinery where the foliage is falling, and where the ventilators are open night and day. When they are sorted and stored for winter, it should be in a cool dry store-room or shed, from which frost can be excluded. Roping Onions in long strings I regard as time wasted; but if sufficient tops still adhere to them they may be gathered up quickly into a bundle of a size which can be readily gripped with the hands and given a tie ready for hanging up. Where Onions are required largely late in the spring, all the smaller-sized, fully-ripened bulbs should be reserved for the purpose, as these will be found sound and not inclined to grow like the larger and more fleshy bulbs.

PARSLEY.—The first sowing of Parsley will be getting very crowded in the beds, and should be stripped of all the large outside growths or any yellow leaves from the underside, so that the fresh growths may have plenty of light and air. Plants that stood through last winter here, and did not bolt to seed in the spring, are looking remarkably well. Make successional plantings from the several sowings made through the summer. Look well to that sown or pricked out in frames or pits, as recommended, and see that it does not suffer for want of water or thinning out. Parsley may also be sown or transplanted into deep, narrow boxes, and stood outside. If well established before winter, these will be found of use to place in any house at disposal, and will produce a good growth inside.

PLANTS UNDER GLASS.

By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

EUCCHARIS if required for flowering at Christmas, should now be rested for a time, and if the plants are plunged, they should be lifted and placed on slates or bricks. Less water will be required at the roots, but they should not be allowed to droop. If the plants are syringed twice a day, this will be almost all the water necessary. Give the plants a good cleaning, remove mealy-bug by sponging with soft-soap and water, at the rate of two ounces of soap to one gallon of water. A cooler temperature should be given, and toward the end of October, they may be started into fresh growth by replunging into a bottom heat of about 70°.

BOUARDIAS that were planted-out, should now be taken up and potted into good rich soil. Place them in a cold frame, and keep it rather close and shaded until the roots have entered the fresh soil. Plants that have been grown in pots during the summer, and are full of roots, will require applications of weak manure water two or three times a week. These plants must be taken into the greenhouse or frames before the nights get too cold.

SOLANUMS should be potted up into pots as small as will conveniently contain the roots. Place them in a cold frame and keep close and lightly shaded for a time; when root action has again commenced, admit plenty of air. Plants that were grown in pots will be safe outside until the end of the month.

CALLAS (*Richardia aethiopica*).—These should now be lifted and placed in good-sized pots containing turfy loam, leaf-soil, and plenty of well-decayed cow-manure. When they are potted place them outside again in the shade until towards the end of the month, when they should be taken to the greenhouse. If the flowers are required early, a few must be taken to the greenhouse or conservatory at once and placed in a position where they will receive plenty of light.

CAMPANULA PYRAMIDALIS.—These plants should be potted on into 6 inch pots, which are generally large enough for them to flower in. For potting compost use good turfy loam, leaf-soil, and a few half-inch bones. Place them on ashes outside, and syringe the plants frequently. They may be wintered in cold frames, as a little frost will not harm them.

FREESIAs having now commenced their growth should receive a good soaking with water, and as soon as the roots are full of roots they must be liberally supplied with manure-water. Pot the next batch of bulbs into 48-sized (5 inch) pots, and cover them with a little cocoa-nut fibre. Do not water until growth has commenced. Pot up batches of named Hyacinths, Jonquils, Narcissus, and Tulips as soon as possible after they come to hand, especially if the flowers are required early. A good quantity of *Scilla sibirica* may be placed in large 60's, and they will make a very pretty edging for the conservatory stage. *Lilium Harrietii* and *L. candidum* must also be potted up without delay, or the bulbs will soon shrivel.

THE HARDY FRUIT GARDEN.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

GATHERING FRUIT.—That care and judgment be exercised in the harvesting of fruit is all important, or the labour of months to obtain fruit in the best possible condition as to appearance and quality may be to a great extent thrown away. To secure such results, trees of choice Plums, Peaches, Pears, &c., should be looked over daily at this season, especially in the afternoons of hot days, such as we have experienced lately. It will not be difficult to determine which fruits are really mature and fit either for storing or for use, as the case may be. Taking Plums, for instance: for culinary purposes these need not be quite ripe, and colour is, of course, immaterial; but for dessert, not a fruit should be gathered that is not in the highest degree perfect in ripeness, bloom, and colour. Such fruit will be proportionately appreciated when sent to table. If fruit be left too long on the trees, it is frequently insipid, and almost tasteless. Peaches are never in the best condition when allowed to remain on the trees after they are ripe, or if allowed to fall into nets underneath instead of being gathered. If these are to be packed for a journey, they are best gathered a day or so before they are fully ripe, because they are less liable to damage during travelling. Each fruit should be carefully wrapped in tissue-paper, and firmly embedded in soft, white wood-wool, placing them in single layers in shallow boxes. They may thus be sent long distances in good condition. Nectarines should never be gathered until quite ripe and fit for table.

ROOT-PRUNING BARREN FRUIT-TREES.—Apples, Pears, or Plums, trained as pyramids, that may be growing vigorously, but are practically barren, should now be root-pruned, in order to check such exuberant growth, and induce the formation of fruit-buds. Young trees may have a trench opened all round at a distance of from 2½ to 5 or 6 feet, according to the size of the tree, working well underneath, so as to sever all tap or other large roots. If fresh soil is available, some may be put into the trench, to encourage the growth of fresh fibry roots, finishing off with the old soil, and treading and making all firm. Make each tree at once secure against high winds by three or four lengths of wire, or stout tarred string fastened to strong pegs, or stakes driven securely into the ground at equal distances round the base, a band of some soft substance, such as old packing or hay, being attached to the tree to prevent injury by wire or string. In the case of large or older trees, this root-pruning should be only partially done at one time, the trench being only taken half-round, the remaining half being done the following season if necessary. Where the subsoil is cold and wet means should be taken to induce roots to the surface, by preserving as many as possible and laying them in fresh compost.

AUSTRALIAN LEMONS.—A Covent Garden sale of Lemons, just received from Australia, has attracted attention to the scarcity of this fruit, and the capabilities of the Irrigation Colonies of Mildura and Renmark as Lemon-growing districts. Five hundred cases were disposed of at prices ranging from 9s. 6d. to 14s. 6d. per case, which is regarded as an exceptionally good price at auction, but not fully representing the value of the fruit, and higher prices are confidently expected when the quality becomes known.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER, Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	SEPT. 16	Sale of Store and Greenhouse Exhibition and Decorative Plants, at the Victoria and Paradise Nurseries, Upper Holloway, by order of Messrs. B. S. Williams & Son, by Protheroe & Morris (two days). Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	SEPT. 17	Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY,	SEPT. 18	Dutch Bulbs, at Protheroe & Morris' Rooms. Trade Sale of Roses and Plants at the Avenue Nursery, Bexley Heath, Kent, by order of Messrs. P. H. & J. Cooper, by Protheroe & Morris.
THURSDAY,	SEPT. 19	Dutch Bulbs, at Protheroe & Morris' Rooms. Important Annual Sale of Conifers, Euonymus, &c., at the Wood Lane Nurseries, Isleworth, by order of Messrs. C. Lee & Son, by Protheroe & Morris.
FRIDAY,	SEPT. 20	Clearance Sale of Palms and Plants at the Melbourne Nurseries, Bexley Heath, by order of Mr. R. Gölzow, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	SEPT. 21	Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—57°1.

The Chiswick Vegetable Show.

As compared with previous conferences and exhibitions at Chiswick, notably those connected with Apples, Roses, Ferns, Conifers, Pinks, Chrysanthemums, and Dahlias, the exhibition of vegetables was considerably inferior, and the information elicited as to vegetables and their culture conspicuous by its absence. The weather this time was all that could be desired, but the attendance was not large.

It must be remembered that this was the first occasion for some years when efforts have really been made by the Royal Horticultural Society to obtain a first-class and thoroughly representative vegetable exhibition. That the number of exhibitors in many of the competitive classes was not equal to the anticipations of many interested in the exhibition was freely admitted, and in this matter there was considerable disappointment. In the matter of originality, too, with the exception of a very interesting exhibition from Sir TREVOR LAWRENCE, there was far too meagre enterprise, and one looked in vain to the exhibits from the largest and best firms for anything new among vegetables, for something that would make an additional variety in our present collections. On the other hand, most of the vegetables exhibited in the competitive classes were of first-class quality; indeed, there was but little produce in the exhibition-tent that could be fairly classed as inferior. Mr. T. WILKINS, gardener to Lady THEODORA GUEST, obtained the first place in the competition for twelve distinct kinds with a collection worthy of the class; and

Mr. WAITE, gr. to Colonel W. P. TALBOT, may also be congratulated on the collection he exhibited in the class for nine distinct kinds. Potatoes were exhibited in moderately good quantity, the quality of the tubers in very many cases being quite satisfactory. The Peronospora pest has made itself visible in most gardens since the drought of the early summer was followed by showers. In the gardens at Chiswick this unpleasant fact could hardly fail to be noticed in the Potato haulms; and in gardens where a skilful and intelligent system of culture has not been adopted against the progress of disease, we fear considerable loss will be experienced among the tubers of late varieties. Naturally, however, there was no evidence of any untoward circumstances affecting the Potato, in the specimens upon the exhibition tables, and in this particular, exhibition produce frequently illustrates in no sense the bulk of the crop outside. The Brassica section of vegetables was by no means lacking in size or quality; and this remark might be equally applied to roots, which we regard as remarkable, bearing in mind the climatic conditions of the greater part of the season. In another place are given full particulars of the produce in each of the classes, and we need not refer to them more in this place. It is only fair to add, however, that the great seed-growers, though failing in the particular already mentioned, nevertheless made a capital display of vegetables of all known sorts, and though the various collections contained no really new vegetable, they illustrated practically the very best varieties and latest improvements in each type; moreover, each was an object-lesson in good cultivation. Should a Vegetable Exhibition by the Royal Horticultural Society become an annual event, and we are strongly of opinion that it should do so, there must be some readjustment and revision of the schedule, in the endeavour to make it more popular with exhibitors, and likely, also, to produce an exhibition that shall present more educational features than did the one under notice. When this has been done, and the event has become recognised as an important one, there is no reason we know of why this exhibition should not become the best illustration of vegetables ever seen in the country.

THE CHISWICK INSPECTING COMMITTEE.—We understand that the following gentlemen formed the committee appointed by the Council, without the knowledge of the Garden Committee, to report on the gardens at Chiswick:—C. E. SHEA (chairman), W. WILKS (Secretary), J. DOUGLAS, H. WILLIAMS, H. SELFE-LEONARD, J. WILLARD, E. HILL, J. JACQUES, and N. A. BARNES. The Chairman, Secretary, and Messrs. J. DOUGLAS and H. WILLIAMS, are members of the Council, and two are also members of the Chiswick Board.

HORTICULTURAL MEETING AT GHENT.—A certificate for cultivation and flowering (*à l'unanimité*) was awarded to M. F. VAN DRIESCHE-LEYS, for *Justicia coccinea*, an annual specimen, having fifty fine racemes of expanded flowers. Certificates of Merit were allotted to M. PYNÆRT VAN GEERT for *Dieffenbachia Fournieri*, with very erect foliage, firm in texture, of a beautiful dark-green hue, all marbled with white; to M. L. POELMAN MAENHOUT for *Vriesea Henrici*, from *V. pallidiflora* × *V. splendens*, a plant not fully in bloom, but already noticeable for its very long floral raceme garnished with fiery-red bracts—this Bromeliad, by reason of the unusual length of its flower-stem, should prove very useful for floral decorations; to M. PYNÆRT VAN GEERT for *Tradescantia Regina*, a species introduced

from Peru by l'Horticulture Internationale; the habit and colour are magnificent, leaves lanceolate, pointed, dark green, streaked and lined with white; to M. ALBERT TOEFFAERT for *Lalio-Cattleya Andreeana*, a new hybrid of *C. bicolor* × *L. elegans*, obtained by M. CH. MARON, who has described it in the *Revue Horticole* for September 1; the flower is well expanded, measuring 7 inches across, the sepals are from $2\frac{3}{4}$ to $3\frac{1}{2}$ inches long, in width from $\frac{1}{2}$ to $\frac{3}{4}$ of an inch, of a delicate violet-rose tint; the petals, of the same colouring as the sepals, and a little broader, are waved along the edges. The lip is of a shape quite new among Cattleyas. It is recurved to the tip of the column, and shows a plane surface slightly curved back and wavy all round, of a deep lilac colour with a white border at the tip; the length is $1\frac{1}{2}$ inches, and the breadth from 1 to $1\frac{1}{2}$ inch, the gynosteme is white, and the edges of the lip which it envelops are also white and open to a breadth of $\frac{3}{4}$ inch. A Certificate was granted to M. L. DE SMET-DEVINER, for *Anisogonia decussata*, a most distinct and still rare Fern; foliage thick, indented, the dark green colour gives it a resemblance to a dwarf *Zamia*; it is a viviparous variety, of much beauty, the petioles of the fronds are covered with buds; a very ornamental species. Mlle. EUGÉNIE GREQUER obtained an award for a collection of cut Cactus Dahlias, among them were the following fine varieties, Charming Bride, Empress of India, Lady Montague, Juarez or Etoile de Diable, Stanley, Salmon Queen, Asia, Madama Burel, and Sir Trevor Lawrence. Certificates for flowering were allotted to M. F. VAN DRIESCHE, for *Gesnera Donkelaeri*, from *G. bicolor* × *Gloxinia rubra*, exhibited with about twenty fine flowers; to M. G. DE SAEGER, for *Grevillea Preislii*, a new plant from Holland, remarkable for flowering almost continuously through the year; the very curious flowers have narrow crooked petals, whose red and yellow colours, they being borne in large quantities, produce a very pretty effect; to M. PYNÆRT, for *Rottlera hamosa*, a new Gesneriad (?) with delicate blue flowers with a large yellow spot, this plant, by hybridisation, would probably produce some interesting new varieties. *Ch. D. B.*

THE BARRON TESTIMONIAL FUND.—A meeting of the General Committee of the above fund was held at the Hotel Windsor on Tuesday afternoon, when there were present Dr. Masters (Chairman), and Messrs. J. H. Veitch, P. Veitch, H. Turner, P. Barr, G. Gordon, R. Dean, J. Laing, H. B. May, W. Y. Baker, H. Herbst, A. W. G. Weeks, G. W. Cummins, J. Cheal, Ranger Johnson, and the Hon. Secretaries, Messrs. W. Marshall and B. Wynne. Mr. H. J. VEITCH accepted the post of Treasurer to the fund. Several letters were read from Messrs. Sutton & Sons and other persons willing to serve on the committee, and promising support. It was resolved to publish the list of subscribers. The amount already promised is £116 15s. A sub-committee was appointed to arrange details.

STIRLING HORTICULTURAL SOCIETY.—The annual exhibition of this Society was held in the Public Hall on the 5th inst. There were over 1000 entries, the increase in the entries over last year being chiefly in the fruit section. The various exhibits of Grapes, Peaches, Apricots, Plums, &c., were of high cultural merit. Pot plants made a fine display. The best collection of plants arranged on tables for effect was from Mr. Lunt, Keir Gardens; and the 2nd prize was taken by Mr. D. Airdrie, Larbert House. The winners of the extra prize for four bunches of Grapes and the Clovenfords prize for our bunches of Grapes, were Mr. W. Rutherford, Airthrey Castle, and Mr. T. Lunt, Keir, respectively. Cut flowers and vegetables, notwithstanding the season, made a good display, the 1st place for an extra prize for the best basket of vegetables falling to Mr. McNeill, Gargunock House. Other principal prize-takers were Mr. J. Carmichael, Tonch; Mr. J. Waldie, Dollarbeg; Mr. W. W. Ritchie, Polmaise; Mr. A. Ferguson, Woodville; and Mr. J. King, Blairdrummond.

AUSTRALIAN FLOWERS.—The Orient s.-s. *Ophir* has brought from Sydney a bouquet of Australian Lilies enclosed within a block of ice. They have been sent to the Agent-General for New South Wales, with the request that he will ask her Majesty's gracious acceptance of them.

CARDIFF EXHIBITION, 1896.—Cardiff is laying itself out for an exhibition on a large scale in 1896. As might be expected in a district so intimately connected with the coal and iron industries, the mining

a fasciated stem bearing fifty-four normal flowers, exhibiting the bright red usually seen in the variety, and one pure white flower in which no trace of colour is to be seen. In fact, it is a flower of *L. speciosum* album among a number of the red variety.

NOMENCLATURE OF GARDEN PLANTS.—The following are the recommendations made by a committee of the society of American florists at the annual meeting held at Pittsburg, Pa., from Aug. 20 to 23. 1. the priority of name shall be recognised as

author for the same; 7, the nomenclature committee shall, in all cases, before passing judgment finally on alleged synonymous plants, correspond with all the parties directly interested so as to get all the testimony possible bearing on the same; 8, exceptions to the report of the nomenclature committee shall be made to the secretary within sixty days after the reading of the report. Such appeals shall be indicated in the report of the society by an asterisk, and be referred to the committee for reconsideration the following day,

FIG. 51.—CLEMATIS INDIVISA LOBATA, IN THE CONSERVATORY CORRIDOR AT FALKLAND PARK. (SEE P. 303.)

and engineering sections will be very prominent. Maritime interests will be well represented, as would be natural at a port where shipments of coal, coke, and patent fuel in 1894 amounted to 15,316,165 tons. Other sections of the exhibition will embrace the latest developments in electricity, in scientific instruments, &c; while agriculture, horticulture, sports and pastimes will not be overlooked, the latter probably including a water show on a big scale. Representative men of all classes have the affair in hand, but Lord WINDSOR is president, Her Majesty the QUEEN, patron, and the Prince of WALES will be asked to open the exhibition.

A FASCIATED LILIUM SPECIOSUM.—In Mr. McARTHUR'S nursery, Maida Vale, W., there is, at present, a plant of *Lilium speciosum rubrum*, with

belonging to the originator or introducer of a variety; 2, the names from foreign countries shall be recognised and used except those in Japanese, and to be translated; 3, the purchaser of a new variety from an originator can by mutual consent between them, change the name, provided the variety has never been disseminated; 4, when the originator has sold, or consented to such change of name, he has the privilege of using such name again; 5, in registering a name, it must be accompanied, wherever possible, by a specimen of the plant or flower, or a complete description of the same; 6, the finding of the secretary of the Chrysanthemum, Rose, and kindred societies shall be considered as authority in cases of complaint or appeal, and in reported cases of plants wrongly named, not coming under the head of the above societies, this committee shall give the

A MANURE HEAP BURNT.—Considerable excitement was caused at South Ealing on Sunday afternoon the 1st inst., by the sudden breaking out of fire in a large heap of manure of about seventy loads in the market grounds of Mr. ROBINS, in Gunnersbury Lane. The Hounslow branch of the District Railway runs through the grounds, the railway being crossed by an archway. It was on this arch, but at a distance of 20 yards from the railway, that the heap, consisting of ordinary stable-dung carted from London, had been placed, and it is believed the fire originated from spontaneous combustion. The heap was about 7 yards in length, 4 yards high, and correspondingly broad, and when the fire was at its fiercest the heat was intense. Eventually the fire-engines were brought to play upon it, and the flames were subdued, though by the frequent breakings into

flame, there was no doubt a large body of fire within, and water was poured on to it throughout Sunday night. It is understood Mr. ROBINS' loss is covered by insurance.

THE SOCIETY OF AMERICAN FLORISTS has just held its annual meeting at Pittsburg with great success. We have nothing like this great society in this country, although such a one might be inaugurated without much difficulty. Next year the meeting is to be held at Cleveland, Ohio, under the presidency of WILLIAM SCOTT, a florist in Buffalo. Mr. SCOTT is a son of ALEXANDER SCOTT, gardener to Sir GEORGE STAUNTON, at Leigh Park.

STOCK-TAKING: AUGUST.—The figures representing the trade of England during the past month—imports and exports—are of a satisfactory character. With two exceptions, imports are all in favour of "our side"—the excess in value over the same month last year being £2,972,784—the deficit for the eight months past, compared with the same period last year being represented by £1,030,524. Our export trade shows a ready response to this, and it is worthy of remark—if it be only repetition—that those whose trade with us helps to increase our balance, themselves find their home trade and trade prospects all the better for the improved figures. Taking into account the social condition of nations, our Trade and Navigation Returns, say, for the past month and eight months, offer a problem, the solution of which cannot but prove of value to such as can demonstrate the values submitted by the officials of the Board of Trade. Take the following excerpts from the "summary" table of imports for the month of August:—

IMPORTS.	1894.	1895.	Difference.
Total value of imports	£ 31,635,521	£ 34,611,305	+2,972,784
(A.) Articles of food and drink—duty free	11,908,426	12,514,364	+605,938
(B.) Articles of food and drink—dutiable	1,801,632	2,306,484	+504,852
Raw materials for textile manufactures	2,418,420	2,834,508	+416,088
Raw materials for sundry industries and manufactures ...	4,512,350	5,030,190	+517,840
(A.) Miscellaneous articles	1,132,003	1,215,758	+83,755
(B.) Parcel Post	71,779	73,130	+1,351

It is worthy of notice that some journals are now taking stock of what the foreigner supplies us with in the shape of "food"—almost as if the figures constituted the record of a new discovery; and so we here reproduce our usual excerpts from the general figures relating to the imports of fruits, roots, and vegetables:—

IMPORTS.	1894.	1895.	Difference.
Fruits, raw:—			
Apples bush.	338,310	192,520	-145,790
Cherries "	522	2,128	+1,606
Plums "	422,868	187,389	-235,479
Pears "	457,100	195,552	-261,548
Grapes "	117,213	151,183	+33,970
Unenumerated "	244,678	224,338	-20,340
Onions "	389,408	534,712	+145,304
Potatoes cwt.	51,463	97,314	+45,851
Vegetables, raw, unenumerated value	£ 146,596	£ 170,860	+24,264

The lessons conveyed by these figures have so often been stated or "black-boarded," that further notice would be superfluous. Just here, it may not be uninteresting to give a few items concerning our imports from "little Guernsey"—an island possessing many features of interest for our home growers of fruit, flowers, vegetables, &c. It appears that with about 36,000 inhabitants, there are not fewer than 1,500 persons who grow crops for exportation—sending

away hundreds of thousands of packages yearly, and returning a gross income of more than £500,000. The chief crops are indoor crops of Tomatoes, Grapes, French Beans, Melons, and flowers; of outdoor crops, there are early Potatoes, Broccoli, and flowers. Of these productions, Tomatoes are the most important. In our last Stock-taking, deserved prominence was given to light railways as one of the remedies for the relief of agricultural depression; it is interesting to notice now that there is some prospect of the commencement of the proposed Chipstead Valley line, the "bill to enable" having been passed, and the Board of Trade having been communicated with for power to construct the line, with certain modifications. The cost of the line is about £60,000, or £10,000 per mile—we heartily wish the scheme success. Road locomotion is also interesting the Institute of Engineers, who invite papers in competition for prizes on the subject of motors, electricity, mineral oils, compressed gas, &c.; and it may not be inopportune to draw attention to the experiments made some thirty years since in the manufacture of gas from all sorts of vegetable refuse. These are carried on in London, and may still be remembered by some of our interested readers; the Great Eastern Railway Company are now using a modification of this system. On the whole, the subject of light railways and road locomotion as adapted to the wants of tillers of the soil seems to have taken good hold. The subject of

EXPORTS

for the past month is a very interesting one. Here the figures show an increase of £1,900,255, the figures being for August, 1894, £18,581,240, as against £20,481,495 for the month just closed. All items show an increase with the exception of animals (living) £10,813, and of £10,694 in machinery and mill-work. The excess in value of exports for the past eight months of the year is £3,295,246—that is, £147,158,497, against £143,863,251 in the corresponding eight months of 1894. In all this we see an incentive to activity in the home trade, which means an increase of employment and prosperity among the workers.

"THE BOTANICAL MAGAZINE."—The plants figured in the September number are the following:—

Helianthus debilis, Nuttall.—This is the same plant as figured by us, 1895, i., p. 167, f. 24, as *H. debilis* var. *cucumerifolius*. Sir JOSEPH HOOKER annotea *H. præcox* also with this species. It is an annual plant, which does well in beds in the summer; t. 7432.

Rumex hymenosepalus, Torrey.—This is the Canada plant, which is used for tanning purposes, the root being the part used. It is a native of New Mexico and Arizona; t. 7433.

Cleyera Fortunei, Hook. f., in *Gard. Chron.*, 1895, i., p. 10; t. 7434.

Atraphaxis Muschketowi, Krassnov.—A hardy Polygonaceous shrub, with glabrous, lanceolate leaves, and terminal many-flowered racemes of small pinkish flowers. It is a native of the Altai Mountains, t. 7435.

Richardia Rehmanni, N. E. Br. See *Gard. Chron.*, 1893, ii., 564, sub nom. R. Lehmanni; t. 7436.

EDINBURGH.—A splendid show was held in the Waverley Market on September 11. There were over 2,100 entries, about half of them in the fruit classes, but we are unable to give a detailed report in our present issue.

CHESHUNT, WORMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The fortnightly meeting was held on Thursday, in St. Mary's Hall, Cheshunt, Mr. GEORGE PAUL presided. Over 300 members were present to hear Mr. JAMES DOUGLAS, of Great Gearys, Ilford, give an excellent lecture on "The Carnation." Mr. DOUGLAS gave a thorough description of the Carnation, of its origin, and of the progress the plant has made up to the present time. He then dealt with its propa-

gation by seeds, layering and cutting, the most suitable soil, the flowering period, and closed with some remarks upon the classification of Carnations and Picotees. During a short discussion, Mr. GEORGE PAUL alluded to the practice of dressing the blooms. Mr. W. L. YATES referred to the gout disease attacking "Mrs. Reynolds' Hole," and the fungoid disease upon the Malmaison section, two diseases for which there is no remedy known. Mr. DOUGLAS, having replied to questions put to him, Mr. JOSEPH ROCHFORD proposed a hearty vote of thanks to him for his interesting and instructive paper, which was carried unanimously. Mr. THOMAS ROCHFORD was thanked for sending decorative plants to adorn the hall. The next meeting will be held on Thursday, September 19, in the Tarnford Coffee Room, when Mr. J. FEARS, of Hertford, will deliver a lecture on Dahlias.

CITY CORPORATION MARKETS.—It has been thought for some time past that "something was about to be done" with the vegetable and fish markets attached to the Central Market in West Smithfield, and the other day it was announced by the daily Press that both of these were to be abolished. Some outsiders had come to the conclusion that the Corporation had been offered a price for both sites and the buildings thereupon sufficient to recoup the capital expended. One market report says:—"From the City head-quarters I have received information that no decision whatever has been come to respecting the two markets, though the matter has been under discussion by the committee—probably not for the first time in the past two years." It would be a pity, in the interest of the public, that anything save "improvement" should interfere with the markets in question.

A VEGETARIAN LUNCHEON.—At the Vegetable Show on Tuesday last, at Chiswick, a novel and interesting, we can scarcely say satisfactory, feature was the luncheon. We append the menu, which may be of interest:—

MENU.

2s. 6d. a head.

ENTREES.

- Vienna Pie and Beetroot.
- Mushroom and Potato Patty, Green Peas and Mint Sauce.
- Haricot and Egg Pie with Salad.
- Lentil Sausage Roll.
- Melton Mowbray Pie and Pickled Walnuts.
- Savory Patty and Mixed Pickles.

SALADS.

- Tomato Salad and Mayonnaise Sauce.
- Mixed Salad and Egg.
- Cucumber, Beetroot, Lettuce, Watercress, Radishes, Celery and Tomatos.

CHEESE.

- Cheddar, Gorgonzola, and Stilton.

SWEETS.

- Red Currant and Apple Pie.
- Apricot Tartlet and Cream.
- Damson Tart.
- Custard Tartlets.
- Blanc Mange and Fruit.
- Jellies.
- Boiled Cup Custards.

FRUITS.

- Stewed Apricots.
 - " Pineapple.
 - " Pinus.
 - " Bartlett Pears.
 - " Black Currants and Raspberries.
 - Fresh Fruits, various.
- } With Cream.

SUNDRIES.

- Egg and Tomato Sandwiches.
- Cheese Sandwiches.
- Rolls, Biscuits, Butter, Cherry Cake, Sultana Cake, and Seed Cake.

BEVERAGES.

- Tea, Coffee, Chocolate, Lime Juice, and Soda. Home-made Lemonade, Egg and Milk, Milk, and Kops Ale.

ICES.

- Neapolitan.

THE KENT CHAMPION BELT COMPETITION.—The Challenge Belt offered by Messrs. H. CANNELL & SONS, of Swanley, to the Amateur or Cottage Garden Association in Kent, who can show the best exhibit of vegetables, has this season been won by the Milton Society from the Society at Rodmersham, who have held it during the past year.

CLEMATIS.

AMONG climbers, none are more useful or more beautiful than the species of Clematis. This week we give figures of two of the most useful. The one, *C. indivisa* var. *lobata*, is a New Zealand species with evergreen foliage (see fig. 54, p. 301). It is admirably adapted for conservatory decoration or for cut flowers. It makes an excellent plant for covering pillars, or for any other purpose for which greenhouse climbers are required. But the uses of this charming silvery-white flowered plant do not end with its utility

C. montana is hardy, and has deciduous foliage. Nothing can be more beautiful as a trailer to cover the fronts of houses (see fig. 55). A country village we passed through last spring had almost every house completely draped with this plant, and the profusion of white starry blooms formed a floral picture, the magnificence of which it would be hard to excel. It does much better when allowed to ramble at its own discretion than when cut back or formally trained. The illustration we give is of a plant covering the porch of the residence of G. Ratcliff Steel, Esq., at Bexley.

accuracy of which I can vouch for. The cut shows the original bush, which is nine years old from seed. The plant is over 9 feet high, but was much higher before the fruiting-canes were cut back. Its fruits are large, and of a dull purple colour. Mr. T. J. Thompson, the owner of the plant, commenced gathering the fruit this season on July 8, and gathered continuously (Sundays excepted) until August 12, a period of five weeks. Mr. Thompson, who resides at the village of Oneida, N.Y., sold his fruit as fast as picked to a gentleman, who distributed it to the neighbouring towns and villages, receiving as commission 1 cent = one half-penny per quart for handling. Think of this percentage, you fruit growers of Kent; do you get such conscientious middle-men as this one? The fruit has netted the grower nine and ten cents per quart ($4\frac{1}{2}d.$ and $5d.$), and something like 40,000 quarts have been sold this season. The original plant in 1893 bore twenty-eight quarts of fruit, certainly a large crop for one plant, however large. *John Charlton, Rochester, N.Y., U.S.A.*

FIG. 55.—CLEMATIS MONTANA, HARDY CREEPER, ON THE RESIDENCE OF G. RATCLIFF STEEL, ESQ.

WHITE WARRINGTON GOOSEBERRY.—Not uncommon in private gardens near Aberdeen; and at least two of the leading nurserymen there have it in stock. *Dell.*

THE BEST SUMMER DRINK.—It is not sufficiently known, that of all the varieties of beverages, which include ginger-beer, lemonade, Nettle-beer, &c., there is none equal to that made from the poorest and worst of the windfall Apples, and it can be made at a cost of about one half-penny per quart. Boil the Apples in water to a pulp, any quantity, from 1 to 2 lb. per gallon; add sugar to taste, ferment with yeast in the usual way, and bottle. It is ready the day after bottling, but does not remain at its best for many days, and for this reason small brewings are preferable. Use the Apples which are worthless for any other purpose; the experiment may be made at a cost of twopence, and once tried, it will become a permanent practice. Where honey is plentiful, it is preferable to sugar; but the fermentation with this is very active, and strong bottles must be used. *Thos. Fletcher, Grappenhall, Cheshire.*

WISTARIA CHINENSIS.—I cannot write with authority of any other species or variety. But having seen and handled some fine specimens of the above, I desire to thank "W. J. B." for his very informing article (pp. 237, 238). We have no hardy climber of equal usefulness and merit, and it is so perfectly hardy as seldom to be injured by such frosts as we had in February of this year. In fact, it seems rather to like frost than otherwise. I have never seen the Wistaria more heavily laden with blossom than this year. During the season I have seen some plants clothing an area of 400 square feet or more, one mass of bloom, the only trace of the bitter cold of February being that the foliage was lighter and more scant than usual. These symptoms of punishment, however, passed away as the summer advanced, and now, early in September, the plants generally as verdant as usual, and even more thickly furnished with autumn bloom, which has been abnormally plentiful on most of the larger plants all through August. In not a few gardens the second bloom is more valued than the first. It lasts longer, the racemes are shorter, more slender, and frequently intermixed with leaves and graceful branchlets, choice admirable material for indoor furnishing, as well as for chaste effect over houses or in landscape. Neither does the second blooming which seems quite natural to all the finer specimens in the open air appear to injure or weaken the stamina of Wistarias, or sensibly diminish the profusion of the first bloom. If it did the latter, the second harvest of beauty should still be welcomed. For if the Wistaria has a fault it is that the first blooms cannot be fully seen for the crush. For telling points on walls and arches the length and beauty of the racemes have been much enhanced by a timely thinning of the crowded flower-buds. In addition to the normal type, *W. sinensis*, I have tried the white, the double, and the variegated-leaved varieties of the same. The latter is what gardeners call miffy, and seldom grows well. Following the rule of so many variegated plants, the more variegation the less growth, the more green the more. There is such a pleasing variety and play of colour in the normal leaves and branchlets of the *Wistaria sinensis*, that the plant could hardly be improved by the assumption of silver or golden variations or variegations. Possibly the plant thinks so also, and for this or other less simple reasons, calls a halt to growth when arrayed in new livery,

as a climber, beautiful though it be when so employed, as will be seen by reference to our illustrations. One of the best uses to which we have seen the plant put was as a decorative subject for the table. They were grown in 6 or 8-inch pots, and were kept well cut back to hard wood, which was trained round sticks to form a bushy head. When so grown, they are beautiful objects for the table, or for indoor and conservatory decoration, the profusion of white flowers carried well out from the bright green foliage having a charming effect. Then they may be used for growing in baskets for hanging in lofty conservatories. For this purpose it requires to be treated the same as if grown in pots, the length of the stems being restricted, but as many of them as possible encouraged to droop over the basket.

HOME CORRESPONDENCE.

THE BLACK RASPBERRY.—In your issue of July 20 you allude to the Black Raspberry, or Black Caps, as we call them here. The improved varieties are grown by hundreds of acres all over the northern United States. The fruit is dried in vast quantities when the price runs low, and in its dried state it meets with a great demand in sections of this country, such as mining or mountainous districts, where ordinary fruits cannot be grown. Every housekeeper here appreciates them for canning, and uses from 1 to 3 bushels for this purpose, and he must be an epicure indeed, who could not enjoy its rich, full flavour in pies, or as canned fruit at the tea-table. I enclose you particulars of a newly-introduced variety. The cut was made from a photograph, the

The white variety seldom or never grows, like the so-called blue or purple. This seems singular, but so it is. Had the leaves been white, or always paler than the common form, we might naturally have expected a more weakly growth, and fewer flowers, from the reduction of the supply of chlorophyll. But we hardly look to the flowers as greatly adding to or deducting from the vital source of vigour and life. Then, again, where the leaves of white *Wistarias* are paler than the purple, it must not always be assumed that they are so in virtue of their white flowers; for, as already stated, there is a wide play of colour on the leaves of purple-coloured *Wistarias*. The weaker the plants, from whatever cause, the paler their leaves. Hence, it appears as if lack of strength were as potent a bleacher as lack of colour in the blooms. From whatever cause, the white variety of *Wistaria sinensis* never, so far as my experience goes, covers anything approaching the same area as the common coloured sort. Has any reader of the *Gardeners' Chronicle* ever seen a white *Wistaria* in England covering an area of 200 feet, or double *Wistarias* of any colour rivalling the single one in vigour or amount of growth? With the single advantage of preserving the bloom longer, the doubling of the blooms of *Wistaria* is a doubtful benefit, and robs them not a little of their grace and beauty. Permit me to say in conclusion, that the Scotch *Laburnum* is the best pair and prop for the *Wistaria sinensis*; these two planted in good soils giving a most artistic account of themselves on lawns or in landscapes. The only objection to such matchings for effect is the disparity of life between the two. For while in our climate the common *Wistaria* will live for centuries, the *Laburnum* is comparatively short-lived. It will live much longer, however, and bear up the additional burden of its beautiful companion all the better if the seed-pods of the *Laburnum* are picked off soon after the flowers fade. *D. T. Fish.*

THE FRENCH CLIMBING BEAN.—"H. E.," at p. 272, states:—"It is a pity the Fruit Committee, &c., should have raised the question as to whether Messrs. Veitch & Sons or Messrs. Sutton & Sons have the prior claim to the name of this Bean." I beg to state the committee have done nothing of the sort; the committee decided that both were identical—that much was within its powers to determine. As to the rightful name, the committee have nothing to do. That may be or may not be a matter for the Council to determine; but the Fruit Committee neither raised, nor considered it had claim to raise, such a question. *A. Dean.*

THE R. H. S. AND MR. BARRON.—The treatment (good or bad) which Mr. Barron has received from the Council of the R. H. S. is the leading topic of discussion just now at every flower show, or other place where horticulturists meet, and the expressions of disgust at the way in which the "retirement" of Mr. Barron has been initiated, and is apparently to be accomplished, are neither few nor complimentary. As a Fellow of the Society of some years standing, and a steady supporter of the good work it has done in recent years since Chiswick began to be renovated, and the valuable experimental and "testing" work carried on there with such remarkable diligence, skill, and success, I regret exceedingly that the fair name of the Society should be mixed up with such an unpopular deed as the Council has committed. The plausible letter issued by the Council last week, and now going the round of the papers, has only made matters worse, if that is possible! It explains none of the points which Fellows, and the gardening fraternity, are most particularly anxious to know, and for all the good it is likely to do, it might as well been left unwritten, or at least unprinted. What we want to know, without any ambiguity, is (1.) Who initiated the retirement of Mr. Barron, and for what reason? (2.) Who were the "committee" of experts who inspected Chiswick Garden and the work carried on there, and what was the nature of their report? and (3.) What benefit the Council think the society will derive from the transaction should their ends be accomplished? A plain answer to these questions, without further beating about the bush, will prove far more valuable to the Fellows and supporters of the society than any such suave epistle as we have been treated to by the Council. *Scotland, September 11, 1895.*

— The correspondence in connection with this circumstance in recent issues has drifted into an attempt to draw comparisons of the work done at Chiswick and that of private gardens, and, according to your correspondent, "Head," with respect to

magnitude, importance, and the necessary qualifications for control and direction, the private garden comes out an easy first. There are but few gardeners, now-a-days, so ill-informed as not to know that the great dissimilarity of the work, both in subject and detail, at once prevents any fair comparison being made, and the attempt to do so, fairly or unfairly, only shows ignorance; indeed, to me the whole tenor of "Head's" letter is so obviously one-sided as to give one the impression that he is a man with an "axe to grind." What is the regular routine work of a private garden, to a gardener any way, in comparison with the every-varying, ever-widening, systematic and scientific operations—I nearly said fads—of an experimental garden, as Chiswick is now recognised to be? Hundreds of these experimental trials, &c., are yearly made and carried out with the greatest exactitude, and the whole recorded and tabulated for future reference. Irrespective of all this, there is also, I am sorry to admit, an immense amount of routine work to be done, sufficient to tax the abilities of many of our best gardeners. Under the system upon which Chiswick was started and is carried on, this routine work could not be dispensed with, but we are now within a measured distance when at least one-half can well be avoided for the future, to the advantage of the gardens and to all those interested in their welfare. The Council has now determined to introduce radical changes in the administration and organisation of Chiswick Gardens and its work, and this announcement will surely be hailed with the keenest satisfaction by every true horticulturist in the country—this much we gather from the letter from the council, see p. 270. But why, may I ask, was this letter so long delayed? Had they "in the early part of this year," when these changes were determined upon, published the fact of their intended introduction, much discussion and no little harsh feeling would have been avoided, and one almost feels that their tardy recognition and admission of Mr. Barron's devoted services was only made in consequence. However, all's well that ends well, and so long as the gardening public know that the new arrangements have been carried out in a spirit of friendship, and of this we have the assurance both of the Council and Mr. Barron, all will be satisfied. In conclusion, then, let us hope that the reorganisation of Chiswick may be on the very broadest lines for the advancement of horticulture. In its administration heretofore Chiswick has been too conservative—too exclusive. There are some countries from whose book we should not hesitate to take a leaf, and that of France furnishes us with a model for what Chiswick should become—a national school of horticulture, with a curriculum equal, at least, to that of Versailles. The nucleus of such a school already exists, although admittedly of small extent; but in these days of cheap land this should prove but a minor obstacle, to be overcome at will, with many possible future advantages. Such a school should be recognised and subsidized by the State, for in no other country are there so many outlets for really clever scientific men, in positions which at present are mostly filled by foreigners. One more word, and this with respect to the salary the Council is offering to Mr. Barron's successor. As the possibilities of Chiswick for good are almost infinite, £200 per annum without a house is an insufficient salary for a thoroughly qualified man, and as the days of mediocrity are past in men, so they should be in salaries. They will therefore do well to increase this to £300 per annum, or £250 and a house. *Introspector, England.*

— As a Fellow of the Royal Horticultural Society of London, I have read "with surprise and regret" the half-hearted and ambiguous apology published by the Secretary by order of the Council. As an explanation it is lamentably weak, and obscures the main point by introducing questions of detail, about which most of us are agreed. The Council were perfectly within their rights in desiring to remove Mr. Barron or any other of the paid officials of the Society; but the methods adopted were so undignified, and so unconstitutional, as to have excited much distrust, and to have caused serious apprehensions to arise as to the future proper conduct of the Society's business. Not only has the Chiswick Board been ignored, and so far insulted, but all true British gardeners and business men believe that some amount of injustice has been meted out to Mr. Barron himself, after his long and honourable services on behalf of the Society. Something very much of the nature of a secret conspiracy appears to have been adopted, and as one result, an adverse report seems

to have been drawn up and signed by the following members of Council and others, viz.:—C. E. Shea (Chairman), W. Wilks (paid Secretary), H. Selfe Leonard, James Douglas, Harry Williams, J. Willard, E. Hill, J. Jaques, and N. A. Barnes. The Council, in tendering "a frank expression of regret" to the Garden Board for having ignored their very existence, seem to forget that something more is due to Fellows of the Society, and to gardeners generally, who are now asking all sorts of questions about these unbusiness-like proceedings. The Council have really done one of two things—they have either been honest, and courteous, and above-board in retiring Mr. Barron, or they have been underhanded and indiscreet, even if not actually discourteous, to an old and loyal official, and also, through him, to gardeners generally. We wish to know the truth, the whole truth, and nothing but the truth of this miserable affair. It is a principle that is involved, and not in any way a merely personal matter. Where is the report that was drawn up and signed by those, whose names we have given above? If it is not forthcoming, confidence in the society, and its council and secretary will be most seriously shaken. Let the council direct the secretary to lay the whole thing bare; if they have done the right thing in the best manner, they have nothing to fear, but if there has been anything discourteous, or of the nature of private intrigue, then let us judge on the direct evidence—not to produce or publish the report and correspondence—at once, will only defer the trouble until the society's annual meeting. Surely the Royal Horticultural Society of England has no need of a higger-magger policy—the society must be like Cæsar's wife—and to risk its power for good, by not allaying the discontent now raised, would be suicidal in the extreme. *F. R. H. S. Ireland.*

"RUST" IN BEGONIAS.—Having charge of an extensive collection of Begonias, I have found considerable injury caused by the so-called "rust" mentioned in your last issue by Mr. W. W. Sheath at p. 268. Like him, I have heard it attributed to a fungus and to excessive moisture in the houses. Neither of these reasons appeared to me to be satisfactory, and a close examination of injured plants has revealed the presence of large numbers of white insects, barely visible to the naked eye. I believe these to be the cause of the mischief, and have found frequent fumigations to be the only effectual remedy. I agree with Mr. Sheath that too high a temperature in spring is favourable to the rapid spread of this terrible pest. Unfortunately, it is not confined to Begonias, as Achimenes, Eranthemums, and other plants frequently suffer in the same manner. *W. K.*

THE BERMUDE LILY.—Between 1878 and 1888 the enquiry for bulbs of *Lilium longidorsum* from merchants who trade with Bermuda, was so great, that it taxed the resources of both Holland and Japan to supply the needs of the Island. Can someone tell us if the produce of these heavy annual consignments ever left its shores bearing the same name? Mr. Ball, of Chelsea, was, I believe, the first London house to make *Lilium Harrisii* known here, and directly our large market growers took to it, several bulb firms obtained it extensively, and the demand has been maintained until the present time. This year, however, a smart American plantsman has initiated a syndicate in Bermuda, and the combination is strong enough to control about ninety per cent. of the past season's crop. If they are successful, a nice haul will be landed in dollars, mostly from this country. When it is borne in mind that Bermuda is a British possession, it seems remarkable that such things should be. *Seedsmen.*

THE CHISWICK TRIALS.—In reading an account at p. 234 of the amount of time and space devoted to the trials of flowers and vegetables at Chiswick, one is tempted to ask if it is at all needful for such a garden to engage in such work, especially seeing that the trials are practically of no use to gardeners generally, or to the trade. It is a well-known fact that gardeners stick to a few well-known varieties, proved by themselves or their neighbours; and if you pick up promiscuously any nurseryman's catalogue—say, Sutton's—you will see that it is not the Chiswick trials they rely upon, but the trials in private gardens and press notices, as proved on nearly every page. Many gardeners receive far more applications to test garden novelties, manures, insecticides, &c., than they can entertain. What sense or reason is there in encumbering Chiswick with the labour of proving the heights, colours, time

of flowering, &c., of 500 Phloxes, and a proportionate number of common garden vegetables and plants that are hardly ever heard of afterwards? There only two varieties of Phloxes in cultivation, and about two dozen of these embrace the best. I saw them all set out in a small patch in Dobbie's nursery at Rothessay the other day. Are there not plenty of subjects of far more permanent interest and importance in gardening to prove than seedmen's novelties, and which would cost about as much time as it would do to write the labels for 500 Phloxes alone? It has often occurred to me that there are many long-disputed matters of culture, &c., in horticulture that an experimental garden might set at rest by a very little patient experiment carried out conscientiously, in a philosophic and scientific spirit. For example, the kind of soil, texture, and depth, &c., for a Vine border is a question still unsettled and wrangled over, notwithstanding Chiswick opportunities. The "turf fibre" theory is the most popular still, but it has never been demonstrated that such a border is any better (if as good) than one made of good garden soil judiciously enriched. Yet the turf border has cost, in hundreds, if not thousands of gardens, probably 70 per cent. more in cash than as good a border of common soil would have cost, and I am strongly of opinion that a large portion of that 70 per cent. has been lost—sacrificed to "rule of thumb"—and that Lindley was right forty years ago, if not more, when he said that a "finely divided soil" was the best for Vines, so long as it was permeable. Numbers of other problems, involving much time and expense, might be suggested that an experimental garden might concern itself with, leaving the least important, not to say frivolous, matters alone. But to carry out such experiments successfully it requires a mind open to conviction, and with a Darwinian bent of investigation. I would further suggest that if, as is said, some of the glass-houses are "white elephants" on the Society's hands, and Grapes hardly do more than pay expense, it is not necessary to waste fuel at a high price on them. There is work which they could be devoted to in the culture of other kinds of fruits and trees that prefer a cool structure all the year round, and with these numbers of useful tests could be made that require little trouble. *Head.*

PRIZES AND POINT VALUES.—It is so generally held that the award of prizes at flower shows to exhibits according to their respective values is the right and proper thing to do, that it seems odd the principle is not generally adopted. Two things, however, will tell against the adoption: first, ordinary practice which regulates prizes arbitrarily and without real regard to the relative merits of the exhibits to each other; and second, the *laissez faire* principle which so strongly dominates flower show management, and sanctions the continuance of an old system as the best, simply because it is an old and stereotyped practice. At the annual bank holiday show, held at Carshalton, Surrey, Mr. A. H. Smee very kindly originated, and there is now continued, a special class for nine vegetables, open to all subscribers in the district, the prizes being a lump sum of five pounds, which, if the competition be large enough, is divided into six. The collections are all strictly pointed, numbers of marks given being rigidly in accordance with quality. At the recent show there were eight entries in the class, and when all were judged, it was found that the first six stood as follows, 61, 57, 55, 49, 49, and 46 points, the gradations in quality being in no case very wide. As a result, the five pounds was apportioned into six prizes, thus, 19s. 4d., 17s. 11d., 17s. 4d., 15s. 6d., 15s. 6d., and 14s. 5d., these sums bearing an exact relation to the point-value of the exhibits. Had the money been apportioned under the ordinary rule, £2, £1 5s., 15s., 10s., 6s., 4s., the first collection would have been awarded 20s. more, and the sixth 11s. 6d. less. *A. D.*

JUDGING AT FLOWER SHOWS.—I notice in your answers to correspondents in your last issue an answer to a question on "Judging at Flower-shows." Kindly allow me to say, I imagine you have been misled on the subject. Instead of a group of plants in pots, the schedule provided for a group of plants for effect, which I contend alters the case altogether. Each group was given a space of 10 feet by 6 feet, or its equivalent (a circle), the centre of which was the tent-pole, which, of course, had nothing to do really with the group, but in two cases the poles were furnished so as to give the groups a more finished appearance. I think the pole could have been furnished with anything—say, cut Bamboos, Ivy, moss, &c.—or left entirely bare, without disqualifying the exhibit. *Judge.*

CUCUMBER LOCKIE'S PERFECTION.—There are two houses of this Cucumber in the St. Neot's branch nursery of Messrs. Wood & Ingram, of Huntingdon, the plants having been put out in the end of May. One house is 100 feet by 15 feet, the smaller 20 feet by 15 feet, and the plants are in boxes formed of planks 1 foot in depth by some 2 feet in width. The plants stand 4 feet apart in the boxes, and both houses being span-roofed, they are trained up the inside; the depth of soil in which they are growing is about 9 inches. What strikes the visitor is the admirable condition of the plants, and the wonderful crop of fruit they have produced. It is not too much to say that a record for productiveness is established; the crop is enormous, and every fruit is true to shape, showing the fine quality seen in those, the raiser, Mr. Thomas Lockie, has been in the habit of exhibiting. Mr. W. Ratchelous, the foreman at the St. Neot's nursery, stated the plants were in good yellow loam enriched with manure, that a little of Beeson's plant-manure was placed in the soil, and some of the manure with a little soot laid on the surface once a week and watered-in. It does seem as if no variety of Cucumber could be more productive, and no Cucumber be better adapted for market and exhibition purposes. *R. D.*

VENIDIUM CALENDULACEUM.—I have been looking in vain for the year in which this charming subject was introduced. Its flower-seed lists it is generally classed as an annual, and treated in that way it is a delightful garden plant during the summer months. Sown seeds sown in March in a cold frame, or better still in a gentle bottom heat, will give plants which, if they have ordinary care, will flower in July, and if not allowed to seed will bloom for a considerable time. Then a sowing should be made in May for late summer and autumn-blooming; and like the *Gazania* it is seen at its best late. The flowers are golden-yellow, with a dark brown disc, and it may be appropriately likened to a glorified pot Marigold. One of its chief features is its freedom of bloom. I find it does best when planted out in a sunny spot, but it should not want for water. In the somewhat firm sandy loam of the Bedford seed grounds it roots freely, and the plants grow into large size. A few years ago an extraordinary seedling re-introduced it, and offered it at a high price per packet, and I have often wondered if he realised a fortune by doing so. It well deserves to be more generally grown. *R. D.*

HEUCHERA SANGUINEA AND HYBRID.—Complaints are frequently made that this plant does not flower freely, but nothing could be more satisfactory than its conduct in my garden. It must, however, be renewed frequently from cuttings or seed, which ripens plentifully; and exposed situations, swept by cold winds in winter, must be avoided. Whilst giving it the full advantage of the mid-day sun, it should be screened by a wall or hedge on the north side. In such situations it flowers abundantly, and never more abundantly than last spring, in spite of the severe winter. I have a variety of a deeper and brighter red than the type, but it is difficult to improve the pure and distinct colour of the flower as first distributed. Last year a hybrid seedling appeared spontaneously in my garden, more robust than the seed-parent, with flesh-coloured flowers, of which a second crop is now out in abundance. I take it to have resulted from *H. sanguinea* × *H. cylindrica*. I think I saw the same in flower last June at Kew. *C. Wolley Dod.*

LARGE PEACHES.—Some Sea Eagle Peaches, of unusual size and finish, have been lately gathered in the gardens at Ketton Hall, Stamford. The crop was a medium one, and the fruits averaged about 1 lb. each. The largest weighed 17, 18, and 19½ oz. respectively. The tree is planted in a cool-house in the natural soil. The crops of Peaches and Nectarines in the earlier houses were also very good, being heavy and well finished, and averaging from 14 to 16 oz. in weight. Owing to recent changes at Ketton, Mr. Drabble is debarred from bringing these splendid fruit to any exhibition. *A Grower.*

GLADIOLUS SHAHZADA.—This is one of Messrs. Kelway & Son's new introductions, and it is remarkable for its deep dark crimson colour flushed with purple, and its rich purple markings in the throat, and for the stoutness and fine form of the individual flowers. Two very fine spikes of it were exhibited at the recent flower show at Taunton, and its marked individuality of colour caused it to stand out from the rest of the flowers in the stand. Extreme caution is now necessary in awarding

Certificates of Merit to new varieties of Gladioli, but of the excellence of this one there could be no doubt. *R. D.*

FOOD REQUIREMENTS OF THE CHRYSANTHEMUM.—Referring to the article upon the above subject of your correspondent, M. P. Andersen, which appeared in the issue of August 17, p. 181, and the reply of W. Dykes in September 7, p. 272, I beg to state that I agree with Mr. Dykes that the compost and manurial mixture of Mr. Andersen was decidedly deficient in nitrogen. The rate at which the mixture was used is stated to be one part in 400 of soil, whereas the quantity recommended by me, and of a more concentrated manure, was one part to 250 parts of soil, while that suggested by Mr. Dykes was still larger. Your correspondent will also find that I recommended after the potting that the Chrysanthemum plants be watered every three weeks up to the time of flowering with a manurial solution ¼ oz. of the mixture to each gallon of water. Mr. Andersen made the mistake of mixing basic slag and sulphate of ammonia together; hence, not only was the nitrogen of the manure lost as a gas, but the evolution of free ammonia doubtless had a tendency to injure the growing plants. Starvation and injury thus went hand in hand during the early part of the experiment. Again, the mixture used was lacking in soluble phosphate, owing to the fact that the phosphate in basic slag becomes available only very slowly, therefore, when this substance takes the place of superphosphate, twice as much must be employed. Mr. Andersen tells us that his compost appeared to suit the plants much better after some months than at first, showing pretty clearly that the evolution of free ammonia from the soil was injurious to the plants, and also that the phosphate only began to act after the main growth of the Chrysanthemums had been made. Two very interesting facts have become clear in the experiments at Rothamsted, which have an important bearing upon the relative value of soluble and insoluble phosphate of lime; one is, that phosphate of lime, if not taken up at once by the growing plant, becomes fixed in the soil, and is only recovered by growing plants over long periods of time. The other is, that the capacity of cultivated plants to take up phosphate of lime existing in the soil, differs in a very remarkable degree. As one illustration, we may select an experiment with Swedish Turnips. There were two plots of land, one receiving 3 cwt. superphosphate of lime per acre, and the other 6 cwt. per acre of basic slag (ground fine). The roots receiving the superphosphate grew much faster at the beginning than those which had the basic slag. But the roots with the basic slag continued to grow later into the season, and eventually gave about equal weight of crop with those receiving superphosphate. It is evident, therefore, that 1 part of phosphate of lime in the form of superphosphate is equal to 2 parts of the phosphate in the form of basic slag. Also that the Swedish Turnips were not able to take up the phosphoric acid of the basic slag until towards the end of the season. It is quite clear that the absence of a soluble phosphate of lime in the early stages of plant growth and insufficient nitrogen was the cause of failure in Mr. Andersen's Chrysanthemum experiments. *J. J. Willis, Harpenden.*

APOGAMIC FERNS.—Mr. E. J. Lowe, in his reference to my article on the above subject, assumes that apogamic Ferns being destitute of archegonia, cannot yield varieties through their spores, a conclusion he deduces from my quotations from De Bary's papers on apogamy in the *Botanische Zeitung*, and my own remarks thereon. De Bary, however, makes no such assertion, and my remarks were directed solely to the impossibility of effecting crosses, and in that way combining varietal forms in the fashion for which Mr. E. J. Lowe has rendered himself famous among British Fern-cultivators. Within the last few days he has sent me a number of fronds of the crested male Fern to demonstrate variation in its progeny, a fact to which I had already alluded in my paper as indicating exceptions which De Bary failed to find. I also said "we have no reason to assume apogamy is a bar to variation any more than other bud-forming phenomena," which to my mind covers the whole ground of Mr. Lowe's contention. Assuming, as we must do, that the spore when shed contains the varietal potency which is eventually seen in its own (i.e., not crossed) progeny, we are justified in expecting as much variation from apogamic buds as from normal sexual ones fertilised by antheridia on same prothallus; and to

what an extent this self-variation may be carried, I demonstrated some years since at Chiswick by exhibiting a number of most diverse plumose *Athyria*, passing through all grades from plain to grandiceps cristate forms, and yet the result of a sowing from one and the same plant. These for reasons then given at length and generally accepted, certainly owed none of their diversity to crossing, although it was little inferior in range to Mr. Lowe's exhibits, shown to demonstrate the complex effects of multiple parentage. In my plants, however, the variety ran only in three directions, viz., delicacy of dissection, development of folioseness, and extent of terminal crissation, while his, as might be expected from their hybrid origin, showed diversity of all sorts. It is a very curious biological fact, that the crested male Fern is exceptionally easy to raise from spores, and comes up as a stray in profusion among other sowings, demonstrating, in conjunction with its robust habit of growth, that its non-sexual mode of reproduction is in its favour, and seemingly might be a perpetual factor without any detriment to the continuance of that special branch of the species. *Chas. T. Druery, F.L.S.*

NEW INVENTIONS.

A NEW BUDDING-KNIFE.

THIS new knife differs from all others in make. It is well known to all who practise budding that the hand of the workman has to execute various manoeuvres before the bud can be inserted in the T cut. The chief difficulty lies in raising the bark. For this operation it was formerly necessary to turn the knife in the hand. The new budding-knife, invented by the head-gardener of one of the largest nurseries in Germany, Mr. Kaehler, and by Mr. Grunewald, of Tempelhof, near Berlin, enables all the operations to be made without turning the knife. The process now is as follows: the bud is cut by the long straight part of the knife. By the same part the obverse cut is made. Then the lower point of the triangular apex is laid against this obverse cut, and the lengthwise cut is made by a waving motion. By turning the knife to right and left the bark is separated. Care should be taken that during this action the upper point of the apex remains in the same position. The bud may be inserted while the knife is raising the bark. By this knife (fig. 56) during ten minutes, seventy-five good buds of *Acer*, *Syringa*, *Plums*, *Cherries*, *Cydonia*, &c., were made before a committee of gardeners. *U. D.*

WEST'S IMPROVED PATENT ORCHID BASKET.

IN the new Orchid-basket (see fig. 57), the inventor has made an effort to secure a more thorough watering of the contents than is possible by the same means in the case of the ordinary basket made of square teak rods. The upper inside edges of the otherwise square rods are bevelled off with a view to throwing the water towards the centre of the basket. There are also two extra bevelled rods with flanges inserted between the two top bars, and these make the four sides comparatively level with each other, and therefore a better receptacle for water. It is claimed that following the adoption of this new basket, the rather tedious process of dipping baskets containing Orchids will be quite unnecessary, as each plant can be equally well saturated by means of a syringe or watering-can.

COLONIAL NOTES.

HONG KONG.

BARTHEA CHINENSIS is an erect-growing little Melastomaceous shrub, attaining a height of about 3 ft., and the only representative of the genus. It makes its home on the north side of the island at an elevation of about 1,400 feet, and in the immediate vicinity of *Aristolochia longifolia*, *Gordonia anomala*, *Rhododendron squamatum*, *Woodwardia Harlandi*, and many other plants. It is an exceedingly pretty thing when in flower, and on account of this, there is every

probability that it will be exterminated in Hong Kong in a very few years. Another thing which militates against its chance of existence, is that it grows just outside a European's private residence. The Chinese servants are sent out to gather flowers, and, of course, they cut the first they come across, which means *Barthea chinensis*, when in flower. If they were to cut flowers in a proper manner, there would be no harm done, but these vandals cut the whole shrub down when they get the chance. The flowers are over 2 inches across, white suffused with pink in colour, and are borne on the ends of the branches

long, and about $\frac{3}{4}$ inch broad, plicated, and somewhat grass-like in appearance. The rhizomes vary in size from that of a goose-quill to a man's little finger. The plants which I found were growing on the south side of the island in a comparatively dry situation, not many feet above sea level, whilst other collectors have found it in marshy spots on the top of one of our high hills.

Aristolochia longifolia is a rare Hong Kong plant, and is found growing in the clefts of rocks in rather shady situations. The leaves are 6 to 8 inches long, 1 to $1\frac{1}{2}$ inches wide, and lanceolate in shape.

FIG. 56.—A NEW BUDDING-KNIFE.

generally in threes. The leaves are lanceolate in shape, $2\frac{1}{2}$ to $3\frac{1}{2}$ inches long, three-nerved, and on petioles $\frac{1}{2}$ inch in length. The calyx tube is sharply four-angled and $\frac{1}{2}$ inch long, having subulate lobes 2 lines long. The corolla consists of four petals nearly 1 inch in length, and over $\frac{1}{2}$ inch in breadth. The plant flowers in March.

Lagerstromia Fordii was first found by Mr. Ford a few years ago on Lantau Island. In August last, I found it for the first time in Hong Kong, on the south side of the island, growing near the sea. There was only one plant of it, and this was about 10 feet high, thriving in very little soil on the top of a rock. It is not such a showy species as some of the other *Lagerstromias*, but nevertheless, is a plant well worth cultivating. The flowers are produced in panicles 3 or 4 inches long, at the end of the branches. The calyx is about 3 lines long,

The veins are very conspicuous on the under surface, but less so on the upper. The stems and leaves are rusty tomentose when young, but the upper side of the leaves becomes glabrous when old. The flowers are produced in April on the old wood near the roots. The inner or upper side of the perianth is dark purple, the throat being creamy-yellow with a few purple spots on it. The mouth of the perianth is fully 2 inches across, and the tube $3\frac{1}{2}$ inches long, bent in the shape of a hook. The outside of the flower is marked with purple veins and articulations, and densely covered with hairs, the general colour of the outside being greenish. When the flowers are fully developed, a very disagreeable odour is emitted from them, similar to that of other species of the genus. A plant which I found had upwards of a dozen flowers on it, and its growths were about 10 feet long. *W. J. Tutcher.*

FIG. 57.—A NEW STYLE ORCHID-BASKET.

downy white on the outside, and the tube furrowed. The petals are white, the limbs being about 2 lines across, orbicular in shape, and crimped on long thin claws. The leaves are lanceolate, 3 to 4 inches long, and 1 to $1\frac{1}{2}$ inches wide, on petioles of a quarter of an inch. When ripe, the capsules are dark brown in colour, oval in shape, and about $\frac{5}{8}$ inch in length.

Pachystoma chinense, when seen growing amongst long grass, is a pretty little Orchid when in flower, although it is destitute of leaves at the time. It produces its scapes ranging from 9 inches to 2 feet high, and bearing from six to twelve flowers in April. Each flower is subtended by a light brown lanceolate bract, $\frac{3}{4}$ inch long. The sepals are nearly 1 inch long, and $\frac{1}{2}$ inch wide, narrow oblong in shape, and of a light lilac colour. The petals are the same length and colour as the sepals, but only $\frac{1}{2}$ inch in width. The lip is three-lobed, caccate at the base, and crested in the centre. The middle lobe is either light green or yellow, the lateral lobes being of the same colour as the sepals and petals. The scapes are sheathed in light brown-coloured bracts their whole length. After the flowers have died away, the leaves appear. These are about 2 feet

FIG. 58.—AN OLD STYLE ORCHID-BASKET.

HONG KONG BOTANIC GARDENS.

The annual report on the Botanical and Afforestation Department of Hong Kong (by the Superintendent, Charles Ford, F.L.S.) for the year 1894 is now before us. The climatic and other difficulties of the season under review, not merely proved excessively difficult to cope with, but, in spite of all the efforts of the staff, caused serious and lasting injuries to the gardens. Immunity from storms for many years past had been evident in the beauty of the plants; in 1894 a series of typhoons, and a sudden and prolonged drought, did mischief, which all the precautions taken were powerless to completely counteract.

A still more serious evil was the plague of caterpillars which was prevalent during May and June. The species (*Eutricha punctata*) multiplied so numerously, that an organised and very extensive raid was made against it, over a thousand people being at one time employed in collecting the caterpillars, and bringing them to certain police-stations, the authorities at which were empowered to pay for them by weight. Over 36 tons of caterpillars in all were collected, and the price paid for them was 4,889.95 dols.

This expense was not the only loss suffered, since, in spite of all pains taken to collect and destroy the pest, considerable damage was done before it was completely eradicated, since, while affecting nearly all the Pines in the colony, it was especially numerous in certain localities, where many plants were made leafless, and (growing on poor soil) eventually died from it.

Although less satisfactory than those of former years, this report is so far encouraging in that the difficulties mentioned in it are now surmounted, so that, granted a few favourable seasons, the gardens will, in condition and financial position, soon regain their former standpoint.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 5.—A meeting of the Fruit and Vegetable Committee was held at Chiswick on the above date.

Present: Mr. J. Wright, in the chair; and Messrs. G. Norman, J. A. Laing, G. Wythes, W. Farr, W. Cummins, A. Dean, and A. F. Barron, Secretary.

The subjects to be examined were a large collection of some 78 varieties of Potatoes, chiefly new, 75 diverse varieties of Brassica, and some American Tomatoes. The Potatoes were found to be of very diverse character—some early and ripe, others very late and robust. Disease was found rapidly decimating the leafage in all varieties, and in some others, owing, no doubt, largely to the excessively porous nature of the soil, to be much affected with disease. Some, again, especially those of the Magnum Bonum type, of which there still seem to be so many seedlings raised, had become, through super-tuberation, very ungainly, whilst some others were very large. It was noticeable that round-tubered varieties generally had grown out less than kidney forms. Ten sorts of great cropping capacity, and of excellent appearance, were selected for cooking, and later these, very admirably served in their coats, were tasted, and the following received three marks:—Cockerel's Seedling, pebble-shaped, white, medium grower, tubers having a mealy Regent-like quality; Syn House Prolific, late, strong grower, oval, capital quality; Birmingham, late, tubers round, white, handsome—excellent; Sutton's Triumph, now pretty well known, round, strong grower—very good; and Pride of Tonbridge (Webber), flattish-round, rough skin, white—also good.

Cabbages.—The whole of the large trial of Brassica is from a sowing of seed made May 19. Two of the earlier varieties were dealt with at a previous visit. On this occasion, after inspecting the entire group carefully, the committee resolved to select the best from types, and the old Dwarf Early York, as a summer Cabbage; Sutton's Little Gem, a capital stock, greener and better than Little Pixie; Leeds Market, the best of the larger section, specially good for market field culture; Winnigstadt, a very green pointed-heart variety, that always stands drought wonderfully well; and St. John's Day, the tenderest eating, for it eats like a Colewort, are the best. Of all the dwarfier forms of flat or Drumhead Cabbages, each had three marks. This latter is a specially valuable Cabbage from summer-sowings to turn-in during autumn and winter. Of the two forms of Red Cabbage, the old large and the newer Dwarf Early Blood-red, the committee regarded the latter as far the best, and gave three marks to the Erfurt Blood-red (Banary) and Sutton's Blood-red, as the best stock. A capital stock of the Dwarf Green Curled Savoy Cabbage also had three marks. The comparative absence of uniformity in many of the stocks was noticed, showing that the greatest care is needed in seed-growing to keep Cabbage stocks perfectly true.

The Tomato plants in pots, chiefly of American strains, did not exhibit any advance over varieties previously certificated, and well known in commerce. It is worthy of note, too, in relation to home-raised varieties, that many highly lauded elsewhere, when tried at Chiswick seem to be very much of a muchness indeed with other varieties.

SEPTEMBER 10.—On Tuesday last a vegetable exhibition by the Royal Horticultural Society, which was arranged to take place at Chiswick, was held after efforts to promote such an exhibition under other auspices had failed. The weather was decidedly more pleasant than on other occasions at Chiswick, and the show of vegetables from the point of view of quality was satisfactory, even if the number of competitors was rather smaller than looked for. As the gardens themselves were looking well, and there were excellent collections of Dahlias, fruit, and other things, the visit to Chiswick was an enjoyable one. For further remarks on this exhibition, see p. 300.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. Chas. E. Pearson, Chas. Jeffries, J. H. Fitt, R. Dean, W. Bain, Geo. Stevens, George Gordon, Jno. Laing, Jas. Walker, Robt. Owen, Harry Turner, J. Jennings, Geo. Paul, Jno. Frazer, H. Herbat, J. T. Bennett Poë, Ed. Mawley, and J. D. Pawle.

Messrs. BARR & SON, King Street, Covent Garden, exhibited a miscellaneous collection of hardy flowers, containing the very best of the species now in flower, perennial and annual Asters, Violas, Tigridias, Lilliums in variety, perennial Sunflowers, Pyrethrus, and a collection of varieties of Phloxes were conspicuous. Amongst the varieties of Phloxes, an Award of Merit was recommended to Leonora da Vinci, a capital variety, with large white flowers, having rose centre, bright-looking and very pretty. Messrs. BARR & SON had also a collection of plants of bedding Antirrhinum in many colours, and plants of a dwarf strain, growing about 10 inches high, very compact and free-flowering. A pretty white variety, about 15 inches high, extremely floriferous, should also be mentioned, it is called Queen of the North (Silver Flora Medal).

Some garden Roses in miscellaneous variety were from Messrs. WM. PAUL & SONS, Waltham Cross Nurseries, Herts. The blooms, cut with long stems and foliage, and tied in bunches, were exhibited in an attractive manner. The Duke of York, winter-flowering Chios Rose, was well exhibited, and with W. A. Richardson and Marie Van Houtte, form a very excellent trio in this section of Roses. Queen Mab is a new China variety for next season, in colour very distinct, of different shades of Apricot, very pretty in the bud, and likely to become popular (Silver Flora Medal).

A new perennial Sunflower called Stoke Park Favourite, was exhibited by Mr. J. HUGHES, Stoke Park Gardens, Guildford. The plants are said to grow 5 to 6 feet high, of good branching habit. The blooms are produced on long stems, and are suitable for furnishing vases, &c. The flower is an extra bright one, of medium size (Award of Merit).

Messrs. ROBT. VEITCH & SON, Exeter, had a few bunches of *Nemesia strumosa*. Mr. WALTER SALMON, Ivy Cottages, Elder Road, West Norwood, exhibited a collection of tall French Marigolds and some double flowers of *Zinnia elegans*, beside a general collection of hardy flowers, including *Asters* in variety, *Violas*, *Salpiglossis*, *Dianthus*, *Dahlias*, *Phloxes*, and other things (Silver Banksian Medal).

Miss HUDSON, Gunnersbury House Gardens, was awarded a Silver Banksian Medal for a decorative exhibit of Dahlias, and a similar medal was obtained by Mr. A. WATERER, Knap Hill Nursery, near Woking, who exhibited some specimens of the effective blue Spruce, *Picea pungens argentea*.

DAHLIAS.

The collections of Dahlias filled a considerable portion of one of the tents with their brilliance. Mr. T. S. WARE, Hale Farm Nurseries, Tottenham, had a large bank, having a raised background of panels of Cactus and decorative varieties, fronted with bunches of bright Pompons. Of true Cactus varieties, there were excellent examples of *Delicata*, *Cannell's Gem*, Mrs. A. Beck, new, pale orange-scarlet, fine Cactus shape; *Gloriosa*, Miss V. Morgan, Bertha Mawley, Matchless, Mrs. Francis Fell, white, with slight pale yellowish-green centre—a decided acquisition to the white forms if it will maintain this character; *Lady Penzance*, Robt. Cannell, Countess of Gosford, and Earl of Pembroke. Of decorative varieties, the best were Harry Freeman, John H. Roach, Empress of India, Viscountess Folkestone, Lady Montague, Obsan, Maid of Kent, a very pretty fancy variety; *Kynerith*, R. Maher, and Countess of Pembroke. Of Pompon varieties, there were charming bunches of *Emily Hopper*, yellow; *Arthur West*, Tommy Keith, *Virginalis*, Stanley Ford, *Sunshine*, Mary Kirk, *Hector*, *Winifred*, and *Florence Woodland*, &c. (Silver-gilt Banksian Medal).

A very excellent collection of 144 blooms of show and fancy Dahlias came from Mr. S. MORTIMER, Swiss Nursery, Farnham. Some leading flowers, characterised by high quality, were seen in Mr. Gladstone, Mrs. Morgan, *Buttercup*, *Colonist*—one of the most distinct and constant, *Duchess of Albany*, *Sunset* (fancy), *George Barnes* (fancy), *Jno. Walker*, *Novelty*, Mrs. J. Downia (self, very fine), and *Henry Eckford*, as a fine crimson self. Mr. MORTIMER also had a dozen bunches of Cactus and decorative varieties, chief among them being *Delicata*, *Lady Penzance*, *Bertha Mawley*, *Mayor Haskins*, &c. (Silver Flora Medal). Then there was a good collection of show Cactus, Pompon, and single Dahlias, from Messrs. J. CHEAL & SONS, Crawley, about four dozen blooms of the show types, and charming bunches of the following singles, *Victoria*, *Phyllis*, *May Sharpe*, *Miss C. Morland*, small, bright orange-scarlet, very good; *Evelyn*, *Dearest*, very chaste; *Lowfield Beauty*, *Miss Roberts*, a charming soft yellow; *Miss Ashley*, amber shaded with delicate rose, and having a crimson ring round the eye; and *Miss Glascock*, a very good selection of single varieties for exhibition purposes. There were twenty-four bunches of Pompons also, the choicest were *Rosebud*, pale ground, broadly tipped with rosy-purple (Award of Merit); *Arthur West*, *Ceres*, *Phoebe*, *George Bruckman*, *Sunshine*, *Lilian*, *Lorna Doona*, *Emily Hopper*, *Martial*, *Mabel*, *Grace*, *Revenge*, *Tommy Keith*, and *Darkness*. Of Cactus varieties, Mrs. Wilson Noble, salmon-red, an excellent Cactus type, very bright and fine (Award of Merit); Mrs. Gordon Sloane, dark salmon-red, good Cactus; Earl of Pembroke, *Lady Penzance*, *Mayor Haskins*, *Harmony*, *Delicata*, *Ernest Glass*, and *Gloriosa* (Silver Flora Medal).

Mr. C. TURNER, Royal Nursery, Slough, had a handsome bunch of his large, bright, pale-yellow decorative Mrs. Turner *Endymion*, bright scarlet, a good Cactus; and fifteen blooms of *Beatrice*, bright rosy-pink with a slight flushing of mauve, very distinct, constant and attractive; and some bunches of charming Pompons, mainly new, viz., *Ganymeda*, already described (Award of Merit); *Claribel*, pale ground, suffused with purple and tipped with white, very distinct (Award of Merit); *Madeline*, yellow ground, tipped with dark crise (Award of Merit); *Zoe*, yellow, tipped with white, very pretty (Award of Merit); *Pearl*, white; *Ruy Blas*, *Jason*, *maroon*; and *Veitchii*, crimson, very bright and finely formed.

Mr. J. T. WEST, Cornwallis, Brentwood, had some fine new Cactus varieties, such as *Miss Annie Jones*, brilliant scarlet, one of the brightest of the true Cactus type (Award of Merit); *Miss Nightingale*, bright deep orange-scarlet, very effective, true Cactus (Award of Merit); *Minnie*, delicate pink lower petals, the centre white, a decorative variety; *Barnett Tabrum*, bright red with slight dark shading, fine Cactus shape; *Emily French*, pale salmon-red, a very good type; *Mabel*, delicate salmon basal petals, flushed with rose, yellow centre, true Cactus, a model in point of shape; and *Miss Ethel*, bright reddish-cerise, very attractive, but not a good Cactus type.

Mr. W. BATCHELOR, Harefield Park, Uxbridge, had decorative *Willie Batchelor*, bright pale scarlet, with white flame and tip, small and very pretty (Award of Merit); and single, Mrs. Gore Langton, rather large, but very distinct, cerise-crimson, with a maroon ring round the eye (Award of Merit).

Mr. C. TURNER also had new show *Dahlia Marjorie*, amber ground, suffused with salmon, the reverse of the petals slightly purple, very promising; *Barbara*, a deep crimson self; *Shotesham Hero*, tipped with bright purple; *Rosamond*, pale ground with bright rosy-purple tip; and *Dante*, a small maroon-crimson self, good shape.

Mr. G. ST. PIERRE HARRIS, Orpington, had *Yellow Globe*, a very promising yellow self, of fine petal and great depth; *Hero*, an orange-red self; and *Mabel*, fancy, pale ground, flaked, splashed and striped with crimson.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. Jas. O'Brien (Secretary), Jas. Douglas, H. J. Chapman, and H. M. Pollett.

Chiswick seems to have but little attraction for Orchid growers. On the present occasion there were but few entries. The small group of hybrid Orchids staged by Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea, was the only important exhibit, but it contained some remarkably fine things. Of these, the magnificent *Laelio-Cattleya* × *Clonia* *superba* (L.-C. × *elegans* Turneri ♂, C. Warscewiczii ♀), may be ranked among the best results of the hybridist's skill, its flowers being large, finely formed, and of a rich and glowing colour. In form it resembled *C. Warscewiczii*, but the lip was more openly displayed at the base. The petals were very broad, and, like the whole flower, of good firm substance; the sepals and petals soft rosy-lilac, with an indescribably beautiful closely-set veining of crimson-purple; the broad labellum is of a glowing magenta-purple hue, the outside of the side-lobes lilac, with purple veining—a most beautiful flower, viewed from any aspect, and well worthy of the First-class Certificate awarded. Another fine novelty was *Laelio-Cattleya* × *Ennomia* (C. Gaskelliana ♂, L. *pumila* Dayana ♀), a plant of neat dwarf habit and large flowers of the *C. labiata* type; sepals and petals of a delicate light rose colour; the base of the lip orange, the front lobe light velvety-purple with slight lilac margin (Award of Merit). In the same group were *Laelio-Cattleya* × *Parysatis* (L. *pumila* ♂, C. *Bowringiana* ♀), a pretty plant, with the habit of *L. pumila*, but much stouter, and flowers equal in size, and resembling in form those of *L. pumila* *prestantis*, flowers rosy-lilac, with light purple front to the lip (Award of Merit); *Cypripedium* × *Carnusium*, Veitch's variety (*Haynaldianum* ♂, *Spicerianum* ♀), a very singular and beautiful variety, with its distinguishing features, so far as they have been tested, a much dwarfier inflorescence, and darker and more richly-coloured flowers than the type, and having the lower sepals disjointed and divergent right and left, a feature which has so far proved constant, and which gives the flower a very striking appearance. The upper sepal is white, suffused with purple the base green, with chocolate spots; lower sepals yellowish, with emerald-green lines; the rest of the flower greenish yellow, with purple-brown tinge (Award of Merit). *Cypripedium* × *Metis* (*philippinense* ♂, *villosum* Boxalli ♀), with shining yellow flowers flushed with chocolate, the large yellow hairy staminode being very singular; and *Laelio-Cattleya* × *Nysa* *purpurea*, a worthy hybrid of the L.-C. × *exoniensis* class, and which was so finely shown in several varieties by Messrs. Veitch at the corresponding show at Chiswick last year. *Cypripedium* *Charlesworthii*, with double labellum, was also shown. Messrs. Jas. Veitch & Son were the first introducers of *C. Charlesworthii*, but their plants being small, they were not the first to flower it.

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent the pretty *Maxillaria striata*, with flowers of good size. The sepals yellow, striped with purple, the lower ones reflexed; petals similarly coloured, but narrower and curved back at the tips; lip cream-white with purple veining, and white apex (Botanical Certificate).

HY. SHAW, Esq., Stamford House, Ashton-under-Lyne (gr., Mr. J. Cliffe), sent *Cypripedium* × *Whitelynnum* (*Boxalli atratum* × *Lawrenceanum*), whose flowers much resemble a dark form of *C. Boxalli*, but the leaves are tessellated, and indicate that a cross has been effected.

A. H. SMEE, Esq., The Orange, Wallington (gr., Mr. Cummins), showed a three-flowered inflorescence of a pretty light form of *Cattleya* × *Hardyana*; and A. H. MILTON, Esq., Castleton House, White Ladies Road, Clifton (gr., Mr. A. Murrell), showed *Odontoglossum Inlesleyi splendens* and *Oncidium Jonesianum*.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. W. Wilks, Geo. Banyard, G. W. Cummins, H. Balderson, J. Wright, J. W. Bates, P. C. M. Veitch, W. Farr, G. H. Sage, Robt. Fife, Jas. H. Veitch, Wm. Pope, Jas. Cheal, T. Francis Rivers, Geo. Wythes, Geo. Reynolds, and Alex. Dean.

THE COMPETITIVE VEGETABLES.

These were all found in a large tent, ample room being thus provided. Generally, the quality was excellent, that of the best collections first-rate. More competition might have been looked for, but the prizes were perhaps none too attractive. Still, with the present year's experience, if the show be followed up yearly, there can be no doubt, with a revised schedule, it will grow into exceeding popularity, and become the great vegetable exhibition of the kingdom.

Collections.—Those in the class for twelve kinds naturally included the best samples, and brought the leading exhibitors. The 1st prize was taken by Mr. T. WILKINS, gr. to Lady THEODORA GUEST, Inwood Gardens, Henstridge, with generally very fine samples. They comprised Autumn Giant Cauliflower, superb Leeks, gigantic white Celery, rather large Intermediate Carrots, good Perfection Tomatoes, Autocrat Peas, Ne Plus Ultra Runner Beans, fine Goldfinger Potatoes, large but rather spotted Ailsa Craig Onions, beautiful Snowball Turnips, and Globe Artichokes. Mr. BOWERMAN, gr. to C. HOARE, Esq., Hackwood Park, Basingstoke, was a very close 2nd, having also good Cauliflowers, grand Ailsa Craig Onions, splendid Perfection Tomatoes, good Celery, Satisfaction Potatoes, rather too large; good Beet, Prizewinner Runner Beans, good Carrots, Peas, &c. Mr. MAIRS, gr. to Mr. J. SHELLEY, Crediton, was 3rd. The whole of the prizes in this class were given by Messrs. SUTTON & SONS, Reading, and were the only special ones offered.

Exhibitors in the class for nine kinds were excluded from the larger one. Here Mr. C. J. Waite, gr. to the Hon. Col. TALBOT, Glenhurst, Esher, was a good 1st, having excellent Cauliflowers, good Carrots, Perfection Tomatoes, Prize-winner Runner Beans, Snowball Turnips, Exhibition Onions, Satisfaction Potatoes, &c.; Mr. EMPSON, gr. to Mrs. WINGFIELD, Amptill, Beds, was 2nd; and Mr. BASILE, gr. to the Rev. O. L. POWELL, Weybridge, 3rd.

In the class for six kinds, a fresh lot of exhibitors competed, the best being Mr. Kneller, gr. to G. PORTAL, Esq., Malshanger, Basingstoke; Mr. LLOYD, Merton Lodge, Chiswick, coming 2nd; and Mr. G. NORTH, Buckingham, was 3rd.

Taking the classes now in schedule order, there were eight lots of three Cauliflowers. Mr. EMPSON coming 1st with perfect heads; Mr. W. POPE, gr. to the Earl of CARNARVON, Highclere Castle, Newbury, 2nd, with very solid ones; and Mr. MAIRS was 3rd.

Only two competed for Kale heads, Mr. Wythes, gr. to Earl PERCY, Syon House, Brentford; and Mr. PENTNEY, Isleworth, taking the prizes.

There was good competition with dishes of Brussels Sprouts, Mr. BOWERMAN coming 1st with Sutton's Dwarf Gem; Mr. POPE 2nd with Exhibition, larger.

Mr. EMPSON had the only dish of Spinach, good round Flanders. There were thirteen pairs of Marrows; with one exception all good. Mr. MAIRS was 1st, with very pretty smallish long white; Mr. E. LYE, gr. to M^s. KINGSMILL, Sydmonton Court, Newbury, being 2nd, with others, very handsome, and a trifle larger. Cucumbers were fairly good, Mr. LYE having the best pair with Matchless; Mr. WAITE coming 2nd with Progress, and Mr. EMPSON 3rd with Model. Scorzocera in bundles was not an attractive class. Mr. PENTNEY had the best roots, and Mr. WAITE had the best sorts of Salsify.

Of Runner Beans nearly all were of the scarlet type, Mr. LYE being 1st with beautiful Prizewinner; Mr. BOWERMAN coming 2nd with the same variety. With dwarf French Beans Mr. BOWERMAN was 1st, having handsome Canadian Wonder; Mr. H. W. WARD, gr. to the Earl of RADNOR, Longford Castle, Salisbury, being 2nd with the same. Broad Beans were too much out of season, but there was a capital dish of Mammoth Long Pod from Mr. LYE; and Mr. BOWERMAN was 2nd with the same; Mr. WAITE coming 3rd.

Peas were fairly good for the time of year. Mr. W. PALMER, Andover, being 1st with Duke of Albany; Mr. WARD coming next with good Anticipation; and Mr. WYTHES was 3rd with Autocrat. Messrs. WILKINS and COOKSON had the best of the Artichokes in that order. Mr. WYTHES was the only exhibitor of Caroons. Something like the old show form was seen in the superb samples of Potatoes shown by Mr. POPE, who had three beautiful dishes of Kidneys in Magnet, Matchless, and White Kidney; Mr. BOWERMAN was 2nd with Snowdrop, Cole's Favourite, and Prizetaker; Mr. WHITE coming 3rd. The best single dish of Kidneys came from Mr. LYE, who had fine Chancellor; Mr. NORTH coming 2nd with Breeze. The best three dishes of Rounds were from Mr. POPE, also beautiful samples of Satisfaction, Perfection, and Nonsuch, medium and perfect; Mr. MAIRS came next with The Dean, Pink's Perfection, and Windsor Castle; Mr. NORTH was 3rd. With one dish of Rounds Mr. NORTH was a good 1st with handsome Windsor Castle; Mr. LYE coming 2nd with Satisfaction. This latter exhibitor had the best six Leeks, clear, white and good; Mr. MAIRS coming 2nd; and Mr. POPE 3rd.

Mr. WAITE was well 1st with three dishes of Onions, having fine Ailsa Craig, Exhibition, and Cocoa Nut; Mr. MAIRS coming 2nd, and Mr. WARD 3rd. The best three bunches of Turnips were from Mr. NORTH, Mr. OSMAN SUTTON coming 2nd; whilst with a single bunch Mr. WAITE was 1st, and Mr. LYE 2nd, both with very handsome Snowball. Mr. WYTHES was the only exhibitor of Celeric, but the sample was excellent.

With three varieties of Carrots, Mr. NORTH was 1st, having very long, thin, tapering Long Surrey, good Intermediate, and Model; Mr. POPE was 2nd, with good samples; and Mr. EMPSON 3rd. With single variety, Mr. MAIRS was 1st, having very handsome Intermediate; Mr. WILKINS coming in 2nd, and Mr. BOWERMAN 3rd, with the same variety. Mr. LYE had the best six Parsnips, Mr. WAITE coming 2nd, both very handsome lots. The latter had good Horseradish, Mr. WYTHES coming 2nd. Mr. Webster, gr. to E. J.

PRESTON, Esq., Beckenham, had the best and very handsome Beet in Veitch's Blood Red, a perfect stock; Mr. WAITE coming 2nd. This exhibitor was 1st with two varieties of Endive, and Mr. PENTNEY was 2nd, both having Batavian and Green Curled. Mr. LYE came 1st with two varieties of Lettuces, both Cos; Mr. WAITE coming 2nd. Celery was good, Mr. WILKINS having the best with Solid White and Sulham Prize, Mr. WAITE being 2nd.

A collection of salads enabled Mr. WYTHES to win 1st place easily, as his capital collection was set up artistically in a large plot, having plants of ripe fruit of Tomatoes bent over the top. Lettuces, Endives, Cucumbers, Celery, Beet, &c., made up the collection. Mr. WAITE was 2nd, and Mr. SALMON, West Norwood, 3rd. Mr. SALMON was 1st with a collection of eighteen bunches of Herbs in variety; Mr. WAITE being 2nd. The consolation class for any other vegetable, still brought Mr. WAITE to the front with a superb dish of Perfection Tomatoes; Mr. BASILE came 2nd with huge firm Red Cabbages; and Mr. ALBERT, of Chiswick, was 3rd with Tomatos, Corncobs, Kohl Rabi, huge Pumpkins, &c., made up other variety here.

MISCELLANEOUS.

There were numerous honorary exhibits. Foremost was a very large, varied, and interesting collection of vegetables, sent by Mr. O. THOMAS, from the Queen's Gardens, Frogmore. It would be idle to say that these samples compared favourably with what were in the competitions; but the collection was a remarkably varied one, and comprised every description of vegetables in season, as also Salads. The whole was artistically grouped and represented in the collecting and arranging a great amount of labour. A Silver-gilt Knightian Medal was awarded.

A not less meritorious collection came from Barford Lodge, Dorking, set up by Mr. Bain, gr. to Sir TREVOR LAWRENCE, president of the society. This comprised Herbs and Salads, Gourds and Tomatos, Beans and Capsicums, Potatoes and Carrots, huge Aubergines, tiny Kohl Rabi, growing Mustard and Cress, &c. A Silver-gilt Knightian Medal was awarded. This exhibit, to which we must refer again, was the most original and instructive in the whole show.

Mr. EMPSON had a large and excellent collection of Carrots (Vote of Thanks). Mr. WOODHEAD, Isleworth, had nice red and white Cabbages, Turnips, and Brussels Sprouts. Mr. W. PALMER showed Tomato Palmer's Triumph, like Conference. Mr. H. W. WARD had Carter's Heartwell Cabbage, Model Curled Lettuce, and Giant Cos do. Messrs. FELLOWS & RYDER, Orpington, showed twenty-one dishes of their handsome Tomato Duke of York, the fruits of medium size and perfect form (Silver Banksian Medal); and from the Society's gardens came examples of the varieties of Cabbages and Potatoes, mentioned in our report of the meeting of the Fruit Committee at Chiswick on Thursday last, and all of which received three marks for general excellence. Awards of Merit were recommended to these.

A collection of seven varieties of Peas in so many dishes was shown by Messrs. DE BROTSCHELD, Gannorsbury House, Acton, gr. Mr. Jas. Halson, Sutton's Prolific, Sutton's A1, William I., Veitch's Chelonian, Sutton's Reading Giant, Sutton's Exonian, and Veitch's Autocrat. The last-named was sown on May 13, Reading Giant and Chelonian on June 5, and the others on July 11. All the latter were ready to pick, but not very full.

Two Cucumbers, called Frogmore Prolific, were shown by Her Majesty the QUEEN (gr. Mr. O. Thomas). These are medium-sized, dark green fruits, obtained from Lockie's Perfection x Rochford.

Mr. T. Wilkins, gr. to Lady THEODORA GUEST, Inwood House, Henstridge, sent a few fruits of Mango for exhibition.

A dish of Swedish Apples [Akers] was shown by Messrs. GEO. BUNYARD & Co., Maidstone. The fruits are very solid, the colour similar to a Peach, but faintly streaked. Messrs. BUNYARD & Co. also had a dish of fine fruits of Lady Sudeley Apples.

A seedling Plum, named Gordon Castle, was exhibited by Mr. CHAS. WEBSTER, Gordon Castle Gardens, Banff.

Fruits of the Alpine Strawberry Quatre-saisons, Rouge Ameliorée that obtained an Award of Merit on August 13 last, were exhibited by Mr. HUDSON, Gannorsbury House Gardens, Acton, W.

A capital Melon was exhibited by Mr. H. W. WARD, gr. to the Earl of RADNOR, Longford Castle, Salisbury. The variety is known as the Earl's Favourite, is a good size, straw-coloured, prominently netted, green-flesh of very good flavour (First-class Certificate). Two Melons were also staged by Mr. J. W. MILLER, gr. to Lord FOLEY, Ruxley Lodge, Esher. One of these was named Archie Henderson, a large fruit, thickly and coarsely netted, and green-fleshed. The other was La Favourite, also green-flesh.

From the Royal Gardens, Windsor, Mr. O. THOMAS exhibited stem of Tomato, Frogmore Golden, with fruits, a large good-looking variety; and Mr. A. J. WARD, Richmond, showed a lot of first-class Tomatoes, Chemin Rouge, which had been grown upon a Richmond allotment (Bronze Banksian Medal).

A pleasant-looking Apple named Marshall's Seedling, was exhibited by Messrs. TROS. RIVERS & SOX, Sawbridgeworth; and A. H. SNEY, Esq., The Grange, Wallingford, showed two fruits of an exceptionally solid culinary Apple named Rem-borough, large size, green, but slightly coloured with deep eye (Award of Merit).

Mr. Wythes, gardener to Earl PERCY, Syon House, Brentford, exhibited haulm of a dwarf very prolific French bean, named Northumberland Prolific (Award of Merit). Two nice-looking red-fleshed Melons were shown by Mr. J. Corbett, gardener to the Marquis of NORMANBY. A dozen plants of the Cabbage Lettuce, named Sutton's Favourite, exhibited by Mr. HUDSON from Gannorsbury House Garden, were culturally

Commended by the committee. Some fruits of a Tomato named Bart's Surprise, from Mr. F. M. BURR, Red House, Worthing, were rather small long fruits of little solidity. A dish of very well-grown fruits of Pear Souvenir du Congrès, exhibited from the Royal Horticultural Gardens, were culturally Commended.

Messrs. S. SPOONER & SONS, Hounslow, Middlesex, contributed a very commendable collection of fruit, none of which was other than good in quality. We noticed a nice lot of Duchess Favourite, a good, well-known September Apple something like Quarrenden in appearance, but higher-coloured, even, and rather larger; Lord Suffield, Stone's Apple, Worcester Pearmain, Yellow Ingestre, Councillor, and many others; also a dish of Hesse Pears, and a few sorts of Plums (Silver Knightian Medal).

Messrs. J. CHEAL & SONS, Lowfield Nursery, Crawley, showed excellent specimens of a very ornamental scarlet Crab, as well as fruits of Transcendent, Golden Siberian, and Dartmouth Crabs. A rare lot of Tomato stems in many varieties laden with heavy crops from the open air were the means of obtaining for the Earl of CARNARVON the committee's thanks.

As is usual on such occasions as this, Messrs. SUTTON & SONS, Reading, staged a representative collection of vegetables illustrative of high culture and careful selection, and a Silver-gilt Knightian Medal was awarded the exhibit. Ailsa Craig Onions, 70 of which were said to weigh 2 cwt., and several varieties of Carrots which were very fine; but why it is necessary to show that the Carrots have penetrated to a depth of 3 feet 10 inches is not evident. However, that is the length of one of the roots shown, though of course for practical purposes only about 12 inches was of any use. The Exhibition variety, which is a cross between Long Surrey and Intermediate Carrots, was very noteworthy. Windsor Castle Potato and Little Gem Cabbage were also deserving all praise. Tomatos and other vegetables were well represented.

A collection of vegetables remarkable for high cultural merit was the exhibit from Messrs. R. VEITCH & SON, Exeter. Their Monarch Leeks, Model Carrots, Flying Dutchman Tomato, and the different varieties of Onions, Carrots, Cauliflowers, Radishes, and other things, reflected very great credit on the Exeter firm, and a Silver Knightian Medal was awarded.

Messrs. H. CANNELL & SONS, Swanley, Kent, were not behind, but exhibited a large collection of vegetables from their farm near Swanley. A Silver Knightian Medal was awarded this collection, in which there were excellent samples of Onions, Leeks, Beet, Carrots, Brussels Sprouts, Artichokes, Marrows, &c.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea, in their remarkable collection, had splendid specimens of their Green Curled Endive, Broad-leaved Batavian Endive, and White Curled Endive. Their Savoys, Cabbage, Seakale, Beet and Carrots, too, were of capital quality; Kohl Rabi, both green and purple kinds; Salsify, Turnips, Radishes, Runner Beans, and Tomatoes, were all of good character and choice selection. Messrs. Veitch were deservedly awarded a Silver-gilt Knightian Medal.

Mr. Geo. Wythes, gr. to Earl PERCY, Syon House, received a similar Medal for a very large collection of vegetables to be shown from a private garden, and representative of almost all kinds now in season.

Messrs. DOBBIE & Co., Rothesay, Scotland, had a commendable collection of vegetables, and their Parsley, Dobbie's Selected, deserves mention; it is one of the very finest curled selections we have seen. Parsnips, Celery, and other things were included in this exhibit (Bronze Banksian Medal).

Messrs. BARR & SON, King Street, Covent Garden, exhibited a number of varieties of Tomatoes cultivated in the open, most of them of the Perfection type; also a nice lot of dwarf Kale, both green and purple (Silver Banksian Medal).

Messrs. SUTTON & SONS, Reading, exhibited a Scarlet-runner Bean called A1, apparently a wonderful bearer, with good fleshy pods of rich green colour (Award of Merit).

Lecture on Garden Manures.

There was considerable interest manifested in the lecture given by Mr. W. G. Watson, the subject of which was "Garden Manures." In the absence of the author, the paper was read by the Assistant-Secretary (Mr. J. Weather), and the chairmanship was undertaken by A. W. Sutton, Esq.

In commencing the subject, Mr. Watson very properly dealt first with the most common form of manure and also the most easily procurable, viz., that furnished by stables or farm-yards. It was remarked that stable or farm-yard manure was exceedingly variable in its quality. It would vary in this particular, according to the age and condition of the animals, upon what kind of straw was used, and, further, upon the quantity of straw that was mixed with the real manure. Manure from young growing animals was less strong than older ones, and animals that were worked very hard would also give manure of medium strength only. In either case there would be more nutrition abstracted from the food by the animals than in the case of fully-grown animals only partially worked. Medicine given to animals would be sure to affect the quality of the manure. All the straw over and above the quantity requisite to absorb the urine would, in the same proportion, weaken its character. Stable-manure contained almost all the elements required by crops, organic and inorganic. As a general manure, it was a most perfect one. If, however, nothing be supplied to the land other than this manure, the same land will in time be lacking in lime and nitrogen, two elements which in large degree become absorbed from the food by the animals for the formation of bone and flesh.

Valuable hints were given as to the treatment of this kind of manure, and the heap-method explained. It was insisted that in order to keep off the rain, manure should be stacked in covered places. Urine being the very best part of the manure should not be allowed to trickle away, but should run into an underground tank, from which occasionally it could be pumped and thrown over the mass of decaying manure, which would prevent excessive fermentation, and the consequent loss of ammonia. The temperature and the centre of the heap should never rise beyond 150°, nor be allowed at any time to steam. In either case there will be a loss of ammonia. A strong odour would likewise indicate loss from this cause. The degree of usefulness possessed by the excrement from different animals was explained thus: the manure from cows contained a small amount of nitrogen, and large percentage of water. Horses' excrement was richer in nitrogen, and contained less water; it had also the advantage of being easily distributed, and was soon available as plant food. Sheep-dung had a still higher percentage of nitrogen, and a less degree of water, being also easily soluble. Pig manure varied considerably, according to the food they consumed, &c. The reasons for applying fresh dung to stiff soils, and thoroughly decomposed manure to light and dry soils, was next explained, and the necessity of giving soil of the latter nature manure which was at once soluble and available to the plants was emphasised. Unless this was done, the manure was wasted through the soil, before the crops had benefited from its application.

Bones were now employed in very much finer condition than formerly. It had been found that the finer the bones were ground, the sooner were they available to plant-life, and the more valuable were they as manure. Bone-meal is now very much used.

Superphosphate of Lime.—Mr. Watson then explained the character of this valuable manure, by saying that were bones treated with sulphuric acid, certain gases would become volatile, and the remaining compound would be that known as superphosphate of lime. This superphosphate was now manufactured by other means, and a considerable amount is used. Bone-meal was better for dry and hot soils than the superphosphate.

Nitrate of Soda: Phosphatic Slag.—The phosphatic slag, a mineral manure, was good for peaty soils, and considerable benefit might be expected to follow its application on land in the Fen district. Nitrate of soda was obtained in large quantities from South America. Its action was quicker than that of any other nitrogenous manure. The quality of this manure is very variable. It is more easily washed from the soil than any other, and it is therefore not a complete manure, but should be used only as an immediate stimulant.

Guano—This was described as the dried excrement of birds. It used to contain about 16 to 18 per cent. of ammonia, but through the excessive adulteration now practised, it falls frequently to 11 per cent., and sometimes 9 to 10 per cent. The Texas Guano is the excrement of the native bats, and realises high prices. Guano is adulterated with sand, clay, powdered brick, gypsum, &c.

Lime was next alluded to, and its well-known action upon soils explained. The application of lime hastens nitrification, and is very useful in old gardens where a quantity of vegetable humus is present.

Potash is absolutely indispensable to plants, and without it no chlorophyll can be formed. It is applied frequently as kainit, but has the reputation of creating a tendency to parasitic fungi when used in large quantities.

Sea-weed was used in lands near the shore, and in preparing it, the weed was frequently mixed with coarse manure or gas lime. About 10 to 15 tons per acre was the quantity recommended.

Fish, salt, and woollen rags, are all used as garden and agricultural manures under certain circumstances. The fish is carted together and covered with earth. When decomposed, it is used at about the rate of 1½ tons to the acre. Salt acts organically upon the soil, in addition to being a manure. Its application is useful in ridding the soil of certain insect pests. Woollen rags are much used in Kent as manure for hops.

Blood and Soot were also alluded to, and their uses explained. If economy be practised in regard to manures, it was necessary to first find by analysis what was deficient in the soil, and then supply that only. Some soils were deficient only in one element, and did not require a general or perfect manure. The storage of manure is an important item economically. The gardener who allows the urine to escape from his stable manure, and afterwards buys chemical preparations, may be said to buy what he throws away.

A few hints were then given by Mr. WATSON on the subject of making experiments in regard to land manure and crops.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 3, 4, AND 5.—On Tuesday last was opened, under the auspices of the National Society, an early exhibition of Chrysanthemums in the Royal Aquarium. Fortunately, perhaps, from the visitors' point of view, the early shows are held in conjunction with exhibitions of Dahlias and Gladioli under the same management. At the September show there is usually but a small collection of Chrysanthemums to be seen, and the occasion under notice was certainly no exception to the rule. But little success appears to reward the attempt to prolong the season of the large-flowering Chrysanthemum, by obtaining varieties that will bloom well before autumn is commenced. Probably most people will

not see any cause for regret in this circumstance, being of opinion that the Chrysanthemum is essentially an autumn flower, that it is best appreciated at that period, and that if it be desirable that the flowering period be prolonged, it should be by the means of late varieties rather than early ones.

CHRYSANTHEMUMS.

The class for twenty-four bunches of Chrysanthemums, in not fewer than eighteen varieties, was won by Mr. ERIC F. SUCH, The Nurseries, Maidenhead. The "hunches" consisted of a number of sprays in each variety, dibbled into pots filled with cocoa-nut fibre, in a similar manner to that in which cuttings are put in—an arrangement not quite as pleasing as the ordinary tied bunches.

The twelve blooms of Madame C. Desgranges, from Mr. J. WRIGHT, 87, Denmark Road, Camberwell, were of good quality, and it was remarked that the 2nd prize collection came from almost the same locality—Clapham.

In the stand of twelve blooms of any large-flowering varieties, excepting M. C. Desgranges, we noticed that E. Molyneux, E. Dean, and Louise were prominent. The last-named new variety is a very useful one for early work. The exhibitor of the best lot was

Miss DEBENHAM, St. Peter's, St. Albans, who let place for twelve Pompons, but the class was not remarkable. The best six bunches of any yellow varieties, excepting M. C. Desgranges, included Mrs. Burrell, G. Wermig, and Mrs. Hartshorn. The collection was shown by Mr. W. C. Pagram, gr. to J. COURTENAY, Esq., The Whim, Weybridge.

For early work the following six varieties should be useful, as they were shown in the successful stand for that number of distinct varieties, excluding M. C. Desgranges—Miss Anna Hartshorn, E. Dean, Louise, E. Molyneux, W. H. Lincoln, and Madame Edward Rey. The exhibitor was Mr. Chas. Cox, gr. to J. TROTTER, Esq., Brickendon Grange, Hertford.

There were few groups of Chrysanthemum plants staged. We noticed one from Mr. NORMAN DAVIS, Camberwell, composed chiefly of plants of the white-flowered Lady Fitzwigram, and some Ferns.

Mr. H. J. JONES, Ryecroft Nursery, Lewisham, had a fair-sized group of tuberous-rooted Begonias, Ferns, Lilium lancifolium album, and a few Chrysanthemums, the whole being very attractive.

DAHLIAS.

These were plentiful, and the quality good. Amongst the principal exhibitors were Mr. CHAS. TURNER, Royal Nurseries, Slough, who was 1st for forty-eight blooms; Mr. JNO. WALKER, Thame, Oxon, 1st for thirty-six blooms; Mr. GEO. HUMPHRIES, The Nurseries, Chippenham, won for twenty-four blooms; J. CHEAL & SONS, Lowfield Nurseries, Crawley, 1st for eighteen distinct bunches, &c.; and J. BURRELL & Co., Cambridge, 1st for twelve bunches of Pompons and others.

Collections of blooms were also shown by the trade, including a very large one from Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham; others from Messrs. J. CHEAL & SONS, Messrs. DOBBIE & Co., Rothesay, &c.

GLADIOLI.

The collection of these that won 1st place, was one from Messrs. J. BURRELL & Co., who staged a good display, but arranged them in too stiff a manner.

Miscellaneous Exhibits included nice collections of fruit from S. SPOONER & SONS, Hounslow, and J. CHEAL & SONS; hardy flowers, fruit, &c., from Messrs. J. LAING & SONS, Forest Hill Nurseries; Sweet Peas, from the Brockhampton Nurseries (W. E. Tidy, manager), &c.

SEPTEMBER 3.—There were a few Chrysanthemums submitted before the Floral Committee on the above date.

Mr. JOHN ROBERTS, nurseryman, Shepperton, brought a small white-flowered sport from Madame Desgranges, of Pompon size and shape, very free and useful for cutting from, which the committee wished to see again. It is named *Amande*, and Mr. ROBERTS stated the flowers find a ready sale in the market. From Mr. H. J. JONES, Ryecroft Nursery, Lewisham, came two early-flowering varieties, viz., *Madame Caruvarise*, bluish; and yellow Pompon *Amie Conderchet*, which the committee commended in each case.

A First-class Certificate was awarded to the white semi-double form of *Anemone japonica* named *Whirlwind*, the blossoms pure and semi-double, from Mr. PRITCHARD, nurseryman, Christchurch. The same award was made to Messrs. J. LAING & SON, Staadest Nurseries, Forest Hill, for *Linaria italica*, a charming free-flowering white species; and to Apple Red Bietingheimer, a fine fruit much tinted with red, and partaking of the form and size of *Warner's King*. From Mr. R. OWEN, nurseryman, Maidenhead, came four varieties of early-flowering Japanese Chrysanthemums, and a Vote of Thanks was awarded. Improved cups and tubes for Chrysanthemum blooms were shown by Dr. WALKER, Wimbledon, and Mr. THOS. JENNER, Rochester.

A committee of Dahlia experts made the following awards: To Cactus Dahlia Mrs. A. Beck, bright salmon-red, a true Cactus variety, with some novelty of colour. Single Dahlias *Hetty Dean* and *Pompon Flora*, deep yellow, were very attractive. These were from Mr. T. S. WARE, Hale Farm Nursery, Tottenham. A First-class Certificate of Merit was awarded to Mr. J. T. WEST, Cornwallis, Breatwood, for Cactus Dahlia *Valkyrie*, crimson centre, shading to rosy-mauve and lush, very distinct, a fine Cactus type; also to Cactus Dahlia *Fusilier*, pale bright scarlet, very distinct and attractive, from Messrs. KEYNES, WILLIAMS & Co., nurserymen, Salisbury; also to Messrs. J. CHEAL & SONS, nur-

eryman, Crawley, for Cactus Dahlia Mrs. Wilson Noble, salmon-rose, a very distinct and pleasing flower. Also to the following varieties of Pompon Dahlias from Mr. CHARLES TURNER, Royal Nursery, Slough, viz., *Douglas*, very dark maroon, of fine shape; *Fabio*, yellow, heavily tipped with bright red; *Nerissa*, soft rosy pink, very pleasing; and *Ganymede*, salmon, flushed with delicate mauve on the petal edges.

Some attractive varieties of the single Cactus Dahlia were shown by Messrs. DOBBIE & Co., nurserymen, Rothesay, but they failed to find favour with the committee.

Three very fine forms of Hybrid Gladioli were submitted for approval by Messrs. J. BURRELL & Co., nurserymen, Cambridge, and First-class Certificates of Merit were awarded to each, viz., *Terea*, a pale pink, flaked slightly with dark reddish-purple; *Sunray*, delicate pink, with slight flakes of crimson; and *Blushing Morn*, delicate flesh, with a tinting of pink—a charming variety.

NATIONAL DAHLIA.

SEPTEMBER 6, 7.—What with the Royal Aquarium show on the 3rd, and the above exhibition of the National Society at the Crystal Palace three days later, the Dahlia growers had a busy week. The show and fancy varieties were finer at Westminster, for the heat and closeness of the atmosphere appeared to have told upon them towards the end of the week, and the flowers were smaller, and less finished. The Cactus and decorative varieties were superb, however, and the singles and Pompon varieties very fine.

Show Dahlias.—At the Crystal Palace, Mr. C. TURNER, Royal Nursery, Slough, was an easy winner for sixty blooms, distinct, the following being in fine character:—John Hickling, a very fine yellow self; George Rawlings, John Standish, an old flower, yet still a fine exhibition variety; Gloire de Lyon, Warrior, W. Powell, another fine yellow self; Harry Turner, Willie Garratt, Mrs. Gladstone, the best bloom of his variety in the show; Arthur Rawlings, Florence, Duchess of York, a charming tipped flower; Grand Sultan, Alice Emily, Burgundy, Mahel Tranter, a very pleasing soft primrose-yellow self; Mrs. Saunders, one of the best fancies, yellow, tipped with white; Diadem, John Walker, the finest white self; Mand Fellows, a charming light flower; R. T. Rawlings, and Shottesham Hero, heavily tipped with rosy-purple, very good. Mr. JOHN WALKER, nurseryman, Thame, Oxon, was a good 2nd; and Messrs. KEYNES, WILLIAMS & Co., Salisbury, 3rd.

With forty-eight blooms, Mr. TURNER was again placed 1st, a few of the finest flowers in the stand being Warrior, Alice Emily, Hope, George Rawlings, R. T. Rawlings, James Vick, Shottesham Hero, John Bennett, Mathew Campbell, Pleasance, very bright; and Mrs. Gladstone, Mr. J. WALKER was again 2nd; and Messrs. KEYNES & Co., 3rd.

With thirty-six blooms, Mr. GEORGE HUMPHRIES, nurseryman, Cheltenham, came to the fore, having well-developed blooms of *Comedian*, Self, Duke of Fife, Willie Keith, Miss Cannell, William Powell, Harry Turner, Duchess of Albany, John Walker, R. T. Rawlings, Mrs. Mortimer, and Queen of the Belgians; Mr. J. T. WEST, Cornwallis, Breatwood, was 2nd; and Messrs. J. SALTMARSH & SONS, nurserymen, Chelmsford, 3rd.

With twenty-four varieties, Messrs. SALTMARSH & SONS were 1st, with a very good stand, their leading flowers being *Colonist*, J. Hickling, A. Rawlings, R. T. Rawlings, John Walker, Prince of Denmark, William Rawlings, and Alice Emily; Mr. J. T. WEST, who was 2nd, had the following very good, W. Powell, John Walker, Harry Turner, Queen of the Belgians, Shirley Hibberd, Miss Cannell, John Hickling, and Mrs. Gladstone; Mr. G. HUMPHRIES was 3rd.

With twelve blooms, Messrs. J. CHEAL & SONS, Lowfield Nursery, was 1st, the stand containing good examples of Mrs. Gladstone, W. Rawlings, Arthur Cock, George Rawlings, R. T. Rawlings, and John Walker; Mr. ARTHUR, Florist, Romford, was 2nd.

In the *amateurs' division* for twenty-four blooms, Mr. THOMAS HOBBS, Lower Easton, Bristol, who has been showing remarkably well this season, was 1st, with capital blooms of Henry Glasscock, Duchess of Albany, John Henshaw, Alice Emily, Hartie King, Prince of Denmark, Harry Turner, T. W. Girdlestone, Geo. Rawlings, Mrs. Gladstone, and Willie Keith; Mr. L. FEWKES, Castle Bromwich, Birmingham, was 2nd; and Mr. T. ANSTISS, Brill, 3rd.

With twelve blooms, exclusive of fancies, Mr. A. Starling, gr. to H. H. RAPHAEL, Esq., Havering, was 1st, his leading flowers being John Walker, Wm. Rawlings, J. T. West, James Vick, R. T. Rawlings, *Colonist*, and T. W. Girdlestone; Mr. J. GURNEY FOWLER, South Woodford, was 2nd. With six blooms the 1st prize fell to Mr. E. JEFFERIES, Langley, Chippenham; Mr. J. GILBERT, Freshwater, Isle of Wight, was 2nd.

Fancy Dahlias.—Mr. T. ANSTISS, Brill, had the best twelve blooms, *Dandy*, Prince Henry, Mrs. Saunders, and Matthew Campbell being very good; Mr. S. COOPER, Chippenham, was 2nd. For six blooms, Mr. A. STARLING was 1st, and Mr. E. JEFFERIES 2nd.

In the open classes for Dahlias in colours, the best six blooms of any dark variety was Willie Keith, from Mr. C. TURNER; Mr. S. MORTIMER, Farnham, was 2nd with James Cocker. Several other varieties were shown. The best light, not yellow, were those of John Walker from Mr. WALKER; Mr. S. MORTIMER was 2nd with Mrs. Gladstone. There were other exhibitors, but these two varieties only were shown. The best six blooms of a yellow came from Mr. WALKER, who had W. Powell; Mr. MORTIMER was 2nd with John Hickling.

R. T. Bawlings and Buttercup were also shown. The best-tipped Dahlia was Mrs. Saunders, six excellent blooms being shown by Mr. M. V. SEALE, Sevenoaks; Mr. MORTIMER came 2nd with Mrs. N. Hills. Mr. G. HUMPHRIES had the best six blooms of a striped Dahlia, showing Frank Pearce in very fine character; Mr. J. WALKER was 2nd with Matthew Campbell. The best-edged Dahlia was Miss Cannell, from Mr. J. WALKER; Mr. J. T. WEST coming 2nd with his namesake.

Cactus Dahlias.—In order that only true forms of the Cactus type should be shown in this class, a list is published in the schedule of prizes of those eligible for exhibition in this class. With eighteen varieties in bunches of six blooms, Messrs. J. CHEAL & SONS were 1st, having superb examples of Mrs. Wilson Noble (new), very fine; Harmony, Earl of Pembroke, Delicata, Lady Penzance, Matchless, May Pictor, Bertha Mawley, Countess of Gosford, Mrs. Gordon Sloane (new), and Purple Prince. Messrs. KEYNES & Co. were 2nd, having different from the foregoing:—Fusilier (new), very fine; Mrs. Barnes, very pretty; Grenadier, and Royal George. 3rd, Mr. C. TURNER. With twelve bunches, Messrs. J. BURRELL & Co., nurserymen, Cambridge, were 1st, having Gloriosa, Countess of Gosford, Earl of Pembroke, Mrs. Pearl, Delicata, Lady Penzance, Mayor Haskins, Robert Cannell, and Mary Hillier. Mr. J. T. WEST, was 2nd, having fine bunches of Miss A. Nightingale (new), Miss Annie Jones (new), Mary Hillier, Gloriosa, Matchless, and Delicata.

Decorative Dahlias.—In the class for twelve bunches, no Cactus variety could be shown, but Mr. C. TURNER had to be disqualified through inadvertently staging a Cactus form. Messrs. J. CHEAL & SONS had the best twelve bunches, the most striking varieties being Arthur Cheal, Chancellor Swayne, Mrs. Hawkins, Harry Freeman, Maid of Kent, Amphion, and Lady Primrose. Mr. M. V. SEALE was 2nd, having of good varieties distinct from the foregoing, Baron Schroder, Marchioness of Bute, and Sir Roger.

Pompon Dahlias.—There were very few shown, Mr. C. TURNER taking the 1st prize for a collection of small-sized flowers, beautifully fresh and bright, including Nerissa, Fabio, Bacchus, Ganymede, Douglas, Purity, Geo. Brinckman, Buy Blas, Jessica, Crystabella, Eric, Amber, and Iola, edged with bright purple; 2nd, Messrs. KEYNES & Co., their best varieties being Madge, Tommy Keith, Irene, Arthur West, Lilian, Janet, and Model.

With twelve bunches, Messrs. J. BURRELL & Co. were 1st; and Mr. J. T. WEST 2nd.

Single Dahlias.—These still hold their own, and they were shown in very fine condition in twenty-four bunches. Messrs. J. CHEAL & SONS were placed 1st, the most distinct being Miss Hanshaw, Guillema, M. C. C., Formosa, Miss Glasscock, Miss Roberts, Victoria, Phyllis, Marion Hood, and Northern Star; 2nd, Mr. SEALE, who had in good character, distinct from the foregoing, Mrs. Parrot, Miss Jeffries, Duchess of Albany, W. C. Harvey, Eclipse, and Evelyn. There was no entry in the class for twelve bunches.

Cactus and Decorative Dahlias.—With twelve bunches, Mr. J. STREDWICK, St. Leonards, was 1st, having very good bunches of Gloriosa, Delicata, Countess of Gosford, Bertha Mawley, Harmony, Juarez, and Lady Penzance; Mr. E. Brown, gr. to M. W. MORRIS, Esq., Horley, was 2nd. With six bunches, three blooms of each, Mr. E. MAWLEY, Berkhamsted, was 1st; and Mr. S. COOPER 2nd. With six varieties of Cactus only, Mr. J. STREDWICK was 1st; and Mr. E. BROWN 2nd.

Messrs. H. CANNELL & SONS offered prizes for four bunches of Cactus Dahlias sent out by themselves, Mr. W. MIST being the only exhibitor, and took the 1st prize.

Pompon Dahlias, Amateurs.—With six varieties in bunches, Mr. J. T. HUDSON, Gunnersbury, was 1st with some excellent flowers; Mr. J. STREDWICK taking the 2nd prize. With six bunches, six blooms in each, Mr. S. COOPER came 1st, and Mr. G. WYATT, Twickenham, 2nd.

Single Dahlias, Amateurs.—In the class for six bunches, ten blooms of each, Mr. T. W. GIRDLESTONE, Sunningdale, was 1st, with Kitty, Sobrette, Golden Locks, Dearest, Prince of Wales, and a seedling; Mr. C. OSMAN, Sutton, was 2nd. With six bunches, six blooms in each, Mr. E. MAWLEY was 1st, and Mr. W. PARROTT, Sevenoaks, 2nd. With twelve varieties of single fancy Dahlias, Messrs. J. CHEAL & SONS were the only exhibitors, and they had Phyllis, Mrs. Harris, Fred Leslie, Alice Searle, Mrs. Wyrthes, Miss Glasscock, May Sharpe, Dearest, and James Scobie in excellent form.

Seedling Dahlias.—Certificates of Merit were awarded to the following: Show Dahlia Yellow Globe, bright yellow, with amber centre, six fine blooms of excellent quality being shown (G. HARRIS, Orpington); Cactus, Beatrice, bright pinkish-lilac, true Cactus, very distinct and attractive (C. TURNER, Slough); Cactus, Henry Stredwick, dull crimson, flushed with maroon, becoming brighter with age, true Cactus (J. STREDWICK, St. Leonards); Cactus, Mrs. Monnt, brilliant scarlet, with slight dark shading, true Cactus; Mrs. Wilson Noble, salmon-rose, very distinct, and extra fine, a true Cactus (J. CHEAL & SONS); Cactus, Miss Annie Jones, bright pale scarlet, a true form; and Miss A. Nightingale, salmon-red, deepening in colour, very distinct, true Cactus (J. T. WEST, Brentwood); Mrs. A. Beck, bright pale orange-red, a fine true type (T. S. WARE); Fusilier, soft salmon-red, distinct and true; Grenadier, pale scarlet, very fine, and effective; and Royal George, lively salmon-lilac and rose, true Cactus, very distinct (KEYNES, WILLIAMS & Co., Salisbury). To Pompons, Douglas, bright deep maroon, small, fine shape; Nerissa, soft rosy-pink, very pleasing, small; and Ganymede, salmon, flushed on the edge of the petals with delicate mauve (C. TURNER). Pompons, Rosebud, pale ground, heavily tipped with crimson-purple, fine shape, very pretty (J. CHEAL & SONS). Single, Sobrette, pale ground flaked and pencilled with crimson and maroon, quite distinct, fine form (T. W. GIRDLESTONE); and single,

Beauty's Eye, soft pink, with a ring of orange-crimson round a golden centre (E. MAWLEY). The foregoing awards were made by a large committee of Dahlia experts.

Of miscellaneous exhibits there were a large number, Messrs. J. LAING & SONS, Forest Hill leading the way with a group of Camellias and one of Glorinas, the latter from seeds sown in spring, all showing high quality. Mr. M. PRITCHARD, nurseryman, Christchurch, had a collection of hardy cut flowers; Messrs. DOBBIE & Co., seedsmen, Rothesay and Orpington, had cut Dahlias of various types, including a collection of the single Cactus types; Messrs. H. CANNELL & SONS, Swanley, a collection of bunches of Cactus and decorative Dahlias; Messrs. CHEAL & SONS, several stands of the same; Mr. T. S. WARE, Tottenham, a large collection of Dahlias, forming an important feature; and Messrs. J. PEED & SONS, Lower Norwood, Dahlias and cut hardy flowers.

GLASGOW HORTICULTURAL.

It was admitted on all hands that the excellence of the exhibits generally at the recent show was equal to anything that has been seen in the West of Scotland previously; the enthusiasm of the citizens has been aroused somewhat by the attention now given to horticulture in the case of parks and botanic gardens. The nurserymen and florists did much to make the display a good one.

Enclosing the orchestra was a great display of fine-foliage and flowering-plants, staged by Messrs. AUSTIN & McATULIN, who also had two tables with choice selections on each.

Messrs. THYNE made their usual exhibits of Crotons, Dracaenas, and Palms, and other suitable plants, including numerous Lilies interspersed in the exhibit, which enhanced its appearance.

A table of choice plants came from Mr. DEWAR, the Curator of the Botanic Garden, who throws great energy into the work of the exhibitions. His table was rich with Marantas, Begonias, Aloacasias, Alloplectus Lynchii, Zingibers, and other species.

The tables furnished by gardeners in competition were all arranged with taste, but variety was to some extent wanting. Crotons, though of the finest colour, should not be included in a group without any regard to proportion. Mr. HUGH MCGULEY, gardener, Langside, was 1st.

Orchids were few in number, but the plants were good and well-flowered. Mr. D. WILSON, gr., Westmount, was 1st for three plants. Odontoglossum Pescatorei had one spike of large size, with flowers finely developed. Mr. GEO. WESTON, Pollockshields, was 2nd. The competition for one Orchid only was engaged in by three exhibitors. Ferns were not so numerous as at some former exhibitions, but the excellence of the plants was remarkable. The Gleichenias of Mr. JOHN MITCHELL were excellent.

CUT FLOWERS.

Passing to the adjoining hall, a grand display of cut flowers was seen. Much labour had been expended by the exhibitors in protecting their flowers from the drenching rains. Mr. FORBES, nurseryman, Hawick, had a display of spikes of Hollyhocks, Antirrhinums, &c., and Carnations in quantity.

Gladolus were as fine as we have seen them in Scotland, Mr. SMITH's 1st prize stand was remarkable for cleanliness, size, and fine form. Mr. M. CAMPBELL, nurseryman, Blantyre, had a large and choice selection of Carnations, Cannas, &c. His bunches of Carnation Valkyrie were much admired. Cannas rich in colour were Madame Soubeyrand, Lutea splendens, Explorator Crampel, and Madame Crozy. Mr. CAMPBELL had also a capital collection of Dahlias.

In another hall Mr. CURTISSTON had a display of herbaceous plants, Liliuns, Phloxes, Helianthus in variety, Tritomas, Coreopsis lanceolata (one of the best flowers on this gorgeous table, 26 feet long), Ranisies in quantity, and their new Violas, Mrs. R. K. Mitchell, William Haig, and Sweetness, were well exhibited. Mr. SWELLIE'S Pansies, in such variety, made a great show; Viola sprays filled long tables. Messrs. DOBBIE & Co., of Rothesay, staged a large exhibit, embracing great variety. Cannas were very attractive; Queen Charlotte, Madame Crozy, and Premier de Neice are very pretty varieties; Cactus Dahlias, including such attractive varieties as Sir Walter Scott, Dandy Dimont, and Pirate, were beautiful and distinct. This exhibit was backed with a selection of Fuchsias in pots. A selection of Celery, red and white Leeks, and Onions was also shown by Messrs. DOBBIE.

Asters, Sweet Peas, Marigolds were passed, and then we paused to see the fine exhibits of Roses. Messrs. COCKER & SONS, Aberdeen, had a 1st prize lot, which at any season would be considered first-rate; Captain Hayward, Caroline Testout, Mrs. J. Laing, Gustave Piganean, Alice Brunner, Louis van Houtte, and Prince Arthur were amongst the finest blooms. Mr. CROLL, Dundee, had a good collection, being 2nd.

FRUIT.

There was the usual excitement over the exhibits of fruit. The display of Grapes was equal to that of former years. Black Hamburgs were remarkably fine in colour and size of berry, as well as in bunch. Mr. MENZIES, Dunipace Gardens, was again 1st, a position which he has held for three seasons past; Mr. WHITE, the Castle, Largs, was a good 2nd.

In a class for any Grape other than Black Hamburg, Mr. THOMSON, gr. at Wheatlands, had a pair of grand bunches of Muscat Hamburg, which excelled the Alicantes, Madresfield Court, and others; Muscat of Alexandria was largely represented. Mr. KIDD was 1st with fine examples from Carberry Towers; Mr. McCONOCHIE, Cameron House, was a good 2nd. In the class of four bunches Mr. LESLIE, Pitcullen, Perth, was

1st, his Madresfield Court, Muscats, Alicantes, and Gros Maroc being of great merit; Mr. McCONOCHIE was a close 2nd.

The collections of fruit were good. Mr. D. MURRAY, Culzean, was 1st for thirteen dishes, all of much excellence, a good smooth Cayenne Pineapple, capital Noblesse Peaches, Elrage and Pineapple Nectarines, were among the best fruits which this exhibitor ever tabled; we have seen finer Grapes from Culzean. Mr. McBEAN, Craighends, was 2nd, his Grapes being his best dishes.

In the class for six sorts, Mr. LESLIE, Perth, was 1st, his Peaches were remarkably fine; Muscat and Black Hamburg Grapes good; Mr. HALLIDAY was 2nd. Melons were numerous and were judged uncut. Peaches were finely coloured, and Mr. McBEAN's six fruits were large, and had 1st prize. Plums and outside fruit generally was not of more than average in quality. Apples of the larger kitchen sorts were very fine and more highly coloured than we should have expected. Mr. SMITH, Roselea, had two dozen splendid Apples.

VEGETABLES were excellent. Mr. McBEAN had 1st prize for thirteen sorts, which were of the highest merit, and the Veitch Memorial Prize was also awarded him. The 2nd prize went to Mr. BROWN, gr., Houston, for a collection little inferior to McBEAN'S. In the class for six sorts, Mr. McBEAN was 1st, and Mr. BROWN, 2nd, for Messrs. SUTTON'S prizes. Celery, Onions, Leeks, Carrots, and the fifty pots of Parsley, were of finest quality. Altogether, the exhibition was satisfactory to all.

The judging of baskets of flower bouquets, sprays, crosses, &c., which was done by ladies, require much patience and knowledge, as the numbers and variety were bewildering.

A novelty in economics was the exhibit of teakwood pots, Orchid stakes, &c., from Mr. JOHNSTON, Paisley. The darkness of the Standrey Halls is much against the appearance of such a grand display.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending September 7, is furnished from the Meteorological Office:—

"The weather continued very fine and dry generally over the greater part of England until the night of the 6th, when severe thunderstorms, accompanied by heavy rain and hail, were experienced over our southern and eastern counties. In most parts of Ireland, Scotland, and the north-west of England the conditions were again unsettled, frequent rain alternating with fine, bright intervals.

"The temperature exceeded the mean in all districts, the

excess being as much as 4° or 5° over eastern, southern, and central England. The highest of the maxima, which were recorded on rather irregular dates, varied from 85° in 'England, E.,' 84° in the 'Midland Counties,' and 83° in 'England, S.,' to 72° in 'Ireland, S.,' and 71° in 'Scotland, N. and W.'

The lowest of the minima were registered at the beginning of the week over England, but towards its close over Ireland and Scotland; they ranged from 34° to 35° in Scotland, from 40° to 42° in Ireland, and from 38° to 46° over England; in the 'Channel Islands' the lowest reading was 51°.

The rainfall was less than the mean in most districts, but just equalled it in 'England, E. and S.,' and exceeded it in 'Scotland, N.' and 'England, N.W.' At all our most southern and south-eastern stations, the only rain occurred during the thunderstorm noted above, when large amounts were reported in many places.

The bright sunshine exceeded the mean in all districts excepting 'Scotland, N.' The percentage of the possible duration ranged from 63 in 'England, S.' and the 'Channel Islands,' and 62 in 'England, E.,' to 40 in 'England, N.E.' and over Ireland, 35 in 'England, N.W.,' and 28 in 'Scotland, N.'

MARKETS.

COVENT GARDEN, September 12.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

OUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Arums, Asters, Bouvardias, Carnations, Chrysanthemums, etc.) and their prices in s. d. s. d. format.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Apples, Damsons, Figs, Filberts, Grapes, etc.) and their prices in s. d. s. d. format.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Adiantum, Aspidistra, Asters, Chrysanthemums, etc.) and their prices in s. d. s. d. format.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table with columns for vegetable types (Beans, Cauliflowers, Cucumbers, Marrows, etc.) and their prices in s. d. s. d. format.

POTATOS.

Best samples, good demand at £1 to £4 10s.; ordinary, £3 10s. to £3. Supplier heavy. J. B. Thomas.

FRUITS AND VEGETABLES.

BOROUGH: Sept. 10.—Quotations:—Carrots, 1s. 3d. to 3s. 6d. per dozen bunches; Turnips, 1s. 6d. to 2s. per bag; Onions, 2s. 6d. to 4s. 6d. per bag; Horseradish, 1s. to 1s. 8d. per

bundle; Apples, 1s. 6d. to 4s. per bushel; Pears, 1s. 9d. to 2s. 6d. per bushel; Plums, 2s. to 2s. 6d. per half-sieve.

SPITALFIELDS: Sept. 10.—Quotations: Scarlet Beans, 1s. 6d. to 2s. per bushel; Vegetable Marrows, 2s. to 2s. 6d. per tally; Cabbages, 4s. to 5s. per tally; Onions, 3s. to 3s. 6d. per bag; Carrots, 2s. to 2s. 6d. per dozen bunches; Turnips, 2s. 6d. to 3s. per dozen bunches; Horseradish, 1s. per bundle; Apples, Keswick Codlins, 1s. 6d. to 2s. per bushel; do., Councilors, 2s. to 2s. 6d. do.; Luffingtons, 2s. to 2s. 6d. do.

STRATFORD, Sept. 11.—There has been a fair supply of all kinds of fruit and vegetables, but trade has been rather slow:—Cabbages, 2s. to 5s. per tally; Cauliflowers, 1s. to 1s. 6d. per dozen; do., 5s. to 7s. per tally; Turnips, 2s. 6d. to 3s. per dozen bunches; Carrots, household, 2s. to 30s. per ton; 1s. to 1s. 6d. per dozen bunches; Mangrels, 15s. to 18s. per ton; Swedes, 17s. to 20s. do.; Onions, English, 1s. to 1s. 6d. per dozen bunches; do., Dutch, 2s. 6d. to 3s. per bag; do., Ghent, 2s. 6d. to 2s. 9d. per case; do., Port, 4s. 6d. to 5s. 6d. do.; Apples, English, cookers, 1s. to 2s. 6d. per bushel; do., dessert, 2s. to 4s. per bushel; Watercresses, 5s. to 6s. per hamper; Plums, ordinary, 1s. 3d. to 2s. 6d. per half-sieve; do., Victoria, 2s. to 2s. 9d. per half-sieve; Greengages, 4s. to 4s. 6d. per half-sieve; Damsons, 1s. 9d. to 2s. 3d. per half-sieve; Tomatoes, English, 2s. to 3s. per peck; foreign, 1s. 9d. to 2s. per box; Cucumbers, frame, 1s. to 2s. 6d. per dozen; do., field, 4d. to 6d. per dozen; Beans, Scarlet, 1s. 3d. to 2s. per bushel; do., 2s. 6d. to 3s. 6d. per bag; Beetroot, 2s. to 3s. per dozen bunches; Celery, 1s. to 1s. 3d. per roll; Parsley, 1s. to 1s. 6d. per dozen bunches.

FARRINGDON: Sept. 12.—Quotations:—Apples, Manx Codlin, 2s. 6d. to 3s. per bushel; Golden Knobs, 3s. per half-bushel; Pears, Williams, 3s. 6d. to 4s. per half-bushel; Hazel do., 3s. per bushel; Peaches, 6s. per case; Grapes, Spanish, 7s. per barrel, white; 9s. 6d. do. black; Plums, blue, 2s. 6d. per half-bushel; 4s. 6d. per half-bushel; Tomatoes, 3s. per basket of 12 lb.; Cucumbers, 2s. per dozen; Cauliflowers, 1s. 6d. to 2s. per dozen; Cabbages, 1s. 6d. per dozen; Beans, 3s. per bushel; Marrows, 1s. per dozen; Turnips, 3s. per dozen bunches; Carrots, 3s. per dozen bunches; Horseradish, 1s. to 1s. 3d. per bundle; Beetroot, 3s. 6d. per doz. bunches; Onions, 2s. per bag; Mint, Thyme, 3s. per dozen bunches; Sage, 2s. per dozen; Parsley, 3s. do.

HAY.

Averages.—The following are the averages of prices at the principal metropolitan markets during the past week:—Clover, prime, 90s. to 110s.; do., inferior, 50s. to 80s.; hay, best, 60s. to 90s.; do., inferior, 36s. to 60s.; mixture, 70s. to 92s. 6d.; and Straw, 20s. to 35s. per load.

* Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

* PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florist's varieties cannot, as a rule, be named.

APPLES: R. N. Apples are frequently preserved by drying for future use in this country. The methods of doing this have been repeatedly written upon in these pages, and we may refer you to our issue for Dec. 5, 1891, p. 680 and p. 53 of same volume. In the latter page is also figured a very convenient machine for evaporating fresh fruit. It is manufactured by Ph. Mayfarth & Co., Frankfurt, and may be had in suitable sizes for treating small or large quantities. One of these machines was at Chiawick for some time, and the result was very satisfactory. Further references in Gardeners' Chronicle are Sept. 10, 1892, p. 308, and Oct. 22, 1892, p. 497. You might obtain all information in regard to fruit evaporation by writing to Mr. A. Ludwig, F.R.H.S., 16, Mincing Lane, London, E.C.

ASTERS: G. S. Your Aster roots are attacked by grubs allied to those of the Cockchafer, probably those of the Cockchafer itself, R. McL.

BERRIBS: Dummy. Please catch the insect, and we will endeavour to name it for you.

BOOKS: E. F. B. I, The London Market Gardens, by C. W. Shaw, published at 37, Southampton Street, Covent Garden, W.C. This book may not give you all the information you require, but it is the best we can recommend you. 2, Handy Book of Bees, by A. Pettigrew, published by Wm. Blackwood & Sons, Edinburgh and London.

CARNATIONS: A. J. H. Impossible to form an opinion; the flowers were dried to tinder.

EMPLOYMENT IN AMERICA OR THE COLONIES: Gardener. We possess no convenient means by which to transfer young gardeners from situations in England to similar employment in America or the colonies. There are vacancies frequently arising for suitable men in such places, as evidenced by advertisements which appear in this and other Journals. You would do well to advertise, or write to some of the leading nurserymen in the country you wish to remove to.

FICUS ELASTICA: J. E. P., Altrincham. The plants of Ficus elastica were probably grown on bottom-heat or in a very warm house before you got them, and the change has caused the damage to the young growths. When the plants get established with you they will no doubt thrive.

FUCHSIAS: W. R. Flowers quite withered; send them to some grower of these plants.

HAW'S PATENT WATERING-CAN: W. C., Jamaica. These cans may be obtained through most of the horticultural sundriesmen.

MULBERRY LEAVES: E. C. C. D. Not at all uncommon, especially on the stronger growing shoots.

MUMMY PEA: H. Stark nonsense, often exposed in these columns. The Peas are "fasciated," as often happens when plants are grown vigorously. The condition has become hereditary. The plant has been figured in our columns as the Crown Pea.

NAMES OF FRUITS: (see notice under Names of Plants). Croft. 1, Blenheim Orange; 2, Court of Wick; 3, Cellini; 4, Manx Codlin; 5, Golden Noble; 6, Fearn's Pippin; 7, Damelow's Seedling.—J. P. 1, Hawthornden; 2, Ribston Pippin; 3, Emperor Alexander; 4, Cellini; 5, Gloria Mundi; 6, Small's Admirable.—J. A. F. 1, New Hawthornden; 2, Tower of Glamis; 3, Lord Grosvenor; 5, Lord Derby; 6, Damelow's Seedling.—C. E. 1, Gravenstein; 2, 3, not recognised; you should send better specimens.—T. K. Apple Yellow Ingestre. Pears small, and partly decayed. We cannot name such fruit.—H. Humphreys. Pear Beurré Clairgeau.—A. J. B. Peaches all bruised beyond recognition during transit.—F. Y. The Grapes sent are undoubtedly Black Hamburgs, but not yet quite ripe; other fruit next week.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—Bloomfield. 1, Chrysanthemum lacustre; 3, Tradescantia virginica; 4, Agathe celestis; 5, Montbretia crocosmiflora; 7, Kerria japonica; 8, Leycesteria formosa; 9, Asphodelus luteus. Two had no labels, one Solidago canadensis, the other Alstromeria psittacina.—S. W. O. H. Clethra arborea.—Northleigh. Catalpa pulcherrima.—E. R. 1, Spiraea Douglasi; 2, Asclepias incarnata; 3, Dracocephalum virginianum; 4, Centaurea macrocephala; 5, Kerria japonica variegata; 6, Periploca græca.—C. A. Datura Stramonium, Thorn Apple.—C. W. 1, Spiraea Thunbergii; 2, Eonymus radicans; 3, Retinospora squarrosa; 4, Eucalyptus pugnans var.; 5, Olearia Haasti; 6, Skimmia japonica.—Mrs. H. Hieracium aurantiacum.—G. H. S. 1, Codonopsis ovata (see fig. 59); 2, Scutellaria, probably S. columba; 3

FIG. 59.—CODONOPSIS OVATA: FLOWERS PALE BLUE, FETID.

Hieracium aurantiacum; 4, probably Psammisia Hookeriana, allied to Vaccinium; 5, Genista tinctoria; 6, Astrantia major; 7, Darenta Plamierii.—H. F. Leads. Zygopetalum Mackayii.

NECTARINE ON PEACH-TREE: *James Vert.* Such a circumstance does not commonly occur, but instances have again and again been recorded. We have observed one case this season ourselves in the nursery of Mr. Walker at Ham Common, where both fruits were to be seen on the same shoot. We were afterwards informed by Mr. Walker that the fruit had fallen during stoning. In the *Gardeners' Chronicle* for July 13 last, we figured a composite fruit with well-defined sections of Peach and Nectarine, and this we think is even more remarkable than the other case. It goes to prove that there is no real or botanical difference between the fruits, and the one may revert to the other upon occasion, but at present we have no knowledge as to the precise circumstances that tend to this reversion.

"NICHOLSON'S DICTIONARY": *N. C.* It would be a very large book indeed that contained the name of every plant. Mr. Nicholson's Dictionary professes only to include the names of plants that are worth cultivating in gardens, and a very liberal idea has been followed in regard to such. *Senecio viscosus* and *Chenopodium polysperum* are British plants—weeds, if we may use the term, and descriptions of them may be found in Bentham and Hooker's *British Flora*. *Nicotiana rustica* is a good name, and is mentioned in the *Treasury of Botany*, and later in *Index Kewensis*, the standard work on horticultural nomenclature.

PACKING GRAPES: *Old Packer.* In our opinion the method you describe is not a good one. There should be much less material about the fruit, no tying at the ends, and the bunches should not be laid on top of each other, as it would appear from your description they are placed, in the case you speak of. Many excellent systems of packing Grapes for railway transit have been described and figured in these columns. See reference given to a correspondent in our last issue.

PLUMS: *R. N. H.* The Silver-leaf disease—the cause is not known. There is no fungus.

ROOTS: *J. McL., Ireland.* Dynamite, or gunpowder, but preferably the former, is frequently used in order to blow up the roots of large trees, which have been felled, and by such means a great saving in labour is made. If you have had no previous experience in such an operation, however, we cannot advise you to employ these explosives, unless you obtain the assistance of some one who thoroughly understands their use.

SOILS: *K. M. G.* We do not undertake to analyse soils, but you would probably obtain the analysis of a sample by sending it to Dr. Dyer, Great Tower Street, London, E.C. The fee will be from one to two guineas.

VINERY INFESTED WITH INSECT PESTS: *T. O.* From the description you give of the leaves it is likely that most of the injury results from red-spider, but if thrips and scale are very numerous also, there will be considerable difficulty experienced in saving the appearance of the Gros Colmar Grapes. You might try the sulphur cure in order to get rid of the spider, adopting the usual method of heating the hot-water pipes very hot at night, and dabbing them over with sulphur, at the same time keeping the house closed during the operation. As the Grapes are colouring, you must be careful in any process that it be not overdone. Sponge the foliage frequently, and if time is not available to go over all the foliage, sponge around each bunch of fruit, and when the crop has been gathered, more drastic methods can be adopted.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."
IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s.

If set across three Columns the lowest charge will be 30s.
Page, £8; Half Page, £4 10s.; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS.
26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.*

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.*—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for Terms.

SPECIMEN FREE. Price 2d.

Published Friday for Saturday.

FLORIST'S ASSISTANT, or to Fruiterers and Florists.—Young Lady, of good appearance, seeks situation as above.—G., 41, Ronalds Road, Highbury, N.

OVERHEARD IN A BUS.—"Sir, you are a clumsy fellow—you trod on my foot." "I am extremely sorry—I hope I did not hurt you very much." The soft answer turned away the other's wrath, and even produced an apology. "Oh, no, not very much—you must excuse me, I am a little irritable—fact is, out of sorts, liver, biliousness, and that sort of thing, you know—thoroughly wretched." "My dear sir, of course I excuse you. But why don't you take something?" "Tried everything—no good." "Nonsense, you haven't tried Holloway's Pills, I know—they never fail in cases like yours." "Gad! I never thought of 'em. By Jove, I'll try 'em at once. Hi! conductor, stop the 'bus."

On view morning of Sale, and Catalogues had.

Preliminary Notice.

The SECOND and MAIN PORTION of the well-known COLLECTION OF ORCHIDS of The Firs, Laurie Park, Sydenham, to be SOLD by AUCTION, without the least Reserve.

MESSRS. PROTHEROE AND MORRIS have received instructions from C. Dorman, Esq., who is giving up the cultivation of Orchids, to SELL by AUCTION, on the Premises, The Firs, Laurie Park, Sydenham, on WEDNESDAY and THURSDAY, October 16 and 17, without the least Reserve, the SECOND and MAIN PORTION of his well-known COLLECTION, comprising, among other species, the very best varieties of Odontoglossum Alexandrae (white and spotted forms), O. Pescatorei, and many hybrids of exceptional beauty, that have received First-class Certificates; also selected varieties of Cattleya Trianae, C. Mossiae, C. Mendeli, &c.; grand specimens and many new hybrids of Cypripedium, Dendrobium, &c.

May be viewed. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Lee, Kent.

To FLORESTERS, FRUIT GROWERS, NURSERYMEN, and OTHERS.—The valuable long Leasehold Property known as WRIGHT'S NURSERIES, Turner Road, Lee. The Premises are conveniently situated near the Market, and comprise thirty-three Glasshouses, a five-roomed Cottage, stabling, coach-house, &c. Also the Leasehold DWELLING-HOUSE, No. 17, Turner Road, the whole forming a choice property for Fruit and Flower Cultivation.

MR. DOUGLAS YOUNG will SELL the above by AUCTION, at the Mart, E.C., on WEDNESDAY, September 25, 1895, at 2 o'clock precisely.

May be viewed. Particulars and conditions of sale may be obtained at the Mart, E.C.; of the Solicitors, Messrs. PORTLAND, BOARD, AKERMAN AND CO., Temple Chambers, Temple Avenue, E.C.; or of the Auctioneer, 51, Coleman Street, E.C., and 213, Clapham Road, S.W.

The Begonia Nurseries, Saffron Walden, G.E.R.

MESSRS. THURGOOD AND SON have received instructions from C. G. Payne, Esq., to SELL by AUCTION, upon the Premises, on FRIDAY, September 27, commencing at 11 for 12 o'clock, in convenient lots, to suit the Trade and Private Buyers, a very choice collection of some 50,000 BEGONIAS, in Pots, Boxes, Lights, and Beds. Nearly all of this extensive and grand selection have been purchased regardless of expense, and with great care and good judgment, from the finest and most celebrated specimens sold by Monsieur Felix Crouse, Nancy; Messrs. Laing & Son, Forest Hill; Messrs. Cannell & Sons, Swanley. They embrace magnificent Doubles and Singles, including large and well-established Tubers, and 1895 Seedlings of the richest colours, many of which have not been proved, and are confidently expected to turn out exceptionally fine. It is considered that this Auction affords the very best opportunity ever offered to the public in England for securing these favourite "Begonias of the First Water." A few FUCHSIAS, HYDRANGEAS, GERANIUMS, LILIES, ZONALS, PEACH TREES, and a quantity of various PLANTS; 4 GREENHOUSES, 27 FRAMES, and 70 CASTS OF POTS.

Catalogues may be had of the Auctioneers, Saffron Walden.

Hall's Nurseries, Truro.

IN BANKRUPTCY. Re SAMUEL HALL.

MR. THOMAS GILL has received instructions from the Official Receiver to SELL by PUBLIC AUCTION, on MONDAY, TUESDAY, and WEDNESDAY, October 14, 15, and 16, at 10 o'clock each day, the whole of the

EXTENSIVE STOCK of Evergreen Trees, Hardy Conifers, Hardy Ornamental Flowering Shrubs, Trees, Climbers, &c. A large quantity of Fruit Trees, consisting of Peach, Pear, Apple, Cherry, Gooseberry, and Currants, &c. A quantity of Perennials, Chrysanthemums, Pinks, Arum Lilies in pots, Fuchsias, Ampelopsis Veitchii, Ferns, Marguerites, Phloxes, Clematises, Begonias, Box edging, Narcissus bulbs, &c.; together with six Greenhouses.

Catalogues now ready. The Nurseries will be on view from September 23 until the time of Sale, from 10 A.M. till 4 P.M.

For further particulars apply at the offices of the Official Receiver in Bankruptcy, Truro; or to the Auctioneer, Market Street, Penryn.—Dated September 11, 1895.

FIRST-CLASS FLORIST, SEED, BULB, and PLANT BUSINESS for SALE.—Same hands nine years; on Lease. No reasonable offer refused. W., 17, Albion Street, Hyde Park, W.

FOR SALE.—FREEHOLD NURSERY, 13 Greenhouses, nearly new, well heated with Hotwater-pipes; Water laid on. 1 1/2 mile from Station. Particulars, apply to Owner, J. HOWELL, Hextable, Kent.

SMALL NURSERY BUSINESS for DISPOSAL.—1/4 acre of Land, 4 Glasshouses, with Stock, Tools, Jobbing Work, and Poultry included. First reasonable offer.—C. EVANS, South Crescent Nursery, Coldbath, Lewisham Road, S.E.

To Nurserymen and Florists commanding business. THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 21, 1895.

THE ROSE SEASON OF 1895.

AFTER all, we can say with some degree of confidence, that the past summer has been far from a bad one for Roses. The prospects after the frost broke up were not reassuring; complaints came from all quarters of the heavy loss and damage which had resulted. Some of these were curious, for results were very different in the same districts, and the difference could hardly be traced to soil or position. A warm and dry spring without an exceptionally sharp late frost, furnished the best possible result from the little wood that was spared, and one of the features of the season has been the beauty of the garden or decorative Roses. Many of these are not only less hardy of themselves than others, but their long growths are more fully exposed to the weather. Much of the injury during the frost was caused by the sudden and extreme changes in temperature. At night a frost of about 20° or more frequently occurred, and day by day during a few hours at mid-day the wood was thawed, and upon walls a warm temperature produced by the brightness of the sun. This alternate freezing and thawing was most harmful, and as we chiefly grow our climbers and garden Roses upon walls or in sheltered places, they naturally suffered severely. Under such circumstances, it was surprising to see garden Roses so good as they have been. At the earliest and latest shows they were as good as in any previous season. Some of this may be the result of their more extended culture; still, there is the fact, that at Gloucester and at Derby we saw some truly splendid stands of garden Roses.

Teas and Noisettes, too, notwithstanding the idea (still more prevalent than I could have credited) of their extreme tenderness, have been very good. Undoubtedly, the best of these were seen at Gloucester, although some good blooms were exhibited at the National Rose Society's meeting at Derby. I think the competition at Gloucester, the Crystal Palace, and Derby, as well as the many other Rose exhibitions held in the country, was greater even than usual, while in many cases there were more exhibitors than I expected. But here, in mid-Sussex, we had a worse time than many of my rosarian friends. Upon all of my maiden beds the effects are still seen. Even now many buds and breaks upon standards and half-standards are disappointingly puny. It seems as though the cold had pinched or bound the bark in such a way, that it was unable to swell and allow of a healthy junction and growth of Rose and stock, while in a large number of cases, the dormant bud was killed outright. At pruning-time I did not expect to see so good a Rose season; indeed, it seemed quite impossible under the most favourable conditions of spring and summer. But we have few flowering shrubs that recover so quickly as the Rose. This more especially applies to the Teas

and Noisettes. No doubt many of us, too, were led to give a little extra care and attention to our Roses after the severe ordeal they had gone through.

Growth, especially that of the later breaks, was healthy and clean, there being less maggot and fly than usual; but as the season advanced, I was much troubled by the stem-boring saw-fly and small Rose-chafers. Later still, we had a swarm of small hard bugs, a miniature beetle in appearance, which injured the blooms badly. They were even worse than the large and dark brown thrips sometimes experienced, which are such a nuisance among our lighter-coloured varieties late in the season. A rather prolonged drought then checked growth seriously, just as our first crop of bloom was being realised; but the rain which followed upon the warm ground caused a very speedy change for the better. During this change, mildew, as usual, appeared. I have had many enquiries of late for a recipe for mildew outdoors. Many remedies have been tried, but none seems to me to be effective unless under glass. Nor can we expect to succeed so long as the main causes are beyond our control. We can do something, however, by choosing sites that are not naturally draughty; and by avoiding the other extreme, namely, a close and sultry atmosphere at midday, with a great change at night, as is experienced in Rose gardens that are much enclosed. More especially is this extreme noticeable in the late summer and autumn, when we are always more affected with mildew than at other times. Then, again, we should not plant that victim of mildew—Her Majesty—among other Roses. Innocente Pirola and Souvenir de Paul Neyron are also very subject to attacks, and it seems a mistake to place them among a general collection, which in many cases would have got the better of a slight attack if such contagious company were not present.

Writing of Her Majesty reminds me that this variety was the Rose of 1895. We generally find one or more Roses standing out conspicuously among the rest, and Her Majesty has done so during the past summer. It won the medal as being the best Hybrid Perpetual in the whole exhibition at the Crystal Palace, taking this honour both in the nurserymen's and amateurs' divisions. We had one more Rose take two of these silver medals during 1895, once at the Palace and again at Derby. This was Comtesse de Nadaillac, but upon neither occasion was there that depth of colour so remarkable in the Comtesse as grown at Oxford. Rarely is there a season when this grand Tea does not carry off one or more silver medals. While we have a few most persistent winners of this honour, such as the Comtesse, Horace Vernet, The Bride, Catherine Mermet, A. K. Williams, and Souvenir d'Elise Vardon, there is frequently some very little-known variety which is capital for a season, and then drops almost out of knowledge in the course of a few seasons. Last year we had Marguerite Bonnet, this season it was Comtesse de Ludre. While there are many grand Roses that one might expect to appear year after year, Comtesse de Nadaillac, Xavier Olibo, and A. K. Williams are the only three that figure among this and last season's twelve Silver Medal Roses of the National Rose Society.

A new feature deserving mention is the giving of a gold medal to be held permanently as a memento of winning the champion challenge trophies in either nurserymen's or amateurs' divisions. A year's possession of the trophy alone, certainly seemed inadequate, and I am glad to see this change. But what are we to do in the case of past winners? For example, Mr. B. R. Cant, who won the trophy this season, and secured the Gold Medal first offered, also won in 1881—82—83—85—86, and '91. It might have been an entirely fresh winner, and in such case he would have held an equally valuable proof of success. If the funds should allow, it would be a graceful act to present a Gold Medal for each past success, or else one to each winner, inscribed with the dates of previous successes! Messrs. Harkness & Sons have won challenge trophies upon nine; Mr. B. R. Cant,

Rev. J. H. Pemberton, five; and Mr. E. B. Lindeell six occasions. These are the most frequent winners, but quite half-a-dozen other growers have held this trophy for more than one season.

The Gold Medal for a new Rose was awarded to Helen Keller at the Derby meeting, and here we certainly saw this variety in better form than at the Crystal Palace. It is a splendid Rose, and good in growth; and some wood which has reached me is ample proof of this. New Roses were an exceptional feature at the metropolitan meeting, and probably the best twelve that have been seen were staged then. No fewer than ten out of the dozen were raised by the exhibitors—a record among new Roses, for we must remember that Ethel Brownlow (one of the Silver Medal Teas of 1895), Margaret Dickson, Earl of Dufferin, and several more grand varieties raised by the same firm were not eligible in this stand.

Of the new Roses, I like Helen Keller, Marchioness of Downshire, Marchioness of Londonderry, Avoca, Marquise Lita, and Mrs. R. G. Sharman Crawford, with a decided preference to the last-named Rose. A sport from Catherine Mermet, called Muriel Grahame, is not yet in commerce, but it will make a capital Rose if we are to judge from the blooms exhibited.

I cannot leave the new Roses without once more directing attention to a new Hybrid Sweet Briar, called Jeannie Deans. There is, perhaps, too close a similarity between some of the lighter shades in this new class of Roses, but no complaint of that kind can be attached to this very bright and semi-double variety.

Returning to the garden, I would like to call attention to the freedom from red-rust among our Hybrid Perpetuals. The true Teas and Noisettes are not troubled with this enemy, nor are several of the Hybrid Teas and the Rogosa varieties. By the way, *Rosa rugosa calocarpa* is most distinct, and I believe will be very popular. Perhaps no Roses are more generally liked than these, when once they have been grown. Always gay from the time leaves are put forth until winter is with us, in bloom, berry, and foliage; thoroughly hardy, good in town or country, and never attacked by mildew or red rust. I should find it a difficult matter to choose a flowering shrub of more reliable and lasting decorative value than these Japanese Roses.

Although I have headed this article the past Rose season, a plentiful supply of bloom is still with us, and as time goes on and we get improved varieties, our seasons get considerably extended. Still, the Rose season proper is undoubtedly past. Teas and Noisettes chiefly figure among our late summer and autumnal Roses—indeed, I have the fourth distinct crop of William Allen Richardson upon an outside wall; and it is the same with many varieties in these classes, and among the best of the hybrid Teas, such as Viscountess Folkestone, Caroline Testout, Gustave Regis, and Marquis of Salisbury.

There is a great improvement in the appearance of Rose-stocks, and our forebodings of spring, when the dry weather threatened little growth, and therefore the risk of a small percentage taking the bud, have now happily been dispelled. Nor have I seen the buds in better condition than at present. Late-planted standard Briars did badly; but those set in during early winter are fairly good. A. P.

NEW OR NOTEWORTHY PLANTS.

MASDEVALLIA LAWRENCEI, Kränzlín.*

This plant is in foliage and size like a small specimen of *Masdevallia tovarensis*, and the flowers, which are $\frac{1}{2}$ to $\frac{3}{4}$ smaller, have also a slight resemblance to this species. They arise from the top of the flower-stalk successively, and not at one

* *Masdevallia Lawrencei*, Krzl.—Scapo triquetrad ad 15 cm. alto alato, squamis bracteiformibus scariosis 3—4 acutis carinatis ovaria longe non aequantibus; cupula floris brevi, sepali dorsalis parte libera triangula in caudam quater longiorem producta, aepalis lateralibus oblongo-lanceolatis acuminatis basi tantum ocellitis caudiculis brevibus, cupula alba instu

time, as in *M. tovarensis*; and an examination shows that the resemblance is merely superficial. The tube of the flower is covered inside with numerous and beautiful spottings, but with a lens of some power these spottings prove to be little warts, with a serrated surface; the lateral sepals are widely separated, and the dorsal one is united with the two others for nearly its whole length. The petals and the lip are rather thick and fleshy, the latter thickened and serrated at the apex. I believe this is the plant which Mr. Rolfe named *Masdevallia guttulata* in *Gard. Chron.* Sept. 6, 1890, ii, p. 267. The name has to be changed because another species, under the name of *M. guttulata*, was published by Professor Reichenbach in 1877; the latter is quite a different plant, and more in the way of *M. ionocharis*, Rchb. f. The only resemblance consists in the small spotting on a white ground. I am indebted to Sir Trevor Lawrence, Bart., for fresh material of this interesting species. F. Kränzlín.

STAPELIA LONGIDENS, N. E. Br. (n. sp.)

This species is a native of Delagoa Bay in South-east Africa, where it was originally discovered by Mrs. Monteiro, who sent flowers of it to Kew in 1883; since then it has been introduced into cultivation by W. H. Tillett, Esq., of Norwich, with whom it first flowered in October, 1892. So far as the appearance of the stems is concerned, it is one of the most remarkable species of the genus known to me, on account of the very long teeth of the stem; the only other species that approaches it in this character is *S. Woodii*, to which it is the most nearly allied, but the teeth are much longer than in that species, and the flowers quite distinct. The following are its characteristics: Stems glabrous, green mottled with purple, $2\frac{1}{2}$ to 6 inches long, 4 to 5 lines thick, obtusely four-angled, the angles with long, ascending, stout teeth, $\frac{1}{2}$ to 1 inch long, and about $\frac{1}{2}$ inch thick at the base, terete, gradually tapering to a fine soft point. Cymes sessile, several-flowered. Pedicels $\frac{3}{4}$ inch long, 1 line thick, glabrous. Sepals 4 lines long, $1\frac{1}{2}$ line broad, lanceolate acuminate; corolla $1\frac{1}{2}$ inch in diameter, quite glabrous, with a campanulate tube $2\frac{1}{2}$ lines deep (the bottom of it raised up so as to form a convex cushion supporting the corona), and horizontally spreading lobes 7—8 lines long, $4\frac{1}{2}$ —5 lines broad, ovate-lanceolate acute, flat; the colour is pale greenish-yellow, spotted all over with dark purple-brown (cream colour spotted with crimson, according to Mrs. Monteiro), the spots very small within the tube, increasing in size towards the tips of the lobes, where they are more or less confluent. Outer corona of 5 short, quadrate, emarginate lobes, deflexed on the basal cushion of the corolla, purple-brown with yellowish side margins; inner corona of 5 simple, lanceolate, acute lobes, inflexed over the apex of the anthers, scarcely gibbous behind, dull yellowish, dusted with purple-brown. Follicles 7 inches long, $\frac{1}{2}$ inch thick, gradually tapering to a beak, glabrous, streaked with purple on a pale ground; seeds 5 lines long, 3 lines broad, ovate or elliptic-ovate, crowned with a tuft of hairs, flat with broadly-winged margins, pale brown. Delagoa Bay. N. E. Brown.

ÆSCHYNANTHUS HILDEBRANDII (see fig. 62, p. 333).

PLANTS and seeds of this new species of *Æschynanthus* were received at Kew in January, 1894, from Mr. H. H. Hildebrand of Fort Stedman, Shan States, Upper Burma, who found it growing at a high altitude in the forests, its short stems forming dense tufts upon the trunks of trees, to which it clings by means of its roots, which creep into the crevices of the bark, finding nourishment there. When in flower it had the appearance of a compact

Inteola tota superficie interna pustulis crebris purpureis supra serratis decorata; petalis brevibus linearibus supra bilobis fere triquetris carnosis albidis; labello oblongo lineari carnosio antice minute serrulato ibi incrassata albedo minutissime purpureo-aspero. Totus flos 2 cm. longus. *Masdevallia guttulata*, Rolfe?

cushion of orange-scarlet. The plants at Kew are grown in a cool, moist house, such as suite Maedevallias, and they have been in flower since the spring. The longest stems are 9 inches long, but usually they are only 6 inches or less, with a few whorls of fleshy tomentose leaves near the top, from which spring the flowers in clusters of from two to six. They are of a rich flame-scarlet colour, with a margin of crimson. So far as is known, this is the only species of *Eschynanthus* that can be cultivated in a cool-house, all the others, of which there are about fifty known, being tropical. It is a suitable companion for *Sarmienta repens*, the pretty little Chilean representative of the order, but it is preferable to that plant—from a cultivator's point of view,

The Tomato Re Umberto, known in Naples under the name of Fiascone, and in France as Merveille d'Italie, furnishes the largest quantity of preserve, which, however, is not of so fine a flavour as that made of other kinds. It is cultivated in gardens near the town.

The variety known under the name of Fiasconcello, corresponding to the Spanish Tomato cirilla, is distinguished by its Plum-shaped deep scarlet fruit. It is a better cropper than the former, its flavour is finer, and its cultivation is constantly increasing, to the detriment of the other kind, although it gives less preserve in proportion to its size. These are the varieties of Tomatoes grown largely under irrigation. There is, however, another kind, very valuable, because it can be grown without watering—

THE HORTICULTURAL SHOW IN NAPLES.

In connection with an exhibition of birds, there was the other day a plant and flower-show in Naples. Owing to the short notice, the plants exhibited were rather few in number, but cut flowers and floral arrangements were more numerous. Amongst the exhibits, there were some specialties which to English readers may be of interest. *Dr. G. Motta-reale, Portici, August, 1895.*

(To be continued.)

MICROSTYLIS MACROCHILA.

The genus *Microstylis* is not a favourite one with Orchid-growers, but that many of the species are possessed of sufficient beauty, both of leaf and flower, was well exemplified in the pretty group of them staged in the centre of the fine collection of Orchids in flower exhibited by Messrs. F. Sander & Co., of St. Albans, at the last Temple Show of the Royal Horticultural Society. Two of the prettiest were *Microstylis Scotti* and *M. macrochila* (fig. 60), both of which had their pale-green and cream-coloured leaves beautifully mottled with light brown. The flowers of *M. macrochila* are dark purple, and it appears to be very free in growth and bloom if grown in a moist, warm, and tolerably shady house. After the growths have flowered and matured the leaves fade, and from that time until the next growing-season, water should be withheld or very sparingly afforded. It is the neglect of this resting season, and the habit of watering plants all the year round, which has probably caused the scarcity of *Microstylis* in collections.

FIG. 60.—MICROSTYLIS MACROCHILA.

at any rate—it being much more easily kept in health. The plant was figured in the *Botanical Magazine*, t. 7365. *W. Watson.*

ITALY.

TOMATOS.—This year Tomatos have, in the province of Naples, flowered rather late, owing to unfavourable weather, and at the end of June there was but a scanty supply of the variety called Sicily, known in England under the name of Early Red Tomato, or Powell's Early, a variety which holds the first place for its precocity. The most important Neapolitan varieties are the common of Naples, or Padula, grown in certain well-watered grounds close to the town, and much appreciated for its flavour and productiveness. This variety produces large, fleshy, scarlet fruits, generally of a round shape, somewhat depressed in the upper part, and crossed by a deep furrow almost to half of the fruit. It is much made use of for sauces and for preserving, as well as for eating in salad when not quite ripe.

for instance, in the Vesuvian sandy grounds, where no other herbaceous kind could be grown during summer. It is the so-called "Ciento a schiocca," which is a sub-variety of the pyriform variety, known in England under the name of Pear-shaped Tomato. It is cultivated extensively in Torre-del-Greco. The plant is nipped at the point when 4 inches high, it then ramifies, producing almost erect stems, which grow without support. Its racemes produce from ten to fifty fruits of a pale red, approaching to orange colour; it is pear-shaped, and has a transverse diameter of about 1/2 inch, and its flavour is sensibly acid. This fruit may be kept a very long time, and even in June clusters of fruits produced in the previous October may be seen. The farmers take them off before their perfect maturity, i.e., when the first fruit begin to turn into red, and fasten them with a string which they unite at the extremities, giving the whole an appearance of enormous bunches of Grapes, which vary in weight from 12 to 16 lb. If, however, there is wet weather during growth, the fruit loses in proportion its long-keeping property.

FLORISTS' FLOWERS.

THE SHRUBBY PHLOXES.

Messrs PAUL & Sons grow a fine collection of Phloxes in their interesting hardy plant nursery at Boxbourne, Herts. All the best named varieties are here, such as Etna (Lemoine), salmon-scarlet, dark eye; Kosuth, cherry-rose, with a purplish tint in the centre; Carillion, rosy-lake, fine form; Eclairer, purplish-crimson, with light eye; Emmanuel l'erve, clear lilac, large, fine form; and many others of the newest and best. At the Old Nurseries, Caeshunt, there is a fine collection of seedlings in flower at the present time. There may be some difference of opinion as to which of the two collections is the more beautiful. For my part, I decide for the seedlings. Not only do well-grown seedlings make a beautiful show in the garden, but they are much more interesting. I am not one of those who fancy that the dwarfier you can get plants the more should they be prized; but the varieties of *Phlox decussata* of gardens twenty-five years ago, were from 1 to 1 1/2 foot; too tall, and in dry seasons the stems becoming devoid of leaves to a great extent, become decidedly unsightly if not masked by other plants. The height of the newer varieties is much reduced, and the seedlings now in flower at Caeshunt are sturdy specimens, averaging 1 1/2 foot high. Very few of these seedlings can be selected which are not as good as the named varieties; and the great variety of colour amongst them is a noteworthy feature. Some with pure white flowers of exquisite form were very fine; others exhibited purple-lilac, rose and scarlet tints—and all of them were of good form, very few indeed harking back to the primitive type.

Some amateurs may say, "It is all very well for you to recommend seedlings, but how are we to get them?" My reply to this is, save your own seed from the best named varieties. The latter can be obtained direct from any good florist, and in a season like this it is not difficult to obtain seed; but in order to have anything like success in seedling raising, the flowers should be cross-fertilised by hand, and some care and judgment exercised in the blending of the colours. I have found that if the flowers are not cross-fertilised, an immense number of plants may be grown, and the varieties will be good, but they will vary in colour but little

*

or not at all from the parents. The seed should be sown on a hot-bed about February 1; it very soon vegetates, and when the plants have grown 1 inch high, prick them out in boxes, and grow them on near the glass in a warm greenhouse. By proceeding in this manner, sturdy plants may be had ready to plant out in the open borders about the first week in the month of May—a little earlier will be all the better. If they are planted at about 14 inches asunder, each plant will throw up one strong spike in the autumn. Although the Phlox is classed with perennials, the plants may be had finely in flower in seven or eight months from the time of sowing the seeds. The soil for seedling Phloxes, as for named varieties, should be worked to a good depth, and I never knew them to suffer from over-manuring. If the soil is deep and well manured, the plants are well sustained through the heat and drought of the summer. The first year there is only one stem flower to each plant; and if it is intended to flower them a second year, they should be replanted about 2 feet asunder, on fresh deeply worked, and well manured ground.

The same treatment is necessary for the named varieties, but a good system of propagation must be carried out. It is easy enough to chop an old Phlox plant into pieces with a spade, and plant them separately, but this clumsy procedure does not give satisfactory results. The best spikes are obtained from plants that have been propagated from cuttings in gentle bottom-heat, and the best cuttings are found on old stools when the plants start to grow in the spring. If taken off with a heel, and inserted singly in small pots, the roots soon form. Early-propagated plants, grown on till they come into 6-inch pots, produce handsome spikes, and form very useful stuff for greenhouse decoration. After flowering, turn them out of the pots into the open ground, as recommended above for seedlings—24 inches asunder. Such plants produce the finest flower-spikes the following season, and three only should be allowed to each plant. *J. Douglas.*

ORCHIDS AT BURFORD, DORKING.

SIR TREVOR LAWRENCE, Bart., the President of the Royal Horticultural Society, is justly known as one of the most liberal of the amateurs of gardening, who have throughout maintained a fine collection of Orchids, and he is as keen a collector of good and rare Orchids at the present day as he has ever been, although the varied collection which he has succeeded in getting together renders it increasingly more difficult to find good things already not sufficiently well represented there. As the number of species, too, increase, the difficulty of keeping in health unique plants about which little or nothing can be gleaned to serve as a guide to their culture has to be met. In this particular, and in most other matters relating to Orchid culture, the remarkable success attained at Burford, and the splendid condition in which the plants there now are, give ample proof of the interest taken in them by their owner, and the care and skill of his attentive Orchid-grower, Mr. W. H. White.

From time to time we have given illustrations of some of the marvellous plants in the Burford collection, and it greatly enhances the pleasure of a visit to look up the specimens illustrated. Invariably we find them in better condition than ever, and on the present occasion the noble specimen of *Sophranitis grandiflora* illustrated in *Gard. Chron.*, April 20, 1895, and the others which we have depicted, were found in splendid condition, and promising a still greater show of bloom in the coming season. Especially is this the case with the great mass of *Cattleya Lawrenceana*, exhibited by Sir Trevor Lawrence recently before the Royal Horticultural Society, with fifty-eight flowers, one of the spikes bearing no fewer than thirteen blooms. In the coming season it will probably exceed that number, in the aggregate at least, if not on the single inflorescence.

Commencing with the lean-to warm houses in

which the *Vanda teres* and *V. Hookeriana* thrive so well, and in which the tall specimen of *Vanda* × *Miss Joaquim* (*Hookeriana* × *teres*), is thriving and approaching the flowering stage, we found the rich collection of varieties of *Lælia anceps* throwing up spikes profusely, and the singular *Luisia volucris*, *Lælia Lawrenceana*, and the curious greenish-white *Epidendrum lmschootianum* in bloom. In the next division, on the front of which the scarlet *Habenaria militaris*, the allied *H. rhodocheila*, and the white and pink forms of *Habenaria carnea*, thrive so well, and make such a fine show, in bloom were the pretty Burford hybrid, *Cypripedium* × *picturatum* (*Spicerianum* × *superbiense*), *C.* × *Morgania Burfordiense*, still the best of its class, and one that it is difficult to conceive finer in its way; *C.* × *Euryale*; various other *Cypripediums*, and a pretty variety of *Cattleya Luddemanniana*.

These houses, like the other warm houses at Burford, have all the available space under the staging planted with *Cyrtodieras*, *Pittonias*, *Pilea*, and other pretty compact-growing foliage-plants. Such a method fills up vacant spaces, is effective, and very favourable for the plants. In one corner of the house, just passing out of bloom, is a large specimen of *Cælogyne Camingii*.

The next house, a cool intermediate one, has a full collection of the large-flowered *Maxillarias* in excellent condition. *M. Hübschii*, *M. facata*, and a few others being in bloom, as well as *Oncidium incurvum* and *O. i. album*. *Odontoglossum Bickoniense* and *O. B. album*, *Miltonia Clowesii* and other *Miltonias*, and some pretty tufts of the orange-scarlet *Lælia monophylla*, which here thrives so well that the plants bear from twenty to thirty or more flowers on each.

In the large intermediate-house, filled principally with a splendid collection of *Lælias* and *Cattleyas*, the bank of varieties of *Vanda tricolor* and *V. suavis* is in undiminished vigour and beauty. These plants sorely trouble most growers, and we wonder how many have completely failed with them during the long time those in the Burford collection have been growing in the most satisfactory manner. In this house is an immense mass of *Oncidium lanceanum*, some 4 feet across, and in the most perfect health; on the front stage is a large quantity of hybrid *Cattleyas* and *Lælias*, and of equally-priced rare imported kinds, which are being carefully tended until their flowering stage is reached. Among the plants in flower are a fine example of the singular *Cælogyne fuliginosa* and *Cattleya* × *Blesensis*.

In the large span stove-house, amid the fresh-looking foliage and brightly-coloured spathes of the plants of *Anthurium Andreanum* and its hybrids, are many fine and rare *Dendrobiums*, among which were in flower *D. Lowii*, *D. cruentum*, &c., and *Vanda Hookeriana*. On one side is a collection of the handsome-leaved *Bartolonias*, and in a corner the giant specimen of *Grammatophyllum speciosum*, which regularly sends forth its tall, stout pseudo-bulbs and graceful Palm-like foliage, but as yet has not produced flowers. Some day the reward of patience and skill will come, and the flowering of the plant add another triumph to the many which have been won at Burford.

The large *Odontoglossum*-house has its occupants in very fine condition, a noteworthy fact when it is remembered that many of the specimens have been on the place for a number of years. These plants at one time, although keeping perfectly healthy, did not make the progress desired until they were shifted into their present quarters, and since that time they have increased in vigour and in size in a remarkable degree, and another house on the same plan will probably be built for new-comers. A few *O. Pescatorei*, *O. cristatum*, and a good lot of *O. grande*, the pretty yellow *Oncidium cristatum*, *Trichocentrum albo-purpureum*, and others also were in flower.

In the next intermediate-house, the large table in the centre is filled with the specimens of *Sobralias*, which a little earlier in the year are one of the sights of Burford, ten or a dozen different species and varieties, each giving a profusion of bloom at one

and the same time. At present the species chiefly represented are *S. macrantha*, of which there are some grand plants and varieties; and *S. xantholenca*. Here in bloom, too, are some large specimens of *Cypripedium* × *Ashburtonia*, *C.* × *Crossianum*, and other of the older varieties; and in a shady corner a large specimen of *Cypripedium Schlimii*, which seems to flower continually. On one side is a bank of the Burford variety of *Cypripedium* × *Leeanum asperum*; on another, a splendid lot of *Mittonia vexillaria*, with a few good *M. × Beauiana*, and about the house in flower were *C. Charlesworthii*, *C. Spicerianum*, *Vanda cærulea*, a plant of a very large form of *Stenia pallida*, and another of the pretty fringed-lipped *Chondrorhyncha Chesteronii*; two fine plants, one with four spikes, each 18 inches long, of the rare and pretty *Epidendrum sceptrum*; several of the true *Cypripedium purpuratum*; *Oncidium aurosum*, *O. chsirophorum*, *O. cornigerum*, *Pholidota obovata*, and some other singular botanical species. The rare *Heliamphora nutans* is also thriving here. In the adjoining house are some good *Miltonia Roezli* in bloom, *Oncidium Jonesianum*, *Lælio-Cattleya* × *elegans*, *L. × Amanda*, the pretty *Aganisia ionoptera*, *Epidendrum ottonii*, *E. Godseffianum*, &c.

The large span-roofed warm-house, in which the *Phalænopsis* occupy the staging on one side, is always interesting from the floor to the roof, for underneath the staging, and in front of the hotwater-pipes, *Eucharis grandiflora* is planted, and it grows in a marvellous manner and produces a great quantity of its large pure white flowers; while the roof is thickly set with hanging-baskets of *Cirrhopetalum*, *Bulbophyllum*, *Catsetum*, &c., which are here in greater variety than in any other collection, and they are constantly producing their quaint flowers, ranging from the immense hooded *Bulbophyllum grandiflorum* (illustrated in the *Gardeners' Chronicle* from the unique specimen at Burford, April 6, p. 429), to the little *Cirrhopetalum Camingii*, with its profusion of flowers arranged like tiny pink parasols. The coppery-orange *Cirrhopetalum Mastersianum*, and a few other curious botanical species are in flower; and among the *Catsetums*, a great mass of the pretty green and white *C. Rustellianum*, which in the structure of its pretty flowers seems to stand alone in the genus. At the end of the house is a number of specimens of marvellously pretty *Acætochili*, and in bloom are *Phalænopsis violacea*, *P. Esmeralda Regnieriana*, a number of rare hybrid *Cypripediums*, and a good show of varieties of *Dendrobium Phalænopsis Schroderiana*. On one side the Burford hybrid *Calanthes* are making up immense bulbs, and on the pots of some of them, seedlings of a new race are coming up in great profusion. In the adjoining sunny lobby the hybrid, deciduous *Dendrobiums* are ripening the fine growths they have made, and some quite new crosses are expected to flower next year.

In the *Asides*-house the specimen of *Oavirandra fenestralis* (Lattice plant), always an object of interest, is still in fine condition; and in flower are *Stauropis philippinensis*, a real gem, with slender stem, clad with distichous leaves, from the base of each of which proceed a pretty red-brown flower, with a yellow margin, and with curiously-ridged lilac lip, the whole plant forming a pretty spray of flowers with foliage. *Oncidium Kramerianum*, *Asides Lawrencei*, *Dendrobium bracteosum album*, *Polystachya odorata*, and other fine things are also in bloom; and in the *Madevallia*-house many *Madevallias*, *Pleurothallis*, &c., chiefly of botanical interest, are still flowering—while the new seedling-house seems to contain material for novelties for many years yet to come.

In the general garden, so ably tended by Mr. W. Bain, the show in the greenhouses and stoves is well worthy of the Orchid department; indeed, the brilliant effect, the splendid tuberous *Begonias*, pretty *Sarcocarpus*, and fragrant Lilies, make in the conservatory whose roof is laden with the mingled flowers of the white and the crimson varieties of *Lapageria rosea*, would be difficult to excel.

In the open ground there are flowers everywhere;

the beds of brilliant Cannas; of graceful and bright Montbretias; fragrant and richly-coloured Roses, Gladioli, Crinum Powelli (which is here one of the finest hardy bulbs), and other flowers being all that could be desired, while here and there peep forth novelties or well-known old plants never seen in such beautiful form before. Two remarkable instances of the latter are the pretty bushes of sky-blue Tweedia corulea, which by cutting back are here caused to make neat and charming plants; and the purple Rhodochiton volabile, which runs over a rustic arch.

CHRYSANTHEMUM MAXIMUM AND ITS ALLIES.

THE receipt of a letter and specimens from Rev. C. Wolley Dod induced us to examine the herbarium specimens, and those in cultivation at Kew and Chiswick:—

CHRYSANTHEMUM PALLENS, J. Gay (1833), ex *Indice Kewensi*, i., 527.—Bracts of the involucre with a deep white or pale brown margin; corolla of disc-florets gibbous, or spurred at the base.

C. MAXIMUM, Ramond (1800), ex *Indice Kewensi*, i., 527.—Bracts of the involucre with a brown margin; corolla of disc-florets not gibbous or spurred at the base. The association of fleshy leaves and a more or less coarsely hairy epiderm is unusual.

C. PALLENS is usually the smaller plant, 2 to 3 feet, the leaves lighter-coloured, less hairy, and less fleshy than those of maximum. C. maximum is a rather more robust plant, with darker-coloured, larger leaves, and involucre bracts, and without any spur or protrusion at the base of the corolla of the disc-florets, such as characterise the disc-florets of C. pallens.

In addition, there are C. LACUSTRE, a coarse-growing, tall perennial, 4 to 5 feet high, with thick, fleshy, quite glabrous, glossy leaves, and large white flower-heads. The ray-florets of this species have a rather deep, lacinate, membranous cup, surmounting the ovary. No such pappus or cup exists in the florets of the disc. The involucre scales are ovate-oblong acute, with a deep membranous border, extending from the tip to about the middle of the scale. To this belong certain garden forms called latifolium and grandiflorum; and here belongs in our opinion the larger of the two plants called maximum by Mr. Wolley Dod in the communication, and of which he has kindly transmitted specimens. This is still in bloom, whilst C. maximum and C. pallens are both over.

C. SEROTINUM is also a tall-growing perennial, 4 to 5 feet, not yet in bloom. Its upper leaves are sessile, lanceolate, coarsely serrate from above the middle to the tip, dull green, slightly pilose, especially upon the lower surface, and often with a pair of small lobes or teeth at the very base. The involucre scales in the young state are covered with white hairs.

C. ATRATUM has leaves auricled at the base, and the involucre leaves almost black at the tip. This is perhaps only a form of C. leucanthemum.

"C. PALLENS.—Last spring I received from Mr. Marshall, chairman of the floral committee of the Royal Horticultural Society, a plant named Chrysanthemum pallens; he asked me whether I knew it as a distinct species from C. maximum. When the plant flowered I found it to be what I have grown for many years as the type of C. maximum (Ramond), but on careful examination of the characters, with the help of a botanical expert, I find it to be C. pallens (Gay). In common with most amateurs I have generally considered that there were two forms of C. maximum (Ramond), one of slender habit, growing at most about 2 feet high; the other coarser and with thicker leaves and larger flowers, reaching, on rich soils, a height of 4 feet. Both of these are distinct from the still taller and larger C. latifolium syn. C. lacustre. The smaller of these two plants will be found on examination to be C. pallens (Gay),

and the larger C. maximum (Ramond). The botanical distinctions between the two are not obvious, except the difference in size; but the name "pallens" is derived from the colour of the bracts of the involucre. If a flower is turned upside down, the general colour of the edges of the bracts is nearly straw-coloured in C. pallens, whilst in C. maximum it is dark brown. The lower part of the stalk in C. pallens is hairy, whilst that of C. maximum is smooth. There are also differences in the pappus and the achene only to be observed by minute examination. The native range of C. pallens is more extensive than that of C. maximum, and it is less of a mountain plant, reaching from Portugal through southern France and northern Italy, nearly to the Black Sea. It is known that C. maximum is variable from seed, and where these two closely

FIG. 61.—A SPECIES OF FICUS—PROBABLY F. SIELA—STRANGLING A MANGO TREE.

allied species are grown near one another, it will probably be found that they amalgamate, and produce intermediate forms, but as botanists have recognized them as distinct, it is better that they should have their right names given to them in gardens. C. Wolley Dod."

A FICUS STRANGLING A MANGO TREE.

OUR illustration, taken from a photograph kindly furnished by Mr. G. M. Woodson, College of Science, Poonah, exhibits a Mango tree growing in a grove near Lanowlee, on the Western Ghats, India, being killed in the embraces of a Ficus. The process of destruction is well and correctly described in the following words by Mr. James Rodway in the *Guiana Forest*:—

"Woe betide the forest giant when he falls into the clutches of the Clusia or Fig. Its seeds being

provided with a pulp, which is very pleasant to the taste of a great number of birds, are carried from tree to tree, and deposited on the branches. Here it germinates, the leafy stem rising upward, and the roots flowing, as it were, down the trunk until they reach the soil. At first these aerial roots are soft and delicate, with apparently no more power for evil than so many small streams of pitch, which they resemble in their slowly-flowing motion downward. Here and there they branch, especially if an obstruction is met with, when the stream either changes its course or divides to right and left. Meanwhile leafy branches have been developed, which push themselves through the canopy above, and get into the light, where their growth is enormously accelerated. As this takes place the roots have generally reached the ground, and begun to draw sustenance from below to strengthen the whole plant. Then comes a wonderful development. The hitherto soft aerial roots begin to harden and spread wider and wider, throwing out side-branches which flow into and amalgamate with each other until the whole tree-trunk is bound in a series of irregular living hoops. The strangler is now ready for its deadly work. The forest giant, like all exogens, must have room to increase in girth, and here he is bound by cords which are stronger than iron bands. Like an athlete, he tries to expand and burst his fetters, and if they were rigid he might succeed. . . . The bark bulge between every interlacing—bulges out, and even tries to overlap; but the monster has taken every precaution against this by making its bands very numerous and wide. . . . As the tree becomes weaker its leaves begin to fall, and this gives more room for its foe. Soon the strangler expands itself into a great bush almost as large as the mass of branches and foliage it has effaced. . . . If we look carefully around us we see examples of entire obliteration—a Clusia, or Fig, standing on its reticulated hollow pillar, with only a heap of brown barks at its base to show what has become of the trunk which once stood up in all its majesty on that spot."

LATE STRAWBERRIES.

AS we experience such varying seasons, this one very hot, the next wet and cold, the importance of growing both early and late varieties of Strawberries on different aspects is obvious. This year our late plants on north borders were an especially welcome addition to the supply, as the outside crop was over earlier than usual. Last season, owing to late spring frost during May, much of the bloom of the mid-season varieties was injured by frost, and in the southern parts of the country the earliest plants had fruit half grown which was destroyed, whereas the bloom on north borders was less advanced, and remained uninjured.

August is a good month to plant for late supplies, and I venture to assert that the fruits will be much appreciated, as we never appear to have too long a season or too abundant a crop of Strawberries. Last year I find that our supply lasted six weeks, thanks to our late kinds; this year we gathered much earlier and the period was a little over five weeks. Of late varieties there is a large choice, and the first place I would give to British Queen, a variety that does not do well everywhere, but is well worth growing if it thrives—it just follows on the main crop varieties. Eleanor or Oxoniac is also a large-fruited late variety, not noted for flavour, but a free grower and trustworthy cropper. Aberdeen Favourite is superior, though a little smaller; a fine type, of brisk flavour, and very late when grown in the shade of a north wall. For some seasons Jubilee used to be grown here in the same aspect for its good qualities and lateness, but it has now made way for Latest of All, a much superior variety, with the British Queen flavour, and coming best in dry hot seasons. It is a very fine fruit, and an immense cropper, requiring frequent renewals if great size in the fruit is required. I am unable to recommend Waterloo, as it does not crop freely at Syon, owing, I think, to the nature of the soil; and young plants, unless planted very early, seldom fruit freely. The "Pine" section of Strawberries consists mostly of late varieties, such as Eton Pine and Filbert Pine; but if my choice was limited to two only, I should select British Queen and Latest of All, planting them in the month of July for fruiting the next season. In good land, these two varieties will succeed admirably, giving fine large fruits after the plants in open beds have ceased to bear. G. Wythes.

BOTANICAL SECTION OF THE BRITISH ASSOCIATION.*

(Concluded from p. 297.)

ORGANISATION OF SECTION.—I am afraid I have detained you too long over these matters, on which I must admit I have spoken with some frankness. But I take it that one of the objects of our section is to deliver our minds of any perilous stuff that is fermenting in it. But now, having taken leave of the past, let us turn to the future.

We start at least with a clean slate. We cannot bind our successors, it is true, at other meetings. But I cannot doubt that it will be in our power to materially shape our future, notwithstanding. When we were only a department I think we all felt the advantage of these annual meetings, of the profitable discussion formal and informal, and of the privilege of meeting so many of our foreign brethren who have so generously supported us by their presence and sympathy.

I am anxious, then, to suggest that we should conduct our proceedings on as broad lines as possible. I do not think we should be too ready to encourage papers which may well be communicated to societies, either local or central.

The field is large; the labourers as they advance in life can hardly expect to keep pace with all that is going on in it. We must look to individual members of our number to help us by informing and stimulating addresses on subjects they have made peculiarly their own, or on important researches on which they have been especially engaged.

NOMENCLATURE.

There is one subject upon which, from my official position elsewhere, I desire to take the opportunity of saying a few words. It is that of nomenclature. It is not on its technical side, I am afraid, of sufficient general interest to justify my devoting to it the space which its importance would otherwise deserve. But I hope to be able to enlist your support for the broad common-sense principles on which our practice should rest.

As I suppose, everyone knows we owe our present method of nomenclature in natural history to Linnæus. He devised the binominal, or, as it is often absurdly called, the binomial system. That we must have a technical system of nomenclature I suppose no one here will dispute. It is not, however, always admitted by popular writers who have not appreciated the difficulty of the matter, and who think all names should be in the vernacular. There is the obvious difficulty that the vast majority of plants do not possess any names at all, and the attempts to manufacture them in a popular shape have met with but little success. Then, from lack of discriminating power on the part of those who use them, vernacular names are often ambiguous; thus *Bulrush* is applied equally to *Typha* and to *Scirpus*, plants extremely different. Vernacular names, again, are only of local utility, while the Linnæan system is intelligible throughout the world.

A technical name, then, for a plant or animal is a necessity, as without it we cannot fix the object of our investigations into its affinity, structure, or properties.† *Nomina si necesse perit et cognitio rerum.*

In order to get clear ideas on the matter, let us look at the logical principles on which such names are based. It is fortunate for us that these are stated by Mill, who, besides being an authority on logic, was also an accomplished botanist. He tells us:‡ "A naturalist, for purposes connected with his particular science, sees reason to distribute the animal or vegetable creation into certain groups rather than into any others, and he requires a name to bind, as it were, each of his groups together." He further explains that such names, whether of species, genera, or orders, are what logicians call connotative: they denote the members of each group, and connote the distinctive characters by which it is defined. A species, then, connotes the common characters of the individuals belonging to it; a

genus, those of the species; an order, those of the genera.

But these are the logical principles, which are applicable to names generally. A name such as *Ranunculus repens* does not differ in any particular from a name such as John Smith, except that one denotes a species, the other an individual.

This being the case, and technical names being a necessity, they continually pass into general use in connection with horticulture, commerce, medicine, and the arts. It seems obvious that, if science is to keep in touch with human affairs, stability in nomenclature is a thing not merely to aim at but to respect. Changes become necessary, but should never be insisted on without grave and solid reason. In some cases they are inevitable unless the taxonomic side of botany is to remain at a standstill. From time to time the revision of a large group has to be undertaken from a uniform and comparative point of view. It then often occurs that new genera are seen to have been too hastily founded on insufficient grounds, and must therefore be merged in others. This may involve the creation of a large number of new names, the old ones becoming henceforth a burden to literature as synonyms. It is usual in such cases to retain the specific portion of the original name, if possible. If it is, however, already pre-occupied in the genus to which the transference is made, a new one must be devised. Many modern systematists have, however, set up the doctrine that a specific epithet once given is indelible, and whatever the taxonomic wanderings of the organism to which it was once assigned, it must always accompany it. This, however, would not have met with much sympathy from Linnæus, who attached no importance to the specific epithet at all: *Nomen specificum sine generico est quasi pistillum sine campana.** Linnæus always had a solid reason for everything he did or said, and it is worth while considering in this case what it was.

Before his time, the practice of associating plants in genera had made some progress in the hands of Tournefort and others, but specific names were still cumbersome and practically unmanageable. Genera were often distinguished by a single word; and it was the great reform accomplished by Linnæus to adopt the binominal principle for species. But there is this difference. Generic names are unique, and must not be applied to more than one distinct group. Specific names might have been constituted on the same basis; the specific name in that case would then have never been used to designate more than one plant, and would have been sufficient to indicate it. We should have lost, it is true, the useful information which we get from our present practice in learning the genus to which the species belongs; but, theoretically, a nomenclature could have been established on the one-name principle. The thing, however, is impossible now, even if it were desirable. A specific epithet like *vulgaris* may belong to hundreds of different species belonging to as many different genera, and taken alone is meaningless. A Linnæan name, then, though it consists of two parts, must be treated as a whole. *Nomen omne plantarum constabit nomine generico et specifico.*† A fragment can have no vitality of its own. Consequently, if superseded, it may be replaced by another which may be perfectly independent.‡

It constantly happens that the same species is named and described by more than one writer, or different views are taken of specific differences by various writers; the species of one are therefore "lumped" by another. In such cases, where there is a choice of names, it is customary to select the earliest published. I agree, however, with the late Sereno Watson§ that "there is nothing whatever

of an ethical character inherent in a name, through any priority of publication or position, which should render it morally obligatory upon anyone to accept one name rather than another." And in point of fact, Linnæus and the early systematists attached little importance to priority. The rigid application of the principle involves the assumption that all persons who describe or attempt to describe plants are equally competent to the task. But this is so far from being the case that it is sometimes all but impossible even to guess what could possibly have been meant.*

In 1872 Sir Joseph Hooker† wrote:—"The number of species described by authors who cannot determine their affinities increases annually, and I regard the naturalist who puts a described plant into its proper position in regard to its allies as rendering a greater service to science than its describer when he either puts it into a wrong place, or throws it into any of those chaotic heaps, mis-called genera, with which systematic works still abound." This has always seemed to me not merely sound sense, but a scientific way of treating the matter. What we want in nomenclature is the maximum amount of stability, and the minimum amount of change compatible with progress in perfecting our taxonomic system. Nomenclature is a means, not an end. There are perhaps 150,000 species of flowering plants in existence. What we want to do is to push on the task of getting them named and described in an intelligible manner, and their affinities determined as correctly as possible. We shall then have material for dealing with the larger problems which the vegetation of our globe will present when treated as a whole. To me the botanists who waste their time over priority are like boys who, when sent on an errand, spend their time in playing by the roadside. By such men even Linnæus is not to be allowed to decide his own names. To one of the most splendid ornaments of our gardens he gave the name of *Magnolia grandiflora*: this is now to be known as *Magnolia foetida*. The reformer himself is constrained to admit, "The change is a most unfortunate one in every way."‡ It is difficult to see what is gained by making it, except to render systematic botany ridiculous. The genus *Aspidium*, known to every Fern cultivator, was founded by Swartz. It now contains some 400 species, of which the vast majority were, of course, unknown to him at the time; yet the names of all these are to be changed, because Adanson founded a genus, *Dryopteris*, which seems to be the same thing as *Aspidium*. What, it may be asked, is gained by the change? To science it is certainly nothing. On the other hand, we lumber our books with a mass of synonyms, and perplex everyone who takes an interest in Ferns. It appears that the name of the well-known Australian genus, *Banksia*, really belongs to *Pimelea*; the species are therefore to be renamed, and *Banksia* is to be rechristened *Sirmuelleria*, after Sir Ferdinand von Mueller; a proposal which, I need hardly say, did not emanate from an Englishman.

I will not multiply instances. But the worst of it is, that those who have carefully studied the subject know that, from various causes, which I cannot afford the time to discuss, when once it is attempted to disturb accepted nomenclature, it is almost impossible to reach finality. Many genera only exist by virtue of their re-definition in modern times; in the form in which they were originally promulgated they have hardly any intelligible meaning at all.

It can hardly be doubted that one cause of the want of attention which systematic botany now receives is the repulsive labour of the bibliographical work with which it has been overlaid. What an enormous bulk nomenclature has already attained may be judged from the *Index Kewensis*, which was

* Phil., 219.

† Phil., 212.

‡ As Alphonse de Candolle points out in a letter published in the *Bull. de la Soc. Bot. de France* (xxxix.), "the real merit of Linnæus has been to combine, for all plants, the generic name with the specific epithet." It is important to remember that in a logical sense the "name" of a species consists, as Linnæus himself insisted, in the combination, not in the specific epithet, which is a mere fragment of the name, and meaningless when taken by itself.

§ *Nature*, xlvii., 54.

* Darwin, who always seems to me, almost instinctively, to take the right view in matters relating to natural history, is (*Life*, vol. i., p. 364) dead against the new "practice of naturalists appending for perpetuity the name of the first describer to species." He is equally against the priority craze:—"I cannot yet bring myself to reject very well-known names" (*ibid.*, p. 369).

‡ *System of Logic*, i., 132.

prepared at Kew, and which we owe to the munificence of Mr. Darwin. In his own studies he constantly came on the track of names which he was unable to run down to their source. This the *Index* enables to be done. It is based, in fact, on a manuscript index which we compiled for our own use at Kew. But it is a mistake to suppose that it is anything more than the name signifies, or that it expresses any opinion as to the validity of the names themselves. That those who use the book must judge of for themselves. We have indexed existing names, but we have not added to the burden by making any new ones for species already described.

What synonymy has now come to may be judged by an example supplied me by my friend Mr. C. B. Clarke. For a single species of *Fimbristylis* he finds 135 published names under six genera. If we go on in this way, we shall have to invent a new Linnaeus, wipe out the past, and begin all over again.

Although I have brought the matter before the Section, it is not one in which this, or indeed any collective assembly of botanists, can do very much. While I hope I shall carry your assent with the general principles I have laid down, it must be admitted that the technical details can only be appreciated by experienced specialists. All that can be hoped is a general agreement amongst the staffs of the principal institutions in different countries where systematic botany is worked at; the free-lances must be left to do as they like.

PUBLICATIONS.

I have dwelt at such length on certain aspects of my subject that perhaps, without great injustice, you may retort on me the complaint of one-sidedness. But when I survey the larger field of botany in this country, the prospect seems to me so vast that I should despair even if I had my whole address at my disposal of doing it justice. I think that its extent is measured by the way in which the publications belonging to our subject are maintained. First of all, we have access to the Royal Society, a privilege of which I hope we shall always continue to take advantage for communications which either treat of fundamental subjects, or at least are of general interest to biologists. Next to this we have our ancient Linnean Society, with a branch of its publications handsomely and efficiently devoted to systematic work. Then we have the *Annals of Botany*, which has now, I think, established its position, and which brings together the chief morphological and physiological work accomplished in the country. Lastly, we have the *Journal of Botany*, a less ambitious but useful periodical, which is mainly devoted to the labours of British botanists. I remember there was a time when I thought that this, at any rate, was an exhausted field. But it is not so; knowledge in its most limited aspects is inexhaustible if the labourer have the necessary insight. The discoveries of Mr. Arthur Bennett amongst the potamogetons of the Eastern Counties is a striking and brilliant instance.

Besides the publication of the *Annals*, we owe to the Oxford Press a splendid series of the best foreign text-books issued in our own language. If the thought has sometimes occurred to one's mind that we were borrowers too freely from our indefatigable neighbours, I, at least, remember that the late Professor Eichler paid us the compliment of saying that he preferred to read one of these monumental books in the English translation rather than in the original. I believe it is no secret that botany owes the aid that Oxford has rendered it in these and other matters in great measure to my old friend, the Master of Pembroke College, than whom, I believe, science has no more devoted supporter.

PALÆBOTANY.

I have said much of recent botany; I must not pass over that of past ages. Two notable workers in this field have passed away since our last meeting. Saporta was with us at Manchester, and we shall not readily forget his personal charm. If some of his work has about it a too imaginative character, the patience and entire sincerity with which he traced

the origin of the existing forms of vegetation in Southern Europe to their ancestors in the not distant geological past will always deserve attentive study. But in the venerable, yet always youthful, Williamson we lose a figure whose memory we shall long preserve. With rare instinct he accumulated a wealth of material illustrative of the vegetation of the Carboniferous epoch, which, I suppose, is unique in the world. And this was prepared for examination with incomparable patience either by his own hands or under his own eyes. He illustrated it with absolute fidelity. And if he did not in describing it always use language with which we could agree, nothing could ruffle either his imperturbable good nature or the noble simplicity of his character. Truth to tell, we were often in friendly warfare with him. But I rejoice to think that before his peaceful end came he had patiently reconsidered and abandoned all that we regarded as his heresies, but which were, in truth, only the old manner of looking at things. And I think that if anything could have contributed to make his departure happy, it was the conviction that the completion of his work and his scientific reputation would remain perfectly secure in the hands of Dr. Scott.

VEGETABLE PHYSIOLOGY.

Turning again to the present, the difficulty is to limit the choice of topics on which I would willingly dwell. In an address which I delivered at the Bath meeting in 1888, I ventured to point out the important part which the action of enzymes would be found to play in plant metabolism. My expectations have been more than realised by the admirable work of Professor Green on the one hand, and of Mr. Horace Brown on the other. The wildest imagination could not have foreseen the developments which, in the hands of animal physiologists, would spring from the study of the fermentative changes produced by yeast and bacteria. These, it seems to me, bid fair to revolutionise our whole conceptions of disease. The reciprocal action of ferments, developed in so admirable a manner by Marshall Ward in the case of the Ginger-beer plant, is destined, I am convinced, to an expansion scarcely less important.

But, perhaps, the most noteworthy feature in recent work is the disposition to reopen in every direction fundamental questions. And here, I think, we may take a useful lesson from the practice of the older Sections, and adopt the plan of entrusting the investigation of special problems to small committees, or to individuals who are willing to undertake the labour of reporting upon special questions which they have made peculiarly their own. These reports would be printed *in extenso*, and are capable of rendering invaluable service by making accessible acquired knowledge which could not be got at in any other way.

We owe to Mr. Blackman a masterly demonstration of the fact, long believed, but never, perhaps, properly proved, that the surface of plants is ordinarily impermeable to gases. Mr. Dixon has brought forward some new views about water-movement in plants, which I confess I found less instructive than many of my brother botanists. They are expressed in language of extreme technicality; but, as far as I understand them, they amount to this. The water moving in the plant is contained in capillary channels; as it evaporates at the surface of the leaves a tensile strain is set up, as long as the columns are not broken, to restore the original level. I can understand that in this way the "transpiration current" may be maintained. But what I want to know is, how this explains the phenomena in the Sugar Maple, a single tree of which will yield, I believe, 20 to 30 gallons of fluid before a single leaf is expanded.

We owe to Messrs. Darwin and Acton the supply of a *Manual of Practical Vegetable Physiology*, the want of which has long been keenly felt. Like the father of one of the authors, "I love to exalt plants" (i. 98). I have long been satisfied that the facts of vegetable physiology are capable of being widely taught, and are not less significant and infinitely

more convenient than most of those which can be easily demonstrated on the animal side. How little any accurate knowledge of the subject has extended was conspicuously demonstrated in a recent discussion at the Royal Society, when two of our foremost chemists roundly denied the existence of a function of respiration in plants, because it was unknown to Liebig!

ASSIMILATION.

The greatest and most fundamental problem of all is that of assimilation. The very existence of life upon the earth ultimately depends upon it. The veil is slowly, but I think surely, being lifted from its secrets. We now know that starch, if its first visible product, is not its first result. We are pretty well agreed that this is what I have called a "proto-carbohydrate." How is the synthesis of this effected? Mr. Acton, whose untimely end we cannot but deeply deplore, made some remarkable researches, which were communicated to the Royal Society in 1889, on the extent to which plants could take advantage of organic compounds made, so to speak, ready to their hand. Loew, in a remarkable paper, which will perhaps attract less attention than it deserves from being published in Japan,* has from the study of the nutrition of bacteria, arrived at some general conclusions in the same direction. Bokorny appears recently to have similarly experimented on *Algæ*. Neither writer, however, seems to have been acquainted with Acton's work. The general conclusion which I draw from Loew is to strengthen the belief that form-aldehyde is actually one of the first steps of organic synthesis, as long ago suggested by Adolph Baeyer. Plants, then, will avail themselves of ready-made organic compounds which will yield them this body. That a sugar can be constructed from it has long been known, and Bokorny has shown that this can be utilised by plants in the production of starch.

The precise mode of the formation of form-aldehyde in the process of assimilation is a matter of dispute. But it is quite clear that either the carbon dioxide or the water, which are the materials from which it is formed, must suffer dissociation. And this requires a supply of energy to accomplish it. Warington has drawn attention to the striking fact that in the case of the nitrifying bacterium, assimilation may go on without the intervention of chlorophyll, the energy being supplied by the oxidation of ammonia. This brings us down to the fact, which has long been suspected, that protoplasm is at the bottom of the whole business, and that chlorophyll only plays some subsidiary and indirect part, perhaps, as Adolph Baeyer long ago suggested, of temporarily fixing carbon oxide like hæmoglobin, and so facilitating the dissociation.

Chlorophyll itself is still the subject of the careful study by Dr. Schnuck, originally commenced by him some years ago at Kew. This will, I hope, give us eventually an accurate insight into the chemical constitution of this important substance.

The steps in plant metabolism which follow the synthesis of the proto-carbohydrate are still obscure. Brown and Morris have arrived at the unexpected conclusion that "Cane-sugar is the first sugar to be synthesised by the assimilatory processes." I made some remarks upon this at the time,† which I may be permitted to reproduce here.

"The point of view arrived at by botanists was briefly stated by Sachs in the case of the Sugar-Beet, starch in the leaf, glucose in the petiole, cane-sugar in the root. The facts in the Sugar-cane seem to be strictly comparable ‡ Cane-sugar the botanist looks on, therefore, as a 'reserve material.' We may call 'glucose' the sugar 'currency' of the plant, cane-sugar its 'banking reserve.'

"The immediate result of the diastatic transformation of starch is not glucose, but maltose. But Mr. Horace Brown has shown in his remarkable experiments on feeding Barley embryos that, while they can readily convert maltose into cane-sugar, they altogether fail to do this with glucose. We may

* *Bull. College of Agric. Imp. Univ. Tokio*, vol. ii.

† *Journ. Chem. Soc.*, 1893, 673.

‡ *Kew Bulletin*, 1891, 35-41.

conclude, therefore, that glucose is, from the point of view of vegetable nutrition, a somewhat inert body. On the other hand, evidence is apparently wanting that maltose plays the part in vegetable metabolism that might be expected of it. Its conversion into glucose may be perhaps accounted for by the constant presence in plant tissues of vegetable acids. But, so far, the change would seem to be positively disadvantageous. Perhaps glucose, in the botanical sense, will prove to have a not very exact chemical connotation.

"That the connection between cane-sugar and starch is intimate is a conclusion to which both the chemical and the botanical evidence seems to point. And on botanical grounds this would seem to be equally true of its connection with cellulose.

"It must be confessed that the conclusion that 'cane-sugar' is the first sugar to be synthesised by the assimilatory processes seems hard to reconcile with its probable high chemical complexity, and with the fact that, botanically, it seems to stand at the end and not at the beginning of the series of metabolic change."

PROTOPLASMIC CHEMISTRY.

The synthesis of proteids is the problem which is second only in importance to that of carbohydrates. Loew's views of this deserve attentive study. Asparagin, as has long been suspected, plays an important part. It has, he says, two sources in the plant. "It may either be formed directly from glucose, ammonia (or nitrates) and sulphates, or it may be a transitory product between protein-decomposition and reconstruction from the fragments."*

In the remarks I made to the Chemical Society I ventured to express my conviction that the chemical processes which took place under the influence of protoplasm were probably of a different kind from those with which the chemist is ordinarily occupied. The plant produces a profusion of substances, apparently with great facility, which the chemist can only build up in the most circuitous way. As Victor Meyer † has remarked: "In order to isolate an organic substance, we are generally confined to the purely accidental properties of crystallisation and volatilisation." In other words, the chemist only deals with bodies of great molecular stability; while it cannot be doubted that those which play a part in the processes of life are the very opposite in every respect. I am convinced that if the chemist is to help in the field of protoplasmic activity, he will have to transcend his present limitations, and be prepared to admit that as there may be more than one algebra, there may be more than one chemistry. I am glad to see that a somewhat similar idea has been suggested by other fields of inquiry. Professor Meldola ‡ thinks that the investigation of photochemical processes "may lead to the recognition of a new order of chemical attraction, or of the old chemical attraction in a different degree." I am delighted to see that the ideas which were floating, I confess, in a very nebulous form in my brain are being clothed with greater precision by Loew.

In the paper which I have already quoted, he says of proteids §:—"They are exceedingly labile compounds that can be easily converted into relatively stable ones. A great lability is the indispensable and necessary foundation for the production of the various actions of the living protoplasm, for the mode of motions that move the life-machinery. There is a source of motion in the labile position of atoms in molecules, a source that has hitherto not been taken into consideration either by chemists or by physicists."

But I must say no more. The problems to which I might invite attention on an occasion like this are endless. I have not even attempted to do justice to the work that has been accomplished amongst ourselves, full of interest and novelty as it is. But I will venture to say this, that if capacity and earnestness afford on any day of success, the prospects of the future of our Section possess every element of promise.

KEW NOTES.

TACCA PALMATA.—This is a new addition to the cultivated species of Tacca, seeds of it having been received at Kew last year from the Java Botanic Garden, from which a batch of plants were raised, and most of them are now flowering in the tropical houses. The general characters of the plant are similar to those of the well-known *T. artocarpifolia* from the Mascarene Islands, but smaller, the slender leaf-stalks being 1 foot long, supporting a palmatifid blade 9 inches across; the flower-scapes are erect, from 18 inches to 2 feet in height, and it bears a umbel of about twenty dull purple flowers springing from a quartette of leaf-like, green bracts. The flowers, which are $\frac{1}{2}$ inch in diameter, have three inner and three outer recurved segments. The plant is worth a place among interesting easily-grown stove plants. Probably it will grow to a larger size. *T. pinnatifida*, from the roots of which arrowroot is prepared in Fiji, has also lately flowered at Kew. A fourth species grown here is *T. cristata*, generally known as *Ataccia*.

CRINUM PURPURASCENS.

Sir John Kirk, K.C.B., recently brought to Kew seedlings of a *Crinum* which he found growing in deep water at Brass near the mouth of the river Niger, and which, so far as he could see, was a true aquatic, the leaves as well as the stems being quite submerged, the head of flowers only appearing above the surface of the water. In the distance the flowers had the appearance of a *Nymphaea*. On pulling at one of the flower-heads he drew up with it a long Leek-like stem with narrow strap-shaped leaves more like some sea-weed in character than any *Crinum*. Sir John, on seeing a plant of *C. purpurascens* in the Kew collection, which is a native of that region, thought it might probably be the same as what he saw at Brass. The inference is that *C. purpurascens* is of aquatic habits, and judging by Sir John's description, it is a much more attractive plant when seen growing in deep water than when growing in a pot in the ordinary way. It flowers annually in a stove at Kew.

AGAVE KEWENSIS.

For many years there has been a gigantic Agave in the succulent-house at Kew under this name. Its early history appears to be unknown, but thirty years ago it was included by Jacobi in his *Monograph*, where it was first described under its present name. At that time it was a large plant, so that probably its age now is fifty to sixty years. It is now flowering for the first time, the pole-like spike reaching to the roof of the house, and bearing a dense head of large bright yellow flowers. A figure of it has been prepared for the *Botanical Magazine*, where, no doubt, Mr. Baker will tell all that there is to be told with regard to it. Meanwhile it is worth the while of anyone interested in Agaves to see this plant, which is exceedingly handsome in flower, but which does not at present look like perpetuating itself, the leaves having all perished, and the stem failed to develop suckers. Possibly, however, bulbils will be produced on the inflorescence.

CEREUS GIGANTEUS.

One of the large specimens of this giant Cactus recently obtained from Arizona, and represented in the photograph of a group of Cacti published in these pages a few weeks ago, is now flowering freely. This is the second time this species has flowered at Kew in the last five years, the first being in 1891, when a figure was published in the *Botanical Magazine*. The flowers are 6 inches long, trumpet-shaped, with numerous short white petals surrounding a large cushion-like cluster of yellow stamens, in the centre of which is the erect many-rayed stigma. Compared with the colossal stem the flowers are small and disappointing. Had the flowers been on the same scale as those of *C. Eyriceii* (*Echinopsis*) they would have been about the size of an ordinary wash-tub. W. W.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

MELONS.—Late crops of Melons often prove useful during shooting parties in October, but to obtain fruit of good flavour at such time, late batches of plants should be grown in heated pits or houses where a night temperature ranging from 65° to 70° can be maintained. If this convenience is at command, and provided the plants are strong and healthy, it is not too late even now to set a few fruits. The above-mentioned night-temperature, together with a brisk, growing heat during the day ought to produce ripe fruit towards the end of next month. The continued bright weather has proved very beneficial to the present crop, as ventilation was admitted freely to the fruit during the latter stages of ripening, which is very necessary to good flavour. Where the fruit is in different stages of swelling, a fair amount of moisture can safely be used while there is sun-heat, but at the first approach of dull, wet weather, great care must be taken to ensure an even temperature, and there must be less atmospheric moisture. Slight surface-dressings of fresh loam may be given to sustain the plants in a healthy condition until the fruits are cut.

TOMATOS.—If not already prepared, a house should be got ready for plants that are at present standing in pots out-of-doors, so that they may be removed under cover before damage is done by heavy rains or frosts. A house that has been used during the summer for Melon-growing may be selected with advantage, as the pots, if small, and full of roots, can be stood on the soil used for the former crop, and allowed to root into the same. Plants occupying large pots will require to be surface-dressed and stood upon bricks, that the drainage may be thorough. Train the fruiting-stems as near the roof-glass as possible, and continue to shorten back lateral growths, also the strongest foliage to half its length, so that light and air may easily reach the clusters of flowers. The house should be ventilated freely during bright weather, and a slight circulation in the hot-water pipes should be maintained if the weather becomes damp. Atmospheric moisture must be avoided, or disease will follow. Water rather sparingly. We are testing several varieties for winter work, and up to the present Frogmore Selected has set the best crop. Clusters of fruit, eight and ten on each, are swelling very evenly.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

DAHLIAS.—Show and other varieties of Dahlias should be given attention by cutting off all dead flowers as they appear, and by securing the plants against rough weather. Dahlias are most useful autumn-flowering plants, and every inducement should be given them to continue in flower as long as possible. Before the plants have passed out of bloom they should be looked carefully over, and correct names attached to each of them; or where this is impossible, discard the plant, as there is nothing more confusing than wrongly-named plants.

ALPINE AURICULAS in beds or borders must be kept clean from weeds, and the plants ought now to be growing strong and healthy. Where the plants are grown in pots, young seedlings and offsets that are growing in small pots or boxes should be moved into 5 or 6-inch pots. They require perfect drainage and rich sandy loam, with a good quantity of small broken brick in it. Place them in frames or pits from which the lights can be taken off during dry weather. In winter they must be given a situation that is dry and airy, but free from frosts.

BULBOUS PLANTS.—Seeds of these that have been sown during the season should now be sown in boxes, and placed in pits from which severe frost can be excluded. Bulbs of Narcissus, *Lilium candidum*, Anemones, Tulips, Hyacinths, Crocus, Iris, *Gladiolus Colvillei*, &c., may be planted as soon as the beds or borders are cleared of their summer occupants. Those put into herbaceous borders should be planted in clumps of from six to twelve bulbs, and kept as near the front as possible, that they may be readily observed when in bloom.

PRIMROSES AND POLYANTHUSES that require planting out should be removed as soon as possible. Where they are growing thickly in old-established beds, every other plant should be taken out.

* *Loc. cit.*, 64.

† *Nature*, xlii., 250.

‡ *Pharm. Journ.*, 1890, 773.

§ *Loc. cit.*, 12.

WALLFLOWERS may also be planted in their winter quarters as soon as possible. Window-boxes standing in sheltered positions should be filled with them at once; and some plants should be put into pots, in order to fill the vases in spring. These may be kept in a cool pit or house.

CARNATIONS AND PINKS.—Layers and cuttings which are well rooted must be planted out without delay. Give the ground a good manuring, and a little fresh lime at the time of planting. Late layers should be left on the plants for some time yet, as they do not root so quickly.

HERBACEOUS BORDERS.—A considerable amount of cleaning-up will be required at this season. The borders are very gay just now with the flowers of *Tritoma Uvaria*, *Michaelmas Daisies*, various sorts of *Helianthus*, *Anemone japonica*, herbaceous *Paloxea*, *Hyacinthus candicans*, and *Bulbocodiums*. Annuals sown or planted in these borders should be kept within bonnets. Such plants as Sweet Peas, Marigolds, *Tropæolums*, summer *Chrysanthemums*, *Pelargoniums*, and annual *Scabions* should be grown on borders or beds to themselves, or on shrubby borders. *Dahlia*s, annual *Sunflowers*, *Mignonette*, clumps of *Ten-week Stocks*, and such plants that will come off quickly may be grown in herbaceous borders, but they should not be allowed to interfere with the flowering and ripening of *Pæonies*, *Spizæas*, *Delphiniums*, and other hardy plants.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

VENTILATION AND SHADE.—The principal work to be done in Orchid-houses now is the repotting of the cool-growing species, but while such work is in progress, there are other important matters requiring attention. Each day has a shorter period of light than its predecessor, and it is necessary to take advantage of all the sunlight in order to assist the plants to thoroughly ripen their growth. Gradually expose the collection as a whole to extra sunlight, and on every favourable opportunity admit a free circulation of air. In the hottest division, where *Dendrobium*s still in full growth, *Cyrtopodiums*, *Renanthras*, *Grammatophyllums*, *Vanda Hookeriana*, *Cattleya superba*, *C. Schilleriana*, *Catacætnæ*, &c., can be accommodated to a position by themselves, the plants will now require only the thinnest of shading under any circumstances; but such plants as *Phalænopsis*, *Angræcum citratum*, *A. Ellisii*, *A. Kotschyi*, *A. Sanderianum*, *A. pellucidum*, *Phaius tuberculatus*, *Anæctochilna*, *Eulophiella Elisabethæ*, *Cypripediums*, the warm-growing *Cœlogyne asperata*, *C. Lowii*, and *C. Cumingi*, are liable to permanent injury if exposed to direct sunlight. The amount of shading in the case of these, however, may be lessened by not lowering the blinds quite so early in the morning, and by lifting them sooner each afternoon. It is important that discrimination should be used in this matter, and when the blinds are down during the middle hours of the day, it is necessary to guard against over-ventilation, so as to minimise the fluctuation in the temperature through cold winds. Many of the *Aëidea*s and *Saccobalanus* are still growing freely, and will only require to be moderately shaded. The deciduous *Calanthes*, which are now commencing to show their flower-spikes, will scarcely require to be shaded at all; by thus exposing them the bulbs become strong and well-ripened, and the colour of the flowers will be clear and rich. There are few Orchids that enjoy an airy atmosphere at this season more than the *Cattleyas*, especially when there is plenty of sun-heat. There is no need to be continually pulling the blinds up and down at every burst of sunshine, as *Cattleyas* will stand more direct sunlight at this season than any other, and they will only require shade at all for an hour or so during the hottest part of the day. Such species as *Lælia anceps*, *L. autumnalis*, *L. albida*, *L. Gonldiana*, *L. Marriottiana*, &c.; *Vanda terea*, *V. Kimballiana*, *V. Amesiana*, *Schomburgkias*, *Barkerias*, *Eulophias*, *Epidendrum atropurpureum*, *E. Randii*, *E. rhizophorum*, and *Odonoglossum citrosannum*, also delight in plenty of sunshine during the autumn, and an abundance of fresh air whenever practicable. *Miltonia vexillaria*, *Cœlogyne*s, *Vandas* of the *suavia* and *tricolor* section, the cooler-growing *Aërides*, as *A. crassifolium*, *A. maculatum*, *A. m. Schröderæ*, *Saccobalanus coleate*, and the cooler-growing *Cypripediums*, which, when an intermediate-house is not at command, are usually cultivated with the *Cattleyas*, all require an airy position and moderate shading. The *Odonoglossum*, *Made-*

ralias, and other species in the cool-house should be protected from strong sunshine at all times. Those *Dendrobium*s that have completed their growth and have for the past few weeks been gradually dried and hardened off, may be fully exposed to the sun. Very little water is needed now to keep the bulbs plump. Afford plenty of air by opening the ventilators at both top and bottom, but avoid cold draughts.

THE HARDY FRUIT GARDEN.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

PEACHES AND NECTARINES continue to require frequent attention. The growths should be secured, and the laterals on vigorous shoots stopped to one leaf. Late kinds need as much air and sunlight as possible, in order to obtain fruits of good colour and flavour. The fruits should not be shaded by leaves, which may be fastened back; or if this cannot be done, shortened, or taken away entirely. Long sappy growths may be shortened, but this must be done with care, or the diverted sap may unduly excite dormant buds that should fruit next season. Trees that have been cleared of fruit may now have old bearing wood that can be spared taken out, and if the shoots are then still crowded, they may be thinned freely. Each shoot requires a space of 9 to 12 inches in order to ensure the perfect ripening of the wood, and which is the best preventive of injury by hard frosts. The roots often require water at this season, and if upon examination the borders are found to be dry, they should be given a good soaking at once, first breaking the surface if trodden hard near the wall. Where lifting has to be done it should be attended to in good time; and before the fall of the leaf. Many good growers transplant their trees periodically, and the roots by frequent removal become a mass of fibres, so that the slight check experienced is beneficial in hastening wood ripening, and preventing rampant growth. If any trace of red-spider be detected, give the trees a thorough washing with clear water three or four days in succession, applying it with force from the garden-engine, and taking care that every portion is well wetted. Any trees that are badly infested should be treated with some safe kind of insecticide, afterwards syringing them with clear water till clean.

STOPPING PEARS, PLUMS, ETC., ON WALLS.—Continue to stop secondary growths on Pear, Plum, Cherry, and Apricot trees on walls, pinching all such to one leaf so as to keep the spurs close to the wall, and to allow of sun and air having free access to every part. The shoots must be secured to the wall as they advance in growth, or it may be difficult to bring them into a proper position later on. Overgrown spur-growth may also now be thinned, cutting out one here and there, where they can be spared. If a few of these are taken away yearly, a neglected tree will in a few years be furnished with short spurs close to the wall, and the fruit will be greatly improved in size and quality. In the case of old exhausted trees, this should be supplemented by clearing away the top soil and applying a good dressing of rich compost to the roots.

THE KITCHEN GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

SWEET BASIL has made abundant growth in the open this summer, and should now be dried for use during winter. Where a green supply in winter is expected, preparations for growing it in heated pits or in boxes, must be made at once. Sow the seed now, and as soon as the seedlings can be handled, carefully prick them out, and as they are very tender they must not be put into a cool draughty house. A Cucumber-house or Pine-stove will suit them well, but keep them as near to the roof-glass as possible.

GENERAL WORK.—Since the rains have come the growth of weeds has caused considerable trouble in the kitchen garden, and it has been difficult to destroy them by hoeing. Hand-weeding is imperative in the case of some crops where the hoe cannot be used, but during dry days let all the garden be thoroughly cleaned, afterwards hoed, and if dull weather ensue repeat the operation soon afterwards. Turnips sown as advised will now require thinning, which will need to be done twice, or they will still be left too thickly. Some of the late sowings on poor soil may be left a trifle closer than the others for producing sprouts next spring. Chirk Castle Blackstone and

Orange Jelly are two good ones for this purpose, and they will stand hard winters well. Let all Turnips which are fully matured be pulled, trimmed, and put away in the root-house, as Turnips do not improve by being left in the ground after they are mature. Endive will now require blanching. The blanching may be done by tying the plants when dry—or better still, by placing inverted flower-pots over them. If flower-pots are used, a few only need be done at a time, for when the holes are stopped, the blanching process is a rapid one. Asparagus may now receive the last dressing this season of salt or fish manure. See that the growths are not badly beaten down, and any fresh growths with berries attached should be removed. Peas and Beans now exhausted should be removed, and the ground cleaned of all weeds; but if the Peas were sown thinly, and are not troubled badly with mildew, they will make side-growths if left, and still produce a few good dishes. Scarlet Runners will be benefited by a good soaking of manure-water. Broccoli will require to be earthed up, just sufficient to keep them steady in case of rough winds. Cabbage and Coleworts may be treated the same when large enough. Large beds of old stools that furnished hearts for spring cutting, which were cleaned of old dead and decaying leaves, and were cut with the intention of obtaining young sprouts through the winter, will now be making nice growths, and should be encouraged, for many of them will stand through an ordinary winter. All second-early Potatoes will be best lifted at once, and if seed be required, it should be selected. Beds of Early Horn Carrots and also Turnip-rooted Beet may be cleared from the ground. Give attention to the pricking out *Caniflowers* and Cabbages for winter work, and dust them occasionally with soot or lime.

PLANTS UNDER GLASS.

By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

CYCLAMENS, if grown in cold frames, must now be removed to the greenhouse; or if they can be placed in a small house or heated frame, where the temperature can be kept about 50° at night, they will do much better, as in the greenhouse they are apt to become drawn. Keep the plants close to the glass, and lightly shade them during very bright weather. Weak manure-water may be given twice a week, and this may be varied occasionally by applications of weak soot-water. As soon as the plants are taken in, they should be fumigated with Richards' Compound if they are affected with any fly or thrip. Syringe them lightly on bright days until the flowers commence to open, after which the operation should be discontinued.

WINTER-FLOWERING PELARGONIUMS should now be cleaned of all yellow and decaying leaves, and afterwards placed in their winter quarters. These plants do much better, and the flowers last considerably longer, if a small light airy house can be devoted to them, and damping will be less likely to occur than when they are grown among other plants. Before the plants are staged they should be given a top-dressing with a good fertiliser. If they are not required to flower until winter, the buds may be picked off for a while longer, but on no account should the shoots be stopped, or they will not flower until spring.

CARNATION SOUVENIR DE LA MALMAISON.—Those layers first potted will now be ready for moving into their flowering-pots, which should not be less than 24-size. For a potting compost use good turfy loam, peat, leaf-soil, wood-ashes, and plenty of coarse sand. Pot the plants firmly, and take this opportunity to look the plants over very closely for disease and fly. If the former is present it should be cut clean out with a sharp knife, and burnt. When they are potted the plants may be put into cold frames, withhold water for a few days afterwards, when a thorough soaking may be given. Some of the new varieties of the *Souvenir de la Malmaison* type of Carnations best worthy of cultivation are Sir Charles Freemantle, Princess Daisy, Mrs. Everard Hambro, Sir Evelyn Wood, and Toe Churchwarden.

EAST LOTHIAN STOCKS should now be potted into 48 sized pots, which will be found the most suitable size in which to flower the plants. A compost of good loam, leaf-soil, and cow-manure will suit them well. Pot very firmly, and plunge them out-of-doors in coal ashes. Do not water for a day or two, but afterwards give them a good soaking.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOW.

THURSDAY, SEPT. 26. { Royal Horticultural Society: Great Show of British-grown Fruits at the Crystal Palace.

SALES.

MONDAY, SEPT. 23. { Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, SEPT. 24. { Dutch Bulbs, at Protheroe & Morris' Rooms. Highly important Sale of the celebrated Beech Lawn Collection of Established Orchids, by order of W. E. Lee, Esq., by Protheroe & Morris (three days).

WEDNESDAY, SEPT. 25. { Dutch Bulbs, at Protheroe & Morris' Rooms. Annual Unreserved Clearance Sale of Greenhouse Plants, &c., at The Floral Nurseries, Castle Hill, Maidenhead, by order of Mr. E. Owen, by Protheroe & Morris.

THURSDAY, SEPT. 26. { Dutch Bulbs, at Protheroe & Morris' Rooms.

FRIDAY, SEPT. 27. { Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms.

SATURDAY, SEPT. 28. { Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—55°.9.

The British Association and Agriculture.

For many years of its existence this journal, to the extent of half of its superficial extent, was identified with agriculture; and the *Agricultural Gazette* was recognised as one of the farmer's staunchest friends and ablest advocates of his best interests. The man above most other men who was noted as the best friend of agriculturists was the Editor of the *Gazette*—Mr. JOHN C. MORTON; and his writings of five-and-twenty years since are as valuable and pertinent to-day as they were when first this journal saw the light. Mr. MORTON has gone to his rest, but the good he essayed to do, and did, has not been "interred with his bones," and of this we have daily evidence; amongst other bodies the British Association has taken up the subject of agriculture, and in the endeavour to forward its interests has achieved some amount of success, and here it may not be out of place to remind our readers that the *Agricultural Gazette's* remedy for agricultural distress was summed up in the words, "free land, freedom of contract, sufficiency of working capital, and sufficiency of brain power." The British Association devoted Monday last to agriculture, and preparation had been made for a large attendance of those supposed to be most interested in agriculture; but the expectations were not warranted by the result. Men of high authority in various departments of science spoke on the subject of Government aid to education, and the endowment of experiments; on the extension of the work of the Board of Agriculture; to the publication of results obtained by experimenters, the duty of County and District Councils in the matter of agricultural education; but not a word that we can discover on the means adopted by foreign agriculturists to make their trade pay them, and to some extent govern the markets in this country. Some admitted that of most things grown we manage to grow the finest crops—climate considered: and admitting this, the value of further experiment is questionable; and it being admitted that agriculture is an

industry like weaving or iron-working, some notice might have been taken of the relative position of all in the matter of freedom of action, of the chances of profit in investment of capital in one, as compared with the other. It was gratifying to note appreciation of the fact that whilst the area devoted to Wheat-growing is decreasing, that set apart for Oats and Barley was steadily increasing—furthermore that the increase in the number of breeding swine was something like 25 per cent.

And so it comes to pass that, however interesting were the papers read and the consequent discussion thereon at Monday's meeting of the British Association—and nothing can be said against their value in these separate respects—we are forced to the conclusion that the old propositions of the *Agricultural Gazette* above recorded are as unimpeachable as ever—free land for the farmer, freedom of contract, sufficiency of capital, and of brain power. Given all these, and this one industry must prove as successful as any other in the land.

Tillage and Nitrification.

FROM the earliest period to the present day adequate tillage of the soil has been counselled and practised, but so slow are the processes of the human mind that although the operation has been practised from time immemorial, it is only now, thanks to the labours of a few chemists and biologists, that we are beginning to realise in what the advantages consist. In the course of a decade or two the physiologists have lighted upon truths of the utmost practical importance, which successive generations of practitioners, from the time of the expulsion from Eden till now, have failed to recognize. The subject has been suggested to us by a paper published in the *Revue Scientifique* for June 22, by M. P.-P. DEHÉRAIN, on the "Effects of Tillage in Promoting Nitrification in the Soil." The conclusions arrived at are, in brief, as follows:—We know now how to take advantage of the phosphates and of salts of potash; and if we knew at the right time how to convert the nitrogen contained in the humus of the soil into nitrates, agricultural produce would be proportionately increased.

To ensure such results the soil has, from remote ages, been constantly and vigorously "worked," but it is only now that we begin to understand the advantages of such tillage and the conditions under which alone it is beneficial. However thoroughly ploughing and digging be done, their value is but little unless the soil be in a damp condition. If the ferments in the soil whose action it is necessary to excite are dormant or feeble, and do not begin their work in early spring, the tillage is relatively ineffectual.

The whole question of nitrification is dominated by the slowness of the evolution of the nitric ferments. Rendered inert by the frosts of winter, it is but slowly that they begin their work of nitrification, and produce only in April and May insufficient quantities of nitrates. Hence the necessity for the employment of nitrate of soda; hence the necessity for having a fleet constantly at sea, conveying these nitrates at great cost from the coast of the Pacific.

Now when the ground is damp, well aerated, and the ferments are active, there are produced, without any addition, many more nitrates than are necessary. The soil of Guadeloupe yielded, on May 30, 39 milligrammes of nitrogen per 100 grammes, or 390 milligrammes per kilo., or 390 grammes per tonne, or, lastly, 390 kilos. to 1000 tons—that is to say, infinitely more than

is necessary for the heaviest harvest. In applying the same calculations to the soil from Eure-et-Loir there were found only the insufficient amount of 25 kilos. of nitrogen.

"What then is lacking?" asks M. DEHÉRAIN. Replying to his own question he repeats, "Active ferments." Can we go further, that is to say, can we cultivate these ferments and pass their nitrifying properties from one soil to another? Can we, in spring, sow nitric ferments in full activity which shall supply the place of those paralysed by the frosts of winter? Is this an impossible dream? I know not. Leguminous plants owe their property of fixing atmospheric nitrogen to the presence on their roots of nodules filled with bacteria; now, already, on several occasions, the germs of these bacteria have been transferred from one soil to another with beneficial effect. From time immemorial such tillage has been practised, the soil having, at great cost, been transported from one place to another. For what reason? What do these soils contain? These are the problems which are now to be attacked, but without discounting future possibility and limiting ourselves to present knowledge, we now know that if we put the ferments of the soil into working order, we can obtain from it more nitrates than the heaviest crops require, and, if we remember that it is not only under the influence of micro-organisms that the nitrogen in the soil becomes assimilable, but that it is also by their activity that atmospheric nitrogen becomes fixed, that it enters into the cycle of organised beings, we recognize how true and how profound was the saying of M. BERTHELOT, "The earth is a living thing!"

The paper concluded with an eloquent tribute to the genius of PASTEUR, by whose labours the nature of fermentation and the principles on which the manufacture of wine, beer, and vinegar depend have been elucidated. PASTEUR has investigated the parasitic organisms causing disease in silkworms and domestic animals, and shown how their malign influence may be controlled or abolished. It is he who has devised "vaccines" which prevent the destructive effect of epidemic diseases on our flocks and herds. Moreover, the obscurity which surrounded so many of the diseases of mankind is gradually being dissipated. M. PASTEUR teaches us how to cope with hydrophobia; one of his pupils neutralises the poison of diphtheria. But to cure sick mankind is not sufficient. The healthy must be fed, and now we see more clearly how this is to be accomplished, and we recognize to-day that the fertility of the soil is due to the action of the ferments which it contains.

ROYAL HORTICULTURAL SOCIETY'S FRUIT SHOW.—On Thursday, September 26, and two following days, the Royal Horticultural Society's Great Show of British Fruit will be held at the Crystal Palace. The exhibition, which promises to be even a greater success than that held last year, will be opened by the Lord Mayor, Sir JOSEPH RENALS, at 12.30 on September 26, when he will be accompanied by the Sheriffs and the Master and Warden of the Worshipful Company of Gardeners. A public luncheon will be held on the same day at 1.30 in the Grand Saloon, and will be presided over by Sir TREVOR LAWRENCE, Bart. Lectures will be given each day of the show in the Garden Hall at 3.30 as follows:—September 26, "New Fruits of Recent Years," by Mr. G. BUNYARD; September 27, "Pruning Fruit Trees," by Mr. A. H. PEARSON; September 28, Prize-essay on "The Commercial Aspect of Hardy Fruit-growing." Nurserymen and others are particularly requested to exhibit under

the schedule. By direction of the Council, exhibits outside the schedule will only receive cards of Commendation according to merit. Vegetables, other than Tomatoes, are not allowed to be shown. With reference to exhibits outside the schedule, exhibitors should bear in mind the new rule adopted at the suggestion of the Fruit Committee:—"All collections of fruit are limited to 100 dishes or baskets, and all dishes or baskets must be of distinct varieties of fruit, no duplicates being allowed."

BEDDINGTON, CARSHALTON, AND WALLINGTON HORTICULTURAL SOCIETY. — The above

tributed by the trade and private growers, and County Council Certificates will be granted for specially meritorious productions. The Hon. Secretary will furnish further particulars on application.

THE ADULTERATION OF ATTAR OF ROSE.—The difficulty in obtaining pure otto or attar of Rose in the European markets is a fact well known to all. Andropogon oils play the largest part in this systematic adulteration, but "Geranium oil" from *Pelargonium capitatum* also takes a place. Some new features as to the authors of this adulteration have just been brought to light in the Report of the

the otto may not be tampered with after reaching the merchant's hands, there is no means of ensuring that the peasant, whose stock the latter buys up, has not already adulterated it. Supervision during distillation is no guarantee, for the ingenious peasant is in the habit of sprinkling essence of Geranium over the freshly-gathered Roses before distillation, in order to increase the yield. Congelation at a certain temperature, which is principally relied upon as a test of purity, is quite fallacious. These are new lights in the preparation of attar of Rose to which the attention of our perfumers will, no doubt, be directed, especially when it is considered the enormous price this pro-

FIG. 62.—*ESCHYNANTHUS HILDEBRANDII*: FLOWERS ORANGE AND SCARLET. (SEE P 324)
(The single flowers to the right and left of the plant are of natural size.)

society, as Mr. G. W. CUMMINS, the Honorary Secretary, requests us to inform our readers, have, in conjunction with the Surrey County Council, arranged to hold a special show at the Public Hall, Carshalton, on October 16 and 17, of vegetables, fruit, &c., and also a large representative collection of Potatoes from trial plots in various parts of the county of Surrey, grown under the Technical Education Committee, so as to show the effects of diverse soils on the yield. Addresses will be given by the Surrey County Council's instructors on horticulture on "Fruit and its Cultivation," and "The County Potato Experiments." A few prizes will be offered for local cottagers' produce, whilst provision will be made for collections of vegetables and fruit con-

British Consul at Sofia, in Bulgaria, where, speaking of this important industry, he says, the adulteration to which otto of Roses has always been subjected seems hardly to have been checked by the prohibition imposed by the Government on the importation into Bulgaria of the adulterating medium, essence of Geranium. Indeed, the quantity of otto which reaches the European markets in a pure state must be very small. Last summer the British Chamber of Commerce at Constantinople sent a delegate to Kezanlik, the principal otto-producing centre, with the view of procuring an absolutely pure sample, to serve as a standard for purposes of comparison. This gentleman, however, was obliged to return empty-handed, for he ascertained that though

duct realises. In connection with this peculiar and limited industry, it is interesting to note that the cultivation of the Kezanlik Rose has been started with some success at Broussa, in Asia Minor, by Mussulman refugees from Bulgaria.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The first meeting of the fifth session of this society was held at their room, 25, Westgate Road, on Tuesday, the 10th inst. The chairman, Mr. BULLOCK, presided over a good attendance. A paper entitled "Botany, as an Aid to Observation," by Mr. JAS. SCOTT, Farn-dene, Gateshead, was read by the Secretary. By the discussion which followed, it was evident that Mr

Scott's paper was the means of creating a good deal of enthusiasm on the part of the younger members to know more of the theory of their business.

CALIFORNIAN NOTES.—Mr. J. BURT DAVE, of the University of California, kindly sends us three photographs, which, interesting though they be, are unsuited for reproduction. No. 1 is of *Quercus agrifolia* [?], Nêz, as it grows on Mare Island, San Pablo Bay, Cal. It illustrates to some slight degree the curious effect of the cold westerly trade-winds in shaping the outline of exposed trees. These keen winds, in many cases, absolutely prevent growth on the exposed side, causing a curiously "lob-sided" development; often indeed, in such situations, *Quercus agrifolia*, and especially *Umbellularia californica*, grow up conformably with the contour of the hill behind them, being practically flattened out. No. 2 is a photograph of a lady standing in a clump of wild Mustard (*Brassica nigra*), which often grows from 8 to 12 feet high, taking exclusive possession of fence corners and rich waste lands. No. 3 illustrates a hedge of white Marguerites (*Chrysanthemum frutescens*), 4 feet high, with a background of *Quercus agrifolia* [?] and Pines.

OPIUM AND MORPHIA IN CHINA.—It is stated that concurrently with the decrease in the importations of foreign opium into Amoy, it is found that large quantities of morphia are brought in, as much as 800 ounces having been imported during one month. A considerable portion of this is used for hypodermic injection, this practice being greatly on the increase, and it is carried on at many establishments in the city. This habit is judged by medical men to be more injurious than opium smoking. Habitual opium smokers taking morphine injections are enabled to abstain from the opium pipe, but are by no means cured of opium smoking, as cessation from the injections inevitably leads to an increased indulgence in smoking. Moreover, no care is taken to keep the syringes properly clean, and evil consequences frequently result from the insertion of dirty instruments into the skin.

AGRICULTURAL TEACHING IN ABERDEEN UNIVERSITY.—A conference took place on Friday, 13th inst., in Marischal College, Aberdeen, in reference to the proposed introduction of agricultural teaching into the University. The special committee appointed by the University Court in connection with the matter, met representatives of the Aberdeen County Council and Town Council; Dr. SMITH, of Newhills, presiding. The whole matter was fully discussed, gratification being expressed at the response made by the public bodies, including £200 from the Town Council, to the proposal. The meeting came to the conclusion that there was now a strong claim for a liberal grant by the Board of Agriculture, and it was remitted to the convener to assist the factor (Dr. HUNTER) in preparing an estimate of the probable income and expenditure for the current year, on the footing that there should be a lecturer on agriculture, and a separate lecturer on agricultural chemistry. The meeting on this understanding adjourned, till a reply should be obtained from the Board of Agriculture.

BOTANIC GARDEN, NEW YORK.—The tract selected comprises 250 acres of the most desirable section of Bronx Park, near the old Lorillard mansion. Included within the tract is a beautiful grove of Hemlock Spruce, which was not only the pride of the original owners, but remains to-day one of the chief attractions of the park. Provision for its preservation is therefore made. The first advance towards this object was made when the Torrey Botanical Society of Columbia College was formed. In 1891 an Act was passed authorising the project, but it was inoperative owing to the violation of some constitutional provision—the failure, it was said yesterday, to include in the bill an authorisation of the city to issue bonds while appropriating the needed money. This defect was overcome by the enactment of chapter 3 of the laws of 1894. The success of the project was assured on June 18 last, when, at a

meeting held in the office of President SEB LOW, of Columbia College, the assurance was given that the necessary 250,000 dol. to be secured from private sources had been subscribed. The site of the new home of botany is beautifully adapted to the growth and cultivation of flowers. In addition to the grove of Hemlock, which includes the entire west bank of the river within the tract, there is much protective wood. The Bronx furnishes abundant water, the soil is fertile, and there is both low and high lying land. The plot of 250 acres includes one-half of the entire length of the gorge of the river, which has been so often admired and sketched by artists. The natural scenery is delightful, and the garden will be worthy of its magnificent scenic setting. The citizens of New York will before long be able to point with gratification to a superb exhibition, not only of our own flora, but also of the variegated and fragrant plants of other climes, equal to anything in Kew Gardens, or in the famous gardens of Paris and Vienna.

WEEDS.—The *Bulletin* of the Kansas State Agricultural College for June, 1895, contains descriptions and figures of the seedling plants of about 150 common weeds of the State. The utility of such work is so obvious, that it is to be hoped the managers of our village schools will set their children to work to discover and detect the seedlings in the fields and hedge-rows. In many cases this work may be done even in winter, and may be made interesting to the children.

MACHINERY EXHIBITION IN VIENNA.—The Consul-General for Austro-Hungary (11, Queen Victoria Street) sends us the following note:—"Encouraged by the great success of the Exhibition of Agricultural Machinery, held at Vienna during May last, the Imperial and Royal Agricultural Society in Vienna has decided to hold a second exhibition in May next year. The prospectus will include not only agricultural machines in the strict sense of the word, but appliances used in all branches of industry connected with agriculture, such as breweries, distilleries, yeast, sugar, vinegar, and starch factories. The mart will also extend to tools and engines used in forestry, saw-mills, celluloid-factories, orchards, vineyards, in the feeding and breeding of cattle, horses, fish, &c. It will comprise electrical machines used in the service of these industries, seeds and manures. Provisional applications for space (which will not be considered binding) will now be received by the Committee of the Second International Exhibition of Machines. I. WIEN, Herrengasse 13, Austria. W. Prinzig, Acting Imperial and Royal Consul-General."

NICOTINE POISONING FROM EATING GRAPES.—A paragraph has been going the round of the papers, drawing attention to the poisonous nature of Grapes gathered from Vines to which nicotine has been applied as an insecticide, it being stated that several alarming cases of illness had been so caused at Dorchester. In answer to our inquiries, Dr. FISHER, of Dorchester, has furnished us with some particulars of the occurrence alluded to. It appears that about six weeks ago a vineyard was fumigated several times with a preparation described as containing "the pure nicotine of tobacco in a highly-concentrated form." The Grapes were not syringed or touched in any way afterwards. A bunch of these Grapes were partaken of by a lady and her daughter. The daughter soon afterwards became deadly pale, felt ill, vomited, and after lying down for some hours, recovered. The mother was more seriously affected. She felt giddy, turned white, and, after lying down, became quite cold, sweated profusely, and thought she was dying. After vomiting, however, she slowly recovered, but remained much upset for the rest of the day. Another bunch of these Grapes was given to a lady and her child, soon after which the lady fainted, and the child was sick. A strong young man ate a bunch in the train on his way to London, and he also was most violently sick and ill. Another lady ate three

bunches on different occasions, and after each felt giddy, and had to "hold on to the table;" she neither felt sick nor turned cold, but it should be mentioned that she is accustomed to smoke. The cook also "felt very queer" after eating a bunch. In three of the above cases, the symptoms were alarming, and all suffered considerably. Dr. Fisher says it is manifestly difficult to explain these cases on any other theory than the one advanced—namely, that the symptoms were due to nicotine poisoning. The victims were all people in robust health, never given to such attacks, and they did not live in the same house. The importance of the subject is increased by the fact that this preparation has recently found great favour with gardeners and others on account of its great insecticide power, and that although it is definitely stated on the label that it contains the concentrated nicotine of tobacco, it is equally definitely stated that "the proprietor wishes it to be clearly understood that it contains no injurious ingredient whatever." Perhaps not injurious to plants, but the phrase is open to a double meaning. To state on the label that the compound should be kept in a safe place out of the reach of children is perhaps a roundabout way of saying it is a poison, but we prefer the shorter term. *British Medical Journal*, September 14, 1895.

SHIRLEY AND SURROUNDING DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.—The monthly meeting took place at the Parish Room, Shirley, Southampton, on the 16th inst., the President, Mr. W. F. G. SPRANGER, in the chair. The subject for the meeting was "The Cultivation of the Fuchsia," contributed by Mr. E. G. WILCOX, gardener to Col. W. SINKINS, Aldermoor House, who is well qualified to speak on the subject, he having gained first honours for the best six Fuchsias at the late Southampton and local shows. Questions were put to Mr. WILCOX on the subject of manuring, potting the plant, and the uses to which Fuchsias might be put in beds and borders, all of which were satisfactorily replied to. A cordial vote of thanks was accorded to the author of the paper. The attendance of members was very good.

AN EXHIBITION OF VEGETABLES AT BRIGHTON, SEPTEMBER 12, 13, AND 14.—A vegetable show was held on the above dates in the store-rooms of Messrs. TILLEY BROTHERS, seedsmen, of Brighton, excellent prizes being offered in upwards of twenty classes, for all of which there was a keen contest, exhibits coming from all parts of England. The principal class for a collection of not less than six kinds brought eight exhibits. The 1st prize fell to Mr. H. STEVENS, of East Preston, Worthing, with autumn Giant Cauliflowers, Satisfaction Potatoes, Autocrat Peas, Giant Runner Beans, Snowball Turnips and Onions, good Carrots, Marrows, Leek, and Tomatos. Potatos shown as single dishes were excellent, especially Mr. H. STEVENS' Snowdrop Kidney, and Mr. F. CLARE'S Zenith. Upwards of 200 dishes were staged in the various classes, and the show (the first of the kind held) was a great success.

NOVA SCOTIAN APPLES.—The condition of the Apple orchards in the principal fruit districts, according to the *Government Report*, is very satisfactory, with exception of Bear River, where a crop of not over 35 per cent. is expected, and West Cornwallis, where a small crop is indicated, although the bearing trees look well. Complaint is made of the Baldwin, both at Bridgetown and Aylesford. The Aylesford Gravensteins also do not seem to have blossomed as fully as usual. Other reports from King's County are:—fruit well set and maturing satisfactorily. The crop promises to be quite up to average. Well set, clean, and smooth, crop average, but 25 per cent. less than the great crop of 1894. Pests not troublesome. Present appearance satisfactory; no injury from insect pests. Set well, prospect good; some at Paradise have canker-worm and roller. Crop not large, but quality promises to be very good. The crop is maturing well. The Plum crop is reported variously from different

districts, mostly unfavourably, but there will probably be an average crop wherever the trees have been reasonably well attended to.

ROYAL BOTANIC SOCIETY OF LONDON.—In the Victoria tank of this Society, in their gardens, Regent's Park, there is to be seen one of the finest plants of the *Victoria Regia* ever grown in this country. It covers a space of over 400 square feet, each of the eleven leaves measuring more than 7 feet across apart from the turned-up rims, which stand 6 or 7 inches above the water. The flowers are pink, and follow one another in quick succession, rising just over the centre of the plant. Visitors to the gardens should see it now, while it is in its greatest perfection, as, being grown as an annual, it will shortly begin to decay.

MR. BARRON'S RETIREMENT.—Concerning this matter, Mr. A. H. SMEE has sent us a copy of the following letter, addressed to the President of the Royal Horticultural Society, which we publish in full:—"My dear Sir TREVOR,—I should be wanting in courtesy to yourself and other members of the Council if I did not give you notice of the questions which I propose to ask at the next annual meeting of Fellows, or at such early period as the Council may think it desirable to call the Fellows together for the special purpose of taking them into their confidence. I shall require the production of the minutes of the Council which appointed this special committee to report upon Chiswick, the date of its appointment, the names of the committee, the reference and the scope of its enquiry, the report it made, and all the correspondence emanating from the secretary or other officer relating thereto, also a statement of the proposed changes in the management of its Chiswick Garden. I shall also ask questions which will require the production of the minute-book of the Garden Committee, and also the minutes of all the committees (fruit and floral), which visit Chiswick for the purpose of the seed trials, &c. The logical outcome of the action of the Council (if the rumours are true), by superseding the standard committees and the appointment of this special committee, and not consulting them on their Chiswick Garden, implies a direct vote of censure on all members of these committees, and is equivalent to a vote of non-confidence in the competency of the Garden Committee. The Council must see that by the appointment of this Special Committee questions are raised which are far more reaching in their consequences than the consideration of the dismissal of an old employé. It is a public announcement by the Council to the horticultural world that they have no confidence in the ability, skill, or integrity, of the forty or more members composing their committees which visit the gardens at Chiswick, and this, too, at a time when others like myself are endeavouring to raise the standard of judging at local horticultural exhibitions with a desire to place the judging above the suspicion of local influence. The managers of these local shows have selected their judges from members of the fruit and floral committees, who, the Council by its action, have considered to be unworthy of confidence for consultation as to the management of its own garden. How will it be possible for the managers of local shows to continue to employ them as judges? What, too, is the position of these members, who are employed in giving technical instruction, and acting as public examiners of candidates' papers on horticulture? To my mind their character is at stake, and some action must be taken in this matter where everything depends upon confidence. The Council must, at a public meeting, justify their action, or retract their proceedings; they must either rehabilitate the character of the members of these committees, or reconstruct the committees. The sooner the matter is cleared up the better, for the uncertainty which overhangs the question is doing no good to horticulture. The least that can be the outcome of this unfortunate action of the

Council will be that its proceedings have been most unbusinesslike, and that they have unintentionally committed an uncourteous and stupid blunder."

FRUIT ESSAY COMPETITION.—In consequence of the excellence and equality in merit of two of the essays on the "Commercial Aspects of Hardy Fruit-growing in the United Kingdom," the Council of the Royal Horticultural Society increased the prize-money originally offered, and Mr. L. CASTLE, manager of the Duke of Bedford's experimental fruit farm at Ridgmont, with Mr. S. T. WRIGHT, Glewston Court Gardens, Ross, have had the honour of being awarded equal first prizes. One of these essays will be read at the Crystal Palace fruit show, and both will presumably be published as soon afterwards as possible. The adjudicators were Mr. A. F. BARRON, Mr. J. WRIGHT, and Rev. W. WILKS.

AUSTRALIAN TIMBER.—It has for years been a pleasant duty to record any endeavour to popularise the use of Australian wood in this country, whether for paving or upholstering purposes. Gradually the Eucalyptus and other large timber trees have become popularly known, if not as popularly used. To-day our vehicular traffic is carried on over roads constructed of wood from the Antipodes, and promise is not wanting that New Zealand and Australian timbers will soon obtain higher rank. The Manchester Ship Canal Company, we believe, are endeavouring to make a market here for the wood noticed; they have brought, and continue to bring, to Manchester what may be looked upon as pioneer cargoes for that section of the industrial world. The venture, we have been informed, has so far been successful, and there is no doubt that, when the capacity of the Eucalyptus is better known, it will enter in successful competition with most kinds of timber now on the market.

"TIJDSCHRIFT VOOR TUINBOUW."—The three first monthly parts of a new horticultural journal have been published at Gröningen by Mr. J. B. WOLTERS. The publication is edited by Dr. Bos, Meers. E. H. KRELAEGE, LEONARD SPRINGER, and others, and is illustrated with coloured plates and other illustrations.

AN ORCHID COLLECTOR.

DAVID WILLIAM ALEXANDER is probably known, either personally or by repute, to everyone interested in Orchids residing in Grenada and Trinidad. In appearance he is a strapping big fellow of the African race, and has a pleasant face and pleasing manners. His home in Grenada is called La Digue, and when at home he is a gentleman in a cloth

suit, and shining black shoes. His costume when collecting, however, is very different: he then dons a strong canvas suit and peaked hat, and no shoes. A very sharp-edged cutlass hangs from his side ready for emergency. He works very hard, and can undergo days together the extraordinary work of collecting, during all sorts of weather, alone in the deepest woods, where he often sleeps, on some branch of a noble tree, out of reach of the wild animals which roam around him at night in search of prey, and who fill the forests with weird noises and screams like those from human beings. He is wondrously enough to know the bird or animal that vents his feelings in such a way; whose hisses and roars, or plaintive notes help to denude the night of the awful stillness that reigns through the forest by day; which of the two is pleasanter is best known to one who has experienced both, but Alexander gets his snatches of sleep in spite of them all, and resumes his searchings as day dawns. Up in the topmost branches he is able, through long experience, to detect small Orchids where others might search in vain. Sometimes he has to fell the trees to obtain his treasures, and generally being alone, he has to carry his rich but heavy loads many miles to the nearest place for shipment. He does a great deal of collecting in Venezuela for gentlemen in Trinidad. From thence he has already brought to light one new Orchid—probably more; and it is probable that among his recent collections more will be added to the known list of South American Orchids. Of the Trinidad forms, he appears to know the habitat of each one. Ever since Mr. Prestoe's time in Trinidad (a former Government botanist there), he has, I believe, been a collector of Orchids. The very few commercial Orchids native of Grenada offer no inducement to the collector; hence Alexander's frequent journeys to Trinidad and Venezuela. His large collection at La Digue, Grenada, represents a choice selection of plants, and are sold as often as a good offer presents itself. All these plants, with few exceptions, are mounted on blocks. Among these might be instanced:—*Oncidium Papilio*, *O. lanceanum*, *O. citrinum*, *O. luridum*, *O. haematochilum*, *O. altissimum*, *O. iridifolium*, *Diacrium* (*Epidendrum*) *bicornutum*, *Gongora maculata*, *Coryanthes* species, *Cattleyas*, *Rodriguezia secunda*, and *Cynoches* species. These are, however, but a few, noticed when the writer paid the collector a visit about a month since.

A word more of his home. La Digue is some 2 to 3 miles distant from the town of Grenville, or, say, 14 miles apart from the town of St. George, the principal port and town of Grenada, where the mail steamer companies and other shipping have their depôts. His house, which stands amidst a small Cacao plantation of his own, is kept beautifully clean. He evidently lives a very pleasant bachelor life, and on good terms with all mankind. *W. E. Broadway, Botanic Garden, Grenada, B. W. I., August 22, 1895.*

HOME CORRESPONDENCE.

CAMPANULA NITIDA.—As we were promised that there should be a review of the garden Camoannas, which were to be grown and examined at Chiswick, I have been eagerly looking out for something about that ancient and mysterious garden plant, *C. nitida* (Aiton), syn. *C. planiflora* (Lamarck). I believe botanists, though too cautious to say so, would agree that the plants which pass in gardens and herbariums under this name, and which are said to have flowers either blue or white, single or double, are nothing more than permanently stunted forms, probably originating at different times, of *C. persicifolia*. The oldest figure of the alleged species is in Dodart's *Histoire de Plantes* (Paris, A. D. 1676), where it is called *Trachelium americanum minus flore coruleo patulo*. Since that date it has had at least half-a-dozen names. Its history is carefully investigated by De Caudolle in his *Monograph of Campanula*, p. 313. He says he found it in many herbariums and gardens, varying from 6 to 18 inches high, the specimens agreeing in nothing but the flowers, which were precisely those of *C. persicifolia*, but smaller. He never could obtain a seed of it, and found it die of

cold in very severe winters. This seems hardly consistent with its alleged habitat, Arctic America; but it was probably referred to America by gardeners for the same reason that many plants were referred to Jerusalem a century earlier, because no one was likely in those days to go there to look for them. America during the present century has been pretty well hunted for plants, and Asa Gray in his *Flora of North America*, says of this plant "vaguely attributed to North America, wholly unknown in a wild state, apparently allied to *C. persicifolia* and not North American." My experience of the plants sold as *C. nitida* is that they are not consistent with one another; but most of them if planted in good rich soil, either develop their growth into typical *C. persicifolia* or die. *C. Wolley Dod*, *Edge Hall, Malpas, P.S.*—If this alleged species were lost, I would undertake to make it again in a very few years by a selection from dwarf forms of *C. persicifolia*. *C. W. D.*

ERITRICHUM STRICTUM (?).—A most beautiful and continuously free-blooming hardy annual, with deep blue flowers, was sent to me in the spring of last year by the Rev. Theodore Marsh (the well-known raiser of hybrid *Lachenalis*), of Cawston Rectory, Norwich. He wrote to me when sending it that, being perfectly hardy, it required no special care, and usually sowed its own seed freely all round wherever it grew, so that by transplanting the seedlings in the spring, it could be made use of wherever a border of blue flowers was wanted in the garden. I transplanted my self-sown seedlings accordingly this spring round one of my beds of Lemoine's *Gladioli*, where they have bloomed continuously and most profusely during the whole summer, and have been much admired by all visitors to my garden; to none of whom was the plant known, and nearly every one asked for the name, and wished to know where they could obtain seed of it for next year. The small deep blue flowers exhale a strong perfume, somewhat resembling that of the flowers of the common Lime tree, and during the sunny hours of the morning they are covered with flies, bees, and other insects, who seem to find the odour very attractive. I have not been able to find the name in any of my books of reference, except the *Index Kewensis*, the horticultural dictionaries only mentioning one species of *Eritrichum*, the pretty little alpine, *E. nanum*. I sent some flowering specimens to Messrs. Cutbush, the well known London nurserymen and seedmen, who wrote me that they knew it, and sold seed of it under the name of *Eritrichum nothofolium*; and to them I have accordingly referred all my friends for seed of this most ornamental plant. On referring to the *Index Kewensis* for this second specific name, I find it is said to be synonymous with *Plagiobothrys nothofolium*. I also sent flowering specimens to the Herbarium at Kew for identification, and the learned botanical authorities there said it was not an *Eritrichum* at all, but apparently one of the Hound's-tongue family, *Cynoglossum furcatum*, figured by Wight in his *Illustrations of East Indian Plants*, vol. iv., t. 1395. I hope some of your readers will recognise and give the correct name of this plant. *W. E. Gumbleton*.

SLUGS AND WORMS.—You must be almost, if not quite tired of the above subject, but I know not how to get information except by your paper. If Mr. W. T. of Bishop's Teignton, South Devon, will kindly allow me, I will send him one of the earth slugs if I find that they have no shell, which I have not noticed at present. Perhaps "W. T." can tell me how many sorts or varieties of the little fish called sticklebacks there are? I. Walton only mentions one; but I am told one variety has three spines on its back, another two, and a third has only one spine. *Robert Warner, Widford Lodge, Chelmsford*.

JUDGING AT METROPOLITAN AND LARGE PROVINCIAL HORTICULTURAL EXHIBITIONS.—Permit me to suggest that, at all important open competitions of this kind, there should be an expert (say, from Royal Horticultural Society), in attendance as a scrutineer, to see that no points of merit in the exhibits are overlooked, and if any error occur, that it may be pointed out before the adjudicators leave their work. Generally men of notable positions are selected as judges, and rightly so; but after all, they are liable to mistakes, and a scrutineer would materially assist in securing justice in each award. By thus making their judgments as perfect as possible, they would be of the greatest value to mere local societies; inasmuch as thousands go to premier shows to study the points of merit in the awards, and take the cue

afforded. Consequently, judges at local shows are often twitted if they endeavour to correct evident errors; and sometimes they bring undeserved contumely on the judges, quibbling and cavilling between competitors and committees. I could instance some awards at a high-class provincial show recently held, which have borne fruits at subsequent shows, and which furnished pegs for the nonplussed competitor to hang his quibbles upon. *P. M.*

HARDINESS OF CLEMATIS DAVIDIANA.—It may interest your correspondents in to-day's number of the *Gardeners' Chronicle* to learn that the *Clematis Davidiana* has proved perfectly hardy here in the open ground. It was planted about a year ago, and is now a nice bushy plant, covered with grey-blue flowers. We did not admire it very much at first, but now it has gained upon our affections, and there is no longer "a talk" about digging it up! It has the great recommendation of novelty—so dear to ladies! *H. M. E., Leamington*.

A VINE SPORT.—I looked in the other day to see some of the wonderful examples of fruit, plant, and flower culture at Mr. Thomas Rochford nurseries, at Broxbourne, Herts, and was shown a very remarkable instance of variation from the original on a Vine of the Black Alicante Grape. The rods are not of great length, and they are furnished from base to summit with splendid bunches. There is no question here of the transmission of sap by grafting. The Vine for 4 or 5 feet from the base is producing bunches which are undoubtedly Alicante; the upper part of the rod about 6 feet or more is producing Grapes altogether different, and resembling in size of berry the Gros Colmar; but, the leaves and wood are not of this variety, nor are they quite identical with Alicante. It is curious that the Vine should thus break into a new character at a certain point, and retain it to the very top of the cane; in all my experience of Vine growing I never knew such a case as this. The difference in the berries is so marked that it cannot escape observation. *J. Douglas*.

THE DOUBLE-FLOWERED DAISY.—I was very pleased to see Mr. E. Bennett's remarks on these flowers in a recent issue of the *Gardeners' Chronicle*, p. 206. I have seen Daisies at their best in the three places named—Aston, Cliveden, and Belvoir, and have no hesitation in placing Aston first with this lowly flower. It was well worth the journey from Bury to Birmingham to see the Aston Daisies in the heyday of their freshness and beauty. Mars was indeed marshalled into might as Daisy edgings extended into miles of broad bands, or furnished enormous masses of beds and borders of brilliant colours. The Daisies, in fact, were the eyes of those beautiful gardens, when spring gardening at Aston was at its best. Messrs. Fleming at Cliveden, and Wm. Ingram at Belvoir, each made good use of Daisies in those great examples of spring gardening. But in these the Daisies were accessories rather than principals, as at Aston. And now, through no better reason than that I can discover than the caprices of fashion, the employment of Daisies is on the wane: spring-flowering bulbs, annuals, *Violas*, *Primroses*, *Aubrietias*, *Arabis*, &c., having crowded them out from many a spring garden, and other plants are also sharing the same fate. A few years ago it was no uncommon thing to see many thousands of Forget-me-Nots, mostly of the best of all the early-flowering varieties, viz., *Myosotis disitiflora*, propagated for spring bedding every year; but now we seldom meet with this pleasing support to the Daisies and brilliant contrast to the yellow *Primroses* in such bold and telling masses as were common at that time. Writing of Daisies, it is to be hoped that we may not lose the quaint Hen-and-Chicken form amid our changes of fashion. Further, does any reader of the *Gardeners' Chronicle* possess the white-flowered Hen-and-Chicken Daisy, or has anyone been successful in raising new forms of this curious and interesting plant? Perhaps the introduction and illustration of the new Daisy, Bride, and Mr. Bennett's interesting and informing letter may do very much to restore the Daisy to its old place, power, and popularity in our spring gardening. *D. T. Fish*.

TRIALS AT CHISWICK.—A recent wrangle over the nomenclature of a Bean, with a purposeless result, led to the statement being made on behalf of Chiswick Gardens that everything sent there for trial was not tried. That such is the case is due first, to lack of space, and second, to there being no trial of the particular products taking place that season. There is a general assumption in the

country that any one may unsolicited send anything at any time to Chiswick to be grown for trial, quite oblivious of the fact that one thing grown does not constitute a trial, but that real tests of value are found only when the best representatives of any one product are grown along with new-comers. It was doubtless under such conditions that the Bean, the unfortunate object of a sharp discussion recently, was in 1885 put on one side at the time, and was, with many other things, probably relegated to the dust-heap after the seed had become sterile. There can be no doubt, however, but that the best work done by the Royal Horticultural Society at Chiswick is found in its annual trials, and it would be indeed a grave misfortune were any scheme, however valuable, that may be proposed to govern Chiswick operations in the future, should in any way interfere with or militate against the continuation of these trials. There are times and seasons when these trials are most successful, and others, when arising from adverse seasons, they are less so. These are accidents which always arise in gardening, and may not be absolutely under our control. None the less, there can be no doubt whatever as to two things. First, that every effort of which the garden staff has been capable have been put forth to conduct these trials successfully and impartially; and, second, that the respective committees, when they have assembled at Chiswick to examine results, have done so in a spirit of absolute impartiality, and entirely devoid of bias. I have seen a good deal in connection with these trials, as a member of one of the committees, and can truly aver that those members who attend the meetings at Chiswick, and be it understood do so at personal and pecuniary sacrifice, come to their work with the honest desire to be just and impartial, and nothing more. Very rarely indeed is it that a member has any interest whatever in what may be under trial—and if he have, then he is invariably absent. Only recently, at least so far as the Fruit Committee is concerned, does it seem to have been the practice for that body to call for a trial, which is now done in the form of a request to the Council to authorise a trial of some particular product during the succeeding year. When that committee finds certain products apparently new, or at least professedly so, constantly coming before it, what wonder if it asks for a trial of that product at Chiswick, because so many claimants for honours being in the field it becomes rather monotonous, as well as puzzling. A good trial helps to clear the air of dubious claims for superiority, and often shows that novelties so called are neither novel nor improvements. A notable trial requested next year is one of Cucumbers. This is a vegetable with which undoubted advance has been made during the past ten years, but still not quite so great as to justify the production of at least a dozen new claimants for honours in one year. No wonder, with so many Richards in the field that the Fruit Committee felt the best course was to invite the Council to promote a thorough trial of these assumed new and established older sorts at Chiswick next year. It is practically impossible for any committee to deal satisfactorily with Cucumbers at the table, especially when the exceedingly fine handsome varieties in commerce are remembered. If any improvement or advance is to be found it can only be in the direction of greater precocity or of cropping qualities. It is very easy for "Heads" or "Tails" to sneer at these trials, but a seat on the committee for a year or two helps materially to testify to their exceeding necessity. But there remains the difficulty as to the efficient conduct of a Cucumber trial at Chiswick. Without doubt the best results are invariably obtained in low-span houses, such as are found in market or seed-growing establishments, where Cucumbers are grown so admirably. There is, so far as I know, no house in the gardens suited for a trial, and if the trial is to have any value a big one must be conducted. The best results are also got when plants are grown in pots or boxes of restricted size, or in shallow troughs, for root-area must be not too considerable. The soil also should not be very far from the glass. How are such conditions to be furnished? If during the winter the Council could erect in the gardens a long low-span house, say 100 feet by 12 feet, with a sunken central alley, they would then provide the very place needful for a trial. Later, Melons might follow, also Tomatoes, and such a house would be of great service in the gardens in many ways. There are one or two exceptions perhaps to the general good success attendant on vegetable trials in the gardens. Peas do not always grow well, because the soil is very porous, and rapidly dries, whilst it is certain that the enclosed atmosphere becomes in hot

weather literally super-heated. These are not conditions ordinarily favourable to Peas. Still, some first-rate trials have been furnished when seasons have been cool and drizzly. Potatoes, again, do not often turn out well; that is chiefly due, as this year, to the excessively porous nature of the soil, and to its being too highly charged with nitrogenous substances. A firmer soil, in which nitrogen is a minor element, and phosphate and potash are in greater proportion, is always better for Potatoes. Disease has badly raged amongst the trial Potatoes at Chiswick this season, and the growth of top is abnormal. I have found the same results exactly on soil of precisely similar texture, and highly charged with nitrogenous nature at Richmond, but at the same place on poorer and stiffer soil the crop is clean and excellent. Some of the same varieties much diseased at Chiswick have given splendid crops on poor soil in various parts of Surrey. It would be well for these two vegetables if the Council could somewhere obtain within a few miles an acre of more open and firmer soil for future trials; that would then leave room for some other things of interest to be grown at Chiswick. In both directions the interests of horticulture would be greatly served. *A. D.*

TOMATOES TRUE TO NAME.—Year by year the difficulty of obtaining Tomato seed true to name is becoming greater, especially in regard to the varieties of fine quality, viz., Hackwood Park Prolific, which I make bold to say, from several years' experience in growing the same, as also the splendid crops I have seen growing elsewhere, is the finest market grower's Tomato. I have at different times procured some seeds, presumably of that variety, from the leading seedmen, but have been sadly disappointed with the results. In one case not one plant out of a thousand or more, grown from a packet of seed, bore any resemblance to the true variety, but proved to be almost worthless. In another instance some 50 per cent. were true. A neighbour of mine has this season been greatly dissatisfied with seed obtained from what was considered a reliable source. Doubtless many others could a similar tale unfold. The variety above-mentioned was raised by Mr. Bowerman, gardener at Hackwood Park, Basingstoke, and it was awarded a First-class Certificate by the Royal Horticultural Society. The stock then passed into the hands of a well-known nursery firm, with whose name I am acquainted; and, judging by the habit of the plants from a trial-packet of seed received some few weeks since from this firm, I think they have the true variety. Another variety, also difficult to obtain true, is Trophy. At present I have a house planted with plants raised from seed from a well-known London firm; and although Trophy, there are fully half-a-dozen other varieties, including bad forms of Old Red, Dedham Favourite, &c. The Trophies are very good, but I would not care to save seed from such a mixture. I hold that, where seed-saving is practised, there should be but one variety grown in the house, and that true. Anyone conversant with Tomato growing will know with what ease the pollen of these spurious varieties on a hot dry summer day is wafted about by currents of air through the house—without mentioning other means whereby it gets distributed. I say that seedmen cannot be too particular as to the source from which their stock is obtained. There is nothing more annoying than after careful and painstaking culture of a house, or houses filled with plants, to find when the fruit appears that it is not the right thing. It is only a question of a half-a-crown or so at the outset, but when wrong varieties are supplied, and as in my case, really worthless ones, the loss involved is serious, especially to a market grower. *P. F. Le Sueur, Grand Vale, Jersey, Sept. 10.*

RED-FLOWERED DENDROBIUMS.—Mr. Rolfe's remarks on *Dendrobium sanguineum* (p. 292) leads me to think he is not acquainted with *D. arachnites*. This species flowered the first time at Downs in 1885. A description of the same plant is given in Messrs. Veitch & Sons' *Orchid Manual*, part iii., p. 18. It is described as a remarkably beautiful and interesting Dendrobe, producing brilliant red flowers. A flower and pseudo-bulb was forwarded to Professor Reichenbach, who identified it as *D. arachnites*, and described by him in the *Gardeners' Chronicle*, 1874. Professor Reichenbach sent a note to the *Gardeners' Chronicle*, July 4, 1885, in which he states:—"This lovely gem has waited a long time from our first knowledge of it up to its flowering in England. It came first from my oldest English correspondent, Mr. Stuart Low, who presented me with a giant dried flower that exceeds in size

either of the seven other flowers at hand. It was sent by Mr. Boxall in 1875 to Mr. W. Bull, who sent me a flower and an extract from his correspondent's letter, which said the plant was very rare. Lastly, Mr. F. Sander appeared very pleased with Mr. E. Rimann, a very ardent collector and connoisseur of Dendrobias, for sending living plants, dried flowers, and sketches. The bulbs are rather yellowish honey-coloured, neatly stalked, perhaps not so always, as Mr. Rimann's sketch does not represent it. The flowers have broad, linear, blunt, equal sepals and petals, and a much broader lip of different shape, sometimes simple ligulate, with basilar angles, sometimes with a very attenuate anterior part. It is convolute. The whole flower is of a very bright cinnabar-red, the veins of the lip being partly covered with a peculiar haze. The average flowers exceeds 1 inch in length. Mr. Low's flower is like the father, exceeding the present ones by a half length. Mr. E. Rimann speaks in the highest terms of it, and such a pyramid of cinnabar flowers as he sketched them must be striking. Of the leaves I know nothing. I was lately most agreeably surprised to obtain a fine fresh bulb, and a very good flower from our Orchid Cræsus, Mr. W. Lee." Prof. Reichenbach says, "Of the leaves I know nothing;" but some time after his note appeared, he paid us a visit, and I remember the first Orchid he asked to see was this Dendrobe in question, when he particularly admired the new pseudo-bulb and leaves—but whether he recorded any further notes or not will, perhaps, not be known until the secrets of his great herbarium are revealed to the world. *C. Woolford.*

RUST IN BEGONIAS.—I am an extensive grower of Begonias, and it is my opinion that the so-called rust mentioned by "W. K." in your last issue, p. 304, is caused by neglect on the part of the growers, for I do not believe that the small white insects are the cause of it. I am more inclined to the opinion that it is produced by fungus, induced by insufficient ventilation, being careless with the water-pot, and the use of stimulating manures. I have seen Gloxinias similarly injured. Flowers-of-sulphur will be found an effective remedy if sprinkled on the foliage. *H. W. C.*

VINE AT HACKTHORN HALL, LINCOLN.—In the notice of this Vine on Saturday last, the name of the gardener, Mr. William Popple, who planted the Vine twenty-five years ago, and to whose care it undoubtedly owes much of its success, was accidentally omitted. *C.*

THE ROYAL HORTICULTURAL SOCIETY AND MR. BARRON.—We are still in the dark as to details, but cannot rest until the Council has recognised its responsibility, and has made all plain to its constituency. Perhaps we shall learn next week that a return has been made to the *status quo ante*, which might be the best remedy for blundering—which seems to have been heavy, it only from the point of view that right was done in a wrong way. If this return is not made I am anxious for the future, and wish, in the first place, to support "Introspector" in his contention that £200 a year is not a sufficient salary for a qualified man as the new Superintendent. It is not a living wage. The very least that should be offered is £250 a year, with a house and its usual accompaniments. If the Society offers £300 (and a house), it would not be a penny more than a suitable man with a family ought properly to spend. I have no interest whatever in the appointment, and therefore consider it a duty to make these remarks. The right man for the post would not be well off in any case; he must be a first-class gardener, and a man of culture and refinement, and must be prepared to entertain, and could not live in a suitable manner on the salary offered. It is the duty of the Society to offer a salary upon which a man may live without difficulty and discomfort. I do not consider, indeed, that the kind of man for the post is really well paid with less than £400 or £500 a year, which is, perhaps, no more than that of the town surveyor who looks after the neighbouring roads and sanitary arrangements. Many technical men get much more, and I beg to ask why a proficient horticulturist should receive less than the average of other technical persons. I may refer, for instance, to the Telegraph Department of the Post Office, which I happen to light upon in *Whitaker*. Further, in consideration of the future, it seems to me rash that a Council, not elected for the purpose, should propose the reorganisation of Chiswick. We have always understood, rightly or wrongly, that a Council not qualified for dealing with Chiswick, was, necessarily, represented by the Chiswick board, which, however, is

well qualified. The Council need not be shut off from all concern in dealing with Chiswick, but it is above all things essential that qualified men alone should be directly responsible. I regard the Council, of course, as a mixed body, or at any rate, liable to be so, and it has always appeared that a delegation of competent men was unavoidable. This delegation does exist, in the Chiswick board, and from what has transpired it appears necessary to demand for it the right to primary concern and responsibility in any reorganisation that may be contemplated. If the Board is not strong, it can very easily be made so. This leads me to my last point—the position of the new Superintendent. We know perfectly well that even members of the Council may not be able to recognise the technical nature of the work to be done, and might criticise or influence without knowledge of the matter in hand. It is, therefore, important to secure that the new Superintendent shall hold a position of unquestionable responsibility and authority, save in the presence of a duly authorised and qualified committee of the Society. To the Chiswick Board he ought to act as Secretary, in order that he may be in close touch with that body, and be in a position to understand and be understood. He cannot be regarded as a mere subordinate, but must be looked upon as a member of the Society in an especially responsible position. The head of the Chiswick garden is necessarily the chief officer of the Society in practical matters, and unless this is fully recognised it is impossible that Chiswick can be managed, as it ought to be, to the full benefit of the Society, and for the good of the country. After all, as it is to be hoped, the Council may retract and thus avoid an increased expenditure, which, so far as is known to anyone outside, is quite unnecessary—unless, it be perhaps, to provide the present Superintendent with the assistance he may want. *Pro bono Publico.*

— The matter can hardly be left where it now stands. The publication of the names of the special Council that advised the Council in this unfortunate matter does but make things worse. With a few exceptions, the names represent nothing in particular to horticulturists; and had each been as weighty as that of Mr. Douglas, it is of infinitely more importance in a matter of this sort to know what was said or reported than who said it. Gardeners wherever they meet are hankering to know two things—first, the full text of the special report that led to Mr. Barron's resignation; and second, the character of the new policy which seemed to the Council incompatible with the retention of the distinguished services of Mr. Barron. The honour and the interests of the Society, as well as the wounded *esprit de corps* of the craft, require the production of both at the earliest possible moment. *D. T. Fish, September 17.*

THE QUARRY, SHREWSBURY.

THE Quarry, as is well known to many readers of the *Gardeners' Chronicle*, is the place wherein the Shropshire Horticultural Society holds its great annual exhibition of plants, cut flowers, fruits, and vegetables, and it would be hard to find a more suitable and charming spot in which to hold a show of such magnitude and excellence as is the Shrewsbury Floral Fête. The site occupies a fairly central position in the town, and is within easy reach of the general railway station. Nature has been very kind to the Quarry grounds, which cover an area of about 12 acres; and the Corporation of Shrewsbury (to which body this public park belongs), backed up by the Shropshire Horticultural Society, have made the most of the advantages afforded by Nature, until a place of very delightful and quiet resort has been provided for the inhabitants of and visitors to the picturesque town of Shrewsbury.

The entrance to the Quarry is close to St. Chad's Church, and is a very imposing one, there being a roomy and handsome lodge of the Queen Anne style of architecture, with several massive ornamental gilded iron gates adjoining, and provided by the Shropshire Horticultural Society. Right in front of the gates is a broad straight avenue, which extends about 400 yards in length, in a gradual descent down to the broad, swiftly-flowing waters of the winding Severn, and is flanked on either side by extra fine specimens of Lime trees (*Tilia europæa*), which were

planted in 1720. A statue of Hercules at the end of this avenue appears to guard the approach thereto from the river, a ferry being close by. This avenue divides the Quarry grounds, but admits of free access between the lines of trees from one side to the other at any point. During an exhibition that part of the grounds to the left on entering, contains the several large tents in which the horticultural exhibits are staged, secretaries' tent, luncheon tents, and the splendid bandstand—also we believe the generous gift of the Shropshire Horticultural Society, and the ornamental portion of The Quarry, known as the "Dingle;" while that on the right accommodates a variety of attractions acrobatic, fireworks, &c., with a row of refreshment tents in the background.

The "Dingle" referred to is situate at the rear of the space occupied by the exhibition tents, and a short distance from the bandstand. It is a hollow of considerable depth, and covers about an acre in extent. One half of this space consists of water, with a circular jet fountain in the centre, shedding its silvery spray about 9 feet above the surface of this miniature lake, in which Lillies, &c., are luxuriating. The other half is laid out with flower-beds cut out of the grassy award, with another fountain playing in the centre of same. The "Dingle" is partly enclosed by trees and shrubs, with an inner boundary composed of rough stones forming a bank of irregular height and outline, with various kinds of hardy plants of bushy, drooping, and trailing habit growing thereon. Well-kept gravel walks lead to and intersect this charming dale-like summer retreat.

Beds filled with golden Harry Hieover Pelargonium, intermixed with variegated grass and edged with blue Lobelia, had a pleasing effect; as also had beds of "Happy Thought" Pelargoniums, edged with dwarf variegated grass and blue Lobelia intermixed, and scarlet Tropæolum edged with a good band of Bambusa Fortunei variegata, Begonias, also in variety, having an outer band of blue Lobelia and Golden Pyrethrum; scarlet Pelargoniums, encircled with a band of variegated-leaved Pelargoniums; beds filled exclusively with Heliotrope and Pentstemons; and raised beds, with scarlet-flowered Begonias, intermixed with the silvery-leaved Dactylis elegantissima in the middle, and having a raised band of Saxifraga densa, showed up to advantage, the colours in the individual beds harmonising well with one another, and contrasting effectively with the surrounding objects, including beds of Rhododendrons and Bracken. A grotto, with water trickling down among the hardy Ferns which grow out of the walls, &c., and a fine statue of the goddess of the Silver Lake, presented by the Earl of Bradford in 1879, are also features of the Dell. Underneath the recumbent figure of the goddess, which rested on a pedestal having three steps ascending thereto, are engraved the following lines:—

"Sabrina fair,
Listen where thou art sitting
Under the glassy, cool, translucent wave,
In twisted braids of Lillies knitting,
The love-train of thy amber dropping hair,
Listen for dear honour's sake,
Goddess of the silver lake,
Listen and save."

In conclusion, I should like to say a word in favour of the variety of attractions other than those which are provided in the horticultural portion of the Quarry grounds for the paying public by the committee of the Shropshire Horticultural Society, and to which some well-meaning people object. For my own part—and I have attended the Shrewsbury Show pretty regularly in the capacity of judge during the last eight or ten years—I candidly admit that I see nothing to object to in the practice of drawing together 40,000 or 50,000 people to a flower show by other attractions than those provided in the exhibition tents, if these are of an innocent and high-class description. On the contrary, I think, from every point of view, much good results therefrom, and the Society is accordingly entitled to the thanks not only of horticulturists but of the general public as well, for the good which it has

done and is doing by offering liberal prizes to be competed for annually, in promoting a standard of high cultural skill among gardeners, amateur, and cottagers in the cultivation of plants, flowers, fruits, and vegetables, and also in promoting a love for the same subjects among the thousands of people from mining and other populous districts, who are induced to visit the show more from a desire to see the variety of attractions than from any wish to see the horticultural exhibits. These visitors, however, evince great interest in inspecting the inmates of the numerous tents, and in that way a love for and a wish to grow and tend to the requirements of plants, flowers, &c., is excited, perhaps for the first time, in their minds. Hence, the end more than justifies the means. Moreover, it is quite certain that were the acrobatic and similar attractions omitted from the Society's programme, there would be a great falling off in the annual receipts, and therefore the Shropshire Horticultural Society would not be able to continue the gifts to local charities which it has hitherto contributed with such liberality. H. W. W.

NURSERY NOTES.

MESSRS. LITTLE AND BALLANTYNE,
CARLISLE.

As in the case of some other old firms, ownership is no longer indicated by the title of this one. The present proprietor is Mr. James Watt, by whose knowledge and energy an originally large business has been still further developed. An extensive seed trade is conducted, and beyond this Mr. Watts is known as a farmer and stock-breeder, both in East Lothian and Cumberland. The nursery at Knowfield lies on the outskirts of the ancient city of Carlisle, and contains, in addition to the enormous stock of forest trees, an interesting variety of plants of horticultural value. Trees and shrubs, indeed all things pertaining to ornament, are grown extensively, and the firm does a large export trade. I was struck with the possibilities of some hardy subjects seen here in lending brilliant colour and beauty of form to the garden for which too exclusively we turn to tender plants, requiring annual propagation and artificial heat in winter. Populus argentea, I believe a variety of P. alba, was such an one. It was planted in lines, and every individual treated as a kind of pollard by cutting it back to near the ground each year—the white foliage was decidedly ornamental; and in contrast we observed the rich coloration of Acer Schwedleri, or similar red-leaved variety, the plants being treated in precisely the same manner. This idea of utilising hardy trees for the purpose of "subtropical effect" in gardening may easily be carried further. It is not generally known, for instance, that the autumn tints of Quercus coccinea may be used for dwarf arrangements by cutting back every year; and for handsome leaves, hardly any plant can beat Pannonia imperialis, which, if grown with single shoots, produces leaves 2 feet across each way, the shoots themselves reaching a height of about 9 feet.

The extent of ground cultivated is nearly 200 acres, and one cannot but notice the general arrangement which seems so perfect that it would be easy, without a plan, to locate the position of every crop or particular tree. Some of the crops are exceptional in extent, and the damage done to certain kinds during the past winter is suggestive of anxiety in the management of such a concern. There is, however, the compensating advantage that plants grown here will be hardy enough for almost any district in Britain. The hardy Conifers do well, and are treated as a specialty. Among the new kinds, a variety of the Scotch Fir, Pinus sylvestris pyramidalis, is most striking. It has very upright branches, and thus emulates the habit of the Irish Yew. This, I believe, originated from seed, and, if true, it is curious that such a habit originates from seed, while the weeping habit as often originates as a bud-sport from an ordinary tree or shrub. Records

upon this matter would in any case possess interest. Among the golden Conifers Thuya occidentalis aurea was very fine, and certainly it is one of the best. Thujaopsis dolabrata does well, and therefore cold is not the something inimical which prevents it doing well in places further south. Among specimen trees Pseudolarix Kæmferi was showing well its fine ornamental character.

An interesting Conifer is Pinus Pence, which in south-eastern Europe represents the magnificent Pinus excelsa of the Himalayas. It is denser in habit, more conical, and has shorter leaves than that species. Perhaps the most interesting of the Pines noted was Pinus Balfouriana, of which there is a handsome tree. In Veitch's *Manual of Coniferous Plants* it is said that its merits as a decorative tree have yet to be proved; and it is of interest to remark that this specimen was decidedly ornamental, and its tufted foliage, which has originated the name Fox-tail Pine, was clearly noticed. The braches, however, are small.

There was a new Holly of the Hodginsii type called Golden King, and likely to prove an acquisition for association with its well-known consort, Silver Queen. As a pretty curiosity, we may mention Fagus sylvatica tricolor which originated here, and has distinct rosy colour, especially about the margins. It looks like a sport from the Copper Beech, but I was not informed of its origin. Among trees of coppery tint, Betula purpurea is looked upon with great favour, it being of first-rate colour. Ulmus corylifolia rubra, which should be valuable from the same point of view, was also noticed. The tree seemed to be of vigorous growth and richer in colour than the Copper Beech. Quercus robur nigra is another useful subject in tree combinations. From grave to gay, I may turn to the Roses, which are extensively grown in all sections. Reference to the houses must be brief. They contain most plants for which there is a demand, or interest. I saw, for instance, some of the finer-growing Conifers under glass; this method of culture seemed to develop their beauty, and, in one or two cases, entirely alter the out-door character of the species. L.

ORCHID NOTES AND GLEANINGS.

LÆLIO CATTLEYA × BRYMERIANA (L.C.
× AMANDA ♀, × C. WARSCEWICZII.

A NOBLE inflorescence of this fine hybrid is received from Mr. John Powell, gr. to W. E. Brymer, Esq., M.P., Irlington House, near Dorchester, where the plant was raised some years ago, and where it is now flowering for the fourth time. The scape is stout, over 1 foot in height, bearing on the upper half four flowers on a stalk, 3 inches in length. The flower in form is nearest to L.C. × Amanda, and in size and colour to C. Warscewiczii (gigæe). The flowers measure 7 inches across; sepals and petals of a bright rosy-lilac colour. The lip is slightly three-lobed, and also of a rosy-lilac tint, with a beautiful veining of bright purple, fading off to lilac towards the crimped margin. When mature and while waning, the flowers assume a decidedly blue tint, which causes it to appear different than in the earlier stages. J. O'B.

PECULIARITIES OF GROWTH IN ORCHIDS.

Whether it is that growers take more notice of strange growth and abnormal flower-productions than formerly, or whether the last hard winter has been the cause of more unusual growths in Orchids or not, I know not; but of late I have had many strange specimens sent, and questions asked as to the nature of the abnormal productions. All seem to point to the fact that it is difficult to define arbitrarily what may or what may not take place in growths or in flowers, and the more experience I obtain the less inclined do I become to say "always" or "never" to any feature in any plant, and especially an Orchid. Writing from Liverpool recently on this subject, F. H. M. says:—"I have a Lælia autumnalis which

is producing a growth on the side of a pseudo-bulb, and a Lycaste Skinneri with a new growth on the top of an old pseudo-bulb. There appears in the September number of *The Orchid Review*, middle of p. 268, referring to *Cattleya labiata*, 'Pseudo-bulbs clavate, always monophyllous.' I recently purchased a plant of *Cattleya labiata autumnalis*, of which the following is a description. Bulbs five, all of the stout, club-shaped type, each about 7 inches long. This year's growth is monophyllous, and bears the usual double flower-sheath. Last year's was similar, but I was told that the sheath was abortive. Then come two diphyllous bulbs, both of which apparently produced flowers, and then the first (or last) is again monophyllous. The diphyllous bulbs are like the others, but their leaves are shorter, wider, and very thick. Perhaps some other correspondents may be able to remark on these interesting subjects."

false trade description. Mr. Tristram, for the Trades' Mark Protection Association, prosecuted, and Mr. H. D. M. Page defended.

Mr. Page said it would be now his duty to place before the magistrates his clients' defence. He took it the charge was in three heads; that there was a description given to the article sold. That the defendants' description was false, and the falsity was in naming it Shephard's Kale. The Act provided that any person who applied any false trade description to goods, should be subject to the provisions of the Act, unless he proved that he acted without intent to defraud. A further section provided that any person who sold any goods or anything to which a false trade description was applied, must prove that having taken all reasonable precaution against committing an offence against the Act, he had at the time of the alleged offence no reason to suspect the genuineness of the trade description. The definition given of "trade description" in the Act was as follows:—The expression "trade description" means any description taken or indication direct or indirect as to the mode of producing any goods. Mr. Page went on to deal at length with the Act, and contended that they did not come within the definition at all. In the first place the Shephard's seed was only a variety of a seed commonly called Kale, it was not produced by Mr. Shephard—he simply sowed the

It contained no implication as to who grew the seed, although it applied to the first introducer. They frequently bought back seeds from farmers from their own stock. Questions were then put as to the custom of the trade, but Mr. Tristram objected, as custom of the Trade could not override an Act of Parliament. Continuing, witness said he had never heard any objection raised by a person whose name the seed bears to the sale of seed, though not grown by him. Part of the seed which was bought from Mr. Edney was sold to Mr. Harry Waters, the steward to Lord Lawrence. Since the case was previously before the court he had germinated some of the seed saved by Mr. Payne from the complainant with perfect result.

At this stage the court adjourned.

On resuming, the cross-examination of the witness was proceeded with.—In answer to Mr. Tristram, Mr. Toogood said he could show no catalogue of any other firm which contained mention of his seeds; he could not swear that he had ever seen one. The advocate next proceeded to catechise the witness in reference to firms in the South of England, and as to whether Shephard's Kale was mentioned in them. An advertisement was put in, in which it was stated that all seeds were grown by the firm; the witness explained that all seeds bearing their name were grown by them. They did not grow every seed,

FIG. 63.—CROSS-HOLDER.

FIG. 64.—WREATH-HOLDER.

FIG. 65.—SHOWER BOUQUET HOLDER.

NEW INVENTIONS.

TO DISPLAY SHOWER BOUQUETS.

With a view to simplifying this operation, a holder or stand, the application of which is illustrated in figs. 63, 64, 65, has been designed and may be obtained from Messrs. Osman & Co., 132, Commercial Street, London. This patent bouquet, wreath, and cross holder, intended for the use of florists and exhibitors, is made in brass, either polished or nickel-plated. The illustrations well show the appliance, but we may add that the holder is trumpet-shaped, split, and furnished with a sliding ring, and can be expanded or contracted, or set to any angle by means of thumb-screws. The trumpet-holder may be removed, and a hook substituted in the case of wreaths or similar designs. The stem is telescopic, and its length is regulated by a set-screw.

LAW NOTES.

SHEPHARD v. TOOGOOD & SONS.

This case, of which a brief notice was taken from the *Times*, and published in these columns on August 24, was resumed on Thursday, September 12.

At the Southampton Police Court, before Mr. G. P. Perkins and other magistrates, Messrs. Toogood & Sons, seedmen, of Above Bar, were summoned for selling Shephard's Kale by a

seed, and Nature did the rest. Then he contended it was not a false trade description, inasmuch as it was not calculated to deceive and mislead any one as to the nature of the goods sold. Mr. Page went on to mention the witnesses he proposed to call. They included, he said, some of the best growers in the country, to whom the question was of immense importance. He also went on to contend that it was recognised that after a seed had been placed on the market anyone was able to sell the seed, provided he sold it by the name which had been given it. He went on to quote instances of this, and contended that the seed which was being grown by Mr. Edney was absolutely true to stock. Going on to deal with the complainant's evidence, he said the magistrates at this last hearing must have been struck with the very unsatisfactory way in which he gave his evidence. For an intelligent man to stand before them and say that whilst he attached a meaning to Shephard's Kale he could attach no meaning to Sangster's A 1 Peas was, he considered, rather straining the credulity of the Court. He had assumed a very strong bias, and then he had not called a single witness from the trade to support him. It was also absolute nonsense to talk about a secret process in producing the seed—it was preposterous.

The first witness called was Mr. William George Toogood. He said he was in partnership with his brother as seedsmen. He had had nineteen years' experience in the trade. The seed he had sold, which was now in question, was bought of Mr. Edney, of Dean, in March of this year. He told witness he had gone through the Kale, and it was perfectly true in every way. The general practice of growers was to sow varieties of seeds in trial-grounds. In watching growth in the trial-grounds it was noticed varieties vary, and if they noticed anything they approved of they selected that specimen. They sowed, and resowed the seed year by year until they considered the variety fixed. Then the seed was given a name—in many cases they preferred to give their own; it was then placed in the catalogue and sent to farmers and growers generally. The name of a person attached to a seed simply indicated its variety; there was no other inference to be drawn from it.

nor did he know anyone who did. This was the first year his firm had sold Shephard's Kale, and he mentioned other firms who sold the Kale. He could not sell the article as Kale because there were about twenty-five varieties of Kale, and a farmer, when buying, would want to know what sort it was.

Alderman Rogers agreed with the witness, and said they must give some indication of what sort of Kale was wanted.

Witness would swear he had never sold Shephard's Kale by any other name. He had once sent a packet with "Kale grown from Shephard's stock" on it, probably because the gentleman ordered it as such.

Mr. Tristram said he had no objection to its being sold in that way.

Cross-examination continued: Mr. Shephard had said he ought not to sell his Kale, but he said he had a right to do so. He bought the Kale from Mr. Edney as Shephard's Kale.

Re-examined: In the firm's catalogue, a number of seeds were named with other people's names. It was a fact that he employed farmers largely to grow seeds for him under his supervision. Shephard's Kale was not known universally; it was a purely local growth. It was not in other catalogues on that account.

Mr. John Gater was next called. He said he was a farmer of West End, and a buyer of seed. Most of the varieties of seeds bore the name of an individual, but the use of that name was not indicative of who grew the seed in question. If he was sold a parcel of Shephard's Kale, he should not expect they were grown by Mr. Shephard.

Mr. William James Nutting, of the firm of Messrs. Nutting & Son, Southwark Street, London, said varieties of seeds with personal names were generally quoted in all catalogues. A catalogue of Messrs. Hurst was produced with an entry of Nutting's selected dark red Beet, and he said his firm had not supplied it direct. A man's particular seed should be sold under his name, though it need not necessarily be produced by him. The use of the personal name was no indication of who grew the seed under offer. It was not his experience that seed grown by a person other than the introducer would

produce bad stock. He did not know any secret mode of producing seed.

Mr. Thomas Arthur Newby, manager to Messrs. Hurst, of Houndsditch, said in reference to one of their Swedes, Hurst's Mouch, it cost £500 to bring it to perfection, and now it was quoted in other catalogues.

Mr. J. F. Edney, a farmer of West Titherley, gave evidence to having bought seed from Mr. Shepard of the variety in question. He sold the seed, and saved some, and produced from it. Some of this he sold to Mr. Toogood as Kale seed. It was, in fact, Shepard's Kale seed.

Mr. Page intimated that he had other witnesses, but would not call them, and the magistrates retired to consider their decision at ten minutes past four. Six minutes later the Chairman said the magistrates were unanimous in dismissing the summons with costs, after having considered the matter very fully.

In answer to Mr. Page, the Chairman said they meant the whole of the costs, but these being left to the Court, they afterwards stated the amount at £5 5s.

Mr. Tristram applied for leave to state a case, which was granted.

SOCIETIES.

BATTLE HORTICULTURAL.

SEPTEMBER 4.—Favoured by magnificent weather and a picturesque location, the annual show of the Battle Floral and Horticultural Society was a great success. Most postponed events suffer, but though put off a week on account of the Hastings Carnival, the indefatigable Hon. Sec. and committee must be heartily congratulated on the display made in the three large marquees provided, including over 1000 entries.

Potatoes were present in profusion, and were almost without exception of very high quality. Onions were, as a rule, deficient in finish, but root crops were clean and good all round.

In the first division, Mr. T. Portnell, gr. to Sir ARCHIBALD LAMB, Bt., was well to the fore for six stove and greenhouse plants; and he had also six very clean and good foliage plants. Begonias were not good, and Fuchsias, with the exception of one lot, were badly bloomed. Zonal Pelargoniums were fairly well shown, but they are not equal to the heavily-flowered specimens one meets with on the E. and S.E. coasts. Altogether, the plants in divisions 1 and 2 were not so good or so numerous as in past years. Cut flowers were in plenty, but if we except the stove and greenhouse blooms staged by Mr. T. PORTNELL, and the decorative Dahlias of Mr. STREDWICK, they were not worthy of special notice. Roses were good and bright for so late a season, Mr. T. DURRANT YOUNG, Eastbourne, making the best show; while the amateur honours fell to Mr. H. FOSTER, of Ashford, in both divisions. Gladiolus were very poor; Mr. J. FOSTER, Ore, had 1st prize. Mr. J. CHIVERS, St. Leonards, won for Phlox Drummondii.

Fruit was in grand condition, and the entries were numerous. Mr. W. ALLEN, gr. to Lord BRASSEY, took both 1st prizes for a collection of eight dishes, given by Col. HANKEY, Beaulieu, as well as a thoroughly well-deserved 1st, for three bunches of Muscat of Alexandria Grapes and three bunches of Black Hamburgs. Three bunches of Black Hamburg Grapes, shown by an amateur, W. C. RAPER, Esq., were perfection in size, colour, and finish; while a market grower, Mr. F. GORE, secured a good 1st for three bunches of Gros Maroc.

Melons were numerous, but a trifle over-ripe. Mr. PORTNELL secured 1st prize with Elenheim Orange.

In Apples, Mr. W. ALLEN took 1st, with Lady Sudeley (dessert variety), and Peasgood's Nonsuch (culinary), both of which were handsome dishes.

The most tempting feature in the fruit classes was, however, the Plums, which were highly coloured and finished; indeed, I have rarely seen Gages so good. 1st, Mr. E. P. RICHARDS, gr. to the Hon. F. A. BRASSEY; 2nd, Mr. T. PORTNELL; 3rd, Mr. GOWER, gr. to Mrs. LAWRENCE. While an amateur, B. H. THORPE, Esq., took 1st with Transparent Gage, and 2nd with Washington; and 1st in the culinary class with Pond's Seedling, all grown on open wall, and perfect in colour and finish.

Local and other florists made a good display in plants, Ferns, and cut flowers of hardy perennials. Two groups arranged by Mr. HOLLANDS and Mr. CHARLTON respectively, of Tunbridge Wells, were very attractive, and contained some good novelties, the former showing good Ferns and Caladiums, while some pans of the pretty *Sibthorpia europæa variegata*, were conspicuously well-coloured and healthy. Mr. CHARLTON had a hybrid *Statice (latifolia × incana)* of elegant habit, with small blue flowers, most useful for cutting; some good hybrid *Montbretias* and *Rudbeckia tomentosa*. T. Bunyard.

ROYAL CALEDONIAN HORTICULTURAL.

SEPTEMBER 11, 12.—The autumn show of this Society was held in the Waverley Market, Edinburgh, on the above dates. Probably few more successful shows have been held under the auspices of the Society. The number of entries was over 2100, and of these the majority were good in quality. Fruit and cut flowers embraced the most classes, and particularly in those devoted to Grapes and Apples, the

entries were very numerous, and the exhibits remarkably good. The collections of *Gladiolus* and tuberous *Begonias* were brilliant in colour, the former never having been seen in finer condition in Edinburgh. In the vegetable classes, the competition was generally keen. Nurserymen from all parts were present, and their exhibits did much to give the place an additional gay and furnished appearance.

PLANTS.

The plants arranged for effect upon tables were deserving of praise. That arranged by the winner of the 1st prize and Turner Memorial Cup, Mr. G. WOOD, gr., Oswald House, Edinburgh, was an excellent arrangement. Upon his table were noted *Oncidium incurvum*, *Odontoglossum*, grasses, Palms, Crotons, and other decorative plants and Ferns. The 2nd prize went to Mr. J. MCINTYRE, gr. to Mrs. GURNEY PEASE, Woodside, Darlington.

In the class for four stove and greenhouse plants in flower, the plants were small generally. Mr. J. MCINTYRE was 1st, and included plants of *Lapageria rosea* and *Statice profusa*; 2nd, Mr. W. BENNETT, Corstorphine. Mr. W. McMurtrie, gr. to Sir ED. COLERBROOKE, Bart., Abington House, was 1st for a single specimen stove or greenhouse plant, with a well-flowered *Statice profusa*.

Orchids were few, and the plants generally small. For four distinct kinds, Mr. J. ALLEN, gr. to J. PRIMROSE, Esq., Arundel House, Dumfries, took 1st prize, with *Odontoglossum grande*, *O. Harryanum*, *Cattleya Dowiana*, and *C. Eldorado*; Mr. W. HUTCHINSON, Balmadie, Aberdeen, was a close 2nd, with *Dendrobium Phalenopsis*, *Dica grandiflora*, *Cypripedium Spicerianum*, and *Cattleya Dowiana*. A magnificent plant of *Oncidium incurvum*, with more than twenty spikes of expanded flowers, from Mr. J. CURROR, Eskbank, took 1st place for a specimen Orchid.

In the class for *Cypripedium*, Mr. W. SHARP was 1st, with good plants of *C. Schroderianum*, *C. Harrisianum superbum*, and *C. oenanthum superbum*.

For foliage plants, Mr. T. LUNT, Keir Gardens, Dunblane, took the premier position with splendidly-grown plants, *Cissus discolor*, *Alcascia metallica*, *Anthurium crystallinum* were especially good. Mr. A. URQUHART, Liberton, was 2nd, with smaller but creditable plants. The best Crotons in the class for two came from Mr. T. LUNT; 2nd, Mr. J. MCINTYRE, Darlington. Table plants were numerous, and lined the raised centres of the fruit tables. Mr. M. McIntyre, gr. to Sir C. TENNANT, The Glen, Innerleithen, taking 1st prize.

Tuberous Begonias were generally good, those coming from Mr. A. B. HENDERSON, gr. to W. MACFIE, Esq., Clermiston, being far beyond the rest in quality and size of bloom. In the class for six, Mr. D. ADAMS, Duddingston Cottage, was 2nd. Mr. A. BRYDON, Tweedbank, Innerleithen, was 1st for a specimen double Begonia, exhibiting a deep salmon-coloured variety.

Fuchsias were good. Mr. A. PRYIE, Newington House, was 1st for two; and Mr. W. AITKEN for a single specimen.

Pelargoniums creating a blaze of colour, Lilliums and other flowering plants occupied considerable space, the early-flowered *Chrysanthemums* being fairly numerous.

FERNS.

The prizes for Ferns were well competed for, as usual. Mr. J. NAPIER, gr. to P. N. FRASER, Esq., Murrayfield, was a successful exhibitor in the larger classes. Mr. A. URQUHART, Southfield, Liberton, being 2nd to that exhibitor for four distinct exotic kinds. Mr. NAPIER and Mr. J. NAIRN, Craigcrook, took 1st and 2nd places for four *Adiantums*, both exhibiting good plants. With a splendid *Adiantum Farleyense*, Mr. D. McMURTRIE, Abington House, was 1st. Mr. NAPIER was successful in the class for nine distinct British Ferns, the classes for these being well contested.

CUT FLOWERS.

The fine spikes of *Gladiolus* staged by Mr. SMITH, Prestwick, were the admiration of all, his blooms were of large size and very brilliant in colour. This exhibitor was 1st in the classes for twelve, and for six spikes. Hollyhocks were well shown by Mr. A. OLIVER, gr., Crosswell Hall, Morpeth, who was 1st for twelve magnificent blooms, and also for five spikes. Judging from the number of Dahlias of all sections shown the season has been suitable for them. The 1st prize for twelve show blooms was gained by Mr. W. CRAIG, Duns, for a very even lot of heavy substance and perfect shape; followed by Mr. W. VEITCH, of Carlisle, the latter taking 1st place for six show blooms, and also in the class for twelve fancy blooms.

The best Dahlias in the class for six trusses, single blooms, came from Mr. J. PEARSON, Murrayfield, who also secured 1st place for six bunches of single Cactus Dahlia blooms.

Sweet Peas were shown in abundance and great variety. In the class for six bunches, Mr. A. BRYDON, Innerleithen, was 1st.

For twelve trusses of stove or greenhouse flowers, Mr. W. SHARP, Forgandenny, and Mr. M. MCINTYRE, The Glen, Innerleithen, took 1st and 2nd places respectively.

Carnations and Picoetes, Pansies and Violas, brought many entries, and the winning lots were of first-class quality.

Chrysanthemums in bunches and single flowers were fairly good, Mr. J. NAPIER being 1st in the bunched class, and Mr. A. BRYDON securing that position in the classes for the twelve and six varieties.

Mr. LOW, Dundee, was 1st for well-arranged hand bouquets among fifteen competitors.

Roses.—The exhibits in these classes required a considerable space, and were in most cases good. The best twenty-four distinct varieties were from Mr. W. HARPER, gr. to J. RICHARDSON, Esq., Perth, conspicuous upon his board were Ulrich Brunner

E. Jacobs, A. K. Williams, Grace Darling, General Jacqueminot, and Gloire de Margottin; Mr. W. PARLANE, Rosses, 2nd. In the class for twelve blooms, there were seventeen entries, Mr. J. HOOD, Helensburgh, securing 1st place. Tea Roses were numerous also, and the classes devoted to separate varieties brought some good blooms. In the classes for six blooms, each of Charles Lefebvre and La France, Mr. HOOD was 1st.

Herbaceous Cut Blooms.—The class for twelve bunches of herbaceous flowers had numerous entries, and Mr. J. MEIKLE, Bridge of Weir, was placed 1st for a fine selection.

FRUIT.

Ninety-six classes were devoted to fruit, and as there were a great number of entries in some of the classes, the grand display may be easily imagined. The prizes for the collection of twelve dishes of fruit, exclusive of Pines and Bananas, presented by the Corporation of Edinburgh, brought three competitors, the 1st prize going to Mr. W. SMITH, gr., Oxenford Castle, Dalkeith, whose exhibit was a selection of choice fruits of very exceptional quality; the 2nd prize was gained by Mr. J. HUNTER, gr., Lambton Castle; while Mr. D. MURRAY, Calzean Castle Gardens, was 3rd. The collection of eight dishes also contained some excellent fruit. Mr. J. HUNTER was 1st, and Mr. W. SMITH 2nd. For twelve dishes of hardy fruit, grown out-of-doors, Mr. S. T. WRIGHT, of Hereford, was 1st, and Mr. J. DAY, Garlieston, 2nd. Mr. J. HUNTER carried off the 1st prize for twelve dishes of orchard-house fruits (Grapes excluded).

The best six bunches of Grapes, three varieties, came from Mr. J. LESLIE, Pitcnellen, closely followed by Messrs. D. & W. BUCHANAN, Kippen, who also staged some excellent bunches. For two bunches of Muscat of Alexandria, Mr. D. KION, Carberry Towers, was 1st, with well-finished fruit. The 1st prize for two bunches of Black Hamburg Grapes went to Mr. J. POTTER, Cumberland; 2nd, Mr. J. MENZIES, Larbert, both of whose exhibits were very fine. There were eight competitors in this class. An enormous bunch of Black Alicante Grapes with fine berries, well finished, and carrying a good bloom, secured Mr. T. BOYD, gr., Callender Park, Falkirk, the 1st place, the bunch weighing about 10 lb. Mr. T. BOYD was also 1st for one bunch of Lady Downe's, and was followed by Mr. T. LUNT.

Mr. M. MCINTYRE, Innerleithen, was 1st in the class for one bunch of Grapes with finest bloom, showing Cooper's Black. Mr. T. BOYD was 1st for a Queen Pineapple of not less than 3½ lb. weight; 2nd, Mr. MCINTYRE, who carried off the prize for any other variety not less than 5 lb. in weight, with a good smooth Cayenne. For the best green-fleshed Melon, Mr. T. BOYD was 1st with a medium-sized fruit. Mr. J. MORRISON, gr., Archerfield, secured 1st place both for twelve Peaches and for the same number of Figs.

Apples required the space afforded by several tables. Mr. S. T. WRIGHT, Hereford, being the most successful exhibitor, taking fourteen 1st prizes out of the thirty-three classes. The fruit was, generally speaking, large, though hardly ripe.

Pears were not so numerously shown as Apples, but some very fine fruit was staged. Mr. J. GIBSON, Chiswick, and Mr. S. T. WRIGHT, sharing many of the prizes between them. Some very fine red and white Curran's were staged, and the entries for these classes were numerous.

VEGETABLES.

Of the five competitors who staged collections, Mr. J. GIBSON, Devonhurst, Chiswick, was 1st, and was awarded the Medal of the Veitch Memorial Trustees. Mr. B. RAE came 2nd with a creditable collection.

For two Cucumbers, Mr. P. MAIN, Polmont, was 1st, also for twelve Tomatos. Cauliflowers were best shown by Mr. J. LORRAINE, Lasswade. Mr. J. COSSAR, Dunbar, staged the best twelve varieties of Potatoes. Parsnips, Turnips, and Onions brought a large number of competitors. Indeed, the classes for vegetables all round were most eagerly contested.

NURSERYMEN'S CLASSES.

Messrs. B. E. LAIRD & SONS, Messrs. DICKSON & Co., of Edinburgh, and Messrs. J. & R. THYNNE were the only exhibitors of plants, the former securing three 1st and three 2nd prizes out of the six classes. For thirty *Gladiolus* spikes, Mr. G. MAHR, Ayr, was 1st. For eighteen trusses single Dahlias, Messrs. R. B. LAIRD & SONS won; Mr. M. CAMPBELL 2nd. Out of the thirteen classes for cut Roses, Messrs. J. COCKER & SONS, Aberdeen, took ten 1st prizes, including the classes for thirty-six and eighteen. Messrs. T. SMITH & SONS, Stanara, are to be commended for their stand of twelve which took the 1st place, upon which some magnificent blooms were noted. Messrs. D. & W. CROLL, Dundee, were also successful Rose exhibitors, taking 1st prizes for twelve blooms of *Marville de Lyon*, and for twelve blooms of Charles Lefebvre. For twenty-four trusses of *Chrysanthemums*, Messrs. DICKSON & Co. were successful; while for Carnations and Picoetes, Mr. W. CAMPBELL was 1st.

MISCELLANEOUS EXHIBITS were numerous. Messrs. R. B. LAIRD & SON arranged a pretty table of stove and greenhouse plants. Messrs. METHVEN & SON were conspicuous for Begonias, Clematis, Lilliums, and other flowering plants. A fine table of highly-coloured foliage plants came from Messrs. J. & R. THYNNE, of Glasgow, which were very much admired. The tables of Ferns, including "Filices," was a relief after the blaze of cut flowers, and Messrs. BIRKENHEAD & SON are to be congratulated upon the good display made. Herbaceous and florists' flowers came from Messrs. J. COCKER & SONS, from Messrs. DOBBIE & Co., and Messrs. CUTHBERTSON, Inthessay, the tables of each being centres of attraction.

Mr. W. ECKFORD filled a table with Sweet Peas in great variety; Carnations and Sweet Peas forming also a pretty table, from Messrs. LAING & MATHER, Kelso.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (ACCOMULATED), RAINFALL, and BRIGHT SUN. Includes sub-columns for Above (+) or below (-) the Mean, Day-deg., and 10ths Inch.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts— 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c. Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending September 14, is furnished from the Meteorological Office:—

"The weather, as a whole, was again fine and dry over the greater part of the Kingdom, although rain was experienced in nearly all places on the 10th or 11th. In the extreme north of Scotland the conditions remained unsettled, and rain fell almost daily. Severe thunderstorms occurred in some parts of Scotland on the 9th.

"The temperature again exceeded the mean, the excess ranging from 2° in 'England, E. and Ireland, S.' to 4° in 'Scotland, W.' The highest of the maxima were recorded on the 9th, when the thermometer rose to 87° in 'England, S.W.' (at Llandoverly), 86° in the 'Channel Islands,' 84° in 'England, N.W.,' 83° in 'England, S.,' and to 82° in the 'Midland Counties.' The lowest of the minima, which occurred on the 13th, ranged from 37° in the 'Midland Counties,' and 38° in 'England, S.' to 45° in 'Scotland, W. and England, N.W.,' and to 49° in the 'Channel Islands.'

"The rainfall just equalled the mean in 'Scotland, N.,' but was less in all other districts. Over 'England and Ireland, S.,' the fall was very slight.

"The bright sunshine was rather deficient in 'Ireland, N. and Scotland, N.,' but was again very prevalent in all other districts. The percentage of the possible duration ranged from 60 in the 'Channel Islands,' and 58 in 'England, S. and E.,' to 35 in 'England, N.W.,' 22 in 'Ireland, N.,' and 20 in 'Scotland, N.'

MARKETS.

COVENT GARDEN, September 19.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

Table with columns for VEGETABLES—AVERAGE WHOLESALE PRICES and MUSHROOMS. Lists items like Beans, Runners, Cauliflowers, etc.

POTATOES.

Beet samples, good demand at £4 to £4 10s.; ordinary, £2 to £3. Supplies heavy. J. E. Thomas.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing various cut flowers like Arums, Asters, French p. bn., Carnations, etc., with prices in s. d. s. d.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing various fruits like Apples, Peaches, Damsons, Figs, etc., with prices in s. d. s. d.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing various plants in pots like Adiantum, Aspidistra, Asters, etc., with prices in s. d. s. d.

SEEDS.

LONDON: Sept. 18.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that business in field seeds continues on a narrow scale. Trifolium is in diminishing request, quotations for fine samples are now abnormally low. Winter Tares come forward more freely, the demand being small, values naturally favour buyers. Sowing Rye is also exceedingly cheap. The new white Mustard is proving rather a short crop. Rape-seed is depressed. Bird-seeds are for the moment in meagre request. There is no change in either Peas or Haricots.

FRUITS AND VEGETABLES.

BOROUGH: Sept. 17.—Quotations:—Onions, 3s. 6d. to 4s. per bag; Horseradish, 1s. to 1s. 3d. per bundle; Apples, 2s. 6d. to 4s. per bushel; Peas, 1s. 9d. to 2s. 3d. per bushel; Plums, 2s. 3d. per half-sieve.

SPITALFIELDS: Sept. 17.—Quotations:—Cabbages, 3s. to 4s. per tally; Collards, 2s. 6d. to 3s. 6d. per tally; Beans, 1s. to 1s. 3d. per bushel; Carrots, 2s. to 2s. 6d. per dozen bunches; Turnips, 2s. to 3s. per dozen bunches; Onions, 1s. 9d. to 2s. per dozen bunches; Beet, 1s. 6d. to 2s. per dozen; Sage, 1s. 6d. to 2s. per dozen bunches; Lemon Thyme, 2s. per dozen bunches; Sweet Basil, 1s. 9d. to 2s. per dozen; Apples, 1s. to 2s. 6d. per bushel; Damsons, 2s. per half bushel.

STRATFORD, Sept. 17.—There has been a good supply of all kinds of produce at this market during the past week, and a brisk trade has been done at the undermentioned prices:—Cabbages, 2s. to 5s. per tally; Cauliflowers, 9d. to 1s. 6d. per dozen; Turnips, 1s. 6d. to 2s. 6d. per dozen bunches; Carrots, household, 2s. to 3s. per ton; do., 1s. to 2s. 3d. per dozen bunches; do., cattle-feeding, 20s. to 22s. per ton; Mangels, 16s. to 18s. do.; Swedes, 15s. to 20s. do.; Onions, Ghent, 2s. to 2s. 6d. per bag; do., Bordeaux Port., 4s. 6d. to 5s. 6d. per case; Apples, English cookers, 1s. 6d. to 3s. per bushel; do., dessert, 2s. to 3s. 6d. per bushel; Plums, 1s. 6d. to 2s. per half-sieve; Damsons, 1s. 3d. to 1s. 9d. per half-sieve; Tomatos, English, 2s. to 3s. per peck; Cucumbers, frame, 1s. to 2s. per dozen; do., field, 4d. to 8d. per dozen; Beans, Scarlet, 1s. to 1s. 6d. per bushel; do., 2s. to 3s. per bag; Beetroot, 2s. to 2s. 6d. per dozen bunches; Celery, 9d. to 1s. per roll; Parsley, 1s. to 1s. 6d. per dozen bunches.

FARRINGTON: Sept. 19.—Quotations:—Cabbages, Collards, 1s. per dozen; Cauliflowers, 1s. 6d. to 2s. dozen; Turnips, 3s. dozen bunches; Carrots, do.; Mint, Parsley, 3d. big bunch; Sage, 2s. per dozen; Beans, 1s. 6d. to 2s. per bushel; Spinach, 2s. per bushel; Marrows, 1s. per dozen; Onions, 3s. per bag; Apples, large Cat's-heads, 3s. per bushel; do., Ingestre, 2s. 9d.; Golden Knobs, 2s. 9d. per half-bushel; best Williams

A very tempting table of Grapes, arranged with coloured vine foliage, came from Messrs. D. & W. BUCHANAN, Forth Vineyards, near Stirling, and was much admired. Many other exhibits received their full share of attention from the large number of visitors who were present at all times during the hours when the exhibition was accessible to the public.

FUNGUS FORAY AT HUDDERSFIELD.

HUDDERSFIELD was selected by the mycological section of the Yorkshire Naturalists' Union as the headquarters of the 1895 Fungus Foray. On Saturday, Monday, and Tuesday, September 7, 9 and 10, a series of meetings and excursions were held. The chief object of the meetings was the investigation of the woods and pastures in the neighbourhood of Huddersfield for fungi.

The party included Dr. M. C. Cooke, M.A., A.L.S., of London; Mr. George Massee, F.R.M.S., F.L.S., of the Royal Herbarium, Kew; Mr. Carleton Rea, M.A., B.C.L., of Worcester; the Rev. W. Fowler, M.A., Liveredge; A. Clarke and J. Sutcliffe, of Huddersfield; A. Bairdow, C. Crossland (hon. sec.), H. T. Soppett, J. W. Sutcliffe, of Halifax; and J. Needham, of Hebden Bridge. Saturday's excursion was to West Wood, Honley, and Storthes Hall Wood, under the leadership of Mr. A. Clarke. Although fungi were scarce objects, a few interesting specimens were found. Fixby woods and pastures, the hunting ground of James Bolton, a famous Halifax botanist, one of the pioneers of the study of English fungi, and who flourished during the latter part of last century, were also visited, and here also a few interesting species were found.

Monday's excursion was by train to Hebden Bridge, thence by conveyance to the delightful woods of the Hebden Valley. This was under the leadership of Mr. James Needham and the secretary. As in the previous excursions, fungi were by no means plentiful, but amongst those collected were two good finds, viz., Paxillus paradoxus and Boletus nanus, which hitherto had not been found in West Yorkshire. The specimens collected in the aggregate amounted to upwards of 200 different kinds, among which were many interesting forms.

Meetings were held each evening at the Y.M.C.A. rooms, at which place the specimens collected were determined and placed on exhibition. Consignments of fungi were sent in by the neighbouring societies from their respective districts. Not the least interesting part of the programme were the lectures delivered by Mr. Massee, on the Saturday and Monday evenings, which were illustrated by well-prepared lantern slides, showing the structure and development of a variety of fungi that are destructive to cultivated plants, and methods were described for checking their devastations.

TRADE NOTICE.

MR. JAS. GRIEVE.

MANY readers of the Gardeners' Chronicle will be pleased to learn that Mr. James Grieve, for many years nursery manager to Messrs. Dickson & Co., Edinburgh (who have been compelled to remove their whole nursery business to Liberton, owing to a large portion of their ground being required for railway purposes), has retained part of the Redbrae Nursery, where he will, in company with two of his sons, carry on a general nursery and florist business, under the name of James Grieve & Sons. It is Mr. Grieve's intention to devote a large proportion of his time to hardy florist's flowers, with the raising of so many of which, especially Pansies and Violas, his name is so intimately connected.

Obituary.

JAMES HARRIS.—We regret to hear of the death of Mr. James Harris, which took place on August 29, after a short and severe illness, at the Gardens, Torrance Castle, East Kilbride, Lanarkshire, the residence of Colonel Harrington Stewart. Mr. Harris was well known as a good Rose grower, a class of plants he took a great interest in, and of tuberous-rooted Begonias, of which he had got together one of the finest collections in the west of Scotland. The deceased was in his fifty-ninth year, and leaves a widow, one daughter, and eight sons, to mourn his loss. I may mention the fact that two of his sons hold responsible positions, one as Curator of the Chincóna Botanic Garden, Jamaica, and another as chief of the Orchid department of Messrs. J. Veitch's Nursery at Chelsea. W. Camm.

"DICTIONNAIRE PRATIQUE D'HORTICULTURE."

—This has now reached its fortieth part, down to the letters Mn. We have so often spoken in appreciative terms of this publication, that we need not repeat what we have said, but congratulate M. MOTTET on the regular progress of his laborious undertaking. The publisher is O. DOIN, 8, Place de l'Odéon, Paris.

Pears, 7s. per half-bushel; Hazels, 2s. per half-bushel; Plums, bush, 3s. per half-bushel; Damsons, 2s. per half-bushel; Grapes, Almeida, 17s. per barrel (best); Liebon, 12s. 6d. per barrel; Onions, case, 5s. 6d.

POTATOS.

BOROUGH: September 17.—Quotations ranged from 55s. to 90s. per ton.

SPITALFIELDS: September 17.—Quotations:—Blackland Magnums, 35s. to 45s.; Bruce, 40s. to 50s.; Sutton's Abundance, 40s. to 55s.; Highland Hebrons, 50s. to 70s.; do., Bruce, 45s. to 60s.; Snowdrops, 60s. to 80s. per ton.

STRATFORD, Sept. 17.—Quotations:—Magnums, dark soil, Bruce, 25s. to 45s.; light, do., 40s. to 60s.; Reading Giants, 45s. to 70s.; Sutton's Regents, 45s. to 60s.; Snowdrops, 50s. to 70s. per ton.

FARRINGDON: Sept. 19.—Quotations: White Hebrons, 70s. to 80s.; Red do., 70s. to 80s.; Snowdrops, 80s. to 85s.; Imperators, 80s. to 70s. (of good shape); Bruce, also a good shape, 70s. to 80s.; Magnums, 35s. to 45s. per ton.

LONDON AVERAGES: Sept. 18.—Snowdrops, 60s. to 80s.; Hebrons, 60s. to 80s.; Imperators, 50s. to 60s.; Puritans, 50s. to 55s.; Early Rose, 55s. to 60s.; Regents, 55s. to 65s.; Magnums, 40s. to 55s. per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending September 14, and for the corresponding period in last year:—1895: Wheat, 22s. 10d.; Barley, 23s. 11d.; Oats, 13s. 8d. 1894: Wheat, 20s. 5d.; Barley, 23s. 9d.; Oats, 15s. 9d.

HAY.

Averages.—The following are the averages of prices at the principal metropolitan markets during the past week:—Clover, prime, 90s. to 110s.; do., inferior, 50s. to 80s.; hay, best, 60s. to 90s.; do., inferior, 30s. to 60s.; mixture, 70s. to 92s.; and Straw, 20s. to 38s. per load.

* * Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

* * PLANTS, FRUITS, ETC., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists varieties cannot, as a rule, be named.

ANALYSIS OF SOIL: *Thos. Bury*. You could obtain an analysis from the Agricultural College at Downton, Wilts, on payment of a small sum.

APPLE SEEDLING: *M. B.* The Apples you send us are of good size and appearance, and may prove to be a good useful sort. It is too early at present to pass a definite opinion. We would recommend you to send six fruits to the Fruit Committee of the Royal Horticultural Society for their opinion next year.

BEGONIA LEAVES DISFIGURED: *A Constant Subscriber*. Before your question can be answered, you must send us some of the creatures which cause the injury to the leaves. Probably, they are some species of slug which are night feeders generally, and must be looked for after dark.

BOOKS: *W. H. M.* *Fruit Farming for Profit*, by G. Buyard, published by F. Buyard, 29, Week Street, Maidstone; *Practical Fruit Culture*, by J. Cheal, published by G. Bell & Sons, York Street, Covent Garden.—*F. White*, *My Gardener*, by H. W. Ward, published by Eyre & Spottiswoode, East Harding Street, E.C.—*Amateur*. The serial works on Orchids in the English language, now being issued, are *The Orchid Album*, by B. S. Williams & Son, Paradise and Victoria Nurseries, Upper Holloway, N. Monthly parts, price 5s. It has been running since 1881; *The Orchid Review*, monthly, price 1s. Communications should be addressed to the editor of the *Orchid Review*, Lawn Crescent, Kew; *Lindonia*, conducted by Messrs. J. Linden, Lucien Linden, and E. Rodigas; published by Eug. Vanderhaegen, Ghent; *Reichenbachia*, published by F. Sander & Co., St. Albans.—*Revider*. *The Horticultural Handbook and Exhibitors' Guide*, new edition (W. Blackwood & Sons, Edinburgh and London).

CINERARIAS: *Interested*. Perhaps the soil is infested with the grub of a weevil very destructive to Cinerarias and most other things. Can you send us some of the grubs you have seen?

CRABS: *J. Backhouse & Sons*. The Crab received from the late Dr. Regel, and again sent to us, is a variety of *Prunus Malus prunifolia*, see *Gardeners' Chronicle*, p. 427, October 2, 1886. The Crab John Downie, fruits of which you kindly send us, is a very ornamental variety, either in flower or fruit, the latter fact being well shown by the fruits sent.

DUROLINE: *P. M.* We should greatly doubt the suitability of this material for covering ainery instead of glass; but as a wall protector entirely open in the front, it would answer admirably.

GRAPES: *Gardener*. Not having the least knowledge of the circumstances under which your Muscat Grapes are cultivated, we shall not presume to state in what respect your culture is deficient. It may be said, however, that shanking usually indicates that the border is in an unsatisfactory condition, that the roots have penetrated a wet sub-soil below the border, or that too much water has been given the Vines.—*W. L.* You may be right. We have seen instances before where the colour in Grapes has been affected by the stock on which the variety has been grafted. In this case, however, we take the colour to be merely a slight disfigurement by rust from cold draught, especially as the exposed parts of the berries are alone discoloured.

HECKBERRY: *W. A.* *Prunus Padus*, Bird Cherry.

HIPPASTRUMS: *Amateur*. Supposing that the bulbs have been growing under glass all the summer, growth will soon cease altogether, when water should be gradually withheld until the leaves turn of a yellow colour, when no more should be afforded. Some varieties are almost evergreen in habit, but these should be similarly treated. If the plants have completed their growth, plunged to the rim of the pot in a mild hotbed, the roots will have penetrated the substance of the bed, whether it consist of tanner's bark, Oak leaves, or cocoa-fibre refuse above a heated chamber. They may be partially lifted out if when the leaves have turned yellow. The temperature of the house should not exceed 45° in the winter. Failing the accommodation this mode of culture demands, the dried-off bulbs may be kept in their pots in a frost-proof dry room, or on a shelf in a vinery or greenhouse. The repotting may commence in January, and should be completed by the middle of the next month for all bulbs of flowering age, and that of young non-flowering bulbs by the end of March—of course the earlier the better, so that the plants may have the benefit of a long season of growth. Seedlings whose bulbs are not larger than a sparrow's egg must not be dried off, although the quantity of water required will be very small from October to January. Bulbs purchased at the shops may be either potted when bought, or kept in sand or cocoa-nut fibre till the proper time for starting the bulbs arrives.

NAMES OF FRUITS: (see notices under Names of Plants). *W. T.* Pear Belle de Bruxelles.—*W. S. L.* 1, Styrian; 2, Marie Louise; the Apple is Hornmead's Pearmain.—*W. Cann.* 1, Rosemary Russet; 2, Cox's Orange Pippin; Plum much bruised, may probably be Pond's Seedling.—*J. G.* 1, Stone's Apple; 2, a pale fruit of Duchesse of Oldenburgh; 4, Pear Marie Louise; Plums should not have been packed with Apples.—*T. W.* We can only undertake to name six fruits at a time; Pears, 1 and 1½, Marie Louise; 2, 2½, Beurré de Capiaumont; 4, Louise Bonne; 5, 5½, Doyenné Boussoch; Apples, 2, Blenheim Orange; 4, Keswick Codlin.—*T. Y.* 1, Worcester Pearmain; 2, Maltster; 3, Duchesse of Oldenburgh; 4, Lord Suffield; 5, Peasgood's Nonesuch; 6, Dutch Codlin.—*W. S. Tighe.* 1, Worcester Pippin; 2, Duchesse of Oldenburgh; 3, Autumn Pearmain; 4, Cox's Pomona; 5, Worcester Pearmain; 6, Gloria Mandi.—*W. C.* Apple, Gladstone; Damsons, the Farleigh variety.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to consult the next number.*—*J. McD.* A *Zygopetalum*. The flower was destroyed by a slug in the moss!—*A. S.* *Veronica Chamædrys*; distorted by an insect. *N. C.* *Polygonum cuspidatum*.—*H. W. R.* Two shillings received for *Gardener's Orphan Fund* with thanks, 1, *Acalypha Macraefiana*; 2, *Polygonum cuspidatum*.—*J. T. P.* *Celsia arctura*.—*T. W. B.* *Solidago canadensis*, Golden Rod.—*H. T.* *Cytha-*

rexylum betoniannum.—*F. Herrington*. *Polygonum cuspidatum*.—*A. M.* 1, *Lycostera formosa*; 2, *Pinus Sabiniana*; 3, *Tilia europæa laciniata* (the cut-leaved Lime).—*H. B.* *Oncidium ochthodes*, which is said to be the same as *O. chrysornis* of Reich. f.—*Elmet, Leeds*. The *Odontoglossum Uro Skinneri* is quite equal in every respect to those we have remarked on, though differing from either.—*Wooltsey*. 1, *Polygonum cuspidatum*; 2, *Hieracium aurantiacum*; 3, *Pteris argyræa*; 4, *Adiantum concinnum latum*; 5, *Adiantum decorum*; 6, *Polypodium crasseifolium*; 7, *Pteris tremula*.—*C. B.*, *Monmouth*. *Polygonum cuspidatum*.—*N. C.* 1, *Capsella bursa-pastoris*; 2, *Stellaria media*; 3, *Euphorbia* sp., probably *peplus*.—*Cammoes*. Send better specimen.

OAK GALL AND OAK APPLE: *Royal*. The terms are synonymous.

PEACH SHOOTS: *Gardener*. There appears to be nothing the matter with your Peach-shoots, but the leaves are infested to some extent with small scale, and probably red-spider. Syringe them well daily until the leaves begin to fall off, and then the trees can be thoroughly cleaned before they are started again. Keep your house open night and day, and use no fire-heat.

ROSES, MUSHROOM SPAWN, &c.: *Grower for Market*. We cannot recommend dealers. Why do you not advertise your requirements, or scan our advertisement columns?

WALNUTS: *C. C.* Keep the nuts, after the shells have been dried in the shade spread out on a net or table, in dry salt, clean silver-sand, or charcoal-dust, and store in a cool cellar. The nuts will not keep more than four months in good condition.

WATER LETTUCE, &c.: *N. C.* Water Lettuce is a West Indian name given to *Pistia stratiotes*, a very common tropical water-weed, which propagates itself with such rapidity, that it frequently covers tropical ponds with its foliage. It may easily be grown in water-tanks in warm-houses in this country. The plant floats on the water, and sends down into the same a mass of fine roots. The leaves are sometimes 5 inches long, produced in a tuft, and runners are very freely produced from each plant. *The Treasury of Botany* would be useful to you, as it contains interesting particulars about this and many other plants you are interested in. *Hyptis suaveolens* is known as the West Indian Spikenard; *Fernia Asætoide*, *F. galbanifera*, and *F. orientalis*, are not garden plants, though in their Mediterranean homes each is of economic value. You may experience difficulty in obtaining the plants unless through a botanic garden.

COMMUNICATIONS RECEIVED.—*A. Cordery*.—*H. J. H.*—*J. Stone*.—*W. E. F.*—*W. E. N.*—*D. W.*—*C. McL.*—*J. T.*—*A. L.*—*A. J. K.*—*R. S.* & *J. Limited*.—*J. P. & Sons*.—*S. S. P.*—*A. M. DIED.—At Rangoon, Burma, on July 14, 1895, JOHN JOSIAH COLES HARDING, son of the late THOMAS EDWIN HARDING, H.E.I.C.S., aged sixty-two and a half years.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

ROBERT WARNER & CO'S NEW PATENT WINDMILLS.

Saves Coal, Pumps Water, Grinds Corn,
Cuts Chaff, &c.

Supports can be made in Teak, Iron, or
Steel, for Hot Climates.

Prices from £17, including Pump and Timber Supports.

May 27, 1883, The Dell, Englefield Green, Surrey.
ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
Dear Sirs,—It affords me much pleasure to inform you the
25 ft. Annular Sail geared Windmill, on 40 feet timbers, work-
ing a set of 3 in. x 9 in. stroke treble pumps, that you fixed
here for Baron Schröder, is giving very great satisfaction,
pumping the water through 4,224 feet of pipe, to a vertical
height of about 50 feet. I must also express my thorough
appreciation of the manner in which the whole of the work
has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schröder.
R. WARNER & Co. have made and erected a similar Mill and
set of Pumps for Lord Northbourne.

Engineering Works, WALTON-ON-THE-NAZE, ESSEX.

THE BEST & CHEAPEST FUEL for GREENHOUSE BOILERS, STOVES, & HEATING APPARATUS.

ANTHRACITE SMOKELESS COAL.

G. R. CARTER & SON supply their LARGE, NUT, or
COBBLE COALS (the Nuts being about the size of a Walnut, and
the Cobbles about the size of a man's fist), delivered by van, at any address
within the 4 mile radius of Charing Cross; or in truckloads, at any Railway
Station. This Coal is absolutely smokeless, and it requires much less
attention than any other description of fuel, burning for twelve hours at least
without any supervision, and giving from five to ten degrees more heat than
Coke. Quotations on application to—

THE GARDENERS' CHRONICLE

("THE TIMES OF HORTICULTURE")

A Weekly Illustrated Journal

(ESTABLISHED 1841)

Among the Correspondents & Contributors to recent Volumes the following, out of many Hundreds, may be named:—

ALPINE PLANTS:—

BALL, J., F.R.S., the late.
CHURCHILL, G. C., Clifton, Bristol.
CORREYON, H., Geneva.
DEWAR, D., Glasgow.
DOD, Rev. C. W., Malpas.
JENKINS, E., Hampton.

AMATEUR GARDENING:—

BADGER, E. W.
BOYLE, Hon. Mrs., "E. V. B." ("Days and Hours in a Garden").
BRIGHT, the late H. A. ("Notes from a Lancashire Garden").
CLARKE, Col. Trevor.
ELLACOMBE, Rev. Canon.
EWBANK, Rev. H., Ryde.
FREMANT-MITFORD, A. B.
GUMBLETON, W. E., Belgrove, Cork.
SALTER, J., F.R.S.
THOMSON, W., Teigomouth.
WEIR, Harrison.
WILSON, G., F.R.S., Weybridge.
WILKS, Rev. W., Shirley.

ARBORETUM, &c. :—

ANNESLEY, the Earl of.
ACLAND, Sir T., Bart.
ACTON, T., Kilmacurragh.
BAKER, W. R., Bayfordbury.
BARRON, W., the late.
COURTOWN, the Earl of.
CROUCHER, G., Ochtertyre, Crieff.
DIECK, Dr., Mersburg.
DUCIE, the Earl of.
EGERTON, Sir P., Bart., the late.
ENNISKILLEN, the Earl, the late.
GROSVENOR, Lord R.
HENRY, Mitchell.
LONDDESBOROUGH, the Earl of.
MCLEAY, the late Sir G.
MEATH, the Earl of.
NICHOLSON, G., Curator, Royal Gardens, Kew.
POWERS COURT, Viscount.
RASHLEIGH, J.
SARGENT, Prof., Arnold Arboretum, Cambridge, U.S.A.
SHANNON, the Earl of, the late.
SMITH, T. A. Dorrie, Esq.
STAIR, the Earl of.
TREVELYAN, Sir W., Bart., the late.
VAN VOLXEM, J., the late, Brussels.

CHEMISTRY:—

CHURCH, Prof., F.R.S.
DEHERAIN, Prof., Paris.
DYER, Bernard.
GILBERT, Sir J. H., F.R.S., Rothamsted.
LAWES, Sir J. B., Rothamsted.
MITCHELL, W. S.
MULLER, Dr. Hugo, F.R.S.
WARRINGTON, R., F.R.S.
WILLIS, J. J., Rothamsted.

DISEASES OF PLANTS:—

ARTHUR, Prof., New York.
BOS, Dr. Ritzena, Wageningen.
COOKE, Dr. M. C.
KLEBAHN, Dr., Bremen.
MAGNUS, Prof., Berlin.
MASSEE, G., Kew.
MURRAY, G., British Museum.
PAGET, Sir James, F.R.S.
PHILLIPS, W.
PLOWRIGHT, Dr. C. B., King's Lynn.
PRILLIEUX, Prof., Paris.
SMITH, W. G.
SORAUER, Prof., Proskan.
WARD, Prof. Marshall.

FERNS:—

BAKER, J. G., Royal Gardens, Kew.
DRUERY, C. T.
HEMSLEY, A.
LOWE, E. J., Chapstow.

FLORISTS' FLOWERS, &c. :—

DEAN, R., Ealing.
DODWELL, E. S., Oxford, the late.
D'OMBRAIN, Rev. H. H., Westwell.
DOUGLAS, J., Ilford.
HORNOR, Rev. F. D.
LLEWELYN, Sir J. D., Bart.
MOLYNEUX, E., Swanmore Gardens.
PAUL, G., Paisley.
TURNER, C., the late.

FOREIGN CORRESPONDENCE:—

ADLAM, R. W., Johannesburg.
ALBOEF, Dr., Odessa.
ANDERSEN, J., Sweden.

FOREIGN CORRESPONDENCE:—

ANDRE, E., Paris.
BARRON, L., New York.
BENNET, H., the late. M.D., Mentone.
BUDDE J. H., Utrecht.
CARRIERE, E., Paris.
CARUEL, Prof., Florence.
COSTERUS, Dr., Amsterdam.
CLOS, Prof., Toulouse. [Brussels.
CREPIN, Director, Botanic Garden,
DAMMER, Dr. Udo, Berlin.
DE BOSSCHERE, C., Lierre, Belgium.
DE GANDOLLE, Casimir, Geneva.
DEVANSAYE, A. de la, Angers.
DRUDE, Prof., Dresden.
DUCHARTRE, Prof., the late, Paris.
ENGLER, Prof., Berlin.
ERNST, Dr., Caracas.
FENZI, Cav. E., Florence.
FORSTER, O., Scheibbs, Upper Austria.

GARDEN INSECTS:—

BLANDFORD, F.
MCLACHLAN, E., F.R.S., Pres. Ent. Soc.
MICHAEL, A. E., F.R.S.
WESTWOOD, Prof., F.R.S., the late.

HERBACEOUS PLANTS:—

BARR, P., Covent Garden.
CLARK, W. A., York.
CREWE, Rev. H., Harpur, the late.
DEWAR, D., Bot. Gardens, Glasgow.
DOD, Rev. C. W., Malpas.
ELLACOMBE, Rev. Canon.
ELWES, H. J., Cirencester.
EWBANK, Rev. H., Ryde.
FOSTER, Prof., Cambridge.
HARTLAND, Baylor, Cork.
JENKINS, E., Hampton.
FOSTER, Prof., Cambridge.
WILSON, G. F., F.R.S., Weybridge.

INDIA AND THE COLONIES:—

BANCROFT, G., M.D., the late, Queensland.
BENNETT, G., M.D., Sydney, the late.
BOLUS, H., Capetown.
BROADWAY, W. E., Royal Botanical Gardens, Trinidad.
CRADWICK, W. Hope, Botanic Garden, Kingston, W.I.
DUTHIE, J. F., Saharunpore.
FAWCETT, W., Superintendent Botanical Department, Jamaica.
FORD, C., Hong Kong.
HART, J. H., Superintendent, Botanical Department, Trinidad.
IM THURN, Everard, British Guiana.
JENMAN, J. S., British Guiana.
KING, Dr., F.R.S., Director, Royal Botanic Gardens, Calcutta.
KIRK, J., Wellington, N.Z.
LAWSON, Prof., Halifax, Nova Scotia.
MACOWAN, Prof., Cape Town.
MACOUN, Prof., Ottawa.
MOORE, C., Sydney.
MUELLER, Baron, Sir Ferd. von.
MURTON, H. J., Siam. [Melbourne.
RIDLEY, H. N., Superintendent Botanical Department, Singapore.
SAUNDERS, Prof., Ottawa.
SMITH, T., Timaru, New Zealand.
STOREY, H. Ooteypore.
TRIMEN, H., F.R.S., Director Royal Gardens, Ceylon.
WOOD, Medley, Botanic Garden, Durban. And many others.

LANDSCAPE GARDENING:—

ANDRE, E., Paris.
BAINES, T., Southgate.
BARRON, W., Elvaston, the late.
BURVENICH, F., Ghent.
CHEAL, J., Crawley.
GOLDRING, F., Kew.
JACKMAN, J., Woking.
JOHNSTON, T. P., New York.
JULIAN, G. R.
MAWSON, Windermere.

ORCHIDS:—

ANDERSON, J.
BULL, W., Chelsea.
BUYSSON, M. le Comte.
COOKSON, N., Wylam-on-Tyne.
KRANZLIN, Dr., Berlin.
LAWRENCE, Sir Trevor, Bart., M.P., President, Royal Horticultural Soc.

SOLD BY ALL SEEDSMEN.

THERE IS NOW
 A CERTAIN AND SAFE REMEDY IN
THE XL ALL MILDEW WASH.

☞ Kills Mildew and Insects at the same time.
 ☞ Does not Mark or Stain Fruit, Flowers, or Foliage.
 PRICE:—
 1 gallon, 12s. 6d.; ½ gallon, 6s. 6d.; 1 quart, 4s.; 1 pint, 2s. 6d.

A Report selected from many:—
 From Mr. JOHN MADDOX, Bryn Glas Gardeos, Newport, Mon.
 "I have now given your Mildew Wash a good trial, and find it the very best remedy yet introduced, being most effective in killing the Mildew and Green-fly at the same time, and without the slightest injury to the foliage of the Roses. It is clean and most simple to use, and the smell is not objectionable.
 "Like all your other XL ALL'S, it is just what is wanted, and one feels thankful that they are all come at last.
 "P.S.—One application is sufficient."
 To be had (the same as all the other XL ALL'S), through all Nurserymen, Seedsmen, Florists, and Sundriesmen everywhere; or direct from the Sole Proprietor, G. H. RICHARDS, Old Shot Tower Wharf, Lambeth, London, S.E.

HUGHES'
VAPOUR ROLL

TO FLORISTS and FRUITERS.—A young Lady desires re-engagement. Thoroughly experienced in every branch of the above. Highest reference.—**BETA,** 8, Lorne Gardens, St. John's Wood, London.

MAN'S INGRATITUDE.—We have it on Shakespeare's authority that the winter wind is not more unkind than man's ingratitude. In many cases this is unfortunately only too true. There are times, however, when the benefit received is so great that ingratitude becomes impossible. When life is rendered a burden to us by sickness, and someone comes and restores us to health, we should be base indeed to feel ungrateful. Thus, millions are to-day grateful to **HOLLOWAY'S PILLS and OINTMENT,** which have cured them of all stomach and liver troubles, banished headache, flatulency, indigestion, and low spirits, and cleared their systems of gout, rheumatism, sciatica, and all similar ailments.

Also ROMAN HYACINTHS, LILIUM CANDIDUM, SNOW-DROPS, &c.
On view morning of Sale and Catalogues had.

DUTCH BULBS—DUTCH BULBS.

Sales nearly every day, in Large and Small Lots, to suit all Buyers.

MR. J. C. STEVENS will **SELL** by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, nearly every day, at half-past 12 o'clock, first-class consignments of Choice HYACINTHS, TULIPS, CROCUSES, NARCISSUS, and other BULBS arriving daily from well-known farms in Holland, in the finest possible condition.
On view morning of sale, and Catalogues had.

WEDNESDAY NEXT.

IMPORTANT TRADE SALE OF BULBS.

A SPECIAL COLLECTION of choice named HYACINTHS, specially lotted for Glass, Pot, or Border Cultivation, including most of the best-known sorts; a great assortment of TULIPS; a collection of rare NARCISSUS; a fine variety of CROCUSES, &c.

Several thousand ROMAN HYACINTHS and NARCISSUS from France, for Early Forcing; a number of well-grown PALMS, &c.

MR. J. C. STEVENS will **SELL** the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on **WEDNESDAY NEXT**, October 2, at half-past 12 o'clock precisely.
On view morning of Sale, and Catalogues had.

Mr. J. C. STEVENS

BEGS TO ANNOUNCE THAT

MESSRS. LINDEN'S

FIRST GREAT ORCHID SALE

Will take place at his Great Rooms, 38, King Street, Covent Garden, on **THURSDAY**, October 17 (Mr. STEVENS being previously engaged for the 3rd). As this is likely to be a very attractive Sale, and will probably draw a large attendance, it will be an unusual opportunity for including anything choice that Growers may have in Flower. Fifty Lots will be reserved in the middle of the Sale for such Plants.

Extensive Sale of Potato Crops, within easy reach of THE LONDON MARKETS.

OLD PARK BURY, NETHER WYLDE, BATLERS GREEN, & ALDENHAM FARMS,

ALSO ON **NEWLAND'S FARM, RADELETT, AND THE HOME FARM, ALDENHAM ABBEY.**

The Crops are within easy reach of Radlett Station on the Midland Railway, 1½ miles from Park Street on the London and North-Western Railway; and 3 miles from St. Albans.

MESSRS. HUBBERT, SON, AND FLINT are instructed to **SELL** by AUCTION, on the Farms, on **WEDNESDAY**, October 2, 1895, commencing at 12 o'clock precisely, in numerous lots, to suit purchasers, about—

185 ACRES of fine Growing Crops of POTATOS,

Magnum Bonum, Bruce, and Beauty of Hebron.

Within easy reach of the London Markets. The Crops are well worth the attention of Salesmen, Dealers, and others. They stand adjacent to good roads, and within short distances of the goods yards and sidings. Every facility will be given to buyers to clamp on the land, and to remove their lots.

Catalogues, and all further particulars, can be had on application to the Auctioneers, Messrs. HUBBERT, SON, AND FLINT, at Watford, Herts; and 11, Serle Street, Lincoln's Inn, W.C.

Sutton, Surrey.

Capital Detached Freehold Residence and 2 acres, about 10 minutes' walk from Sutton Station.

MESSRS. DEBENHAM, TEWSON, FARME, AND BRIDGEWATER will **SELL**, at the Mart, on **TUESDAY**, October 8, at 2 o'clock, the FREEHOLD detached RESIDENCE, known as Fairview, Eaton Road, approached by a carriage sweep, and containing five bed-rooms, dressing-room, bath-room, box-room, three reception-rooms, and offices; stabling, coach-house, cow-house, and outbuildings. The grounds comprise tennis-lawns, productive kitchen-garden, and well-stocked fruit plantation; vineery 66 feet long, double Peach-house 73 feet long, Cucumber frame, and potting-shed—in all about 2 acres. With possession.

Particulars of Messrs. MORGAN AND UPJOHN, Solicitors, 7, Furnival's Inn, Holborn; and of the Auctioneers, 80, Cheapside.

Hall's Nurseries, Truro.

IN BANKRUPTCY. Re SAMUEL HALL.

MR. THOMAS GILL has received instructions from the Official Receiver to **SELL** by PUBLIC AUCTION, on **MONDAY**, **TUESDAY**, and **WEDNESDAY**, October 14, 15, and 16, at 10 o'clock each day, the whole of the

EXTENSIVE STOCK

of Evergreen Trees, Hardy Conifers, Hardy Ornamental Flowering Shrubs, Trees, Climbers, &c. A large quantity of Fruit Trees, consisting of Peach, Pear, Apple, Cherry, Gooseberry, and Currants, &c. A quantity of Perennials, Chrysanthemums, Pinks, Arum Lilies in pots, Fuchsias, Ampelopsis Viticilia, Ferns, Marguerites, Phloxes, Clematites, Begonias, Box edging, Narcissus bulbs, &c.; together with six Greenhouses.

Catalogues now ready. The Nurseries will be on view from September 22 until the time of Sale, from 10 A.M. till 4 P.M. For further particulars apply at the offices of the Official Receiver in Bankruptcy, Truro; or, to the Auctioneer, Market Street, Penryn.—Dated September 11, 1895.

GREAT CATTLEYA SALE,

ON FRIDAY, OCTOBER 4, 1895.

167 Marvellous Cattleyas FROM SANTAYUNI.

As our Collector gathered these Plants over a very wide area, and took every plant he could find, we confidently expect among them will be the

SUPERB

CATTLEYA OWEANIANA

(F.C.C., R.H.S., Sept. 6 1895).

See Drawing, and *Journal of Horticulture* Block, in Catalogue.

And the magnificent varieties—

C. SANDERÆ, C. HARDYANA, C. MRS. FRED. HARDY, C. MASSAIANA, C. ROTHSCCHILDIANA, C. FRANCONVILLENSIS, C. ROCHELLENSIS, HAMAR BASS'S VAR., CLARKE'S VAR., the DUC DE MASSA'S white sepaled and petaled CHYSOTOXA, &c.

Also 76 of a NEW TYPE of

CATTLEYA SANDERIANA,

from a previously unknown locality, and where no plants have before been collected.

Every plant is offered, together with

109 PLANTS OF

CATT. AUREA CHRYSOTOXA,

The largest and most exquisitely beautiful of this magnificent species.

Also 38 plants of a most distinct-looking grand type of Cattleya, probably a

NEW NATURAL HYBRID

of the two parents, Chrysotoxa and Sanderæ or Hardyana.

We draw the special attention of buyers to these plants, and thoroughly recommend them.

Every Cattleya found by our Collector is here offered, and all the plants have dormant eyes, thoroughly ripened pseudo-bulbs, and cannot fail to do well. Also,

40 PLANTS FROM ISABEL, CHRYSOTOXA AND IMPERIALIS TYPE, MIXED.

Probably the newest and finest varieties will be found among these.

MANY OTHER GRAND CATTLEYAS

From Brazil and Colombia,

Will also be SOLD by AUCTION, by

Messrs. PROTHEROE & MORRIS

67 and 68, CHEAPSIDE, LONDON, E.C.,

On FRIDAY, October 4,

At half-past Twelve o'Clock precisely,

By Order of

Messrs. F. SANDER & CO.
ST. ALBANS.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 28, 1895.

SOME OLD-WORLD GARDENS.

THERE is an indescribable charm about old-fashioned gardens, which in modern ones seems to be lacking. The pictures are toned with a mellow restfulness, soothing and grateful to the townsman's nerves. "Fair quiet and sweet rest" are there, no violent contrasts of crude colours, scarlet, yellow, or blue, distract the eye; mingled fragrances pervade and pleasant memories linger around them. From this old mossy-stemmed Apple-tree, once again drooping with its wreaths of crimson and gold, we gathered a pocket full of luscious fruit full sixty years ago. The goldfinch still puts her pretty nest in the boughs overhead. From that old China Rose we plucked a bud, and put with it a spray of Ladslove to offer to a blushing lassie of sweet seventeen!

All the year round, too, there is something to admire in these old gardens, from Snowdrops and Winter Aconite, Crocus, and the "rathe" Primrose; through the freshness and beauty of April and May, to the time of Roses in leafy June, when the garden is in its prime, Pinks and Lilies are there, with Rosemary, Ladslove, and Lavender. Then comes the waning year, when—

"Heavily hangs the Hollyhock,
Heavily hangs the Tiger-Lily."

Perhaps it is during August and September that the flower-garden wears its most resplendent colours, and when butterflies sun their gorgeous wings on the petals of the Phlox, the Hydrangea, and the Aster.

There are few lovers of a garden, and worthy of the name of amateur, who will begrudge the gardenless visitor a glimpse of his flowers.

Let me endeavour to give a brief sketch of some gardens which, by the courtesy of the owners, I have been allowed from time to time to saunter through. There is one garden, by the way, accessible to the public, as of course it should be—they pay for its keeping—Royal Kew, perhaps the grandest garden in Europe! But I speak of others not so well known.

One of the most delightful old gardens in England is that of Lord Essex at Cassiobury Park, near Watford. These gardens were repeatedly visited by John Evelyn, and about them Stephen Switzer remarks: "It must not be passed by that at Cassiobury the polite spirit of gardening shone brightest," and that he "never saw that truly delightful place without being more than ever ravished by its natural beauties." Entering from the woodlands by the head-gardener's cottage, beneath a leaf-fringed arch in the lichen-stained wall, we see a portion of the old kitchen garden. In front of us is a border about a hundred yards long and three yards wide. On either side of it is a broad, smooth, gravel walk; and along the centre, at intervals of perhaps half-a-score yards, is a line of standard, dome-shaped Filberts. On either margin is a belt of

white-flowered Pinks, 2 feet wide; then the centre—nearly 5 feet across—is entirely filled with Lily of the Valley, Lilies, and Pinks. One may imagine the perfume exhaled as the spring showers patter among the leaves and blossoms.

One of the paths is over-arched by Apple, Pear, and Plum trees. When I saw it the trees were loaded with rosy bloom, and a smart shower had scattered the pink and white petals on the cool earth beneath. The borders on either side are filled with such old-fashioned flowers as York and Lancaster Roses, Pæonies, Larkspurs, Phloxes, and Solomon's Seal. A seat beneath this leafy tunnel was a favourite resort of the late venerable Earl. There he would sit and ponder, with nothing to disturb his reveries save the songs of the blackbird, the thrush, the goldfinch, or the amorous descants of the nightingale, all of which, and many others, found safe and happy homes among the twinkling leaves.

In some of these old gardens, the walls are not the least attractive feature, whether at the time when the Apricot, Plum, Nectarine and Peach are flowering, or when the luscious fruit shows in rich, tempting festoons and clusters. Sometimes that saucy fellow with the "golden dagger," will put his nest in the branches of a Morello Cherry, in the midst of the silver tassels, or among the snowy rosettes of the Pear; and in the chinks and cranies, blue-tits and wrens build cosy nests. The copings of such old walls, too, afford a footing for House-leek and Stonecrop, Wallflower and Snapdragon, Polypody, Spleenwort and Maidenhair Fern, with the elegant little Toadflax.

Opening a door in the opposite wall, one suddenly comes upon the delightful pleasure-grounds. The broad, smooth lawn, close and soft as a carpet of emerald pile, are chequered with the shadows of stately Cedars and pillared Beeches. A gentle slope leads to the river Colne; one espies its silver ribbon beneath the branches of ancient Thorns. Here and there are herds of fallow deer resting and ruminating in the shade.

Some of the finest Silver Firs in Britain flourish here, with Limes, Beeches, Hemlock Spruce, and a large collection of coniferous trees. Kew Gardens, we believe, were largely furnished from Cassiobury in the time of the Capels. In the orangery are some old trees, drooping with fruit. Near to this house is the quaint pleasure of the late Lady "A." It is a rectangular plot, with a low latticed screen in front, covered with crimson China Roses. At the back is a screen with Roses and Clematis. In this are three circular openings—happy thought!—each affording charming views into the adjoining woods. The effect is startling! It gives one the impression of three charming landscapes, changing momentarily with the changeful light. Passing through one of the green alcoves, we come upon a sheltered dell and rockery, rich with a variety of Ferns; then a sculptured fountain, and, bending over it, one of the many Willows reared from a cutting brought from St. Helena, which still droops over the spot where Napoleon was first buried. Such is but a brief glimpse of one of the finest old gardens in England: historically famous, rich in antiquities, and abounding in interesting specimens of trees and shrubs. The inhabitants of Watford are not slow to avail themselves of the privilege of walking through the delightful park, and now and again strolling through the gardens and pleasure-grounds.

My next old garden is part of the historic Moor Park estate. There are few holiday resorts for north-west London better known than Moor Park, and especially among school

children. The late noble owner, Lord Ehury, probably never refused permission to ramble in his beautiful park. In the midst of it stands the stately mansion, once the residence of the unfortunate Duke of Monmouth and his Duchess. The estate, it may be remembered, was once the property of Cardinal Wolsey, whose great house stood, encircled by a moat, some hundred yards below. He was visited, while residing here, by King Henry VIII. and Queen Katharine. The cardinal's Oak still lives.

The park, some 500 acres of rolling sward, has many magnificent Oaks—a grove of them near the upper pleasure-grounds are pollarded. It is said that this was done by command of the Duchess of Monmouth on the death of the Duke. On the east front is a grand old Italian garden with marble fountains and statuary. It is a brilliant spectacle in the summer months aglow with dazzling colours. From these, the dazzled eye finds relief in glancing over a spacious lawn with noble Beech woods to the left and right. This is a favourite resort of herds of fallow deer. In the distance, softened by blue mists, one descries the northern heights of London. Moor Park was once the residence of Commodore Anson, who delighted under the guidance of the famous landscape gardener, "Capability" Brown, to embellish and improve the gardens and pleasure-grounds, and this beautiful and spacious lawn was one of his improvements. From the Italian garden, one may walk through the grounds, rich in rare Conifers and splendid trees, and enlivened here and there by bright colours.

At a quarter of a mile from the mansion is the large, old-fashioned kitchen garden, also the work of Brown. This is even more interesting than the lawn, with its fountains, statuary, and Yews. It is an oblong, of from five to six acres in extent, surrounded by high walls, and bordered on the south by an extensive range of glass-houses. The broad, smooth walks are margined with herbaceous flowers and fruit-trees, among which is a line of dome-shaped Pears—a charming picture when the trees are in bloom, and not less beautiful, though more tasteful when loaded with handsome fruit.

A distinguishing feature of these old-world gardens is the mingling of flowers, fruit, and vegetables. On entering the gardens from the park the *coup d'œil* is charming. A geometrical lawn slopes away southward, gay with Roses, Carnations, Zinnias, Asters, Violas, and choice bedding plants, a most interesting and delightful mass of mingled colour, fragrant with Mignonette, Heliotrope, and Stocks. On the right is a fruit quarter, with scores of varieties of Apples, Pears, and Plums. Broad walks run east and west through the garden, the central one margined with raised borders, is thickly planted with a host of old favourites, Hollyhocks, Fuchsias, perennial Larkspurs, Pæonies, Phloxes, Foxglove, Hydrangea, Campanulas, Gladiolus, Agapanthus, Sweet Briar, Clematis, perennial Sunflowers; and, nestling in the crevices of the hürs, cushions and rosettes of choice alpines. The gardens are fortunate in having a broad setting of emerald sward and waving woods, while in the distance is seen the silvery-grey line that marks the valley of the Thames as it sweeps by Windsor.

The walls of this fine old garden are covered with Peaches and Nectarines, Pears, and Plums, while one stretch of them was covered this year with an enormous crop of Apricots—a charming picture, though scarcely more beautiful than when loaded with the snow-white blossoms, bee-haunted all day long. One must not forget those hedges of Rosemary, Lavender, and Sweet

Briar, nor the lines of stately Hollyhocks, huge pyramids of glowing colour.

There are several delightful old gardens in the neighbourhood of Harrow Weald and Stanmore. One of the finest is that of Bentley Priory; half a century ago the Priory was the residence of the late Queen Adelaide. On the south front is a fine Italian garden, with statuary, fountains, and Irish Yews. A distinguishing feature of the garden a few years ago, was the huge cones or pyramids of blossom standing at intervals of a few yards. They were from 10 to 12 feet high, and 7 feet through at the base. The plants, Pelargoniums, Clematis, Heliotrope, Tropæolums were trained to stakes, and the effect of these huge cones of blossom was surprisingly beautiful. During the months of June, July, August, and September some grand Orange trees loaded with fruit were placed along the terrace. A spacious park engirdled with fine trees stretches down to a lake, and beyond, at a distance of 4 miles, is seen Harrow Hill, with its church. It is a relief to turn from the brilliant parterre and sparkling fountains to the delightfully cool greenery and shade of the Cedar garden, with its bowers of Roses and the winding paths of the fernery.

At the distance of half a mile, on the margin of Stanmore Common, there is another delightful old garden, once the property of that wealthy penmaker and connoisseur of art, Joseph Gillott. No part of this garden is visible from the high road, but the worthy lady to whom it now belongs from time to time throws it open to visitors from London. Sometimes it is a party of hundreds of elderly poor folk; at another, a number of district visitors or scripture readers; or, again, at another, a large party of Sunday-school teachers. Recreation, rest, and ample hospitalities are provided for each and all.

A distinguishing feature of this old garden of 21 acres, is the fine collection of coniferous and deciduous trees, the latter remarkable for their brilliant foliage. One might wander for hours beneath the cool arcades, and emerge suddenly on the borders of a landscape steeped in sunshine—woods, waving cornfields, placid lakes haunted by wild-fowl; while, on the horizon, is the stately grey pile of St. Albans Abbey. The Lady Bountiful of this grand old garden, Mrs. Brightwen, with its statuary, clipped hedges, and borders filled with choice herbaceous flowers, is never happier than when she sees others enjoying its manifold charms. *T. W.*

NEW OR NOTEWORTHY PLANTS.

ODONTOGLOSSUM ASPIDORHINUM, *Lehm., spec. nov.*

This is beyond any question the most floriferous Odonoglot yet discovered. Not only does every pseudo-bulb produce two flower-spikes at one time, but they do so for two and even three years in succession, a character which, though common among *Masdevallias*, has not yet been observed with *Odonoglossum*. It is therefore quite common to meet with comparatively small masses, which are set with twenty to thirty flower-spikes at one time, and as many as thirty-eight have been observed on one plant. Such plants look very charming and ornamental, more especially as the flower-spikes stand apart from and slightly bend above the short narrow leaves, thus forming a semi-globular flowering mass of great beauty. I think scarcely anything more graceful as a centre plant at a dinner-table could be imagined. The flowers vary somewhat in the colour of the lip, being sometimes pure white, but more frequently more or less spotted with lilac-crimson. The name is given in allusion to the peculiarly upright bent staminode standing like a shield above the nose-like rostellum.

FIG. 66.—CYPRIPEDIUM X LORD DENBY: COLOURS, IVORY-WHITE AND ROSE PURPLE.
(SEE P. 358.)

Plants dense, caespitose, attaining but small dimensions. Pseudo-bulbs long-oviform, strongly compressed, deeply plaited, two-leaved, 4 to 5.5 cm. long, 3 to 3.5 cm. broad. Leaves stiff, papyraceous, cuneate-oblong, abruptly cuspidate, 15 to 18 cm. long, 1 to 1.5 cm. broad. Flower-epike not inclined to branch, 30 to 45 cm. high, nine to fifteen flowered. Sepals and petals oblong, contracted into long ligulate points, and slightly nodulate at the borders, 3.5 to 4 cm. long, 0.6 to 0.8 cm. broad, clear yellow, blotched more or less with red-brown; the petals a little smaller than the sepals. Lip subpanduriform, long-unguiculate, at the margin finely fringed, at the apex abruptly contracted into a sharp convolute point, 3.5 to 4.5 cm. long, 1.5 to 1.8 cm. broad, pure white, more or less spotted with lilac-crimson. The crest consists of four tooth-like laciniae, of which the two lateral ones are protracted into villous cirrhi. The borders of the unguis are densely villose. The column, distinguished by a deep stigmatic cave, bears at the apex on either side a narrow cirriform spreading auricle, and is of a light yellow tint. The staminode is protracted, and bent upright into a flat triangular point, standing shield-like above the rostellum.

Habitat, Columbia. Grows on trees in dense forests on the eastern declivities of the western Andes of the Cauca, 2200 to 2500 metres above the sea. (*Vid. Plant. Lehmanniae*, No. 10021; *Lehm., Ic. Pl.*, t. 1001.) *F. C. Lehmann, Popayan, August, 1895.*

CEROPEGIA DEBILIS, *N. E. Brown (n. sp.)*.

Tuber flattened, with a short woody neck, producing several slender weak stems; as much as 3 to 4 feet in length, and about half a line thick, pendulous under cultivation, glabrous. Leaves rather distant, half to 1 inch long, and about half to three-quarters of a line thick, succulent, subterete, slightly flattened on the face, acute, more or less curved, with petioles about 1 line long, glabrous, light green. Peduncles quarter to half an inch long, glabrous, bearing one to three flowers at its apex. Bracts minute. Pedicels about 2 lines long, glabrous. Sepals 1 line long, lanceolate-acute, glabrous. Corolla 1 inch long, straight; the tube five-eighths to three-quarters of an inch long, ovoid-inflated at the base, and there about 2 lines in diameter, cylindrical and narrower above, scarcely enlarged at the mouth; the outside is glabrous and pale purplish, the inside is sparsely covered with reflexed hairs in the upper part; the lobes are 3 to 3½ lines long, erect, with connate tips, linear from a deltoid base, replicate, greenish, with a blackish-purple keel inside, glabrous outside, covered with rather long, curly purple hairs on the inner face. The outer corona is about half a line long, cup shaped, with five short crenations, and slightly ciliate along the margin within; the inner coronal-lobes are 1—1½ lines long, erect, narrowly obanceolate acute, and dorsally connected at their base to the outer corona by five partitions; the entire corona is white.

This very distinct and rather peculiar species was first sent to me from the *Gardeners' Chronicle* Office two or three years ago, and subsequently I learnt from Mr. J. O'Brien that it was sent to him by Mr. J. Buchanan, who collected it near Zumba in Nyassaland. It differs from all the other species known to me by its weak, pendulous stem. *N. E. Brown.*

CYPRIPEDIUM × LORD DERBY (ROTHSCHILDIANUM × SUPERBIENS).

Our illustration (fig. 66, p. 357) represents the *Cypridium* × *Lord Derby* exhibited by Thomas Statter, Esq., Stand Hall, Whitefield, Manchester (gardener, Mr. R. Johnson), at the meeting of the Orchid Committee of the Royal Horticultural Society, August 13, when it was unanimously awarded a First-class Certificate as the best introduction of its class, although certain members of the committee thought it similar to *C. Massaianum superbum* (*Rothschildianum* × *superbiflorum*), a statement which they ultimately withdrew on the dif-

ference in the parentage and the superior qualities of *C. × Lord Derby* being pointed out. One or two other hybrids of reputedly the same parentage have been recorded, but the fact remains that neither in size nor stately beauty of the flowers, or in the brightness of their colours, has anything comparable to Mr. Statter's production been publicly exhibited. The upper sepal is white, with a greenish tinge at the base, and with some fine purple lines; the petals ivory-white spotted with purple, and the lip brownish-rose. Few and far between do such rewards fall to the lot of the patient hybridist, and Mr. Statter is therefore to be congratulated on his very handsome *protégé*.

THE SEED TRADE.

THE GRASS AND CLOVER SEED CROPS.—The returns from the seed-growing districts in Germany, so far as they have come to hand, appear to show satisfactory crops. Meadow Foxtail Grass is but a poor yield, as the late spring frosts did the plants considerable injury, and the drought setting in when the seed was maturing, caused a further loss of crop. Seed of this kind is expected to be very scarce and high in price, especially as home-grown crops are decidedly below an average yield. Bent Grasses (*Agrostis*) also suffered from the weather, and the supply, both from Germany and the United States, is very limited, and high prices must rule. The waved-air Grass, *Aira flexuosa*, promises a full crop; the plant is well adapted for sheep pastures in dry natural positions. Sweet Vernal is a fine crop, and the quality exceedingly high. This is about the earliest grass to flower, and is known as the Spring Grass in this country. The tall Oat-Grass, *Avena elatior*, has yielded a crop decidedly below the average.

All the Brome Grasses show a good yield, but as they are for the most part of a rough quality, containing but little nutriment, and disliked by cattle generally, they are not much employed in this country for agricultural purposes. The Prairie Grass (*Bromus Schroeteri*), or more properly *B. commulatus*, appears to be the only one in use in this country, probably on account of its herbage in spring affording an early bite to sheep and lambs. Crested Dog-tail Grass has suffered somewhat from the weather, but there is a fair yield of good seed, although it may have lost some of its brightness. This is a grass natural to high and dry pastures and sheep-downs, where probably no other species is more valuable, not only on account of the compactness of its fine short foliage, which is highly agreeable to the close-cropping animals that feed upon them, but because owing to the depth to which the roots penetrate, it remains green during the driest parts of the summer, or at least, long after most other species have withered. Cock's-foot Grass (*Dactylis glomerata*) shows a good crop in the United States, quite one-fourth larger than last year, and though the seeds are somewhat discoloured, their germinating power is all that can be desired. From New Zealand comes good bright seed, but it does not germinate so well. It is a valuable grass, generally liked by cattle, unless when allowed to become coarse through neglect. Fescue Grasses show a varying yield; Sheep's and hard Fescues, though not a full crop, appears to be ample. The fine leaved variety shows the largest yield, but as severe cleaning will be necessary to ensure superfine samples, prices are expected to be high. The yield of Meadow Fescue is large, and seed of very fine quality has been harvested; tall Fescue is a good average crop of fine quality.

The Yorkshire Fog Grass (*Holcus lanatus*), shows a satisfactory yield of good samples. It is a grass which yields largely to the scythe, and where abundant and luxuriant, as it often is on moist peaty lands, it wonderfully increases the bulk of the hay crop, though the hay is soft and spongy. It is recommended that when the hay in which this grass abounds is carried, sprinklings of salt should be given to make it more palatable. The

Meadow Grasses (Poas), show a good yield also; the rough-stalked (*P. trivialis*) is excellent in quality; the smooth-stalked (*P. pratensis*) gives a large yield of very fine seed.

The Red Canary Grass (*Phalaris arundinacea*), shows a large crop in Germany, though it is used in this country to a very limited extent, the herbage being too coarse to be liked by cattle generally, though it is said that the creeping shoots have a sweetish flavour, and are greedily devoured by pigs, who doubtless find them nutritious. It is common in many parts of this country on the banks of rivers, pools, and ditches. Of Timothy Grass (*Paleum pratense*), nothing can be said at present with certainty in regard to the probable yield, though it is said to be good both in Russia and Germany. It is sometimes said that it is a grass not generally found in the best natural pastures in Great Britain, though that is a controverted statement. It attains to its best quality in a deep and retentive soil.

All kinds of Clover appear to have brought, or to be bringing good yields this year, and especially so the white variety. Alsike, *Trifolium incarnatum*, Trefoil, and Sainfoin all promise well, but the yield will depend upon the weather, whether favourable or otherwise. *Pisum.*

ASTILBE LEMOINEL.

UNDER the generic term of Astilbe we include the whole of a group of plants with perennial stock, herbaceous stems, the foliage deeply cut, and large branching inflorescences composed of a multitude of small flowers; in colour white or pale rose, individually insignificant, but producing a remarkable effect owing to their numbers. The plants have the appearance of being related to *Spiræa*, of the *Aruncus* section, so that many of them, after long cultivation, are commonly known under the name of *Spiræa*, whilst botanists have also given them the name of *Hetera*; we believe it is quite justifiable to include them all in one single genus, the genus *Astilbe*, as most of them have been produced through the easiness with which they cross, an incontestable proof of kinship.

The name of *Spiræa* should be at once absolutely rejected. *Spiræas* belong to the order Rosaceæ, and are characterised by the existence of numerous stamens, and of a pistil formed of from three to five carpels, usually free. *Astilbes*, on the contrary, are Saxifrageæ, and have from five to ten stamens and two carpels, usually more or less united—at any rate, at the base.

The genus *Astilbe* was founded on *A. rivularis*, Hamilt., a perennial shrub, a native of Nepal and temperate regions of the Himalaya from Cashmir to Bhotan; it has spreading rhizomes, spreading radical leaves, twice divided into three, the divisions dentate, the petioles furnished with numerous dull-coloured hairs. The stems, which grow up to nearly 5 feet, bear several alternate leaves, and are terminated by a large paniculate truss formed of numerous small flowers. The corolla is deficient, the lobes of the calyx numbering from four to five, are yellowish-white, and the eight or ten stamens are pure white. *Astilbe rivularis* does well in a gravelly situation; where it is fresh, and partly shaded, it forms a nice decoration for the borders of lakes, &c., but it is necessary to cover it with leaves during the severe cold of our winters.

Under the name of *Astilbe rubra*, Hook., there was introduced, more than forty years ago, a species indigenous in the mountains of Khasya, and north-east of Bengal; it was discovered by Griffith, and sent to Kew by J. D. Hooker and Thomson, who found it thriving at altitudes of from 5000 to 6000 feet. It differs from the preceding species by the existence of five rose-coloured petals, arranged in star-like form, and by the abundance of large reddish-brown hairs which are on the stems, leaves, and inflorescences. The species is also known as *Astilbe rivularis rubra*, and cannot stand very severe winters. *Astilbe decandra*, from America, was introduced into England about 1812; it is like the preceding

species, in habit resembling *Spiræa Aruncus*; leaves large, biternate, of a glaucous tint; the flowers, borne in ramified panicles, are white.

Astilbe chinensis (*A. odontophylla*), was introduced not many years ago from China, but does not appear to be widely known, as it is not included in horticultural catalogues. It rarely exceeds 2 feet in height, the leaves are triternate, and the flowers white with purplish-bronze shadings. This may perhaps be a variety of the following species. *Astilbe Thunbergii*, Miquel (*Hoteia Thunbergii*), was introduced fifteen years ago from Japan by Messrs. J. Veitch & Sons, of Chelsea. It is a pretty species, with very elegant foliage, of which the folioles are petiolate, oval, and covered as well as is the entire plant, with little silky hairs; the ramified inflorescences are

foliis aureo-reticulatis (about 1871), the foliage of which is green, variegated with yellow along the veins of all the folioles, and the inflorescences of which are more tufted and compact than in the type; also *A. japonica foliis-purpureis*, the foliage of which is shining bronze, at least in the young state, passing to dark green when completely developed; and, finally, *A. japonica compacta multiflora*. This last kind, lately put into trade, is destined to supplant the common variety for all purposes for which it is suitable. The foliage is firmer, more developed, the inflorescences are larger and more ramified, and form white plummy-looking tufts; it appears that this variety is a form of *A. japonica* with leaves reticulated with yellow, but the foliage of which has returned to its normal colour, and the panicles, already more

name is no more ridiculous than many terms in botanical nomenclature, such as *Dracæna Draco*, *Eryvum ervilia*, *Specularia speculum*, &c.*

A. (Spiræa) astilboides grows from about 1½ foot to 2 feet high; the pinnatifid leaves have reddish petioles; the folioles oval, pointed, much toothed, hairy, of a brown-green colour; the ramified floral stalks are covered with little white flowers, dense, which are in the form of a tubular calyx with five white lobes, five white petals, ten white stamens, and two united carpels. This species, as a perennial, likes a silicious soil, and is particularly effective in rockwork, but is especially valuable for pot-culture and for forcing, under which very pretty flowering specimens can be raised.

The origin of a variety, called by its producer, M.

FIG. 67.—ASTILBE LEMOINFI X. (SEE P. 358.)

perfectly erect, and bear flowers with petals white merging into pale rose, elegantly set along the floriferous branches.

Everyone knows *Astilbe japonica*, Miquel, more often called *Hoteia japonica*, Morr. and Deane, or even *Spiræa japonica*, Hort. It is a plant covered with long brown hairs on the base of the stems and petioles, with radical leaves in tufts, trifurcate petioles, folioles oval lengthy, almost coriaceous, of a dark bright green on the upper surface; panicles straight, ramified, while the bracts, the pedicels, the calyx, the corolla, and the stamens, are pure white. This species, when grown in quantities for forcing, is also an excellent perennial plant; it likes a peaty soil, and generally a cool and half-shady soil. The rhizomes are perfectly hardy, but very often the young shoots are destroyed by spring frosts.

Many other varieties of *A. japonica* are also cultivated. By hybridising has been obtained *A. japonica*

compact, have profited by the increased vigour due to the return of the chlorophyll, and gained still more in size and abundance.

The year 1879 marked the first appearance of a new species, for which numerous names are not lacking. It was, in fact, at that time that Mr. William Bull, of Chelsea, who introduced the plant, sent it out as *Spiræa nivosa*; the following year he showed it under the name of *Spiræa Aruncus astilboides*, a designation applied to it by the Kew botanists; or simply as *Spiræa astilboides*, a term under which it soon became popular. Maximowicz, who had discovered it in Japan, separated it from the *Spiræas*, and called it *Aruncus astilboides*, Maxim. But the *Aruncus* are also *Spiræas*, and all the characteristics of the plant we allude to refer it to *Astilbe* or *Hoteia*; so, keeping the specific name, now perhaps too widely spread to be changed, it should be named *Astilbe astilboides*. Really this

Desbois, of Ghent, *Spiræa astilboides floribunda*, is described in the *Revue de l'Horticulture Belge* for 1891 (p. 145). One day M. F. Wiot, of the firm Jacob Makoy et Cie., of Liège, showed M. Desbois a rapid method of multiplying *A. (Spiræa) astilboides*, from seed. "I sowed them in the month of May," said M. Desbois, "I often remarked that the foliage of these seedlings was dark green, almost resembling that of *Spiræa japonica*, instead of exhibiting the metallic-brown tint of the type. . . . The following spring I was struck by the distinctive characteristics of my seedlings and of the type; I still more admired the fine thyrsoidal trusses of flowers much more close and numerous in my seedlings. I deemed myself authorized henceforth to consider my acquisition as a new species."

* A name more in accordance with facts and logic would be *Astilbe aruncoides*; only the authority of a botanist is lacking to cause this to be admitted. E. L.

M. Debois thought that his plants corresponded to a specific type of *A. (Spirea) astilboides*, while the plant originally introduced under this name was an inferior variety of the same type. We think that, on the contrary, his plant was a natural hybrid between *A. japonica* and *A. (S.) astilboides*, probably cultivated at a little space apart one from the other in his garden, and easily crossed by the insects of all kinds which never cease to visit these flowers. We believe this for two reasons: the first is that *A. (S.) astilboides*, from seedling plants sold by the firm Jacob Makoy et Cie., were exactly similar to the type; the second reason is, that we have artificially crossed *Astilbe japonica* with *A. (S.) astilboides floribunda*, and have obtained all sorts of intermediate forms, many of them very fine, and superior to both parents. The accidental hybridisation just mentioned is therefore possible. As these varieties have not been sufficiently studied, and as they are not yet re-named, we will refrain for the present from speaking of them. We will, on the contrary, say a few words about another hybrid, *Astilbe* × *Lemoinei*, the production of which tends to confirm the theory advanced above, namely that *Astilbe Thunbergii*, *Hoteia japonica*, and *Spirea astilboides* are but species of the same genus and should be classed as *Astilbe*.* We owe this novelty to a cross effected between *A. Thunbergii* and *A. (S.) astilboides floribunda*. Here is the description:—foliage very elegant, rising to 19 inches in height; long ramified petioles; large folioles broadly oval, dentate, pinnated, furnished with very bright green hairs and with a satiny look. Immediately above rise broad ramified panicles borne on firm peduncles, and forming plummy inflorescences 19 inches high; the flowers have five white petals, ten rosy stamens, and two carpels, and are extremely numerous, and the general appearance is of white, slightly rosy. Placed alongside of *A. (S.) astilboides floribunda*, as shown in the photograph, the new plant is seen to be twice as high, the time of its flowering is intermediate between the times of its two parents; it blooms in the course of July, some days before *A. Thunbergii*, one of the latest of the genus. Lastly, *Astilbe Lemoinei* is absolutely hardy, and as well adapted for forcing, as is *A. japonica*, which it excels from every point of view. *Emile Lemoine*.

ORCHID NOTES AND GLEANINGS.

CATLEYA WARSCEWICZII, COUNTESS OF DERBY.

THIS unique form of what is popularly known as a white *C. gigas* is now in flower at Stand Hall. The plant, which was certificated last year, has been divided, and both pieces are now in flower—one with three flowers, the other with two. That which strikes the orchidist most is the distinctness of the colours of the flower; the segments are white as snow, and the lip is velvety-crimson, with the upper portion having two orange-coloured eyes shaded white. Then the crimson, which is of the deepest hue, runs up from the lower division of the lip to the base of the column. No florist flower could be more distinct in its lines of colour, which do not shade into each other like many species and varieties, but show the divisional lines in a marked degree. The lip, too, although bifid, forms two-thirds of the outline of a circle, and the lobes overlap one another. Truly this is one of the grandest of *Cattleyas*, and it is to be hoped that the numerous importations will give us a few more such. The plants are growing in cylindrical baskets suspended from the roof, and are in the best of health; indeed, all Mr. Statler's *Cattleyas* under Mr. Robert Johnson's care are in exceptionally good health, and yield in their season satisfactory crops of flowers. *J. A.*

* Our trials at fertilising *A. (S.) astilboides floribunda* with *Spirea Arancus* have always been ineffectual; another reason for separating this plant from the *Spireas*, and rejecting the classification of Maximowicz, *E. L.*

MASDEVALLIA LOWII.

THIS still remains one of the rarest, as it is also one of the most striking, of *Masdevallias*. Belonging to the *M. Chimæra* section, its flowers bear little resemblance to any other member of the group at present in cultivation, although it is doubtless closely allied to *M. trinema*. A healthy plant of *M. Lowii*, possessing about a dozen leaves is in bloom in the collection of R. I. Measures, Esq., Cambridge Lodge, Camberwell. The well-displayed flowers have long triangular equal sepals of a greyish-white tint, profusely spotted with red-purple except at the tips, and bearing at the base of each two or three purple lines. The small, almost flat-shaped, dark purple labellum is a very peculiar feature. It was illustrated in the *Gardeners' Chronicle*, Sept. 6, 1890, p. 268.

ORCHIDS AT MESSRS. JAS. VEITCH & SONS.

IN the Royal Exotic Nursery, King's Road, Chelsea, the waning show of *Odontoglossums*, *Masdevallias*, and other cool-house Orchids, is succeeded by the occupants of the warmer houses, the *Cypripediums*, which are more or less represented here every day in the year, making an exceptionally good display, and the house in which they are arranged is gay with their varied blooms. Among the prettiest are *C. × "H. Ballantine"* (*Fairieanum × purpuratum*), a charming and neat hybrid, as are all the other hybrids of *Fairieanum*; *C. × tessellatum porphyreum* (*concolor × varbatum*), an old but handsome and still rare variety; and *C. × Clinkaberryanum* (*philippinense Roebelinii × Curtisii*), a noble flower which was illustrated in the *Gard. Chron.*, 1893, July 22, p. 86. Among others also we noted *C. × Morgania*, still a leader in its section; *C. × Chas. Canham*, a noble flower; *C. × ænanthum*, and its variety *asperum*, in many varieties; and the forms of *C. × Ashburtonia*, equally numerous; *C. × orphanum*, *C. × Carnusianum*, *C. × Youngianum*, *C. × conchiferum*, *C. × Io grande*, *C. × polystigmaticum*, *C. tonsum*, *C. Chamberlainianum*, *C. Curtisii*, *C. × cardinale*, *C. × leucorhodum*, and others of the *Sedeni* class; and staged with them was a grand form of *Vanda Sanderiana* and other rare species.

IN another house, with *Coelogyne Massangeana* and other species in flower suspended overhead, was a well-flowered batch of the pretty white *Dendrobium Desei*, *D. formosum giganteum*; the glowing rosy-crimson *D. glomeratum*, with a profusion of flowers; *D. Palearctica Schroderiana*, in good examples and great variety; *D. bigibbum*, *D. superbiens*, a small batch of the handsome *D. McCarthia*, some pretty plants of *Saccolabium caeleste*, *Phalæopsis violacea Schroderii*, *Angraecum citratum*, &c. In small groups arranged along the staging was a very effective and showy display of the soft scarlet *Habenaria rhodocheila*; the handsome vermilion *H. militaris*; the flesh-coloured *H. carnea*, which has also prettily-marked leaves; and of *H. c. nivosa*, its pure white form, which has plain green leaves. Also a plant of the pretty *Nephelephyllum pulchrum*, with bronzy leaves and curiously-formed flowers; and other species of botanical interest.

IN the Rockery-house, where a show of Orchids is always maintained, the most striking plants in flower were fine specimens of *Vanda tricolor* and *V. suavis*, the soft cinnabar-scarlet tinted *Epidendrum cinnabarinum*; *Grammatophyllum Ferzianum*, *Sobralia Lucasiana*, *Oncidium microchilum*, and other species of *Oncidium*; *Miltonia Clowesii* and *M. spectabilis radians*, *Paphinia rugosa*, *Odontoglossum grande*, *O. Bictonense* and *O. B. album*, *M. Roezlii*, and some fine coloured specimens of the large-flowered type of *Miltonia vexillaria*.

IN the *Cattleya*-house, the forms of *Cattleya Eldorado* and *C. Loddigesii* are the principal plants in bloom; and the *Nepenthes*-house and the ornamental intermediate-house rockery are very beautiful, a group of the different forms of greenhouse *Rhododendron* well displaying their scarlet-orange, yellow, pink, and white flowers.

COCHLIODA.

THIS small genus is closely allied to *Odontoglossum* and the old *Mesospidium*, which is now

merged with it. The plants belonging to it are evergreen, and require cool treatment; and they are natives of the Peruvian Andes. *Cochlioda Noezliana* is a very handsome and distinct novelty, which was introduced in 1891 by Messrs. Linden of Brussels, through Mr. John Noezli, after whom it is named. It is a most welcome addition to our cool Orchids, being distinct in colour; moreover, the rich orange-scarlet tint of its flowers is one that is very little represented in the Orchid family. In habit of growth it closely resembles *C. vulcanica*, having ovate-oblong, compressed pseudo-bulbs, and long, narrow leaves. The scapes are produced from the base of the completed bulb, and are pendulous, many-flowered, in some instances branched. The flowers are about 1 inch in diameter, and of a soft brilliant orange-scarlet; the lip is trifid, of the same colour as the sepals and petals, with a golden-yellow disc. The column is bright violet-purple, which produces a striking contrast with the scarlet of the remainder of the flower. The flowering period is May and June, and for this reason it should be found valuable as a summer exhibition Orchid. The flower is very enduring, and we have been able to use the same plant at several exhibitions. We have found it succeed best grown in baskets, in a compost of peat and sphagnum-moss, with good drainage. During the growing season it should receive a liberal supply of water. Propagation is effected by dividing the pseudo-bulbs. *Orchid Album*, vol. xi., part 128.

ONCIDIUM ORNITHORINCHUM ALBIFLORUM

THIS was first flowered by the late John Day, Esq., of Tottenham, a most enthusiastic Orchid grower, and whose collection was one of the largest and most complete ever brought together in this country, but unfortunately was dispersed some years ago on the death of its owner. This variety is in the habit of its growth similar to the type, and is quite as floriferous as the species, its beautiful white flowers being produced, in some cases, several together from the base of the leaves, and are pure white, saving the yellow calli at the base of the lip. It is a very useful subject for cutting purposes, and on that account should be eagerly sought after by collectors. It should be grown in a compost of peat and sphagnum-moss in a basket, and placed in the *Cattleya*-house at the shady end, a liberal supply of moisture being required during the growing season, and afterwards only just sufficient water should be given to keep the pseudo-bulbs from shrivelling. This plant may also be grown in the cool-house, but we prefer the *Cattleya*-house, having found that it does better there. It is propagated by division of the pseudo-bulbs. The flowers are produced during the summer months, and last a considerable time in perfection. *Orchid Album*, vol. xi., part 128.

M. VUYLESTEKE'S ORCHIDS.

AMONG these I noted *Miltonia Empress Augusta Victoria*, of unusual habit, bearing a flower of over 4 inches (10½ cen.) in height, by 3½ inches (9 cen.) across; the two lateral sepals are each 4 inches long; the lip measures 3 inches wide by 2½ inches in height. The colouring of this flower is admirable, peculiarly dark rose; the divisions are more pointed than those of the type. I would mention also a plant of *Cattleya gigas*, the very large flowers of which had spreading divisions of an exceedingly delicate colour; the handsome dark lip is about 4 inches long by 3 inches wide. The seedling *Odontoglossum* before noticed continues to thrive. I admired a fine form of *Cypripedium Charles Canham*, good flowers of *C. De Bosscherianum*, *Loochriensiensis*, and other varieties. *Ch. De Bosschere*.

TREES AND SHRUBS.

CUPRESSUS (RETINOSPORA) SQUARROSA.

A FINE plant of this Conifer, seen at Linton Park, near Maidstone, and others a trifle smaller, in Yorkshire, a few days since, remind one of its great beauty and distinct silvery appearance, and prove

that it is quite hardy enough to endure our English climate, even when the thermometer falls below zero. Like most of the genus, it is rather slow in growth, but this is an advantage in some instances, as many of the Pines and faster-growing trees become naked and unsightly after forty years' growth, an appearance which the plant under notice is not likely to have in the same period. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

THE ORANGE, OR GOLDEN-BERRIED MOUNTAIN ASH.

I was very much struck a few weeks since on seeing an avenue of this tree above 100 yards in length. I do not remember having observed it planted in quantity before; indeed, it is a tree rarely to be met with. This variety of *Pyrus aucuparia* should be planted about the gardens and pleasure-grounds as a companion to the red-berryed variety, which is also to be seen in fine berry this season. I was informed by Mr. Goodman, the owner of this avenue, that the birds never touch the berries of this variety until long after they have eaten all the red berries, which is a point in its favour. The specimens sent have been gathered three weeks. *Edw. Bennett, Lyne, Chertsey.* [The bunches of fruit sent by our correspondent were of a beautiful orange tint, and profusely set with berries, showing how favourable the weather had been when the trees blossomed. Ed.]

THE SYLLABUS OF THE SUMMER SCHOOL OF HORTICULTURE AT CHELMSFORD.

The course of elementary instruction in Horticulture was given at Chelmsford during the first three weeks in July. Owing to the size of the class and the nature of the instruction, all the work (with the exception of the three chemical lectures) was carried on in a shed roughly fitted up as an extemporised botanical laboratory—the continuous fine weather making the necessity pleasurable.

As a rule, the scientific part of the instruction was given in the morning, and the more purely horticultural lectures and demonstrations during the afternoon of each day. Visits to nurseries, gardens and seed farms in and around Chelmsford, formed an interesting feature of the programme. The following places were visited:—

1. Private garden of the Mayor of Chelmsford.
2. Trial plots of Mr. Cullen, seed grower, Witham.
3. Seed farm and orchard of Mr. Seabrook, Springfield.
4. Town farm (for the disposal of sewage), Chelmsford.
5. Fruit and general nurseries of Mr. Saltmarsh, Moulsham, Chelmsford (Two visits).
6. Melon and Tomato houses of Mr. Miller, Chelmsford. At all these places the class was received with the utmost kindness and liberality. The students in each case were taken round either by the principal or his manager, and full, interesting and instructive information was given throughout.

At the end of the course an examination was given by Mr. John Fraser and Mr. David Houston.

The following was the course of practical instruction given by Mr. John Fraser:—

DEMONSTRATION I.

THE SOIL AND ITS PREPARATION.

I. Preparation of land for the growth of crops, and practice in the use of implements.

- (a) Garden ground should be trenched every second or third year; part of this should be accomplished every year.
- (b) Take out a trench 2 ft. wide and 18 inches to 2 ft. deep.
- (c) Wheel the soil, as it is taken out, to the far end of the quarter to be trenched.
- (d) Cut the two sides of the trench perpendicularly as the work proceeds, so that no hard ridges may be left to retain water as in a trough in winter.
- (e) Fork or pick up the bottom of the trench so that the sub-soil may be loose and allow superfluous moisture to drain away.
- (f) If the ground is intended for deep-rooting Carrots or Parsnips, put a layer of farm-yard manure in the bottom of the trench.
- (g) For other crops, especially shallow-rooting ones, more manure should be placed in a layer about 9 to 12 inches from the surface.
- (h) Dig the soil of the second trench into the first, and repeat the operation till all the trenches are turned over.
- (i) Fill the last trench with the soil taken from the first.

2. Rolling.

- (a) Roll the garden walks to make them smooth and firm.
- (b) In dry weather it will be necessary to water the walks thoroughly about an hour previously to rolling them, to render them soft, otherwise rolling will have no effect.
- (c) Roll the grass lawns to render them firm and smooth, and to destroy worm casts.

3. Practice in the use of the rake, and preparation of seed beds.

- (a) Level a piece of ground, breaking the clods and raking off the stones with as little soil as possible.
 - (b) Make the surface smooth and ready for seed sowing.
 - (c) Rake off the weeds from ground that has just been hoed, clearing them thoroughly of soil.
 - (d) Wheel the weeds to the rubbish heap, and the stones to another.
- 4. Practice in the use of the Dutch hoe.**
- (a) Push the hoe through the soil about ½ in. to 1 in. below the surface, so as to cut the roots of all weeds.
 - (b) In doing so, be careful not to cut or injure the cultivated plants.
 - (c) Hoeing is also intended to loosen the surface of the soil amongst all growing crops, especially in dry weather; every part should therefore be equally loosened.

**DEMONSTRATION II.
MANURES AND THEIR USE.**

1. Farmyard manure.

- (a) Preparations for the fermentation of fresh farmyard manure.
- (b) With a steel fork, shake up the manure loosely, piling it up into a conical heap.
- (c) Let it lay for four to six days, according to the rate at which it heats.
- (d) Should it be very dry, give it a watering with a rosed watering-pot as the work proceeds. This will assist it to ferment regularly and equally, and prevent violent heating and loss of nitrogen in the form of carbonate of ammonia.
- (e) After four to six days, when the heap has partly subsided, shake it up in a fresh heap, with the raked manure in the centre.
- (f) After a few more days it will be fit for the making of hot beds and Mushroom-beds.

2. Sampling different kinds of artificial manures.

- (a) Note the colour and general character of guano.
- (b) If it smells unusually strong, it is losing nitrogen in the form of ammonia.
- (c) It should always be kept as dry as possible, to prevent loss until about to be used.
- (d) Note general character of sulphate of ammonium.
- (e) If in its crystallised form, it is a highly-concentrated manure containing about 20 per cent. of nitrogen.
- (f) Nitrate of sodium is also in the form of crystals, and contains about 15 per cent. of nitrogen.
- (g) Compare coarse and finely-crushed bones and bone-meal.
- (h) Examine the ground phosphates; ascertain and remember the difference between them and superphosphate.
- (i) Superphosphate has been prepared by treating the original substances with sulphuric acid.
- (j) Coprolites are largely used for the making of it.
- (k) The best superphosphates are made from phosphatic guanos.
- (l) Note the general character of potassium salt, known as kainit, and compare with nitrate of sodium, &c.

3. Preparation of liquid manures.

- (a) Get some pure cow-dung, put it into a tank, and fill up with water.
- (b) Let it stand for a day or two, cover with a guano bag to prevent the manure from rising, while drawing off the liquid for use.
- (c) Dilute it with water according to its strength, until of a pale brown colour and relatively weak.
- (d) Water pot-plants with it every second or third day, and with clear water on alternate days, if necessary.
- (e) Place a bag of soot in a tank of water, and after 24 hours the clear liquid may be used as a stimulant. Soot contains a small quantity of ammonia.
- (f) Another liquid manure may be made by putting a haudful of guano into 4 to 6 gallons of water.
- (g) Use it weak rather than strong, and alternately with the liquid from cow-manure.

DEMONSTRATION III.

PRELIMINARY CULTURAL OPERATIONS.

1. Seed-sowing—vegetables.

- (a) Prepare a compost of two parts of loam, one part leaf mould, and half a part of sand; mix the whole thoroughly.
- (b) Get some seed-pans and drain them carefully; cover the drainage with the rough siftings of the compost.
- (c) Fill the pans with the compost; press it down evenly and firmly, finally making the surface perfectly smooth and level.
- (d) If the soil is relatively dry, give a good watering through a fine rose, and allow the superfluous moisture to drain away.
- (e) Sow seeds of Lettuce or Onions, evenly and rather thinly all over the surface.
- (f) Cover the seeds with a shallow layer (½-inch) of a finer and more sandy portion of the compost.
- (g) Give a light sprinkling of water to settle the compost.
- (h) Stand the seed-pans in a greenhouse, and keep a daily record of the temperature and the date of the first appearance of the seedlings.

2. Transplanting seedlings.

- (a) Transplant the seedlings about 1½ to 2 inches apart each way into other seed-pans or boxes before they get crowded. Carefully lift with all the roots intact.
- (b) The distance between the seedlings may vary according to the natural vigour and size of the kind, and the time they are to remain in the boxes.
- (c) Return the boxes to the greenhouse pit or frame, and place on a shelf or bench near the glass to prevent the seedlings from getting drawn.

3. Planting trees or bushes.

- (a) Lift evergreens with a ball of soil proportionate to the size of the plants.
- (b) Previous to lifting, take out holes of sufficient depth and width to take all the roots when spread out.
- (c) Deciduous trees and shrubs, when lifted in autumn and winter, need not have soil attached, unless of large size.
- (d) Cover the roots (1) with the finer soil, (2) with rougher material; (3) tread firmly when the holes are about half full; (4) give a good watering, and leave them till the water drains away.
- (e) Finally fill up the holes and tread firmly.
- (f) Stake the trees, &c., if necessary, to guard against wind.

4. Mixing composts.

- (a) Make up a compost of three parts fibrous loam, half a part each of leaf-mould and well-decayed cow-manure with a good sprinkling of sand. This will suit *Pelargonium* and other plants of similar character. Break up the loam roughly by hand, and do not sift any portion of it.
- (b) For *Fuchsias*, more sand should be used. The compost in this case should be light and rich.
- (c) Make up a compost of equal portions of loam and peat, with half a part of sand. This would answer for many Ferns.

5. Potting.

- (a) Drain the pots well according to size, covering the drainage with Moss.
- (b) Put a little soil in the bottom of the pots.
- (c) Turn out your plant, remove the crocks and the looser portions of the old soil.
- (d) Pot firmly, and afterwards give a watering with a rosed watering-pot.

6. Staking.

- (a) Stake various plants neatly and effectively, using stakes proportioned to the size of the same.

DEMONSTRATION IV.

VEGETABLE CULTURE.

I. Making sets of Potatoes.

- (a) It is not advisable to cut "round Potatoes" when only 1 in. to 1½ in. in diameter, nor "kidneys" unless more than 2 in. long.
- (b) The eyes at the apex of the Potato are always the strongest, and one of them should be secured in as many cases as possible for each set.
- (c) For the sets obtained from the basal end of the Potato, select the strongest eyes.
- (d) Cut the kidneys longitudinally, so as to get a good-size 1 piece of the tuber for each eye.
- (e) Never cut too close beneath the eye of any set, lest the bud should be deprived of proper nourishment.
- (f) Relatively large sets are better than small ones.

2. Preparing a seed-bed for Onions.

- (a) With a fork, level the surface of the ground, if it has been laid up in ridges for the winter.
- (b) Give a top-dressing of pigeon's or fowl's dung and soot, forking it lightly into the surface.
- (c) Tread the soil all over, firmly and evenly, with the feet, or roll it to effect the same purpose.
- (d) Mark off the ground at each end with pegs 12 in. apart.
- (e) Stretch a line from peg to peg along the ground and with the draw-hoe take out trenches half-an-inch in depth, and along the side of the line which is used as a guide.
- (f) After all the trenches have been taken out, sow the Onion seed, thinly and evenly.
- (g) With the back of the rake, fill in the trenches, beating down the soil lightly with the same.
- (h) Rake the ground smooth along the lines (not across them), so that no clods or stones may obstruct the germination of the seeds.

3. Sowing Peas.

- (a) Ascertain the height of the Peas to be sown, and if it be 3 ft., mark off the ground in lines at least 2½ ft. apart.
- (b) Stretch a line from peg to peg along the ground, and with a draw-hoe take out trenches 3 in. deep.
- (c) Sow the Peas evenly and moderately thickly along the trenches.
- (d) With the rake, fill in the trenches till the soil forms a slight ridge above the Peas. Leave the soil rough, as raking is unnecessary with this crop.

4. Sowing Beans.

- (a) Peg off the ground in lines 2 ft. to 3 ft. apart, according to the height of the Beans to be sown.
- (b) Take out trenches 3 in. deep, and the full width of the hoe.
- (c) Sow or plant the Beans in a double row, placing the seeds 6 in. apart in the lines, and alternately with those of the companion line.

DEMONSTRATION V.
PROPAGATION OF PLANTS.

1. Making cuttings.

- (a) Make cuttings of Gooseberries of young shoots of medium strength and 12 in. to 14 in. long. If longer than this, reduce them by cutting off a part of the apex.
- (b) Carefully cut away or remove all the buds except four at the upper end. This will prevent suckers, and secure a clean stem.
- (c) Prepare cuttings of Red and White Currants precisely in the same way.
- (d) Make cuttings of Black Currants about 12 in. in length. Note of the buds should be removed, as suckers in this case are desirable.
- (e) Plant the cuttings in trenches, covering them to a depth of 5 in., and tread the soil firmly against them.
- (f) Make cuttings of Carnations and Pinks, each 2 in. to 3 in. long.
- (g) Cut them horizontally, immediately beneath a joint, with a sharp knife.
- (h) Remove the lower pair or two of leaves, and slightly shorten the rest if they are very long.
- (i) Treat Pelargoniums in the same way; they may, however, vary from 2 in. to 5 in. in length.
- (j) Remove Rose cuttings with a small heel of the old wood.
- (k) For planting outside, they should be 9 in. to 10 in. long. Remove the lower leaves, but not any of the buds.
- (l) Insert them in trenches 4 in. apart, and in lines 12 in. asunder, to leave room for hoeing.
- (m) Cut the base of the cuttings 6 in. below the surface; cover with soil and tread firmly.
- (n) For insertion in pots under glass or in a hothouse, the cuttings need only be 3 in. to 5 in. long.

2. Budding.

- (a) Bud Roses a little below the surface of the soil, in the case of bushes; and as near the main stem as possible, in the case of standards.
- (b) Make a transverse cut through the bark with the budding-knife, and a longitudinal one about 3 in. long.
- (c) Prepare the bud by inserting the knife a little above it, passing downwards and outwards till a piece of wood and bark $\frac{1}{2}$ an inch in length is removed.
- (d) Cut off the leaf retaining the petiole. Carefully remove the wood from the bark, retaining the core of the bud in all cases.
- (e) Lift the bark of the stock with the thin end of the handle of the budding-knife, and slip in the bud beneath the bark so lifted.
- (f) All these operations should be done as quickly as possible, to prevent injury to the cambium layer by exposure to the air.
- (g) Bind up the inserted bud with raffia, covering all except the bud.

3. Grafting.

- (a) Graft Apple, Pear, and other fruit trees about 3 in. above the soil, except in special cases where it is convenient or necessary to work the trees at a higher level.
- (b) For splice-grafting, cut both stock and scion in a slanting or oblique direction, so that the latter will exactly cover the cut surface of the former. The object is to make the cambium layer of both to coincide.
- (c) In the case of tongue-grafting, make a notch or a deeper slit in the stock, with a tongue in the scion to correspond to the same.
- (d) When perfectly fitted, insert the tongue in the notch, and bind stock and scion firmly together with a piece of raffia.
- (e) Where triangular notch-grafting is intended, take out a triangular groove in the stock, narrowing the notch to a point at the lower end.
- (f) Cut the scion so that it will accurately fit the groove in the stock.
- (g) Insert it, and tie up firmly with raffia.
- (h) Cover the grafts with grafting clay, and that again with moss to keep out drought.

4. Layering Carnations and Shrubs.

- (a) Make up a compost of sandy soil and leaf mould, and spread some of it around the Carnations to be layered.
- (b) Remove the lower leaves of the shoots to be layered.
- (c) Pass the blade of the knife inwards at a node, and upwards for half-an-inch or thereby, being careful not to sever the shoot from the parent plant.
- (d) Peg down the shoots, keeping the tongue or cut open.
- (e) Cover the layered portions of the shoots with the compost, and give a good watering with the rosed watering-pot to settle the soil. Repeat the watering in dry weather until the layers are rooted.

5. Division of herbaceous plants.

- (a) Take a clump of Iris and clear away the soil from it.
- (b) With a knife, remove every crown of leaves with a portion of roots to the same.
- (c) Every portion, thus carefully removed, will form a plant.
- (d) Hundreds of other herbaceous plants may be treated in the same way, with the smallest possible loss or waste of material.
- (e) Never use a spade in the division of herbaceous plants of any kind, but particularly valuable and slow-growing sorts, as it occasions much loss.

I T A L Y.

(Continued from page 325.)

FLOWER-CARPETS.—In Torre-del-Greco is celebrated every year during the month of June a religious festivity called the "Quattro Altari" (Four Altars), when, amongst its principal attractions are to be seen the so-called tappeti di fiori, or flower carpets. On the floor of the churches occupying a space which measures 45 by 40 feet, these carpets are formed. This year there were five of them, representing, "Tobias's Departure," "Thomas of Aquino," who compiled the Liturgy of the Sacrament; "Jesus rescuing Peter on the Waters," "Naomi and her step-daughter."

For the formation of these really artistic carpets, which formed the admiration of all who saw them for the first time, the material employed is cut flowers or their petals, coloured sand, and saw-dust. Could not such "carpets" be introduced by fashion in garden parties, or any such worldly amusements, using secular subjects? We think that they would be a great success. [We hope not. En.]

At the Naples flower-show a similar carpet has been greatly admired. It was of rich design, and contained in the centre the royal arms. It was composed with the produce of the vegetal realm, and the flowers mostly employed were Dahlias, Pinks, Asters, Delphiniums, fruits of Ailanthus, and dust of burnt Vine and dried Chestnut leaves. The green of its border consisted of leaves either entire or minutely cut. The gardener, di Cristi, who had created this carpet was highly complimented.

CANNAS.

About the middle of the long aisle, the numerous visitors stopped admiringly before the gorgeous show of Cannas presented by Messrs. Dammann & Co. of San Giovanni-a-Teduccio. No words can express the beauty of the new varieties. How far behind are left the poor Cannas with small flowers and stiff petals compared with these Cannas both as regards their vigorous growth and the size of their flowers! The label indicated "new varieties of Orchid-flowering Cannas," and, in fact, the large flower outrivals and sometimes surpasses the largest tropical Orchids.

The strong and compact spikes of the variety Austria are covered with enormous flowers, attaining a diameter of 6 inches and more; the yellow-spotted throat of which, and pale-red petals bordered with yellow, present, against the mass of foliage, a most striking sight.

The Canna Italia is a grand plant exceeding 6 feet in height, with Musa-like leaves and enormous spikes of brilliant red flowers bordered with yellow. These are two of the most splendid varieties, which for their beauty, leave varieties like Madame Crozy and others far behind; and yet in future, there will be still more splendid varieties such as Alle-mannior, La France, and others.

The jury interpreting the general admiration, and considering that nothing of the kind had been exhibited before, awarded Messrs. Dammann & Co. the Diploma of Honour. Dr. G. Mottarella, Portici, August, 1895.

of the selenipedium section, may with advantage be repotted or top-dressed as each case may require. Among varieties now in bloom mention may be made of C. Maynardi \times , C. picturatum \times , C. orphanum \times , C. Harrisianum superbum \times , C. Morgania \times , C. Ashburtonia \times , C. Crozianum \times , C. purpuratum, C. ceanthum \times , and its variety superbum. As these plants commence to grow very soon after the flowers fade, no delay should occur after the flowers are past in repotting or surface-dressing them. It is now a good season to take and prick out young seedlings into very small pots, or to give more root-room to those that were taken off last spring; if the work be done at once, they will become well established before winter. When repotting Cypripediums, it is not necessary to raise them above the rim of the pot, therefore keep the compost just below it so as to render watering easy. The pots used should be well drained, and the compost may consist of rough fibry peat and clean picked sphagnum in about equal parts, adding some broken pieces of brick or crocks to keep the soil free and porous. When well rooted these plants may be almost deluged with water the whole year round, but they must be carefully protected from strong sunshine at all times.

CATLEYA-HOUSE.—In the Cattleya-house, Cattleya Bowringiana, C. Alexandrae, and the autumn-flowering varieties of C. labiata, are showing their bloom-spikes, and will require sufficient water to keep the roots moist, but not wet, until the flowers open, when it must be gradually discontinued. Although the weather during the past summer has been exceptionally hot, there are still some plants of Lælia purpurata, L. tenebrosa, Cattleya crispata, and C. lobata, with growths only a few inches high, and fortunately they appear very much stronger than those which started earlier. As these growths will soon commence to make new roots, the plants should be examined to find out if they require more root-space. In every case the roots should have sufficient space to grow inside the pot, therefore when re-potting, allow room for two seasons' growth. During the growing period the plants should be placed in the lightest position in the Cattleya-house, and water very carefully afforded as recommended in former *Calendars* for others of the same genus. Some of the spring-flowering Cattleyas, as C. Trianae and C. Mendeli, have completed their growth, also C. gigas, C. Eldorado, C. Hardyana, C. Macraissa, C. Dowiana, and its beautiful variety aurea, these will consequently require less water at the root, and all the sunlight possible, so that the newly-formed bulbs may become properly matured. The present is a critical time with many Cattleyas and Lælias, and the grower should look over them every day, especially when the weather is dull and damp. He will probably notice that the outer sheath which encircles the pseudo-bulb, especially at its base, will be soft and sappy, clinging so tightly to the bulb as to prevent the ingress of air, which is frequently a cause of decay. Should this occur, slit open the sheath from top to bottom, and keep the plants dry at the root for a few days, and at the same time reduce the amount of atmospheric moisture. When on opening the sheath it is found that the bulb has already commenced to turn black, the affected part should immediately be cut off, or the plant may die altogether. To prevent such decay occurring, careful ventilation, with plenty of sunshine, is necessary.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

PINES.—Suckers which were put into 6-inch pots last month, and plunged in a bottom-heat of 80°, should now have a nice lot of roots. Do not pot these on at this season, as growth made during the winter months is always weak. Keep the young stock as quiet as possible until the spring, when, with lengthening days, growth will be both strong and rapid; only sufficient water should be afforded to keep the bulb fairly moist. The plunging material should be kept well up to the rim of the pots, and quite firm. It is not wise to shift the plants oftener than is really necessary, as there is danger of a check occurring, which may cause the plants to produce fruit prematurely. If the plants can be given a steady bottom-heat of 65° to 70°, and plenty of light, it would be as well not to disturb them until the spring. Shading of all kinds should be dispensed with at once, if this is not already done. Take advantage of bright sunshine to remove and

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorset.

CYPRIPIDIUMS.—The present is a good time to look over the Cypripediums which occupy the warmest division, and report those that require it. Such plants as C. Stonei, C. Lowi, C. Lawrenceana, C. selligerum \times , C. Rothschildianum, C. Curtisi, C. Swani-anum, C. Sandermanum \times , C. barbatum, C. super-ciliare \times , C. Hookerae, &c., that bloomed during spring and early summer, will by this time have made considerable growth, and unless any of them are suffering for want of root-room, it will be advisable to let them remain undisturbed until the flowering period is over, but such as have bloomed late, as C. Io grande \times , C. Measuresianum \times , C. Chamberlainianum, C. radiosum \times , C. Pollettianum \times , C. Parishi, C. T. B. Haywood, and those

well wash the roof-lights, so that as much light as possible may reach the plants. Continue to ventilate daily so long as the weather is mild and bright, and the floors may be damped several times during the day. A night temperature from 65° to 68° will be sufficient, and 75° by day with sun-heat. Queens intended to fruit next spring will have filled their pots with roots, and should be prepared for a season's rest, by gradually reducing the temperature of the house, and affording less water at the roots. If the plants are not carefully prepared in this way, they will fail to throw up good fruits when required. See that the plunging material is made firm, and kept well up to the rim of the pots, as this tends to keep the soil moist and save watering. Ventilation and temperature should be the same for these as advised for the young stock. Such varieties as smooth Cayennes and C. Rothschild which are swelling fruit, must be given plenty of heat and moisture. Utilise sun-heat as much as possible, and ventilate but little. Continue to feed the plants with guano, or other stimulant. If the suckers on these plants have become large, they may be taken off at once, potted into 6-inch pots, and plunged in a brick bottom heat; but should they be small, it would be better to reduce the foliage on the old plant, and allow them to grow on until spring.

CUCUMBERS have improved wonderfully since they were planted at the beginning of the month. All fruit and male flowers should be kept pinched off, until the fruit is really required. Surface-dress the border slightly at least once a week, as this keeps the roots from going down into the dung. Stopping and tying of the shoots must receive daily attention. Syringing should now be done on bright mornings, about 9 A.M., and again about 2.30 P.M. Ventilate cautiously, as the least draught may give a serious check. The night temperature must not fall below 70°, or mildew may appear. Keep a sharp look out for green-fly or thrip, and check either at once by fumigating. If the floors and bare spaces are damped down at night with manure-water, it will assist in keeping the foliage free from these pests.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

BEDDING PLANTS.—Preparations should now be made for housing plants which require to be protected during winter. October frosts frequently occur very suddenly, and many varieties of bedding-plants are then unsafe out of doors. Pelargoniums will sustain a few degrees without injury, but Lobelia of the Erinus section, Iresines, Coleus, Alternantheras, and some varieties of Pelargoniums, should be lifted and boxed or potted at once, and placed for a time in close-shaded pits or frames until they have commenced to make roots. Pelargoniums as a rule are now in a better condition for blooming than they have been all through the summer, and may be kept tidy as long as possible, but arrangements should be made to bring them in at short notice. Tuberos Begonias now in good bloom may be lifted, and placed under glass if desired; or they may be left in the beds for some time yet, providing the weather continues dry and fine. Dahlias usually keep well in the ground until November; if they are blackened by the frost before that time, the tops should be cut off 6 inches above the ground. Dahlia Rising Sun is a splendid autumn bedder, and is now a blaze of colour. We have it round a border of Chrysanthemum Madame C. Desgrangs, which is now a mass of bloom. Autumn-flowering Chrysanthemums, Dahlias, and Helianthus, and are blooming profusely. Bedding Dahlias Cloth of Gold and Crimson Queen are excellent for autumn show. Crimson Queen is about the colour of H. Jacoby. Dahlia Rising Sun is the colour of John Gibbons.

FALLING LEAVES will now give additional work. There is nothing more untidy than accumulations of leaves up to the edgings of flower or shrub-beds. They should be swept up every day.

GRASS LAWNS should be kept closely mown, and well rolled when mowing is not required. Mowing is best done in the afternoon at this season, there being usually very heavy dews in the morning. Grass edgings of walks and drives may be kept tidy by clipping, as long as the grass continues to grow; and any which have become uneven and weedy may be edged with the grass edging-knife, which will give them a smart appearance during the

winter. Asphalting of walks with steep gradients, if not already done, should be completed as soon as possible; and walks and roads that require fresh gravel on them should be attended to. Before adding the gravel, give a good dressing of weed-killer. Roll the walks and roads well, and compensate for lack of flowers by extra neatness.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

CABBAGE.—It will soon be the proper time to plant Cabbages in the quarters. If the plants have been growing in nursery beds, they will be strong and sturdy, possessing numerous roots. In this garden Cabbages usually follow an Onion crop, the ground being cleared of this crop at about the right time. It is not necessary to dig light soils before planting. Plants which come out of nurse-beds, and consequently have compact root-masses, require to be planted with a trowel. I always dig the land in this garden, having first afforded it a light dressing of bone-meal and fresh soot. Lime may be used in the place of soot, but I do not care to apply both at the same time. The ground should be nicely broken up whilst digging it, and if dry when the job is finished, it may be trodden evenly all over, and shallow drills drawn, in which to plant. The drills should be about 1 foot apart, and the plants stand at the same distance, each alternate plant being drawn in the spring for the earliest use, which will leave the remainder at 2 feet apart. This planting should consist of early-hearting varieties, such as Ellam's Early and similar ones. Afford the plants a good watering if the soil is dry. Cabbages carefully planted with a trowel soon make good plants, stand the winter well, and do not bolt readily.

CAULIFLOWER.—The produce of the seed sown last month should now be of a proper size for pricking-out in nurse-beds. Various methods are adopted for keeping Cauliflower plants through the winter, and that of planting in cold frames is, I consider, one of the best. It is well to prick-out Cauliflowers twice, first at about 3 inches apart, when, if they are carefully shaded and matured, they soon begin to grow. The next remove should be into the cold frames or handlights, as the case may be. In frames they should stand at 6 inches or a greater distance apart. The number put under handlights may vary from five in small ones to nine or twelve in larger-sized lights. Keep cloas for a few days, and then expose the plants fully till frosts or heavy rains point to the necessity of putting the lights over them. Air must be admitted at all times when there is no frost. The soil should not be so rich as to favour rank growth. Finely-powdered charcoal, a small quantity of lime, road-grit, leaf-mould, spent Mushroom-bed manure, and burnt earth, are excellent for mixing with the staple. The latest succession do well under hand-glasses. Cauliflower plants may also be pricked out at the foot of south walls, and if the winter is not unusually severe, they will survive. Beds may also be provided for them, bending hoops over these to form a support for a covering of bast-mats. Some cultivators sow seed a little later than the usual date, and keep the plants in pots throughout the winter in a cool well-aired place, planting them out in the spring. Those raised from spring sowings will produce nice heads within a short time of others which were autumn-sown, that many growers have now ceased to trouble themselves with autumn-sown plants; and late Broccoli fairly well bridge over the gap between the season of the two kinds of plants.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

STRAWBERRIES AUTUMN-FRUITING, ETC.—Look over Strawberry plantations, and cut off all late runners that have started since the beds were cleaned. Late bloom is not uncommon this autumn, owing to the premature ripening of the plants during the exceptionally hot weather of the early summer. Any such late flower should be removed at once, and the surface of the soil well stirred with the hoe before the mulching with short rich manure, which should be done at this season. Newly-planted beds may be similarly treated, and if these were planted in good time from the strongest early runners, kept clean, and have been helped by mulchings, they will produce the earliest and finest fruit. Early-forced plants which have been planted to give a supply of fruit in the autumn must be

effectually protected from birds, and the trusses of fruit should be supported by forked twigs, or other device for keeping the fruit clean and well exposed to the benefit of sun and air. If movable span-roof frames are available, they may with advantage be placed over these plants, and if a free admission of air be given, the fruit will be greatly improved. Whatever protection be afforded, it should be removed as soon as the fruit is gathered; if kept on too long the plants will become weak, and unable to withstand a severe winter.

AUTUMNAL RASPBERRIES.—Autumn-fruiting Raspberries are now ripening, and they require some care to protect them from birds and other enemies. If twine netting be used for protection, select nets with a small mesh, small birds being a troublesome as blackbirds, &c. The usefulness of Raspberries in the autumn is so great that the crop is worth considerable trouble to secure. When new canes are planted, a good open situation should be chosen, and the soil trenched if possible, and liberally enriched with good rotten manure. Planting should be done early, the canes being cut down to a few inches of the ground, and well mulched with rather long strawy manure, which is not so liable to be scratched over by birds as short material. When established, the canes must be cut down annually close to the ground as soon as the fruit is gathered. In the spring, carefully select four or five of the strongest canes to each stool, cutting away all others. Train the reserved canes thinly to wires, and keep sucker growth under by using the hoe frequently. The best and most prolific varieties are October Red, Large Monthly, and October Yellow.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

WINTER VIOLETS.—Frames should now be made ready for planting winter-blooming Violets. I have tried several methods of growing these plants, and by far the best results were obtained by planting in frames in which Melons or Cucumbers had been cultivated. These frames or pits are 4½ feet deep, the walls pigeon-holed all round, the frame itself standing on brick piers. Such a frame is about 30 feet long, and round it a walled trench 2 feet wide extends for holding stable-litter. During severe weather, this is kept filled with fresh stable-manure. By this means frost is kept out, and the soil warmed a little, and the plants are kept growing and flowering. The plants should be brought up close to the glass when planted, and a small quantity of fresh loam and leaf-soil added to that in which the Melons, &c., grew. The soil should be made very firm round about each plant, no loose soil being left about the neck of the plant. A good soaking of water should be afforded the bed on completing the planting, and a heavy syringing twice a day in bright weather. The lights may be left off night and day until signs of frost are noticed, when they may be placed over the plants, but tilted unless the frost is sharp. A number of plants may be planted in cold frames, for although they may not give much bloom through the winter, unless it be very mild, they will flower freely in the spring, and prove very useful as a succession to the earlier ones. A few of the best double varieties for early flowering are Marie Louise, Neapolitan, Lady Hume Campbell, Comte de Brasze, or Swanley White; single are, Victoria (this is by far the best for winter work), Welliana, and The Czar. A good hardy double variety for growing outside is Queen Victoria, which has enormous flowers of very dark blue colour and very fragrant.

MARGUERITES.—Should any of these be planted out, a batch of cuttings for flowering next spring may be taken. The cuttings strike readily in sandy soil in cold frames, if kept close and shaded during bright weather. Plants growing in pots should be afforded liberal supplies of manure-water, and they may now be allowed to flower.

SCENTED-LEAVED PELARGONIUMS.—These plants should be taken indoors before the nights become cold, any light airy house being suitable for them. Place them close to the glass, to prevent their being drawn, and afford plenty of plant-food, so as to keep them green and healthy.

CHRYSANTHEMUM SHOW IN BATTERSEA PARK.

—Information reaches us from the Superintendent of Battersea Park that the Chrysanthemum Show will be open to the public in the Frame Ground in that park, near the Albert Bridge entrance, on and after Oct. 5, between the hours of 10 A.M. and dusk.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOW.

SATURDAY, SEPT. 28 { Last day of Royal Horticultural Society's Exhibition of British-grown Fruit, at the Crystal Palace. Essay on the Commercial Aspects of Fruit Culture, at 3.30.

SALES.

MONDAY, SEPT. 30 { Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, OCT. 1 { Dutch Bulbs, at Protheroe & Morris' Rooms. Clearance Sale of Nursery Stock, at the Saxe Weimar Nursery, Castle Road, St. Edward's Road, Southsea.

WEDNESDAY, OCT. 2 { Dutch Bulbs, at Protheroe & Morris' Rooms. Great Sale of Lillium Harrisii, at Protheroe & Morris' Rooms.

THURSDAY, OCT. 3 { Dutch Bulbs, at Protheroe & Morris' Rooms.

FRIDAY, OCT. 4 { Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms.

SATURDAY, OCT. 5 { Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—54°.1.

The Fruit Show at the Crystal Palace.

The second show of British-grown fruits by the Royal Horticultural Society, in conjunction with the Crystal Palace Company, was opened on Thursday last, a circumstance that precludes our giving more than a partial report in this issue. The exhibition, so far as we were able to judge at the time of going to press, is a very successful one. There were 180 exhibitors this year in comparison with 140 last year, and the number of entries in the competitive classes are 1800, as against 1300 in 1894. The quality of the fruits exhibited confirm, as we anticipated, the general opinion that the present season has been a very favourable one for most fruits, and particularly the more important kinds from an economic standpoint. Apples may be regarded as the fruit of the season, and the excellent produce staged by many of the exhibitors is an indication of the quantity and quality of the crop generally. We were not surprised to find that Pears are not so splendidly represented as was the case last year; and Grapes though generally in finer condition, contained nothing of so first-rate quality as the best exhibit of last season. In regard to other fruits and the exhibition generally, it may be said that while in quantity the show is greater than last year, the quality is superior also.

As Sir T. LAWRENCE said in his speech after the luncheon, the present exhibition is another proof, if that were necessary, that we are capable of producing Apples in this country that are equal in quality to any in the world, and it may be hoped that such a demonstration may still further tend to induce farmers who are now working the land to little profit, or perhaps at a loss, to turn their attention to "various branches of a small culture," including that of fruit-growing. In view of this, Sir TREVOR LAWRENCE did well to call attention to the subject of fruit-drying, as in a great measure, the financial success of hardy fruit culture will depend upon the adoption of some satisfactory system of preserving in years of glut, that part of a crop over and above what is immediately required for consumption. Much of the loss experienced by the present growers, may be attributed to the fact that when fruit of

any particular kind is unusually abundant, a large amount is allowed to go to waste, because the market prices for the moment will not pay the cost of harvesting and marketing the fruit. Sir TREVOR LAWRENCE attributed our backwardness in this country in regard to this matter to the circumstance that horticulturists do not readily combine, and in order to inaugurate a satisfactory system of fruit-drying, it was necessary that some kind of combination among fruit-growers should be effected for the purpose. Undoubtedly the difficulty in regard to this matter lies here, but, as Sir TREVOR LAWRENCE added, we hope that gardeners are not so blind to the benefits to be derived from co-operation as to prevent an early application of the principle. There are other points than this, however, to which the grower must give increased attention, in order to compete satisfactorily with imported fruits. We still grow too many varieties for market-work, the harvesting of the fruit is not effected with sufficient care, and the present loose system of packing must give place to more careful methods. There must be regular and systematic grading, and everything done to make the fruit as attractive as possible.

Reverting to the present exhibition, it is a matter for congratulation that the Royal Horticultural Society, has established this annual display of British-grown fruits; and especially so, because in conjunction with the exhibition a series of lectures are given upon the subject that are of very great educational value. Now that a first-class fruit-show has been established by the one society capable of making it and keeping it a success, we hope that no lack of enthusiasm on the part of exhibitor or appreciation by the public will prevent its increased development and usefulness. We must, however, add a word of regret, that we are unable to record a departure from the customary style of displaying the exhibits. We are free to admit that a number of exhibits of Apples in single dishes, or of any other fruit in similar classes, admit of a little variety of arrangement, but granting this, surely the collections of numerous varieties might be arranged in some more artistic manner than obtains? Why could they not be shown in such a manner to visitors that they would appeal to them in the same way as does a bouquet or a picture? This might be easily accomplished without in any way tending to deteriorate the quality of the fruits, or to prevent accurate comparison for the purposes of judging.

THE ROCKERY AT WARNHAM COURT, HORSHAM (see Supplementary Illustration).—There is no better way of exhibiting the beauties of most alpine plants and others of low growth, than to plant them on rockeries. The plants are then placed in positions approximating, however distantly, to those in which they grow in their natural habitats. Their necessities can likewise be met in the matter of sunlight, or the lack of it, rapid drainage of the soil, in securing deep crevices in the dampness of which many species of Orchids succeed without soil of any kind about their roots—merely small nodules of some kind of stone—limestone or other taking its place, resembling, in this respect, the epiphytal species of Orchids, Tillandsias, &c. A rockery admits of the more ready use of a variety of soils, according to the claims of the different species of plants; for soils of granitic, limestone, chalk, sandstone, peaty and loamy nature, than a flat border would render possible; the use of rock, artificial or natural, rendering the separation of the various materials an easy matter. There are rockeries

and rockeries, some erring against every canon of good taste in their construction. In the one which is the subject of our illustration, no ambitious attempts, usually abortive, to create an Alpine landscape on flat land, have been made, but dwarf masses of sandstone, with due regard to stratification in the rocks which appear to protrude from the soil, have been arranged over the area with singularly good effect. The walks that lead through the rockery are sufficient to allow of every plant being examined at close quarters, and the whole merges harmoniously into the surrounding pleasure-grounds. We hope in an early issue to give a list of the plants found on the rockery, as well as other particulars of interest to our readers.

THE MANCHESTER BOTANIC SOCIETY AND ALLOTMENTS.—The following letter from Mr. BRUCE FINDLAY appeared in the *Manchester Guardian* of September 20, 1895:—"Sir, Permit me to bring under the notice of your readers the initiation of a forward movement in relation to this most important subject. Its object may be described as one to assist rural effort in connection with the cultivation of the soil. It is well known that during the last few years a very large number of persons have become tenants of small allotments in the neighbourhood of large towns. On the 5th of last month Mr. GLADSTONE, speaking upon this subject, said: 'There never was a period in the history of this country when rural effort in relation to the soil deserved greater support, and those who render help in this direction are public benefactors.' The Council of this Society propose to hold an annual exhibition in the Old Trafford Gardens, on a very large scale, of the productions grown by the tenants of small holdings, at which prizes will be awarded for fruits, flowers, vegetables, poultry, cheese, butter, &c. Prizes will also be given to the growers of window-plants in our large towns. The counties embraced within the sphere of this effort will be Lancashire, Cheshire, and Derbyshire. We are all familiar with the old saying, that 'the hope of reward sweetens labour;' and there can, I think, be no doubt whatever that this special effort will be the means of stimulating the poorer classes of society in their endeavours to excel in producing flowers, fruits, and vegetables. The Council are of opinion that it is the proper and legitimate work of the Society they represent to introduce and carry out this project. In order hopefully to inaugurate this important scheme in a comprehensive way, an annual outlay of £200 will be necessary. To meet this expenditure a special fund is being established, and it is hoped that £5,000 will be raised for this beneficent purpose. It may be added that a donor of £25 to this fund will become a life member, or be entitled to nominate one. Knowing that the lamented Prince Consort forty years ago took a lively interest in this subject, I took the liberty of bringing the matter under the notice of Her Most Gracious Majesty the QUEEN, and had the honour of receiving the following reply:—'Balmoral, September 2, 1895. Dear Sir,—I am commanded by the QUEEN to enclose a cheque for £25, as a donation towards the purpose referred to in your letter of August 21.—I am, dear Sir, yours faithfully, FLEETWOOD J. EDWARDS.' Since the receipt of this letter, and as the result of several letters I have written to ladies and gentlemen interested in the subject, I am pleased to state that nearly £1,000 has been promised. A general appeal will shortly be made to the inhabitants of the districts concerned, together with the list of the donors, and it is hoped that the result will be commensurate with the importance and beneficence of the undertaking.—BRUCE FINDLAY, Royal Botanic Gardens, Manchester, September 19, 1895."

THE BECHUANA CHIEFS AT READING.—On Wednesday, September 18, KHAMA and the other South African Chiefs at present in England visited the establishment of Messrs. SUTTON & SONS, Seed Merchants, Reading. The visit had been brought about by the Hon. EUSTACE WYKEHAM FIENNES, a

THE ROCKERY IN THE GARDENS OF C. T. LUCAS, ESQ., AT WARNHAM COURT, HORSHAM.

resident at Earley, near that town. The visitors, with Mr. WILLOUGHBY, arrived at Reading about 10 A.M. on Wednesday, and were received at the G.W.R. station by the Hon. EUSTACE FIENNES, Mr. M. H. SUTTON (the venerable founder of the firm), Mr. MARTIN JOHN SUTTON and Mr. A. W. SUTTON, Mrs. A. W. SUTTON, and other members of the family, and were driven to the business premises in the Market Place. Here they signed the visitor's book in the usual form, writing their names very clearly in English characters. The visitors were conducted over the various departments, and they also attended the usual 10.30 religious service in the meeting-room on the premises. After a tour of the Market Place, the party were driven to the various nurseries and trial-grounds of Messrs. SUTTON in the neighbourhood of the town. Afterwards the Chiefs were driven over to Earley, lunching with the Hon. E. W. FIENNES, visiting the Biscuit Factory of Messrs. PALMER, at Reading, before taking their departure.

A BI-GENERIC FERN HYBRID.—With this, writes Mr. DRURY, I enclose a frond, one of several recently sent me by Mr. E. J. LOWE, of a most remarkable hybrid which he has raised between *Scolopendrium vulgare* and *Ceterach officinarum*. In this the joint characters of these two very dissimilar Ferns are seen too clearly to admit of doubt, though it is somewhat singular that while the form of the *Ceterach* frond is so evident in the lower two-thirds, the extremely acaly character of that species is entirely obliterated by the *Scolopendrium* parent. The frond sent is the best I have as regards general characters, but in another the sori near the centre of the frond are more clearly seen to be in opposed pairs, affording a most undoubted proof of *Scolopendrium* influence. This can be detected in two small sori near the apex of specimen sent, and it is, moreover, interesting to note how the pinnatifid character of *Ceterach* gradually merges into the simple frond of *Scolopendrium* which forms the termination. As the venation in both Ferns is dichotomous with free ends, I can detect no particular modification in this respect, except perhaps that in *Ceterach* there is a clearer indication of a midrib in the pinnæ. The fructification where not in pairs is distinctly that of *Asplenium*, with a well-developed indusium; the sporangia perfect themselves, but were all burst when the fronds reached me. I found, however, a few spores, but all appeared irregular in shape and imperfect; it is doubtful, therefore, if the hybrid will be really fertile. Mr. BRITTON in his *European Ferns*, p. 137, figures a presumed hybrid between *S. Hemionitis* (or *S. vulgare*), and *Ceterach officinarum*, but this is by no means so clear a case as the one I now bring before your notice, especially in view of the abundance of curious forms that *Scolopendrium* produces without the aid of a cross at all, and some of which resemble strongly the illustration cited.

CHINESE INSECT WAX.—As an illustration of what a State function will sometimes do, it is officially reported from China that the festivities and illumination in connection with the celebration of the sixtieth birthday of H. M. the Empress Dowager caused an increased demand for insect white wax from *Fraxinus chinensis*, which is used for coating tallow candles, and giving them greater consistency, and the export rose from 9133 cwt. in 1893 to 2,934 cwt. in 1894, the price averaging £225 a ton.

JULES LAVERRIER.—This eminent writer on agricultural subjects died suddenly at Lyons on his way home after finishing his duties as a member of the jury at the Vienne (Isère) Agricultural Exhibition. After leaving the Saussie School of Agriculture, where he had been most successful as a student, he translated into his native language a variety of foreign works relating to agriculture, and LAVERRIER went in 1858 to Mexico as Director of the School of Agriculture, and on his return to France, about thirty years ago, he was appointed Librarian to the Société Nationale d'Agriculture in Paris, a post which he filled for the remainder of his life.

TRAGACANTH AND PERSIAN BERRIES IN ANGORA.—Under the name of "Kutiera," the white Tragacanth-like gums of *Cochlospermum Gossypium*, and some of the species of *Sterculia*, are known in India; and according to a recent consular report from Angora, a similar name, "Kitré," is applied to true tragacanth, furnished by a species of *Astragalus*. It is said to be known in commerce as fine white Syrian tragacanth, and appears in the usual forms as leaf, or flaky, vermicelli, or worm-like and mixed, or "sorts." It has the appearance of twisted ribbons, is white or reddish, due apparently to the state of the weather, sunshiny or cloudy and moist; it is nearly opaque, and slightly ductile, especially when fresh. Its adaptability in lieu of borax for giving a lustre to starched linen is perhaps not generally known. The districts where the shrub is chiefly found are Yozgat, Iekilip, Cesarea, Kaledjik, and Angora. Like the Yellow-berry (*Rhamnus infectorius*), this plant is also neglected, owing to the falling off in the foreign demand, and though abundant in the above-mentioned districts, little or no trouble is taken by the peasants to collect the gum; this is done by men specially sent from other parts. It is found growing wild in the fields, on the roadside, and even in hilly parts. On account of its prickly nature, animals avoid it, but it is frequently gathered by the peasants for fuel. Yellow-berries were formerly an article of export of great value for dyeing purposes. Much labour and expense were at one time bestowed on its culture, but the universal use of chemical dyes has reduced its demand to less than one-fourth, and its value to one-tenth of what it realised twenty-five years ago, so that now the cost of gathering is barely covered. Cesarea is the principal centre where it is grown.

CHESHUNT, WORMLEY AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The fortnightly meeting of this society was held at Turnford on Thursday, Sept. 19. There was a good attendance, and Mr. JASON FEARS, the secretary of the Hertford Horticultural Society, read an instructive cultural paper on the Dahlia, concluding with a select list of varieties. A hearty vote of thanks was accorded the author for his excellent paper.

THE SALE OF THE STAMFORD HOUSE ORCHIDS.—The collection of Orchids of H. SHAW, Esq., Stamford House, Ashton-under-Lyne, was sold by ARTINGSTALL & HIND in their Rooms, Manchester, on Sept. 19, and upon the whole realised fair prices. Among the chief were *Cattleya Mendeli Bluntii*, which, after some spirited bidding, realised £98 4s.; *Lælia elegans Turnerii*, £27 6s.; *Cattleya Mossiæ Reineckiana*, £16 16s., and another one, £6 10s.; *Cattleya Mendeli Firthii*, £5 10s.; *Lælia Gouldiana*, £4 10s.; *Cattleya Gaskelliana alba*, £4 4s.; and *Odontoglossum crispum*, Stamford House variety, £12 12s.

THE SALE OF W. R. LEE, ESQ.'S, COLLECTION OF ORCHIDS.—WM. R. LEE, Esq., Audenshaw, near Manchester, entrusted Messrs. PROTHEROE & MORRIS to dispose of the whole of his collection of Orchids, which comprised many rare and well-grown species. It might be as well to give the names of the principal lots over £10 that fell to the hammer of Mr. PROTHEROE, showing what the best species and varieties realised. The white form of *Cattleya speciosissima*, called *Sanderæ*, fetched £78 15s.; *Cattleya aurea Hardyana*, £63 5s.; *Cypripedium* × *Winnifred* Hollington, said to be the only plant in commerce, £73 10s.; *Cattleya Mossiæ Reineckiana*, £42; *Dendrobium Læanum*, a good-looking plant of the *Phalaenopsis* type, £42; *Cattleya labiata alba*, with two bulbs and a growth, £68 5s.; *Cattleya Gaskelliana*, £26 5s.; *Lælio-Cattleya Phoebe*, £22 1s.; *Cypripedium Ayllogii*, £23 2s.; *Cypripedium Læanum giganteum*, £17 17s.; *Dendrobium atro-violaceum*, £18 18s.; *Cattleya labiata Warneri*, £15 15s.; *Cattleya Wagneri*, £13 13s. and £11 6s.; *Cypripedium* × *Aubigine*, £13 13s.; *Cypripedium* × *Statleriannum*, £11 11s.; *Dend. Falconeri giganteum*, £21; *Cattleya Trianaei*, £17 17s.; and one named

W. R. Lee, £14 14s.; *Cypripedium insigne*, like *Sanderæ*, £21; *Lælio-Cattleya Arnoldiana*, £15 15s. and £11 11s.; *Dendrobium nobile giganteum* W. R. Lee, £13 13s.; *Lælio-Cattleya* × *Euterpe*, £12 12s.; *Pachystoma Thomsoniana*, £11 11s.; *Dendrobium stratiotes*, £10 10s.; *Cattleya crispata superba*, £11 11s.; and *Dendrobium nobile illustre*, misnamed "illustrus," £10 10s. None of the plants above-named were large, but they were generally in good health. At the second day's sale at Audenshaw, the following prices were realised for plants specified:—*Cattleya aurea Hardyana*, £63; *Cattleya Chocoensis alba-maxima*, £26 5s.; *Cattleya exoniensis*, £21; *Cattleya Mossiæ Reineckiana*, £21; *Cypripedium* × *Ayllogii*, £21; *Dendrobium splendidissimum Læanum*, £12 12s. and £11 11s.; *Dendrobium nobile Hardyana*, £11 11s.; *Cattleya Gaskelliana alba*, £11 11s., and *Cattleya Gaskelliana*, Audenshaw var., £16 16s.; *Cypripedium insigne* of the *Sanderæ* type, £11 11s. The two days' sale realised about £2000.

LUDLOW CHRYSANTHEMUM AND FRUIT SOCIETY'S EXHIBITION.—The town of Ludlow intends to hold its first Chrysanthemum Show on Thursday, Nov. 14 next, which will be supplemented by a competitive show of table-plants, cut flowers, of hardy fruits and vegetables, and Potatoes, divided into the usual three categories—Open, Amateur, and Cottager.

DEATH OF TREES BY SUNSTROKE.—During the late extraordinary warm spell, the writer of this paragraph was called upon to see a large Sugar Maple tree that was supposed to have been destroyed by a leak of the city gas-main at the root; but an examination showed that the tree died, literally, from sunstroke. It is strange that close observers of trees are unable to see when anything is out of the common run of things, and consequently note that something is going wrong. This Sugar Maple had been planted on the street probably a quarter of a century ago, and was about 4 feet in circumference; but the trunk was almost triangular, and yet this peculiarity seemed to attract no attention. The tree was simply triangular because on three sides of the tree the bark and wood had evidently been destroyed years ago, while the outer bark still continued to cover up the injury, and the only live wood was on the angles of the trunk. Only about one-third of the trunk was practically alive. When the exceedingly warm spell came, it was impossible for these limited ducts to supply the moisture required for such a large surface of foliage, and the tree, therefore, literally died from inability to furnish the moisture required for transpiration. It may be always taken for granted, that when the trunk of a tree, naturally cylindrical, takes an angular form, there is something wrong beneath the bark, and an examination should at once be made. The flatter portions will usually be found dead. In this case, the bark should wholly be cut away from the dead portion, and the denuded part painted, in order to check rotting away. In time, the healthy wood may grow over the wound or lifeless part, and the life of the tree be eventually saved. *Mechanics' Monthly for August.*

BOTANY AND THE AMERICAN GOVERNMENT.—Under the title of "The Botanical Work of the Government," Mr. J. M. COULTEA gives in the *Botanical Gazette* for June a brief sketch of the work of the U.S. Department of Agriculture. There are four divisions. That of Botany, under Mr. F. V. COVILLE and seven assistants, includes, besides more purely scientific work, the investigations of weeds, of poisonous and medicinal plants, and the testing of seeds; 38,600 dols. was appropriated for its use in the past year. The division of Vegetable Physiology and Pathology, with Mr. B. T. GALLOWAY as chief, finds work for as many as ten assistants. Potato disease, diseases of fruits and cereals, and the anatomy of galls, are among the subjects to which attention is now being given. The appropriation for the year ending June 30, 1895, was 26,100 dols. The division of Agrostology comes into existence with the first of July, as separate

from the division of Botany. It deals with forage plants and grasses, its function being to instruct and familiarise the people with the habits and uses of these plants, to investigate their natural history and adaptability to different soils and climates, to introduce promising native and foreign kinds into cultivation, and to identify all grasses and forage plants which may be sent in for the purpose. Professor LAMSON SCRIBNER, its chief, is preparing a handbook of the United States grasses. He has two assistants, and the appropriation amounts to 15,000 dolars. The Forestry division is under Mr. B. E. FERNOW, with four assistants. Its main work during the past three years has been the study of the character and value of the woods of "merchantable species." Mr. FERNOW has, however, a much more difficult task in hand, namely, the arousing and organising public sentiment in favour of a rational forest policy. Mr. COULTER'S article brings home the fact that in some things our American cousins have got a long way ahead of us. *Natural Science.*

ROTATION OF CROPS FOR THE GARDEN.

ONE of the most exhausting systems of soil cultivation is that of growing the same crop year after year on the same land, and even on the rich virgin soils of America it is now becoming recognised that rotation of crops offers the advantage of distributing the work of planting, cultivating and harvesting over a greater period of time, so that a smaller force of labour can cultivate and care for more crops in the aggregate than when limited to the short season adapted to one crop. The labour on both farm and garden can be utilised to better advantage when a variety of crops is grown than when but one is planted. Dr. Chas. O. Flagg, Director of the Rhode Island Agricultural Experiment Station, has called attention to this fact in the sixth annual Report of the station.

In the opinion of most gardeners the one thing needful for the successful production of crops is an abundant supply of stable manure, though of late years the value of artificial fertilisers has also been recognised.

The growing of profitable crops without the use of some manurial help is not to be thought of. At the same time it must be remembered that there are other practical and economical methods which must be brought into play in the production of crops.

For example, manuring must stand on the same level with cultivation, drainage, and rotation of crops. The old-fashioned system of cropping in rotation has, however, by the very force of circumstances been almost entirely superseded both on the farm and in the garden.

The idea that the intelligent arrangement of crops into a rotation increases the annual yield and helps improve and preserve the fertility of the soil is not a new one, nor confined to the days of modern horticulture. But if rotation is followed in the garden it becomes necessary to have more than one system, because each gardener must be guided to a great extent by the requirements of the family for which he has to provide vegetables. And the grower for sale has to consider the markets, so that it must frequently happen that some kinds must be produced in large quantities and in untimely seasons.

The primary reasons for rotation are found in the soil, and the different demands for food which the various crops make upon it, as well as difference in capacity of various plants to collect their food. The soil serves to fix the plant, and furnishes a medium through which it may send its roots for food and moisture, in which capacity it acts as a great store-house; and the history of horticulture, so far as we know it, clearly show that a fertile soil is one which has accumulated within it the residue of ages of previous vegetation, and that it becomes infertile as this residue is exhausted. The dark-coloured soil at the surface, varying in depth according to location, is generally due to the presence of organic matter—decaying leaves, stems and roots, with the

decomposing litter from stable manure. This portion of the soil contains by far the larger percentage of plant-food, and is constantly reinforced by whatever fertiliser is applied, by the decay of roots, and falling leaves, &c.

As plants differ widely in their habit of growth above ground, so is there a difference below the surface in the root development. Some have a large mass of fine thread-like roots, which fill the surface-soil; others have large fleshy roots, which penetrate deep into the subsoil, and draw their supplies of food from the lower portions of the soil. In this way the deep-rooted plants grow upon supplies entirely beyond the reach of those having a shallow-rooted system; and herein we find a strong reason for the rotation of crops. Larger crops can be produced by a judicious combination of shallow and deep-rooted plants. Again, plants vary in their ability to secure a sufficient supply of food from the same soil. It is well known that the Cabbage tribe will thrive upon land much too poor to grow a good crop of Onions or Carrots.

The Rothamsted experiments seem to indicate that the Potato is able to avail itself of a less proportion of the nitrogen of the manure supply than almost any other garden crop, and the weight of tubers obtained per acre is consistent in showing how large is the amount of manure required in proportion to the quantity of produce obtained.

Some plants, while having sufficient power to secure an abundance of certain elements, lack the power to extract the small quantity of some other ingredient essential to its growth. The white Turnip and Radishes are a well-known illustration, in that fertilisers or manures containing a relatively large amount of soluble phosphates always give the best crops, notwithstanding the fact that these plants are not especially rich in their contents of phosphoric acid. The Turnip and other root crops simply have a low power of assimilating phosphoric acid from the soil, and unless a liberal amount of that element is supplied in a soluble form the crop is lessened.

In rotations, plants which are delicate feeders should be grown when the soil is full of available plant food, and be followed by strong feeders which will secure and use food left by the preceding crop. For instance, Potatoes may follow Peas, and late Turnips succeed Potatoes. When any crop is removed from the soil it carries certain elements of fertility with it, and repeated removals of the same crop without manuring will sooner or later exhaust most soils of those elements, so that further cultivation of that crop will be unprofitable. The soil is said to be *worn out*. Let that portion of land alone, and very quickly it would grow up to weeds and grass—thus Nature begins the slow process of restoring the ground to a condition of fertility through the growth and decay upon and within the soil of a variety of wild plants. The rank growth of some of these plants is Nature's contradiction as to the worn-out condition of the soil, and proves that the soil is worn out only as relating to the plants requiring the same elements in the same or about the same proportions. A very interesting illustration of this fact is to be found in one of the Rothamsted experiments, in which a piece of land exhausted for Wheat-growing has been uncultivated and left to seed itself since 1882. At the present time (1895) there are found on this portion of land representatives of twenty-one different botanical orders of plants. These are made up of forty-six genera and fifty-one species. The fifty-one species consist of twenty-two annuals, two biennials, and twenty-seven perennial plants. It is also a significant fact that grasses which are of the same botanical order of plants as Wheat, do not flourish so well as those of other orders, also that several leguminous plants have established themselves and grow with great vigour, producing flower and seed in abundance. No cultivated leguminous crop has been sown here for the past sixty years certainly.

We learn from this investigation that the minerals of the soil which are so necessary to the successful growth of leguminous plants still exist in sufficient quantity, whilst the nitrogen which is the ingredient

so essential for cereal crops has become exhausted, and therefore the grasses are poor for lack of suitable food. A good system of rotation with thorough cultivation would go far toward indefinitely postponing the evil day of unprofitable crops.

The same elements serve in the main as food for most horticultural plants, but the relative quantities of each have a wide variation. If 1 ton of each of the following named crops, in the condition in which they are marketed or gathered for home consumption, were taken from the soil, they would remove the amounts of nitrogen, phosphoric acid, and potash stated in pounds in the table. The second portion of the diagram illustrates what would be removed from the soil by taking away 1 ton of the refuse or unealeable portions of these crops:—

Chemical Constituents contained in One Ton of Marketable Produce of the following Crops. Quantities in Pounds.

Constituents.	Potato Tubers.	Onion Bulbs.	White Turnips.	Carrot Roots.	Cabbage Heads.	Broccoli Heads.	Peas Seed and Pods.
Nitrogen ...	8	3	4	5	7	15	80
Phosphoric acid ...	3	1	2	2	2	3	19
Potash ...	13	9	6	7	10	11	33

Chemical Constituents in One Ton of Unsaleable Produce.

Constituents.	Potato Haulm.	Onion Stalks.	Turnip Leaves.	Carrot Leaves.	Cabbage Stems and Leaves.	Broccoli Stems and Leaves.	Pea Haulm.
Nitrogen ...	11	8	7	11	5	6	23
Phosphoric acid ...	3	0	2	2	3	2	8
Potash ...	10	4	5	6	13	3	22

A comparison of the figures shows that there is a considerable variation in the amounts of plant-food abstracted from the soil by the growth of these crops. The quantity of each constituent in the Peas is seen to be very large, but the mineral food of this crop is largely drawn from the lower part of the soil and sub-soil, while it is able to obtain some considerable portion of its nitrogen from the atmosphere through the friendly bacteria which multiply within the nodules upon the roots. The large mass of roots left to decay within the soil, and that of most of the unsaleable portion of the crop (the haulm) which should be returned to the land, adds to the quantity of organic matter, while the mineral elements are left near the surface for the use of other crops, so that, instead of an exhausting crop, Peas and similar leguminous plants, are probably the best renovating crops which can be grown, and hence should find a place as often as possible in every sound system of rotation, whether on the farm or in the garden. In connection with the foregoing statements, it may be observed that Peas and Beans grow more favourably on garden soils that have recently been chalked or limed. These substances favour the development of the pod, and the maturation of the seed. Potash manures and wood-ashes are also extremely helpful in the same direction, and direct experiments appear to show that the immediate supply of potash within the root-range of the plant will probably be sooner exhausted than will that of lime.

Crops which draw heavily upon the supply of phosphoric acid in the soil should be followed by those which require but little of this element.

Cultivation and stirring the soil frequently promote the rapid formation of available plant-food from the supplies of insoluble material in the soil, hence hoed crops have an important place in any rotation as a means of increasing fertility. Broad-leaved plants favour the development of soluble plant-food in the soil by furnishing the conditions necessary for nitrification—that is, partial shade and protection from too great heat, while the surface soil is kept more moist because of less evaporation.

Narrow-leaved plants do not shade and protect

the soil as do broad-leaved ones. It is also a fact that garden crops vary in the season of their growth, some making most of it in the cool weather of autumn and spring, and others only growing during the heat of summer. Here we have another important reason for a rotation of crops. *J. J. Willis, Harpenden.*

FORESTRY.

TREES, SOILS, AND SITUATIONS.

ONE of the most frequent queries put by intending tree-planters is, "What are the best trees to plant

will grow in ordinary soil, providing the latter contains nothing of an inimical nature—but growing and thriving are different terms. Soil, of course, is not the only requisite for healthy vegetable growth, any more than food is the only thing necessary for animals, climate and situation being of equal

FIG. 68.—CACTUS DAHLIA "MRS. WILSON NOBLE": COLOUR, BRIGHT SALMON.

CACTUS DAHLIA
"MRS. WILSON NOBLE."

THE bloom shown in our illustration, fig. 68, was exhibited by Messrs. J. Cheal & Sons, of Crawley, at the meetings of the Royal Horticultural Society held on Tuesday, August 13, and September 5, this year; the variety on the latter occasion receiving an Award of Merit. The flower exhibits most of the points characteristic of the modern race of Cactus Dahlias, as is well shown in the illustration; and the colour is bright salmon-pink.

on this or that particular soil?" Answers to this question are usually plentiful enough, and lists of trees which have proved suitable for every typical soil may be found in every work which deals with arboriculture. The fact nevertheless remains, that nothing is more uncertain than the failure or success of any genus or species of tree in any particular soil, and little short of actual experience, extending over a series of years, enables us to definitely say that a certain species will or will not thrive on a specified site. Generally speaking, any kind of plant

importance as essentials to success. Providing the latter are suitable, the question of soil becomes of less importance, although it must not be forgotten that soil may greatly modify the effects of climate and situation, and *vice versa*, especially in regard to frost, aerial moisture and temperature, rainfall, &c. The species of tree tried has also much to do with these influences, some trees being more affected by soil, while with others climate and situation seem to play the more important part. Our usually imperfect knowledge of the constituents

of the subsoil accounts for a good deal of what appears to be inexplicable. Sudden variations in the lower strata may cause a warm soil to become suddenly cold and wet at a particular spot, or be the means of fertility being replaced by poverty, thus checking and retarding growth. All these uncertainties make tree-planting more or less of a speculation, although in extensive planting operations the occurrence of blanks and failures is always anticipated to some extent, and we are usually satisfied if the general results are good. Where individual trees are particularly wanted, as in the case of an avenue, however, the success of a tree, or a few trees, on a certain site, is often an important matter. Nothing spoils the appearance of a short avenue more than a few stunted trees here and there along its line, destroying, as they do, that uniformity which we look for in a regular design. In long avenues, slight irregularities are inevitable, and do not interfere with the general effect, a case in point being the Long Walk in Windsor Park, where storms have made frequent gaps, and differences in the size of the trees, due to soil, may also be observed. Most persons, again, have their favourite kinds of trees, and when planting, naturally wish them to be represented as much as possible, whether the soil and situation are suitable or not. While in most cases, therefore, species which are evidently not at home may be avoided when planting, or removed when already present, there may be other cases where it may be worth while to take some trouble in order to overcome unfavourable conditions of soil or situation.

How this may be done depends, of course, upon the conditions which it is desirable to bring about or to remedy, as the case may be. In many instances the situation alone is at fault, either through its cold exposure or inclination to the sun. The native habitat and characteristics of growth of introduced trees require careful consideration—more so, perhaps, than they usually receive. Our summers are, as a rule, highly favourable to the growth of all kinds of trees; but our springs and autumns are too treacherous and uncertain to ensure the uninjured growth of the young shoot in the former, and its proper ripening in the latter season. To this fact alone much of the non-success of our introductions may be traced, as when either of these conditions repeatedly fail, the free growth and characteristic form of the tree are destroyed. Most of the Coniferae are shallow rooters, liking plenty of moisture both in the air and soil, providing that in the latter is not stagnant. This is especially the case with the genera *Picea* and *Abies*, both of which are mostly natives of mountain regions with cool and moist climates. For such trees, hot and dry situations are quite unsuited, and on soils of a generally dry nature, cool and shady situations should be given, either on a north slope, or where they are shaded by other trees from the morning and afternoon sun. By reason of its deeper root system, the genus *Abies* is better able to withstand drought and surface dryness. The tendency of the members of this genus to commence growth before the spring frosts are over, however, renders a cool situation desirable in their case also, unless shelter be provided in the shape of surrounding trees. Pines, on the other hand, usually stand drought well, and succeed on dry, gravelly soils, with thorough drainage.

AMELIORATION OF THE SOIL.

Where it is evident that the soil is to blame for the failure of a particular species, the question arises as to whether its mechanical, or chemical nature is at fault. If the first-named, the necessary alteration may often be made by the addition and intermixture of clay, sand, leaf-mould, &c., with the natural soil, according as tenacity or porosity may be its predominating feature. Conifers being shallow rooters, the preparation of the soil to a moderate depth will be sufficient; and if a small area be dealt with at first, it can be gradually extended as growth proceeds. The tree itself will be a good indication of the necessity for this extension, and it may be that, when once thoroughly established, it will be found to accommodate itself fairly well to its sur-

roundings, and further help may be dispensed with. The warmth and moisture of the soil can also be regulated to a great extent by drainage, rough stone drains, a foot or 18 inches below the surface, being sufficient to aerate the soil, and prevent stagnation. The chemical nature of the soil is perhaps the most difficult to alter without going to considerable trouble and expense. Trees often fail because some inimical compound, or an excessive proportion of some element, such as lime, magnesia, iron, or an organic acid, is present, than on account of the absence from the soil of one or more of the necessary constituents of plant-food.

The excessive proportion of any element can be neutralised by the addition of lime or leaf-mould, according as the excess is acid or alkaline in its nature; but as this is only practicable on a small scale, the ultimate result of such work is rarely satisfactory. However carefully a patch of soil may be prepared, the roots are sure to push out beyond it, and get into the unfavourable soil beyond. In such cases, it is only waste of time to plant trees which are evidently unsuited to the soil, and only a careful choice of species will have satisfactory results.

Both on dry and shallow or on unsuitable soils of any kind, much may be done by mulching or top-dressing the surface to modify or contract unfavourable conditions. Almost any kind of loamy or leafy soil, old garden refuse, or turf parings will do for this purpose, and if the known preference of the tree for a particular soil can receive attention, so much the better. The soil should be lightly worked into the surface, but not so much so as to disturb the roots to any great extent. Mulchings of leaf-mould or short grass are also useful in retaining moisture, and improving the mechanical and physical condition of the soil. On lawns or places where a neat appearance is of consequence, these top-dressings must be confined to trees whose branches sweep the ground, otherwise the lawn will be broken and unsightly. This can be avoided, however, by removing the turf and old surface soil to a depth of a few inches, and replacing the former after some good, new loam has been added.

There is little doubt that the freshness and vigour of all specimen trees might be greatly increased by the timely addition of suitable soils and composts to the surface, instead of leaving them to take their chance of growing, lingering, or dying. *A. C. Forbes.*

NURSERY NOTES.

MESSRS. T. RIVERS & SON, SAWBRIDGE-WORTH.

PROBABLY fruit gossip is never indulged in more freely than in the months of September and October. The varying conditions of soil and climate have raised and depressed our hopes alternately many times during the season, but now the result is no longer the subject of speculation or anxiety—the time has come when congratulations may be offered. Much labour has been lately required to harvest the fruit, and the produce already making itself felt in the fruit-room is proof that the present season has been a favourable one—at least, there are few fruit growers who will be disposed to complain in regard to it. A week or so ago the visitor might have seen an excellent crop of Apples at the Sawbridgeworth nurseries of Messrs. T. Rivers & Son; and Pears also, though fewer in number, are a fair average crop, and the fruit is good. Plums have not borne anything like the crop they did last season, but then the yield was enormous. Although this is an aspect of these nurseries that may be less interesting than the inspection and study of the young fruit trees of every description that are being grown for distribution, it is one worthy of remark in passing, because in a measure it shows Mr. Rivers' faith in fruit-growing for profit. To the objection of the inveterate grumbler, that nurserymen produce the trees, attempt to create or foster a market for them, by inducing others to plant them for profit, but who find it more

easy to grow trees than their produce at a profit, Mr. Rivers might say, "But I practise both; much of the land that can be spared is planted with trees in ordinary orchard method, for the very purpose of supplying fruit for marketing." Mr. Rivers is indeed a market-grower as well as a successful nurseryman and fruit raiser. Another fact the visitor may notice is, that in the matter of varieties, and especially in the case of Plums, those which have been planted for the above purpose are to a very large extent varieties which have been raised from seed by Mr. Rivers himself, or his late father.

Turning from this part of the business to that of fruit-tree raising for distribution, the culture is only such as might be expected under the direction of a firm that has been long known for first-class fruit culture, and for extraordinary results in the raising of seedling varieties of fruit.

Apples being rightly regarded as the most important of domestic fruits, are grown in very large numbers. Different formed trees, suitable for orchard culture, or for the garden, and even the suburban villa garden, abound, and the training they receive, whether the trees are intended for orchard standards or half-standards, garden pyramids or bushes, or for planting at the foot of walls, as well as the differently trained espalier trees, is such as has been found by long and wide experience to be best, and the young trees look well and healthy. It is hardly needful to say that all good standard varieties are included in the collection, but in addition to these there may be seen a good seedling variety named Rivers' Codlin, excellent for cooking purposes, of large size, attractive colour, rich in flavour, and firmer in flesh than Codlins in general. The fruit can be used from September until December, and the tree is a good grower. Early Rivers, which is recommended as an improvement upon Lord Suffield, and Rivers' Early Peach, almost similar to Irish Peach, but rather earlier, may be mentioned.

Pear trees are looking in the best of health; many of the youngest trees have made quite average growth, others are a little shorter, owing to the discouraging character of early summer. Taking the promise at the end of June, however, with the actual facts in September, the result is surprising. The pyramidal system of training is very popular as applied to Pears, and numerous good examples of this style are noticed, but for many kinds no training is more satisfactory than the bush. Amongst an excellent lot of trees intended for walls and espaliers, Cordons looked very fine. In June these trees are looked over, and the more robust shoots stopped to four or five buds, leaving all others intact. Early in October all the shoots are pruned down to three eyes. Such is the pruning that Mr. Rivers' has found successful. Some of the seedlings raised at this nursery are among the best kinds in commerce and include Conference, Fertility, Dr. Hogg, Beacon, and Magtate. Dr. Hogg and Beacon require to be double-grafted, but with this attention they give abundant satisfaction.

Plums can only be placed second in importance to Apples, and the growth upon these was even better than that on any of the fruit trees if we except Cherries. Mr. Rivers has raised numerous varieties of Plums, and all of them are well known for their value. Of dessert varieties we need only mention Grand Duke, Late Rivers, Monarch, The Czar, and Early Favourite; and of kitchen varieties, Early Prolific, Late Prolific, Sultan, Autumn Compote, Blue Prolific, and Bittern. Early Transparent Gage is earlier by about ten days than the old Transparent, but fruits of Golden Transparent and Late Transparent were still hanging, and luscious rich fruits they were. We were shown a new variety upon several young trees, at present without a name. The fruits were quite hard, will ripen in October, and being like Monarch in appearance, but longer, the value of this seedling may be considerable. The flavour is described as good, and the stone very free. Cherries, we have already remarked, looked strong and well. All fruit inside and out has been long gathered, but mention

deserves to be made of Early Rivers, a seedling raised by Mr. Rivers, and one of the very best for market, and for a general crop in July, or in orchard-houses a month earlier. Apricots are grown almost exclusively for planting against walls, or as bushes in pots, and an excellent lot of the latter were of splendid appearance.

Peaches and Nectarines, as everyone knows, receive a large share of attention from this firm, and trees of most kinds are prepared for planting in out-of-door positions. Damsons, Raspberries, Quinces, Crabs, Strawberries, Gooseberries, Currants, and Nuts are all looked after, but we must pass from the out-of-door department to orchard-house subjects.

FRUIT TREES IN POTS.

If favourable terms are used in describing the general condition of the trees outside, and the success of the methods of culture adopted there, what must one say when speaking of the orchard-house trees here? How highly must we praise the pyramidal Peach trees in pots, the Apples and Pears in pots, and the marvellous pot Vines. Here we are dealing with the specialties of the firm, and with culture that is frequently imitated, but has never been surpassed in any other place. Let us look at a couple of excellent span-roofed houses full of pyramidal Peach-trees, really pyramidal in shape, each shoot as regular as if placed, yet as perfect in its way as the old-fashioned pyramidal Azaleas that were trained with such precision. Of course, the fruit-tree has shoots all quite free of each other, but the regularity of the growth, and the altogether unique appearance of those trees from 8 to 11 feet high, must be seen to be believed. Then what crops they carry! A tree of Salway was still ungathered, the fruits being not yet ripe, and upon this specimen there were about seven dozen fruits, and of good quality. It may be useful to remark that these trees are potted into two-thirds loam and one-third decomposed manure, and they are afterwards top-dressed twice during the season with kiln dust and horse-droppings. None of the trees are rooted through into the borders, but they have all a mass of fibrous roots at the top of the pots, attracted there by the surface dressings. These roots are treated as annual, and if the plant is not to be repotted the following season, they are taken away, and as much of the top-soil removed as possible, and fresh added. On the other hand, if the tree is to be repotted, it is taken out of the pot, and the ball reduced by about one-third by a special tool; and unless it is to be grown on to larger size, it is then put back into the same pot, which is well cleaned and thoroughly drained. In this way it is remarkable that trees are kept in robust health and capital bearing condition for years and years. It is very interesting to view the original plants of many of Messrs. Rivers' seedling Peaches and Nectarines, such as Lord Napier and others that have been in commerce many years, yet the original seedlings bear freely now in pots. The list of Peaches raised from seed by Messrs. Rivers is far too long to be given here, but we are indebted to this firm for many standard varieties; and the Nectarines, with same origin, are almost as numerous, and include Rivers' Orange, Spencer, Lord Napier, Stanwick Elruge, Pine-apple, Humboldt, Albert Victor, and last, but first in importance, Rivers' Early, raised by Mr. T. Francis Rivers, and certificated in 1892. It is said to ripen twenty-one days before Lord Napier. Already this variety has become well distributed, and Messrs. Rivers are preparing an immense stock, as the value of the variety deserves. Trees of all sizes, in pots, of Peaches and Nectarines, and trained in excellent manner as far as they have grown, were noticed. On Apples, Pears, and Plums, we cannot now dwell, but all of them are well done.

A large house of young Fig trees in pots we would mention in order to recommend this crop to those who have never tried Figs under suitable conditions. There is no more prolific crop, or one which will better repay labour and expense, providing the fruit is liked. Plenty of heat, moisture,

and air, with some method of restricting the roots, and a simple method of pruning, which consists chiefly in thinning the shoots out by removing the least desirable ones altogether, and a little stopping of gross growths during summer, constitute satisfactory culture. We have only briefly mentioned the Vines in pots for forcing early next season. When these are seen, the fact that their culture has become specialised here is comprehended at once. It is not safe to quote figures, but something like 3000 have been grown this season, and the well-ripened, short-jointed, strong canes tell their own tale, and are their own recommendation. Much more that we might say of this establishment must be omitted; our notes are already longer than we had intended.

METHOD OF VENTILATING TOMATO-HOUSES.

A NEW ventilator, designed by Mr. F. D. Woolf, Severn Nursery, Shirley, Southampton, for use in early Tomato, Vine, and other houses, is illustrated by the following figures:—

FIG. 69.—A VENTILATOR FOR EARLY FORCING-HOUSES.

No. 1 represents the front view of the ventilator when fixed to the hot-water pipe, and shows perforated front 18 by 6 inches, through which heated air passes into the house.

No. 2 represents the back of the ventilator when fixed, and shows an aperture 9 by 2½ inches, through which the cold air passes from No. 3.

No. 3 has one end fixed into the outside wall of the house, from which a brick is removed, the other end passing through the opening at back of ventilator shown in No. 2.

The cold air passes through No. 3 from the open into the back of ventilator, and is heated to the temperature of the house before passing through the perforated front shown in No. 1.

The ventilator is made in sections, and can be applied to any existing house having a service of hot-water pipes near the front wall of a lean-to and both walls of a span-roof house.

The patentee, Mr. F. D. Woolf, Severn Nursery, Shirley, Hants, claims that by its use a constant and efficient circulation of warm air can be maintained night and day at all seasons of the year, and that it will prove of great worth as a preventive of disease in Tomatos.

ARISTOLOCHIA ELEGANS IN AFRICA.

ARISTOLOCHIA elegans, Masters, was first described and figured in the *Gardeners' Chronicle* (n. s., xxiv. (1885), p. 301, fig. 64), from a plant cultivated by Mr. William Bull, who introduced it from Brazil. Dr. Masters states, in the place cited, that the plant is a native of Rio, where it was collected by Glaziou (n. 13,163), whose specimens are in the Kew Herbarium. He also goes on to say:—"It is singular that, so beautiful a plant, native of so well-known a botanical district, should not previously have been introduced or described."

But it would appear not to be a native of Rio Janeiro, or even of the province of that name, notwithstanding the specimens in the Kew Herbarium labelled "Environs of Rio Janeiro." It is now well known that many of Glaziou's specimens labelled thus at Kew are from distant provinces, and some are from cultivated plants. Besides Glaziou's specimens there is one at Kew, undoubtedly of the same species, from the distant interior of Brazil. It is labelled: "On the Parana, 26° to 27° S. lat., D. Parodi." This was received at Kew early in 1883, but the specimen being a poor one, was not recognised by Dr. Masters, or more probably not seen by him.

Aristolochia elegans is then, in all probability, at home on the banks of the Parana River, some 700 or 800 miles westward of Rio Janeiro. It is true that Parodi's specimen is doubtfully referred to this species in the *Botanical Magazine* (t. 6909), but I see no reason for the doubt.

The most remarkable fact in the history of this plant is to come. A few days ago Sir John Kirk, who has lately returned from his special mission to the Niger Protectorate, brought to Kew specimens and seeds of what struck him as a highly-ornamental *Aristolochia*, which he collected near the landing-place at the mouth of the Brass River, W. Tropical Africa. It was so unlike any *Aristolochia* in the herbarium from Africa, though from a locality where one would have expected it to have been collected before, that Sir John Kirk was questioned as to the probability of its being introduced. He replied that it was growing plentifully in the grass, and had every appearance of being indigenous. At first it seemed likely that it had been introduced with ballast from Brazil; but if it is a native of the interior only of the latter country, this explanation seems hardly sufficient. On the other hand, it is exceedingly unlikely that it is a native of Africa and Western Brazil. There is little doubt that several American plants have reached West Africa accidentally, and have become so thoroughly naturalised as to have every appearance of being at home. Is this one? *W. Botting Hemsley.*

STRAWBERRIES.

As far as blooming was concerned in these parts, it has been a marvellous year; some of the large Strawberry plantations were more beautiful than usual, and where they were fortunate enough to get rain, there must have been a paying produce, while in others, the long drought seriously affected the crop. It was so with my garden, there being no rainfall for weeks, and so the large quantity of blossom set badly, and in most instances, the plants suffered, and the fruit was deteriorated.

I am induced to make a few remarks, after reading Mr. G. Wythes' note on the subject. My soil is a light stony one, resting on gravel, &c., therefore dry naturally. It suits British Queen, and the plants not only grow strongly, but this year threw up an immense quantity of flowers, and though owing to the hot dry weather a number "went blind," still I had a good crop of fairly large deliciously-flavoured fruit, and fine in colour—but now comes the curious part to notice. Mr. G. Wythes calls the British Queen a late sort, and yet it ripened some of the berries before and equal with the Vicountess Hericart de Thury growing in a bed adjoining, while the latter was not half the size, and of decidedly worse quality. I have dug up the whole bed. I never cared for it never found it equal to some others, and shall not plant this variety again. It is over-estimated. Another good Strawberry generally, Vicountess, this year would not grow out, though the fruit was by no means small; still, the drought and heat had such an effect, that the points were not only not coloured, but absolutely dry and hard, and even green in some cases. Still, as it is usually a good bearer of rich-coloured, well-flavoured berries, I have left it for another year. Now of Waterloo. As to its worth generally, I may say I like it much, and it has done well, the fruit being delicious. One thing I may mention is this: I have known persons able to eat this variety without the inconvenience that has too often arisen after partaking of Sir Joseph

Paxton, Sir Charles Napier, and some others. However, this year "Waterloo" was fairly burnt up. It broiled in the sun, and was nearly useless. I think it is an uncertain "doer," and wants the soil and season "just right," and then, in my opinion, it is distinct, well worth having, and by its peculiar flavour, "stands alone." Of this I have made a fresh bed, and hope for better things next year.

Now I come to another sort, "White Knight." This seems to be a capricious variety, for Mr. Bauyard, and some others, have taken it out of their catalogue as "useless." And yet with me this grew strongly, bloomed freely, and bore some very fine, excellent, and well-flavoured berries. Everyone that tasted it wanted more, and I may add that it was quite equal to, if it did not surpass, British Queen. So pleased am I, that I have planted several more rows. The colour is a light bright vermilion on the sunny side, the rest a blush to clear white, with white flesh. Perhaps the season and soil both suit; but however that may be, it was "very good," and early.

Of course, for next year I have put in a few plants of Royal Sovereign, also Laxton's Latest of All, A. F. Barron, and a sort I have generally found worth growing, Sir Charles Napier, bright, handsome and useful; and a seedling of my own, with very ugly berries, but of excellent flavour. It is covered closely with seeds, and dull in colour, but with rich red pulp. Is a very strong grower, and hardy, and I like it. My object in writing is to point out that as soil, position, and seasons vary so much, is it not well to try some sorts that even have "a bad name" as delicate growers, and amongst these are some of the best, such as British Queen, Dr. Hogg, and with me White Knight? *Harrison Weir, Sevenoaks.*

HOME CORRESPONDENCE.

A SUNDAY MORNING AMONG THE WASPS.—On the afternoon of Saturday, September 7, there came such a raid of wasps (*Vespa vulgaris*) into our Peach-case, making such an onslaught on our Peaches and Nectarines, more especially the latter, as almost to threaten their speedy disappearance, that made me resolve when Sunday morning came to gather the fruit. I am almost ashamed to confess that by the time we got there the sun was already high in the meridian, and our Peach-case very much more in possession of the enemy than it was the evening before. So firm and multitudinous a footing had they obtained, that it was completely out of the question to attempt to gather fruit with any reasonable degree of safety. There was no time to lose, and it was evident that if any of the fruit was to be saved, the enemy would have to be dislodged. Therefore to this end it occurred to me that I might treat them to a dose of "NL All" vaporiser. Two of these fumigators were procured, lit, put into position, and the house shut up as closely as we possibly could. We stood safely outside, exceedingly interested, watching through the glass the gradual discomfiture and final death in this lethal chamber of those hosts of wasps. It was curious to note how, when the wasps found there was something amiss, they left off feeding, took to wing, flew wildly against the glass, and finally dropped dead. There were also in the house a number of blue-bottle flies (*Calliphora vomitoria*). These fought against the nicotine fumes much longer than the wasps, being evidently much stronger or less sensitive in their respiratory organs. On this point, some entomological reader might kindly throw some light for our edification. Whilst looking on, I observed one of the vaporising pans was about empty, and being desirous of continuing the vaporising a little longer, I went in, passed to the far end of the house (75 feet), where the bottle containing the essence of nicotine had been left; by the time I got back and poured some into the pan I had more experience than I cared for of its potency. It got into my nose and throat, and made my eyes run with water, so that I was only too glad to rush out into the fresh air. Needless to say, that after this we gathered the fruit comfortably, nor was it a bit the worse for the vaporising fumes which had so effectually cleared the house of wasps. *W. Miller, Combe Abbey, Sept. 13.*

FRUIT-TREES ON OUR HOUSE-TOPS.—Your recent leader on this subject recalls many efforts in this direction made through a considerable portion of the last half-century. The majority of these proved so abundantly successful, that I advocated a roof culture of fruit strongly in many directions as a ready means of paying the rent of cottages by cultivating the enlarged areas and improved sites over our heads. For one striking advantage of roof culture is that the most grasping landlord can hardly charge any additional rent of the tenant for clothing his roof with plenty of fruit, and thus adorning his property with higher beauty. As you, however, very properly observe, tenants need greater, longer security of tenure and against disturbance, as well as simpler, easier means of obtaining compensation for unexhausted improvements before they can be expected to invest much money or skill in adding to the value or beauty of other people's property. In most of the rural districts where courses of lectures have been given on fruit culture, the more intelligent of the working classes are becoming experts, more or less, in fruit, vegetable, and flower-growing. And what with continuation-classes in all directions, in which horticulture and agriculture may be taught and horticulture adopted, as a subject for praise and pay in all our elementary schools, it may be hoped that every householder or his children will soon be sufficiently taught in the mysteries of plant life and the secrets of successful culture as to be able to make the most and best of his small holdings, allotment gardens, and house-tops. The latter, though so seldom turned to practical and profitable account, are by no means the least important. It may surprise some to see vegetables named in connection with roof culture or clothing. But surely our warmest aspects are admirable for Tomatoes, and just the place to waken them up out of the sleepy disease if anything can do it. And the Aubergines, or Egg-plants, seem coming in at last. Who shall say how soon they may startle the natives by growing their useful eggs of all shapes, colours, sizes on the house-tops. How grand and gorgeous our Marrows and Gourds would look on our house-tops, while scarlet and other runners would have garlands of beauty, as well as send down bushels of sweet plenty from the same coign of vantage. Those who have seen and smelt the indescribable medleys of fragrance and beauty running wild on house-tops from Roses, Honey-suckles, Jasmies, Clematis will hasten to clothe their roofs with flowers. Profit, however, may be gathered, as well as pleasure, from flowers on roofs. Covered with *Maréchal Niel* or other Tea Roses, such as *Gorge*, *Wm. Allan Richardson*, *Nipheto*, climbing *Devoniensis*, *Honoré*, &c., house-tops might be covered and coined into gold. Then as to fruit. Our roofs are so varied in size, so different in aspect, that the whole of them may be clothed with fruits of some sort from the luscious Grape and Fig to the winsome Plum and the acid Morello Cherry. Hardest for the north and east, tenderest to the south and west. Apples, Pears, Plums, Peaches, Nectarines, Apricots, Grapes, Gooseberries, Currants, Blackberries may all be mounted and marshalled to good purpose on or over the roofs of our dwelling-houses, factories, stables, cow-sheds, and other buildings. Of course, the lower the buildings the nearer the roofs are to the ground, and the easier it is to reach them. Roofs may also be posted so much and so completely in the teeth of the wind that only the hardiest plants could grow to much or any good progress. But on average roofs, most of our fruit grow to profit, certainly into verdure and beauty. Certain cautions, however, are needful to command success. Careful selection of varieties for localities, and for house-top sites. Skillful preparation of suitable root-runs. The raising of the trees from 6 inches to a foot clear of the roof, 9 inches is a good average. Otherwise during scorching hot days on house-tops, leaves and fruits alike will often be scorched. Pears, Figs, Grapes, Plums, are particularly liable to this on summer and autumn days, without a speck of cloud from dawn to dark. There is yet one more danger, and that is from cutting draughts on house-tops. On the sides or ends of prevailing cold or strong winds a deal or pine shelter should be run up from the roof to the level of the fruit trees or bushes, flowers, &c. I observe you advocate protection for Fig trees on roofs. My experience is that they are far hardier, safer, more fruitful without it. The zero frosts of last February, and the sad havoc it has made among fine outside Figs, has not modified my opinion; for my latest observations show but little difference between the present state

of Figs with and without protection through February. But what difference there is seems in favour of the out-of-door Figs that have had no protection for years. Our roof and wall Figs in the open under rational treatment, that is, a starving regimen, suffer less from the frosts of winter, however severe, than the chills and changes of spring. And everyone will admit that the protected Fig finds itself in a very much worse vital and physical condition to contend with our erratic springs than the unprotected one, which has already withstood the winter in the open. *D. T. Fish.*

THE CHISWICK VEGETARIAN LUNCHEON.—I notice in the *Gardeners' Chronicle*, September 14, a menu of a "vegetarian" luncheon given at Chiswick at the last meeting of the Royal Horticultural Society. In looking through it, I find such things as eggs, cheese, and butter, not to mention milk and cakes. Now I always like to learn, and although I know that some fowls make better "layers" than others, and might consequently come under the care of the National Carnation and Picotee Society, still, will some one kindly inform me how they (the fowls), cows, and goats flower, and the best way to raise them from seed or cuttings. *W. M.*

DOUBLE DAISIES.—The chief cause of the neglect of these hardy flowers in spring bedding, is no doubt their average lateness in blooming. Could anyone introduce a variety that would begin to bloom from the middle or end of March onward, then a great gain would result; commonly they begin to flower from the middle or end of April, and are usually at their best during May, that is too late for bulbs, most of which bloom in April. No bedding plant for producing a carpet of colour can be better than is the blood red. The Giant White and Mottled are also effective. We can easily have *Myosotis disitiflora*, our earliest Forget-me-Not, which should always be raised from seed, in bloom throughout April; also coloured Primroses, selected early Violas from old plants, *Abrietas*, *Arabis*, *Doronicum plantagineum*, and some other pretty hardy things, and to have Daisies a month later is annoying. If there were not summer bedding exigencies, it would matter less, but where those exist, then Daisies are too late. *A. D.* [The plant reverts largely after a few years, if not so much in regard to colour at least in doubleness; and although a "double" flower, the whole of the organs of propagation are not suppressed, hence the plants fill the flower-beds with seedlings which of itself becomes in time a nuisance. *Ed.*]

OAK-GALL AND OAK-APPLE.—In last week's answers to correspondents it is stated that these terms are synonymous. Of course, an Oak-apple is an Oak-gall, yet I venture to think that a distinction is commonly drawn from a popular point of view. The spongy Oak-gall (produced by *Teras terminalis*), sacred to the memory of King Charles, is the true Oak-apple, whereas the hard round gall (produced by *Cynips Kollar*), which first appeared in this country about forty years ago, is more usually called the Oak-gall, although not unfrequently also designated Oak-apple. Moreover, there are many native kinds of Oak-galls which would never be called Oak-apples. Your reply was right, and it was wrong. It all depends upon the nature of the query, or what was intended thereby. *R. McLachlan.* [Our correspondent's inquiry related to the Oak-apple, as we thought, but the wording was not too clear on that point. *Ed.*]

PEACHES AND NECTARINES ON THE OPEN WALL.—During the past few years we have heard much less than formerly of failures of Peaches and Nectarines on open walls. It is not so long ago the cry went up, and I believe there were many gardeners of the opinion, that owing to adverse seasons it was not worth the trouble to cultivate the Peach on unprotected garden walls. Whether or not there was generally in the south any reason for this opinion being held, I am enabled to vouch for the correctness of the statement that for the last twelve years, with two or three exceptions, the crops at Mereworth have been exceptionally heavy, and the quality of the fruits good; and, on the whole, the Peach trees have cropped as well as Pear and Apple trees, or, in fact, as any other kind of fruit grown in these gardens. I can see no reason why, with ordinary attention, the same should not continue. One thing, however, is certain; it is of no use depending upon old trees for throwing good crops of fruit; but young trees of good varieties, if well attended to, will afford, in the majority of years, good

results. In the less favourable parts of the country a full south aspect is necessary, and the latest varieties should be discarded, the fruit not ripening satisfactorily, excepting in warm gardens. Here I may mention we have 420 yards, 210 yards in each stretch, facing south-east, and which never gets any sun after 2 P.M., and it is from the trees on these walls that the best fruits are gathered. One of these walls is planted with the trees on the level, and those on the other on a raised border. Those trees which are planted on the level border always do the best, keeping freer from insects, and requiring less water at the roots and overhead syringing—in fact, it is seldom that water is artificially applied; neither do we mulch the roots with manure, but afford a good sprinkling of poultry-manure, carefully picking it in during the early spring. This dressing benefits the trees wonderfully. This training is another point of importance which is practised, so that the wood, not being crowded together, gets well ripened. I always disbud very gradually, extending the operation over many weeks. Very little pruning is required, and the trees suffer no check. Thanks to Messrs. Rivers, we have now many good early and late varieties of Peaches and Nectarines, which prolong the season considerably. The early American varieties have several points in their favour. Waterloo and Hale's Early are very useful fruits; that valuable variety, Rivers' Early York, follows quickly, and Early Louise ripens at a useful time, while Alice and Condor are not to be despised. The best of the mid-season Peaches are Dymond, Royal George, Stirling Castle, Grosse Mignonne, and Goshawk. Noblesse, Royal Charlotte, Barrington, Gladstone, and Admirable are useful to follow these. Of Nectarines, Lord Napier, Elruge, Stanwick, Pine-apple, Humboldt, and Pitmaston Orange are marvels of goodness. Another early Nectarine, and one which, in my opinion, has a future, is Early Rivers, which ripens about ten days earlier than Lord Napier, which appears to be very free. The fruits are very luscious, and resemble those of Lord Napier. Peach trees require plenty of space, as will appear when I state that some trees planted eleven years ago at 21 feet apart, now cover the entire allotted space and more, some being fully 28 feet across. When these trees had been planted four years, I was advised to lift them, but as I was anxious to get the walls covered, I left them alone, with the result that as the trees grew they soon began to fruit with great freedom. That the Peach thrives and produces the best fruit and keeps freer from insect pests when growing in a firm soil I have had ample proof. It is said by some gardeners no manure should be applied at the time of planting the young trees, but this depends entirely on the nature of the soil. If it be poor, something should be added to encourage free but not gross growth. Well-decayed manure should at all times be incorporated with the soil, but should the loam be somewhat heavy, a less decayed manure is better together with plenty of lime rubbish. All good cultivators understand the value of drainage wherever these fruits are grown, and the amount of this should always be regulated in accordance with the nature of the soil. *H. Markham, Mereworth, Maidstone.*

EXTRAORDINARY SINGLE LEAVES ON THE VICTORIA REGIA.—From the measurements given in a recent issue of the *Gardeners' Chronicle* of leaves of the *Victoria Regia* in the Royal Botanic Society's Garden, Regent's Park, London, it would appear as though some of the leaves upon a plant of the same species growing in the Sheffield Botanic Garden are still larger. I have never seen a more vigorous plant, or one with finer leaves, than the Sheffield specimen. The tank in which the plant is growing is 28 feet in diameter, and even this width is insufficient for the leaves to develop fully, as they get damaged by being squeezed against the sides of the tank. The surface of the water is entirely covered with leaves; the flowers are large and numerous, and at the time of writing there are flower-buds in various stages of development showing above the surface of the water. To-day, September 24, the largest leaf measured was 7 feet 3½ inches in diameter, inside measurement, with a turned up margin 3½ inches high, which gives the full measurement of 7 feet 10½ inches diameter. The next largest leaf is 7 feet 2 inches. Then there are three of 7 feet 1 inch, and two of 7 feet; two younger leaves, each 6½ feet, and another 5½ feet. There are also upon the plant three smaller ones. Four leaves have been cut from the plant, each of which measured

upwards of 7 feet in diameter. All the above measurements were taken inside, without calculating the rims, which vary from 3 to 4 inches in depth. *William Harrow.*

THE CHISWICK TRIALS.—I can quite understand "A. D.'s" reluctance to abolish or reduce frivolous and unproductive "trade" trials at Chiswick, and deal instead with what Mr. W. T. Thielton Dyer, in his address, calls "fundamental questions," which he considers a noteworthy feature of modern vegetable physiology. The occupation of the committees would in some cases, I fear, be gone. Mr. Thielton Dyer's paper, of absorbing interest, reads like a romance; and who knows but that when "A. D.'s" Committees rise to the occasion and perform similarly interesting and careful work in the sphere of horticulture, we may yet live to read papers as entertaining from Chiswick, where the materials might, I think, in time be found. At present, many of the deliberations there are, to say the least, "drumlie," and one would not wonder if in the re-organisation contemplated by the Council, the committees come in for some share of attention and admonition. A "wake-up" might do good. We can imagine "the wrangle" over that Bean, and the "purposeless result" described by "A. D." The Cucumber puzzle in prospect, I do not expect much from. The fact is, raisers of new varieties of common things depend largely for trade on their novelty, and could no more get on without them, than the milliners and dressmakers could without constantly changing fashions; but to prostitute Chiswick as an advertising medium to the business, because of "so many claimants for honours being in the field," is too bad. Chiswick should and could select and arrange its own work annually if it chose to try, and hardly ever will keep its expenses within bounds, and its work up to the mark, till it adopts the plan in force in most well-conducted country establishments, of forecasting and estimating the work beforehand. Some reasonable proportion, I submit, should exist between the expense and trouble connected with the so-called "trials" and the results; but how does the matter stand? Take the 500 Phloxes, for example: of that number, the bulk, according to a contemporary, was supplied by one member of the trade. A fraction of the 500 received three and two marks when the committee went over them last year, but the most of the work appears to have been sorting out the much larger number of inferior "duplicates," and "varieties too much alike." Is such game worth the powder to any one but the man who sells the plants? I noticed that no sooner had the committee done their work, than a report of it, bald as it was, was at once prominently appended to the lists of the vendors who encumbered Chiswick with the trials—the parties mainly benefited. Numbers of the vegetables "tried" can only be proved by cooking. Were they tested in that way? If not, the verdict of the committee is not worth anything. *Head.*

MR. A. H. SMEE'S LETTER.—Permit me to say that the "heckling" to which Mr. Smees proposes to subject the Council on the Chiswick business may, probably, cut both ways, if persisted in; and I hope, as an outsider, that the Council will speak out without reserve, if forced, no matter what happens. I trust also that everything will be published for the benefit of that multitude of horticulturists "throughout the country," who, we are told, are consumed with anxiety on the subject, but of which there is no sign, if we except the small section who are making all the fuss. Provincial horticulturists of all degrees take but a languid and casual interest in Chiswick at present, but they might be induced to take more under different circumstances. I am sure also that you would greatly oblige your numerous readers by telling them precisely what the functions and powers are of the different "Councils," "Boards," and "Committees," which we hear so much about. When Chiswick is reorganised, I hope there will be at least three competent and able men at the head of affairs who will know how to conduct the business of the Society, and keep meddlers in their proper place. I have never been able to make out how the business of the Royal Horticultural Society was conducted; but I do know that other business concerns, involving much vaster interests, depend mainly for their success on the chairman, the secretary, and the manager, with an occasional quorum, and who, while doing their duty, would certainly not brook that dictation from irresponsible members, which a few "fellows" of the Royal Horticultural Society seem to regard as their special

privilege. It is, no doubt, dreadful to think of what may happen if Mr. Smees should be deprived of judges from Chiswick for local shows. But to restore his confidence, I would advise him to take a trip to the provincial local shows anywhere, where he will see the awards dealt out before a discriminating public, in a manner above suspicion, whether as regards "local influence" or good judgment. I await the Council's justification of its proceedings in regard to Chiswick, and I have confidence that it knows what it is about, and hope it has a good scheme in view. Of one thing I am confident, and that is, that the Council have nothing to fear from the general body of horticulturists throughout the country if it acts wisely and fearlessly. At present the reported general agitation and "indignation" is an utter sham in my belief. *Head.*

SOUVENIR DE LA MALMAISON CARNATIONS AT EATON HALL, CHESTER.—Being in Chester a few days ago, and in the company of a friend, I took the opportunity of visiting the gardens of Eaton Hall. Mr. Barnes, the head gardener, himself kindly conducted us over the more interesting parts of the gardens. Amongst the many fine things to be seen here we were particularly struck with several houses filled with plants of *Souvenir de la Malmaison Carnations*; every plant (and there must be several thousands) was in perfect health—not a sign of disease or any kind of insect to be seen upon them. They are grown principally, Mr. Barnes informed us, to supply cut bloom during the London season. Such a grand lot of plants as these Carnations were could with difficulty be found anywhere else. *B. Ashton, Glosop Hall Gardens, Derbyshire.*

SEEDSMEN'S TRADE MARKS.—There is an important point in connection with the seed case that came before the Southampton magistrates last week that seems to have escaped notice, for no reference is to be found to it in the lengthy reports in the local papers. It is assumed that the plaintiff registered as a trade mark a certain device embodying the words "Shepherd's Kale" as applied to that particular seed, and the Patent Office have taken his money in return for a right, which by virtue of their certificates professes to give him protection upon all parcels that he distributes. The Kale gains in popularity, and local farmers save their crops for seed, some finding its way into the hands of another seed-distributor still bearing the original name. Many will say it is still Shepherd's Kale, and so it may be, but my contention is that when a trader goes to the expense of controlling a specialty according to the law, he seems to be quite within his rights to do his utmost to hinder his name being hawked everywhere without some qualification attached that will show the buyer what he is purchasing; if not, what is the use of a registered trade mark at all? The seed was never in his possession, the crop may not have had the necessary care bestowed upon it, and although there may be no secret means adopted to keep it true, any one who has had to do with the seedling of the Brassica tribe knows how readily a variety will revert if not planted in a proper situation, and rogued and re-selected each season by experts. To make comparisons of Sangster's Peas, Wheeler's Imperial Cabbage, and Brown's Monarch Swede, is beside the question altogether, from the fact that the old-fashioned growers who raised these varieties probably never had any idea of protecting their rights under the Trade Marks or any other Act, and as a consequence, their goods are everybody's property. If there is nothing in "selection," will someone kindly tell me why it is the custom with all the best houses in the trade to supply what is known as "stock seed" when they require farmers to grow for them? Ask Messrs. Carter or Sutton if they would allow any one of the Cabbage tribe to go out for seeding again that was "one year only" grown from their private stocks! I have no knowledge of the parties in this case, but these matters seem to me to require elucidation. *Agri-Horti.*

RED-FLOWERED DENDROBIUMS.—I have read with interest Mr. C. Woolford's note at p. 337, with respect to the rare and almost forgotten *Dendrobium arachnites*, Rchb. f., which I have known ever since 1887, when it flowered in the collection of Baron Schroder, at The Dell, Egham. Previously, I had only known it by description. Whether the plant still exists, and whether others are known, I cannot say. Fortunately, all the dried material is not locked up in the Reichenbachian herbarium, though it cannot be said that the species is yet adequately

known. Why Mr. Woolford should have thought I am unacquainted with this species, I cannot imagine. It certainly has not crimson flowers. Reichenbach called it "cinnabar-red," and unless my memory is at fault, "cinnabar-orange" would have been more strictly correct. This colour occurs in several others, though they are seldom seen in cultivation. My remarks referred to a "crimson-flowered" *Dendrobium*, and the colour is repeated in the description. The phrase is not applicable to *D. arachnites* at all, which in colour is about as much like *D. sanguineum*, as *Lælia cinnabarina* is like *Broughtonia sanguinea*. *D. sanguineum* is the only species yet known to me with blood-red flowers. *R. A. Rolfe.*

THE RETIREMENT OF MR. BARRON.—It is much to be regretted that Mr. Barron's name should have lately become the subject of general conversation, and the Council so much censured for what may yet meet with the approval of all well-wishers of horticulture, and those apparently interested in the Royal Horticultural Society. Why all this warmth has been manifested is not quite clear to me. It should be borne in mind that the present Council has enjoyed universal confidence, and brought the Society to a much better position, both publicly and financially, than at any time previously, and for which I am grateful, as I think others should likewise be. I have been connected with every one of the Council, either in committee or else in some business capacity, and I therefore repose with all confidence, that when the proper time arrives for them to give an account of their stewardship, they will show how wrong it is to question their integrity; therefore, before a general condemnation is passed, I think it is only right we should wait patiently for an explanation of their parting with their Superintendent, for in all probability that which is so bitterly complained of may have made the contemplated alterations absolutely necessary, and ultimately prove of great advantage to horticulture generally. I am not in possession of any cabinet secrets, neither do I desire to shield the guilty of any wrong actions whatever, but it must be plain to all, looking at the useful and important work being done, and the amount of money expended by the County Councils and several colleges in various parts of the country, that our young men emanating from Chiswick and Kew are in great danger of losing prestige and position in the eyes of ladies and gentlemen requiring skilled gardeners. In my opinion, Chiswick should be, without delay, made a college for the highest attainments in horticulture, not only where youths are to be employed and instructed, but where professional gardeners seeking situations should be centralised and be usefully employed; and when waiting for appointments they should have the opportunity, during that time, of still further practising and seeing the highest class of gardening carried out. Whenever a gardener is required, he would then be readily found, and a suitable man quickly engaged. It may yet prove that something of this kind is in contemplation, and if so, I am of the opinion that great good is likely to follow. In my opinion, it is one of the most pressing requirements at the present moment for gardeners when out of situations, particularly when their discharge is brought about through no faults of their own—that there should be some horticultural centre for them to go to. Ladies and gentlemen also made aware of their being in readiness could personally see and select what they required. It seems to me that Chiswick and Kew are where they might very conveniently be located and be usefully and temporarily engaged; of course, under wise regulations I consider this a project of great importance. At present, when a gardener through the decease of his employer or other eventualities is under notice to quit, in all probability he is more often than not 5 or 10 miles away from any town or city, he hesitates where he had better move to, and eventually takes the nearest house-to-let. Now all depends upon good luck in advertising and his distant friends; nothing comes at all suitable; time rolls on, and after awhile he finds his hard-earned savings gradually dwindling, and in many cases a real good man at last is compelled to accept something quite different to his deservings and requirements. He gradually becomes forgotten, and after weeks of inactivity he gets disheartened and disgusted with the profession; whereas, if located in the neighbourhood of the above-mentioned gardens, with a scheme set on foot for this purpose, gardeners would be within touch of those requiring them, and would probably soon obtain suitable employment according to their ability; at all events, I think it is quite possible for

the Council to establish a kind of Bureau for professional gardeners, ready and capable to undertake the management of either large or medium-sized places, at once if required, and which would certainly often be a convenience to proprietors. I would gladly double my subscription, and no doubt many others would do the same, to enable the Council to organise such an institution as I have foreshadowed or suggested. It would be a boon to many. I am repeatedly asked for a certain class of man—and time is all important. After writing and communicating with several men out of place, scattered about, I hear the place is filled, more often than not, by some incompetent person, because the skilled man was not at hand, or could not easily be seen, being so far from London; whereas, if engaged from such an institution, he would have a higher standing, and would also be independent of the nurserymen, and would allow him to be far more free as to his future dealings. *Henry Cannell, Swanley.*

—By an advertisement in the *Gardeners' Chronicle* I notice the Royal Horticultural Society of London is in want of a new Superintendent, one having a thorough practical and scientific knowledge of all branches of horticulture. Salary £200 per annum. To an ordinary gardener this amount seems liberal, but to a scientific man I should say it is decidedly small. A scientific education is not obtained without some considerable expense, either to the individual himself or to someone else. Self-taught men of course can be had, and men, like most gardeners, can be had in any quantity to work for the mere love of it. Of the £200, £50 at least would have to go towards the rent of a decent house. There would be rates, taxes, &c., in addition, leaving less probably than £150 to live upon, not much certainly to maintain a man and family, before the glaring light of a very exacting horticultural world. Of the two, I should much rather prefer the retiring-money offered to Mr. Barron, though, as far as yet explained, I fail to see the wisdom of a poor society retiring so strong, so active, so practical, and so horticulturally scientific a man as Mr. Barron on £180 a year. It will take the subscriptions of a good many Guinea Fellows to make up this sum. Then there is the £200 for the new man—£330 in all. True, as Mr. Barr says, there are rich men among the Fellows, and one or other of these may come forward and say, "We will pay it all," but this much has not yet been offered, and until it has been said, we are obliged to fall back upon the old proverb, "It is easy to be liberal with other people's money." Had Mr. Barron retired of his own accord, the probability is, they would not have offered him so much; nor do we know how much of this is what may be called solatium or hush-money, to keep the horticultural world quiet, and to hide the "inner council" over a piece of almost unpardonable work; and this to a man who has done more, perhaps, than either any inner or outer council ever did to keep Chiswick Gardens together—at a time, too, when the Society had almost reached that stage of dissolution known as *mors extrema*. Mr. Barron's name and personality at that time was a power in itself, and for any existence the Society now has, it owes to Mr. Barron—at any rate, when the Society's proceedings were at the lowest possible ebb. That is the opinion we gardeners in the country had of it. Why now Mr. Barron should be turned out is a conundrum to us. Well, Mr. Barron will retire with all honours, carrying with him the sympathy and hearty good wishes of his fellow horticulturists; and when he shakes the Chiswick dust from off his feet, and walks out of those gardens, he will have a warm welcome amongst his many horticultural friends, whether they be scientific or merely common-place practical. It takes all sorts of men to make up even a good-working horticultural community. From my point of view, I thought a good practical man was what they most wanted at Chiswick. The science of plant culture and botany is well cared for in the Royal Gardens of Kew with its handsome national grant of £21,779 a year. Is the inner Council of the Royal Horticultural Society jealous of its colossal neighbour? if so, and it perseveres to emulate, it may, in the near future find itself very much in the position of the frog in the fable. Mr. Barron induced me to become a Guinea Fellow. I derive no benefit from the Society. True, they sent me some tickets of admission to their shows, of which I was not able to avail myself; and, by-the-by, I also got the Society's *Journal of Horticulture*, though I never could see that a paper is so much better for being read before a Council than it is when communicated to us through the medium of the

many weekly horticultural periodicals, through which it would reach us sooner, and be more widely diffused. Pity anything should happen to the Society in its present unique position, for without it and its Drill Hall—a place I have never yet seen—what would become of the outlet for the many little exhibits brought there from such people as the Veitchs of Chelsea, the Bunyards of Kent, the Laings of Stanstead, the Cannells of Swanley, the Pearsons of Nottingham &c., amongst nurserymen. Then there are besides a tribe of gardeners locally planted in and around London. To all these and sundry others the Society deals out its Knightian, Banksian and other Bronze Medals, Certificates of Merit, Votes of Thanks, &c. To us gardeners in the country far away, who have not a chance of even a look through the window, the farce is all the same—exceedingly laughable. *W. Miller, Combe Abbey, September 17.*

LATE STRAWBERRIES.—I have this day (September 22) picked twenty-three full-sized fruits of *Vicomtesse Héricart de Thury*, equalling in flavour the summer produce. I shall be able to pick again about twenty-eight more fruits from plants put out last year. *J. May, The Gardens, The Red House, Leatherhead.*

THE HERBACEOUS BORDER.

ASTER CORYMBOSUS.

This belongs to the small-flowered section; and so small is it that many persons might consider it an insignificant plant, it being but $1\frac{1}{2}$ feet high. It is, however, very useful for mixing with other flowers of a larger and stiffer habit of growth, its slender sprays lightening up and improving the appearance of other things. It is a plant of easy culture in the herbaceous border. *W. H. Divers.*

ERITRICHUM STRICTUM (p. 336).

This plant grows freely here, coming up wherever seed was dropped the previous season; and, unlike *E. nanum*, there is not much fear of losing the plant when once it gets established. It is much admired for its pretty blue flowers, and is useful for cutting for filling vases—for effect by daylight—when *Myosotis* is not obtainable. I may have it under the wrong name, but it was grown at Kew last season under this name, and seed of the plant is also offered for sale by several English firms. The scent of the flower approaches, in my opinion, that of the *Woodruff* (*Asperula odorata*), but it is less powerful. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

Obituary.

HERMANN STENGER.—Hermann Stenger, formerly a familiar figure in the horticultural world, died suddenly at his residence, 33, Chancellor Road, West Dulwich, on Monday, the 23rd inst., at the age of sixty-seven years. A native of Erfurt, one of the principal centres of the nursery and seed industries in Germany, Stenger came to this country upwards of forty years ago, and first took service under Messrs. Veitch at Exeter. He was subsequently traveller for Messrs. Veitch at Chelsea, and then for Messrs. Henderson of the Pine-apple Place. For a short time he was associated in partnership with Mr. Herbst at the Kew Road Nurseries, Richmond. Following upon this, he became manager of Messrs. James Carter & Co's nurseries, at Forest Hill, and afterwards, about twenty years ago, he entered the service of Messrs. Vilmorin & Co., representing that firm in this country. But after four or five years' service, the slow paralysis that had been coming for some time, rendered him quite helpless in the legs, and for the last fifteen years, or thereabouts, his travelling has been limited to a wheel-chair. In spite of his affliction, he was cheerful to the last, for he enjoyed good general health, and, thanks to the great liberality of Messrs. Vilmorin, he ended his days in comparative comfort.

ISIDORE VERVAET.—The death of this well-known nurseryman, of Ghent, on the 21st inst., is announced.

SOCIETIES.

ROYAL HORTICULTURAL.

GREAT EXHIBITION OF BRITISH-GROWN FRUIT AT THE CRYSTAL PALACE.

September 26, 27, 28.

THE Show was opened by the Sheriffs of the City of London, Alderman and Sheriff Samuel, and Sheriff Hand, who drove down to the Palace in State, and were received at noon by Sir Trevor Lawrence, the President of the Royal Horticultural Society, and members of the Council, and conducted over the Exhibition.

A gardeners' luncheon subsequently took place in the Grand Saloon, the President of the Society in the chair. The loyal toasts were duly honoured, the President referring, amid applause, to the fact that Her Majesty was a patron of the Society, and took a deep interest in its welfare, as evidenced by the magnificent display of hardy fruit from Her Majesty's gardens. The President, in giving the health of the "Sheriffs of the City of London," said they were in hopes of having the Lord Mayor present with them that day; but as they were all aware, his lordship had been engaged in an exhausting series of enjoyment and dissipation in France. However, in the absence of the Lord Mayor, they were very glad indeed to have the presence of the Sheriffs of the City of London, who had been kind enough, not only to drive down to the palace, but to do so in state. They all knew what important duties the sheriffs of London discharged, and they were much obliged to the sheriffs for being present. The senior sheriff (Mr. Samuel) was a member of the Gardeners' Company, and they welcomed him in that capacity, as well as sheriff of London. He believed they had that day shown the Sheriffs such fruit as they had never seen before, as he considered a finer collection of hardy fruit had never been tabled in any exhibition in the Kingdom. He need hardly say how much they were all obliged to gentlemen from all parts of the kingdom who had been kind enough to contribute to the show. He was quite sure that the importance of fruit cultivation in this country would receive a very considerable fillip from the show. He thought they had successfully proved that they could produce in this country hardy fruit which could not be beaten in any part of the world. Referring to the correspondence which had been going on in the subject of fruit drying, the President said we in this country had never done much in that direction; that, however, was partly due to the fact that we did not readily combine for operations of that sort, which needed co-operation rather than individual effort. When there was a glut like there had been during the present year, and when there was a difficulty to find a profitable market for even good samples of fruit, it would be a great advantage if the surplus fruit could be dried, if only for domestic consumption. Recently there had been statements made about the quantity of butter imported to this country, representing about £10,000,000 annually. Whatever could be said about fruit-drying, there was no doubt that we could produce butter of the highest quality. When farming was so precarious, it did not say much for the farming classes if they could not compete with the foreigner in the matter of butter.

Alderman and Sheriff Samuel responded. He said that, in justice to their civil chief, he must tell them that his lordship was that day attending a meeting of the Court of Common Council, and he was quite sure when the Lord Mayor heard of the reception that had been accorded to the sheriffs, he would regret, as much as they all did, that he was unable to be present with them. The City of London had always, by their guilds, taken a deep interest in anything that could tend to the supremacy and the welfare of the country at large. It was one of the most pleasant functions of the sheriffs to attend on such occasions as the present to testify by their presence how much they desired to see British industries flourish.

Sheriff Hand proposed the Royal Horticultural Society. He dwelt upon the growth of the society, and said there was no knowing what would be the result of the next twenty-five years' work if even only one half of the 3,500 Fellows did their level best.

The President responded. He said the Society was in a satisfactory condition, and was the acknowledged head of the horticulture of the United

Kingdom. He bore testimony to the excellent work done by all concerned, especially mentioning the valuable services rendered by their Assistant-Secretary, Mr. John Weathers, in the regrettable absence through illness of their Secretary, the Rev. W. Wilkes. The President thanked the authorities of the Crystal Palace for their efforts to make the show a success, which he sincerely hoped it would be financially, and otherwise.

The President next gave the toast of "The Judges," and thanked those gentlemen for all they had so kindly done.

Mr. Dunn, gardener to the Duke of Buccleuch, responded.

Mr. Pearson, of Chilwell, proposed the toast of "The Press—Horticultural and General." Mr. Barnes, *Standard*, responded; and the proceedings ended.

THE SHOW.

The schedule is divided as follows: Division I. containing seventeen classes, for fruits grown under glass or otherwise, open to all. Division II., including six classes, open to nurserymen only. Division III., containing twenty-eight classes, for fruits grown in the open air, open to gardeners and amateurs only. Division IV., containing sixty-four classes, for single dishes of fruit grown in the open air (amateurs and gardeners only). Division V., containing five classes for dried fruits, not preserved in fluid or sugar, the fruit to be grown and dried in the British Islands; and Division VI. containing six classes, for which special prizes were offered. Below we give a report of the first three of these divisions, and the other three, together with important exhibits by the trade, must be deferred until next week.

DIVISION I.

FRUITS GROWN UNDER GLASS OR OTHERWISE, OPEN.

The leading class in this open division was one arranged for a collection of twelve dishes of ripe fruit, not fewer than six kinds, nor more than two varieties of a kind. Three exhibitors contended for honour here, and the successful one in obtaining 1st prize was Mr. J. McIndoe, gr. to Sir JOSEPH PEASE, Bt., M.P., Hutton Hall, Guisborough, Yorks. His three bunches of Foster's Seedling Grapes and Gros Maroc Grapes were good, not phenomenal. Pears, Pit-maston Duchess, and Doyenné Boussoch admirable; Peaches, Golden Eagle and Exquisite, excellent in colour and size excepting one, perhaps, in the dish of Exquisite, which was not quite equal. Yellow Magnum Bonum Plums and Bryanston Green Gage were good; Figs (Brown Turkey) very good; and Apple (Gascoigne's Scarlet) and Melon (Yorkshire Beauty) completed the collection.

The 2nd prize was taken by C. E. KEYSER, Esq., Stanmore, who had Black Alicante and Muscat of Alexandria Grapes, Victoria and Pineapple Nectarines, Thames Bank, and Sea Eagle Peaches, Brown Turkey Figs, a seedling Melon, and Hero of Lockinge Melon, and a Ripley Queen Pine weighing 6 lb. 10 oz. Plums, Golden Drop, and Pear Bauré Hardy, completed the exhibit, which was good in general quality, but not equal to Mr. McIndoe's.

Mr. Goodacre, gr. to the Earl of HARRINGTON, Elvaston Castle, Derby, was 3rd, and his fruits were of no mean quality.

The collection of eight dishes, including four kinds, and not more than two varieties of a kind—Pines excluded—was very well won by Mr. Geo. Reynolds, gr. to Messrs. de ROTHSCHILD, Gunnersbury Park, Acton, Middlesex, Gros Maroc Grapes with large well-coloured berries, Muscat of Alexandria fairly good, but with a few bad berries; capital Sea Eagle and Thames Bank Peaches, Pine-apple Nectarines, Sutton's Al Melon, Ribston Pippin Apples, and rather poor Coe's Golden Drop Plums were included. Mr. F. Harris, gr. to Lady H. SOMERSET, Ledbury, took 2nd position, in whose exhibit we remarked very commendable Gros Maroc Grapes, capital Golden Drop Plums, Pine-apple Nectarines, with high colour; and a very fine dish of Gladstone Peaches. Mr. W. J. Empson, gr. to Mrs. WINGFIELD, Amptill, was 3rd.

GRAPES.

Mr. GOODAORE staged thoroughly good, if not extraordinary, Grapes, in the class for six distinct kinds, two bunches of each, and well secured first place. His varieties were Lady Downes, Gros Colmar, Muscat of Alexandria, one bunch, capital; Barbarossa, Mrs. Pearson, and Alicante. The only other competitor was Mr. REYNOLDS, and he took 2nd prize for Chasselas Napoleon, Alicante, Trebbiano, Mrs. Pince, Muscat of Alexandria, and Gros Maroc, all of good average quality.

Three distinct kinds, two bunches of each.—This class was won by Mr. R. Grindrod, gr. to P. J. PHILLIPS, Esq., Whitfield, with half-dozen bunches, chiefly remarkable for an exceptionally large bunch of Black Alicante, and the berries also good and well coloured; but unfortunately some of the berries had been disfigured by rubbing. Two commendable bunches of Gros Colmar were included, but the Lady Downes were poor. Mr. A. Belcher, gr. to Sir E. H. BARNETT, Bt., Cranleigh, Surrey, was 2nd, with moderately good Grapes.

Black Hamburg, three bunches.—Mr. Wm. Taylor, gr. to C. BOYER, Esq., Forest Hill, London, was 1st in this class with moderately-sized bunches, of good quality for the date of the season; 2nd, Mr. W. MITCHELL, Chilworth Manor, Romsey, Hants; 3rd, J. A. TULK, Esq., Cowley House, Chertsey (gr., Mr. Newman). There were four other entries.

Madresfield Court, three bunches.—Mr. J. Day, gr. to G. J. MASSEY, Esq., Carlisle town, won in these classes, but he was very little before Mr. W. Taylor, gr. to C. BOYER, Esq., Forest Hill, who had shorter bunches with much larger berries. 3rd, Mr. J. Gibson, gr. to Earl COWLEY, Chippenham. There were four entries.

Gros Maroc, three bunches.—Mr. J. GIBSON won this class with very highly-coloured berries, and moderately sized compact bunches. Mr. DAY was only a little behind him, and the 3rd place was secured by Mr. Newman, gr. to J. A. TULK, Esq., Chertsey. There were five other entries.

Alicante, three bunches.—Three well-finished bunches staged by Mr. G. REYNOLDS, won in this class, but very much larger bunches less pretty, highly coloured, but the berries small were staged by H. TATE, Esq., Park Hill, Streatham Common (gr., Mr. W. Howe), and a little dissatisfaction was expressed. The 3rd prize treble came from Mr. J. BURY, Byfleet. There were six other exhibits.

Any other Black, three bunches.—Three excellent bunches of Mrs. Pince (Black Muscat) won in this class, and were staged by Mrs. W. MITCHELL, Romsey, Hants. The 2nd prize was awarded to Lady Downes, exhibited by C. S. S. DICRENS, Esq., Coolhurst, Horsham, Sussex (gr., Mr. A. Kemp); and the 3rd to an exhibit including an enormous bunch of Grasse Guillaume, hardly finished, and exhibited by C. BOYER, Esq., Forest Hill (gr., Mr. W. Taylor). There were five other exhibits.

Muscat of Alexandria.—The finest bunches in this class, in which there were seven entries, came from Mr. W. Tidy, gr. to W. D'ARCY, Esq., Stanmore. These had fine berries, well finished. Mr. W. Taylor, gr. to Alderman CHAFFIN BATTE, was 2nd with very large bunches, rather wanting finish, and Mr. Empson, gr. to Mrs. WINGFIELD, Amptill, was 3rd with smaller examples.

Any other white.—Mr. Taylor, gr. to C. BOYER, Esq., Forest Hill, was well 1st, having splendid Buckland Sweetwater, the berries showing very fine finish. Mr. Reynolds, gr. to the Messrs. ROTHSCHILD, Gunnersbury Park, was 2nd with excellent Chasselas Napoleon; and Mr. Robinson, gr. to W. LAWRENCE, Esq., Sittingbourne, was 3rd with Buckland Sweet water.

TOMATOS.

These were in wonderful form, there being ten lots of four varieties, though in some cases the likeness between so-called varieties was too discernible. Mr. Howe, gr. to H. TATE, Esq., of Streatham Common, was 1st, with a rather large, but deeply-coloured Trophy, Frogmore selected, Hackwood Park, and Sutton's Perfection; Mr. A. RYDER, Orpington, was 2nd with very handsome Duke of York, Ignouton, Mayflower, and Trophy; Mr. CARRAWAY, Pulbrook, coming 3rd.

There were sixteen single dishes, Mr. HELMAN, Lewes, having the best in very handsome Polegate; Mr. M. C. SANDERS, Tring, coming 2nd, with Ham Green Favourite; and Mr. Richards, gr. to R. SUMMERS, Esq., Streatham, with Perfection was 3rd.

The class for six clusters brought nine lots, of which Mr. J. GORE, Polegate, had the best, in good but not large ones of that variety; Mr. Wells, gr. to F. G. ARBUTHNOT, Esq., Bexley, was 2nd, with the Old Bed, capital clusters; Mr. J. HILL, New Malden, being 3rd, with Conference.

ORCHARD-HOUSE FRUITS.

There were four large collections shown in the class for hardy fruit, grown partly or entirely to illustrate orchard-house culture, although the bulk seemed to have come from walls or the open. Here Mr. C. Blick, gr. to M. W. SMITH, Esq., Hayes, was 1st, with fifty-four dishes of Apples, Pears, Peaches, Plums, Nectarines, Cherries, and all very fine. Mr. Potts, gr. to Sir MARK COLETT, Sevenoaks, was 2nd, also with very fine and somewhat similar fruit; Mr. McIndoe, gr. to Sir J. PEASE, Guisborough, being 3rd, with forty dishes, all good.

DIVISION II.—NURSERYMEN ONLY.

The first prize for a collection of fruit trees bearing fruit in pots in this important class, was won by Messrs. T. RIVERS & SONS, Sawbridgeworth, who staged a magnificent collection of fruit trees in pots. In the centre was a pyramidal tree of Salway Peach which had borne upwards of eighty fruits, but some of which had fallen during transit. Then there were well grown trees of Apples, including Wagener, Cox's Orange Pippin, Beauty of Kent, Pea-good's Nonsuch; Pears, Louise Bonne of Jersey, Parrot, Princess, Conference, St. Lezin, &c. Grapes, Trebbiano, Golden Queen, Black Alicante, Directeur Tisserand, and White Tokay; besides Peaches, &c., and other fruits.

Messrs. GEO. BUNYARD & Co., Midstone, were 1st in the class 19 for a collection of hardy fruits grown partly or entirely under glass to illustrate orchard-house culture. The collection was staged on a table, in the centre of which were some fruit trees in pots, carrying crops of good fruit. Apples, Baumann's Red Winter Reinette, Cornish Aromatic, and Rosemary Russet; Pears, Bauré Superfin, Madame Lye Baltet; Figs, Violet Sepor, Brown Turkey, and others; also Peaches, Princess of Wales and Sea Eagle were represented in this manner. On the tables the fruits in dishes were of capital quality, and included Apples, Pears, Crabs, Figs, Peaches, Plums, and Grapes, of very high quality.

Messrs. GEO. BUNYARD & Co. also won 1st honours in the class for a collection of not more than 100 distinct varieties of hardy fruits grown in the open. The produce was exhibited in dishes and baskets; in the centre of the larger baskets was a Palm, and the surface covered with a mound of Apples, while the centre-piece consisted of a cone of different coloured Apples, and surmounted with a Dracæna. The Apples, Pears, and fruit generally were excellent, and were effectively displayed by the inclusion of such high-coloured fruits as

Worcester Pearmain, Akera, Duchess of Oldenburgh, Mère de Méage, Lady Sudeley, Duchesses's Favourite, Colville Rouge, Précoce, and others.

Class 21 was for a similar collection of hardy fruit, to include not more than five varieties, and the 1st prize was taken by Mr. H. BERWICK, Sidmouth Nurseries, Devon, who staged a magnificent lot of fruit. Apples, such as The Queen, Peasgood's Nonsuch, Emperor Alexander, Cox's Pomona, Blenheim Grange, Cellini Pippin, Bismarck, Golden Noble, Worcester Pearmain, and many others were large and excellently coloured. Pears of Beurré Clairgeau, Louise Bonne of Jersey, Souvenir du Congrès; Peaches, Plums, &c., were alike good.

The best collection of fifty distinct varieties of Pears was won by Mr. J. WATKINS, Pomona Farm Nurseries, Hereford, who did well, considering the more difficult task of exhibiting Pears than Apples during the present season.

There were five collections in class 23, some very fine fruit being staged; and Messrs. GEORGE BUNYARD & Co., nurserymen, Maidstone, were awarded the Silver-gilt Medal for a collection conspicuous for the fineness and finish of the samples, and their brilliant colour. There were grand fruit of Mère de Méage, Peasgood's Nonsuch, Warner's King, Bramley Seedling, Tyler's Kernel, Blenheim Orange, Bauman's Red Winter Reinette, Brabant Bellefleur, Swedish Reinette, Washington, &c.

FRUIT GROWN IN THE OPEN AIR.

DIVISION III.—GARDENERS AND AMATEURS ONLY.

This [comprised much that had great interest for those interested in Apple and Pear culture in this country. Visitors accustomed to see Apples of Colonial production, were found asking if the grand fruits staged were English-grown, and seemed grateful that it was so. Many of the culinary Apples were very fine, and in not a few cases grandly coloured, and a feeling of exultation that such fine specimens were the products of English gardens was justifiable.

Culinary and Dessert Apples.—In the class for eighteen dishes, twelve culinary and six dessert, there were eight competitors. Mr. G. Woodward, gr. to Major WARDE, Barham Court, Maidstone, was 1st with really superb examples of Tyler's Kernel, Lord Derby, Peasgood's Nonsuch, Stone's, Emperor Alexander, Belle Duboise, Bismarck, Belle Pontoise, Gascoyne's Scarlet Seedling, Washington, Mère de Méage, Warner's King, and The Queen; of dessert varieties, Cox's Orange Pippin, Baumann's Red Winter Reinette, Wealthy, Ribston Pippin, King of Pippins and Cornish Aromatic, all grandly coloured. 2nd, Mr. Geo. Goldsmith, gr. to E. G. LODER, Esq., Horsham, who had very fine Emperor Alexander, Gloria Mundi, Peasgood's Nonsuch, Lord Derby, Mère de Méage, Cox's Pomona, Bismarck, Cellini Pippin, very fine; and The Queen; and of dessert varieties, Wealthy, King of Pippins, Cox's Orange Pippin, and Ribston Pippin. 3rd, Mr. W. King, gr. to J. COLMAN, Esq., Gattin, Reigate, also with some very good fruit.

With twelve dishes, eight cooking and four dessert, there were fourteen competitors, Mr. T. W. STARTUP, Maidstone, taking the 1st prize with excellent examples of Warner's King, Lord Derby, Gascoyne's Scarlet Seedling, very fine; Peasgood's Nonsuch, Beauty of Kent, New Hawthornden, The Queen, and Stone's; and of dessert varieties, Mahbot's Pearmain, Ribston Pippin, Bauman's Winter Reinette, and Cox's Orange Pippin; 2nd, Mr. A. T. KILLICK, Maidstone, who had of culinary varieties, Lord Derby, Peasgood's Nonsuch, Bismarck, Gascoyne's Scarlet Seedling, Mère de Méage; and of dessert, Worcester Pearmain, Ribston Pippin, and Cox's Orange Pippin; 3rd, Mr. W. G. PRAGNELL, gr. to J. K. D. WINGFIELD DIGBY, Esq., Sherborne Castle. Admirable fruit was shown in this class.

There were sixteen competitors with nine dishes of apples, six cooking and three dessert. Mr. T. Turton, gr. to J. HARGREAVES, Esq., Maiden Erlegh, Reading was 1st, who had finely-finished fruit of Emperor Alexander, Mère de Méage, Peasgood's Nonsuch, Warner's King, Cox's Pomona, and Loddington Seedling; and of dessert Apples, Ribston Pippin, King of Pippins, and Cox's Orange Pippin; 2nd, Mr. S. H. GOODWIN, Warwick, also with capital fruit of Peasgood's Nonsuch, Cox's Pomona, Blenheim Orange, and Yorkshire Beauty; and of dessert fruit, King of Pippins and Worcester Pearmain; 3rd, Mr. R. GRINDROD, gr. to R. S. PHILLIPS, Esq., Whitfield, who had very fine Peasgood's Nonsuch, Mère de Méage, Emperor Alexander, and Warner's King.

Culinary Apples.—There were thirteen collections of six dishes. Mr. WOODWARD taking the 1st prize with magnificent examples of Warner's King, Emperor Alexander, Lord Derby, Stone's, Belle Duboise, and Peasgood's Nonsuch. 2nd, Mr. S. J. WRIGHT, gr. to C. LEES CAMPBELL, Esq., Gleston Court, Hertfordshire, who had very fine Warner's King, Peasgood's Nonsuch, Lord Sniffield, Belle Duboise, Lane's Prince Albert and Ecklinville. 3rd, Mr. J. E. BARTON, gr. to Sir E. PAUL BACK, Twickenham, who had very fine Winter Hawthornden, Lord Sniffield, Peasgood's Nonsuch, and Emperor Alexander. The best three dishes out of twelve competing collections came from Mr. B. C. SANDERS, gr. at Halton, Tring, who had wonderfully fine Peasgood's Nonsuch, Emperor Alexander, and The Queen. 2nd, Mr. A. T. KILLICK, with very fine Peasgood's Nonsuch, Warner's King, and one unnamed; 3rd, Mr. W. JONES, gr. to J. R. BROUGHAM, Esq., Carshalton.

Dessert Apples.—There were nine entries of six dishes. Mr. WOODWARD again being 1st, with fine and superbly coloured examples of Washington, Ribston Pippin, Red Winter Reinette, Cox's Orange Pippin, Lady Sudeley, and Calville Rouge Précoce; 2nd, Mr. G. GOLDSMITH, with Cox's Orange Pippin, King of Pippins, Egremont Russet, Ribston Pippin, Adam's Pearmain, and Gravestein; 3rd, Mr. BANNISTER, gr. to H. ST. VINCENT AMES, Esq., Westbury-on-Trym. With

three dishes, Mr. ATKINS, gr. to O. S. S. DICKERS, Esq., Horsham, was 1st out of thirteen competitors, having excellent fruit of Ribston Pippin, American Mother, and Cox's Orange Pippin, all finely finished; 2nd, a collection which bore no exhibitor's name, the varieties King of Pippins, Cox's Orange Pippin, and Ribston Pippin; 3rd, Mr. T. TURTON with the same varieties.

Dessert Pears.—Some very fine Pears were shown, though they lacked the relative size and finish seen in the Apples; the best eighteen dishes, there being four competitors, came from Mr. G. GOLDSMITH, who had Souvenir du Congrès, Duchesse d'Angouleme, Pitmaston Duchess, General Todleben, Sylvestre d'Automes, Van Mons Leon le Clerc, Princess Beurré Alexander Lucas, Marguerite Marillat, Beurré Diel, Marie Louise d'Uccle, Louise Bonne of Jersey, Madame Treyve, Doyenne Boussouch, Maréchal de la Cour, Beurré Superfin, Doyenne du Comice, and one unnamed. 2nd, Mr. WOODWARD also with good fruit of Durondeau, General Todleben, Grosse Calebasse, Pitmaston Duchess, Marguerite Marillat, Emile de Heyst, Fondante Therriott, Marie Benoit, Triomphe de Vienne, Beurré Diel, Doyenné Boussouch, Beurré Superfin, Brockworth Park, Reine des Tardives, Princess, &c. 3rd, Mr. SPENCER, gr. to H. C. MOFFATT, Esq., Goodrich, Herefordshire, who had fine fruit of Marie Louise d'Uccle, Durondeau, Doyenné de Merode, Souvenir du Congrès, and Beurré Bachelier.

There were eight exhibitors of twelve dishes. Mr. Cotterill, gr. to Sir W. GEAR, Tonbridge, was 1st, with good examples of Beurré Clairgeau, Gen. Todleben, Pitmaston Duchess, Marie Louise, Maréchal de la Cour, Duchesse d'Angouleme, Brockworth Park, Doyenné du Comice, Beurré Bosc, Beurré Superfin, Gansel's Bergamot, Madame Treyve, and Beurré Rance. 2nd, Mr. W. PRAGNELL, with Beurré Clairgeau, General Todleben, Pitmaston Duchess, Marie Louise, Louise Bonne of Jersey, Marie Louise d'Uccle, Beurré Diel, Doyenné du Comice, Maréchal de la Cour, Beurré Superfin, and Winter Nelis; 3rd, Mr. A. OFFER, gr. to J. WARREN, Esq., Handcross Park, Crawley.

There were seven exhibitors of nine dishes of Pears, Mr. J. GIBSON, gr. to Earl COWLEY, Chippenham, taking the 1st prize with good fruits of Beurré Clairgeau, Duchesse d'Angouleme, Pitmaston Duchess, Flemish Beauty, General Todleben, Triomphe de Vienne, Durondeau, Alexandre Lamhre, and Louise Bonne of Jersey; 2nd, Mr. J. E. BUXTON, who had Pitmaston Duchess, Flemish Beauty, Brockworth Park, Durondeau, Louise Bonne of Jersey, Marie Louise, very fine; and Marie Louise d'Uccle; 3rd, Mr. G. W. JONES.

With six dishes there were eight competitors, Mr. W. BANNISTER taking the 1st prize with Pitmaston Duchess, Madame Treyve, Maréchal de la Cour, Beurré Superfin, Marie Louise, and Durondeau, all very finely coloured. 2nd, Mr. SLOGROVE, gr. to Mrs. CRAWFORD, Reigate, who had Pitmaston Duchess, Doyenné du Comice, Triomphe de Vienne, Brockworth Park, and Doyenné Boussouch. 3rd, Mr. RICKWOOD.

There were eight exhibitors of three dishes, Mr. G. Fennell, gr. to W. M. CAZALET, Esq., Fairlawn, Tonbridge, was 1st with Marguerite Marillat, Pitmaston Duchess, and Souvenir du Congrès; 2nd, Mr. R. EDWARDS, gr. to G. H. FIELD, Esq., Bushey Lees, Sevenoaks, with Doyenné du Comice, Madame Treyve, and Pitmaston Duchess; 3rd, Mr. C. THOMPSON, gr. to Messrs. W. & E. WILLS, Hounslow.

Steeping Pears.—There were eight exhibitors of three dishes, Mr. WOODWARD taking the 1st prize with Vicar of Winkfield, General Todleben, and Catillac; 2nd, Mr. W. COTTERELL, with Uvedale's St. Germans, Vicar of Winkfield, and King Edward; 3rd, Mr. G. GOLDSMITH. With a single dish, Mr. J. MASTERSON, gr. to the Countess of CAMPERDOWN, Shipston-on-Stour, was 1st, with Uvedale's St. Germans; Mr. J. GIBSON, Chippenham, came 2nd, with Vicar of Winkfield; and Mr. B. EDWARDS 3rd, with the same.

Peaches.—There were twelve collections of three dishes, Mr. WOODWARD taking the 1st prize with very good fruit indeed of Nectarine Peach, Sea Eagle, and Princess of Wales. 2nd, Mr. C. HERRIN, gr. to C. M. FORTESCUE, Esq., Dropmore, Maidenhead, with Sea Eagle, Barrington, and Walburton Admirable. 3rd, Mr. J. MCINDOE, gr. to Sir J. W. PEASE, Bt., Hutton Hall, Guisborough, with Golden Eagle, Princess of Wales, and Exquisite. The best dish of any one variety of Peach was Barrington, from Mr. Richards, gr. to R. SUMMERS, Esq., Streatham; Mr. Markham, gr. to Viscount FALMOUTH, Mereworth, was 2nd, with Princess of Wales. There was but one collection of three dishes of Nectarines, from Mr. GOLDSMITH, who was awarded the 1st prize with unnamed fruit. Only one dish was staged in the class for a single dish, and the first was quite unripe.

Plums.—There were five exhibitors with four dishes of Plums, Mr. MCINDOE taking the 1st prize, with excellent fruit of Monarch, Golden Drop, Jefferson's, and Bryanston Green Gage; 2nd Mr. G. Day, gr. to C. J. MASSEY, Esq., Garlistown, who had Kirke's Golden Drop, Reine Claude de Bay, and Lawson's Golden Gage; 3rd, Mr. J. MASTERSON.

With one dish of dessert Plums other than Gages, Mr. C. HERRIN, gr. to the Hon. G. M. FORTESCUE, Dropmore, was 1st with very fine Coe's Golden Drop; Mr. RICKWOOD, gr. to Lady FREAKE, Twickenham, being 2nd; and Mr. Fennell, gr. to W. M. CAZALET, Esq., Tonbridge, being 3rd with same variety.

Mr. J. Day, gr. to C. J. MASSEY, Garlistown, had the best four dishes of Plums, with Pond's Seedling, Goliath, and Victoria; Mr. MCINDOE coming 2nd with Pond's Seedling, Magnan Bonum, Monarch, and Grand Duke; Mr. J. NOWELL, Abergavenny, was 3rd.

In the single dish class of cooking varieties, Mr. EMPSON was 1st with fine Grand Duke; Mr. W. C. SANDERS coming 2nd with Monarch, and Mr. TEBBUTT, Isleworth, 3rd, with Belle de Septembre.

Then in the single dish class for Gages, Mr. Hill, gr. to C. W. ADEANE, Esq., Cambridge, was first with Reine Claude; Mr. MCINDOE coming 2nd with Bryanstone Gage, and Mr. NOWELL was 3rd with Golden Gage.

Only two dishes of Purple Gages were staged, but neither secured an award.

Damsons were largely shown, the best three dishes coming from Mr. FENNEL who had Cluster King, and Prune varieties; Mr. KILLICK, Maidstone, was 2nd with Prune, Farley, and the Old Damson; Mr. Royall, gr. to Major DUGDALE, Stourminster, being 3rd. The best dish of Bullaces came from Mr. TEBBUTT, Mr. WELLS coming 2nd; and Mr. FENNEL, 3rd.

Cherries.—The best Morello Cherries were from Mr. MASTERSON, gr. to the Countess of CAMPERDOWN, Shipston-on-Stour; Mr. NOWELL and Mr. DAY coming 2nd and 3rd.

Nuts.—Mr. Turton, gr. to JOHN HARGREAVES, Esq., Marden Estate, was 1st for ten dishes, and Mr. J. GOODWIN, Mereworth, was 2nd with six dishes—fine Kentish Cobs and Filberts being prominent. Mr. G. HILMAN, Lewes, was 3rd.

Quinces.—There were fourteen lots of Quinces, the best coming from Mr. MITCHELL, Romsey, Hants; Mr. King, gr. to J. COLMAN, Esq., Galton, Reigate, 2nd, and Mr. GARAWAY, Bath, 3rd.

(To be continued.)

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (ACCOMULATED), RAINFALL, and BRIGHT SUN. It contains numerical data for various districts across the UK.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts— 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c. Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; "Channel Islands."

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending September 21, is furnished from the Meteorological Office:—

"The weather continued very fine and dry over the Kingdom generally, but a considerable amount of rain was again experienced in the north of Scotland, and some slight falls occurred in most other localities about the middle of the week."

"The temperature continued above the mean, the excess ranging from 1° to 3°. The highest of the maxima were registered in most places on the 18th, and varied from 76° or 77° in most of the English districts, to 66° in 'Scotland, W.', and to 64° in 'Scotland, N.' The lowest of the minima were recorded either on the 20th or 21st, when the thermometer fell to 31° in 'Scotland, W.', 33° in the 'Midland Counties,' and to between 35° and 40° in most other districts; in the 'Channel Islands' the lowest reading was 48°. At the inland station the diurnal range of temperature was very large."

"The rainfall exceeded the mean in 'Scotland, N.,' but was less in all other districts. Over the greater part of the Kingdom the fall was extremely slight."

"The bright sunshine was again very prevalent in all districts, excepting 'Scotland, N.' The percentage of the possible duration ranged from 71 in the 'Channel Islands,' and from between 46 and 54 over England, to 33 in 'Scotland, E.' and to only 15 in 'Scotland, N.' The highest percentage recorded at any individual station was 80 at Jersey."

MARKETS.

COVENT GARDEN, September 26.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

OUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing various flowers and their prices, including Arums, Asters, Bouvardias, Carnations, Chrysanthemums, Eucharis, Gardenias, Gladioli, Lapageria, Lilium Harrisii, Lilium lancifolium, Lily of the Valley, Maidenhair Fern, and Marguerites.

ORCHID-BLOOM in variety.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing various fruits and their prices, including Apples, Cobs, Damsons, Figs, Filberts, Grapes, Melons, Peaches, Pears, Pine-apples, Plums, and Guernsey.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing various plants in pots and their prices, including Adiantum, Aspidistra, Asters, Chrysanthemums, Coleus, Cyperus, Dracæna, Evergreen Shrubs, and Ferns.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table listing various vegetables and their prices, including Beans, Cauliflowers, Cucumbers, Marrows, Mushrooms, Tomatoes, and Potatoes.

POTATOS.

Snowdrops, 90s. to 100s.; Beauty of Hebrons, 60s.; Bruce and Megnums, 50s. to 70s., according to sample and quality; Blackland Megnums, 30s. to 40s. On account of the very mild weather, trade dull. J. B. Thomas.

SEEDS.

LONDON: Sept. 25. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that the reports received from all the Clover and Grass seed-producing countries indicate abundant crops, and of good quality; low prices all round are consequently anticipated during the approaching season. The sowing demand for Trifolium is now dying off. There is no change in seed Rye. The new Pess and Haricot offer reasonably; the abnormally hot weather now prevailing naturally limits, for the moment, the sale of these articles. As regards Bird-seeds, there is no fresh feature. Scarlet and White Runner Beans are quoted cheap. No alteration is shown in either Mustard or Rape-seed. New English Wheat, suitable for seed, come forward slowly.

CORN.

Averages. — Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending September 21, and for the corresponding period in last year: — 1895: Wheat, 22s. 7d.; Barley, 24s. 2d.; Oats, 13s. 3d. 1894: Wheat, 19s. 8d.; Barley, 23s. 5d.; Oats, 15s. 2d.

ENQUIRIES.

"He that questioneth much shall learn much."—Bacon.

CANON TRISTRAM, in his book on Japan, speaks in high praise of a creeping Pyrus japonica. What is this? I never heard of it, and it is not mentioned in the Japanese nurserymen's lists. E.

LADY-GARDENERS' ASSOCIATION IN THE MIDLANDS. — A correspondent desires the address of this association. Can any reader kindly furnish it?

Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

PLANTS, FRUITS, ETC., TO BE NAMED. — Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

ABNORMAL FLOWER OF ODONTOGLOSSUM GRANDE: H. C., Surrey. The specimen sent consists of two flowers of Odontoglossum grande joined together on a fasciated stem. Both flowers are perfect. The occurrence is not uncommon, and plants on which such abnormal growth takes place are liable to do the like again. In some the peculiarity becomes fixed.

ADDRESS BOOK: H. & Son. There are two, one being published at the office of the Journal of Horticulture, 171, Fleet Street, E.C., and the other at the office of The Garden, 37, Southampton Street, Strand, W.C.

BOOKS: Hurst & Son. Practical Forestry, by A. D. Webster, 2nd edition; published by W. Rider & Son, Limited, 14, Bartholomew Close, E.C. Price 5s. Twenty-one illustrations. A much larger work treating of the scientific, as well as the practical sides of Forestry, is Dr. William Schlich's Manual of Forestry. It is published in three volumes by Messrs. Bradbury, Agnew & Co., 8, 9, and 10, Bouverie Street, E.C. It is well illustrated, and is the standard work on the subject. A new edition of Brown's Forester has also recently been published. — Sir C. S., Boynton. Fruit Culture, by J. Cheal, contains just the kind of information the gardener stands in need of. Published by Messrs. G. Bell & Sons, York Street, Covent Garden, W.C.

BUSINESS OF MARKET GARDENER, &c.: H. H. A. No premium would be required. If you have no acquaintance with growers for market, you should make use of our advertising columns. The business cannot be learned in less than six months in it. "Read, mark, learn" should be your motto.

CARNATION: W. J. G. A monstrosity known as the Wheat-ear Carnation, often figured in our columns. It is not very uncommon.

DAHLIAS: J. Corderoy. The flowers sent are very singularly marked; indeed we do not remember to have seen any quite like them. It is no unusual occurrence to have flowers of dissimilar colours on the same plant in single and double-flowered varieties, the Dahlia being much given to sporting. You may be lucky in reproducing the particular varieties from seed, and fixing their characters.

DONATION. — Mr. A. J. Keen sends postal-order for 2s. 6d. as a donation to the Royal Gardeners' Orphan Fund, which we gladly forward to the secretary, Mr. A. F. Barron.

EARLY MELONS AND CUCUMBERS: S. T. K. To describe in full the various practices of cultivators would occupy too much of our space, and we would advise you to buy the manual entitled Cucumber and Melon Culture for Amateurs, by W. J. May, published at the Bazaar Office, 170, Strand, price 1s.

FLY: L. Dawes. The fly is Chlorops scularis, the larvae feed in the straw of cereals. R. McL.

GREASE BANDS FOR FRUIT TREES: Joe. Cart grease answers very well. It should be smeared on waterproof paper passed three or four times round the stem. Broad bands of zinc with the upper part for the space of an inch bent over at a right angle, if smeared in the same manner, are an effectual stop for the wingless members of the Winter-moth. Means should be taken to prevent the grease running on to the bark; and the application of grease must be renewed occasionally, as it tends to get hard, allowing the moths to cross the band without hindrance. Put the bands on early in the next month.

HORSE-CHESTNUT: J. D. Large and coarse things have often the prefix "horse" attached to them. The vessels of the leaf-stalk are arranged in the form of a horseshoe. The nuts are also supposed to be beneficial in some diseases of the horse.

INSECTS: G. P. 1. The leaves of the Morello appear to be attacked by the grub of a saw-fly. 2. Grubs of the common cockchafer. — Interested. Wire-worms are not at all particular as to whether the roots are sound or not.

MELONS AND CUCUMBERS: S. T. K. The two varieties you mention of the first-named fruit are suitable; you might add the following: — Eastnor Castle, Frogmore Seedling, Golden Perfection, Gunton Orange, Read's Scarlet-flesh, and The Countess. Telegraph Cucumber, as you say, is excellent, so are Market Favourite, Tender and True, and Allan's Favourite.

MINA LOBATA: W. P. It is a half-hardy annual. It may be obtained of W. Thompson, Tavern Street, Ipswich.

* * * The applications to name flowers, and especially fruit, are so numerous at this season as severely to tax our resources. They entail an expenditure of time, labour, and money, of which our readers have no idea. We are always willing to oblige our correspondents as far as we can, but the editing of the Gardeners' Chronicle is our business, to which everything else must give way. Correspondents are respectfully requested to observe the rule that not more than six specimens be dealt with at a time. If more are sent, it would be a graceful act on the part of the sender, to send also a small contribution to the Gardeners' Orphan Fund. Delay in any case is unavoidable.

NAMES OF FRUITS: D. W. C. McIntosh. 1, Worcester Pearmain; 2, Cox's Orange Pippin; 3, send later; 4, not recognised; 5, Claygate Pearmain. — A. J. K. 1, Doyenné du Comice; 2, not recognised; 3, Gregoire de Bourdillon; 4, not recognised; 5, Marie Louise; 6, not recognised; 7, Conseiller de la Cour. — L. A. 1, Verulam; 2, Marie Louise; 3, not recognised; 4, Triomphe de Jodoigne; 5, Emile d'Heyst; 6, Beurré Clairgeau. — W. E. N. 1, New Hawthornden; 2, Lane's Prince Albert; 3, not recognised; 4, too small to be recognised; 5, Blenheim Orange; 6, Reinette du Canada. — J. P. 1, Lane's Prince Albert; 2, Lord Suffield; 3, Cox's Orange Pippin; 4, Wellington; 5, not recognised; 6, Annie Elizabeth; 7, King of the Pippins. — W. R. F. 1, Power of Glamis; 2, Emperor Alexander; 3, not recognised. Cherries: J. N. L. Fruit quite smashed, therefore not recognisable. — J. W. 1, Trumpington; 2, Rosemary Russet; 4, Dumelow's Seedling; others unrecognised. — W. E. T. Pear Beurré d'Amanlis; 2, Jersey Gratioli; 3, Lane's Prince Albert; 5, Landeberger R-inette; 7, Pine-apple Russet; 6, Blenheim Orange. — M. H. Wilford. 1, Dutch Codlin; 2, Cellini; 4, Keawick Codlin; Pear, a worthless sort, unknown. — G. T. Colea. 1, Lord Grosvenor; 2, King of the Pippins; 3, Sam Young; 4, Beespool; 5, Court of Wick. — A. Reid. 1, Lord Derby; 2, Forge; 3, not recognised. — Tavistock. 3, King of the Pippins; 4, Lord Derby; 5, Golden Noble (?); 6, Biemarck. — Old Subscriber. Pears, 1, Doyenné Boussoch; 3, Thompson's; 4, Lord Derby; 5, rotten; Apple, 6, Stone's. — Sir C. Strickland. Pear greatly bruised, most probably Beurré d'Amanlis. — Joe. 1, Mank's Codlin; 2, Lord Suffield; 3, Yorkshire Beauty; 4, Calville St. Sauveur; others not known. — W. S. T. Souvenir du Congrès.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number. — W. K. 1, Oncidium excavatum; 2, Oncidium prætextum; 3, is a leaf of Oncidium Jonesianum we should say, although O. Cebolleta, a yellow species having similar leaves, is imported with O. Jonesianum. — S. S. B. The flower is not of the species known in gardens as Cattleya amethystoglossa (C. guttata Prinzii). It seems to be a small form of C. Leopoldi. Some varieties of C. elongata (Alexandrea) resemble this, and it is possible that yours may be that species, if so, the inflorescence will be carried up on a long stalk. If you would

like the question definitely settled, kindly send a full-length inflorescence when it is fading.—*A. G.* 1. *Smilax asper*; 2. *Arabis lucida variegata*; 3. *Sedum stoloniferum* (syn. *S. spurium*); 4. *Myrtus communis* (large-leaved); 5. *Helianthemum* var. (Rock Rose); 6. *Pyrus* sp.; 7. *Helianthus decapetalus multiflorus*.—*G. R.* 1. *Miltonia Clowesii*; 2. *Cattleya Forbesii*; 3. *Hæmanthus coccineus*; 4. *Aspidium aristatum variegatum*; 5. *Casuarina stricta*; 6. *Pelargonium grossularioides*, or a cross from it.—*G. W.* *Cassia corymbosa*. Fruit next week, if possible.—*F. W. B.* *Crataegus sibirica*, sometimes called *sanguinea*.—*S. J.* 1. *Pandanus graminifolius*; 2. *Anthurium cordifolium*; 3. *Hibiscus rosasinensis striata plena*; 4. *Saccharum officinarum* (Sugar-cane), so far as we can judge by the specimens sent; 5. *Parietaria officinalis*.—*F. B.* 1. *Helianthus decapetalus multiflorus*; 2. *Helianthus rigidus*; 3. *Aster novæ-belgii*; 4. *Helianthus lœtiflorus*; 5. *Cyrtomium falcatum*.—*T. T., Leeds.* 1. female flowers of *Catasetum purum*; 2. *Dendrobium secundum*; 3. *Dendrobium Leeanum*; 4. *Dendrobium Phalæopsis*, a very handsome and distinct light form; 5. *Odontoglossum* species of the *O. odoratum* section, but seemingly distinct.—*A. M., Brixton.* A broken leaf of some grass, with the seeds of some plant adhering to it.—*John Dimmick.* *Salvia Horminum*.—*W. H. G.* 1. *Polygonum cuspidatum*; 2. *Helianthus multiflorus*; 3. *Silphium perfoliatum*; fruit next week, if possible.—*H. R.* *Kalmia angustifolia*.—*E. H. C.* 1. not recognised; perhaps *Indigofera*.—2. *Pyrola minor*; 3. *Melilotus officinalis*, white variety.—*C. G.* 1. *Polygonum Fagopyrum*; 2. *Salvia Horminum*.

NURSEYMAN: *E. J.* You should stick to the business. The wages paid are not everywhere so low as you are receiving. Endeavour to better your position, advertise, &c. We do not think that floral decorators, unless they have special abilities, are better remunerated than men in your branch.

PEARS WITH FITTINGS AT THE SURFACE: *H. S. W.* The result of a check to growth, arising, probably, from the roots being in an unfavourable soil. Take up the tree and replant it on another site in loamy soil, a little manure, lime rubbish, crushed bones. See that the drainage is good; or if too large for successful transplanting, destroy it, and plant a new tree of another variety; putting a layer of chalk, 1 foot thick, rammed hard, coal-ashes or concrete below the roots at not less than 3 feet from the surface. This should not be less than 3 yards square.

PECCAN NUTS: *J. B.* A species of *Carya* or Hickory, not grown in this country for commercial purposes.

PELARGONIUMS: *S. T. K.* Obtain Messrs. H. Cannell & Son's Catalogue. It will afford just the sort of information you require.

THE THREE BEST LATE, FREE-BEARING COOKING APPLES: *E. P. B.* Betty Geeson, Winter Greening, and Norfolk Beauty (Beefin). These varieties will keep till June, or as long as Apples need to be kept.

TOMATOS: *S. T. K.* No cure for the "spot" on the fruits of this plant. Remove all affected fruit without delay, and burn them forthwith.

VARIEGATED HOP: *W. P.* The Hop is not an annual; at least, it is not treated as one in this country.

YOKOHAMA NURSEY COMPANY: Apply to Messrs. Protheroe & Morris, 67, Cheapside, London.

COMMUNICATIONS RECEIVED.—*W. W.* (many thanks).—*E. L. B.*—*Melville.*—*C. S. G.*, Boston.—*E. L.*—*J. K.*, Hanley (many thanks).—*C. A.*, no one received. Was it a large branch?—*J. D.*—*H. L.*—*J. CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."
IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of more than 80 per cent., and that it continues to increase weekly.
 Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is prepared for reference in all the principal Libraries.

THE GARDENERS' CHRONICLE

("THE TIMES OF HORTICULTURE")

A Weekly Illustrated Journal

(ESTABLISHED 1841)

Among the Correspondents & Contributors to recent Volumes the following, out of many Hundreds, may be named:—

ALPINE PLANTS:—

BALL, J., F.R.S., the late.
CHURCHILL, G. C., Clifton, Bristol.
CORREYON, H., Geneva.
DEWAR, D., Glasgow.
DOD, Rev. C. W., Malpas.
JENKINS, E., Hampton.

AMATEUR GARDENING:—

BADGER, E. W.
BOYLE, Hon. Mrs., "E. V. B." ("Days and Hours in a Garden").
BRIGHT, the late H. A. ("Notes from a Lancashire Garden").
CLARKE, Col. Trevor.
ELLACOMBE, Rev. Canon.
EWBANK, Rev. H., Ryde.
FREMANT-MITTFORD, A. B.
GUMBLETON, W. E., Belgrove, Cork.
SALTER, J., F.R.S.
THOMSON, W., Teignmouth.
WELSH, Harrison.
WILSON, G., F.R.S., Weybridge.
WILKS, Rev. W., Shirley.

ARBORETUM, &c. :—

ANNESLEY, the Earl of.
ACLAND, Sir T., Bart.
ACTON, T., Kilmacurragh.
BAKER, W. R., Bayfordbury.
BARRON, W., the late.
COURTOWN, the Earl of.
CROUCHER, G., Ochtertyre, Crieff.
DIECK, Dr., Merseburg.
DUCIE, the Earl of.
EGERTON, Sir P., Bart., the late.
RNNISKILLEN, the Earl, the late.
GROSVENOR, Lord R.
HENRY, Mitchell.
LONDESBOURGH, the Earl of.
MACLEAY, the late Sir G.
MEATH, the Earl of.
NICHOLSON, G., Curator, Royal Gardens, Kew.
POWERS-COURT, Viscount.
RASHLEIGH, J.
SARGENT, Prof., Arnold Arboretum, Cambridge, U.S.A.
SHANNON, the Earl of, the late.
SMITH, T. A., Dorrien, Esq.
STAIR, the Earl of.
TREVELYAN, Sir W., Bart., the late.
VAN VOLXEM, J., the late, Brussels.

CHEMISTRY:—

OHURCH, Prof., F.R.S.
DEHERAIN, Prof., Paris.
DYER, Bernard.
GILBERT, Sir J. H., F.R.S., Rothamsted.
LAWES, Sir J. B., Rothamsted.
MITCHELL, W. S.
MÜLLER, Dr. Hugo, F.R.S.
WARINGTON, R., F.R.S.
WILLIS, J. J., Rothamsted.

DISEASES OF PLANTS:—

ARTHUR, Prof., New York.
BOS, Dr. Ritzema, Wageningen.
COOKE, Dr. M. C.
KLEBAHN, Dr., Bremen.
MAGNUS, Prof., Berlin.
MASSEE, G., Kew.
MURRAY, G., British Museum.
PAGEF, Sir James, F.R.S.
PHILIPPS, W.
FLOWRIGHT, Dr. C. B., King's Lynn.
PRILLIEUX, Prof., Paris.
SMITH, W. G.
SORAUER, Prof., Proskau.
WARD, Prof. Marshall.

FERNS:—

BAKER, J. G., Royal Gardens, Kew.
DRUENY, C. T.
HEMSLEY, A.
LOWE, E. J., Chesham.

FLORISTS' FLOWERS, &c. :—

DEAN, R., Ealing.
DODWELL, E. S., Oxford, the late.
D'OMBRAIN, Rev. H. H., Westwell.
DOUGLAS, J., Iford.
HORNER, Rev. F. D.
LLEWELYN, Sir J. D., Bart.
MOJYNKUX, K., Swaomore Gardens.
PAUL, G., Paisley.
TURNER, C., the late.

If set across three Columns the lowest charge will be 30s.
Page, £3; Half Page, £4 10s.; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON STREET, STRAND, W.C.

GARDENING APPOINTMENTS.

Mr. T. H. USHER, late Gardener to General Sir B. HARRISON, Hawley Hill, Blackwater, as Gardener and Bailiff to Mrs. WAINWRIGHT, Hoe Place, Woking, Surrey.

TO NURSERYMEN.—FOREMAN, age 27; has good experience Inside and Out; well acquainted with general Pot-stuff, Cucumbers, Tomatos, Mushrooms, Chrysanthemums, &c.; good references.—H. P., 6, Oak Terrace, Manor Road, Chigwell, Essex.

FOREMAN, Inside.—Age 28; fourteen years' experience in Plant and Fruit Houses, &c. Previously as Foreman. Good references.—GEO. WHITE, Gatehouse, Westwell, Ashford, Kent.

FOREMAN.—Age 26; good experience in Plant and Fruit Houses, and general Garden Work. Highest references.—W. CAFFYN, 15, Stafford Road, South Beddington, Wallington, Surrey.

JOURNEYMAN (Inside), in good Gardens.—Age 23.—Can be confidently recommended by J. MALTBX, Denton Manor, Grantham.

JOURNEYMAN (INSIDE).—H. FENNELL, gardener to Lord St. Oswald, Appleby Hall, Doncaster, can with confidence recommend E. Dodson, age 22, who has been with him eighteen months, to anyone requiring the above.

JOURNEYMAN, in a good establishment.—Age 23; good Decorator. Good references from first-class establishments.—M. V. SEALES, Vine Nurseries, Sevenoaks, Kent.

JOURNEYMAN, in good Establishment.—Situation wanted by a young man, age 22, as above. Five years' experience. Can be well recommended.—HEAD GARDENER, Newlands, Teyham.

JOURNEYMAN (FIRST).—Wanted, by Gardener's Son, with excellent references, a situation as above. Life experience in Plant and Fruit Houses, and general routine of Gentleman's Garden.—JOURNEYMAN, Mr. Rae, 1, Oxford Villas, Wormley, Herts

JOURNEYMAN (FIRST).—Age 23.—A. TRAIL, The Gardens, Fulshaw Hall, Wilmslow, wishes to recommend as above. Seven years' experience.—T. BURGESS, Chapel Road, Alderley Edge, Cheshire.

JOURNEYMAN (Inside).—Age 22; eight years' experience; two years in present situation; good references.—P. W. A P S H O T T, Taplow Court Gardens, Maidenhead.

JOURNEYMAN, Inside, or Inside and Out.—Age 20. J. THOMPSON, Norton Stoke, Under Ham, would be pleased to recommend J. PITMAN, as above. Six years' experience. Abstainer.—Norton Stoke, Under Ham.

TO GARDENERS.—A young Man (age 15) seeks situation as IMPROVER in Gentleman's Garden or Nursery. Experienced Inside and Out. Good references.—C. FRANKLIN, 52, Kilburn Park Road, Kilburn, N.W.

IMPROVER.—Mrs. WEBB, Milford House, Godalming, recommends a youth of 18 as above.

IMPROVER.—Mrs. HENRY RITSON can with confidence recommend William Watson. Age 18; three years' experience. Both preferred. Would pay small premium.—WILLIAM WATSON, Sea View Lodge, Sunderland.

IMPROVER.—Situation wanted in the Garden by a respectable young Man, Age 18; abstainer. Good character.—GEORGE NORRIS, Sonning, Reading, Berks.

IMPROVER.—Aged 21; seeks a good general training in SRED and BULB line. Has gained with leading London and Provincial Firms, excellent Nursery and Shop experience, including the making-up of Floral Designs. Fulllest information and references.—Address, H. W., 31, Giesbach Road, Upper Holloway, London, N.

TO GARDENERS.—Young man requires situation, Inside and Out. Seythe and Machine. Three and a half years' good character. Highgate district preferred. J., 34, Lutol Street, Highgate.

TO NURSERYMEN and OTHERS.—Wanted, by young Man, age 21, situation as IMPROVER, or JOURNEYMAN (SECOND), in Houses; has had nearly five years' experience in Grapes, Cucumbers, Tomatos, Melons, Peaches and Stove and General Greenhouse Work. Good references.—J. E. T., Mrs. A. Wright, Brown's Yard, Harefield, near Uxbridge, Middlesex.

TO NURSERYMEN and OTHERS.—Young man, age 23; well up in Cucumbers, Tomatos, Chrysanthemums, Pot Stuff, and general Nursery Work.—G. LUTMAN, Redlands Nursery, Emsworth.

TO NURSERYMEN.—Young Man, age 24, seeks a situation in a Nursery; well up in forcing Lily of the Valley and Tulips, &c.; also in Cucumbers and Tomatos.—F. W., Lofts Lodge, Saffron Walden, Essex.

CARPENTER and HANDY MAN.—Age 35, married; seeks situation, would make himself useful in House, Garden, or Estate; abstainer; good references.—E. NEWBY, New Street, Andover.

SHOPMAN.—With five years' experience in good provincial house in Flower, Vegetable and Farm Seeds, Bulbs, Plants, &c. Age 23; good references.—J. W. B., 4, Hartley Terrace, Handsworth, Sheffield.

BOOK-KEEPER, or GENERAL CLERK.—Age 23; five years' experience in the trade; accustomed to County Court business.—LEDGER, 41, Wellington Street, Strand, W.C.

FLORIST'S ASSISTANT.—Situation required by a young lady, well up in Wreaths, Bouquets, and General Shop Routine. Can be well recommended.—BERTHA, Mr. Thos. Butcher, Florist, South Norwood.

TO FLORISTS.—Situation wanted by a young Lady, in Florist and Fruit Shop; best of experience.—FLORIST, 25, Thindall Street, Scarborough.

THE GOOD DIE YOUNG.—Unlike most popular sayings, this has very little truth in it. Experience every day proves that some at least of the good are spared to make the world brighter and better, and a more pleasant place to live in. In fact, our experience is that good people, and good things generally, live the longest. For example, consider the thousands of articles which have been widely advertised and are now forgotten. Why? Because they were bad. On the other hand, we have HOLLOWAY'S PILLS and OINTMENT, which have proved the faithful friend of poor humanity for fifty years and more. Why? Because they are good. Of a truth, that which is good does not die, but lives for all time.

Best obtained from

SUTTONS' INIMITABLE BEDDING TULIPS.—Single First Early, White, Yellow, Scarlet, Rose and White (striped), each, 2s. per dozen; 14s per 100

SUTTONS' INIMITABLE BEDDING TULIPS.—Mr. J. M. McHattie, Gardener to His Grace the Duke of Wellington, says:—"The Bedding Tulips made a most brilliant show. They lived through the exceptionally severe winter, when all our Wallflowers were killed, and they now help us in the way of cut flowers in the place of Wallflowers. I planted 18,000 Wallflowers, so you can imagine our loss."

SUTTON'S BULBS GENUINE ONLY DIRECT FROM SUTTON AND SONS, THE ROYAL SEEDSMEN, READING.

NOW is the TIME to PLANT PYRETHRUMS, Gaillardias, Delphiniums, and Peonies. Catalogue of KELWAY AND SON, Langport, Somerset.

Chilwell Nurseries, Notts.

In consequence of the approaching Expiration of Lease, of a portion of their Nurseries, Messrs. J. E. Pearson & Sons will offer a portion of their Stock of Fruit Trees, &c., by Auction, viz.:—30,000 FRUIT TREES, comprising 15,000 Standard Apples, for Orchards; 7000 Pyramid Apples, in fruiting condition, mostly carrying fruit this season; principally worked upon the Paradise Stock, for which the Nurseries are so well known; 2100 Standard, Pyramid, and Dwarf Plums, in all the best varieties; 550 Cherries, the best varieties in the Midland district; 1350 Damsons, Farleigh Prolific and the Prune; Standard and Dwarf Pears; also 3500 FANCY HOLLIES, Green and Variegated; and 500 STANDARD LIMES and ELMS, fine straight trees, suitable for Avenue or Street-planting.

To be SOLD by AUCTION, by

MESSRS. PROTHEROE AND MORRIS on the Premises, Chilwell Nurseries, near Nottingham. The Nurseries are 1½ miles from Beeston Station, Midland Railway, 10 minutes from Nottingham or Trent Junction, there being a frequent service of trains from both places, on THURSDAY NEXT, October 10, at 11 o'Clock precisely.

May be viewed. Catalogues may be had on the Premises, and of the Auctioneers, Estate Agents and Valuers, 67 and 68, Cheapside, E.C., and Leytonstone, E.

Lincoln.—Absolutely without Reserve.

IMPORTANT TWO DAYS' CLEARANCE SALE of exceedingly well-grown GENERAL NURSERY STOCK and FRUIT TREES.

By Order of Messrs. Pennell & Sons, who require a portion of the Land for the purpose of Seed Growing, in consequence of the increase of their Seed Business.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, Bracebridge, near Lincoln, about 2 miles from either of the Lincoln Railway Stations, on THURSDAY and FRIDAY, October 17 and 18, 1895, at 12 o'Clock precisely each day, without reserve, a portion of the exceptionally well-grown

NURSERY STOCK,

The whole of which has been carefully transplanted, and is now in first-class condition for removal. The Stock comprises 4000 Evergreens and Conifers, 1 to 4 feet, suitable for boxes, pots, and growing-on; 400 Specimen Conifers, 2 to 8 feet, in the borders. These specimens have all been grown with great care, and are now adapted for immediate effective planting. 900 Green and Variegated Hollies, 1500 Green and Variegated Box, 1½ to 2½ feet; 300 new Golden Box, 1½ to 2 feet; 2500 Austrian Pines, 1 to 2½ feet, good plants; 1000 Laurels, best varieties, 1½ to 3 feet; 2500 oval-leaved Privet, 3 to 4 feet; 1000 Standard Trees for Street and Avenue Planting; 100 Acer Negundo variegata, 5 to 6 feet; 1500 Flowering Shrubs and Forcing Plants, 3000 Berberis aquifolia, 1 to 2 feet; 600 Dwarf Roses of the best varieties, 800 Ivies and other Climbing Plants, Herbaceous Plants, 2500 Standard and Pyramid Apples, 5-yr. Trees, all true to name; 3500 transplanted Crabs, and other Stock.

NOTE.—The Auctioneers desire to call special attention to this important Sale. The whole of the Evergreens have been transplanted within two years, and have been allowed plenty of room, and have also been pruned. The Standard Trees are straight, and everything has been grown solely for a high-class retail trade. Messrs. Pennell & Sons will undertake to carefully lift and despatch any lots, charging only the cost of labour incurred and material used. Goods may be transmitted from the Lincoln stations to any part of the Kingdom without change of truck.

May be viewed any day prior to the Sale. Catalogues may be had on the Premises; at the Seed Shop, High Street, Lincoln; at Messrs. PENNELL AND SONS' Chief Offices and Seed Warehouses, Gowt's Bridge, Lincoln; and of the Auctioneers, Estate Agents and Valuers, 67 and 68, Cheapside, London, E.C.

OFFICES AND SHOWROOMS—

65 AND 65A, SOUTHWARK ST., LONDON, S.E.

Manufactory and Workshops: 4 and 6. GROVE. SOUTHWARK, S.E.

Peace having been once more re-established in Colombia,

GUILLERMO KALBREYER

CAN NOW AGAIN SUPPLY THE FOLLOWING WELL-KNOWN ORCHIDS AT UNDERMENTIONED PRICES:—

ODONTOGLOSSUM CRISPUM,
best broad petaled variety ... £40 per 1000
,, LUTEO-PURPUREUM ... £36 ,,
,, CUSPIDATUM PLATIGLOSSUM, £36 ,,
PILUMNA FRAGRANS NOBILIS, £36 ,,

CATTELYA TRIANÆ, best variety, £7 per case.
,, SCHRODERI ,, £8 ,,
,, SANDERIANA ,, £9 ,,
,, MENDELI ,, £9 ,,

The cases measure about 20 by 34 in., and contain about 50 to 60 good strong pieces of Cattleyas, of Odontoglossum crispum about 250, and of the other Orchids 120 good strong plants.

The plants are packed with the greatest care and best method, but under no circumstance will G. K. hold himself responsible for the state of plants on their arrival in Europe. *Conditions*:—All Consignments are shipped entirely at Buyer's risk and expense from port of shipment. Plants ordered must be paid for on receipt of bill of lading to Messrs. ROESING BROTHERS AND CO., 10, Basinghall Street, London, E.C., who will then give orders for forwarding the consignment to the Purchaser.

The best time for dispatching Orchids from here, and to establish them with the best advantage in Europe, are the months—December to April.

EARLY ORDERS INVITED.

A considerable reduction will be made on orders of 1000 and more of each kind of Odontoglossum, and on four cases and more of Cattleya of each kind

Address:—G. KALBREYER, La Flora, Bogota, Republica de Colombia.

THE Gardeners' Chronicle. SATURDAY, OCTOBER 5, 1895.

THE ROYAL SCOTTISH ARBORICULTURAL SOCIETY.

THE members of this Society went to Germany this season for their annual outing—perhaps the most notable excursion they ever made; but never before has so little been said about it. Is this because it was an unlearning lesson the members had to read? When the report of the expedition appeared in the Scotsman at the time, I was wandering in the over-thinned woods on certain highland estates, and I out the articles out, expecting, however, to see more about it in the arboricultural papers, but have been disappointed. I therefore beg to append a few admissions from the Scotsman article, written apparently by authority. Many times and quite lately, the superiority of the German forests has, by members of the Royal Scottish Arboricultural Society, been attributed to difference of soil or climate, or to the species grown, or to all three put together; but it is now gratifying to find the Society acknowledging its errors on these points. I begin with the following extract:—

"There are many ways in which Great Britain agrees with Germany in regard to the growth of trees. The soil in both cases is very much of the same character—sands, loams, clays, and marls constituting the predominant types. The climate, on the average of the year, agrees very closely in both countries as regards rainfall and temperature, the greater cold of a German winter being counterbalanced by the warmer character of a German summer. And the trees cultivated in, or indigenous to, the two countries show practically no difference as regards species, the Spruce, Scotch Fir, Larch, Silver Fir, Beech, Oak, Birch, Alder, Sycamore, Ash, &c., constituting the materials that the German forester has to work with just as at home

"Here (Germany) the woods are formed neither for beauty nor for game cover, but for the production of the maximum yield of the finest timber. There is here, therefore, no inducement to over-thin the woods so as to encourage the development of the lower branches; on the other hand, the trees are packed as close as they will grow, with the result that long, straight, bare poles are produced, which possess about as much beauty as a lamp-post, but which furnish timber of fine fibre and clean growth, which carpenters and architects know how to appreciate."

I decline to believe that there are neither beauty nor game in the Germany forests, for both are there—nor is there any force in the argument that either beauty or game are enhanced by overthinning, nor has Brown or the Royal Scottish Arboricultural Society ever advocated severe thinning on any such plea; but probably the writer felt some trifling apology necessary, and just put it that way. Here is a bit about

a timber crop left for fifty years "uninterfered with by the hand of man," a plan some of us have often recommended as preferable, at any rate, to the Scotch thinning practice:—

"Saturday, August 3, was devoted to an inspection of the Oak woods in the neighbourhood of Freienwalde, a short distance from Eberwalde, and in some respects this was the most enjoyable part of the whole excursion. It was the general remark of the excursionists that the work seemed to grow in interest day by day; but this feeling was probably induced by the fact that as time went on the members were becoming more familiar with the conditions of German forestry, and therefore better able to appreciate the results. The forest around Freienwalde is for the most part primeval—that is to say, up till within the last fifty years or so it had been left uninterfered with by the hand of man. But now it is being gradually taken in hand with the object of regeneration, and as the soil is very rich, the Oak is the tree that is designed for the dominant species. The older class of Oaks are 250 to 300 years old, and average 120 feet in height, and 3 feet 6 inches in diameter. They are for the most part perfectly straight and with very little taper, and were universally acknowledged by all to be not only finer than any trees that the members had ever seen before, but finer beyond any conception of what was possible. The total quantity of timber per acre averages about 6500 cubic feet."

In conclusion, it is worth remarking how rapid the change of opinion has been latterly on the subject of forestry practice—thanks, not so much to recent books, but to discussion in the horticultural and agricultural papers, which have suggested the books. Nor will the attempt to saddle past failures on the owners of estates and the game stand looking at, for however much these may be to blame, it is a fact that forestry practice, and the choice of species to plant, have been almost wholly in the hands of the foresters, whose advice landowners have followed. A gentleman who owns extensive woods in the Highlands called on the writer the other day, and, speaking of his own woods, said they were next to worthless as timber. The trees were neither of the right sort, nor their timber of the right quality; and all, he said, because "we had not known any better—what to plant, or how to manage woods."

A question of some interest I would like to put here. There have been advertised for sale lately nearly 140,000 cubic feet of blown-down mixed timber of fair average quality on the Duke of Argyll's estate at Inverary, and another sale of only less extent at Finavon, in Forfar—much of the timber "exceptionally good," and it would be exceedingly interesting to know what price per foot the different kinds of timber in these lots fetch, trimmed on the ground as they lie, if the owners or their agents have no objection to furnish the information for the benefit of their neighbours. *J. S., W.*

NEW OR NOTEWORTHY PLANTS.

PILEA SPRUCEANA, Wedd.

THIS new introduction of Messrs. Low & Co. is now flowering in the Botanic Garden at Glasnevin. It is a dwarf herbaceous plant, with a pubescent stem, leafy at the top. The leaves are opposite, on short petioles, with a broad, rounded, membranous stipule in front of each; the blade of the leaf is elliptic obtuse, with crenate-dentate margins, strongly three-nerved, and bullate between the veins, thinly hairy on both sides, dark bronzy-green, and very shining on the upper surface, purple beneath, 1 to 2 inches long, 10 lines to 1½ inch broad. The flowers are in flat-topped terminal cymes, of a light green colour.

Pilea Spruceana ought to make a useful decorative plant where dark foliage is desired, and possibly it might be found useful for summer bedding. It is a native of Peru and Venezuela. *N. E. Brown.*

ASPLENIUM (EUASPLENIUM) OROUPOUCHENSE, Prestoe, M.S., n. sp.

Stipites, slender, naked greyish, channelled, 3—4 in. long; fronds narrowly lanceolate, bipinnate, chartaceous, glabrous, glossy, but dull green, ¾—1 foot long, reduced at the base, tapering upwards into gradually reduced segments at the acuminate apex; rachis slender, grey, channelled, naked; pinnae apart, the lower distant, alternate, except the reduced basal ones, spreading, nearly sessile, base cuneate-truncate, broadest, the end rounded but toothed, 1—1½ inch long, ¼—½ inch wide; pinnules cuneate, bluntly dentate on the outer curved edge, about 3 lines long and wide; veins flabellate, slender, reaching short of the margin; sori short, medial on the veinlets, ¼ line long; involucre equally short, rather vaulted at maturity, revealing the crowded spores.—Trinidad, West Indies.

I have had specimens of this Fern for some long time, referred to me by Mr. Hart, who found it in the herbarium of the Botanical Department, under the M.S. name given to it by Mr. Prestoe, apparently its first discoverer, after the district or locality where it grows. Mr. Hart has lately gathered it in the same region. I cannot find that it has ever been described or published. It belongs to the cuneatum group, but is well marked by the narrow, slender fronds and short darcoid sori and involucre. It makes an interesting pot-plant. *G. S. Jenman, Demerara, July 24, 1895.*

ORCHID NOTES AND GLEANINGS.

ARUNDINA BAMBUSÆFOLIA.

THE elegant Bamboo-like growths of this pretty Orchid, which are often 4 or 5 feet in height, render it an ornamental plant even when not in bloom; but when furnished with its terminal heads of rose and purple flowers it is a charming object, and as the flowers follow each other in succession, it lasts in bloom when in good condition throughout the whole summer and autumn. It is at present in flower in the collection of Geo. C. Raphael, Esq., Castle Hill, Englefield Green (gr., Mr. H. Adams). The plant is evergreen, and therefore requires to be kept moist at all seasons. It seems to thrive best in a cool part of the intermediate-house.

CATLEYA DOWIANA AUREA.

This charming yellow-coloured, fragrant species seems to have flowered exceptionally well this season if we may judge by the specimens sent by several correspondents. Accompanying some very fine and richly-coloured flowers, Mr. Geo. Roberts, gr. to R. Brooman-White, Esq., Arddarroch, Garelochhead, sends a note, "We have had a splendid show of *Catleya aurea* this season. Already over 100 blooms have opened, and there are still many in bud. As you will see, the lips are very broad and of very dark purple-crimson colour, the gold veining in them running in some almost to the margin."

Mr. A. H. Murrell, gr. to A. H. Milton, Esq., Castleton House, White Ladies Road, Clifton, also sends a grand flower, in which the petals are marbled with rose colour as in *C. aurea marmorata*.

MASDEVALLIA GUTTULATA, Rehb. f.

I can confirm Dr. Kränzlin's supposition (p. 324) that *Masdevallia Lawrencei* is the plant which I described in 1890 (*Gardeners' Chronicle*, 1890, ii., p. 267) as *M. guttulata*; and, what is more, I can state that it is also the *M. guttulata*, Rehb. f. (*Linnaea*, xli., p. 118), described in 1877. The latter was not unknown to me, but I had placed the reference next to *M. ionocharis*, Rehb. f., because the flowers were said to be of the same size, and no other affinity was given. I had seen the plant two or three times unnamed before finding it under the name *M. guttulata*, which I adopted, thinking it to be only of garden

origin. Afterwards I found that it had been given by Reichenbach himself. I overlooked *M. guttulata*, Rehb. f., because I did not look in the *M. ionocharis* group, any more than in the *Chimera* or *Coccinea* group, to which I knew it did not belong. The identity of the two has been duly recorded (*Woolw. Monogr. Masd.*), and it is most unfortunate that Dr. Kränzlin should now add another synonym. *R. A. Rolfe.*

THE ASHLANDS, NEWCHURCH-IN-ROSENDALE.

Within a radius of 20 miles of Manchester there are, as is well known, many fine and valuable collections of Orchids, whose treasures have been repeatedly seen at the Whitsuntide exhibitions held in the Botanic Gardens, and at the meetings of the Royal Horticultural Society in London. There are several collections which, owing to the modesty of their owners, have hitherto seldom been exhibited. That of R. Ashworth, Esq., of Newchurch, is one of these. There has been got together at this place a collection which at the present moment can well hold its own amongst those which are more widely known, and may shortly rank as one of the finest in the district.

Unlike the connoisseurs in the south, whose gardens are more favourably situated, climatically and atmospherically, the gentlemen of Manchester have in many instances built or acquired their residences almost within sight of the huge chimney stacks of their mills and manufactories, out of which dense volumes of smoke and soot are being emitted day and night. It is therefore gratifying to have to note such excellent examples of health, cleanliness, and floriferousness as are here found.

In a house chiefly devoted to *Dendrobium*s there was a rich display of bloom, the more conspicuous plants being *D. Phalaenopsis Schroderianum* in many varieties; good plants of the beautiful *D. Dearei* and of *D. formosum giganteum*. In this house a plant of *Catasatum Bangerthii* of grand quality, and carrying a fine spike of ten very large flowers fully open, with two other flower-spikes approaching maturity, and one spike of twelve blossoms of equally large flowers just passed, was remarked. Considering the plant has but two leads, and it is growing in a 6 inch basket, it can really be said to be a specially floriferous example. Of *Cypripedium*s there was a goodly show of flowers, whilst the number of unopened spikes visible amongst the foliage told of a rich display coming on.

In the *Catleya*-house there was quite a large number of species in flower, fine plants of *C. Dowiana*, *C. Dowiana aurea*, *C. Harrisoniæ violacea*, *C. bicolor*, a very fine form, with bright tawny-yellow sepals and petals, and dark amethyst-coloured lip; *C. gigas Sanderiana*, Ashlands variety, which is unquestionably worthy of its distinctive appellation, is a fine and well-formed flower, measuring over 8 inches across the petals, which are broad and flat. The colour is a deep rose-pink, the petals heavily splashed with bright violet-purple, reminding one of the beautiful *C. Mossiæ Hardyana*; the lip is large and flat, of a bright purplish-crimson colour in the front, orange-yellow veins showing in the throat. Of *Lælia*s, two fine plants of *L. elegans* of the *Schilleriana* type were remarked in flower, one having an intensely deep purplish-crimson lip; also numbers of the *Lælia præstans* and *pumila* sections in many varieties; *Oncidium*s, *Miltoniæ*s, *Epidendrum*s, and others, in flower.

In the *Odontoglossum*-house there was not much bloom, although there were some few good forms of *O. crispum*, and a particularly good plant of one of the finest forms of *O. crispum guttatum*.

The collection embraces most of the species and varieties usually met with, whilst rare and costly species and varieties are numerous. Great praise is due to Mr. E. Pidgley for the evidently intelligent manner in which he manages his charges. *I. I.*

"LINDENIA."

The last part of this publication is devoted to the illustration and description of a beautiful series of variations from *Catleya labiata* var. *Mossiæ*. No fewer than forty-six forms are described, many with

Latin names attached. As it is clear that accurate lines of demarcation and classification cannot be drawn for these individual forms, is it not desirable to call them all—as some are already—by names such as *Qastelet*, *Crépin*, *Dumortier*, *Morren*, *Spring*, *Kckx*, *van Beneden*.

DEUTZIA LEMOINEI ×.

DEUTZIA Lemoinei, which was brought forward for the first time at one of the meetings of the *Société Nationale d'Horticulture de France*, on April 12, 1894, and whose appearance was signalled by a favourable description in the *Bulletin* of the same Society,* is a hybrid from *D. gracilis* × *D. parviflora*.

production. It came originally from North China, and the vicinity of the Amour river, whence it was introduced into the Imperial Botanic Garden at St. Petersburg, then into the Arnold Arboretum at Cambridge, United States. Professor Sargent, the well-known director of that establishment, sent us some branches, one of which put forth a bud which developed and took root. Thus we were enabled to be the first in Europe to introduce this fine species into the trade. At the same time the Paris Natural History Museum had received from Professor Sargent in 1887, some seeds of the same species, and succeeded in blooming the two or three plants thus raised. This plant forms an upright tuft, scarcely more than 5 feet high, the stems rather thick, stiff, and standing vertically, the leaves elliptical or

of 1891, *D. parviflora* produced a certain number of hybrids which, planted the second year in the open ground, bore unharmed the colds of the three last winters. They are tufts about 3 feet high, the branches of which are quite erect, and bear from early in May clusters of flowers; as many as (from 1000) to 1500 flowers and buds may be counted on each plant.

In general appearance *D. Lemoinei* × is intermediate between its two parents, although it has not their qualities. The branches are more upright, firmer, and more solid than in *D. gracilis* (♂), more regular in appearance, not so long, and in greater number than in *D. parviflora* (♀). The inflorescences are developed in all the axils of the branches, appearing early and in a regular manner, so that no lack or

FIG. 70.—*DEUTZIA LEMOINEI* ×. (FROM A PHOTOGRAPH.)

D. gracilis, Zuccarini, which grows in the damp mountain valleys of Japan, is a little bushy shrub with lanceolate leaves, and white flowers arranged in single bunches, with glabrous anthers borne on the central point of a trilobed thread. This species, introduced by Siebold about the middle of this century, and brought into trade by M. J. Baumann, a Ghent nurseryman, is now universally grown; it is raised in large quantities for forcing, and it is even stated, in the *Nouveau Jardinier*, that "this of all shrubs is the most suited for this kind of cultivation." It is hardy, and likes a light, fresh soil, wherein is a good proportion of peat.

Deutzia parviflora, Bunge, is a shrub of recent in-

tervention. Its stems are lanceolate, dentate, much reticulated and wrinkled on both sides, deep green in colour. The preceding year's stems bear down their entire length small trusses of flowers exactly resembling those of Hawthorn in appearance. The flowers are widely open, the petals are creamy-white, rounded, and diminishing at the base into a very narrow point, which displays the calyx as in many Rosaceous plants. The stamens are clear yellow, the threads just spreading at the base, but not auriculate at the summit.

This is the most valuable species of the genus, as the flowers open in April, some days before those of *D. gracilis*. Further, it can be forced; lastly, it is perfectly hardy in the climate of Nancy, where varieties of *D. crenata* are often frozen to the ground level.

Crossed with the pollen of *D. gracilis* in the spring

space is visible; while in *D. parviflora* it is not rare to see long stems bare of flowers here and there, and as if by chance. The hybrid has not the corymb of *D. parviflora*, nor the long truss of *D. gracilis*. It bears a ramified panicle, erect, sometimes hemispherical, sometimes cone-shaped with a broad base. Each cluster includes from fifteen to twenty-five large and well-opened flowers, measuring $\frac{3}{4}$ of an inch to an inch, in appearance different to those of other *D. utzias*. The petals are broad, oval, with undulated edges, of the purest white, and quite concealing the lobes of the calyx; the stamens are reddish-yellow with a trilobed thread. The flowers of *D. Lemoinei* × are spread quite out, while those of *D. gracilis* have pointed petals, and are generally but a little open; they touch in the inflorescence so as completely to hide the peduncles and pedicels; this is not so with *D. parviflora* or *D. gracilis*.

* * The *Société Nationale d'Horticulture de France* allotted its highest award for this shrub—a 1st prize, with a First-class Certificate of Merit.

Dentzia Lemoinei is an excellent shrub for forcing, as is testified by the plants given in April, 1894, to the Société d'Horticulture de France. They were taken up and potted the previous autumn, then grown in a cool house. Placed in the temperate-house, they would flower much sooner. The plants thus obtained are well formed, regular, laden with pure white flowers, without being encumbered by too abundant foliage. Grown side by side with *D. gracilis*, they surpass that plant in beauty. Thus we believe that this new shrub will soon be widely multiplied for forcing, and will gradually supplant *D. gracilis*. In the open ground it needs no special care, so it may have place in all gardens, however small. Quite as floriferous as is *D. gracilis*, it has the advantages of being more hardy and sturdy, of growing much more quickly, and of flourishing in any soil. *Emile Lemoine, Nancy.*

VANILLAS OF COMMERCE.

THE August number of the *Kew Bulletin* contains an interesting historical and descriptive account of the species of Vanilla yielding aromatic fruits, more or less used in commerce, which has been prepared by Mr. R. A. Rolfe, A.L.S., Assistant in the Herbarium, who has also monographed the species of the genus, fifty in number, for the Linnean Society.

At least five species are said to yield aromatic fruits, and three are known to be used in commerce, though the well-known *V. planifolia* is by far the most important, and practically the only source of the commercial product. The history of this plant is very interesting, and it is remarkable how long a time elapsed before the botanical source of the economic article was known. It appears that it was used by the Aztecs of Mexico as an ingredient of chocolate prior to the discovery of America by the Spaniards, who adopted its use, and that it was brought to Europe as a perfume about the year 1510, at the same time as Indigo, Cochineal, and Cacao, and ten years before the arrival of Tobacco. Clusius put the first botanical notice on record, in 1605. He had received some fragrant pods from one Morgan, apothecary to Queen Elizabeth, and described them under the name of *Lobos aromaticus oblongus*, without being aware of their origin or use. Nearly half a century afterwards Hernandez gave a figure of a fruiting-branch under the name of "*Araco aromatico*." The native name was given as *Tlixochitl*, but its use as a drug only is mentioned. The original figure was one of a series of 1200 executed in Mexico during the previous century by the King of Spain. In 1658 Piso stated that the fragrant siliques or pod was called by the Spaniards *Vayilla*, and that it was used both as a drug and as an ingredient in the manufacture of chocolate. The name is the diminutive of the Spanish *Vaina*, a pod or capsule. Towards the close of the century Dampier gave some interesting information about the plant. In a small Indian village in South Mexico he found a large quantity of Vanilloes drying in the sun. The fruit was described as a little "cod," growing on a small vine, and turning yellow when ripe, when the Indians gathered and prepared it, and sold it cheap to the Spaniards.

The Vanilla was introduced to England before 1739, in which year the first edition of *Miller's Gardeners' Dictionary* appeared. In this work he states that having received some branches of the plant, which had been gathered at Campechy by Mr. Robert Millar, and sent home by way of sample, he planted them in small pots and plugged them in a hotbed of tanner's bark, where they soon put out leaves and roots. Nothing further is recorded about them, and it is probable that they were soon afterwards lost.

By this time other species of Vanilla had become confused with the true plant, and one of these was ultimately described under the name of *V. aromatica*, though the name was evidently taken from the economic plant. For many years *V. aromatica* was thought to be the source of the Vanilla of commerce, but at length it was found that its fruits were not aromatic at all,

V. planifolia was described and figured by Andrews, in 1808, from a specimen which flowered in the collection of the Right Hon. C. Greville, at Paddington, which had been introduced by the Marquis of Blandford, but it was not until long afterwards that it became known that this species was the source of the Vanilla of commerce. A year before the self-same plant had been figured and described by Salisbury under the name of *Myobroma fragrans*. Humboldt, in 1811, and Schiede some years later gave a considerable amount of information respecting the Vanillas of Mexico, and the latter described four new species, two of which, *V. sylvestris* and *V. sativa*, have since proved to be the wild and cultivated forms of *V. planifolia*, and a third, *V. inodora*, to be the one so long known as *V. aromatica*. Prof. C. Morren first succeeded in producing fruits in quantity and in proving that *V. planifolia* was the source of the commercial product. By a certain method of culture he succeeded in obtaining fifty-four flowers on one plant, and by fertilising them artificially, obtained the same number of pods. A year later he succeeded in obtaining a crop of 100 pods. His paper "On the Production of Vanilla in Europe," which was read before the British Association at Newcastle in 1833, was remarkable in several respects. Besides proving the botanical source of the Vanilla of commerce, and showing the need for artificial fertilisation, he also succeeded in tracing his plant to the original one in the Right Hon. C. Greville's collection at Paddington. It appears that Parmentier succeeded in obtaining cuttings of this plant, which he confided to the care of Dr. Sommé, Director of the Antwerp Botanic Garden, where it grew rapidly, and slips were widely distributed in Belgium and France, though they very seldom flowered, and never fruited. In 1819 Dr. Sommé sent two plants to the Dutch colonies of Java, by M. Marchal, who, with difficulty, got one there alive. This flowered at Batezorg, but failed to fruit; and in 1825, Blume, who can hardly have known its history, again described it as *V. viridiflora*.

A very interesting circumstance about the Paddington plant did not come out until many years afterwards, and that is, that in 1807, the very year in which Salisbury's figure appeared, a drawing was prepared by Francis Bauer, showing both the flower and also the fresh fruit. How the flower became fertilised is not known, nor yet whether any aromatic fragrance was observed. Morren thought that the fruit might have been a commercial pod, but the drawing proves that it was fresh, besides showing the stalk by which it was attached. Deltiel ascribes the present important industry in Réunion to plants obtained from Paris in 1822, which it is pretty certain also came from the Paddington plant. He also states that they proved sterile until about the year 1841 or 1842, when a slave named Edward Albin discovered a simple and rapid method of fertilising the flowers artificially, which has been practised ever since! He also states that artificial fertilisation was first practised by Neumann in the Jardin des Plantes, though no mention is made of this by Morren. In Mexico and Central America fertilisation is effected naturally by small bees belonging to the genus *Melipona*, which visit the flowers for the sake of the honey they afford. Elsewhere artificial fertilisation has to be resorted to.

With respect to the other species with economic fruits, it appears that *V. pompona*, Schiede, has thicker, very fleshy pods, which are more difficult to dry, and also fetch a lower price on the market. They have, however, long been known as an article of commerce, and are largely used in a fresh state. It is diffused from Mexico to Guiana and Colombia, and is cultivated in the West Indies, being the source of West Indian Vanilloes. Brazilian Vanilla is produced by *Vanilla Gardneri*, Rolfe, a species here described for the first time, having previously been confused with *V. planifolia*. "South American Vanilla," it is thought belongs to the same species, and of this as much as 9,000 lb. are said to have been produced in 1891. It has a rank odour, and is probably used as an adulterant. *V. odorata*, Presl, and a new species called *V. appendiculata*, Rolfe,

have aromatic fruits, but are not known in commerce. An indigenous West Indian species, called *V. pœo-antha*, R. & H. f., has also been cultivated as a Vanilla plant, but has little perfume. According to Humboldt, there is a Peruvian species with aromatic fruits, but nothing further is known about it. Thus it will appear that the author has brought out several interesting and unexpected facts. Those who would read the matter in full should refer to the original paper.

FOREIGN CORRESPONDENCE.

POISONING FROM EATING GRAPES.

ALTHOUGH not bearing directly on the subject of poisoning by nicotine, appearing on p. 334 of the *Gardeners' Chronicle*, the following remarks are sufficient to prove the danger of using injurious remedies upon products which are cultivated for market purposes. In France, in almost every vineyard, sulphate of copper is used either as a cure or preventative against mildew, which attacks the leaves, and in syringing the leaves the berries naturally receive a certain amount, and which when eaten produce a slight poisoning. Here (Cannes) at this season of the year, when Grapes are cheap and plentiful, I have remarked an increased occurrence of illness, which medical men attribute to colic, but which I contend is really slight poisoning from eating Grapes which have sulphate of copper on them. I have met with several cases amongst friends, and have also found the effects of it myself; and as a further proof, I find the pain is accelerated by drinking anything containing an acid. Considering the greater part is used for making wine, where the poison would be nullified by fermentation, the danger is not great; but in any way, I should assume that the addition of copper (placed in the wine), which is often practised, would be unnecessary. *Riviera.*

THE PROPERTIES OF THE GRAPE VINE.

If our forefather Adam was of a philanthropic turn of mind, and knew the many properties of the Vine, he must have felt a pleasure in handing down to mankind a plant which would prove in itself a miniature pharmacopœia. Perfectly ripe Grapes are good for persons suffering from inflammation, such as gastritis, &c., whilst the unfermented juice (*wort*) acts as a laxative. The seeds, or stones, are reputed as a popular remedy against dysentery and blood-vomiting. The ash from the canes act as a diuretic. The leaves, dried in the shade and powdered, are used in cases of hæmorrhage. The sap from the young shoots is used for inflammation of the eyes. Dried Raisins are an excellent pectoral for affections of the chest. White wine acts as a tonic aperitive; whilst red wine (which poets love to quote) is both nourishing and fortifying, if taken in moderation. Again we have the vinegar, which is employed for so many purposes, and the oil, which is extracted from the seeds, and is used in southern Europe for illuminating purposes. *Riviera.*

OXALIS TROPÆOLOIDES.

I am sending you by sample-post a plant of *Oxalis tropæoloides*, Aurora, and one of *O. t. Brilliant*, and I wish to tell you that seed of these yields from 50 to 70 per cent. of variegated plants; Aurora germinates with yellow seed-leaves, but Brilliant with white seed-leaves (I refer to the first leaves sent up from the seed), but later leaves display the differing variegations. Aurora does not change to the colours of Brilliant, nor do the leaves of Brilliant turn like those of Aurora. Both species are of very slow growth at first, and later on not growing so quickly as does the old variety. The intensity of colouring is so vivid and attractive that both are worth a place in the garden. I would further mention that the variety was awarded a Silver Medal at the recent Jubilee Exhibition at Magdeberg (August 29 to September 8). I have been told that the variety I have named Brilliant was shown in 1872 under the name of *Oxalis tropæoloides roseo-picta*, and that it has been lost since. *Friedrich Rawer, Quedlinburg.* [The specimens which accompanied this note were exceedingly pretty and high coloured. Ed.]

THE HERBACEOUS BORDER.

ASTER MAACKII.

AMONGST the most distinguished-looking and distinct Michaelmas Daisy now in flower, *Aster Maackii* (Rogel), a native of Japan, deserves favourable notice. The height is about 4 feet, the habit good, and the flower as large as that of *A. novæ angliæ*, the rays are regular and horizontal, of a pale purplish-blue. It came to me two years ago as a novelty from Mr. W. Thompson, of Ipswich, and spreads very moderately. I observe in Mr. Thompson's seed catalogue Amur-land given as the habitat. *C. Wolley Dod, Edge Hall, Sept. 29.*

THE HERBACEOUS PHLOXES.

The Phlox being my favourite plant, and having grown it for years with some degree of success, I was interested by Mr. Douglas' remarks at p. 325 concerning them. I am not sure that Mr. Douglas is writing of the shrubby Phloxes, viz., *P. suffruticosa*, or the garden form (*P. omniflora*), at all, since the greater portion of his notes bears no reference to this section, but are directed to the herbaceous Phloxes proper, viz., *P. decussata*. The two sections are too distinct to be mixed by anyone, even if they desire it. Those who require Phloxes that are mostly dwarf in habit, will find them in *P. suffruticosa* varieties, which, in reality, are the shrubby Phloxes proper. These range from 1 to 2 feet high, and a few kinds taller than this, but they have not the wide range of colour that we find in the herbaceous Phloxes, viz., the varieties *P. decussata*. The shrubby Phloxes are, moreover, much the more delicate; slugs are their pernicious enemies, devouring the young shoots almost as fast as they appear, unless prevented doing so, and in few gardens do they thrive sufficiently to be of much decorative value. But it is quite otherwise with the herbaceous Phloxes, these growing in almost any garden. The fine variety *Etna* (Lemoine) mentioned by Mr. Douglas, has nothing to do with the "shrubby" section whatever. This kind undoubtedly belongs to the herbaceous group. The other varieties mentioned I am not acquainted with. Mr. Douglas says that the Phloxes of twenty-five years ago were too tall, and this was true enough of some kinds, but there were good dwarf kinds also, which are scarcely superseded to-day. For example, take *coccinea*, *Regulus*, *J. K. Lord*, *Lothair*, *Madame Moisset*, *Independence*, *The Queen*, and you have an assortment of the dwarf kinds twenty-five years since that figure among the best of to-day. But I believe that height of stem is simply due to culture, as I find numbers of the old varieties which I have grown, fully 4 feet high, and completely foliated to the ground at that height, figuring in catalogues at the present time at 1½ foot. These herbaceous Phloxes, when well grown, are among the grandest ornaments of the garden, and those that require to be "masked by other plants" are certainly not well grown by any means. Phloxes which in dry seasons are devoid of leaves on their stems to a great extent, have suffered distinct neglect. Such plants must either be very old, or be standing in the dry soil of a crowded shrubbery, or have been afforded insufficient quantities of water, any one of which is quite sufficient to render them unsightly. I do not know of any London nurseryman who did greater justice to these Phloxes than the late Mr. R. Parker, of Tooting, for not only had he a very fine and remarkable collection, but he grew them well. This comprehensive collection was the admiration of all, and the great massive heads of colour thrown up for weeks together was a sight in itself. The whole secret of his success was in affording moisture at the root. The large specimen beds were planted near to the water-tanks, and in summer-time, twice, and sometimes thrice weekly, the beds were flooded; and so that the water should not run away, a ridge of earth was formed round the beds to keep it in. It is apparently a forgotten fact that these Phloxes, or at least the original species, is almost, if not quite, a bog or marsh plant. At any rate, there is no

position in the garden that in summer time will suit them so well. I must also confess that I have little faith in the reputed dwarfness of the new kinds. Given the requisite treatment for full development, there is scarcely any variety of this section known to me which will not, in the second year after planting, attain to a height of from 3 to 4 feet. These Phloxes, although they flower well the first, do not attain perfection till the second year, and this only when let alone. Mr. Douglas suggests replanting, if it is intended to carry them on a second year. This is one of the greatest possible errors in Phlox culture, and is simply and surely the undoing of the first year's work. Such a system not only keeps the plants unnaturally dwarf, but it also, and that most effectually, restricts the development of the flower-heads; and it is no doubt in a large degree due to this or similar treatment that we see these Phloxes so poorly grown generally, for it must assuredly follow that any cultural treatment robbing the plant of its natural development will not improve the colour or the size of the flowers. The great majority of these herbaceous Phloxes will produce immense panicles of bloom 1 to 1½ foot through when well grown, irrespective of laterals; but to get such results the plants must be put out in their permanent places, when, if intelligently treated, they will bloom well. The cutting inserted in the spring of 1895 will produce one flower-head about August the same year; and, if let alone, it will, in 1896, produce from four to six fine heads of bloom; and, if still left undisturbed, and soaked with moisture in the summer, will, in 1897, produce from twenty to twenty-four much finer heads of bloom than ever. I note that Mr. Douglas would restrict the heads of bloom to three on each plant, but I cannot understand the reason why. To obtain the best results, the soil must be deeply trenched and heavily manured; in these matters it is impossible to err. Employ young plants, from cuttings if possible; failing these, the fresh young growths from the outside of large clumps, carefully avoiding the hard woody material. If pot plants are obtained, shake them free of all soil, and, removing any small suckers, reduce to one strong shoot, and in planting spread the roots horizontally. The old stem should be buried at least 2 inches, as the plants are great surface-rooters. Phloxes may be planted over a rather long season; but, for ensuring success, the early autumn is in every way excellent. In summer-time supply them abundantly with water, and liquid-manure in plenty; and while a heavy mulch of manure will be most helpful, moisture must always be regarded as being very essential to successful cultivation. *E. Jenkins, Hampton Hill.*

THE WIZARD OF HORTICULTURE.

THE name and fame of Luther Burbank are world-wide. He was born in Lancaster, Worcester County, Mass., on March 7, 1849. From his continued successes in producing new forms of living plants in unexpected directions, he is often called "The Edison of plant life" and "The wizard of horticulture."

At eighteen years of age, after having received a liberal education, Mr. Burbank went to Worcester, Mass., to learn wood-turning and pattern-making. After three years, and finding the dust and confinement not suited to his tastes, he purchased a 20-acre farm in Lunenburg, Mass., where he could continue to study, investigate, and experiment with the variations of plants, and this was where the "Burbank" Potato originated, and where many other experiments were instituted, some of which have since resulted in valuable fruits, flowers, and vegetables.

Finding the climate of New England too severe for some of the plants with which he was working, he removed to Santa Rosa, California, where he has since lived, and where his creative work in producing new fruits, flowers, vegetables, trees, shrubs, and grasses has made his name famous; the benefits conferred by this work will be better known a gene-

ration hence, for it is a pioneer work, and the life of one man is too short to show the full results.

The work which Mr. Burbank is now doing would seem to be enough to occupy the time and abilities of a dozen men, and, not being satisfied with the hardiness or habits of the material which can be produced through the channels of the general trade, he takes journeys of many thousand miles to the mountains in the far North, where plant life has to struggle with a brief summer and a temperature of 60° to 80° below zero [?]. Desert and mountain top, swamp and field, each have to contribute to his omnivorous plant workshop, and when the finished product is turned out in the form of a hardy cross-bred Plum, a frost-resisting berry, or a charming new Rose or Lily, he finds ready sale for it at prices which seem fabulous to those who do not know the cost of time, thought, and labour necessary for its production.

From the multitude of seedlings raised each year, he selects a very few which, by their growth, show improvement over others of their species heretofore cultivated. These are tested for several years before their characteristics can be definitely ascertained. The seeds of these improved specimens are planted, and, a promising variation of the last generation of seedlings having been produced, several improvements may be expected in the next generation. The best of these are, in their turn, selected for producing still others, and, after a time, by this careful selection, great improvement is the natural result. Another means employed is to select the best varieties, and cross them with others. By this plan valuable varieties are sometimes obtained. *The National Nurseryman.*

BELGIUM.

ORCHIDS AT THE BELGIAN EXHIBITIONS.

ON the same day, September 22, two exhibitions were held in Belgium, one at Brussels, the other at Mortsel, Antwerp. At both, Orchids were well represented. At the Brussels exhibition, organised by the *Société de Flore et la Linéenne*, M. Lucien Linden showed thirty *Catasetums* in bloom, all fine varieties which had flowered last year; *C. imperiale* was even better than it was last season. Many new varieties were added to those with which we are already familiar. M. Ch. Vuylsteke staged an admirable group of fine varieties of *Miltonia vexillaria* var. *autumnalis*; this is quite other than the common type; it always flowers in September and October, thus deserving the name of *autumnalis*.

M. Jules Hye-Leyson showed a pretty miscellaneous collection of Orchids, among which may be named *Vanda Lowii*, *Saccolabium Blumei*, *Cypripedium Charlesworthianum*, with two beautiful flowers, well-coloured, especially over the very wide standards; *Odontoglossum Harryanum*; *Cypripedium Morgania* ×, remarkably fine; *C. Blunzi Lubbersiana*, with five splendid flowers; *Cypripedium macropeternum*, with two flower-stems and six good flowers; *C. Annie Meunrea*; *C. Charles Canham*, with seven splendid blooms; *Oncidium Lanceanum*, marvellous in colouring; *Epidendrum sceptrum*, and *Miltoniopsis Bleiana*.

Among M. Peeters' collection may be mentioned *Vanda cœrulea*, *Miltonia vexillaria superba*, *Oncidium Lanceanum*, *Miltonia Blunzi Lubbersiana*, *Cattleya granulosa*, *Odontoglossum Wilkeanum*, *Cypripedium Morgania* ×, and *Cattleya O'Brieniana*. M. M. Stepman & Moens showed a fine collection of *Cypripediums*, including *C. virens*, splendid as to colour; *C. Charlesworthi*, and *C. Sallieri Hyeanum*. M. Vuylsteke staged *C. Rothchildianum*, with three flower-stems and nine superb flowers; the plant strong and fine.

At Mortsel, Antwerp, M. Flor Pauwels staged a remarkable collection of miscellaneous Orchids; among them may be noted—*Epidendrum raniferum*; *Oncidium aureum*, with three fine bunches of bloom; *Asiodes virens*, with two superb trusses; *Cypripedium Bolerlaerianum* × (*C. Dauthieri* × *C.*

Harrisianum), flowering for the first time, the blossom large and good, with a fine standard, resembling greatly that of *C. Harrisianum*; *Vanda javia*, *V. teres*; *Miltonia Moreliana*, with a hundred flowers; *Oncidium incurvum*, with seven fine flower-stems; *Cattleya maxima floribunda*, new, but not sufficiently fixed to be criticised; *Dendrobium cruentum*, *Cypripedium Chamberlainianum*, *C. Thomsoni*, *Zygopetalum Gauthieri*, magnificent in colour; *Acineta superba*, with three fine clusters of delicately-scented flowers; *Cypripedium Veitchi*, with four beautiful blossoms; and *Oncidium daasytyle*, well-bloomed. MM. Janssens & Vincent sent a beautiful selection, including the following:—*Oncidium Lanceanum*, admirable in colouring; *Odontoglossum Coradinei*, a very pretty variety; *Saccolabium Blumei*, *Cypripedium ceasanthum superbum* magnificent, *Cattleya crispata*, *Cypripedium Ashburtonense*, remarkable; numerous fine varieties of *Odontoglossum crispum*, one of which, *var. Triandi*, was quite remarkable.

Commander Jones also staged some fine Orchids, among them *Odontoglossum Krameri*, *Trichopilia coccinea*, *O. cariniferum*, *Peacatorea cerina*, a species of *Lycaste* with olive-green sepals, dotted and speckled with brown, the petals and lip white, with numerous dull rose spots.

M. Jean de Bosschère exhibited an album of dried Orchid blooms, accompanied with illustrations.

ORCHIDS AT L'HORTICULTURE INTERNATIONALE.

We noticed that *Catasetums* were flowering even better here this year than last season. We have before greatly admired many surprisingly fine varieties of *C. Bangerothi*, *splendens*, *macrocarpum*, and others, and would further mention *C. Bangerothi giganteum*, *C. splendens aureo-maculatum*, of which there are numerous varieties; *C. splendens aureum*, *C. macrocarpum albo-punctatum*, *C. splendens maculatum*, *C. splendens album*, *C. revolutum roseo-punctatum*, *C. O'Brienianum*, and others. It is assumed that *Catasetums* have but a short life, but, at this establishment, there is a plant of *C. Bangerothi Pottianum*, which has been under cultivation for eleven years. In addition to *Catasetums*, *Cattleyas Rex* and *gigas* are here blooming abundantly.

Many Orchid-lovers are surprised at the great number of seedling Orchids here found, and which are the result of various crossings between diverse genera and species. Thus, at L'Horticulture Internationale, there are about 1000 *Odontoglossums*, all thriving young plants. Notable also are the very numerous specimens of *Davallia Truffautiana*, a new plant, which will soon prove to possess valuable decorative qualities.

ORCHIDS AT DEURNE, NEAR ANTWERP.

M. Flor Pauwels has here so remarkable an establishment (amateur) that all plant-lovers passing through Belgium should see it. On August 25, though many flowers had been cut the evening before, we found still 109 flowering plants. We do not know when we have before seen such successful cultivation of *Phalaenopsis*, and on so large a scale; the vegetation luxurious, the leaves firm, glistening, in excellent health; with promise of abundant bloom, which shall be spoken of later. Meanwhile, we commend this collection to the attention of Orchid-lovers. *Ch. De B.*

POTATO CROP AT BUXTED PARK, 1895.

At one time, owing to the long-continued absence of rain, it seemed doubtful if Potatoes this season would be worth lifting, but where the ground was properly tilled and the sets properly prepared, the result has exceeded my expectations. I have lifted the early and second early kinds, and find them satisfactory in every respect. In a few instances supertuberating had set in, although not to a serious extent. The Ashleaf varieties were not such a heavy crop as usual, nor were the tubers so large, but the flavour is excellent, and there is no sign of

disease or of a second growth. The same may be said of the second early kinds. From 200 square yards of ground more than 13 cwt. of good tubers of Supreme (Sutton's) were lifted, not reckoning the small ones, and not one was diseased. Renown (Webb's), produced about the same weight of tubers; Marvel was all that could be desired, even in size, of good shape, and free from disease; Wrangler and Al (Sutton's) were very good, as were Perfection and Triumph, which produced good crops of even-sized, well-formed tubers free from disease. Considering that so little rain fell during May and June, it is matter for astonishment how well Potatoes have turned out. Only $\frac{1}{2}$ inch of rain was registered between the month of April and July. The late strong-growing varieties are not yet lifted. The haulm is making a second growth, which is a sure indication of renewed root action, and as the soil is now very moist, nothing but cold weather will stop growth. Where the skin has not "set," this may not be serious. I usually plant these varieties at 3 feet apart, which allows of sufficient soil being drawn up to make wide ridges, and this measure prevents the soil about the roots getting dry during a season like that of this year, and growth goes steadily on, even in a dry time. Two years ago no rain fell between planting-time and the date of lifting the earliest; still, these were a good crop. Where the soil is poor the crop is very light, there not being sufficient haulm to cover the ridges, and the sun-heat penetrated far into the soil. On my stiff land, unless it be well prepared, there is no hope of getting a satisfactory crop of tubers, it becoming baked into hard clods difficult to break into pieces. Where Potatoes were planted on such ground, they have done very badly this season, especially the short-topped varieties. I have given up planting divided sets, except in the case of new varieties, of which there are few sets, the results obtained being much better from whole medium-sized ones, prepared by being stood on end, eyes uppermost, in a light airy place. If the tubers are hardened by being exposed to the action of the sun for a few days, by being left on the ground after lifting, they do not start into growth so early in the spring, and the shoots are more robust, particularly if the sets are kept in a cool place till planted. On the heavy soils hereabouts, shallow planting is practised, but plenty of earth is drawn to the plants to prevent the tubers from pushing through the covering. The soil is made as fine as possible before planting and earthing-up, and this, in a measure, prevents it from getting very dry during droughty summers. I have dispensed with farmyard manure for Potatoes, and I use artificial manure instead, which is sowed along the drills before the sets are laid in. The moisture in the soil dissolves it, so that the plants are benefited at an early stage. Earthing-up is done as soon as the plants are sufficiently forward, and in this way the roots are kept moist, and should the season prove a wet one, the moisture drains away into the furrows. *H. C. Prinsep.*

KEW NOTES.

TECOMA RADICANS.—In the warmer parts of this country *Tecoma radicans* thrives well, even without the protection of a wall; there is at Kew now an old specimen flowering freely, which is growing in the open with no other protection than that which the shrubs growing near it afford. Where space can be given, however, a position on a wall facing south is to be preferred for the plant. It is a native of the Southern United States, and according to Loudon, has been cultivated in England for more than 250 years. The flowers are borne in terminal clusters on the long rambling growths of the current season. About a dozen flowers occur in a cluster, and each one is $3\frac{1}{2}$ inches long by 2 inches wide at the mouth of the trumpet-shaped corolla, which is of a brilliant red and orange; the base is clasped by the red calyx. When grown as a bush it should be pruned hard back before growth commences, and it will in time form a thick self-supporting stem. On a wall

it can be extended at will, but when once the allotted space is filled, the same hard pruning is necessary. It is essentially a sun-loving plant, as is proved by the great wealth of bloom after summers like those of the present year and of 1893.

CEANOTHUS GLOIRE DE VERSAILLES.

Whilst many of the species of *Ceanothus* are very beautiful when grown as wall plants, or far enough to the south to dispense with any protection at all, it is only comparatively few that can be included among really hardy shrubs in the neighbourhood of London. *C. azureus* is one of the best of these, and of the numerous varieties of it that have been sent out in recent years, *Gloire de Versailles* is—for cultivation in the London district—probably the hardiest and most useful. It is more vigorous in habit than the species itself, and the panicles of flowers are much larger, and of a richer tint of blue. At Kew, this variety is planted by itself in a large bed; the plants are 3 to 4 feet high, and for the last two months they have flowered most profusely, the feathery panicles of small blue flowers giving a charming effect. The frosts experienced last January and February were a sufficiently severe test of the hardiness of any shrub, and it speaks well for this *Ceanothus* that with no more protection than a thick layer of dry leaves afforded, the plants received no real injury. The later, softer growth of last year was, as might be expected, killed, but this only anticipated the knife by a few weeks. All the varieties of *Ceanothus azureus* strike readily from cuttings.

ECREMOCARPUS SCABER.

Like other hardy and tender Chilean plants, this one has become quite rare. It was first collected by Archibald Menzies about 100 years ago, but was not introduced to cultivation until 1824. It is a plant of a climbing habit, somewhat Clematis-like foliage, but belonging to the *Bignonia* family. It is usually killed to the ground in winters of ordinary severity, but occasionally it survives if the plant has the protection of a south wall. In any case the roots should be protected by a thick layer of dry tree-leaves or brushwood. There need never, however, be any fear of losing it, for it ripens seed in abundance; and seedlings obtained early in the year and grown on in a frame until May, and then planted out, flower freely the following August. The flowers are borne to the number of twelve or more together on the racemes, the corolla being tubular, $1\frac{1}{2}$ inches long, constricted at the mouth, and of a bright orange-red. The leaves are bipinnate, with dark-green, irregularly-lobed leaflets. The leaves are opposite, but after flowering has begun, at every third or fourth node a raceme takes the place of a leaf. The midrib is terminated by a many-branched tendril, by which the stems are securely held to whatever support is near. This was one of the climbers specially studied by Charles Darwin when investigating the movements of climbing plants. *W. J. B.*

MORELLO CHERRY CULTURE.

MR. TEMPLE'S interesting remarks on the above-mentioned subject in a recent number of the *Gardeners' Chronicle* (p. 293), recall to my mind the fine specimen trees of the Morello Cherry which used to adorn, and probably adorn still, the 18-foot high wall at the back of the curvilinear-roofed orchard-house at Scone Palace Gardens, Perth. The trees covering this wall were fine examples of good cultivation and careful training, being furnished from bottom to top with healthy shoots, every one of which was trained with the utmost precision as regarded intervening space and the point on the wall at which the individual growths radiated from the centre of each tree. The young men who were annually entrusted with the re-arranging and nailing of such large trees were sensible of the implied confidence and honour conferred upon them by the chief, and also of the labour and skill which the manipulation of the thousands of small shoots involved, and of the importance of the verdict which followed the completion of the work. My friends, Messrs. D. T. Fish

and George Smith, Vice-Regal Lodge, Dublin, and other readers of the *Gardeners' Chronicle* who have either helped in the building up of, or have seen the Morello Cherry trees at Scone, will remember them with feelings of pride, notwithstanding the recollection of benumbed fingers and the intense cold sometimes experienced in doing the work.

I have no doubt about the trees of which I write, or the ones which may have succeeded them, being as fine examples of cultural skill now as they were then.

When I took charge of the gardens here a little over twenty-four years ago (August, 1871), I made up my mind to have trees of the Morello Cherry to come as near those described above as the dif-

about 3 feet deep, extending 2½ feet on either side the place marked on the wall for the centre of each tree, and 3 feet therefrom, placing 9 inches deep of clinkers or brickbats, broken fine on the top, in the bottom of each hole for drainage, covering this with turves, grass-side down, and then placing therein sufficient good yellow

FIG. 71.—MELON, EARL'S FAVOURITE! A NEW GREEN FLASHED VARIETY, RAISED BY MR. H. W. WARD.

19 INCHES IN CIRCUMFERENCE, 4 LB. IN WEIGHT.

Awarded a First-class Certificate by the Royal Horticultural Society on September 5 last. Fruits were exhibited at the Crystal Palace Show, which were highly commended.

(See p. 402.)

Perhaps my friend, Mr. McKinnon, who succeeded Mr. John Halliday (since deceased), many years ago in the management of Scone Palace gardens, will kindly furnish particulars to the editor of this Journal as to the present condition of the trees referred to above; also a few notes as to the soil, drainage, and treatment bestowed upon the trees in question, as

ference in height of walls (9 feet), would permit. Accordingly, I planted several young trees at the fall of the leaf that autumn, and with what success I shall leave to others who have seen the trees from time to time in full bearing to say. Having obtained healthy young trees—the first consideration in successful fruit culture—I opened holes

loam (to which a little lime-rubble had been added) to plant the trees in. I may here remark that prior to planting the trees permanently in the holes thus prepared for them, they had been grown on in available spaces between Peach and other trees for a year or two, according to space, in which to develop their growth. Towards the end of September these

trees had a trench taken out around them, and a little of the soil removed from under the roots, so as to admit their being lifted and transplanted with nice balls of earth adhering to the roots, thereby preventing the trees experiencing much, if any, check in the process of transplantation, cutting off any damaged roots, and shortening back straggling ones before placing the individual trees in position, afterwards working the soil well among and about the roots, and finally treading it over before laying on a surface-dressing of short dung to the thickness of 3 or 4 inches, and extending over the loosened ground, and giving sufficient water to settle the soil about the roots, the trees being then secured loosely to the wall to allow of the soil settling down a little before being finally nailed. The trees are treated in precisely the same manner as Peach and Nectarine trees, as regards the laying-in of the young shoots annually, cutting out old ones, and the sprurring back foreright shoots.

Young healthy trees planted as described above, and afterwards kept clean and sufficiently moist at the roots during the summer and early autumn months, cannot well fail to make satisfactory growth and yield remunerative crops. Our trees have never failed in yielding heavy crops of fine fruit, which from the middle of September up to the time the crop is exhausted, are used for dessert, the flavour having a pleasant sub-acidity about it.

The black-fly is the most troublesome pest to deal with that affects the young growth of Cherry trees; until this year the most effectual remedy that I had recourse to was tobacco-juice and clean water, used in the proportion of 1 quart of the former to 4 gallons of the latter. But this season, having been induced to give Bentley's "Compound Quassia Extract" a trial, I have no hesitation in pronouncing it the best and cheapest insecticide that I am acquainted with, 1 gallon of the Extract making nearly 100 gallons ready for use. Another advantage which the Extract has over the tobacco mixture referred to above, is that it leaves no nasty smell about the trees on which it is used; but being intensely bitter in flavour, it not only dislodges or destroys the aphids on the trees when it is applied, but it renders the foliage less liable to future attacks. *H. W. Ward Longford Castle Gardens.*

FRUIT, VEGETABLE, & FLOWER CULTIVATION IN GERMANY.

Fruit cultivation in the neighbourhood of Frankfort seems to have been recently taken up with much energy, and is fostered a good deal by societies which discuss the progress, and assist their members, practically and theoretically, in the selection of the qualities and treatment of cultivation. The Royal College for fruit, vine, and floriculture at Geisenheim on the Rhine, is especially referred to in a recent report as exercising a very beneficial influence in this direction. It organises lectures for the instruction of proper persons, who are trained as fruit or Vine-growers or florists; it also sends round travelling teachers to give lectures, advice and instruction, as to the most lucrative way of disposing of the fruit crops, as to the best methods of drying and preserving kernel or stone-fruits and vegetables, the packing of the fruit, the preparation of fruit syrups, jellies, marmalades, &c., and thus as to the preserving of the fruit. The culture of berry-fruits has been especially promoted by the introduction of wines made from different berries and other productions, which have been brought before the consumers by the numerous exhibitions, where, by means of prizes, endeavours were made to increase the zeal of the growers to produce fruit suitable for the market. Of late, special attention has been directed to the better disposal of the fruit crops, since the cultivation itself has made such undoubted progress. Thus, at Frankfort, as has already been mentioned in these pages, a central depot for the sale of fruit has been founded, which offers its services gratuitously. It accepts offers from the growers, and hands them on as demands arise. It likewise

arranges in autumn large fruit sales, at which the supply as well as the demand is very lively. Last year the demand exceeded the supply, especially in green Nuts, Cranberries, Apricots, Peaches, Mirabells, and Plums. At the commencement of August, 1894, at the central office, goods had already changed hands to the extent of upwards of 1,000,000 kilos., almost exclusively berry fruits. The central office gives its assistance to all interested parties, to buyers as well as sellers, entirely free of charge. It does not even ask for the reimbursement of its own expenses. The enterprise thus is purely conducive to the public good, and is intended to promote German fruit cultivation. During the present summer, it was intended to establish similar institutions in other places after the Frankfort pattern. It has been successfully initiated in a few South German cities. The wealth of the population has been advanced in some instances in quite a remarkable degree by the cultivation of fruit and berry trees.

The Cherry orchards at Gaben need only to be mentioned, as well as "the orchard of the capital," for such is considered the small town of Weidert, situated between Potsdam and Berlin, on white sand-hills, near the River Spree. There the growing of fruit, notwithstanding the unfavourable soil, has increased wonderfully. The fruit produced excels by its superior quality, and is preferred by consumers. The growers, who have organised themselves into trades unions, are now in possession of a fleet of their own, and during the season ship their produce every morning in their own steamers to the markets at Berlin.

Floriculture is also visibly extending in Germany, especially, it is stated, since special hothouses for certain kinds of plants have been more generally erected. The cultivation of plants amongst children in schools has also been much promoted by the distribution of prizes, consisting of plants, bulbs, flower-stands, thermometers, and other articles useful in gardening.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By RICHARD PARKER, *Gardener, Goodwood, Chichester.*

WATERING THE SOIL OF THE FRUIT-TREE BORDERS.—This matter should always claim attention at this season, and in particular this year after the excessive heat and drought experienced. A tree border which has been allowed to become very dry is almost as productive of shanking in Grapes as a very wet and cold one, and it is often from this cause Peach and Nectarine trees shed their flower-buds when started into growth the following season. Providing good drainage is secured, and the soil is filled with roots in every part, it is almost an impossibility to afford too much water, as although the crop of fruit may be gathered, a great amount of moisture is required to sustain the foliage in a healthy state, and develop the wood and buds. If the surface of the border has become hard, the crust should be carefully broken up with a fork, so that the water may readily enter the soil. In gardens unprovided with pipes and hydrants, the work of watering is severe; nevertheless, in a season like the present, a strenuous effort should be made to carry out the work, so much of next season's success depending on its proper performance.

SHIFTING PEACH TREES.—The month of October is the best period for lifting and transplanting these trees, particularly those in the early forcing-houses, where it is necessary that the trees become established betimes in the new soil, and therefore in a fit state for beginning to force in December and January. Peach trees may be planted as soon as the growth of wood is finished, and if the work be carefully done, no injury will occur to the foliage, and it is a great point to keep it in a healthy condition to the latest date. A preliminary to transplanting is to heavily water the soil the night previously, which will have the effect of retaining a good quantity of soil about the roots. In preparing sites for the trees, only sufficient soil need be removed to allow of enough fresh soil being added for one season, wide, rich borders only promoting the growth

of strong, unfruitful wood. A firm soil, a border of no great width, and additions annually made as the trees seem to require it, afford much better results. After planting, one copious watering should be afforded, and the foliage heavily syringed several times a day, with slight shade, if the temperature by day be very high, but dispensing with its use when the foliage no longer flags on exposure. The branches should be but lightly fastened to the trellis at first.

THE KITCHEN GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

LATE FIELD POTATOS.—All field crops should now be lifted, as the tubers will not be improved after this date by being left in the ground. Moreover, the most should be made of the splendid weather now prevailing almost everywhere in these islands, to gather them in. The haulm may first be cleared off by giving it a sharp pull upwards whilst treading on the soil over the roots with the feet close together. The haulm should be put in small heaps and burned. A few hedge brushings will readily effect this in dry weather. All hands should be employed in the early part of the day in digging a sufficient quantity which will provide work for the rest of the day in picking up, and thus afford some time for the tubers to get dry before storing them. If the Potatos which are first dug are the first gathered, the whole may be put away free of soil than if picked up directly they are dug up. In the case of those obtained from a fresh source for supplying a change of sets, I would recommend that these be the first lifted, and the required quantity of sets selected from the nicest shaped and middle-sized tubers. Of those that are left select what are fit for the table, and lastly the small and diseased tubers, the latter to be kept by themselves as food for pigs. Diseased Potatos keep sweet for some time stored in tubs after cooking them, if a little salt be mixed with them when crushing them. If the crop has to be carted some distance, it is advisable to put the tubers into sacks having a plain mark on the outside to denote the grade. Those intended for table use should be put into the Potato-cellar or clamp. Seed-Potatos are best clamped after exposing them to the sun for a few days. Care should be taken to put no diseased tubers into store. When space can be found for them in the spring, get them out in good time, to prevent their growing much before planting them.

EARLY BROCCOLIS AND LATE CAULIFLOWERS.—From now onwards the plants in the quarters should be examined each alternate evening, removing any heads which are found fit for use, and covering up those with leaves that have heads forming. Those intended for lifting and replanting in pits or sheds should have the root masses cut round with a bright spade, preparatory to lifting them later in the year. By doing this, growth is checked, and a number of small roots form that readily seize on the soil into which they are transplanted.

GENERAL WORK.—The covering materials for Runner and Dwarf French Beans, which it is intended to cover in the event of frost, should be in readiness for use at the shortest notice. Gatherings should be made from each kind where no covering up is done; and if these are kept spread out thinly in a cool, moist place, they will keep in a fit state for use for a considerable period.

PLANTS UNDER GLASS.

By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

HINTS ON WORK IN GENERAL.—No time should be lost in getting all kinds of plants which suffer from cold and wet into their winter quarters, making a beginning with the more tender species. The various houses in which the plants will be placed should have the glass and woodwork washed and the walls lime-washed, and soured or mossy soil under the stages cleared out, supplying its place with clean gravel, shingle, &c. Early Chrysanthemums whose flower-buds are beginning to open, should be among the first brought in, as the flowers spoil if exposed to the dew or rain, although the chief part of the stock of Chrysanthemums will be better if left out whilst the weather remains as it is at present. Meantime, let everything be got in readiness for housing the plants. Examine the plants for earwigs before bringing them into the houses—a smart shake will generally dislodge these. Tree Carnations should be placed in a light airy house, admitting

plenty of air night and day in mild weather. The heavy dews and moist atmosphere of autumn are conducive to the swelling of the flower-buds and the healthy green appearance of the "grass," and when the plants have been placed in the house, they should receive a light dewing overhead twice a day, and the pots be well syringed all round for a week or two afterwards, or the leaves may take on a yellow unhealthy tinge. Indian Azaleas are not safe as regards most of the varieties if left out longer than the beginning of October. These plants should receive a thorough syringing with weak tobacco-water, laying them on their sides on the turf in doing so. Epacrises should be removed to the cool greenhouse, or other light structure, from which frost can be excluded; also *Salvias*, *Eupatoriums*, *Genistas*, *Solanums*, and *Richardias*. *Mignonette* will withstand a few degrees of frost without harm, but it will be safer to place it in cold frames, drawing off the lights in fine weather. Ivy-leaved *Pelargoniums* should be taken indoors, and allowed to flower. These are very pretty plants for conservatory decoration work in the early winter, and the plants may be placed in that structure at once. They soon commence to show for flower. A good batch of *Spiræas* should now be potted up; and if the plants are required to flower early, they should be selected from those which have been cultivated on a south border, as being more likely to be thoroughly ripened. If this be done at once, the plants will soon lose their foliage, and may then be started gently, and thus had in flower by the end of the year. A batch of named varieties of zonal *Pelargoniums*, for flowering next summer, may now be put in. If the old plants were planted out, well-ripened cuttings should be taken from them, inserted in small pots, and placed in cold frames, or on a greenhouse shelf.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorset.*

GENERAL REMARKS.—The hot weather lately experienced has been very favourable to a large number of species, especially those that are deciduous or semi-deciduous, and therefore requiring a thorough rest in winter. Other species have likewise benefited from the sun-beat, which is shown by their more than usually vigorous root action. Moreover, I have not observed any injury inflicted on *Oreotoglossums*, *Maedevallias*, *Occidiums*, and other species of Orchids which are subjected to a cool treatment, although on several occasions it was impossible to keep the temperature in the houses below 75° during the hottest hours of the day—in fact, on two or three days the thermometer registered 85°. This was the case in span-roofed houses; but lean-to's facing north or north-east had, at such times, a much lower temperature, and a cool, humid atmosphere was easily maintained. With such a night temperature as has prevailed lately, air should be admitted to the cool-house, and unless the cold weather comes, no artificial heat may be necessary for some time. When frosty nights occur, efficient warmth must be maintained by the boilers to prevent the temperature falling below 50°. While the present fine weather lasts, the day temperatures of the warmer divisions can be readily maintained at the proper degree; and during the night, the ventilators may be freely used if the hot-water pipes are kept a trifle warmer than in summer. The warmth of the East Indian-house at night should range between 70° and 75°; that of the Cattleya-house about 70°, Mexican and Intermediate-houses about 65°, and on cold nights 5° less in each division. It is a matter of importance that the temperature at night should be carefully regulated, but at times it is difficult to forecast the weather, and fluctuations occur late in the night or the early morning hours, consequently it is preferable to afford a little more warmth when finishing up for the night than run the risk of having a low temperature in the morning. If the temperature of the various divisions falls a few degrees below what is considered the proper standard, no water should be afforded any of the plants, or damping-down done before the proper degree of warmth is reached. In the East Indian-house are delicate species, such as *Angraecums*, *Phalæopsis*, *Calanthes*, *Bulbophyllums*, *Cirrhopetalums*, *Epidendrum bicornutum*, *Oacidia n. Lanceolum*, *O. hæmatochilum*, *Chysis*, *Phaiis-Calanthes*, *Phaiis tuberosus*, &c., which are very susceptible to injury by a cold moist atmosphere, even for a short time at this season, many of them being in growth. Cattleyas and *Lælias* are also plants whose half-matured bulbs decay very easily if too much water be afforded, or a check is

brought about by a low temperature at night. The bright sunshine has increased the plague of black and yellow thrips, and unless these pests are diligently sought for and destroyed, many valuable plants will be disfigured. There is nothing better for killing these insects than the Richards' XL Vaporising Fumigator.

THE HARDY FRUIT GARDEN.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

THE REPLACING OF UNSATISFACTORY TREES WITH NEW ONES.—Observant cultivators of hardy fruits will have taken note of the trees and bushes which are grown in various modes in their gardens, and determined which of them might be superseded by other or better kinds or varieties. In some instances the trees will have become unprofitable through age or other causes, and the replacing of such by younger plants is a necessity that should not be overlooked or delayed. Vacant spaces on the walls or espalier fences should be turned to use, if only a cordon be planted here and there. It is always advisable to have a reserve stock of young fruit-trees of the kinds grown on walls, viz., Peaches, Plums, Pears, Apricots, Figs, and Cherries. Such a reserve stock is cheaply worked up by buying a few maiden trees yearly, and training them in the various methods of dwarf, fan, horizontal and riders. The same remark holds good of bushes and standards of hardy kinds of fruit. These trees, taken from the home nursery, and planted in the early autumn, feel scarcely any check if the work be properly performed. As a rule, Apple and Pear trees remain in good health much longer than stone-fruits; and, instead of uprooting inferior varieties, if the trees are fairly healthy and vigorous, they should be headed-back in February, and re-grafted in the spring with better varieties. Trees of good varieties of Apples and Pears, which are unhealthy or unfruitful, should not be hastily condemned, as it may be possible to restore these to health and fruitfulness by paying due attention to root-pruning and lifting, and affording better drainage or a more suitable soil. A few cuttings of Gooseberries and Currants should also be struck yearly, and then, if these young bushes are shifted and afforded a little more space every year or every second year, gaps are readily made good, and new plantations made.

WORN-OUT ORCHARDS.—The replanting of an ancient orchard is commonly a mere waste of time and money, the better way being to break up and plant a new piece of ground. If a new orchard be decided upon, the actual planting of the trees should be delayed for a year or so, to enable the land to be trenched two or three spits deep, but without bringing much, if any, of the subsoil to the surface, drained, and exposed as much as possible to the action of the weather, burning all roots and rubbish on the ground, and scattering the ashes over the surface. If the soil be heavy, a liberal dressing of road-scrappings or plaster and old mortar, should be well worked into and mixed with the staple; and if of a light kind, a dressing of marl or clay should be applied, and allowed to lay on the surface till pulverised by frost, when it may be incorporated with the soil by means of the plough and harrow, or digging-forks. In the spring, after manuring the land, a crop of Potatoes or roots may be planted or sown on the land as a means towards getting it into a clean condition for receiving the trees. In October, or as soon as trees can be lifted safely, the planting may be carried out. Standard trees may stand according to habit and style of growth, at distances varying from 12 to 20 feet; half-standards and bushes on crab-stocks at a distance of 18 feet. Each tree must be staked and loosely tied at first, and mulched with half-rotted manure as soon as the planting is finished. In heavy soils, which rest on clay, it may be sometimes advisable to increase the depth of available soil and thus keep the roots at or about the surface, to form an impervious stratum a few yards square under each tree, at a depth of 2½ feet, and make a mound of soil 12 feet in diameter, and 1 foot high, on which to plant. This mound may consist of the surface soil scraped towards each station from the intervening land, or of fresh materials brought in for the express purpose.

THE FLOWER GARDEN.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

SPRING-FLOWERING PLANTS.—Where spring gardening is extensively carried out, the flower-beds should now be cleared of their summer occupants.

There being more time at this season than in the spring for performing the necessary trenching and digging of the soil in the beds, this should be done. Beds which have been thickly planted should receive a heavy dressing of rotten manure, with some charred soil and ashes from the charred rubbish-heaps, all duly screened of large stones and rough materials, before digging them. Beds of small size should have the soil removed to a depth of two spits, refilling them with fresh soil and manure. The beds in which Hyacinths and other kinds of bulbs are to be grown, should be well drained by placing rough materials to the depth of 6 to 8 inches at the bottom, the layer of soil above being not less than 1½ foot in depth. As soon as the digging is finished, planting operations may begin.

ANEMONE CORONARIA.—The corms of this plant should be planted at about 5 inches apart, and covered with soil to a depth of 2 inches, previously sprinkling leaf-soil and charred refuse about them. When the beds of this plant are large, they should be neatly lined out, and care taken to plant the angles of the beds (if any) neatly. Seedling Anemones should be planted out as soon as possible into rich friable soil.

HYACINTHS may be planted 4 inches deep, and from 4 to 6 inches apart, according to variety and other considerations. If other plants are to be planted as well, between the bulbs, more space must be afforded—say from 8 to 10 inches. Care should be taken to plant them at regular distances apart. If the soil in the beds is very dry, it should be made firm and level by treading it evenly all over before planting, and afterwards raking it. Plant bulbs with a trowel or a strong iron-shod dibber about 4 feet long with a movable tread fixed on one side to regulate the depth of the holes. Before the bulbs are placed in the holes a handful of sand or charred refuse may be dropped into the bottom, the bulb being then covered with the soil of the bed, and made firm. *Narcissus* and *Jonquils* may be planted in the same manner; *Tulips*, *Crocus*, and other small bulbs may be planted with the ordinary dibber, the distance between them being regulated according to the growth of the variety. All bulbs require to be planted much closer together when planted in beds by themselves.

CROCUS FOR EDGINGS of beds should be planted 2 inches apart and 3 inches deep. Look out for mice after planting these corms.

RANUNCULUS, PERSIAN IRIS, Snowdrops, winter Aconites, Scillas, &c., should now be planted; the three last named should be planted thickly if used for edgings or designs on the lawn.

LILIUM CANDIDUM.—If these bulbs have grown in the same place for several years half of the bed should be taken up and replanted elsewhere, affording the soil a dressing of rotten manure or leaf-mould. Plant the bulbs 6 to 8 inches deep, and mix wood ashes with the soil when planting, this material being a good stimulating plant-food, either applied to the soil or afforded in the water used.

FRUIT GROWING IN AMERICA.—Some idea may be gained of the scale on which fruit-farming is carried on in America from the operations of one establishment alone, the Hale Orchard Company, which, in 1891, planted 100,000 Peach trees in Georgia. During April and May this year 50 men were occupied all day in removing excess fruits in order to allow the rest to have room to develop. They began to come to maturity in June, and from the 20th of that month 350 men, aided by 50 mules, were engaged every day gathering and carting away, filling 4000 baskets in the 24 hours. Imperfect, bruised, and scratched fruits, separated from that in prime condition, amounted to 300 bushels a day. It took from 525 to 600 baskets to fill a railway refrigerator van, and each van load represented a value, including cost of gathering, packing, and transport, of £100. From this single orchard 80 van-loads were sent away this year. In Houston County the cultivation of the Peach alone gives employment to 3000 people. *Echo, Sept. 24, 1895.*

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR OCTOBER.

MEETINGS.

TUESDAY, Oct. 15. { Royal Horticultural Society's Committees at Westminster; Horticultural Club.

TUESDAY, Oct. 29. { Royal Horticultural Society's Committee.

SHOWS.

TUESDAY, Oct. 8. { National Chrysanthemum Society, at the Aquarium (three days).

TUESDAY, Oct. 29.—Havant Chrysanthemum (two days).

WEDNESDAY, Oct. 30.—Jersey Chrysanthemum (two days).

THURSDAY, Oct. 31. { Highgate Chrysanthemum (two days).

SALES FOR THE ENSUING WEEK.

MONDAY, Oct. 7. { Dutch Bulbs at Protheroe & Morris' Rooms.

TUESDAY, Oct. 8. { Dutch Bulbs at Protheroe & Morris' Rooms.

WEDNESDAY, Oct. 9. { Dutch Bulbs at Protheroe & Morris' Rooms.

THURSDAY, Oct. 10. { Dutch Bulbs at Protheroe & Morris' Rooms.

THURSDAY, Oct. 10. { Sale of 30,000 Fruit Trees at the Chilwell Nurseries, Nottingham, by order of J. R. Pearson & Sons, by Protheroe & Morris.

FRIDAY, Oct. 11. { Orchids and Dutch Bulbs at Protheroe & Morris' Rooms.

SATURDAY, Oct. 12. { Dutch Bulbs at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT OHISWICK.—82°.5.

THE greatest benefactor to the human race in our age, or perhaps in any other, has been removed by death. On September 28 died LOUIS PASTEUR. He was in his seventy-third year, and had been in failing health for some time. His own life's work then was done, but its results and its ever-widening consequences are the inheritance of the ages.

PASTEUR was by education a chemist, by nature an experimentalist and a reasoner. His advent was timely. Men could not fail to recognise the progress that science was making, but the majority asked, as they always have done, and always will do, *cui bono?* They looked as many do still, on the work of the naturalist as laborious trifling. Incapable of appreciating its purpose, they indulge in mild ridicule on the patient labour of the observer. To them the accumulation of wealth is the main business of life, and anything that does not directly lend itself to that object receives but scanty respect. PASTEUR, in the investigation of the problems put before him, sought after truth and truth only. He never sought to enrich himself. It was not the money-value of the results that actuated him. His observations were made at once the common property of humanity. But the practical men were, in this case, not slow to appreciate the value of the knowledge thus placed in their hands. We cannot in this place allude to PASTEUR's many discoveries, nor attempt to gauge their value. By his investigation into the causes of anthrax, and his demonstration of the means of combating it,

France, it is said, was enriched by an amount exceeding the war indemnity paid to Germany. The silk industry, on the verge of ruin, was restored in consequence of his researches on the disease affecting the silk-worm. The cultivation of a pure unmixed yeast, and the setting forth of the conditions under which brewing and distilling can be successfully carried on, have proved of enormous benefit to those industries.

The means he has placed in our hands for the prevention and neutralisation of diseases like hydrophobia, splenic fever, cholera, diphtheria, even if they be not absolute in their results, are sufficiently so to justify the application to PASTEUR of the epithet with which we commenced this note. Following up the indications made known by PASTEUR, our surgeons, headed by Sir JOSEPH LISTER, now perform with confidence and success operations from which even such consummate operators as FERGUSON or LISTON would have quailed, and which, indeed, they would have denounced as unjustifiable.

PASTEUR's successes have been very largely the result of his patient study of the minutest of living bodies. Whether we call them germs, microbes, bacteria, bacilli, spirilla, it matters not; the point is to observe the conditions favourable to their development, and, as MARSHALL WARD has done, the circumstances prejudicial to them. Their life-history has to be unravelled with all, and more than all, the minute accuracy that a detective would employ in tracing the career of a criminal. With the knowledge thus obtained a basis for experimental proof is afforded, and these experiments have, as we have seen, eventuated in the most signal benefits to the animal kingdom, and to the human race.

To the practical gardener it may be of interest to point out that the "cultivation" of the germs, the selection of some, and the rejection of others, and other methods adopted in the study of bacteria, are, so far as principles go, identical with those that regulate the procedures of the gardener.

To the gardener and the agriculturist, again, the results of the study of the bacteria of the soil are of primary importance. We do not recall that PASTEUR himself took up this part of the subject, but it is so intimately connected with his researches, that it is natural to associate his name in connection with them.

The distinctions of race, creed, nationality, from one point of view, are effaced in the case of such a man as PASTEUR. We may congratulate France on her distinguished son, but we feel that he belongs to humanity, not to any special country.

On the quay at Boulogne stands a statue of our own JENNER, raised by grateful and sympathetic France. How graceful and appropriate a thing it would be to erect on our own shores a monument to PASTEUR, in many ways the lineal descendant of Jenner.

DENDROBIUM PHALÆNOPSIS VAR. HOLOLEUCA.—The quantities of the handsome *Dendrobium Phalæopsis* var. *Schroderiana* which have been received during the last few years have brought many fine varieties, and among them a pretty class of light-coloured varieties, more or less tinged with pale lilac, and which go under the common denomination, "delicatam;" but the number in which the sepals and petals are pure white are very limited. In the *Gardeners' Chronicle*, December 3, 1892, p. 668, Dr. KRÄNZLIN describes *D. Phalæopsis* var. *Rothschildiana*—a beautiful white variety, with a faint flush of pink, which flowered in Lord ROTHSCHILD's gardens at Tring Park. Later, another white appeared, which was called *D. Phalæopsis* var. *alba*, but in that were some pink lines in the

lip. The variety *hololenca*, which we illustrate, fig. 72, appears to be the first wholly white variety, and it was exhibited by J. T. HOLMES, Esq., Beechen Cliff, Bath, at the meeting of the Orchid Committee of the Royal Horticultural Society, August 13, when it was awarded a First-class Certificate; and the plant has since passed into the rich collection of ELINAH ASHWORTH, Esq., Harefield Hall, Wilmslow, Cheshire. Of other varieties in which white predominates, one of the most remarkable is *D. Phalæopsis* var. *albo-purpurea*, flowers of which we received from Dr. JESSOP, Roundhay, Leeds (gr., Mr. TYSON), in which the flowers are white, with some dark plum-coloured markings on the lip, the contrast between the lip and the white sepals and petals being very remarkable.

HORTICULTURAL CLUB.—The following are the arrangements for the *conversazioni* for the next three months. October 15, "Botanical Rambles in Lapland and Novaya Zemlya," by Mr. C. E. PEARSON, illustrated by specimens of the flora. November 12, "Flowers, Fruits, and Plants in the Life and in the Home," by Mr. T. D. FISH; and "The Fruit Supply of Covent Garden," by Mr. GEO. MONRO.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Rev. W. WILKS has forwarded to the secretary the sum of fifteen guineas, being the amount of the harvest thanksgiving offerings in Shirley Church on the 29th ult., in aid of the Gardeners' Royal Benevolent Institution.

NATIONAL CHRYSANTHEMUM SOCIETY.—A largely-attended meeting of the General Committee, presided over by Mr. BRIAN WYNNE, took place at Auderton's Hotel, on the 30th ult. The secretary, Mr. R. DEAN, brought up a circular relating to the Jubilee celebration in 1896, which had been approved by the President, Sir EDWIN SAUNDERS, and by Mr. J. RITCHIE, the Chairman of the Board of Directors of the Royal Aquarium, and which is shortly to be issued; and reported that a Jubilee schedule of prizes is in preparation, and that some handsome special prizes had been promised. Some interesting correspondence from the Colonies was read; one correspondent writing from Timaru, New Zealand, said some very fine new varieties of *Chrysanthemum* had been raised in that locality, and it was hoped that blooms of some of the best, frozen in ice, would be sent to England in May next. The Secretary reported the amount of prize-money awarded for *Chrysanthemum* and *Dahlia*s at the September show; and the award of certain medals was confirmed. The Secretary reported that he had arranged with Messrs. T. S. WARE, and J. CHEAL & Sons, to clothe the two fountains with flowers at the coming October show, provided the frost held off, and it was agreed, that in the event of their being able to do so, a sum of money should be allowed to each for expenses of cartage. Seventeen new members were elected, including two fellows; and the Hertford Horticultural Society was admitted to affiliation.

CHANGE OF DATE OF THE CHESTERFIELD CHRYSANTHEMUM SHOW.—We are informed by Mr. NELSON, the honorary secretary of this Society, of the fact that the committee have altered the date at which the show was originally fixed, viz., Wednesday, November 20, to Wednesday, November 6, an alteration called for by the forward state of the flowers of the *Chrysanthemum*.

AT THE CRYSTAL PALACE FRUIT SHOW.—*Country Visitor to Gardening Pressman*, "You seem to know all about these things; will you tell me (pointing to dish of *Beurré Diel* Pears) who *Beurré* is? I find his name on lots of dishes of fruit. What is he? Where does he live?"—G. P. explains that the word is French, and signifies butterlike, the variety of Pear with that word affixed having flesh of a buttery texture.—C. V. (*scratching his ear in vexation*). "Ah, dang it! I might a' known that; but what has the *Diel* to do with Pears?"—G. P. "Nothing; it is merely a dedicatory name."—C. V. "Is that so? Well, I think I'd go now."

CRYSTALISED PALACE'D FRUITS.—“Mr. Punch heartily congratulates the Royal Horticultural Society on their grand show of British-grown fruit (none “made in Germany”), and the Crystal Palace Company on the excellent arrangements made for the most advantageous display of these magnificent *fruits defendus*, for “forbidden fruit” they certainly

THE DEVON AND EXETER GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—The annual business meeting of this Association, of which Sir STAFFORD NORTHCOE, Bart, M.P., is president, was held in the Council Chamber of the Guildhall, on Wednesday, October 2, at eight o'clock, the Mayor of Exeter in the chair. The business to be transacted

secretary was re-elected. We learn from the committee's report for the session 1894-95, that they are able to report very favourably of the work of the association for the past year. The number of members at present on the roll is 89, and the balance in hand £20 16s. 2d., showing that, numerically and financially, the association is in a highly satisfactory

FIG. 72.—DENDROBIUM PHALAENOPSIS HOLOLEUCA: FLOWERS PURE WHITE. (SEE P. 396.)

were, as, much to the disgust, probably, of the apothecaries and family doctors, the visitor could not taste any of the luscious specimens attractively set before him. They were all *les pommes du voisin*, but though “forbidden,” their appearance was anything but “forbidding.” It came to an end last Saturday, when it is reported that all the fruits were safely got out of the building except one sleepy Pear, whom nothing could arouse.

consisted of the reading of the Secretary's and the Treasurer's report for the past year, both of which were adopted; the election of a president, vice-presidents, secretary, treasurer, and committee for 1895-96; and the transaction of other business, and to consider the modification of Rules 3 and 5, as regards date of the annual meeting and the appointment of two secretaries. The new president elected is C. R. COLLINS, Esq., Hartwell House, Exeter. The

condition. An evening was set apart for short papers by younger members of the association, and this proved to be a wise departure, for, not only were the short essays themselves of considerable merit, but the interest thus given to the juniors in the profession had a most salutary effect on the association as a whole. The review of the papers for the year proved as interesting as formerly, and the discussion arising therefrom brought out many valuable expe-

riences in actual practice. The association having decided to affiliate with the Royal Horticultural Society, are now associated with that illustrious horticultural body, and receive all the privileges which membership conveys, namely, copies of the proceedings of the society as published to its fellows, a transferable ticket admitting to all its meetings and exhibitions, and the privilege of nominating one of its members to be ranked as a Fellow of the Society. By resolution, Mr. ANDREW HOPE was nominated and elected to represent the Association. The autumn programme of the session 1895-96, comprises the annual business meeting on Wednesday, Oct. 2; the reading of a paper entitled "Fruit as Food," by Mr. J. I. PENGELEY, Exeter, on Wednesday, Oct. 16; on Wednesday, Oct. 30, a discussion, having as its subject, "Window Gardening, and the Selection and Treatment of House Plants," will take place; the Rev. Dr. DANOAR, president of the Training College, will give a lecture on "Carnations," on Wednesday, Nov. 13; on Wednesday, Nov. 27, there will be a discussion on "Judging at Flower Shows," which will be opened by Mr. W. ROWLAND, of Parkerwell Gardens; Mr. J. D. NANSRAWEN, Whiteway Gardens, will give a lecture on "Wild Gardens and Pleasure Grounds," on Wednesday, Dec. 11.

— At the Carnival held at Exeter last week in aid of the hospitals of that city, this Association was represented by a floral car artistically decorated with fruits and flowers, the sides being trimmed with Bamboos, golden-leaved Elders, Ampelopsis, and other gay-coloured foliage. In the centre was a living representation of Flora which, as a *tableau vivant*, was amazingly effective, the make up being highly humorous. Flora would perhaps have been more easily recognised by *habitues* of Covent Garden; but he sustained the part with commendable gravity and graciousness of presence. What was hailed as the "gardeners' car" was quite a feature in the procession, and in the report of the Carnival Committee is "highly commended."

MR. C. P. SLOCOMBE.—The death was announced a few days ago of Mr. C. P. SLOCOMBE, who was at one time a prominent etcher and a master in the National Art Training School at South Kensington. He had for some years been in a bad state of health, and had long been unable to take any active part in the work of his profession. All students who were at the South Kensington School during the years he held his appointment there, will remember him as an especially able teacher, and as an adviser who could always be relied upon for frank and intelligent criticism. *Globe*, October 2. [Mr. SLOCOMBE was a pretty constant frequenter of the Royal Horticultural Society's meetings at Kensington and Westminster, and contributed occasional illustrations of plants, flowers, &c., to the *Gardeners' Magazine*, when it was edited by the late SHIRLEY HIBBERD.]

THE TORQUAY DISTRICT GARDENERS' ASSOCIATION is a very vigorous body. The programme for the coming season, as we learn from the *Weekly Mercury*, Plymouth, September 21, issued by Mr. F. C. SMALE, the Hon. Sec., is a good one. The Chrysanthemum show will be held at the Bath Saloons towards the end of October. This will take the place of the exhibition hitherto promoted by the now defunct horticultural society.

"THE HISTORY OF GARDENING IN ENGLAND."—This work, by the Hon. ALICIA AMHERST, will comprise a sketch of the progress in the art of gardening in this country from the earliest times. The plan and design of the gardens, what flowers were grown in them, the chief horticulturists and the principal books in each period are treated of, as well as the various changes in the culture of fruit and vegetable gardens. Numerous gardens still in existence are cited as examples of each successive fashion. In the chapters dealing with the earliest times, many old records are quoted, and some transcribed for the first time from original MSS. Letters and household accounts, and notes from private MSS. of the seventeenth and eighteenth

centuries, are also here printed for the first time. The book will contain sixty-five illustrations of gardens, from MSS., engravings, sketches, and photographs. The work also comprises a copious bibliography of printed books relating to gardening down to the year 1837, chronologically arranged, and a list of the authors, placed alphabetically; also a good index to the whole book. The Appendix consists of a reprint of the portion of the Parliamentary Surveys of Wimbledon and Theobalds, giving full descriptions of the gardens there in the year 1649. The book will be published by Mr. BERNARD QUARITCH, 15, Piccadilly, London, at a cost of 15s. if subscribed for, the price to be raised to a guinea on the day of publication.

LATE STRAWBERRIES.—Last week we noted a fact or two concerning the unseasonable fruiting of the Strawberry in the South; and now we insert a note taken from the *Newcastle Daily Journal* of September 26. Mr. W. G. MACFARLANE, fruit-grower, Alnwick, sends us some specimen plants bearing fine ripe Strawberries from his gardens. They were gathered from runners made this year, and are the product of a seedling Strawberry named the Duke of York; they are really what ought to be the crop of 1896. This is the nearest approach to a perpetual-bearing Strawberry ever raised up to this time. "We began," says Mr. MACFARLANE, "pulling on June 10, and we will have fruit until the plants are killed by frost."

— As an instance of the extraordinary weather which has prevailed in Cornwall this summer, it is stated in the *Daily Telegraph* that Strawberries were on sale in Penzance market on September 20. One gardener informed a correspondent that he had gathered a fourth crop this season. Apple trees bearing fruit are also in several instances still blooming.

FLORAL DECORATION OF RAILWAY STATIONS.—To encourage the cultivation of flowers at the railway stations on the Midland Railway Company's system, that Company, says the *Morning Post*, offered £200 in prizes among their station-masters. There were upwards of 200 entries for the competition, and yesterday the first prize was awarded by the judges to the station-master at Matlock Bath.

POMOLOGICAL SOCIETY, BOSKOOP.—At the meetings in May, June, July, and August, the under-mentioned plants obtained First-class Certificates:—*Sambucus racemosa plumosa fol. aurea*, from Mr. K. Wezelenburg, of the firm of C. de Vos, Hazerswoude; *Picea pungens glauca pendula* (Koster & Co.), from Messrs. Koster & Co., Boskoop; *Crataegus oxyacantha foliis aureis*, from Mr. P. van der Kraate, Litz., Boskoop; *Magnolia Alexandrina folia variegata*, from Mr. J. Walraad, Jr., Boskoop; *Clematis M. Koster*, from Mr. D. A. Koster, Boskoop; *Spiræa Bumalda* Anthony Waterer, introduced by Mr. K. Wezelenburg; *Chamæcyparis Lawsoniana glauca Triomphe van Boskoop*, from Mr. D. Grooten-vorst, Boskoop. *Azalea mollis Machtelina Alberta*, from the firm of G. J. Alberts, Boskoop, obtained a Second-class Certificate. *Hydrangea aurea maculata*, from Mr. K. Wezelenburg, Second-class Certificate. *Picea pungens glauca* (Koster & Co.), raised from seed by Messrs. Koster & Co.; and *Taxus baccata temperanea*, from Messrs. Otolander & Hooftman, being plants fully worthy a First-class Certificate, could not have this award owing to their having been too long in commerce. P. A. Ottolander.

SWEET PEA CUPID.—Our readers will remember the illustration of this beautiful dwarf white sweet pea, exhibited on June 25, at the Royal Horticultural Society, by Mr. DOUGLAS, for Messrs. BURPEE. A photograph of a portion of a field of seven acres is now before us, and we are assured that it blooms from the middle of April or beginning of May, till checked by the frost. Messrs. HURST & SON, of Hondditch, are the sole wholesale agents to the trade in Great Britain and the Australian Colonies. The plant does not grow over 5 inches in height.

BOUQUET-HOLDERS.—Mr. W. TRESEDER, of Cardiff, tells us that he has had in use for the last fifteen years a similar appliance to that figured in our issue for September 21.

APPLES IN THE UNITED STATES.—The latest reports to hand from the best-informed quarters in the United States are variable in their character. Some five States commercially interested in the fruit state that not more than half a crop is expected; returns from fifteen others are favourable; some few are about average, and others are expected to yield in excess of previous years. Taken as a whole, the yield is expected to be in excess of that recorded for some years past. Peaches appear to have suffered much in certain localities, and as to the ultimate outcome of the crop, no one appears to speak with any degree of certainty.

WATERLOW PARK, HIGHGATE.—We are informed by Mr. J. PALLET, the Superintendent of this park, that the exhibition of *Chrysanthemums* will be open to the public on and after Saturday, October 5, from 10 A.M. until dark.

NURSERY NOTES.

A MIDLAND SEED FARM.

During a journey from Birmingham through the notorious "Black Country" to Wolverhampton, the traveller's attention is inevitably engaged by the great chimney stacks as they belch forth volumes of vile smoke, or are surmounted by a weird blaze now disappearing from sight, apparently from exhaustion, and again starting out as if making a determined effort to rise higher than previously. On either side of the railway, the face of the land is covered with huge stacks of coal, or with vast cinder heaps and refuse from the mines and ironworks. As far as the eye can see, the scene is of this nature, the surface of the earth is totally unused except for the purpose of depositing the miserable heaps of refuse already mentioned, and instead the genius and energy of man has been devoted to obtaining the wealth hidden in the earth's bosom. Agriculture in such a district seems out of place, as indeed it is, yet it has not been driven so far away as the traveller would suppose.

Only a few miles from Stourbridge Junction, a station not very far from the two mentioned towns, are the Kinvor seed farms belonging to Messrs. Webb & Sons, of Wordsley, and these are in the centre of a fertile country of the most picturesque character.

THE ESTABLISHMENT AT WORDSLEY.

Before inspection is made of the seed farms, however, the visitor is likely to be shown the establishment of Messrs. Webb & Sons at Wordsley. The extent of the business done by the firm, and the annual growth of the same, may be here in a measure estimated. The commodious buildings used for the storage of grain and various root-seeds, horticultural and agricultural, together with flowering bulbs for the garden, tell to some extent what an amount of produce has to be dealt with. Nor is the present accommodation equal to the requirements of the business. The large block of buildings that were until very recently known as the new store-houses, will be soon supplemented by a new and equally large warehouse now nearing completion, the only fault of which, in the words of one of the managers, who finds lack of store-room to be a great inconvenience, is that it is not large enough. Messrs. Webb do a large reciprocal trade with their agricultural patrons, and considerable space is requisite for the storage of Hops and wool, an immense lot of which was in storage a week or two ago. The wool trade is an extremely variable one, and no doubt the firm lose money on this article in some seasons, but possibly the succeeding ones compensate. Before this part of the premises is hurriedly left, it should be added that the visitor will assuredly be interested in inspecting these warehouses, for the most recent

and best machines for every purpose may be seen' and the manner in which they perform their work, whether it be cleaning the seeds, or other operations, is surprising.

THE SEED FARMS AT KINVER.

Those who see only the establishment at Wordley, have not nor can they have the faintest idea of the beautiful, well-cultivated farms in the neighbourhood of Kinver, where Webbs' seeds generally are tested and raised for stock purposes. It is a lovely drive from the head offices along these healthful country roads before Kinver is reached, and it being our first visit, our surprise at seeing such fertile land found frequent expression; questions also as to the locality were freely asked and as willingly answered. "We are now driving in the direction of Kidderminster," said our companion; "yonder on the left is Sedgley Church, which is said to stand on higher ground than any other Church in England." In this district, then, we drove round the greater part of the 2000 acres of land that Messrs. Webb & Sons devote in a more or less degree to seed-raising, and a good portion of which is their own freehold. This is only a small part of the land that is cropped annually to supply the needs of the business. The system adopted is something like the following: All seeds are raised, tested, and systematically rogued by competent assistants on the Kinver farms, but the produce from this harvest is "stock" seed, and to a large extent the "stock" seed is given out to selected growers in suitable localities to cultivate for Messrs. Webb, who take all the produce, and it is this seed that is sold to customers. In this way the firm estimates that they employ annually in the United Kingdom and on the Continent over 18,000 acres of land for the production of their farm and garden seeds, bulbs, &c. We do not intend to speak of the newer or favourite varieties of the different grains or roots, or other agricultural crop. Experimental work is annually done on the Kinver farms; better varieties of each crop are sought, but the results are to be seen in the numerous catalogues that Messrs. Webb issue, to which we will refer those who seek such information.

GARDEN SEEDS AND TRIAL-GROUNDS.

The little town of Kinver, lying low under the heights known as Kinver Edge, to most persons in the Black Country is only less familiar than their own town. Excursion parties may be seen any day passing along the one important street the place can boast, or climbing the "Edge." The farm Messrs. Webb possess nearest the village, and very close to the old but pretty country church, is called Kinver Hill Farm, and it is on this one where the trial-grounds are, and most of the garden crops, such as Potatoes, Peas, and other things, are grown. Many acres had been devoted to Peas, and upwards of 230 varieties have been grown for comparison with each other. Potatoes also claim a large share of time and attention in this manner, and each year the firm send out fresh varieties, which they believe are improvements upon previous ones. Such are Progress, Goldfinder, Record, and many others. Turnips, Cabbages, and indeed all Brassicas are grown and tested in large quantity, and efforts are constantly made to keep each variety as true to its type as possible. Webb's Emperor [Spring] Cabbage has long been a favourite, and some capital heads were seen when these notes were taken. Lettuces, Parsley, Onions, and every garden crop is dealt with; but we must hasten to notice, if only briefly, the trial grounds, where a great variety of flowers were being tested. It would be useless to describe these grounds, where most things are planted in nursery lines or beds much as they are in any other trial ground. What first occasioned remark were some beds of Poppies, a very good strain of the Opium Poppy, *Papaver somniferum*, strong in stem, bold in flower, and including various pretty colours. Larkspurs were quite a failure, the extraordinary character of the early part of the season had spoiled the prospects entirely. Some of the plants were coming into bloom, others

were only just through the soil. The graceful but showy Clarkias had fared differently, and plants of a good strain, both in mixed colours and in pure white, were in bloom. Delightful were the Eschscholtzias, blooming profusely in the different shades common to the flower; and by a quantity of *E. tenuifolia* we were reminded of a very pretty cream-coloured Eschscholtzia, with dwarf good habit, and a particularly free bloomer, that, although old, is seldom seen. It was rather early for Godetias in the Midlands, though they were blooming freely enough in the South. Mignonette in quantity and variety scented the air very perceptibly. Webb's Dwarf appeared of good habit, very strong, and a free flowerer. A nice collection of Zinnias, single and double, in bloom, were testimony sufficient that the strain is an excellent one. There were Sweet Alyssum, *Collinsia bicolor*, and the white variety; Candytufts, of which Webb's Snowflake seemed far and away the best. The plants were bushy, and the flowers pure white and good. The coloured varieties had come very true from seed. The strain of Gaillardias known as "Eclipse," may be commended as being in every way satisfactory. The French Marigolds had come tolerably true from seed, and the dwarf tuft-like habit encouraged is very pleasing. Asters were not in bloom when we saw them, but trials are made of a large number of these as well as other things, which we must leave unnoticed. Large and small plots of the natural and other grasses, and breadths sown from Webb's popular mixtures of Town grasses, various mixtures for alternate husbandry, &c., should be mentioned, as they are of interest to all.

The above are impressions felt during a hurried visit to Kinver, where extremes meet in such a manner that the Black Country well nigh encircles one of the greenest, most delightful landscapes—including lovely Eaville—the Midlands can boast. P.

HOME CORRESPONDENCE.

STICKLEBACKS.—The following British species are known, and described by Yarrell:—*Gasterosteus trachurus*, the common three-spined stickleback, in salt and fresh water; *G. semirarmatus*, found with the preceding; *G. leirurus*, smooth-tailed, also common; *G. brachycentrus*, short-spined, found in the streams, ponds, and sea of the north of Ireland; *G. spinulosus*, four-spined, found near Edinburgh; *G. pungitius*, ten-spined, found both in sea and rivers; *G. spinachia*, fifteen-spined, common around our sea-coast. In the *Annals of Natural History* for October, 1852, will be found some very interesting accounts of the habits of the sticklebacks during the breeding season, by the late Mr. Warrington, of Apothecaries Hall, where I well remember seeing them in his aquaria. W. T.

ROTATION OF CROPS FOR THE GARDEN.—On carefully reading and weighing, as I always do, the communications of Mr. Willis of Harpenden in the *Gardeners' Chronicle*, on p. 366 I was rather surprised to light on the following sentence in the middle column near the top:—"It is well known that the Cabbage tribe will thrive upon land much too poor to grow a good crop of Onions and Carrots." I should be glad of a little fuller explanation of the sentence, which is the only one I question, in the three columns of Mr. Willis's powerfully-reasoned article. But taking the phrase, "the Cabbage tribe will thrive" as equivalent to the ground growing "a good crop of Onions or Carrots," practical growers will not accept the sentence as in accordance with their experience. They would rather say that of the three crops named—Carrots would thrive best on the poorest land, Onions on soils of medium richness, and Cabbages best of all on the richest of all. Practically, many of the finest Carrots are grown without manure; Onions receive from 12 to 20 tons per acre, applied in the autumn; Cabbages, from 20 to 40 tons per acre, and still ask for more. After many years' experience and observation of these three crops in garden and field, I cannot recall a case in which a crop of Cabbages suffered loss of weight from over-feeding. Rich manures may at times develop abnormal tenderness in winter Cabbages or thousand-headed Kale, but this can hardly be the meaning of the sentence in question. At the other end of the scale we all know how easy it is to feed Carrots into

bolting, the scale, or coarseness. While as to Onions, high feeding leads them into bull-neckedness and other unprofitable ways, while poverty of soil dwarfs Onions into picklers. While thanking Mr. Willis heartily for all his other teaching on rotation of crops for the garden, I hope he will be so good as to throw some additional light on the alleged affinity of the Cabbages for poor land, which few of us have ever seen in garden or on farm. D. T. F.

LIME-TREE MITE.—The Lime trees in this neighbourhood are, and have for some weeks, been infested by huge quantities of mites (evidently a species of the so-called "red-spider"). The under-surface of the leaves was first infested. These curled up and fell prematurely. The trunks then became enveloped in a silvery web, looking at first sight like the tracks of dry slime left by an army of slugs. Up and down this web the mites continually move. They now form large clusters around the base of the trunks like lumps of yellow ochre. The enclosed sample will give a slight idea of their numbers. They were taken off in one lump, and although I daresay there are a few millions in the tube, they are as it were, but a drop in a bucket, compared with the myriads on the tree. *Geo. Parish*. [The Lime-tree mite, *Tetranychus tiliarum*. Ep.]

NARCISSUS FLOWERING IN SEPTEMBER.—On the 21st December, 1894, I planted one hundred bulbs of "Scilly white," which bloomed well during the last fortnight of April. The foliage was persistent for a long time, after that of all other Narcissus had disappeared, and even now its remains are still visible. About the middle of August, new foliage began to appear, which is now 10 to 14 inches high, and very strong. The first bloom-spikes were observed at the end of the third week in September, and now (on the 30th) more than half the bulbs are either in full flower, or showing for flower. Is not this very unusual? No doubt my garden is a very warm one, but no other Narcissus has behaved in this precocious manner (excepting three bulbs of *N. poeticus*, which have leaves 4 inches long, but no flowers). For the last week the sun has been very powerful, the thermometer in the shade at half-past 8 A.M. ranging from 63° to 69°. W. T., *Bishop's Teynton, South Devon*.

A RECENT SEED CASE.—An anonymous letter, treating of our recent litigation with Mr. Shephard, appeared in the last issue of the *Gardeners' Chronicle*, and we shall be grateful if you will kindly, in the interests of justice, allow us brief space for a discussion of the communication in question. "Agri-horti" (the *nom-de-plume* under which the identity of the writer is concealed) directs attention to "a fact that seems to have escaped notice," namely, that the "plaintiff registered as a trademark a certain device (a sheep as a matter of fact) embodying the words 'Shephard's Kale' as applied to that particular seed." So far from this having been lost sight of, we were summoned to appear under the provisions of the Merchandise Marks Act, and it was solely on this point that the case was tried and decided. Most practical men must endorse the common-sense verdict of the bench. From "Agri-horti's" letter we gather that he considers it desirable that the sale of a useful vegetable should be confined to the man who is fortunate enough to notice the natural sport, and who is sufficiently shrewd to promptly register the variety under his own name. Surely he cannot have reflected on the vast injustice of the greater portion of the human race being deprived of a natural valuable vegetable-food, because they may know nothing of the raiser who chose to call the variety after himself. We would also point out that we never on any occasion made use of Mr. Shephard's trade-mark, and that we merely sold a variety by its own name. As your anonymous correspondent fails to see the analogy between Shephard's Kale, Sutton's A 1 Kale, Hurst's Monarch Swede, Nutting's Beet, Wheeler's Imperial Cabbage, &c. (all of which were mentioned in the case), we fear it will be hopeless to demonstrate to him the very decided difference between selling "Shephard's Kale" and "Shephard's Kale Seed." "Agri-horti" draws attention also to a reporting error, which previously we had considered unworthy of contradiction, on the excellent, old-fashioned principle of "the least said the soonest mended." He says:—Ask Messrs. Carter or Sutton if they would allow any one of the Cabbage tribe to go out for seeding again that was 'one year only' grown from their private stocks? Now in this case our stock seed was purchased directly from the raiser by our grower, and "Agri-horti's" misappre-

hension probably arises from an incorrect report published in a local paper, from which presumably the *Gardeners' Chronicle* report was taken. This reads:—"Mr. J. F. Edney, a farmer, of West Titherley, gave evidence to having bought seed from Mr. Shephard. He sold (presumably sowed) the seed, and saved some, and produced from it. This he sold to Mr. Toogood as Kale seed." We are unable to say how the misunderstanding arose, but the true report should read as it did in one of our principal papers—the *Southampton Times*:—"Mr. J. P. Edney, a farmer of West Titherley, said in May, 1892, and July, 1893, he bought from Mr. Shephard a quantity of Kale seed which he sowed. He saved the seed at Mr. Shephard's request, but after it had been harvested he said he did not require it. He sold a portion of it to Messrs. Toogood & Son as Kale seed." As to the question of selection alluded to by "Agri-horti," the plants were several times carefully "rogued" by our grower, who has a practical knowledge of the technique of the work. The newspaper reports did not mention that we had a number of witnesses in court (though the magistrates did not consider it necessary to call them), including two noblemen's stewards, who were all prepared to attest that it was impossible to distinguish the crops raised from Mr. Shephard's and our seed growing side by side. These witnesses had further brought with them specimen-plants to illustrate the complete similarity. One other point only, and we will trespass on your valuable space no more, "Agri-horti" writes as though no similar case had been tried, when he might hear of two or three with very little trouble. *Toogood & Sons*.

THE PRESERVING OF FRUIT.—Permit me to thank Mr. J. J. Willis, Harpenden, for his courteous and useful answers to my questions to be found in *Gardeners' Chronicle*, p. 216. The answers carefully studied show how it comes about that so much jelly and jam are spoilt in the making through breaking down the structure, as well as lowering the quality of the fruit through overcooking, as well as over-sugaring. Truly, it seems that the chemistry of fruit-preserving needs teaching, as thoroughly as the theory and practice of plant-feeding and land-manuring. *D. T. Fish*.

THE GLUT OF FRUIT.—Many kinds of fruit are over-abundant in some parts of the country, and much of it is sold at prices hardly paying the cost of gathering, to say nothing of carriage. We are so accustomed to look on Great Britain as a fruit-importing country, that no one seems to have thought of our exporting fruit in seasons of plenty to less-favoured countries in northern Europe. Why should not some of our merchants try the experiment of sending fruit nicely packed in boxes and baskets to Norway, Sweden, Iceland, and the Baltic ports by steamers leaving Harwich, Hull, Grimby, Goole, Newcastle, and Sunderland? Apples and Pears would be especially suitable fruits to send, and these, with Damsons, and other Plums that will bear carriage well, should find a ready sale. Ireland, too, is badly supplied with fruit, unless it be American at a late part of the season; and it might be found worth the while to send it there in some quantity. Tomatoes, Melons, Figs, and Cucumbers, in the height of their season, might be added to this list of our exports to northern ports. *M.*

THE ROYAL HORTICULTURAL SOCIETY.—It is to be regretted that Mr. Miller should have concluded an otherwise admirable letter in last week's *Gardeners' Chronicle* by indulging in a sneer at the expense of the recipients of various medals and other awards made at the ordinary meetings of the Royal Horticultural Society. Were it not for the public spirit shown by the large body of persons who do so laudably support these meetings, and that render the Drill Hall gatherings at once the most interesting as well as attractive of their kind regularly held in any part of the kingdom, the great charm incidental to the Society's operations would be wanting, and horticulture would be shorn of one of its brightest central attributes. It is news to learn from one "who has never been to the Drill Hall," and who is in consequence not a specially fit authority on the matter, that these numerous exhibitors at, or supporters of, the Drill Hall meetings, reside—or to use Mr. Miller's phrase—are planted in and around London. There are some of us old frequenters of these meetings, who have seen exhibitors come from all parts of the kingdom, and if they have meritorious exhibits, have found just the same favour shown to them as has been exhibited towards the exhibits of those who reside nearer London. The sneer is as unworthy as it is unjust, and it is to be regretted that a gardener so highly esteemed as is

Mr. Miller should have so far forgotten himself as to utter it. If the awards made at the Drill Hall are so highly prized, whether they be medals or certificates, that persons from a wide area are constantly exhibiting meritorious, if not always new, objects to secure these awards, it is evident that they are held in esteem everywhere else if not at Coombe Abbey. Why does Mr. Miller aver that the whole thing is a farce? If these awards are farces, then are the labours of the Society's Committees farces, then is the Society a farce; and so too is horticulture. After all, the Society and the Committees will go on their way, even though Coombe Abbey or other of the carping fraternity may fume and rave. If there has been a grave mistake made in relation to the Superintendent—and nearly all deplore it—yet that error will not overthrow the Society, which is far too firmly fixed in the estimation of all who love gardening. The recent wonderful show of fruit at the Crystal Palace, even though the pecuniary attractions the Society could offer were small, is marked evidence, were such needed, that though storms may rage or errors be made, the great body of horticulturists have in it ample confidence. Mr. Miller treats with scant consideration the privileges guinea fellows enjoy, just because he cannot utilise his own. Why envious of other's opportunities, because he is debarred from enjoying them? What other society offers more than the Royal Horticultural Society does for the money? There are two grand shows annually, those of the Temple and the Crystal Palace, each of three days' duration. There are some twenty meetings at the Drill Hall, where there is generally a charming little show; and the fellow may see all the best novelties the year can produce. There is the constant use and enjoyment of Chiswick gardens, always interesting and attractive to lovers of gardening; and there are the copies of the *Journal* (not of *Horticulture*, Mr. Miller) of which there are, at least, three yearly issues that represent cash value. So much for the Royal Horticultural Society. Do not let us seek to scuttle the ship in our efforts to save the pilot. *A. D.*

TRADE MARKS.—With respect to your remarks on p. 371, there is no doubt the Trade Marks Act as it applies to seeds stands on a very unsatisfactory basis. Some years ago, we spent several hundred pounds in cross-fertilising Wheats, and produced a number of varieties which were distinct and of considerable merit; these we sold in small quantities the first season, but certainly not sufficient to recoup ourselves for the initial outlay. The next year we were met in every direction with the advertisements of farmers who had grown these Wheats and offered the seed at just about the price it cost us to produce, and this in face of the fact that we had registered the brand as a trade mark. In our endeavour to stop these announcements, we were advised that there was no remedy. Our greatest complaint was, that not only did the farmers advertise the Wheat by name, but they also used the title of the originator, such as "Carter's Stand-up;" and although they grew the seed, no steps may have been taken to keep it true and pure, yet it still went forth as "Carter's Stand-up," and if the produce turned out unsatisfactory, it cannot but have a most deterrent effect upon the introducer. We are entirely with your correspondent, that the law as applied to trade marks for seeds is at present absolutely valueless, and the only return one gets for the care and expense of raising new varieties true and pure is the reputation which gradually grows round a house of standing. *James Carter & Co.*

THE "THOROUGHFARE" TREE.—The gigantic Oaks of Sherwood Forest are remarkable for various peculiarities. The Greendale Oak, which we have here designated the "thoroughfare tree," has a roadway through its trunk. This was cut in 1724, and was wide enough for a carriage and four to be driven through it. This was actually done by the Earl of Clare, who laid a heavy bet that he could perform the feat, and he won the wager. The dimensions of this archway are noteworthy. Its height is 10 feet 3 inches, and its width 6 feet 3 inches; the circumference of the tree in a line with the crown of the arch was 35 feet. The tree is reckoned to be at least 1500 years old, and it is now propped up and braced together with chains. There are many other giant trees in this forest, such as the Major Oak, which is 30 feet in circumference. The spread of this tree's branches overshadowed a space 240 feet across from side to side. There is a hollow in its trunk big enough to hold a dozen persons standing close together. *The People, September 22, 1895.*

SOCIETIES.

ROYAL HORTICULTURAL.

GREAT EXHIBITION OF BRITISH-GROWN FRUIT AT THE CRYSTAL PALACE.

September 26, 27, 28.

(Continued from page 374.)

THIS important exhibition was opened on the day we went to press last week. We could, therefore, only insert a portion of our report. The remainder, together with a summary of the papers read at the Conference, will be found in the following columns:—

DIVISION IV.

Single Dishes of Fruit Grown in the Open Air (Amateurs and Gardeners only).

DESSERT APPLES.

The fruits exhibited in these classes were of the highest excellence; competition was numerous in almost every class, and this part of the exhibition was most satisfactory.

Adams' Pearmain.—There were ten dishes of this variety staged, and the quality was generally high. The most successful exhibitor was Mr. T. TURTON, gr. to JNO. HARGREAVES, Esq., Maiden Erlegh, Reading, whose fruits were superior in size to any others staged; 2nd, Mr. MCKENZIE, gr. to F. W. CORNWALLIS, Esq., Linton Park, Maidstone; and 3rd, Mr. Geo. Woodward, gr. to ROGER LEIGH, Esq., Barham Court, Maidstone.

Cox's Orange Pippin.—This class is always largely contested, and there were magnificent fruits exhibited. The 1st prize for this popular variety was taken by Mr. T. TURTON, who had first-rate specimens, or he would not have beaten the other fifty exhibitors. The 2nd prize went to Mr. S. T. WRIGHT, gr. to S. LEE CAMPBELL, Esq., Glewston Court, Herefordshire; and the 3rd to Mr. W. COLLINS, gr. to J. E. BORLAND, Esq., Sutton, Surrey.

King of the Pippins.—This excellent Apple was shown almost as largely as the one just noticed, there being forty-two dishes. Very great difference was noticeable in the degree of size and of colour in the fruits from different localities. Those from Mr. A. WYATT, Hatton, combined excellent colour with unusual size; and Mr. JNO. TURNER, Brighton, and Mr. S. T. WRIGHT, who were 2nd and 3rd respectively, had fruits of capital quality.

Mannington's Pearmain.—These did not strike us as being of more than average quality. Mr. T. TURTON had the best; and Mr. POTTER, gr. to SIR MARK COLLETT, Bart., Sevenoaks, was 2nd; the 3rd prize was taken by Mr. C. ROSS, gr. to CAPTAIN CARSTAIRS, Newbury.

Margil.—About twelve exhibitors staged dishes of this variety, and Mr. THOS. SPENCER, gr. to H. C. MOFFAT, Esq., Ross, took 1st prize, being followed by Mr. A. WYATT, Hatton, and Mr. BUXTON, gr. to J. A. FORSIEA, Esq., Chertsey.

American Mother was only shown in six instances, but most of the fruits were of more than average quality, and the colour was good. The 1st prize went to Mr. MCKENZIE, the 2nd to Mr. THOS. SPENCER, and the 3rd to Mr. S. T. WRIGHT.

Reinette du Canada.—Mr. GEO. WOODWARD had first-rate specimens of this rather large Apple. He was followed by Mr. MONRO, gr. to J. L. BUCKNALL, Esq., Beckenham, and Mr. H. C. PRINSEP, gr. to VISCOUNT PORTMAN, Buxted Park, Uckfield. There were seven dishes on the table.

Ribston Pippin is an invaluable Apple, and as many as forty-three dishes were staged, being nearly as many as there were of Cox's Pippin. Remarkable fruits were included in this large collection, and it was with splendid specimens that Mr. A. COCKE, Arun Gardens, Rudgwick, won highest honours; Mr. MCKENZIE was 2nd; and Mr. G. THOMPSON, gr. to Messrs. W. & E. WELLS, Hounslow, 3rd.

Rosemary Russet.—Mr. P. CAVANAGH, Roehampton Lane, S.W., who won 1st prize for this variety, had good average exhibition fruits; Mr. T. TURTON was 2nd with smaller, more highly-coloured fruits; and Mr. BRIDGES, gr. to W. L. BEDHEAD, Esq., Brentford, was 3rd.

Scarlet Nonpareil found eight exhibitors, and the 1st prize was taken by Mr. EMPSON, gr. to Mrs. WINGFIELD, Amptill; Mr. MCKENZIE, gr. to Linton Park, was 2nd, and Mr. GEO. WOODWARD 3rd.

Worcester Pearmain, in about twenty-one dishes, looked very bright, the colour generally being good. Mr. G. WAKEFIELD, Bearsted, had fruits of extra colour, and was 1st; Mr. KILLICK, Langley, Maidstone, was 2nd; and Mr. W. MEASE, gr. to A. TATE, Esq., Leatherhead, 3rd.

Any other variety.—Thirty dishes or upwards were staged, and the 1st prize was awarded to a dish of lovely fruits of St. Edmund's Pippin, shown by Mr. MCKENZIE; a good dish of Gravenstein, from Mr. O. HERRIN, gr. to the Hon. G. M. FORTESCUE, Maidenhead, took 2nd prize; and nice Jeffersons from Mr. P. CAVANAGH, Roehampton Lane, 3rd.

COOKING APPLES.

Alryston.—Of the dozen exhibitors of this excellent cooking Apple, the most successful was Mr. MCKENZIE, who had excellent fruits; Mr. GEO. WOODWARD made a good 2nd; and Mr. P. CAVANAGH was 3rd.

Bismarck.—Only an equal dozen exhibited dishes of Bismarck, an Apple that has become fairly popular. Mr. MCKENZIE had excellent fruits, and was 1st; while Mr. GEO. WOODWARD had fruits of almost equal quality; and Mr. Geo. Goldsmith, gr. to Sir E. G. LODER, Horsham, was 3rd.

Benham Orange Pippin showed the opinion in which it is held by being exhibited in about thirty instances. There was

marked difference in the quality of the several dishes, but some first-class specimens were included. Mr. C. ROSS was 1st; Mr. NEWMAN, gr. to J. A. TULK, Esq., Chertsey, 2nd; and Mr. T. W. STARTUP, Maidstone, 3rd.

Bramley's Seedling.—The best dish of this variety came from Mr. AUSTIN T. KILLICK, and were large and good. Mr. GEO. WOODWARD was 2nd; and Mr. C. ROSS, 3rd.

Cellini Pippin.—There were fifteen dishes of this very pretty and not less useful fruit. The colour generally was well developed, Mr. KILLICK, who was 1st, had fruits of large size, and of medium colour; Mr. MCKENZIE was 2nd, and Mr. GEO. WOODWARD, 3rd.

Cox's Pomona.—There were about twenty-three dishes of this variety staged, and the fruits being good in size and of exceptional colour, they looked very pretty. 1st, Mr. C. ROSS; 2nd, Mr. G. H. GOODWIN, Mereworth; 3rd, Mr. GEO. WOODWARD.

Duchess of Oldenburgh.—This pretty Apple is evidently but little popular, only five dishes were shown, and two of these were very poor. Mr. S. T. WRIGHT was 1st; and Mr. G. H. GOODWIN and Mr. S. HAINES, gr. to the Hon. D. P. BOUVERIE, Highworth, 2nd and 3rd respectively.

Dumelow's Seedling.—Mr. BRIDOWELL, Mill House, Orsett, Grays, was 1st, and beat twenty-one competitors. On the whole, this variety was exhibited in satisfactory condition. The 2nd prize went to Mr. C. ROSS; but why the 3rd prize was withheld we do not know, unless it was because most of the fruits were shown under the name of Wellington.

Ecklinville Seedling.—Although this large Apple is of soft texture, and not suitable for long keeping, the variety is an excellent one for mid-season service. Out of seventeen exhibitors, the successful one was Mr. MCKENZIE; and he was followed by Mr. GEO. WOODWARD, and Mr. C. HERRIN, Dropmore, in the order of their names.

Emperor Alexander. being shown in excellent condition, made a capital display. Mr. MCKENZIE had the best among twenty other competitors; this exhibitor was followed by Mr. BUXTON and Mr. GEO. WOODWARD.

Gascogne's Scarlet Seedling.—Eleven dishes of this variety, equally well coloured, made a similar display. 1st, Mr. MCKENZIE; 2nd, Mr. GEO. WOODWARD; and 3rd, Mr. GEO. WOODWARD.

Golden Noble.—These fruits were in great contrast to the preceding high-coloured varieties, generally the quality was first rate. Mr. GEO. WOODWARD took 1st position, Mr. MCKENZIE 2nd, and Mr. G. GARAWAY, Bath, 3rd.

Golden Spire filled six dishes. Mr. WOODWARD had excellent examples, and Mr. GOLDSMITH was 2nd, followed by Mr. T. W. STARTUP.

Grenadier.—Only two dishes were staged, and the 1st prize was withheld.

Hawthornden (New).—This worthy Apple was staged by fifteen exhibitors; the quality of most of the fruits was very good. Mr. MCKENZIE took the 1st place, and the 2nd and 3rd prizes went to Mr. W. BANNISTER, gr. to H. ST. VINCENT AMES, Esq., Westbury-on-Trym, and Mr. WOODWARD.

Lane's Prince Albert.—Mr. C. ROSS with splendid fruits, won 1st prize from eighteen competitors. Mr. H. C. PRINSEP and Mr. S. T. WRIGHT, took 2nd and 3rd places respectively.

Lord Derby.—A grand lot was exhibited. The 1st prize was taken by Mr. GOLDSMITH; the 2nd by Mr. WOODWARD; and Mr. G. WAREFIELD, Bearstead, was 3rd. There were twenty-two dishes.

Lord Grosvenor was displayed by ten exhibitors, and we thought that the quality was not more than average. Mr. WOODWARD, however, had a dish of very good fruits, and he was followed by Mr. MCKENZIE and Mr. R. WEBB.

Lord Suffield, which occupied the next position, is of much the same colour. There were twenty-four dishes, and the prizes were taken by Mr. TURTON, Mr. MCKENZIE, and Mr. J. E. BURTON, gr. to Sir E. PAUL, Bart., Twickenham, in the same order.

Me de Ménage is a very different coloured fruit. Mr. MCKENZIE's dish was of very high colour, and the fruits from H. S. MOFFAT, Esq., Goodrich Court, and Mr. C. ROSS, who were 2nd and 3rd, were also of good quality. There were twelve dishes.

Northern Greening.—Eleven dishes of this Apple were shown, and those from Mr. H. C. PRINSEP, who was 1st, were capital. The 2nd and 3rd prizes went to J. B. BROUGHAM, Esq., Carshalton, gr., Mr. W. JONES, and Mr. W. COTTELL.

Newton Wander is a very pretty fruit when seen in perfection. Mr. GOLDSMITH had excellent specimens, and was followed by P. CROWLEY, Esq., Croydon (gr., Mr. Harris); and Mr. S. T. WRIGHT.

Peasgood's Nonsuch, perhaps, makes a more handsome display than any other Apple; size, form, and colour it combines in an unusual degree. Excellent fruits were seen in the eighteen dishes or so that were staged. Mr. MCKENZIE was 1st, Mr. WOODWARD 2nd, and Mr. R. C. SANDERS, gr., Halton, Tring, 3rd.

Potts' Seedling.—The best of fourteen dishes was that from THOS. RIDGWELL, Esq., Orsett, Grays, Essex. He was followed by Mr. P. CAVANAGH, who had very good fruits; and Mr. G. BELMAN, Lewes.

Spencer's Favourite.—There were seven dishes of this golden-coloured Apple, and Mr. WOODWARD won 1st prize. He was followed by Mr. T. W. STARTUP and Mr. S. T. WRIGHT.

Stirling Castle, exhibited in a score of cases, was best from Mr. C. ROSS; and he was followed by Mr. GOLDSMITH, and Mr. J. FINCH HILL, Watford.

Stone's.—Ten good and fairly even dishes of this large fruit were shown, but Mr. MCKENZIE won, and he was followed by Mr. WOODWARD and Mr. C. ROSS.

The Queen is a very pretty fruit when seen in the perfection exhibited by the specimens from Mr. R. C. SANDER; the

2nd and 3rd prizes were taken by Mr. MCKENZIE and Mr. GOLDSMITH.

Tower of Glamis.—There were fourteen dishes, and most of them were of very fine quality. Mr. WOODWARD, who was 1st, was followed by Mr. C. ROSS and Mr. T. W. STARTUP.

Warner's King.—Mr. MCKENZIE had the best dish of fruits, and of the other twenty-one exhibitors, Mr. WOODWARD and Mr. WRIGHT were successful for 2nd and 3rd places.

Waltham Abbey Seedling.—There were five competitors, and the best was Mr. T. W. STARTUP, who had five very fine fruits. He was followed by Mr. MCKENZIE, and Mr. S. T. WRIGHT.

Any other variety.—There were twenty-nine exhibitors in this class, and a good number of varieties were represented. The 1st prize went to Mr. MCKENZIE; Mr. WOODWARD, with capital Belle Douboise was 2nd; and Mr. T. W. STARTUP, who had Tyler's Keruel, was 3rd.

DESSERT PEARS.

Beurré Diel.—1st, Earl PERCY (gr., G. Wythes), Syon House, Brentford, for examples, first class in every point. 2nd, H. ST. VINCENT AMES, Esq., Westbury-on-Trym (gr., Mr. Bannister), whose four were better coloured than the 1st prize lot, but it was lacking in size. 3rd, Sir E. G. LOTER, Leonarda Lee, Horsham (gr., Mr. G. Goldsmith). Fourteen entries.

Beurré Hardy.—Of this fine Pear there were only seven entries, and the samples varied greatly, both in size and in colour. 1st, ROGER LEIGH, Esq., Barham Court, Maidstone (gr., Mr. Woodward), with very fine large fruits; 2nd, Mr. H. C. PRINSEP, gr., Buxted Park, Uckfield; 3rd, C. R. W. ADEANE, Esq., Cambridge (gr., Mr. J. Hill), fine fruit of high colour, that seemed to us as good or better than Mr. Prinsep's.

Beurré Superfin.—Of this variety there were four entries, the 1st prize going to Mr. G. WOODWARD, Barham Court; 2nd, to Mr. GOLDSMITH, Leonard's Lee; and 3rd, to Sir W. GEAR (gr., Mr. Cotterell).

Williams' Bon Chrétien.—This variety was, of course, long past its best, and the fruits shown were large. The best as regards condition merely, came from the Hon. W. LOUTHER'S garden, Wickham Market. The awards were as follow:—1st, Mr. ALFRED DE ROTHSCHILD, Halton, Tring (gr., Mr. R. C. SANDERS); 2nd, Mr. C. HERRIN, gr., Dropmore; 3rd, Mr. J. SPOTTISWOOD, Brighton.

Catherine.—Only three dishes of this variety were shown, and Mr. G. WOODWARD was 1st, Mr. G. WYTHES 2nd, and J. W. MELLEES, Esq., Chingford (gr., G. Nicholson), 3rd.

Maréchal de la Cour.—Five dishes of this variety were shown, and all from South Country gardens. 1st, Mr. G. GOLDSMITH, Leonard's Lee, with very fine examples; 2nd, J. K. D. WINGFIELD DIGBY, Esq., Sherborne Castle, Dorset (gr., Mr. Pragnell); 3rd, Mr. G. WOODWARD.

Doyenné du Comice.—Nine dishes of this fine early Pear were exhibited, all being of remarkably good quality, although differing much in size. 1st, Mr. GOLDSMITH; 2nd, Mr. G. WOODWARD; 3rd, G. H. FIELD, Esq., Sevenoaks (gr., Mr. R. EDWARDS).

Durondeau.—Of this Pear there were sixteen entries, several of them being of the usual brilliant crimson and russet tints seen when the fruit is at its best, and none were deficient in size. The 1st prize went to a dish much less ripe than most of the others, probably owing to its being espilier-grown, shown by J. E. BORDLAND, Esq., Sutton, Surrey (gr., Mr. Collins); 2nd, Mr. J. SIMS, Maidstone, of very high colour; 3rd, Mr. G. GOLDSMITH.

Amille d'Heyst.—Four dishes of this variety were tabled, varying much in the size of the fruits. Grandly-grown examples came from Mr. G. WOODWARD, 1st; from Mr. G. GOLDSMITH, 2nd; and a dish of rather undersized ones from Mr. J. NOWELL, Abergavenny.

Fondants d'Automne.—Of this variety eight dishes were shown of greatly varying merit. The 1st was shown by Mr. J. GIBSON, gr., Chippenham; 2nd, Mr. ROGER, gr., Holmwood, Dorking; 3rd, Mr. H. C. PRINSEP.

Glout Morceau.—Eight dishes were tabled of fairly even quality, 1st, Mr. G. GOLDSMITH; 2nd, Mr. W. COTTERELL; 3rd, PERCY LAWRENCE, Esq., Clapham Park, S.W. (gr., Mr. C. W. CHARD). The samples came from widely separated parts of the country, as Bath, Streatham, Tonbridge, and Shipton-on-Stour. One exhibitor had shown Beurré Bachelier under Glout Morceau.

Josephine de Malines.—There were nine entries in this class, and the fruits were of very varying size and appearance. 1st, Captain CARSTAIRS, Newbury (gr., Mr. C. ROSS), highly coloured fruits, large and clear in the skin; 2nd, Mr. BANNISTER, Westbury-on-Trym; 3rd, Mr. J. HILL, Cambridge.

Louise Bonne de Jersey.—This was a large exhibit, the dishes numbering twenty-four, and most of them were of good size and bright colour. 1st, Mr. G. GOLDSMITH; 2nd, Mr. W. KING, gr., Gatton Park, Reigate; 3rd, Mr. J. NOWELL, Abergavenny; this lot of fruit beating even the winning Sussex dish for high colour.

Marie Louise.—Of this favourite Pear twenty-two dishes were shown, some being ripe, whilst others wanted two or three weeks yet to make them eatable. 1st, Sir E. PAUL, Bart. (gr., J. E. BURTON), with large, clear-skinned examples, still green; 2nd, Mr. G. GOLDSMITH; 3rd, Mr. H. C. PRINSEP.

Naville Filvie.—Three dishes only were shown. 1st, H. C. MOFFAT, Esq., Goodrich Court; 2nd, Mr. WYTHES; 3rd, Mr. G. FENNELL, Tonbridge.

Pitmaston Duchess.—Of this showy, if not particularly good Pear, twenty-six dishes were shown, including several of large size, but nothing of superlative bigness was noted. The finest were those shown by Mr. J. COWLEY, who was 1st; and Mr. G. WOODWARD, 2nd. Mr. COTTERELL was 3rd.

Souvenir du Congrès.—Ten dishes of this showy variety were tabled, mostly of large size and high colour, although singularly the largest fruit, those from Mr. WYATT, Hatton,

were green. 1st, W. & E. WELLS, Hounslow (gr., Mr. Singleton); 2nd, Mr. T. TURTON; 3rd, Mr. G. GOLDSMITH.

Thompson's.—Three dishes of this nice-eating and useful variety were shown. 1st, Mr. G. GOLDSMITH; 2nd, Mr. J. GIBSON; 3rd, Mr. COTTERELL.

Triomphe de l'étoile.—Six dishes were shown in this instance, some of them consisting of perfectly ripe fruits. 1st, Mr. R. C. SANDERS, Halton; 2nd, Mr. G. WOODWARD; 3rd, Mr. J. GIBSON.

Winter Nels.—Of this very delicious and valuable late variety there were seven dishes shown; 1st, Mr. H. C. PRINSEP; 2nd, Mr. G. GOLDSMITH; 3rd, Mr. RICKWOOD, Twickenham.

Any other variety of Pear.—In this competition there were Beurré d'Amanlis, Beurré Rance, Maréchal Soult, like a Marie Louise in shape; Gansell's Bergamotte, Jersey Gretiola, a good, but neglected variety; Flemish Beauty, beautiful, but of poor quality; Beurré Clairgeau, of which the name may be said; Marie Louise d'Uccle, Duchess d'Angouleme, Princess, Brockworth Park, Soldat Laboureur, Jargonelle. 1st, Mr. R. EDWARDS, gr. to G. H. FIELD, Esq., with Madame Treve 2nd, Mr. COTTERELL; 3rd, Mr. ROGERS.

DIVISION V.

DRIED FRUITS.

It is a pity that these classes were not taken up by more competitors, as it is now generally believed that in the event of more extended hardy fruit culture in this country it will be increasingly important that in some measure we should apply the system of fruit preserving so largely practised by continental growers. Sufficient was shown notwithstanding to demonstrate to visitors who had not before seen fruits treated in this manner, that good results have already been obtained in instances where the system has been tried. All the fruit shown in the following classes must have been grown and dried in the British Islands.

The 1st class was for a collection of dried fruits, and Mr. W. A. TROTTER, Ledbury, was awarded the 1st prize for a collection, principally composed of Apples either as rings or cord, or whole fruits. Varieties so treated were Golden Noble, Hawthornden, and Flower of Herts.

Some attractive-looking "rings" of Apple Golden Noble, secured another 1st prize for Mr. TROTTER, in the class for 1 lb. weight of Apples sliced. There was no competition in these two classes, but in the next for 1 lb. weight of Apples, dried whole, Mr. TROTTER, who was 1st with good-looking fruits of Flower of Herts, was followed by Mr. R. W. BULL. The best exhibit in the class for Plums, was also from Mr. TROTTER, who exhibited a variety of this fruit all of an inviting appearance. Both Plums and Damsons were included, some dried during the present season, and others in 1894. Mr. R. W. BULL was 2nd. Cherries, dried whole, 1 lb. in weight, brought the remaining 1st prize to Mr. TROTTER.

DIVISION VI.

SPECIAL PRIZES.

The Worshipful Company of Gardeners offered three prizes for six varieties of hardy fruits grown in the open air, two gallons of each, at least two kinds of fruit to be represented. There were four exhibitors, the 1st prize going to Mr. S. H. GOODWIN, Mereworth, who had skips of excellent fruit of Lady Henniker, Cox's Pomona, Loddington Seedling, Blenheim Orange, and Cox's Orange Pippin Apples, the latter particularly fine; Doyenné du Comice Pears, a splendid lot of fruit, very even, and finely finished. Mr. G. TEBBUTT, Isleworth, was 2nd, having Lady Henniker and King of Pippins Apples, Brionne de Mello and Louise Boane of Jersey Pears, Belle de Septembre (Autumn Beauty), and Sandal's Plums; a more varied collection, but lacking the superb finish of Mr. GOODWIN'S contribution. Mr. A. WYATT, Hatton, Hounslow, came 3rd; he had Pitmaston Duchess and Durondeau Pears; Duches' Favourite, Yellow Ingestre, King of Pippins, and Cox's Orange Pippin Apples.

Mr. A. WEIR'S special prizes for a bushel of Apples (42 lb.), of a cooking variety, and half a bushel (20 lb.) of a dessert Apple, packed for market in as many packages as may be desirable; cost of packages and method of packing to be stated, the competition open only to amateurs and private gardeners, brought seven competitors, the 1st prize going to Mr. GARDNER, gr. to P. T. PHILLIPS, Esq., who had his fruit packed in three ordinary oblong hampers, three layers in each; the two lower layers packed with the base of the fruits downwards, the upper layers on their sides, each layer kept secure by pads of wool placed to fill up the space; the cost of the baskets, 2s. 6d., 9d., and 6d., as they varied in size and quantity. The baskets containing the culinary Apples were lined with stiff brown paper, interleaved with blue, and the fruit was each wrapped in the latter. The lines of the dessert Apples were separated by using bruised corrugated paper, interleaved with blue; a layer of paper was laid over the top of each basket when filled, then wood-wool, and the lid fastened down. 2nd, Mr. Cotterell, gr. to Sir W. GEAR, Tonbridge, who had carefully graded fruit in boxes. One containing Pitmaston Duchess Pears, and one with Worcester Pearmain Apples packed in coloured paper and wood-wool, the cost of the box and packing for the Pears was 6s. 4d., and that for the Apples, 4d. Though only one prize was offered, a 2nd prize appeared to have been awarded to Mr. COTTERELL.

There were six competitors with a package, basket, or otherwise of 12 lb. of Grapes received by rail. The 1st prize went to Mr. G. COOPER, Sunninghill, who had packed (apparently Gros Maroc) in an ordinary stout white wicker Grape-basket, lined with soft paper, the bunches carrying a beautiful bloom lying close to each other, the stems of the bunches securely fastened to the rim, and which, to all appearance, might have been carried any distance without disturbance. One of the leading features was the extremely neat finish

given to the packing. 2nd, Mr. J. GORE, Polegate, packed in much the same way, having the same varieties, but as far as we could see, he had furnished no particulars of cost. 3rd, Mr. Harris, gr. to Lady H. SOMERSET, Eastnor Castle, similarly packed. Gros Maroc and Alicante appeared to be the two varieties of Grape employed.

There were seven competitors in the class for the best packed box or packages of Peaches, twenty-four fruits, received by rail. Mr. W. WELLS, gr. to F. G. ARBUTHNOT, Esq., Bexley, took the 1st prize, having a layer of fruit, each wrapped in tissue paper, and packed in wool-wool, the cost of box and packing, 8½d., an ordinary shallow deal box being employed. 2nd, Mr. R. GRINDROP, who had a similar box lined with coloured paper, each fruit in two wraps of soft paper, and packed in moss; no particulars as to cost supplied. 3rd, Mr. Peatney, gr. to A. J. HOWARD, Esq., Isleworth, who had wrapped his fruit in soft paper, and then packed in wool-wool; cost of box and packing, 7½d.

There were several competitors with a box or other package of ripe Pears, twenty-four fruits received by rail, and Mr. W. WELLS was placed 1st, with Beurré d'Amanlis Pears, packed in wood-wool, the cost of box and material, 8½d.; 2nd, Mr. A. PENTNEY, with Marie Louise, similarly packed, the cost of box and packing, 4d.

The prizes offered by the Vegetarian Federal Union, for selections of specimens of fruits, nuts, grains, &c., suitable for growing on a 2-acre plot, did not bring any competition, so far as we could learn.

MISCELLANEOUS FRUIT.

Among the non-competitive collections of fruit, that from Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, was conspicuous. On one table was a remarkable exhibit of Apples representing a good number of varieties, which, from the qualities they possess, are the best that can be selected, and each of these was shown in excellent condition. Another table contained a collection of large and choice Pears of the best varieties, and individually the dishes were excellent.

Capital fruits of *Late Devonensis* Peach from a south-west wall were shown, and sprays and fruits of *Rubus laciniatus*, a first class Blackberry, also *Alpine des Quatre Saisons* Strawberries, White Grapes, Currants, Damsons, and ornamental varieties of Crabs. Sprays of the new large Winter Cherry (*Physalis Francheti*) were noticed also (Highly Commended).

Messrs. JNO. PEED & SONS, Rouppell Park Nurseries, Norwood Road, London, S.E., staged a collection of Apples and Pears well deserving of remark (Commended); and from Messrs. CHAS. LEE & SON, Hammersmith, a similar collection was shown. The fruits were of uncommon colour, and good in quality (Very Highly Commended). The Australian Irrigation Colonies were represented by some Mildura Lemons, and various dried fruits.

Messrs. JNO. LAING & SONS, Stanstead Nurseries, Forest Hill, S.E., covered a table with remarkable Apples and Pears, in a number of varieties. In large baskets of Apples and dishes of the same, were splendid Cellini, Cox's Orange Pippin, and Washington (Very Highly Commended). Mrs. B. WELLS, Crawley, Sussex, had a small collection of Apples, and exhibited a fruit of Peasgood's Nonsuch, grown by Mr. Mortar, Upper Norwood, said to weigh 1 lb. 10 oz.

An interesting collection of fruit was exhibited by Mr. WILL TAYLOR, Hampton, Middlesex, which included Apples and Pears in variety, most of them good in colour; Coe's Golden Drop, Grand Duke, and Belle de Septembre Plums; and bunches of a hardy Grape, named Reine Olga de Wurtemberg, recommended for open walls.

Mr. Owen Thomas, gr. to Her Majesty the QUEEN, Windsor, exhibited about 100 dishes of Apples and Pears, most of them being of first-rate quality. No attempt had been made to arrange these in the form of a Trophy, as was done at the exhibition last season (Very Highly Commended).

Mr. JOHNSON, Hanger Hill, Ealing, had a stand, where he exhibited specimens of his Mushroom spawn; and another stand was devoted to the display of Orr's Patent Storing-trays for fruit or other light articles. These wooden trays are made in an ingenious manner, that when fitted together, they form a substantial stand, and they are easily packed for transit.

The Horticultural College, Swanley, showed forty-four dishes of Apples of favourite varieties, several, viz., Bramley's Seedling, Peasgood's Nonsuch, Emperor Alexander, Gloria Mundi, Melon, Concellor, Norfolk Beaufin, Washington, being above the usual standard of quality.

Miscellaneous Exhibits.—Messrs. FELLOE & BYDER, Orpington, Kent, sent a collection of twenty-one dishes of Tomato Duke of York, a form apparently of Sutton's Perfection. The fruits smooth, regular as to size, and ripe, each dish held nine fruits. An excellent exhibit.

Messrs. SUTTON & SONS, Reading, showed an enormous screen, 6 feet high and 60 feet long, on which were displayed fruiting stems to the number of six or more loaded with ripe fruits of each of the varieties of Tomato grown by them. It was a good method of showing the fruiting capabilities of the different varieties, but on the whole it struck us as being overpowering in extent and in the mass of vivid colour. (Very highly commended.)

New Scottish Apples were shown by Messrs. NOTHAED & LOWE, Cotton's Wharf, London, E.C. The varieties were Graevenstein, and Bank's Red Graevenstein, a smaller fruit than the type. All were very bright looking.

Mr. W. H. WARD, gr., Longford Castle, showed Melon Earl's Favourite in nine examples, some very prettily netted, others but slightly. A Vote of Thanks. (See fig 71 p. 393.)

Messrs. J. CHEAL & SONS, Crawley, had two large tables filled with fruits on maiden trees in pots, and in dishes and baskets. A great mound of Bismarck Apples occupied the centre of one of the tables, and was flanked by two groups of

upright Cordons, loaded with fruit of the same variety. Of fine size were Apples, Jubilee (new), King of the Pippins, Cox's Pomona, Hawthornden, Atalanta, Warner's King, Betty Geeson, Bramley Seedling, Ribston Pippin, Lucombe's Seedling, Mère de Ménage, Ecklinville, Washington, Yorkshire Beauty, Nanny (the famous Sussex Apple), Sandringham, Duchess of Oldenburg, and Cellini. (Very highly commended.)

Messrs. CHEAL'S exhibit of Pears included fine samples of Duchess de Mouchy, Abel Fetel, Doyenné du Comice, Beurré Diel, Beurré Hardy, General Toilehan, and Duchesse de Nemours, a big stewing Pear; Coasseller de la Cour, Glout Morceau, Louise Bonne, Léon Leclerc, and Pitmaston Duchess.

Messrs. W. PAUL & SON, Waltham Cross, had a table thinly laid out with dishes of Apples and Pears of generally high quality. Of Pears were remarked Beurré de l'Assomption, Doyenné Boussoif, Beurré Diel, Frederick of Wurtemberg, Marie Louise d'Uccle, Vicar of Winkfield, Beurré Bachelier, Van Mons, Léon le Clerc, Madame Treve, Glout Morceau, &c. Of Apples in fine example, the following were remarked:—Annie Elizabeth, Waltham Abbey Seedling, Lord Derby, Beauty of Waltham, Duchess Favourite, Forge, Wealthy, Cox's Pomona, Baignette du Canada, Stone's, Bismarck, Stirling Castle, Emperor Alexander, Warner's King, Cellini (Highly Commended), King of the Pippins, &c.

Messrs. S. SPOONER & SONS, Hounslow Nurseries, Middlesex, exhibited a group of Apples and Pears in considerable variety. The quality was highly commended.

MISCELLANEOUS (FLOWERS).

From Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham, was exhibited an extensive display of Dahlia blooms, including most of the sections, each of which was well represented, considering the advanced date in September. A collection of Begonia plants in flower, single and double varieties, was also staged by Mr. Ware.

A group of Begonias in flower, and Chrysanthemums, also out blooms of large-flowered Chrysanthemums, exhibited by Mr. H. J. JONES, Ryecroft Nursery, Lewisham, was very pretty.

Messrs. WM. CUTBUSH & SONS, Highgate Nurseries, London, N., showed a large number of blooms of a single Dahlia, named Watford Beauty, orange-coloured, with scarlet ring round the disc. Also fruits of their Polegate Seedling Tomato, and fruits of Catbush's Green-flesh Melon.

Messrs. JNO. LAING & SONS, Forest Hill, London, S.E., besides a few orchard trees in pots, exhibited a very tastefully put up group of Caladiums, Begonias, Dracenas, Ferns, &c. The Begonias were of the ornamental foliage section, and included a few very attractive varieties. Caladiums and Crotons, also were well-grown and of good colour.

Messrs. WM. PAUL & SON, Waltham Cross Nurseries, Herts, who seem to induce their Roses to flower long after bloom has disappeared from most gardens, exhibited a collection of cut blooms from varieties specially good for late blooming. A few fruit trees in pots carrying fruits from these nurseries likewise deserve remark.

Messrs. J. CHEAL & SONS, Lowfield Nursery, Crawley, exhibited stands of Dahlias of a variety of types—Pompoms, Cactus, decorative, show, fancy, and single-flowered.

Messrs. J. VEITCH & SONS, Chelsea, showed *Magnolia Watsoni* in bloom, *Berberis Tounbergi* in berry; *B. vulgaris*, also to show fruitfulness; and *B. Hakodate*, a new Japanese species, for comparison. The berries of the latter were equally abundant as those of *B. vulgaris*, but they are of a brighter hue, being scarlet instead of crimson.

A large collection of hardy flowers was shown by Mr. LAD HAMS, the Shirley Nurseries, Southampton, which included bunches of their Perpetual Pink, very fresh and nice for so late a date; *Rhus glabra laciniata*, which dies off of rich colours, &c.

Messrs. W. WOOD & SON, Wood Green, N., showed a collection of horticultural sundries of the usual heterogeneous nature.

THE CONFERENCES.

At the Conference on Thursday Edmund J. Baillie, F.L.S. of Chester, presided.

NEW FRUITS OF RECENT INTRODUCTION.

MR. DENYARD read an exhaustive paper on new fruits of recent introduction. He found some difficulty, he said, in defining the word "new," but he adopted the term for convenience; and he added that his remarks would be based upon his own personal experience, and not on hearsay.

APPLES.

Dealing first with Apples, he said many fine fruits had come to the front. In dessert sorts they had the Beauty of Bath, an August fruit of great beauty. It was rather acid, and would, he thought, prove more of a market fruit than a garden variety. Next came the September Beauty, one of Laxton's seedlings. This had a very rich flavour and soft texture, and was worth culture, although not a great bearer till it gained age. No early dessert fruit of late years had taken the public taste like Lady Sudeley, as for perfume, colour, flavour and beauty, it took precedence of all the August and September kinds. The Armored was a little russet well-flavoured Apple; it bore freely and would be valuable where very

late fruit (May) was required. The Christmas Pearmain, to be sent out by his firm, was a soft-fleshed, briskly flavoured Pearmain. This was a good grower, and a regular bearer. The fine dessert Apple, South Lincoln Pippin, had been purchased by his firm, and it would be sent out in 1896. This would succeed where Cox's Orange failed, and was considered as good as that old and fine variety. The Okera was a pretty rosy salmon fruit, in perfection in September and October. It was elegant on the table, and of fine, brisk quality, and of a curious egg shape. It was a good grower and fair bearer. It required to be laid up to ripen, as the flesh was hard when eaten fresh from the tree. The May Queen, although certificated many years since, was now little known. It was a capital late dessert kind for February and March, and a great bearer. The Wealthy was an American variety, with soft flesh and pleasing flavour. Its fruit was of a lovely crimson, and was in perfection and profusion in October. Williams' Favourite was an August fruit of great merit. It was a good grower and profuse bearer, and could be highly recommended. These appeared to cover the new dessert novelties, but many older and little known varieties should be noticed to complete the group; such as Roundway Magnum Bonum, the finest flavoured dessert apple, Calville Rouge Précoce of great beauty with aromatic flavour and a good bearer, Allen's Everlasting, an old kind, little known, but of the finest possible quality, the tree being a close grower and free bearer.

In Culinary Apples there were more novelties, such as Early Rivers, a fine variety bearing well at Sawbridgeworth. It might be described as a late Suffield. Hambling's Seedling was a large fruit that would prove a grand late variety. It was of vigorous growth, and for garden and orchard planting would prove an addition, as large culinary fruit was scarce in March. The Pyford Wonder was a late heavy kind which had been sent out, and well shown by the Hereford nurserymen. Apples of this class would always be useful after Christmas. Salmarsh's Chelmsford Wonder should prove a useful late cooking sort. Vicar of Beighton was a handsome fruit fancied by their old friend the late Shirley Hibberd; but it must be condemned, as it cast its fruit prematurely, and the tree was, moreover, very liable to canker, and was an awkward grower. Pearson's Newton Wonder was a vigorous orchard tree, and restricted on the Paradise Stock was a very free bearer. He anticipated that it, with Bramley's Seedling, would beat the tender and much be-cankered Wellington out of our orchards. It was a really grand new variety. For that grand late variety—Belle Pointoise, which kept into May, they were indebted to Sawbridgeworth. Mrs. Barron was distinct in growth to any other, and would prove most valuable for cultivation in restricted gardens. Tyler's Kernel was little known, but it formed a vigorous orchard tree, and would probably produce twenty-five bushels. White Transparent was a very lovely and useful first-early Kitchen fruit. Its primrose colour and capital cooking qualities made it worthy of the Award of Merit which it gained. The new sorts, Duke of York and Bowhill Pippin, to be sent out by his firm, would take a good place by-and-by.

CHEERRIES.

Coming next to Cherries the writer said that in this department new kinds were not plentiful, but the honour of introducing some good sorts rested with Messrs. T. Rivers and Sons, whose Emperor Francis, Cleveland Bigarreau, Ludwig's Bigarreau, must rank A1 among the White Heart race; and Black Hawk, Géant d'Heidelberg among the black ones, Windsor, an American red-black, were also likely to prove useful. Among early black Cherries, Rivers' Early quite took the lead, and although not strictly new was yet little known.

NECTARINES.

Nothing Messrs. T. Rivers & Sons had introduced to their group of Nectarines, and they had now crowned a glorious set by introducing Rivers' Early. This fine kind was not only a good grower but was seven to eight days earlier than any other, and if well-thinned, the size was grand and the flavour exquisite. Among recent introductions the late kinds, Newton and Spencer, were food for the gods, and their enormous size, grand colour, and exquisite flavour marked them out as A1, while the wood was stout and very short-

jointed, pointing to heavy crops and good constitution. The Dryden was also one of the finest for mid-season.

PEACHES.

Messrs. T. Rivers again took the lead, and their introductions had done much to lengthen the season in the kinds for culture under glass. The Americans had given us fine early Peaches, but they were not much known yet, and could only be valued for their precocity. An early Peach of a first-class flavour was still required. Général Laée, Early Canada, Harper's Early, from America, were not so good as Hale's Early. The Alexander, Waterloo, Amsden June, were very early; but unless under good conditions did not possess rich flavour, though they were juicy and pleasant, and came three weeks before any others. A word as to failures with these sorts under glass. There was no difficulty in setting these American kinds if a low temperature were kept until the fruit was set, when the day and night heat could be raised, and they soon swelled and astonished every one by their quickness in ripening, but the continuance of forcing heat during flowering was a wrong process, and caused them to cast their fruit. Outside, this did not occur, and they were valuable additions to early fruits in this section. The best way to get them of really good flavour was to set them in an orchard house, to grow them on till within a fortnight of ripening, and then to stand the trees outside for the finishing touch, when they took on fine colour, and became really good in flavour, though not first class. In late Peaches there were no novelties to chronicle, but the mid-season kinds were well supplemented by Dymond and Goshawk, which, though not new, were yet little known, and had the benefit of a good constitution.

PLUMS.

In Plums Messrs. T. Rivers again took first place with early sorts. Stint was a gain for an early dessert kind, and the Sawbridgeworth race of transparent Gages received substantial additions in the Early Transparent and Late Transparent, and the late Golden Transparent again was fine and very late. All these possessed the best and richest flavour for dessert. To the same firm was due the Count Atthem's Gage, one of the red-skinned sorts, of exquisite flavour, and a good bearer and grower.

In dessert Plums none had proved of so much benefit as Rivers' Monarch, a large black Plum, ripening at the end of September, and being a good grower and profuse bearer.

In Damsons, Bradley's King took the first place. It was of the richest flavour, and now that the trees had gained age it bore annually. It was unequalled for private use.

PEARS.

Beacon was a profuse bearer on Quince, but a slow grower. It did admirably on the Pear. The fruit was sweet and pleasant, but must not be left on the tree till fully ripe (August to September). Marguerite Marrillat was an immense fruit with fine colour, and when eaten in condition was excellent (September to October). Messrs. Veitch's Beurré Fonqueray was a fine green Pear, which would replace B. Bachelier. It was a free-bearer and hardy (October). Directeur Hardy was a good grower, and ranked A1. Rivers' Conference was an elegantly shaped fruit and a great bearer, and when not over-ripe of fine flavour and buttery. It was a good grower (October). The striped Doyenné du Comice had yet to be proved. The Beurré du Buisson was a remarkably fine-flavoured, long Pear, juicy and delicious. It grows slowly but bears well, and was quite A1. (December to January). Le Lectier was a large Pear of uneven shape, but of fine quality, keeping till January; while of older introductions Rivers' Maguane and Princess maintained their characters.

Late Pears are very much neglected, and in passing it might be said that Beurré de Jonghe, Doyenné d'Alençon, Marie Benoist, Duchesse de Bordeaux, are very fine and reliable sorts, which succeeded in the South and West as open pyramids, and in the colder parts of the country should do well on walls. Beurré Julie was a small but first-class pear, and deserved to be better known. It was a profuse bearer and was in season in October to November. The Fondante de Thirriott was handsome and very good, and a good grower of moderate size (December). The list of baking Pears had been extended by the introduction, through the Pear Conference, of Gilgil and Directeur Alphaud,

and as the public taste grew for stewed Pears, they would be appreciated.

In Quinces new sorts were plentiful from America, but at present the results had to be waited for.

RASPBERRIES AND STRAWBERRIES.

In Raspberries, Superlative Red justly held the first place. He could not speak well of Keighley Queen, lately introduced. Surpassé Pastolf from the continent was a good red. In yellow Raspberries they had stood still, but a very large fruited one might be expected in 1896 from his firm.

In STRAWBERRIES they had made a great advance, and it was to be regretted that Mr. Thomas Laxton did not remain with them to see the success of his Royal Sovereign. Taking the earliest kinds, the earliest is Laxton's No. 1, a fine-flavoured variety. Laxton's King of Earlies is yet one of the best for flavour. It is closely followed by Royal Sovereign and Sensation (a fine fruit but soft). George Rundle and May Queen have not yet been so good as to warrant their adoption. Incomparable (Ridgwell), which gained the award of merit, is an improved Goliath of firmer texture, and there are a few Continental sorts, mostly introduced by Mr. George Paul, which are useful fruits, such as Auguste Boisselat, Edward Lefort, La France, Souvenir de Kieff, and Unser Fritz. These were not new, but are valuable in a collection. In late sorts Laxton's Latest of All (unfortunately named, as it was not a very late kind), is the best of recent sorts. Its fine size, Queen style, and splendid flavour singled it out for general cultivation. He must not overlook the new ones from Gunton Park, and Mr. Allan deserved credit for introducing Empress of India, Gunton Park, and Lord Suffield, as they were a departure in the direction of more distinct flavour, as against many recent sorts which went for size only. He would like to give a word of caution. Many growers in trying new varieties did not give them time to show their qualities in various seasons. Strawberries for all seasons must be cultivated, and he would ask growers to hesitate before condemning new or fresh varieties on trial, as it did happen that those which proved valuable in a dry were worthless in a wet season; and, as good gardeners, they should provide for all changes of weather.

GRAPES.

In Vines (Grapes), from time to time, really fine novelties were got, but the public taste took years before they became popular. He had however great faith in Lady Hutt, a large bunched white of grand flavour, and Diamant Traube, very fine; and in Black Grapes, Appley Towers, which might be described as a late Hambro'. Grapes would soon have to be divided into two sections—handsome sorts for the market; and choice sorts, with flavour, for one's own eating.

MISCELLANEOUS.

Among outside fruits the Japan Wine-berry deserved notice. It was a useful fruit for tarts, &c., and as a handsome climber or trailer, its pretty, weeping habit and red stems marked out a future for it.

The American Blackberries had been a failure.

It would, Mr. BUNYARD said in conclusion, be necessary to carry out a rigid selection in order to admit of the introduction of so many new fruits.

The CHAIRMAN said they had listened to a most interesting paper which opened up ground for good discussion. He noticed that Mr. Bunyard did not allude to a variety of Strawberry which surpassed the Royal Sovereign, he referred to Laxton's Monarch.

Mr. BUNYARD said he had not yet tried it.

Mr. ROPELL remarked that it was a dark horse.

Mr. PLAYFORD (South Australia) said he was a grower from the other side of the world—the colony of South Australia. (Cheers.) As colonists they had been exceedingly anxious to get the best varieties to grow in the open. He sent to Mr. Bunyard, who forwarded several varieties, which, although they travelled 16,000 miles, all turned out well. He would like to say that he thought that in growing for profit it was a great deal better to confine themselves to the very best varieties, and only a few of them. There was one Plum he thought might be introduced into this country, the Japanese Plum. It was very much like an ordinary Peach—a cross between a Peach and an Apricot. There was one Plum called Red Heart, a most excellent fruit. He was astonished Mr. Bunyard did not mention the Bismarck Apple. It had been grown for some years in the Colony, and he had a specimen which measured 16½ inches round in one direction and 16½ inches in the other direction. He thought that would beat anything shown at the Palace that day. He, however, devoted himself principally to the cultivation of Cherries. The first Cherries he got were the Early Purple King. It was the very earliest variety and made a splendid show, as did

Early Lyons. He also grew Tunford Bigarreau, which, if gathered before it was ripe, would not lose its flavour after it was picked; the Black Tartarian, Knight's Black, Waterloo, which will keep well in extreme cold, St. Marguerite, a very large, firm, black Cherry, were other varieties that he cultivated. He had picked something like 30 tons of Cherries a year. He had between 15 and 20 acres of land, but by no means the whole of this was devoted to Cherries. He was also growing a Blackberry that came from the Himalayas, and some of those had been sent to Kew Gardens.

Mr. CRUMP, replying to a remark made by Mr. Rivers, who was not distinctly heard, said he had had nothing to do with the raising of the May Queen. He had, however, got a model tree, and the variety was one which should be grown by everyone.

Mr. ROPELL said he was very much struck by the remarks of the gentleman from South Australia. He, however, must dissent from some of his opinions. He was afraid if they selected only a few Apples and a few Pears, and so on, they would remain stationary. If their efforts were confined and cramped entirely by the mercantile element, they would soon put a stop to progress. They did not all work for merely pounds, shillings, and pence. Many of them worked for the love of the thing; but if people could get a profit out of horticulture, so much the better. He had himself a crop of Diamant Traube, and he was glad to find that Mr. Bunyard had learnt its merits. He would not like to leave the Nanny, an excellent Sussex Apple, out of a selection of fifty. The list of first-class Apples was, however, so large, that it was a matter of great difficulty to reduce the number to anything like fifty; and their friend from Australia would do wisely to try all the sorts sent out to him, and not to stick to the dozen he had got. If he did not do so, he would find himself left out in the cold.

Mr. BUNYARD, in replying on the discussion, said he would not advise anyone to embark on the Plums from Japan. He had got all the varieties he could, and he had only had two bear fruit, after twelve years. He would have mentioned the Bismarck Apple, but he thought it was thoroughly well known. The same remark applied to the American Mother Apple. With regard to the Nanny, there was one objection—it very seldom cropped.

A hearty vote of thanks was proposed by the Chairman to Mr. Bunyard for his paper.

Mr. GRANT, in seconding the proposition, said, up till recently he had been associated with Roses, but for the last five years he had gone in for fruit, and he was satisfied with the results obtained. He did not think they need fear the competition of their Australian or American cousins, who were not going to equal anything they saw in the Palace that day (Laughter).

SECOND DAY'S CONFERENCE.

The second day's conference took place on Friday, under the presidency of Mr. Bunyard, when Mr. A. H. PEARSON read a most interesting paper on

PRUNING FRUIT TREES.

MR. PEARSON said he approached the task of reading a paper on that subject with trepidation—the subject was one upon which so much had been said; and yet he found from experience that there was still a great deal of darkness in the mind of the average amateur on the matter, and even the great lights of horticulture differed very materially on some important points. Let them take for instance the very first question which arose in the mind of the ordinary amateur. He purchased some fruit trees from a nurseryman, and his first question was should the trees be pruned at the time of planting? Nine authorities out of the ten would a few years ago have replied, No! It was not so long ago that a little band withstood a host of experts upon this very question, and he was glad to say withstood them with such obstinacy that, although the question was not settled, it was left an open one. The advocates of non-pruning assert that the transplanting of fruit trees being a considerable check to the trees, this result should be counteracted by leaving the branches full length for the first year so that they might produce as much foliage as possible and thus induce root-action; whilst those who advocated the pruning of newly-transplanted trees took an entirely different view of the matter, and argued that, as the act of transplanting entailed some check upon the roots, and also in all probability some reduction of their length, the branches should also be shortened to maintain the balance; further that the long shoots being left on the tree caused a considerable amount of needless evaporation of the stored-up sap, made it much more difficult to secure the tree from being rocked about by the wind, and lastly that it defeated the end in view, inasmuch as development of leaves from the full-length shoots was so poor compared with that on the shortened shoots, that root action was retarded rather than advanced. These ideas had been gaining ground during the past few years. Of course, the results upon experimental plots, and

the results which came under the observation of every intelligent nurseryman, from the planting of trees under his own supervision, were results which were measured by the eye, and which might to some extent be read differently; but happily there was established in this country, thanks to the enterprise of His Grace the Duke of Bedford, an experimental fruit-station, where results would be accurately recorded by men of science, so that prejudices, one way or the other, would not be allowed to bias the judgment of results.

The manner of pruning a newly-planted tree must depend greatly upon the tree to be operated upon. Broadly speaking all young, well-grown and vigorous trees should have their branches shortened to one-third of their original length after planting; if the planting was done *very* early in the season the pruning might with advantage be deferred for a week or two in order to minimise the risk of the buds which were left being dried up, but in the case of trees planted later in the season the pruning might be done at once. What were the objects to be attained by pruning fruit trees? Firstly, to obtain fruit; and, secondly, to form trees of a nice shape and in a condition to continue fruit-bearing. With many planters, the first object seemed to be lost sight of, whilst others equally neglected the second. Pruning required a good deal of judgment, and much depended upon the kind of tree, the stock upon which it grew, and the form of tree which one desired to have as a result of one's cultivation. It was therefore impossible to lay down any hard and fast rules for pruning—each case must be taken upon its merits. There were, nevertheless, two rules that could always be kept in view, and which formed the basis of nearly all pruning: first, that all branches must be so disposed as to admit the sunlight and air into the middle of the tree—for, without this, fertility was impossible; and, second, that all leading shoots should be as strong as possible, in order that a free flow of sap be maintained, and the side shoots should be as weak as possible in order to favour the formation of fruit spurs. A good axiom would be—the more a branch is shortened by pruning, the stronger will be the growth resulting from the remaining buds. After all, one's judgment was quite as useful in pruning as the knife. To begin with a few examples, let them suppose that they had purchased some standard trees of Apple, Pears or Plums which had been well grown. If the trees were young, say three or four years old, the shoots should be cut back to one-third of their length, taking care to prune to an *outside* bud, so as to produce a tree with an open head. The reason for this was that the first care, with standard trees, must be for a few years to secure good growth and form firm open heads which would carry fruit for generations—and those who sought to obtain fruit at once made a fatal error. If young standard trees were left unpruned they would make scarcely any growth the following season, but the buds would just push out a few leaves and remaining nearly dormant, would, the following year, be transformed into bloom buds, and if these produced fruit the long branches would be broken down and the tree ruined for life: if, on the other hand, one wished to prune them back the first year after planting, a whole season would be lost, and it was often very difficult to find buds to prune to, as the buds on the lower portion of these long branches would have failed to develop and were what were technically called "blind."

Pyramid trees should be treated much in the same way as standards; young vigorous trees should be closely pruned; older trees, being more formed, did not require such severe pruning, as the foundation of the tree was already laid, and what one wanted was rather to continue the work already begun, than to cut hard back and so form strong shoots; older transplanted trees merely required the longest shoots shortening, in order to maintain the balance of the tree, and to prevent their lower portions having undeveloped buds. It was frequently advisable to thin out entirely a few of the branches upon formed or specimen trees, where they were placed too closely together, as this was an operation which seldom received attention. These remarks upon pyramid trees were of course based on the supposition that they had been carefully pruned during their youth in the nursery. When one read of pyramid trees being purchased and planted which had stems three feet and over in length devoid of a branch, these remarks were not applicable. Such trees could only be treated by being cut hard back to 15 or 18 inches from the surface of the ground, and allowing them to start again if one

was possessed of sufficient patience to await the result, the alternative being to dig them up and burn them.

CORDON TREES.—These should have the leading branch left as long as possible, the only object of shortening it at all, if well ripened, being to ensure the whole of the buds breaking. Now as they wanted the buds to form fruit spurs, it was obvious that they should be as weak as possible, and bearing in mind the fact that the more one pruned away, the stronger would the growth be from the remaining buds, let them err rather on the side of cutting away too little than too much.

ESPALIER TRAINED TREES.—These should have the leading shoot pruned back to about 14 inches from the top pair of branches; provided, of course, proper buds could be found there to make growth to form the next pair; if not they must cut where the bud was, be it an inch or so higher or lower. The side branches which were about 1 foot apart, should be treated just in the same way as cordons. He wished to make it clear that the pruning of a cordon or espalier tree should be the exact opposite of that recommended for a standard tree, for the simple reason that in the case of a standard tree, the result which one wished to obtain was growth, whilst for the already formed trained tree one wanted short fruit-spurs.

SUMMER PRUNING.—This, as ordinarily carried out, was the main cause of our garden fruit-trees being unfruitful; whereas, if properly done, it should have the most beneficial effect. All side-shoots of cordons and side-shoots from the branches of espalier or other trained trees, or pyramids, should be gone over during the season of early growth (May), and pinched back with the finger and thumb-nail to three leaves. These shoots would then commence to grow again from the upper buds, and should be pinched back to two leaves (making five). Sometimes a third pinching was necessary in a wet autumn. The result of this treatment would be that the side-shoots would be thin and weak, and so predisposed to form fruit-spurs, whilst the leading shoots and those required for extension would have had an extra amount of sap thrown into them, and would consequently be strong, clean, and vigorous. In the subsequent autumn or winter pruning of these side-shoots leave always on young and vigorous trees three buds; on old trees, two would suffice. The reason for leaving three buds was, that one or two—generally two—must make growth, whilst they wanted the lowest one to remain nearly dormant, and just put out a leaf or two, so as to develop into a fruit-bud next year. The mode of summer pruning often seen practised was very different to that here described. It consisted in allowing the side-shoots to grow freely until July, and then cutting them hard back to two buds. The result was, that the shoots were far thicker and stronger than they should be, and consequently more liable to make strong wood next season. The tree received a great check from the removal of so much foliage, and finally, the buds left were almost certain to break out into growth the same season. Close pruning like this quickly transformed a tree into a dense thicket of shoots impervious to sun or air, and totally unfitted for bearing fruit. Close pruning was responsible for more failures in garden fruit culture than all other causes put together, and he blamed the method of close summer pruning, because the trees were thus subjected to two close prunings a year instead of one, and thus became thickets in about half the time. The reduction of spurs, necessary as it was, must be deferred until the bloom-buds are formed. As soon as one had a really developed bloom-bud on the spur, any growth extending beyond it might and should be removed, so as to give the tree a neat appearance, prevent the overcrowding of foliage, and have the fruit as close to the main feeding supply as possible.

STONE FRUITS.—He would like to say that all stone fruits hated the knife, and the more pinching one could do to save subsequent pruning the better would the tree like it, and the less would they be troubled by gumming and other evils.

ROOT-PRUNING.—In the present condition of knowledge—and many things had to be learned—he looked upon root-pruning more in the light of a surgical operation to be undertaken advisedly than as one of the routine operations of the fruit garden. Care should be exercised, or the cure was apt to be worse than the disease. In the case of young trees there was of course no difficulty in the matter; but with old trees, when the roots had extended to a considerable distance, there was a great danger of killing the tree. The *modus operandi* of root-pruning was this: as early as possible in the season,

as soon as the leaves turned yellow, and before they fell off, get out a trench round the tree to be operated upon, cut back the strong roots (with an upward cut of the knife) and drive a spade under the ball of soil in which the tree stood, so as to sever any tap-roots which might be working down into the subsoil, fill up the trench again as quickly as possible with some good loam and old manure from a spent hotbed, and the shortened roots would make plenty of young fibres before the advent of winter. When really old trees had to be dealt with, it was best to prune only half way round the tree one season, and to complete the circle next year.

Mr. Pearson, whose paper was listened to with deep interest, explained many of the points by means of specimen trees which he brought with him for the purpose.

Mr. ARNOLD said he had paid a deal of attention to the paper, particularly with regard to the pruning of cordons. He found from practical experience that it answered well to go round the trees, say in June. Instead of cutting away the lateral growths, he broke them and left them hanging, and he found that when they wanted to cut back finally to the third bud, it answered to break the branch at the fourth bud as they would find that the first bud beyond the break would develop into an unmistakable fruit bud.

Mr. COLVILLE BROWNE (Hextable) said he should like to corroborate the remarks of the last speaker. As one who had a good deal to do with fruit-pruning, he found the greatest benefit to be derived in private gardens—he was not quite sure whether it would answer in large establishments—by breaking off the breast shoots and the superfluous shoots. It was noticeable that below the break or below the twist they certainly did get an unmistakable fruit bud. It was very curious, and he thought it might be advantageous to bear it in mind with respect to rank growers like the Pitmaston Duchess. If they had some good system of bending or twisting with rapid growers, they would obtain very much better results in the long run and have less work for the knife. He found there was more harm done by the pruning knife than from any other cause. Magnificent trees were sent out from the nurseries and spoilt in four or five years. He thought, however, nurserymen were greatly to blame, because they did not give all the information they ought to. They had to thank Mr. Pearson for giving them so much valuable information that day.

Mr. FLETCHER (gardener to Mr. Thompson of Maidenhead) bore testimony to the value of the paper, and said those who had lately taken up the work of fruit culture needed such light and guidance. He was very pleased to hear Mr. Pearson speak about newly-planted trees, and he thought it might be taken for granted that as a rule newly-planted trees should be pruned. He knew there had been a controversy on the subject, but he was not certain which side won. They should be guided by common sense a great deal, and by circumstances. In fact, a great deal should be left to individual judgment.

Mr. RIVERS said he could fully bear out what had been said about twisting the branches. Constant pinching was not a success, and with cordon trees one pinching was enough, and it should be done in June. He was once in a garden at Rouen, belonging to a professor. The trees were beautifully arranged, but there was hardly a fruit on them. He asked the gardener whether there was any fruit in the orchard, and the gardener said there was. They had not got any fruit on the cordons because, added the gardener, they were pruned on the professor's system (laughter). With regard to root pruning, he thought it was absolutely necessary occasionally.

A gentleman asked whether it might not be worth while to get over the difficulty by preparing the trees before transplanting, in the same way as they ought to do with Rasp berry canes.

Mr. BENVARD said he would strongly advise that pruning should not be done the first year. As to pruning trees before they were sent out from the nursery, speaking as one who had to do a vast amount of packing, he would be very glad to do the pruning, as nurserymen were but mortal and tradesmen. But people would not like to pay 3s. 6d. for a well-pruned tree, because they would think it too small for the money. It should, however, be remembered that these trees were entrusted to railway companies. They were handled by inexperienced persons, and sometimes damaged seriously. If the trees were sent out properly pruned, and were then damaged, they would never be got into proper form again.

Mr. PEARSON said he hoped he had made it quite clear that close pruning was the thing he was fighting against. Replying to questions, he said that at present he had no dwarf stock for Plums. With regard to the bending-down of branches, one method was that adopted by their old friend, Shirley Hibberd, who used to tie bricks and stones to the ends of them. As to giving information in a catalogue, his experience was that the reader would take no notice of what was said, as he would be sure to think that the nurseryman had his own axe to grind. With regard to pyramids, there are a number of them which must not be pruned at all at the end of the branches. Cherries did not like the knife. As regards standard trees—Apples, Pears, and Plums—he believed most strongly in pruning them at the time of planting.

(To be continued.)

ONIONS AT BANBURY.

SEPTEMBER 19.—The annual Onion Show, established by the late Mr. Henry Deverill a few years ago, took place as usual in the Seed Establishment, Cornhill, Banbury, on the above date, the whole of the shop and one of the warehouses being filled with exhibits. Despite what many regard as an untoward season, Onions have finished in fine condition, as was evidenced by the splendid samples exhibited on this occasion, there being a very keen competition in several of the classes.

The Champion prize for the six largest and handsomest specimens of any one of Deverill's Pedigree Onions, was won by Mr. J. BOWERMAN, gr. to T. HOARE, Esq., Hackwood Park, Basingstoke, who had six of Ailsa Craig, weighing 17½ lb., all very nicely finished, handsome, plump, and solid. The largest of the six weighed 3 lb. 1 oz., and when lifted from the open ground, 3 lb. 6 oz.

The next class was for twelve specimens of either one of the following varieties—Ailsa Craig, Advancer, Cocoa Nut, and the original Excelsior. There were several competitors, and all four prizes went to Ailsa Craig, which is the largest Onion in cultivation; Mr. BOWERMAN again taking the 1st prize with twelve, weighing 30½ lb.; Mr. NICHOLLS, the Gardens, Nuneham Park, Oxford, winning 2nd, with 26½ lb.; Mr. N. KNELLER, the Gardens, Malsanger Park, Basingstoke, 3rd, with 23½ lb. With twelve specimens of the flat type, viz., Rousham Park Hero, Anglo Spanish, The Lord Keeper, or Royal Jubilee, Mr. N. KNELLER came in 1st with twelve very finely-finished examples of Anglo-Spanish, weighing 2½ lb.; Mr. R. LYE, the Gardens, Sydmonth Court, Newbury, taking the 2nd; and Mr. C. J. WAITE, the Gardens, Glenhurst, Esher, the 3rd, both showing Anglo-Spanish, in each case the dozen bulbs weighed 19 lb., Mr. LYE's were better finished.

With twelve examples of the Improved Wroctoo, said to be one of the best keeping Onions in cultivation, Mr. R. LYE came 1st with 12 lb. weight, all true to type; Mr. HAINES, The Gardens, Coleshill, Shrivenham, was 2nd, with 11 lb.

In the class for twenty Onions of any variety, offered by HENRY DEVERILL, Mr. KNELLER, Basingstoke, was 1st with Ailsa Craig, weighing 33 lb.; and two other prizes were awarded to this variety.

The next class was for twelve Onions of any variety, grown in Scotland and the Northern Counties; Mr. C. J. FISHER, York, came 1st with capital bulbs of Royal Jubilee; Mr. MILLER, Stockton-on-Tees, 2nd, with Anglo-Spanish; and Mr. G. COLES, Lancaster 3rd, with Royal Jubilee.

Valuable prizes were also offered for eight dishes of vegetables in the main varieties distributed by Mr. HENRY DEVERILL; the 1st was won by Mr. R. LYE with a superb collection; Mr. C. J. WAITE being a close 2nd. There was also an excellent competition in the class for eight dishes of vegetables, shown by cottagers and allotment holders, and a number of capital collections were staged.

This exhibition is very popular in Banbury, the town having long been famous for its Onions; and free admission is permitted to anyone desirous of witnessing it.

GRAND YORKSHIRE GALA.

SEPTEMBER 24.—A meeting of the guarantors and life members in connection with the Grand Yorkshire Gala was held on the above date, at "Harker's Hotel." Alderman Sir Joseph Terry, J.P. presided.

The balance-sheet submitted showed a profit of £413 7s. 4d. on the year, compared with £348 3s. 4d., on the gala of 1894. It was recommended that grants amounting to £300 should be made, and they were apportioned as follows:—County Hospital, £50; Dispensary, £50; Blue and Grey Coat Schools, £40; Boys' Industrial School, £10; Girls' Industrial School, £10; Bootham Asylum, £21; Home for Friendless Girls, £10; Home for Nurses, £15; Blind School, £5 5s.; Soldiers' Institute, £5; Penitentiary, £10; Yorkshire Society's School, £3 5s.; St. Stephen's Orphanage, £10; Charity Organisation, £10; Association for the Care of Young Girls, £10; Hungate Mission, £5; Sisters of St. Vincent de Paul (Crèche), £5; Gratuities, £7 10s. It was decided to invest £100 of the £222 at present in the bank, and a suggestion was made that the remainder, or a part of it, might be devoted to the improvement of the fixtures.

Obituary.

PETER GRIEVE.—By the sudden death of Mr. Peter Grieve on the early morning of September 26, 1895, the borough of Bury St. Edmunds has lost a useful citizen, and horticulturist a warm-hearted comrade and a distinguished practitioner. Though suffering for some years from heart disease, the deceased, with his usual pluck and perseverance, has attended to his customary duties as a member of the Burial Board, a regular attendant at the reading-room, &c. One of his last acts was the sending of a testimonial to Mr. Barron, the receipt for which was his first letter received after his death this morning. Knowing him so well as I have done for nearly fifty years, I believe he would hardly have had this other-

wise. Mr. Grieve was 83, and will be buried with his only daughter, Lucy Grieve (her Pear is fruiting well this year, close to her dead father in Bury), at Culford, close to his life-work. Mrs. Grieve, who is well known and gratefully remembered by so many gardeners for her hospitality, survives her husband, and will have the warm sympathy of many readers of this notice. The funeral took place in the churchyard at Culford on Tuesday, October 1.

I should like to say something—much, in fact—of the worth and work of my friend of nearly fifty years; but his loss is too recent, and too great. Located near him, associated with him in every possible way in horticultural matters for so long a period, his sudden removal leaves a vacant place which is hardly likely to be filled. I loved him as a friend, a companion, a neighbour; a brother of the pen, the knife, and spade; and never found him wanting in any good work, or kind word or deed. As to his great doings as a cultivator in all departments—are they not to be read in all the back records of Culford Gardens for years, and in many a back number of the *Gardeners' Chronicle*? His solid soundness as a juror; his practical experience as a

Peter Grieve.

writer, are also well known. His work among double Petunias and Pelargoniums was also duly chronicled as it appeared; and the art of raising Tricolors by the father of most or all of them, may, I believe, still be had.

Neither has the change of fashion in furnishing flower-beds detracted from the value of Mr. Grieve's work in hybridisation or cross-breeding Pelargoniums or other plants; his skill and perseverance were marvellous, and so were the products; the tricolors, bicolors, and bronzes had a brilliant reign for years; and it is quite possible that for various purposes they may have a renaissance. Be that as it may, Mr. Grieve did good work at Culford and other places as a landscape gardener, as well as a cultivator and cross-breeder. The grand Yew hedges inclosing the vegetable quarters in the princely kitchen gardens are of his planting, and will prove, perhaps, his most enduring monument. His flower-garden within the centre of the kitchen-garden, and in other directions; his raised beds of beauty on the vine-borders, were for years pictures of exquisite colouring and finishing. And now he rests under the shadow of the old fame and the old

beauty; and may his rest and his rising be alike blessed in the heart-felt wish of all his comrades who knew him best, and loved him most! *D. T. Fitch.*

[Our portrait is of Mr. Grieve in middle life, and originally appeared in our columns on August 28 1875, in illustration of a detailed account of his career. Mr. Grieve was one of our most valued correspondents, and we highly appreciated his judgment when, some years since, we had occasion to seek his advice. But it is as a hybridist that he will in the future be known. Those who knew him best will be called in their turn, but Grieve's work in advancing horticulture will remain a valued heritage to posterity.]

CHARLES V. RILEY.—It is with great concern that we extract the following paragraph relating to this distinguished entomologist from the columns of *Garden and Forest*, no other communication having up to the present reached us. CHARLES V. RILEY, the well-known entomologist, died in Washington on Saturday night from injuries received in a fall from a bicycle. He was born in London in 1843, came to this country at the age of seventeen years, and settled on a farm in Illinois. He served as a soldier in the last years of the war, and after some experience in journalism, he was made State Entomologist of Missouri, which position he filled for nearly ten years. His work in that State attracted much attention, and in 1878 he came to Washington, where, until last year, when he resigned his position, he has practically supervised all the entomological work carried on by the Government. Mr. RILEY was a tireless worker, with an aptitude for original research, and many of his published papers are of permanent value. He had a talent, too, for political management, and for many years he was recognised in the Department of Agriculture as one of the forces in directing its policy and selecting its agents.

PLANT NOTES.

CONVOLVULUS MACROSTEGIUS.

I RECEIVED seeds of the above-named plant from California at the commencement of this year, and was informed by the sender that, like the *Solanum xanti*, it was indigenous to the Island of Santa Cruz, and that it had yellow flowers, and was now in all probability sent to Europe for the first time. I distributed seeds to several friends, and sowed some myself, of which four germinated, and were in May planted out in my garden, where they have grown most vigorously, sending out long trailing shoots from 2 to 3 feet in length, but have not bloomed. I fear the winter frosts will kill it even here, and should be glad of some information about it. *W. E. Gumbleton.*

SOLANUM XANTI VAR. WALLACEI.

At the commencement of this year I received from the Director of the South Californian Acclimatization Society at Montecito, Santa Barbara, some seed of what he assured me was a most beautiful new *Solanum*, under the above name, and which came from the Island of Santa Cruz, and was now sent to Europe for the first time. He said that the flowers of this plant were of a beautiful shade of true blue, and sweet-scented, so that I thought I had got a treasure indeed. Nearly a dozen of the seeds came up, and keeping five for myself, I distributed the others amongst my friends, who are interested in new plants. I planted my five plants in a bed in my garden in the month of May, where they grew and developed very rapidly, sending up first a single stem to a height of between 3 and 4 feet, and then branching freely from the axil of nearly every leaf all up the stem. About the middle of July bunches of buds appeared on the points of all the topmost shoots, which opened towards the end of the month, when, to my great disappointment, the colour of the flowers turned out to be not at all true blue, as they had been described to me by the sender of the seeds, but of a purplish-lilac, with five little green and

white spots or marks round the centre of the flower, one at the base of each petal. I could not perceive any trace of perfume, which was another disappointment to me. I sent specimens to the herbarium at Kew for identification, which were pronounced to be merely the type form, *S. xanti*. Can it be that *S. xanti* var. *Wallacei* was a blue hybrid form, and that the seedlings have reverted to one of the parents? I think this must be the case. *W. E. Gumbleton.*

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—
0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending September 25, is furnished from the Meteorological Office:—

"The weather during this period was extremely fine, dry, and summer-like generally. Thunder and lightning were experienced, however, over Ireland on September 23, and over the more southern parts of England on September 24 or 25, but the storms were accompanied in most cases by very little rain.

"The temperature was unusually high for the time of year, the excess above the mean being as much as 16° over the greater part of England, and between 7° and 9° elsewhere. In the majority of districts, this week has been warmer than any experienced during the past summer. The height of the maxima were registered on September 24 at most of the English stations, but towards the end of the period in the Irish and Scotch districts. They were as high as 86° in the 'Midland Counties' and 'England, S.,' 85° in the 'Channel Islands,' 84° in 'England, E. and S.W.,' and 82° in 'England, N.E.,' while over Ireland and Scotland the highest readings ranged between 75° and 79°. The lowest of the minima were recorded either on September 22 or 23, when the thermometer fell to 32° in the 'Midland Counties,' 34° in 'England, E.' and 'Scotland, W.,' and to between 35° and 40° in most other districts. The diurnal range of temperature during the first few days of the period was exceedingly large at our inland stations; at Loughborough and Stamford, on September 23, the range was 45° during the twenty-four hours. Later in the week the minima were very high for the time of year.

"The rainfall was very slight, or altogether absent, over the kingdom as a whole, but a rather considerable fall occurred at one or two central and southern English stations during the thunderstorms of September 24. In some cases measurable amounts resulted from heavy dews or wet fogs.

"The bright sunshine was still deficient in 'Scotland, N.,' but was extremely abundant in all other districts. The percentage of the possible amount of duration ranged from 83 in 'England, S.,' and 81 in 'England, E.,' and from between 59 and 73 in the other English districts, to 49 in 'Ireland, N.,' 45 in 'Scotland, W.,' and to 26 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, October 3.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

SEEDS.

LONDON: October 2.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., describe to-day's market as bare alike of business and of buyers. Just now, consumptive sowing-wants are at a minimum, whilst no speculation whatever has yet sprung up. All kinds of Clover and Grass-seeds are consequently cheap and neglected. There is no change in either Rye or Tares, Canary-seed having for the past month exhibited remarkable steadiness, now shows decided signs of making a jump upwards. For Peas and Haricots, the inquiry is slow. Mustard and Rape-seed show no alteration.

FRUITS AND VEGETABLES.

BOROUGH: Oct. 1.—Quotations:—Onions, 2s. 9d. to 4s. per bag; Horse-radish, 1s. to 1s. 3d. per bundle; Peas, 3s. to 6s. per half-sieve; Apples, 2s. 6d. to 4s. 8d. per bushel; Plums, 2s. to 2s. 6d. do.; Damsons, 1s. to 1s. 9d. per half-sieve.

SPITALFIELDS: Oct. 1.—Quotations:—Apples, Werner's King Pippin, 2s. 6d. to 3s. per half-bushel; Lord Suffield, 2s. 6d. to 3s. do.; Pears, Callabash, 3s. to 3s. 6d. per half-sieve Dutch Bergamot, 1s. 6d. to 1s. 9d. do.; Cabbages, 4s. to 5s. per tally; Cauliflowers, 5s. to 6s. do.; Collards, 2s. 6d. to 3s. do.; Celery, 8s. to 10s. per dozen; Onions, 1s. to 1s. 6d. per dozen bunches; Greens, bunch, 1s. 6d. to 2s. per dozen; Beet, 1s. 6d. per bushel; Beans, 1s. to 1s. 9d. do.

STRATFORD, Oct. 1.—Quotations:—Cabbages, 2s. to 3s. per tally; Savoys, 2s. to 4s. 6d. do.; Cauliflowers, 8d. to 1s. 3d. per dozen; 2s. to 5s. per tally; Turnips, 1s. 6d. to 2s. 3d. per dozen bunches; 2s. to 40s. per ton; Carrots, household, 25s. to 35s.; do., cattle-feeding, 20s. to 27s. 6d. per ton; Mangels, 30s. to 75s.; Swedes, 20s. to 25s. per ton; Onions, 2s. 3d. to 2s. 6d. per bag; Dutch do., 2s. 6d. to 2s. 9d. do.; Apples, English cookers, 2s. to 4s. per bushel; do., dessert, 2s. 3d. to 5s. do.; Plums, 2s. to 2s. 6d. per half-sieve; Damsons, 1s. 6d. to 3s. do.; Tomatoes, English, 2s. 9d. to 3s. 6d. per peck; Cucumbers, frame, 1s. to 2r. 6d. per dozen; Scarlet Beans, 1s. to 1s. 3d. per bushel; and 2s. to 2r. 6d. per bag; Beets, 2s. to 2s. 6d. per dozen bunches; Celery, 8s. to 1s. per dozen heads; Horse-radish, 9d. to 1s. per bundle; Parsley, 1s. to 1s. 6d. per dozen bunches.

FARRINGTON: Oct. 3.—Quotations:—Cabbage, 6s. tally; Collards and Cauliflowers, 2s. per doz.; Celery, 1s. 2d. per roll; Beetroot, 2r. 6d. per bushel; Carrots, 2s. per bag; Turnips, 2s. 6d. do.; Marrows, 1s. per dozen; Parsley, 3d. per bunch; Sage and Thyme, 2s. per dozen bunches; Apples, Duches, 1s. 9d. per half-bushel; Canadian, Gravenstein, 11s. per barrel; English Grapes, 11d. per lb.; Lisbon, do., 11s. per case; Almeida, do., 14s. do.; Lisbon black do., 16s. do.; Tomatos, 3s. 9d. per 12 lb.; Pears, Marie Louise, 6s. per bushel; Damsons, 2s. per half-bushel; Plums, 2s. do.; Apples, Blenheim Pippin, 5s. 6d. per bushel Ribston Pippin, 2s. per half-bushel; Cucumbers, 3s. per dozen.

POTATOS.

BOROUGH: October 1.—Quotations ranged from 55s. to 90s. per ton.

SPITALFIELDS: October 1.—Quotations:—Main Crop, 40s. to 50s.; Snowdrops, 50s. to 70s.; Bruces, 40s. to 60s.; Sutton's Abundance, 50s. to 60s.; Imperators, 60s. to 80s.; Reading Giants, 45s. to 60s. per ton.

STRATFORD, Oct. 1.—Quotations:—Dark soil Bruces, 33s. to 40s.; light do., 35s. to 60s.; Reading Giants, 45s. to 65s.; Snowdrops, 50s. to 70s.; Hebrons, 55s. to 70s.; Sutton's Regents, 45s. to 50s. per ton.

FARRINGTON: Oct. 3.—Quotations: White Hebrons, 70s. to 80s.; Red do., 70s. to 80s.; Jeannie Deans, 65s. to 75s.; Sutton's Abundance, 50s. to 60s.; Imperators, 45s. to 50s.; Magnums, 45s. to 50s. per ton.

LONDON AVERAGES: Oct. 2.—Snowdrops, 50r. to 70s.; Hebrons, 50s. to 80s.; Puritans, 60s. to 80r.; Imperators, 40s. to 60s.; Magnums, 35s. to 40s. per ton.

* * Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

* * PLANTS, FRUITS, ETC., TO BE NAMED.—The applications to name flowers, and especially fruit, are so numerous at this season as severely to tax our resources. They entail an expenditure of time, labour, and money, of which our readers have no idea. We are always willing to oblige our correspondents as far as we can, but the editing of the *Gardeners' Chronicle* is our business, to which everything else must give way. Correspondents are respectfully requested to observe the rule that not more than six specimens can be dealt with at a time. If more are sent, it would be a graceful act on the part of the sender, to send also a small contribution to the *Gardeners' Orphan Fund*. Delay in any case is unavoidable. Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

ADDENDUM.—CRYSTAL PALACE FRUIT SHOW: Mr. W. Taylor, gr. to C. Bayer, Esq., Forest Hill, S.E., wishes us to supply an omission in our report in last week's issue of the *Gardeners' Chronicle*. His exhibits of twelve bunches of Grapes in six varieties having been placed on a side-table, escaped the notice of judges and reporters alike. The varieties consisted of Gros Maroc, Mrs. Pearson, Madresfield Court, Mascot of Alexandria, Black Hamburg, and Black Alicante.

APPLES FOR NAMING: *Dartnall & Co.* Your fruit, unfortunately, got mislaid, and we should be pleased to endeavour to obtain their names if you would kindly send again.

BLACK AND WHITE GRAPES: *H. G. B.* The berries are affected with the so-called "spot," a fungus called *G. asporium lævicolour*; there is no known cure for it, although the free use of sulphur, which is a substance inimical to all forms of fungus life, might ward off future attacks. It should be applied mixed with white-wash as a dressing for the hot-water pipes, and for filling evaporating pans placed about the vinery. Remove as soon as seen all the affected berries, burning them forthwith.

CLERODENDRONS: *R. M.* Keep them moderately dry during the winter.

COELOZYNE CRISTATA: *R. M.* When growing, the temperature of the cool part of the Cattleya-house suits it well, but during the winter it should be kept in a cooler house, removing to a warm house before growth begins. It will flower from December to March, and if it be not exposed to damp, or the flowers are sprinkled with water, the latter will individually last in good condition for a long time. As autumn approaches the quantity of water afforded at the root should be gradually reduced, till in the winter just enough is applied as will keep the pseudo-bulbs plump. In the summer, a slight shade may be allowed on the house when the sun is hottest, at other times full exposure is best for the plant.

FLOWER POTS FOR PLANTS OF COLEUS TO BE WINTERED IN: *R. M.* Half-a-dozen cuttings would be a sufficient number for a large 48, i.e., a 5 inch pot.

FUMIGATORS: *K. L. G.* We are unable to inform you which is the best apparatus.

GRAPES: *A. L.* The berries came to hand in a decayed condition owing to the great heat and bad packing, and no caterpillars were found in the box. Please send the caterpillar carefully packed in a tin box, when we will endeavour to give you its name.

INSECT DESTROYING SAXIFRAGE: *E. L. B.* Probably a grub of some species of weevil. The beetles (weevils) themselves can be caught when feeding at night, but in the case of the grubs it is a difficult matter. You should take up the Saxifrage plants, searching carefully for the grubs, and then replant into fresh soil in another part of the garden.

INSECTS: *A. Parry.* The Pear trees were attacked by sawfly larvæ. Carefully hand-pick, and destroy them; or place a sheet, or something similar under the trees, and strike the lower part of the trunks sharply with a mallet, gathering up the larvæ that fall. If the trees are tall, spray with kerosene emulsion. *R. McL.*

NAMES OF FRUITS: *Hartwell.* Pear Hessele; Apples, 1, Duchess of Oldenburgh; 2, Cox's Orange.—*A. Reader.* 1, Hollandbury; 2, Golden Noble; 4, Hawthornden; 5, Brownlee's Russett; 6, Early Julian.—*C. R.* 1, Emile d'Héyst; 2, Fondante d'Automne; 3, Belle de Bruxelles; 4, Napulón; 5, Beauté Bosc.—*W. J.* 2, Duchess of Oldenburgh; 3, Keswick Codlin; 4, Lord Grosvenor; 5, Northern Greening; Pear Hessele.—*C. W. F.* 1, Round Winter Nonsuch; 2, Duchess of Oldenburgh; 3, Hoary Morning; 4, Royal Russet; 5, Danmelow's Seedling.—*A. E. F.* 1, Manx Codlin; 2, Round Winter Nonsuch; 4, Ecklinville Seedling; 5, Blenheim Orange; 6, Pear Winter Nelis.—*Conway.* 1, Egg or White Paradise; 3, Golden Noble; 4, Lane's Prince Albert; 6, Old English Codlin; 5, Lord Grosvenor; 8, King of the Pippins.—*A. J. K.* 1, Adam's Pearmain; 2, Gloria Mundi; 4, Golden Noble; 6, Besspool. Others uncertain. Thanks for donation for Gardeners' Orphan Fund, which has been forwarded to the Secretary.—*Alpha.* 1, Kerry Pippin; 2, Blenheim Orange; 6, Yorkshire Beauty; others probably cider varieties.—*W. G. E.* 1, Beauté Diel; 2, Williams' Bon Chrétien; 3, Verulam; 4, Thompson's; 5, Marie Louise.—*A. Berylly, Chichester.* Apple, Ribston Pippin.—*H. C. B.* 1, small Lane's Prince Albert; 2, Mère de Ménage; 3, Blenheim Orange; 4, Gloria Mundi; 5, not known; 6, Lord Grosvenor.—*G. W. R.* Apple, Hall Door.—*A. L.* 1, Maréchal de la Cour; 2, Fondante d'Automne; 3, Chamontelle; 4, Deux Sœurs; 5, Bergamot d'Esperen; 6, Josephine de Maloia.—*F. L.* 1, Doyenné Boussoch; 2, Besspool; 3, Vicar of Winkfield; 1, Cox's Orange Pippin. Peach, too far gone.—*T. B., Esher.* 1, Gloria Mundi; 2, Cellini; 3, not known; 4, Blenheim Orange; 5, Alfriston; 6, Mergil.—*Sherrington.* 1, Pear Marie Louise;

2, next week; 3, Catillac.—*Constant Reader.* Isabella, or some similar American Grape.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to consult the next number.*—*W. T. H.* You must send better specimens.—*R. G. K.* 1, Aster Tradescanti; 2, A. cordifolius; 3, A. acris var. punctata; 4, A. lævis.—*Bagshot.* Magnolia acuminata.—*E. A. T.* 1, Oncidium varicosum; 2, Oncidium dactyle.—*J. K.* 1, Polygonum cuspidatum; 2, Oncidium carthaginense.—*R. M.* 1, Matricaria inodora flore-pleno; 2, Polystichum aculeatum; 3, Lastrea spinulosa; also 3, Nephrodium molle.—*H. A.* Pentas carnea.—*J. T.* 1, Nephrodium molle; 2, Cystopteris bulbifera.—*G. A.* Nerine O'Brienii carminata.—*J. M.* 1, Crataegus coccinea; 2, Sambucus canadensis.—*G. K.* Amaryllis Belladonna.—*G. E.* Gnaphalium uliginosum.

PETUNIA: *W. A. G.* Not uncommon.

PYROS MAULEI: *E. W.* The fruits make a preserve, rather acid, but very agreeable to the taste. Pare the fruits thinly, and remove the seeds. Boil the fruit gently until it is quite soft, then pass it through a sieve, weigh it, and add half the weight of the best loaf-sugar (crushed) to the pulp, and boil the mixture until it "jellies" as it cools. Put it away in glass jars, carefully tied down.

SEEDLING BALDWIN APPLE: *J. D.* Without seeing the plant we are not enabled to form an opinion concerning the pruning that may be necessary. We should opine, having regard to the warmth of the autumn, that a small amount of shoot-thinning only will be all the pruning required. It is not good practice to crop young trees heavily, as it tends to check growth too much.

STONE FLOOR THAT GETS GREEN: *R. M.* Use Weed-killer, which is to be bought of the florists and nurserymen. It is a poison, and you must therefore be careful in its use, and not allow children, domestic animals, fowls, &c., to go into the room till the substance has done its work. It may be mopped all over the next day, and the dirty water poured into an underground drain. Scrub the floor with a best broom and hot soap-suds.

THANATOPHORE: *R. T.* We believe it to be an efficient means of killing insects infesting plants grown under glass, without injury to the latter.

WALNUTS: *H. G. B.* There is no difficulty in removing the outer covering of the nuts, if you allow them to remain ungathered till quite mature. Do not store them in heaps before removing the husks, but do it without delay.

WILLIAMS' BON CHRÉTIEN PEAR: *W. E. N.* You have let the fruits remain on the tree too long, with the result that they have become "sleepy." This variety should be taken from the tree as soon as the stalk parts readily from the stem, going over the tree each alternate day till the crop is gathered. After gathering any of the fruits, place them in a cool dry place till they begin to change colour. It is at this stage that they are the best eating, a perfectly yellow Bon Chrétien being nearly always over-ripe. In the South, except in cold clayey soils, this variety should not be grown on south walls, the fruits generally becoming mealy or else rapidly over-ripe. The flavour of the fruit is more racy from trees growing in the open quarters.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is prepared for reference in all the principal Libraries.

NEW PATENT
WINDMILLS.

Saves Coal, Pumps Water, Grinds Corn, Cuts Chaff, &c.

Supports can be made in Teak, Iron, or Steel, for Hot Climates.

Prices from £17, including Pump and Timber Supports. May 7, 1893, The Dell, Eglefield Gap, Surrey. **ROBERT WARNER & CO.,** Engineers, 27, Jewin Crescent, E.C. Dear Sir,—It affords me much pleasure to inform you the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,324 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully, **H. BALLANTINE,** Head Gardener to Baron Schröder. **R. WARNER & Co.** have made and erected a similar Mill and set of Pumps for Lord Northbourne. **NUMEROUS OTHER TESTIMONIALS ON APPLICATION TO 27, JEWIN CRESCENT, CRIPPLEGATE, LONDON, E.C.** Engineering Works, WALTON-ON-THE-NAZE, ESSEX.

THE BEST & CHEAPEST FUEL for GREENHOUSE BOILERS, STOVES, & HEATING APPARATUS.

ANTHRACITE SMOKELESS COAL.

G. R. CARTER & SON supply their LARGE, NUT, or COBBLE COALS (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered by van, at any address within the 4 mile radius of Charing Cross; or in truckloads, at any Railway Station. This Coal is absolutely smokeless, and it requires much less attention than any other description of fuel, burning for twelve hours at least without any supervision, and giving from five to ten degrees more heat than Coke. Quotations on application to—

THERE IS NOW
A CERTAIN AND SAFE REMEDY IN
THE XL ALL MILDEW WASH.

☞ Kills Mildew and Insects at the same time.
☞ Does not Mark or Stain Fruit, Flowers, or Foliage.

PRICE:—
1 gallon, 12s. 6d.; ½ gallon, 6s. 6d.; 1 quart, 4s.; 1 pint, 2s. 6d.

A Report selected from many:—

From Mr. JOHN MADDOX, Bryn Glas Gardens, Newport, Mon.

"I have now given your Mildew Wash a good trial, and find it the very best remedy yet introduced, being most effective in killing the Mildew and Green-fly at the same time, and without the slightest injury to the foliage of the Roses. It is clean and most simple to use, and the smell is not objectionable.

"Like all your other XL ALL'S, it is just what is wanted, and one feels thankful that they are all come at last.

"P.S.—One application is sufficient."
To be had (the same as all the other XL ALL'S), through all Nurserymen, Seedsmen, Florists, and Sundriesmen everywhere; or direct from the Sole Proprietor, G. H. RICHARDS, Old Shot Tower Wharf, Lambeth, London, S.E.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates

THE "WORCESTER HERALD,"

ESTABLISHED 1784.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Lincoln.—Absolutely without Reserve.

IMPORTANT TWO DAYS' CLEARANCE SALE of exceedingly well-grown GENERAL NURSERY STOCK and FRUIT TREES.

By Order of Messrs. Pennell & Sons, who require a portion of the Land for the purpose of Seed Growing, in consequence of the increase of their Seed Business.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, Bracebridge, near Lincoln, about 2 miles from either of the Lincoln Railway Stations, on THURSDAY and FRIDAY NEXT, October 17 and 18, 1895, at 12 o'Clock precisely each day, without reserve, a portion of the exceptionally well-grown

NURSERY STOCK,

The whole of which has been carefully transplanted, and is now in first-class condition for removal. The Stock comprises 4000 Evergreens and Conifers, 1 to 4 feet, suitable for boxes, pots, and growing-on; 400 Specimen Conifers, 2 to 8 feet, in the borders. These specimens have all been grown with great care, and are now adapted for immediate effective planting. 900 Green and Variegated Hollies, 1500 Green and Variegated Box, 1 1/2 to 2 1/2 feet; 300 new Golden Box, 1 1/2 to 2 feet; 2500 Austrian Pines, 1 to 2 1/2 feet, good plants; 1000 Laurels, best varieties, 1 1/2 to 3 feet; 2500 oval-leaved Privet, 3 to 4 feet; 1000 Standard Trees for Street and Avenue Planting; 100 Acer Negundo variegata, 5 to 6 feet; 1500 Flowering Shrubs and Forcing Plants 3000 Berberis aquifolia, 1 to 2 feet; 800 Dwarf Roses of the best varieties; 500 Iries and other Climbing Plants, Herbaceous Plants, 2500 Standard and Pyramid Apples, 5-yr. Trees, all true to name; 3500 transplanted Crabs, and other Stock.

NOTE.—The Auctioneers desire to call special attention to this important Sale. The whole of the Evergreens have been transplanted within two years, and have been allowed plenty of room, and have also been pruned. The Standard Trees are straight, and everything has been grown solely for a high-class retail trade. Messrs. Pennell & Sons will undertake to carefully lift and despatch any lots, charging only the cost of labour in careful and material used. Goods may be transmitted from the Lincoln stations to any part of the Kingdom without charge of truck.

May be viewed any day prior to the Sale. Catalogues may be had on the Premises; at the Seed Shop, High Street, Lincoln; at Messrs. PENNELL AND SONS' Chief Offices and Seed Warehouses, Gowt's Bridge, Lincoln; and of the Auctioneers, Estate Agents and Valuers, 67 and 68, Cheapside, London, E.C.

Brixton, S.W.

CLEARANCE SALE of well-grown healthy NURSERY STOCK, specially adapted for London and Suburban Planting, by order of Messrs. Ponsford & Son, who purpose converting the Land into Lawn Tennis Grounds.

Sunningdale, Berks.

SIX DAYS' UNRESERVED SALE of exceptionally well-grown NURSERY STOCK, being the most important Sale held at this Nursery for many years, by order of Mr. Charles Noble, including a portion of the unique collection of Specimen RHODODENDRONS, and matchless Specimen Golden RETINOSPORAS and HOLLIES.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, The Nurseries, Sunningdale, close to Sunningdale Station, and within easy distance of Bagshot, S. W. R., on MONDAY, October 21, and FIVE FOLLOWING DAYS, at 12 o'Clock each day, without the least reserve, several acres of unusually well-grown NURSERY STOCK, the whole in the best possible condition for removal, comprising thousands of Rhododendrons amongst them a large number of unique Specimens and Standards, unsurpassed in the trade, and forming one of the finest collections ever submitted to public competition. Several thousands of Ghent and other Hardy Azaleas, 10,000 oval-leaved Privet, thousands of Berberis aquifolia, enormous quantities of Conifers in various sizes, including Cupressus, Thuja, and Thujoopsis, suitable for hedges, screens, and general planting; a grand lot of perfect specimen Variegated Hollies, matchless specimen Golden Retinosporas, Dwarf Roses, a large quantity of Standard and Bush Apples, Gooseberries, Currants, Standard, Ornamental, and Forest Trees, and other Stock, which will be found fully described in Catalogues to be obtained (post free) of the Auctioneers.

It is impossible to adequately call attention to this important Sale within the limits of an ordinary advertisement, and intending purchasers are respectfully invited to inspect the stock, which will well repay a visit to these Nurseries.

May be viewed. Catalogues had on the premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

Hollamby's Nurseries, Groombridge, near Tunbridge Wells.

GREAT UNRESERVED SALE of NURSERY STOCK, by order of the Executors of the late Mr. Edwin Hollamby.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, as above, close to the Groombridge Railway Station, on THURSDAY and FRIDAY, October 24 and 25, at 12 o'Clock punctually each day, 45,000 CONIFERS, named and other Rhododendrons, Azaleas, Laurels, Larch, Scotch Firs, Ash, Spanish Chestnuts, strong, transplanted Quick, Hardy Climbers, Dwarfs, Climbing, and other Roses, the whole in splendid condition for removal; also Seakale, extra strong for forcing, and other Stock.

May be viewed any day prior to the Sale. Catalogues may be had at the Nurseries; and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

Two Days' Sale.—Tottenham, N.

Adjoining the Tottenham Hale Station, Great Eastern Main Line.

Mr. Ware's GREAT ANNUAL SALE of immense quantities of NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, The Hale Farm Nurseries, Tottenham, N., on TUESDAY and WEDNESDAY, October 29 and 30, 1895, at 11 o'Clock precisely each day, in consequence of the large number of Lots.

2500 ROSES IN POTS, EXTRA STRONG, of the best sorts. 100,000 CARNATIONS and PICOTEEs.—Named sorts in pots, consisting of the very best varieties in cultivation, both new and old kinds.

TREE CARNATIONS in variety, fine plants in 48-pots. 50,000 DOUBLE and SINGLE TUBEROUS-ROOTED BEGONIAS.—Probably the finest Collection in the world, and a special feature at this Nursery. These will be offered both in mixture and selected to colour. The tubers are remarkably strong and fine, not a bad variety will be found amongst them.

50,000 CLEMATIS and AMPPELOPSIS, and other Climbers; 10,000 IVIES in variety. 100,000 SEAKALE and ASPAGUS, extra strong forcing stuff. Both these are grown by Mr. Ware in enormous quantities at Tottenham and elsewhere. The season has suited the growth of both remarkably well, and Mr. Ware states that he never had them so fine.

25,000 HOME-GROWN LILIES. Of these, Mr. Ware holds one of the largest collections in the trade. All the Bulbs offered will be of good size, perfectly healthy, and such as cannot fail to give satisfaction.

200,000 BURLIN CROWNS LILY OF THE VALLEY.—These are exceptionally fine, being of the true Berlin or best forcing variety.

FORCING PLANTS and BULBS, in endless variety. 200,000 HERBACEOUS PLANTS and MISCELLANEOUS BULBS.

HOLLYHOCKS, selected to colour. CHRISTMAS ROSES, Double and Single PYRETHRUMS, LINKS, DELPHINIUMS, POENTILLAS, PHLOX, PÆONIES. Also thousands of other PLANTS, TREES, and SHRUBS, in great variety, including a large quantity of POLARS suitable for forming Screens, broad-leaved PRIVET, fine bushy stuff, &c.

The Stock may be viewed any day prior to the Sale. Catalogues may be had on the Premises; and of the Auctioneers, Land and Estate Agents, and Valuers, 67 and 68, Cheapside, London, E.C.; and Leytonstone.

Sales of Azaleas, Camellias, Palms, and Decorative PLANTS, FERNS, &c.

MESSRS. PROTHEROE AND MORRIS respectively announce that their SALES of the above will commence on MONDAY, October 21, and then take place EVERY MONDAY and THURSDAY throughout the season. Catalogues forwarded free by post on application.

Enfield Highway, N.
Sales of LIVE AND DEAD FARMING STOCK, by order of Mr. John Josiah Wilson, jun., who is giving up his Farm and Market Gardens in consequence of expiration of lease and retirement from business through ill-health.
Absolutely without reserve.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, Rose Cottage Farm, Enfield Highway, opposite the Black Horse, one mile from Brimsdown and Churchbury stations, and two miles from Enfield Town stations, G. E. Ry., on THURSDAY, October 17, at 12 o'clock precisely, 12 valuable CART HORSES, fit for brewers or contractors (all worked by Mr. Wilson), two Ponies, first-class Cob, over fourteen hands, five years, by Pireus; brindle Jersey Cow in Calf, four Spring Market Waggon, three Vans, eleven Market Gardeners' Carts, three light Spring Carts, and others; several Sets of Harness, Market Garden Implements, consisting of Ploughs, Subsoils, Horse-Hoes, Mould Ploughs, Rollers, five sets of heavy and light Harrows, 25,000 Strawberry Baskets, a large quantity of Red Willow Rods fit for Basket-making, the produce of over two acres of land, and two years' crop, one and a half acres of Champagne Rhubarb Roots, six acres of Savoys and Collards, and many other items.

On view two days prior to and morning of Sale. Catalogues may be had on the Premises; at the principal Inns in Enfield and district; at Mr. Wilson's Stand, Spitalfields Market; of J. Barrett, Esq., Solicitor, 7, Leadenhall Street, E.C.; and of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C., and Leytonstone.

Woking, Surrey.—Without Reserve.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. H. & C. Cobbatt, who are compelled to effect an immediate clearance of a large portion of ground, to SELL by AUCTION, on the Premises, the Horsell Nurseries, Woking, about a mile from Woking Railway Station on TUESDAY, October 29, and two following days, at 12 o'clock precisely each day, several Acres of well-grown NURSERY STOCK, which has been carefully prepared for removal, comprising a large quantity of Border Shrubs, in great variety; 30,000 Fruit Trees, consisting of Standard, Pyramid, and Dwarf-trained Apples, Pears, Plums, Peaches, Nectarines, and others; 30,000 Forest Trees, Scotch Firs, Pinus, Birch, Quick, &c.; 5000 Standards, Half-standards, and Dwarf Roses, in all the best varieties; 3000 Potting shrubs, 2000 Climbers, 5000 Standard Ornamental and Flowering Trees; 10,000 Fruit and Manetti Stocks, Rhododendrons, Hardy Azaleas, and other Stock.

May be viewed any day prior to the Sale. Catalogues may be obtained on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.; and Leytonstone.

Friday Next, October 18, 1895.—Without any Reserve.
BY ORDER OF MESSRS. SANDER & CO., ST. ALBANS.

2000 CATTLEYAS,

In simply marvellous condition. The grandest lot ever imported, from San Huaca.

SANDER'S MONTANA TYPE OF IMPERIALIS and AUREA, Mixed. 441 Lots.

These are the first and only plants from these mountains, and are from quite a different part of Colombia to those sold by us on October 4. Remarkable Plants of—

CATTLEYA, probably GIGAS or AUREA section, MONTANA type. All Seeding Plants, and mostly all unflowered. A much diversified and most remarkable lot of plants.

CATTLEYA GIGAS IMPERIALIS TYPE.

The great crimson and purple gigas, 275 Lots. Also—187 lots of a form of SANDERIANA.

from a native collector, from the far exterior. These are of a wonderfully distinct-looking and promising character. Bulbs are long, as in *Lælia*, club-shaped, with thick, short, broad leaves. The plants are simply grand. This magnificent type of *Cattleya gigas*, together with *C. aurea*, will be as prolific in quite new forms as our celebrated Montana varieties of *Cypripedium insigne*. Our collectors are exploring vast districts at great expense to secure all the forms of these magnificent *Cattleyas*, which we shall hope to offer to Orchidists without any Reserve. We must sell them, if only to continue the great work of collecting we have undertaken in these new pathless wilds and hitherto impenetrable mountains. Every importation will be offered as it comes to hand. This is the best time of year to buy this type of *Cattleya*; this we guarantee, the plants are perfectly dormant, and could not be in finer or more perfect condition for growing. Also—

A NEW GUINEA DENDROBE,

with large white flowers, as large as *D. bigibum*, with bulbs in the way of *D. atro-violaceum*. Collector describes it as a GRAND NEW DENDROBE.

Together with other fine ORCHIDS, including 20 Boxes of MIXED ORCHIDS.

For all Particulars of Sale, see Catalogue.

Also *CYPRIPEDIUM INSIGNE*, from near the Siperianum district, and *CELOGYNE ASPERATA*, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, October 18, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

DUTCH BULBS.

GREAT UNRESERVED SALES.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., EVERY DAY, at 12 o'clock, large consignments of NAMED HYACINTHS, TULIPS, CROCUS, NARCISSUS, and other BULBS from Holland, lotted to suit the Trade and Private Buyers.

Also ROMAN HYACINTHS, LILIAM CANDIDUM, SNOWDROPS, &c.

On view morning of Sale, and Catalogues had.

Thursday Next.

**MESSRS. LINDEN'S
FIRST GREAT ORCHID SALE
OF THE SEASON.**

Mr. J. C. STEVENS

Has received instructions from Messrs. Linden, L'Horticulture Internationale, Parc Leopold, Brussels, to SELL by AUCTION, at his Great Rooms, 33, King Street, Covent Garden, on THURSDAY NEXT, October 17, at half-past 12 o'clock precisely, a magnificent Collection of IMPORTED, SEMI-ESTABLISHED, and ESTABLISHED ORCHIDS, comprising—

A NEW HYBRID CATTLEYA,

probably a natural Hybrid between *Cattleya aurea* and *gigas* or *Hardyana*,

The Magnificent and Rare

SOBRALIA LINDENI.

The most beautiful and absolutely grandest *Sobralia* ever introduced. Only a few plants having been imported, a plant of the same has just flowered in the Collection of C. J. Lucas, Esq.

Linden's famous strain of

CATTLEYA MENDELI.

Superb Established Plants, all unflowered.

The New and beautiful

- LÆLIO-CATTLEYA LINDENI.
- LÆLIO-CATTLEYA TREYERANI.
- LÆLIO-CATTLEYA SAYANA.
- LÆLIO-CATTLEYA MARGARITÆ.

A grand lot of

**CATTLEYA MAXIMA
FLORIBUNDA.**

The freest-flowering *Cattleya*, producing as many as 20 large flowers on one spike, semi-established, in perfect condition, all unflowered, many in bud.

Also fine plants of

**CATTLEYA MAXIMA
GIGANTEA.**

Semi-established, unflowered, many in bud.

The New and Beautiful

ZYGOPETALUM JORISIANUM,

having been introduced under enormous difficulties from the Sierra de Marawaca, growing at an elevation of 6500 feet, the highest point of the Surina Chain, on the territory of the Mariquitares Indians, the most savage tribe known.

Selected Plants of Linden's Choicest

Varieties of

LÆLIA PURPURATA.

Together with a fine importation of *ONCIDIUM LANCEANUM*, in grand condition; fine Established Plants of *PHAJUS HUMBLOTI*, *CATTLEYA REX*, &c.

On view morning of Sale, and Catalogues had.

DUTCH BULBS—DUTCH BULBS.

Sales nearly every day, in Large and Small Lots, to suit all Buyers.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 33, King Street, Covent Garden, nearly every day, at half-past 12 o'clock, first-class consignments of Choice HYACINTHS, TULIPS, CROCUSES, NARCISSUS, and other BULBS arriving daily from well-known farms in Holland, in the finest possible condition.

On view morning of Sale, and Catalogues had.

WEDNESDAY NEXT.

IMPORTANT SALE.

A GRAND IMPORTATION OF ROSES, from a trustworthy German Grower, including many of the newest and most popular sorts of Standards, Half-Standard, Dwarf, and Climbers. (The Roses from the above Nurseryman sold last spring have given the greatest satisfaction during the past summer.)

A collection of CARNATIONS, a number of well-grown PALMS, 500 LILIAM HARRISII, from Bermuda, LILIAM CANDIDUM, and other, FRESIA REFRACTA ALBA, ANEMONES, GLADIOLI, and many other Bulbs. Also a special consignment of

BULBS FROM HOLLAND.

Including a Fine Collection of Double and Single HYACINTHS, a great variety of TULIPS, CROCUSES, SCILLAS, in splendid order for Winter and Spring Flowering, rare NARCISSUS, SNOWDROPS, ARUMS, IRIS, 1000 SPIRÆA JAPONICA, 1000 DIELYTRA SPECTABILE, EARLY ROMAN HYACINTHS, Paper-white NARCISSUS, ITALIAN HYACINTHS, &c., from France.

MR. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 33, King Street, Covent Garden, on WEDNESDAY NEXT, Oct. 16, at Half-past Twelve o'clock precisely.

On view morning of Sale, and Catalogues had.

Saunders Lane Nursery, Woking, Surrey.

About 1 mile from Worplesdon and 3 miles from Woking Stations on the L. & S. W. Railway.

UNRESERVED CLEARANCE SALE.

MESSRS. WATERER AND SONS are instructed by Messrs. T. Holdforth & Son, who are declining business, to SELL by AUCTION, upon the Premises, on MONDAY, October 21, 1895, and TWO FOLLOWING DAYS, at 11 for 12 o'clock, the whole of the Young and Well-grown NURSERY STOCK, comprising 20,000 Berberis of sorts, 8 in. to 3 ft.; 20,000 Green and Variegated Hollies, 30,000 Privet ovalifolium; 1 to 3 ft.; 10,000 Dwarf, Tea, and Hybrid Perpetual Roses; 20,000 standard and Dwarf Roses in maiden bud; 10,000 Manetti Stocks; 8000 Standard, Pyramid, and Dwarf-trained and other Fruit Trees; 15,000 Gooseberry and Currant Bushes; 10,000 strong Raspberry Canes; 6000 Lime, Mountain Ash, and Laburnum, from 6 ft. to 15 ft.; 3000 Pampas Grass, 10,000 Virginia Creepers, 10,000 Ivies of sorts, 10,000 Hypericum Calycinum, English Yew, from 3 ft. to 5 ft.; and thousands of Conifers, Ornamental, Evergreen, and Deciduous Flowering Shrubs. The whole of the Stock is in fine condition for removal, and well worthy the attention of Nurserymen and others.

May be viewed six days prior to the Sale, and Catalogues had upon the Premises, and of the Auctioneers, at either of their Offices, at Chertsey, Weybridge Station, and Walton-on-Thames.

THE FREEHOLD NURSERY, comprising about 6 acres, with Two Cottages, forming a most Magnificent Site for the Erection of a Residence, TO BE SOLD.

ORCHIDS.—ORCHIDS.—ORCHIDS.

MESSRS. POPE AND SONS have received instructions from J. Fellows, Esq., J.P., of Churchfields, West Bromwich (who is removing to a distance, and will have no accommodation for Orchids), to SELL by AUCTION at their Sale Rooms, 6, Phillip Street, Birmingham, on THURSDAY NEXT, Oct. 17, at Half-past 1 o'clock prompt, the whole of his very CHOICE COLLECTION OF ORCHIDS, including very fine *Cattleyas*, *Oncotoglossums*, *Oncidium*, *Cypripediums*, *Mastodallias*, *Maxillarias*, *Dendrobium*, *Thunias*, *Pleionias*, *Phalenopsis*, *Sophranitis*, *Lycastes*, *Ceologynes*, *Cymbidiums*, &c., amongst which will be found many Rare and Choice Varieties.

On view the Afternoon before and on Morning of Sale, Catalogues post-free on application to the Auctioneers.

West Drayton, Middlesex.

ELEVENTH ANNUAL SALE OF NURSERY FRUIT STOCK.

MESSRS. NORMAN AND SON are instructed by Messrs. Smith & Son, to hold the ELEVENTH ANNUAL SALE OF NURSERY FRUIT STOCK on the Ground, on TUESDAY and WEDNESDAY, October 29 and 30, 1895, each day at 11 o'clock punctually, in consequence of the number of Lots, comprising about

30,000 2, 3, and 4-year-old Standard and Half-standard APPLE TREES, including several new kinds, which have not been brought before public notice, except at these Sales; about

30,000 Standard and Half-standard PLUM TREES, 30,000 Cluster DAMSONS, 5000 Standard CHERRY TREES, 3000 PEARS, 100,000 CURRANTS and GOOSEBERRIES, and about 3 Acres of RHUBARB STOOKS.

Full grown, and suitable for Forcing and other purposes, including Linnaeus, Champagne, Albert, &c., of which particulars will be given in the Catalogues.

On view the day prior to the Sale, and Catalogues had of Messrs. J. SMITH AND SON, Growers, Sipson, and 445 and 449, Covent Garden Market, London, W.C.; and of the Auctioneers, Uxbridge, Middlesex, and Beaconsfield, Bucks.

WANTED TO RENT, on Lease, several acres of ARABLE and PASTURE LAND, with some Glass preferred. Full particulars to C. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SALES BY AUCTION.

To Market Gardeners, Fruit Growers, and Estate AGENTS.

THE NURSERY, DOWNHAM MARKET.
IMPORTANT TWO DAYS' SALE OF VALUABLE NURSERY STOCK.

MR. CHARLES HAWKINS is favoured with instructions from Messrs. Bird & Vallance to SELL by AUCTION, on FRIDAY and SATURDAY, October 18 and 19, 1895, commencing each day at half-past 10 o'clock—

12,000 FRUIT TREES, specially grown for Market Gardeners and Fruit Growers, including the best varieties and most popular sorts; 1500 ORNAMENTAL TREES and SHRUBS of various sizes, all growing as specimens; 100,000 FOREST TREES, &c.; well worthy the attention of Planters; 1000 ROSES, 1000 CARNATIONS, and HERBACEOUS PLANTS.

The Stock may be viewed at any time before the Sale upon application to Messrs. BIRD and VALLANCE, Downham Market. Descriptive Catalogues may be obtained of Messrs. Bird & Vallance, Downham Market; or of the Auctioneer. Offices: Downham Market and Bank Chambers, King's Lynn.

MR. W. DORANT will SELL by AUCTION, at St. Peter's and Catherine Lane Nurseries, St. Albans, Herts., on October 24 and 25, 1895, at 11 o'clock each day, the valuable STOCK IN TRADE of a Nurseryman and Florist, comprising large Span-roof Conservatories, Forcing-houses, Frames, large Halifax Boilers, 800 feet 4-inch H.W. Piping, Furnace Fittings, Cisterns, Specimen Plumosa and other Ferns, Bouvardias, Climbing Begonias, Palms, Aspidistras, Solanums, Plumbagos, Double Primulas, large Azaleas, Clerodendrons, Genistas, and other pot Plants; Hardy Perennials, 5000 Manetti Stocks, choice Maiden Apples, Pears, Plums, Apricots, Cherries, Bush Trees, Roses, Ivies, Creepers, &c.

On view day previous and morning of Sale, and Catalogues obtained of W. DORANT, Auctioneer, St. Albans.

WANTED, TO RENT, SMALL NURSERY with 300 ft. to 600 ft. run of Glass. W., 41, Wellington Street, Strand, W.C.

WANTED, TO RENT, one or two thousand feet run of MODERN GLASS-HOUSES, with open ground and Dwelling-house, within 20 miles of London.—G. L., 41, Wellington Street, Strand, W.C.

WANTED, TO RENT on Lease, not less than ten years, a NURSERY, about three acres of land, with four hundred feet run of Glass or more, within two miles of a Town; with no Stock or very little. W. H., 41, Wellington Street, Strand, W.C.

FOR SALE.—Price £400. High-class Fruiterer's, Green Grocer's, &c., with Small Nursery. South Coast Town.—Particulars from H. E., 4, Lordship Terrace, Brixton Road, Dorking.

TO BE DISPOSED OF, a MARKET GROWER'S NURSERY, in one of the best growing districts, consisting of 6050 square feet in five Houses, erected within last three years; nearly 1 acre of rich pasture, and 3/4 acre of Garden Ground. I less cause of giving up. This is one of the most genuine things ever offered. Twelve miles from London.—A. B., 41, Wellington Street, Strand, W.C.

Splendid Opportunity to Gentlemen at command. TO BE SOLD, as a Going Concern, Goodwill free, of Old-Established FLORIST and MARKET NURSERY.—Glass nearly 20,000 feet, greater part recently erected; situated at well-known watering-place; well stocked, and in thorough working-order; great and increasing demand for Cut Flowers, Cucumbers, Tomatoes, and every kind of Market Produce in Plant Trade. Being a sound and genuine concern, it is well worth attention. Long lease, small ground rent. The Stock (which is clean and well-grown, being grown on for Autumn and Spring work) at low valuation. Price for Land, with all the Glass Erections and Pippings, £1,750. No Agents. Apply, OWNEE, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

Splendid Opening for Fruit and Flower Growing. KENT (SWANLEY).—FOR SALE, a compact FREEHOLD NURSERY of 5 acres of good Arable Land, well adapted to Fruit and Flowers, with eight Glass Houses 150 feet long, one 100 feet long, Cottage and Sheds, Stabling for three horses, together with a well-built modern Residence. Price for the whole, £2600. Or would be sold in two Lots. For further particulars, apply to Messrs. PRALL and PRALL, Land Agents and Valuers, Dartford.

Hooton Estate, Cheshire. TO NURSEYMEN, FLORISTS, and OTHERS. TO BE LET, the productive gardens of HOOTON HALL, extent nearly 5 acres, having an excellent stock of Standard Apple and Pear Trees. The glass comprises Greenhouse, three Vineries, Peach, Orchard, Tomato, Cucumber, and Melon Houses; there are the usual Potting Sheds, Fruit Room, Office, Gardeners' Bothy, Stabling, &c., also good Gardener's House.

For further particulars, apply to Messrs. SMITHS, GOBE and CO., 18, Whitehall Place, London, S.W., and 6, Newgate Street, Chester.

SMALL COMPACT NURSERY TO LET, 8 miles from Covent Garden, 6 Greenhouses, and about 1/2 Acre of Land, on Lease. Rent, £15. Stock optional. Dwelling-house adjoining may be had.—G. E., Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, W.C.

To Nurserymen and Florists commencing business. HAMPTON-ON-THAMES, on THE MARLING PARK ESTATE, free from London fogs, a deep rich loam, the favourite neighbourhood for Growers, FREEHOLD LAND for SALE, on easy system of payment. Excellent sites for residences.—For full particulars apply to Mr. FREDK. G. HUGHES (Surveyor), the Estate Office, Hampton-on-Thames.

To Florists and Gardeners with Capital. FOR SALE, important high-class LOCAL BUSINESS, splendid position, main road. Nine miles from Covent Garden. Same hands twenty years. Fifteen Greenhouses and Pits, all heated by Hot-water. Long lease, moderate rent. Dwelling House attached. Price includes all Glass, Stock, and Plant. Full particulars of Mr. DELL, North Finchley.

FOR SALE, a small valuable long leasehold NURSERY, 6 miles from Covent Garden. Seven large Greenhouses, well stocked; two Vineries. Cucumber-house, Plant-houses, five-roomed Cottage. Low Ground Rent. Lease eighty-six years to expire. Eighty-five feet Glass. Facing main road. All particulars of FLORIST, 11, Dafforne Road, Tooting, Surrey.

3, CROSS LANE, LONDON, E.C.

WITHOUT ANY RESERVE.

FRIDAY, OCTOBER 18, 1895.

2000 CATTLEYAS

IN SIMPLY MARVELLOUS CONDITION.

The Grandest Lot ever Imported from **SAN HUACA.**

SANDER'S

MONTANA TYPE OF IMPERIALIS AND AUREA MIXED
(461 LOTS).

These are the first and only plants from these mountains, and are from quite a different part of Colombia to those sold by us on October 4.

REMARKABLE PLANTS

OF
CATTLEYA, PROBABLY GIGAS OR AUREA SECTION
(MONTANA TYPE).

All Seedling Plants, and mostly all unflowered. A much diversified and most remarkable lot of plants.

CATTLEYA GIGAS, IMPERIALIS TYPE.

THE GREAT CRIMSON AND PURPLE GIGAS. 275 LOTS.

ALSO, 187 LOTS OF A FORM OF

SANDERIANA,

From a Native Collector, from the far interior. These are of a wonderfully distinct-looking and promising character—bulbs are long (as in *Lælia*), club-shaped, with thick, short, broad leaves. The plants are simply grand. This magnificent type of *Cattleya gigas*, together with *C. aurea*, will be as prolific in quite new forms as our celebrated Montana varieties of—

CYPRIPEDIUM INSIGNE.

Our Collectors are exploring vast districts, at great expense, to secure all the forms of these magnificent *Cattleyas*, which we shall hope to offer to Orchidists without any reserve. We must sell them, if only to continue the great work of collecting we have undertaken in these new pathless wilds, and hitherto impenetrable mountains. Every importation will be offered as it comes to hand.

This is the best time of year to buy this type of Cattleya; this we guarantee, the plants are perfectly dormant, and could not be in finer or more perfect condition for growing.

ALSO,

A NEW GUINEA DENDROBE,

With large white flowers, as large as *D. bigibbum*, with bulbs in the way of *D. atro-violaceum*. Collector describes it as a GRAND NEW DENDROBE.

Together with other fine Orchids, including TWENTY BOXES OF MIXED ORCHIDS.

FOR ALL PARTICULARS OF SALE, SEE CATALOGUE.

BY ORDER OF

F. SANDER & CO., ST. ALBANS,

On FRIDAY, OCTOBER 18, 1895, by Messrs.

PROTHEROE & MORRIS,

67 & 68. CHEAPSIDE. LONDON. E.C.

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 12, 1895.

THE "SPOT" DISEASE OF ORCHIDS.

THE disease known as "spot," which appears under the form of brown spots or blotches on the living leaves of Orchids, is unfortunately too familiar to cultivators and admirers of these plants, and although the health of the plant is not materially affected, except when the spots are unusually numerous, nevertheless the unsightly blotches on the leaves detract greatly from a full appreciation of the beauty of Orchids when in bloom.

The disease first appears under the form of minute pale spots, one to two millimetres in diameter, on the upper surface of the leaf, which vary considerably in number and arrangement, being in some instances numerous and crowded, in others, few in number, and scattered. Every portion of the leaf is equally susceptible to the disease, and the fact that very young leaves of diseased plants frequently show "spot," has been considered by some as strong evidence in favour of the disease being due to some parasitic organism; this, however, is not the true explanation, the disease proving conclusively to be of a non-parasitic nature, and with proper precautions to be entirely under the control of the cultivator. My previous note* announcing that "spot" was due to the presence of an organism called *Plasmodiophora orohidis*, was based upon the absolute agreement with the microscopic details of two diseases of Vine-leaves described by Viala and Sauvageau,† and attributed to the presence of two organisms called *Plasmodiophora vitis* and *Plasmodiophora californica* respectively. Returning to the Orchid disease: the minute pale spots already alluded to, which, it may be remarked, are not at all conspicuous, and are likely to escape observation unless specially looked for, soon assume a pale brown colour, and gradually increase in size, retaining an irregularly-circular outline, until they attain a diameter varying from four to eight millimetres. When the spots are numerous and near together, they frequently run into each other, forming irregular blotches of variable size and form. As the disease progresses, the spots become darker in colour, and owing to the collapse of diseased cells beneath the epidermis, the surface of the spot becomes depressed below the level of the surface of the leaf. In many instances, the disease passes completely through the leaf, forming a corresponding brown depressed spot on the under surface.

* *Annals of Bot.*, vol. ix. p. 170 (1895).

† *La Bruzière et la Maladie de Californie. Journ. de Bot.*, tom. vi., pp. 355 and 378, pl. xii. (1892).

Microscopic examination shows the following details. The first indication of disorganisation is plasmolysis, followed by the complete disappearance of the chloroplasts from the palisade-cells of the leaf, hence the pale colour of the spots during the first stage of the disease. This is immediately followed by the appearance of a highly refringent, hyaline, oleaginous-looking sphere in each cell. During the early period of formation, the centre of the sphere presents a granular appearance, and when broken up and treated with a solution of iodine, the granules prove to be minute starch grains, which were liberated from the disintegrated chlorophyll grains, and engulfed during the formation of the sphere. Within three days from the first appearance of the spheres, the enclosed starch grains have become completely dissolved, and their substance added to the common mass. If at this stage a section through a diseased spot be placed in water and examined under the microscope, the spheres will be seen to undergo vacuolation, gradually changing from the previous solid condition into hollow vesicles, the walls of which become irregularly perforated or reticulated, the configuration of the network slowly and constantly changing after the fashion of the movements presented by the vegetative phase of *Plasmodiophora Brassicæ*, but differing in the movements, being of a purely physical nature, the perfectly homogeneous membrane becoming thinner in proportion as the vesicle increases in size, and in constantly retaining a rounded, even contour. Increase of size usually continues until the vesicle fills the cell in which it is contained. Vacuolation takes place exactly as stated above when sections are placed in a 1 per cent. solution of osmic acid instead of water, which, taken alone, is sufficient proof that the spheres in question are not of an amoeboid nature. In some instances, instead of one, several spheres are formed in a cell, each undergoing vacuolation, but remaining comparatively small in size.

The composition of the spheres is proved by the action of reagents to be complex, and although I have sometimes spoken of them as tannin-vesicles, it must be clearly understood that I do not intend to convey the idea that they consist entirely of tannin, although agreeing in many respects with the structures called tannin-vesicles by Klercker.*

That tannin is present is shown by the following reactions: Potassium bichromate produces a bright-brown precipitate, insoluble in water; an aqueous solution of cupric acetate causes a dingy-brown colour, which changes to green when subsequently treated with an aqueous solution of ferrous sulphate; a 1 per cent. solution of osmic acid blackens the spheres, but as previously stated, does not prevent vacuolation. Finally, the accumulation of methylene-blue by tannin-bearing cells, as pointed out by Pfeffer,† held good, the vesicles becoming stained deep blue after remaining in an exceedingly dilute aqueous solution of methylene-blue for twenty-four hours; iodine-green may be substituted for methylene-blue with good results. All the above reactions are most decided before vacuolation takes place; in fact, when the vesicles are fully distended, but little coloration is produced by any of the reagents mentioned. On the other hand, the presence of proteids in the spheres is suggested by the rapid staining of the mass, on the application of such reagents as eosin, carmine, iodine, &c. Carbohydrates are also in all probability present.

The spheres originate in the cell-sap, and their presence depends entirely on plasmolysis of the cells, which occurs during the earliest phase of the disease.

Contemporaneously with the formation of the tannin-vesicles the cytoplasm becomes turbid, the primordial utricle at the same time becoming tinged brown, and undergoing important changes. In some cases, the inner surface of the latter becomes uniformly covered with minute, spherical masses, and in this condition resembles, superficially, cells filled with the spores of a *Plasmodiophora*; here, how-

ever, the resemblance ends, as the minute spheres are found to form only a single layer lining the primordial utricle, and not completely filling the cell, as in *Plasmodiophora*; furthermore, reagents show that the spheres consist of tannin, and not protoplasm. In other cases, the inside of the epiplasm, and sometimes also the cell-wall—which, along with the other parts, undergoes disintegration—is covered with tubes or variously branched, very slender rods of a brown colour. Usually, however, the epiplasm or primordial utricle becomes entirely disorganised, drops of tannin accumulate at various points in its substance, accompanied in many instances by minute crystal-like bodies. These eventually disappear, leaving holes in the membrane, which, along with others previously present, produce an irregular reticulation, the whole being of a brown colour. The nucleus of the cell frequently remains unchanged throughout the entire cycle of disease.

In Viala and Sauvageau's account of the Vine disease previously alluded to, vacuolated tannin-vesicles and the reticulated primordial utricle have been respectively interpreted as constituting the vegetative phase of their supposed *Plasmodiophora vitis*.

The investigation of the disease under consideration was at first pursued along lines suggested by the preconceived idea that a fungus was the cause of the mischief, and it was only after numerous and varied experiments had failed to demonstrate the existence of the hypothetical fungus, that a search was made for bacteria, but with a like result. Finally, failing to induce the disease in healthy plants by inoculation with the expressed juice from diseased spots, even when introduced under the epidermis, thus proving the absence of an enzyme or organic ferment, which would have been due to the presence of fungi or bacteria, this was accepted as corroborative evidence of the absence of these organisms.

At this stage, Mr. W. Watson, assistant curator, Royal Gardens, Kew, whom I take this opportunity of thanking for numerous practical hints during this investigation, suggested a sudden chilling of the plants as a probable cause of the disease. Acting on this suggestion, the following somewhat drastic experiment was undertaken.

A young healthy plant of *Habenaria Susanæ*, R. Br., perfectly free from "spot," and which, up to the date of the experiment, had been growing in a house having a temperature ranging between 75° and 80° Fahr., was selected for experiment. Minute particles of ice were placed at intervals on the uninjured epidermis of the upper surface of the leaves, the plant—along with the pot in which it grew—was then placed in a sink and covered with a bell-jar, and cold water from a tap allowed to flow over the bell-jar for twelve hours, during which time the temperature inside the jar ranged between 41° and 45° Fahr. Twenty-four hours after the experiment, the points on the surface of the leaves originally covered by particles of ice were pale in colour, and on examination under the microscope, plasmolysis of the cells of the palisade-tissue, and degeneration of the chloroplasts, were found to have taken place. The remaining spots were examined at intervals, and within four days, every phase of the disease was observed, agreeing in every respect with the features already described.

The foregoing experiment showed that a sudden fall of 30° of temperature could not induce "spot" on the dry surface of the leaf, but only at those points where it had been moistened by the melted ice. That the chill caused by contact with the ice itself was not necessary for the formation of "spot," was proved by a second experiment with the same species of plant, all the conditions being as nearly as possible counterparts of those in the first experiment, excepting that minute drops of water at a temperature of 45° Fahr., were placed on the leaves instead of particles of ice. A diseased spot appeared at each point previously occupied by a drop of water, and showed all the microscopic characteristics of true "spot." Numerous additional experiments, with the object of determining the minimum depres-

sion of temperature necessary to produce the disease, showed that the formation of "spot" could not be induced by a fall of less than 9° Fahr., from the average temperature in which the plant had been previously growing. One other point in regard to temperature was clearly demonstrated by the experiments, viz., that plants which had previously grown in a high temperature, became diseased at a much smaller reduction of temperature than plants previously accustomed to a comparatively low temperature.

In conducting the experiments described above, irregularity in the appearance of the spots in different specimens of the same species, even when conducted under precisely similar conditions as to temperature, showed that some other undetermined factor exercised an influence. After repeated experiments this proved to be the relative amount of moisture present in the plant. After a pseudo-bulb with its accompanying leaf had been removed from a plant and allowed to remain for three days in a dry place, it was found impossible to produce spot by the method mentioned above, whereas with a similar specimen removed from the same plant, and having the pseudo-bulb placed in water at once, fully developed "spot" could be produced in four days. Similar results were obtained when experiments were made with entire plants; those copiously supplied with water at the root, and grown in a high temperature, "spotting" readily; whereas plants in a resting condition, scantily supplied with water and kept in a low temperature, usually resist all attempts to produce "spot" artificially.

It may be mentioned that, other conditions being equal, "spot" can be produced with the greatest certainty, and in the shortest amount of time, when the experiment is conducted in an atmosphere saturated with moisture. This agrees with the experience of gardeners, who state that "spot" is most prevalent in foggy weather.

Experiments show that "brunissure," or browning of Vine-leaves, when the plants are grown in the open air, can be caused by the following combination of meteoric conditions. A copious deposition of dew and rapid fall of temperature, following heavy rain. Similar conditions produce the disease in the leaves of Tomatos, which has been described by Abbey* as due to an organism named by him *Plasmodiophora Tomati*.

SUMMARY.

The Orchid disease known as "spot" is of non-parasitic origin; the initial cause being the presence of minute drops of water on the surface of the leaves at a time when the temperature is exceptionally low, and the roots copiously supplied with water.

The effect of the chill produced by the drops of water under the above-mentioned conditions, is to cause plasmolysis of the cells of the leaf underlying the drops; this is followed by the precipitation of tannin and other substances, and eventually the complete disintegration of the cells.

"Spot" in the broadest sense of the term, which would include the effects of exceptional meteoric conditions on the living parts of plants, more especially the leaves, when growing in a state of nature, is, in the case of cultivated Orchids, mainly, if not entirely, caused by the three following conditions: 1, too high a temperature; 2, too much water, and not sufficient air in contact with the roots; 3, watering or spraying with a falling instead of a rising temperature. *George Masee, F.L.S., a principal Assistant, Royal Herbarium, Kew, in "Annals of Botany," October.* [The original is accompanied by a coloured plate showing the microscopical changes referred to.—ED.]

raisers, Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, at the meeting of the Orchid Committee of the Royal Horticultural Society held at Chiswick on September 5, when it was awarded a First-class Certificate. The sepals and petals are of a soft rosy-lilac, with an indescribably beautiful tracery of bright purple lines. The labellum is of a glowing magenta-purple hue, the outside of the side lobes lilac, with purple veining.

years naturalised in Mauritius, where it was introduced from South America in 1790, and where it took possession of waste lands to such an extent as to lay the foundation of a considerable fibre industry, which was started in Mauritius about twenty years ago, and has grown considerably since. It is also cultivated in India and Ceylon. An interesting account of this industry in Mauritius was published in the *Kew Bulletin* for 1890, p. 98.

epines. The species (this identical plant, no doubt) first flowered at Kew in the Succulent-house in 1860, and as the plant does not flower till it has attained considerable size, the specimen under notice is probably half a century old.

CEREUS TRIANGULARIS.

There were no fewer than thirty-six magnificent flowers expanded one morning this week upon a plant of this night-flowering Cactus in the Succulent-

FIG. 74.—*LELIO-CATTELEYA CLONIA SUPERBA*: ROSY LILAC, LIP PURPLE.

KEW NOTES.

FURCRAEA GIGANTEA.—This plant may now be seen in flower in the Succulent-house at Kew, or rather outside it, the spike having pushed up through the roof to a height of 25 feet. The plant, which has scarcely any stem, consists of a large rosette of about sixty leaves, which are about 5 feet long and 6 inches broad, spineless, bright green, and is a striking object even when out of flower. The spike bears numerous branches of whitish star-shaped flowers, 2 inches across, and drooping. The plant will, of course, perish as the result of flowering. The last time this species flowered at Kew was in 1874. This is one of the most important of fibre-yielding plants. It is known commercially as the Mauritius Hemp-plant, or Green Alocs (*Alcôs vert*), having been many

PITCAIRNIA FERRUGINEA.

There is a large example of this, the largest of all the Pitcairniae, in the Temperate-house at Kew, where the comparatively cool temperature appears to suit it, the head of leaves being fully eight feet through, and perfectly healthy. This year the number of flower-scapes it has produced is larger than usual—they are 6 feet long, branched, clothed all over with a dense rust-like down; the flowers, which are 4 inches long, are at first of a pale steel-blue colour, afterwards changing to white. According to Mr. Baker, this species attains to a height of 12 feet, with a stem as thick as a man's arm. The Kew plant has a stem 6 inches in diameter, and about a dozen branches or rosettes of leaves; these are about a yard long and 2 inches wide, shining green above, whitish beneath, the margins armed with stout

house at Kew. The bright weather we have experienced this year has given us more flowers than usual in the Cactus-house, and if we could be certain of such weather every year Cacti would soon find general favour. *C. triangularis* is one of the oldest of cultivated Cacti, a plant of it being recorded in the Hampton Court garden in 1690. The stems are stouter than those of most of the night-flowering scandent species, distinctly trigonous, and the flowers are a foot across, the narrow reflexed sepals coloured greenish-yellow, and the lacceolate petals milk-white with a large cluster of bright yellow stamens filling the whole cup. The Kew plant is trained along the rafters of an unshaded house of intermediate temperature, but it would be happier if trained against a wall to which its aerial roots might cling.

CATTLEYA ELONGATA (C. ALEXANDRÆ).

This is again in flower at Kew, and again falls short of what we were led to expect when it was first introduced. It has an erect scape 1 foot long, bearing three flowers, each having a pedicel 2 inches long, and measuring 2 inches across the segments. The colour of the sepals and petals is a coppery brown, with a flush of rose about the tips, the lip being deep rose, above which the white top of the column shows conspicuously. In a broad sense, I should say this is a form of *C. guttata*, although for garden purposes it requires to be distinguished on account of the length of the pedicels, the waviness of the petals, and the peculiar colour of the sepals and petals. It grows well when treated as a tropical Orchid. The name preferred here was given to this plant in 1877 by M. Rodrigues [Orchid., Nov. 1, 72, ex *Indice Kewensi*], fifteen years before it was named *C. Alexandræ*, by its introducer, M. Linden.

STANHOPEA HASELOWIANA.

We have had this plant in cultivation three years, thanks to an importation of it by M. Linden, although it was described by Reichenbach forty years ago. It is one of the handsomest and largest-flowered of the many species now known, and it is as easily managed as any of them. The Kew plant is now in flower, filling the warm Orchid-house with a delicious fragrance, and delighting visitors with its extraordinary form and delicate colours. Before the segments curled back each flower was fully 6 inches across, and coloured pale creamy-yellow, with a suspicion of apricot in it, the whole being dotted over with irregular ring-like blotches of lilac-purple. In structure the flower is not unlike *S. Wardi*, from which, however, it differs in having the mesochil, or middle portion of the lip, being unusually long, as well as in being much larger, and different in colour. To those who cultivate this beautiful genus I would recommend *S. HaseLOWIANA* as a plant worth procuring. A figure of it has been prepared for the *Botanical Magazine*. Mr. Rolfe thinks *S. Moliana*, figured in *Lindleya*, v. vii., t. 333, is probably the same species. *W. W., Kew.*

FLORISTS' FLOWERS.

FINISHING THE BLOOMS OF CHRYSANTHEMUMS.

If blooms of the finest exhibition quality are to result, the finishing processes must be closely attended to, or the ten months' labour and anxiety will be thrown away. If suitable accommodation exists this last phase of culture is quite simple, but not so if the houses are unfitted for the proper development of the flowers in the month or six weeks previous to their opening. The worst kind of house is one that is lofty and lacking in light. Such houses are usually much too moist, causing injury to the petals and lengthening of the flower-stalks, with consequent weakness long before the blooms are fully developed. In this kind of house the conditions are such that the buds do not swell satisfactorily. Sometimes a season's labour is thrown away by a single act of carelessness on the part of the gardener or his assistants, or by want of knowledge as to the requirements of the plants at that time.

After the Chrysanthemums are housed and the colour of the florets is visible, developing begins. It should be remembered that buds which have become deformed ever so little cannot become perfect flowers, and it is better to remove them and thus relieve the plant. The blooms that remain will be all the better if the energies of the plant are spent upon two blooms rather than three, which is the usual number allowed to each plant.

It is seldom that a house can be devoted entirely to Chrysanthemums, although it is best if it can be managed. A span-roofed greenhouse affords good accommodation for the plants in the final stage of growth; and in such a house the tints of the blooms ought to be of great excellence, owing to the abundant light and air enjoyed—and it is upon these two points that so much depends in the finishing of the blooms. Generally, Peach-houses or vineries, after the fruit is gathered, are utilised for Chrysanthemums,

and here also the plants obtain sufficient light and air; moreover, the foliage in the case of the Vines is useful as shade for the flowers. The Vines leaves must not be left too thickly on the rods, or epindling will occur. Air must be afforded day and night till the blooms are generally expanding, when some reduction in the amount of air admitted may take place; as at that stage I object to a direct current passing over the plants in such a manner as to cause a draught, the more especially when—as is sometimes the case—the house faces north or east. If the weather is cold, wet, or foggy, use slight artificial heat so as to ensure buoyancy. The air should be admitted freely at the front, and come at the top of the house. Shade of some kind is always necessary while the blooms are expanding to prevent scalding, or as some term it damping, and the shade should be of a temporary character because of the importance of light in dull weather. The plants should not lack manorial assistance, although some growers would have no believe that directly the colour of the florets becomes visible manuring should cease. This is a fallacious practice, the plants requiring feeding as much then as at any time. My practice is to feed the plants until the blooms are three-parts expanded, and then to afford no more. The kind of manure should be varied, and affording strong doses of any one kind is bad for them—weak and often is a much more prudent practice; besides, the same kind of stimulant always afforded, ceases to have any good effect. A return to pure water only for two or three waterings is conducive to success, especially where animal manures have been employed, the clear water acting as a purifier. It is allowed to be more difficult to finish an incurved than a Japanese bloom. If the latter are large in diameter and depth, the petals proportionate in breadth, and the colour rich and clear, and the florets evenly disposed so as to form a perfectly symmetrical flower, everything necessary in a Japanese bloom is attained. But in the incurveds we must not only obtain size, but also depth, and what is perhaps more important, solidity of petals; and blooms which lack any one of these requirements are not perfect. If the diameter of a bloom of any of the "Queen of England" section is 5 inches, and the depth 2 inches, the bloom is not properly developed.

I have, perhaps, entered rather too fully into the requirements of the blooms, and especially those belonging to the incurved section; but having seen so many mistakes made by exhibitors in ignoring essential points, I am impressed with the idea that beginners cannot have the matter placed before them too plainly. There is too much hankering after size in incurved flowers, and beginners sometimes have the idea that early crown buds give the largest blooms—and so they will in diameter, perhaps; but if they are "taken" before the middle of August, the blooms are sure to be rough as well as "thin," and quite useless in competition against flowers that were not taken until somewhere near the 25th of the same month, or the following week. Earlier-formed buds develop florets that are more inclined to reflex than incurve, when this tendency is common. In these cases the opening blooms should be turned upside down by removing the branches from the upright stake, and making the branches equally safe by some other means. In the case of vineries or Peach-houses being employed, I usually tie the branches to the wires, and bend the blooms downwards. In this manner the florets incurve much better than they will do when growing upright. Daily attention is necessary in removing mis-shapen petals, for all the bending in the world will not make all the petals grow towards the centre. If these deformed petals are removed, those of perfect shape will fill their places, and grow evenly, making a perfect bloom. By following the details here given, the work of dressing the blooms is much facilitated when they are cut and ready for the exhibition stand.

Japanese blooms can be much improved whilst opening by the same means. Sometimes, the plants having received a check at the roots in some way or other, development in the flower is retarded; instead

of unfolding evenly and straight, the tips of the florets curl inwards, which is a deformity. A little attention paid to relieving such by the aid of the tweezers, is time well spent. The development of the blooms may be much retarded if insect pests are not well looked after. Earwigs are very troublesome, being partial to the succulent petals, and they will climb almost any height to get at them. Traps made of Bamboo-cane or Bean-stalks 1 foot long, thrust in amongst the leaves, still constitute the most efficacious manner of checking their progress and depredations. *E. Molyneux.*

ORCHIDS IN THEIR HOME.

We disembark, say at Savanilla U.S. of Colombia, or at the mouth of the mighty Rio Magdalena.

The river is navigable for a distance of 600 miles, and under favourable conditions, the voyage will take from nine to ten days, whereas under reversed circumstances it might take fifteen to twenty days. The lower parts do not offer much of interest to the traveller, as the surrounding country is very low and swampy. Indeed, large stretches are inundated, but after a time habitations and small towns begin to appear. Most of the habitations are built of Bamboo and earth; a good many consist simply of a few Bamboo poles secured in the ground, with a few leaves of *Cocos batyracea* tied on for roof and walls. The principal foods are corn, rice, Bananas, and Yuccas. The latter are the tubers of *Manihot utilisima* (known in commerce as Tapioca).

The vegetation on the Lower Magdalena is somewhat monotonous, but, gradually ascending, the number of species increases. The scenery in many places is magnificent; imagine the river banks covered with trees or shrubs of all descriptions, festooned with Vines and climbers down to the water's edge, forming a dense mass, here and there brightened by the presence of lovely flowers and beautifully-coloured birds. Behind this extends a beautiful landscape dotted with Palms, and in the background the blue chains of the Cordilleras, towering one above the other. The collector will feel not a little disappointed by the almost total absence of Orchids along the river, if it be his first trip.

After the terminus of the Lower Magdalena is reached a short railroad takes the traveller to Honda. Here the river forms some mighty rapids, which divide the Magdalena into sections, the Upper and the Lower. From Honda the only means of transportation left the traveller is on mule or horseback. After three or four days' hard riding on a stubborn mule over hot plains, wading rivers, climbing and descending hills, Ibaguè is reached. The latter used to be, and still is, to a certain extent, the centre for *Cattleya Trianai*. However, at present the plants are becoming very scarce there. Ibaguè is situated at the foot of the Tolima, a snowy peak, forming part of the central mountain chain of Colombia, and at an elevation of 4000 feet above sea-level.

WHERE THEY GROW.

One of the most important items to the collector is the finding of a good district, not only where plants are abundant, but also where a good strain of varieties may be obtained. This involves a great many hardships and inconveniences, but it certainly pays, though a good deal of money and time has to be spent before obtaining results. In districts where plants are plentiful and help easily procured, the collecting is, comparatively speaking, a pleasure compared to what the exploring trips are. Before commencing to gather the plants, a good central place must be selected as head-quarters—a place situated, if possible, in the district itself, or in the immediate outskirts, or, in short, in some place from which there is an exit permitting the collector to transport the plants on muleback. By head-quarters I mean a few ranches or tents pitched for the occasion in which to store and dry the plants and make cases, &c. When tents or ranches are ready, men are sent out in different directions in parties of twos and threes, after previously being shown what and how to collect. They carry provisions to last them sometimes for two weeks. They bury themselves in the mountains, ready to destroy anything in their way

bearing an Orchid. Whenever a plant is detected, the tree is cut down and the plant torn off from the trunk or the branches. The plants are packed in string bags, and carried down to the ranch. The vegetation is most exuberant in the Cordillera mountains, with their spurs and hills; rivers and streams, forming valleys and gullies, hollows and precipices impossible to describe or imitate; and in these secluded localities it is where the Orchida luxuriate, and where they display their magnificent flowers to the best advantage, inviting the collector to come and pick them, yet oftentimes defying every attempt to capture them. If the collector is a lover of plants, he will here see Nature in all its marvellous beauty. For a moment or two he is likely to forget himself, forget all hardships and worries, while a feeling of enthusiasm steals over him, leaving an impression which he will not soon forget. *J. E. Lager, in "American Gardening."*

(To be continued.)

PEA TRIALS IN LINCOLNSHIRE.

WHEN at Boston about the middle of July, I had an opportunity of seeing a large and very successful trial of Peas in the seed-trial grounds of Messrs. W. W. Johnson & Sons, seed merchants of that town. Mr. Alfred Johnson had spared no pains in getting together all the new varieties he could obtain; the seeds of which were sown in good ground. Every trial sample was staked, and all that good cultivation could do was done to ensure a complete test. To add to the success of the trial, the weather had proved highly favourable. For while the southern midlands, London, and districts stretching to the sea had felt the drought severely, most refreshing rain-showers had visited the Boston district; and while the pasture in the South was brown, in this portion of Lincolnshire it was living green. Peas had, therefore, done well, they had made a healthy clean growth, and developed fine well-filled pods.

Taking the earliest varieties, William Hurst and English Wonder (Barbury) led the way. The earliness, dwarfness, cropping qualities, and good character of William Hurst are well known; not so in the case of English Wonder, a dwarf early wrinkled variety, with dark green pods which fill well, the pods being a little pointed. I have heard this Pea so well spoken of in different parts of the country, that I am gratified to have my own high opinion of it confirmed; it is an excellent Pea for small gardens. Sutton's AI, an early indented variety, will be found very serviceable to those who prefer an early crop of the Ringleader type. But a coming early Pea will be found in Sutton's Seedling, a dwarf, first early, wrinkled variety, growing strongly in the fertile Lincolnshire loam, and not exceeding a foot in height, the pods pale green in colour, a little pointed, and well filled with fine Peas. As it was sent out only in the present year, it may not be widely known, but visitors to the Temple Show had an opportunity of seeing bearing plants of this Pea in pots. Sutton's Favourite Marrowfat, new in the present year, was doing well also, a wrinkled marrow, producing pale-coloured, broad square-tipped pods, well filled, the plants bearing freely, height 20 inches or so. Chelsea Gam was here also, closely resembling William Hurst, from which it is a supposed selection, but with pods more scimitar-shaped. Daisy, growing here to the height of 2 feet, is an excellent garden Pea to produce an early crop, it bears large full-pointed pods, and it is an excellent cropper, and valuable for small gardens. Witham Wonder, appeared to be a curved-podded variety of the English Wonder. Stanley (Horsford) is a promising Pea, a little taller in growth than Sutton's Seedling, producing large full-curved whitish pods, and an excellent cropper; like the preceding, a very useful variety for small gardens. Plentiful has all the character of a green form of Day's Sunrise, growing to a height of 2½ feet, coming in after William 1st, a rare cropper, producing straight well-filled pods, to all appearance a very prolific and hardy Pea for market gardens. Gradus, announced as a large-podded first early wrinkled variety, produces fine-pointed pods of the character

of those of Duke of Albany, but the work of selection is by no means complete, judging from what was seen at Boston. But with rigid selecting, a very good type of early Pea is likely to be produced; in height it is about 2 feet. May Queen, sent out by Messrs. Sutton & Sons as a first early wrinkled variety, as early as American Wonder, is one of the earliest in flowering and podding, and produces a fairly good crop of medium-sized pale pods. Here it was about 18 inches in height; it is an early variety well worthy a trial. A green form of Earliest of All does well in the sandy soil of Lincolnshire, and is considered valuable for market purposes. Sutton's Bountiful is a fine Pea, bearing pods somewhat curved at the points; it is in the way of Gladiator, but much earlier. Sutton's A 1 Marrowfat, which follows their May Queen in bearing, is a first-class Pea, having well-filled pods of good size; it should be noted as a valuable garden variety, at Boston it was from 2½ to 3 feet in height. Sutton's Empress of India is like the foregoing, a valuable garden Pea, it has large well-filled pods of the Duke of Albany type, somewhat pointed, a variety which appears to be becoming very popular in the country, height 3½ feet; it comes into bearing directly after William 1st. Oracle (Laxton), sent out as a main crop variety, produces very fine green pods and foliage; the dry seed a blue round, somewhat wrinkled; a second early of a fine robust growth—the pods containing on an average ten Peas. This a variety that appears to suit Lincolnshire well, and it grows to a height of 2½ feet. Gladiator may be described as in the way of Telegraph, but earlier, pods large and curved, 2½ feet. The foregoing may be said to form the section of first and second early varieties.

Among the main crop Peas, Laxton's Alderman must find a place; it grows to the height of 5 feet, and produces handsome large green pods, like those of Duke of Albany; and whether employed for garden or exhibition purposes, will be greatly esteemed.

Eckford's Critic, grows to about the same height, and produces very fine blunt tipped pods, and as seen here well deserved the three marks given to it in the Chiswick trials. Sutton's Royal Jubilee is a very fine late Pea, probably one of the latest, bearing large scimitar-shaped pods, 3 feet in height, very robust in growth. It may be described as a late Windsor Castle—it appears to be a Pea with a great future before it. Duke of York has appearance of being a selection from Duke of Albany, but earlier, and likely to be very useful. Censor (Eckford), is a Pea growing to the height of 2½ feet, having fine full dark green pods, slightly incurved, certainly a very fine garden variety. Yorkshire Hero was also here represented by a very fine stock, and still holds its own despite rivalry. Sharpe's Queen is a very robust grower, about 3 feet in height, pods large, green, slightly curved, a great cropper of a fine quality; apparently of somewhat delicate constitution, as it is subject to mildew. Sutton's Perfection Marrowfat appears to resemble the foregoing in many respects, but to all appearance a more robust grower. President Garfield is a Pea said to be difficult to keep true; it is of the same style and quality as Prince of Wales, but the seed is larger and more wrinkled. Prince of Wales is an old Pea of good quality, but needs improving by means of rigid selection; it is in considerable demand in some parts of the country. Consummate (Eckford), is very like Sharpe's Queen in height and general appearance. Satisfaction, in height 2½ to 3 feet, bears very fine and well filled pointed pods, and is said to be of excellent quality. Dr. Maclean, a fine old variety in considerable demand in the West of England, was also here in excellent character; and Veitch's Perfection, still a fine old garden Pea, was represented by a very fine true stock which crops wonderfully well, and which yet remains one of the most useful garden Peas. Invincible (Johnson), is a blue wrinkled variety, 3½ feet in height, bearing freely, very fine, slightly curved pods, the quality high. Autocrat is a most valuable late Pea, with medium-sized dark well-filled pods; a dwarf Ne Plus Ultra, height 3½ feet—it is ex-

cellent for shewing at late exhibitions. Sutton's Dwarf Mammoth Marrowfat is a very fine garden Pea, producing immense slightly-curved pods, extra fine for exhibition, height 3 feet. Sutton's Conqueror bears large white pods which curve back a little at the points, and the pods are apt to be a little indented; a very fine variety, in height 3 feet—a new Pea of the present year. Sutton's Late Queen is also new of the present year, pod the shape of that of Ne Plus Ultra, a little paler in colour, a robust grower and free cropper, and a fine garden variety, 3 feet. A Pea of unusual excellence is found in Johnson's Unrivalled, a dwarf and prolific wrinkled Marrow, somewhat of the character of Telephone, with large bright green pods, averaging ten Peas in a pod; height 4 feet—a fine and robust garden variety. A variety named George Clelland is a robust grower, with dark foliage, long deep green pointed pods of the Queen type, very promising; the plants were from a late sown sample introduced from America. Sutton's Windsor Castle appears like a selection made from their Royal Jubilee on account of its lateness; of robust growth, free cropping, large pointed, well-filled pods, very prolific, an excellent garden variety, height 3½ feet.

Of the taller section, Eckford's Epicure is an illustration, growing to the height of 6 feet, large, slightly curved Telephone pods, and a great cropper. Boston Hero, also 6 feet, is said to be the result of a cross between Duke of Albany and John Bull, and in Lincolnshire it requires to be grown in a rather dry, shallow soil; in a generous one, it goes very much to haulm—it is a very free bearer. Wem (Eckford) is a very tall grower in Lincolnshire, producing very large whitish pods of excellent quality in the seeds; it is a free cropper. Memorial (Eckford) is a deep green wrinkled Marrow, growing quite tall, with very long, slightly-pointed pods, promising to be very fine for exhibition.

In the next group appeared Telegraph, represented by a very fine stock, a variety in great demand in Yorkshire; a Leeds seedsman informed me that he sold more of this than of any other variety. Goliath appears to be a round-seeded form of Telephone, and yet distinct from Telegraph. Harrison's Glory and Bedman's Imperial represent two varieties largely grown for cooking purposes in winter; both were fully podded. Day's Commander appears to be King of the Marrows; Ambassador, a pointed-podded Ne Plus Ultra; Goldfinder, a very fine stock of Ne Plus Ultra, as it is exactly like it. Duke of Albany, one of the Peas most generally grown, was very fine here.

I had opportunities of seeing some of these Peas growing in large breadths in open fields, where, they were, of course, not staked. Here Sutton's Bountiful was very fine, apparently ready to gather four or five days after Earliest of All; a fine market variety. English Wonder was really superb in the open, as early as any variety, green in foliage and pods—literally a mass of well-filled pods. So prolific is it, that I was informed a short time ago by Mr. J. Perkins, of Northampton, that he had harvested 5½ bushels of seed from 1 gallon of seed—a return of over 44 fold. Sutton's Early Marrowfat is also a very fine market Pea, bearing heavily. Sutton's Dwarf Mammoth Marrowfat may be regarded as an improvement of Stratagem; on an extensive plantation the individuals were found to be bearing large, well-filled pods in pairs. Windsor Castle is also a fine field Pea; the same may be said of Invincible. Market gardeners should keep an eye on both of these. Sutton's Exhibition Marrowfat under field culture produces large curved pods, and is a great cropper—a fine variety for late exhibitions; height, 3½ feet. Duke of York (Cooper, Taber & Co) seemed better under field culture than when staked; it was producing a wonderful crop of fine pods. Superabundant (Eckford) was very fine under field culture; it is a flat-podded variety, and very prolific. Sutton's Magnum Bonum Marrowfat, which grows to a height of 3 feet, is a grand cropper, producing very fine pale-green pods, slightly curved. Gradus (Harrison & Sons) was in the field as early as Earliest of All; it bears pointed

Pods, is a great cropper, and excellent for field culture. Sutton's Royal Jubilee is a vigorous grower and heavy cropper under field culture. Critic and Censor were also very good.

That it may be fairly said we have too many Peas, there can be no doubt. Messrs. Hurst & Sons' catalogue for the present year contains 122 names, and of these a few may be accepted as synonyms; perhaps the growth in numbers is not very remarkable after all, for their catalogue issued in 1852 contained forty-nine varieties. It is perhaps well to have an ample choice to meet individual tastes, and adapted to certain localities; still there is an amount of bewilderment in the contemplation of so many, and the differences between some are only very slight. Perhaps the old adage, that it is possible to have too much of a good thing, may be accepted in the case of Peas; and it does appear as if the list is likely to be extended rather than reduced. Certain it is, that no one who values Peas as a cooked vegetable can fail to have his taste gratified among so many claimants to his favour. *R. D.*

BERLIN.

CYPRIPEDIUM Charlesworthii is one of the best *Cypripediums* of its class, as was shown here at the last meeting of the Horticultural Society, by Mr. Lackner, of Steglitz, near Berlin. Young plants imported in 1894 were beset thickly with flowers; a good many of them bore two flowers upon one stalk. There were two forms, one with the upper sepal folded backwards, thus resembling *C. Spicerianum*; the other one with this petal quite flat. In the large collection exhibited there were differently coloured forms: the most interesting one, an imported plant of this year, had a dark red petal. *Vanda Kimballiana* is also a fine plant when in flower. Mr. Lackner exhibited more than 100 plants, all flowering at once—indeed, a fairy-like picture. The cut flowers of this, as well as of the *Cypripedium*, keep fresh in water for over three weeks, whilst they last upon the plant for from two to three months.

A very fine new *Dahlia* of the Juarezi group, the colour of "La Reine Rose," won a First-class Certificate from the Horticultural Society. The grower was Mr. Schwiglewski, of Carow, near Berlin.

Helianthus rigidus (?) is a giant among Sunflowers. A flower-stalk of 4 mètres 35 centimètres (about 14 feet), was exhibited at the last meeting.

A large International Horticultural Exhibition will be held at Berlin in the spring of 1897, when the Horticultural Society will celebrate its seventy-fifth birthday. The Society has granted 50,000 marks for medals, &c. A new feature at this exhibition will be a section for amateurs. It is proposed that only such amateurs as grow their plants without any help from a gardener shall be allowed to exhibit in this section. Another clause runs thus, that only such plants shall obtain a prize as have been cultivated by the exhibitor for at least one year. Of late years it has been observed more and more here, that the highest prizes are taken not by such gardeners as cultivate the best plants, but by those who have the most money, and can therefore buy up the most and best plants. The amateur section of the Horticultural Society thinks that this is wrong, and therefore has framed the above clause, which will bring the prizes within the reach of the best growers.

PALMS IN LIVING-ROOMS.

Some good Palms for living-rooms are the following, judging by those in my collection; *Elais guineensis*, the West African oil Palm; it grows thus very well, almost better than in a nursery. *Pinanga javanica*: this highly interesting Palm is somewhat difficult to root. I potted my plant in a large pot, containing saw-dust, so that the earth maintained a more equable temperature; since then the plant has grown rapidly. The leaves are reddish when young, and afterwards become bright green. *Chamædorea corallina* needs time before it can

accommodate itself to the dry air of a living-room, as the older leaves are apt to turn black; but once acclimated, it grows rapidly. A very fine Palm, which is quite hardy, is *Martinezia caryotifolia*; it grows very well. One of the most rapid growers is *Wallichia caryotoidea*, of which I have young plants about a year old and a foot high; they have from five to six leaves. My *Phoenix humilis* is a most delicate plant; it is like *Cocos plumosa* in habit, but of as graceful form as *Cocos Weddelliana*. This latter gave me much trouble at first, until I learned that the plant disliked much water. It became yellow when I watered it too much; it is now turning dark green, since it has received as little water as possible. The *Cocos Datil*, on the contrary, cannot get water enough; indeed, it is a plant which grows best in a swamp. Here it in a short time attains immense dimensions; my specimen, one and a half year old, is about 1 mètre (3 feet) high. A somewhat more difficult plant to grow is *Areca rubra*. I had two large specimens, one more than 6 feet high. Both died without my being able to tell why. Now I am experimenting with a young plant about a foot high; this is doing very well. A very hardy and fine Palm is *Hyophorbe Verchaffeltii*. Very variable plants are the *Chamærops humilis*. I have three large specimens, but all three are so different one from the other, that they might well belong to three distinct species. My collection of Palms, containing some thirty species, and about sixty or seventy specimens, gives me much pleasure, as I grow the plants from seed. The plants are accustomed from the first to the dry air of a room, and many a species, cultivated in the hot-house in nurseries, grows well in my rooms without any other attention than a protecting pot containing saw-dust—for, as I have found, the roots are the weakest organs of the Palms.

Ageratum mexicanum flore roseo: this long-desired variety, with pure rose-coloured flowers, was exhibited by F. C. Schmidt at Erfurt; the new variety will certainly become popular in gardens. *Pueraria Thunbergiana* is a leguminous climber from Japan; its habit resembles a giant Bean, and in foliage also. The flowers, crimson-red, are set on long, straight spikes, which appear on the outmost apex of the plant. The plant is perennial, quite hardy here at Berlin. Its greatest merit is, that it grows rapidly; a two-year-old plant in the nursery of Mr. Späth, at Rixdorf, near Berlin, who imported the seeds from Japan, measures now about 12 mètres (about 36 feet). *Amaryllis Belladonna* does not thrive when grown in pots. A very fine plant, with over a dozen flowers, was exhibited by the gardener of the famous Wörlitz Park, near Dessau, at the last meeting of the Horticultural Society at Berlin. It is hardy at Wörlitz, where it grows best in warm, sunny borders near walls; here at Berlin it is necessary to protect the plant during the winter. *Paulownia imperialis*, which here must be protected during the winter each year, and which, notwithstanding, often dies, is best grown as an undershrub. If the plant is cut down yearly in the autumn to a foot high, and then protected, it sends up in the spring a great many shoots, the tallest of which reach a height of more than 4 mètres (13 feet). Treated thus, the plants form bushes of unrivalled beauty. *U. D.*

ORCHID NOTES AND GLEANINGS.

EPIDENDRUM GODSEFFIANUM.

This is perhaps the most handsome of its section, and well away from the merely botanical class of *Epidendrum*, its tall branched spikes of large yellow-ground coloured flowers, veined with purplish-brown, and with ample white lip veined with bright purple, making it a really handsome species. As its flowers endure for a very long period of time, it is a very desirable plant. It was imported by Messrs. F. Sander & Co., of St. Albans, with the true *Cattleya labiata*, and named in honour of the manager of the St. Albans Orchid nursery.

A very fine form of it is flowering with C. J.

Lucas, Esq., Warnham Court, Horsham (gr., Mr. Duncan).

CYMBIDIUM GIGANTEUM.

Although one of the earliest-known species, and one which has been represented in collections for over sixty years, this fine species has become rare, although it has much grace and beauty. A very fine variety, having long sprays of flowers, in colour yellowish, closely striped with purple, and with bright yellow lip spotted at the base with purple, and at the apex with brownish-red, is in flower at Sunningdale Park gardens. The plant is one of a small collection brought by Mr. Joicey, jun., from the Himalayas.

SOBRALIA LINDENI.

Under this name a few fresh imported tufts of *Sobralia* were sold by Messrs. Linden, of Brussels, at Messrs. Protheroe & Morris' Rooms in Cheapside, on September 12, 1893. A flower from a specimen then purchased is kindly forwarded by C. J. Lucas, Esq., Warnham Court, Horsham, and, as Mr. Lucas says, it certainly a most charming species. The flower is large, the sepals and petals of a delicate bluish-white, and the lip is also bluish-white on the basal half, but the front portion is of a rich deep crimson-purple, shading off into a nearly blue tint towards the margin. This finely-coloured area is traversed by well-defined branching white lines, which make it a very distinct feature. At a distance the flower resembles a light form of *Cattleya Luddemanniana*.

THE PUBLIC PARK AT DARLINGTON.

Most large towns are now in possession of public parks and flower-gardens, but few possess one which has so many charming features as Darlington in its situation and surroundings. It is distant but 1 mile from the centre of this fine old town, which, among other things, is celebrated for its connection with George Stephenson, of railway fame, and contains in the railway station the redoubtable No. 1 engine and tender by which the first railway journey was made. Darlington was honoured this year by a visit of the Royal Agricultural Society of England, and the many visitors to the town which this visit occasioned were drawn to the public park, whose excellent keeping and numerous fine features came in for well-deserved eulogy. The approach to the chief entrance to the park on the town side is a broad, well-kept road, bounded on the right by the river Skearn and the public gymnasium; on the left, by a row of villas, having well-kept front gardens. The park, together with the lake, has an area of 46 acres, and entrance is made to the park through ornamental gates of iron, having lodges at the sides, and a broad road with an avenue of promising Lime-trees that were planted fifteen years ago when the park was enclosed by the corporation of the town. Since that time, much work in laying-out, tree-planting, and otherwise improving the park, has been carried out by Mr. James Morrison, the superintendent.

The natural undulation of the ground lends itself well to the methods of planting and bedding-out which are adopted, there being no elaborate geometrical design of flower beds, but something fresh and novel takes the eye at every turn. The pavilion and superintendent's house are beautifully situated on the terrace; on the grass slope below the terrace and in front of the pavilion, are five designs in carpet bedding; the centre bed of the five being a large circle, carefully planted, so as to represent the arms of the borough of Darlington, surmounted by a naked arm holding a pickaxe; below this the No. 1 engine, with two trucks, and the hales of wool, and the head of a bull; on the quarter surrounding the arms the words "Insignia Burgi de Darlington;" and below is the motto on a scroll, "Floreat Industria." The groundwork consists of *Antennaria tomentosa*; the engine and bull's head are worked out with the dark-leaved *Ajuga reptans*, the letters and woolpacks with golden-leaved *Pyrethrum*, and a bordering of a dark blue *Lobelia erinus*. The two

beds which are on either side of the borough arms, represent eight rayed stars, outlined with *Echeveria glauca*, the centre of one of them containing a representation of the royal crown, in *Pyrethrum*, on a groundwork of *Herniaria glabra*, the jewels being represented by crimson and blue flowers; the other bed is planted so as to represent the crest of the Prince of Wales, the feathers being worked out with *Mesembryanthemum cordifolium variegatum* and *Pyrethrum*, and the motto, "Ich Dien," is shown on a groundwork of dark green. The beds at each end are circular, and are surmounted by a crown; in the centre of the circle are the letters R. A. S. E., the monogram of the Royal Agricultural Society of England. This is enclosed by a Garter, bearing the motto of the Society, "Practice with Science;" and below each bed, on a scroll, are the words, "Welcome to the Royal." [The Darling-

edging of *Cerastium*, and dotted with *Dactylis glomerata*. A bed of golden *Pelargoniums*, Harry Hieover, with a broad band of *Viola Mulberry Queen*, dotted over with *Lilium auratum*; a bed of mixed single-flowering tuberous *Begonias*, dotted with *Hydraagea paniculata*, was good. In another, silver and green-leaved *Pelargoniums* were planted together; in another *Love Lies Bleeding* was intermixed with blue-flowered *Lobelia* and *Dracæna indivisa*.

As will be imagined by the reader, the talent of the superintendent in devising pleasing mixtures of flower-beds is of no mean order, and I could very considerably lengthen my list of combinations, did it appear desirable to do so. The *Pentstemon* finds abundant use in the park, mixed with *Violas* and *Musk*, &c. *Lilium longiflorum* var. *Harrisii*, *Dahlias*, *Gladiolus*, *Enlalia gracillima*, and *Ficus elastica* are

viz., *Abies concolor*, *Thujaopsia dolabrata*, *Tunga canadensis*, *Cupressus Lawsoniana variegata*, &c. A large lake for skating and boating is supplied by water from the river Skearn.

The lake is furnished with several islets, grottos, and waterfalls. The shrubs and trees with which the isles are planted consist of golden-leaved *Elder* and *Willow*, the latter having leaves of light green tint, and the whole contrasts well with the surrounding trees. Some old *Willow* trees of large size growing near the lake contribute greatly to the general good effect seen in this part of the park. For the amusement of the public, boats are placed in the lake, and bowling, croquet, and lawn-tennis grounds have been laid out. Some useful span-roofed houses stand in the garden, together with cold frames, and pits for the propagation of the great number of plants that are required for the beds and borders. *Spergula arvensis aurea*, a small yellow-foilage plant suitable for carpet bedding, has been largely increased for use another season, and a large stock of *Viola Countess of Hopetoun* is in course of preparation. B. W.

VEITCH'S SCARLET MODEL CARROT.

This new variety of Early Horn Carrot, shown in our illustration (fig. 75), belongs to the stamp-rooted class, of which *Nantes* and *Carentan* are good types of late varieties. In this class the root has an almost equal diameter at top as at bottom, and there is, therefore, less of the central watery portion. The variety is well adapted for hotbed and early out-of-doors sowings, coming quickly into use. When full-grown it makes an excellent exhibition specimen-root, as was well observed at the vegetable show at Chiswick on September 5 last, in roots grown by Messrs. R. Veitch & Son of Exeter.

PLANT NOTES.

LYGODIUMS AS ROOF AND PILLAR PLANTS.

THESE plants are especially adapted for covering roofs and pillars in glasshouses. They are evergreen stove or warm-house plants, and in most cases the stems are better left until they turn brown, but in the case of *L. japonicum*, it will be found best to train up fresh foliage each year, entirely removing the old stems. The compost should be a rich one, as they are vigorous-rooting plants, and when the soil becomes filled with roots, they will be benefited by liberal applications of liquid-manure. The species best known, and most useful in our gardens are *L. japonicum*, a native of the tropics of the Old World, and a very elegant light-growing plant, the lower fronds upon its stems being barren and less divided in the segments than are the upper and fertile ones. For covering the roof or a back wall, this is perhaps the best.

L. dichotomum is of a much more robust habit, producing a profusion of dark green foliage, the stems of which are much stronger, and last in good condition for two or three years; this is a native of Tropical Asia. *L. venustum*, introduced about 1850 from the West Indies, &c., is a most desirable plant. The hardiest species is *L. palmatum*, a native of the United States of America, a rather small but useful pot plant, with small four to six-lobed palmate pinnules; the fertile pinnules are much divided, and give the plant a distinct appearance. Other species less often observed in gardens are *L. pinnatifidum*, *L. articulatum*, a New Zealand plant forming a good stage plant, and *L. reticulatum* from the Polynesian Isles. In some cases these plants will not take kindly to the division of their rhizomes for propagation, but remain stationary after the performance, but ultimately start into growth. Where spores can be obtained (and they are freely produced upon some species), they should be utilised for their increase. R. L. Harrow.

FIG. 75.—CARROT, SCARLET MODEL.

ton people will not be long before they recognise the incongruousness of such decorations. Ed.]

On the terrace were some good examples of bedding, in which the blaze of scarlets, pinks, and other colours was toned down by dot plants of a graceful character. *Pelargoniums*, at the time of my visit, were in good bloom, better than I had seen them at places further south. Some fine beds consisted of blue and white *Lobelias*, with *Harrison's Musk* as groundwork, the latter just showing through the *Lobelia*, the bed being thinly dotted with small plants of *Grevillea robusta*. One good bed was planted with *West Brighton Gem Pelargonium* and dark *Heliotrope Garibaldi*; another had *Pelargonium John Gibbons*, dotted with *Abutilon Thompsoni variegata*. Other beds consisted of *Henri Jacoby Pelargonium*, with thin lines of the variegated *Grass*, *Dactylis glomerata*, planted diagonally across the beds. Some raised beds were edged with *Echeveria secunda glauca*, and planted with blue and white *Lobelia* and *Love Lies Bleeding*. Another bed had a filling of *West Brighton Gem*, and an

much employed, and the usual class of subtropical plants lend grace and beauty of leaf to the more sheltered parts of the ground. *Roses* are in excellent condition here, and although the plants were cut down to the snow-line by frost last winter, very few were lost, and they have since made vigorous growth and flowered well. Many of the best varieties are to be found here, and the soil appears to be very suitable for the *Rose*, as well as for *Gladiolus Brencleyensis*, the latter being planted early in the spring between the *Roses*, so that a bright mass of colour is obtained in the beds when the *Roses* are past. Many of the spikes had three and four branches. The herbaceous border occupies a good position between a large tennis-court and a bowling-green, and is 30 feet wide, and 200 feet long. The plants with which it is planted seem very well chosen, and consisted chiefly of *Pæonies*, *Poppies*, *Delphiniums*, *Phloxes* and *Helianthus*; *Cactus* and other varieties of *Dahlias* being planted amongst the perennials for affording an autumn display. In a small arboretum near the band stand, are nice specimens of *Conifers*,

DUNEDIN, STREATHAM HILL.

THE residence of N. Sherwood, Esq., head of the well-known firm of Huret & Son, seed merchants of Houndditch, London, is a model of a pleasant retreat within easy distance of the City, and around it the gardens are in keeping with the comfortable dwelling. Within their moderate limits something of every branch of horticulture is done in a creditable manner, the whole forming a pretty and interesting example of what may be accomplished in the space usually allotted to the suburban garden. Adjoining the house is an ornamental octagonal structure, whose interior is converted into a beautiful rockery planted with Ferns, and over which a miniature waterfall runs into an ornamental basin beneath. A pleasing feature in the rockery is that no crude imitation of nature is attempted, such as one often sees in rockeries under glass, and which seems altogether out of place under a roof; but, rather is the rock of the stalactite cave imitated, and that, too, with happy effect. From the terrace outside the Fernery the eye takes in the smooth well-kept lawn, bounded on each hand by borders, etill gay with flowers, and especially with the late-flowering annuals, which also make such a fine show among the Gladiolus in the garden at the end of the lawn; and through which runs an arched path, clad with Roses and climbers, having fragrant flowers. Striking objects on each side of the lawn are clumps of Rhododendrons, large Arancaria imbricata, Cedar of Lebanon, and other trees, all of which have been planted with a view to effect. The show of flowers in the open garden may now be quickly terminated at any time, and then the beauties of the stately trees and ornamental shrubs will become more visible.

Of chids of the showier species have for a considerable time been grown at Dunedin with success, so far as the cool-house species, which are most liked by Mr. Sherwood, are concerned, and the success is in a great measure due to the suitable house provided for them. The ground beneath the plant-stages not taken up by the rain-water tanks is planted with Ferns, foliage Begonias, &c., the foliage reaching up to the staging which runs on each side, and over the edge of which depends *Isolepis gracilis*, mingled with Maidenhair Ferns. Such an arrangement is not only beneficial to the plants, but makes a pretty feature in the house. The bulk of the plants consist of *Odontoglossum crispum*, which, judging by their stout, plump pseudo-bulbs and the many robust flower-spikes, show the correctness of the treatment afforded by Mr. Jones, the gardener. Here, too, the *Masdevallias*, *Ocicidium mecranthum*, *Odontoglossum Edwardi*, and others of that class thrive, and are at the present time sending up flower-spikes; and a row of *Sophrontia grandiflora* represents that pretty cool-house plant at its best.

At one end of the house are several strong plants of *Ceogyne corrugata*, which thrive here, and bloom profusely grown with the *Odontoglossums*. In many places where it is grown in warmer houses, the plant does not flower, and in some cases soon perishes. Among others, *Masdevallia bella* and *Odontoglossum grande* are in bloom, and many others well advanced in bud. Near the cool house is a small, rock-lined, unheated nook filled with very fresh-looking specimens of *Todea superba*, *Todea pellucida*, &c.

At the end of the Cattleya-house is a group of *Dendrobium formosum giganteum*, *D. Phalenopsis Schroderianum*, *Cattleya maxima*, *Ocicidium Jonesianum*, and other showy species; and in the small warm-house beyond, *Dendrobium Johnsoniæ* and other hot-house *Dendrobiums* are thriving. The Cattleyas are the least satisfactory, probably owing to a difficulty in applying bottom ventilation on one side of the house, but to obviate which an attempt is being made. In this house variegated *Panicum* and *Pellionias* trail over the stages with pleasing effect.

In another little house, a batch of *Miltonia vexillaria*, *Ceogyne cristata*, and the *Cypripediums* are

doing well. Then follow a house of *Cyclamens*, *Primulas*, and *Bouvardias*, and a very pretty rock-house planted with Ferns, foliage *Begonias*, and other ornamental plants, and with the trailing *Ficus stipularis* clinging to the rock; and at the end a Fern-house is reached, in which the different varieties of *Gymnogramma* are truly magnificent, the large specimens of gold and silver varieties being specially beautiful. The *Adiantums*, too, are good, as also fine plants of *A. Farleyense* and other Ferns, which are arranged with the *Gymnogrammas*.

FRUIT REGISTER.

THE STRAWBERRY-RASPBERRY.

THIS magnificent fruit is one not generally known; it is a native of Japan, and is known botanically as *Rubus sorbifolius* [= *rosæfolius*?]. In manner of growth, it is somewhat similar to our common Raspberries. The young plants commence bearing when only about 2 inches high, and full-grown bushes yield heavy crops of fruit. The leaves of this plant are somewhat like a Rose bush. The fruit is of large size, a brilliant red colour, and very deliciously flavoured; it resembles a huge Strawberry very much, and hence the name, Strawberry-Raspberry.

Being such a fine fruit, and so different from all other kinds, it will be widely cultivated when better known. It can no doubt be used for every purpose that our Strawberries and Raspberries are put to. In regard to hardiness, I believe it will succeed over a wide range of country. *S. L. Watkins, Grizzly Flats, California*, in "*Canadian Horticulturist*."

THE WEEK'S WORK.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, Fork.

CLIMBING PLANTS.—Those that are planted against walls, pillars, or on rustic-work of any kind, and which have grown strongly, should have the strong shoots thinned out, and then be nailed or otherwise secured. Most persons prefer a free mode of securing climbing plants, so that their natural habit is not overmuch constrained, and any severe cutting-back at this season should be avoided, especially of those which are evergreen.

IVY.—This, if of rampant habit, should have all the shoots that are not clinging fast to whatever they are growing against, removed, but on no account should the foliage generally be cut off at this time of the year. The planting of Ivy wherever it is required may now be done, and beyond the necessary securing of the plants quite close to the wall, &c., after the soil has sunk, not much further training is called for, it being better for the young plants to get strong at the base, and form a good foundation of young shoots that will cling to the wall of themselves. Edgings of Ivy will, after a few years, become weedy, and impossible to clean. In such case, it is the best practice to take up the plants of which the edgings consist, dig the ground, adding new soil and leaf-mould, and planting it with young plants.

AMPELOPSIS QUINQUEFOLIA, and other species that have grown out away from the wall, should have the shoots thinned where growing too thickly and heavily. The shoots themselves have a graceful appearance when the foliage has fallen, but care should be taken to make them secure against the wind.

JASMINES.—The evergreen species should be thinned, and treated in the same manner as *Ampelopsis* for the present. *Jasminum nudiflorum* is now generally coming into bloom, and the shoots should be left in the way they have grown till flowering is past.

CLEMATIS FLAMULA (Virgin's Bower), and *C. vitalba* (Traveller's Joy), should be left for the present in their wild beauty, also the hybrid garden varieties, although these last will require to be made secure against the wind. Most of them are secure enough if there be anything to which the shoots and tendrils can cling to or twine around. This year the *Clematites*, &c., have grown and bloomed luxuriantly. *Chimonanthus fragrans*, *Choisya ternata*, *Cotoneaster microphylla*, *C. Simonsi*, *Cratægnæ*

pyracantha, *Cydonia japonica*, *C. Manlei*, *Elaeagnus reflexa*, *Eucallonia macrantha*, *Garrya elliptica*, and the various species of *Lonicera* may now be planted, care being taken to have the drainage made good. Fibry half-rotted loamy leaf-mould and rotten manure make a compost for these plants, which affords them a good start.

RHODODENDRONS.—The present is a good time to make new beds of peat or light fibry-loamy soil for these plants. The soil, if it must be excavated, should not be less than 2 feet in depth, and the sub-soil if not naturally drained must be artificially denuded of its moisture. If lime be present in the staple, every means must be adopted to keep the water from it getting into the peat. In some districts a mixture of peat, leaf-mould, loam, and burnt refuse will grow these plants satisfactorily, as also *Pontica*, Ghent, and mollia *Azaleæ*. *Kalmias*, *Andromedas*, *Ericas*, *Gaultherias*, *Menziesias*, &c., although a peaty soil is best. Provided these plants are well furnished with root-masses, the planting may proceed in mild weather till the end of November. The present season will be favourable for obtaining plants with well-matured wood and plenteous flower-buds.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

CATTLEYAS GIGAS AND DOWIANA AUREA.—

Owing to the large consignments of *Cattleya gigas*, *C. Dowiana aurea* and its variety *chrysofoxa*, that reach us at this season, the excellent condition in which they arrive, and from the fact that they may be purchased for low prices, many new growers may attempt their cultivation, and to such a few hints on their management may be useful. Immediately they are bought, carefully sponge them with tepid rain-water, and thoroughly examine every bulb for the *Cattleya-fly*. The pest may be found in the deformed pseudo-bulbs, or if a small round hole be observed in any part of the bulbs, its existence is proved. Sometimes these insects appear in the new growths when they are only a few inches high; the growths then commence to swell at the base and to gradually taper off thinly at the top, and make but little further progress. When the plants are so affected the young growths should be cut off and burnt immediately. If once the flies are allowed sufficient time to establish themselves in the house, it is impossible to eradicate them before much damage has been done, and perhaps many valuable plants irretrievably ruined. After the imported plants have been well cleaned they should be placed singly in the smallest pots possible—just large enough to allow for one season's growth. The pots should be nearly filled with rough drainage material, then hold the plant a trifle above the rim of the pot and fill up to the rhizome with smaller crocks, and steady the plants if necessary by tying the pseudo-bulbs to neat stakes, but use no moss or peat. The crocks in which the plants are placed should for a time be very sparingly watered. This being the season in which the plants make most roots, these will soon commence to push out from the last-made pseudo-bulbs, when the plants may then be supplied with peat and sphagnum-moss in equal parts. This should be packed firmly around the roots, intermixing with the compost a few thick pieces of crock to keep it open and to prevent decomposition. These newly imported species should not be subjected to the *Cattleya-house* temperature now, otherwise the dormant eyes which are showing at the base of the foremost pseudo-bulb will probably start away into growth before proper root action commences, and although the plants may make a fairly good pseudo-bulb, they will not, owing to the lack of sunshine during winter, become properly matured, and when their natural season arrives for growth, those plants that break again will be weak and unsatisfactory. It is not possible to prevent every imported plant from making new growth now, and those which do start should be given encouragement, by heat and moisture, to grow quickly. The primary object should be to induce root-activity, and prevent growth as far as is practicable. While the growths are dormant, keep them in the coolest part of the intermediate-house, where water will only be required occasionally. Some growers use Teak-baskets in preference to the ordinary flower-pot, but I see no advantage in doing this, as baskets are very liable to decay. Baskets are light and convenient for suspending the plants close to the roof-glass; but where low-roofed houses exist, the plants when in pots are just as easily brought to the light, and are more under the grower's eye.

THE HARDY FRUIT GARDEN.By W. POPE, *Gardener, Highclere Castle, Newbury.*

DIFFERENT ASPECTS FOR WALL TREES.—Some amount of care and forethought are needed in selecting the most suitable aspects for different sorts and varieties of fruits. In most districts, south walls are best suited for Apricots, Peaches, and Nectarines; but here, and doubtless in many other places, a west aspect suits them better, Apricots being healthier, and Peaches more free from leaf-blisters in such an aspect. A Cherry-tree or two, if the fruit is wanted early, however, should be given a place on a south wall, good varieties for this purpose being Mayduke and Black Tartarian. Three useful Plums well deserving the same aspect are Rivers' Early Favourite, July Green Gage, and Early Prolific. A few early Pears, which should be cordons, as the fruits are not often required in large quantities, might be Doyenné d'Été, Jarzonelle, Williams' Bon Chrétien, Clapp's Favourite, Berré d'Amant, and Souvenir du Congrès. These should not be left on the trees till fully ripe, but gathered as soon as they show indications of ripening, or they will be mealy and insipid. Figs in the southern counties generally do well on south walls, Brown Turkey and White Marseille being good varieties. If space can be found for a few cordons of red and white Currants, they will be found of great service in somewhat lengthening the season. Of Apricots, Hemekirk, Kaisha, New Large Early Peach, and Moorpark are among the best. Good Peaches are Alexander, Hale's Early, Early York, Dr. Hogg, Grosse Mignonne, Belle de Doué, Dymond, Noblesee, Violette Hâive, Barrington, Walburton Admirable, Stirling Castle, Sea Eagle, and Salway. Of Nectarines, Early Rivers, Balgowan, Violette Hâive, Stanwick Elrage, and Humboldt are good. Walls with an east aspect are best for the main crop of Cherries and Plums. Good varieties of the former are Werder's Early Black, Reine Hortense, Early and Late Duke's, Bigarreau Napoleon, Black Tartarian, Early Jaboulet, and Elton. Of dessert Plums, Green Gage, Donnion's Superb, Huling's Superb, Jefferson, Kirke's, Transparent Gage, Coe's Golden Drop, Reine Claude de Bayay, De Montfort, Monarch, Grand Duke, Angelina Bardett, Blue Imperatrice, Ickworth Imperatrice; and of culinary varieties, Early Prolific, Orleans, Prince Eaglebert, Pond's Seedling, Victoria, Magnum Bonum, Diamond, Belle de Septembre, and Gibborne's. West walls are good for Pears. Berré Superb, Doyenné à Comice, Durondeau, Maréchal de la Cour, Marie Louise, Thompson's, Berré Diel, Pesse Colmar, Berré Bachelier, Easter Berré, Les Plus Meuris, Marie Louise d'Uccle, Emile d'Hayet, Glou Moréau, Pitmaston Dacches, Souvenir du Congrès, Madame Treyve, Winter Nelis, and Josephine de Malines being some of the best for the different seasons; while for stewing there is nothing better than Castillac and Belleime d'Hiver. North walls are especially useful for Morello Cherries, of which it is hardy possible to have too many. Red Currants should also be planted in quantity on this aspect, and a tree or two of the Victoria Plum, if room can be spared.

PLANTS UNDER GLASS.By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

FREESIAS.—If these bulbous plants are required in bloom at the end of the month of December, a batch of them should be placed in a house having a temperature of about 60° at night and 65° by day, and afforded plenty of water; and when the pots are filled with roots, some suitable fertilizer may be used. The blooms of Freesias are very useful for cutting, and a succession of them may be obtained throughout the winter by placing batches of the bulbs in heat at intervals of three weeks. Place sticks to the plants when 3 or 4 inches high, and syringe them frequently in bright weather.

DOUBLE-FLOWERED PRIMULAS.—These plants should be removed to a house having a temperature of 55° by night, and 60° by day. Such a house, if admitting plenty of light, will suit them admirably if they be placed close to the glass on shelves. Here they may remain till flowers appear, when if desirable, they may be placed in the conservatory. These Primulas require much light and plenty of space in which to develop their leaves, or the latter soon spoil.

POINSETTIA PULCHERRIMA.—These plants should now be afforded a temperature of 60° by night and about 70° by day, and a liberal treatment if large bracts are looked for. Always keep the

plants near the glass, to prevent drawing of the stems and leaf stalks.
