FLORISTS.—Young Lady desires an engagement in or near London. City preferred. Experienced in Table Decorations, &c.—**V. M.**, 10, Taagley Park, Hampton-on-Thames.

TOO MUCH STRESS cannot be laid on the fact that in the whirl of unnatural excitement, and in the struggle for existence in this generation, no attention whatever is vouchsafed to the most ordinary rules of health. When the muscles become relaxed, the nerves over-sensitive, and the brain wears at the slightest task, these symptoms are part of Nature's warnings that the delicate organism of the human frame is out of gear. In most cases a gentle stimulant and mild restorative is all that is required to impart fresh vitality to the jaded nerve, and it is a well-known fact that a few doses of **HOLLOWAY'S PILLS** work wonders and restore the lost tone of the nervous system.

WATER SUPPLY!! — WATER SUPPLY!!!

SEND FOR ILLUSTRATED LIST, No. 27, of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For RAISING WATER for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from 300 to 400,000 gallons per day. Will force to a height of 800 feet.

FIG. A.—This ram lifts part of the same water that works it. (Engraved from Photo. of Ram which raises 250,000 gallons per day of 24 hours to medium heights, with good working fall.)

This View represents a Ram worked by impure river water, whilst pumping pure water from a well or spring and forcing it to a small reservoir on the hill, at an elevation of 523 ft., and a distance of one mile, from which reservoir the water is gravitated for fire-extinguishing and general requirements of mansion, stable, farm, and village.

FIG. B.—This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

TESTIMONIALS.

From T. FERNYHOUGH, Esq., Agent to the RIGHT HON. LORD HINDLIFF, Braaley, Ashbourne, Derby. March 17, 1894.

DEAR SIR,— Referring to the two Patent "B" Rams you started six months ago for the Right Hon. Lord Hindlip, on the Alsop-an-le-Dale Estate, I am glad to congratulate you on the success of your attempt to raise the necessary supply of water under conditions so difficult, the height to raise the water being more than 63 times that of the working fall. The Rams are worked by water from the River Dove, with the small working fall of 8 ft. 3 ins., and issuing from the rocky bank close by is a copious stream of pure spring water, 8000 gallons per day of which the Rams force to a reservoir three-quarters of a mile distant, and at the extraordinary height of 523½ ft. above the Rams. The water is then gravitated from the reservoir to the several farms and houses on the estate, giving an ample supply to each, and still leaving a good overflow at the reservoir.

I am glad to add that the Rams lift more water than you promised, and seem to work with great ease and smoothness, notwithstanding the great elevation they force to—Yours faithfully, T. FERNYHOUGH.

From the RIGHT HON. THE EARL OF HARROWBY, 44, Grosvenor Square, London. February 21, 1893.

SIR,— I have pleasure in stating that the two Hydraulic Rams which you supplied and fixed for me last autumn, at Sandon, have proved so far most successful, and that the work gives every promise of durability, while the economy, compared with the former much smaller and intermittent supply by steam-pump, will be considerable.

With a fall of about 14 ft. from a previously-existing mill-pool, the Rams supply reservoirs 168 ft. above the brook whence the water is forced, through pipes 1½ miles in length. They sent up, as long as I required it, about 41,000 gallons per day. I now generally work the two Rams alternately (for a fortnight or so each), but can at any time work the two together, if the full supply of 41,000 gallons should be needed.

The business of this somewhat complicated water-supply was conducted by you with singular promptness and punctuality; and no local difficulties arose in the execution of the work, owing to the excellent and efficient men whom you sent from your works at Accrington.—I am, Sir, your very obedient Servant, HARROWBY.

From T. DYNE STEEL, Esq., M.Inst.C.E., Past President South Wales Inst. of Engineers, Bank Chambers, Newport, Mon. April 24, 1891.

USK WATERWORKS.

DEAR SIR,— In September of last year I applied to you for a Hydraulic Ram for the purposes of the Usk Waterworks, to be capable of raising 27,000 gallons per day, a height of 127 ft., with a working fall of driving water of 27 ft., and on your guaranteeing that performance, I gave you an order for the Ram. The machine you supplied has now been put to work, and I have much satisfaction in saying that it far and away exceeds in its performance my most sanguine expectations, and possibly yours also. I have just completed a series of exhaustive tests, with the following results:—Working fall of driving water, 30 ft.; vertical height raised, 127 ft.; length of rising main, 850 ft., from Ram to outflow; length of supply pipe 200 ft.; gallons per hour raised, 1,812; driving water used per hour, 8,186 gallons, showing the remarkable and gratifying result of 83 per cent. of efficiency. The tests were carefully made and repeated, the water measured and levels properly taken. Several trials were made, and I shall be glad to give any engineer interested in the subject facilities for repeating the tests at the spot. I may here state that for the rising main I used a large diameter of pipe, in order to reduce friction, with excellent effect.—Yours faithfully, T. DYNE STEEL.

From MARTIN CURTLER, Esq., Agent to the Right Hon. LADY NORTHWICK, Sansome Place, Worcester. Feb. 18, 1895.

DEAR SIR,— I have great pleasure in informing you that the Hydraulic Ram which you put in for the Right Hon. Lady Northwick, at Northwick Park, last year, has worked, and is working, most satisfactorily. The water, as you know, had to be raised to the height of nearly 400 ft., with 1,900 yards of rising main pipe, to a large tank on the top of a hill, in order to supply several farms on the estate with water by gravitation. The supply to the tank is most ample, and there is an adequate overflow left below the Ram. Altogether the work is a very great success.—Yours faithfully, MARTIN CURTLER.

JOHN BLAKE, Oxford Street Works, ACCRINGTON, LANCASHIRE.

Thursday, Dec. 12.

GREAT SALE OF JAPANESE LILIES,

being an important consignment of 620 Cases, comprising:—

18,428 LILLIUM AURATUM,
4,132 " SPECIOSUM ALBUM,
1,920 " RUBRUM,
6,200 " LONGIFLORUM,
5,450 " KRAMERI, extraordinary bulbs,
300 " TIGRINUM SPLENDENS,
572 " BROWNII,
915 " MELPOMENE,
100 " AURATUM VIRGINALE,
200 " RUBRO-VITTATUM,
300 " ALBO-MARGINATUM,
140 " LEITCHII,
500 " THUNBERGIANUM ATRO-SANGUINEUM,
180 " TESTACEUM; together with
98,000 Seeds KENTIA BELMOREANA, in exceptionally grand condition; and
110,000 " CORYPHA AUSTRALIS.

MESSRS. PROTHEROE AND MORRIS will **SELL** the above by **AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **THURSDAY, December 12**, at 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will **SELL** by **AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY NEXT, December 6**, at half-past 12 o'clock.

A **MAGNIFICENT** consignment of **CATTLEYAS** FROM A NEW DISTRICT.

Arrived in the most perfect condition.

The Collector writes:—"The plants I am now sending you are in three distinct varieties, and not any more will be sent, being very scarce; in fact, the district is cleared. These should not be confounded with the ordinary Cattleya of Caracas. The varieties are extraordinarily fine, with large flowers, varying from dark velvet to most brilliant crimson; the labellum, of magenta, is richly striped with orange."

These plants were collected on Cool High Mountains at an altitude of 1750 feet, and with them came

4 plants **CATTLEYA REINECKIANA**, true;
and 3 large plants **CATTLEYA WAGNERII**, true;

also a quantity of picked plants of **ONCIDIUM PAPHIUM MAJUS**.

Such plants as the above have never yet been introduced into Europe.

Also from a private grower, 50 fine-grown plants of **ODONTOGLOSSUM ALEXANDRE** unflowered, four to five bulbs on each plant, 100 masses of **CYPRIPEDIUM SPECTABILE**.

About 1000 **ONCIDIUM JONESIANUM**, a few **NEW BROMELIAS**, **NEW CACTUSES**; five plants of the famous **CATTLEYA LUDEMANNIANA**, established; twenty-five plants, unflowered, all in sheaths of **CATTLEYA SCHRODERE**; and several plants of an Orchid called in its native country **CASCO ROMANO**.

On view morning of Sale, and Catalogues had.

Chesterfield.

SALE of the **LEASEHOLD NURSERY** and **GLASS ERECTIONS**, in one lot as a going concern, and the **STOCK IN TRADE** by **AUCTION** in lots.

MESSRS. CUTBERT'S SPECIALITE MUSHROOM SPAWN, Always alike; most productive. Hundreds of testimonials. Per bushel, 6s.
R. AND G. CUTBERT, Seed, Bulb, and Plant Merchants, Southgate, N. Established 1797.

OWEN'S ROYAL CHRYSANTHEMUMS.

—The best, cheapest, and most complete collection in the kingdom. All the latest and best varieties. Awarded 25 Medals and 275 First class Certificates for New Varieties. Every variety of merit supplied. Catalogue, Penny Stamp.

R. OWEN, F.R.H.S., Floral Nursery, Maidenhead.

NEW RASPBERRY. (STEELE'S VICTORIA.)

A New Variety of great merit, introduced by us last year. This was raised by Mr. Steel, of Ealing, and is the finest market variety grown for Covent Garden: free-grower, heavy cropper, large handsome fruit, fruiting very early, and lasting well through the season until very late. The fruit is essentially a Dessert Fruit, being large, handsome, and very superior flavour. Strong Canes, 6s. per 100; 50s. per 1000. Now ready for Delivery. Special Quotations for large quantities on application.
WATKINS & SIMPSON, Seed Merchants, 13, Exeter Street, Strand, W.C.

To Nurserymen, Builders, Local Boards, Vestries,

AND OTHERS WHO INTEND **PLANTING TREES and SHRUBS THIS SEASON.**

ROBERT NEAL, The Nurseries, Trinity Road, Wandsworth, S.W., begs to offer an extensive stock of **FOREST and ORNAMENTAL TREES, SHRUBS, ROSES, GRAPE VINES, FRUIT TREES, CLIMBING PLANTS, &c.**, which being grown in the neighbourhood of London are especially suitable for Town Planting. Also a large stock of extra fine **SEAKALE** and **RHUBARB**, for forcing.
CATALOGUES free on application.

MANCHESTER WHOLESALE FLOWER MARKET.

SOURCE D'OR, 12s. per 1000; rooted Lady Lawrence, 2s. per 100; **W. H. LIOCOLN**, 2s. per 100; **MADAME DESGRANGES**, 15s. per 1000.
CHIPPERFIELD, Florist, Hampton Hill.

LARGE SPECIMEN HOLLIES.

From 6 to 8 feet, well furnished with shoots to the ground. JOHN FRASER, The Nurseries, South Woodford, Essex, begs to invite attention to a splendid lot of cheap Specimen Hollies, which are suitable for planting in large towns or elsewhere. The sorts consist of the common Green, and many of the best broad-leaved kinds, such as Scotica, White-berried, Canadian, Hedgehog, Bay-leaved, Nigrescens, and others. These Hollies have been regularly transplanted, and will lift with good balls. As it is necessary to clear the ground, a Special Low Price will be quoted for large quantities. Sizes and Prices may be had on application.

RHODODENDRONS.

The finest named hardy varieties, bushy, and full of buds, from £7 10s. per 100, upwards.

CONIFERS, HARDY EVERGREENS, DECIDUOUS TREES, &c., in large quantities. CATALOGUES on application.

J. CHEAL & SONS, Crawley, Sussex.

Awarded First-class Certificate of Merit.

GLOXINIA, "AIGBURTH GRIMSON."

THIS is the finest high-coloured variety ever sent out. As its name indicates, it is a vivid-crimson self, of the highest merit. The flowers are erect, of the finest form and substance, of great size, and abundantly produced the habit of the plant is all that could be desired.

This charming variety was raised in our Nursery in 1893, and was exhibited for the first time at the Liverpool Summer Show, August, 1894, and was much admired by all who saw it, and was unanimously awarded a First-class Certificate of Merit.

Having proved that it is reproduced quite true from Seeds, we now offer Seeds from carefully-fertilised flowers at 2s. 6d. per packet, post-free.

Liberal terms for this sterling novelty, per dozen or per 100 packets, to the Trade, from Messrs. NUTTING AND SONS, Messrs. HURST AND SON, London; or of the Raisers—

ROBT. P. KER & SONS, BASNETT STREET, LIVERPOOL.

WINTER DRESSING.

Guaranteed to clear out Mealy Bug.

Cleanse and prepare your Fruit Trees and Plants, both indoors and out for a healthy start next season, and destroy Scale, Bug, Red Spider, American Blight, and the larvae of other insects, by using the

XL ALL LIQUID INSECTICIDE WASH (Patent),

A pure Nicotine Preparation (under a new system), from duty-free Tobacco. Absolutely safe, and no fear of injury to the buds. In use goes twice as far as any other Insecticide.

Per Pint, 2s.; Quart, 3s. 6d.; ½ Gallon, 5s.; 1 Gallon, 10s.

POSITIVE PROOF.

Mr. E. HILL, *The Gardens, Tring Park, Tring*, writes:—
"Nov. 15, 1895. I cannot speak too highly in favour of your XL ALL Liquid Insecticide (Wash), as a Winter Dressing for Mealy Bug on Vines and Fig Trees. We gave it a trial last winter with the most satisfactory results, and if applied according to directions, it is perfectly safe in the hands of a novice, and I am justified in saying that for the purpose mentioned it is the best remedy that has yet come under my notice."

To be obtained from all Nurserymen, Seedsmen, Florists, and Sundriesmen; or, direct from—

G. H. RICHARDS, Sole Proprietor, Old Shot Tower Wharf, Commercial Road, Lambeth, London, S.E.

Further Particulars and Testimonials post-free on application.

GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 2s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

RESULT

Proves more than volumes of print. My Collection of Chrysanthemums has again succeeded in winning the President's Prize for Group of Plants, and the Gold Medal for Table of Exhibition Blooms, at the National Chrysanthemum Society's Show, November 5, 1895. In addition to many other prizes my collection has now been awarded

5 GOLD MEDALS

in two years—the highest award obtainable in each case. I have much pleasure in announcing that I have secured some Grand Seedlings from our two most noted and successful English raisers, Chas. E. Shea, Esq., and H. Briscoe-Ironside, Esq., which, together with my own Seedlings will form a collection

UNRIVALLED.

My GENERAL GUIDE is now ready, with reduced prices for all last season's novelties, and contains the following Cultural Articles:—How to Grow Japanese for Exhibition; How to Grow Incurved for Exhibition; How to Grow Specimen Plants; How to Grow for Decoration; How to Dress Incurved for Exhibition; and How to Save Seed. A large number of Growers attribute their

SUCCESS

to following the advice given in my Guide, which can be obtained, post-free, for eight stamps.

My LIST of NOVELTIES for 1896 will be ready in December.

Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail ceared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schröder.

H. CANNELL AND SONS' Stock is the largest and completest in existence, and in the finest possible condition; will certainly give satisfaction in all parts of the world. As a proof they append the following:—

M. C. Gabain, Havre, France.

November 9, 1895.

With the plants you have sent me, it will interest you to learn, at the exhibition held here, I was awarded the "Grand Prix d'Honneur," i.e., the highest award over all other exhibitors, a valuable Sévres Vase, presented by the French President; also two Gold and one Silver Medals. It was gratifying to receive the assurance from all competent judges that nothing finer than my display had ever been seen in Paris, or elsewhere. Amongst the most admired was your Sunflower.

SWANLEY, KENT.

SELECT NOVELTIES IN FLOWER SEEDS for 1896, OFFERED BY HURST & SON, 152, HOUNDSDITCH, LONDON. SEED MERCHANTS.

OUR COMPLETE LIST OF NOVELTIES WILL BE POSTED IN A FEW DAYS.

WALLFLOWER RUBY GEM.

This grand Novelty is certainly the most brilliant and effective variety of single Wallflower hitherto sent out.

The colour is a beautiful clear shade of Ruby-Violet, with a bluish satin-like sheen (quite unlike the old purple Wallflower, which is more dark and dull in colour), and when seen in a mass the effect produced is very striking. It has the habit of the ordinary dark Blood Wallflower of medium height, and the flowers are extra large and of good substance.

A coloured illustration of this Novelty will be issued with our General Seed Catalogue for 1896.

Large Packets, retail, 1s.; Smaller Packets, retail, 8d.

GRAND NEW CRIMSON

PERPETUAL-FLOWERING CARNATION, URIAH PIKE.

(Grown by Mr. GEORGE MAY, Teddington, from whom we have bought the entire stock of seed grown this year, and now offer the same for the first time.)

Awarded Six First-class Certificates, besides the Silver-Gilt and Silver Medals of the R.H.S.

This is undoubtedly the GRANDEST CRIMSON CARNATION ever offered, at the same time the most decided acquisition to the Tree or Perpetual-flowering class that has ever been raised. In point of colour this noble Carnation reigns supreme, being a veritable GLOWING CRIMSON-VELVET SELF, and in this respect ABSOLUTELY UNIQUE.

Packets of 50 Seeds, retail, 2s. 6d. each; Packets of 25 Seeds, retail, 1s. 6d. each.

FOR PRICES TO THE TRADE, SEE OUR NOVELTY LIST.

SWEET PEA CUPID.

We call special attention to the new dwarf SWEET PEA CUPID, a most unique Novelty of American origin, for which we have been appointed by the Vendor, MESSRS. ATLEE, BURPEE, AND CO., PHILADELPHIA, Sole Agents for the distribution to the Trade in Great Britain, the Australian Colonies, and India.

A brief Description of Cupid (the only dwarf Sweet Pea ever known).—The foliage is very dark green; blossoms pure waxy-white, of unequalled substance, and fully as large as "Emily Henderson." The plant does not grow over 5 inches high, and never more than 12 to 15 inches in diameter. The stems are about 4 inches long, bearing two or three blossoms, all very near the end of the stem. It is a wonderfully free bloomer, and begins to flower as early as May and continues until November. The seed is white, and of usual size.

Packets of 20 Seeds, retail, 1s. each; Half-size Packets of 10 Seeds, retail, 8d. each. Electros, for use in Catalogue, supplied free on application.

IMPORTANT NOVELTY OF LAST YEAR.

PRIMULA FIMBRIATA RUBRA SUPERBISSIMA.

This grand new Primula may be described as the red counterpart of P. alba magnifica. The fringing of the extra large bold flowers—which are of great substance—is of the same heavy character as in P. alba magnifica, and which distinguishes that variety from all others; whilst the colour is that of the best type of the ordinary "rubra."

Per Packet, retail, 2s. 6d.; Larger size Packets, retail, 3s. 6d.

W. W. JOHNSON & SON,

SEED GROWERS and MERCHANTS,

BOSTON, LINCOLNSHIRE.

NEW PEA,**"BOSTON UNRIVALLED."**

A NEW, PERFECTLY DISTINCT, and VALUABLE ACQUISITION.

An unusually prolific, dwarf, wrinkled, Second Early Marrowfat, of the best table quality. Height, 2½ to 3 feet; pods large, 5 to 6 inches in length, of the "Telephone" shape and colour, but more even in size than that well-known variety, there being from 9 to 11 fine peas in the pods. These mostly hang in pairs, literally covering the haulm, which is robust, and not subject to mildew.

A first-class Pea for either Private Gardens or Market Growers, and as an Exhibition variety must rank as a decided improvement and great acquisition in profitable Horticulture.

Retail, per Sealed Half-pint Packet, 1s. 6d.; per Sealed Pint Packet, 2s. 6d.

Trade Price and List of Testimonials on application.

VEITCH'S CLIMBING FRENCH BEAN.

First-class Certificate R.H.S.

ADMITTEDLY THE GREATEST ACQUISITION FOR YEARS.

Equally good for forcing, or for open ground.

Sealed Packets, 1s. Pint Packets, 1s. 6d.

Trade Terms and Testimonials on application.

**ROBERT VEITCH & SON,
EXETER.**

ANTHONY WATERER

Invites an inspection from intending Planters to the following well-grown TREES, having stout, clean stems, with handsomely-furnished, well-balanced heads, and from frequently transplanting are splendidly rooted:—

- ACER DASYCARPUM, 14 to 20 feet.
 - .. WIERII LACINIATUM, 10 to 14 feet.
 - .. NEGUNDO VARIEGATA, Standards, 8 to 10 feet.
 - .. REITENBACHII, 12 to 14 feet.
 - .. SCHWEDLERII, 12 to 18 feet.
 - .. WORLEYII, 12 to 14 feet.
 - .. LEOPOLDII, 12 feet.
 - BEECH, Purple, Pyramids, and Standards, 10 to 20 feet.
 - BIRCH, Silver, 12 to 14 feet.
 - CERASUS SEROTINA (American Bird Cherry), 12 to 16 feet.
 - CHESTNUTS, Horse, 14 to 20 feet.
 - .. Double White, 14 to 16 feet.
 - .. Scarlet, 12 to 18 feet.
 - .. Briotii, 10 to 16 feet.
 - EEMS, English, 10 to 12 feet.
 - LIMES, 12, 16 to 20 feet.
- All our Limes are the best red-twigged variety.
- .. EUCHLORA or DASYSTILA, 12 to 14 feet.
 - .. Silver-leaved (Tilia argentea), 12 to 14 feet.
 - LIQUIDAMBAR, 6 to 10 feet.
 - OAK, English, 12 to 14 feet.
 - .. Scarlet American, 12 to 14 feet.
 - POPULAR CANADENSIS MOYA (the true variety), 12 to 16 ft.
 - SYCAMORE, Common, 12 to 17 feet.
 - .. Purple, 14 to 16 feet.
 - THORNS, Double Pink, 8 to 10 feet.
 - .. Paul's Double Scarlet, 8 to 10 feet.
 - .. Double White, 8 to 10 feet.

WEEPING TREES.

- BEECH, Weeping, Pyramids, and Standards, 8 to 12 feet.
- .. Weeping, Purple, Pyramids, and Standards, 7 to 12 feet.
- BIRCH, Young's Weeping, Pyramids, and Standards, 8 to 14 feet.
- .. Cut-leaf Weeping, Pyramids, and Standards, 10 to 12 ft.
- EEMS, Weeping, Pyramids, and Standards, 7 to 14 feet.
- LARCH, Weeping, Pyramids, 8 to 10 feet.

KNAP HILL NURSERY, WOKING, SURREY.

FRUIT TREES A SPECIALTY.

STRAWBERRIES.

ROYAL SOVEREIGN.—The best Strawberry grown. Special quotations for large quantities. Also all the best of the New and Old Varieties, including Competitor, Sensation, A 1, Allan's New Ones, &c.

FRUIT TREES of all sorts, in all forms. Send for Descriptive Catalogue.

JOHN WATKINS,

POMONA FARM NURSERIES, WITHINGTON, HEREFORD.

KENT: THE GARDEN OF ENGLAND.

SUPERIOR KENT ROSES.

George Bunyard & Co.,

ROYAL NURSERIES, MAIDSTONE,

Are offering well-grown and finely-rooted Roses at the following cash prices. Package free. Selection left to themselves.

- SUPERIOR H.P. STANDARDS, 2½ to 3½ feet stems, assorted, choice, per dozen, 18s. to 24s.
- HALF-STANDARD H.P.'s, 1 to 2 feet stems, choice, per dozen, 12s. to 18s.
- STANDARD or HALF-STANDARD TEAS and NOISSETTES, per dozen, 24s. to 35s.
- H.P. DWARFS, oo Seedling Briar, per dozen, 9s. to 12s.
- H.P. DWARFS, oo Manetti, per dozen, 7s. 6d.
- FINE CLIMBERS, for Pillars and Walls, per dozen, 9s. to 15s.
- DWARF TEA-SCENTED and NOISSETTE, per dozen, 18s.
- CHINA, MOSS, and PROVENCE ROSES, per dozen, 6s. to 9s.

Copies of G. B. & Co.'s Fruit List, 6 stamps.

FRIDAY, DECEMBER 13.

**SANDER'S
GREAT XMAS. SALE**

PRELIMINARY NOTICE.

10,000 ORCHIDS

WITHOUT ANY RESERVE.

For AMATEURS and THE TRADE.

SWAINSON'S TRUE OLD LABIATA,
SANDER'S
RED AND WHITE UNRIVALLED TYPE.

100 NEW HYBRID ORCHIDS,
NEW CYPRIPEDIUMS,
NEW DENDROBIUMS,
UNFLOWERED HYBRIDS,
NEW LÆLIAS, WHITE LÆLIAS,
NEW HYBRID LÆLIO-CATTLEYAS,
with PARENTAGES GUARANTEED.

NEW IMPORTATIONS OF—
BRAZILIAN ORCHIDS,
COLUMBIAN ORCHIDS,
NEW GUINEA ORCHIDS,
EAST INDIAN ORCHIDS,
VANDA CERULEA, in grand order.
MEXICAN ORCHIDS,

LÆLIA TENEBROSA, SANDER'S Type,
found growing with
CATTLEYA WARNERII, the finest type.
These plants, without doubt, contain among them
the rare and beautiful hybrid Lælio-Cattleyas,
GOTTOIANA and ALBANENSE.

All the plants offered are in wonderful order,
and a more varied and remarkable lot we have
never seen.

ALSO

ODONTOGLOSSUM ROSSII MAJUS,
ODONTOGLOSSUM CERVANTESII and
DECORUM VARIETIES,
ODONTOGLOSSUM VEXILLARIUM,
SANDER'S RADIATUM TYPE,
MILTONIA WARSCEWICZII (Oncidium
fuscatum),
CATTLEYA SCHOFIELDIANA AUREA?
ONCIDIUM PHYMATOCHILUM,
BOTANICAL ORCHIDS, various, 10 in a lot.
CYPRIPEDES and DENDROBES FROM
ANNAM.

BUY SANDER'S CATTLEYA LABIATA
to have the grandest, brightest, and most
beautiful of all types.

IT IS SWAINSON'S GENUINE OLD TYPE,
the best and only true unrivalled, and gives
White and Red Flowers, indescribably brilliant,
and of the most perfect form.

Mr. WM. HENRY PROTHEROE, the great Plant
Auctioneer, has repeatedly stated from his
rostrum in Cheapside:—"Sander's labiata is
the best of all; of this I am quite satisfied."

TO BE SOLD BY AUCTION BY
MESSRS.

PROTHEROE & MORRIS,

67 & 68, CHEAPSIDE, LONDON, E.C.,

ON FRIDAY, DECEMBER 13, 1895.

Gardeners' Chronicle.

SATURDAY, NOVEMBER 30, 1895.

FERNS IN POTS.

AN enquiry was made by a correspondent, "C. B. C.," so long ago as last June, as to whether any British species of Ferns are grown in pots, and a suggestion that a further description would be of interest. I would, in the first place, refer him to the view of my fernery, which appeared in these pages (Aug. 27, 1892), together with some details which he may find of value. As regards pot-culture or otherwise, most of the plants are in pots, and only a few actually in the soil. The reason for this is that in practice Ferns planted in the soil under the favourable conditions induced by a covering of glass, speedily interfere with one another as they develop, and form a jungle in which the individual beauty of each plant is altogether marred or hidden. If in pots, on the other hand, not only is the freedom of growth somewhat checked, but it is quite easy to shift and readjust from time to time as the need for greater space arises. Another advantage is that in the winter, when the deciduous Ferns are down, the still presentable evergreen ones can be rearranged, so as to maintain a good effect while, were they in the soil itself, shifting at that time would be detrimental. To obviate the unpicturesque appearance of ordinary pots, I use a number of rustic ones of various forms, and mix these and all others, as far as possible, with burrs. In fact, the plan of my fernery is all rockwork, and instead of planting the Ferns alone in the nooks and crannies created for them, I insert the pots as well. The fernery is somewhat oblong, 18 by 14, one end being formed by the wall of the dwelling-house containing the dining-room window, and the opposite end by a very roughly-built burr wall. As an amusing instance of the British workman's peculiarities, I may mention that, having provided so many loads of burrs for the bricklayers for this wall, I had occasion to be absent for a few days, and on my return, found a plain ordinary brick wall erected, it being, as I was told, "impossible to build a wall with stuff like that supplied." I made them pull it down, and called in an intelligent blacksmith, who undertook the job, and did it splendidly. Upon this wall there are fixed several large cork pockets, consisting merely of large curved pieces of cork wired strongly together with copper wire to the requisite size and shape, and then tied by same means to stout nails and hooks driven into the wall. These receptacles are filled with soil, and not only hold plants as pots would do, but also accommodate a number which were inserted as seedlings into holes made through the cork here, there, and yonder. Sundry flat-sided rustic pots are also hung wherever they can be accommodated, so that the wall is fairly covered with foliage. The roof at this end, being boarded over for about

18 inches or so, has the effect of drawing the plants a little, and making them decumbent instead of upright, with remarkably good effect. As few British Ferns are naturally decumbent, the highest wall-pocket of all was originally devoted to a *Woodwardia radicans*, the fronds of which drooped nearly to the ground, and were quite 7 feet long, until a specially severe winter killed it. At the foot of this wall is a low rockery, except in the centre, where a sunken petroleum-barrel forms a rock-fringed pool, into which the rain-water from the roof is drained by two underground pipes. This rockwork extends round three sides of the house, and is about 18 inches high, next a 2-foot tiled path (porous red-and-white tiles), which runs round a central rockery of oblong shape, and built up of fairly bold burrs. The chinks and crevices in the whole of this rockwork are filled with self-sown seedlings of various species, *Asplenium Trichomanes* especially. *Scolopendrium*s appear in any quantity, and have constantly to be weeded out, common—or nearly common—ones being too often the intruders. Of specimen plants only two are really planted in this central mound; the King of the Male Ferns, with a fine trunk, and a crown of fronds, measuring 4 feet 11 inches from the soil to the tips; and the Victoria Lady Fern, a bit of the original, which is no less than 3 feet 6 inches long, being a single crown, with a distinct trunk. The side-wall to the left is really the garden wall, surmounted by a wooden one carrying the roof; the opposite wall is red brick, and of the same height, 7 feet, so that there is no side-light whatever. Along the garden wall is erected a long slate trough, composed of roof-slates, supported at their lower edges on stout nails driven into the wall, and from the upper edges suspended by stout copper-wire attached to hooks driven into the woodwork. This trough, which is well drained, accommodates at the level of the eye, a considerable number of choice small varieties of *Asplenium*, *Scolopendrium*s, *Cryptopteris*, and other dwarf Ferns; while from its position it practically does not interfere at all with larger Ferns growing in pots on the rockery beneath. This is really a good idea where space is limited, and indeed where it is not it has a great advantage in affording a habitat for wall and dwarf Ferns at a most convenient level for their examination.

Wherever convenient, flat-backed rustic pots are hung over this trough on hooks and nails in the woodwork, which is painted chocolate, to harmonise with the green. The brick wall on the other side is largely marked by cork and slate pockets and pots, while a slate shelf just below the roof houses a number of *Polypody* varieties in pans.

Next the dwelling-house, considerations of damp prevented the use of rockwork, and in one corner a Wardian case forms a congenial home for several varieties of *Trichomanes radicans* and *Hymenophyllum*s, while *Todea pellucida*, *T. superba*, and *T. s. grandipinnula* supports the foreign element in conjunction with *T. reniforme*. A series of shelves up to the window level occupies the rest of the space at this end, and here are a few of the *crème de la crème* of British Fern society, at the head of which I must be permitted to place an enormous plant of *Athyrium f.-f. plumosum Drueryi*, the queen of a section of which I am glad to learn your correspondent possesses an admired representative. Well may his lady folks compare these Lady Ferns with Male Ferns to the disparagement of the latter, but I fear they must thank the prophetic instinct of

old botanists rather than Dame Nature for the imputation of the sex, though really the existing varieties show that for diversity of fashion and delicacy of taste no imputation could be more appropriate. In one of the writer's latest finds, indeed, *A. f.-f. revolvens*, we have actually the "lady" in ringlets.

Although mere size cannot be deemed a special element of beauty, yet since it is usually associated in Ferns with greater development of the characteristic features, the following actual dimensions of some fronds in my fernery may be of interest:—*Lastrea f. m. cristata*, 3 feet 11 inches, plus a 12-inch trunk; *Athyrium f.-f. Victoriae*, 3 feet 6 inches; *Polystichum aculeatum pulcherrimum*, 3 feet 6 inches; *Athyrium f.-f. pericristatum* (Cousens), 3 feet 3 inches; *A. f.-f. plumosum Axminster*, 3 feet 7 inches; *A. f.-f. plumosum Drueryi*, 3 feet 6 inches long by 1 foot 8 inches wide, the pinnae measuring 10 inches long by fully 5 inches wide. *Chas. T. Druery, F.L.S., F.R.H.S.*

NEW OR NOTEWORTHY PLANTS.

NEPHRODIUM (EUNEPHRODIUM)

DEJECTUM, *Jenn., n. sp.**

A FINE robust species, of the size and habit of tetragonum and Leprieuri of the *Lastrea* group, but of very different general characters, marked particularly by the distant sharply-deflected pinnae of the lower half of the fronds, stramineous vascular parts, and striation of both surfaces caused by the close raised veins, the lowest pair of which on one or both sides of the midrib unite together at the ends, forming an elongated loop, as in *Pleocnemia*. From the patent united lobes at the top of the fronds the pinnae gradually deflex and widen apart downwards to the base where the distance reaches 4 to 5 inches. *G. S. Jenman, Demerara, October 18, 1895.*

ORCHID NOTES AND GLEANINGS.

CATLEYA BOWRINGIANA.

WE have now in flower and bud four plants of the above, the largest growing in an 8 inch pot has three spikes, with thirteen, ten, and eight flowers on them; the other three are growing in 6-inch pots, the one has two spikes with sixteen and eight flowers; the other two spikes with nine and four flowers, and the other one spike with fifteen flowers. I should be glad if you or any of your correspondents will kindly say what is the greatest number of flowers on a spike they know of on this species of *Catleya*. *W. Dawes, Little Vess Gardens, Shrewsbury.*

THE SPECIES OF DIACRIUM.

Diacrium (*Epidendrum*) *bicornutum*, *Hook.*, and *Diacrium* (*Epidendrum*) *indivium*, *Bradf. MSS.*, are still common in Trinidad, although the yearly export by collectors has diminished the supply to a considerable extent. *D. bicornutum* is found almost exclusively on the seashore, where it grows on rocks and the branches of trees well exposed to the breeze.

**Nephradium* (*Eunephradium*) *dejectum*, *Jenn., n. sp.*—Stipites strong, erect, subquadrate, stramineous, slightly puberulous, channelled, 1½ to 2½ feet long; fronds erect, pinnate, subcoriaceous, dark green, paler beneath, striated, 2 to 3 feet long, 10 to 15 inches wide, the acuminate apex pinnatifid, the base very slightly reduced; rachis strong, and with the midrib stramineous and channelled; pinnae truncate, sessile, subproximate, and spreading in the upper half, distant, deflexed, and shortly stipitate and subcuneate at the base in the lower, 6 to 8 inches long, 1½ inch wide, tapering to a finally acuminate entire point 1½ inch long, cut a third to half-way to the midrib into broadly rounded oblique or subfalcate open lobes, ¼ inch wide, with a narrow sinus between, and subcrenulate or even margins; veins conspicuous on both surfaces, close, simple, curved, ten to fifteen to a side all fertile, the lowest three to five opposite pairs, uniting and running together to the sinus with a streak between, and with the costa, grey, puberulous beneath; aeri small, medial or near the rib, reaching from the costa to the apex of the lobes; involucre small, grey, puberulous.—Guiana; in the region of Malali, Demerara River, frequent in moist situations.

It forms at times magnificent clumps, which are seen to advantage when in flower, in well-protected positions. A clump of this class was well figured in the *Gardeners' Chronicle*, p. 337, vol. xvi, 1834. This figure was engraved from a photograph by F. Morin, Esq., of Port-of-Spain, from a picture of a plant in the garden of a suburban villa belonging to Mrs. Kavansgh. We have had similar clumps in flower near the office of the gardens from February to May, where they are simply hung up attached to the blocks of wood as they were cut from seaside trees, having no compost, basket, or other support of any kind. The attention they receive is to secure them against the attacks of insects, cockroaches, &c., and to give an occasional watering in dry weather. They are fully exposed vertically, but are sheltered on all sides by buildings and trees.

The second species, *D. indivium*, is one which is confined almost exclusively to the inland districts. It differs from the preceding in being of much smaller size, and by having an undivided lip which is quite white, and not spotted as in *D. bicornutum*, and the pseudo-bulbs and leaves are also much smaller. An expanded flower of *D. bicornutum*, which was taken at hazard from a clump, measures 2¼ inches in breadth, while another of *D. indivium* measures only 1½ inches in the same diameter. *D. indivium* is more amenable to cultivation than its larger brother, and makes an exceedingly pretty plant when well grown. Both plants are very impatient of moisture, and when established will stand drought almost with impunity. Doubts have been expressed as to the specific value of the name of *D. indivium*, but to the field botanist who is conversant with the plants in their homes, the characters are clearly marked, and no intermediate forms have as yet been seen. It is true that the latter plant is (as Griebach says) nearly allied, but the difference in form of the lip, its habit, and the colour of the pseudo-bulbs, as well as its constant habitat in the interior woods, would appear to bear out a legitimate claim to specific distinction.

In connection with the growth of Orchids, it has been noticed that the presence of ants is apparently necessary to their maintaining a healthy condition, but whether this is in reality due to some action of the ant itself, or to some indirect cause, has not yet been proved, and investigations are needed to show what is the real influence the ant has upon the health of the plant. It has been suggested that the presence of stinging ants acts as a protection to the plants, but I am inclined to think from recent investigations that the benefits the ants confer on the plant are those of providing it with the mycelium of a fungus to cover its roots, which organism enables it to take up food which would be otherwise unobtainable. It may be shown that the ants act as protectors to the plants, as well as providing them with a means of obtaining nutriment, but it is almost certain that the fungus which grows in the material they accumulate around the roots plays a much more important part by providing the plant with food material. *Bulletin of Trinidad Botanical Garden, October, 1895.*

MR. GODSEFF'S EPIDENDRUM (EPIDENDRUM GODSEFFIANUM).

This is one of the giants amongst the *Epidendra*, the plant itself being 2 to 3 feet in height, or even more as it grows on rocks and tree trunks in its native wilds. The pseudo-bulbs are 4 to 6 inches in length, terminated by 2 to 3 strap-shaped, oblique pointed, and very leathery leaves. The flower-spike is branched at its extremity, and as thick as the culms of a slender Bamboo (say, *Thamnocalamus Falconeri*) below. The flowers themselves are 1½ to 2 inches in diameter; the prevailing colour being olive or cinnamon on sepals and petals alike, the three-lobed lip being white with purple lines on its disk. The sepals and petals are incurved, hollowed out or spoon-shaped, and marked with faint lines or nerves. The sepals outside are pale fawn coloured, having a few scattered brown dots. As *Epidendra* generally, so this is a very robust and interesting

species, the flowers being full and of fine form, and their fragrance in the morning is very delicious, reminding one of a mixture of tropical fruits. The plant is very remarkable when growing, on account of its size, and it thrives in a warm moist house when growing with plenty of water at its roots. The plant is now flowering in the Botanical Gardens of Trinity College, Dublin. The species is named in compliment to Mr. Godseff, who is well known as the manager of the Sanderian collection of Orchids, &c., at St. Albans. *F. W. B.* [E. Cappartianum is, we believe, a synonym of this plant. Ed.]

CYPRIPEDIUM X SELLIOERUM, MALFORMED.

As bearing on our remarks at p. 495, October 26, and previously, T. W. Swinburne, Esq., Corndean

TRICHOPILIA BREVIS.

At the meeting of the Orchid Committee of the Royal Horticultural Society, Nov. 12, this pretty species, which was exhibited by Messrs. F. Sander & Co., was duly noticed in our columns, and we now give an illustration of the plant (fig. 105). The species appears to be of the section of *Trichopilia* known in gardens as *Heleia*, and of which the previously known species *Trichopilia (Heleia) sanguinolenta* is well illustrated in the *Botanical Magazine*, t. 7281.

Trichopilia brevis is a plant of neat habit of growth. Its flowers have the sepals and petals of an Indian-yellow colour, barred with chestnut-brown. The ample labellum pure white, with a few purple marks at the base. It thrives best when grown in a moist intermediate-house, such as suits *Miltonia Roezlii*, *Miltonia vexillaria*, and the plants usually associated with them.

average crop, New England being especially deficient; while in the central-west the crop is the largest ever grown. The season has been one of contradictions, new conditions constantly arising of sufficient importance to vitiate preconceived ideas.

May frosts were followed by such weather as operated to minimise their importance. Drought, growing serious in June and July, was relieved in August. On September 1 the crop appeared virtually made, and in extent there was every indication that it was record-breaking. The final output of marketable Apples is large, but it is not the burdensome crop that seemed certain a short time ago.

Dry weather, hot winds and locally severe storms during September made great changes in the prospect for winter fruit. The "windfall" has been sur-

FIG. 105.—TRICHOPILIA BREVIS FLOWERS OF AN INDIAN-YELLOW COLOUR, BARRED WITH CHESTNUT; LIP WHITE, WITH PURPLE MARKINGS AT THE BASE.

Hall, Winchcombe, Cheltenham, writes:—"I am sending you a flower of *Cypripedium selligernum*, taken from a plant which invariably throws up a similarly deformed bloom as a preliminary, and after that is over, it sends up a spike of good flowers. I have now one with a two-flowered spike following a deformed flower."

The flower is a very singular one. The sepals and petals are of the usual form, but the labellum is inside out. The part which in the normal flower is at the back and resting on the lower sepals, being in front, and the opening in the pouch, with the sides turned out instead of in, is at the back. It is a very singular freak, and it bears out our conclusions, formerly expressed, as to the constancy of abnormal flowers in some plants.

THE APPLE CROP OF 1895.

We learn from the *American Agriculturist* that the estimated commercial crop of Apples of the United States for the present season is one of the largest in recent years, and will yield probably 66,000,000 bushels, showing an increase over the average production of about 8,600,000 bushels. When prices are high, as they were last year, a lot of fruit not usually included in the commercial crop, finds its way into the market. While ordinarily this would never appear, it serves the purpose of ultimately swelling the totals.

The distribution of the crop of the present year is said to be peculiar, the greatest Apple-growing districts east of the Alleghanias showing less than an

prisingly large, and the ill effect of the hot weather is becoming further apparent in marked difficulty in securing fruit of perfect keeping quality. Especially is this true in southern Illinois, and in portions of Missouri, while in heavy-laden orchards of Missouri and eastern Kansas and Nebraska the extent of loss from high winds can only be appreciated by personal inspection of orchards.

It is difficult to accurately estimate the total crop of Apples in barrels, because there has never been any accurate census determination of the size of any given crop. The census of 1890 undertook to give such a measure, but the work was very faulty from unintentional omissions. Taking that result, however, as a basis, and as representing what might be called the marketable crop as distinguished from the

total crop (including farm consumption, cider stock, and fruit fed to animals, or allowed to rot on the ground), it would seem that the crop this year is about 16 per cent. larger than that of 1889, and larger than that of last year by about the same measure.

The crop in the principal States of America in 1889 as reported by the census, in 1894 as determined by market movement, and in 1895 as estimated by the *American Agriculturist*, the only authority placing such detailed estimate on record, is presented in the following statement:—

State.	1895.	1894.	1889.
	Bushels.	Bushels.	Bushels.
Maine	790,000	1,930,000	1,228,000
New Hampshire ...	985,000	1,974,000	1,313,000
Vermont	550,000	946,000	505,000
Massachusetts ...	558,000	1,320,000	676,000
Connecticut	785,000	990,000	789,000
New York	6,375,000	5,918,000	3,398,000
Pennsylvania	5,550,000	4,264,000	3,021,000
Ohio	6,450,000	2,871,000	5,515,000
Michigan	3,750,000	5,815,000	5,261,000
Indiana	3,307,000	1,056,000	3,514,000
Illinois... ..	3,792,000	1,991,000	3,340,000
Missouri	3,884,000	1,974,000	3,479,000
All others	28,400,000	26,500,000	24,694,000
Total	66,256,000	57,629,000	57,242,000

An examination of this table shows that the New Hampshire crop this year is little more than half that of 1894, and smaller than in 1889. In New York and Pennsylvania it is a third larger than last year, and double that of 1889. The Ohio crop is two and a quarter times larger than last year, while the Michigan crop is less than two-thirds as large as in 1894. The most remarkable gains over last year's production are noted in Indiana, Illinois, and Missouri—three times as large in the first, and nearly double in the latter two. The total crop in these three States, however, only slightly exceeds their production in 1889.

THE CANADIAN SITUATION.

Canada, as a whole, has not been favoured with an abundant Apple crop for several years, although exceptional localities have borne well. This is true regarding the 1895 crop, with a material shortage in much of Ontario. Owing to the severe frosts about the time fruit-trees were in bloom, many Lake Erie and Huron counties suffered, and Apple-shippers from Toronto westward, with possible exceptions of a narrow strip close to the water's edge and around Niagara, will have less to do this autumn and winter, the crop being required for home consumption. This important section, which usually has a liberal surplus for shipment, has already marketed a considerable part of their available crop. Down the St. Lawrence river Apples are not grown so largely for export purposes, and will this year provide little. It is certain that the big crop in the United States will preclude the movement of any considerable quantity of Canadian fruit across the border, even from favoured sections, and the surplus from Lake Ontario counties and further east will seek an outlet abroad. In the Annapolis valley, the Apple-growing section of Nova Scotia, a fairly good crop has been harvested, including both autumn and winter varieties, the latter being fine in quality, and adapted to the export trade. Early shipments from that province, however, shared no better fate than did those from the States, as England was well supplied with home-grown and continental fruit. Considerable quantities of Nova Scotian Apples are drifting into Boston, partly on commission, and providing the market is right, may eventually be re-exported to England.

THE OUTPUT FOR AMERICAN SURPLUS OF APPLES.

Seeking for a place to dispose of the large reserves of sound winter fruit, the fact is developed that the Apple crop, taking the world at large, is a full one. Last year the deficiency in many of the American

States absorbed much of the surplus of those where the yield was liberal.

But this year the crop is more evenly distributed, and it is an exception rather than the rule to find a State with a positive deficiency.

Turning to the output on export account, this may amount to more as the season wears away. England is about the only foreign customer that America has. Up to late autumn England is supplied with fruit from the liberal home yields, and from the continent of Europe, including Holland and Belgium, which have very large crops; France, which turned off fair quantities; Germany and Italy with at least sufficient crops of Apples of their own to make it improbable they will need to import many, and may possibly send a few to the United Kingdom, as they do usually. This fruit, however, is autumn stock, and once out of the way should enable American exporters to ship more freely to England. Latest advices report an increased interest in leading English and Scotch markets, with an outlook for better figures. Showing the drafts made upon the various surplus countries for British consumption is the following table of—

English Imports of Apples in bushels in 1894.

United States	1,441,657
Germany	50,492
Holland	504,740
Belgium	1,160,923
France	509,537
Portugal	64,567
Italy	7,775
Channel Islandr... ..	7,199
Australasia	135,962
Canada	1,081,859
Other Countries... ..	3,958
Total	4,968,669

There is just now a severe sifting of quality, and the range of prices is very wide. Standard varieties of winter fruit, such as Baldwin, Greening, Spy, Ben Davis, &c., are going rapidly into cold storage, some of the best posted and largest growers advising not to accept present quotations. This, too, in spite of the fact that vast quantities of soft stock have either been sold for cider purposes at from 5 to 10 cents per bushel, or else permitted to rot on the ground. The enormous quantities of windfalls, cider Apples, poor and gnarly fruit generally, out of the way, the market is expected to clear up. Large as the crop is, it is certainly much less than seemed assured before the trees began to drop so badly. *J. J. Willis, Harpenden.*

PARIS.

MICROSPATHA GUINEENSIS.

CULTIVATORS know this dwarf Aroid best under the name of *Nephtytis liberica* (N. E. Brown, in *Gardeners' Chronicle*, June 18, 1881, p. 790). We mention it now for the sake of calling attention to the profusion in which the orange-coloured berries are produced. These are borne in such numbers that the plant is at this season very ornamental. The berries are clustered, each about the size and form of a small Olive, and of a bright yellow or orange colour. At the Jardin des Plantes we recently observed the use made of this plant for ornamental purposes.

AMPHITECNA NIGRIPES.*

This highly curious Bignoniad or Crescentiad has lately been in flower in the Paris Jardin des Plantes. It has an erect stem, oblanceolate glabrous entire leaves, and bears tufts of yellowish-green flowers from the old wood. Each flower is about an inch long, with a short calyx, dividing into two boat-shaped segments, an irregular tubular corolla, contracted in the middle, dilated on one side below the four-five parted limb.

* Baillon in *Revue Horticole* (1882), p. 464, fig. 99, as *Crescentia*; see also Miers in *Trans. Linn. Soc.*, xxvi. (1883), 163, nomen genericum tantum.

CAMPTOSEMA ERYTHRONOIDES.*

A handsome stove shrub, with pinnate foliage, ovate lanceolate segments, with clusters of rosy-lilac flowers near the apex of the branches. The individual flowers are something less than an inch long, compressed, the standard wings and keel nearly of the same length. The plant which is in bloom in Jardin des Plantes differs somewhat from the plant described and figured by Bentham.

IDRIA COLUMNARIA.†

This plant in the *Kew Index* is referred with a mark of doubt to *Fouquieria spinosa* (Torrey in Emory, *Notes of a Military Reconnaissance*, 147, t. 8, Mexico, 1848). The plant in the Jardin des Plantes is highly curious, consisting of a stout, thick, conical stem, 2 to 3 feet high, and as much through at the base, giving off slender spreading branches near the top, and provided with small-stalked ovate acute leaves. It is a native of Lower California. The figure of *Idria* cited has a tall, nearly unbranched, columnar stem, with stalked spikes of yellow flowers near the summit. The plant in the Paris garden was not in flower, so that its identity with Kellogg's plant is uncertain. In any way it is highly remarkable. *M. T. M.*

HARDY PLANTS AT COLLOONEY.

CARYOPTERIS MASTACANTHUS.—This pretty flowering shrub (see *Gardeners' Chronicle*, February 2, 1884, fig. 149), has flowered at this place for the first time this year. It has proved quite hardy, having withstood the frosts of last winter under the slight protection afforded by some Spruce branches; and I hope now that it is well established it will bloom at an earlier part of the autumn. The flowers come in small clusters from the axils of the lateral shoots and are of a deep lavender colour.

CLERODENDRON TRICHOTOMUM.

This plant flowered here this autumn, just previous to the sharp frosts setting in, in October. It is an interesting plant where it thrives, and the flowers come early; and when our plants are well established, they may do better in this respect. The young wood is of a soft nature, but it takes no harm, except, perhaps, an odd shoot or two will die back during a severe winter. It is planted in a border and close to a wall; and a plant of *Abelia rupestris* standing near it flowered profusely this autumn.

TUPA FEULLEI.

This made a grand show in the herbaceous border, with its beautiful spikes of red *Salvia*-like flowers, during the summer and autumn. The plant succeeds in good sandy loam, and is benefited by a few applications of manure-water at the root when well established. Increase is by division of the roots, and from seed.

HYPESICUM REPTANS.

For covering a slope or the rockery, where a moderate depth of sandy loam can be afforded, this is one of the prettiest subjects I know of; and it is hardy, very floriferous, and easily raised from seed. I have grown the plant in an ordinary border on raised mounds of sandy soil, and even in this way it is attractive. A few stones placed under the trailing shoots keep them clean and free from grit.

H. MOSERIANUM ×.

This is a choice subject, very suitable for a rockery or border, lasting in flower a long period of time. It is an erect-growing hardy variety.

LAMNUM AUREUM

Is a useful plant for covering a flat surface, and, as its name implies, it is a yellow-leaved plant. It is thought highly of here, and is a capital ground-work plant where Dutch bulbs, &c., are planted. The plant likes full exposure.

TIARELLA CORDIFOLIA

Is an old favourite, and one of the best plants for covering a large area in a short space of time, and

* Bentham in *Martius' Flora Brasiliensis*, xv., t. 155.

† Kellogg in *Proc. Calif. Acad.*, ii. (1883), 34, ex *Indice Kewensi*, t. 1204.

it will thrive in almost any position or aspect, but the better it is treated the more its true character is developed. It is a free-flowering subject, with thick stolons, and cordate, acutely-lobed leaves, hairy above, and pubescent beneath. It is propagated by bits of the stolons being taken in early spring, and planted just beneath the soil.

CORNUS CANADENSIS.

We were unable to succeed with this plant when planted in a loam and sand, but find that it will grow freely in a mixture of sphagnum and peat. The pretty star-shaped flowers appeared on October 27, and continued for some time in good condition. The beauty of the shrub is enhanced by its leaves, which assume a bright red colour on the approach of autumn.

POLYGONUM BRUNONIS.

This is a handsome plant, good all the year round a very free bloomer, and very suitable for planting on the ledges of the rockery, and even in a border.

DRYAS OCTOPETALA.

When planted near to a flat and somewhat eloping slab of rock, having a rough surface, this will in time clothe it with a network of growths, which flower freely, and when passing out of flower the stalks are surmounted for some time with feathery seed vessels.

HYDRANOEIA SCANDENS.

We find this a desirable trailing plant, suitable for covering a rugged stone or boulder, effective when in bloom, and also during the autumn, when the leaves assume a pale yellow tint. It thrives as well on the shady side of the rockery as on the south side. *H. May, Markree Castle Gardens, Callooney, Sligo.*

THE NEW ZEALAND INSTITUTE.—In the *Transactions of the New Zealand Institute* (1894), Mr. T. Kirk publishes some systematic descriptions on New Forms of *Celmisia*, Revision of the New Zealand *Gentiana*, New Zealand species of *Gunnera*, some plants from the Upper Waimakariri, New Grasses from Macquarie Island, and New Zealand species of *Colobanthus*.

NOTES FROM CAMBRIDGE BOTANIC GARDEN.

(Continued from p. 518.)

DIPLADENIA BOLIVIENSIS on a rafter in the plant stove, and the Yam in fruit in the same house, presented a striking contrast, and are plants too seldom used for effect on the roofs of glass-houses. Some fine specimens of *Ixoras*, very notable among them being a fine piece of *I. Bandhuca*, of a very deep scarlet, light up the plant-stove with fine glowing tints on the eve of the November fogs.

PELLIONIA DAYEANANA.

The semi-succulent stems, peculiar foliage, and the contrast in colour, size, form, between the male and female flowers, give this plant a most remarkable appearance. It makes, in fact, a useful and novel addition to our stove creepers.

DICHORISANDRA THYRSIFLORA.

is one of the best of this useful order of showy and easily-grown stove plants, flowering freely under good cultivation throughout the summer and autumn. The deep golden anthers bring out to the best effect the rich dark blue of the flowers.

CEROPEGIA SANDERSONI AND C. STAPELIIFORMIS.

It is worth while for all lovers of nature to rest awhile in such Botanic Gardens as those of Dublin, Cambridge, Oxford, &c., to have a half-hour's fellowship with some of the many curious and instructive plants that are all too prone to be trodden under foot in our hot haste after shows, decoration, and profits, in these modern days of fever and excitement. Horticulture is fast losing its high character of the leaner cult, but careful study of *Ceropegias* might do something to help us to regain it.

Ceropegias are seldom or never found in private gardens, they are of little or no use for button-holes, wreaths, dinner-table decorations, or market flowers,

Possibly few practical men know that the literal rendering of the name is a fountain of wax. And the design, form, and uses of these fountains are miracles of constructive design and adaptations of means to ends. The whole structure of the flower seems designed to protect the stigma or ovary from wet and the inroad of flies and other insects. *Ceropegias* are not ranked among fly-catchers, though the structure of the blossoms are so peculiar, that should any living thing get into the corolla it would stand but a poor chance of getting out again, whether the fountain on the top or the tube at the bottom were filled with honey or not. In some species, such as *C. Sandersoni*, beautifully in bloom at the time of my visit, the five petals formed a raised tent, supported on five open arches, that wind round the top of the bulged-out portion of the tube; so that any living thing that gets into the well-lighted, carefully-guarded, life citadel of the *Ceropegia* has a raised palace on the roof with five windows, each a quarter of an inch deep, to look out of—a tower of observation, or mayhap allurement, probably unequalled among plants. The five petals diverge from a centre to a point in the centre, and the extremities overlap these arches like umbrellas sufficiently far to render each flower water-proof. The colour of *C. Sandersoni* is a pale green, mottled and veined with a darker green, with a beautiful peculiar translucid appearance. *C. stapeliiformis* is a purple-flowered smaller variety. Both these are greenhouse plants, and could be grown easily, where their flowers could be best seen, climbing up or drooping down from a roof, pillar, or rafter.

C. elegans is, perhaps, best known; but this being a native of India, needs the warmth of a stove to do it justice. This species has also purple flowers, and long hairs clothe certain portions of its very curious flowers. All these species and most others are climbing plants, requiring to be trained on rafters or trellises. They are easily propagated by cuttings, or root, or stem, or bulb division, for the species that have bulbous roots.

To bloom them freely the tops must be kept fairly thin, freely exposing them to light and air. They thrive best in a mixture of peat, leaf-mould, and sand. One or more plants should be grown in every glass-house, as few plants afford more interest and pleasure to families and students than such wax fountains or tent flowers as *Ceropegia Sandersoni*.

Gerbera Jamesoni.—On the occasion of a recent visit I was much pleased with some specimens of this still rare and striking plant. It seems it was first introduced from the Transvaal by Rehman, in 1878. It was subsequently found and sent home by Mr. Jameson, whose name it now bears in the gold-field districts of Barbertown. Hitherto, its progress under cultivation has been rather slow. I do not remember, in fact, seeing this striking and beautiful plant in robust health and full beauty anywhere else but in the Cambridge Botanic Garden. (See *Gardeners' Chronicle*, June 22, 1889, fig. 122, p. 773.)

Mr. Lynch, with his usual courtesy, supplied me with a few notes that must prove exceedingly useful to others who would like to grow this very ornamental plant to perfection. It is grown at Cambridge in the open air, but it is not quite hardy nevertheless. Neither does the *Gerbera* take kindly to pot culture. Hugging the south ends of the nice new range of glass in the Cambridge Botanic Garden, may be found several hardy bulbs and other plants that have the full benefit of all our solar heat, and considerable help from the hot walls of the plant-stoves and Fern-houses behind. Amongst more of such plants is a fine group of *Opuntias*, most of which survived the zero frosts of last February. I do not say that such tempting food for frost wholly escaped, but a fine group still survives, protected with a temporary frame of glass in winter, and mayhap, but I am not sure of the latter, a mat over the glass.

It was a happy thought of Mr. Lynch's to plant the Transvaal *Gerbera* behind the *Opuntia*, and close

to the warm wall behind it; and here it may be said to grow like a weed, blooming persistently from April 1 to the middle or end of October. Mr. Lynch thinks the *Gerbera* and *Opuntias* mutually protect and assist each other. Both have a glass covering to keep them dry rather than warm in winter. He also adds, as already stated, it does so well here because it is planted against a wall, behind which are four hot-water pipes.

The general appearance of the plant is something like an enormous Dandelion, with large flame-scarlet Daisy-like flowers, standing up strongly on flower-stems averaging from 1 foot to 18 inches or more in length. The prevailing colour is a uniform flame-scarlet, but the colour varies considerably from seedlings, some having a decided shade of salmon. The blooms also vary very much in size, the blooms being finest in sunny fine summer weather, some of them showing scarlet single Daisies, measuring as much as $4\frac{1}{2}$ inches across. The persistency of the blooms after cutting is even more marvellous than their perpetual blooming from April to October inclusive.

In this genial home for this striking plant, seeds are plentifully ripened by Mr. Lynch, who kindly adds, that by sowing these in a warm house so soon as ripe the plants are ready for distribution or planting out in the spring; those who have seen this plant in good form can hardly doubt that it is bound to have a brilliant future in many gardens in its present form, and may prove useful to hybridists of Daisies, *Chrysanthemums*, Dandelions, &c. *D. T. F.*

FLORISTS' FLOWERS.

CHRYSANTHEMUM GOLDEN WEDDING.

MANY complaints were made last season concerning the weakness of constitution in this variety, and the failure of the plant to flower satisfactorily. I had not grown it, and determined to try it this season. I have found no difficulty whatever as regards its constitution. The plants were late when I received them, which accounts for the buds showing late, and the flowers are only now (Nov. 14) half expanded, but the plants are certainly healthy and strong. I am very pleased with the flowers, which are of a rich golden-yellow colour, in that respect closely resembling *Jardin des Plantes*. The petals are broad and of good substance, and I shall expect to see this variety come eventually more to the front. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

THE AURICULA.

The plants show a remarkable tendency to damp-off in the late autumn, the outer leaves rapidly decaying; and if these be not removed, frequently the main stem is apt to decay as well. The alpine varieties are equally liable to be thus injured, and these effects are not confined to plants grown under glass, but are seen in the plants in the rock-garden. When removing decaying leaves, no trace of decay should be left on the plants. Many of the show varieties are very scarce, and duplicates cannot be obtained, and it is therefore advisable to avoid losses. The plants should be arranged in a certain kind of order, beginning, say, with the green-edged flowers, and following on with grey-edge, white-edge, and self, this being the order in which florists have always arranged them, and a careful fancier places his choicer specimens in the best position he has for them, and where they are under his eye, and easily come-at-able. The plants should at this season be as near as possible to the glass, but should not touch it. In fine weather the lights should be removed during the day, and replaced in the evening as soon as dew is noticed on the leaves of the plants. In foggy weather let the lights be kept close. After foggy weather the glass, if the garden is suburban, will be coated with a black oily substance, which must be washed off, but the plants will not have suffered. The plant frames, which have been in a shady position during the summer, should be placed in an open position.

Watering must be done with care, affording no water if a plant be not very dry, and always keep the leaves from being wetted when applying water.

CARNATIONS AND PICOTEES.

Those who have to deal with a large collection may not always be able to do this, that, and the other at the proper time—indeed, during the last two or three years I have been obliged to step outside the rules and regulations often laid down for myself and others; but, as a worthy man and good old florist used to say, "What odds? you're aye learning something." And herein he was quite right. For instance, I have always been anxious to get the border Carnations planted out before the end of September, and yet I have had splendid success from plants put out after the middle of November. I began this year to plant out the choice border Carnations about the middle of November, and as I write they look very promising. A little decayed manure will be spread over the surface as soon as frost sets in. I plant three of one sort together, and the clumps are 2 feet asunder, measuring from the centre of the three. Seedlings, again, ought to be planted out where they are to flower in June or July, but this cannot always be done. I plant them 15 inches asunder, but the ground was not available this year; therefore the plants were put out 7½ inches asunder, and now, when the ground has been cleared, every alternate row is being removed, and the alternate plants in the rows, leaving the remainder at the regulation distance, and filling up the rest of the borders. They were removed carefully with a mass of roots, and do not seem to have suffered in the least.

We have not yet finished up the potting of the layers, although we began early in October, and one of the very best northern growers has just written me to say that he does not find his plants suffer in the least when he can get them potted before Christmas. This, of course, would depend a good deal on the season, for sharp frosts are not uncommon in December, and they may also last long; still, it is well to know that layers may be potted up, and plants may be set out in November, and still succeed admirably.

The plants early potted-up in frames require to be carefully gone over, all dead and decaying leaves removed, green-fly brushed off, and the surface of the soil stirred; weeds also will have appeared, and should be removed, placing the plants on a freshly-stirred surface of ashes or cocoa-fibre.

In some districts spot is troublesome, but if any plants show signs of being injured by it, they should be removed from the frames into the greenhouse, where it is not so likely to spread. The rust, as it is termed, is not affected by atmospheric conditions, and must not be played with, but the affected leaves cut off as soon as remarked, and the plants watched in case it might reappear. Cleanliness is important in the frames, and greenfly must on no account be permitted to increase. It makes a sad mess of the beautiful foliage.

PINKS.

The hardy garden Pink in all its beautiful varieties, is a plant which should be found in every garden. Many of the very choicest Carnations lack scent, but the Pink never. I have read most that the late Rev. George Jeans wrote upon the Pink under the signature of "Iota," and he preferred the flower to the Carnation; and I once heard a leading florist declare at the luncheon after the Birmingham Carnation Show, that the Pink was certainly to be preferred to the Carnation. What we want is raisers of new varieties. The Carnation has plenty of worshippers and producers of new varieties, and we ought to get out of the strict grooves in Pinks as we have done in Carnations. There is too much sameness in the laced Pinks, and it requires an expert and well-educated eye to distinguish one from another.

We may in time get selfs of various colours, and if such can be obtained, the Pink will again become as popular as it once was as a garden flower. My large plants for forcing are now well established in 5 and 6-inch pots in garden frames. For forcing, the laced

varieties are not as well adapted as selfs, as the flowers do not then come furnished with lacing, or even if grown in pots. The open air, no shading, and no glass protection of any kind, afford the most perfect laced Pinks. The earliest of the plants may be put into gentle heat forthwith, keeping them close to the roof-glass, and taking care that they do not lack water at the root. Plants in the borders should be made secure after frosts by pressing the soil firmly about them; and if any of the leaves are eaten by slugs, &c., hunt for the depredators, and kill them. *Jas. Douglas.*

THE HOLLYHOCK.

There are evidences that the stately Hollyhock is once more upon the plane of improvement. At flower-shows held in various parts during the past summer and early autumn, at which florists' flowers play an important part, I have seen the Hollyhock in better condition than usual, showing not only that it is better grown, but that there are better varieties. The disease which caused the loss of so many fine varieties is not now so virulent as in former years, giving confidence to raisers of new varieties, so there is hope of the Hollyhock becoming a garden favourite once more. At Saffron Walden, so long associated with the labours of Charles B. W. Chater, Messrs. Webb & Brand, the successors of the latter, are promoting a Hollyhock revival with conspicuous success, and they have some of the old favourites of years ago, which escaped entire annihilation still under cultivation, such as *Alba superba*, one of the best white varieties; *Alfred Chater*, clear rose; *Amaranth*, a new variety, of high quality, soft amaranth-pink, full, and of the best form; *Bijou*, scarlet, tinted with buff; *Carus Chater*, crimson-scarlet, bright, and extra fine; *Fire King*, bright reddish-carmine, extra fine; *Mulberry Gem*, a very distinct variety, in colour a rich glowing Mulberry; *Golden Drop*, a fine self, yellow; *Primrose Gem*, soft primrose; *Nymph*, white, tinted with delicate pink; and *Walden King*, one of the best of the old varieties, deep crimson. It will thus be seen that the choicer named Hollyhocks of the present day exhibit a wide range of tint and combinations of colour.

The propagation of the Hollyhock is a work of much interest, and to all appearance is most successfully performed by those who make the culture of the plant a specialty. Grafting is the most commonly followed method, and it is performed by Messrs. Webb & Brand both in autumn and spring, the autumn being the time most preferred, if good shoots are obtainable for the purpose, which is not always the case, especially when the plants are allowed to seed, the production of seed appearing to delay the putting forth of growths from the roots which form the scions for grafting purposes. Grafting is done on to the roots of strong-growing seedlings. Budding may be successfully done during the summer months, much in the way that Roses are budded on to the seedling Briar; but it is hardly satisfactory, as it is found in experience that the budded shoots commence to flower so very low that they scarcely form a spike of any length.

The autumn-grafted plants are put into pots and placed in cold frames; they are kept close for a time until growth appears, then air is given, and in this way plants are obtained for sending out in the spring.

Seeds of fine strains of Hollyhocks have been somewhat scarce for years past, but always in demand. Some sown in January in heat, and the plants, if well cared for, grown on into size and planted out in good ground, will flower in the autumn. The strongest and most satisfactory plants are obtained when treated as biennials, the seeds sown in July in the open ground, and transplanted in the autumn to flower the following summer; such plants always produce larger blooms and finer spikes, and are better fitted to sustain the attacks of the disease than those raised from the winter sowing.

It may be added that seed taken from any one variety will frequently come quite true to character,

and if not fully representative of the variety, almost invariably of the same tint of colour.

That Hollyhocks can be successfully grown, and fine spikes produced during the summer months, is conclusively shown in the seed trial grounds of Messrs. Sutton & Sons, of Reading. The plants are put in deeply dug, well-manured ground, and carefully watered and mulched during hot drying weather; the plants grow strong, tall, and stately, developing fine spikes, some of which being of very fine quality, rival those shown in days of yore. The Hollyhock is not a difficult plant to grow, but it is one that must have good culture in order to succeed. *R. D.*

NURSERY NOTES.

FISHER, SON, & SIBRAY, HANDSWORTH, SHEFFIELD.

It was with feelings of relief that I left behind me smoky Sheffield, and journeyed out to the village of Handsworth. Though so rural, Handsworth is within the city limits, and is readily accessible by several means, and it would be a village of an ordinary character were it not for the extensive nurseries of Messrs. Fisher, Son, & Sibray, Limited, which formed the object of my visit. On entering the nurseries at the main gate, the first house passed into was one with a large span-roof, which has been recently rebuilt, and is now intended for a show-house.

Orchids are particularly good, several houses being devoted to their culture. *Cattleyas* and *Lælias* bristling with sheaths, *Dendrobiums*, *Cælogynnes*, *Cypripediums*, and *Odontoglossums*, were well represented in all the best species and varieties. There was a grand batch of *Dendrobiums* in 4-inch pots, some having as many as nine strong growths; and those on wood blocks were equally fine.

Suspended from the roof of one of the houses were *Nepenthes Hookeriana*, *N. Mastersiana*; and indeed, most of the best species and varieties. Effectively arranged on the stages beneath these were *Alcaasia Watsoni*, *A. Sanderiana*, *A. Lowii*, and others; also a very fine plant of *Cyanophyllum magnificum*, the moist air required by the *Nepenthes* exactly suiting its needs. *Crotons* occupy a particularly well-lighted house, and are given a very high and moist temperature, and the growth and colouring of the foliage are simply superb. *Flamingo*, *Baron James de Rothschild*, *Madame Chas. Heine*, and *Massangeana*, were especially conspicuous. The cleanliness and vigour of these plants were remarkable.

Amongst other stove-plants the *Dracænas*, *Eucharis*, continental varieties of foliage *Begonias*, and *Amazonia punicea* were all noticeable for their good condition, as were such climbers as *Allamandas*, *Aristolochias*, *Dipladenias*, and the *Stephanotis floribunda* (Handsworth variety).

Both stove and greenhouse Ferns receive much attention; the following being a few of those worthy of notice in the stove section for their splendid form:—*Davallia tenuifolia*, *Pteris tricolor*, *Adiantum cuneatum variegatum*, *A. macrophyllum*, and *A. Lathamii*. In the greenhouse section, *Todea Fraseri*, *T. pellucida*, and grand masses of the Killarney Fern (*Trichomanes radicans*), together with a nice batch of the Venus Fly-trap (*Dionæa Muscipula*), all deserve special mention. A notable house is the large Palm-house, which contains all the choicest species of Palms, ranging in height from 2 to 10 feet. Underneath these, so as to economise space, was a large quantity of *Pancreatium fragrans*. *Coccos*, *Kentias*, and other Palms are raised from seed by the thousand, and when potted off from the pans and plunged in cocoa-nut fibre, with a genial heat, they soon make plants of a suitable size for table decoration. A large double span-roofed house contains Palms, *Araucaria Napoleon Baumann*, *A. excelsa*, *Dacrydium Franklinii*, &c. These are kept quite apart from the sale plants for decorative purposes, the firm entering largely into this branch.

Bouvardias, *Azalea indica*, *Tea Roses*, *Greenhouse* and *Japanese Rhododendrons*, *Cannas*, *Epacris*,

Camellias, &c., were all the best of their kind. Marguerite Carnations were perfect, and it has never fallen to my lot to see a finer show of blooms in all shades of colour. Of course, these are only flowered inside for seeding purposes. Seed sown early in the season will ensure plants in full bloom in July and August, many of which are almost equal to florist's varieties. Several houses are occupied by Lapagerias in different stages of growth, notably *L. gigantea*, *L. alba*, *L. maculata*, and the celebrated red variety, *L. profusa*. These are all produced from layers from plants planted out in convenient borders for this especial purpose.

Four houses are set apart for the cultivation of flowers and foliage for cutting, and a very praiseworthy rule is rigidly enforced, viz., that no flowers, &c., are to be cut in any other houses. Their

of the Grecian variety, and some large-leaved varieties not yet in commerce. Evergreens, such as Aucubas, *Prunus cerasus* var. *rotundifolia*, vars. *latifolia* and *caucasica*, are numbered by thousands. Owing to the Aucubas being liable to injury from frost, it is the practice to transplant them in August, the object being to ripen the young growth.

Fruits.—Fruit trees cover some 60 acres; Peaches, Nectarines, Plums, Cherries, and Apricots, dwarf and fan-trained, were all very good; and of espalier and pyramid-trained Pears, the stock is a very fine one. Standard Apples, Pears, Plums, and Dameons, were all clean-grown capital trees. Particular attention, I was told, is paid to the selection of stocks for budding and grafting, and where necessary, double-grafting is carried out to ensure fruitfulness, examples of which may be observed in the splendid specimens of Bis-

FLORICULTURE IN HANLEY.

THE possibilities of beautifying and decorating the surroundings of the dwellings of the working classes, and, indeed, those of more pretentious domiciles, are shown by several working-men resident in Hanley. A striking instance of what can be done in this respect is shown in the little plot of garden at the rear of the residence of Mr. G. Bowering, the chairman of the County Borough of Hanley Chrysanthemum Society, 27, Windsor Street, Hanley. For many weeks it has been the admiration of passers by. The wealth of bloom, the fresh, green appearance of the foliage, and the variegated colours of the plants, made one of the prettiest pictures imaginable. The Mayor, who recently paid a visit to Mr. Bowering's residence, and

FIG. 106.—A TOWN GARDEN, HANLEY, STAFFORDSHIRE.

contents, at this season, consist principally of *Smilax asparagoides*, *Odontoglossum*, *Adiantum cuneatum*, *Asparagus plumosus*, *A. deflexus*, *Tabernaemontana*, *Coccygnes*, and early-flowering *Chrysanthemums*. About half-a-dozen houses and numerous pits are devoted to the propagation and growth of *Ivies*, *Ampelopsis Veitchii*, *Clematis*, &c.

In the herbaceous and alpine gardens numerous beds were noticed which have been planted with the best varieties of *Narcissus*. Coming to some thousands of tree and bush *Ivies* in variety, which are such invaluable town plants, I was told that there is a great demand for these plants. Hybrid *Rhododendrons*, *Ghent* and *mollis* *Azaleas*, were also here in their thousands, and particularly well set with flower-buds. Tea and dwarf hybrid *Roses* in pots, and standard *Roses*, took up several acres, and could scarcely be surpassed for general excellences. *Handsworth* has long been famous for its *Hollies*, and at the present time there is a large stock of fine plants

marck, *Gascoigne's Seedling*, *Peasgood's Nonsuch*, *Lord Derby*, and other varieties of *Apples*. Whether it is the nature of the soil, or the constant use of the hoe, the trees when lifted show great masses of fibry roots. *Gooseberries* are grown in hundreds of thousands. Immense breaks of black *Currants*, particularly *Buddenborg's Black Prince*, the growth of which is something remarkable, were observed. The wants of customers in the way of *Strawberries* are not forgotten, a large breadth being planted with the best varieties for trial purposes, and also for obtaining early layers. A large tract is also set apart for trials of vegetables and farm seeds; and another very important feature is the seed department, the firm during the 150 years of its existence having always been noted for its reliable seeds.

The area of these nursery grounds is about 200 acres, and every portion of the land is under some kind of nursery crop, park and forest trees forming no small portion of the same.

expressed his pleasure at the charming appearance of the garden. Mr. Bowering is to be congratulated on his taste and perseverance, and if his example only tends to show what may be done to brighten our dwellings, he will have done a great deal to encourage others to follow his lead. *Staffordshire Weekly Post*, September 7, 1895.

[This garden, of which a photographic view was kindly furnished by Mr. Jas. Kent, superintendent of the public park, Hanley, is reproduced in fig. 106. Our readers will not fail to notice and admire this garden, situated in the heart of this not very salubrious pottery town of 60,000 inhabitants.]

RANUNCULUS CORTUSÆ-FOLIUS.

SINCE I received a First-class Certificate and Cultural Commendation for the above plant from the Royal Horticultural Society, I am constantly being

asked by correspondents as to my method of cultivation, and a few remarks in the *Gardeners' Chronicle* will probably suffice to answer them. (See *Gardeners' Chronicle*, 1892, April 9, p. 465.) When growing in pots, I use the following compost for the plant, viz., three-quarters loam, one quarter leaf-mould and rotted dung, with sufficient sharp sand to keep the mass porous. The tubers should be potted about the end of the month of September, one tuber being placed in a 16-sized pot. The potting should be firm. Stand them in a cold frame, with abundance of air, afford water just sufficient to keep the soil moist till growth commences, when, provided the drainage is good, they will require abundance. As the pots fill with roots, manure-water should be afforded once or twice a week. At that time the plants should be taken to an airy house not pervious to frost, and a sharp look-out kept for green-fly, the leaves and flower-buds being very soon disfigured by these insects. The plants usually come into bloom by the beginning of the month of March. After flowering is passed, and the leaves are ripe and turning yellow, water should be gradually withheld, the pots being laid finally on their sides out-of-doors till potting time again comes round. The most important time is after the flowering is over, attention being required to be given to the thorough ripening of the tubers, without which success is doubtful. The odour of the flowers resembles that of some of the *Vandas*. *C. F. Wood, Heathfield Gardens, Reigate.*

THE FLORA OF KASHMIR.

The report on the valley of Kashmir, by Mr. Walter R. Laurence, the Settlement Commissioner for the Kashmir and Jammu State, which has just been issued from the Oxford University Press, contains matter which will be of much interest to the botanist, the horticulturist, and the agriculturist.

Mr. J. F. Duthie, the Director of the Botanical Survey of Northern India, has furnished the report with a list of the plants which may be found in the neighbourhood of Gulmarg, and this list is of especial value, seeing that no list of plants of the Kashmir valley has as yet been published. In dealing with the Flora of the Kashmir valley and its mountains, the commissioner has confined his attention to those plants and trees which possess some well-known economical value for the people. As the Kashmiris turn nearly every plant and tree to some use, and attribute medicinal properties to every growing thing, it will be seen that Mr. Laurence's task was by no means an easy one.

The various indigenous plants and trees have been grouped under their several economic uses and properties, and there are fourteen divisions in all:—

- | | |
|----------------------|----------------------|
| 1. Condiments. | 8. Medicines. |
| 2. Drugs. | 9. Poisons. |
| 3. Dyes and Tans. | 10. Scents. |
| 4. Fibres. | 11. Soap and Alkali. |
| 5. Fodders. | 12. Timber. |
| 6. Foods and Fruits. | 13. Yeast. |
| 7. Hair-washes. | 14. Adulterants. |

Kashmir is very rich in fibres, and the natives make great use of them. Mr. Laurence thinks that it is possible, as communications with India improve, a trade in fibres may be developed, as every year sees a great waste of valuable fibre-yielding plants. The boatmen of Kashmir require ropes of good quality, and it is stated that for towing-ropes the cotton fibre is the best material.

The Barza or Paper Birch is of great importance to the Kashmiris, the bark being used to perform the duties of rough paper, and the roofs of all the better class of houses and of shrines being formed of Birch bark, on which a thick layer of earth is laid.

Kashmir is rich in Grasses, and the boundaries of the Rice-fields furnish a fine crop of hay every year. This hay is twisted into long ropes which are suspended from trees, thus protecting the hay from the weather. On the lakes and swamps of Kashmir, the following food-plants are to be found growing wild:—

- | | |
|--------------------|---------------------------------|
| Water Chestnut ... | ... <i>Trapa bispinosa.</i> |
| " " " " ... | ... <i>Euryale ferox.</i> |
| Water Lily ... | ... <i>Nymphaea stellata.</i> |
| " " " " ... | ... <i>Nymphaea alba.</i> |
| Sacred Lotus ... | ... <i>Nelumbium speciosum.</i> |
| Sweet Flag ... | ... <i>Acorus Calamag.</i> |
| Reed Mace ... | ... <i>Typha species.</i> |

Of the fruits of Kashmir, the following are indigenous, and are found in all parts of the valley. Mr. Laurence says their fruit is not so good as that of the cultivated tree, but that it is by no means to be despised. The Mulberry, Bitter Cherry, Plum, Apple, Pear, Vine, Walnut, Pomegranate; the Raspberry, Blackberry, Bramble, Strawberry, Gooseberry, Red Currant, Black Currant, Bird Cherry, Barberry, *Elaeagnus*, Beam tree, Hazel, and Gueldres Rose. The Raspberry and the Currants are, according to Mr. Laurence, equal to the cultivated varieties of Europe.

The Kashmiris take great pains with their hair, and besides using butter and oil, they employ numerous plants for this purpose. To strengthen the hair, they use the powdered roots of a plant known as Zonir, mixed with butter; and to induce a curliness of the hair, they employ a wash made from *Corydalis Falconeri*. Mr. Laurence gives a list of the more common medicinal herbs, but the task is a difficult one, for the hakims of Kashmir, the native physicians, attribute some property to every plant. Many plants are used for scents, the most important of the aromatic plants of Kashmir being the *Saussurea* [?].

Kashmir is rich in forests, which produce a great variety of timbers, the most valuable being that of the Deodar. A Department of Forestry has lately been formed under the supervision of a European forest officer, and it is hoped that the indiscriminate and wanton destruction of forests, which has been allowed to proceed for so long, will cease. It is a curious fact that no Oaks occur in the valley and its mountain sides, and that no specimen of the Himalayan *Rhododendron* is known in the valley of Kashmir.

Mr. Laurence's book is a valuable contribution to the economic flora of India, and we trust he may some day find time to pursue his researches on the botany of the Kashmir valley a little farther. *H. C. F.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

MANURING, TRENCHING, AND DIGGING.—An effort should be made at this season to trench as much of the kitchen garden as possible, in preparation for next year's crops. The manure should be carted or wheeled by hand as near as possible to the land to be dug. In large kitchen gardens it is usual to have the walks of sufficient width to admit of a horse and cart, and if the wheels are broad and a little attention be paid to cleaning the tyres of soil when coming off the land or from the dunghill, it is much the more economical practice. The edging is got over by means of a strong kind of low bridge made 2 feet wider than the cart. The work of carting direct on to the land should never be undertaken except when it is dry or frozen. In gardens which it is customary to trench to a depth of 2 to 2½, or 3 feet, put the top spit into the bottom of each trench, the soil at that depth is equal to the top in fertility, and may safely be brought to the top. I think 2½ feet is deep enough to dig for most purposes, and in but few gardens is the bottom soil equal to that at the surface, unless it has been placed there when trenching the land. In case the soil at the bottom is not so good, bastard trenching is the best way of doing the work. In bastard trenching, the soil at the bottom of the trench should be broken up, manured, and dressed with lime or soot, or both. The lime and soot should be intimately mixed with the soil, and the manure go just beneath the upper spit on the top of the shovelling, which should not be less than 2 inches thick. If the land is retentive and stiff in texture, it may be ridged. For my part, I do not find much advantage in this method over flat digging, provided the surface be left as it falls from the spade. Land badly infested with wireworm, or in which Cabbages club, should now be dressed with gas-lime, one of the best remedies for the purpose; and the present is the best season to apply it. Gas-lime, as it comes from the purifier at the gas-house is lumpy and adhesive, needing to be broken up and passed through a fine screen or sieve, so as to distribute it in finely comminuted particles over each spit of trenched or dug soil. It may be used at the top or bottom at the rate of one handful

to one superficial yard. If gas-lime be used at this rate or less each year so long as the land appears to need it, much good will be effected. A dressing may be used of quite this strength over the surface of the entire garden, and it may be used among almost any kind of crop if used with due care and in a fine state.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

PLEIONES, OR INDIAN CROCUSES.—Our plants of *Pleiones* have been very gay for the past few weeks; and, considering the ease with which they can be cultivated, the large number of the flowers they produce at a dull season, and the beautiful effect afforded when they are used for decorative purposes, space should be found for a number of the plants even in a small collection. By the time this note appears in print, *P. concolor*, *P. lagenaria*, *P. Reichenbachiana*, *P. praecox*, *P. Wallichiana*, *P. maculata*, and its almost white variety, *alba*, will be going out of bloom, and the careful observer will note that the green shoots from which the flowers sprang are in reality new growths, which under proper treatment form strong flowering pseudo-bulbs. This treatment consists in affording fresh rooting material to the roots, which start from the base of these new growths. As regards repotting *Pleiones*, it is not necessary to disturb them annually, unless the soil has become soured, as they may be grown in the same pots for a couple of seasons and still produce plenty of blooms. It is immaterial whether ordinary shallow pans or pots be used, excepting that pans are best where space is limited. Whichever be used, plenty of clean crocks should be afforded, as copious waterings are required by the plants during active growth. Over the crocks a thin layer of sphagnum-moss should be placed, for the two-fold purpose of keeping the compost uniformly damp and the drainage unclogged by soil. Turn the plants out of their pots or pans, removing most of the stale soil, and cutting off all roots which are dead; and instead of dividing the pseudo-bulbs and bedding them out, as is often practised, I simply repot them in clumps almost touching each other, and merely pull off those which may have grown beyond the main mass of the clumps, which may be used for increase of stock. The compost should consist of equal parts of fibry loam, peat, and sphagnum moss, well mixed with a moderate quantity of coarse silver sand. Some growers make use of a mixture of peat and leaf-soil, sand, and finely-broken crocks, with equally good results; and I have occasionally observed plants doing well in ordinary peat and sphagnum moss. Wherever it is possible, the spaces between the pseudo-bulbs should be filled in with the roughest portions of the compost, giving preference to sphagnum moss as being retentive of moisture. When repotting is finished, the plants should be placed near the roof glass in any house having an intermediate temperature, and be afforded scarcely any water until the young growths start to grow vigorously; and as the roots and foliage develop, so must the quantity of water afforded be increased, weak liquid-manure water being supplied once a week after complete re-establishment. In addition to the varieties mentioned, there are *P. humilis*, *P. Hookeriana*, and its pretty variety *brachygloussa* which come from greater elevations, which do best when hung up close to a ventilator in the *Odontoglossum*-house that is commonly left open. These species generally flower about January or February, therefore till they have done so they should on no account be disturbed, but kept in the cool-house and afforded water sufficient in quantity to prevent the pseudo-bulbs from shrivelling.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

FRUIT-BUSH PRUNING, ETC.—The pruning of Gooseberries and Currants may now be carried out, spurring-in the side shoots on the former and red and white Currants to about three-quarters of an inch in length, and thinning out the shoots and spurs where much crowded. To preserve the simple basin shape to the bushes, branches should not be allowed to cross each other, and one or two crossing branches or shoots should be cut away. Some gardeners are constrained to leave the pruning of Gooseberry bushes till the spring, so as to ensure enough fruit-buds being left for a crop, and shoot-buds to form the bush after the birds have despoiled them, and where this has to be done, the bushes should be bundled up faggot-wise as soon as the leaves have fallen, which will prevent the birds gaining an access

to any but those at the outside of the bundle. If the pruning is performed early in the autumn, and the bushes are dressed forthwith with soot and lime (which is best put on rather thickly with a white-washing brush), no bird will touch them; even a good dusting with dry lime whilst the wood is wet acts as a deterrent, but is not so effective as the lime and soot wash, and it may require to be done a several times. Black Currants need a thinning of the older branches, and a reduction of the young shoots, encouraging the stouter young shoots that spring up from the root. All suckers not required for this purpose should be dug up, and if necessary employed for increase instead of cuttings. In preparing cuttings of bush-fruits, choose ripe shoots of $1\frac{1}{2}$ to $1\frac{1}{2}$ foot in length; cut the bottom end transversely just below a joint, and the top on the slant. If clean stems are wanted, the buds must be taken out from the lower part of the cutting, leaving three or four at the top to furnish the main branches. In the case of the black Currant, this method is not recommended, the finest fruit invariably coming on the young wood, and this can only be obtained by means of the growths springing from the root. All cuttings should be inserted as soon as made, if in mild weather, in rows at 6 inches apart and the same in depth, the rows being 1 foot apart, for the better convenience of cleaning the ground.

BULLFINCHES, TRAPPING, ETC.—A sharp look-out must be kept now for bullfinches, shooting or trapping them on their first appearance. In a few hours a couple of these pests will do an immense amount of damage on an Apricot or a Plum tree; and where a good call-bird can be had, they may easily be taken in a trap-cage, or they may be captured with bird-lime.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

HINTS ON WORK IN GENERAL.—There should be no delay in carrying out the necessary cleaning, pruning, and training of trees, Vines, &c., in the various forcing-houses, many other jobs claiming attention at the new year, when less time, therefore, will be available for doing the various operations thoroughly. All of the Peach and Nectarine trees should be pruned, and the young shoots tied loosely in bundles to some of the main branches. Then proceed to wash every part of the roof and trellis. When the shoots are thus drawn up together, the gardener is enabled to use with expedition and safety some approved insecticides on the trees, besides thoroughly cleansing the rougher parts of the bark on stems and branches. For scale I use nothing but clear water at 130° applied with a syringe on three or four successive days, and this, if the water be copiously used, never fails to destroy scale. The fruiting wood may be washed with a large sponge dipped in a rather strong solution of soft-soap and water before laying in, mealy-bug being less easily destroyed, and it is necessary to use petroleum at the rate of a wine-glassful to 4 gallons of water, first having stirred in 4 oz. of soft-soap. To apply this dressing, use an ordinary scrubbing-brush, and repeat the application on three or four successive days. I do not advocate the coating of the Vines with clay, &c., and would caution gardeners against the use of tar, as I have known Vines so injured by this substance that it has taken years for them to recover. Thoroughly washing the Vines as recommended while in a dormant state, and keeping a sharp look-out during the first few weeks after starting to force for stray bugs is a perfectly safe and sure mode of destroying this, the worst of all Vine-pests we are acquainted with in this country. Fortunate are those who like myself have no mealy-bug on the Vines, as I well know the amount of labour entailed, and the worry caused when this pest is about. The cleaning of the Vine stems, shoots, &c., is often entrusted to inexperienced men, who sometimes strip off the bark too freely from the stems, which cannot be other than detrimental. Before the work of cleaning the houses and Vines, &c., is begun, place a thick layer of stable-litter on the borders to absorb moisture, and mitigate the evils of trampling on them whilst moist. By afterwards burning the litter in the open air, numerous insects are got rid of that may have fallen from the Vines or trees. Finally, the Vines may be gone over with a paint-brush, the point of which is merely moistened with petroleum, and apply this to every part of the Vine except the bud's rougher outer portion, which should be removed, and this can be done by a sharp-pointed piece of hard wood or even an ordinary plant-label, and as it is chiefly

round the spurs that the bug collects, these parts should be very carefully examined. Having cleaned the Vines in this manner, wash every part of them with hot-water into which petroleum in the above given proportion is mixed, and kept thoroughly and intimately incorporated at 130° of heat.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

THE SPRING GARDEN.—During mild weather the planting of Tulips, Hyacinths, Narcissus, Anemones, and other roots, the planting of which has been deferred, should be finished as soon as possible, the bulbs, &c., succeeding fairly well if planted at any time during December if the weather permits, which it does not always do, severe frosts setting in sometimes, delaying every kind of work. It sometimes happens that early planted bulbs push through the soil if the season is mild earlier in winter and spring than is good for them, and when that is the case short manure or leafy soil should be laid on to protect them from frost. If the material used is such that it can remain on the beds without looking unsightly, and the bulbs grow through it, so much the better. A keen look-out should be kept for mice, which destroy Crocus corms in the winter months, especially at times when much snow lays long.

PANSIES, WALLFLOWERS, PRIMROSES, POLY-ANTHUS, MYOSOTIS, DAISIES, AND AJUGAS.—The planting of these spring-flowering subjects may be continued, weather permitting, not forgetting to fill up gaps in earlier-planted beds, and choosing dry weather for this kind of operation. Pansies are often injured by wind, and they should always be made secure by pressing the soil to them when the latter is dry. Rabbits and hares must be kept from these plants, for if they once get a taste of them, and the beds are not protected, they will make a clearance of them. Late cuttings of Viola or Pansy, or seedlings that are being wintered in frames, should have the lights removed from off them on fine days, and abundance of air afforded at nights; and the lights put over them as a protection against heavy rain or frost.

CARNATIONS AND PICOTEEES in frames should have attention, very little water afforded till days get longer, and in fine weather the fullest ventilation night and day is needed. If the pots are not as yet plunged in fine coal-ashes or cocoa-nut fibre refuse, this should be done.

CALCEOLARIA, PENTSTEMON, ANTIRRHINUM.—If in frames, these plants require about the same kind of treatment as the above-named throughout the winter. The cuttings should now be well rooted, and should any of them show flower, as they will do when the shoots taken were hard in texture, and bad to get, the flowers must be nipped off with a pair of scissors. These young plants do not require much water, still they must not be allowed to become dry. It is a good thing to put two handfuls of wood ashes or burnt refuse in each watering-can when watering the beds. Afford abundance of ventilation to all rooted cuttings, and cover up well against frost.

CUTTINGS OF HOLLIES AND OTHER EVER-GREENS, and hardy deciduous shrubs, should now be taken, selecting short well-ripened shoots, with a portion of the older wood attached. They should be placed in nursery lines at 1 foot apart in sand, loam, and leaf-soil, in a sheltered situation, the more tender varieties such as Garrya elliptica, Skimmia japonica, male and female varieties; and Aucuba japonica, male and female varieties, should have the shelter of pits or frames.

ROSES.—In mild and favourable weather take cuttings of H.P. and other kinds of hardy Roses, the cuttings being taken before the bushes, &c., are pruned. Rose cuttings should be made from short well-ripened shoots. As a place for the cutting-bed, a sheltered border facing the west serves as well as any, and the cuttings should be placed in little trenches, a foot or further apart, the trenches being filled with sandy loam. It is better to make a good number of cuttings, keeping each variety labelled and in damp soil till all are ready for insertion, and then the job can be quickly finished. Remove all eyes or buds from the portion that will be underground, which applies also to all cuttings of deciduous shrubs, or suckers will be a source of vexation and trouble. The soil about Rose-cuttings must be made very firm and levelled with the back of the spade. A Rose-cutting should not be placed deeper than half its length, and this should be 8 to

12 inches. In hard weather protect the bed with Fern or litter.

CHRYSANTHEMUMS.—The autumn-growing varieties that are planted in beds or borders should be cut off near the ground, and in cold situations the old stools protected with short manure placed round the root-stock. Cuttings of each sort should be kept in pots under the shelter of frames, or in a cool house, during the winter.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

PLANTS IN COLD FRAMES.—In these receptacles, the herbaceous Calceolarias are cultivated in most gardens until their removal to warmer quarters is necessitated by hard weather. The plants will require careful watering, and to be turned round every week, kept close to the glass, and have plenty of air afforded the frames in mild weather. The common white slug must be carefully sought for, as they soon gnaw and disfigure the leaves. When the pots fill with roots, some weak soot-water may be afforded occasionally, say once a fortnight. Bedding plants in frames require at this season scarcely any water at the root, nor will they do so for the next two months; but should water be needed, see that it is afforded early in the day. In mild weather, ventilate freely at the top and bottom; and keep everything about the plants sweet and clean, and free from decay.

CINERARIAS.—These, if for a late display, should be afforded some weak manure-water, if the pots are filled with roots, and a fumigation if green-fly has made its appearance. Fancy Pelargoniums will need to be kept close to the glass, and allowed air night and day; and even in cold weather they should not be quite unnaired. Do not let them remain in one position for longer than one week, but turn them round wholly. Stop all shoots when four or five leaves are made, doing so at one time, or the plants will break irregularly. Pelargoniums being plants very subject to aphid, should be fumigated once a month.

ZONAL PELARGONIUMS.—These, if for summer flowering, may be potted into large 60's or 48's, placed close to the glass in a pit or greenhouse, and when the roots have permeated into the fresh soil, the points of the leading shoots may be pinched off.

EAST LOTHIAN STOCKS are benefited by being top-dressed with a small quantity of Clay's Fertiliser, and by having the pit-lights drawn entirely off in mild weather. Some of them may be placed on a shelf in a house having a warmth of about 50° by day to 45° by night. These will bloom early, and a Peach-house just started is a very suitable place for pushing them on into flower.

BORDER CARNATIONS.—These, if standing in cold frames, will require scarcely any water for the next two months, but plenty of air day and night in mild weather.

WALLFLOWERS, if cultivated in pots, may be brought on into bloom by gradual forcing. Covent Garden Blood-red is a good variety for early flowering, it being a plant of dwarf habit, and the flowers of a pleasing bright colour. Wallflowers put into gentle heat at this season flower in February.

TREE PÆONIES IN POTS.—These are beautiful plants for cultivating for conservatory and greenhouse decoration, and if any of them are in need of repotting, the present is the proper time to do it. The pots need should be about two sizes larger than those the plants are occupying, and the potting-soil may consist of turfy loam, leaf-soil, cow-manure in a dry state, and enough coarse sand as will keep the soil in a porous condition for a year or two. Plants in an unhealthy state should have the old soil shaken clean away from the roots, and be repotted into clean pots of the same or smaller size, and not allowed to flower till the second year after repotting. Plunge them over the rim in fresh tree-leaves in cold frames, or place in a late Peach-house or vinery. If the potting-soil is moderately moist at the time of using it, no water need be afforded the plants before growth begins. Pæonies, when forced into bloom with heat, should be brought on very gradually, or the flower-buds will fail to open; and the strongest and best-rooted plants should be selected for this purpose. Good varieties for growing in pots are Reine Elizabeth, Madame de Vetry, Blanche Noisette, Madame Callot, the Queen, lactea, Punicea, Beauty, Homer, and Jupiter.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41° 2.

To eat an Artichoke gracefully is so difficult an accomplishment that punctilious people might well prefer to partake of the luxury in private. Knives and forks are useless under the circumstances, and not only are the fingers soiled, but the heap of *débris* left on the plate is disagreeably suggestive, in its size, of a "kitchen-midden" or a rubbish heap. To be sure there is the delicate morsel from which all the scales or bracts spring, viz., the Artichoke bottom, botanically the "receptacle." An Artichoke is botanically a large Thistle-head, with its scales or bracts, its flowers, its Thistle-down or pappus, and its receptacle. The receptacle in most Artichokes is relatively small, and apt to be mixed with the "choke," by which expressive name the pappus of the innermost florets is designated. Now, if the Artichoke bottom could be developed at the expense of the succulent matter of the scales, a great gain would result; and this great gain has, in a certain degree, been obtained, though it is so little known in this country, that we deem it desirable to call attention to the matter. At the Paris *tables-d'hôte* at this season, "*fonds d'artichaut*" are used with a freedom which shows that there is no scarcity of them in the markets, and that the price must be considerably lower than it is here. Moreover, not only are they much more abundant than Artichokes are in England, but they are of thicker and more fleshy substance, and there is in consequence more of the toothsome morsel. Pursuing our enquiries, we luckily fell in with our excellent friend M. DE VILMORIN, and from him we not only learnt all the particulars we

desired, but we were enabled to see the plant growing in his most interesting trial-grounds at Verrières, alongside of several other varieties. From this source was obtained the specimen from which our illustration (fig. 107), was prepared. The foliage is very distinct and handsome, but we must await another opportunity of figuring this. The scales or bracts of the receptacle are comparatively less succulent than in the ordinary varieties, whilst the receptacle or bottom is unusually thick and fleshy. The variety is not altogether unknown in this country, and is mentioned in many of our garden catalogues as the large green Paris Artichoke; but it is certainly less known than its merits deserve, and much less grown than the ordinary Globe Artichoke. Around Paris it is grown as the *Artichaut vert de Laon* (pronounced Lönn).

It is very hardy for an Artichoke, with greyish leaves almost destitute of spines. The "heads" are, as we have said, remarkable for the depth of the receptacle. The ovate-lanceolate scales are wholly green or slightly tinted with purple at the base, at first closely packed, but subsequently rather spreading at the ends, and usually entire at the margin. M. DE VILMORIN remarks that though not so early as some other varieties, it is the best for general purposes. No other variety has a receptacle so deep and fleshy. It comes true from seed, but is best grown from offsets.

Like the ordinary Globe Artichokes, it requires a deep, rich, moist, but well-drained soil, and it should be planted in lines about 1 yard apart each way. The sets are planted in spring, and will even produce flowers the first season, but it is better to await the second season's growth. In hot dry weather, water must be afforded, and in winter protection by mats or a thick layer of dry litter is essential. After four years it is best to form a new bed, or in large establishments to arrange for a series of beds to come in succession. The prices asked in our markets ought to secure ample remuneration to the grower.

The cultivated Artichoke is not a distinct species, but a derivative from *Cynara cardunculus*, the Cardoon. Indeed, the Artichoke, as we know it in gardens, is not found anywhere in a wild state. The *Cynara cardunculus* has been developed in two directions. In the Cardoon the ribs of the leaf have been developed, whilst in the Artichoke the flower-heads have been the objects of selection. In the Botanic Garden at Turin, by growing the wild plant from Sardinia side by side with the cultivated Artichoke, Professor MORIS was enabled to prove their identity, and this view was supported by Professors WILKOMM and LANGE, who have had special opportunities for obtaining information. ALPHONSE DE CANDOLLE, in his *Origine des Plantes Cultivées*, shows that the ancients only knew and cultivated the Cardoon, the Artichoke, as we know it, not being introduced into Florence till 1466. It is doubtful whether the ancient Egyptians cultivated the plant, and there is, it appears, no word in Hebrew or in Sanscrit for the Artichoke, an indication of its comparatively recent introduction into cultivation. In this country the Artichoke was cultivated in 1548.

One of the most curious points in the history of the wild Cardoon is its naturalisation during the present century in the Pampas of Buenos Ayres, where it has spread with such abundance as to obstruct travel and traffic. It is worth enquiry whether the foliage of this wild or half-wild Cardoon might not be utilised for the sake of its fibre, and a nuisance thus converted into a blessing.

THE Expert Committee appointed by the City of London Corporation, to report on the Forest, met recently, for the purpose of inspecting the work which has been done, and report to the Chairman of the Committee as follows:—

"We have, again, very carefully inspected those portions of Epping Forest upon which we had previously reported, and we have examined the work which has been carried out since the issue of that report, with the view of seeing whether it was in accordance with the spirit of our recommendations.

We beg to make the following remarks:—

EPHING THICKS.—This was the first point visited. We were struck with the beauty of the outline which has been obtained by judicious cuttings on the fringe of the wood. We consider that the work done throughout this wood has been good.

THAMES VALLEY (THEYDON BOIS).—This is an unsightly and monotonous portion of the forest, owing to the number of gaunt pollard Hornbeams. We consider that this would admit of further clearing, and that portions might be advantageously thinned out in large patches and sown with Oak, Beech, and other trees. As these grow up, further areas might be taken in hand in the same manner.

THEYDON COPPICE.—We have made one or two suggestions here to the Superintendent of the Forest with the view of opening out glades. There are a number of young trees coming up through the coppice which are in danger of being choked. These should be carefully preserved by cutting out such portions of the coppice as are a source of danger to them. This course will enable this portion of the forest to assume once more that natural aspect which the treatment of former years, when pollarding and coppicing were allowed, has obliterated.

BACK OF RIGGS' RETREAT (THEYDON BOIS).—The thinning here has been moderate. We have pointed out to the Superintendent places where further action is necessary, with a view to improving the condition of some of the finer trees.

THEYDON HIGH WOOD.—In the northern portion of this wood, which consists of Beech trees, there is—as a matter of consequence—no underwood.

We consider that the policy to pursue in this portion, is to mark those trees which are most worthy of preservation, and gradually to free them from any worse trees which may be injuring them. By laying down a definite line of action in this way, there will be continuity of policy independent of changes of officials.

The southern portion of the wood may, we consider, be left alone for some years to come.

BROADSTROOD (LOUGHTON).—We have made some suggestions with a view to improving the outline.

WOODRIDDEN HILL.—We have no objection to offer to what has been done here.

VERDEBERS' RIDE (HIGH BEECH TO WOODRIDDEN).—We are of opinion that the glades which have been opened out here might have been bolder and less close together.

We have made some suggestions to the Superintendent with a view to improving these.

CLAY ROAD, LOUGHTON.—We consider that the breaking up of the straight line has been judiciously effected, and that the result is a great improvement on the previous state of things. The thinning has nowhere been excessive.

BURY, OR HAWK WOOD.—There are a number of pollard Hornbeams in this wood which should be removed. They are damaging the Oak trees; they prevent the holes of the Oaks from being seen, and their removal would improve the character of the wood. We attach great importance to retaining the character of this portion of the forest as an Oak wood, and we would recommend that nothing further be done here beyond the gradual clearing-out of the pollard Hornbeams.

BUSH WOOD, WANSTEAD.—The thinning done here during past years appears to be judicious.

WANSTEAD PARK.—The old Elms, with undergrowth of young Sycamore coming up between them, are the principal feature of this wood. The

object of thinning was to remove some stag-headed Elms, and those which interfered with the development of the Sycamores. No other Elms, unless dead or dying, need be removed, as the Sycamore now has sufficient light and air to hold its own against the Elm.

WALTHAMSTOW WOOD.—In this wood a number of Hornbeam pollards have been cut out in single trees here and there. In our judgment, a better effect would be obtained in future by removing such pollards as it may be desirable to get rid of, in groups, leaving other portions unthinned in the meantime. By adopting this course, a gradual return to a more natural condition of the woodland would be obtained, the artificial pollards giving way to natural and unmutated trees.

2. It is desirable that when the plan is matured and approved, the execution of the work should be placed in the hands of the Superintendent of the Forest, who should be responsible to the committee for the entire management of the forest.

3. At the present moment, the forest is in places littered with heaps of cut timber. This is very unsightly, and we strongly recommend that arrangements should be made for the cut timber to be removed by May 1 in each year.

A. B. FREEMAN-MITCHELL, ED.
 JAMES ANDERSON.
 WM. ROBINSON.
 W. SCHLICH.
 A. D. WEBSTER."

geometry and astronomy, and calculations of altitudes and superficies. Mr. Baker thought the number of plants named at the date referred to was a matter of some interest to botanists, and suggested publication of the list of names with their identification where possible. Dr. D. Morris, C.M.G., read a paper on the "Development of a Single Seed in the Fruit of the Cocoa-nut Palm (*Cocos nucifera*)." Alluding to the occurrence of Palms with twin and trifid stems arising from one base, it was shown that these were due—(1) to several seeds in one fruit; (2) to more than one embryo in a seed; or (3) to a branching of the primary shoot. In cases cited by Rumphius, Forbes, and others, several seeds were found in one fruit. The course of development of the single cell was illustrated by means of lantern slides.

FIG. 107.—THE PARIS GREEN OR LAON ARTICHOKE; SHOWING ON THE LEFT A PORTION OF THE HEAD, AND ON THE RIGHT A SECTION SHOWING THE THICKNESS OF THE RECEPTACLES. (SEE P. 618.)

OAK HILL, WOODFORD.—The thinning here has been carefully carried out.

KATE'S CELLAR, LDOUGHTON.—This wood is typical of the large area of monotonous Hornbeam pollards which are unfortunately so conspicuous a feature of Epping Forest. The clearings are too small, and too near each other. We recommend that, in future, they should be of a bolder type, and further apart.

Although it may not be exactly within the terms of our reference, we beg to offer the following remarks for the consideration of your committee:—

1. We would suggest that a plan of operations should be drawn up, showing which areas it is proposed to deal with during the next ten years, and the character of the operations. This scheme should be drawn up by the Superintendent of the Forest, and submitted to the Epping Forest committee, who might, if they thought well, take further advice as to the proposals made in the scheme.

OUR ALMANAC.—We shall be obliged if secretaries of horticultural and other societies, and our correspondents generally, will send us as soon as possible the dates of any exhibitions or meetings to be held during 1896, for insertion in our annual Almanac.

LINNEAN SOCIETY.—On the occasion of the meeting on Thursday, November 21, Mr. J. G. BAKER, F.R.S., Vice-President, in the chair, his Grace the Duke of Bedford, Messrs. Bernard Arnold, and E. B. Fernan were elected Fellows of the Society. Mr. B. B. Wood was admitted. The Rev. G. Henslow exhibited a MS. Commonplace Book of the latter end of the fourteenth century. The entries in Latin and English were found to consist chiefly of medical recipes, in which about 200 plants are named for their use, and some methods of distilling *aqua vitæ* described. In addition were some notes on

The obliteration of the two cells began about the second or third week after the spathe was open. By the end of the seventh week they were reduced to narrow slits, which were still traceable in the mature fruit. On behalf of Mr. A. J. Ewart, Professor Harvey Gibson gave an abstract of a paper on "assimilatory inhibition, the causes by which it may be induced, and their influence on vitality." It was shown that most inhibitory agencies operate by inhibiting the initial stages in assimilation, but any cause affecting the rapidity of removal of carbohydrates from assimilatory cells will also affect their power of assimilation, the commencement of which is determined mainly by the development of the chlorophyll pigment, but is also influenced by other indeterminate factors, probably plasmatic in origin. The paper dealt mainly with the discussion of experiments with a large number of plants, and criticism of the results arrived at by

other investigators. An interesting discussion followed, in which Dr. Scott, Professor Reynolds Green, and Professor Weiss took part. On behalf of Mr. A. C. Seward, Professor Reynolds Green gave the substance of a paper on a new species of *Pinitis* from the West Indies (England).

— At the evening meeting to be held on Thursday, December 5, 1895, at 8 P.M., the papers to be read are:—1. Mr. J. C. DANCE, F.L.S., "On a New Species of *Bromus* in Britain; 2. Mr. W. F. KILBY, F.L.S., "Notes on New or Rare Phasmids in the Collection of the British Museum."

THE ROYAL HORTICULTURAL SOCIETY'S COMMITTEES.—At the last meeting the various committees were asked to recommend the names of new members to replace those who retire by rotation or otherwise. It is very desirable that new members be introduced, and those who can suggest desirable persons should at once communicate with the chairmen of the respective committees. The meetings of the Scientific Committee have been very poorly attended during the last year, and it is obvious that the rule enacted a few years since, though unimpeachable in theory, has, in the case of this committee, proved disastrous in practice.

NATIONAL ROSE SOCIETY.—The nineteenth annual general meeting of the National Rose Society will be held, by permission of the Horticultural Club, at their Rooms, Hotel Windsor, Victoria Street, Westminster, on Thursday, December 5, at 8.30 P.M., to receive the report of the committee, to pass the accounts, to elect the committee and officers for the ensuing year, and for the transaction of other general business. The nineteenth annual dinner of the National Rose Society will take place, by permission of the Horticultural Club, at their Rooms, Hotel Windsor, on the same day at 5.30 P.M. The chair will be taken by the Rev. A. FORSTER-MILLMAN, Vice-President.

ROYAL BOTANIC SOCIETY.—A meeting of the Fellows of the Royal Botanic Society was held on Saturday afternoon in the Museum at the Royal Botanic Gardens, Regent's Park, Mr. ANTHONY BREE presiding. The following new Fellows were elected: Sir Oswald Mosley, Lady Milford, Mrs. Milley, Mrs. Nugent Stuart, Mrs. Vignoles, and Messrs. D. Sherman, H. Hoare, J. Eoman, and C. Blaligh, and, as a member, Mrs. Carter Tucker. The secretary stated that the society was in possession of one of the finest collections of economic plants in England, and he exhibited three specimens of *Cinnamomum* grown in the gardens, *Cinnamomum zeylanicum* (Ceylon), *Cinnamomum Cassia* (East Indies), and *Cinnamomum Kamini* (Japan). The following donations were also on view: *Balanites* of *Gloriosa speciosa* (India), presented by Mrs. GARDNER; Tears of "Frankincense" (*Olibanum thuriferum*), presented by Mr. JAMES COLLINGS, and some very fine *Chrysanthemum* blooms and seedling *Cyclamen*, one year old, grown in Japan etc.

THE PALMS AT BATTERSEA PARK.—This park contains a fine collection of Palms, estimated to be worth £2,000, but there is no proper building available for their reception. Many are thrust away from public observation in one of the more greenhouses, the door of which has had from time to time to be lowered to give space for the growing plants. They now stand in a pit nearly 5 feet deep, and as this is below the river level, flooding takes place. Other Palms are ignominiously laid on their sides in a neighbouring greenhouse. In 1894, the County Council resolved to build a proper shelter for these plants, but this decision was subsequently revoked in view of the possibility of the Albert Palace becoming available for the purpose. The Parks Committee is again seeking authority to erect a Palm-house at an estimated cost of £2,000.

MR. H. R. HUTCHINSON.—The completion of the gigantic *Indica Lemnata* has liberated Mr. HUTCHINSON from the employment of that work. Mr. HUTCHINSON has been working under Mr. JACQUES's supervision for more than twelve years,

and his services as an amanuensis familiar with plant-names and with botanical literature would be of high value to anyone requiring such services, as we can testify from our own knowledge.

"THE ROSARIAN'S YEAR-BOOK FOR 1896" will be published on January 1, 1896. It will be edited by the Rev. H. HORTWOOD D'OMERAIN, Hon. Sec. of the National Rose Society, and will contain:—1, Mr. Alexander Dickson (with photograph), by Mr. C. J. Grahame; 2, The Ministrations of the Flowers, by Rev. D. Williamson; 3, Rose Growing in California, by Mr. John L. Howard, of San Francisco; 4, Simple Roses for Garden Decoration, by Mr. George Laing Paul; 5, The Rose and the National Rose Society in 1895, by the Editor; 6, Lord Penzance's Hybrid Sweet Briar—their further Development, by Mr. Charles Wyatt; 7, The Rose Weather of 1895, by Mr. Edw. Mawley, F.R.M.S., Hon. Sec. of the National Rose Society.

BOTANICAL ESTABLISHMENTS.—The *New Bulletin* (Appendix III, 1895), has a full list of public botanical establishments at home and in the Colonies, together with the names of the officers of those establishments.

FLOWERS IN SEASON.—We have received from Penzance Castle, Cornwall, where Mr. T. JOHNSON is gardener to Colonel A. CONYTON, some exceptionally robust flowering shoots of the lovely and fragrant greenhouse plant *Lonchitis graminifolia*. Usually, the plants are not easy of cultivation, and such heads of flower as sent are very rarely seen. In size they reminded us whilst unpacking them, of large-flowered Hydrangeas. From the appearance of the flowers we conclude that the plant has been grown in a border in a cool greenhouse, but in such a locality it would probably succeed under the shelter of an outside wall.

PEESHESHIRE HORTICULTURAL ASSOCIATION.—The fortnightly meeting of the above association was held in the lesser Good Templar Hall on Tuesday evening, and in the absence of the Vice-President, Mr. A. SALTER, the chair was occupied by Mr. D. L. MACKINTOSH, Kingmanstown. After the meeting was opened, the chairman introduced Mr. JAMES GRAY, gardener, Colchester, who read an instructive paper on the "Cultivation of Orchard-house Fruit Trees in Pot." At the close the chairman conveyed to Mr. GRAY the thanks of the association for his instructive paper, and also for the fine exhibition of Peas which he brought to illustrate his subject.

MILD WEATHER AND HARDY FLOWERS.—A correspondent, writing from the west of England, remarks upon the wonderfully mild weather—Jasmines, China Roses, Wallflowers, Violets, Pyrus japonica, &c., are in full flower.

PRESENTATION.—We understand that it is the intention of the leading foreman and others in the employ of Messrs. JAS. VINTON & SONS, Royal Exotic Nursery, Chelsea, to present an illuminated address, a timepiece and two silver candlesticks to Mr. DAVIDSON, on his retirement from service. Mr. DAVIDSON has occupied the onerous post of manager of the seed department for twenty-seven years, and is relinquishing it on account of failing health.

SUMMER & AUTUMN SHOWS.—At Warwick in Nottinghamshire last summer the local Rose and Horticultural Society's exhibition was held under very unfavourable weather conditions, the result being a heavy deficit, although the show itself was all that could be desired. To enable the committee to meet the loss, it was proposed that an autumn show should be held, without prize competitions, simply relying upon the support of the horticulturalists in the neighbourhood. H. N. MACHES, Esq., of Warwick, gave very cordial support to the idea, which resulted in a surprisingly successful exhibition in the town-hall on Nov. 21, when, without a price of any kind, an admirable display of *Chrysanthemum* plants and fruit was obtained. Collections of cut blooms, groups of plants and fruit were sent by

the Duke of PORTLAND, the Right Hon. F. J. SAVILE FOLMAMEB, Sir H. WATSON, Viscountess GALWAY, Mrs. ANDERSON, J. D. ELLIS, Esq., Viscount HALIFAX, and Mrs. MELLISH, Hoickock Priory, Messrs. B. S. WILLIAMS & SON also contributed a group of plants. The exhibition was opened by the Duchess of Newcastle, and resulted in a clear gain of £50 after paying off the deficit. It was an interesting experiment, but it is to be hoped the next summer show will not only be able to meet its own expenses, but possibly to provide something towards the establishment of an annual autumn exhibition. *Cor.*

CHESHUNT, WORMLEY AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—At the usual fortnightly meeting of this Society, held at Turnford on Friday last, Mr. HUTCHASON presiding, Mr. A. PRABOE contributed an interesting paper on the Tuberous-rooted Begonia. At the close, a discussion was initiated by Mr. HUTCHASON, and taken part in by Messrs. G. WESTON, A. SIMONS, W. PALMER, and others, the subject being chiefly the rust-diseases of the leaves of Begonia, peaty-compost, manures, &c. Heartly votes of thanks to Mr. PRABOE and the chairman concluded the meeting. The next meeting will be held on Thursday, December 5, when Mr. Wm. HARRISON will give a lecture on Grape-growing for Market.

"FLORA OF DUMFRIESHIRE."—Mr. G. F. SCOTT-BELLING, assisted by J. McANDREW, J. T. JOHNSTONE, Miss HANNAY, and others, has written a Flora of Dumfriesshire, including Nithdale in Kirkcudbrightshire. This work is, it is stated, almost entirely produced by local botanists, who have studied not merely the land and maritime plants growing in the districts named, but also the insects frequenting the vegetation, and the conditions of climate and soil under which it occurs. Introductions on the geology, entomology, climate, and meteorology of the neighbourhood, and a map, partly geological, are accordingly included in a volume treating mainly of the local flora. Everywhere, nowadays, the inter-relationships of the various sciences are acknowledged, and also the impossibility of treating of any one of them without constant reference to kindred studies.

AN UNPARALLELED ATTRACTION.—In a cottage window in a well-known seaside town, we lately observed a small, but doubtless select, collection of fruit and nuts. That possible purchasers might on no account fail to notice theseainties, attention was attracted to them by the following inscription, most legibly written, and pointed among some Apples: "Look. Number six, 1d. a pint." Though the quality of the fruit might be easily equalled or excelled by that of other samples of it, the label surely was, at least, as regards spelling, a nonpareil.

TREE PLANTING IN ABERDEENSHIRE.—The Lords Committee of the Government of Gordon's College, Aberdeen, a college possessed of many acres of land, have accepted the offer of Messrs. WILLIAM SMITH & SONS, nurserymen, Aberdeen, for planting the lands of Pittodulzie, Auchterless, with trees, their estimate being at the rate of £1 16s. per imperial acre, and 8s. per acre for renewal for two years. Mr. THOMAS MINNIE, Glenburnie, was the successful offerer for furnishing the plantations at Logierstone and East Craig, his estimate being at the rate of £2 per imperial acre. He also stipulates to renew at least 1000 trees within two years if required.

TREE PLANTING AT EXMOUTH.—The first Lime-tree of the many which are to grace some of the principal streets in Exmouth, was planted recently in most beautiful weather by Mr. R. LEY, the chairman of the District Council. Some outside pressure was brought to bear, and a private committee offered to purchase several hundreds of trees if the Council would accept and plant them. This they have undertaken to do, and in the presence of an enormous crowd, among whom were some hundreds of school-children, who sang some appro-

prate school-songs, the initial step was taken. The chairman in the course of his remarks said that it was a great pleasure to him to have planted the first tree, and hoped the avenue of which it would form a part would become a source of pleasure to the inhabitants.

IRISH GARDENERS' ASSOCIATION.—Mr. J. H. PARNELL, M.P., lately delivered before this Society an exhaustive lecture on Fruit Culture in the Southern States of North America, in the course of which he described the Irish as a quarter of a century behindhand in fruit-growing, being in about the same condition as were the inhabitants of the State of Alabama when the lecturer first settled there. Now fruit-growing was one of the most important industries of that State. If Irish fruit-growers meant to make their industry a commercial success, they must first of all find out by experiment what were the varieties of fruit and vegetables best adapted to the local conditions. When he first began to send fruit to New York, one car-load a day was considered sufficient—indeed, almost to glut the market; now they were sending 100 car-loads a day. It took a long time to ascertain what each tract of country was specially adapted for, but perseverance and experiment had done it for them, and similar steps would have to be taken in Ireland with a view to finding out what fruits did best in different parts of that country before the industry could be established on a sound commercial basis. The full account of Mr. PARNELL'S lecture is given in the *Irish Farmers' Gazette* of November 2. Mr. F. W. MOORE, of Glasnevin, made some pertinent observations on the subject of fruit-growing in Ireland, pointing out that finer Apples were not to be seen than those produced in Ireland.

TREE PLANTING IN THE ISLE OF MAN.—We learn that on the crown lands in the Isle of Man Her Majesty's Commissioners of Woods and Forests continue afforestation operations, and we understand Messrs. THOS. KENNEDY & Co., Dumfries, have again secured orders to supply a large number of forest trees for this purpose.

HORTICULTURAL MEETING AT GHENT.—The finest exhibit at this meeting was certainly that sent by M. LUCIEN LINDEN, consisting of eight splendid varieties of *Catssetum*, of which five received a Certificate of Merit (*par acclamation*); they were *C. mirabile*, *macrocarpum*, *Lindeni*, *splendens*, *chryso-toxum*, *Banerthi* *capuliforme*, and *macrocarpum aureum*, already described and figured in the *Gardeners' Chronicle*. M. L. LINDEN sent a *Davallia Truffautiana*, which also obtained a Certificate of Merit (*par acclamation*), and which is also known to our readers. M. G. DE SAIGHER obtained a similar award for fifteen beautifully grown *Chrysanthemum*, all good sorts. An equal award was allotted for *Hypolytrum Schraderianum*, from M. PYNABERT, a very ornamental plant, resembling a graceful *Pandanus*; the leaves at the base are of a beautiful violet-rose tint (see *Gardeners' Chronicle*, April 8, 1893, p. 414). [Certificates of Merit were awarded as follows:—To M. F. DESBOIS, for *Poinsettia pulcherrima* fol. aureo var., the leaves nicely bordered with golden-yellow, giving a very pretty effect when the plant blooms. To the same exhibitor, for *Scolopendrium vulgare* scalariforme, a very curious variety, crimped, embossed, and undulated; to M. PYNABERT, for *Asplenium marginatum*, the foliage very pale green, almost transparent, remarkable above all for a thickened membrane of darker colour which borders each leaf; and also to M. PYNABERT for *Pteris serrulata* voluta, a seedling variety with wavy foliage and pale in colour. To M. RODIGAS, for *Pennisetum Rappelianum*, a most elegant grass; the light spikes are violet-rose in colour, and will be useful for floral decorations. To M. JULES HYE, for *Lelio-Cattleya Diana*, L. elegans \times C. pumila; the lip, which is dark purplish-red, is a great advance. To M. L. DE SMET-DEUVIERE, for *Cypripedium bellatulum* and *C. Charlesworthi*, two varieties of each species. To M. ARTHUR VAN DEN HEEDE, for *Pteris Bachneri*, a variety of strong and robust habit: useful for cultivation on a large scale.

To MM. DEO MRYZE and L. DE SMET-DEUVIERE, for *Asparagus Sprengeri*, a greenhouse variety of vigorous growth, and producing, if just sheltered from frosts, a quantity of elegant bright green spikes, very decorative.

CHRYSANTHEMUMS AT ANTWERP.—The recent exhibition organised by the Société Royale d'Horticulture of Antwerp, shows the progress made in *Chrysanthemum* culture, as both amateur growers and horticulturists alike staged new and well-cultivated plants. Among the exhibits were the following from M. TR. VERMEULEN: *Internationale*, with thirty flowers; *Mlle. M. A. de Galbert*, *Dac de York*, M. E. G. DAVERNAY, M. CHARLES MOLIN, M. E. BOYCE, M. Ad. GIRAUD, Benjamin Giraud, and other varieties, attaining a maximum height of $4\frac{1}{2}$ feet, and each bearing from twenty-five to forty flowers. M. HENRI VANDERLINDEN staged *Lincoln*, 4 feet high by $4\frac{1}{2}$ feet across, with 200 flowers; *Internationale*, with fifty-four flowers, nearly 8 inches across; *Souvenir de Jambon*, with ninety-two blooms, and nearly 5 feet across, and other varieties. Among the plants a year old should be mentioned *Sunset*, with fifteen large flowers; *Docteur Allard*, with fifty blooms; *Waban*, a marvel, with flowers nearly 10 inches across; M. Benjamin Giraud, with fifty blooms; Charles Davis, with twenty-five large flowers; and *L'Etendard*, with flowers nearly 8 inches across. Among M. CALVAT'S new varieties were an un-named sort, clear sulphur-yellow, very delicate; *Secrétaire Général Ern*, Eijerens, dull red, spotted with yellow; *Réve d'Or*, pale, shining golden-yellow; and *Madame K. Rey-Jourin*, lilacy-rose, C. De B.

EXHIBITION OF FLOWER PAINTINGS.—An interesting exhibition of flower-paintings in water-colours has just been opened at 293 (over SQUIRE'S), Oxford Street, by Miss MARIE LOW, F.R.H.S., who is already well known as a clever floral artist. For some years Miss Low has made a speciality of flower painting, and anyone who sees her work at this exhibition will be convinced of its excellence. Among the many examples of her art may be mentioned a glorious picture of a mass of Lord PENZANCE'S Sweet Briars, which have excited so much attention during the last year or two. *Papaver orientale*, with its huge scarlet blooms, makes a splendid picture; so also do *Disa grandiflora* and a group of Dr. WALLACE'S *Calochorti*. Among many other flowers represented may be mentioned Mr. A. J. ROWBERT'S new yellow *Panay*, the *Uriah Pike Carnation*, *Anemone japonica*, *Mimulus*, *Daffodile*, *Clematis*, and several *Orchids*. The charm of Miss Low's water-colour paintings lies in the softness and brilliancy of the colours, and the fact that she can portray objects in a very natural way.

NEW PUBLICATIONS.—*Introduction to the Study of Fungi*, by M. C. COOKE, M.A., LL.D. (London: ADAM & CHARLES BLACK.)—*Our Edible Toadstools and Mushrooms*, by W. HAMILTON GIBSON, with thirty coloured plates. (New York: HARPER BROTHERS.)

WHITELEY'S NURSERIES, HILLINGDON.

IN the rapid and perfect manner which characterises Mr. Whiteley's business operations, another portion of the nursery, to the extent of $2\frac{1}{2}$ acres, has been put under glass, and is now occupied by a fine roomy block of houses, each 240 feet long and 24 feet wide, and by a run of commodious lean-to houses under the boundary wall. When started, the old block was thought to be ample, but it was not found sufficiently extensive, hence the present great addition, and the contemplation of covering more ground next year.

The block of houses, built with a view to every possible need in the culture of the plants, by Mr. W. DUNCAN TUCKER, of Tottenham, requires more than passing attention, for in it are several new ideas in the arrangement, and in the ventilation and water-supply, most of them worked out at the suggestion of Mr. G. Bethell, the clever and

well-known manager at Whiteley's Nurseries. For example, every part of the wood-work of the interior is either grooved or throated, so that drip is impossible, and the throating of the heavy pitch-pine timber which forms the wall-plate of each pair of houses, as well as the water-way between them, will give a much longer life to the structures by preventing decay in that vulnerable part. The bottom ventilation too, which is arranged by glazed drain-pipes bringing air from each end, and allowing it to pass into the house at intervals through openings carefully regulated, is another good feature. The pipes are made to answer a double purpose, viz., to bring in fresh air, and to carry off the water from the roof. Continuous lever-gearing effects the other ventilating appliances of the houses. The arrangements for water-supply at all points, and for passing plants from one house to another, and other labour-saving contrivances, are admirably and economically carried out.

With regard to the heating, the new block enjoys exceptional natural advantages, for the ground gradually rises from the end, where the two sets of three 10-foot Cornish boilers are placed to the extreme end, and thus a proper flow and return are facilitated. So pressing is the demand for space, and for the stock to be got out of it, that all through Mr. Bethell has been treading on the heels of the builder, and even now the greater portion of the block is filled—and well filled too. Some four of the great roomy structures contain thousands of beautiful Palms, among which the graceful *Kentias* of course predominate, though *Latania*, *Sesforthis*, and *Coryphas* are represented in such proportion as the knowledge of the demand at the great establishment in Westbourne Grove shows well how to regulate. *Kentias* are the favourites everywhere, and in boxes fast requiring potting-off, Mr. Bethell has something like a million coming on ready to take the place of those now saleable.

About 14 000 splendidly-grown *Chrysanthemums* occupy several of the other large houses, and present a bewildering mass of colour in them from end to end. Only the best sorts for market, and for cutting, are grown in quantity. Though every new one is tried, few succeed in getting on the list of those to grow largely. One of the best ever tried is W. H. LINCOLN, and of this Mr. Bethell has thousands, both tall and dwarf, the large plants having from eight to twenty immense rich yellow flowers; while those not more than a foot high, in 48-pots, bear six to ten. It has strong wood, fine lasting foliage, and noble flowers, which last long, either cut or on the plant, and these qualities constitute a fine market variety. Two sports obtained at Hillingdon are being worked up, and bid fair, viz., a bright yellow Charles Davis, and a fine white *Mlle. Lacroix*. *Eynesford White*, too, is a great favourite.

Azaleas, *Tuberoses* in all stages, *Bouvardias*, *Genietas*, and all kinds of bulbs for forcing, occupy the remainder of the houses, many of which in their season will be filled with *Tomatos*, a commodity with which the consumer never seems to get satisfied.

In the old block, with its lofty covered arcade 300 feet long, for packing and other operations, some twenty-six houses are devoted to Ferns, and yet so rapid is the sale of plants in small pots that there is often a difficulty in getting enough for potting-on. One house is full of all pure white *Cyclamens*, not one of the plants having a trace of colour; several with *Aralia Sieboldii*, some with *Crotons* as brilliant in their coloured foliage as are the flowering plants in their blooms. In one are scores of plants of the graceful and handsome *Dendrobium Phalanopsis Schroderianum*, their fine sprays arching all around, and in no part of the vast establishment is an inch of room wasted.

This portion is thus described by the builders, Messrs. Messenger & Co., of Loughborough:—

"The west wall (to right of illustration, fig. 108) is 14 ft. high, and upon this are built the lean-to vinerias, in all 650 ft. in length, and 14 ft. wide. They are divided into two blocks, disconnected in the centre; but the houses are practically seven in number, thus divided for early, intermediate, and

late varieties of Grapes. The wall in the foreground is occupied by Peach-houses (lean-to) in three divisions; total length 268 feet. The further or south wall provides accommodation for the Mushroom-house, 180 feet long.

"The main block of buildings consists of thirty-three houses, chiefly equal spans, arranged in three sections, with intervening roads. The section on the south side comprises Chrysanthemum-house (in centre), 18 feet wide; Pine-house, 15 feet wide; and others for Orchids, Melons, stove, and other plants, each 12 feet wide. The length of each house is 117 feet, with divisions as required for growing purposes.

"The central block comprises Camellia-house, 18 feet wide; Pine-house, 15 feet wide; Orchid-houses, Cucumber-houses, stoves, and plant-houses, each 12 feet wide. These are also 117 feet in length, with divisions.

"The remaining block comprises houses of various lengths, the longest being the five to the west side, which are 265 feet in length, and are built without front lights for use as stoves. These are 15 feet wide. Next comes a commodious structure for Roses, Camellias, and Chrysanthemums, 231 feet long, 18 feet wide. A three-quarter span for Strawberries, and four span plant-houses, each 218 feet by 14 feet, complete this group.

"The span and lean-to pits are a feature of the range, and the total length of them is close upon 1,450 feet.

"To obtain an efficient water supply, capacious tanks run crosswise through the centre of each group of houses. Into these the rainwater is carried, the collecting surface of course being considerable. Provision is also made in each house for obtaining the water from the tanks.

"The heating is derived from nine Trentham boilers arranged in five stokeries at convenient intervals. These can be used separately or together as desired. There is also an ample amount of piping to each house."

ABOUT CHRYSANTHEMUMS.

(Continued from p. 619.)

AT THE HOME OF FLOWERS, SWANLEY.—In the very large house which Messrs. Cannell & Sons group their Chrysanthemum plants each autumn, it is possible to make a very imposing display, its capacity being practically equal to the accommodation of the whole of the stock, which is itself exceedingly large and varied. Of course, there is no room to spare, and it has become requisite here, as in other places, to select with great discrimination the varieties to be grown, for the object of furnishing blooms that may be exhibited at the various shows, where Messrs. Cannell take their wonderful Pelargoniums, Cannas, and other things. Space has to be found for the increasingly large number of home seedlings, and for the testing of Continental, American, and other novelties. In addition to these, only the very best and newest varieties are included, and the greater part of the stock is planted out and grown quite differently for the production of healthy cuttings for stock purposes.

Examining the seedlings first, we were impressed by the unusually dwarf character of the plants. Mr. Cannell has been working for some years to procure a race with lower stature than we have become used to, and to a large extent he has succeeded, but one is prepared to find that a large-flowering tendency, as well as varied colours, are not easily obtained for the first few years that these efforts are made. However, when good flowers are borne by seedlings not more than 2 feet high, it may be hoped that such varieties, should they be worthy of a place in respect to the quality of the flower, will at least prove less in height another season than those that used to run up to the roof of a vinery at its centre. Eureka is a name given to such a seedling. It is a white-flowering Japanese, a wide flower with broad florets, which beside slightly incurving, have also a kind of twist in the direction of a ring. Mrs. Oporto Tait, on the seedling plant, is also very dwarf; the flower is a yellow Japanese, florets broad and slightly twisted, colour very pleasing. Lord of Lorne is a deep gold colour, similar to Thunberg, and Mr. Cannell thinks it may be superior to that fine variety. Wood's Pet is a seedling from Sanflower, and is rose-coloured, the florets droop in ringlets, and it is hoped the variety may prove a good one. Other seedlings, many of which are as yet unnamed, were noticed in considerable quantity. New varieties by other raisers were noticed, but most of these we have referred to on former occasions. Kentish White looked well, and was present in quantity. It was awarded a Certificate by the National Society a week or so again, and though the bloom as generally exhibited is of moderate size only, it is very pretty, and

the habit of the plant is dwarf and good. Decorative varieties, such as Mr. Cannell's Centaurea, Mrs. Filkins, and others, with narrow, twisted, and otherwise bizarre-appearing florets, are popular with many persons, and are no doubt very adaptable to some kinds of decoration.

As usual, there was to be seen on this occasion an excellent display of zonal Pelargoniums in full flower, and Cannas, and other plants, interesting and cheerful-looking. *Mum.*

CHRYSANTHEMUMS, ETC., AT THE GRANGE.

For several years past Mr. A. H. Smee, of the Grange, has made a practice of throwing open his gardens to his neighbours and the public generally in the autumn that they may see the Chrysanthemums, and in the spring that they may have an opportunity of inspecting the orchards for which he is famous. In accordance with this custom, the gardens have been once more thrown open to visitors. The Chrysanthemums were arranged in the large greenhouse, between 400 and 500 plants being exhibited. This year they have been grown much more dwarf than hitherto, and consequently the visitor on entering the house found facing him a bed of bloom rising from between 2 and 3 feet high to over 6 feet. Perhaps the most notable were Commandant Blussett, Beauty of Exmouth, Florence Davis, President Borel, W. Seward, Mrs. Harman Payne, Mdlle. Thé ére Rey, Lord Brooke, Autumn Tints, Niveum, Duke of York, Glorionum, and Madame Cambon, which was grown from seedlings raised in Algiers. Amongst the singles were Miss Rose and Mary Anderson. All the plants are strong and well grown, showing that the greatest care and cultural skill have been bestowed upon them, while the blooms are large, well-shaped, and in the finest possible condition. In addition to the Chrysanthemum-house, visitors were permitted to inspect the Fern-house, which never looked better. The Cattleya-house contained some very fine specimens of Cattleya in bloom, some *Oncidiums*, *Cypripediums*, and *Dendrobiums*. *Wallington and Carshalton Herald.*

WARTER PRIORY, POCKLINGTON, YORKSHIRE.

This, the residence of C. H. Wilson, Esq., M.P., is delightfully situated in beautifully undulating, well-timbered grounds, near the village of Warter. The Priory was formerly the site of a religious house, but nothing remains but the name. The commodious modern mansion is replete with present-day conveniences of all kinds. The gardens are tastefully laid out with flower-beds, lawns, and shrubberies, and everything about them is in perfectly good order, as befits a place of which the owner is proud. The flower-garden this year had at the time of my visit suffered severely from a thunderstorm, and the well-filled beds of Pelargoniums were bereft of much of their blossoms, and all the others had temporarily suffered with the exception of two large beds of tuberous-rooted Begonias, which were, in spite of it all, a blaze of colour. Other fine-looking beds consisted of Pelargonium West Brighton Gem, a variety that withstands rough weather better than some others; and Mrs. Clibran *Nasturtium*, a good thing for bedding. Several species of *Bambusa* and *Palms* of large size are among the plants effectively made use of in groups together, and as single specimens.

A plant-conservatory adjoins the residence, and here were found *Palms*, *Dracenas*, climbing plants, &c., and even in the full summer, it is kept well furnished with plants in flower. The large range of plant and fruit-houses well repaid the visit. The Orchid-houses numbered three, and these were filled with many valuable species and varieties. There are two plant-stoves, two Rose-houses, a Gardenia-house, fernery, Palm-house, greenhouse, two houses for the cultivation of *Eucharis*, and four for that of *Carnations*; the varieties of the latter consisting of *Souvenir de la Malmaison*, *Winter Cheer*, *Uriah Pike*, and others. Rarely have I observed the first-named in finer health and condition. The fruit-

houses consist of two large span-roofed vinerias, with Vines carrying heavy crops of good Grapes, the varieties consisting of Muscat of Alexandria, Gros Colmar, Lady Downes, and Black Alicante. Some small lean-to's supply Early Grapes, Peaches, and Nectarines. The Peach-houses contain splendid trees of the best varieties. Among other houses observed, mention should be made of one for growing Pears, Melon and Cucumber-houses, and some orchard-houses. Much work was in progress, and alterations and improvements of various kinds undertaken. The Chrysanthemum is a plant that is largely grown for decorative purposes, and the gardener, Mr. Pike, is an exhibitor of them; the collection contained a great number of the best modern varieties. *B. W.*

HOME CORRESPONDENCE.

ENGLISH *versus* GERMAN CYCLAMENS.—As the grower of Cyclamens for one of the firms best known in England for their strain of Cyclamens, and who cultivate upwards of 20,000 seedlings and old bulbs or corms every year, I think, after reading the article, "English v. German Cyclamens," that the English varieties could not have had full justice during the growing period, or they certainly would not have appeared so inferior in quality as pointed out. I myself think it would be a very difficult undertaking to surpass the English varieties that were grown by Mr. Schwarzburg, if they had the right treatment, most of which were raised by the firm I am with, and certificated by the same at different periods. I also noted that there was a complaint about purity of colour. Nor is a pure white mentioned in the list of English names. If they had, the following four named varieties, Mont Blanc, Dame Blanche, Baroness Burdett Coutts, or grandiflora alba, I think they would have compared very favourably with the German strain, as all four are splendid whites if grown to their best. The marking of the foliage is not given much attention in England, the point aimed at being a good sturdy plant, with quantity of flowers and quality combined to make it sell. But if our friends over the water would like to see English-grown specimens in their glory, they could not do better than take a trip across in March and attend the Crystal Palace and Regent's Park spring shows, and I think they would be highly satisfied that Cyclamens can be well done in England. *J. N. S.* [Why should not our Berlin friends send some of their choicest samples for comparison? *Ed.*]

THAT CLIMBING FRENCH BEAN.—Referring to the correspondence on this subject, may I ask if anybody ever saw a French Bean that did not climb, more or less, where it had the chance? or if there be any gardeners who would have a climbing French Bean needing sticks to support it, when they could have the same Bean equally good without that extra and needless trouble? French Beans will climb, if allowed, and Scarlet Runners, if pinched, will do equally well without climbing, and are extensively grown that way by market-men. I understand from what I have seen, and from what I have read in the *Gardeners' Assistant*, &c., "that the French growers have French Beans (not Runners) that climb from 6 to 9 feet, but the dwarf form is the most popular. It does seem absurd to have one grower recommending a Pea because it does not need sticking, and another putting up a Bean for the opposite reason; and it would be very interesting to learn if "A. D." or anyone else belonging to the Royal Horticultural Society's Committees ever seriously proposed to bestow an award on a Bean whose sole recommendation was that it needed sticks to support it, or, as Mr. Ward puts it, because it attained "a hitherto unheard-of height of 7 feet!" "Not wanted" would be the verdict of any practical man even if the "climbing" claim was new. A large portion of the cost of climbing Pea and Bean culture is the sticking. I dispose of thousands of Pea and Bean rods annually from the woods, at from 1s 3d. and 2s. and upwards per 100, according to quantity, some amateurs having rather fancy notions about their Scarlet Runner rows. That is the cost of sorting out in the wood, and by the time they are carried and put to the crops and removed again in autumn, a large part of the profit, if any, is gone. I know

of crops of Scarlet Runners which, during the past summer, did not pay for the sticks and sticking, at from 1*d.* to 2*d.* per lb. I have seen from twenty to thirty long rows of tall Peas and Runners, in gardens, that must have cost nearly 20*s.* per row to stick—a sum that would have supplied the Peas. *J. S. W.* [Our usual 'cute correspondent seems to have missed the point in this case; for it is not because it is a climbing variety that it has found, and is likely to find, favour with gardeners; but because it is a much more continuous bearer, and in that way saves land, seed, and labour. With French Beans of the ordinary type, we must sow once in three weeks from the middle or end of April till the middle of July, if a good succession of tender pods is to be obtained; whilst with this new Bean twice or thrice would suffice. It is a moot question if this Runner Kidney Bean would not be profitable as a forcer. The chief danger to be apprehended would be, of course, the entire loss of the leaves from red-spider. We can insert no further correspondence on this subject. *Ed.*]

ROSA RUGOSA FOR GAME COVERT.—During the past two winters we have planted small patches

APPLES: THE TRUTH ABOUT PRICES—RIBSTON AND COX'S ORANGE PIPPIN.—I heartily thank the essayist for his obliging reply to my inquiry as to the low-placed price occupied by these two finest of our dessert Apples. I had the most perfect faith in his quotations, and had a shrewd suspicion—confirmed by his lucid explanation—that it is but another case of size, colour, bulk, over-riding quality. It must be borne in mind that the essayist is here writing of marketing and making solid profit out of Apples, and most growers will readily allow that Peasgood's Nonsuch at 28*s.* per cwt. will fetch more money per acre than Cox's Orange Pippin at 30*s.* per cwt. The more's the pity! But then pity will be a long time in moulding public taste or controlling prices by quality alone; though possibly as raw Apples get to be more eaten as food, such splendid sorts as the Ribston or Cox's Orange Pippin will command such high prices as to render them the most profitable market Apples. Meanwhile, however, it is very discouraging to hear on such high authority as that of this able essayist, that he has never yet been able to make a profit on his Ribstons, either on the Paradise or free stocks. I had hoped that the Paradise stock root-pruning improved culture and training would

price that Peasgood's Nonsuch and Warner's King, we should no longer have our market growers and writers assuring us that they could no longer grow our best dessert Apples at a profit. I hope no one will assume that the Apples named are necessarily on all sites and soils the best of their class for eating or cooking. In any attempt to get prices controlled by quality, I thought it wise not to have the issue confused through comparison of the merits of contending varieties. *D. T. F.*

THE JUDGING OF VEGETABLES AT SHOWS.—We seem sadly to want a national code of rules for judging. Might not some public body such as the Royal Horticultural Society, for example, compile such a code? It should take each vegetable in the order of its utility, and state the number of marks to be given it, allowing for quality, cleanliness, staging, &c. If such a standard were formed it would be of the greatest service to judges, particularly as in a case I have in my mind, where the judge was a traveller and not a practical man. I shall be greatly pleased to hear that such a code is available, and that I have overlooked it. *W. H. Patterson.*

VALE OF CLEVELAND AND SHARPE'S VICTOR POTATOS.—For some years we have grown Vale of Cleveland Potato, and we have no hesitation in pronouncing it to be identical in every respect with the yellow-fleshed Sharpe's Victor, and this opinion has been confirmed from time to time by Potato experts who have seen the two varieties growing side by side in our trial grounds. We procured Vale of Cleveland direct from Mrs. Short, of the Seed Stores, Market Place, Stokesley, and she informed us that her late husband sold the whole stock, excepting a few small tubers, to Messrs. Chas. Sharpe & Co., of Sleaford, and that he claimed that Sharpe's Victor, when it appeared, was in every respect similar to his own Potato. Admitting this to be so, it is quite evident that to the late Mr. Geo. Short belongs the honour of having first raised this distinct type of Potato, which possesses all the good qualities of the variety now so well known in commerce as Sharpe's Victor. It is a singular coincidence that two hybridisers should have raised seedlings the characteristics of which are identical, but from entirely different parents, and it is somewhat remarkable that Messrs. Chas. Sharpe & Co. should have become the fortunate possessors of them both; for there can be no doubt that amongst the very earliest varieties of Potatos, Vale of Cleveland and Sharpe's Victor probably have no rival. *W. W. Johnson & Son, Boston.*

— With reference to Mr. D. T. Fish's letter in your columns recently, allow me to say that the confusion referred to appears to arise owing to the variety of the Potato introduced and still known in the name of Albert Victor, which has a white flesh, being confused with Victor, better known as Sharpe's Victor, which has a yellow flesh. *Cultivator.*

PEACHES AND NECTARINES.—I can fully endorse the sound and opportune remarks made by Mr. Markham under the above heading in the *Gardeners' Chronicle* for September 28, p. 370. Peach and Nectarine trees are easily enough grown in 90 per cent. of the gardens in Great Britain and Ireland, where the necessary wall or fence space is available for training the trees to, always assuming that the cultivator has a practical knowledge of the requirements of the trees, and that healthy kindly-growing trees, true to name, are obtained and duly planted in good-sized well-drained holes, using sound fertile loam as a rooting medium. The observance of the above simple but most important points is absolutely necessary to attain to success not only in the culture of the Peach and Nectarines, but also in that of Plums, Pears, Apples, &c. All that is required after the trees have been selected and planted in the manner indicated is to keep them perfectly clean and the soil about the roots uniformly moist. The growths should be trained thinly rather than otherwise over the space allotted to each individual tree, disbudbing freely at short intervals, as advised in Mr. Markham's excellent note, after the wall space has been furnished, which, starting with maiden trees, may be accomplished within a few years from the time of planting by following the extension system of training. This consists in not cutting back the young growths to within a few inches of their bases, as used to be the practice, and is still done in many places, at pruning-time the first year after planting—that is, in twelve or fourteen months from that time. This is how it is done. In the ordinary way, the trees are planted as soon as they

FIG. 108.—THE OLDEST RANGE OF GLASSHOUSES AT MR. WHITELEY'S ESTABLISHMENT, HILLINGDON. (SEE P. 651.)

of the above-named charming species of Rose, with a view to testing it as a suitable plant for game coverts. So far our venture is satisfactory. Rabbits have not destroyed any of them. I am bound to say, though, they are not very numerous in the part where the *Rosa rugosa* are planted; still, they have injured Laurels and Berberis planted near to them. Will those of your correspondents who may have tried planting them where rabbits are plentiful kindly say if their experience is satisfactory? In our stiff limestone soil this Rose grows well, and if rabbit-proof, I can see it is going to be a capital covert plant. It keeps its foliage well into the winter months, which is an important point in this class of plants. The price, too, will soon be a moderate one, if the demand springs up for it, seeing that it can easily be reproduced from seed [or suckers]. Just imagine large masses of it in flower in July in the open glades of woods and plantations, or in autumn, when thickly sprinkled with its large rich red-coloured seed-vessels or "heps." I mention these advantages, as they would add to its value in the opinion of sporting gentlemen, nearly all of whom have a strong liking for natural beauty, as well as for sport. I should say, too, it would be a grand stock on which to bud many of our choicer garden Roses. I have not heard of its having been used for this purpose, though it may have been. *H. J. C., Grimston, Tadcaster.*

have made, as it has, the cultivation of Ribston Pippins practicable, and likewise profitable. To ensure the latter, however, a more elastic list of trade and market prices may have to be formulated and established. This may be difficult, but ought not to be impossible. And it was chiefly with a view of directing the attention of such able growers and capable business gentlemen as those essayists, to the national importance of revising our Apple prices on some standard of quality, rather than the allurements of colour and the weight or size, that induced me to query the position assigned to some varieties named. Of course, it may be answered that our salesmen have already classified our Apples and other fruits, as we soon find to our cost when we attempt to buy Ribstons or Cox's Orange Pippins by name. But these fancy prices in retail hardly reach the growers for wholesale. We want a gradation of prices based on quality, chiefly as discriminating and far reaching among Apples, Pears, Plums, as we already have it among Grapes. Few or none would grow Muscat of Alexandria if their market price hardly exceeded that of Hamburgs. But while Muscats command four or five times the price of Hamburgs, their place and presence in our markets and on our tables are assured. Supposing, and the supposition can hardly be held to be extravagant, that the Ribston Pippin and Cox's Orange Pippin commanded double the

have been received from the nursery after the fall of the leaf—say, towards the end of November. The young shoots, whether two, three, five, or seven, are secured loosely to the wall to admit of the fresh soil settling down a little, as well as retarding the flowering period. Early the following February, as soon as the sap begins to rise, and the unpruned shoots towards the ground, and secure them to the wall with nails and shreds in that position, the bend starting from the point whence the first of the young shoots is desired to proceed—say, 4 or 5 inches from the bottom of the individual shoots. The check thus given to the flow of sap causes a sufficient number of wood-buds to push from each shoot to form a good-sized "fan-shaped" tree the first year after planting. Of course, as soon as the buds nearest the base of the individual shoots so treated have pushed into growth, the nails should be drawn, the shoots—main shoots—spread out on the wall, in the form of a hand with distended fingers, and secured thereto with nails and shreds, leaving sufficient room in the latter for the development of the branch, the young shoots indicated above being trained at proper distances over the intervening spaces. Trees of *Crimson Galande* and *Djmod Peach*, and *Dryden* and *Humboldt Nectarine*, planted a few years ago and treated in the manner described above, have completely furnished the trellis fixed to one of our highest (12 feet) walls out-of-doors, and planted at the usual distance from one another, ripened this year twelve to fourteen dozen good-sized fruits on each, which were the admiration of all who saw them. I merely mention this to show those readers of the *Gardeners' Chronicle* who may hitherto have taken an unfavourable and wrong view of Peach culture out-of-doors, what good returns may be easily secured from Peach and Nectarine trees in two or three years from the time of planting by following the extension system, which I have more than once advocated in the *Gardeners' Chronicle*. The crop, taking thirteen dozen fruits as the average for each of the four trees, and at the moderate price of 4s. per dozen, would be £10 8s., not by any means a poor return for the initial outlay, space of wall occupied, and labour incurred in training, &c. That the Peach and Nectarine will grow and flourish planted against walls having south, west, and east aspects I have the most conclusive evidence, the only difference being in the time of ripening; the same variety planted in all the aspects indicated would yield a pretty good succession of ripe fruit, those ripened on the east and west walls possibly might not be quite so good in flavour as the fruit ripened against a wall having a south aspect. Like Mr. Markham, I have formed a high opinion of the *Early Rivers Nectarine*. It is a good grower, and apparently a free bearer, the fruit being unusually large, of handsome appearance, fine quality, and very early in ripening. In conclusion, I may say that the present is a good time for transplanting young trees which have been grown for a year or two in available spaces between those permanent trees which have not quite furnished their allotted space; lifting them with good balls, they experience little, if any, check in being transplanted into their permanent positions, and time is afforded for the roots to push into the new soil before the trees shed their leaves. Trees so planted gain time, and have decided advantage over trees planted after the fall of the leaf. *H. W. Ward, Longford Castle.*

TIMBER v. GAME.—I am rather puzzled by Mr. Foote's distinctions, p. 582, between practical and technical knowledge, and to learn that employers do not want the latter. I thought technology consisted of the application of established principles in the arts and crafts, and constituted intelligent practice as opposed to "rule of thumb;" and I must say I never met with an employer who would not have preferred a technically-trained forester or gardener to one of the misnamed "practical" type. As to woods and game, they can be successfully combined, except in the case of rabbits in young plantations. It is quite easy to plant a mixture, or pure forest of good timber trees, for a crop, that will shelter game, provided the thinning is not over-done. Pheasants want most protection. They will not stay in winter in a wood which the wind blows too freely through, but a forest of bare poles will break and subdue the stiffest gale that ever blew if they stand thick enough on the ground. Everyone knows this who has stood on the lee-side of a Larch plantation in winter, thick, but one which you can see through. The trees break the wind in the same way that stakes or stones driven in, not far asunder, will break up the most furious torrent into gentle dribbets.

I have just been making a trout-stair on this principle to enable the fish to climb a kind of cascade. Employers rarely object to follow intelligent advice from their foresters whom they expect to understand their business, as a matter of course. What is most needed among owners of estates is a better system of managing their game in conjunction with their woods. We want more pheasants for the gun and fewer rabbits. Keepers never have a sufficient number of pheasants, and if a rabbit or two is not frequently popping up between the pheasants, sport flags; hence keepers will not kill rabbits unless forced by some one who can step in and take the duty off their hands, and that does the business. Then your keeper will act; if a woodman with a gun, dog, and ferrets has the mere authority to step in when and where he chooses, if the keepers fail. This just works a miracle on our friend in velvet. There are no objections to pheasants, but the system of hatching is deplorable. Given a fair covert with a sufficient stock of cocks and hens to begin with, I would undertake with well-regulated shooting, to crowd any wood or estate with wild birds permanently in one year. But what is done? All the early eggs are picked up in large numbers, perhaps every season, and as many more bought to put under hens; and at the shooting season about one or two birds may be to every dozen eggs bought all to the gun, and often not so many, so great is the mortality. I know of the record on a number of estates, and this statement is no exaggeration. Rabbits have to be preserved to make up for the pheasants, and the woods have to be kept quite for these, and the woodmen banished for the greater part of the year in order not to disturb the game. If gentlemen would put down stock for wild-nesting in the first instance, and simply let their keepers know that game would be expected, and the woods looked after at the same time, they could, by some proper arrangement of the work, then have plenty of sport, and also timber. My advice to foresters who cannot secure something like the above conditions is to do their duty as far as circumstances permit, and to view the damage done by the game with philosophic equanimity, always taking good care to let the damage be easily seen by those who have to pay for it, and to have the said regularly estimated and sent in to the game department. A correct debtor and creditor account against the keeper is one of the best methods I know of for keeping the subject "warm," for the process is one "velveteen" cannot stand, but it has opened the eyes of some employers. All game-keepers, I contend, should be under the control of the forester. *S., The Woods.*

PACKING COMPETITION AT CRYSTAL PALACE SHOW.—I was much interested in this packing competition, and I quite endorse what Mr. Harris says respecting the judging being intrusted to Covent Garden salesmen—one would be enough. I did not attend at the Palace this year, but what I saw in 1894 convinced me that a salesman would be the best judge, and I expressed this opinion at the time. I do not refer to the Grapes, but to the Peaches and Pears, which were nearly hidden from view by the mass of material used, and which I considered was quite unnecessary, whether they were intended for market or private use; and as one of the judges, p. 555, says, he and his colleague found but slight advance over last year, I may conclude that what I saw last year was simply repeated. In the month of August last, I was in Covent Garden market, and at the stall of one of the leading salesmen I was looking at the Peaches offered for sale, packed in a mass of cotton-wadding, some over-ripe, and the wadding clinging to the bruised parts; and I said to the salesman's foreman, "You cannot sell stuff like this." His reply was, half the fruit sent into the market is spoiled by bad packing. Cotton-wool is not now used by growers to pack Peaches for market, neither is moss, and no salesman would look with admiring eyes upon any exhibit which was packed in either of those materials. Wood-shavings are recommended by some, and they are certainly very elastic, in fact, too much so, and there is an odour on opening a box of fruit packed with them that is not at all appetising; so growers use for packing Peaches, finely cut white tissue paper, which can be bought for £1 17s. 6d. per cwt., and 4 ozs. will back a box of twenty-four Peaches, costing a little over 1d. To prove this, I have this year grown and packed 15,000 Peaches and Nectarines, and used 1½ cwt. of paper shavings in packing. Our *modus operandi* is to shake a handful of well-teased shavings over the bottom of the box, take the fruit in the left hand, and with the right wind a few shavings tightly round the stalk-half

sufficient to keep it clear of the box; when placed firmly in it repeat the process until the box is full, taking care to keep them pressed tightly together as the packing progresses. When full, place a sheet of tissue paper the size of the box over all, now shake enough well-teased shavings on the paper so that when the lid is put on the shavings are slightly pressed upon the fruit; should the box be too deep, use clean well-dried moss or grass, filling up the space firmly before shaking on the shavings, and so high that the fruits, when packed, are nearly level with the top of the box, only requiring a few shavings to keep them in position. By this method of packing, nearly one-half of the fruit is displayed, so that buyers can see the size, colour, and condition without touching it. The boxes are tied three or two together, and sent by van 5 miles to the railway station, over roads and under conditions that would make a nervous grower faint. Nine-tenths go to London, the other to Manchester, i.e., about 150 miles, and not one complaint has reached us this year. Single boxes are more liable to injury than when two or three are tied together, but we send Peaches to all parts in large and small boxes, singly, and by rail, and post, without the least bruising—using boxes adapted to the number of fruits to be packed into them, so that firmness is preserved, which is the great essential to successful carriage. The time taken to pack a box of twenty-four fruits is about five minutes. I grade and pack 60 dozens in three and a half hours, and this quantity I do almost daily during the busy season, the largest number sent away in one week being 333 dozens, and the largest number in one day 131 dozens. *Wm. Armstrong, Toddington Orchard Co.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 26.—The usual fortnightly meeting of the Society was held in the Drill Hall, James Street, Westminster, on Tuesday last, when an interesting exhibition was made, albeit the hall was less full than on some previous occasions. *Chrysanthemums* again constituted one of the more important items, and there were several novelties recognised by the committee. Orchids were not numerous, neither were fruit exhibits, but there was a large collection of Apples and Pears, and another of vegetables.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. Jno. Fraser, Jas. Walker, H. B. May, H. Herbst, R. Dean, Geo. Stevens, J. H. Fitt, R. B. Lowe, C. J. Salter, H. Briscoe Ironside, Chas. Jefferies, J. D. Pawle, Chas. E. Shea, J. W. Barr, Chas. E. Pearson, Ed. Beckett, H. J. Jones, Geo. Nicholson, Geo. Gordon, C. Blick, and Rev. G. H. Engleheart.

A group of Rose trees in pots formed the exhibit of Messrs. WM. PAUL & SON, Waltham Cross Nurseries, Herts; the variety was *Enchantress*, described as a new winter and bedding Rose, a hybrid between China and Tea-scented kinds. Some very free-flowered sprays were also shown, and the committee recommended the variety an Award of Merit. The bloom is white, with lemon flush, but in the bud shows a pleasing tint of fresh salmon or pink (*Silver Banksian Medal*).

Messrs. JNO. LAING & SONS, Forest Hill, London, S.E., exhibited a plant of *Dracena lentiginosa*, with long strap-like leaves, of good colour. Also *Calamus Palembangicus*. Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea, again exhibited their *Javanico-Jasminiflorum* hybrids of *Rhododendrons*, but on the present occasion there was a very beautiful group of small well-flowered plants, in place of the cut blooms shown last time. Messrs. VEITCH also staged a plant in flower of *Begonia* × *Mrs. Heal*, which we recently figured, and a variety of a similar strain named *Eusign*, with larger leaves and paler flowers (*Silver Banksian Medal*).

From the Botanic Gardens, Glasnevin, Mr. F. W. MOORE sent foliage and flowers of *Sphaeralcea umbellata* (*Malva umbellata*), a stove shrubby plant with *Malva*-like flowers of bright violet; native of Mexico.

H. GUNLING, Esq., Harrow Weald House, Stanmore (gr., Mr. Ripley), showed a plant of the very old *Canarina campanulata*, a greenhouse herbaceous perennial with campanulate flowers of a curious shade of orange-purple, not showy but interesting, and not frequently met with.

Mr. J. CRAWFORD, of Cedlington Hall Gardens, Newark-on-Trent, sent cut blooms of *Carnations*.

A handsome *Begonia* in flower was exhibited by J. T. BENNETT POE, Esq., Holmewood, Cheshunt. This was a seedling from B. Froebeli, and named B. F. *incomparabilis*. Leaves were nearly a foot across, handsome and pubescent on under surface, the veins very conspicuous by reason of their pale colour contrasted with the deep, but bright, green of the leaves. Spikes upwards of 2 feet high, many-flowered, each bearing upwards of thirty flowers nearly 2 inches across, pubescent outside and full, bright scarlet in colour. The appear

ance of the plant in the hall was distinct and fine, and it probably excited more interest than any other exhibit.

CHRYSANTHEMUMS.

Mr. R. OWEN, nurseryman, Maidenhead, had a collection of new varieties, Awards of merit being made to the following:—Country of Gold, a small Primrose-coloured narrow-petalled variety, very free, charming in sprays, and promising well for market and decorative work. Mrs. Ellen Newbold, a pale yellow reflexed Japanese, broad petalled, of good size as a decorative variety, and pleasing shape. Another promising market flower, and incurved, Bonnie Dundee, having, in a true incurved form, the colours of Lord Brooke, but less of reddish-brown and more of gold, a charming exhibition variety. In addition there were Oceana, a broad-petalled flower of the Vivand Morel type, white, with a delicate pink suffusion; Walter Owen, reddish cerise, with a bronzy-yellow reverse, but roughly shown; and General Roberts, &c. (Silver Bankian Medal).

From Mr. WELLS, Earlswood, Redhill, came incurved Sir Trevor Lawrence, a very promising white flower of the Queen of England type, and a primrose sport from it named Harry Wells. As the Floral Committee declined to say whether or not it was a true incurved, no award was made; and Major Bonaffon was similarly treated, as no pronouncement was made as to the particular class, though recently shown in several cases as an incurved variety.

From Mr. W. Slogrove, gr. to Mrs. CRAWFORD, Gatton, Reigate, came a grandly-formed and full incurved golden yellow Japanese, named William Slogrove, a flower of great refinement, which will make a very acceptable exhibition variety (Award of Merit).

From Mr. H. J. JONES, Rycroft Nurseries, Lewisham, came Anemone Japanese Surprise, pale lilac-pink, with faint stripes of purple (Award of Merit); Major Bonaffon, in fine character; Mrs. P. Purcell, delicate purplish-pink, with silvery reverse, a very novel incurved Japanese; and Olive Ochree, the golden florets with a bronzy reverse, much incurved, and a golden centre, distinct in character (Award of Merit). Mr. H. BRISCOE-IRONSIDE, Burgess Hill, had some seedling Pompons, but to all appearance partaking too much of a mixed character; and Neve, a white Japanese of a decidedly promising character, if it can be grown large enough. Mr. W. JUKES, Weybridge, had Japanese Mrs. W. Maling-Grant, a promising variety, a mixture of yellow-salmon and bronze; a handsome reflexed variety. From Mr. E. H. JENKINS, Hampton, came a fine and showy yellow Japanese, Golden Dart, which was recommended an Award of Merit as a valuable market and decorative variety.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Secretary), T. B. Haywood, S. Courtauld, Dr. M. T. Masters, E. Hill, H. Williams, E. Ashworth, W. H. Protheroe, T. Statter, F. Hardy, J. Gabriel, H. J. Chapman, W. H. White, C. J. Lucas, J. Douglas, and H. M. Pollett.

The meeting was a thin one so far as the exhibits were concerned, the only group of any extent being staged by Messrs. F. SANDER & Co., St. Albans, and for which they received a Silver Bankian Medal. The body of the group was composed of fine examples of beautiful hybrid Calanthes, varying in colour from cream and rose to purple. Among them were C. x Bella, C. x Florence, C. x Wm. Murray, C. x Bryan, C. x Clive, and C. x Harold. An interesting plant in Messrs. SANDER'S group was Phaiocalanthe x Berryana (P. Humboldtii x C. Masuca), and which had bright rose-coloured flowers, with singular-shaped labellum, in which P. Humboldtii could be distinctly traced. Also in the same group were Phaiocalanthe x Arnoldiana, Pescatorea Lehmannii, P. Klabochorum, and the white Bollea Schroderiana, the rare Dendrobium Leeanum, Acanthisia ionoptera, Angreicum polystachys, Brassia Lewisii, Lælia autumnalis alba, Habenaria Suzanne; Sophronitis grandiflora, Odontoglossum Biconense album, Miltonia Schroderiana, some fine hybrid Cypripediums, and the singular Bulbophyllum crassipes.

To Messrs. LINDEN, l'Orticulturne Internationale, Parc Leopold, Brussels, fell the honour of taking the only First-Class Certificate at this meeting, its award being secured by their richly-coloured Catasetum imperiale, about which opinions differ as to whether it is a crimson-purple C. Bungeorothi, or a richly-coloured form of the variable C. x splendens. In any case, it is the most gorgeous Catasetum known (see *Gardeners' Chronicle*, March 16, 1895, fig. 44). Messrs. LINDEN also showed cut spikes of their form of Cattleya maxima.

Sir TREVOR LAWRENCE, Bart., Burford, Dorking (grower, Mr. W. H. White), sent a very fine hybrid Cypripedium raised between C. Stonei platytenum and C. concolor, and named C. x platycolor. It had an inflorescence of three flowers and one bud, the flowers equal in size to those of C. x concolor, cream white, flushed with rose, and with minute purple dots on the sepals and petals (Award of Merit). Sir TREVOR LAWRENCE also showed Arundina Philippi, a slender plant with terminal sprays of rose flowers with crimson lip, like small A. bambusefolia (Botanical Certificate).

THOS. STATTER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), sent Cattleya aurea Marantina, a fine variety, with rich purple, gold-veined lip, and yellow petals and sepals, over which spread a coppery hue, the petals also being marked with rose colour in a very effective manner (Award of Merit); and Cypripedium x plumosum (barbatum x conantherum superbum)

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, again showed the singular hybrid Epidendrum x Wallisio-ciliare, and the two species from which it was

derived. On this occasion it secured an Award of Merit. Messrs. Veitch also showed the pretty Malayan Dendrobium subclausum, with brilliant orange-coloured flowers (Botanical Certificate).

J. W. TEMPLE, Esq., Leyswood, Groombridge (gr., Mr. E. Briatow, sent Cattleya x Miss Williams (Harrisonia x labiata Gaskelliana), with pretty rosy-lilac flower, with crimson blotch on the lip; and C. labiata, Temple's variety, fine in form and colour.

G. L. PALMER, Esq., Springfield, Trowbridge (gr., Mr. Chas. Richman), sent Cypripedium x Madehne (ballatulum x Argus), with yellowish-white flowers, spotted with purple, and tinged with lilac (Award of Merit); also C. x Dibdin, C. x Seegerianum, and other hybrids.

C. J. LUCAS, Esq., Warnham Court, Horsham, showed Cypripedium x Warnhamensis (Curtisii x philippinense).

Sir FREDERICK WIGAN, Clare Lawn, East Sheen (gr., Mr. W. H. Young), showed fine cut examples of Epidendrum (Barkeria) Lindleyanum and Lælio-Cattleya x Wm. Murray.

Mr. Gribble, gr. to the Marchioness of LONDONDERRY, Plas Court, North Wales, sent Lælia anceps.

Messrs. HUGH LOW & Co., Clapton, showed Oncidium hæmatocichum, Phalenopsis Brymeriana, P. intermedia Portei, some pretty Cypripediums, &c.

STANLEY CLARK, Esq., Oak Alyn, Wrexham, sent Cattleya Trianaei Mrs. Stanley Clark, a noble form, with rich crimson-purple lip, and a feather of the same colour on the petals.

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent an extraordinary Calanthe (named provisionally F. W. Moore), with a fine head of lilac-purple flowers, which on reaching maturity, become light rose, the lip changing to bronzy-yellow (Botanical Certificate); Masdevallia Chimæra aurea, in which the flowers have large patches of clear yellow on the sepals (Award of Merit); Odontoglossum præstans, and the pretty Phaius Bernaysii, from Fiji, with white flowers with chrome-yellow face to the segments.

T. W. SWINBURNE, Esq., Corndean Hall, Winchcombe, sent Cypripedium x Wallærtianum (Harrisonianum x villosum).

Fruit Committee.

Present: T. Francis Ritter, Esq., Chairman; and Messrs. H. G. Pearson, Jas. H. Veitch, Jos. Cheal, J. Wright, Alex. Dean, J. W. Bates, Geo. Wythes, Jas. Hudson, H. Balderson, G. Reynolds, Geo. Norman, Robert Fife, and Philip Crowley.

Exhibits of fruit were few. The largest of these was a collection of Apples and Pears from the Lowfield Nurseries of Messrs. J. CHEAL & SONS, Crawley, which included 100 dishes.

The most attractive of the Apples, by reason of their large size or good colour, were Blenheim Orange, Ribston Pippin, Alfriston, Jubilee, New Hawthornden, King of the Pippins, Cox's Orange Pippin, Mère de Ménage, Prince Albert, Bess Pool, Peasgood's Nonsuch, Cox's Pomona, Hereford Beefing, and Bismarck. Of the last-named, excellent fruits in regard to both size and colour were shown, whilst their fresh-looking appearance proved that they will keep well for some time longer (Silver Knightian Medal).

There were several exhibits of seedling Apples, including Stubb's Seedling, a Quarrenden-like fruit, but a good keeper, also before the committee on a previous occasion. The committee recommended an Award of Merit to this variety, the exhibit of Mr. W. PALMER, Andover; and requested that Mr. E. STEWARD, 57, Carrington Street, Nottingham, who exhibited fruits of a pale yellow variety with russet spots and blotches, fruits rather flat-looking, with deep eye, would exhibit same on a future occasion.

A variety named Palmer's Favourite was shown by Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, S.W.; and another one named Christmas Pea-arsin, was shown by Mr. GEO. WYTHES; and a double Apple, caused by the fusion of two fruits, was from Mr. H. APPLEBY, Dorking, Surrey.

Messrs. LANE & SON, Berkhamsted, exhibited excellent specimens of their Apple Lane's Prince Albert, gathered from trees in the open orchard twenty years old (Vote of Thanks).

Mr. Jno. Crook, gr. to W. H. EVANS, Esq., Forde Abbey, Chard, showed a dish of small red Plums, of the variety Coe's Late Red.

A Tomato of the Perfection type, named Nield's Seedling, was shown by Mr. W. NIELD, Horticultural College, Cheshire, and was referred to Chiswick for trial.

A dish of Jerusalem Artichokes, Vilmorin's New White, was shown by Mr. WYTHES, and also a dish of Wythe's Seedling Potato, a kidney, from a cross between Myatt's Prolific and Beauty of Hebron, said to be ready for use nine weeks after planting, and of good table quality (referred to Chiswick). Fine with fruits of Tomato, All the Year Round, certificated in April last, were exhibited by Mr. Farr, gr. to A. PEARCE, Esq., Spring Grove, Isleworth; the exhibit well represented this variety's free-bearing qualities in November.

Earl of PERCY, Syon House, Brentford (gr., Mr. G. Wythes), supplemented his previous exhibits of vegetables by another another one consisting chiefly of green kinds, which included about forty sorts of Brassicas, some forced Asparagus, also Syon House and Veitch's Improved Telegraph Cucumber, and some Mushrooms. Leeks in several varieties were commendable. Veitch's self-protecting Broccoli, the green curled Savoy, Cottagers, Asparagus, arctic and other varieties of Kales, and Coleworts, were all represented by meritorious produce. Of Brussels Sprouts we noticed Veitch's Exhibition and Sutton's Dwarf Gem, the latter as being a short-stemmed variety, thickly furnished with small close sprouts from base to apex (Silver Knightian Medal).

Lecture on Asparagus Culture.

The lecture in the afternoon was upon Asparagus culture, by Mr. Jas. Mason, a market grower. After briefly alluding to the botanical affinities and characteristics of the plant, as well as its native habitats, the lecturer declared that after cultivating the common Asparagus for many years, he was impressed by the fact that British growers allow far too much foreign-grown produce to be imported into this country. English "buds" were admittedly less in size, but they were of undoubtedly better quality, and sufficient ought to be produced to supply the London market entirely. This delicious vegetable was convenient to the grower in regard to sending it long distances, being easily packed, and of comparatively insignificant weight.

In respect to propagation by means of seeds, Mr. Mason had several points to insist on with emphasis. Seed should not be sown in the autumn, nor in May, as some growers have advocated; but in March, preferably towards the middle of the month, or when the weather was sufficiently open. The seeds were some little time before germinating, and if sown in autumn were very liable to rot; on the other hand, the ground was usually too dry during May for them to germinate as freely as was desirable. Seed should be sown in drills about 1 foot asunder, sown rather thinly, and afterwards the plants thinned to 4 inches or more apart. Before sowing, the land should have been given a winter's good cultivation, by well trenching, and afterwards thoroughly working it. The aim should be to secure really hard, strong plants by the following March. Five or six pounds of seed would produce sufficient plants to plant an acre of land the following year. In regard to land, the Asparagus was not very fastidious. The soil generally near the coast suited it well, if there was sufficient depth. Indeed, any soil of good texture and sufficient depth was sufficient, providing the same was porous. The last-named condition was an essential one in any case. Rough, wet land would always be unsatisfactory. When the seedlings are above ground, the surface of the land should be hoed, and some weak manure-water given to encourage as good growth as possible. Planting should be done the following spring as soon as the "buds" began to move. It was best to select the strongest plants, and keep them to themselves, thus obtaining even beds. Only one-year-old plants should be used, and it was better to sow seed as advised, and then replant, than to sow, and thin to the distance required in permanent beds.

If green Asparagus was required only, the crowns need not be deep, about 3 inches of soil and mulching being quite sufficient; but there were several advantages connected with the deep-earthing system. It was a protection from frost, and from the light, and atmosphere. The buds were much better also. Mr. Mason would advise a medium course by putting 5 or 6 inches of matter above the roots. Common salt was a good manure, and should be applied while the plants are growing, preferably during the months June, July, or August at the rate of 5 or 6 cwt. per acre. If the beds were well made, and planted, and consistent care given afterwards, they may last twenty, thirty, or even forty years. Buds should never be cut after midsummer, however, or the practice would induce the formation of smaller buds for the following season. If it was wished to cut Asparagus after that date, it should be cut from a portion of the land only; the crowns would continue to produce buds until September at least, and it would be well to throw those crowns away.

The French method of culture was then alluded to, Mr. Mason saying that the French growers planted at greater distance apart, at greater depth, and obtained larger but fewer "buds" per acre than English growers. Asparagus should be cut carefully, and a proper toothed knife always used for the purpose. As soon as the "buds" were about 2 inches above-ground was the best time to cut them. In conclusion, the lecturer said that cottagers might easily cultivate Asparagus if they so desired, and thus secure for their tables the finest of all vegetables.

ULSTER HORTICULTURAL.

NOVEMBER 12.—The above society held its annual Chrysanthemum, fruit, and vegetable show on the above date in the Great Hall, Belfast. The usual enthusiasm was more manifest than ever, probably by reason of this being the finest show ever seen in these parts. The exhibits were of high order of merit, and their number more than doubled those of 1894.

The rockwork set up by Mr. McKIMM, Curator of the Belfast Botanic Gardens, was a great point of attraction for visitors. The sheet of water, the bridge which could be crossed, the great variety of foliage plants, hardy and exotic, made use of, and the noble Palms, the Ferns, and other plants so generously made use of, appeared to afford much pleasure.

Close to this exhibit was, in a cultural sense, a grand display of exotic plants from the gardens of J. B. HOUSTON, Esq., Orangefield (gr., Mr. Gray). Of this collection, Codiaeums (Crotons) formed the larger part, and their leaf-colouring was very fine. Interspersed with these were Palms, Ferns, Ficus, and Dracænas, and an edging of Ivy and moss gave the whole an appropriate artistic finish.

Passing long lines of Roman Hyacinths, Mignonette, bouquets in great numbers, Carnations, and table plants, the onlooker came to the exhibits of Messrs. H. DICKSON, viz., foliage plants, both hardy and exotic, in great variety, flowering plants, Conifers, and hardy shrubs, to which a 1st prize was awarded. Other varied and attractive groups came from the same exhibitor.

The PARKS COMMITTEE sent their quota, consisting of

graed groups of pot Chrysanthemums of somewhat dwarf habit, of good width, with vigorous foliage and fine flowers. Mr. Mahappy, the gardener, holds a leading position as a grower.

CUT BLOOMS.

The Countess of PEMBROKE, Mount Merrion, Dublin, was 1st for thirty-six cut Japanese varieties, a capital lot containing many excellent new and old varieties. T. H. TORRENS, Esq., was 2nd with a capital lot of rather less even character than those which came from Mt. Merrion. J. G. SMALLMAN, Esq., was 1st with twenty-four, his flowers of Vivand Morel, A. Perry, and Niveum, being extra fine ones. Many fine exhibits were noted in the smaller classes. The Countess of PEMBROKE was easily 1st for six white blooms; and J. ROGERS, Esq., for six yellow ones, consisting of finely-grown blooms of Sunflower.

Twenty-four incurved blooms were well represented, Golden Empress, Princess of Wales, and Lord Alcester being the more prominent ones for size and fineness. The six blooms of Japanese and six of Anemone-flowered varieties were of much merit, especially the latter. The names of their owners we were unable to discover. A weak point in these shows is the withholding the names of the cultivators.

FRUIT.

Among the leading exhibitors of fruit were General O'NEIL, Lord DOWNSHIRE, and General PAKENHAM. The trade was well represented by fine collections of Apples and Pears from Messrs. RIVERS & SONS, Sawbridgeworth; Messrs. MCGREY & SON, Portadown; Mr. GEO. DICKSON, Newtownards, and others. Alongside on the tables were about 700 dishes of brilliant-coloured Apples, and many dishes of generally good Pears, and an extra large display of Potatoes. In at least two of the competing collections an exhibitor defeated his chances of success by dusting a white substance over his tubers—and was disqualified.

In the Grape classes, Lord DOWNSHIRE (gr., Mr. Bradshaw) took the lead, and received a special award for a collection of four varieties. Lord O'NEIL's and Mr. JOHNSTON's gardeners were well to the front in the choice fruit classes.

Lord ANNESLEY was a leading exhibitor in the vegetable classes. Enormous Leeks and heads of Celery in great quantities, and good Cauliflowers, were the vegetables which were the finest in quality. The Parsnips and Beet were too large and coarse for ordinary use.

TWICKENHAM CHRYSANTHEMUM.

NOVEMBER 19.—A thorough representative show was held on the above date at Twickenham. Chrysanthemums were the chief feature, but other exhibits were also numerous and good. There were only two competitors for the prizes for groups, but each of these made good display, which combined quality in the plants with effective arrangement.

The best came from Mr. Rickwood, gr. to Lady FRAKE, the blooms in this case being the finer; Mr. G. H. Sage, gr. to Earl DYSART, Ham House, Richmond, was 2nd, and his plants were dwarfer than the others.

For a miscellaneous collection of plants, Mr. H. E. FORDHAM, florist, Twickenham, had much the best arrangement, and consequently won quite easily.

For twenty-four Chrysanthemum blooms, incurved and Japanese in equal numbers, Mr. PORTBURY, Ripon House, Putney, was worthily 1st, with an even exhibit, comprising the best-known varieties; Mr. C. J. Waite, gr. to Hon. W. P. TALBOT, Esher, was 2nd, quality of the incurved varieties costing him several points.

Mr. PORTBURY also had the best twelve incurved blooms in another class, Mr. BRADY being 2nd. The same positions were taken by these exhibitors in the class for twelve Japanese, the contest being a close one.

The class for Pompons was a capital one, Mr. Chas. Garrod, gr. to J. R. TINDALE, Esq., being 1st, and Mr. BRADY 2nd.

Floral decorations made a notable feature, the most successful in this section being Miss C. B. COLE and Miss N. H. COLE, who both displayed excellent taste.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 20.—The Floral Committee met at the Royal Aquarium on the above date, a considerable number of novelties being staged.

First-class Certificates of Merit were awarded to incurved Bonnie Dundee, pale bronzy-yellow, of lovely shape, and highly refined; and to Japanese Anemone Robert Adair, delicate flesh, with drooping petals, attractive in colour; both from Mr. R. OWEN, Maidenhead. To Japanese M. A. D. Chatin, a creamy-white incurved Japanese, a large, full flower of good quality; and Jules Chrétien, a large, broad-petalled incurved Japanese, of good substance; from Mr. E. BRACKETT, Aldenham House, Ektres. To single Kate Williams, bright yellow, large but somewhat loose; and to Japanese Parthenia, a delicate blush reflexed Japanese, small in size as Japanese go now; both from Mr. H. J. JONES, Lewisham. To Japanese Surprise Amiral, a large yellow Japanese of full substance, partly incurved and partly reflexed, with an inclination to roughness; from M. E. CALVAT, Grenoble, France. And to Japanese Mrs. Hermann Kloss, reddish-bronze and gold, also with a tendency to looseness; from Mr. WILLIAM SEWARD, Hanwell.

The following are of a decided promising character: Japanese Luino, bright yellow, very pleasing in tint; Japanese Strava, pale yellow; and Vignolo, of much the same colour, but different in build; from Mr. H. B. IRONSIDE, Japanese

Graphic, warm pink, with silvery reverse; from Mr. R. OWEN. Japanese Desdemona, a delicate blush-pink reflexed Japanese, from Mr. H. J. JONES.

NOVEMBER 27.—A good number of novelties were staged on this occasion.

First-class Certificates were awarded to William Slogrove from Mr. W. SLOGROVE, and described in our Royal Horticultural Society's report of the previous day. Japanese Anemone Surprise (R. OWEN), and to Japanese Olive Oclee, both previously described. Japanese Madame J. Bernard, delicate rosy-lilac, with silvery reverse, the petals arranged in a kind of whorl. The committee wished to see it again. Other promising flowers were staged which will, no doubt, be seen again in better condition next season.

YORK CHRYSANTHEMUM.

NOVEMBER 20.—The Ancient Society of York Florists opened their annual exhibition of plants, flowers, fruits, and vegetables in the grand hall of the Fine Art Institution at York.

The exhibition of Chrysanthemums, considering the lateness of the date for such an early season, was very good. One of the principal features of the show was the splendid collections of Apples exhibited by Messrs. BACKHOUSE & SON, York; Messrs. G. BUNYARD & Co., Maidstone; and Mr. JOHN WATKINS, of Withington, Hereford. They were the most magnificent ever seen in the north of England.

CHRYSANTHEMUMS.

The competition for the prizes offered for groups of Chrysanthemums arranged with other foliage plants, was very good, the 1st prize going to Mr. COTTAM, nurseryman, Cottingham, Hull. 2nd, Mr. J. H. KINGSTON, York. The groups were very effectively arranged around the sides of the great hall. Circular groups of Chrysanthemums, cultural merit being the chief point of consideration, were arranged down the centre of the hall, and somewhat detracted from the effect produced by the side groups. A grand effect would have been produced had they been grouped right round the hall. The 1st prize for these was taken by Mrs. GUTCH, of York; 2nd, Mr. W. B. RICHARDSON. Very excellent blooms of the best varieties in cultivation were shown in all these groups.

Open class for specimen plants of Chrysanthemums.—In these, the competition was not great, but some good incurved varieties were shown by Mrs. GUTCH, who was 1st in the class for four plants with Mr. G. Rundle, Mr. Glenny, R. Cannell, and Mrs. Dixon; 2nd, Mr. DICKENSON.

Mr. DICKENSON was 1st for four Japanese; 2nd, Mrs. GUTCH. *Cut blooms.*—The competition in these classes also was not so large as we have seen previously. Many exhibitors who entered, no doubt owing to the warm weather, were unable to appear. The 1st prize, £10, to which is added the Citizens' Challenge prize, value £12, for thirty-six blooms, eighteen incurved and eighteen Japanese, was taken by Sir JAMES WALKER, of Sand Hutton, York, with a grand lot of flowers, especially of the incurved varieties, which included Empress of India, Golden Empress, Baron Hirsch, Hero of Stoke Newington, Princess of Wales, Princess Teck, Mrs. Coleman, J. Agate, Jeanne d'Arc, John Lambert, and other good varieties; among the eighteen Japanese were Mrs. H. Payne, Madame M. Hoste, Vivand Morel, Col. Smith, Miss D. Shea, Sunflower, Stanstead White, E. Molynsux, &c. The 2nd prize went to Mr. A. MILNTHORPE.

The best twelve blooms, incurved, one variety, were from the Earl of FAVERHAM.

Eighteen incurved blooms in twelve varieties were best from C. H. SIMPSON.

Sir JAMES WALKER won for eighteen Japanese blooms. The class for eighteen blooms, open to gardeners and amateurs residing within 5 miles of York, to the 1st prize for which is added the Citizens' Challenge prize. 1st was won by Mr. W. B. RICHARDSON; 2nd, Mrs. GUTCH.

FRUITS.

Pears and Apples were shown in splendid condition. Pitmaston Duchess Pears, and Ribston Pippin Apples, shown by Lord HOTHAM and Sir J. W. PEASE, were prodigious in size, and excellent in colour. Grapes were not quite up to the standard of former years. In the class for six bunches, in three varieties, the 1st prize was taken by Lord HOTHAM, Dalton Hall, Hull (gr., Mr. J. Allop), with moderate-sized, well-finished bunches of Muscat of Alexandria, Alicante, and Mrs. Pearson; 2nd, Mr. R. H. HEYWOOD JONES; two bunches of Black Grapes were also best from Lord HOTHAM; two bunches of White Grapes from Mr. ARTHUR WILSON.

For a collection of fruit in six varieties, Lord HOTHAM was 1st, and Sir W. PEASE 2nd.

The best six dishes of baking Apples were from Lord HOTHAM, and six dishes of dessert varieties also. Lord HOTHAM had the best six Pears.

Sir J. W. PEASE was 1st in the class for nine dishes of Apples, and six dishes of Pears; with Apples—Gascoigne Seedling, Royal Russet, Bismarck, Ribston Pippin, King of the Pippins, Court Pendu Plat, Blenheim Orange, Adams' Pearmain, Manchester Pippin. Pears: Josephine de Malines, Léon Le Clark, Marie Louise, Ne Plus Ultra, Durondeau, Pitmaston Duchess—splendid dishes.

VEGETABLES.

Messrs. SUTTON & SONS, Reading, exhibited a splendid collection of ninety varieties of Potatoes, which were a great attraction.

In the open classes for vegetables, the principal prize-takers were Sir J. W. PEASE, Messrs. SANGSTER & SONS, Mr. T. WAITE, Mr. G. WELBY, Mr. J. SUTTON, Mr. J. WHITEHEAD, Mr. J. G. THRAXTON, and Mr. WRAGG.

SOUTH SHIELDS AND NORTHERN COUNTIES CHRYSANTHEMUM.

NOVEMBER 20, 21.—The above society held its first exhibition in 1882, but after 1886 became defunct until reconstituted again in 1890. The show has every year since improved, and the one held on the 20th and 21st inst. in the Royal Assembly Hall, South Shields, was the best the society has held.

For twenty-four Japanese, eighteen varieties, there were ten competitors.

For twenty-four Japanese, eighteen varieties, Mr. J. T. Wheeler, gr. to Mrs. MITCHELL, Jesmond Tower, Newarth, was 1st, amongst ten competitors; his best flowers were Vivand Morel, Chas. Davis, Mrs. C. H. Payne, Boule d'Or, Mr. G. J. Nofford, Mlle. Thérèse Rey, Eva Kowles, Niveum, Sunflower, Waban, and Duke of York. Mr. G. Shotton, gr. to Mr. H. ANDREWS, Swarland Hall, was 2nd.

For twenty-four incurved blooms, eighteen varieties, Mr. G. SHOTTON was 1st. Mr. Shotton is a new exhibitor, and bids fair, along with Mr. Wheeler, to do honour to Northumberland. Mr. Jas. Coultas, gr. to Alderman HARRINGE, Hollyhurst, Darlington, was 2nd; and Mr. J. BLAIR 3rd. The first were a fine lot, and the judges were most emphatic in their praise.

For eighteen varieties, Japanese, Mr. T. J. WHEELER won, with flowers and bunches equally good as those in the class for twenty-four blooms; Mr. P. BLAIR was 2nd.

Mr. G. SHOTTON was 1st for eighteen incurved blooms; and Mr. JAS. COULTAS was 2nd.

For twelve Japanese, Mr. PETER BLAIR was 1st; and for a like number of incurved, Mr. G. SHOTTON won.

The best six bunches of Pompons were shown by Mr. T. J. WHEELER; and for twelve Anemone-flowered, Mr. G. C. SMITH, Floral Cottage Hall, was 1st. Whilst for twelve reflexed, Mr. G. SHOTTON was the most successful.

BOUQUETS, &c.

Epergnes and bouquets are always an important feature at this exhibition. One centre table, the entire length of the hall, was filled with admirable exhibits of this description. The best bouquet was from Mr. J. SUMMERS, Fawcett, Sunderland; and Messrs. PERKINS & SONS, Coventry, were 2nd. For bridal bouquet, these exhibitors occupied the same position.

The epergnes were tastefully arranged, and contained many choice flowers. Mr. THOS. BATTENBY, Anwell Park, Blaydon-on-Tyne, was 1st for dinner-table.

For bunches of Chrysanthemums and for ladies' sprays, Messrs. PERKINS were 1st; and for button-hole bouquet, Mr. J. McKenzie, gr. to the Rev. R. BURDON, Heddon House, Wylam-on-Tyne, was 1st.

PLANTS.

For a group of miscellaneous plants, not exceeding 10 feet by 8, there were four competitors, Mr. Jno. McIntyre, gr. to Mrs. GURNEY PEASE, Woodside, Darlington, being 1st; the arrangement was of his usual artistic manner. Mr. J. Wood, gr. to Ed. HOPPER, Esq., Riverside, Morpeth, was 2nd.

There were classes in this section for table and miscellaneous plants.

The amateur classes were well contested, and those for Grapes in open classes especially so.

GLASGOW CHRYSANTHEMUM, FRUIT, AND VEGETABLE.

NOVEMBER 21.—This show, the second held in Glasgow, was an improvement on that of last year. The St. Andrew's Hall, in which it was held, was filled throughout with an excellent display of Chrysanthemums, arranged with tables of plants so as to relieve the monotony of a display of merely cut flowers. The towering Palms, foliage plants, Ferns, &c., called forth favourable comments on all sides, and were most creditable to Mr. Dewar (president), Mr. Cunningham and Mr. Wyllie (secretaries), and the other promoters who had spared neither time nor trouble to render the display worthy of the western capital of Scotland.

CUT BLOOMS.

The 1st prize, contributed by the Corporation of Glasgow, was gained by Mr. JAMES DAY, gr. at Galloway House, for thirty-six blooms (Japanese), which were in every respect first-rate, and equal to any seen elsewhere in the north; the 2nd prize went to Mr. JAMES BRIGGS, gr., Cochoa, Duntocher.

Mr. D. NICOL, gr., Kossie, Forgardenny, was 1st in the class of twenty-four Japanese, and well sustaining his reputation as an excellent cultivator. His bloom of Madame Carnot received an Award, as being the finest bloom in the show; and he had several other grand flowers. Mr. H. DUNAGAN, Dunfermline, was a good 2nd. This was a class in which the competition was rather severe. All the other classes of Japanese varieties brought exhibits of high order.

The incurveds were mostly finer in form than of large size, and many fine blooms were noticed in the numerous exhibits. Mr. DAY led well with excellent blooms in the class of eighteen; and Mr. JNO. CLARKE, gr., Selkirk, was 2nd, with finely-formed blooms.

For twelve incurved and twelve Japanese, Mr. NICOL was 1st, with a fine exhibit; and Mr. CLARKE was 2nd. The last exhibitor was 1st among many of the minor classes, for six grand blooms of *E. Molyneux*.

In the classes for amateur exhibitors, many fine blooms were tabled.

There were several tables in competition for effect which were brilliant with plants of dwarf Chrysanthemums and foliage plants. Mr. ARCHIBALD, gr., Bothwell Castle, was 1st, with a somewhat crowded table; Mr. DALE was 2nd.

Table Plants, which divided off the long lines of Chrysanthemum blooms, were said to be the finest display of the kind previously seen in Glasgow. Mr. LANDSEBOROUGH, gr., Beech Wood, was 1st for six plants which could scarcely be surpassed. His *Crotons*, *Chelon* and *Prince of Wales*, were greatly admired.

Specimen Chrysanthemums, in pots, although better than last year, called for no special comment. *Roman Hyacinths* were not equal to the display last year, still there were some fine half-dozen exhibited. Among special awards, Messrs. THYNE, AUSTIN & McASLIN were well to the front with tables loaded with Chrysanthemums. Messrs. CANNELL, Home of Flowars, Swanley, Kent, had fifty or more beautiful bunches of their choicest zonal Pelargoniums, which attracted many admirers. All shades of colour, from the white Sea Gull to Royal Purple, were in capital form.

Messrs. CROSS had grand Pears and Gros Colmar Grapes; Messrs. SMITH & SIMONS had a splendid display of Potatoes—about fifty large dishfuls, and all handsome; Messrs. BUCHANAN, of Forth Vineyard, had an attractive exhibit of Grapes in baskets, large in berry, and beautifully coloured. Their collection of Vine-leaves of brilliant colours was very attractive, and the baskets of Tomato-fruits were finely coloured, and of capital quality.

Huge Palms for competition decorated the orchestra.

Messrs. DOBBIE & Co. had a large table of Chrysanthemums in the lesser hall, loaded with many of their choicest seedlings, some of the forms quite distinct and very beautiful.

Orchids were few. Mr. MITCHELL, gr., Bantockine, was 1st for a plant of *Cattleya labiata*, densely loaded with blooms; Mr. WILSON, gr., Kelvinside, was 2nd, with a plant of *Cypripedium insigne*, of an immense size and plentifully flowered.

FRUIT.

This made a good show. The classes were not numerous, but all were well represented. Mr. LESLIE, gr., Pitoullan, as usual, was in great force; his Grapes were large in bunch and berry, but his Gros Colmans were not equal in colour to what he generally tables; but his 1st prize bunches of Muscats were first-rate. Mr. MURRAY, Parkhall, ran Mr. LESLIE hard in the various classes; Mr. ORMISTON, gr., Johnston, had some finely coloured bunches in the black Grape classes. Mr. MURRAY was 1st for Lady Downes; and his bunches of Trebbiano, for exhibition only, were examples of first-rate culture.

Apples were well represented, and Mr. DAY's collections of dessert and culinary varieties were far ahead of all others. Mr. ANGUS, Dalzell, was 1st in the larger class for Pears, his dishes of Marie Louise and Doyenné du Comice being about the best seen in Scotland. Mr. DAY showed well in this class.

VEGETABLES.

These exhibits were on the whole somewhat coarse for a Glasgow exhibition. Leeks and Celery were in great quantities; Cauliflowers remarkably good—Veitch's Protecting formed the 1st prize exhibit from Mr. STEWART, gr., Knock-derry Castle.

For a collection for ten sorts there was strong competition, and Mr. J. BROWN, gr., Houston House, greatly distanced his competitors with a first-rate exhibit; his Cucumbers, Celery, French Beans, and roots were as fine as could be desired. *M. Temple, Carron*.

NEATH CHRYSANTHEMUM.

THE above Society held its annual show in the Gwyn Hall recently, the display being the best yet made by this Society.

The competition was keen, especially in the cut-bloom section, and some of the best known growers in the Principality were present. Groups were very satisfactory, the 1st prize exhibit in the open class being an excellent one. The amateurs' and cottagers' exhibits have very much improved. Fruit was well represented; whilst with vegetables, Mr. Foster, gr. to Mr. WILLIAMS, Aberpergum, who has been so successful all the season, was invincible. Messrs. CLIBRAN of Manchester had a fine collection of fruit and cut blooms of Chrysanthemums; Mr. LLEWELLYN of Neath also had a fine stand of fruit and plants.

Mr. GWYN (gr., Mr. Bradley), won 1st place for a group in the open class; 2nd, Mr. H. PRICE—both of Neath.

For six specimen plants in pots, Mr. BRADLEY was 1st; and Mr. PRICE was 2nd.

The chief prize in the cut-bloom section was for twenty-four blooms, Japanese and incurved, to be included in equal numbers. There were seven entries, and Mr. Williams, gr. to the Earl of LISBURNE, Crosswood Park, Aberystwith, was 1st, with a grand collection, his chief blooms being Mrs. W. H. Lees, Charles Davis, Viviani Morel, Mille, The dse Rey, and Viscountess Hambleton, among the Japanese, the last-named variety gaining the special prize for best blooms in the show; and Mr. C. B. WHITALL, Mrs. R. King, Golden Empress, Lord Alcester, and Brookleigh Gem, amongst the incurved. Mr. Dumble, gr. to Sir CHARLES PHILIP, Pictou Castle, Haverford West, was a good 2nd; and Mr. Rogers, gr. to Mr. CLIVE, Llanelly, 3rd.

For twelve incurved, Mr. DUMBLE was 1st, and Mr. WILLIAMS 2nd.

The best collection of twelve Japanese came from Mr. Joy, gr. to Mr. BOWRING, The Heath, Cardiff, in a division open only to growers in South Wales and Monmouthshire.

The best collection of twelve varieties, including equal number of incurved and Japanese flowers, Mr. WILLIAMS was 1st; and for twelve incurved blooms, Mr. DUMBLE was the best exhibitor; Mr. JOY winning for twelve Japanese.

AYLESBURY CHRYSANTHEMUM.

NOVEMBER 21.—The seventeenth annual exhibition of this Society was held in the Corn Exchange on the above date, when the average quality of the exhibits compared favourably with that of 1894, the quality being good, and in some instances noteworthy.

Mrs. BARTLETT (gr., Mr. W. Turnham), secured for the third time the Silver Challenge Cup offered for the best group of Chrysanthemum plants, which now becomes the property of the exhibitor.

In the open classes Mrs. BARTLETT was successful in the class for forty-eight cut blooms; and Lady A. DE ROTHSCHILD (gr., Mr. H. Warren), was 2nd in the same class, and the winner of many other prizes. The quality of the blooms in this class was exceedingly satisfactory, and the disparity between the two most successful exhibitors was very small indeed. In Lady A. DE ROTHSCHILD'S stand was an excellent bloom of Robert Owen, selected by the judges as the best in the show.

The open class for thirty-six distinct blooms was won by Mr. H. GURNEY; and Col. LEE (gr., Mr. Lee), 2nd; whilst that for twenty-four blooms distinct, was taken by Mrs. BARTLETT. Lady DE ROTHSCHILD had the best six Anemone blooms.

Among the exhibits in the classes for trained plants, was an excellent specimen of *W. H. Lincoln* with 200 blooms upon it, shown by Mrs. BARTLETT in the specimen class.

NORWICH HORTICULTURAL.

NOVEMBER 21, 22, 23.—An excellent exhibition was held in St. Andrew's Hall, Chrysanthemums forming one of its principal features, and improvement in all sections was noted, except in the incurveds.

Cut blooms were many and good, and the 1st prize for forty-eight distinct Japanese varieties fell to Mr. Allan, gr. to Lord STUFFIELD, Gunton Park, the blooms, comprising the leading varieties, being excellent; Mr. Rogers, gr. to Lord RENDLESHAM, Rendlesham Hall, came in a good 2nd.

The best thirty-six Japanese, of Norfolk growth, came from Mr. OGLE, gr. to the Marchioness of LORNAIAN, Blickling Hall. The best twelve Japanese varieties, open, were those shown by Mr. Messenger, gr. to C. H. BERNERS, Esq., Woolverstone Park, Ipswich. This lot of blooms were grandly developed. Mr. MESSENGER won also for six Japanese with an equally good set.

Mr. J. C. SHIDDICK, gr. to Hon. A. E. FELLOWES, M.P., Honingham Hall, had the best incurved specimens, which were fairly good. Mr. F. KIRK, gr. to R. CROSS, Esq., Worstead, was 1st for six incurved of any one variety, namely, Empress of India; and also for reflexed and Anemone Pompon varieties.

Pompons made a fine display in the twelve varieties class, shown in bunches of six blooms. Mr. J. EASTWOOD, gr. to J. SUTTON, Esq., Telegraph House, Great Yarmouth, was 1st with blooms of leading varieties; Mr. W. TURNER, gr. to Dr. J. WILSON, Great Yarmouth, being a close 2nd.

In the competition for the best twelve Anemone flowered, and in that for six bunches of single-flowered varieties, Mr. EASTWOOD was 1st in both with fine examples.

PLANTS

showed improvement on former years. Mr. O. Wodehouse, gr. to H. TREVOR, Esq., Plantation, Norwich, was the winner in the class for six Japanese, with well-flowered plants of suitable varieties; and Mr. FISHER, gr. to E. MASTERS, Esq., Flixton Park, Beccles, in that for Pompon varieties, with remarkably well-flowered plants of *W. Westlake*, *Cedo Nulli* varieties, &c. Mr. BOLTON, gr. to J. G. SNELLING, Esq., Eaton Hall, was an easy 1st for six plants in reflexed varieties, likewise for six incurved varieties. Mr. NOTCUTT, Broughton Road Nursery, was awarded a First-Class Certificate for Japanese Chrysanthemum *Edith Tabor*, a pure yellow-flowered variety, possessing great merit; and a similar award was made to Mr. NOTCUTT, also for incurved *Major Bonnaion*, orange-coloured.

Messrs. DANIEL BROS. showed Chrysanthemums, fruit, a variety of plants and of vegetables, which added considerably to the attractions of the show.

MANCHESTER ROYAL BOTANIC.

NOVEMBER 22, 23.—The Chrysanthemum Show under the auspices of the above society, was held in the Town Hall. The exhibits generally were of excellent character. The pot plants, although showing evidence of being retarded, were full of well-developed flowers, and cast fine masses of colour along the sides of the spacious hall. The incurved blooms were highly meritorious, the chief prizetakers putting up an unusually well-grown assortment. The Japanese were scarcely so good upon the whole, although in much greater numbers than

we have seen them at previous exhibitions of the society. The cut flowers generally comprising those grown indoors and those grown outdoors, were clean and brilliant. What always adds to the features of the November exhibition, is the grand display of Orchids, comprising *Cattleyas*, *Dendrobiums*, *Cypripediums*, and *Sophrontias* from various exhibitors.

PLANTS.

The finest collection of nine came from T. HARKER, Esq., Bank House, Fallowfield, followed by G. H. GADDUM, Adrea House, Didsbury, and by J. C. CHORLTON, Esq., Didsbury Priory, these gentlemen taking the best positions in the other classes of pot plants. The Pompons were finely grown and abundantly flowered, the best coming from Mr. CHORLTON, Mr. JAMES BROWN, Lengfield, Heaton Moor; and Mr. R. HARDWICK, Woodley's Grange, Ashton-on-Mersey.

CUT BLOOMS.

For forty-six incurved blooms, not fewer than eighteen varieties, and not more than two blooms of one variety, E. BEHRENS, Esq., Bettisfield Park, Whitechurch, was a long way 1st among nine competitors; 2nd, Col. E. LLOYD, Aston Hall Shrewsbury.

For twelve incurved, E. BEHRENS, Esq., and Col. LLOYD respectively gained 1st and 2nd.

For twenty-four varieties, cut blooms, Japanese, Mr. BEHRENS was again 1st; and Mr. J. STANNING, Broadfield Leyland, 2nd.

For thirty-six miscellaneous cut blooms, 1st, J. BROCKLE BANK, Esq.

Amongst the whole, we noted as the best incurved blooms Charles Curtis, a fine showy primrose; J. Agate, a good white; Mrs. Coleman, buff; J. B. Whitnall, dull maroon; Golden Empress of India, a model flower; Princess of Wales, pink; with white centre; Queen of England, bluish; Robert Cannell, bronze; John Lambert, bluish and orange-shaded—very pretty; Mrs. Kearns, one of the best, of a soft pink glow—very compact; Lord Rosebery, purple-lilac; Miss M. Haggas, primrose; Wm. Tunnington, bronze, as compact as a cone; Mrs. Robinson Key, yellow; Baron Hirsch, one of the best of the bronze type; C. B. Whitnall, purple, shaded; Jeanne d'Or, flesh colour; Brockleigh, fine pale lilac.

Among the best Japanese were Mrs. B. Ward, orange and yellow; Viviani Morel, of a pinkish cast; Stanstead White, a really good flower, better than we have seen it this season; Duke of York, crimson, and white at the back of the florets, one of the prettiest; H. L. Sunderbruck, good, clear yellow; Ed. Molyneux, still a prominent bizarre; Mlle. Thérèse Bey, one of the most beautiful, white with yellowish cast; E. L. Jamieson, a good ruby shaded flower; E. G. Schwabe, a fine showy flushed pink, with white back florets; International, showy bluish; Etnie de Lyon, a roseate pink; Miss M. Blenkiren, shaded orange and white; Viscountess Hambleton, shaded lilac, with orange at the back of the florets; Mons. Panboucke, a very fine flower; Silver King, pale crimson, with the back of florets as if silvered; Primrose League, best of its class; E. W. Childs, mauve; Niveam, good, clear white Louise, fine broad petal, and good generally.

ORCHIDS.

The platform was filled with Orchids in great variety from HEATH & SON, Cheltenham, comprising *Cattleya labiata* in great number, but nothing of first-class excellence among them. *Cattleya Mastersii*, a hybrid in which the blood of *Harrisii* is largely intermixed, was good. There were quantities of *Dendrobium Phalaenopsis*, some very good *Ocoidium varicosum*, some rather rare *Cypripediums*, the chief amongst them being an insigne *Sandera* with three flowers, the pale yellow and the white being particularly pleasing, and calling forth general encomiums; the whole were nicely set amongst Palms and other ornamental plants, and made a picturesque display.

Mr. JAMES CYPHER, Cheltenham, had a less numerous but choice lot, in which a new *Cypripedium*, in the way of *Lecanum giganteum*, but with a dorsal sepal broader and clearer than in that superb variety, was prominent; also one of the most striking of the *Odontoglossum Cervantesii*, or, rather, *Humeanum* section, in which the whole of the segments were flushed, and the concentric rings and spots more than usually prominent. There were many good types of *Dendrobium Phalaenopsis*, which is proving itself to be one of the very best novelties that has been introduced for years for its great variety, and its usefulness for indoor decorative purposes.

Mr. G. S. BALL, Bowden, received First-Class Certificates for *Cypripedium insigne Sandera*, with two well-developed large flowers—pity that the dorsal sepal is not altogether free of faint pinkish spots—it is undoubtedly the best of the insigne division; also for *Lycaste*, a natural hybrid, showing the lip and petals of *Skinneri*, with the narrowish bronze sepals of one of the forms of *L. gigantea*. Along with these were several other good *Cypripeds*, and a white *Lycaste Skinneri*.

MISCELLANEOUS.

WM. CLIBRAN & SON, Altrincham, had a very creditable assortment of plants in variety, very effectively grouped together. This collection of cool, hardy herbaceous, as well as of Chrysanthemums of various types, and other flowers, was a showy one.

Mr. JAS. BROOME sent a lot of posies of hardy herbaceous flowers grown in his garden at Llandudno.

H. CANNELL & SONS had a beautiful lot of double and single-flowered Pelargoniums arranged in pyramidal bunches, along with a few select Chrysanthemums.

Messrs. **LOAD**, Ashton-on-Mersey, had a fine lot of cut sprays of various indoor flowers which sell well in groups at this season of the year.

DICKSON & ROBINSON exhibited a fine collection of Cyclamens set out amongst Maidenhair Ferns; and **DICKSON, BROWN & TAYLOR** had a similar assortment.

Mr. **JOHN WATKINS**, nurseryman, Hereford, put up a collection of over fifty dishes of dessert and culinary Apples in first-rate condition.

VARIORUM.

A TROPICAL FROG AT KEW.—Dr. Gunther, writing to *Nature*, says: A short time ago Mr. W. Watson, the assistant curator of Kew Gardens, informed me that he had noticed for several years, in some of the bothouses, specimens of a small frog, which, hiding away during the day among the pots and orchid baskets, enlivened the quiet evenings with their shrill, whistling notes. Suspecting that this frog must be of foreign importation, I asked the director to allow some of the specimens to be caught, and some days ago I had the pleasure of receiving three specimens in excellent condition. The frog is *Hylodes Martinicensis*, a small arboreal species, distributed over, and common in, many West Indian islands (Martinique, Porto Rico, St. Vincent, Dominica, Barbados, &c., and possibly in Trinidad). Mr. Watson recollects that he observed it first some ten years ago, that he lost sight of it for some time, but that it reappeared about four or five years ago. Taking into consideration the few facts with which we are acquainted as to the reproduction of this frog, it seems most probable that several specimens of both sexes were, on more than one occasion, accidentally introduced in Warden cases. However that may be, it is evident that the frogs have freely propagated since their introduction. At present they are most numerous in the propagating houses, in which the temperature ranges between 80 deg. and 100 deg., sinking in winter at times to nearly 60 deg. Accompanying Mr. Watson one evening, I heard from several points the call of the frogs, which somewhat resembled the piping of a nestling bird; and guided by the sound, I had soon the pleasure of seeing one of them clinging to the side of a glass case. There is nothing extraordinary in the accidental importation of individuals of a tropical species of frog into Europe; but it is an interesting experience, that the species should have permanently established itself. This is owing, in the first place, to the favourable conditions under which it found itself placed, and secondly, to the peculiar mode of its propagation. *Hylodes Martinicensis*, and probably the majority of its congeners, does not spawn in water, but deposits from fifteen to thirty ova on leaves in damp places. After a fortnight the young frogs are hatched in a perfect form, having passed through the metamorphosis within the egg, thus escaping the vicissitudes and dangers to which they would have been exposed during the progress of the usual Batrachian metamorphosis. This instance of the acclimatisation in Kew Gardens of the "Coqui" (as the frog is called in Porto Rico) is unique in Batrachian life at present. I trust that the little guest may long flourish where it has found such a congenial home, and where it usefully aids in the destruction of plant-eating insects and wood-lice, of which I found great numbers in the stomach of a specimen. If at a later period a nest with ova were discovered, Mr. Dyer would delight the heart of embryologists, to whom the opportunity of examining fresh ova of this frog would be most welcome.

Obituary.

LORD DE TABLEY.—The deceased peer was generally known as a scholarly and elegant poet. It is not so well known that as the Hon. Leicester Warren he was a critical botanist of great acuteness, as witness his investigations on the genus *Rumex* and many other British plants.

RICHARD GILBERT.—By the death, on Friday, Nov. 22, of Richard Gilbert, at the age of seventy-three, the gardening world is the poorer by an excellent gardener, and a man of sterling worth. The deceased had been gardener to the Marquis of Exeter, and during the last few years tenant of the kitchen garden and appurtenances at Burghley House, Stamford, at which place he died. His connection with Burghley began in 1868, he having been recommended to the post of lead gardener by the Superintendent of the Royal Horticultural Society's Gardens at Chiswick. Mr. Gilbert had the advantage of a varied experience in gardens and gardening, and had many changes of masters, before he settled to his life's-work at the place with which his name was to become intimately connected.

To those who may be interested in the matter, we would refer our readers to his autobiography, which appeared in these pages on August 14, 1875. He was an enthusiast in his profession, doing thoroughly, and with all his heart, whatever he undertook, but his forte was fruit and vegetable culture, and out-of-doors gardening generally. In few places could better

trained and fruited wall-trees, or finer Strawberries, be found. His British Queens were unsurpassed for size and goodness, and although, as was natural in a man capable of having an opinion, about retaining what was best in every sense in the older productions of the garden, he was constantly testing new varieties of fruit and vegetables. We believe there was scarcely a new Strawberry brought out by Messrs. Laxton of Bedford, Mr. Lovell, Mr. Allan of Gunton Park, or other raiser of note, that he did not at once buy and test in the capital soil of Burghley. At one period, some ten years ago, he endeavoured to raise varieties of Savoy, and crosses between Cabbages and Broccolis, which were the one or the other according to the season at which they were cut; but these, although they found favour with gardeners for a time, are, at this date, not generally liked. With his Queen of Broccolis, and Universal Savoy, he was more successful, and these are likely to survive for years to come. His Royal Sovereign Tomato, and Burghley Park Cherry, are meritorious productions, as are Victory of Bath and Gilbert's Green-Flesh Melons. Most of these novelties were raised by him, and of the others he was simply the introducer. One of his greatest feats as an exhibitor, and he exhibited much and frequently at the London and other big shows, was the winning of the Carter

Challenge Cup, for a collection of vegetables, at the Royal Horticultural Society's show on July 7, 1875, his chief opponents being Mr. Arkell and Mr. Pragnell.

GEORGE LAWSON.—The death has occurred, says the *Athenaeum*, at the age of sixty-seven years, of Professor George Lawson, who occupied the Chair of Chemistry and Mineralogy in the University of Halifax, Nova Scotia. He was a native of Dundee, and while engaged as a young man in a city office he devoted his leisure to science pursuits, and in 1848 he left his native town for Edinburgh as assistant to Prof. Balfour. In 1858 he was called to fill the Chair of Natural History at Kingston College, Canada, some years afterwards taking up his late position at Halifax. In 1888 he was elected President of the Royal Society of Canada. It is not too much to say that to Prof. Lawson must be ascribed much of the success attendant on fruit-growing in the Dominion, since he was the first to direct attention to the possibilities of Canada's development in this direction. He was a Fellow of the Royal Physical and Botanical Societies of Edinburgh, and of the Institute of Chemistry of Great Britain, and an honorary member of the Edinburgh Geological and Scottish Arboricultural Societies. He was also a Fellow of the Royal Society of Canada. In the summer of last year he visited Scotland, and in October last he retired from college work, looking forward to well-earned rest. On November 1, however, he was seized with paralysis, and ten days later passed away. He was twice married, and his first wife, Miss Lucy Stapeley, of London, contributed to the *Transactions of the Botanical Society of Canada* a paper on "The Silkworm and other Fibre-yielding Insects, and the growth of their Food Plants in Canada." Prof. Lawson was an old and valued correspondent of this journal, and furnished us regularly with reports on the Apple crops of Nova Scotia.

MRS. BRUCE FINDLAY.—It is with much regret we announce the death of Mrs. Bruce Findlay, wife of the Curator of the Manchester Royal Botanical and Horticultural Society, which occurred at Old Trafford on Wednesday, November 20.

MARKETS.

COVENT GARDEN, November 28.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

Trade slow; supplies heavy. Snowdrops, 70s. to 90s.; Hebrons, 75s. to 85s.; Bruces, 55s. to 60s.; Black lands, 30s. to 45s. J. B. Thomas.

SEEDS.

LONDON: November 27.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended. There has not this week been any noteworthy change in the values of either Clover or grass seeds. As yet no general inquiry of any importance has sprung up for seeds, a few large provincial firms have, however, been taking advantage of the low rates current to lay in some supply. Tares are neglected. Peas and Haricots show no alteration. Mustard and Rape seed keep firm. As regards Bird seeds there is no fresh feature.

FRUITS AND VEGETABLES.

BOROUGH: Nov. 23.—Quotations:—Cabbages, 2s. 6d. to 3s. per tally; Savoys, 4s. to 5s. 6d. doz.; Carrots and Turnips, 2s. 6d. to 3s. per dozen bunches; Apples, 4s. to 6s. per bushel; Chestnuts, 6s. to 9s. 6d. per bag; Walnuts, 4s. to 5s. do.

SPITALFIELDS: Nov. 23.—Quotations:—Cauliflowers, beat, 6s. to 9s. per tally; do., seconds, 1s. 6d. to 2s. 6d. do.; bunch Greens, 1s. to 1s. 6d. per dozen; Savoys, 2s. to 3s. per tally; Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; Artichokes, 1s. 6d. do.; Horse-radish, 1s. 1d. to 1s. 2d. per bundle; Carrots, 2s. per dozen bunches; Turnips, 1s. 6d. do.; Celery, 7s. to 9s. per dozen rounds; Onions, 3s. 6d. to 4s. per bag; Carrots, 1s. 3d. do.; Turnips, 1s. 3d. to 1s. 6d. do.; Apples, cooking, 3s. to 4s. per bushel; dessert, do., 4s. 6d. to 5s. 6d. do.

STRATFORD, Nov. 23.—There has been an abundant supply and a fair trade done at the undermentioned prices:—Cabbages, 2s. to 4s. per tally; Savoys, 2s. to 4s. do.; Greens, 6d. to 1s. per bag; do., 1s. to 1s. 6d. per dozen; Cauliflowers, 6d. to 1s. 6d. per dozen; do., 2s. to 7s. per tally; Scotch Kale, 6d. to 8d. per bushel; Turnips, 1s. to 1s. 6d. per dozen bunches; do., 20s. to 40s. per ton; Carrots, household, 25s. to 32s. do.; do., cattle-feeding, 17s. to 26s. do.; Mangels, 12s. to 15s. do.; Swedes, 15s. to 18s. do.; Onions, English, 8s. to 9s. do.; do., Ghent, 2s. 6d. to 2s. 9d. per bag; do., Ports, 4s. to 5s. 6d. per case; Apples, English, cookers, 2s. 6d. to 3s. 9d. per bushel; do., dessert, 2s. 6d. to 5s. do.; do., Nova Scotia, 13s. to 16s. per barrel; Pears, English, 2s. 6d. to 5s. per bushel; Beet-root, 6d. to 8d. per dozen; Celery, 6d. to 10d. per bundle; Horse-radish, 1s. to 1s. 3d. do.; Parsley, 1s. to 1s. 6d. per dozen bundles; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half-sieve.

FARRINGTON: Nov. 23.—Quotations:—Cabbages, 2s. 6d. per tally (Collards); Cauliflowers, 1s. 6d. per dozen; Turnip-tops, 1s. 8d. per bushel; Leeke, 1s. 6d. per dozen; Sprouts, 1s. 6d. per half-sieve; Onions (English), 4s. 6d. per bag; Beetroots, 1s. 6d. per bushel; Turnips, 2s. per dozen bunches; Carrots, 2s. do.; Parsnips, 1s. per score; Celery, 13s. per dozen rounds; Apples, (Blenheims), 4s. 6d. per bushel; Wellingtons, 4s. 8d. do.; Canadian Ribstons, 15s. per barrel; Baldwins, 15s. 6d. do.; Newtown, 12s. to 16s. do.; Tonkin King, 15s. do.; English Grapes, 1s. 2d. per lb.; Tomatos, English, 3s. 6d. per 12 lb.

POTATOS.

BOROUGH: November 26.—Quotations ranged between 40s. and 80s. per ton.

SPITALFIELDS: November 26.—Quotations:—Main Crop Kidney, 50s. to 65s.; Reading Giants, 40s. to 60s.; Bruces, 40s. to 55s.; Imperators, 50s. to 60s.; Hebrons, 60s. to 80s.; Sutton's Abundance, 50s. to 70s. per ton.

STRATFORD, November 26.—Quotations:—Bruces, dark soil, 35s. to 40s.; do., light, 40s. to 60s.; Reading Giants, 40s. to 55s.; Sutton's Abundance, 50s. to 70s. per ton.

FARRINGTON: November 23.—Quotations: Main Crop Kidney, 80s. to 90s.; Jeannie Daus, 70s. to 80s.; White Hebrons, 70s. to 80s.; Bruces, 60s. to 65s.; Magoums, 45s. to 55s.; Sutton's Abundance, 65s. to 75s. per ton.

LONDON AVERAGES: Nov. 27.—Danbars, 90s. to 100r.; Snowdrops, 60s. to 90s.; Hebrons, 60s. to 90s.; Sutton's Abundance, 80s. to 65s.; Puritans, 55s. to 69s.; Regents, 60s. to 70s.; Imperators, 40s. to 50s.; Magoums, 35s. to 45s. per ton.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 80s. to 100s.; do., inferior, 50s. to 70s.; hay, best, 60s. to 90s.; do., inferior, 36s. to 60s.; mixture, 70s. to 87s. 6d.; and straw, 30s. to 41s. per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending November 23, and for the corresponding period in the previous year:—1895: Wheat, 25s. 7d.; Barley, 25s. 1d.; Oats, 14s. 4d. 1894: Wheat, 19s. 11d.; Barley, 22s. 4d.; Oats, 14s. 3d.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S. * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending November 23, is furnished from the Meteorological Office:—

"The weather varied considerably in different parts of the kingdom. Rain was of frequent occurrence excepting in the south-east, but the amounts were less heavy than those of the weeks immediately preceding. The air was very humid generally, and fog or mist were experienced at times. The temperature again exceeded the mean, the excess ranging from 4° in 'England, S.W. and the Channel Islands,

to 2° in most of the western and northern districts. The highest of the maxima were recorded on the 17th at most of the English stations, but later in the week in Ireland and Scotland. They ranged from 59° in the 'Channel Islands,' and 57° in the south-west and south of our islands, to 54° in 'Scotland, W.' and 'Ireland, N.' The lowest of the minima were registered on the 18th, and varied from 23° in the 'Midland Counties,' to 36° in 'Scotland, N. and W.,' and 'England, N.E. and N.W.,' and to 33° in the 'Channel Islands.'

"The rainfall slightly exceeded the mean in Ireland, and just equalled it in 'England, E.;' in all other districts there was a deficit.

"The bright sunshine was in excess of the mean for the time of year in most parts of the kingdom. The percentage of the possible duration ranged from 33 in 'Ireland, N.,' to 10 in 'England, S.,' and to 9 in 'Scotland, N.'

CHRYSANTHEMUM SPORT: J. W. V., Barnet. The bloom you send appears to be a sport from the variety you name, but the colour, though distinct from the type, is not very attractive. It may be well, however, to grow it as strongly as possible next season, and exhibit blooms before the National Chrysanthemum Society, when its true worth could be more certainly determined.

DENDROBIUM: F. W. M., Dendrobium Linawianum thrives in most collections as well as D. nobile when grown in the same manner. But in places where the proper resting season in a cool and dry house is not strictly observed the plants of D. Linawianum resent the neglect more than those of D. nobile. We recommend you to keep your specimens in a cool, dry, but light situation until they start into growth again and then gradually to take them into the warmest and most humid house you have until the growths are fully completed. We have no evidence of its situation in its native habitat.

"GARDEN ANNUAL" and "HORTICULTURAL DIRECTORY": W. E. L. You should apply to the editors of those periodicals. How can we tell?

INCANDESCENT GASLIGHT IN A CONSERVATORY: A. E. K. The fumes from gas, unless completely consumed, are very injurious to plant life, in proportion to the amount of sulphur left in the gas. It is rarely that the gas is quite free from this deleterious substance.

LILIUM LONGIFLOSUM VAR. HARRISH: L. L. B. The blooms are obtained at this season from long-delayed bulbs, which may not have been potted till June or later, but grown under natural cool treatment—except, perhaps, just before flowering, when they are placed in mild heat, so as to obtain well-expanded blossoms. These bulbs are selected from importations arriving late in the season, which are suitably retarded.

IVY: G. G. The grafting of the variegated forms on stocks of any strong green variety can be best undertaken when growth commences naturally; or, if you would hasten the operation, it may be done in a close moist pit or house having a maximum temperature of 65° and minimum of 55°, choosing the latter part of February or beginning of March. It would be better if the stocks were one-year rooted in pots.

MARKET STRAWBERRIES: A. K. H. We give you the names of varieties of moderate price when purchased as young plants, viz., Noble (Laxton's), Vicomtesse Héricart du Thury, Sir Chas. Napier, and Elton Pine. Your method of cultivation is very suitable, but we should be inclined to plant some of the early varieties in the warmer place, and the later in the colder site.

MUSHROOM SPAWN: A. B. C. We should imagine that he would be liable to an action for damages if he knowingly sold "spawn" that had lost its vitality, or which was incapable of producing Mushrooms.

MUSHROOMS: F. B. The withered brown appearance of the young Mushrooms points to spawnbricks having been employed in which the mycelium "spawn" had "run," and consequently become useless; or to too great warmth in the beds.

NAMES OF FRUITS: *H. Smith, Greenhaugh.* Your Apple is Egg or White Paradise.—*C. Kemp.* Apple, Emperor Alexander.—*C. W. C.* Apple, Golden Noble; Pear, Josephine de Malines.—*C. Liddiard.* Your Apples are unknown to us.—*G. D. 1.* Beurré Superfin; 2, Marie Louise; 3, Duchesse d'Angoulême. Apples, 1, Brymer; 2, Northern Spy; 3, not known.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to consult the next number.*—*W. G. Ventnor.* The Chrysanthemum bloom you send is true Val d'Andorre, but light in colour owing to an early had having been selected, and to the unusual warmth during September. Such matter as these should be addressed to the Editor.—*D. L., Contich.* 1, *Ocimum prætextum*; 2, *Ocimum tigrinum*; 3 and 4 *Ocimum annuiculatum*; 100, a *Phyllocactus*, possibly the seedling known as *sarantiacus*.—*J. H. Cheilanthes hirta.*—*W. M. M., Ross.* 1, *Liparis longipes*; 2, *Cymbidium giganteum*; 3, *Bulbophyllum inodora*.—*J. B. Maxillaria picta.*—*D. J. 1.* *Filiponia Pearcei*; 2, *Gymnogramma ochracea*; 3, *Selaginella viticnlosa*; 4, *Bambusa gracilis*; 5, *Dracæna fragrans*; 6, *Dracæna rubra*.

ODONTOGLOSSUM HABRYANUM: *F. H. M.* The variety is distinct in having the sepals almost wholly of a dark chocolate colour. The original, like your plant, comes darker in some years than others. Many thanks for promise to send a photograph.

RASPBERRY PLANTING: *F. J. F.* If the canes are to be planted at wide distances and then bent over and secured to a stake 3 feet high placed midway between the stools, the stools or clumps should not be less than 6 feet apart if it be land on which the Raspberry grows vigorously, and 5 feet in other cases. If the Raspberries are to be secured to an espalier fence, then, plant at 1½ feet apart. Do not put more than one plant in a hole.

SITUATION ON A TEA OR SUGAR PLANTATION: *W. B.* Advertise in some of the colonial papers, or in the *Tropical Agriculturist* and similar trade papers.

WOODLICE AND MUSHROOMS: *H. E.* Clear away the hay now covering the beds, and pour boiling-water into the crevice, which are sure to be found between the bed and the walls—repeat this twice a day; remove all material, stones, bricks, tiles, litter, &c., which could form hiding-places for the insects, and dash boiling-water into all accessible and likely hiding-places. Cover the beds with bast mats, or clean straw; or leave them uncovered. Mushroom-beds do not need covering, unless the soil be very light, or much fire-heat is used.

COMMUNICATIONS RECEIVED.—*J. H.—L. C.—E. A., Paris.*—*E. P., Ghent.*—*C. T. W.—H. J. W. B.—W. W.—J. W.—O. N.—W. Fell & Co.—R. C. W.—R. D.—W. S. H.—J. C. W. & Son.—J. B., Shifnal.—J. SANDER'S GREAT CHRISTMAS SALE.

10,000 ORCHIDS, WITHOUT RESERVE.

For Amateurs and the Trade, Lotted to suit all Buyers. 100 HYBRID ORCHIDS.—Parentages guaranteed. Splendid crosses, including Cypripediums, Dendrobiums, Phaius, Phallo-Calanthes, Calanthes, Lelias, Cattleyas, and Lælio-Cattleyas; full descriptions given in Catalogues.

CATLEYA WARNERI.—A fine Consignment. Superb varieties are among them.

LELIA TENEBROSA.—Found growing with C. Warneri, and from this circumstance, and the distinct appearance of the plants, the magnificent natural hybrids.

LÆLIO-CATLEYA GOTTOIANA and L.C. ALBANENSE may be looked for. Both the C. Warneri and the L. tenebrosa are most distinct and remarkable looking.

ODONTOGLOSSUM VEXILLARIUM (Sander's radiatum type).—Black-eyed Susan and Memoria C. D. Owen illustrate this superb section.

VANDA CÆRULEA, a fine consignment, probably containing such forms as the huge-flowered varieties of Lord Rothschild, Lord Ardilana, J. Gurney Fowler, Esq., &c.

ODONTOGLOSSUM CEBVANTESII and O. ROSSII MAJUS, both in fine condition, and both splendid cool-house winter-flowering Orchids.

LELIA ALBIDA, a fine importation; plants in grand condition. L. a. sulphurea, L. a. Mariana, L. a. Stobartiana, &c., will be found among them.

A LELIA SPECIES, distinct-looking plants, imported with L. Wendlandiana, but possibly an Epidendrum, or perhaps a generic hybrid.

MILTONIA WARSCWICZII, a grand species, also known as Oncidium fuscatum.

CATLEYA LABIATA, unflowered plants of Swainson's genuine old type. Dendrobium densiflorum, D. nobile (from Annon), Cypripedium bellatulum, O. Rothschildianum, Cattleya citræa, &c.

CHILWELL NURSERIES, NOTTS.

Established 1782.

RESULT

Proves more than volumes of print. My Collection of Chrysanthemums has again succeeded in winning the President's Prize for Group of Plants, and the Gold Medal for Table of Exhibition Blooms, at the National Chrysanthemum Society's Show, November 5, 1895. In addition to many other prizes my collection has now been awarded

6 GOLD MEDALS

in two years—the highest award obtainable in each case. I have much pleasure in announcing that I have secured some Grand Seedlings from our two most noted and successful English raisers, Chas. E. Shea, Esq., and H. Briscoe-Ironside, Esq., which, together with my own Seedlings will form a collection

UNRIVALLED.

My GENERAL GUIDE is now ready, with reduced prices for all last season's novelties, and contains the following Cultural Articles:—How to Grow Japanese for Exhibition; How to Grow Incurved for Exhibition; How to Grow Specimen Plants; How to Grow for Decoration; How to Dress Incurved for Exhibition; and How to Save Seed. A large number of Growers attribute their

SUCCESS

to following the advice given in my Guide, which can be obtained, post-free, for eight stamps.

My LIST of NOVELTIES for 1896 will be ready in December.

H. J. JONES,

RYECROFT NURSERY, LEWISHAM, S.E.

LARGE SPECIMEN HOLLIES.

From 6 to 8 feet, well furnished with shoots to the ground.

JOHN FRASER, The Nurseries, South Woodford, Essex, begs to invite attention to a splendid lot of cheap Specimen Hollies, which are suitable for planting in large towns or elsewhere. The sorts consist of the common Green, and many of the best broad-leaved kinds, such as Scotica, White-berried, Canadian, Hedgehog, Bay-leaved, Nigrescens, and others. These Hollies have been regularly transplanted, and will lift with good balls. As it is necessary to clear the ground, a Special Low Price will be quoted for large quantities. Sizes and Prices may be had on application.

NEW RASPBERRY.
(STEELE'S VICTORIA.)

A New Variety of great merit, introduced by us last year. This was raised by Mr. Steel, of Ealing, and is the finest market variety grown for Covent Garden: free-grower, heavy cropper, large handsome fruit, fruiting very early, and lasting well through the season until very late. The fruit is essentially a Dessert Fruit, being large, handsome, and very superior flavour. Strong Canes, 6s. per 100; 50s. per 1000. Now ready for Delivery. Special Quotations for large quantities on application.

WINTER DRESSING.

Guaranteed to clear out Mealy Bug.

Cleanse and prepare your Fruit Trees and Plants, both indoors and out, for a healthy start next season, and destroy Scale, Bug, Red Spider, American Blight, and the Larvae of other insects, by using the

XL ALL LIQUID INSECTICIDE WASH
(Patent).

A pure Nicotine Preparation (under a new system), from duty-free Tobacco. Absolutely safe, and no fear of injury to the buds. In use goes twice as far as any other Insecticide.

Per Pint, 2s.; Quart, 3s. 6d.; ½ Gallon, 5s.; 1 Gallon, 10s.

POSITIVE PROOF.

Mr. E. HILL, *The Gardens, Tring Park, Tring*, writes:—"Nov. 15, 1895. I cannot speak too highly in favour of your XL ALL Liquid Insecticide (Wash), as a Winter Dressing for Mealy Bug on Vines and Fig Trees. We gave it a trial last winter with the most satisfactory results, and if applied according to directions, it is perfectly safe in the hands of a novice, and I am justified in saying that for the purpose mentioned it is the best remedy that has yet come under my notice."

To be obtained from all Nurserymen, Seedsmen, Florists, and Sundriesmen; or, direct from—

G. H. RICHARDS, Sole Proprietor, Old Shot Tower Wharf, Commercial Road, Lambeth, London, S.E.

Further Particulars and Testimonials post-free on application.

(LIMITED),

SEED GROWERS and MERCHANTS,

BOSTON, LINCOLNSHIRE.

NEW PEA, "BOSTON UNRIVALLED."

A NEW, PERFECTLY DISTINCT, and VALUABLE ACQUISITION.

An unusually prolific, dwarf, wrinkled, Second Early Marrowfat, of the best table quality. Height, 2½ to 3 feet; pods large, 5 to 6 inches in length, of the "Telephone" shape and colour, but more even in size than that well-known variety, there being from 9 to 11 fine peas in the pods. These mostly hang in pairs, literally covering the haulm, which is robust, and not subject to mildew.

A first-class Pea for either Private Gardens or Market Growers, and as an Exhibition variety must rank as a decided improvement and great acquisition in profitable Horticulture.

Retail, per Sealed Half-pint Packet, 1s. 6d.; per Sealed Pint Packet, 2s. 6d.

Trade Price and List of Testimonials on application.

GARDEN REQUISITES.

FRIDAY, DECEMBER 13,

AT HALF-PAST 12 O'CLOCK.

SANDER'S GREAT XMAS. SALE 10,000 ORCHIDS

WITHOUT RESERVE.

For AMATEURS and THE TRADE. Lotted to suit all Buyers.

100 HYBRID ORCHIDS, PARENTAGES GUARANTEED.

Splendid crosses, including

CYPRIPEDIUMS, DENDROBIUMS, PHAIUS, PHAIO-CALANTHE,

CALANTHE, LÆLIAS, CATTLEYAS, And LÆLIO-CATTLEYAS,

Full descriptions given in Catalogues.

CATTLEYA WARNERI,

A fine consignment. Superb varieties are among them.

LÆLIA TENEBROSA,

found growing with C. Warneri, and from this circumstance and the distinct appearance of the plants, the magnificent natural hybrids, *Lælio-Cattleya Gottoiana* and *L.-C. Albanense* may be looked for.

Both the C. Warneri and L. tenebrosa are most varied and remarkable-looking.

ODONTOGLOSSUM VEXILLARIUM,

SANDER'S RADIATUM TYPE.

Black-eyed Susan and *Memoria G. D. Owen* illustrate this splendid section.

VANDA CÆRULEA,

A fine consignment, probably containing such forms as the huge-flowered varieties of Lord Rothschild's, Lord Ardilaun's, J. Gurney Fowler, Esq.'s, &c., &c.

ODONTOGLOSSUM CERVANTESII and ODONTOGLOSSUM ROSSII MAJUS,

Both in fine condition. Both splendid Cool-house, Winter-flowering Orchids.

LÆLIA ALBIDA,

A fine importation. Plants in grand condition. L. a. sulphurea, L. a. Marianæ, L. a. Stobartiana, &c., &c., will be found among them.

A LÆLIA SPECIES?

Distinct-looking plants, imported with L. Wendlandiana, but possibly an Epidendrum, or perhaps a bigeneric hybrid.

MILTONIA WARSCEWICZII.

A grand species, also known as *Oncidium fuscatum*.

CATTLEYA LABIATA,

Unflowered plants of SWAINSON'S GENUINE OLD TYPE, And *Dendrobium densiflorum*, *D. nobile* (from Annam), *Cypridium Rothschildianum*, *C. bellatulum*, *Cattleya citrina*, &c., &c.

TO BE SOLD BY AUCTION BY MESSRS. PROTHEROE & MORRIS,

67 & 68, CHEAPSIDE, LONDON, E.C., ON FRIDAY, DECEMBER 13.

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 7, 1895.

ROSES.

THE National Rose Society has published a pamphlet entitled *Hints on Planting Roses*, compiled by a committee appointed for the purpose. The work is intended for novices and amateurs, and is likely to be received by them with favour from the clearness and simplicity of the directions given.

The subjects treated of are the season when planting operations should be considered, the best time to order Roses, the best time to plant or replant them, the best method of effecting these operations, lists of Roses suitable for cultivation for various purposes. The following extracts will show the practical nature of the little book, copies of which may be had at a cost of a few pence from the Secretaries of the National Rose Society, Rev. H. H. D'Ombraun, Westwell, Ashford, Kent; or E. Mawley, Esq., Rose Bank, Berkhamsted, Herts:—

HOW ROSES OUGHT TO BE PLANTED.

Whenever it is possible, Roses should be given a bed to themselves, in an open spot, away from trees, and not planted among other flowers. A bed 3 feet wide will hold two rows of plants, and one 4 feet 6 inches wide, three rows. The distance between the plants for dwarfs should be about 18 inches, and for standards about 2 feet 6 inches. The beds having been made ready, and the position of the Roses in them marked out, the next thing, and the most important of all, is to see that they are properly planted. Some of the plants should be carefully removed from the trench where they had been "heeled in," and brought to the side of the bed they are intended to occupy. A mat should always be thrown over them, to keep their roots from drying by exposure to sun or wind. A hole should then be dug about a foot square, and of sufficient depth, in the case of dwarf (or "bush") Roses, to allow the junction of the stock and scion to be about an inch below the surface of the bed when the operation is completed. In the case of standards the hole should be 6 inches deep. A plant should then be taken from beneath the mat, sprinkled with water, and held with the left hand in the centre of the hole, while with the right the roots are spread out horizontally and evenly in it, taking care that the roots cross each other as little as possible. Some of the finest soil available should next be sprinkled over the roots so as just to cover them. Over this light covering place 3 inches more soil, which may then be trodden in and the hole filled up. Tread the soil firmly round the plant when this has been done. Firm planting is very necessary for the future well-being of Roses.

In the case of heavy soils, or where the ground remains for any length of time in too wet a con-

dition for the planting of Roses to be satisfactorily carried out, it is an excellent plan to secure some light gritty soil, such as the clippings obtained from the sides of roads when the grass-edges are being cut. A spadeful of this material may then with advantage be placed both above and beneath the roots instead of the natural soil. Soil of this character may be firmly trodden without caking together, and the grit in it encourages the early formation of roots.

When planting Roses singly on lawns or elsewhere, the same method should be followed as when inserting them in beds. Where Roses are planted in the spring the shoots should be pruned before planting.

SINGLE PLANTS ON LAWNS OR IN BORDERS.

Previous to planting Roses singly on lawns or in borders a hole should be dug for each, 18 inches square and 18 inches deep. The soil removed from the holes should be well mixed with one-fourth of its quantity of well-decayed manure, before being restored to them. If the soil be found poor and unsuitable, better soil from another part of the garden or some turfy loam should be substituted. No grass should be allowed to grow within at least 6 inches of the stem of Standard Roses planted on lawns.

CLIMBING OR PILLAR ROSES.

For Climbing and other Roses of very vigorous growth the hole prepared for their reception should be 2 feet square and 2 feet deep, and care be taken that the soil be of a suitable character and well enriched with manure. For it must be borne in mind that such Roses require much more root-room than those which are pruned back every year, and in most cases are intended to occupy the same positions for many years to come. Therefore, any extra care and attention bestowed on the planting of strong-growing Roses, like those referred to, will, sooner or later, be well repaid.

STAKING STANDARD ROSES.

As the planting proceeds, each plant should be secured to a firm stake of some kind. In order to avoid damaging any of the roots, the stakes should be driven firmly into the holes prepared for the reception of the plants before planting them. Dwarf or bush-plants do not need staking; but, to prevent injury from high winds, all long growths should be shortened previous to planting.

THE LABELLING OF ROSES.

Where there is only one plant of any variety, a permanent label, with the name of the Rose either written or printed upon it, should be attached to a small stake placed near it, and not to any part of the plant itself; but when several plants of the same variety are grouped together, or follow one another, labels will only be necessary at the beginning of each such group or row.

THE WINTER PROTECTION OF DWARF TEAS AND NOISETTES.

All kinds of Roses should be planted in the way previously described. Teas and Noisettes and other tender sorts, however, require after planting some protection to be given them, or they will be liable to injury should an unusually severe frost afterwards set in. Fortunately, dwarf plants may be readily protected by drawing the soil over the centre or crown of them to the height of 3 or 4 inches. This will be found an excellent method, for, except in extreme cases, the plants are in this way saved from serious damage, although the exposed portion of their shoots may be destroyed. If further protection be required, bracken or straw may be placed loosely among them.

THE WINTER PROTECTION OF STANDARD TREES AND NOISETTES.

In most winters the insertion of bracken in the heads of Standard Roses, or tying their shoots to a secure central stake, and thatching them with straw or bracken, will be found to answer excellently.

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT CAMBRIDGE LODGE, CAMBERWELL.

THE collection of R. I. Measures, Esq., Cambridge Lodge, Flodden Road, Camberwell, is rich in Cypripediums, and especially in the rare hybrids, many of which have been raised on that place; and much attention was given to the crossing of *C. bellatulum* and others like it, the results being in some cases very fine, although many of these crosses have not as yet flowered. It shows the adaptability of Orchids when properly managed, and speaks much for the skill and attention given them by Mr. Chapman, the gardener. The hybrids of the niveum section of Cypripediums are not the easiest to manage even in pure country air, much less at Cambridge Lodge, which is, in fact, in London.

Two beautiful forms, now in flower, are *C. × Annie Measures* (*bellatulum × Dayanum*), and *C. × Chas. Richman* (*bellatulum × barbatum*), the latter now bearing a second inflorescence which, like that of the preceding one, is two-flowered. Other plants in bloom in good specimens were *C. × Leeanum Masereelianum*, a very fine variety; *C. tonsum superbum* with nine flowers; *C. × Statterianum*, *C. × orphanum*, *C. × T. B. Haywood*, *C. × regale*, a pretty tinted flower; *C. × Amasiana*, *C. callosum*, the noble *C. × Allenianum superbum*, *C. × Carrierii*, *C. × marmorophyllum*, *C. Charlesworthii*, *C. × Arthurianum*. A great number of large specimens of *C. insigne* were remarked fast coming into flower; the best of those that were expanded being the clear yellow *C. insigne Sandersæ*, and the richly purple-spotted *C. i. Cambridge Lodge* variety, which among other characteristics has the flower bract striped with purple.

One of the *Cattleya*-houses was filled with glowing plants of *Cattleya labiata*, carrying hundreds of flowers. The floriferousness of these plants will be understood, some of the plants in 9 inch baskets or small pots carrying ten to fourteen flowers each. The dark colours predominate as usual, but the most prized is the white *C. labiata* R. I. Measures' variety, which possesses no other tint than a delicate veining of pink on the lip, which only serves to brighten the attractiveness of the flower. *Cattleya Hardyana* and *C. Bowringiana* add greatly to the display.

The genus *Madevalla* forms another feature of this collection, two houses now being set apart for these plants, in which at present many singular-looking botanical species are in flower, together with interesting *Pleurothallis*. The showy species of the former will not come into bloom till next spring and later. In other houses, an extensive collection of *Vandas* in splendid condition was noted; equally good *Cymbidiums*, containing all of the species, even the rare *C. Traceyanum*.

In one house were *Lælia purpurata* and *L. elegans* in splendid condition; in another warm-house the *Paalænopsis* were flourishing, and everywhere there was evidence of a keen interest being taken in the various plants.

SACCOLABIUM AMPULLACEUM, Lindley.

"Being of dwarf habit, it may be advantageously treated in baskets or teak cylinders, hanging from the roof, and thrives well under a regular temperature of 18° to 22° C., in a very bright and moist atmosphere. It requires scarcely any shading, as its leaves are thick and leathery, but in summer the humidity of the house must be maintained to near the saturation point, and the compost kept always alive and moist." *Lindley*, t. 1535.

CATTELYAS AT LAEKEN.

During the present and last week or two there have been flowering in the *Cattleya*-house at Laeken many plants of *Cattleya labiata* carrying nearly 600 flowers; and on one plant alone there were forty-two flowers fully open. This is a gorgeous *Cattleya*, free-flowering, and very easy to grow, and therefore cannot be too highly recommended, when flowers at this season are prized. It is, moreover, very various in its colouring. *Laeken, December 1.*

ORCHIDS AT CASTLE HILL, ENGLEFIELD GREEN.

The residence of George C. Raphael, Esq., is surrounded by a pleasant garden and pleasure-grounds, in a part of which a commodious block of houses, convenient of access, is devoted to Orchid culture, which seem to give more than the usual proportion of flowers at all seasons. On the occasion of a recent visit, the *Cattleya*-house was gay with flowers of *Cattleya labiata*, numbering about 100 spikes in various stages. Among them there was much variety, and some of the dark forms, of which *C. labiata*, Raphael's var., is the best, were very attractive, scarcely two plants bearing flowers exactly alike in colour or marking, and although popular fancy favours the dark varieties, the lighter ones are, in their way, equally beautiful. Arranged in the house with these plants were some *Cattleya aurea* and *C. Bowringiana*; a pretty plant of the fragrant old *Epidendrum ciliare*, *Cymbidium giganteum*, *Lælia autumnalis atropurpurea*; the noble *Vanda cœrulea*, Raphael's variety, with large, almost circular flowers, netted with violet; and fine varieties of *Lælia anceps* in bud.

In one of the warm-houses, *Paalænopsis* thrive admirably, which is more than can be said of them in many collections. Some plants of *P. violacea* and *P. rosea* were in bloom, and others showing for flower. In another house, in which a large plant of *Musa Cavendishii* bears a heavy bunch of fruits, and the handsome *M. coccinea* is in bloom, were in flower *Dendrobium superbum* and its variety, *Goldiei*; *D. Darcyi*, and some very fine *D. formosum giganteum*. At one end of the house, a noble specimen of *Nephrolepis exaltata*, some 8 feet across, was suspended from the roof; and *Dendrobium Dalhouseianum* had made many new growths more than 6 feet in length; here also the plants of *Eulophiella Elisabethæ* grow and flower vigorously, and *Cœlogyne pandurata* had eight spikes of its handsome emerald-green and black flowers.

In another house there was a fine show of *Dendrobium Phalænopsis Schroderiana*, of which Mr. Adams, the gardener, is justly proud. The fine sprays of variously-tinted flowers arching over from either side made a charming display; and not only are the plants grown to perfection, but the selection has been a happy one, for among them are a large number of superb varieties, both light and dark.

Flowering in the Cypripedium-house were good pieces of *C. Spicerianum*, *C. Charlesworthii*, *C. × Io superbum*, *C. × Leeanum*, *C. tonsum*, *C. × Arthurianum*, &c., and in the other houses, among other things, some good *Cochlidia vulcanica*, *Pleione lagenaria*, *P. Wallichiana*, *Oncidium tigrinum*, the singular and pretty *Zygopetalum Barkei*, *Arundina Bambusaefolia*, *Sopronitis*, *Odontoglossum*, &c.

CATTELYA BOWRINGIANA.

Your correspondent, W. Dawes, in last week's *Gardeners' Chronicle*, asks—"What is the greatest number of flowers known on a spike of this species of *Cattleya*?" We had a plant recently in bloom in a 14-inch pot with six spikes (which I exhibited at the Tunbridge Wells Show), one with nineteen, one eighteen, two seventeen, one fifteen, and one fourteen, flowers, on a spike. This is the greatest number of flowers I have ever had on a spike, although we have had the same plant for these ten years. Perhaps some of your correspondents will say what their experience is with this species. *Charles Earl, Somerhill.*

NOTES FROM OAKWOOD.

LILIAM ABRATUM was especially fine in the rather damp soil in the wood, and poor in the drier soil of the hill, owing to the hot dry weather. I think *Eulalia* are not enough grown. A good clump is always a pretty object, and when autumn frosts cut the flowers that are out, *Eulalias* still show well for a time; besides the graceful leaves, the flowers make very pretty winter decoration. I bought some sent from Japan, not knowing what plant produced them till our *Eulalia zebra* bloomed. This has flowered very well this season, and *E. gracillima* or *univittata* has had a few flowers with us for the first time. *Eulalia japonica variegata* has not flowered. I believe *E. zebra* is the only one which can be relied on

for flowers. The sharp frosts cut the Liquidambar a little, the leaves are beautiful, but not quite up to the usual colour. *Aponogeton distachyon* is flowering well. We have many Primroses and Gentianellas in bloom. *Iris Vartani* has been beautiful. *Gaultheria procumbens* clothing the sides of ditches and

NEW TEA ROSE ENCHANTRESS.

It has long been difficult to obtain good Rose blooms under glass during the dull weather of the late autumn and early winter months, before the forced blooms are available, and for this purpose

crop of young buds in various stages of development, promising to unfold during the winter months. *Enchantress* is the result of a cross between a Tea-scented and a Chinese Rose; the blooms are creamy-white with deeper centres, inclining to the globular shape, and produced in great abundance on the plants.

FIG. 110.—ROSE ENCHANTRESS; CREAMY WHITE WINTER FLOWERING VARIETY. (MESSRS. WILLIAM PAUL AND SON)

on banks in full sun is always pretty, the red fruit taking the place of flowers. The North American Cranberry, *Oxycoccus macrocarpa*, at the side of a pond makes a pretty carpet, and has fruited very freely. The fruit is excellent stewed and in tarts—I think better, from being fresher, than the Russian Cranberries. *George F. Wilson,*

Messrs. Wm. Paul & Son's new variety *Enchantress*, for which they obtained an Award of Merit at the recent meeting of the Royal Horticultural Society, is particularly valuable, as the plants exhibited were covered with large numbers of fine cream-coloured blossoms possessing all the desired qualities of size, fulness and fragrance; there was also a plentiful

In addition to its value as a late blooming variety indoors it is a fine bedding Rose, for throughout the summer and early autumn, plants growing out-of-doors in the Waltham Cross nurseries were covered with a profusion of most beautiful flowers, which continued unfolding until the severe frosts of last October so suddenly put an end to all outdoor Roses.

FRUIT GROWING FOR SMALL GARDENS.*

(Continued from p. 612.)

PEARS.—We next come to Pears. These are not such certain croppers as Apples, and during wet summers lose a great deal of their flavour, and do not keep so well; however, when they are good there is no fruit to beat them, and they should therefore be grown, but in smaller proportions than Apples, where room is scarce. There is no really good Pear worth growing for July and August; Jargonelle is perhaps the best, but it is very difficult to get it just right, as it goes sleepy without warning, and for that reason is not to be recommended. [Gather it ere it is quite ripe, and keep in a cool room for a day or two. Ed.] September, Williams' Bon Chrétien; October, Louise Bonne de Jersey (Fondante d'Automne)†; for November, Marie Louise (d. g.) (Emile d'Hayat); November to December, Doyené du Comice; January to March, Duchesse de Bordeaux; February to April, Josephine de Malines. Nearly all Pears will do for stewing before they are ripe, and windfalls come in very handy for this purpose; but a very valuable Pear, grown exclusively for baking, and ready from December to March, is Catillac.

Late-keeping fruit must always be left hanging on the trees as long as possible, as it will then keep better, be more fully flavoured, and should not be picked until it readily parts from the tree, except in places exposed to high winds; in many instances a greater portion of the leaves will have fallen before the fruit is ready for gathering, and this should only be done during fine bright weather, with as little handling as possible. A large number of fruits soon shrivel, and often do not keep through being picked directly a few premature windfalls occur (which are invariably worm-eaten), instead of being left on the tree.

Sound fruit should be stored in a dark place, free from frost, and well ventilated, on slotted shelves, easily accessible; and care should be taken not to mix any diseased or bruised fruit with it.

PLUMS AND CHERRIES.

We will next turn our attention to Plums and Cherries, about which little need be said, as the cultivation suitable for Apples and Pears is equally suitable for these. They are usually grown as trained trees against a wall or fence, where they succeed well, and are easily protected from birds; they will do equally well as pyramids, where they can also be well protected from birds by the use of the garden-webber, which will be found very handy for Currants as well; black cotton is better than white, as the birds are unable to see it until they become entangled, and are therefore much more frightened.

The following varieties of Plums are good, constant bearers: end of July and beginning of August, Rivers' Early Prolific, a deep purple; August, Denniston's Superb Gage, greenish-yellow; September, Victoria, bright red on sunny side, and yellow on the other; October, Coe's Golden Drop, light yellow, with dark red spots. Gather ripe fruit of Coe's Golden Drop Plum, wrap them separately in tissue paper a week afterwards, and store in a single layer in a cool, dry room. Fruit treated thus will keep until Christmas. Probably the best all-round Plum is the Victoria, of which such large quantities are annually brought into the market. It usually bears very abundantly, and should therefore be thinned shortly after the fruits are formed, and later on, when nearly fully formed, can be again thinned, and used for preserving, bottling whole, cooking, or stewing; the remaining ones on the tree will then grow to a good size, and make splendid dessert fruit.

The following Cherries are good bearers, and well-flavoured sorts: end of June, Early Rivers, black;

beginning of July, May Duke, dark red; middle to end of July, Bigarreau, red on sunny side, yellow on shaded side; August and September, Morello, dark red, but this is only suitable for culinary purposes and Cherry-brandy. If only one is grown, choose May Duke.

GOOSEBERRIES

require somewhat similar treatment as to planting and pruning, and are usually grown in the shape of a bush, and are not unfrequently allowed to grow into a tangled thicket, making it very difficult to pick the fruit, which is then very small and not fully flavoured. A general rule to be followed when pruning, is to allow a clear 6-inch space between each branch, and if pruned in the summer, it will make it far easier to decide which shoots to leave and which to cut back, as a tree looks very different when covered with leaves than when denuded. They are easily raised from cuttings. These should be firm, hard, and free from pith, about 15 to 18 inches long, from which every bud and spine must be picked off for about 12 to 14 inches of its length, so that 4 to 5 inches can be inserted in the ground, leaving a straight stem of 9 to 12 inches high; the cutting is pruned back to about four or five eyes above this to form the branches. When these have grown about a foot, they should be shortened about 9 inches to prevent them from drooping and eventually touching the ground. The future pruning should be carried out on precisely the same lines as already explained with Apples and Pears, except that when a strong vigorous growth forms in some convenient part, it can be left with advantage, and the old original branch next it can be cut entirely away—provided, of course, it does not crowd the bush. They can be planted about 2½ feet apart while young, and when they touch each other, the intermediate ones should be dug up and replanted elsewhere, 5 to 6 feet apart. They are also grown in the form of a three-pronged fork, either against a wall or wire fence, where they take up but little room and bear remarkably well. They should be planted 18 to 20 inches apart, so that each branch is 6 inches from its neighbour. If the young wood made during the year is under a foot long, the bushes require manuring when the fruit is setting next spring, but not otherwise.

Gooseberries are often infested with caterpillars, which if not checked, will seriously injure the tree. They may be got rid of by dusting the trees all over and under with lime after a heavy dew; this should be repeated two or three times. [Shaking them off on to calico sheets is effectual. Ed.] Sparrows and finches also attack the buds in spring, but the use of the garden-webber will soon prevent their depredations. The best kinds to grow are, Whitesmith, white; Early Sulphur, yellow; Keepsake, green; Warrington, red—this is a good variety for training gridiron fashion; Red Champagne is the fullest flavoured for dessert, but it does not bear quite so freely as Warrington.

RED CURRANTS

are usually grown in the bush form, but the best shape is probably for the head to form a cup, standing on a stem about 9 inches from the ground with branches about 6 inches apart, and when once formed they give no further trouble, as no fresh growths are allowed to form, every one being cut back to two eyes when they appear, and if the branches have never been allowed to grow more than 1 foot a year, the buds will develop all the way up, from which clusters of Currants will hang. Seven branches will usually be found sufficient, and when from 4 to 5 feet long they should not be allowed to grow any more; thus, in four or five years time, the tree will be fully grown. As the buds are a tasty morsel for the finches in the spring, they should be protected, otherwise one has to mourn the absence of fruit, and the trees are reduced in bearing properties for the next year or two. Under these circumstances, it is better to postpone the autumn pruning till late spring, as the birds will then take the buds on the

new growths, which are to be cut back in preference to those which are retained at their base. A very handy form which is sometimes adopted, is to grow the tree in the form of a miniature standard, with a stem 3 to 4 feet high, and a head as above described; Strawberries and vegetables can then be grown underneath. Manuring and cultivation are the same as for Gooseberries. Red Dutch is the best for either bushes or standards, and White Dutch is the best white sort, of which one bush will usually be found sufficient.

BLACK CURRANTS.

There is no easier fruit to grow than the Black Currant, which requires no training or staking whatever. Unlike all other bushes that have been described, suckers are induced to grow up from the roots every year, as the finest fruit is borne on the young wood; the older and weaker wood is cut out so soon as the fruit is gathered, to allow the tree to confine its energy to producing healthy new shoots, which should be left about 5 or 6 inches apart.

The earth around Currant-bushes and Raspberries should never be dug up, as they produce fibrous roots, but slightly picked up with a fork and manured every year with a top-dressing, which also protects the roots which are near the surface from injury from frost, and from becoming dry during summer.

Black-fly often attacks the points of the new shoots, causing the leaves to curl up, and the Currant bud-mite is sometimes very destructive. The easiest method to get rid of them both is to cut them off and burn them. Black Champion and Lee's Prolific are the best varieties to grow.

RASPBERRIES.

If one part of a garden is moister than another Raspberries will do better there than elsewhere, as they require a good deal of moisture, and the soil should be thoroughly good for at least 18 inches deep, to ensure strong canes and large fruit. After planting in the autumn, the canes should be cut down to about 9 inches from the ground to induce them to make good-sized roots, and thus lay the foundation for strong, healthy stools; if this is not done, however strong the canes may be, all the energy is expended in producing fruit, with the result that the next-year canes will be thin and weakly, and the stools ruined. When the stools are well established, from six to seven of the strongest canes should be allowed to grow each year, and the remainder, together with the old canes, when fruiting is over, should be cut right down; all growing rooted suckers—of which a large number grow every year—should be pulled up, and if planted again, they will form new stools. In the autumn, tie them securely to a stake, reduce the two outside ones to 15 inches from the ground, two of the others about 30 inches, and the remainder about 4 to 5 feet; fruit will then be produced the whole way up the bush.

When planted to form rows, two lines of wires or laths should be run 2 and 4 feet from the ground respectively, and the alternate canes reduced to about 2 feet, and the others about 4 feet 6 inches to 5 feet; the stools should be 6 inches apart, and the rows from 4 to 5 feet, according to the height the canes are left. There are some short standing kinds which do not require stakes, and are usually grown extensively for market purposes, Carter's Prolific being the best for this purpose; Superlative is, however, the best of all, but requires stakes. The Strawberry is the last fruit I propose to deal with this evening, for, although Peaches, Nectarines, and Apricots should, perhaps, have been included, yet they require special walls, localities, and treatment, which excludes them from general cultivation in small gardens, and are, in fact, far better grown in a cool orchard-house.

STRAWBERRIES.

Like all other plants, require to be carefully planted. It is no use making a hole with a dibber, forcing the roots in, and treading the earth in on top of them like so many Cabbage-plants, and then expect them to grow when probably two-thirds

* Extracts from a Paper read before the Streatham Hill Agassiz Society, on Oct. 25, 1895, by Mr. J. C. Waltham.

† Those in parentheses give a more extended list of good kinds.

have their heads covered up, and the remainder half out of the earth. Separate holes must be dug, the roots well spread out all round, and the earth gently, but firmly, pressed down all round, if we want to procure the strongest and healthiest plants, which at the same time means large fruit.

They reproduce themselves by runners. The earliest of these, when required to form new plants, should be pegged down firmly to the ground, but better still on to the underside of newly-cut turf without Couch, or into small pots containing rich soil, when they will be ready for planting out during August, and commence bearing fruit the following year. They should be planted about 1½ to 2 feet apart. The runners that are not required should be cut off as they appear, as they weaken the plants.

As the beds only last in good condition four or five years, others should be planted permanently in another part of the garden to take their place when it is seen that the old ones are giving out.

During the first crisp frosts in autumn, all runners and rubbish having been cleared away some time previously, and the ground between the rows lightly pointed over with a fork, turning in a little short manure (deep digging with the spade being injurious), cover the ground 2 or 3 inches thick with partially-decayed manure containing a good amount of stable dung. This must not be packed closely around the plants; it will be washed by the winter rains and be perfectly sweet by the spring, forming a close clean cushion for the fruit to rest upon.

The mulch also prevents the escape of moisture from the earth by evaporation, which is retained for the support of the plants and crops—a most important point in dry, hot weather. It also saves the trouble of putting clean straw under the trusses of fruit, which is liable to be injured by the process, and prevents the untidy appearance caused by the straw blowing about the garden.

The best kinds to grow are: early—Noble, or Keen's Seedling; medium—Sir Joseph Paxton; late—Latest of All, or Waterloo.

As well-rooted and well-grown varieties of fruit trees, true to name, cost no more to buy and cultivate than do those of an inferior kind, it is essential that they should be procured from growers of repute.

When a plot of ground is to be set out with trees it is better to commence planting the centre with the late-keeping kinds of fruit, so as to enable the early kinds and those that are gathered direct off the tree, to be as near the paths as possible when they are easily accessible during any kind of weather, and the ground is not so much trampled upon as when planted in the centre.

All trees, as they come from the nurserymen, have labels attached, which soon rot or become illegible, and as a great deal of the interest is then lost, permanent labels should be attached as soon as possible. The most suitable kinds can be procured of Mr. John Smith, Royal Label Factory, Stratford-on-Avon.

USUAL DISTANCES FOR PLANTING GARDEN FRUIT TREES AND BUSHES.

- Apples, pyramids or bushes on Crab, 6 to 12 ft. apart.
 " " Paradise (close-pruned), 3 to 5 feet apart.
 " espaliers, horizontally-trained, 15 feet apart.
 " cordons, same as Pears.
 " gridirons, 8 feet apart.
 Apricots against walls, 15 feet apart.
 Cherries, ditto, fan-trained, 15 feet apart.
 " pyramid, or bushes, 6 feet apart.
 Currants and Gooseberries, 4 to 6 feet apart.
 Figs against walls, 10 feet apart.
 Filberts and Cob-nuts, 12 to 15 feet apart.
 Nectarines and Peaches against walls, 15 feet apart.
 Pears, pyramids or bushes on Quince, 4 to 6 feet apart; if on Pear, 6 to 12 feet apart.
 " cordons, upright or oblique, on walls, 2 ft. apart.
 " " doubles, as edgings, 12 feet apart.
 " " single, as edgings, 6 feet apart.
 Plums, pyramids or bushes, 6 to 10 feet apart.
 " against walls, 15 feet apart.

FRUIT TREES SUITABLE FOR SPECIAL ASPECTS.

North Walls.—For Morello Cherries, early Pears, Plums and Cherries for keeping, late Currants, and Gooseberries, as trained trees.

East Walls.—For Plums, early Cherries and Pears, early Currants and Gooseberries.

South Walls.—For Apricots, Peaches and Nectarines, very early and very late Pears, Plums, Grapes and Figs.

West Walls.—For Pears, Plums and Apricots, and the hardier Peaches, Nectarines, and late Pears.

For walls not facing the cardinal points, a combination of the kinds may be tried; thus north-west would take those both north and west, and so on.

NUMBER OF TREES, ETC., REQUIRED FOR AN ACRE OF LAND.

19 360	at 1½ ft. apart	for Strawberries.
10 890	" 2 ft.	" cordon trees or Strawberries.
4 840	" 3 ft.	" pruned Pears on Quince, or Apple on Paradise.
2,722	" 4 ft.	" { do. do. do., or Gooseberries and Currants.
1,742	" 5 ft.	
1,210	" 6 ft.	" do., or partly-pruned Pyramids.
899	" 7 ft.	" Apples on Crab.
680	" 8 ft.	" do. do.
537	" 9 ft.	" do. do.
435	" 10 ft.	" feathered Apples or Plums.
360	" 11 ft.	" do. do.
302	" 12 ft.	" bush trees, pyramids, half-standards, and Nuts.
257	" 13 ft.	" espaliers.
222	" 14 ft.	" do.
193	" 15 ft.	" standard Plums, Damsons, or red Cherries.
170	" 16 ft.	" do. do. do.
150	" 17 ft.	" do. do. do.
134	" 18 ft.	" do. do. do.
120	" 19 ft.	" do. do. do.
108	" 20 ft.	" standard Apples, Pears, &c.
75	" 24 ft.	" do., and Cherries.
48	" 30 ft.	" Cherries, where pastured underneath.
40	" 36 ft.	" Cherries, or large-growing Apples.
36	" 40 ft.	" Cherries, or strong Pears.

In plantations where there is both a top and bottom crop, the standards may be placed at the greater distances, recollecting that Apples and Pears give a heavier shade than Plums.*

One of the best books on the subject before us is, *Profitable Fruit Growing for Cottagers and Small Holders of Land*, by John Wright, F.R.H.S., published by E. H. May, 171, Fleet Street, E.C., and was a prize essay, in competition with several others, read before the Worshipful Company of Fruiteers in 1889.

INDIA.

M A D R A S.

The *Proceedings of the Agri-Horticultural Society of Madras* for April to June, 1895, include reports of the proceedings, notes on *Araucaria* seed, *Euryale* ferox, and *Liberian Coffee*, the last two items being of especial interest.

THE SUPERINTENDENT OF THE BARODA STATE GARDENS.

Mr. J. M. Henry, the former Superintendent of the State Gardens, who, after serving about twelve years in the presidencies of Madras and Bengal, and sixteen years in Baroda, closed his Indian career lately, and left for England to start in business with his son.

Coming from the Royal Gardens, at Kew, in 1867, Mr. Henry was one of the oldest Kewites in India. He was, both as a gardener and a companion, highly esteemed and respected by all his numerous friends.

* The paper was illustrated with practical demonstrations of the various methods of grafting, samples of well and badly-grown branches, besides a good collection of the above-named fruit.

and everybody heartily joined in subscribing to a present consisting of a very fine breakfast glass set, in a silver frame.

Many of his gentlemen friends met at a dinner-party, when in the course of a speech proposing the health of Mr. Henry, and wishing him God-speed, Professor Littledale said:—"As regards his work as Superintendent of the Gardens, I may say, that although the extraordinary development of gardening in Baroda, under His Highness, has necessitated the calling-in of other trained professionals to assist in the work, we cannot forget that it was chiefly Mr. Henry who traced the original lines upon which he and others have since been working with such good taste and marked effect. Mr. Henry will not only be missed horticulturally, but also socially. He has kept up a very popular gymkhana for years, and his house has been an ever-open resort for his troops of friends. When he goes he will not leave a single enemy behind him at Baroda, but all of us who remain here will remember him with love."

Mr. Henry, in reply, said:—"When I arrived here in November, 1879, the park was so only in name. By the generosity of the Maharajah it is now second to none in India. Makarpara was a wilderness which took you half a day to reach, by reason of the badness of the roads. Now you may reach it in twenty minutes with a fairly good horse and trap. When you do, what a paradise! All the old dilapidated dwellings, with which it was the rule to surround palaces in olden times, cleared away; in their place, green lawns, flourishing Palms, and flowering plants. Luxmi Velas is a new palace, the foundation of which was laid shortly after my arrival. Its tower, domes, and minarets are landmarks for miles—"bosomed high mid tufted trees" in a magnificent garden and park of about 1000 acres. Umrat, our seaside resort, is a natural gem or oasis in a wilderness of sand, beautified and made a royal residence by the same hand. Time fails to enumerate all the improvements done and proposed to be done at Umrat, but a few more of the most important I will mention. The sands that surround Umrat as a wilderness are to be planted with Cocoa-nuts, and also all the sea coast for miles, now a sandy desert. The arid plains and dry hill-tops of the Kadi district are to be reforested. Roadside trees are being planted in every district, where the heavy-laden and weary may lie down and rest. Plans and estimates are in course of preparation for gardens and parks for every town of any size in the whole of the Maharajah's domain, beginning with those with a population of 15 000 or upwards. For every State bungalow now built, the estimate contains an item for the formation of a garden. I trust my successor, Mr. Krambeigel, may be given the strength and the length of life to see the fruits of his labour."

THE DORMANT PERIOD IN PLANTS.

A FRUITFUL cause of failure in the cultivation of exotic plants is due to ignorance of the climatal conditions under which the plants grow in the land of their origin, and especially the proper season for resting. In temperate climes, where the winter and summer are pretty clearly defined, deciduous plants discard their foliage as the year's temperature declines, and appear during the winter either as leafless objects or inconspicuous collections of dormant buds more or less hidden by the soil. Evergreen plants, on the other hand, retain their foliage till the spring, but only, as it were, on sufferance, active growth ceasing almost entirely, and the verdure only persisting by its own inherent toughness. This is easily seen by our familiar Christmas decorations, where the Holly, Ivy, Laurels, &c., last green for weeks unless placed in hot, dry rooms, where they perish by desiccation.

The resting period in these cases is clear enough, but it is another matter altogether when we import plants from tropical and sub-tropical regions, where the difference between the seasons may be very small indeed as regards range of temperature, and altogether dependent upon widely varying conditions of drought

and moisture, so that instead of having a warm and cold season, with a fairly evenly distributed rainfall throughout the year, we have a wet and dry season, with a constant high temperature. Under such conditions, we naturally find indigenous plants to be very differently constituted to ours, being fitted at once to withstand excessive drought and heat during their resting period, and to assume active development at short notice immediately the rains begin.

Now, these periods of drought and moisture vary considerably on different parts of the earth's surface, and the native plants adapt themselves in conformity to it. Nor is this merely a case of latitude and longitude; for if it were, the matter would be comparatively simple, and the native country of a plant would determine its needs within certain fairly-defined limits. Elevation above the sea-level is, however, a most potent factor to be dealt with, and if ignored, leads to many mistakes being made in the methods of cultivation pursued. In the tropics we may by ascending the loftiest mountains, pass through every grade of climate from the hot plains of the sea-level, with an average mean temperature of 80° or so, to the region of perpetual snow where only the hardest alpinists survive. Yet, despite this obvious fact, many a plant has been collected, and safely transmitted from high, cool regions in the tropics, only to die in a warm stove, where they have been placed because they came from the tropics, where a high temperature has been presumed to be universal. In several cases, presumably dead plants of this category have been thrown to the rubbish-heap, only to astonish their owner by braving the elements, and obtaining a new lease by their accidental exposure to conditions more congenial to their needs.

A curious feature in this connection is the great fastidiousness of some plants, which will only thrive if their natural condition be very closely imitated, and the cosmopolitan tastes of others which will stand most diverse treatment with impunity. Our native *Asplenium marinum*, for instance, which thrives on our western coasts, where it must occasionally be subjected to some frosts, revels in a hothouse treatment, and becomes a huge and much robust plant. Such wide adaptability is, however, the exception, hence it is of great importance to the gardener to know something of the native natural conditions of growth, temperature, and humidity, and above all, when and how the plant assumes its dormant state, and for how long it maintains it. With plants which are to be forced into flower it is essential to withdraw them from all disturbing influences, and knowing when the dormant period is due, to lead up to it by reducing heat or moisture as the case may be, and maintaining them under such conditions until it is desired to start them into growth. Then the application of heat and moisture will be followed by a healthy vigorous growth, accompanied by an immunity from vermin, the presence of which is only too often an indication of a previous too short sleep, and consequent weakness.

The period of rest seems, as we have indicated, to be determined mainly by the nature of the seasonal changes to which the plants are subjected in their native habitats, but in some cases it appears to be independent of this. The bulbs of Hyacinths, Tulips, and other spring-flowering plants are busy during the winter in forming their roots and even their leaves whenever not actually frozen up, and quite early in the year, little later indeed than many other plants that are beginning active growth, and long before the sun has attained very great power, they have flowered and formed new bulbs, their foliage has died down, and they lie in the dormant state for many months, only awakening when winter has again set in. This seems a very strange provision of nature that a bulb should resist all the vivifying influences of summer sun and shower, and wake up into active life when the soil is at or below freezing-point, and the great bulk of vegetation dead or asleep. It would be interesting to know how these bulbs would behave if shipped direct to the Antipodes in the spring. In those

cases where the cycle of life has been fully completed, and the whole vitality of the flower is compressed within the rootless bulb, it seems feasible that if they could be at once subjected to their normal growing conditions, they could hardly be weakened by losing their rest; though, on the other hand, it must be assumed that some subtle recuperative process is going on in resting plants akin to that which renews animal vigour during sleep, or otherwise the shortening of the period of rest could hardly be so detrimental as it is, even when favourable conditions for growth accompany the re-awakening.

With regard to Antipodean plants which have long been introduced into this country, such as the New Zealand *Todea superba* and *pellucida*, they have fully adapted themselves to our climate, and rise in our early spring at precisely the time when at home their growth would be ceasing. How long, however, such a change takes to establish, we do not know. Amongst our native Ferns we have noted a certain obstinacy in retaining the home periods of awakening deciduous *Athyria* found in Scotland, starting into growth a week or two later than southern finds even after years of culture under like conditions. *Polypodium vulgare*, especially in its varietal forms, demands, curiously enough, a much longer period of rest, or rather starts into growth under glass very much later than normal plants in native habitats. They often, indeed, show no trace of starting under glass until July or even August, and this with perfectly cold culture, so that the lateness of their starting is not to be attributed to growth unnaturally maintained by warmth long after the normal dormant period should begin. This case is unique in our experience, culture under glass inducing, as a rule, and as one would expect, a somewhat earlier development than out-of-doors. Seedlings, as a rule, are more precocious in their growth than old plants, and quite deciduous Ferns, like *Athyria*, with very little warmth indeed, will the first year retain their fronds right through the winter, though later nothing will prevent them dying down in the normal way in autumn. We have found, however, that even in a few generations, it is possible, by selective culture under glass, to considerably lengthen the growing period of *Athyria*s, shortening the dormant period in equal measure. Most of the plumose superbum section of this species remain quite green for fully a month after all their immediate progenitors in the same house have withered entirely down. One form, indeed (*A. f.-f. plumosum*, Drury), is perfectly green at the time of writing (end of November), and has been so at Christmas; while, on the other hand, without any stimulus beyond its own inherent robustness, it rises into active growth a full month before its fellows. One year, indeed, a robust growth started on Dec. 2, before the old fronds had even turned colour, but frost immediately after stopped its progress.

It would almost seem by this case that further selection might eliminate at one and the same time the deciduous nature of the species, and the dormant period also; this latter being decidedly reduced one-half in two generations, and nearly as much in one, since its parent is not far behind it in the long retention of its verdure, while the grandparent growing by their side, dies down as early and as thoroughly as any *Athyrium* we are acquainted with.

How long the actual dormant period is, as compared with the apparent, is an open question, as well as that of the recuperative or strengthening processes which undoubtedly accompany them. The roots certainly commence to be active long before there is any sign of life in the crown. Hyacinth bulbs grown in glasses are a familiar exemplification of this; and as regards Ferns, even in the depth of winter the crowns will be seen to be fattening up, implying great root activity and preparation for the coming rapid growth in the spring. It is highly probable, therefore, that in most, if not in all cases, much of the dormancy is more apparent than real, and that a good deal of secret and subtle work is being done, of which we know little or nothing, but the need for which is evidenced by the weakness

subsequently shown when the dormant period is unduly curtailed, and these processes are interfered with. *Chas. T. Drury, F.L.S.*

THE FLORA OF THE AMOUR LITTORAL.

The vegetable covering of the Amour country is luxuriant and peculiar, and displays a great difference from the floras of adjacent parts of Siberia. Even the woody vegetation exhibits a striking dissimilarity to that of Siberia and Transbaikalia. With the ordinary Siberian races of Conifers are here associated the Manchurian Cedar, the Pitch Pine, *Abies sibirica*, and an ally of the Conifers—the Yew peculiar to the mountains of the Caucasus. The flora of the foliage trees is very rich and varied, as it here meets the beneficent influences from the eastern ocean. The genus *Tilia* is represented by two peculiarly eastern forms, *T. cordata*, Mill., and *T. mandchurica*, Rupr. et Max. The Maple, a stranger to the whole of Siberia, has here four representatives; the Apple appears in Transbaikalia in the shape of a very small fruited variety. *Pyrus* is here represented by a beautiful species, *Pyrus ussuriensis*, Maxim.; and the bird Cherry—*Prunus Padne*—by two local varieties. Two local species of Walnut embellish the forests of the Amour, viz., *Juglans mandchurica* and *J. stenocarpa* Max.; and the Ash by a localised species unknown to Siberia, *Fraxinus mandchurica*, Rupr. With the European varieties of the Elm is associated *Ulmus montana* [campestris?], Winkl. There is also a new species of Hazel, the *Corylus mandchurica*, finally, among the Birches reappear a Kamchatka variety, *Betula Ermani* (*Ulmifolia*), Cham.; and one local timber tree, *B. costata*, Trantv. The charming little tree of the Amour country, with a palmy crown, *Dimorphanthus mandchuricus*, Rupr., is far removed from the Siberian species. It belongs to the natural order Araliaceæ, which loves a moist climate. Not less remarkable is the Cork tree of the Amour, belonging to the family of Xanthoxylaceæ, nowhere to be met with in the whole of Russia.

The shrubs of the Amour country are still more peculiar than the trees. No fewer than twenty-four species here met with are entirely new to anyone arriving from Siberia and Transbaikalia. Of these, three are climbing plants. They are, first of all, a beautiful plant, pertaining to the rare family of Schizandraceæ, with pale rose-scented flowers and red berries (*Maximowitchia chinensis*, Ruprecht), spreading from Northern China through Manchuria to the Amour; a species of Vine, very slightly distinguished from *Vitis amurensis*, Ruprecht. The species of Clematis appearing here belong to the non-climbing shrubby variety of that genus. Of the two species of local Barberry, one is also peculiar to Northern China, *Berberis sinensis*, Desfontaines, the other, *Berberis amurensis* is local. The very curious shrub, *Actinidia kolomikta*, Ruprecht, covered with large white-scented flowers, has not yet found a strictly definite position in systematic botany, being now classed with one and again with another of the natural orders.

Of the four varieties of spindle-tree there is one, *Eaonymus alata*, Thunberg, which is also found in Japan; and three local species, viz., *E. paniculatus*, Maximowicz, *E. Maackii*, Ruprecht, and *E. macropetrus*, Ruprecht. Of the Leguminosæ, the small shrub found here, *Læspedeza stipulacea*, Maximowicz, also grows in the environs of Peking. Of the Rosaceæ, the local species of Cherry, *Prunus glandulifolia*, Ruprecht, and Meadow-sweet, *Spiræa amurensis*, Maximowicz, are shrubs. Two local species, belonging to the same genus as our so-called garden Syringa (*Philadelphus*), are a conspicuous adornment of the forests, viz., *P. tenuifolius*, Ruprecht, and *P. Schrenkii*, Ruprecht. The beautiful local shrub of the same family, *Dentzia parviflora*, Bunge, is a Chinese plant, spread by cultivation. To the family of Araliaceæ, not met with in Siberia, belong two shrubs common to this flora, and that of Northern China. Of the Honeysuckles there are here one Chinese species and two local, *Lonicera Maackii* and *L. Maximowitschii*, Ruprecht. Common to Northern

China is a species of Lilac occurring here on the skirts of the woods, with somewhat minute whitish flowers, *Syringa amurensis*, Ruprecht. A variety of Laurel met with on the lower Amour is that called after Kamtchatka, *Daphne Kamtchatica*, Maximowicz.

Among the herbs of the Amour country, no fewer than 110 species are exclusively peculiar to this region; the rest are common to China, Japan, Kamtchatka, and even America, but more especially to

indicated that it might prove a shy bearer. And these prophecies have been all too literally fulfilled.

As to the quality of this Pear there can hardly be two opinions. *The Florist* of 1875, in giving a beautiful coloured wood-cut of Lucy Grieve Pear, summed it up in a sentence thus, "If we cannot claim for old England the parentage of many of our favourite Pears, we may at least assign to her some of the very best in quality, and among these must rank the subject of our present illustration, of which excellent

These fruits differ considerably from the type in other matters, and are so remarkable, that my wife has painted and forwarded a *fac simile* of the finest specimen (fig. 111). One of the peculiar leaves is still persistent from the end of the stalk, and is true to its Willow-like character. But the Lucy Grieve Pear, like many others, is less richly coloured this year than usual. However, it can hardly be said of the painting accompanying this note, that the colour is a deep lemon-yellow, though it is thin and in some places thickly marked with russet, and has a russet patch near the eye and the stalk. The flesh is also moderately firm, fine grained, tender, and melting, very juicy, with a rich, luscious flavour, and a slight and agreeable dash of acidity such as is occasionally met with in the Glou Morceau. Since this Pear has increased in size, it becomes more like this fine old Pear at its best, and possibly may have been raised from it. But the odour and the flavour of this Pear are more penetrating and agreeable. Dr. Hogg, our highest authority on such matters, calls Lucy Grieve a delicious Pear, having the texture and flesh of Marie Louise—and surely no higher praise can be given. The history of this fine Pear is thus pathetically written by the father of its raiser, Mr. Peter Grieve, so recently deceased:—

"It happened very long ago—
How long? we scarcely seem to know—
A fair young child, in joyous glee,
Plucked with her daring little hand,
A ripe Pear from a tree.
And ate the mellow fruit she chose
With all the zest which childhood knows;
But marvelled in its inmost core
Some dark green pips to see;
And marvelled more to hear it told
That each small pip so plump and bold
Might yet become a tree.
Then thoughtfully she pondered long,
How this thing could be so,
And lastly in a pot of earth
A tiny seed did sow.
That seed became a living plant,
And claimed her willing care,
While promises were kindly made
With friends its fruit to share.
In time the plant became a tree,
With foliage bright and fair;
The child, a merry little maid,
In favour everywhere.
Affection cherished for the tree,
Which cold and storm could brave,
But long before it bore a fruit,
The maid was in her grave.
And when at last it ripened fruit,
They who full well do know,
Declare on England's fertile soil
No richer e'er did grow;
And say that how that fruit so choice
Its raiser's name should bear,
And be hereafter always known
As little Lucy's Pear."—P. G.

—D. T. F.

FIG. 111.—LUCY GRIEVE PEAR.

(Weight, 14 ozs.; circumference lengthwise, 15 inches; shorter girth, 11 inches.)

FLORISTS' FLOWERS.

PROPAGATION OF CHRYSANTHEMUMS.

EARLY in the present month, and before the last of the plants which have borne large blooms are cut down, a beginning should be made in the propagation of Chrysanthemums, for although the Chrysanthemum season is short, a long period of time is required in cultivating the plant to perfection. Nowadays, when the large-flowered varieties are so numerous, especially those of the Japanese section, and they are so highly thought of, poor blooms are not tolerated; and every gardener who grows these plants should make himself acquainted with the best methods of culture, so as to enable him to excel. A most important detail of culture is the propagation of the plants.

It may be taken for granted that it is useless to hope for very fine blossoms if the start be not early; no amount of forcing at any stage making up for lost time. December is undoubtedly the best month in which to take cuttings, but there is no one day which is better than another, and the gardener must

Transbaikalia and Siberia. The whole flora of the Amour comprises 340 plants common to European Russia, whilst, with those of Transbaikalia, it numbers 527 varieties. *J. St. Vincent Corcoran, Odessa, Sept. 14.*

THE LUCY GRIEVE PEAR.

THIS fine Pear, though it obtained a First-class Certificate from the Royal Horticultural Society on October 23, 1874, has been comparatively little grown. Its long thin Willow-like leaves, which suffice to distinguish it from nearly all other Pears,

samples were sent to us last autumn by Mr. Grieve of Culford."

Up to the present year this fine variety has neither been distinguished by free-growth or free-bearing; but singularly enough 1895 has been a record year for this Pear. The sample before me as I write, grown by Mr. Hughes, gardener to Thomas C. Porteous Oakes, Esq., of Newton Court, measures 15 inches in circumference lengthways, 11 inches round at the widest part, and weighs 14 oz. This fruit, and there were several almost as large, is just as large again as that figured and described on p. 84 of *The Florist* for 1875, where the average weight is given as 7 oz.

be guided by circumstances—cuttings of particular varieties having to be taken when they are fit. There is also a difference in cuttings, some being good, others bad. The best kind of cutting is that which springs up through the soil an inch or so distant from the stem, and is free from all traces of buds, flower-buds forming early at the point of a cutting, rendering it useless for propagation. A cutting having a clean uninterrupted growth is essential, without which the efforts of the cultivator will be in vain.

There are several methods of striking cuttings, some gardeners preferring a cold frame, others a cool-house from which frost is simply excluded, but no artificial warmth employed, as this will cause the cuttings to be unduly hastened. The cold frame answers very well when the weather is not very frosty, but it has the bad consequences that in periods of sharp frosts there is a difficulty in affording air to the cuttings, to the loss of many of them from damp. In a cool-house capable of being warmed none of these drawbacks exist, and the rooting of the cuttings goes on unhindered, and growth takes place without a check. The formation of a callus is hastened if the leaves are not allowed to flag, and there is no better method of preventing this occurring than to place the cuttings under hand-lights or in a small frame, the pots standing on coal-ashes, and as near to the glass as possible, to prevent spindling. If one cutting be inserted in one small pot, the repotting of the rooted plant is facilitated, and no check given. A sandy soil pressed somewhat firmly into the cutting-pots and covered with a thin layer of sand, is all that is necessary for striking the cuttings, the sand hastening root-formation, as some of it is sure to be carried to the bottom of the hole when the cutting is dibbled in; and the cuttings of this plant root more readily in sand than soil. Having inserted the cuttings, afford them a plentiful watering, and cover them with the hand-light. Remove the top daily for about an hour to dissipate moisture, and in the evening wipe the inside of the top with a sponge. Water will not be required before the cuttings are rooted, but should the soil become dry it must be applied in sufficient quantity to moisten the soil throughout.

A period of from three to five weeks is required for the cuttings to become well-rooted, and when this has taken place the lights should be tilted on one side, until the amount of ventilation afforded in this manner is increased by degrees till the cuttings will bear exposure without their leaves flagging. By this method stocky growth and a thorough foundation are assured. *E. Molyneux.*

CULTURE IN WESTERN AUSTRALIA.

It is pleasant to learn, through the agency of the Agent-General, that fruit and vegetable culture are making satisfactory progress in the far-away auriferous portion of the globe which has so rapidly risen into fame all over the world. Orchards and vineyards are gradually being developed in valleys where rivers or streams of any capacity run, and in some places, as in Perth, we are told that Grapes are sold at 4d. per pound. Apricots, Peaches, and Melons also are gradually coming into market, and Strawberries, Raspberries, and Currants are to be found here and there. Of course, where the rainfall is limited in extent, cultivation is a ticklish job, but then irrigation is made to assert its beneficent power, and as population grows, so also does the extent of acreage under fruit and vegetable cultivation. Land is cheap enough, for it is stated that the cost of freehold in farms is something like 10s. per acre, the payment being extended over twenty years = 6d. per acre per annum! And so, possibly, it may come to pass that alluvial gold may by-and-by be found more easily of acquirement than diluvial—as in California. By-the-way, it may be noted that fruit trees and cuttings are sent from both New South Wales and South Australia. We are reminded by the Agent-General that grass

seeds are now placed on the free list of imports, as well as garden seeds. In the tariff-free list are to be found bulbs, fruit, and ornamental trees, scions and grafts, manures of all kinds, plants, and Vine cuttings. The following pay a duty of 5 per cent. *ad valorem*.—Agricultural, horticultural, and viticultural implements and machinery (not garden rollers); wire netting and steel fencing wire, standards and staples.

The increase in the value of timber exports is surely worthy of mention here. In 1893 the value of this export was £33,888, last year this had increased to £74,809. It may not be generally known that the forest region of extra tropical Western Australia occupies an area equal to the whole territory of Great Britain—the intratropic zone of forest is also enormous, and there is many an indication that as time goes on more and more of the timber produced in these regions will find its way to the mother country. *E. C.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

By BAILEY WADDE, *Gardener, Birdall Gardens, York.*

THE HERBACEOUS BORDERS.—The work of cutting down and clearing away the dead and decaying stems and foliage of perennial plants should now be finished. Large plants of Delphiniums, Hemerocallis, Heliopsis, Ranunculus, Iris, and Michaelmas Daisies, growing in old borders which are not going to be replanted, should be taken up bodily with a spade, cutting off and replanting a good-sized strong healthy clump cut from the outside of the root-mass, affording the transplanted portions rotten manure and fresh soil. These pieces will grow well and flower more satisfactorily than old undisturbed clumps. When putting a border in order at this season, place a short stout stake against each plant which dies completely down, so that they may not be trampled upon; and when the work of clearing and planting the borders is finished, lightly prick over the surface affording a dressing of rotten manure and fresh loamy soil and the sifted charred remains of the refuse-heap, in all about 2 inches thick. Care should be taken that the top-dressing is free from the seeds of weeds. A few good indispensable perennials consist of *Alstromeria*, in variety; *Anemone japonica*, and the white-flowered variety *Honorine Jonbert*, and its double form; *Anthericum liliago*, *Asters Amellae*, *gandiflorus*, *Shortii*, *Nova Belgæ*, and *Nova Angliæ*; *Campanula persiciflora*, *Carpatia* in blue and white varieties, *grandis*, *latifolia*, and many more; *Doronicum caucasicum*, *plantagineum excelsum*, *Harpur Crew*, and *Cinsii*; *Delphiniums* in great variety, *Eryngium*, *Ferula gigantea*, *Helianthus*, or perennial Sunflowers, including the showy *angustifolius*; *Inula glandulosa*, and *I. g. grandiflora*; *Papaver nudicaule*, *P. orientale*, *Pæonies*, *Phloxes*, *Pyrethrum roseum*, in great variety.

MISCELLANEOUS MATTERS.—Now is the right time for examining the lawn-mower, repairing damages, and generally cleaning and oiling the parts where there is friction. The mower should be kept in a dry place. Flower-sticks, stakes, labels of all sorts and sizes, pegs for layering, should be made; cutting-boxes and plant-tubs well aired and then painted. The planting of deciduous trees and shrubs may still be proceeded with, weather permitting; also the thinning-out and cutting-back of such as are growing too thickly, and staking without any delay all standard trees which having but small hold of the ground are likely to be injured by wind. The grass edgings to shrub beds may be trimmed, and the soil slightly stirred with digging-forks, taking care to bury the tree-leaves in the spaces where there are no roots to be injured. Thorn and other deciduous hedges may be trimmed, keeping them broad at the bottom but narrowing towards the top. If heavy snowfalls occur, relieve all choice subjects of the greater portion, before injury is done to them.

PLANTS UNDER GLASS.

By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

THE GREENHOUSE IN WINTER.—All hard-wooded plants such as *Ericas*, *Azalea indica*, *Rhododendrons*, *Boronia*, *Epacris*, &c., will stand in need of close attention as regards their watering throughout the winter; and in regard to the temperature of the

greenhouse, a small amount of artificial heat may be afforded, together with top and bottom ventilation in mild weather—a temperature of about 55° by day to 50° by night being sufficient, the warmth being allowed to fall 5° in very cold or windy weather. If any of the plants are infested with thrips, fumigate the greenhouse on two nights in succession with Richard's Compound. Any necessary training, sticking, &c., may be proceeded with; and a few plants of *Epacris*, *Erica hyemalis*, and *Boronia megastigma* may be placed in a slightly warmer house to bring them early into flower.

ADIANTUM CUNEATUM.—Where fronds of this species are in much request for cutting, it is good practice to cut the fronds, say of four to six potfuls, completely down, then allow them to get somewhat dry at the roots, and place them in a temperature of about 70° by day, and 65° by night, when they will soon push up new fronds, which as they grow, may be gradually hardened before cutting them as before. If plants of this species are treated in batches in this manner capital fronds may be obtained throughout the year.

CHRYSANTHEMUMS.—The plants as fast as the flowers fade, and they lose their beauty, should be cut down, for the Chrysanthemums being generally grouped together, the suckers which will form the cuttings get weak and drawn, and in some cases bleached in consequence; hence the need to remove the top growth quickly. Place the stools, as the plants are now called, in a light airy house for a time, to allow the shoots to become firm before taking them, and as soon as that is apparent, secure the necessary cuttings. After neatly trimming each cutting, place it singly in a small pot, in sandy loam and leaf-soil; afford the cuttings a good watering, and place them under a hand-light, or put into a pit or house from which the frost is excluded. Guard against damp by ventilating it in the morning, and by wiping the moisture off the glass daily if the hand light be used, and apply heat to keep out frost and dissipate excessive dampness. Two very pretty varieties for cut bloom are *Jane* and *Yellow Jane*; and three very late ones for Christmas decoration are *Admiral Sir F. Symonds*, *Lady Canning*, and *Lady Lawrence*.

LACHENALIA TRICOLOR.—These bulbous plants, now in full growth, will require liberal supplies of weak manure-water at the root when the pots or baskets are found to be filled with roots. I find that the plant flowers best when repotted in alternate years, or allowed to go for two years. Keep the pots or baskets near to the glass, and turn them round occasionally, for the purpose of keeping the foliage evenly distributed all round the pots, &c.

THE HARDY FRUIT GARDEN.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

PROTECTING FIG TREES ON WALLS, ETC.—Means should be devised, and material got in readiness, for covering Fig trees in case of severe frost setting in. Light sheep hurdles neatly thatched with straw, and made long enough to reach the tops of the trees when placed in a leaning position, and standing out from the wall about 3 feet at the bottom, are a good form of protectors for out-of-door trees, as besides throwing off rain and snow, they are easily removed when necessary in mild weather, and with care will last for many years. Where, however, these are not available, Spruce Fir branches or other evergreen trees may be employed, and these, if properly applied, make a fairly efficient protection. Straw bands are sometimes used to envelop the branches which are taken off from the walls and banded together, but this method is untidy, for which reason I do not recommend it.

PRUNING AND TRAINING OF TREES IN GENERAL.—The pruning and training should be carried on with dispatch, weakly or stunted trees should be cut-back severely, as thin slender growths are of no use for fruit-bearing; and the operation, if performed early in the winter, almost invariably leads to strong breaks. If the roots are in a healthy condition, the surface-soil should be cleared away, and a good dressing of material suitable for encouraging root-action afforded. In the same manner, young trees that were planted last season, and which failed to make a satisfactory start, should have their branches cut back to the starting point, when in all probability a vigorous growth will be the result, and the trees greatly benefited. Pyramid trees now being received from the nursery as fruiting

trees frequently arrive with vigorous growth on the upper part, whilst the lower part is either bare or furnished with only a few weak branches, which is a consequence of the trees having been crowded in nursery plantations, and not getting enough light at the bottom. Such badly-furnished trees should be cut down to about 2 feet from the graft at planting-time; and from the strong growths which will result a sufficient number should be selected for the lower tier of branches, and for a stout leading shoot, which may have the point stopped once during the summer. By acting in this manner, no serious loss is really incurred by what may appear to be too severe pruning, but time will be saved, seeing that a handsome, vigorous tree is obtained sooner than would otherwise be the case. Let the training of old and young trees quickly follow the pruning, and in doing so, closely examine the old fastenings, removing any that are tight, or which are not likely to last another season. The leather shreds introduced by Mr. Murgatroyd, of Leeds, seem to be just what is wanted for wall trees; and, considering their probable durability, they are not too expensive. Young trees for horizontal training should not have the branches brought into position for the first few years, but should be trained at an acute angle, which will tend to the equal distribution of the sap, and conduce to the health and vigour of the lower tiers, these being after a time brought gradually into their proper position.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Bedford, Dorking.*

HINTS ON WATERING.—As a rule, it is affording too much water at the root and too moist an atmosphere, that are the chief causes of the deterioration in Orchids, and it is safer to err, therefore, on the side of keeping the plants dry than on the wet side, especially if they are subjected to a reasonably low temperature. The same distinction should be observed when affording water to both tall and dwarf species of Epidendrum, as with Cattleyas. The plants of *Chysis*, *Catasetum*, *Mormodes*, *Cynoches*, *Cyrtopodiums*, and allied species should be kept comparatively dry whilst at rest. Warm or intermediate-growing *Ocidioms*, *Guatemalan* and *Mexican Oulontoglossums* should be afforded water occasionally to maintain the plumpness. Terete-leaved *Ochids* require very little water whilst at rest, just enough being afforded to prevent shrivelling of any part. Small-growing species, as *Promenæa*, *Rodriguezia*, *Paphinia*, *Compactia*, *Coryanthes*, *Oncidium pulchellum*, *O. triquetrum*, *Ionopsis*, *Burlingtonias*, &c., should be carefully attended to, and water afforded them occasionally to keep them from perishing. The various species which occupy the cool-house, as *Oulontoglossums*, *Masdevallias*, *Maxillarias*, &c., are growing almost at all times, and should be watered often enough to keep the compost moist.

DECIDUOUS SPECIES.—The plants of deciduous *Calanthes*, *Thunias*, *Cyrtopodiums*, *Catasetums*, *Mormodes*, and *Cynoches*, if properly matured, keep fresh-looking and plump in the resting-period without receiving any water. There are many species of Orchids in cultivation which bear a severe drying, and yet produce abundance of bloom, but they do this generally for one or two seasons only, and then push out weak and premature growth, gradually disappearing altogether. The object of beginners in Orchid culture should be to give the plants as good a rest as is possible, and see them safely through the winter.

EVERGREEN SPECIES.—Such evergreen epiphytal Orchids as *Aëridea*, *Saccolabium*, *Rhynchostylis*, *Renanthera*, *Stauropsis*, *Sarcophilus*, *Angraecums*, and the tall-growing *Vandas*, do not require so long a season of rest as the deciduous species; still, the longer they are kept in an inactive state, the stronger will be the new growth. These evergreen species should never be allowed to get quite dry, and water must be afforded in sufficient quantity to prevent loss of foliage. The state of the sphagnum-moss, which has been growing luxuriantly, should afford the cultivator an idea of the needs of the plant, and if it be allowed to assume a whitish-green colour before water is given, it will show that the plant has been kept sufficiently dry. The whole of the mass of compost should not then be saturated with water, but the top-dressing of sphagnum-moss should be merely sprinkled, so as to keep it alive. *Phalenopsis Schilleriana*, *P. Aphrodite*, *P. intermedia* *Portei*, and others, that are sending up their flower-spikes, should receive similar treatment. Evergreen species,

such as *Cypripediums*, *Phaias*, *Calanthes*, *Anectochilus*, &c., require the shortest period of rest of any Orchids, and this should begin immediately the flowering season has passed, affording water sparingly for a few weeks, when new growth will generally commence to be made.

DENDROBIUMS.—*Dendrobium*, especially those of the deciduous or semi-deciduous species, require a long rest, and no water at all at that season, unless the pseudo-bulbs shrivel, when water may be afforded in quantity sufficient to restore plumpness. *Dendrobium thrysoiflorum*, *D. densiflorum*, *D. suavisissimum*, *D. chrysoxum*, &c., which are evergreen, the *nigro-hirsute* species, *D. Lowii*, *D. cruentum*, *D. Draconis* (*eburneum*), &c., and the cooler-growing varieties, *D. infundibulum*, *D. Jamesianum*, *D. cariniferum*, and its variety, *D. Wattianum*, should be kept only slightly moist at the root when at rest.

CATTELYAS AND LÆLIAS.—As regards *Cattleyas* and the tall-growing *Lælias*, experience teaches that at the so-called period of rest, the short pseudo-bulbed species, of which *Cattleya citrina* and *Lælia majalis* may be taken as types, require less moisture at the root than at all other seasons, than the slender, tall-growing *C. bicolor*, *L. harpophylla*, &c.; and those which have pseudo-bulbs of an intermediate size, viz., *C. Mendeli*, *C. Mossiae*, and *C. labiata*, should be treated accordingly. The object is to induce the formation of roots, but not top-growth, and to do this, just sufficient water to keep the pseudo-bulbs and leaves from shrivelling much should be afforded the plants.

THE KITCHEN GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

DWARF KIDNEY BEANS.—Successional sowings should be made at regular intervals of fourteen to twenty-one days, according to the demand. The soil should be of a loamy nature, and rendered porous by using road-grit, sand, or leaf-soil, in quantity to suit the kind of loam. Some gardeners sow six or eight seeds in a number of small 60's, and transfer these before the roots are pot-bound, into 10 inch pots. Ainery started for forcing will be a good place for the seeds in the first stage. Shelves suspended within 1½ feet of the glass are well adapted for French Beans. When the early batches of Beans have made considerable growth, some sort of support from twigs, or small sticks and bast, becomes necessary. When the soil needs water, let enough be afforded to reach every part, any stint in this matter causing loss of bloom and poor growth. As a variety worth growing, Veitch's New Runner French Bean should be tested especially at a later part of the winter, when hot-water pits may be used with good results in Bean culture, although there is little doubt that red-spider will be against this variety replacing the old dwarf ones for inside-work.

SPRING CABBAGES.—These Cabbages which were planted as previously advised, having now become sturdy established plants, and therefore likely to withstand severe weather without loss, should be examined, and any gaps found in the lines filled up with some of the best plants remaining in the seed-beds; the plants freed from decaying leaves, the land from weeds, and hoed rather shallow between the rows. Finally, afford the plantations a good dressing of fresh soot thrown broadcast over the plants as well as the land, and then mould them up, choosing a day for this job when the surface is dry.

WORK IN GENERAL.—Many small matters will now require attention, such as keeping up a supply of Lettuces for salads. If under glass, so much the better, but if these plants must remain out-of-doors, protecting materials should be at hand in case of hard frost. These may consist of mats thrown over hoops placed over the plants, or spare frame-lights, boards, &c.; these remarks apply also to Endive. Roots of *Dandelion* and *Chicory* may be placed in the Mushroom-house; and successional batches of *Seakale* should be put into heat, so as to keep up a regular supply. When small quantities of *Seakale* are required, the roots may be placed in large flower-pots with leaf-mould over them; of course, keeping the light away from it entirely. *Seakale* should not be hard forced, but brought on somewhat slowly, as it will be if the warmth does not exceed 60°. *Seakale* roots intended to be forced this winter, may now be lifted, and the small thongs for making sets selected, burying these in soil until time can be found on wet days for making them. The crowns for forcing purposes should be laid in, in moist soil, litter being

thrown over them in time of frost. *Asparagus* roots may be similarly lifted and laid-in, in some readily-accessible place. The old beds of Cabbages, if the plants were properly treated, will now be producing small compact heads and sprouts, tender and of good flavour. These Cabbage-beds should be cleared of decaying leaves, stripping these off the tall stems, and gathering them by hand or raking them out of the beds, thus affording air to circulate among the plants, and rendering the plantation less obnoxious as regards odour. Young Cabbage plants put out late in the summer will now be furnishing good heads. Coleworts will be plentiful and good at this season, so that there will be no scarcity of Cabbages and Greens for the table. Brussels Sprouts, the most highly prized of winter vegetables of the Cabbage tribe, should be cleared of decaying leaves, &c., but carefully avoiding breaking the fresh ones. The short-stemmed sturdy varieties are to be preferred, as they keep erect, are not so much acted on by wind as the tall ones, which fall about a good deal on rich land, thus rendering the sprouts liable to have the soil splashed on to them by the rain. Heaps of stable-dung, and litter, and fresh tree-leaves, should be mixed and got in readiness for making hot-beds and renewing the linings to pits and frames. The cold pits and frames containing Parsley, Cauliflower, Lettuce, &c., should have the lights removed during dry mild weather.

MUSHROOM BEDS.—Continue to collect and prepare manure for making new beds indoors; and if a bed be made at intervals of three weeks, a good supply of Mushrooms will be kept up. Fresh beds give the more delicate Mushrooms; still, those beds which have been in bearing for some time, will, if kept moist, and the house at the proper temperature, continue to bear for a considerable length of time. The water applied to a Mushroom-bed should not be of less warmth than 85° to 90°; and a bed if damped with the syringe occasionally, and kept covered up with bast, mats or litter, will not require heavier waterings, affording these being a mistaken practice. The coverings of Mushroom-beds out-of-doors, when very wet, should be removed and their place supplied with light dry materials.

FRUITS UNDER GLASS

By RICHARD PARKER, *Gardener, Goodwood, Chichester.*

THE LATE VINERY.—Owing to the favourable season, late Grapes finished well, and with care the bunches should keep in good condition throughout the winter months. The bunches should be left on the Vines till the foliage has fallen in a natural way. At present all the principal leaves are still perfect on our Vines, but they are changing to the usual beautiful tints of decay, but will not entirely drop for a fortnight. To remove these leaves would not improve the Grapes in any way, and there would be the danger of robbing the future fruit-buds of some accession of strength. It is, however, necessary that such sun-light as we have, and unimpeded circulation of air, should be afforded, and to obtain these, the shoots may be shortened to within two or three leaves of the bunch; all lateral growths should be removed. Ventilate freely during bright weather, and apply fire-heat when the temperature in the vinery is likely to fall below 45°, or during wet and foggy weather. The bunches of Grapes should be examined once a week, or oftener, and every berry showing the least sign of decay, removed; for to allow one decaying berry to remain is to risk the loss of the entire bunch, so quickly does decay spread. It is general for the roots of late Vines to have access to outside borders, and these require protecting from snow and rain during the winter, which is best done by covering the border with shutters, or failing these, with a thick layer of ripe bracken, letting the protecting materials remain till the Grapes are cut, but no longer, full exposure to the weather being then best for the Vines. These remarks apply to vineries entirely given up to the Vines; but where bedding plants and others are stored, it is better to cut the bunches of Grapes at this date with a good length of shoot attached, and keep them in bottles of water in the usual manner in a dry cool room.

STRAWBERRIES IN POTS.—Plants placed in cold pits or frames, and afforded full exposure, should have the frame-lights put over them, if falls of snow or sleet threaten; and it would be well after this date to protect the plants from heavy rains, for should severe frost follow these, they would suffer more from the soil being wet, but the lights should be again removed on favourable occasions.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, DEC. 10. { Royal Horticultural Society Committees, at Drill Hall, Westminster.

SALES.

MONDAY, DEC. 9. { Dutch Bulbs, Azaleas, hardy Perennial Roses, &c., at Protheroe & Morris' Rooms.

THURSDAY, DEC. 12. { Great sale of Japanese Lilies, Roses, Herbaceous Plants, Dutch Bulbs, &c., at Protheroe & Morris' Rooms.

FRIDAY, DEC. 13. { Orchids from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°.8.

LAST week we published the second Epping Forest report of the Commissioners appointed by the City Corporation to investigate into certain charges as to excessive thinning of the trees throughout the Forest generally. This report practically exonerates the Forest Conservators. In a large area of 5542 acres, tenanted largely by "gaunt pollard Hornbeams," which must be partly conserved and partly cleared for the young trees springing up, which must in time displace these said pollards, there is room for difference of opinion as how best to keep up the character of the wood as a "natural forest," in terms of the Act of 1878. There is not much occasion for wonderment at those lovers of trees and shrubs and under-growth of miscellaneous description, who live on the spot, protesting in the public prints. Unfortunately, the noisiest critics, however well-meaning, are often the least informed on the subject-matter in hand, as this Epping Forest question has fully illustrated. If the controversy were confined to the proper channels, where arboriculture is appreciated and understood, the wild ideas of irresponsible individuals would never be published. As it is, the conservators and their superintendent must be greatly strengthened in their labours by the unanimous finding of the experts.

In a forest of this kind, which has not been a natural one in the general acceptance of the term, at least since the days of wholesale lopping began, it is desirable to have as many and as varied features as possible. There are by far too many pollarded Hornbeams throughout the whole of Loughton Manor, and we cordially endorse the recommendation of the Commissioners to have much larger clearings than have hitherto been effected, so that eventually spear trees may grow up. It is not wisdom in such a large area to thin out so as to leave individual pollards; it is much better to have groups of these fantastic cripples, with the undergrowths of Brambles, the Dog-rose, the "May," and the Blackthorn clambering round and amongst them. It is delightful to see how those Thorns protect the seedling Oaks, Beeches, and Horn-

beams from the bite of cattle, and the progeny rearing its head above eye-level, will establish itself, and become one of the new features in time to come. Moreover, there are many hundred acres through which it is scarcely possible to crawl, so close are the tree-stems, and the canopy of leaves shuts out completely the light of heaven from the ground, stifling any attempt at herbaceous life rearing its head.

In certain portions of Monkwood, about which there has, in time past, been a good deal of heated controversy, many of the Beech trees are magnificent specimens, and possibly, in time past the thinning has been a little severe, more especially as no underwood will come up under the dense shade of the Beech, and the clearings have not been bold enough to ensure a young crop of seedling trees in the intervals. About Theydon Manor, especially the high wood, Beech is the feature, and it ought to be maintained. There is a pleasing sensation, almost equal to walking over a Turkey carpet, to tread upon a thick layer of Beech leaves.

The chief seat of the Oaks is in Bury, or Hawkwood, and there has been a unanimous expression of opinion as to the conservation of these trees; indeed, the report says, "We attach great importance to retaining the character of this portion of the Forest as an Oak wood, and we would recommend that nothing further be done here beyond the gradual clearing-out of the pollard Hornbeams." If Oaks are to attain large dimensions, it is surely in this low-lying quarter. What has been cut out has improved the character of the remainder. It is exceedingly desirable to show boles of Oaks as well as tops to the forest wanderer; and after the Hornbeams have been seen to, and proper provision made for the upgrowth of young Oaks through the encircling shelter of the underwood, room should be made by judicious thinning, even of the Oaks themselves, for the growth of fine trees, and the formation of picturesque groups. They do much better in this wood than in the adjoining paddock, opposite the Royal Forest Hotel in Chingford Earl's Manor. The Oaks here seem to be as aged as any specimens throughout the Forest, but they have neither attained bulk nor altitude, and seem to be in the downgoing period of their existence. Such fine examples of Oak pollards as are to be seen in Lord's Bushes, one of the offshoots in Hatch Manor, ought to be preserved. The underwood, especially the Hollies, is making fine headway, and the general vigour of herbaceous life at once shows the fertility of this spot.

The Birch is making headway wherever the forest fires have stamped out tree-life. There are some charming young trees of this, which, with a beautiful pendent habit and graceful foliage, well meriting the title of Lady of the Woods, have straight prominent silver-barked stems which lighten the sombre winter scenery. A few miscellaneous trees are springing up, such as Sycamore, and a stray Aspen or two, but these are not encouraged. On the other hand, the Common Crab (*Pyrus Malus*), is encouraged and has not been pollarded; it is beautiful with its abundance of flowers in spring, and its fruits which generally are plentiful, and which the herd of deer eat with great avidity.

The picturesque undulating ground on the one side of the New Road, comprising many salient spots both in Loughton Manor and in Theydon Bois Manor, admits of making many vistas which would greatly relieve the eye of the visitor, shut up for miles, so to speak, within living walls of trees, and so does the corresponding ground on the other side of the New Road, particularly in some parts of Sewardstone Manor and Waltham Holy

Cross Manor, in order to open up the nice bit of pastoral scenery beyond the river Lea. These rides and beaten irregular paths over the forest generally lead to scenery which is shut out from the eye and which is worth opening up, and thus enhancing the forest effects. It has hitherto been dealt with in far too gingerly a way, no doubt, because of the ceaseless agitation of a few busybodies. The best of the out-of-the-way features have arisen from conflagrations. Quantities of the common Brake have sprung up, which, now one mass of russety-brown, is grand after the summer greenery; and then the masses of Farze, and Ling, and Heath, doing battle together wherever there is headroom and light are simply charming—all the more so where there is breadth of space.

In such a large area as this, so near a great city, it would not be out of place, neither would it be entrenching upon the reading of the conditions of transfer from the Crown to the public, to clear an area free from Hornbeam Pollards to form an arboretum, and introduce some of the deciduous trees and shrubs, and coniferous trees of other countries for general gratification and study. They need not be distributed to alter the character of the forest, but a collection of them suitably arranged would form splendid object lessons for all who cared to profit by them. Although the Act says that the natural aspect of the forest is to be preserved at all times as far as possible, it also says that the forest is to be "kept as a place of recreation and enjoyment" to all. This, in our opinion, would be a place of enjoyment to many, as it would enable them to see the arboreal wealth of other countries, "no one daring to make them afraid."

BEGONIA INCOMPARABILIS X.—One of the most remarkable exhibits at the last meeting of the Royal Horticultural Society was a noble-looking winter-flowering *Begonia* (fig. 112, p. 681) exhibited under this name by J. T. BENNETT-POË, Esq., of Chesham. It originated in the south of Ireland, as we learn from its raiser, as a cross between *Begonia polypetala* and *B. Froebeli*. The foliage is very handsome, the leaves being nearly a foot across, and covered with a velvety pubescence of a pretty pink hue when young. The inflorescence is nearly 2 feet in height, standing well up above the foliage, and bears numerous scarlet flowers each about an inch in diameter. Before expansion, the flower-stalk is decurved, and the flattened flower-buds covered with dense whitish pubescence. We congratulate Mr. Poë on the acquisition of so remarkably fine a plant.

OUR ALMANACK.—Secretaries of Horticultural Societies and others, are earnestly requested to forward immediately, the dates of Show Fixtures and of Meetings of Botanical and Horticultural Societies of any kind for 1896, for insertion in the Almanack, to be published in our issue for January 4.

THE ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral meetings of the Royal Horticultural Society will be held on Tuesday, December 10, in the Drill Hall, James Street, Victoria Street, Westminster. The committees will meet as usual at 12 o'clock. An election of new Fellows will take place at 3 P.M.

NATIONAL ROSE SOCIETY.—At the Society's Crystal Palace shows in 1896 and 1897, the following valuable prizes will be offered for Roses raised, or first distributed by Messrs. A. DICKSON & SONS, Newtownards, co. Down, Ireland. There will be a class for amateurs for six distinct varieties, and another for nurserymen for twelve varieties. In each case the first prize will be a handsome Silver Cup and £2, second prize £2, and the third prize £1. Each Silver Cup must be won twice (not necessarily two years in succession), before it becomes the property of the exhibitor. The above prizes are

presented by an amateur member of the Society, who wishes us to make these classes known now in order that intending exhibitors may be better prepared for them next year.

REDUCTION OF RATES FOR SMALL PARCELS ON THE G. E. R.—There are many conflicting

opinions as to the causes of the prevailing depression in the agricultural counties, but there has been something like unanimity upon one point—the question of railway rates. The experiment began on Monday last over the Great Eastern Railway system is, therefore, of great interest, and makes it possible for the farmer and market-gardener to get into direct communication with the consumer in London. Packages of dairy and garden produce may now

be sent to and delivered in the metropolis at rates for carriage varying from 4*d.* for 20 lb. to 1*s.* for 60 lb. This is very greatly less than any railway company has carried for before; and since the Great Eastern covers the districts where the depression has been most acute, the results that follow this departure will be noted with great interest. It will

hope to see other companies follow in its course, and thus prove that the popular is also the paying policy.

SOCIÉTÉ NATIONALE D'HORTICULTURE, PARIS.
—At the meeting of this society held in Paris on Thursday, November 28, M. PEETERS, of Brussels,

FIG 112.—*BEGONIA INCOMPARABILIS* × : FLOWERS, SCARLET. (SEE P. 680)

now be possible for the consumer to have his weekly parcel of butter, eggs, poultry, fruit, and vegetables direct from the producers without the intervention of the middleman. One or two things more seem to be needed, viz., a list of farmers, gardeners, and others, who are willing to supply customers under the new arrangement, and a system of payment on delivery. Should this venture turn out remunerative to the Great Eastern Railway, we may

showed some fine hybrids of *Cypripedium*: *C. Leyseianum* (*C. bellatulum* × *barbatum* Crossi), *C. Senatour Montefiore* (*marmorophyllum* × *Spicerianum*), *C. Niobe* (*Fairieannum* × *Spicerianum*), and *C. Chautini* × *Sallieri Hyeannum*, a splendid plant. From the same exhibitor came a grand plant of *Odontoglossum* (*Miltonia*) *Leopoldianum*, to which an award of a silver medal was made. Messrs. CAPPE ET FILS showed *Cypripedium mont-*

num, which is something in the way of *C. Sandersæ*. M. DORN showed a magnificent *Cymbidium Hookeri*; and some good plants came from M. LESUEUR, among them a good form of *Odontoglossum cuspidatum*. Mr. BEIT exhibited several good *Cattleyas*; Messrs. DUVAL ET FILS, Versailles, presented a plant of *Miltonia vexillaria superba*, and a fine lot of *Cypripedium Charlesworthii*.

DINNER TO EMPLOYEES AT RYECROFT NURSERY.—On Saturday evening, 30th ult., some thirty of the staff at Mr. JONES' nursery, were entertained by him at dinner, the latter being followed by a musical entertainment, in which both amateur and professional artists took part.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—The annual general meeting of the members of this society was held in the Music Hall Buildings, Aberdeen, on Saturday, the 30th ult. Mr. D. M. SMITH occupied the chair, and there was a capital attendance. The society held one exhibition during the season in the Duthie Park, which proved, from a horticultural point of view, most successful. The entries numbered 2021, this total being surpassed by only one society in Scotland. Mr. J. MENRO, nurseryman, Burnside, in criticising the report, thought they should look more to horticultural matters, and leave musical and "fire-eating" matters to take care of themselves.

THE GARDENS IN LINCOLN'S INN FIELDS.—The London County Council are having the grounds of Lincoln's Inn Fields thoroughly drained, the arrangements in that respect having been of the most primitive and inadequate character. The paths are being levelled and gravelled, and later on the beds and shrubberies will be overhauled, and in many instances replanted. The gardens have proved a great boon to the poorer inhabitants of the adjoining thickly-populated districts. There is a fine group of Pines in the centre, and little or nothing needs to be done in the way of altering the plan.

"THE JOURNAL OF BOTANY."—The steady increase in the number of papers which have been sent to the *Journal of Botany* for publication during the last year has forced upon the editor (Mr. JAMES BRITTEN) the consideration of means whereby to meet the demands upon its space. This increase is gratifying evidence that the *Journal* is recognized as a suitable medium of communication with the scientific world. The financial position of the *Journal* does not, however, warrant any additional expenditure. For the last few years it has not, as was at one time the case, involved any loss, but it does little—in some years nothing—more than pay its way. After discussing the position with various botanists, it is now proposed to enlarge the *Journal* by giving an extra sixteen pages monthly, and to raise the price of each number to 1s. 8d., and of the annual subscription to 16s. This means that the contents will be increased by one-half, while the charge will be raised by one-third, so that subscribers will be the gainers by the change. At times, of course, it may be desirable to substitute one or more plates for the additional pages, but the general result of the change will be that each number will contain forty-eight pages, instead of thirty-two as at present. It is suggested that the list of subscribers might easily be enlarged, if those who already subscribe would induce their friends to do so. There are many who, for the sake of encouraging science, would be willing to add the *Journal* to their list of periodicals, or who would present it to some reference library. The work of editing the *Journal* for sixteen years has been considerable, and financially unremunerative, and this gives the Editor a claim to the support of those interested in any branch of botany.

A FRENCH NATIONAL CHRYSANTHEMUM SOCIETY.—A new Society has been formed in France on the same lines as our own National Society. The subscription is fixed at 5 francs, and the Secretary is M. PHILIPPE RIVOIRE, 16, Rue d'Algérie, Lyon.

"JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY."—With commendable promptitude, another number of the *Journal* of the society (vol. xix., part 2) has appeared. It contains, among other things, papers on Fruit Culture in France, by M. C. BALLET; a full account of the Crystal Palace Fruit Show, and the two Prizes Essays on the Commercial Aspect of Hardy Fruit Growing, by Mr. LEWIS CASTLE and by Mr. S. T. WRIGHT respectively.

HONOURS TO HORTICULTURISTS.—On the occasion of the Chrysanthemum exhibition in Paris, M. MARTINET, the editor of the *Jardin*, was made Officier d'académie in acknowledgment of his services to the exhibition of French fruit in St. Petersburg. M. ERNEST BERGMANN, on the same occasion, was made Officier du mérite agricole. The Emperor of RUSSIA has conferred on M. MAX COBNU the grand cross of the order of Stanislas. M. MARTINET is made commander of the same order. M. H. L. DE VILMORIN is made a Chevalier of the Order of St. Anne. These last appointments have been made in connection with the great fruit exhibition at St. Petersburg in 1894.

FROZEN FLOWERS FROM AUSTRALIA.—It is stated in the *Westminster Gazette* of November 23, that a fine collection of blue and white Water Lilies (*Nymphæa gigantea*) has been sent by a leading florist in Sydney, N.S.W., through Sir SAUL SAMUEL, the Agent-General, for presentation to her Majesty the QUEEN. The Lilies were frozen in ice, and received as long ago as August last by the Colonial Consignment and Distributing Company, Limited, being stored at Nelson's Wharf, until Wednesday, November 27, when they were delivered at Windsor. In spite of the length of time, the flowers were in perfect condition, and, seen through the transparent ice, were very attractive.

VEGETABLE FIBRES.—Dr. MORRIS' lectures on this subject before the Society of Arts have now been republished in a complete form, and may be had from the Society of Arts, Adelphi, London. They present within small compass a readable account of the nature, properties, and source of vegetable fibres generally. On looking through this excellent summary, the reader will be struck with the small number of species which have up to the present time been utilised. This is the more astonishing, as the great majority of plants yield "fibre" in some form or another. Is there not here an opportunity for our botanical stations to institute, on a far larger scale than they have hitherto done, comparative trials of various fibre-producing plants, in order to ascertain which are of the most commercial importance. In the mean time we commend the present publication to the notice of all concerned.

MR. BARRON'S RETIREMENT.—With the last meeting of the Fruit Committee for the year, which takes place on Tuesday, December 10, at the Drill Hall, will be terminated Mr. A. F. BARRON'S long connection with that body as secretary. That there will be a considerable attendance of members is probable, as such is usually the case on the last meeting of the year; but in view of this leave-taking, the attendance at this particular committee will doubtless be unusually large. The occasion is a fitting one for some formal proposition from the members, which should be recorded on the minutes of the committee's proceedings, and no doubt such proposition will be forthcoming. In the meantime, we have great satisfaction in announcing that at the last meeting of the Council of the Royal Horticultural Society it was resolved to elect Mr. BARRON as an Honorary Life Fellow of the Society. Mr. BARRON was also elected to serve on the Fruit Committee for the ensuing year.

COLOUR IN BUTTERFLIES.—The scales on the wings of the Pieridæ, to which the Cabbage butterflies belong, are shown by Mr. GOWLAND HOPKINS, of Guy's Hospital, to contain uric acid, to which substance, in fact, they owe their opaque milky-whiteness. The scales of allied yellow insects also

contain a substance similar to uric acid. Pigments of this character are not found in other butterflies, so that when the Pierid "mimics" an insect belonging to another group, the pigment in the two cases may easily be distinguished chemically. These curious observations show that there is a close association between pigments of a decorative character and substances of an excretory nature.

ROSARIAN'S YEAR-BOOK.—The Right Hon. Lord PENZANCE will, we understand, contribute a paper to the forthcoming issue of the *Rosarian's Year-Book* on the "Hybridisation of Roses," with special reference to his experiments on the Sweet Briar.

PROPOSED MEMORIAL TO THE LATE DR. WOODMAN.—We learn that Mr. E. J. JARMAN, seed merchant, Caard, Somersetshire, has kindly undertaken the duties of Hon. Treasurer to the Fund which has been started, with W. NAPPER, 489, King's Road, Chelsea, S.W., as Hon. Secretary. With such workers, the work cannot but be successfully carried out, and it is hoped that after erecting the suggested monument, a substantial balance will be left for the benefit of Mrs. Woodman.

CHRISTMAS NUMBERS.—The Christmas number of the *English Illustrated Magazine* (*Illustrated London News* Office, 198, Strand), contains many tales interesting to read and appropriate to the forthcoming season. *Yule Tide* (CASSELL & Co., La Balle Sauvage Yard, E.C.), is very good this year, and the coloured plate, entitled "Prisoners of War," is a refreshing change from the too plentiful pictures of kittens, puppies, and maidens usually seen at this season.

MR. BUYSMAN.—We have more than once taken occasion to praise the admirably dried specimens of plants, chiefly of economic species, prepared by Mr. BUYSMAN, of Middelburg. It is with regret, therefore, that we hear that the sight of this able preparer is seriously threatened, in consequence of over-application, and that some of his friends are desirous of giving him some assistance in the shape of clerical help in his work. Those who feel disposed to contribute in this laudable object, are requested to communicate direct to Mr. BUYSMAN, Middelburg, Holland. It is especially sad that a breakdown should occur, just when the initial difficulties of his enterprise seemed to have been fairly overcome.

POTATO SCAB.—Potato scab is caused by the attack of a minute vegetable parasite, as was first demonstrated at the Purdue Agricultural Station. It chiefly attacks the crop through infected seed material. The seed material may be disinfected by immersion in a bath of corrosive sublimate. As corrosive sublimate is a deadly poison* when swallowed by man or beast, great care must be exercised in handling it. The corrosive sublimate solution should be of the strength of one part mille (2 oz. to 15 gall. of water). The bath should be about an hour and a half long, although some variation in time is immaterial. Cutting and planting is done as usual. The result of the treatment is a crop essentially free from surface blemishes, and of greater market value. Sometimes a considerable increase in yield results from the treatment. The method is easily and cheaply applied, and is worthy of extended trial. (Abstract of paper published by J. C. ARTHUR in *Bulletin Purdue Agricultural Experiment Station*, August, 1895.)

"MESNY'S CHINESE MISCELLANY."—We have received the first number of this publication, published at Shanghai, and destined, as it appears, to be an encyclopædia of things in general concerning China and the Chinese. The author, having lived more than thirty years in various parts of China, one-half of the time entirely isolated from all foreigners, speaking nothing but Chinese, in constant communication with the highest officials, holding

* An antidote that is probably as good as can be had ready at hand is the white of egg. But no remedy can be of service unless administered without delay.

social intercourse with all classes of the people, travelling extensively by land and water throughout the whole of the eighteen provinces of China proper, note-book in hand, and keeping a journal of all his movements and experiences, has acquired an intimate knowledge of the manners and customs of this peculiar people, and accumulated a vast amount of the most useful and most interesting information, which will now for the first time be placed before English-reading people in the handiest form imaginable, and on the most reasonable terms." The first number, so far as it goes, certainly justifies the author's claims, but it also shows that the services of a competent editor are needed to digest, condense, arrange, and in some places to correct the vast mass

The Chinese name for this plant, it appears, is Anxious Desire, in reference to "the sorrow of some widow who wept under one of these trees [climbing shrub, rather] and died of her grief." Acacia concinna, the Mimosa saponaria of Roxburgh, is mentioned on account of its pods, which contain a detergent principle which enables them to be used in place of soap. A nemu is indicated as a sensitive plant, the bark of which is used for medicinal purposes.

THE ROYAL GARDENERS' ORPHAN FUND.—A meeting of the executive committee of the above took place at the Hotel Windsor on the 29th ult., Mr. WILLIAM MARSHALL in the chair. The following

£2 10s. It was resolved that the annual meeting and election of orphans to the Fund should take place on Friday, February 21 next. The usual vote of thanks was passed to the chairman for presiding.

IMPORTATION OF HORSE-RADISH.—Of all the garden and farm products unnecessarily imported into this country, there is none to our mind less warranted than that of Horse-radish, which comes into Covent Garden in huge barrels from Holland and Germany. The subject was incidentally referred to at the Drill Hall, on Tuesday week last, when Mr. MASON was speaking about Asparagus culture. That gentleman has grown Asparagus and Horse-radish for market during many years, but has always to combat this extraordinary prejudice in favour of Horse-radish from Holland. Is the imported root of better quality? Not a bit of it! The roots are admittedly larger, but they are correspondingly less effective, and Mr. MASON declared he could eat a quarter of a pound of it without it causing him to weep! English roots are smaller and very much better in quality, yet these may often be seen lying in Covent Garden lacking a purchaser, for the very reason that they are English. Surely the ways of the British public are incomprehensible. Can the moral be this: that British growers, if they desire the confidence of their countrymen, must give them Horse-radish that will not cause them to weep?

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, December 9, when a paper will be read by Mr. F. PUNCHARD (Fellow), entitled "The Working of the Agricultural Holdings Act, 1883." The chair will be taken at eight o'clock.

PUBLICATIONS RECEIVED.—From the New York Experiment Station, *Bulletin*, No. 91, for August, 1895, including papers on "A New Strawberry; Strawberries, Raspberries, Blackberries, and Dewberries."—*Bulletin of the Botanical Department, Jamaica*, vol. ii., Part 9, the contents include papers upon "Essential Oil of Orange, Cultivation of Cocoa, Cultivation of the Coconut, Chemical Selection of Cane, and Synoptical List of Ferns."—*Report on Government Botanical Gardens, Saharanpur and Mussooree*, for year ending March 31, 1895. Satisfactory in spite of an unfavourable season as regards weather.—*Landbouwkundig Tijdschrift* (agricultural journal), onder redactie par Prof. Dr. J. Ritzema Bos, Mr. A. D. Van Assendelft de Coningb, Prof. Dr. Adolf Mayer en Dr. A. M. Prins, Ad. 6. Te Groningen Bij, J. B. Wolters.—*The Quiver*, for November. First part of a new volume, and quite up to the usual standard of excellence.—*Nature Notes*, for November, contains as usual many jottings interesting to lovers of natural history.

PLANT PORTRAITS.

ADIANTUM LINEATUM, *Illustration Horticole*, October 30. Segments of fronds broad, cuneate lanceolate undulate, dark green, veined with white.

ARETHUSA DULBOSA, *Meehans' Monthly*, August.

BEGONIA FAUREANA, *Illustration Horticole*, October 15. Leaves oblique deeply palmately lobed; lobes lanceolate, dark green, mottled with lighter green spots.

CHRYSANTHEMUM M. CHENON DE LECHÉ.

This is one of the best and most attractive of the newer varieties of the Chrysanthemum. Its refined character will make it popular with everyone desirous of encouraging such a class of bloom to the exclusion of extra large flowers which combine with them a

FIG. 113.—CHRYSANTHEMUM M. CHENON DE LECHÉ.

COLOURS: ROSY BUFF UPON A YELLOW GROUND, AND THE TIPS OF THE FLORETS, YELLOW.

of varied information collected by the author. A classified index at the end of the year will also be requisite. Mr. MERRY notes the singular accuracy of the narrative of MARCO POLO, in whose tracks he has in many cases travelled. The items of information presented to us in this first number are so numerous and so varied, that we have a difficulty in making any selection suitable for our readers, but in justification of our remark as to the need of an editor, we may mention that the seeds of *Abrus precatorius* are described as "barries." This statement is more than a mere technical error, as it leads to a statement that TATARINOF fell "into the popular error, and confounds this "berry" with a genuine species of Bean perfectly distinct." The seeds, which are perfectly well described by our author, are in reality very closely allied to Beans, and are contained like them in a pod or legume.

special receipts were announced: Rugby Chrysanthemum Society, sale of flowers, £5 2s. 6d.; Mr. F. Miller, Margate, £1 10s.; Mr. G. Harvey, Stanton in Peak, £1 5s.; Mr. Malcolm Dunn, £1 1s.; Mr. J. Miller, Ruxley Lodge, 10s.; Young Gardeners at Raxley Lodge, 10s.; Mr. H. A. Burberry, Birmingham, 15s.; and Mr. J. Lemmon, Elm House, Chichester, 5s. From boxes, the following sums were announced:—Par Mr. T. Turner, Royal Horticultural Society's Gardens, Chiswick, 16s. 1d.; Mr. G. T. Cole, Charters', Ascot, 16s.; Mr. J. McLeod, Roehampton, 15s.; Mr. R. Scott, Bradford, 14s. 2d.; Chislehurst Gardeners' Association, per Mr. J. Lyne, 10s.; Mr. A. D. Christie, Ragley, Alcester, 5s.; Croydon Chrysanthemum Society, per Mr. W. B. Beckett, 21s.; from boxes for viewing the collection of Chrysanthemums at The Grange, Wallington, per Mr. G. W. Cummins.

certain amount of roughness. A pure reflexed Japanese variety, the colour is a beautiful rosy-buff upon a yellow ground, the tips of the florets yellow, and the reverse of the same colour. There is a distinct and attractive appearance about the flower not easy to describe. The florets are very long, regular, and of average width. Mr. W. Wells, of Earlswood Nurseries, Redhill, to whom we are indebted for the photograph, informs us that the plant is an excellent doer, and grows only about 4 feet high. The bloom represented by fig. 113, is one of two that were produced by a plant in Mr. Wells' nursery that only arrived from the raiser (E. Calvat) in March last. One of these blooms was included in Mr. Wells' collection of forty-eight at the Aquarium, and the other one was shown in competition at the Hall exhibition. The larger bloom measured exactly 8 inches across, and was about 5½ inches in depth. The variety has been certificated during the present season by the National Chrysanthemum Society, and an Award of Merit has been conferred upon it by the Royal Horticultural Society. It may be useful to add that the variety does not exceed upon the "first crown" bud, and is in this particular dissimilar to the excellent *Boule d'Or '95*.

HOME CORRESPONDENCE.

DAPHNE INOICA RUBRA AT BERKELEY CASTLE.

—Amongst the many features of interest at Berkeley Castle is a perfect hedge of *Daphnes*, growing in one of the houses, planted out in a border. I consider them wonderful examples of cultivation, being the picture of healthy development, well furnished with branches down to the ground, with many hundreds of trusses of sweet-scented flowers, dispensing the fragrance around. These plants average 5 feet to 7 feet in height and breadth, and as much through. Mr. Shore informed me that the largest were struck from cuttings fourteen years ago; all of them are on their own roots (not grafted). He keeps propagating them in this way, and the plants of less than one year old are 1 foot in height, proving that on its own roots, when properly grown, *Daphne indica rubra* is a valuable plant for winter flowering. At Berkeley the plant is freer than any grafted plant I have ever observed. The Cyclamens, Primulas, Carnations, and Chrysanthemums are very attractive just now, all being well done. *Rusticus*.

CRABS AND APPLES IN PLEASURE GROUNDS.—

Your correspondent "D. T. F." does well to recommend the use of these plants in pleasure grounds, and more especially for arches. I can imagine that the effect would be very charming. I think it a great pity that Crabs and Apples are not planted more extensively in pleasure gardens; for if the trees were placed in suitable positions, the effect in the spring time would be very gratifying, and in the autumn a source of pleasure, especially where varieties fit for dessert would, &c., also planted were used. We have this autumn planted several good varieties of dessert Apples to form a background to beds of Lilac and Laburnum in the grounds here, but I should not advise Crabs for this purpose, especially *Pyrus Malus baccata* on account of its habit to run upwards. This variety is more suitable for woodland scenes or any place where its slender form would correspond with the immediate scenery. *George Burrows, Berwick Gardens, Shrewsbury.*

NATIONAL CHRYSANTHEMUM SOCIETY.—

In view of the Jubilee exhibition of this society next year, and whilst there is ample time for the consideration of the matter, is it not a very pertinent question to ask, whether a much more appropriate place cannot be found than the present quarters of the society for its annual display? It would be difficult to find a more unsuitable spot for the effective display of the flower, associated as it is with surroundings that (to take a very charitable view) are not conducive to the proper enjoyment and critical examination of the exhibits. The arrangements (perhaps in some respects unavoidable) were this season bad enough in all conscience. What will they be next year with an over-dow exhibition, necessarily incident on a greatly augmented schedule of prizes? I know I shall be met at the outset by upholders of the present arrangements with the

rejoinder, that the Aquarium is a central spot, and that, from the board of management, the National Chrysanthemum Society is treated with a liberality in respect of the all-important financial aspect of the case, that would not be possible elsewhere. But, surely, if the National Chrysanthemum Society can raise £1000 for prizes (is such a sum really needed?) next year as it proposes to do, it can, amongst its numerous—and, in many respects, wealthy—supporters, raise sufficient for the hire of a suitable hall in a central spot, minus the objectionable surroundings attaching to its present place of exhibition. I believe that, with a really earnest and determined effort to bring about this much-to-be-desired state of affairs, success would crown such endeavours, the jubilee exhibition would be a red-letter-day in its career, and the National Chrysanthemum Society would secure practical support from a not unimportant number who at present hold aloof from it by reason of present associations. What say your numerous readers who are interested in the cultivation and popularisation of the Golden Flower? and that it should have a worthy place of exhibition. *Mum.*

CARYOPTERIS MASTACANTHUS.—In the number for October 26, 1895, "W. W.," *apropos* of *Caryopteris Mastacanthus*, writes that probably that shrub will require to be well sheltered during the winter, save in any privileged parts of England. In the environs of Paris the plant resists well in *pleine terre* during the winter planted a little deeply. I have seen in the late spring some plants of that shrub that had been forgotten in a border at the preceding autumn come up strongly. The stems had quite decayed, but the roots had not suffered, notwithstanding a cold in Ghent of 17° Réaumur below zero. Consequently I consider the plant quite hardy. The plant is an excellent bee plant. During the season of flowering from July to the middle of October, I have seen every day thousands of honey-bees visit a group of *Caryopteris Mastacanthus*, and they gave a continual movement to the plants by their going to and fro. It is also an elegant plant for the ornament of the gardens, on account of its long period of flowering. *V. A. C., Ledeburg, Ghent.*

CHRYSANTHEMUM GOLDEN WEDDING.—My experience with this variety during the present season enables me to endorse the remarks made respecting it by Mr. W. H. Divers in your last issue. Like many other growers, until this season I failed to grow it satisfactorily, and felt inclined to discard it altogether; but by adopting a different course of treatment, I have this year produced some excellent blooms, measuring 8 inches across by 5 deep. The colour of this variety is very attractive, and for decorative purposes one of the best. Cuttings were inserted singly in thumb-pots on December 15 last, cool treatment being given from the commencement. The plants were stopped during the second week in April, two breaks only being reserved, crown buds being taken. Compost used in potting was of a light rich nature, very little artificial manure being given during the season. The final shift was to 8-inch pots. *H. Warren, Aston Clinton Gardens.*

A HEAVY CROP OF POTATOS.—I have been scanning the columns of the *Gardeners' Chronicle* during the past few weeks to find the weight of a Potato crop from a given area, which might enable me to form a comparison with the crop grown at this place, the varieties are Sutton's Satisfaction and Beauty of Hebron, planted side by side, and each occupying exactly 2 square rods of ground. The sets of Sutton's Satisfaction were planted 18 inches apart, and the rows were 4 feet apart, and the produce weighed 6 cwt. 7 lb., equal to 24 tons 5 cwt. per acre. The tubers were large and of good shape, many of them weighing 2 lb. 4 oz. each. Beauty of Hebron, planted on the same day, at 12 inches apart, and the rows 3 feet, yielded 4½ cwt., or 19 tons per acre. The tubers are of good shape, but not so large as those of Satisfaction, and the heaviest tuber weighed 1 lb. 10 oz. Ours is not considered a good district for the Potato, and this crop is looked upon as exceptional here, although in more favoured localities it may not be uncommon. I may add, that these Potatos were planted to illustrate in a small way the advantages gained by giving the plant plenty of space. *T. Leith, Herriard Park, Basingstoke, Hants.*

COX'S ORANGE PIPPIN.—I have four standard trees of this popular Apple, planted eighteen years ago, which this season produced twenty-seven bushels. They sold for 4s. 6d. per bushel, as they were neither

large nor well-coloured, and I was assured that plenty such could be bought for 3s. 6d. The nett returns for mine came to £1 per tree, but previously 5s. per tree would be about the amount. The fact is, commoner sorts have hitherto paid best. There is an old tree in my orchard which crops regularly in alternate years, and which has produced Apples to the value of £5 in one season. I believe they are Curtailes, a sort no one would plant now—an extra crop should be always rewarded with an extra allowance of manure. *Mid Kent.*

CYCLAMEN CULTURE.—Cyclamens, under ordinary good treatment, that is, with due regard to shading, the supply of moisture to the plants overhead during hot and drying days with a fine spraying-can, a free circulation of air, the avoidance of cold draughts, with abundance of water at the roots, aided by the favourable weather we had in the autumn, have grown into splendid specimens. The growth, which is always free during August and September, was this season quite exceptional, and not a few of the plants have required shifting from 5 inch into 7-inch flower-pots. Our plants have profited by an application or two of weak soot-water, and of the following mixture, viz., two parts Peruvian guano, one part nitrate of potash, one part sulphate of ammonia, and three parts mineral superphosphate. The above ingredients should be passed through a very fine-meshed sieve, in order to get them well mixed together. Half an ounce of this mixture put into 1 gallon of water will be sufficiently strong, and it may be afforded the plants once a week. It may also be applied as a top-dressing at the rate of 1 oz. to ten plants standing in 5 inch flower-pots; but the former is the safer method of using it. The Cyclamen has many valuable properties over and above the average of florist's flowers; it is free-blooming, has a compact habit of growth, handsomely-marked leaves—which in themselves ought to recommend it for house and table decoration—and the flowering-plant lasts so long in the sitting room, producing, as it will, a succession of bloom from October to November—enough good qualities to put it in the foremost rank. It was feared at one time, that as the flowers increased in size, there would be a decrease in the number of them; but the large-flowering varieties bloom just as profusely as the small ones, and many of the blooms have from five to nine petals, and these from 1½ to 2 inches in length, and 1 inch broad, with colours from very deep shades of purple and crimson, rose and pink, to the pure white. *A. E. N. George, The Vineries, Milton.*

ROSA RUGOSA FOR GAME COVERT.—Is not "H. J. C.," of Grimston, Tadcaster, slyly "poking fun," when he suggests *Rosa rugosa* for game covert. No doubt an acre or two of this beautiful flowering plant or shrub would have a fine effect, especially when in bloom, and the growth had attained some 5 to 6 feet in height, and would also provide shelter for some kinds of game; but how about the dogs and sportsmen that had to drive and get them out? I have a vivid recollection of pushing through furze-bushes when rabbit-shooting on the south Downs, and also remember the difficulty of getting the dogs to enter at all where the furze was thick; and the half-blinded state of some of them from the thorns driven into their flesh and eyes as they dashed after their game. But this, I take it, would be surpassed by the thorny barrier of *Rosa rugosa*; at least, I think so, and if each covert was at all high and dense, I for one would forego the pleasure of shooting among it, and not risk my dogs' eyes by turning in any that I cared for. Let any one try a few hours in a bramble covert, and then possibly they would get a small idea of what *Rosa rugosa* would be like—when it was *Rosa rugosa*, and nothing but *Rosa rugosa*. I have seen *Barberis aquifolia* employed with good effect, and the berries were useful as food for the birds; but the most beautiful covert, to my thinking, is that made by the *Rhododendron*. Some forty years ago, I saw one of about 4 acres at Lord Derby's in Knowsley Park. The shelter was good and dry under the rich dark green-coloured foliage, and then the wealth of bloom in varied colour was a sight once seen could never be forgotten. It was lovely; the pheasants covered beneath, and the rabbit scuttled here and there, with now and then a moorhen or a landrail, all added life to the scene, but even this would have been better had it been "broken up" by a few "rooting-trees," such as *Alies* or *Pines*. For my own part, I do not think any shrub so full of thorns as is the *Rosa rugosa*, or even our own beautiful Dog Rose or

Sweet Briar, does for, or would make a good enjoyable covert, by reason of their protective thorns, which are both numerous and sharp. *Harrison Weir*.

— In response to your correspondent's enquiries regarding the above plant as a suitable one for game coverts, I may say the experience gained here with it is not satisfactory, the rabbits eating the bark off to the height of about one foot, the branches thereby dying off to the ground level. They seem to prefer Laurel, Berberis, and Holly, but *Rosa rugosa* is not exempt from their attacks. If "H. J. C." will kindly give the names of a few plants he has found to be rabbit-proof, I should be greatly obliged. *L. Pope, Carlton Hall*.

— I fear "H. J. C." will be disappointed with the above-named *Rosa* for game covert. Three years ago I planted several hundreds, thinking it would be proof against the ravages of that troublesome little creature the rabbit, but no sooner had they been planted than the tips of the shoots were bitten off, and they have kept nibbling at them ever since, until only a few miserable stumps remain. A bed planted two years ago and protected with wire-netting, is now over 3 feet high. It commenced flowering early in June, and continued flowering until the first of the hews were quite red, and was admired by many. *G. Duncan, The Gardens, Letham Grange, Arbroath*.

A CODE OF JUDGING.—If Mr. Patterson will wait but a week or two, he will have an opportunity of obtaining a copy of the code of judging which the committee appointed by the Council of the Royal Horticultural Society for the purpose have prepared, and which is now in the printer's hands. Whether when published it may be found capable of satisfying all requirements, remains to be seen; but the committee have devoted many sittings and much time and labour to its preparation. Presumably, it will be issued in pamphlet form, and at a cheap rate. I trust everyone interested in the subject will secure a copy, and assist, so far as possible, to make the code recognised as the best exposition of exhibition law. *A. D.*

— The case mentioned by Mr. Patterson, p. 653, seems to have been due to the bad judgment of the committee in appointing a judge who did not know his duties. Codes of rules would be of no use to such a person; a good judge must have a practical acquaintance with his work, especially in the case of vegetables and fruit, and such persons are within reach of every horticultural society in the kingdom. When a man has grown things intelligently for a few years, he knows where to look for the weak points, and especially if he has been an exhibitor also. *W. H. Divers, Belvoir Castle Gardens, Grantham*.

EULALIA JAPONICA.—I should like to know if it is unusual for *Eulalia japonica* to flower? I have several large clumps which have been in my nursery for at least ten years, which have never flowered till this year. I am surprised this plant is not commonly cultivated, as it makes a very handsome clump, and more especially when carrying its long plumes of inflorescence. I find it to be much harder than the Pampas Grass, the severe frosts of last winter not affecting it in the least degree. *C. Cundy*.

THE COW PARSNIP (*Heracleum Sphondylium*).—I was much surprised a short time ago by seeing this plant cultivated by a friend of mine who has about one acre of it, and to hear of the large quantity of green food that it produced. My friend told me that he had two heavy crops last year, and after cutting it once this year, he was letting it run to seed. I read in the *Treasury of Botany* it is a plant that is best treated as a biennial. I should be glad to have the experience of some one who has cultivated this plant, and if it may be considered good food for cattle. My friend seems to think it an excellent food. If so, I wonder that it is not commonly cultivated as fodder. I know rabbits and pigs are partial to it. *C. Cundy*.

GAS-LIME AS A MANURE.—I note with some interest what Mr. John Lambert states in reference to the use of gas-lime as an antidote for club in Cabbages, and for the extirpation of wireworm. In lecturing to cottage and allotment-holders, many complaints are made as to the ravages of the wireworm, and the occurrence of clubbing in Cabbages and Cauliflowers. If I understand Mr. Lambert rightly,

he recommends the use of gas-lime in a crude state, just as it comes from the gasworks. It is true that he recommends its application in very small proportions, but I have met with allotment-holders who have applied it to their land just in the form in which it is received from the works, and then found it very difficult to grow anything on the land for a year or two. It is no doubt a useful agent, destructive to insect-life when used as recommended by Mr. Lambert; but my fear is, lest some might put too large a construction upon his words, and apply it unwisely, and with unfortunate effects. Mr. W. G. Watson, in his admirable paper on "Manures and their Uses," tells us that gas-lime "is a mixture of calcium hydrate and calcium carbonate, with sulphite of lime. The two latter compounds are in themselves poisonous to plant-life, but they are both converted into gypsum or sulphate of lime (a plant-food), by exposing the gas-lime to the action of the atmosphere." It may and, I fear, does happen, that when gas-lime is applied in a crude state as received from the gasworks, the two compounds, poisonous to plant-life, are present in undue proportions in the interests of safety, hence the unfortunate results which I have heard allotment-holders deplore. Mr. Watson further states:—"To prepare fresh gas-lime for use in the garden, it may be spread out on a layer of pond-mud, night-soil, or coarse vegetable refuse, and exposed to rain and air." This I hold to be sound and necessary advice. If put on cleared land in the autumn, it can be laid upon the surface at the rate of 40 lb. or so per rod, but it should lie on the surface for several weeks before being forked in, taking care that it is distributed equally through the soil. It is undoubtedly a powerful remedial agent in clearing land of insect-life, but needs to be applied with caution. *R. D.* [It is doubtless safest to use gas-lime after some weeks' exposure in the open for surface-dressing, or when applying it to land dug to one spit in depth; but in the case of dressing the bottom soil in trenching and incorporating with the top spit, which is usually thrown into the bottom of the trenches in the small quantities recommended by Mr. Lambert, no harm, but rather good, would result from the use of gas-lime in the fresh state. *Ed.*]

PACKING COMPETITION AT THE CRYSTAL PALACE.—Possibly no fresh light may be thrown now upon this subject, but I am disposed to agree with "One of the Judges" in his remarks on the same. If a practical gardener who has constantly to pack his produce is not capable of judging in such a case, I do not know who is. Some few years back at Chiswick the judging was done by the fruit committee and others there present as a body. That was certainly not so satisfactory as at the late show, from the simple fact that some of those called upon to adjudicate had no practical knowledge of packing fruit for transit as per schedule. Had it been otherwise the premier award would not have been made to one of two boxes entered for two classes, these being sent tied together. In this way the larger one, by reason of its size and weight, was a protection to the smaller and successful one. In this respect I cannot agree with Mr. Harris, who fails to see why disqualification should follow because the entries in two classes were sent tied together. Most assuredly it should do so, and the judges did quite right in thus using their powers to disqualify an exhibit. In packing for market, moss may be, and no doubt is, one of the best packing mediums, but it does not follow that it is so in every case. Personally, I consider wood-wool preferable, from its freedom from dust, and it certainly is more cleanly in appearance; whilst in regard to spotting being caused by its use, there need be no fear, if the fruit does not remain packed after arrival, which in private use would not be the case, although in market use it might do so. It is not the fault of the judges if the schedule be not sufficiently explicit for intending competitors. In giving their awards, they must interpret it to the best of their ability, and intending exhibitors should do likewise. I inspected the schedule before the late show was held, with the intention of entering in the class for Grapes; but upon consideration I decided not to do so, simply because the wording was, in my opinion, somewhat vague. It certainly afforded a loop-hole for those who were disposed to take advantage of it, of bringing the fruit themselves. This has been done I know, but it should not be allowed. In this respect I am at one with Mr. Grindrod. In my opinion there should be classes for market as well as for private packing in these competitions. *A Prize Packer*.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

Nov. 26.—Present: Dr. M. T. Masters (in the chair); Mr. Michael, Professor Müller, Dr. Bonavia, Esq. W. Wilks, and Rev. G. Henslow, Hon. Sec.

Flies Attacked by Fungus.—With reference to the specimens exhibited by the Secretary at the last meeting, it was reported from Kew that "the fungus is *Empusa culicis*, A. Braun (*Alg. Unicell. gen., Nov.*, p. 105). It is common in various parts of Europe, also in the United States, but not previously recorded for Britain." The specimen was prepared by the late Professor J. S. Henslow in 1810.

Apple Diseased.—The black-coated Apple brought to the last meeting proved to be attacked by *Sclerotinia fructigena*, Rehm. (*Krypt. Flora, Discov.*, p. 67). The minute black lumps on the Apple are the sclerotia of the fungus, from which the asclegerous Peziza form grows. Negligence in spraying during the spring season, when the fungus is on the leaves only, accounts for its presence on the fruit.

Cocor Fruits.—The fruits exhibited at the last meeting proved on further investigation to be of *C. eriopatha*, and not of *C. australis*, as supposed.

Carnations Attacked by Grubs.—Professor Müller exhibited a number of weevil-like grubs which attacked the roots of *Dianthus celsialis*, completely destroying the stem, so that the upper part became detached. They were forwarded to Mr. McLachlan for examination, who has reported that they are probably those of *Hylemyia nigrescens*, of the group Anthomyiidae of dipterous insects.

Vine Stems, Malformed.—Dr. Masters exhibited portions of Vine stems with hypertrophous growths of a tumorous appearance. There did not appear to be any fungus, but they consisted of new cork and wood only. Similar appearances had been seen on Marechal Niel Roses. It was probably due to some injury, perhaps frost, with a subsequent effort to heal the wound.

Hybrid Abies.—Dr. Masters also showed a branch from a hybrid between *Abies Pinsapo* (female), and *A. cephalonica* (male). An intermediate character was seen in the position of the resin canal, in that while in *A. ceph.* it is situated adjoining the epidermis and in *A. Pins.* it is more deeply seated, in the hybrid there was one layer of cells between the canal and the epidermis. The general form and habit more nearly resembled *A. ceph.*, while the strong branches and thick leaf approximated *A. Pins.* The cones, however, with very visible bracts, were those of *A. ceph.*

EXETER GARDENERS' ASSOCIATION.

NOVEMBER 27.—The fortnightly meeting of this association was held in the Guildhall on the above date, when there was a good attendance. Mr. Hill, market gardener, Whiptoo, occupied the chair. The business of the meeting was a discussion on Judging at Flower Shows, Mr. Rowland, gr. to W. Brock, Esq., of Parker's Well, leading by a well-thought-out paper.

Mr. Rowland, in the course of his remarks, alluded to the difficulties that could not well be avoided. When a judge began his duties, he then, perhaps for the first time, got the schedule put into his hands, but unless he had carefully considered it before beginning his work, he was liable to fall into errors arising out of the special conditions of competition in the various classes being sometimes carelessly expressed. The occasional necessity, according to the wording of the schedule, of disqualifying an exhibitor, led to dissatisfaction, and the malcontents airing their supposed grievances, made things pretty unpleasant for the judge. In the necessarily limited time allowed for making the awards, points, apparently trivial, but really important, were overlooked, and, ignoring the hampering surroundings, the critics pounced upon any small discrepancy, and railed against the judges. He, therefore, thought there ought to be one or two referees to follow and check any oversight on the part of those who were responsible for making the awards, so that the error might be there and then corrected. As regards *Chrysanthemums*, it was difficult to compare a large showy bloom with a more refined and equally meritorious flower, though the latter might suffer in comparison as regards size or outward attractiveness. To remedy this, he suggested that in a class of, say, thirty-six blooms, twenty should be named in the schedule, then flower for flower of the same variety could be compared and adjudicated upon.

A long discussion followed, taken part in by Messrs. Protheroe (Beaufort House), Weeks (Stoke House), Lansdale (amateur), Carlyle, Hope, and others.

The society settled the arrangement of their schedule for their spring show, to be held on March 18, and also agreed to the annual supper of the society being held on the first Friday in January.

A vote of thanks to the chairman, and to Mr. Rowland for introducing the discussion, was passed.

Mr. Outram, who has travelled in the horticultural interest for over twenty years in the United States, promised to give a paper in the spring on "The Progress of Horticulture in America." The paper for the next fortnightly meeting was announced, being one by the Dowager Countess of Morley's gardener, the subject "Wild Gardening, and the Laying-out of Pleasure Grounds."

CHESTER PAXTON SOCIETY.

NOVEMBER 19, 20.—The annual Fruit and Chrysanthemum exhibition was held in the Town Hall, under the auspices of the above society. This is the fifth exhibition which the society has held, and the entries each year have been better than those of preceding shows; on the present occasion, they were twice as many as last year.

Over 1,200 dishes of fruit were exhibited, consisting of Apples and Pears, whose superior quality was apparent at a glance; and the excellence was quite general.

The competition was very keen in the classes for Ribston, Cox's Orange, and King of the Pippins; and for kitchen varieties, it was even more so. Peasgood's Nonsuch, Alfriston, Mare de Ménsage, Blenheim Orange Pippin, Warner's King, and Wareham Russet were extensively shown, some fruits of the first-named variety being very fine.

The exhibition has, from its commencement, found much favour in Cheshire and North Wales; and competent judges now say that it is one of the largest exhibitions of hardy fruits held in provincial towns.

Pears were largely shown, and splendid examples of Louise Bonne of Jersey, Marie Louise, Pitmaston Duchess, and Doyenné du Comice, were noted.

Although this was the second occasion when the society has offered prizes for Chrysanthemums, the entries were fairly good, there being six competitors for decorative groups. Most of the classes for cut blooms were well contested, and the majority of the Japanese blooms were excellent. A notable feature was the keen competition in the class for the best-arranged box of cut blooms of single-flowered Chrysanthemums. In the gardeners' class for fruit, the chief prizes were carried off by Mr. E. SEVERN, gr., Combermere Abbey; Mr. J. SAUNDERSON, gr., Bodnant Hall, Denbighshire; Mr. WORKER, gr., Mollington Hall; Mr. JOHN TAYLOR, gr., Hoole Hall; and Mr. THOMAS WEAVER, gr., Christleton Hall.

A very fine collection of Apples and Pears, not for competition, was sent by Mr. BARNES, gr., Eaton Hall; and Messrs. DICKSONS had also a tastefully arranged stand of hardy fruits, Orchids, Ferns, &c. The Duke of WESTMINSTER in declaring the exhibition open, threw out the hint that a very good summer show might be established at Chester; and offered to help and supplement any effort that might be made in this direction. The whole of the arrangements were ably carried out by the Committee, with Mr. G. P. MILN as Secretary.

NATIONAL CHRYSANTHEMUM.

DECEMBER 3, 4, 5.—The last show of the year by the National Chrysanthemum Society at the Royal Aquarium formed a fitting finale to a very successful season. Rarely has the quality of the exhibitions been so high as during 1895. Commencing with the early autumn show, the blooms exhibited on that occasion were remarkable, and we wondered if better ones would be seen in November. In due time the excellence of the great annual show was acknowledged by all, and on the present occasion the Society may well be proud of the display made, for never has there been a finer collection of blooms shown in December than the 1st prize exhibit of twenty-four Japanese in eighteen varieties, from Mr. A. HAGGART. There was no class for groups at this late show, but the enterprise of the large growers was manifest in large miscellaneous collections of plants and flowers, very creditable to them. Cyclamens and Primulas added a little variety, and made the show more interesting. As the whole of the floor space had been appropriated to the ladies' bicycle races! the entire exhibition was held in the galleries.

CUT BLOOMS.

As we have already stated, the 1st prize in the principal class for cut blooms of Chrysanthemums was taken by Mr. A. Haggart, gr. to Mrs. JOHNSTON FOSTER, Moor Park, Ludlow, who secured other valuable classes also. It may be interesting to give the varieties he staged in this class. They were Etoile de Lyon, Ed. Molyneux, Niveau, Duke of York, Golden Gate, Mrs. Harman Payne, Mdlle. M. Hoste, M. Pancoucke, Lord Brooke, G. C. Schwabe, Madame A. Moulin, Mrs. W. H. Lees, Le P. du Bois, Vivand Morel, Beauty of Castlewood, Internationale, Robert Owen, and Mdlle. T. Rey. The 2nd place was taken by Mr. Henry Perkins, gr. to W. H. SMITH, Esq., Greenlands, Henley-on-Thames, in whose stand were good blooms of Madame Carnot, Golden Wedding, and Primrose League. 3rd, Mr. W. Mease, gr. to A. TATE, Esq., Downside, Leatherhead. There were eight exhibits.

Mr. PERKINS occupied the best position in the following class, which was for twenty-four bunches of Chrysanthemum blooms, of any varieties; 2nd, Mr. Jno. Aplin, gr. to W. M. BAKER, Esq., Hasfield Court, Gloucester; 3rd, Mr. C. J. Waite, gr. to the Hon. W. P. TALBOT, Glenhurst, Esher. The whole of the exhibits in this class had not the tasteful appearance the conditions were intended to encourage. In most cases the stems should have been left longer, and varieties selected with good stout stems and erect flowers. The blooms as they appeared in receptacles similar to blacking-bottles, had fallen, and were huddled together in anything but an elegant manner, and were object lessons in how "not to arrange a vase."

The best exhibitor among ten of twelve Japanese blooms, distinct, was Mr. HAGGART, Sunflower and Golden Gate were noticeable in his collection; 2nd, Mr. W. Messenger, gr. to C. H. BERNERS, Esq., Woolverstone Park, Ipswich; and 3rd,

Mr. JNO. APLIN, Mr. HAGGART won again in the class for six blooms, among ten or more exhibitors.

The principal class for incurved blooms, was one for twelve blooms, in not fewer than six varieties, and the quality of the exhibit was decidedly better than we had expected would have been the case—1st, Mr. W. NEVILLE, gr. to F. W. FLIGHT, Esq., Cornstiles, Twyford, Winchester. The best blooms were Lord Alcester, Mrs. R. O. Kingston, Chas. H. Curtis, and a seedling; 2nd, Mr. A. HAGGART; and 3rd, Mr. JNO. APLIN.

In the class for six blooms (incurved), Mr. H. PERKINS was the best exhibitor; and Mr. W. NEVILLE followed.

Another class for bunches of blooms was arranged for twelve bunches of Japanese blooms, in not fewer than six varieties. None of these classes was satisfactory, although some of the blooms were of good quality, 1st, Mr. R. C. NOTCUT, Broughton Road Nursery, Ipswich; 2nd, Mr. H. Alderman, gr. to GILLIAT HATFIELD, Esq., Morden Hall, Surrey; 3rd, Mr. S. J. Cook, gr. to T. H. HARRIDGE, Esq., Holmewood, Hendon. A similar class for six bunches was won by Mr. W. Slogrove, gr. to Mrs. CRAWFORD, Gaton Park, Reigate.

The single-flowered classes were pretty. The best collection of twelve bunches of large-flowered varieties was from Mr. G. W. Forbes, gr. to D. NICOLS, Esq., Regent's House, Surbiton, and Mr. W. C. Pogram, gr. to J. COURTENAY, Esq., The Whim, Weybridge. Mr. A. Felgate, gr. to Her Grace the Duchess of WELLINGTON, Burhill, Walton-on-Thames, had the best collection of twelve bunches of small-flowered single varieties.

Mr. T. TULLETT won in the class for six bunches of small-flowered single varieties, and the one for six bunches of larger-flowered ones.

Amateurs.—The amateur showing best collection of six Japanese blooms distinct, was Mr. H. LOVE, 1, Melville Terrace, Sandown, Isle of Wight. The best exhibit of a vase of Chrysanthemum blooms was made by Mr. D. B. CRANE, 4, Woodview Terrace, Archway Road, Highgate, whose arrangement of moderate-sized blooms, including some single ones, was praiseworthy. Mrs. W. GREEN, jr., Harold Wood, Essex, was 2nd.

Miscellaneous Plants.—The best collection of Cyclamens in pots was from the St. George's Nursery Company, Hsnwell, who had a very large table filled with plants, among which were interspersed a few foliage plants. 2nd, Mr. J. F. McLeod, gr. to J. P. MORGAN, Esq., Dover House, Bechampton. In the centre of Mr. McLeod's group was a panel formed of Adiantum Ferns, with a few pretty plants of Crotons and Dracænas. The best collection of twelve plants of Cyclamens was from Mr. McLEOD; 2nd, Mr. W. Ropley, gr. to H. GRINLING, Esq., Harrow Weald House, Stanmore, whose plants were all white-flowered ones.

The best collection of Primula sinensis, plants in flower, was shown by Mr. A. Newell, gr. to Sir EDWIN SAUNDERS, Wimbledon Common, and mixed with foliage plants the effect was pretty; 2nd, Mr. J. P. McGregor, gr. to Dowager Lady HAY, North House, Putney Hill. Mr. A. NEWELL had the best twelve Primula plants; 2nd, Mr. T. F. McGregor; and the best dozen double Primula sinensis were from Mr. W. Mease, gr. to A. TATE, Esq., Downside, Leatherhead. A very pretty collection of flowering, berried, and foliage plants arranged on a table, space 9 feet by 6 feet, was shown by Mr. W. Howe, gr. to H. TATE, Esq., Park Hill, Streatham Common, S.W.

Non-competitive exhibits.—The most important of these was a large group of Chrysanthemums arranged in a bold manner, with supplementary plants with decorative foliage, by Mr. H. J. JONES, Ryecroft Nursery, Lewisham. Mr. W. WELLS, Earlswood Nurseries, Redhill, had a group novel in arrangement, the background being composed of a cork-clad wall with pockets for Ferns, intertwined Ivy, and such things. In front of this there were between the mounds mossy spaces with trailing Ivy, suspended shower bouquets, &c. A large collection of cut blooms ran from the group on either side, and the whole was backed with white cloth. The arrangement would have been more effective if it had been more boldly carried out.

Messrs. G. PRICKETT & SONS, nurserymen, Tottenham, had a group of plants in flower of the variety L. Canning, a well-known white one suitable for late decorative work. Mr. NORMAN DAVIS, Camberwell; Mr. W. J. GODFREY, Exmouth; and Mr. BOB OWEN, Maidenhead, had each a good representation of novelties, and of the newer but known kinds. Mr. J. R. CHARD, Stoke Newington, exhibited his floral arches, &c.; and Messrs. CUTBUSH & SON, Highgate Nurseries, had a collection of flowering and foliage plants. Mr. A. MERRIDEN had arranged a dinner-table; and Mr. C. J. WAITE exhibited vegetables in a satisfactory manner.

Messrs. SANKEY & SONS, Bulwell Pottery, near Nottingham, had a large exhibit, representing different varieties of garden pottery; and Mr. W. COLCHESTER, Ipswich, had a displayed exhibit of Ichthemic Guano.

Floral Committee.

DECEMBER 3.—A goodly number of novelties was submitted to the Floral Committee, though but few awards were made. A First-class Certificate was gained by Mrs. Charles E. Shea, a delicate sulphur-white variety, raised by Mr. C. E. Shea, a fine and full deep incurving flower of high merit, from Mr. A. HAGGART, The Gardens, Moor Park, Ludlow. To decorative Golden Dart, as shown, a small sized deep yellow Japanese, full of promise for cutting purposes, and especially for market work, from Mr. E. H. JENKINS, Hampton Hill; and to decorative King of Plumes, a small yellow variety with feathered petals, very free and attractive, from Mr. R. OWEN.

Other promising flowers which, though falling upon this occasion to obtain awards, are yet of decided promise, are:—Decorative Janette Sheahan, a buff and gold sport from the

blush-coloured Princess Blanche, a large, well-flowered bush-plant being staged, from Mr. D. Sheahan, nurseryman, Wimbledon; a sport from the incurved Jeanne d'Arc, of which the committee approved, but which they requested to see again in better condition, from Mr. J. TAIT, Lynehow, Carlisle; Mrs. Flight, a seedling white incurved, from T. W. FLIGHT, Esq., Twyford, Hants, which the committee also wished to see again; Japanese Pearl Beauty, a very fine blush-coloured, broad-petalled incurved Japanese, solid, and full, from Mr. KING, Holmwood; Japanese J. W. McHattie, a very fine and full bright crimson flower, with an amber and gold reverse, which the committee wished to see again; this, with other novelties, come from Mr. R. OWEN, Maidenhead; and incurved Egyptian, from Mr. W. J. GODFREY, which the committee regarded as an incurved Japanese, chestnut-purple, with amber reverse.

A new design in flower-pots for large specimen plants of Chrysanthemums, from Messrs. R. SANKEY & SON, Bulwell, Notts, was commended by the committee.

The National Chrysanthemum Society enjoyed its annual dinner on the 27th ult., when it was celebrated with considerable enthusiasm at Anderton's Hotel, Fleet Street, one of the homes of the Society. Sir Edwin Saunders (President) occupied the chair, and there were present the officers of the Society, and a good number of Fellows. More interesting than the toast list (which was duly observed) was the presentation of the Medals and special prizes awarded at the recent great shows, which included the handing over of the two Holmes Memorial Cup to Mr. W. H. Lees. The Chairman, in proposing "The National Chrysanthemum Society," gave an interesting description of some of the political and social features of China, as the country to which we owe the introduction of the Chrysanthemum.

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

DECEMBER 2.—The fortnightly meeting of the above association was held in the Club Room at the British Workman on Monday evening last, Mr. WOOLFORD presiding over the largest gathering of members present at any of the meetings this season.

After the usual business had been disposed of, and a few introductory remarks from the chairmen, Mr. E. J. DEAL, of Messrs. SUTTON & SON's gave a highly interesting lecture on "The Garden Pea and its Varieties." The lecture was made doubly interesting and instructive by the many excellent diagrams prepared by Mr. DEAL, setting forth the peculiarities and variations of the shape of pods of the various types of Peas.

A very interesting discussion took place, in which Messrs. WOOLFORD, LEES, HINTON, BURTON, TURTON, DEARLOVE, BOWIE, TUGRALL, and ALEXANDER took part. Many questions were asked by members present, which the Lecturer ably answered. On the proposition of Mr. LEES, seconded by Mr. NEVE, a hearty vote of thanks was passed to Mr. DEAL, and the wish expressed that as the subject was of much interest, he would again take it up on a future occasion.

TREATMENT OF TREES RECEIVED DURING FROST.

I was speaking recently to a friend on the above subject, who pointedly remarked that "those who know their business send their orders early, and are not troubled about receiving frozen trees." Well, most of us are familiar with the advantages to be derived by sending early orders. Nevertheless, for reasons over which we have no control, we sometimes receive trees that are frozen, and then the question arises, what is best to be done with them? Several instances have come to my knowledge of trees, &c., received in this condition, being treated in a way (and that too by men commanding good positions as gardeners) which, when described, may appear incredible. A case referred to was that of some Peach trees, which on arriving at their destination, were found to have their branches and roots frozen through. They were at once unpacked, had their branches considerably shortened, and their roots trimmed, and then planted in two houses, where borders had been prepared for them; moreover, to make matters worse, the pipes were warmed in order to thaw the trees! I saw these trees the following autumn, and noticed they were very much gummed, and that their branches had died back to the stems, from which, however, young sappy wood was made—how these trees ultimately succeeded I had no opportunity of ascertaining. A second case refers to some Apple trees, which, when received in a similar state, were unpacked and laid in a south border, where they were thawed by the sun. They were subsequently planted, but some of them cankered, and none

did well—in fact, they became an eye-sore and were burned. Another case was that of some hundreds of Yew trees, which in transit by rail were much frozen. These, on reaching their destination, were thawed by warm water, and the following spring, after they were planted, nearly half of them were dead.

The following are particulars of a case that occurred here last winter, and refers to some dozens of Apples, Plums, Gooseberries, and Currants, which were ordered late for some new cottage gardens. These left a nursery on January 25 (the day the severe frost set in), and through an oversight, did not reach here for several days, when they were severely frozen. They were in bundles, surrounded with straw, which was not removed.

The above remarks on various modes of treatment may be at least a guide to the uninitiated how to treat and how not to treat trees, &c., when received in a frozen condition. They prove that artificial thawing is disastrous, and that the only safe course to take is to leave the plants in their packages, keep them from air in the dark, and safe from further frost, until they are naturally thawed, when, as the first opportunity offers, they should be planted.

named. There is, however, a singular variety of colour, as also in picturesque character, in the varying forms of chilensis; and besides, these latter are earlier to bloom, and have their own special value on this account. J.

Obituary.

LADY LAWES.—It is with deep regret that we record the death, at the age of 73 years, of Lady Caroline Lawes, the wife of Sir John Bennett Lawes, Bart., of Rothamsted, who expired on Friday afternoon of last week (the 29th ult.), after a comparatively short illness, at their Scottish seat, Ardchallan Priory, Lock Etive, Argyllshire. The body of the deceased lady was conveyed to Harpenden, and interred in the parish churchyard on Tuesday last.

TRADE NOTICE.

FAILURE OF A SHROPSHIRE SEEDSMAN AND FLORIST.

THE failure is announced of Mr. Robert Porter, seedsman and florist, of The Cross, Oswestry, and of the Rose Hill, Whittington, and Fron Selattyn Nurseries. The statement of affairs shows the gross liabilities to be £3736 5s. 9d., expected to rank £1700 15s. 9d., and assets £2633 12s. 1d., leaving a surplus of assets of £932 16s. 4d. The debtor alleges as the cause of failure, ill-health for the last four years, general depression in trade, keener competition, and difficulty of collecting accounts.

Messrs. MESSENGER & Co., horticultural builders and hot-water engineers, have removed their business operations to extensive new premises recently erected, close to the London & North-Western railway station at Loughboro'. The new buildings occupy a site 2 acres in extent.

MARKETS.

COVENT GARDEN, December 5.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots such as Adiantum, Aspidistra, Chrysanthemums, Cyperus, Dracena, Ericas, Evergreen Shrubs, Ferns, and various foliage plants.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for various fruits including Apples, Grapes, and Pine-apples.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for cut flowers such as Arums, Azalea, Bouvardias, Carnations, and various orchids.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table listing prices for vegetables such as Cauliflowers, Mushrooms, Cucumbers, Onions, and Tomatoes.

POTATOS.

Trade slow supplies heavy. Snowdrops, 70s. to 90s.; Hebrons, 75s. to 85s.; Bruces, 45s. to 60s.; Black lands, 30s. to 45s. J. B. Thomas.

SEEDS.

LONDON: December 4.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that the seed market to-day presented no new or striking feature. A few occasional sales of Clover seed, &c., are taking place, but as yet no general country trade has sprung up.

FRUITS AND VEGETABLES.

BOROUGH: Dec. 3.—Quotations:—Cabbages, 2s. to 3s. per tally; Savoy, 3s. 6d. to 5s. do.; Carrots and Turnips, 2s. to 2s. 6d. per dozen bunches; Onions, 2s. 6d. to 3s. 6d. per bag; Horseradish, 1s. to 1s. 6d. per bundle; Apples, 3s. to 6s. per bushel; Chestnuts, 6s. to 6s. 6d. per bag; Walnuts, 4s. to 4s. 6d. do.

SPITALFIELDS: Dec. 3.—Quotations:—Cabbages, 4s. to 5s. per tally; Collards, 1s. 6d. to 2s. 6d. do.; Leeks, 1s. to 1s. 6d. per dozen; bunch Greens, 1s. 3d. to 1s. 6d. per dozen; Savoy, 3s. to 5s. per tally; Cauliflowers, 5s. to 6s. do.; Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do., 2s. 3d. to 3s. 6d. per bushel; Beetroot, 1s. to 1s. 3d. per bushel; Parsnips, 6d. to 9d. per score; Carrots, 7s. to 8s. per dozen; Horseradish, 1s. to 1s. 2d. per bundle; Apples, cooking, 3s. 6d. to 4s. per bushel; do. dessert, 4s. 6d. to 5s. per bushel; —Cookers are Queens and Northern Greenings; dessert, Blenheim and King Pippin.

STRATFORD, Dec. 3.—There has been a plentiful supply of all kinds, and a fair trade done, except in Potatoes, which is a slow trade. Collards, 1s. 3d. to 1s. 9d. per tally; Savoy, 3s. 6d. to 4s. 6d. do.; Greens, 1s. to 1s. 3d. per dozen bunches; Cauliflowers, 1s. to 1s. 3d. per dozen; do., 4s. 6d. to 6s. per tally; Scotch Kale, 9d. to 1s. per sieve; Turnips, 1s. 6d. to 1s. 9d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 24s. to 28s. do.; do., cattle-feeding, 18s. to 24s. do.; Parsnips, 40s. to 45s. do.; Mangels, 11s. to 12s. do.; Swedes, 14s. to 17s. do.; Onions, English, 80s. to 90s. do.; do., Dutch, 2s. 9d. to 3s. per bag; do., Ports, 4s. to 5s. per case; Apples, English, cookers, 2s. 6d. to 3s. 6d. per bushel; do., dessert, 2s. 6d. to 3s. 6d. per sieve; do., Nova Scotian, 12s. to 14s. per barrel; Pears, English, 2s. 6d. to 3s. 6d. per sieve; Beet-root, 2s. to 2s. 6d. per bag; Horseradish, 1s. to 1s. 3d. per bundle; Parsley, 1s. 6d. to 2s. per dozen bundles; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do., 2s. 3d. to 2s. 6d. per flat.

FARRINGDON, Dec. 3.—Quotations:—Cabbages (Collards), 3s. per tally; Savoy, 4s. 8d. do.; Cauliflowers, 5s. do.; Sprouts, 1s. 4d. per half-sieve; Parsnips, 3s. per sack; Turnips, 2s. per dozen bunches; Carrots, 1s. 6d. per sack; Beets, 1s. 6d. per bushel; Leeks, 2s. per dozen; Celery, 1s. per roll; 12s. per dozen do.; Apples, Blenheims, 4s. 6d. per bushel; Wellingtons, 4s. 6d. do.; Canadian Ribstoes, 18s. per barrel; do. Newtowns, 18s. do.; do. Baldwin, 18s. do.; Greenings 16s. do.; Tomatoes, 7s. per 12 lb.; Grapes, English, 1s. per lb.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 80s. to 100s.; do., inferior, 50s. to 70s.; hay, best, 80s. to 90s.; do., inferior, 35s. to 60s.; mixture, 70s. to 85s.; and straw, 20s. to 42s. per load.

THE HERBACEOUS BORDER.

ALSTREMERIAS.

THE present is a good time to plant any of the hardy varieties of these useful plants. They are serviceable as cut flowers, embracing some very striking shades of colour, that the flowers are always welcome, and not the least point in their favour is that a foot or more in length of stem is readily obtainable when such is needed. Of some importance in their successful culture is the selection of a suitable position, where there is no fear that the plants will be disturbed. A south or south-west border suits them, but they may be planted in other positions. It is not advisable to mix them with the usual occupants of the herbaceous border, for they are apt to travel about by means of underground stems. An important matter is to plant them at a safe depth below ground, so as to be safe from injury by frost. For this reason they should be fully 6 inches or 8 inches below the surface. At the latter depth they are perfectly safe, even in our most severe winters. At planting-time remove this depth of top-soil from the bed, then add a liberal dressing of rotten manure, and dig it into the sub-soil. Roughly level this off, adding a layer of sharp river sand, then lay the tubers on this bed at a few inches apart. In this way a large number of roots may be grown in quite a small space, and a good display of flowers result. The varieties best suited for this are aurantiaca, the forms of chilensis, and peitacina. For its intrinsic worth none perhaps is nearly so valuable in the outer garden as the first-

POTATOS.

BOROUGH: December 3.—Quotations ranged between 40s. and 50s. per ton.

SPITALFIELDS: December 3.—Quotations:—Main Crop Kidneys, 50s. to 70s.; Snowdrops 60s. to 80s.; Bruces, 40s. to 60s.; Reading Giant, 40s. to 60s.; Hebrons, 55s. to 70s.; Imperators, 45s. to 60s.; Sutton's Abundance, 50s. to 70s. per ton.

FARRINGDON: December 5.—Quotations: Dunbars, 90s. to 100s.; Snowdrops, 60s. to 90s.; Hebrons, 60s. to 90s.; Sutton's Abundance, 55s. to 65s.; Puritans, 50s. to 55s.; Early Rose, 50s. to 55s.; Mignums, 40s. to 50s.; Imperators, 40s. to 50s. per ton.

STRAFORD: December 3.—Quotations:—Bruces, dark soil, 30s. to 40s.; do., light, 40s. to 60s.; Reading Giants, 45s. to 50s.; Sutton's Abundance, 60s. to 65s. per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending November 30, and for the corresponding period in the previous year:—1895: Wheat, 25s. 2d.; Barley, 21s. 7d.; Oats, 14s. 3d. 1894: Wheat, 26s. 7d.; Barley, 22s.; Oats, 14s. 3d.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 49° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.		BRIGHT SUN.

 4, Midland Counties; 5, England, including London, S.
 Principal Grazing, &c., Districts—6, Scotland, W.;
 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
 10, Ireland, S. * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending November 30, is furnished from the Meteorological Office:—

"The weather was almost continuously dull over England and the east of Scotland, with a great deal of mist; over Ireland and the west and north of Scotland the sky was frequently clear—especially during the earlier half of the period. Very little rain fell in any part of the Kingdom until the middle of the week, but from that time the falls were frequent, and in some places rather considerable.

"The temperature was rather low during the earlier part of the period, but subsequently rose, and gradually became high for the time of year. The average values for the week were consequently again above the normal, the excess ranging from 1° in most of the western and north-western districts, to 3° in the north-east, east, and south. The highest of the maxima were recorded towards the end of the week, and varied from 58° in the 'Channel Islands,' and 57° in 'England,

S.W. and Ireland, S.," to 49° in 'England, N.E.' The lowest of the minima occurred either on the 24th or 25th, when they ranged from 23° to 30° in Scotland, from 25° to 27° in Ireland, and from 29° to 33° over England. In the 'Channel Islands,' the lowest reading was 37°.

"The rainfall exceeded the mean in 'England, S. and the Midland Counties,' and just equalled it in 'England, E.' In all other districts there was a deficit; that in 'Scotland, N. and W.' being considerable.

"The bright sunshine was very deficient over England and the east of Scotland, but exceeded the mean in Ireland and the north and west of Scotland. The percentage of the possible duration ranged from 33 in 'Ireland, N.,' and 30 in 'Ireland, S.,' and from 21 in 'Scotland, N.,' and 20 in 'Scotland, W. and the Channel Islands,' to between 10 and 3 over the greater part of England, and to 1 in 'Scotland, E.'"

VARIORUM.

CHRYSANTHEMUMS GRAFTED ON ANTHEMIS.

—I have lately noticed, at the Château of M. Jean Everaerts, Mortael, Antwerp, four Chrysanthemums grafted upon Anthemis stock; and the following are the dimensions of these plants, and the number of the flowers:—

Flowers.	Height of Plant.	Diameter of Plant.
Etoile de Lyon, 300	5 feet	8½ feet
Précoce blanc, 500	6½ "	9½ "
Val d'Andorre, 200	5 "	6½ "
Avalanche, 200	5½ "	8 "

Ch. De B.

EVOLUTION IN THE CHRYSANTHEMUM.—Mr. Martin White's suggestion to the gardeners to study evolution in the Chrysanthemum is one which they ought to find particularly easy and pleasant to follow. Nobody knows with absolute certainty the natural species from which the vast number of forms of the flower at present known to horticulture have sprung. The Japanese stock on which we have worked was already modified into shapes and hues correspondent with the dainty taste of that people when we began operations upon it. But nothing is more certain than that in the Chrysanthemum the gardener possesses a flower of unequalled mobility, whether he attempts its modification by means of hybridisation, or by the better, if slower, means of selection. Nor is it to be supposed that the scientific interest in the process is exhausted by the fact that countless varieties of blooms have already been produced. It is a remarkable thing that hitherto variation has followed taste with what might almost be called docility. In Japan taste is prim and neat, or nothing—the Japanese Chrysanthemum is prim and neat. The elimination of the unprim has been, of course, a prime element in the process. In this country the taste is for variety, and even extravagance—and the docile Chrysanthemum is most varied, and as extravagant as could be wished. But in both countries taste, concerned entirely with the bloom, has ignored the calyx, and under the most fantastic of flowers the observer may still see the unchanged calyx of the natural plant, hardly differing, save slightly in the morphological regards demanded by the increased weight of the floral structure, from the calyx of the wild Chrysanthemum common to the Scottish fields. Will any gardener, to whom experiment is dear, try his hand at the modification of the calyx? And, by the way, has any gardener ever tried to "improve" the wild British variety referred to? *Dundee Advertiser*, November 21, 1895.

AMERICAN PLANTS: A. J. B. Naturally, you should apply to the address given in the advertisement, viz.:—Harland P. Kelsey, Highland's Nursery, Kewana, Mitchell County, North Carolina, U.S.A.

BOOKS: *C. W. S. My Gardener* will give you just the kind of information required.—*T. G. H. Cultivated Plants*, by F. W. Barbridge, published by Blackwood, London; an excellent book, now met with only at second-hand book-shops.—*J. D. B. My Gardener*, by H. W. Ward, published by Eyre & Spottiswoode, East Harding Street, E.C.; *Vines and Vine-culture*, by A. F. Barron, published at 171, Fleet Street, E.C.

CENERARIAS, &c., WITH DROPS OF WATER ON THE LEAF-EDGE: J. A. The result of exudation from the leaves in the case of plants standing in recently-watered soil. There is some amount of absorption of moisture by plants not in a gorged condition, but not by others.

CORRECTION: *Re* obituary notice of Richard Gilbert. —We are requested to state that the late gardener at Barghley House was not the tenant of the garden, as stated in our notice of his life, but continued to be head gardener to the last.

CROTON LEAVES INJURED: M. R. Morgan. The damage to the Croton leaves may arise from the ill-effects of steam from the hot-water pipes; or if the pipes have been re-blacked, from the stuff used in colouring the pipes. Some are unwise enough to use gas-tar for this purpose, and the results of this may be witnessed for years afterwards. Sometimes an untrapped drain in the house will cause similar damage. In fact, there are numbers of ways in which the mischief might arise, and which would be easily determinable if we were on the spot, but not easy for an absentee to point out.

DRESSING FOR VINES: C. S. If you carefully read our "Fruits under Glass" Calendar in *Gardeners' Chronicle* for November 30, you will find just the sort of information that you require.

FLORA OF DUMFRIESSHIRE: J. K. You should advertise in our columns; or enquire of some Scots bookseller.

FRUITS, SEEDLING: Jno. Barnett. Your seedling Apple is fairly good, but not superior to many others in cultivation. The Pear seems to be distinct, and well worth cultivation. We can find no trace of the name "Auguste Mignaud." Your photograph shows that an excellent crop has been borne by the tree, and it has been very skilfully cultivated.

IVY: L. P. We do not suppose that Ivy or any plant is benefited by having its leaves cut off, but tidy gardeners cut the Ivy that covers their walls close to the wall almost, so that the foliage shall have a neat fresh green appearance, and not, owing to its weight, pull the entire plant to the ground, as it otherwise might do.

KEW: F. W. If you will enquire of the Director, you will be furnished with full particulars regarding necessary acquirements, &c.

MARKET ANNUALS: W. & S. These are far too numerous for us to give a list in this place, but we will mention a few. Dwarf Nasturtiums in good distinct colour, *Coreopsis* vars., *Chrysanthemum Barridgeanum*, *C. carinatum*, *C. tricolor*, *Gysophila paniculata*, *Roseda odorata* (Mignonette), Ten-week and East Lothian Stocks, *Petunias*, *Verbenas*, *Zinnias*, *Asters*, *Sweet Sultan*, various *Globe Amaranth*, *Balsams*, &c.

MANURE FOR LIGHT DRY LAND: J. L. A. Whatever manure is applied should be well-decayed and rich, cow and pig-dung answering better than that from the stables alone. If you could pen some sheep on the land, say, from forty to sixty animals, on half-acre patches at a time, feeding them with oil-cake, and Swedes, or Turnips, they would consolidate as well as enrich it. The drainage-water from the dung-yard should be saved and distributed over the land in the winter. The land should not be ploughed or dug before it is required to be planted, as much of the fertile properties of the manure is soon lost in very light land; it may, indeed, be advisable to distribute the manure in the furrows when planting the tubers. The crop would be improved by dressings of potash and lime, or superphosphate of lime.

MUSCAT GRAPES: Muscat. We do not know of any variety that is more musky than Muscat of Alexandria. There are Mrs. Pince, a black Grape, with a good Muscat flavour, and Chasselas Musqué. Muscat Dr. Hogg inquired about is a fine white Frontignan, raised by Mr. Pearson, Chilwell.

NAMES OF FRUITS: *P.* Specimens not sufficiently good to determine.—*A. G. F.* 1, Bourré Diel; 2, Cellini; 3, Egg or White Paradise; 4, Mank's Codlin.—*C. W. Strickland.* Pear, Nouveau Poiteau; Apples not quite sure of, resembles Annie Elizabeth.—*Geo. Abbey.* 1, Bourré Clairgean; 2, Bourré Diel; 3, Knight's Monarch.—*A. J. B.* 1 and 2, Bourré Diel; 3, Vicar of Winkfield; 4, Marie Louise.—*Wheeler.* 1, Bourré Diel; 2, Cnaumontelle.—*W. Houghton* 1, Bourré Diel.—*J. Rogers.* 1, Dutch Codun; 2, Court Pendu Plat; 3, Cellini; 4, Hoary Morning; 5, Tibbet's Pearmain.—*W. S. H.* 1 and 2, not recognised; 3, Grange's Pearmain; 4, Alfriston; 5, London Pippin; 6 Emperor Alexander (fruit shrivelled).—*J. K. & Son.* Apple, 1, Waltham Abbey Seedling; 2, Golden Spire; 3, Warner's King; 4, Alfriston; 5, Cockpit, Pears, 1, Uvadale's St. Germain; 2, Colmar d'Arenberg; 3, Huyshe's Victoria; 4, too small.—*C. C.* Cydonia vulgaris, Quince.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—*Constant Reader.* 1, not found; 2, Retinozpora plumosa variegata of gardens; 3, Eucynurus radicans; 4, Cupressus nntkaensis, the Thuioipis borealis of gardens; 5, Thuia orientalis; 6, Cupressus Lawsoniana.—*Subscriber.* 1, Thuioipis dolabrata of gardens; 2, Thuia orientalis (Biota); 3, Retinozpora filifera of gardens; 4, Libocedrus chilensis; 5, Thuia occidentalis, variety Vervaneana; 6, Thuia gigantea.—*T. W. B.* Abies grandis.—*H. D.* A very fine variety of Odontoglossum odoratum, so far as we can judge by the dried flower received.—*Masters.* 1 and 2 seem to be both small barren fronds of Cyrtomium carvotidem; 3, Hoffmannia (Higginsia) Ghiesbreghtii variegata, fruit next week.—*J. M.* Aganisia cornuta, Rchb. f., published in the *Gardeners' Chronicle*, June 5, 1886, p. 720. It is the Acacallis cornuta of Lindley, and it has never been common in gardens. The brown marks on the leaf sent are not caused by disease; such appearances often develop after condensed moisture has settled on the leaf, sometimes while yet in its young state by the moisture collecting in the centre. The damage may not be visible till long after that which has caused it has taken place.—*J. O.* Fota Island, Palm, 1, Trachycarpus excelsus (Chamærops Fortune); 2, an abnormal condition of the same, in which the three carpels are equally developed.

RASPBERRIES: *F. J. F.* Distance to plant if self-supporting, 3 feet by 4 feet. This distance will do for Fastolf, Carter's Prolific, Red Antwerp, and Norwich Wonder. Semper fidelis, and Superlative want more space.

SAXIFRAGA PYRAMIDALIS: *Anxious.* This is now called *S. cotyledon*. The plant is of easy culture in loam and broken sandstone, with good drainage if in pots. Keep in a cool greenhouse in winter near the glass, and afford it but little water till growth recommences. Potting and division in the spring.

COMMUNICATIONS RECEIVED.—*E. Mawley.*—*C. H.*—*G. W.*—*W. P.*—*D. B. C.*—*Harrison Weir.*—*M. Rivoire.* Lyon.—*Ernest Rose.* Paris.—*H. de V.*, Paris.—*Professor Penzig.* Genoa.—*A. E. P.*—*J. AND SIXPENCE FOR EVERY ADDITIONAL LINE. If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, 28; Half Page, 24 10s.; Column, 23.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale. Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER. Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

GREENHOUSE DEPARTMENT.

SPAN-ROOF AND LEAN-TO FORCING-HOUSES.

THE AMATEUR FORCING-HOUSE.

TENANT'S FIXTURE (SPAN-ROOF).

These Houses are offered at an exceedingly low rate, and should be approved by both amateur and professional gardeners, as brickwork, which is very expensive to a small house, is entirely dispensed with. The utility of such a house for forcing or cultivating Cucumbers, Tomatoes, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown.

Specification.—Framework substantially constructed of red deal; the whole of sides, and 2ft. 6 in. of ends, boarded with well-seasoned tongued and grooved matchboards. Half-glass door, complete with rim-lock and brass fittings, in one end; glass 18 oz. throughout, English cut. Ventilators supplied according to size of House, and stays necessary for opening same; stages for plants each side of House; all woodwork painted one coat of good oil paint, and the whole structure securely packed and placed on rail.

21-oz. glass for roof 5 per cent. extra.

All practical minds will be convinced of the importance and utility of this class of house for Gentlemen, Nurserymen, Market Gardeners, and all those who require a cheap, strong House for forcing, or growing Cucumbers, Tomatoes, Melons, &c.

Specification.—Built for brickwork 3ft. high, of thoroughly well-seasoned red deal; roof ventilation according to size; door at one end, all 21-oz. glass; painted one coat. Carefully packed on rail.

W. COOPER, Ltd., NINTH ANNUAL CLEARANCE SALE—continued.

Garden Lights.

These lights are well mortised jointed together, and made in a good workman-like manner, and are well worthy of inspection. Framework made of 2 in. by 2 in. stiles, and properly rabbeted for the glass, with good 2 in. sash-bars. The Glazed Lights are sealed and bedded in good oily putty.

Table with columns: Usual Price, Sale Price, LOT, and descriptions of garden lights with dimensions and prices.

Garden Hand-Frames.

These Frames will be found to be very useful for protecting plants, seeds, slips, and cuttings, during the spring, which, if left uncovered, would probably fall victims to the extreme cold so prevalent in this country during that season.

Table with columns: Usual Price, Sale Price, LOT, and descriptions of garden hand-frames.

Odd Greenhouses.

ALL HOUSES ARE COMPLETE AS LIST.

Table with columns: Usual Price, Sale Price, LOT, and descriptions of various odd greenhouses.

POULTRY APPLIANCE DEPARTMENT.

Movable Poultry Houses.

(SPAN-ROOF.)

These houses are pretty in appearance. They are substantially constructed in sections (in complete readiness for fixing together with facility) of well-seasoned, tongued and grooved match-boards; supplied with door, complete with lock, ventilator slide, and painted outside one coat of good oil paint.

Table with columns: Usual Price, Sale Price, LOT, and descriptions of movable poultry houses.

Span-Roof Poultry Houses.

Made in sections, complete, with door inside and window at end, a flap at back for access to nest boxes, a raised floor about 2 feet from ground, so as to form dry run underneath; nest, perch, ladder, &c.; painted one coat outside.

Table with columns: Length, Width, Height of Ridge, Usual Price, Sale Price, and LOT.

Span-Roof Improved Poultry-House.

These Houses are very roomy and well ventilated, and are specially constructed so that they may easily be taken to pieces or erected. They have a door and window at the ends, a flap at the back for easy access to nest-boxes, are raised from the ground 2 feet, so as to form a dry run underneath, are made of red deal, painted one coat outside, and are roofed with weather-boarding.

Table with columns: Usual Price, Sale Price, LOT, and descriptions of span-roof improved poultry houses.

Nest Boxes.

LOTS 1228 to 1600.

This is the popular method of sitting hens, and should be universally adopted. The bottom is of wire netting, made concave, so that no eggs are left uncovered by the hen; it is also a protection against rats burrowing into the nest.

These boxes are constructed of thoroughly well seasoned, tongued, and grooved matchboards, painted outside one coat of good oil paint, complete with handle, size, 1 ft. 8 in. high, 1 ft. 4 in. wide, 1 ft. 3 in. deep. Securely packed and put on rail at the following respective prices:— Usual price, 4s. each. Sale price, 3s. each. 6 for 16s. 6d., 12 for 30s., 36 for £3 15s.

LOT 1600A.—150 Sacks Suedewet, fresh and clean. Should be used in all Poultry Houses and Dog Kennels. Usual price, 1s. 3d. Sale price 8d., bags included.

Safety Chicken Coop.

These Coops are constructed upon the most improved principle, and are very neat in appearance. They are made of good, sound, well-seasoned, tongued and grooved match-boards, are fitted with a shutter as a protection against winds, sun, and vermin at night, and are painted outside one coat of oil colour.

Securely packed on rail, at the following prices:— Size—2 ft. wide, 1 ft. 10 in. deep, 1 ft. 10. high at front, 1 ft. high at back. Lot. 1601 to 1750... Usual price, 5s. 6d. each. Sale price, 4s. each; 6 for 23s.; 12 for 40s.; 36 for £5 5s. 1751 to 1770... 3 ft. movable wire run, usual price, 4s. each extra. Sale price, 2s. each.

Roofing Felt.

Patent Asphaltic, Rolls 25 yards, 32 in. wide.

Table with columns: Usual price, Sale price, LOT, and descriptions of roofing felt.

Galvanized Corrugated Iron Roofing.

LOT 1931. Best Quality, Perfect S'abs, 27 in. wide.

Table with columns: Usual Price, Sale Price, and descriptions of galvanized corrugated iron roofing.

Special Quotations for 2 Ton lots.

Portable Dog Kennel.

WITH PLATFORM.

Securely packed and put on rail at the following respective prices:—

Table with columns: Lgth, Wth, Hght, Usual Price, Sale Price, and LOT. Descriptions of various portable dog kennels.

HEATING APPARATUS DEPARTMENT.

Hygienic Heater.

Burning Paraffin or Gas without smoke or smell. These Heaters are constructed as a means of Heating by Hot Air without the use of hot-water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this stove, and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems. See list for full description.

Table with columns: Usual Price, Sale Price, LOT, and descriptions of hygienic heaters.

"Invincible" Hot Water Apparatus.

MOST EFFICIENT, AND CHEAPEST IN EXISTENCE. Requires no sunk stove-hole and no brick setting. Will last all night without attention. Burea house cinders; therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed. No. 1 Boilers only, capable of heating 75 ft. 4-inch piping.

Lot 2246 to 2317. Usual price, £2 15s. Sale price, £2. Sale prices for complete apparatus:— Cost of complete apparatus for Greenhouses with 4-in. pipe, flow and return along one side, cut and fitted, so that if the internal measurement of the Greenhouse is given, the apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully racked on rail at the following respective prices:— 7 ft. by 5 ft., £3 12s. 6d.; 9 ft. by 6 ft., £3 17s. 6d.; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3; 15 ft. by 10 ft., £4; 20 ft. by 10 ft., £5; 25 ft. by 10 ft., £6.

Table with columns: Usual Price, Sale Price, LOT, and descriptions of hot water apparatus.

The Amateur's Assistant.

2363 to 2368.

Considering the number of small Greenhouses that do not require much more than sufficient heat to keep out the frost, and the numerous applications constantly received from Amateurs for a cheap and strong stove applicable to the purpose, we are induced to place before the public an entirely original Hot Water Apparatus that will raise the temperature from 15° to 45° above that outside, requires no attention, except to see that the oil vessel is kept supplied. No skilled labour is required for fixing, only to slip the rings over pipes, push into sockets, and fill up with either Plaster of Paris, fire-clay, or any cement. Securely packed on rail as follows:— No. 4, complete with 24 ft. 3 in. piping. Will heat 60 ft. Usual price, £3. Sale price, £2 5s 0d.

(CONTINUED ON NEXT PAGE.)

W. COOPER, Ltd., NINTH ANNUAL CLEARANCE SALE—continued.

The Rapid Propagator.

THE ONLY PERFECT PROPAGATOR FOR RAISING PLANTS FROM SEEDS, SLIPS, OR CUTTINGS.

This Propagator is the best and cheapest now before the public, and will be found especially serviceable to Amateurs and Gardeners who require to strike cuttings and raise seeds in a short space of time.

One of the Propagators will raise large quantities of plants in the spring, thus—to a great extent—dispensing with the necessity of striking cuttings in the autumn; it being well known that many cuttings fall victims to the frost and damp atmosphere so prevalent in this country. This method of propagation saves the trouble and annoyance resulting from the loss of so many plants in the winter time, and also makes it unnecessary to occupy so much space in storing a large number of cuttings.

These Propagators are composed of an outside casing, with movable sheets of glass on top. The bed or bottom is formed of a tank, in which a constant circulation of Hot Water is kept up by the Heater (see illustration), the pots being plunged in a bed of cocoanut-fibre refuse, which should be kept moist. It is heated by oil, one pint of which will burn at least 30 hours. Securely packed (no charge for packing) and put on rails complete at the following sizes and prices:—

Table with 4 columns: Lot, Usual Price, Sale Price. Rows include sizes like 2369 to 2383 (1 ft. 8 in. by 1 ft. 6 in.) and 2393 to 2411 (4 ft. by 2 ft.).

TIMBER DEPARTMENT.

William Cooper's Sunshade.

SUPERSEDES ALL OTHER PREPARATIONS OF THE KIND. Lot 2558. The cheapest, most efficient, and convenient preparation for Shading Greenhouses, Conservatories, Glass Roofs, and Windows of all descriptions. Is applied cold—an enormous advantage over preparations requiring to be used while hot. May be used either inside or outside, and produces a pleasing effect. Is not washed off by rain, but can be instantly removed when desired by rubbing over with a brush whilst it is wet. Made in various colours—White, Pale Blue, and Pale Green. Usual Price, in tins, 1 lb. 1s.; 2 lb. 2s.; 7 lb. 5s. Sale price, do. 1 lb. 4d.; 2 lb. 8d.; 7 lb. 2s.

William Cooper's General Fertiliser.

FOR FLORISTS, GARDENERS, AND AMATEURS.

Lot 2559. This high-class manure is strongly recommended for all kinds of Flowers, Fruit Trees, and Vegetables, and will be found invaluable, both for importing and increasing the produce. Suitable for all crops: Potatoes, Kitchen Garden Produce, Vine, Fruit Trees, Pot Plants, &c., &c. Usual price—tins, 4d.; 7 lb. bags, 1s.; 14 lb. bags, 2s.; 28 lb. 4s.; 1/2 cwt., 7s.; 1 cwt., 13s. Sale price—tins, 3d.; 7 lb. bags, 9d.; 14 lb. bags, 1s. 6d.; 28 lb., 3s.; 1/2 cwt., 6s.; 1 cwt., 10s.

Silver Sand.

Lot 2560-2 cwt. sacks. Usual price, 3s. 3d. Sale price, 2s. 3d. Special offer—4-ton truck on rail, at pit loose, 20s.

Best Cocoa-Nut Fibre Refuse.

Lot 2561-9d. per sack; 10 sacks, 7s.; 15 sacks, 1 s.; 20 sacks, 12s. 6d.; 30 sacks, 18s.; sacks included. Truck, loose, free on rail over 2 tons, 3s. Moistens in heat. Holds heat in winter. Invaluable for potting, planting, forcing, decorating, and used on Strawberry-beds is preferable to straw, keeping the fruit clear from grit, and at the same nourishing the plants. For lightening heavy soils it is particularly useful, and when the soil is light and dry it is of great advantage as a mulch. All slugs and insects are destroyed by its use.

Lot 2577-300 Taganrog mats, nearly new; usual price, 2s. each; sale price, 1s. each.

RUSTIC DEPARTMENT.

Handsome Rustic Summer-house.

Lot 2578-Made for Exhibition purposes, about 10 ft. square, and 10 feet high, complete, with Seats, Table, Curtains, &c.; erected in our Snow-ground, Usual price, £100. Sale price, £30.

Seed Trade.

SHOPMAN or TRAVELLER.—Situation wanted, by a young man, aged 25; eleven years' experience.—**SEEDSMAN, Bengoe Villa, Liverpool Road, St. Albans.**

THE MOST IMPORTANT LESSON Esculapius tried to impress upon his pupils was, that the chief trouble afflicting humanity was due to impurities of the blood. All disorders may be traced to this fact, for unless the source of life is free from disease-germs, it cannot have that strength which is necessary for good health. **HOLLOWAY'S PILLS** are composed of the most precious herbs and soothing balsams which Mother Earth can offer to her children, therefore they may be relied upon to supply the nourishment that is craved by the system. It is no vain boast to say that this is the most wonderful discovery made in the annals of medical science; they will cure or relieve all diseases.

Johnstone, near Glasgow.

TO HORTICULTURISTS.

FOR SALE BY PUBLIC AUCTION, within the "Black Bull" Inn, Johnstone, on SATURDAY, December 21, 1895, at 2 o'clock p.m. (if not previously sold privately). ROSEBANK HOUSE and GROUND.

This property is fitted for the Cultivation of Fruits and Flowers, and is worthy the attention of practical men with some capital. It is within a few miles, by rail, of Glasgow and Paisley. There are large and valuable Greenhouses, Vineries, and Tomato-houses, recently erected, by Boyd, of Paisley. The ground extends to 1 acre, 2 rods, 23 poles, or thereby, and is held in perpetual feu for an annual feu-duty of £8 11s. 6d., or thereby. The house is very commodious, and has a bathroom, W.C., and other conveniences, with stable, coach-house, byre, &c., &c.

Upset price of house and ground £1300. In addition to the price the Purchaser would have to take over and pay for the Greenhouses, Vineries, and Tomato-houses, Heating Apparatus and appurtenances therein, and the gates, gasaliers, and venetian blinds in the house and offices, at a price to be ascertained by arbitration.

For further particulars apply to THOMAS KIRKHOPE, Solicitor, Ardrossan, N.B.

WANTED, to Rent, or Purchase, a SMALL NURSERY and FLORISTS' BUSINESS, in a London suburb.—Address, stating full particulars, SUBUBBAN, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, SMALL NURSERY, with one or two Glass-houses, in or near London.—State price and particulars to HERBERT, 4, Adde St., Wood Street, E.C.

FOR DISPOSAL, capital compact NURSERY. Good seed, Jobbing, and Sundry trade. Good reason for disposal. All in going order. Five Houses, Pits, Stable, and Cottages.—H., 41, Wellington Street, Strand, W.C.

NURSERY GROUND with GREENHOUSES &c., TO BE LET at £20 per annum; or 1½ years' lease at £11 ground rent, for SALE, price £50. Apply on the premises, late Hillier's Nursery, Reservoir Road, Enfield Road, Southgate, N.; or, Mr. DAVIS, 63, St. Martin's Lane, Charing Cross, S.W.

EXHIBITION.**SECOND INTERNATIONAL HORTICULTURAL EXHIBITION, DRESDEN.**

From May 2 to 10, 1896.

Under the high protection of His Majesty the King of Saxony. For particulars, Schedules, &c., write to the Secretariat der Zweiten Internationalen Gartenbau-Ausstellung zu Dresden.

O. LAMMERHIRT, 7, Glacisstrasse, Dresden, N. Die Commission: G. KRAUSE, I. VORS.; T. J. SEIDEL, II. VORS.

TO BE SOLD.—A small FREEHOLD NURSERY, LEAN-TO VINERY, and 4 GREENHOUSES. Stands on about half an acre.

ENSOM, Avenue Road, Southgate.

YORKSHIRE.—IMPORTANT NURSERY BUSINESS for DISPOSAL, in a fashionable inland watering place. The Property is equal to freehold, and contains an area of about 2½ Acres, and comprising an excellent Dwelling-house, substantially built and well-appointed, with extensive ranges of twenty-nine Greenhouses, Bothy, Workshops, Offices, Stabling, &c. In addition to the Nursery is a large and admirably fitted Seedshop, centrally situate in the town, and which the purchaser would have the option of taking. Arrangements may be made, if desired, for the Stock-in-Trade (which is of an attractive description) to be Sold by Auction, or the purchaser may, if desired, take it by valuation in the usual way.

For further particulars and price, apply to MESSRS. PROTHEROE and MORRIS, Horticultural Auctioneers, 67 and 68, Cheapside, London, E.C.

TREE-TOPPING.—Dangerous Trees Lopped and Topped by experienced men. Distance no object.—Apply, CARNE, Timber Merchant, Tooting, S.W.

GOLD MEDAL CHRYSANTHEMUMS.

My Novelties for 1895 helped materially to win for me during the past season THREE GOLD MEDALS, and the PRESIDENT'S PRIZE of the N.C.S. These, together with the varieties raised by Mr. C. E. SHEA, Mr. H. BRISCOE-IRONSIDE, and other raisers, which I shall distribute, will be the finest set ever introduced in one season.

My SUPPLEMENTARY LIST, containing a full description of the above, and other Novelties of the Season, is now in the press, and can be had post free on application. Customers will receive a copy of this when it is ready.

My CHRYSANTHEMUM GUIDE—The most complete work on culture. Post free, Eight stamps.

ALSO IN PREPARATION, THE

CHRYSANTHEMUM ALBUM.

By H. J. JONES,

Containing THIRTY-SIX ILLUSTRATIONS of NEW CHRYSANTHEMUMS from photographs. Every grower should possess a copy, as this will enable him to select varieties from the actual representation of the flowers. This valuable work will be produced at great cost, and can be obtained of the Author, post free, 2s. 6d. each.

NEW RASPBERRY.
(STEEL'S VICTORIA.)

A New Variety of great merit, introduced by us last year. This was raised by Mr. Steel, of Ealing, and is the finest market variety grown for Covent Garden: free-grower, heavy cropper, large handsome fruit, fruiting very early, and lasting well through the season until very late. The fruit is essentially a Dessert Fruit, being large, handsome, and very superior flavour. Strong Canes, 6s. per 100; 50s. per 1000. Now ready for Delivery. Special Quotations for large quantities on application.

GENERAL CATALOGUE
(Over 170 pages) of Nursery Stock, artistically produced, containing some hundreds of illustrations, and full of valuable information, free on receipt of 2s. for postage.

RICHARD SMITH & CO. WORCESTER

ANTHONY WATERER

Invites an inspection from intending Planters to the following well-grown TREES, having stout, clean stems, with handsomely-furnished, well-balanced heads, and from frequently transplanting are splendidly rooted:—

- ACER DASYCARPUM, 14 to 20 feet.
- " WIEHII LACINIATUM, 10 to 14 feet.
- " NEGUNDO VARIEGATA, Standards, 8 to 10 feet.
- " BRITENBACHII, 12 to 14 feet.
- " SCHWEDERII, 12 to 18 feet.
- " WORBLYII, 12 to 14 feet.
- " LEOPOLDII, 12 feet.
- BEECH, Purple, Pyramids, and Standards, 10 to 20 feet.
- BIRCH, Silver, 12 to 14 feet.
- CERASUS SEROTINA (American Bird Cherry), 12 to 16 feet.
- CHESTNUTS, Horse, 14 to 20 feet.
- " Double White, 14 to 16 feet.
- " Scarlet, 12 to 15 feet.
- " Bristii, 10 to 16 feet.
- ELMS, English, 10 to 12 feet.
- LIMES, 12, 16 to 20 feet.

All our Limes are the best red-twigged variety.

- " BUCHLORA or DASYSTILA, 12 to 14 feet.
- " Silver-leaved (Tilia argentea), 12 to 14 feet.
- LIQUIDAMBAR, 6 to 10 feet.
- OAK, English, 12 to 14 feet.
- " Scarlet American, 12 to 14 feet.
- POPLAR CANADENSIS NOVA (the true variety), 12 to 16 ft.
- SYCAMORE, Common, 12 to 17 feet.
- " Purple, 14 to 15 feet.
- THORNS, Double Pink, 8 to 10 feet.
- " Paul's Double Scarlet, 8 to 10 feet.
- " Double White, 8 to 10 feet.

WEeping TREES.

- BEECH, Weeping, Pyramids, and Standards, 8 to 12 feet.
- " Weeping, Purple, Pyramids, and Standards, 7 to 12 feet.
- BIRCH, Young's Weeping, Pyramids, and Standards, 8 to 14 feet.
- " Cut-leaf Weeping, Pyramids, and Standards, 10 to 12 ft.
- ELMS, Weeping, Pyramids, and Standards, 7 to 14 feet.
- LARCH, Weeping, Pyramids, 8 to 10 feet.

KNAP HILL NURSERY, WOKING, SURREY.

UNEQUALLED ARE THE FOLLOWING FOR FORCING:—

BUDS INNUNERABLE.

- RHODODENDRONS, finest named,
- AZALEA MOLLIS, in great variety.
- " GHENT VAR., finest in the Trade.
- " PONTICA, unequalled.
- ANDROMEDA FLORIBUNDA.
- " JAPONICA.
- KALMIA LATIFOLIA.
- " MYRTIFOLIA, very fine.
- RHODORA CANADENSIS.

MAGNIFICENT NOVELTIES FOR 1896.

NO "UP TO DATE" GROWER CAN AFFORD TO DO WITHOUT THEM.

MISS MARY GODFREY, of the largest size, distinct colour, being that of the Peach bloom, finest form. Plants 7s. 6d.

MR. WM. LAYCOCK, lovely variety; blooms large, clear straw-yellow; admired by all who have seen it. Plants 7s. 6d.

PRIDE OF EXMOUTH, immense bloom, of superb form, white, slightly frosted cherry pink, considered by many who have seen it to be the finest novelty of the year. Plants 7s. 6d.

ARONA (Briscoe-Ironside), in size and form similar to Col. Smith, but richer, and the blooms are of much better substance. First-class in every respect. Plants 7s. 6d.

MRS. HUME LONG, another monster bloom, sometimes 14 inches in diameter. Rich deep rose with a light reverse.

These do not by any means exhaust W. J. G.'s list of sterling Novelties for 1896, but all are fully described, together with the very best of last year's introductions in the general Catalogue, which will be issued in a few days.

THE MOST RELIABLE CATALOGUE published, is sent, post-free, to all applicants.

W. J. GODFREY, EXMOUTH, DEVON.

SELECT NOVELTIES IN FLOWER SEEDS for 1896, OFFERED BY HURST & SON, SEED MERCHANTS, 152, HOUNDSDITCH, LONDON.

OUR COMPLETE LIST OF NOVELTIES WILL BE POSTED IN A FEW DAYS.

WALLFLOWER RUBY GEM.

This grand Novelty is certainly the most brilliant and effective variety of single Wallflower hitherto sent out.

The colour is a beautiful clear shade of Ruby-Violet, with a bluish satin-like sheen (quite unlike the old purple Wallflower, which is more dark and dull in colour) and when seen in a mass the effect produced is very striking. It has the habit of the ordinary dark Blood Wallflower of medium height, and the flowers are extra large and of good substance.

A coloured illustration of this Novelty will be issued with our General Seed Catalogue for 1896.

Large Packets, retail, 1s.; Smaller Packets, retail, 8d.

GRAND NEW CRIMSON

PERPETUAL-FLOWERING CARNATION, URIAHI PIKE.

(Grown by Mr. GEORGE MAY, Teddington, from whom we have bought the entire stock of seed grown this year, and now offer the same for the first time.)

Awarded Six First-class Certificates, besides the Silver-Gilt and Silver Medals of the R.H.S.

This is undoubtedly the GRANDST CRIMSON CARNATION ever offered, at the same time the most decided acquisition to the Tree or Perpetual-flowering class that has ever been raised. In point of colour this noble Carnation reigns supreme, being a veritable GLOWING CRIMSON-VELVET SELF, and in this respect ABSOLUTELY UNIQUE.

Packets of 50 Seeds, retail, 2s. 6d. each; Packets of 25 Seeds, retail, 1s. 6d. each.

FOR PRICES TO THE TRADE, SEE OUR NOVELTY LIST.

SWEET PEA CUPID.

We call special attention to the new dwarf SWEET PEA CUPID, a most unique Novelty of American origin, for which we have been appointed by the Vendors, MESSRS. ATLEE, BURPEE, AND CO., PHILADELPHIA, Sole Agents for the distribution to the Trade in Great Britain, the Australian Colonies, and India.

A brief Description of Cupid (the only dwarf Sweet Pea ever known).—The foliage is very dark green; blossoms pure waxy-white, of unequalled substance, and fully as large as "Emily Henderson." The plant does not grow over 5 inches high, and never more than 12 to 15 inches in diameter. The stems are about 4 inches long, bearing two or three blossoms, all very near the end of the stem. It is a wonderfully free bloomer, and begins to flower as early as May and continues until November. The seed is white, and of usual size.

Packets of 20 Seeds, retail, 1s. each; Half-size Packets of 10 Seeds, retail, 8d. each. Electros, for use in Catalogue, supplied free on application.

IMPORTANT NOVELTY OF LAST YEAR.

PRIMULA FIMBRIATA RUBRA SUPERBISSIMA.

This grand new Primula may be described as the red counterpart of P. alba magnifica. The fringing of the extra large bold flowers—which are of great substance—is of the same heavy character as in P. alba magnifica, and which distinguishes that variety from all others; whilst the colour is that of the best type of the ordinary "rubra."

Per Packet, retail, 2s. 6d.; Larger size Packets, retail, 3s. 6d.

ITALIAN CANNAS.

THE group of Cannas called in France "floriferous," is already very rich in plants of medium height, with numerous large flowers, and in colouring as brilliant as varied. We have witnessed the introductions of these fine plants since 1859, when M. Année first obtained crosses at Paasy. Before that time Cannas were hardly known for summer bedding, except in botanic gardens. At the Muséum, there was planted every year a series of the following species:—Canna discolor, edulis, glauca, indica, gigantea, flaccida, and Warscewiczii. Then came the sorts which Bouché described in the Berlin Botanic Garden; those which Roscoe had figured in his *Scitamineous Plants*, and certain others which Loddiges had depicted in the *Botanical Cabinet*, and which were hardly seen save in some English amateur collections.

To M. Année, then, may be attributed the first important results in the artificial fertilisation of Cannas. The flowers which he obtained were varied, but the plants were often too large. Soon the principal object of the growers, among whom were M. Lierval, M. Bihorel and other nurserymen, was to develop plants with large highly-coloured foliage. Seedlings raised by M. Crozy, of Lyons, some time after, proved quite a revelation. He produced a race of Cannas with large and fine flowers; among these the variety Madame Crozy was for some time the most beautiful known. Subsequently other raisers, foremost among whom were MM. Vilmorin at Antibes, obtained some very handsome varieties.

But the class of which we wish now to speak, and which we may call Italian Cannas, are a great advance upon any others yet obtained. It is to MM. Dammann et Cie., nurserymen, of San Giovanni à Teduccio, near Naples, that we owe these splendid plants. One of the partners in this firm, M. Sprenger, said that by always working on the same lines, and always interbreeding the large-flowered varieties, nothing would be obtained more remarkable than the varieties already in existence. He, therefore, sought to infuse new blood into these hybrids, and this was introduced by employing Canna flaccida. This species, originating in the southern United States, is of medium height, 3 to 4½ feet, and bears large flowers, one petal in which is especially developed.

The first trials made by M. Sprenger were unsuccessful. But in 1892-93 he obtained by fertilising Canna Madame Crozy with the pollen of a fine variety of C. flaccida, a splendid plant, which he named Italia (fig. 114). Apart from the unusual size of the flowers and their beautiful golden-vermilion colour, the plant has this peculiarity, that the general

form of it is flattened, resembling an expanded Cattleya [Or a Japanese Iris. Ed.]

The similarity to Cattleya is increased by one of the petals being horn-shaped, like a lip. Here is the description of *Canna Italia* (see fig. 114), taken from living specimens:—

Plant vigorous, tufted, robust, very floriferous, height from 1.50 to 2 mètres (4½ to 6½ feet), to the summit of the spikes, stems dark green, strong, erect, leaves uniform dark bluish-green, erect or a little spreading, in texture very firm and vellum-like, the petiole deeply channelled, amplexicaul prolonged into a very stout and rounded midrib, blade oval, pointed at the summit, decurrent at the base, in length 0 m. 60 by 0.25 m. (2 feet), in width 10 inches; deeply channelled in the middle, veins acutangular, slightly raised and paler in colour, trusses 1 m. (3¼ feet) in height, often rather angular, triquetrous at the top, standing erect in the middle of smaller floral leaves and very long convolute sheaths; spike erect, a foot or more high, floral fascicles distant, sessile, biflorous, having at the base one common bract, very broad, short, obtuse, membranous violet-brown; the two bracts of each flower longer. 0 m. 015 (half an inch), oval, spoon-shaped, obtuse, erect, violet. Ovary oblong, wrinkled, green and violet, with three rounded corners surmounted by a calyx with three erect concave sepals, separated as far as the base, equitant, oblong-oval, obtuse, in colouring red-brown, rather plum-coloured, in length 0 m. 020 (three-quarters of an inch), and 0 m. 010 (three-eighths of an inch) in width. Perianth very large, erect, very widely expanded, two of the outer divisions lanceolate, pointed, spoon-shaped, in length 0 m. 06 m, to 0 m. 08 (a fifth of an inch), in breadth 0 m. 20 to 0 m. 025 (three-tenths of an inch), in colour dull yellowish-red, streaked with much darker brownish-red lines. The third division narrower, 0 m. 014 to 0 m. 015 (half an inch to five-ninths of an inch), more pointed, and yellower at the tip; interior lobes nearly equal, obovate, obtuse, entire, 10 to 14 cent. (3¾ to 5½ inches) long; in width 0 m. 045 to 0 m. 060 (three-twentieths of an inch to a quarter of an inch); two are folded one over the other, and opposed to the third. The surface of all three is flat, and the upper part widely expanded, so that it somewhat resembles a Cattleya flower.* The ground colour is a beautiful orange-red, heightened with vermilion over three-fourths of the surface, and prolonged into oval streaks and spots on a wide golden-yellow margin. The fourth lobe is elliptic, of the same width, twisted, the edges approximate as in the lip of a Cattleya, deeply bilobed at the top, waved, sometimes somewhat lacinate, of a beautiful orange-vermilion colour, bordered with gold, with a large central and basilar channel, shaded with purple on a dark ground; stamiferous lobe, a little smaller, hatchet-shaped, dark vermilion, the edge gilded and streaked with red, stamen linear, arched, inserted laterally towards the middle of the right side, yellow at the base, 0 m. 015 (half an inch) long, pistillary lobe narrow, flattened, at the summit obliquely flattened into a scimitar-like form, the colour golden-yellow and dark vermilion-red.

It was in the summer of 1893 that among a thousand seedlings, this variety, *Italia*, flowered with another bearing yellow flowers shaded with purple, and named *Austria*. This latter variety may be likened to a large Tulip or yellow Lily placed on the top of trusses which emerge from beautiful green foliage. M. Sprenger continued to raise seedlings, and the results will not be long in appearing. For example, in the summer of 1894, he succeeded in flowering some splendid varieties, among which we note the following:—

Atalanta.—Leaves green, bordered with red, very large clear scarlet flowers, or blood-coloured with flame-red centres.

Amarica.—Leaves dull red, streaked with greenish bronze, quite distinct, very brilliant, very large carmine-red flowers, partly streaked with pale yellow. A splendid plant.

Burgundia.—Leaves glaucous, small, with brown margins, large golden-yellow flowers, interior petals scarlet, the others red, spotted.

Allemaniana.—Leaves very large, like those of a *Musa*. Flowers, the largest of the class, carmine-red, with a wide golden-yellow border, spotted with scarlet beneath.

Twelve other varieties raised from seed in 1894 to 1895 gave still other new varieties and colours not hitherto seen. They are not yet named. We are glad to give our readers these descriptions thus early, with illustrations taken from photographs of a plant of *Canna Italia* which I flowered this year at Lacroix, and which are exact as to appearance and dimensions. Ed. André. [We are indebted to the publisher of the *Revue Horticole* for the use of the woodcuts illustrating this article by the accomplished Editor of that journal.]

FIG. 114.—CANNA ITALIA: TO SHOW HABIT.
(One-twentieth of the natural size.)

A SUMMARY OF THE WEATHER OF THE NATURAL YEAR.

THE following observations were commenced at the autumnal equinox in 1894, and brought to an end with the similar event in 1895, the locality being Bradford. The weather during the latter part of September and all October in 1894 was unremarkable. The trees shed their leaves naturally through decay, and not from violence of the weather. The first frost occurred October 22. On November 12 the barometer was very low, but as the weather at Bradford scarcely corresponded to so low a reading, one naturally looked for the cause somewhat further away. In South Wales and the south-west of England the rain fell in torrents, causing the rivers rapidly to rise, and flood the adjacent country. Much damage to property and some loss of life was the consequence. For some days after, storms and shipwreck furnished the newspapers with sensational matter. The next event was the great wind-storm

of December 22. The havoc it wrought about Bradford will cause it to be remembered a long time. Mr. Charles Harding, in a paper describing the phenomenon, said the storm was one of exceptional severity, especially over the northern portions of England and Ireland, and in the south of Scotland. The greatest violence of the wind occurred at Fleetwood at about 9 A.M., and for four hours the velocity exceeded that of any wind recorded in the British Isles. The Board of Trade Returns show that 167 lives were lost during the gale, and the destruction of property was enormous. Within a day or two of the close of the year 1894, temperature for the preceding three months had been much above average, and farmers profited by the mildness, for the after-grass was plentiful, and the cattle could be turned out almost every day. But after that, right away into March, more than two months, the tem-

perature was much below average. Perhaps the weather of January, 1895, would only be rightly described in saying it was about the worst and most trying to man and beast that ever was. There were heavy falls of snow, which were drifted and piled up in all sorts of objectionable places, making it necessary for much labour with the shovel, in order that passengers could get about at all. During the daytime it frequently thawed and rained, and so the roads became slushy and wet. Frost as frequently followed at night, when the roads became as slippery as glass, and very dangerous to travel. With all this, and the intense cold, besides hardly any sunshine, and much mist, it will be seen what has been said about January can scarcely be regarded as too bad. The first two weeks of February were even colder, and as the severity of the weather had been prolonged, the suffering amongst the people became acute. On February 8, temperature fell to about zero all round Bradford. From the middle of February there was a condition of things somewhat

* For this reason in Italy the name of Orchid-flowered *Canna* is given to these plants.

more bearable, but to the second week of March Nature was bound hard and fast with frost. On Wednesday night, March 13, there was a fine display of streamers. The phenomenon was seen at the same time by different persons in localities right across the country, from Scarborough to the Isle of Man. Afterwards the temperature was decidedly warmer, but it would be difficult to prove that one circumstance had anything to do with the other.

Sunday, March 17, was the first spring day. On Sunday, March 24, it was very rough, rain and wind keeping everyone within doors. In the midlands,

winter to summer. The remainder of May and all June was generally suitable for vegetation; notwithstanding, scarcely any bloom was borne by the Thorn, Beech, Sycamore, Oak, or other forest trees. On June 14, the hay-harvest commenced. The crop was light, but of good quality. The fore part of July was marked with frequent thunder-storms, the lightning at times being particularly vivid, and almost continuous. The latter part of July, all August, and the beginning of September might be described as growing weather, for generally it was warm and humid, with rather frequent thunder-

eighteen of them have increased more than they did in 1894, eight of them less, whilst nine of them have grown alike in both years. The increase of all the thirty-five trees this year is 354 fractions of an inch; last year it was 326 (the fractions are sixteenths).

The Apple crop has been exceptionally good. The cereal crops are estimated to be under average in quantity, but in quality they compare favourably with those of other years. *John Clayton, Bradford, November, 1895.*

ORCHID NOTES AND GLEANINGS.

A CURIOUS CATTLEYA.

MESSES. SANDER send us one of the most remarkable semi-double Cattleyas we have yet met with. The parts of the flower are fifteen in number, viz., three sepals, three outer petals, three inner petals, a column of three stamens, and an ovary with three compartments. The arrangement of the parts is even more curious, the outermost row of three sepals is normal in position and form, the succeeding row of three petals is not alternate with the sepals, but superposed to them (radial choria). These three petals have the form of the ordinary lateral petals. The inner row of petals likewise is superposed to the preceding row; one of them, the posterior one, is concrescent with the column, and has the form of an ordinary lateral petal, the other two anterior or antero-lateral are lip-like. Within this inner row of petals is the column bearing one median or posterior anther, and two lateral ones. Of the three compartments of the ovary, two are posterior, one anterior. The arrangement may be understood from the annexed diagram, where X is the axis of the plant, S the sepals, P P the two rows of petals, A the outermost anther, a a the two anthers of the inner row, whilst the central triangle represents the ovary with its median carpel in front, opposite the single anther A, instead of in a line with it as in Orchids generally:—

M. T. M.

ORCHIDS AT OSWALD HOUSE, EDINBURGH.

In the Orchid-houses of J. Buchanan, Esq., the number of plants in flower at this season is small, but several interesting species were noted on the occasion of a recent visit. In one house were noted fine plants of *Cymbidium giganteum* and *Cymbidium Lowianum* throwing up strong flower-spikes; and a plant of *C. sinense*, a much less-conspicuous plant, with purple and brown coloured flowers, which are fragrant. There were also the odorous *Dendrobium heterocarpum*, or more properly called *D. aureum*; and the now popular *D. Phalaenopsis*, in several shades of colour, and of various sizes, and these judging by the number of plants observed, are the owner's favourites. Large baskets of *Coeogyne Massangeana* were in luxuriant health, with some few flower-spikes on plants in the cooler houses. *C. barbata*, with its coriaceous bold foliage and erect spikes of flowers, promises a good display. Plants of this Assam species were doing well in the intermediate-house. The gem of this genus in flower was *C. Gardnerianum*, a native of the Khasia Hills, discovered in 1837, but still anything but common. The pseudo-bulbs are club-shaped, with broadish leaves, and the racemes of flowers of almost transparent whiteness, with just a slightly lemon-coloured blotch on the lip, have an attractive appearance. Tubfuls of *C. cristata*, a yard in diameter, were nearing the flowering stage, and the varieties *alba* and *others* will soon give an abundant crop of bloom. *Laelia anceps*, and its varieties *Gouldiana*, *Scottiana*, and others were numerous represented. A fine plant

*

FIG. 115.—CANNA ITALIA: SINGLE FLOWER, NATURAL SIZE. (SEE P. 704.)

the wind was much stronger than about here, and caused there great damage and loss of life. On Thursday night, April 4, between 8.30 and 10, there was a halo around the moon; at the same time it was observed by a gentleman who was travelling between Liverpool and Southport. Hence, the cause of halos must be at a great altitude, or it could not have been seen at Bradford and Southport at the same time. The last week of April and the first two weeks of May, the weather suited vegetation exactly. It was commonly said that it had been made on purpose for the farmers, and certainly its effect was so sudden as to appear magical. The trees in the short time named turned in their aspect from that of

storms and rain. The remainder of September was exceptionally bright, hot, and dry, suiting the ripening and harvesting of all kinds of vegetation.

The floods of November, the winds of December and March, the inclemency of January, and the low temperature of February, are the extraordinary circumstances of the weather of the natural year. Excepting them, there has been a near approach to a meteorological average during the time under consideration.

The foliage of forest trees has not suffered this year from any ill effects which sometimes arise from wind, frost, hail, or insects. Of the thirty-five forest trees, whose girths I regularly measure,

of *Lycaste Skinneri alba* throwing up its flowers appeared in splendid condition. *Masdevallia tovarensis* and *M. bella* were very bright. The latter plant is said by Mr. Wood, the gardener, to be almost perpetually in flower. A very large specimen of *Odontoglossum coronarium*, sometimes called *O. brevifolium*, was freely covering a large raft nearly 3 feet long by 2 feet wide. This plant has not flowered in these gardens as yet, but efforts are being made to induce it to do so. Many other species of *Odontoglossum* were showing their flower-spikes; a good plant of *O. Edwardi*, carrying an enormous branched spike; several *Oncidium*s, *Cypripedium*s, and others were in bloom, and the houses presented an interesting appearance. H.

BANANAS AT HAMPTON.

THERE are few nobler leaf plants of a tropical nature grown under glass here, and sometimes with fine effect out-doors in warm positions, than are *Musa*s. Of all vegetation, these plants give some of the most luxuriant and the most rapid growth. Planted as sorted suckers of small dimensions in a heated house, in a few months they have become grand specimens, having massive trunks and magnificent foliage, and thus are most speedily noble decorative objects of vegetable production. It is not usually the case that products of this description are found in gardens of limited nature, and where the glass area is comparatively restricted. There are always found, however, exceptions to every rule, and there is a most admirable illustration of this fact to be now seen in a house attached to the residence of H. O. O'Hagan, Esq., Hampton Court, Middlesex. That there is here a good deal of glass relative to the dimensions of the place, there is no doubt; but much of it is devoted to Peaches, Apricots, Vines, &c. The gardens lie close to the Thames, and rather too much so to be pleasant, when the river is exceptionally high. Last winter when the great Thames floods prevailed, the higher portion of the grounds were immersed 3 feet, and the lower parts from 6 feet to 8 feet in water, which poured through the gardens and round the houses in the most furious fashion; of course in such case, everything had to be left to its fate, and a rough fate it was to many. One of the oddest things in the Peach-houses was that all main stems under water suffered nothing, but all the lateral and young shoots were killed, whilst above the water-line none suffered. Whether because thus saturated or because of the exclusion of air, the immersed young wood died, is a point which may be left for plant-physiologists to decide. It will not be a matter for surprise, as was mentioned shortly after in these pages, to learn that this flood having risen to a height of 4 feet in the house devoted to Bananas at that time, grand plants, and carrying huge clusters of fruit, were killed almost outright. So complete was the work of destruction, that out of ten fine specimens not a single sucker could be found alive a week or two after the flood had abated. The gardener, Mr. Last, however, did detach some dormant knobs or sucker bases from the bottom of the stems after they were taken from the soil, and these being placed in pots singly and stood in warmth, presently pushed growth, so that in March, when the house was again prepared for the plants, those about 18 inches in height were put out in the beds, and another good start made. The result may be seen to-day by anyone interested in Banana culture for fruit production, who may care to look in at River House. The house devoted to these plants is an erect span, 21 feet by 16 feet, and is some 11 feet in height. There is a broad centre walk, and on either side a bed enclosed in 9-inch walls, the inner width being 4 feet. These beds are 2 feet in depth. The heating force is obtained from a double row of pipes that run round between the inner walls of the beds and the outer wall of the house, and also from other pipes sunk beneath the iron grating which floors the main walk of the house. At the bottom of each bed

there is some 9 inches of rubble for drainage, this materially reducing the soil area. On that are laid first rough pieces of turf, and then the compost. This is a material of very innocent nature, being chiefly old pot-soil from *Chrysanthemum*s, &c., with which is mixed a moderate quantity of old hot-bed manure, and rather more of turf edgings or trimmings. Of the stereotyped turfy loam in its virgin state there is none. Nearly filled to the level of the walls, this compost settles down materially during the season, so that now its level is some 3 or 4 inches below the wall tops. Four plants only are growing on either side this year; seven of them are carrying huge clusters of fruit, the other being planted later, will not fruit just yet. These clusters are from the tips of the first whorl of pods to the point of their florescence, fully 5 feet long, but the actual length of the fruit cluster is 3 feet. The fruits will commence to ripen in February, and those now set will occupy some two months before they are all ripe. The present average temperature is 60°, but in the summer it is, of course, much higher. There are no mulchings, and no strong ammoniacal smells that are so offensive in close plant and fruit-houses. No artificial manure of any sort is employed; the only description of feeding otherwise than the soil and plenty of water furnish is found in occasional waterings with the contents of a cesspool. The plants now run to about 10 feet to the top of the leafage, which is of very noble character, and reaches 6 feet in length, and of proportional width. The stems of the plants close to the ground are generally 3 feet in circumference. The variety is *Musa Cavendishii*. Could Mr. Last but exhibit one or two clusters of these grand fruits, when matured, at the Drill Hall, no doubt he would receive a high award. It seems a pity that because such cannot well be the case, that some honour may not be paid to such splendid culture as this case shows. No one can see what is here produced, and the surroundings, without realising that Banana culture is at Hampton of the most meritorious nature. A. D.

ABOUT CHRYSANTHEMUMS.

(Continued from p. 652.)

CHRYSANTHEMUMS AT HOLLYHURST, DABLINGTON.—The collection of *Chrysanthemum*s at Hollyhurst, the residence of W. Harding, Esq., though not large, is extremely well grown, and reflects credit on Mr. Coultas, the enthusiastic cultivator of the flower in the district. There are some 400 plants grown, the Japanese forming the bulk of the number, and nearly every one carried good exhibition blooms. There were grand blooms of Lord Brooke, C. Davis, E. Molyneux, Mille. T. Rey, Louise, J. Sarimpton, and others too numerous to mention. Among the incurved, there were good blooms of R-fulgens, Golden Empress, Jeanne d'Arc, Violet Tomlin, &c. Bush plants are also well grown here, and in the greenhouse there were some grand specimens of *Salvia splendens*—a mass of colour. The gardens generally were a picture of neatness and order, and, considering the number of men employed, show that the old school of gardeners can give some of the younger ones pointers. W. S.

SHOW CHRYSANTHEMUMS.

I would ask, cannot the National *Chrysanthemum* Society make a limit as to the height of flowers shown of Japanese varieties, at their own and affiliated society's shows? There is nothing which mars the look of the tables more, than to see one show-board of cut blooms propped up (as if they were on stack pipes) about 18 inches high, and on the next board the blooms may be about 6 inches high. I cannot understand the use of having show-boards 3 inches high in the front, and 6 inches at the back, if such caps and tubes are allowed to be placed upon them. If the flowers were staged of an uniform height, the tables would have a more satisfactory appearance than that which prevails at present. There is generally a fixed limit at provincial shows as regards the Pompons, and it is

usually that they are not to exceed 6 to 9 inches; why, therefore, no rule to the same effect as regards Japanese blooms? There is another proposal I should like to venture to make, that is, the system of offering prizes by provincial shows. I do not see why they should not offer them the same as the National Rose Society, viz., to growers of 50 to 100 plants, 100 to 300, and from 300 to 500. M. E. Mills, *The Gardens, Coombe House, Croydon*.

FOREIGN CORRESPONDENCE.

A TROPICAL FROG.

UNDER the heading of a tropical frog at Kew (*Gardeners' Chronicle*, November 30, 1895). I read with much interest a note on that sort of frog. I had these creatures myself for many years in one of the houses under my management at Herbault-en-Beauce, France, having received them from Guadaloupe, where they are said to be very abundant; but however strange it may seem, I could never acclimatise them in any of the hot-houses, for as often as they were taken into other houses, they lived only a few months.

The house in which I had kept them for ten years was a large lean-to, the back wall of which was nearly covered with blocks of hard wood, covered with the bark, split in large pieces, and nailed to the wall. On these blocks a fine vegetation of Ferns, Bromeliads, and Aroids, grew, and it was among those plants that the frogs used to harbour, and especially down in the hearts of tall-growing *Bilbergias*—in fact, I never saw them anywhere else but just in the centre where the water lodged, and the frogs remained hidden in these plants during all day; but in the evening and at night they used to run nearly all over the house, and were very difficult to catch. I tried many times to catch them, at the same time carrying a light in one hand, but it was almost impossible to do so, they moved so swiftly; but I learnt to catch them in the daytime by tickling them down in the hearts of *Bilbergias*, when they would jump on to the walks of the houses, and thus render it possible for one to catch them. This species of frog is more difficult to acclimatise than anyone would believe, as the following will show. When I left the gentleman's place above-mentioned, the whole of the plants were sold to my new master, and of course with the plants I took care to take away a good many of the frogs, which I distributed as soon as the plants arrived in different houses, where I thought they would succeed; but they did not live long, and after one year I think there was not one left. I have no opportunity of obtaining any more of them from Guadaloupe, and it was only when reading the account of the frogs at Kew in the *Gardeners' Chronicle* that I remembered having had the same kind. Ch. Maxon, *Orchid Cultivator at La Cavalière, St. Barnabé, Marseilles, France*.

PRICES OF GARDEN MANURES.

IN these days when gardeners for their own as well for their employers' sake, are obliged to keep their expenses within reasonable bounds, I think it is time to say something about the price of those artificial manures which are now so commonly used, but the use of which is restricted by the unreasonable prices demanded by some vendors—especially by those who distribute their manures through middlemen connected with the trade. "Live and let live" appears to be a maxim unknown to some. For example, there is now quite a number of different vendors of Vine and plant manures, all of or about the same quality and actual value, according to analysis and the testimony of gardeners of repute, but which vary in price to the extent of from 30 to 50 per cent. or thereabouts—this amount I am credibly informed being divided between the manufacturer and the middleman. A thoroughly well-known agriculturist not long since asserted in a northern agricultural contemporary that if gar-

deners knew as much about manures as the "average farmer"—not a high estimate of "Horty"—he would not think of buying Vine and plant manures at the prices charged for them, because they were not worth "anything like" the price charged, if they were made of the best constituents of manures, compound them as you may. I have long used "artificiale," and have now price-lists before me of the above manures, both good, and apparently of identical constituents, and the difference in the price amounts to the percentage given above. The chief explanation appears to be this, that one

was just double the weight of that on ground which had received no manure—no other kind of manure being given, the ground being poor. The curious feature of this trial was, that the increase was produced not by the Potatoes being bigger, but by there being more of them, and the difference in the appearance of the crops was marked from the beginning. I state this case incidentally, as what I wish to show is that this manure, made of fairly expensive constituents, and bought in the way stated, cost just about £9 per ton, and could, I find, have been got for a still smaller sum. Had I purchased the manure

FIG. 116.—A TOWN GARDEN.

vendor sells direct to the consumer, and the other through the middleman and not only that, but the first of these two vendors offers his manures mixed of his own composition, or mixed to the purchaser's own recipe; or he will sell any of the constituents separately, for the purchaser to mix them at home—a practice now often adopted. I bought this year my Potato-manure in its separate constituents, according to the recipe published by the Technical Education Committee of the Wiltshire County Council. It consisted of 4 cwt. each of superphosphate, kainit, and nitrate, to be applied when mixed at the rate of 12 cwt. per acre; and under perfectly equal conditions, carefully attended to, the crop of "Bruce" Potato under the manure

from a middleman, it would probably have cost about £15 per ton, 25 to 30 per cent. going, I believe, to the latter, and the rest for advertising and profits, &c. The most amazing thing about these expensive manures is that, according to the vendors, one great feature of their value consists in their lasting effects, the best commentary on this quality being that they are to be applied once, or even twice a year, at a rate which would cost about from £25 to £35 per rood. It may be guessed, therefore, what proportion of the lasting elements enter in to their composition, and these are, as a rule, the highest priced, and have hitherto been supposed to last a Vine border at a less rate of application from beginning to end. *Head.*

A TOWN GARDEN.

THE garden, a view of which we give at fig. 116, is situated in one of the blackest suburbs of London, within a short distance of smoky Stratford, and of factory chimneys not readily computable. The garden was reconstructed about 1855 by the late Mr. Frank Masters, of Canterbury, whose dispositions were pleasing to the eye, and specially designed to hide out adjacent suburban gardens. The illustration tells its own tale. It must suffice here to say that the tree on the left is a fine specimen of *Ailanthus glandulosa*, one of the best of town trees; the one near the centre of the cut is an old Almond, whose dying agonies have been recently cut short by amputation. The large shrubs are fine old Hollies, which suffered greatly from recent severe winters and the drought of last summer, but which might still be brought into condition by patience and good management. The tree at the end is a Purple Beech, and near it are planted Golden Poplar, *Acer Negundo variegatum*, Purple Sycamore, Wistaria, and Laburnums, the effect of which in spring is very satisfactory. The garden has for the last few years been in a measure utilised as an experimental garden for the purpose of ascertaining what shrubs would survive under such untoward conditions. Specimens of these have from time to time been exhibited before the Royal Horticultural Society, and made the subject of comment by the writer of these notes, and have excited much interest. *Aucubas*, Hollies, *Skimmia japonica*, the common Fig, and Metake Bamboo, have survived many others, and are still flourishing. Conifers except *Pinus excelsa*, and *Ginkgo biloba*, the Maidenhair tree—fine old specimens of which exist in the vicinity—refuse to grow. Roses are equally refractory, but a large number of deciduous trees and shrubs do well, and till lately there was a good collection of hardy wild plants and hardy Ferns. Under glass, Vines had ceased to bear, but Camellias and Fuchsias bloomed freely. *Lapageria* and *Solanum jasminoides* were the best creepers, and at one time there was a small but choice collection of succulents. The recent death of the owner of the premises, who took great interest in her garden, and was a genuine plant-lover, will necessitate the break up of the establishment.

TREES AND SHRUBS.

LORBERG'S MAPLE.

ONE of the most brilliantly-coloured of Maples in the autumn is the Maple so named in gardens. It is a form of the palmate variety of the common Norway Maple, and has very deeply-divided palmate leaves, the five to seven lobes wedge-shaped at the base, and themselves dividing rather less than half-way down into oblong lobules, terminating in long slender points (acuminate). The specimen before us was sent with a note of commendation by Mr. W. E. Gumbleton.

A WONDERFUL PORTUGAL LAUREL.

I enclose you particulars and a sketch of a gigantic Portugal Laurel growing upon the lawn at Siberts-wold Vicarage, Dover, kindly sent me by the Rev. Thos. Falkner, who states, that owing to the severity of the winter last season, every leaf dropped off, but now it is as green as ever, and well clothed with foliage. The tree overshadows a circumference of fully 100 feet; girth of trunk 5 feet from ground, 5 feet 3 inches; height of tree, 26 feet; circumference of head, 100 feet. *Alfred Outram, F.R.H.S.*

PINUS DEVONIANA.

Under this name, Lindley (*Bot. Reg.*, 1839) described a Mexican Pine discovered by Hartweg in the neighbourhood of Oaxaca at a height of 8,000 feet. It is one of the five-leaved Pines with deep green leaves, 8 to 10 inches long, with sheaths 1 inch long. In Veitch's *Manual*, p. 184, it is mentioned as closely resembling *P. Montezumæ*, of which it is considered as probably only a variety. This, indeed, seems to be the general opinion among

botanists, and a specimen kindly forwarded from Fota by Mr. Osborne as *P. Devoniana*, is clearly not distinguishable from *Montezamæ*. Mr. Osborne describes the tree as very beautiful, but with a tendency to spread instead of keeping a straight trunk.

THE BULB GARDEN.

TIGER LILIES.

DURING the early autumn months the varieties of the Tiger Lily, *L. tigrinum*, afford a rich and distinctive array of colour just at a time when the Sun-flower abounds in almost every garden. It is at such a time that the value of some exceptional bit of colour, such as found in all the Lilies of this section, find special favour. And during the present year the Kew Garden authorities displayed these to great advantage in a series of beds, showy at a considerable distance. The example thus set will be sure to be frequently imitated in the near future. Those among your readers who may so desire to fill some beds of these kinds, cannot do better than see to their planting without any further delay. The type, as indeed the several varieties of the group, are all of easy culture, and will not require any very elaborate preparation in the matter of soil. What these prefer is, a sandy well-drained loam of fairly good depth. Where very heavy and retentive soils are the rule, the best way will be to remove the original soil at least 6 or 9 inches in depth, and return old potting soil, peat-screenings, half-decayed leaves, wood-ashes, and road-sweepings, in its place. And if the garden generally be low or wet, keep the surface of the beds a little above the usual level.

When the soil is ready, the bulbs may be planted at about 5 inches or 6 inches deep; and if sand is plentiful, a good sprinkling may be added about the bulbs. With the soil prepared in the way suggested, little or no manure will be necessary; but if any be given, let it be thoroughly decomposed, and either dug in deeply below the bulbs, or used as a mulch on the surface after planting. *L. tigrinum* (type), *L. t. splendens* (a most handsome kind), and *L. tigrinum flore-pleno*, are all worthy, and among the cheapest of Lilies for the garden. *J.*

SPARAXIS AND IXIA.

I am surprised the above beautiful bulbous plants are not extensively grown in gardens, for all who have seen a well-grown collection admit that they are pretty when in bloom, inexpensive to buy, and easily cultivated, thriving in almost all kinds of soil, and only requiring to be preserved from frosts. The late Mr. Gaines, a famous florist, residing at Battersea, used to cultivate the plants in capital style, he got together a splendid collection, the graceful panicles or clusters of flowers, varying in colour from brilliant crimson to all shades of orange, red, rose, cream, &c., which presented a beautiful picture on a border in the front of some long houses devoted to Pelargoniums. When the plants are planted in this manner in masses they rival Orchids in brilliancy. These bulbs were left in the ground for three years, when they were lifted, sorted, and the strongest bulbs replanted. The border was protected by a thick coating of old tanner's bark in winter. A site for a bed of *Ixias* or *Sparaxis* should face the south, the subsoil should be dry, or be provided with drainage materials, such as brick-bats, laid all over the bottom of the bed; the soil should consist of rich sandy loam, a small quantity of peat and leaf-mould, the depth being not less than 1 foot. The bulbs may be planted in rows or clumps, from 2 to 3 inches deep, according to their size, covered with river-sand to the depth of an inch, previous to covering them with the earth. If cultivated in pots for greenhouse decoration, the bulbs should be potted in October, and the pots plunged in coal-ashes, &c., in a cold frame till the foliage appears, when removal to the greenhouse may take place, or they may remain in the frame. As the plants advance in growth, air must be freely admitted, or the growth

will be weakly and poor; and liquid-manure may be used after the flower-spikes have made their appearance. In the month of May or later, when the leaves die down, turn them out of the soil, clean the bulbs and place them in boxes or drawers until wanted the next October. *Edw. Bennett, Lyne, Chertsey.*

SPANISH IRIS.

All Irises are beautiful, some of them being surpassingly lovely, and fully justifying their generic name; but while the German bearded Iris, *I. Kämpferi*, *I. reticulata*, *I. Susiana*, and other beautiful forms of the family are, comparatively, high in price, *Iris hispanica* are so cheap, that large clumps or beds may be planted of them at a trifling cost; they are, too, admirably adapted for cutting purposes. The flowers are particularly bright and gay in colour, are borne on long stalks, and, while packing and carrying well, last a long time in water. While in bloom—about the end of May or beginning of June—they are veritable "cut and come again" plants and when grown in a rather rich bed, well manured with old, rotted cow-dung, it is astonishing the quantity of bloom they will produce. Considering the low price at which Spanish Iris, either in separate varieties or in mixture, are offered in the bulb catalogues, I am surprised they are not more planted in the flower-beds or in flower-borders. As they die down after flowering, the ragged untidy appearance of a bed of German Iris when out of bloom is avoided. The present is a good time to plant them. I like to see them in a bed by themselves, planted pretty thickly, for they do not take up much room; but I have also seen fine effects where a carpeting of *Silene pendula compacta* was put over them. I saw a bed of Spanish Iris among which *Violas* were planted so as to form a ground-work, and as they all bloomed at the same time, the effect was very beautiful. *A. H.*

FLORISTS' FLOWERS.

THE HOLLYHOCK.

I HAVE been much interested reading the remarks on the Hollyhock by "R. D.," and am glad to know that there are cultivators who can grow the Hollyhock successfully. I have been trying to grow it for the last twenty years, but I must say that my success has not been conspicuous. I can manage to get rid of the Carnation disease, and to keep it away by isolating the Carnations, and placing every new one I obtain into quarantine; and if the disease is there, it soon shows itself, and the diseased portions are then cut off before the spores are developed. This is effectual as regards the Carnation; but the same treatment will not do for the Hollyhock. Every leaf may be cut off, still the disease will show itself whenever the first leaves appear. I tried to grow Hollyhocks in my new place in Surrey, and sowed seed, keeping away every plant from the place but the seedlings. They grew amazingly on the new ground, and I was in expectation of a fine bloom; but almost before the flower-buds were formed, the disease appeared. I tried the plan of removing the leaves affected, but it was of no avail; the attack came in 1894, and was the most virulent I ever knew. How did the plants get the disease? This was a poser for some time, until I found out that some plants of common varieties were growing at the railway station badly diseased; the plants were at some distance, still the minute spores of the disease were carried upon the clothes of the garden men, and thus it came that my plants were infected. If diseased Hollyhocks are allowed to exist at railway stations, it will be hopeless to attempt the culture of this stately plant in any garden whence passengers are passing to and fro; for I believe that the minute spores are carried on the clothes of any one going near diseased plants. I am not sure what I can do next, for the plants were so bad that I destroyed them all. I have a smaller lot of seedlings, and a few named sorts, to flower next year, but I despair of success. A good strain of seed is sure to

give good varieties, as about 50 per cent. of seedling Hollyhocks are as good as the parents; and if good varieties are not produced, one knows well enough who to blame.

As to the culture of the Hollyhock, that is simple enough, for even in cottage gardens the most stately plants are produced with little trouble; nevertheless, the plant is a gross feeder, and the good results obtained in cottage gardens are doubtless owing to liberal supplies of pig-manure. It seems the disease is influenced to a considerable extent by the seasons. The wet season of 1894 was favourable to the development of the disease, and last season being exceedingly dry was unfavourable, the plants having a chance to do better if they were well watered at the roots, and the leaves kept free from red-spider. *J. Douglas.*

BERLIN.

ENGLISH VERSUS GERMAN CYCLAMENS.

TO "F. N. S." I have to reply that English varieties are cultivated by Mr. Schwarzburg just in the same way as the German ones. As I remarked in my first letter, it may be possible that the treatment is different in England and in Germany. It may be also that the English varieties grow best only under the treatment to which they are accustomed in England. The fact is, that German varieties grown together with English ones, and in the same way, surpass the latter. To-day I have a second proof of the truth of my remark. A second lot of seeds of English varieties was given by the Berlin Horticultural Society to another Cyclamen specialist, Mr. Tubbenthal, at Charlottenburg, near Berlin, who tested them. They were exhibited at the meeting of the society on the last Thursday of November, together with varieties grown by Mr. Tubbenthal. This time the difference was still more striking than the first time. In this case also, the English varieties had quite the same cultivation as the home-grown ones. Mr. Schwarzburg has reported upon the trials; but in order that this may be quite disinterested, Mr. Schwarzburg asked the society to select a committee to test his report and the plants. The report will be published in the *Gartenflora*. At this meeting it was stated that the English Cyclamen growers very much surpassed the German ones about fifteen or twenty years ago; but since that time the German ones have progressed so far, after they introduced English Cyclamen blood into their cultivation, that they surpass the English, as is now shown by the plants exhibited. It was remarked during the discussion that several of the varieties which were brought to Germany fifteen or twenty years ago, to freshen up the German Cyclamen blood, were quite the same as were cultivated this year from English seeds. Another remark of interest is, that German gardeners who grow new varieties give no new names to these sorts, but cultivate and improve them yearly by selecting the very best specimens for seed. So it comes about that there are in different nurseries different high-class varieties, but without distinctive names. If I knew on which days the meeting of the London Royal Horticultural Society is held, it would give me much pleasure to send to the meeting some of our best German varieties, as also plants of English varieties, grown here together with the German ones. Then the society could see for itself whether the English varieties are best here, and whether the German ones surpass English ones grown in their native country. On the other hand, it would be of much interest to German specialists if we could see some English-grown plants. I beg English Cyclamen specialists who take an interest in this question to forward to me some of their best-grown plants, that I may show them here before our Horticultural Society. I have further to remark that Mr. Schwarzburg is not a seed-merchant; that he raises only as many seeds as he needs for his own cultivation, so that he cannot give seeds to those who have asked for them, but that Mr. Tubbenthal is willing to supply seeds, as he also grows the plants for seeds.

Chrysanthemums.—At the same meeting there were shown some *Chrysanthemums* by Inspector Weber of Spindlersfeld. I must confess that they now rival the English-grown plants shown some years ago by English specialists. There was amongst them a new variety, *Tangarika*, imported by the President of the German Dendrological Society, Hofmarschall von Saint-Paul-Illaire, directly from the Imperial Gardens at Tokio. This giant variety measured 22 centimetres (about 8½ inches) in diameter, is pure white, and of very fine habit. Hofmarschall von Saint-Paul wrote from his residence at Fischbach, in the Riesengebirge, that amongst the varieties he imported from Tokio there is now flowering one which has a scent very much resembling that of *Violets*, or even more that peculiar to the rhizomata of *Iris florentina*. This may, perhaps, be the parent of quite a new race, welcome to all those who do not like the scent of other *Chrysanthemums*.

Of high interest at the same meeting was some forced *Lilac Marly*, exhibited by Mr. Harms, of Hamburgh. Mr. Harms remarked, that this variety is best for early forcing. It does not need much pre-

large horticultural exhibitions plants which were bought by the exhibitor shortly before the opening of the exhibition; indeed, cases are known in which the plants were only borrowed. Thus, at our last great exhibition in 1890, I remember that one of the jurors, the director of a famous Netherlands botanic garden, exclaimed, surprised, "How comes this plant here? There exists of this species but one specimen, and that is in my garden." The exhibitor, questioned about the matter, declared that the head gardener had borrowed it for the exhibition. Certainly the exhibitor has no other claim to merit than that of having brought the rare plant to the exhibition. To award him a prize would be absurd, but he earns large rewards for the rich collections he has brought to the exhibition, which cannot be proved to be grown by himself. Certainly, at an exhibition, the labour of the cultivator should win him the prize, and not the fact that he has the longest purse to enable him to buy up the best specimens from different nurseries. It is misleading, if the exhibitor does not declare that the exhibited plants are not cultivated by himself. The jurors cannot

There is no doubt that a great many cultivators will exhibit their plants, if they know that they have only to compete with other growers, and not with those who have selected the finest specimens from the best specialists. It is clear that against the latter no cultivator can compete. The gardener's endeavour is to improve his plants. He works to sell his plants. Now, there is, as regards the advancement of horticulture a great difference according to whom a grower sells his plants—to a gardener who buys them for exhibition, or to the public, or to amateurs. In the first case, all who do not know the origin of the plants, will think that the exhibitor of bought plants is the grower. Certainly those who wish to buy the best will go to the exhibitor, and if he would give as good plants as those which he exhibited, he is obliged to buy them from the grower. It is doubtful if he can get together such a collection a second time. At all events, the grower's name remains unknown, and he does not get the prices for his plants which he would get if he undertook the business himself; so it is to the interest of the growers that they should exhibit their plants under their own names. It is very shortsighted to say it is the same thing if the plants are sold to another gardener or directly to the amateur. Only by direct competition between the growers is horticultural progress possible at local or at international exhibitions. Indeed, at the latter it is even more important than at the former; for an international exhibition is visited by far more persons than is a local one, and so competition is greater. If the larger horticultural societies in England and on the Continent would unite to work in this direction, local societies would certainly follow, and then this spurious competition would soon disappear from horticultural exhibitions.

It is a question of secondary interest to determine how long a plant must be cultivated by the exhibitor before it can be admitted to an exhibition. The exhibition committee at first proposed that the plants must be grown by the exhibitor from seeds or cuttings; but this limit was reduced so that only one year's cultivation or one cultural period was deemed necessary. Forced plants were said at first to be admissible when the exhibitor had forced the plants, bulbs, &c., himself. A severer rule would necessitate that the grower of the forced plant must also assert his interest. An exception, it is true, must be made for imported plants, as well as for novelties; but in both cases it is necessary that the exhibitor declare that the plants have been imported, and how long ago they were imported, and also how long he has had the novelties in cultivation and, if not self-grown, that he is not the grower.

At all events, horticulture would be much advanced if these proposals should find acceptance by large horticultural societies. Then certainly the international character would be still more evident than hitherto, because the cultivators would know that at exhibitions right has preference over might, and that they can compete fairly with their competitors in their own special branches of cultivation. I should be glad to hear the opinion of English gardeners on this subject. *Dr. Udo Dammer, Curator of the Royal Botanic Garden, Berlin.*

NASTURTIUM LILIPUT.

UNDER this appropriate name, H. Ernst Benary, florist and nurseryman of Erfurt, has introduced a new variety of *Tropæolum Lobbianum*, very dwarf in growth, being in every respect smaller than the well-known *N. Tom Thumb*, and covered with dainty little flowers in great profusion, and just showing above the small foliage, making it one of the prettiest of annuals. The flowers are of diverse colours, some of these being quite new, not appearing in the old varieties. This feature, and the fact that the seeds are much smaller than those, are evidences of an entirely new break in the *Tropæolum Lobbianum* section. Herr Benary has not as yet been able to fix the colours; but, as he says, the mixture is highly effective in groups and borders.

FIG. 117.—LILIPUT NASTURTIUM.

paration during the preceding summer, as does Charles X. The only preparation needed is that workmen should divide the benches in the nursery-garden during the summer months. From one square metre Mr. Harms raised from 60 to 90 flower-stalks. At the same time, he forces three times during one season, so that the yield is good, especially as much *Marly Lilac* is still imported from Paris. *Dr. Udo Dammer, Friedenau, near Berlin.*

A QUESTION RELATING TO INTERNATIONAL HORTICULTURAL COMPETITIONS.

In the spring of 1897, will be held, on the occasion of the seventy-fifth anniversary of the Berlin Horticultural Society, an international horticultural exhibition. The exhibition committee has proposed that only such plants as have been for at least one year, or for one cultural season, in the hands of the exhibitor, shall be admitted in competition. To this proposition considerable opposition was aroused, and the united committees of the society did not give their approval to it. Now the general body of the Fellows has, at its next meeting, to decide whether this proposal shall be adopted or not. I think the question of such international interest that it may be discussed in this paper. Certainly it would be a very important step if an international arrangement could be made. The reason for the proposal was, that there have been shown at recent

know, without such a declaration, who is the grower. Certainly, there will always be some exhibitors who will not hesitate to declare falsely that the exhibited plants were cultivated by themselves. Against such no laws can avail, but I think that a great many would be afraid to do this if there were an international agreement that all those exhibitors who are convicted of having misled jurors by false declarations concerning the origin of their plants shall return any prize they may have won, shall be excluded from all exhibitions, whether they be local or international ones, and that their names shall be published in the principal horticultural papers of the different countries. If this resolution were an international one, the exhibitions in a short time would be again what they once were—a true show of plants which different gardeners have cultivated.

It was said that the regulation that the plants must have been under cultivation for a certain period by the exhibitor, would give occasion for untruth. I say, that this can be met by the resolution, that he who says that plants which the exhibitor declares to have been cultivated for the necessary time by himself have not been cultivated for so long by the exhibitor, shall be confronted with the exhibitor. Then it will easily be seen who is right. And if this were done several times, such untruths would be checked.

PLANT NOTES.

BURKHILL NEW WHITE MIGNONETTE.

We have had a good many so-called white Mignonettes, as well as scarlet and other colours; but few of these can be said to have had a very lengthened existence. We have greatly improved the primitive type in habit, compactness, profusion and size of blossom; but as to colour, fashion has been in favour of the original neutral tint. But this new white is pure white, with a tinge of bloom that may be truly described as at once bold and graceful. It may be fancy, but I believe it is also a fact, that it is the sweetest strain of Mignonette in the trade. I have met with it several times recently in pots, and on each occasion have been most favourably impressed with its whiteness and refined fragrance. The purity of its colour will make it a most welcome addition to bouquets, wreaths, &c. *D. T. F.*

CLEODENDRON FALLAX.

We find the best way to succeed with this well-known old stove plant is to raise plants from seed each year. A small batch of March-sown plants is just going out of flower, on which are a number of seeds that will ripen in due course. The plants stand on the side stage in an intermediate-house. As stated, the seeds are sown in the month of March in shallow well-drained pans filled with a light compost, and as soon as the young plants are large enough to handle, they are potted singly into thumbs in a mixture of two-parts loam to one of rotted leaf-soil, and when these pots fill with roots, the plants are placed in 5-inch pots in a similar soil, but with the addition of a small quantity of sifted fowls'-dung which has laid in a heap for some months. During the summer the plants are grown in any ordinary Cucumber or Melon-pit, but not too much shaded. In September and October they add brightness to any warm plant-house by their large scarlet panicles of blossom. *H. J. C.*

FRUIT REGISTER.

RASPBERRY BELLE DE FONTENAY.

The fine weather experienced during September and early October was favourable to autumn-fruiting Raspberries, and I do not remember having seen Belle de Fontenay in such fine condition as it was at that season. It is a variety that is excellent for autumn-fruiting, and is well worth cultivation if for that only, as its fruits come in usefully with the retarded red Carrants. It is somewhat tart in flavour, but not therefore disliked as a dessert fruit. Its requirements as to soil are similar to the summer-fruiting varieties, and it should be afforded an early and sunny situation, so that its fruits, particularly in late seasons, may ripen perfectly before frost sets in. Unlike the summer Raspberries, it fruits upon the current year's growth, and in pruning it, therefore, all its canes should be cut down to the ground not later than February. The young growths should be thinned early, leaving the strongest to crop, and these must on no account be allowed to become crowded, but be kept well thinned out, so that they may gain as far as possible every benefit from the sun and air. For this reason it is not advisable to stake them; and, indeed, it is unnecessary to do so, as they are sturdy enough to be self-supporting, and if thus left alone they naturally arch, and fully expose their flowers and fruit. *Thomas Coomber.*

GRAND DUKE PLUM.

As a late black variety, we like this Plum very much. It resembles Diamond in appearance, but the fruit has heavier bloom, and at Mereworth it is of far better flavour, and the trees growing on a west wall, crop freely. The fruits have the good characteristic of keeping for a long time after ripening without shrivelling; in short, it is a most valuable Plum. The variety was raised by Mr.

Rivers, Sawbridgeworth. It is a seedling from Autumn Compote, and ripens from the 10th to 20th of October.

APPLE, NEWTON WONDER.

This comparatively new introduction of Messrs. Pearson, of Chilwell, is apparently a cross between the Blenheim Orange Pippin and Wellington, having a resemblance to both these varieties. I have not as yet grown it, but its good qualities are highly spoken of by Messrs. G. Banyard, at whose nursery place I recently saw some heavy and handsome fruits. If the trees bear early, and are fairly free from canker, then we have in Newton Wonder a first-rate Apple, which can be kept in sound condition till the month of May. It was exhibited by the raisers before the Royal Horticultural Society in 1887, receiving a First-class Certificate. It is said to be eminently suited to cold soils and districts. *H. Markham, Mereworth Castle, Kent.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorset.

CLEODYNE CRISTATA, ETC.—Plants of this winter-flowering Orchid are showing flower-spikes already, and where there are several specimens, a long succession of flowers will be afforded if one or more of them are placed in a slightly warmer situation than the others. At this period the cultivator should guard against over-watering the plants, or sprinkling the bloom-spikes, these being liable to rot away if moisture accumulates about them. Just before the flowers open, afford the plants a thorough soaking of weak liquid manure-water to assist their development. *C. ocellata maxima* and *C. elata* are also pushing up their flower-spikes, and need to be copiously watered till the flowers fade; *C. faccida*, *C. Massangeana*, and *C. tomentosa*, are at rest, requiring very little water at the root before flower-spikes appear, or growth recommences. Species that have bloomed recently, as *C. Rossiana*, *C. Cummingii*, *C. graminifolia*, and *C. sulphurea*, may be re-potted if they require it.

MAXILLARIA.—Among plants in flower is the pretty *Maxillaria lepidota*, whose blooms, although of small size, last a long time in perfection, and a strong plant here with over 100 blooms open is regarded as a very effective feature at this season. *M. picta*, not so showy as the first-named flower, also in flower, is as interesting, and on that account worth growing, as also for its delightful fragrance. Such handsome and strong-growing species as *M. grandiflora* and *M. venusta* that have just passed out of flower should be examined, and if greater root-space be needed, it should be afforded. Overgrown plants, or those whose central growths have become much crowded, may be divided, and made up into small, compact specimens, or re-potted as single pieces. *Maxillarias* require liberal root-watering and a moist atmosphere when making growth; and it is important when repotting them to have the pots well drained. The compost should consist of one-third good fibrous peat and two-thirds sphagnum-moss, with plenty of small crocks intermixed. Pot somewhat firmly, and keep the base of the plant a little above the rim of the pot. It is not advisable to afford the plants a heavy watering for a few weeks after disturbance, but sprinkle the surface of the compost, so as to keep life in the sphagnum-moss. When new growths are observed to push out roots, the quantity of water may be slightly increased. A light part of the cool-house is the proper place for these plants the whole year.

ONCIDIUM INCURVUM.—This is a graceful and pretty Orchid, when well bloomed, that is now starting to grow, and should, if necessary, be re-potted, using the same kind of compost as that recommended for *Maxillarias*. Both genera grow thoroughly well together, as they need an identical treatment. *Oncidium ornithorhynchum* has also just passed out of flower, and may now be supplied with fresh material to root into. This species succeeds in the cool-house in summer; but in winter it should be placed with *Miltonia vexillaria* in the intermediate-house.

MILTONIAS.—The majority of the Brazilian *Miltonias*, viz., *M. spectabilis*, *M. Moreliana*, *M. candida*, *M. bicolor*, *M. Peetersiana*, *M. Clowessii*, *M. cuneata*, *M. Russelliana*, *M. Rognellii*, &c., will now

be resting, and until growth recommences they should be kept comparatively dry at the roots. Keep them in the coolest part of the intermediate-house during winter, where they will obtain as much light as possible. Unfortunately, these plants are seldom kept in a healthy and satisfactory condition. The principal cause of failure in our own case has been the use of unsuitable material for them to root in. I find they thrive best in good fibrous peat from which all the fine matter has been sifted out. Use no sphagnum-moss, but mix plenty of broken crocks with the peat. In such material they can be watered very freely, and during the growing season this is essential. The water passes quickly away, and the risk of damp in bulbs or foliage, and decay at the roots, is practically avoided. Supply fresh material when new growth commences. The dwarf-growing varieties, as *M. spectabilis*, &c., may be put in shallow pans, and suspended to the roof; but others are best grown in pots, and kept well above the rim. *M. Schroderiana*, a rare and handsome species, is in full growth, and should be given the warm temperature of the East Indian-house during the winter months. When the new bulbs are matured, it may be removed to the Cattleya or intermediate-house to rest and flower.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

THE EARLY VINERY.—This house being now closed for the forcing of the Vines, great care will be needed to ensure all the buds breaking regularly, therefore no fire-heat will be needed for the first few days, and this is the more important if the canes are young and have not been forced before. If the canes are strong and well ripened, and the precaution taken to bend them down so that the apex will be as low as the lowest fruiting spur, they may so remain till it is seen that every prominent bud has started. In our early vinery, the Vines are planted in a narrow border, which received a thorough watering when the house was closed; and the canes will be kept fairly moist by syringing them regularly once or twice daily, according as the weather is dull or bright; no more root-watering will be applied until active growth begins, after which time tepid water will be used always. In the absence of frost, no difficulty will be found in keeping the temperature at 55° to 60° during the day, with just a slight amount of circulation in the hot-water pipes, and for ten days or a fortnight this temperature should not be exceeded. The night temperature may range from 48° to 50°. If the roof can be covered at night with thick canvas or other material, it will be an advantage. These temperatures can be secured in mild weather by the sole use of a bed or two of fermenting materials, placed in the house, the moist heat of which greatly assists the breaking of the canes.

SECOND VINERY.—These Vines should now be pruned, and the house got in readiness for a start being made at or about the New Year. Our Vines in the second early vinery are forty years old, and with a view of affording fresh vigour to them without replanting, every alternate cane was cut back to the bottom wire last winter, and from these old stems vigorous canes have been secured, which are in a well-ripened condition. These canes will not be cut back very much, but from 8 to 10 feet of cane will be left, from each of which I hope to take from two to four bunches next season. To make room for the development of these young canes, the lower spurs on the old Vines will be sawed off as far up as may be necessary to allow space for the side shoots of the young canes to grow. The top parts of the old Vines will be cropped until such time as the young ones come into full bearing, when these in their turn will be cut back in the same manner. As the Vine border in this house was recently re-made, nothing is required in the way of preparation beyond raking off the rubbish and levelling the rough surface. After a time the surface-soil will be lightly broken with a fork, and a dressing of Thomson's Vine-manure applied.

STRAWBERRIES.—For the earliest batch, make use of the variety *Vicomtesse Hericart De Thury* potted in 5 inch pots, which cannot be beaten for early fruiting. Prepare them by plunging the pots to the rim in a bottom-heat of 70° to 75° afforded by a bed of leaves, or leaves three quarters, and stable litter one quarter. This should be made up in a pit, capable of being heated, if necessary. Bring the bed pretty close to the glass, and afford a top-heat of about 55°. By

this kind of treatment the plants make strong growth, and by bringing them on slowly the flower-trusses are strong and carried well up above the foliage. Ventilation must be afforded to get rid of rank steam, otherwise injury will be done; in fact, a chink may be left on always if there is any fear that the temperature will rise above the point recommended. The lights should be covered with double mats on frosty nights, the plants being exposed to the light early in the day. I prefer to surface-dress the plants when the fruit is set, but it may be done when the plants are brought in.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

CUTTING EVERGREENS.—If the weather continues favourable, advantage should be taken of it to thin out and prune Laurels, Box (but not clipping the leaves of this last), Hollies, and other ever-green shrubs. The prunings being in demand at this season for decorative purposes, should be saved by inserting them in damp soil. Together with these may be associated in decoration Spruce Fir boughs and Ivy, all of which should be secured and kept in readiness for use. To many of us this season brings a great deal of work in the matter of wreath-making for a variety of purposes; and when the days are fine, it is a good plan to gather in as much material as will be required, it not being an agreeable job to gather it when the trees and shrubs are covered with snow or rain is falling. The work of cutting decorations requires careful doing, or much damage is done, therefore get it through in fine weather if possible and in advance of the time. As material for wreaths for twining round pillars, nothing looks so well as small shoots of Holly, furnished with berries; heavy wreaths for the tops of screens or walls should be made of Mahonia, Spruce Fir, Box, and Ivy, and when the Holly is well-berried, large branches may be cut from trees growing in out-of-the-way places. Care is necessary in fixing Holly branches in position, as they should not be placed so low that persons can brush against them, or damage may be done to the pictures by the leaves, or to carpets by the fallen berries. For bright green foliage the Common Laurel is one of the best.

EVERGREENS BY PARCEL POST.—Packages of these may be sent without much damage if a piece of stick or light lath cut a little longer than the parcel to be sent, so as just to stick out at each end. Lay the stick on a sheet of newspaper, then lay the ever-greens, Mistletoe, Holly, Fern, or even flowers, in the middle of the parcel, and tie carefully with the ever-greens packed all round the flowers, making the outer covering fast to each end of the lath. In this way the decorative materials that are so highly prized by town-folk at this festive season may be sent by post for little cost, and there are no boxes to be returned.

HELLEBORUS NIGER AND OTHER SPECIES.—Bell-glasses, hand-lights, or garden-frames should be placed over the roots of the first-named growing in the borders, so as to protect the blooms from snow and rain. Clumps may also be potted in undivided masses, and placed in an intermediate-house; the best variety for this purpose is *H. angustifolius*—a fine pure white-flowering variety in much request at this season. It can, with a little heat, be quickly brought into flower. There are several fine varieties worthy of a place in the herbaceous and mixed border which are easy to cultivate if the soil be well drained and rich. They are readily increased by divisions and by seeds. For flowering during the winter and early spring they should be planted in situations sheltered from the north and east. Valuable varieties are *H. maximus*, *H. M. laciniatus*, *H. niger* Mme. Fourcade, *H. guttatus*, *H. olympicus*, *H. orientalis*, *H. Dr. Moore*, *H. pallidus*, and *H. p. alba*. The more shrubby varieties, viz., *H. foetidus* and *H. trifolius*, have beautiful foliage.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

FRUIT CORDONS.—The utility of cordons should not be lost sight of by the intending planter of fruit trees, for not only do such forms of fruit trees come quickly into bearing and generally afford the finest fruit, but they should be commonly employed to fill up small vacant spaces on walls or fences which would otherwise be left unoccupied. Where such spaces exist, a suitable selection either of

trained trees or of maidens should be made, planting them as early as possible.

PRUNING SWEET CHERRIES AND PLUM TREES.

These trees, although differing much in character of growth, require a somewhat similar treatment in the matter of pruning and training. The fruit being in both cases produced on spurs, the breastwood and lateral growth on the main branches should be shortened to a couple of buds, and the leading shoots laid in where required, care being taken to avoid crowding the shoots in any part. Pyramids or bushes should have all the lateral shoots not required for furnishing the trees, sparred back to near the main branches, and the leading growths shortened more or less according to strength, in the case of side branches to an outside bud, or if very stout and sturdy, they may sometimes be left unshortened. Keep the centres of the heads thin, so that light may penetrate to the inner parts. Standards, especially of Plums, require frequent attention in the matter of thinning, or in a few years, if this be neglected, the whole interior parts of the tree will be fruitless.

Morello Cherries form very pretty and profitable pyramids or bushes if proper attention be given to the necessary pinching once or twice during the summer. At the present season the young shoots on these must not be shortened, but merely thinned by cutting out the weak and badly-placed ones. As regards wall trees of the *Morello*, much of the old wood may safely be removed and replaced with young growth. An error often made is to train in the bearing-wood much too closely, for as a rule each fruiting-shoot ought to be allowed from 4½ to 6 inches space on each side. Spurs should be thinned in number, those retained being close to the wall, and not allowed to extend themselves so as to form breastwood.

MANURING THE FRUIT QUARTERS.—Advantage should be taken of frosty weather to wheel manure to the Gooseberry and Currant quarters, lightly forking it into the ground, so as to just put it out of sight. Raspberry plantations, if long planted, should have a heavy dressing of farm-yard manure applied as a mulch. New plantations may not require more than will manure the lines of plants for a distance of 1 foot on each side of the same. This will serve at the same time to protect the roots from hard frosts. During open weather, liquid-manure should be applied to the roots of old orchard or established fruit-trees elsewhere, such as wall-trees which are weakly, or fail to finish their crops satisfactorily. Before applying dung to these last, the soil should be drawn away down to the surface-roots, and farmyard drainage-water in quantity afforded; the soil should then be returned over them, and the top-dressing put on.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

EARLY POTATOS.—Where the earliest batch of new Potatos is obtained from plants grown in flower-pots, preparations for a start may soon be made. The pots should not be less than 9 or more than 10 inches in diameter. They should be well washed out, and the bottom covered with a 1½-inch layer of crocks, and these covered with some of the coarser portions of the leaf-mould. As a potting-compost, the now mellow loam that formed the beds on which Melons were grown will be very suitable, if a small amount of leaf-mould or Mushroom-bed manure be added, together with charred earth, &c., filling the flower-pots to three-quarters of their depth. Place the set—preferably an uncut one—an inch deep in the middle. A Peach-house or viney just started to force will be suitable for the pots. If the soil is moist when used, no water will be required by the sets before growth appears, and when that occurs, place them as near as possible to the roof-glass, so that they may grow short-topped and sturdy. When of sufficient height, fill up with warmed soil to within an inch of the rim. At this period a thorough watering of the soil with tepid water may take place. One advantage of forcing the Potato in flower-pots, is that they can be accommodated in places which would scarcely be occupied with other plants; and I have seen some fairly good results come from the following method. The method pursued is to plant in pits capable of being heated, or wooden frames standing on hot beds of dung and leaves, and for the earliest crop the heated pit is preferable. Pits and frames should be whitewashed, in the case of the former, and scoured with soap-and-water in that of the latter, and then filled with well prepared hot-bed materials, viz.,

stable litter and tree leaves, or the latter alone, made quite solid by treading them evenly all over. Before putting on the soil, the warmth should be on the rise, and should the bed have sunk much, enough prepared materials should be placed on the surface and trodden down as before, and to such a depth that the bed of soil will not be more than 6 or 8 inches from the glass. The compost for use in hot-beds is the same as that advised for Potatos in pots, and it should not be of less depth than 8 inches. When the soil has become warm, say 75°, which is about the proper temperature, the sets may be planted. To save time, place a sufficient number of selected sets in boxes or small pots, covering them with leaf-mould, and set them to sprout in mild heat. These when transplanted will have a good bit of leaf-soil adhering to the roots, and will not be much checked in growth by removal. Plant in rows 2 feet apart, and from 9 to 10 inches apart in the row. Grow the plants quickly, but do not let them become drawn by too much warmth, or the exclusion of light and air. Some gardeners sow Radishes between the rows, but it seldom pays to do so, as the Radishes grow much better by themselves. The following are excellent forcing varieties, viz., *Sharpe's Victor* and *Veitch's short-top Ashleaf*.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

FORCING HOUSE.—The plants which may be brought into the forcing-house, vineries, or peacheriee, consist of Lilacs, Deutzias, Roses, *Hortia japonica*, *Azalea indica*, *A. mollis*, Ghent varieties, and Roman Hyacinths, and these being kinds that require but a small degree of heat to bring them into flower, are the best for the mid-winter season. The flowers will endure a much longer time if the plants are brought into a less warm house or pit when these are about to expand. At this date Lily of the Valley crowns are flowering capitally well, owing to their being thoroughly matured. The pots containing the crowns, if they are forced in this manner, and not in boxes, should be plunged in the hottest part of the bed, and afforded plenty of warm water.

CHRYSANTHEMUMS.—Most of the Chrysanthemum plants will shortly be out of flower; and it will require in most places a good deal of forethought and good management to maintain a gay appearance in the conservatory, and to supply flowers elsewhere during the next two months. The following kinds of bulbs, viz., Narcissus, Tulip, Scilla, Iris, and Jonquil, are useful in a variety of ways and easily forced into flower, and these, like others, are the better for being brought into a lower temperature than that of the forcing-house, to open their blossoms. If clumps of Christmas Rose are taken up and placed in a warm greenhouse, they will quickly come into flower; and the pure white flowers are always much admired, and useful in a variety of ways.

POINSETTIA PULCHERRIMA.—The stronger plants, whose heads have been removed, should always be saved for increase of stock, and they may at once be stowed away beneath the greenhouse or stove-stages, or other frost-proof, dry situation. The gaps made by their removal may be filled with others that have been suitably prepared in an intermediate-house.

RICHARDIAS.—All the well-rooted plants should receive plenty of manure-water, and any which are throwing up spathe may be placed in a warmer house than that they now occupy. Fumigate the plants once in three weeks to destroy aphid, which, if unmolested, soon spoil the spathe.

GENERAL HINTS.—Named Hyacinth, late Tulip, and Daffodil bulbs at the present time plunged in coal-ashes out-of-doors or in frames, should be occasionally examined, and all those which have commenced to grow at the top and have plenty of roots should be removed to cold frames or the greenhouse, and injured by degrees to sunlight. Italian Hyacinths succeed the Roman variety, and the blossoms are useful material for light decorative purposes. Keep Violets in frames free from decayed leaves, and if any of the plants show signs of damping, dust them with charcoal-powder, and draw off the frame-lights in mild weather. If frost threatens, place litter round the frames and cover up warmly. The present is a suitable season for obtaining loam, peat, sand, sphagnum and other moss, flower-sticks, &c., and leaf-soil.

EDITORIAL NOTICES.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

WEDNESDAY, DEC. 18 { Sale of the Lease and Stock of the Westfield Nurseries, Ashgate Road, Chesterfield, on the Premises, by Protheroe & Morris (two days).
 THURSDAY, DEC. 19 { Roses, Carnations, Azaleas, Dutch Bulbs, &c., at Protheroe & Morris' Rooms.
 FRIDAY, DEC. 20 { Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°.

Potatoes. UNDER the auspices of the Technical Education Committee of the Surrey County Council, Mr. JOHN WRIGHT conducted a series of experiments, with a view of ascertaining for different localities and various soils, the best croppers and the best varieties generally. The report is now before us, and very interesting it must be for the cultivator. The experiments were conducted in ten different localities, and the results were compared by means of samples got together and exhibited in the public hall at Carshalton, on October 16 and 17. Two hundred and twenty dishes of Potatoes were shown, the tubers being exhibited as taken up, and a sample of the soil upon which they had been grown was placed beside them. The smallest but most shapely came from the chalky soil, the largest from the clay and peat, whilst those from the sand were the most scabbed. A selection from the best was cooked, with varying results, as might be expected from all the tubers being cooked at the same time without reference to their maturity. We cannot give all the details of these interesting trials, but

their general character may be gleaned from the following extract:—

For good shape, thirty varieties were chosen from the entire exhibition. Of these, Chancellor was found in seven collections from as many centres. Satisfaction in six. Goldfinder in five. Renown and Windsor Castle, each, in four collections. The Bruce, Prime Minister, The Canon, Triumph, and Congress, in three collections. Supreme, Dreadnought, Colossal, Best of All, White Perfection, and Victory in two collections. Only one dish each of the remaining fourteen varieties was chosen from the whole of the samples displayed.

For quality, Goldfinder, Supreme, and Satisfaction were the best from dark, boggy soil. Windsor Castle, Satisfaction, and Renown from clay soil. Supreme, Satisfaction, and The Bruce from dark, sandy soil. Colossal, Satisfaction, and Windsor Castle from chalky soil. Challenger, Chancellor, and Duke of York (early) from sandy-peat soil. Future Fame, Satisfaction, and Best of All from gravelly soil. Triumph, Satisfaction, and Windsor Castle from marly soil. Victory, Early Regent, and Dean's Renown from loose sand. Triumph, Victory, and Satisfaction from strong loam. Puritan (early), Windsor Castle, and Dean's Renown from dark porous soil.

Tubers of good shape and marketable appearance were chosen from fourteen other varieties, but these when cooked were found generally deficient in quality. As in the case of at least some of these, the results were, in all probability, the consequence of unripeness—their best cooking-season not having arrived—it would be premature to publish their names, and thus imply, as later experience might prove, unmerited condemnation. Also, it should be stated, that still more varieties afforded good crops in the bulk, yet the tubers were more or less unshapely, and therefore not cooked. As there is reason to infer that these were in a large degree prejudiced by the second swelling after the rains, which was more apparent in some soils and localities than others, the varieties are reserved for further trial prior to the publication of their names.

As only in one district (embracing Mitcham and Bandon Hill) exactly the same varieties were grown in four distinct kinds of soil—bog, clay, sand, and chalk, these trials obviously afford the best basis for comparison as to the relative adaptability of the varieties to soils of the nature indicated. The results, both as to the character of the samples in appearance, and their condition when cooked, are shown in the following summary:—

SUMMARY OF SAMPLES AND COOKING QUALITY OF VARIETIES GROWN UNDER IDENTICAL CONDITIONS IN THE MITCHAM DISTRICT ON THE SOILS INDICATED.

Varieties.	Boggy Soil.	Clay.	Gravelly Sand.	Chalk.	Remarks.
Goldfinder	Sample: good Cooking: floury	Sample: good Cooking: moderate	Not a good sample, and not cooked	Sample: good Cooking: solid	The best on boggy soil.
Supreme	Sample: good Cooking: floury	Sample: good Cooking: floury	Good on bog and sand.
Satisfaction	Sample: good Cooking: floury	Sample: good Cooking: floury	Sample: good Cooking: solid	Sample: good Cooking: firm	Good all round.
Colossal	Sample: good Cooking: waxy	Sample: good Cooking: very good	Good on chalk only.
Dreadnought	Sample: good Cooking: too solid	Sample: good Cooking: too solid	Third rate.
Chancellor	Sample: good Cooking: rather solid	Sample: good Cooking: fair	Good on bog and chalk.
Best of All	Sample: good Cooking: tender	Best on bog soil.
Windsor Castle	Sample: good Cooking: floury	Sample: good Cooking: good	Good on clay and chalk.
The Bruce	Sample: good Cooking: fair	Sample: good Cooking: fair	Good on clay and sand.
Reading Giant	Sample: good Cooking: solid	Fair on clay only.
The Canon	Sample: good Cooking: dark	Sample: good Cooking: solid	Sample: good Cooking: good	Good on chalk.
Prime Minister	Sample: good Cooking: dark	Sample: good Cooking: dark	Sample: good Cooking: too solid	Cooking quality inferior.
Dean's Renown	Sample: good Cooking: fair	Fair on sand only.
Congress	Sample: good Cooking: fair	Fair on sand only.

The cooking qualities of varieties that were not grown for comparison in the particular soils specified, may be seen on reference to Miss Hoare's remarks under the different centres (pp. 4, 5, and 6). The blanks in the table indicate that the samples were not good enough for cooking in the particular soils thus indicated.

If the whole of the varieties could be cooked in January or February by the same qualified official who exercised so much skill and care in October, somewhat different results might be expected, for, as previously indicated, some of the most useful late Potatoes do not develop their best qualities till they have been stored for several weeks or months, and if some of the exhibited samples could be spared from the analysis to which they (also the soil) are to be subjected, a second trial as suggested would complete the test of their relative culinary value. For the purpose of cooking, Potatoes should be kept in a dark place; for planting, they are better where light can reach them, but in both cases they must be kept cool yet absolutely safe from frost.

MANURE TRIALS AT RICHMOND.

The long drought was so antagonistic to the influence of chemical manure, that the effects of the different mixtures were not adequately declared. Four varieties, twenty-five equal sized sets of each, weighing in the aggregate 3 lb., were dressed with chemicals at the time of planting. There was, for the reason stated, comparatively little difference in the results, and it will suffice to give the smallest and greatest yields in each case.

Renown (Webb's).—“No manure”	25 lb.
“ “ Equal parts nitrate of soda and super-phosphate	44 “
White Perfection.—“No manure”	39 “
“ “ A 1 potato manure	45 “
Magnum Bonum.—“No manure”	36 “
“ “ Equal parts kainit, super-phosphate and nitrate of soda	47 “
Chancellor.—“No manure”	44 “
“ Sulphate of ammonia	52 “
“ 3 parts kainit, 1 part each of super-phosphate, and nitrate of soda	50 “

The mineral manures were applied at the rate of 4 lb., the nitrogenous kinds at 1 lb. per rod. No farmyard manure was used.

The R. H. S. year, comes also the dissolution of the Committees.

WITH the last meeting of the several committees. Prior to their dispersal the committees are asked to suggest the names of members for the reconstruction of the committees in the ensuing year. As there are no limitations, excepting that the new Members proposed must be Fellows of the Society, it is a misfortune when the members do not use their privilege, if only to neutralise the prejudice that some people still indulge in, that provincial interests are not sufficiently studied by the Society. Time and space are after all not quite obliterated, and a gentleman living in Scotland or Ireland can hardly be expected to attend so frequently as his brethren who live nearer the centre. But to suppose, as we sometimes hear, that provincial exhibitors, provincial committee men, or provincial exhibits are, apart from those considerations of time and distance that we have alluded to, in any wise differently treated from others, is a mistake that cannot be too emphatically contradicted. A much larger infusion of new members would be desirable in all the committees, but it is difficult to see how this object is to be attained, particularly when the members of the existing committees do not more freely exercise their privilege of suggesting new members, and when the Council do not more rigorously enforce the principle of retirement of older ones by rotation.

Again, the amateur, as distinguished from the commercial element, requires to be much strengthened. Perhaps this could be done through the medium of the Scientific Committee, to whom might be allotted the task of dealing with plants and exhibits not directly of commercial interest. At present the Scientific Committee con-

FIG. 118.—LUDDEMANIA TRILOBA: FLOWERS OF NATURAL SIZE, ORANGE-COLOURED.

sists too exclusively of experts who act as referees in chemistry, entomology, and other sciences, but who are not specially interested in horticulture. It was not so in old days, when such men as WILSON-SAUNDERS, ELWES, BOSCAWEN, MANGLES, GEO. MAW, SIR CHARLES STRICKLAND, and other enthusiastic amateurs took part in the meetings. Another means of strengthening the societies would be the establishment of local committees, according to circumstances, in connection with the provincial horticultural societies, such committees to be in constant touch with those in London, and entitled to send representatives to any of the London meetings. In this way the deplorable waste of energy and opportunities manifested in local exhibitions might be reduced, horticultural progress, rather than the benefit of exhibitors, or the amusement of visitors, made the principal object, and a higher tone generally introduced, whilst the wants and requirements of the provinces would be better made known at headquarters than is the case at present.

But these are subjects which we cannot now further dilate upon. Our main object in alluding to the meetings of the Committees on Tuesday last, is to point out that in the case of the Fruit Committee, at any rate, the occasion was historic. On that day Mr. BARRON retired from his position as secretary, a post he has held since 1865. Votes of thanks to the members of the several committees and to their respective chairmen and secretaries were matters of course; but, in the case of Mr. BARRON, a warmer, more special feeling prevailed, which found partial expression in the subjoined resolution, and which will be accentuated when an occasion will shortly be taken to show how thoroughly the horticulturists of the country appreciate the labours of Mr. BARRON. The resolution referred to was most fitly proposed by our leading Pomologist, Dr. HOGG, who traced the history of the Pomological Society till its absorption in 1865 into the Royal Horticultural Society, where it now flourishes as the Fruit Committee:—

Proposed by Dr. HOGG, seconded by Mr. J. SMITH (Mentmore)—“This Committee desires to record its high sense of the valuable services which Mr. BARRON has rendered to it during his long occupation of the position of Secretary, from which he is now retiring, and to congratulate him on the distinction of having been placed by the Council on the roll of Honorary Fellows of the Royal Horticultural Society. The Committee will also heartily welcome him to a seat at this table, and expresses an earnest hope that he may long enjoy health and happiness, and find many opportunities for continuing to render distinguished service to horticulture and to the Society.”

LUDDEMANIA TRILOBA (*Rolfe, n. sp.*).—This beautiful species is one of the recent discoveries of Consul F. C. LEHMANN in the Andes of Columbia, and it has been flowered and twice exhibited before the Orchid Committee of the Royal Horticultural Society by Sir TREVOR LAWRENCE, Bart. On the last occasion (November 16) the fine plant from which our illustration (fig. 118) was taken was shown, and was unanimously awarded a First-class Certificate. *Luddemania triloba* is a plant of considerable floral beauty, as well as one of remarkable botanical interest. The plant had a pendulous inflorescence over 2 feet in length, and bearing thirty-three wax-like flowers of bright orange colour, the sepals being tinged with copper-brown, and the base of the lip, which is distinctly three-lobed, having a dark purple blotch. By reference to our illustration, it will be seen that the plant requires to be grown in a basket, if for no other reason than to allow of the proper display of its

inflorescence. The best situation for it is the intermediate-house, and in its culture it has the same requirements as the *Acinetos*.

OUR ALMANACK.—Secretaries of Horticultural Societies and others, are earnestly requested to forward *immediately*, the dates of Show Fixtures and of Meetings of Botanical and Horticultural Societies of any kind for 1896, for insertion in the Almanack, to be published in our issue for January 4.

LINNEAN SOCIETY.—On the occasion of the meeting held on Thursday, December 5, C. B. CLARKE, F.R.S., President, in the chair, Messrs. Bernard Arnold and Rupert Vallentin were admitted, and the following were elected Fellows of the society: W. M. Christy, Rev. H. P. Fitzgerald, A. W. Giffen, Rev. E. A. Peacock, R. v. T. R. Stebbing, and W. O. Scantford. The president called attention to a portrait of the late Prof. Babington, of Cambridge, which had been lately presented by his widow to the society. On the motion of Dr. Marie, seconded by Mr. A. W. Bennett, a vote of thanks to Mrs. Babington was unanimously accorded. Prof. Stewart offered some remarks on the types of the axes of certain *Gorgonaceæ*, in which he referred chiefly to the importance or otherwise of the presence of spicules in the axes, and exhibited the following species in illustration of his remarks:—*Paragorgia arborea*, *Melitodes ochracea*, *Saberogorgia suberosa*, *Corallium rubrum*, *Caligorgia verticillata*, *Vernicella guadalupensis*, *Isis hippuris*, *Plexaurella crassa*, and *Eunicella verrucosa*. Some criticism was offered by Dr. Marie, chiefly in relation to the structure of *Gorgonia flabellum* and *Gorgonia setosa*. Mr. Martin Woodward exhibited and made remarks on a living specimen of *Ouarumœna*, which he thought should be regarded as a common *Amœbia* attacked by a parasitic fungus. Mr. G. C. Druce communicated a paper on a new species of *Bromus* in Britain, which was said to differ from others of the genus in its inflorescence, having single-shoot stiff pedicels arising alternately right and left of the main rachis, each bearing at its extremity 3–5 sessile, or, in some cases, shortly-stalked spikelets, giving an interrupted and compact appearance to the whole inflorescence, which is made up of two rows of clustered groups of 3–5 spikelets. This peculiar feature being absent in its nearest allies, the name *interruptus* was proposed to distinguish it. It appeared to have been described or referred to by Professor Hackel as *Bromus mollis* var. *interruptus*; but Mr. Druce considered that it was sufficiently distinct to be entitled to specific rank. He had found it growing abundantly in a field of Vetches near Upton, Berkshire, and specimens had been examined from Headington, Oxford, and Dartford, Kent. In a discussion which followed, Dr. O. Stapf reviewed the literature of the subject, and gave reasons for regarding the so-called new species as merely an abnormal growth of *Bromus mollis*. Critical remarks were made also by Mr. H. Groves and Mr. A. B. Rendle, who were inclined to share the opinion of the last speaker.

—An evening meeting will be held on Thursday, Dec. 19, 1895, at 8 P.M., when the following papers will be read:—I. R. A. ROSE A.L.S., "A Revision of the Genus *Vanilla*;" II. E. S. GOODRICH, F.L.S., "On the *Cephalopoda* collected during the Voyage of H.M.S. *Investigator*."

NATIONAL CHRYSANTHEMUM SOCIETY.—A well-attended meeting of the General Committee took place at Anderson's Hotel, Fleet Street, on the 9th inst., Mr. B. WYNN in the chair. After dealing with some correspondence, the Secretary reported that the amount of prize-money awarded at the December show amounted to £51 4s. 6d. The awards of medals made by the Arbitration Committee to miscellaneous subjects at the same exhibition were approved. It was decided to recommend to the annual general meeting the appointment of three auditors instead of two only, as at present; one to retire annually, and be eligible for re-election for one year. This increase is made necessary by the growth of the society. The Secretary brought

up a recommendation to the General Committee from the Jubilee Sub-committee, that for the future, in all classes in which Japanese Chrysanthemums are required to be shown on boards, the boards for twelve blooms shall be 28 inches in length by 21 inches in depth from back to front; the holes for the tubes to be 7 inches apart from centre to centre; the height at the back to be 7 inches. This was carried. It will be understood that as the size for a twelve-bloom board only is given, it is yet intended to apply to all larger collections. It was arranged that the annual general meeting should take place on February 24; the audit of the accounts being held a week previously. It was agreed, subject to the approval of the managers of the Royal Aquarium, that an exhibition of early Chrysanthemums, Dahlias, &c., should take place on September 9, 10, and 11, and an early autumn show on October 6, 7, and 8, and the mid-winter show on December 1, 2, and 3. It was also resolved that the sum of £20 should be offered for early Chrysanthemums in September, and £10 towards the Dahlia prizes. The dates of the Jubilee exhibition are November 3, 4, 5, and 6. Five Fellows and thirty-four ordinary members were elected, bringing the total number of new members for the year up to 162. Three societies were also admitted to affiliation. A vote of thanks was passed to the chairman for presiding.

"THE BOTANICAL MAGAZINE."—The dedication of the annual volumes of our venerated contemporary has become a matter of much interest to botanists and horticulturists. This year the honour falls to the share of Mr. HARAY BOLTS of Cape Town, whose works on South African Orchids especially, amply entitle him to the warmest compliment that his colleagues can pay him. The plants figured in the current number are:—

Streptocarpus Wendlandi, Hort. Dammann, ex W. WATSON, in *Gardeners' Chronicle*, 1894, i. 590, t. 7447, a magnificent species, the parent of *S. Dyeri* X.

Aloe Luntii, Baker, t. 7448.—A highly interesting species, discovered in Southern Arabia by Mr. LUNT. The stems are short, bearing at the top a tuft of long linear-lanceolate recurved fleshy leaves, destitute of spines at the margin. The flower-panicle is loosely branched, and bears numerous tubular pink flowers tipped with green. Each flower is about 1 inch long (25 cent.).

Buddleia Colvizei, Hook. fil. and Thoms., t. 7449.—The handsomest of all Himalayan shrubs, with pendulous masses of rose-purple or crimson flowers, relieved by the dark green foliage.

Bartholina pectinata, R. Brown, t. 7450. An extraordinary little terrestrial Orchid, from the Cape of Good Hope, with tuberous roots, an erect slender hairy stem, only 3 to 4 inches (80 to 100 mill.) in height, and a solitary roundish thick leaf, spreading on the surface of the ground. The flowers are 2 to 3 inches (50 to 80 mill.) across, with erect linear lanceolate greenish sepals, shorter than the very narrow erect whitish petals, lip 50 cent. across (2 inches), fan-shaped, white, dividing about half-way down into numerous linear fringe-like spreading segments.

Musa rubra, Wallich, t. 7451.—A species with a stem 5 to 7 feet high; leaves, 4 to 6 feet (1½ to 2 met.), long oblong lanceolate acuminate. Bracts bright red, with obtuse golden tips; flowers tubular, yellowish, 1 to 1½ inch long (35 mill.); the females rather shorter than the males.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are requested to state that the committee have gratefully received the sum of £257 3s. 5d., being a proportionate amount of the fund raised to perpetuate the memory of the late Mr. WM. THOMSON, of Clowenford, to be invested and known henceforth as the "Wm. Thomson Memorial Fund."

NATIONAL ROSE SOCIETY.—A copy of the balance-sheet, duly attested, has been sent to us. It shows that the receipts, including balance from last account of £72 11s. 9d., amounted to £788 0s. 7d. The balance at the banker's is £45 14s. 3d., the total

expenditure being £742 6s. 4d. No less a sum than £260 10s. was distributed in prizes at the Crystal Palace.

.. "HANDBUCH DER PRAKTISCHEN ZIMMERTHATNEREI" (*House-Gardening*)—We mention this German treatise by reason of the excellent illustrations, which convey to the beginner at a glance a better notion of what to do and what to avoid than pages of description. The author is Mr. MAX HESDÖRFFER, and the publisher ROBERT OPPENHEIM, of Berlin. The work is to be published in eight parts, at a low price.

ROYAL INSTITUTION.—The following are the lecture arrangements before Easter: Professor John Gray McKendrick, Professor of Physiology in the University of Glasgow, six lectures (adapted to a juvenile auditory), on "Sound, Hearing, and Speech" (experimentally illustrated); Professor Charles Stewart, Fullarian Professor of Physiology, R.I., eleven lectures on "The External Covering of Plants and Animals: its Structure and Functions;" The Rev. Philip H. Wicksteed, four lectures on "Dante;" Professor H. Marshall Ward, Professor of Botany in the University of Cambridge, three lectures on "Some Aspects of Modern Botany;" The Rev. William Barry, D.D., four lectures, "Masters of Modern Thought—Voltaire, Rousseau, Goethe, and Spinoza;" Prof. C. Hubert H. Parry, Professor of Musical History and Composition at the Royal College of Music, three lectures on "Realism and Idealism in Musical Art" (with musical illustrations); The Right Hon. Lord Rayleigh, Professor of Natural Philosophy, R.I., six lectures on "Light." The Friday evening meetings will begin on January 17, when a discourse will be given by the Right Hon. Lord Rayleigh, on "More about Argon;" succeeding discourses will probably be given by Professor Barton Sanderson, Mr. W. S. Lilly, Dr. John Murray, Mr. J. J. Armistead, Dr. Edward Frankland, Mr. A. R. Binnie, Mr. Sidney Lee, Professor T. R. Fraser, Professor Dewar, and other gentlemen.

EARLY WALLFLOWERS.—We have received from Messrs. SUTTON & SONS their Earliest of all Wallflower gathered from plants sown as recently as last May. The plants have already been flowering since the middle of September, and are still full of bloom and bud, and should the weather not prove too severe, will continue to yield acceptable gatherings throughout the winter months, bursting again into new vigour and beauty at the first touch of spring. The value of such a pretty spring flower in December must be apparent to all, especially growers for the market.

FRUIT AND MARKET GARDENS.—The following is the acreage under small fruit crops as given in the Agricultural Returns for 1895, published by the Board of Agriculture:—England, 63,122; Wales, 1,175; Scotland, 5,250. In each case, but especially in England, there is a considerable increase in the area devoted to small fruit crops as compared with that noted in 1894. The total area of land and water in Great Britain is 56,771,728 acres, and in Ireland 20,705,253. Kent has 22,272 acres under fruit, a slight increase over 1894. Middlesex continues nearly stationary with 3,982 acres; Lancashire has 2,517 acres against 2,396 last year; Surrey 1,463 instead of 1,331; Worcester, 3,144 as compared to 2,508. The total area used as orchards in 1895 is given at 21,963 acres in place of 203,821 in the preceding year. The largest orchard areas are, in Devonshire, 26,955; Hereford, 26,538; Somersetshire, 24,520; Kent, 23,260; and Worcester, 19,665 acres. Market gardens occupy in England a total area of 85,398 acres, an increase of more than 4,000 acres over the preceding year. Kent has far more market gardens than any other county, the acreage being returned at 12,516 acres; after which comes Middlesex, 9,410; Bedford, with 7,274 acres; Worcester, 5,586; Essex, 4,740; Surrey, with 3,683. The remaining counties have all a very much smaller area devoted to market gardening.

PIERRE NOTTING.—The death of this famous rosarian, of Luxembourg, is announced. According to the *Revue de l'Horticulture Belge*, M. NOTTING was in his seventieth year, and died on November 2.

THE PUBLISHER OF THE "GARDENERS' CHRONICLE."—We greatly regret to announce that this Journal is no longer to have the services of Mr. A. G. MARTIN as publisher, considerations of health necessitate his residence in the Transvaal or other dry climate. Mr. MARTIN leaves with the sympathy and goodwill of all his colleagues, who trust that he may speedily regain his health and quickly obtain some suitable occupation. Mr. H. A. STRATTON, who for many years has been a trusted assistant, will, in future, undertake the duties of publisher.

HORTICULTURAL PROGRESS IN HOLLAND.—Great activity prevails just now in Holland in the matter of technical education. A school of Horticulture is established at Wageningen; a laboratory for the study of Vegetable Pathology, under the direction of Professor RITZEMA BOS has been founded at Amsterdam; a new horticultural journal has lately been established; and the *Album Van Eeden* is to be continued as the *Bulletijum Haarlemense*, under the auspices of the Society of Bulb Cultivators.

BEGONIA FROEBELI INCOMPARABILIS X.—The insertion of the following letter from Mr. BENNETT-POË, enables us to correct one or two misapprehensions relating to this fine plant, see p. 680, fig. 112. Mr. BENNETT-POË, it appears, was not the raiser of the plant, but Mr. FROEBEL, of Zurich. The flowers, instead of being only 1 inch in diameter, measure upwards of 3 inches:—

"The introduction many years ago by Roez of a tuberous Begonia from Ecuador, dedicated by Alphonse de Candolle to M. Froebel, of Zurich, was an acquisition to growers of tuberous Begonias, for its blooms, though not large, were very brilliant. Some years later, another tuberous Begonia, a winter-flowering species, was introduced from Peru, Begonia polypetala, perhaps the most distinct and remarkable species yet introduced. M. Froebel, of Zurich, employed these two species in the production of the stately and handsome hybrid figured last week, which having taken in general appearance so markedly after the seed-bearing parent, was sent out under the name of Begonia Froebeli incomparabilis X. But happily, in the time of flowering, it takes after the pollen parent, and produces its brilliant blooms in the winter months, when they are far more valuable and appreciated. I have grown this Begonia since 1880, the year it was sent out, and have advocated its claims in the gardening papers both then and subsequently, and again as recently as this autumn, for it has never failed to be a remarkable plant each winter. It would seem to be quite unknown, from the fact that it came as a surprise to those present at the meeting of the Royal Horticultural Society on November 21. I have frequently wished I could show it, but until recently my garden was too far distant to enable me to do so, as Begonias are not plants that will bear a journey of 450 miles before being placed on the exhibition table. A word as to its culture, which is of the easiest. The tubers are potted about August, when they will no longer remain dormant, and are placed in an ordinary span-roof greenhouse where Nerines and various other plants flower, and there they have been in blossom since early in October, and will continue some time longer, judging by the accession of flower-stems to follow, J. T. Bennett-Poë."

A NEW PHASE IN HORTICULTURE.—A correspondent of the *Times* calls attention to what he calls a "totally new departure." Naturally curious to know what this could be, we read on to find that the new departure consisted in retarding instead of forcing certain plants. Nothing very new in this, surely. The application of the practice on a large scale to the Lily of the Valley has resulted in an average of 95 per cent. of flowers from the end of autumn up to Christmas, instead of 50 per cent. obtained by forcing.

THE THAMES EMBANKMENT.—The "laying-out" of the enclosure, east of Charing Cross Station, has been unsatisfactory from the first. The recent erection of the band-stand made things worse—the dotting of some miserable Euonymus on the green lawn seemed to show how little the planter valued the effect of space and "repose" afforded by the turf; and now, quite recently, some flower-beds of the most extraordinary and meaningless pattern have been carved out. There is plenty of time to alter these, and perhaps something may yet be done to improve the general disposition of the lawn, and render them appropriate to the outlines of the enclosure.

"A HISTORY OF GARDENING IN ENGLAND,"—The Hon. ALICIA AMHERST's work under this title

has been published by Mr. QUARITCH, of Piccadilly. This is not a book to be dismissed with a mere mention. It is a standard book, likely to become classic. We hope shortly to give a notice of the book at greater length than we are now able to do.

STOCK-TAKING: NOVEMBER.—Once again the trade and navigation returns bring us pleasant news. The imports and exports for the past month of November are greatly in excess of those for the corresponding month in 1894, and the eleven months' totals are also a cheerful contrast to the figures set down for comparison in last year's record. The excess of imports for the past month is £3,737,012; for the eleven months just finished the increase is £4,320,557, as compared with last year's record. The usual extract from the monthly summary is as follows:—

IMPORTS.	1894.	1895.	Difference.
	£	£	£
Total value of imports	35,234,149	38,971,161	+3,737,012
(A.) Articles of food and drink—duty free	11,519,298	12,958,182	+1,438,884
(B.) Articles of food and drink—dutiable	2,499,605	2,602,113	+102,508
Raw materials for textile manufactures	6,835,644	7,700,372	+864,728
Raw materials for sundry industries and manufactures ...	3,683,795	4,103,954	+410,159
(A.) Miscellaneous articles	1,489,780	1,485,178	-4,602
(B.) Parcel Post	66,420	83,461	+17,041

It is worth noting that, with the trifling fall of £4,604 under the heading of "Miscellaneous," the increase extends to every section into which the returns are divided—what is "minus" in fruits and vegetables being made up in other sub-sections of the duty-free articles of food. It is long since such a state of things was placed to the credit of imports. A second great scheme of road construction will shortly be carried out in European Russia, under the special supervision of the Department of Roads and Bridges—to connect producer and exporter.

We fancy that Parish Councils could be made of immense use in bringing small growers, as well as others, into complete touch with all consuming centres. It is fair to note here that the Board of Trade officials appear to be in earnest respecting help in the matter of light railways—the President of that department, together with an engineer of repute, having been on the Continent studying the system preparatory to setting to work on existing materials and Parliamentary action. As to our usual extracts on the imported fruits, roots, and vegetables, we give the following:—

IMPORTS.	1894.	1895.	Difference.
Fruits, raw:—			
Apples bush.	1,179,595	589,721	-589,874
Cherries "
Plums "	1,535	320	-1,215
Pears "	59,331	22,456	-36,875
Grapes "	100,694	138,668	+37,974
Unenumerated "	58,768	45,933	-12,835
Onions "	597,601	609,388	+11,787
Potatoes cwt.	151,605	81,181	-70,424
Vegetables, raw, unenumerated value	65,551	71,856	+6,305

It will readily be observed that "minus" has it—our, rather the British producer. It would be pleasant to record some new industry in connection with Apple production; possibly that will come in time. The disposal of this fruit in Brittany seems beyond the powers of railway companies; there Apple-waggons line the roads to the railway station, often seeking in vain for carriage, sometimes waiting for a day or two until the goods' entrance opens to them. The wonder is expressed as to whether there will be any reduction in the price of cider in the cider-consuming districts of France. There does

not appear to be any boycotting of that industry on the other side of the Channel, as reported for this country by your correspondent, "E. C.," in a recent number of the *Gardeners' Chronicle*. And now as to our—

EXPORTS.

These foot up for last month the handsome total of £19,540,333, or an increase of £1,457,246 over the total for November last year. There are decreases in the value of live animals, in raw material, and machinery; but the total is not very great. The increase in the eleven months just now ended is put at £8,295,982. With a good surplus in the Exchequer, and a settlement on the American money question, we can afford to look ahead with confidence. Notwithstanding the import-duty of 7s. per ton on coals entering Russian ports, it would seem that the demand for Russian coal has not been increased, or the consumption of the English article reduced. By-and-by, when the promised roads are made there may be a reduction in the cost of the native article. In conclusion, it may be noted that complaints continue to be sent in by our Consuls as to the picking up of some of our trade by "the foreigner," who is keen to note exactly what is wanted in foreign countries, and sends it out. We require an extension of our system of technical schools; we have done pretty well, but very much more is required; and it is about time that the once much-talked-of Imperial Institute should give more reason than it now does for its existence.

DUNDEE CHRYSANTHEMUM SOCIETY.—The annual meeting of the Dundee Chrysanthemum Society was held on the 5th inst., Mr. D. STOBBER in the chair. The Secretary (Mr. W. P. LAIRD) in his report referred to the question of obtaining a Corporation Cup for competition at the annual exhibition of the Society, and said though the request which had been made to the Council had been refused, he had hopes that they would yet have a Corporation Cup. The Treasurer (Mr. D. CROLL) reported that the expenditure for the year was £66 9s., and that there was a debit balance of £6 10s. 8d. They had, however, £27 4s. 1d. still at their credit. The deficiency, he explained, was accounted for by the state of the weather at the annual show, which brought about a reduction in the admission money. The reports were then adopted, and office-bearers for ensuing year elected.

CHEBHUNT, WORMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The usual fortnightly meeting of this society was held on Thursday, Dec. 5, at Turnford, upwards of a hundred members being present, H. N. BUSBY, Esq., presiding. The secretary, Mr. W. L. YATES, having read the minutes of the previous meeting, Mr. WILLIAM HARRISON, of the Turnford Hall Nurseries, delivered an instructive lecture on "Grape Growing for Market," dealing exhaustively with the subject, including the early history, introduction of the Vine to this country from Asia Minor; propagation, grafting, planting, manuring, fertilisation of the flowers, and the entire routine of cultivation under glass of all the more popular varieties of Grapes. The methods of packing for rail and Covent Garden market were fully described and illustrated. At the close a discussion was initiated. On the motion of Mr. W. H. MILES, seconded by Mr. ROLFE, a hearty vote of thanks was accorded Mr. HARRISON for his lecture. The next meeting will be held on Dec. 19, when Mr. W. CASLEA will contribute a paper entitled "Bee-keeping, and its relations to Horticulture."

THE PEOPLE'S PALACE HORTICULTURAL SOCIETY.—A meeting of the Committee took place at the People's Palace on the 7th inst., Mr. E. SHEA in the chair. A very encouraging report was received from the judges who made the awards to the greenhouses in October last, they having made an inspection of nearly forty in the East End, and they reported that the houses, although mostly of home construction, were clean, and the condition of the plants generally satisfactory. The Chrysanthemum show held on Oct. 31 and two following days,

entirely consisted of plants and cut flowers shown by members; and the excellent quality seen in many of the plants and blooms was very gratifying. It was resolved that three exhibitions be held in 1896—a spring show on March 26, 27, and 28; a summer show on June 25 and two following days; and the Chrysanthemum show at the end of October, or during the second week in November, a date to be fixed later on. A series of monthly lectures of an elementary character has been arranged, and a monthly meeting of members also, at which they will be invited to contribute plants, &c. It was also reported that the spring and autumn shows had proved financially successful, but there was a small loss on the summer show, owing to the stormy character of the weather during the time it was open. It is also in contemplation to attempt some modification of the thickly populated areas known as congested districts, though great difficulty is experienced in accurately defining the same. It may be stated that the society supplies its members with bulbs, seeds, &c., at cost price, and to the most needy cuttings are supplied free of cost as far as they can be obtained. The subscription of the members is quite small, but donations from various ladies and gentlemen greatly assist the committee in their work. A cordial vote of thanks was given to Mr. SHEA for presiding.

— On Saturday evening last Mr. J. W. SANDERS, the editor of *Amateur Gardening*, gave a popular and interesting lecture on "How Plants Grow," before a very large audience of members and friends of the People's Palace Horticultural Society, Mr. RICHARD DEAN, the horticultural adviser of the society, presiding. The lecture, which was purely extempore, and delivered in an easy, conversational style, was illustrated by a number of diagrams. The greatest interest was shown in the subject, and at the close of Mr. SANDERS' address, many questions were put to him, and an enthusiastic vote of thanks was accorded to him. The next lecture will be by Mr. RICHARD DEAN, on "Dried Flowers for Christmas Decoration."

"THE AUTOCAR."—This is a new journal, published by ILIFFE & SON, Coventry, and 3, St. Bride Street, Ludgate Circus, E.C., in the interests of the mechanically-propelled road-carriage. In these pages the superiority of automatic carriages to those moved by horse-power is warmly urged. There are illustrations showing various self-propelled vehicles, and whether or not these are ever largely used in our streets, they are at least appropriate in certain instances. The *Autocar* does not deal with any special make of vehicle, but with all driven by machinery, whether carriage, waggon, tram, or bicycle, and whether the motive-power be afforded by steam, electricity, hot-air, or petroleum.

AUSTRALIAN FUNGI.—From the Department of Agriculture, Victoria, comes a systematic arrangement of Australian fungi, by Mr. D. McALPINE. The volume consists of a series of tables, containing condensed information, names, authorities, habitats and characteristics of the several species, which should prove most useful both on account of the importance of the subject treated of, and the clearness with which the information concerning it is here given. The author includes in his treatise a "host" index, and a list of works upon the subject.

APPLES IN PARIS.—The glut of Apples from Normandy is so great that prices have fallen to a very low figure. It is many years since the crop of Apples in the province has been so large, and the cultivators are at a loss what to do with this superabundance. Some of it might be made into cider, but not every variety is fit for that purpose.

MOSS LITTER AND PEAT INDUSTRIES, LTD.—A company (headquarters, 32, Queen Victoria Street, E.C.) has been started which bears the above title, and has for object the introduction of fabrics made from moss litter and peat. It has been discovered that from these materials not only a valuable absorbent antiseptic wool for surgical dressings can be made, but also textiles of various grades, ranging

from coarse blankets to the finest cloth. Another property possessed by peat is that, when submitted to certain preparatory processes, it becomes hard as iron, and takes a good polish. Under yet other treatment it can be developed into tough white paper. These several valuable uses for a raw material hitherto comparatively neglected, have already met with considerable appreciation, and optimists hope that (largely through the intervention of this company) Ireland may in the immediate future reap substantial benefit from her stores of yet unworked treasure.

EUCHARIS GRANDIFLORA (syn. *E. amazonica*).—Mr. OSMAN sends us from Brentry Gardens, Westbury-on-Trym, a fine photograph of this plant, which shows how well the plant is grown in that establishment. The photograph shows twenty plants bearing about 1000 flowers—the third crop this year. Had we not already figured five specimens of this plant, we should have been tempted to reproduce the illustration with which Mr. OSMAN has kindly furnished us.

FIG. 119.—SEED-BEARING SHOOT OF CEPHALOTAXUS PEDUNCULATA: SEEDS BERRY-LIKE, OLIVE-COLOURED. (SEE P. 717.)

THE YORKSHIRE COLLEGE, LEEDS.—The Department of Agriculture of this College, which is affiliated to the Victoria University, has published its fourth annual report, which is of a most satisfactory character. In addition to the two years' training, the College provides for special lectures in the country districts on horticultural and agricultural subjects, the attendance being, generally speaking, good; in some cases the average attendance was as many as 350. Some of the villagers—a minority we are glad to see—"refused to try to learn anything."

TECHNICAL HORTICULTURAL INSTRUCTION.—That excellent gardener, Mr. J. CROOK, of Forde Abbey Gardens, Chard, occasionally places his services at the disposal of the Somerset County Council, and has just recently completed a course of garden lectures at Crewkerne. His syllabus seems to have been a comprehensive one, as it includes two lectures on fruit culture, dealing with hardy trees, such as Apples, Pears, Plums, &c., and also with bush and ground fruits. Two lectures were devoted to vege-

table culture, including the most prominent crops, one to the preparation of the soil, manuring it, &c., and one to flowers and their culture. Such a course as this may well be given in many localities, for there is ample room for wider instruction in even elementary gardening.

SCOTTISH HORTICULTURAL ASSOCIATION, EDINBURGH.—One of the largest meetings of the above society gathered at their rooms, St. Andrew Square, on Tuesday evening, the 3rd inst., when Mr. MALCOLM DUNN read a paper on "Gardeners and their Employers," as given before the Royal Horticultural Society. The paper was well received by the members, and a discussion generally agreeing with the points laid down by the writer followed. After the reading of this paper, the treasurer, Mr. ALEX. MACKENZIE, stated that although the unfortunate weather might have been expected to reduce the financial success of the last Chrysanthemum Show, the balance in hand proved to be considerably over £100. Mr. D. MURRAY, the president, occupied the chair, and a motion of giving the usual subscription of £5 each to the Gardeners' Orphan Fund, and to Edinburgh Infirmary, was received with general satisfaction.

VICTORIAN FRUITS.—It is not very much that our friends in the colony of Victoria can send us, but what they forward is picked and sent on in as good a condition as that sent by most other senders—the quality being of a high order. It is, therefore, satisfactory to be able to state, on the most trustworthy authority, that, the accounts being made up, a fairly remunerative profit has been found to result from the venture. This is the more satisfactory because continued efforts after improvement will most assuredly follow, which but a few years hence will be pleasingly illustrated in our principal markets.

FRUIT-GROWING IN BRITISH COLUMBIA.—There is not nearly enough fruit-trees grown in the State to meet the home demand, and most of the trees planted were imported from Oregon and Washington, or from the Eastern States and Ontario. This is not because good nursery stock cannot be produced; on the contrary, as fine trees can be grown there as in any part of the world. Pears are not so satisfactory as other hardy fruit trees. Here there is an opening for gardeners, small or large capitalists, and others in need of an outlet for their money, experience, and energy.

PROSPECTS IN NATAL.—The completion of the Transvaal-Natal Railway has undoubtedly opened up a fair prospect for those connected with the land and its products in Natal. The railway runs from Durban through the Transvaal, and it is believed that all vegetables and fruits grown in the British colony will find a ready sale in the land of gold and diamonds. The Government Agent in London informed us the other day that a Natal farmer's agency is on foot, to which farmers can submit their produce with the knowledge that a sale will be effected in a business-like manner, and with the certainty of prompt payment." He also stated that the fibre industry is receiving attention in Natal. Arrangements are being made that some 500 acres shall be planted with Agave in the lower Umzimkaba district. All this looks as if the colony was waking up, and just at the right time.

HOOKE'S "ICONES PLANTARUM."—This publication, though severely botanical, frequently contains references to plants which are probably destined in the future to become of horticultural importance. The last issued part (vol. v., part 1, November, 1894), contains figures and descriptions of several new Dipterocarps, by Sir DIETRICH BRANDIS. *Petrocosmea grandiflora*, Hemsl., a Western Chinese Gesneriad, is a charming little tufted plant with much of the habit and appearance of *Saintpaulia ionantha*, but the leafstalks are longer than the blade, not to speak of other characters. The flowers are described as cobalt blue. It should be looked after by our collectors when they have

time to look after something besides Orchids. Dr. STAFF describes several new Melaatomads, some of which must be worthy of introduction. Mr. BAKER describes and figures (t. 2423) a curious little Aloe from Natal with linear spotted leaves, margined with small whitish spines.

NEW GARDEN PLANTS OF THE YEAR 1894.

—As an appendix to the *Kew Bulletin* has been published, an alphabetical list of plants newly-introduced into British gardens, compiled from the several horticultural journals of Europe, and from some of the nurserymen's catalogues.

 VILLARSIA NYMPHÆOIDES, *Garden*, October 19

rally upturned, and this not only when the flowers are being produced, but also on the sterile branches, so that the two rows of leaves thus form a trough along the upper side of the branches. The individual leaves do not greatly exceed 1 inch in length, and are about $\frac{1}{2}$ inch in width, almost perfectly linear and straight-sided, rarely falcate, abruptly pointed at the tip, rounded at the base, with a very short petiole. The male catkins are stalked, each stalk immediately after its origin in the axil of the leaf being abruptly bent downwards out of the way of the leaves. The stalk of the male catkins is about $\frac{1}{10}$ inch long, about the same length as the minute globose catkins themselves, and covered with overlapping ovate acute bracts which pass into the scales of the catkin. The scales of the terminal leaf-bud of the shoot are almost all distinctly acuminate. The seed-bearing peduncles in the native specimens are approximate, and the terry-like seed itself ovoid. We have a rough sketch of the seed of this plant, derived probably from the garden of the late Sir Frederick Pollock, at Hounslow. It is ovoid, and rather pointed at both ends, smaller than in *pedunculata* proper (see fig. 119). In Japan, where it is often cultivated, it is said to form a spreading tree of small stature. No Chinese specimens are in the Kew Herbarium; but Messrs. Veitch in their *Manual*, mention it as having been discovered in North China by Mr. Fortune in 1849, although Fortune does not mention it in his communications on the subject in this journal, and we suspect his plant may have been the true *C. pedunculata*."

Van Tieghem (*Bull. Soc. Bot. France*, 1891, April 24, p. 184), points out a character which is peculiar to this genus, and that is the existence of a resin-canal in the centre of the pith. This character is so easily observed that it is useful to the gardener, who can thus without seeing flowers or fruit, immediately ascertain whether he has a *Cephalotaxus* to do with by cutting a small portion of a branch and observing whether there is a resin-canal in the centre. On a cross-cut the canal, of course, presents the appearance of a blackish dot in the centre of the pith.

NOTICES OF BOOKS.

INSECTS AND INSECTICIDES. By Clarence Weed, D.Sc. (Kegan Paul, Trench, Trübner, & Co.).

This is a second edition of a book that has already received favourable notice in these columns. It is written by an American professor, but much of it is applicable to the old country. Here, however, we are exceedingly slow to adopt the methods recommended by experts; perhaps because it is feared that the trouble and cost would be excessive as compared with the value of the results. But how can we know this without experiment? Whilst the United States, and even European countries, can count; experiment stations by the score or by the hundred, we in this country should have a difficulty in employing the fingers of two hands in computing the number of similar institutions, nor have we a single State entomologist.

AGRICULTURE: PRACTICAL AND SCIENTIFIC. By James Muir. (Macmillan & Co.).

This is an introduction to the study of the principles of agriculture, and gives much serviceable information as to the application of these principles to practice. We find many details given as to the nature and use of manure and sewage, which the reader has usually to disentangle from voluminous treatises. Manures as at present used are employed wastefully, because they are "sown" or dug in at stated times by the calendar, rather than in accordance with the needs of the plant at different periods of its growth, and in relation to the local and seasonal conditions. During the greater part of its existence, water forms the best manure (if we may so call it) for plants. The stimulant and nutritive substances which constitute manures are only required in relatively small amounts, and at particular stages of growth only.

CEPHALOTAXUS DRUPACEA.

We are glad to have the opportunity of figuring the fruits or rather berry-like seeds of *Cephalotaxus drupacea* kindly forwarded to us by Mr. D. Crombie, from the garden of Lord Powerscourt. The seeds as here figured, taper at each end, and towards the base are narrowed into a neck-like process unlike anything we have yet seen in the genus. As to the plant itself we may recall what was said in these pages on January 26, 1884, p. 113.

"*C. drupacea* (fig. 120), in British gardens is the dwarfest form, forming a low bush with greenish-yellow shoots and leaves. The latter are very gene-

Gardeners, in their management of plants under glass, understand this better than agriculturists do, but it is, of course, an easier matter for the gardener than for the farmer to regulate the amount and to time the application of manure; but making all due allowance, the farmer might learn a good deal from his brother in the garden.

THE POTATO IN FIELD AND GARDEN. By W. J. Malden. (London: W. A. May, Mark Lane Express Office, 150, Strand.)

"The introduction of better varieties of Potatoes, the adoption of more economical methods of dealing with the crop, the discovery of means for keeping in check diseases of plants, have made Potato growing an art which can only be successfully carried out where the farmer or gardener is abreast of the times with regard to information on all these points, as home and foreign competition are very strong. The want of a more perfect knowledge in individual cases causes a very large portion of the crop to be grown unprofitably. Those who thoroughly understand the subject, and cater for the best markets, find it a profitable business, although they may not be otherwise better situated than their less successful neighbours." With the sentences just quoted this little book opens. They at once attract our sympathy, and we turn to the succeeding pages to see to what extent the author acts up to his own standard. The investigation is so satisfactory that we may class this as one of the best books on the subject, and in some points the information it contains is more varied and more "abreast of the times" than in any work of similar character that we can recall. The work under notice is divided into ten sections, the first of which deals with the crop generally, including its introduction into Europe, new varieties, &c. Other sections deal with soil, planting, manuring, seed varieties, treatment during growth, diseases of the crop, digging Potatoes, and the cost and feeding value of the crop.

We are disposed to think our author under-estimates the value of high mounding, as recommended by Jensen for the mitigation of the effects of the Potato disease. We have no experience of this as practiced on a large scale, but for small gardens and for cottagers we should recommend the system as preferable to the use of the Bordeaux Mixture. It is much more manageable, cheaper, and equally, if not more, efficient. Another advantage it has is that where this plan is practiced, the rows are not placed so near together as usual, nor are the plants in the rows so close. Of course, a good deal depends on the habit and mode of growth of the variety, but in any case the greater the space between plant and plant, the less is the risk of infection.

HANDBOOK OF WEST AMERICAN CONE BEARERS.

Mr. J. G. Lemmon, who has had such excellent opportunities for studying the Californian Conifers in their native haunts, and whose zeal and enthusiasm have enabled him to turn them to such good account, has published a pocket edition of his descriptive notes on the Conifers of north-west America. It is an excellent little book, illustrated by small photographs. It is written more especially for those who are not botanists, and an attempt is made to introduce good English names in place of Latin designations. We sympathize with Mr. Lemmon's aspirations, but we cannot congratulate him on the success of his attempts. To us it appears that such names as "Evergreen fasciculars," "Broken cone Lumber Pines," "Pendent fruited Pendentia," "False Hemlock Spruces," "Erect-fruited Solitaires," are no improvements on the more terse Latin epithets. People who are really interested in botany soon cease to find the language an impediment; it is not worth the trouble to coin new words for those who care for nothing save external, so far as plants are concerned. The present little book may be had from the author, Telegraph Avenue, North Oakland, California.

IRRIGATION FARMING: A handbook for the practical application of water in the production of crops. By Lute Wilcox; 95 illustrations, 312 pages. (New York: Kegan Paul, Trench & Trübner.)

The author of this work is a practical man, who has spent the greater portion of his life in irrigation work, and is a recognised authority in the United States on the whole subject of irrigation from a practical standpoint. The new manual contains twenty chapters and ninety-five illustrations. This book is primarily written for and adapted for western farmers and farms, but is equally valuable to farmers in the south and other sections of the United States, and other countries. It is divided into twenty chapters, each of which is a condensed treatise on its special topic. The concluding portions of the book give a review of the common law of irrigation, and a glossary of irrigation terms. The other chapters are devoted to the consideration of the following topics: Advantages of irrigation, relation of soils to irrigation, treatment of alkali, water supply, canal construction, reservoirs and ponds, pipes for irrigation purposes, flumes and their structure, duty and measurement of water, methods of applying water, irrigation of the garden, irrigation for the orchard, the vineyard and small fruits, alfalfa, windmills and pumps, devices, appliances and contrivances, sub-irrigation and sub-soiling.

The book is, as we have said, specially adapted for certain portions of the United States, but it will be very serviceable in many of our colonies and in India, on which account we recommend it to the notice of our colonial readers. The practical details of construction, &c., will be found very serviceable.

For greenhouses a plan is adopted of having raised beds in which rows of 2½-inch drain tiles are placed at about 18 inches apart, and at a slight slope, so as to ensure a sufficient fall and obviate stagnation. The lower ends of the pipes project beyond the bed, so that they can be closed during the time that the water is being poured into the pipes at the other end, and opened after a time to allow of the passage of the surplus water. This plan also admits of the aeration of the soil. Whether the pipes would not soon get blocked with roots is a matter to be determined, but if they did, the evil could be remedied without much inconvenience.

ANALYTICAL KEY TO THE NATURAL ORDERS OF FLOWERING PLANTS. By Franz Thonner. (Stam, Sonnenschein & Co.)

A series of tables intended to facilitate the detection of the several natural orders of plants by the student. To us they seem more likely to be useful as furnishing hints to an expert. For instance, it is very misleading to a beginner to cite as the characters of Passifloræ (see p. 113), "Stamens 10; ovules parietal. Shrubs or trees. Juices milky. Calyx 5 lobed. Corolla-lobes valvate, rarely contorted in aestivation." The best way for a student is to frame such tables for himself.

THE HIPPEASTRUM.

THESE are now dormant, and at such time ordinary cultivators are apt to be forgetful of them. Hippeastrums should gradually pass into the resting period in September; and again attention is needed that they be not dried off too rapidly, or air and light admitted too freely. Even during growth the Hippeastrum must have a light shading from bright sunshine, and a moderately high temperature of 65° to 70° as a minimum, and a rather moist atmosphere. Just as the temperature is gradually increased when starting the plants, so also must it be gradually decreased to rest them. The water may be withheld altogether as soon as the leaves take a yellowish tinge.

At present the plants are quite dry at the roots, and they have been removed from the tan, where the roots had ramified all through the plunging material. We have carefully examined every bulb to remove

the dried outer coatings, with any insect pests that may be hidden amongst them; and as a further precaution, the crowns are dusted with tobacco-powder. This kills thrips and the mealy-bug, if any are present. Air should be admitted freely by day, and the heating apparatus must be used to dry up damp, which may be injurious to them. No time should be lost in getting the potting-soil ready. I like to have such soil mixed at least six weeks before using it, so that the manure may in some degree be absorbed by the loam; and good compost may consist of about two parts of good yellow loam to one part light fibrous peat, and one part of decayed stable-manure.

The potting of the plants should take place towards the end of January. The bed where they are to be plunged should have been previously prepared by mixing some fresh tan with the old material, and at the time of potting the bulbs it may be 85° to 90°. Plunge the pots to the rims, as they are potted. Repotting must be done carefully, and over-potting avoided. The largest bulbs are about 6 inches in diameter, and these are potted in 24's or 8-inch pots.

Good flowering bulbs may be put in pots 4½ to 5 inches diameter. The pots should be washed and well drained. In preparing the bulbs for potting, all the old material must be removed, and the base of the bulbs examined. The roots grow in a circle round the base of the bulb, leaving the centre of them quite bare, and there is usually a film of dried skin covering this. Remove the skin to see if there is any decay underneath, and if any be present, cut it away and dust the wound with quicklime, pressing it in with the fingers. The bulbs should be placed on a cone of mould, with the roots hanging down the sides; press the soil firmly amongst them, finishing off with the bulbs about half covered. Some sand ought to be mixed with the compost, and a little ought also to be sprinkled on the surface of the soil. *J. Douglas.*

NURSERY NOTES.

WILL TAYLER'S, HAMPTON, MIDDLESEX.

IN the varied outside department of nursery work and experience, none is more replete with interesting details and information than the fruit-tree department, where this is a specialty. Visited late in the autumn, say till the end of the month of October, much information may readily be gleaned that cannot fail to be of use to those contemplating fruit-tree planting. Amateurs especially learn much in this way, that it is almost impossible otherwise to obtain. In any fruit-tree nursery worthy the name there are to be found object-lessons by the score. The trees may be seen in all shapes and methods of training, and comparisons can be made of their behaviour on different kinds of stock. Moreover, if the visit be early enough, the cropping capabilities of the various varieties may be observed, a rather important piece of information for the beginner; while those who are past the elementary stage will find much to interest and enlighten. The past season I had the opportunity of looking through the fruit-tree nursery of Mr. Will Taylor, which is situated in what is locally known as the "Broad Lanes," Hampton, and for the cultivation of fruit trees and Roses occupies a very favourable position. It is known as the Osborne Nursery, and was some years ago a branch nursery of the late firm of Osborne & Sons, Fulham. Mr. Taylor has now been established here for the last twelve years or so, during which time fruit trees and Roses have absorbed much of his attention. His frequent contributions of fruit at the leading exhibitions are well known, and among these the autumnal show at the Crystal Palace is a notable instance. It is a feature of the nursery that many of the fruits attain to exceptional size, weight, and colour. As proof of this, some dishes of Blenheim Orange Pippin Apple were eagerly purchased by a leading fruiterer for the extraordinary price of 1s. a-piece, and this, too, in an abundant year. At

the same exhibition, a crowning fruit of a dish of Peasgood Nonsuch weighed exactly 22 oz. when gathered, while a similar fruit of Jubilee turned the scale at 17 oz. Admitting that the year has been favourable for fruit crops, one cannot help but notice in this nursery exceptional instances of fine colouring, such varieties as Bismarck, Fearn's Pippin, Gascoigne's Scarlet, Alexandra, Annie Elizabeth, and Crimson Queen being especially worthy of note on this account. The last named Apple is deep crimson in colour, and, as here seen, with the fruits coloured all over, is very handsome. Indeed, such varieties are valuable in the garden from an ornamental standpoint when they have such exceptionally high tints. An instance, quite the reverse, was to be seen this season in that over-praised American Apple, Newtown Pippin, which cannot be grown so satisfactorily, as can the varieties named in the open quarters. It is said to require a wall to grow it to perfection—by no means a recommendation for it, when one sees it side by side with the brilliant Blenheim Orange Pippin grown in Mr. Tayler's nursery. Reinette du Canada is highly spoken of, and the fruits fully endorse the high encomiums passed upon it. It is perhaps the largest dessert Apple, and valuable also as a late kitchen fruit; the latter are covered with russet-brown skin, has tender yellow flesh, of fine flavour, and it is withal a heavy cropper. Ringer is also a heavy cropper, and reliable; it is regarded as a mid-season fruit, and is good till Christmas; the flesh is sweet, requiring little or no sugar when cooked.

Space, however, will not permit of a lengthy enumeration of varieties, suffice to say that all the leading kinds are represented in good fruitful trees. Particularly noteworthy is the small size of the trees that have borne the brilliant-coloured and large fruits alluded to of Bismarck, Blenheim Orange, Peasgood's Nonsuch, and others; and this, with the ordinary cultural routine in such nurseries. For example, trees of Bismarck not yet three years old, and only about 3 or 4 feet high, were literally loaded with large and handsome fruits. And of many other varieties this is equally true. To amateurs with only a small area, these bush trees, fruitful in the year of planting, and occupying such little room, are great acquisitions, being readily pruned, sprayed, and the fruit gathered or examined.

Even market growers are planting the Apple in bush-form, as the fruits from them obtain the highest quality and fetch high prices. Quantities of Wellington, Damelow's Seedling, and Schoolmaster (acid flesh, fine quality, and late), Cox's Orange Pippin, as well as the early well-known kitchen varieties, are here in plenty, and represented by trees in the finest health, vigour, and fruitfulness. The soil throughout the nursery is light loam overlying gravel, is well drained and warm. Pears on the Quince are largely grown in all the leading varieties, and with equally satisfactory results. Roses of all sections are cultivated, and the plants for size and general goodness are all that could be desired. Bush fruits of all kinds in variety, trained trees in abundance, Figs, Grape-vines, and the like, are all grown to meet the constantly-increasing demand, and are alike noteworthy for their clean well-matured growth and general appearance. J.

HOME CORRESPONDENCE.

THE APPLE TREE IN SHRUBBERIES.—At p. 620, a correspondent "D. L. M." inquires, "Why should not the strongest and hardiest of our Apples be planted in the shrubbery, for nothing looks better in the spring, or could be more useful in the autumn." Your correspondent may be interested in learning that this has been carried out in Mrs. Fitzwygram's garden at Larkfield, Hampton Hill, the idea originating with Mr. Maurice May, the gardener, whose argument for doing so was, that if the beauty of the Apple blossom was realised in a shrubbery, we should not rest until all shrubberies were freely planted with the trees. But because Apple trees abound in our gardens, we are content that the shrubbery should remain crammed

full of Laurels, with hungry Poplars overhead, and with other subjects equally ornamental or useful. I believe, in this instance, that some little argument was necessary at first. As soon as the result was apparent, viz., the increased beauty and utility combined, Mrs. Fitzwygram gladly gave her permission to plant more of them, and as other trees become too large in the shrubbery they are taken out, and Apple trees planted instead. In many gardens where space is limited, it is scarcely possible to make the most of the kitchen garden if Apple trees are planted thickly; but by utilising the shrubberies and the margin of the lawn for the fruit trees, a mixed kind of garden is created that is by no means unpleasing, which proves advantageous to the owner and helpful to the gardener. Of course, a shrubbery should not be all Apple trees, any more than as now so generally a confused mass of various species of Laurel and dingy and rusty Conifers. What is sadly needed is, that a much larger percentage of beautiful deciduous flowering trees and shrubs should enter into the composition of the shrubbery than is the case at present. J. [With which opinion we cordially agree. Ed.]

NATIONAL CHRYSANTHEMUM SOCIETY.—What is really wanted is some information about "the suitable hall in a central spot," available for the exhibitions of the above Society. I am able to say that two years ago a special sub-committee was appointed to visit suitable places within a radius of a mile of the Westminster Aquarium, and found nothing that would afford half the space for staging and locomotion as that afforded on the floor of the Aquarium building; while the rent asked for such places as the Queen's Hall is something almost fabulous. Complaints of the unsuitability of the Aquarium appear as regularly every year as does the shortest day, but no alternative sites are suggested. I am sure, from what I know of the committee, they will readily consider any proposal of a practical and suitable nature, if placed before them. One fact is perhaps overlooked by "Mum," and others. A big Chrysanthemum show in November is now associated with the Royal Aquarium, just as the Cattle Show is with the Agricultural Hall, and is annually looked for as a London fixture. Should the National Chrysanthemum Society leave the Aquarium, it would not follow that the November show there would be discontinued; the managers of the building are keen business men, and know the value of such an exhibition, and would, no doubt, hold one, and they would do it on a scale that would dwarf out of all proportion anything the National Chrysanthemum Society would do elsewhere, apart from the subsidy from the Aquarium Company. This is an aspect of the question that I have no doubt is duly considered by the committee, but it is probably one which has not struck "Mum," and those who sympathise with him. One thing is quite certain—that, judging from the report made at the annual dinner, association with the Royal Aquarium does not prevent the rapid expansion on the part of the Society. Another Mum.

—Your correspondent, "Mum," *Gardeners' Chronicle*, p. 681, brings forth the old objection once more against the holding of the autumn exhibition in the Royal Aquarium. He finds all the fault imaginable, but he ends there, leaving to others the difficulty of finding an alternative place. Finding fault is one thing, suggesting improvements is another; why does he not name a better place? He half admits the fact that the Royal Aquarium is central, as it is for visitors and exhibitors alike, and the latter are surely entitled to some amount of consideration. "Mum" appears not to know that the whole of St. Stephen's Hall will be devoted to exhibition purposes next year, and this addition will make an enormous difference to the show, providing, as it does, so much extra space. Who knows, too, what other schemes the management may have in contemplation? Perhaps "Mum" will say where such a site as he has in his "mind's eye" will be found. B.

THE ROYAL HORTICULTURAL SOCIETY'S COMMITTEES.—I saw a note on this subject in the *Gardeners' Chronicle* for November 30. It may surprise some, but it is a fact, that many gardeners in the provinces seldom or never read the transactions of these committees, unless it be those of the Scientific Committee, which have a general interest, though the reports are far too meagre as a rule. Could not some process of devolution be attempted, and a wider interest aroused, by having a few sub-committees (with full powers), which would sit periodically at a

few centres in the provinces in England, Scotland, and Ireland, *en rapport*, of course, with the London Central? I merely throw out the idea, and the plan need cost very little if each committee paid its own expenses. My aim is to suggest some scheme by which the "Royal" could be brought into closer contact with horticulturists all over the country. Up till now I am not exaggerating when I say that we provincial men have not believed that all the "talents" were confined to London and neighbourhood, or all the good things either. The Royal Horticultural Society should "sit on circuit" like Her Majesty's judges. There would be no objection to the secretary of the Society, or some competent member of the Council, presiding at these meetings, but all the members would need to be local with a wide limit. At present we pay little attention, or none at all, to the committees' proceedings in London, and when we do, we discount their transactions on a liberal scale. Faith is weak. J. S. W.

CRABS IN THE GARDEN.—Some of your correspondents have recently been calling attention to the varieties of the crab as ornamental shrubs. To any one planting trees, say for an alcove or shaded walk, *Pyrus Malus floribunda* is a most desirable variety for the purpose. I have enclosed some fruits of the same. R. M., *Newbury*. [Our correspondent kindly sent several shoots of this variety loaded with the fruits, which are yellow in colour, and the size of those of the Whitethorn. Ed.]

GERBERA JAMESONI.—A good specimen of *Gerbera Jamesoni* has done well here in the open border for several years, though it has had no assistance at all from hot-water pipes. I think the plant is certainly larger than that of Mr. Lynch in the Botanic Garden at Cambridge, though the latter is the more floriferous of the two. I have always put a box with the top and bottom knocked out over the head of my plant, and this has been filled up with dry leaves to the top. I generally bid good bye to my *Gerbera* in November, and I see nothing more of it till the middle or end of the following May—though the leaves are all scraped away from it at the beginning of April. By the aid of the above simple precaution, this plant is manageable enough in the Isle of Wight; but if my circumstances were like those of Mr. Lynch at Cambridge, I should follow his plan, which I know to be a very good one. He has the advantage of a much larger crop of flowers than I ever get, but I esteem my plant to be a finer one than his. Which has the advantage, a plant which is grown in proximity to the hot-water pipes of a stove, or another which is favoured by the climate of the Isle of Wight? H. Eubank.

PLANTS FOR GAME COVERT.—I thank those of your correspondents who have replied to my query on the above (see p. 684). I assure Mr. Harrison Weir my question was *bona fide*, knowing that so few shrubs were free from injury by that enemy of tree of shrub growth—the rabbit. I was anxious to add to their number, if possible. As bearing on this subject, I may here mention a remark I have used to owners of estates and others for many years past, viz., "feeding rabbits on growing tree and shrub bark is only comparable in extravagance to using new £5 Bank of England notes to dish up *entrées* at a dinner party." However, this is by the way; rabbits are, and will be, kept for sport on most, if not all, properties where woods and plantations exist, and it is the duty of those interested to find out what shrubs are useful for covert are the least injured by them. I do not think *Rosa rugosa* fairly comparable as to its spines with the wild Dog Rose. I hope I have too much feeling for both man and beast to think even of making large plantations of the Dog Rose for covert. *Rhododendron ponticum* is a well-known covert plant, mainly free from injury by rabbit. Those of us who are situated on the limestone formations know, though, that it will not grow freely enough for that purpose. In most cases, it merely exists. In reply to Mr. Pope, I may mention, that with us English Yews, Hardworth broad leaved, and the ordinary Tree Box, are the only evergreen trees free from injury. Amongst deciduous shrubs, *Spargelia* in variety, flowering Currants ditto, Persian Lilacs, Dog-wood, Snowberry, and Elders are not injured. The latter in particular is never touched by rabbits, even in the hardest winter, and where they are very numerous. H. J. C., *Grimston Gardens, Tadcaster*.

RABBIT-PROOF PLANTS.—Mr. Pope (p. 685) asks for the names of these, and I intended sending a note on the subject some time ago. As last winter was so exceptionally severe, with the ground covered by snow for several weeks, and the woods unfortunately full of

rabbits, a remarkably good trial was afforded. The conclusion I arrived at is that no plant ordinarily grown in woods is proof against attack in a severe winter with one exception, viz., *Rhododendron ponticum*—a plant which thrives here in the natural soil, a stiff clay, and is grown in large masses, some of the plants running up from 12 to 16 feet, and it abounds in all sizes, from tiny seedlings upwards. The rabbits were so pressed for food that they died by hundreds, although fed with hay, &c., but in no case did they nibble the *Rhododendrons*. As regards the liability of other plants to be attacked, I place them in the following order, starting with those which received the least injury, but several of them are about equal in that respect. Yew, Holly, Portugal Laurel, Common Laurel, *Berberis aquifolia*, Privet, Ivy, of this last they ate every leaf obtainable, and in one instance climbed a broken tree 4 feet, and walked along it 26 feet, at a distance of 4 feet above the ground; they also climbed to the top of stacks of green faggots put up on end, and cleared off the bark and young twigs, and large branches of Beech 1 foot in diameter were barked clean by them. So many died of poisoning by Yew and other herbage, that it was not safe to take the foxhounds into the woods after the frosts was over, as they ate the dead rabbits and became ill in consequence. All this tends to show the immunity of *Rhododendron ponticum* from injury; and where it will grow I consider there is no plant its equal for covert planting—its beauty in spring when in flower is well known, and appreciated. Hybrid *Rhododendrons* are not so safe from attack here, possibly because they grow more slowly, and rabbits have a remarkable tendency to attack anything recently planted, or standing in an isolated position, as choice things often do. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

THE IMPORTATION OF HORSE RADISH.—I was very pleased to read your article on this subject in the last week's issue. Mr. Mason's facts cannot be too widely known. Horseradish nowadays has no flavour or pungency. One seldom meets with any now at restaurants, hotels, or green grocers, but what one could eat a dish of, comparatively speaking, without tasting the old Horseradish flavour of one's youth. Then all was English-grown; and the secret is one of cheapness of production. The foreign roots are cultivated in a most inexpensive way, and are sold at a lower price than the cost of production is here. I wonder Mr. Mason did not explain the difference in the style of cultivation in England and in Holland, where most of this tasteless stuff comes from. I also wonder that he and other English growers do not cultivate the root in the cheap way the Dutch do, seeing that the British public prefer cheap and tasteless roots. In Holland they plant in April, the snags, or long thin rootlets at the base of every old root, about 8 or 9 inches apart each way. These enlarge during the summer growth, and being dug up in November, form the article sold as imported roots (an old root enlarged). English cultivation is very different, and much more costly. The crowns of large roots are cut off about 4 inches in length, and planted in February, I believe about 1 foot apart in the rows, 2 feet from row to row, and 1 foot deep. Each crown is worth a penny, which, together with the amount required for labour, entails a cost of about £60 or £70 per acre for planting only. The planted crown throws a shoot up to the surface of the ground, which enlarges to about the thickness of the parent crown; and in November, when the growth is finished, trenches are dug between the rows, and the new growth of 1 foot cut away from the old crown below, and the article sold by English growers, being a new fresh-grown root, full of flavour, and not a piece of old tough root enlarged. The imported roots come over packed tightly in enormous barrels, and anyone may know them in the shops; they are dirty-looking, and have a little leaf green and bleached in the barrels. English-grown roots look much fresher and cleaner, and have a little tuft of green leaf just beginning to grow on the crown. Any one who tries the English roots against the Dutch will soon detect the difference in the flavour and strength; and while he is tasting the English, he will "weep" to think he ever bought or encouraged the foreign root. *Alfred Watkins Cromwell House, Twickenham.*

CHRYSANTHEMUM, M. CHENON DE LECHÉ—The engraving in last week's *Gardeners' Chronicle*, p. 684, represents this charming variety in its true character. It is without doubt one of the best of the many new varieties introduced during the last few years. The

colour is so distinct from any other, and so pleasing, that it is sure to find many admirers. I saw the blooms staged at the Royal Aquarium Show, and at Hall too it was a prominent feature in Mr. Wells' stand. I regard this Japanese as one of M. Calvat's best introductions, and one that will find favour wherever seen. *E. Molyneux.*

GAS-LIME.—I can assure your correspondent, "R. D.," that gas-lime, used in the fresh state, in the quantities I mentioned, and in the way directed in my Calendar in the autumn of the year, will be quite safe for him to recommend when lecturing. No ill-effects will be visible the following season; but instead, if good cultivation be given as well, the soil will not only grow good vegetables, but such as will take prizes. This I have proved for a number of years; and others who have seen the crops that I have grown will corroborate the statement. I should certainly not have recommended the use of fresh gas-lime without having fully tested it for years. *John Lambert.*

BEGONIA GLOIRE DE SCEAUX.—I find this useful free-flowering Begonia of great service for decoration at the present season and later in the year. The flowers of a soft pink colour contrast pleasantly with the rich bronze foliage. I usually propagate the plant from "eyes" in a brick heat like the Vine in the spring, inserting these in light sandy soil, and keeping the latter rather on the dry side till the roots have pushed, and when this occurs, shoot quickly appear above the soil; and the cuttings, if they are then carefully potted, become soon ready for hardening off and placing in a cold frame. The plants with ordinary attention do very well in cold frames throughout the season and make good plants by the autumn, at which season they should then be taken into a house or pit having a temperature of 50° to 55°. During the summer, manure-water should be frequently afforded to all the well-rooted plants. *H. Markham.*

LATE FLOWERING VARIETIES OF CHRYSANTHEMUMS.—Several of your correspondents have lately spoken of varieties of Chrysanthemums suitable for flowering at Christmas and later, but none has mentioned Princess Victoria, a variety which I consider the best of all for the purpose. This variety has a good habit, and, being a good grower, it makes strong compact bushes from 3 to 4 feet high, if stopped once in the spring; and the blooms are good, either on specimen plants, or, if not disbudded, as sprays. Last Christmas my only two plants were grown side by side with L. Canning and other late-flowering varieties, none of which was equal to it in usefulness or beauty. This year I have about thirty strong plants in 8 or 9-inch flower-pots, and they are just commencing to open their buds, and will be in perfection at about the 30th inst. I intend to discard Lady Lawrence in favour of Princess Victoria. I send a spray from the earliest plant for your opinion; also a spray of another variety named Florence Watson, an importation from Japan, which, I think, will make a good late white. *R. Watson, Elkington Hall, Louth.* [The blooms sent of Princess Victoria were of useful decorative size, white, with lemon-coloured centre, outer florets becoming pink with age. Apparently very free in blooming, but compared with L. Canning the blooms are less white. Should the habit of this one be better than L. Canning, the variety is doubtless of first-rate usefulness. Those of Florence Watson mentioned by our correspondent on sprays unthinned have broad, pure white florets, slightly incurved, young florets distinctly lemon-coloured. Some mistake appears to have been made in putting up this bunch, however, as the large blooms from thinned shoots are very deep, the florets are numerous, narrower, and fluted, and little trace of lemon in the centre. They are presumably two varieties, and the broad-floretted one is decidedly pretty. Ed.]

PEAR LUCY GRIEVE.—I was pleased to see the Pear Lucy Grieve figured in your last week's issue, and to read the touching lines in verse by a fond parent, now departed, in memory of his little daughter and her seedling Pear. Partly from the touching incidents connected with the origin of the Pear, I got a maiden plant of it a number of years ago, but it has never fruited with me. It is on the Quince, on which stock it is a weak grower, and evidently shy bearer. However, I am not yet without hope of seeing Lucy Grieve in fruit in *East Lothian.*

TREE-PLANTING AT EXMOUTH.—The inference to be drawn from your note (p. 650) respecting this

is, that the system has only but recently been introduced. Thanks to the generosity of the Lord of the Manor, many of our principal roads were planted several years ago, others were planted last season, and at the present time we have nice avenues of trees, principally Limes. I regret, however, to say that this autumn the public have taken the matter up, and very few Limes, or what, perhaps, would be more suitable, Planes, are being planted; and our beautiful esplanade—perhaps one of the finest in the kingdom—has been disfigured by being planted with a mixed collection of Horse-Chestnuts, Sycamores, Balsam, Lombardy, Black Italian, Silver, and other kinds of Poplars. The Chestnuts will certainly be a failure, for the situation is much exposed to the sea, and in gales they will get every leaf blackened. I may add, that since the trees were planted many have been beheaded to bring them into shape. It is a matter of regret that the Council were so ill-advised as to consent to the planting of such varieties, for it only brings street tree-planting into disrepute. *Exmouthian.* [The kinds named are not, perhaps, the best that could be chosen. Still, the only really unsuitable one is the Horse-Chestnut. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 10.—The meetings and exhibitions for the present year were brought to a close on Tuesday last by that held in the Drill Hall, James Street, Westminster. As is usual on occasions immediately preceding the Christmas season, there was a large attendance at the several committees, and particularly in the case of the Fruit Committee, whose members had to take leave of their Secretary. A resolution passed in connection with Mr. Barron's retirement from this position is referred to on another page. Notwithstanding the unusual attendance upon the committees, the extent of the exhibits was not large, and two of the long tables furnished sufficient accommodation for them all, excepting a group of Chrysanthemum plants. Orchids, cut Chrysanthemums, fruit and vegetables, and a few miscellaneous plants of interest, comprised the exhibition.

Floral Committee.

Present: W. Marshall, Esq., in the chair; with Messrs. J. Fraser, J. Luing, H. B. May, H. Herbst, B. Dean, E. Owen, G. Stevens, J. Jennings, G. Gordon, W. Bain, H. Cannell, J. D. Pawle, H. Sefer-Leonard, G. Nicholson, C. Jeffries, C. E. Shea, J. W. Barr, J. Walker, J. T. Bennett-Poc, H. Briscoe-Ironside, C. Blick, G. Paul, H. H. D'Ombraia, and Harry Turner.

From the gardens of Sir TREVOR LAWRENCE, Bart., Bedford, Dorking (gr., Mr. Bain), came a number of cut spathes of hybrid Anthuriums, all of them pretty; also a number of well-grown plants of *Primula floribunda*, a very pretty little species from China, with yellow flowers, blooms during most of the winter (Silver Banksian Medal).

J. P. BENNETT-POC, Esq., Holmewood, Chesham, again exhibited the plant of *Begonia* × *incomparabilis*, raised by Mr. Froebel of Zurich, and figured in our last issue.

About eighteen plants of seedling varieties of *Primula sinensis*, illustrative of an excellent strain, but hardly in full flower, were shown by Messrs. H. CANNELL & SONS, Swanley, who had also some good sprays of varieties of *Canna*, including Queen Charlotte and an *Alphonse Bouvier*, the latter a very effective crimson-scarlet colour.

Mr. C. HERRIN, The Gardens, Dropmore, exhibited a few plants in flower of *Oxalis Ortgiesii*, a species bearing small yellow flowers and dark orange wedge-shaped leaflets (Vote of Thanks).

Chrysanthemums were again shown by several exhibitors, but the only award gained on this occasion was one by a decorative variety, named *Stressa*, exhibited by H. BRISCOE-IRONSIDE, Esq., Cedar Lodge, Bayes Hill, Sussex. A large number of the blooms were arranged in a stand in an effective manner, and the decorative value of the very soft yellow-coloured blooms was well illustrated.

Mr. ROBERT OWEN, nurseryman, Maidenhead, had a fairly large collection of new varieties, including Mrs. C. E. Shea, J. W. Richardson, Madame Eugène Mercier, and a number of seedlings (Silver Banksian Medal).

A group of Chrysanthemums, shown by G. H. F. TARKS, Esq., Chislehurst (gr., Mr. J. Lyne), was composed of plants of *Jeanette Sheehan*, a sport from the white-flowered *Princess Blanche*, with yellow flowers, having a bronzy centre. The variety was given an Award of Merit by the society in January last, and is apparently very free-flowered, beside being pretty and attractive (Silver Banksian Medal).

A new patent Orchid-basket was exhibited by Messrs. SEASELL & SONS, 135, St. Charles's Road, Heeley, Sheffield, the chief innovation in which is a saucer-shaped top, by which it is claimed the water given is thrown to the centre of the compost.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Secretary), Dr. Maxwell T. Masters, J. Jaques, E. Hill, J. Douglas, W. Cobb, S. Courtauld, H. M. Pollett, T. W. Bond, De B. Crawshay, A. H. Smea, H. Ballantine, H. J. Chapman, W. H. White, E. Ashworth, T. B. Haywood, and R. Brooman-White.

The last meeting of the year brought a good attendance of the members of the Committee, and the exhibits, for the season, were good and interesting.

Sir TREVOR LAWRENCE, Bart. (gr., Mr. W. H. White) as usual, contributed some remarkable plants, the most admired of which was a pretty specimen of the rare *Dendrobium Treacherianum*, whose dwarf Bulbophyllum-like growth bore three short spikes bearing together twenty-three large rose coloured flowers with dark crimson base to the lip. The plant was awarded a First-class Certificate, and a Cultural Commendation was allotted to the grower.

A Botanical Certificate and Cultural Commendation were also given to a noble specimen of *Agrostium pertusum* with eighteen long racemes of neatly-arranged white flowers; a Botanical Certificate for the pretty *Masdevallia pachyura*, with red-brown and clear yellow flowers, and which was now shown for the first time, the plant which has hitherto borne the name in gardens being *M. caloptera*, a totally different and smaller species. Sir TREVOR LAWRENCE also showed the rare *Marmodes Lawrenceanum* (*Lindelia*, t. 275), (Botanical Certificate); a giant variety of *Masdevallia macrura* (Award of Merit), the extraordinary large *Bulbophyllum grandiflorum*, *Dendrobium Cologyne*, and the white and rose forms of *Laelia rubescens*.

Baron Sir H. SCHRODER, The Dell, Egham (gr. Mr. H. Ballantine), sent a most beautiful collection of cut flowers of *Cypripediums*, representing some sixty fine species and varieties, and for which a Silver Banksian Medal was awarded. Of the most striking, we noted the two yellow *Cypripedium* *insigne* *Sanderæ* and *C. i.* *Sanderiana*, the former yet far and away the best of yellow *insignes*; *C. × Southgatei*, *C. × T. B. Haywood*, *C. × Arthurianum*, *C. × Harrisianum superbum*, *C. × Aiusworthii*, *C. × Mrs. Chas. Canham*, and among some pretty unnamed hybrids a handsome flower obtained between *C. Druryii* and *C. superbium*. In the group also were flowers of the pretty *Cologyne Arthuriana*, a near ally of *C. maculata*, but demonstrated by the late Professor Reichenbach to be botanically different. As a garden plant it is certainly distinct, for it flowers after the *C. maculata* is over.

J. T. BENNETT-POE, Holmewood, Cheshunt, staged a very pretty group, of which the centre was formed by a very graceful arrangement of fine spikes of various *Calanthes*; with them was a remarkable noble variety of *Lycaste Skionari*, named *Holmewood var.*; a good plant of a rich blue *Vanda coerulea* (Cultural Commendation), and a singular variety of *Laelia autumnalis*, with large pure white side lobes to the lip. A Silver Banksian Medal was awarded for the group.

Messrs. JAS. VEITCH & SON, Royal Exotic Nursery, King's Road, Chelsea, staged an effective group of rare plants, among which one of their latest and most beautiful novelties, *Laelio-Cattleya × Lady Rothschild* (C. Warszewiczii ♂, *Laelia Perrini* ♀) made its *début*, and secured an Award of Merit. The flower in size approaches *C. labiata*, but the form of the lip follows closely on that of *L. Perrini*, though in the hybrid it is of more ample form, and brighter in colour. The sepals and petals were of a clear rosy-lilac, the disc of the lip primrose-yellow, with some beautiful purple markings at the base, and a bright purple front lobe. Another fine hybrid shown by Messrs. VEITCH was the pure white *Calanthe × Harrisii* (Turner × Veitchii), which received an Award of Merit, and noteworthy things were *Laelio-Cattleya × Pallas* (C. Dowiana × *L. crispata*), the rare *Oymbidium Tracyanum*, and several others (Silver Flora Medal).

Messrs. F. SANDER & CO., St. Albans, staged a very effective group of their various new winter-flowering *Calanthes*, together with *Phaio-Calanthe × Arnoldiana*, *Laelia anceps alba*, *Helicia sanguinolenta*, *Restrepia antennifera*, *Odontoglossum asprum*, *O. Schroderianum*, *O. Nevadaense*, *O. Wilckeanum*, and numerous hybrid *Cypripediums* (Silver Banksian Medal).

Messrs. B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, N., showed a good collection of *Cypripediums*, among which we noted the noble *C. × Pitcherianum*, Williams' var., and others.

THOS. STATTER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), sent the handsome *Cypripedium × Lucienianum superbum*, *C. × Leeanum giganteum grandiflorum* (perhaps the largest of the *C. × Leeanum*), *C. × plumosum*, *C. × Niobe splendens*, *C. × Rufua* (a richly-tinted Lawrenceanum cross), *C. × Ariadne*, *Laelia × elegans nobilis*, a very fine and richly-coloured variety; *Laelio-Cattleya Treasderiana* *superba*.

H. TATE, Esq., Allerton Beeches, Allerton, Liverpool (gr., Mr. Osborne), sent *Cypripedium insigne*, Tate's variety. The form appeared in the midst of a mass imported by Messrs. F. Sander & Co. in 1892, which has been grown on all together. Tate's variety, on which there were two flowers, is remarkable for having the upper and lower sepals alike, and the usual dotted lines and pure white lip of the ordinary variety's dorsal sepal on both upper and lower.

T. W. SWINBURNE, Esq., Corndean Hall, Winchcombe, Cheltenham, staged an interesting group of *Cypripediums*, among which were the pretty *C. × Swinburnei*, with nine blooms; *C. × Swinburnei magnificum*, whose massive flower seems difficult to reconcile as being from the same cross as the type, and yet it is known to be so; the pretty *C. × Iadra*, fine varieties of *C. × Leeanum* and *C. insigne*, *C. Spicerianum*

with ten flowers; the very singular and distinct *O. × Lady Hutt* (*insigne × Fitchianum*), a noble flower, in some respects like a massive *C. × Asburtoniae*, but having a large yellow-coloured staminode, and incurved lobes of the lip of the same clear colour.

Messrs. HUGH LOW & CO., Clapton, arranged a group of Orchids, in which were two fine varieties of *Cymbidium giganteum*, *Oycocoches chlorochilon*, and others.

W. C. WALKER, Esq., Percy Lodge, Winchmore Hill (gr., Mr. Geo. Cragg), showed *Laelia rubescens*, *Oncidium prætexatum*, and a *Cypripedium Charlesworthii*, with curiously-twisted sepals.

G. SHOBLAND BALL, Esq., Earlscliffa, Bowden, Cheshire, sent the rare and beautiful *Cattleya labiata* in better form than it has before appeared; *Cypripedium insigne Sanderæ*, and *C. insigne Ballianum*, a charming clear yellow form, with broad, pure white upper-half to the dorsal sepal, on which were faint purple blotches, suggesting shadows of the blotching seen in *C. insigne Chantinii*.

Messrs. W. L. LEWIS & CO., Southgate, showed *Cypripedium × Ashtonii* (*ciliolare superbum × selligerum majus*) a stately flower, resembling the *C. × Alfred Hollington* (Award of Merit).

D. B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), sent a fine form of *Oncidium tigrinum* (Award of Merit); and F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, showed *Oncidium pictum*.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. T. J. Saltmarsh, W. Wilks, P. C. M. Veitch, G. W. Cummins, Jas. Cheal, A. H. Pearson, J. Wright, Alex. Dean, C. Herrin, J. Willard, Charles Ross, J. W. Bates, Wm. Pope, G. H. Sage, Geo. Wythes, Jas. Hudson, F. Q. Lane, A. Balderson, G. Reynolds, Jas. Smith, G. Norman, Dr. Robt. Hogg, and Jno. A. Laing.

Some fruits of the tree Tomato (*Cyphomandra batsea*) were sent by the South Devon Fruit Farm, Torquay (T. PENDER, Manager). Seed was obtained from Ceylon, and sown in February, 1891, and the plant grew a great height, but did not fruit. After shedding its leaves, the plant was cut down to 1 foot, and this season it has grown to 12 feet high, with branches 60 to 12 feet long. The flowers are produced in bunches like *Solanums*, and the plant has carried fruit at every joint.

The fruits shown were about the size of a small hen's egg, but were not quite ripe. The plant has always been in a cool-house, and it is thought that the fruit will never ripen sufficiently early to be profitable without fire-heat. Many particulars concerning this fruit were given in the *Gardeners' Chronicle* for March 19, 1887, together with an illustration.

The only collection of Apples and Pears was one from Lord FOLEY, Ruxley Lodge, Esher (gr., Mr. J. W. Miller). There were upwards of forty dishes, and included were good specimens of Beauty of Kent, Saadringham, Blenheim Orange, Mannington's Pearmain, Court of Wick, Lord Derby, and many others (Vote of thanks).

Seedling Apples again occupied the attention of the committee, but no awards were given, though the committee are desirous of seeing some of the kinds at a later date.

Mr. CHAS. ROSS, gr. at Welford Park, had Opal, a small yellow fruit, in colour like Golden Noble. Messrs. JARMAN & CO., Chad, Somersset, had fruits of Crimson King Apple, a fair sized fruit, highly coloured, exhibited together with a young tree of the same variety.

Mr. W. EMPSON, Amptill, Beds, exhibited Amptill Seedling and Easter Russet Pippin. Messrs. LAXTON BROS., Bedford, had Laxton's Bedford Scarlet; and the Right Hon. Lord ST. OSWALD, Nostell Priory, Wakefield (gr., Mr. Jno. Easter), showed good dishes of Queen Apple, Alexander, and Prince Albert (Vote of thanks).

Messrs. DOBBIE & CO., Rothesay, N.B., exhibited some very well-grown purple and green Kales, to be known as the Victoria Kale. They were very remarkable for the close curling of the leaves (Award of Merit).

Messrs. H. CANNELL & SONS, Swanley, brought a few Savoys; several varieties of Beet, of good shape and colour, and not over large, notably, Best-of-All and New Purple; some Cannell's Mammoth Leeks, and a collection of Onions in variety, the produce chiefly of field culture, but exhibiting nevertheless, very large size and perfect ripeness. Very fine new forms were Lullington Park Hero, Cannell's Globe, and Southport Red.

A collection of Onions, in about thirty dishes, shown by the Earl of CARNARVON, Highclere Castle, Newbury (gr., Mr. Wm. Pope), was well worthy of remark by reason of the size and solidity of the specimens. Such varieties as Sutton's A1, Ailaa Craig, The Lord Keeper, Sutton's Crimson Globe, Cranston's Excelsior, Veitch's Main Crop, Tongood's Southampton Champion, and Rousham Park Hero, were of excellent exhibition size and quality, but smaller specimens of the same varieties were of equal quality at least, and as convenient. There were two seedling varieties of uncommon shape, but most nearly like Cranston's Excelsior, having a large, almost crimson flat base, tapering to an unusual degree.

ALDERLEY EDGE AND WILMSLOW HORTICULTURAL.

NOVEMBER 29, 30.—A successful show was held in the Drill Hall, Wilmslow, on Friday and Saturday. The competition in most of the classes was good, and considering the lateness of the date, fine blooms were exhibited.

Col. Dixon, Astle Hall, the President, opened the show, and a large number of visitors were present on both days.

The committee are to be congratulated on the result of their first effort, and it is hoped that the show will become a permanent fixture. The fruit shown was very good, and indeed, exhibits generally were praiseworthy.

One feature of the show was a varied collection of Orchids exhibited by E. A. H-WORTH, Esq., Harefield Hall, Wilmslow (gr., Mr. E. Holbrook), which was much admired. A smaller and select collection was shown by Dr. HODGKINSON, The Grange, Wilmslow (gr., Mr. J. Worre).

Messrs. CLIBRAN & SONS, of Altrincham, sent plants and cut flowers, also a fine collection of fruit; Messrs. JOHNSON & WHEELER, of Chesterfield, cut blooms of new varieties of *Chrysanthemums*; Messrs. CALDWELL & SONS, Knutsford, sent Conifers, &c., to decorate the room, and also showed a collection of *Cyclamens*, &c., these various trade exhibits adding much to the attractive ness of the show.

In the local classes, honours were gained by Mrs. BRADLEY (gr., Mr. Geo. Heap), followed by R. B. LINGARD MONK, Esq., J. WHITEHEAD, Esq., H. HEENAN, Esq., and G. HARRISON, Esq. (gr., Mr. W. M. Williams).

HIGHGATE AND DISTRICT CHRYSANTHEMUM.

DECEMBER 4.—The eleventh annual dinner of this Society took place on the above date at the Winchester Hall Hotel, Archway Road, Highgate, and Charles Catling, Esq., the President, occupied the chair. There were more than 100 members and friends present.

The chairman, in proposing the toast of the evening—"The Highgate and District Chrysanthemum Society"—referred to the success of the recent show, which he said was the finest yet held.

Mr. Percival Hart, last year's President, proposed "The President and Chairman," and congratulated Mr. Catling on the success of his year of office.

The chairman briefly responded, and alluded to the stragous manner in which the committee had worked throughout the year. He afterwards presented the Medal awarded at the recent exhibition, which were as follows:—Silver Medal of the National Chrysanthemum Society, to Mr. J. Brooks, gr. to W. REYNOLDS, Esq., J.P., Highgate, as an addition to the 1st prize for a group of Chrysanthemums; Rycroft Medal (presented by Mr. H. J. JONES, Lewisbam), to Mr. A. Page, gr. to A. TAYLOR, Esq., Southgate, for twelve Japanese blooms; Bronze Medal of the National Chrysanthemum Society, to Mr. T. L. Turk, gr. to T. BONEY, Esq., Highgate, for twelve bunches of cut blooms.

NATIONAL CHRYSANTHEMUM.

DECEMBER 11.—As is usual at this, the last meeting of the committee for the year, only a few novelties were staged, but the interest in the meeting was considerably enhanced by a collection of several boards of fine blooms of novelties of a very interesting character, to which a small Silver Medal was awarded.

First-class Certificates of Merit were given to Japanese Mrs. R. W. E. MORRAY, a full, asymmetrical, pure white incurved flower, the petals narrow, but plenty of them, from Mr. R. W. E. MURRAY, Blackford House, Edinburgh; to Japanese Janette Sheahan, a pale yellow sport from Princess Blanche, two finely-bloomed, dwarf, bushy plants, being exhibited; it was Certificated as a late-flowering decorative and market variety.

Messrs. JOHNSON & WHEELER, nurserymen, Chesterfield, sent incurved H. W. Roeman, of a bright pure golden colour, which the committee wished to see again. From Messrs. H. CANNELL & SON, nurserymen, Swanley, came Goldfield, a deep golden incurved Japanese as shown, which the committee asked to see again. It was shown at the meeting of the Royal Horticultural Society on the previous day as *Asanti*, but the exhibitors apparently thought it expedient to change the name! A vote of thanks was passed to Mr. Thomas Bevan for his services as chairman of the Floral Committee during the past year, which was suitably acknowledged.

EDINBURGH ROYAL BOTANICAL.

PLANTS IN FLOWER IN THE GARDEN.

Asystasia scandens is a climbing plant which is perhaps better known under the synonym of *Houtfeya scandens*, and a specimen planted out is now flowering in one of the stoves. It is not a plant of vigorous growth, and reaches a height of about 6 feet or thereabouts. The stems, dark shining green, are swollen at the nodes, and they bear opposite dark green leaves, upon which the venation is very prominent. The inflorescences are terminal, and are borne upon the short branches, in racemes carrying a good number of white flowers 2 inches across the lobes; and the anthers are black. As grown, it is very floriferous, and at this season is a very acceptable addition to the warm-house. It was introduced from Sierra Leone about fifty years ago, and is figured in the *Bot. Mag.*, t. 4449.

Jasminum pubescens.—Where cut flowers are in demand during autumn and winter months, this favourite should not be forgotten, because of its fragrant white flowers. It is a native of China and India, easily grown as a pot plant or when planted out in a border. Afforded a good position in an intermediate, or cool stove temperature, more growth by plants in borders is made, and consequently there are more flowering shoots. In gardens it is often seen under the name of *J. hirsutum*.

Ceratopetalum gumiferum.—A plant of this New South Wales shrub or tree (for it is said to attain the dimension of

the latter) has been in bloom for the past three or four months. The foliage is opposite, the ternate leaves having their leaflets with serrated margins, and it is evergreen. The terminal panicles consist of loosely-arranged flowers, in which the sepals are very prominent, and the petals small and divided into three pointed segments. The yellowish-white sepals turn, at the present time, to a pinkish colour, a change that brings them into more prominence. A good bush of this plant would prove attractive. It is grown in a rather rich compost in a cool greenhouse among other Australian plants.

Reinwardtia.—Every year at this season we are reminded of the usefulness of these old plants in brightening and beautifying the stove or warm greenhouse. The two species, *R. trigynum* and *R. tetragynum*, are both in full flower. They are somewhat similar in their flowers, but distinct in habit and foliage. The first is compact in habit, with entire ovate leaves, growing in pots to a height of 1 to 2 feet, but when planted out as here, it grows to between 2 and 3 feet, and even higher, carrying hundreds of flowers, and forming a compact bush. The variety *R. tetragyna* is of a straggling habit, with larger elliptic serrated leaves, and rather larger flowers of a lighter yellow colour. Both varieties are easily propagated from cuttings in the spring, and they may be placed in a cold frame during the summer, with abundant water at the roots, and copious syringing to keep down red-spider, to which the plants are very subject. They may be kept until their flowers appear in a cool greenhouse, and then placed in gentle heat to cause the flowers to open freely, which they will continue to do for a considerable length of time.

Eucharis Sanderiana, and other Species.—This species named is not so well known as its merits deserve, for it possesses bold foliage on short petioles, shorter leaves, which have a more conspicuous venation than in the well-known *E. grandiflora*. The flowers are of great substance, the perianth not reflexed, and the corona almost absent. It was introduced by Messrs. Sander in 1838, from New Grenada. *E. candida* is also flowering here, its long peduncles carrying blooms in which the corona is very apparent, while the leaves are smooth, on long petioles. *E. Mastersii*, introduced in 1855, shows signs of flowering. All the above varieties of *Eucharis* are worthy of a place in a stove. *R. L. Harrow, Edinburgh.*

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

0, Scotland, N. *Principal Wheat-producing Districts*—
1, Scotland, E.; 2, England, N.E.; 3, England, E.;
4, Midland Counties; 5, England, including London, S.;
Principal Grazing, &c. Districts—6, Scotland, W.;
7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
10, Ireland, S. * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending December 7, is furnished from the Meteorological Office:—
"The weather during this week was very unsettled and stormy over the whole kingdom. Rain fell daily in the west and north, the amount in many places being twice, and in some places three times, the mean; in the east and south, however, the falls were slight, and less frequent. At the end of the period, showers of hail, sleet, or snow were experienced."

"The temperature was high during the greater part of the week, but fell quickly towards its close. The average values for the week just equalled the normal in 'Scotland, N.' but exceeded it in all other districts, the excess ranging from 1° in 'Scotland, E.' and 'Ireland, N.', to 3° or 4° over the greater part of England. The highest of the maxima were recorded on the 4th, in the north, and on the 5th at the more southern stations, and ranged from 58° in 'England, E.' and 'Ireland, S.', and 57° in the 'Midland Counties,' to 53° in 'Scotland, N. and E.,' and in 'Ireland, N.' The lowest of the minima occurred at the end of the week, when they ranged from 25° in 'Scotland, E.,' to 33° in 'England, E.,' and to 40° in the 'Channel Islands.'

"The rainfall was considerably in excess of the mean over Scotland and the North of Ireland, and to a smaller extent in 'England, N.W.,' but in all other districts there was a deficit. "The bright sunshine exceeded the normal amount in most parts of 'England,' as well as in 'Scotland, E. and Ireland, S.,' and just equalled it in 'England, N.W.' Elsewhere there was a deficiency. The percentage of the possible duration ranged from 30 in 'Ireland, S.' and 28 in 'England, S.E. and E.' to 9 in 'England, N.W.,' and to 4 in 'Scotland, N.' At Dublin the percentage recorded was as high as 39, and that at Aberdeen 37."

MARKETS.

COVENT GARDEN, December 12.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

Trade slow supplies heavy. Snowdrops, 70s. to 90s.; Hebrons, 75s. to 85s.; Brucés, 45s. to 60s.; Black lands, 30s. to 45s. *J. B. Thomas.*

SEEDS.

LONDON: December 11.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that as is usual during the Cattle Show week, the seed market is now well attended; meantime, however, no increase of business is shown, and values all round are without material alteration. Offers of Canadian Alsike have for the present fallen off. Mustard and Rape seed keep steady. Blue Peas and Haricot Beans are firm. As regards Canary seed, holders, in spite of the slow inquiry for arrived parcels, express considerable confidence as to an ultimate advance in prices. The new Hemp seed continues cheap and good. The Board of Trade returns give the imports of Clover and Grass seeds into the United Kingdom for the eleven months of this year as 258,534 cwt., value £763,369; as against 295,490 cwt., value £723,856, for the corresponding period of 1894.

FRUITS AND VEGETABLES.

BOROUGH: Dec. 10.—Quotations:—Savoys, 3s. 6d. to 5s. per tally; Cabbages, 2s. 6d. to 3s. do.; Onions, 2s. 9d. to 3s. 6d. per bag; Carrots 2s. to 2s. 6d.; Turnips, 2s. to 3s. 6d. per dozen bunches; Apples, 3s. to 6s. per bushel.

SPITALFIELDS: Dec. 10.—Savoys, 2s. to 3s. 6d. per tally; Cauliflowers, 5s. to 7s. do. (best); do., second, 2s. 6d. to 3s. do.; Turnips, 1s. 6d. to 1s. 9d. per dozen bunches; Greens, bunch, 1s. to 1s. 6d. per dozen; Collards, 1s. 3d. to 2s. per tally; Parsley, 1s. to 1s. 6d. per dozen bunches; Beetroot, 1s. to 1s. 3d. per bushel; Sprouts, 2s. to 2s. 6d. per half-bushel; Celery, 8s. to 12s. per dozen bunches; Leeks, 1s. per dozen; Horseradish, 1s. 2d. to 1s. 3d. per bundle; Apples, dessert, Blenheim, 4s. to 4s. 6d. per bushel; do., King Pippin, 5s. to 5s. 8d. do.; Cookers—Queenings, 3s. to 3s. 6d. do.; Northern Greening, 3s. to 3s. 6d. do.; Wellingtons, 3s. 6d. to 4s. do.

STRAFORD, D.C. 10.—Supply good, demand slow. Cabbages, 2s. 6d. to 3s. per tally; Savoys, 2s. 6d. to 4s. do.; Greens, 1s. to 1s. 3d. per dozen; do., 4s. to 6s. per tally; Cauliflowers, 1s. to 1s. 6d. per dozen; do., 4s. to 6s. per tally; Scotch Kale, 6d. to 9d. per sieve; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do., 2s. 3d. to 2s. 6d. per sieve; Turnips, 1s. 6d. to 2s. per dozen bunches; do., 30s. to 40s. per ton; Carrots, cattle-feeding, 2s. to 2s. 6d.; Parsnips, 40s. to 50s. do.; Mangels, 11s. to 15s. do.; Swedes, 14s. to 17s. do.; Onions, English, 80s. to 85s. do.; do., Dutch, 2s. 9d. to 3s. per bag; do., Port., 3s. 9d. to 5s. per case; Apples, English, cookers, 2s. 6d. to 4s. per bushel; do., dessert, 2s. 6d. to 4s. per barrel; do., Nova Scotian, 11s. to 14s. do.; Pears, English, 3s. to 3s. 6d. per bushel; Beetroot, 2s. to 2s. 6d. per bag; Horse-radish, 1s. 2d. to 1s. 3d. per bundle; Parsley, 1s. 6d. to 2s. per half-sieve.

FARRINGTON: Dec. 12.—Quotations:—Cabbages, 3s. per tally; Savoys, 4s. do.; Cauliflowers, 5s. do.; Sprouts, 1s. 6d. per half-tally; Celery, 12s. per dozen rounds; Leeks, 2s. per dozen; Parsley, 2s. per dozen; Turnips, 2s. per dozen bunches; Carrots, 2s. do.; Beetroot, 1s. 6d. per bushel; Parsnips, 3s. per sack; Onions, 4s. 6d. per bag; Apples, Blenheims, 4s. 6d. per bushel; Wellingtons, 4s. 6d. do.; Baldwins, 16s. per barrel; do. Newtowns, 16s. and 18s. do.; Pears, stewing, Catillan, 8s. per case; Grapes, English, 1s. per lb.; Almera do., 10s. per barrel; Canary Tomatos, 4s. and 5s. per box; Walnuts, 6s. per bag; Chestnuts, 7s. to 11s. do. (cwt.).

POTATOS.

BOROUGH: December 10.—Quotations ranged from 35s. to 90s. per ton.

SPITALFIELDS: December 10.—Quotations:—Sutton's Abundance, 50s. to 70s.; Reading Giants, 45s. to 60s.; Brucés, 50s. to 85s.; Main Crop Kidneys, 55s. to 75s.; Hebrons, 60s. to 80s.; Snowdrops, 60s. to 70s. per ton.

STRAFORD, December 10.—Quotations:—Brucés, dark soil, 35s. to 40s., and 40s. to 50s.; Reading Giants, 40s. to 50s.; Sutton's Abundance, 50s. to 60s. per ton.

FARRINGTON: December 12.—Quotations:—Maincrop Kidneys, 75s. to 85s.; Laxtons, 75s. to 85s.; Jeannie Deans, 65s. to 75s.; Brucés, 50s. to 60s.; Magnums, 45s. to 50s. per ton.

LONDON AVERAGES: Dec. 11.—Dnnbars, 90s. to 100s.; Snowdrops, 70s. to 90s.; Hebrons, 70s. to 90s.; Sutton's Abundance, 50s. to 70s.; Puritans, 50s. to 60s.; Regents, 60s. to 70s.; Magnums, 40s. to 50s.; Imperators, 40s. to 50s. per ton.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 75s. to 95s.; do., inferior, 50s. to 70s.; hay, best, 60s. to 90s.; do., inferior, 38s. to 60s.; mixture, 70s. to 87s. 6d.; and straw, 20s. to 42s. per load.

CYCAR STEMS, as a rule, do not produce branches very freely, but in the Paris Jardin des Plantes an old trunk which has been injured has produced lateral branches, and a whole colony of lateral buds, now about the size of eggs, are in course of formation. No perfect leaves exist at present, so that the species is uncertain.

CHRYSANTHEMUM AND FRUIT SHOW IN CARLISLE.—On Monday, December 9, a large meeting of gardeners and others interested was held at the Bush Hotel, Carlisle, for the purpose of discussing the desirability of promoting a Chrysanthemum flower show at Carlisle. Mr. C. Lonsdale, Rosehill, in the chair. After some discussion it was decided to form a society to be called the Carlisle and Cumberland Horticultural Society, and to hold a Chrysanthemum and fruit show under its auspices next autumn, and possibly a flower show at an earlier date. Mr. Sale, of Botcherby, was appointed secretary *pro tem.*, and the committee then proceeded to appoint office-bearers. The Mayor of Carlisle was appointed president; a large number of gentlemen residing in the district were appointed vice-presidents; Mr. Watt, jun., Knowefield, was elected treasurer, and a working committee was likewise appointed with Mr. C. Lonsdale as chairman. Another meeting will be held in the same place next month, for the purpose of drawing up rules, lists of premiums, &c.

AGARICUS: X. Y. Z. What is called the "Sclerotium" of some fungus, a kind of bud which remains dormant for a time, and then, when times change, develops into mycelium or spawn. We cannot tell you what the fungus is—very likely it is a state of the common Mushroom. In any case, if you pick it out, no harm will arise.

CERTIFICATE IN BOTANY: G. H. H. Yes; write for particulars to the Secretary of the Science and Art Department, South Kensington, London; or, for horticultural botany, to the Secretary, Royal Horticultural Society, 117, Victoria Street, London, S.W.

FRENCH BEAN FLOWERS DROPPING: *Vindex.* The general warmth of the house is too low. It is true that the seed will germinate at a minimum temperature of 60° Fahr., but something higher is needed for rapid growth, together with the fullest amount of sunlight, and a moist heat. No manurial aids are required until a good crop of pods is set. Want of light at this season induces poor development, and your plants may do better as the days lengthen.

FRUIT AND VEGETABLE: G. G. These popular terms need no definition as regards the sense in which they are understood in gardens. As you must know, many vegetable productions are fruits in the sense that they contain the seeds of the plant, as, for instance, Peas, Beans, Tomatos, Vegetable Marrows, Cucumbers, Chillies, &c., which are used as vegetables. "Vegetables" may consist of the entire plant, or part of it, minus the seed-vessels.

"**JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY**": A *Constant Reader.* Apply to the Secretary, 117, Victoria Street, S.W.

NAMES OF FRUIT: *Masters, Warwick.* Pear Vicar of Windfield. — *R. M., Newbury.* Fresh-coloured Apple King of the Pippins; and green-striped Apple Striped Beefing. — *W. J. W.* 4, Cockle's Pippin; 6, Claygate Pearmain; labels on others detached from fruit. — *G. T. M.* Apples 2 and 6, Scarlet Nonpareil; 4, Prince Arthur; 7, Colonel Vaughan, others not recognised. — *Serpell.* Appears to be Tyler's Kernel.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to consult the next number.* — *N. C.* 1, *Matricaria inodora*; 2, *Sedum spurius*; 3, *A. grass*, with foliage only. — *R. Maries.* The lesser *Cymbidium* is *C. giganteum*, the larger *C. Traceyanum*, formerly very rare, but now appearing more plentifully. — *W. S.* The seedling seems to be merely a variation of *Zygopetalum Mackayii*. We fail to detect the slightest botanical difference from the type. Probably the cross was not effected. — *T. R.* *Babiana stricta.* — *E. J., Aberdeen.* 1, *Davallia Tyermanii*; 2, not possible to name from the imperfect barren frond sent; 3, *Lastrea glabella*; 4, *Pteris argyrea*; 5, *Adiantum assimile*; 6, *Adiantum concinnum latum.* — *S. P. D., Barnsley.*

1, *Saxifraga cespitosa*; 2, *Pteris cretica albolineata*; 3, *Lastrea aristata*; 4, *Pteris tremula*; 5, *Asplenium bulbiferum*; 6, *Adiantum cuneatum grandiceps.*

NOTICE TO LEAVE EMPLOYMENT: R. A. If there is no serious fault on his part, the gardener living in the entrance lodge is entitled to one month's wages; and if he is obliged to remove forthwith he can claim compensation for lodging, coal, light, &c., if he have these perquisites, for the space of one month from the date of notice.

ORCHIDS: R. T., *Falkirk.* The finest *D. Wardianum* we have seen. The other is *Cymbidium Traceyanum*, illustrated in the *Gardeners' Chronicle*, 1891. It was an extremely rare plant, but recently we have seen several specimens.

PEAR AUGUSTE MIGNARD: H. & Sons, and J. Barnett. We find that this variety, described by the late J. Scott of Merriott, is mentioned in their *Guide Pratique* by the Brothers Simon-Louis of Metz, which was published in 1876. It is there said to be a variety (raised by Gregoire) under trial.

ROYAL HORTICULTURAL SOCIETY: Bot. If you send in your request, together with the annual subscription, to the Secretary, 117, Victoria Street, Westminster, your name will be proposed at the next meeting of the Society, and doubtless you will be accepted as a Fellow.

SEEDLING PELAGONIUMS: B. & R. The variety you send is one which produces a very large truss, but the individual blooms are not nearly so fine as many varieties already in cultivation.

SCANDS: L. G. *Aldrovanda vesiculosa* is mentioned by E. von Mueller, *Fragm.* vol. 7. It is Australian. *Roridula dentata* was figured in our pages, Sept. 26, 1891, and in the same issue are figures of *Drosera dichotoma*, *D. capensis*, *D. spatulata*, and *Drosophyllum lusitanicum*. The species of *Byblis* are *B. gigantea* and *B. liniflora*, the former having the synonym *Lindleyana*, and the latter those of *filifolia* and *cœrulea*. Both species were introduced in 1848, *B. gigantea* coming from the Swan river district. Polypompholyx numbers four species, viz., *bicolor*, *laciniata*, introduced in 1855. Most of the Sundews and allied genera will grow in sphagnum-moss and a small quantity of peat in well-drained pots stood in pans of water; and propagation is by means of seeds, and strong pieces of the root cut into 1 inch or ½ inch lengths, placed in shallow pans, and slightly covered with sandy peat, and put under a bell-glass. In five weeks these pieces will be fit to pot singly. Most of them succeed under greenhouse or intermediate-house conditions.

TREE LABELS: E. R. Oaken stumps 3 feet long and 3 inches square, charred for a distance of 2 feet from the lower end, and driven into the ground to a depth of 1½ feet, are as good as any, being very durable, and not easily drawn out of the earth. The top should be cut at a convenient angle to receive the name or number, which should be in black oil paint on a white ground. The rest of the label should be painted either of a green or slate colour.

TURNIP: W. C. No larva found.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

CHEAP COVERT PLANTS, viz., *Rhododendron ponticum*, strong, 2 to 3 feet, 15s. per 100; £7 per 1000.—CHARLES WILMOT, Nurseryman, Darley Dale, Near Matlock, Derbyshire.

GRAPE VINES AND ROSES.
JOHN COWAN and CO.
Have this season a large and splendid Stock of Grape Vines suitable for Fruiting in Pots and Planting Vineries. Also a large and splendid Stock of Tea and other Roses, in pots. Descriptive and Priced CATALOGUE post-free on application to the Company—
The Vineyard and Nurseries, Garston, near Liverpool.

RHODODENDRONS.
Well furnished and well budded, with from seven to twenty buds, consisting entirely of the reliable hardy kinds; the MAJORITY BEING ON THEIR OWN ROOTS, they are without doubt the best Rhododendrons in commerce.

HARDY AZALEAS.
All the most beautiful varieties, varying in height from 1½ to 3 feet; the plants are covered with buds.

ROBERT WARNER & CO'S
NEW PATENT
WINDMILLS.

Prices from £17, including Pump and Timber Supports.
May 27, 1893, The Dell, Englefield Green, Surrey.
ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schröder.
R. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne.

GARDENERS AND OTHERS WANTING SITUATIONS.
26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.
Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

BOILING WATER OR MILK.

MR. HOLMES, Beechen Cliff, Bath, BEGS to THANK those who kindly enquired his advertisement for a Gardener, and to SAY HE IS SUITED.

MR. JONES, Abberley Hall, Stourport, begs to THANK the NUMEROUS INQUIRERS for the post of HEAD GARDENER, and to say that the same IS NOW FILLED.

WANTED, for the Tea Gardens in India (Syhet), a SCOTCH GARDENER, about 25 years of age; one who has held a Foreman's situation and an abtainer preferred. Five years' engagement. Salary to begin at 2000 rupees per ann., rising to 2500 rupees the fifth year, with house, &c., found. Second-class passage paid out. (This term is considered as an apprenticeship, after which services are more valuable, and paid according to merit.) To enterprising young men this offers an excellent opportunity of improving their position.—Apply, stating height, chest-measurement, enclosing copies of testimonials, with short history of Gardening career, to ALEX. WRIGHT, 241, South Norwood Hill, London, S.E.

WANTED, a GARDENER.—Thorough knowledge of Kitchen and Flower Garden, acquaintance with Greenhouse, Charge of Pony and Trap. Wife Assist in House. No children. Write, stating wages, with testimonials.—C. READ, The Lawn, Romford.

WANTED, December 28, a SINGLE-HANDED GARDENER, wages £52 per annum and a good house; must understand Glass.—Apply to MAJOR LANG, The Gables, Lewes.

WANTED, a thoroughly experienced KITCHEN GARDENER, for large Kitchen Garden. No Botby; 25 to 30 years of age; must have good character.—Apply by letter, with full particulars, to Mr. BOND, Head Gardener, The Grove, Streatham, S.W.

WANTED, as FOREMAN, in Plant Department, under Glass, a thoroughly capable MAN, who has had experience in large establishments.—Apply, giving references, and stating salary expected, to JNO. COWAN AND CO., Ltd., The Vineyard and Nurseries, Garston, near Liverpool.

WANTED, FOREMAN for the Houses, well up in all departments of Fruit and Plant Culture, and able to manage men. Also a young man as Rose-grower, who has had several years' experience in a first-class Rose establishment. Apply to—W. MEASE, The Gardens, Downside, Leatherhead, Surrey.

WANTED, WORKING FOREMAN for Nursery, must have a thorough practical, up to date knowledge of Tomatos, Vines, and Greenhouse work generally. Forcing, a specialty. Apply by letter, with testimonials, to—D., 1, Wyndham Place, Brynaston Square, W.

WANTED, young MAN, well up in Cucumbers, Tomatos, Mushrooms, and forcing for Market. Capable for Glass and Outdoor Work of small Nursery. Reply, stating salary, E. W., Ridgway Park Nursery, Upper Eastville, Bristol.

To Nurserymen, Florists, and Market Gardeners.
WANTED TO APPRENTICE A LAD, aged 15 (indoors), as above, for a term of three years. The Youth is healthy, active and intelligent, and willing to make himself generally useful. A small Premium can be paid if required; and it is expected that the Apprentice shall be suitably boarded and lodged by his Employer during the term. References required.—Address, giving Full Particulars, S. & Co., 12, Fenchurch Avenue, London.

WANTED, a trustworthy smart young MAN, as SHOPMAN, where brisk Counter Trade is done. Must have general knowledge of Plants and Nursery Stuff.—Apply, with full particulars, stating age, wages required, and experience, JAMES WRIGHT, Nurseryman and Seed Merchant, Leicester.

WAREHOUSEMAN.—WANTED for a London Wholesale Seed Warehouse. Age about 30. Must have had some experience in Agricultural Seed.—Apply, by letter, to Q., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

MAN FLORIST.—Thoroughly experienced in Designs, Bouquets, Wreaths, and all branches. Best London references.—H. H., 5, Bear Street, London, W.C.

"THERE IS NOTHING NEW UNDER THE SUN," is a saying credited to a variety of illustrious authors, from the time of Solomon to the present day. It is a fact that many inventions looked upon as modern are of ancient origin. The telephone, which recently caused such a furore of excitement, was in ancient days a means by which the high priests worked upon the credulity of their disciples. The Pyramids of Egypt and other wonders prove that this generation has a great deal to learn. HOLLOWAY'S PILLS and OINTMENT, however, were not anticipated by our forefathers, and to-day they stand alone as the best cure the world possesses for all the ills that humanity is heir to.

On view morning of Sale, and Catalogues had.

Tuesday, December 31.

By order of Messrs. R. Wallace & Co., of Colchester.

An importation, direct from Japan, consisting of 250 plants of

HEMEROCALLIS AURANTIACA MAJOR.

This magnificent new species was awarded a First-class Certificate R.H.S., July 9, 1895; and F.C.C., Manchester Royal Botanical Society, August 24, 1895. The plant is described and figured in the *Gardener's Chronicle* for July 20, 1895, where on p. 62 Professor BAKER states that it

"IS THE FINEST HEMEROCALLIS I HAVE SEEN."

Also figured in the *Gardener's Magazine* for August 17, 1895; and *Journal of Horticulture*, August 15, 1895. The plant is quite hardy, and the most hardy plant introduced for years. The plants have been collected at great expense, and are all in good condition, and the whole will be offered without reserve.

MESSRS. PROTHEROE AND MORRIS will include the above in their SALE on TUESDAY, December 31, at 12 o'clock.

On view morning of Sale, and Catalogues had.

THE LOST CYPRIPIEDUM.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. F. SANDER & Co., of St. Albans, to SELL, on January 17, 1896,

5000 superb plants of
THE LOST CYPRIPIEDUM.

We have looked for it for over ten years, and now have the 5000 which will be sold without reserve.

The Sale will embrace the biggest lot of CATTLEYS and DENDROBES ever offered in one day, and they are grand.

WANTED, to Rent, or Purchase, a SMALL NURSERY and FLORIST'S BUSINESS, in a London suburb.—Address, stating full particulars, SUBURBAN, *Gardener's Chronicle* Office, 41, Wellington Street, Strand, W.C.

NEW CHRYSANTHEMUMS.

MAGNIFICENT NOVELTIES FOR 1896.

NO "UP TO DATE" GROWER CAN AFFORD TO DO WITHOUT THEM.

MISS MARY GODFREY, of the largest size, distinct colour, being that of the Peach bloom, finest form. Plants 7s. 6d.

MR. WM. LAYCOCK, lovely variety; blooms large, clear straw-yellow; admired by all who have seen it. Plants 7s. 6d.

PRIDE OF EXMOUTH, immense bloom, of superb form, white, slightly frosted cherry pink, considered by many who have seen it to be the finest novelty of the year. Plants 7s. 6d.

ARONA (Briscoe-Ironside), in size and form similar to Col. Smith, but richer, and the blooms are of much better substance. First-class in every respect. Plants 7s. 6d.

MRS. HUME LONG, another monster bloom, sometimes 14 inches in diameter. Rich deep rose with a light reverse.

These do not by any means exhaust W. J. G.'s list of sterling Novelties for 1893, but all are fully described, together with the very best of last year's introductions in the general Catalogue, which will be issued in a few days.

THE MOST RELIABLE CATALOGUE published, is sent, post-free, to all applicants.

ROYAL EXOTIC NURSERY, CHELSEA, LONDON, S.W.

THE NEW GIANT RED PRIMULA.

PRIMULA SINENSIS FIMBRIATA
"MAGNUM BONUM."

(Sterling Novelty for 1896).

This beautiful variety will form an excellent companion to the Giant White Primula, "Snowball," we sent out last year. It was raised by Messrs. J. & J. Hayes, Edmonton. We have every confidence in placing it before our Customers, feeling confident that it will become as popular as our Giant White variety. The plants are very sturdy and compact in habit; the flower stem is strong, and rises well above the strong, robust foliage. The blooms are produced in great profusion, of a gigantic size, beautifully fringed, and the colour is a very beautiful shade of a rich deep red.

Per Packet, 5s.

From Mr. VEIT, The Gardens, Avley End:—"I have grown your magnificent Primula, "Giant Snowball," which is of sturdy growth, with fringed foliage throwing flower-stems well above the foliage, and producing abundance of large blooms of great substance, many of the blooms measure 2½ inches in diameter."

PRIMULA SINENSIS FIMBRIATA, "SNOWBALL" (New),
THE NEW GIANT WHITE STRAIN,

Is, without exception, the finest White Primula in cultivation, and we feel confident that it cannot fail to give satisfaction wherever it may be grown. It is more vigorous in growth than the old varieties, the foliage being remarkably strong. The flower-stem is very sturdy, rises well above the foliage, and bears a profusion of massive flowers of a pure white colour of great substance. The individual blooms measure 2½ inches in diameter, and are exquisitely fringed. Per packet, 5s.

ILLUSTRATED SEED CATALOGUE for 1896 is now ready, and will be forwarded, gratis and post-free, on application.

**GOLD MEDAL
CHRYSANTHEMUMS.**

My Novelties for 1895 helped materially to win for me during the past season **THREE GOLD MEDALS**, and the **PRESIDENT'S PRIZE** of the N.C.S. These, together with the varieties raised by Mr. C. E. SHEA, Mr. H. BRISCOE-IRONSIDE, and other raisers, which I shall distribute, will be the finest set ever introduced in one season.

My **SUPPLEMENTARY LIST**, containing a full description of the above, and other Novelties of the Season, is now in the press, and can be had post free on application. Customers will receive a copy of this when it is ready.

My **CHRYSANTHEMUM GUIDE**—The most complete work on culture. Post free, Eight Stamps.

ALSO IN PREPARATION, THE
CHRYSANTHEMUM ALBUM.

By H. J. JONES,
Containing **THIRTY-SIX ILLUSTRATIONS** of NEW CHRYSANTHEMUMS from photographs. Every grower should possess a copy, as this will enable him to select varieties from the actual representation of the flowers. This valuable work will be produced at great cost, and can be obtained of the Author, post free, 2s. 6d. each.

**GENERAL SPECIAL TRADE LIST
SEED POTATOS** on application.

ANTHONY WATERER respectfully invites from intending Planters an inspection of the following well-grown and finely-rooted EVERGREENS:—
ABIES PUNGENS GLAUCA (COLORADO BLUE SPRUCE, ARGENTEA) 3, 4, 5, and 6 feet.
These are all SEEDLINGS. The plants usually met with are grafted on the Common Spruce.
CEDRUS ATLANTICA, 5, 6, 7, 8 to 10 feet.
GLAUCA, 4, 5, 6, 7, and 8 feet.
CEDRUS LIBANI, 5, 6, 7, 8 to 10 feet.
ENGLISH YEW, 4, 5, 6 to 8 feet.
GOLDEN CHINESE JUNIPER, 4, 5, 6, 7, and 8 feet.
GOLDEN YEW, Seedlings, perfect pyramids 4, 5, 6, and 7 ft. Standards, 6, 7, and 8 feet.
PICEA CONCOLOR VIOLACEA } 4, 5, 6, 7, and 8 feet.
" LASIOCARPA }
" MAGNIFICA } 6, 7, and 8 feet.
PINUS AUSTRIACA LARICIO } 3, 4, 5, 6, to 8 feet.
THUOPSIS BOREALIS, 5 to 8 feet.
DOLABRATA, 5 to 10 feet.
HOLLIES, GREEN, Common, up to 10 and 12 feet.
" HODGINS }
" LAURIFOLIA } up to 10 feet.
" MYRTIFOLIA }
" GOLDEN QUEEN } 4 to 10 feet.
" SILVER QUEEN }
" WATERER'S, and many other variegated kinds, 6 to 10 feet.
" PERRY'S WEEPING } with straight stems and GOLDEN WEEPING } fine heads.
YEW, ENGLISH, 4, 5, 6 to 8 feet, and as much in diameter. Knap Hill Nursery, Woking, Surrey.

ROSA RUGOSA.

THE VERY BEST PLANT FOR GAME COVERT,
At 20s., 25s., 30s. per 100.
Cheaper by the 1000.

THE
Gardener's Chronicle.

SATURDAY, DECEMBER 21, 1895.

ENGLISH GARDENING.

MISS AMHERST is well known to all lovers of old gardening literature for her publication in last year's *Archæologia* of the fifteenth century treatise on gardening by "Mayster Ion, Gardener," and the careful way in which that interesting treatise was edited by her, showed that she was well capable of larger efforts in the literature of gardening. The handsome volume now before us bears ample testimony not only to her skill and perseverance, but to her power of massing together a very large amount of petty details into a book that is throughout very pleasant reading.* The foundation of the book was laid by some excellent papers "On the History of Gardening in England down to the reign of Elizabeth," by Mr. Percy Newbery, which appeared in these pages in 1839; and on this foundation Miss Amherst has made a continuous history of English gardening, starting from the thirteenth century and reaching down to our own day. It is almost a pity that she did not tell us more of the earlier periods, even starting from the departure of the Romans, for though the accounts of gardening in the days between the sixth and thirteenth centuries are very meagre, there is yet enough to show that from the very first the English were a nation of gardeners; and there is a good record that in the eighth century, when the Anglo-Saxons were using the Latinised names, of which Miss Amherst gives a list on p. 3, there was a far larger number of true native British names of plants, showing that the Englishmen of that date were sufficiently acquainted with plants to give them distinct names. But English gardening, as indeed must be the case in all nations, is largely interwoven with English history, and this Miss Amherst brings out very well; her first sentence is, "The history of the gardens of England follows step by step the history of the people. In times of peace and plenty they increased and flourished, and during years of war and disturbance, they suffered." And so she shows what difficulties there were in the way of good gardening till the end of the fifteenth century, when, in "the comparative peace which followed the termination of the Wars of the Roses . . . the gardens were no longer of necessity confined within the embattled castle walls . . . and the custom came in of having gardens beyond it. With this additional space, there was more scope for play of fancy, and before long several changes in design came in." From that time to our own the progress of gardening has been uninterrupted, and Miss Amherst takes us through the gardens of the

* *A History of Gardening in England.* By the Hon. Alicia Amherst. London: Quaritch.

different periods; the Elizabethan gardens, which owed much of their beauty to the refugees from the Continent, who "brought with them some of the foreign ideas about gardening, and thus helped to improve the condition of horticulture"; through the stiff gardens of the seventeenth century, which were so largely destroyed (but of which, there are, fortunately, so many good remains) by the so-called natural gardening, or landscape gardening, down to the "bedded-out" gardens of our own day, and their partial destruction leading to the wild gardens and rock-garden, which are now the fashion.

One great value of Miss Amherst's book is, that she has brought together into one volume an immense mass of information of which very little is new, but which was scattered through many different publications. The labour that she has spent in finding out these different sources of information must have been very great, but the result is excellent. She has searched old cartularies, pipe-rolls, surveys, and probably hundreds of books, more or less bearing on her subject; but perhaps the most interesting extracts that she has given us are those from the different accounts of garden expenses at various times, and in different parts of the country, and the bills for fruit and other garden produce supplied to Royal and other great houses and she has shown that, from the first, the gardener was an important personage in all great establishments, and that the body of gardeners of London were of such strength that they could defy even the Lord Mayor of London, and could demand and obtain a charter of incorporation which was far more in accordance with their own demands than with the wishes of the Lord Mayor.

We must pass by with merely a word of notice the chapter on monastic gardening, though it contains much of interest, to say something of the chapter on the literature of English gardening. The literature on any art or science must always be an index to the existing condition of the art or science, and it is so in English gardening literature to a very marked extent. Nothing shows better the state in which gardening was at different times than the books which appeared from the sixteenth century downwards; and, therefore, Miss Amherst has done well to give very full accounts of gardening literature, with a long list of the writers. The value of these chapters is that they are placed side by side with the accounts of the gardens, and so far they have a distinct value; but here, too, there is nothing new, and she does not seem to be aware of the many similar lists given by other writers, as by Pritzel, Miller, &c.; nor does she seem to be aware of Pulteney's *Progress of Botany in England*, 1790, an excellent book, though now almost forgotten, which may be Miss Amherst's excuse for not mentioning it.

We had noted several other points on which we should have liked to have said more, but space forbids. We must, however, find room for a few points on which we do not altogether agree with Miss Amherst; and we note them, not for the purpose of fault-finding, but in the hopes of helping her in preparing for a second edition. She is so laudably particular in giving full references for all her statements, that we should like to know the authority for the statement (p. 23) that "rosary," in some old documents of Ely, is not a Rose garden, but "a bed of Reeds and Rushes." It is so, no doubt, in the French cartularies, being derived from *roseau*; but we should question its being so used in English cartularies. We are sorry that she adopts (p. 137) the exploded fallacy that the Jerusalem Artichoke is so called from the Italian *girasolo*, for which there is no authority whatever, and her own quotation about "Jerusalem Pears" might have shown her the mistake; and we think she is mistaken in saying that 1722 was "probably the last serious attempt at Vine culture." There is full evidence that excellent wine was made in large quantities at Claverton, in

Somersetshire, and tithes on Grapes were taken later than 1722 at Cromhall, where are still very complete remains of the old vineyard. But leaving all these small deficiencies, we gladly conclude with thanks to Miss Amherst for the very pleasant book she has given us, and with congratulations to her for having brought her long labours to such a satisfactory conclusion. A word of praise also is due to the getting up of the book; paper, print, binding, and illustrations are all that

colour of an ordinary good *L. anceps*. The front lobe of the lip is of a glowing crimson, and the side-lobes are veined and striped with a similarly bright hue, but the chief distinguishing feature consists in the sepals being white at the base, the outer half of each and the margins being rose-crimson, the white basal halves having some clearly-defined chocolate lines on them as though drawn with a pen, constituting a very peculiar and distinct feature. *J. O'B.*

CONSTANTINOPLE

ANONA CHERIMOLIA.

ALLOW me to highly recommend this to the notice of your readers as being a fruit-plant, well worth cultivation. I am surprised that the plant does not meet with general approval in England, for the exceedingly choice fruits are obtainable from December to about February—a time when other fruit is necessarily scarce. I myself have only one plant, planted out in a house with other semi-tropical fruit trees, and although the position is not of the best, I obtain every year about a dozen fruits each, the size of a Pear. By the same post I am sending you a fruit and a photograph of the tree as it stands (figs. 121, 122). Next to this plant we have planted out *Anona squamosa*, *A. Cherimolia Loxensis*, which have also fruited this year. *Anona squamosa* is generally well known, but *A. Cherimolia Loxensis* is much more rare, and the fruit, according to Linder, must be superior to that of *Anona Cherimolia*, which it resembles in shape and size, but it has the skin raised all over the surface so as to form little spines. *Joh. Dekkers, Gardener to His Excellency Aristakes Azarian, Buyukdere, Constantinople.*

FIG. 121.—ANONA CHERIMOLIA: FRUIT REAL SIZE, COLOUR GREENISH.

can be desired, and it closes with two good indexes—good, that is, as far as they go, but the book itself is so full, that a much fuller index would be very acceptable in a second edition.

NEW OR NOTEWORTHY PLANTS.

LÆLIA ANCEPS VAR. LINEATA, new var.

IN Lord Rothschild's gardens at Tring Park, Tring (gr. Mr. E. Hill), the houses filled with the now numerous and beautiful varieties of *Lælia anceps*, both white and coloured, annually make a fine show, and are counted among the most useful of winter-flowering Orchids. Among them is a remarkable variety, flowering for the first time. The petals are of the size and rich rose-crimson

THE ROSARY.

STOCKS.

THE operation of budding is so pleasant and striking in its results, that even where exhibiting is not thought of, many amateurs practise it; ladies especially are fond of it, and their deft and delicate handling makes them very successful operators. Of course, no amateur can contend with the professional budder, who rattles them off in less than no time, and whose quickness seems to many almost incredible. These amateurs, then, will have to determine what stocks they will use, and how they will use them.

The question of stocks is one which has always exercised the minds of rosarians, and while one is advocating one kind, and another a different sort, I fear that judgment will have been formed in many cases without due consideration for the character of the soil for which they are required, or for the varieties of Roses to be budded on them. Various kinds have been from time to time recommended, but for all practical purposes account may be taken of only four. De la Grifferaie, Napoleon, Celine, and other kinds, have been from time to time recommended, and our late Japanese Polyantha has been highly spoken of for Tea Roses, but I think that few amateurs will try experiments, and therefore I shall confine myself to the four kinds most generally used.

The Briar.—The Dog Briar, or wild Rose, of our hedge-rows and woodlands; the Saedling Briar, the Briar cutting, and lastly, the Manetti. The Dog Briar is used almost exclusively for standards and half-standards. The introduction of dwarf Roses has considerably altered the practice in this particular; standards are very much gone out of fashion, and the Rose amateur uses them only for his Teas and Noisettes—he is still firmly persuaded that in no other way can he get such exhibition blooms as from half standards, and therefore the "Briar man," of whom Dean Hole so humorously writes, is still in requisition. All Briar stocks should be planted about this time; of course, as they are received there is very little

fibrous root, and beginners might wonder where the roots were to come from—but so little stress is laid upon these that I know one friend, at any rate, who pares off all the fibrous roots which are on the stock when he receives it, for he does not believe that the roots which are on the stock when he gets it are of any value. It is somewhat curious that, notwithstanding these stocks are obtained from our own hedge-rows, they easily succumb to hard frost, and during the earlier part of this year I know that 70 per cent. in some cases were killed; and I recollect seeing some years ago a splendid piece in the neighbourhood of Paris, of some 30,000 which had been budded the year before, and were grand plants of all the best kinds, but every one of them perished. For these reasons I think all beginners, and all new exhibitors, ought to avoid a standard Rose. It is

with care the hips of those varieties which he knows to be most useful. The process for preparing the seed for sowing &c. is somewhat tiresome, and few amateurs would care to go in for such large quantities; and seedling plants which will be fit for budding can now be obtained at any of our nurseries, and should be planted in rows, the plants being about 6 inches apart and so placed that the portion for budding should be covered during the winter, which covering may easily be removed when the time for that operation comes on.

Briar cuttings has been of late years much in use; it has its advantages over seedling Briar—it is, indeed, suited for a different kind of soil. The seedling Briar sends down its roots, and is suitable for stiff soils—indeed, Mr. Prince says for all soils; but the Briar cutting spreads out its roots, and is therefore more

Botanic Gardens of Mouza. That it has been a great boon to nurserymen and to all growers of the hybrid perpetual class there cannot be the slightest doubt it is too vigorous for Teas, and there has been much heartburning in consequence of the attempt to bud them on it—in fact, it is too vigorous for many of them and the stock overpowers the scions. It has another disadvantage, too; if all the eyes are not carefully cut out below the bud, they are apt to start into growth, and many and many a time have I been asked to account for a Rose not blooming, when on looking at it I have found that the Manetti had completely overpowered the bud, and the foliage being somewhat like that of the Rose, the grower had allowed it to develop itself, leaving him with a fine bush of the stock instead of a Charles Lefebvre or Marie Baumann, which he looked for. Manetti plants may be now easily procured from a nurseryman, but it is very easily propagated from cuttings. These should be prepared as follows: the cuttings should be about a foot long, and should be cleanly cut just below a bud, in a straight line; all the eyes should be carefully cut out except a couple at the top, the cutting should be cut in a slanting direction just above a bud. Mr. Rivers gives the following directions as to planting them, and I do not think that the directions of that Rose-wise Neator can be improved upon: "In planting, the sections of a ridge has to be formed, the cutting placed against it, and the earth dug up to it and firmly pressed; when finished the row of cuttings should stand in the centre of a ridge about 8 inches high, and only one bud of the cutting above the surface. From being thus mounded up, no exhaustion takes place during the dry frosts of winter and spring, and every cutting will grow; in July or August of the following season they will be fit to bud. The ridge must be levelled so as to expose the main stem of the cutting; and, in this, at about 3 or 4 inches from the bottom, the bud must be inserted. The stocks should be budded as soon as possible after being uncovered, or the bark will become rigid and will not open freely." As I have already said, care should be taken about shoots coming from the stock, for however carefully the eyes have been cut out, some will probably have escaped notice. Let me also say that care should be taken as to the varieties which are used: for all weak-growing hybrid perpetuals the Manetti should be avoided, for though, as a rule, it is well adapted for that class, it is idle to attempt to grow some of them on it, such kinds as Horace Vernet and Louis Van Houtte, which are short-lived on all stocks, very soon succumb to the vigour of the Manetti; and experience will perhaps teach the grower that there are some other sorts which in his soil and situation will not succeed on it. In fact, this experience is a subject which greatly enters into the secret of successful Rose-growing, and it is perhaps only after some failures that wished-for results can be obtained. *Wild Rose.*

FIG. 122.—ANONA CHERIMOLIA, IN FRUIT AT CONSTANTINOPLE. (SEE P. 734.)

not a thing of beauty in itself, and for years past I have not grown one. It is true I am not an exhibitor, but I fancy that I have from dwarfs had as good blooms as could well be desired. I may say that where standards are used it must never be when the soil is light, as they are apt to throw out suckers a long way from the plant, and so cause a good deal of trouble.

The Seedling Briar.—Some years ago Mr. Prince, of Oxford, brought forward the seedling Briar, which had been previously used a good deal in France, especially for grafting in pots, but he used it out of doors for Tea Roses, and it has unquestionably become to be the recognised stock for that beautiful class. It is not too vigorous in growth, so that it does not overpower the scion; it is not so early as the Manetti, and so consequently better escapes frosts. It is a somewhat difficult stock to bud as the stems are so small, but it is pretty sure to take if properly managed. Mr. Prince is of opinion, I think, that all Dog Roses are not equally valuable, and so collects

suited for light soils. Both of these stocks do, I believe, equally well for the Teas and Noisettes, and no one I think now-a-days thinks of using the Manetti for that purpose.

The Manetti.—I now come to consider the Manetti, the introduction of which, by the late Mr. Rivers, of Sawbridgeworth, has so largely contributed to the increase of Rose culture in this country. Some few years ago there was a great outcry against it, all kinds of evil practices were ascribed to it, and its days were said to be numbered. This was in itself ridiculous, for it must ever be borne in mind that the amateur champions of former days, such as Mr. Baker of Exeter and Mr. Jowett of Hereford, grew all upon the Manetti, whilst some of the finest blooms of the present day are exhibited from the same stock. Mr. Rivers received this stock some fifty years ago from Signor Crivelli, of Como, who recommended this as the best stock for all Roses (in this he was mistaken). It was stated by him to have been raised from seed by Signor Manetti, of the

THE PLANTS OF THE BIBLE.*

WE are frequently asked to recommend some book on the plants of the Bible, and if the questioner is not a professed botanist, we have some difficulty in giving a satisfactory reply. Some are too costly, some are too superficial, most are written by authors whose botanical education has been neglected. Neither of these charges can be brought about the present little volume. It may be had for a shilling. The information it contains is trustworthy, the author is an accomplished botanist, and familiar with the Mediterranean flora. Professor Henslow has solved our difficulties, and we shall confidently recommend his little book to those seeking information. The interest of the subject never flags, and owing to the configuration of the country, the flora of the Holy Land, as of Egypt, is pretty much what it was in those far-off times with which the earlier as well as the later chapters of the Bible are concerned. Looking at the matter from a purely botanical point of view, we may point out the difficulty, nay, in some cases,

* *The Plants of the Bible*, by the Rev. George Henslow, M.A. (The Religious Tract Society.)

the impossibility of assigning to any particular word a specific interpretation. The names are often used in a broad generic sense, and although we are told that Solomon "spake of trees from the Cedar tree that is in Lebanon, even unto the hyssop that springeth out of the wall," we are not told that he wrote of them, still less, that he formed a herbarium by means of which we moderns could determine what the trees were of which he spake. In the verse quoted, there is of course no doubt as to what Cedar that is intended. It is in Lebanon still; but what was the hyssop? and what was "the thistle that was in Lebanon and sent to the Cedar that was in Lebanon"? The words in the last citation are doubtless used in a metaphorical sense; but with reference to Hyssop, some eighteen aromatic Labiates and one Casper have been mentioned, as in the opinion of divers commentators representing what is translated Hyssop!

In the present little treatise, we have first an introduction, and then, in succession, chapters on textile materials, herbs used for culinary or medicinal purposes, fragrant gums and perfumes, fruit trees, timber trees, desert trees, and aquatic plants.

To show how mistakes may arise, and be perpetuated, we may mention how Gerarde, following De L'Obe^l, figures pitchers of the North American *Sarracenia* as the leaves of the Frankincense tree! The mistake is the more interesting, as this is the first notice of the *Sarracenia* that exists. The whole story was given in our column, Jan. 7, 1893, p. 11, and form, we venture to say, one of the most curious instances of "jumping at conclusions" that could be cited. The origin of the *Sarracenia* pitchers was forgotten, their nature undetected, and so, by mischance, they got taken for the leaves of the Frankincense tree. It is needless to say, Professor Henslow falls into no such blunder, but similar errors in the determination of other Biblical plants might probably be cited. Guido depicts the crown of thorns as composed of the stout spines of the *Gleditschia*—like the *Sarracenia*, an American plant. Others more reasonably, suggest the *Palurus*, which is common in Palestine, or the dwarf *Poterium spinosum*.

The "Willow" by the rivers of Babylon was presumably not, as Professor Henslow supposed, a Willow, but what we now know as *Populus euphratica*. *Salix babylonica* is of Chinese or Japanese origin, and if the Weeping Willow exists now in the valley of the Euphrates, it has probably been introduced. Boissier does not mention it as a native of Mesopotamia, but says that probably some other species has been mistaken for it. But the subjects for comment suggested by Mr. Henslow's book are far too numerous for us to dilate upon. We have indicated the general nature of its contents, and we cordially recommend all those interested in the subject—as who is not?—to make themselves the possessors of this suggestive little book.

CHRISTMAS ROSES.

In the hardy plant garden at this season of the year, we have no flowering plant of such beauty and worth as the Christmas Rose, producing regularly, as it does at this dull season of the year, fine masses of flowers, of perfectly hardy and enduring character. To the gardener and cultivator generally the plant need present no great difficulty, if only a few essentials receive attention. When very near to large manufacturing centres, they frequently suffer from the effects of smoke, and the plants lose much of their foliage. Where this is the case, the flowers are sure not to be satisfactory; but when grown in pure country air, the plants attain a vigour and luxuriance which is a pleasure to behold. In many parts of Gloucestershire they are usually excellent, and equally so in many parts of Cheshire. In one instance, in the first-named county, in an ordinary market garden, I have seen an acre or more of them in fine clumps; and around Bath one may see many good clumps in the cottage gardens. In private gardens, where they

can be given special treatment, very few plants indeed more fully repay it, or more quickly.

The soil should be of good depth, and fairly rich. In Middlesex, on a light soil, which in summer frequently becomes dust-dry several inches deep, the plants suffer a good deal, and in these instances shade is of considerable service. Where possible, 2 feet, or even 3 feet, deep of good soil should be given them, as the deeper the rooting medium, the less will the plants suffer from excessive drought. It is surprising the depth to which their roots descend when opportunity is given them, and the benefit they thus obtain is equally marked. Hellebores, and those of the niger section in particular, are impatient of frequent removal, and care should be taken to treat them well when transplanting is rendered necessary.

The best time in the year for dividing and replanting them is in early autumn. Of course, to split up large plants at this time incurs a sacrifice of flowers, and for this reason only a limited number should be broken up at one time. If carefully done, however, one large specimen may readily be broken into a dozen and often a score of pieces. Those who do not care to break up plants in the autumn will find the next best time to be when flowering is complete. It is a common practice at this season of the year to lift good flowering roots and pot them for decoration in the greenhouse and conservatory. All such plants, when flowering is past, should be broken into smaller pieces, and replanted, and on no account let them be planted back in the old clump, as when this is done they invariably decline in vigour. Beside planting them in a variety of positions, it is a good plan, if cut flowers are largely in demand, to plant some in specially-prepared beds, and in such a way that the blooms may be protected at flowering time. If lights are placed over them, blossoms of greater purity result, and sometimes increased length of stem also. A very fine effect may be produced by growing Christmas Roses in large pots, or even tubs, plunging them their full depth in the open ground during summer, and supplying them plentifully with water and liquid-manure throughout the growing season. In this way their handsome foliage would be for the most part retained, and it would add greatly to the general effect. J.

THE FLORA OF BOURBON.*

Dr. CORDEMOY's new book on the flora of this beautiful island fills a gap in botanical literature, and is one of the most interesting contributions to systematic and geographical botany of recent years. Baker's *Flora of Mauritius and Seychelles* appeared nearly twenty years ago, and the botany of Madagascar is now fairly well known, although there is no consolidated descriptive account of the 5000, or thereabouts, species of plants, published and unpublished, known to inhabit that country.

Commerson botanised Bourbon about the middle of the last century, and made very extensive collections, supplemented by copious notes and drawings; but he died before he had completed his work for publication, and his plants have, to a great extent, like the fruits of many other French expeditions, lain undisturbed in the rich national herbarium at Paris. Aubert du Petit-Thouars went to Bourbon in 1795, and remained there three years. After his return to Paris, he published several important works on the botany of this and the neighbouring islands, including Madagascar, notably his *Histoire Particulière des Plantes Orchidées recueillies sur les trois Iles Australes de l'Afrique: de France, de Bourbon, et de Madagascar*.

Gandichaud, another French botanist of eminence, visited the island in 1818, but his collections were lost in the wreck of the *Uranie*, near the Falkland Islands. He returned to the island in 1837, in the *Bonite*, and subsequently wrote the botany of the voyage. This is incomplete, yet it is one of the most interesting of the earlier contributions to insular floras.

* *Flora de l'Isle de la Réunion* [Bourbon], par E. Jacob de Cordemoy, Paris, 1895.

Several other botanists have visited the island, and many of the peculiar plants have been described and figured in various publications. For the first time an attempt has been made to give the world as complete an enumeration of the plants as the author could, under the circumstances in which he is placed. Unfortunately, Dr. Cordemoy had to work as best he could, on the spot, or not at all; consequently the very extensive old collections in the herbaria of Europe could not be utilised, or only to a small extent by friends at home comparing odd specimens for him. He therefore does not pretend to completeness; and as the greater part of the original forests have disappeared in Bourbon, just as they have done in Mauritius, it is probable that many species that formerly inhabited the island, no longer exist. Nevertheless, a comparatively rich flora is described in the book under notice.

Bourbon is about the same size as Mauritius, from which it is now separated by about 100 miles of sea, though it seems probable that they were joined at some remote period. The mountains rise to an altitude of more than 9000 feet, or nearly three times the height of the highest summits in Mauritius, and the island presents a great variety of climatal conditions. Rain is abundant during the summer months—November to April, and the mean temperature at St. Denis, on the coast, during this season is about 26°·5 (80° Fahr.), sometimes rising to 32° (90° Fahr.). In winter the mean is 20°·5 (69° Fahr.), and at St. Benoit 12° (54° Fahr.). On the Plaine des Palmistes, at an altitude of 3000 to 3500 feet, the thermometer drops in mid-winter to about the freezing point, and very rarely 6° Cent. (22° Fahr.) below. At 7000 to 7500 feet ice is sometimes found as late as November.

Formerly nearly the whole island was covered with forest from the seashore up to an altitude of about 6500 feet. But for half a century all the available land in the lower region has been cleared for cultivation, and the native vegetation is replaced, where not actually under cultivation, by foreign weeds. At the present day the forest region commences at 600 to 2500 feet.

Most of the prominent and useful forest trees are common to the Mauritius, as are all of the Palms. But what is more remarkable, few of them are found elsewhere, though many of the genera of the region extend to Madagascar. In fact, there are very few genera peculiar to either Bourbon or Mauritius, but several restricted to the two, indicating that these islands are separated remnants of a formerly more extensive area of land. On the other hand, peculiar species are very numerous in both islands. Dr. Cordemoy and his collaborators, for he has not worked out all the orders himself, describe upwards of 200 species of flowering plants as new, in a total of less than 1000. More than seventy of these new species are Orchids, and the author expresses his conviction that many terrestrial species yet remain undiscovered, as they are, many of them, very small and inconspicuous, and their period of vegetation is of very short duration. Indeed, as it is, the number of species of Orchids enumerated is 172, or more than double the number of any other order of flowering plants! The island is also exceedingly rich in Ferns and Lycopods, which number together about 220 species. It is true that the author takes a narrower view of species than he probably would do if he were dealing with the Ferns of the whole world; but even after deducting 20 per cent. on this account, there remain nearly a third more than there are in the Fern-flora of New Zealand. Not only are the species numerous, but between thirty and forty genera are represented. Tree and Filmy Ferns are present, though they do not abound to the extent they do in the far-away southern country.

Returning to the Orchids, we find that epiphytal and terrestrial species are both abundant, though the latter preponderate numerically as to species; yet, as they are less conspicuous individually, and many of them are exceedingly small and rare, they are less evident than the former. Among epiphytes the genus *Angraecum* stands first, numbering about thirty species, including

the showy *A. superbum*, *A. eburneum*, *A. gladiifolium*, *A. fragrans*, and *A. palmiforme*. To these Dr. Cordemoy adds the following Orchids as noteworthy for their ornamental character: *Æonia macrostachya*, *Æ. erostria*, *Æ. brachystachya*, *Phejus longibracteatus*, *Calanthe sylvatica*, *Corymbis corymbosa*, *Cryptopus elatus*, *Eulophia scripta*, *Habenaria præalta*, *H. ventricosa*, *Satyrium anæonum*, *Amphorchis discolor*, *Saccolabium squamatum*, and *S. striatum*. Cordemoy also mentions *Amphorchis discolor* and *Arnottia mauritiana* as remarkable for their highly curious dimorphic flowers, "like the flowers of distinct genera on the same spike;" but he gives no description of them.

The intermediate and upper zones of vegetation comprise species of *Phillipia*, dwarf shrubby *Ericaceæ*, *Hypericum*, *Phyllica* (very numerous in South Africa), *Psidium*, and shrubby species of *Senecio*, prominent among which is the endemic *S. Ambavilla*. *Favajasia* and *Eriothrix* are other characteristic

over, and a "perfect terror to evil-doers," be they beasts or human beings. The fruit which we show (fig. 123), was sent us by Commendatore Hanbury, from his rich garden at La Mortola on the Riviera. Its general appearance is shown in the figure the colour and surface resemble those of an Apricot. The juice is intensely acid, but if the fruit is allowed to become a little over-ripe, the flavour loses much of its acidity, and develops an aroma which is delicious. Few people like to eat the fruit raw, but the jam, writes Professor Macowan, is first-rate. A proportion of Kei-Apple with Tomato would, he says, make a good jam.

Cocos australis (?)—We are sorry to be obliged to put a query to this name, as we have received fruits from three different sources, each with different names. The first to send it was our venerated correspondent, M. Charles Naudin, of Antibes. Then Mr. Hanbury kindly furnished us with some; and lastly, Prof. Petzig, of Genoa, obligingly supplied us with speci-

to be in a position to state which is the correct name. In the meantime, the plant may be recommended for planting in our sub-tropical colonies and under glass in this country. The fruit would be very acceptable on the table of the connoisseur. We append Professor Petzig's note on this Palm:—"I read in a recent number of the *Gardens' Chronicle* a short communication made by you upon the ripe fruit of *Cocos australis*, sent from Antibes and La Mortola. I think it is not the true *Cocos australis*, but that it is *Cocos leicopatha*, Barb. Rodrig., a very hardy Palm, which grows in the open air perfectly in Genoa, and throughout the whole Riviera, and which resisted a cold of 2° Celsius, without any harm in spite of a very strong northern wind. I think it is one of our most hardy Palms. We have in our Botanic Gardens, and in the public gardens of Genoa, numerous specimens of this fine *Cocos*, and we have had flowers and ripe fruit of it these five years."

Lastly, we may mention the *Cherimolia* (*Annona Cherimolia*), one of the so-called Custard-apples, specimens of which have been sent to us from Constantinople, see fig. 121. We may refer for details of cultivation to the letter of our correspondent at p. 734. The plant occurs from Ecuador to Peru, according to Von Mueller, is hardy in the mildest coast-regions of Spain, and also in Chile, whilst in Jamaica it is cultivated up to 5,000 feet.

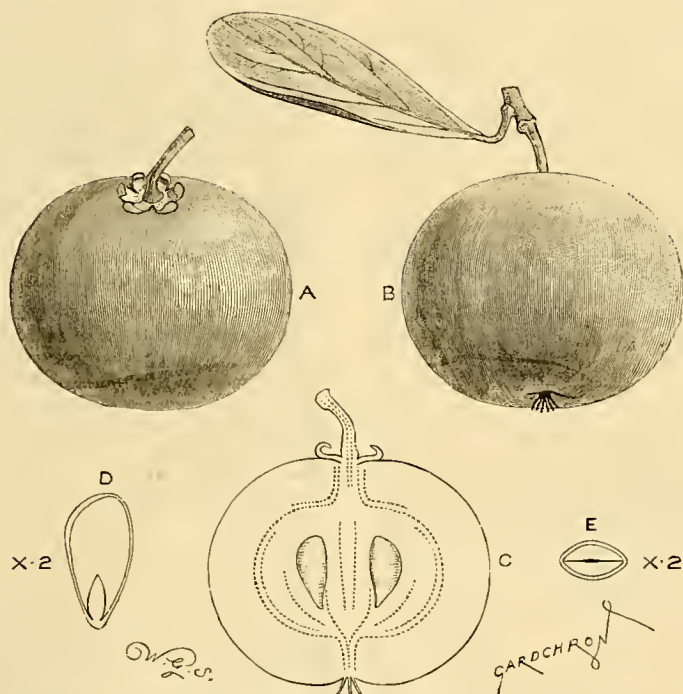

FIG. 123.—*ABERIA CAFFRA*.

A, B, fruit of the natural size; C, section; D, vertical, and E, transverse section of seed, magnified.

shrubby *Compositæ*. Plants of an alpine character are entirely wanting. *Cardamine africana* is the only native Crucifer, and *Stellaria villosa*, the only member of the *Caryophyllacæ*. There are, however, two endemic species of *Ranunculus*, high up on the mountains. *Agauria salicifolia* is an ericaceous shrub or small tree common to Bourbon, Mauritius, Madagascar, and the mountains of Tropical Africa. Altogether it is an exceedingly interesting flora. *W. Botting Hemsley.*

NEW FRUIT AT CHRISTMAS.

Nor Oranges, nor Apples, nor Grapes, form the object of our present note, but a few less widely-known fruits, which have come under our notice lately, and which would be well worth the trouble of growing here under glass. The first we shall mention is the Kei-Apple. This being a popular name, it will occasion no surprise to hear that it is essentially, if not superficially, as unlike an Apple as any two fruits could be. It is, in fact, the berry-like fruit of *Aberia caffra*, a Bixaceous plant, native of Natal and Caffraria, and which is recommended by Professor Macowan as a good hedge plant. It is a sturdy, stocky, short-jointed grower, an evergreen, and with thorns which grow to 6 inches long and

mens, telling us at the same time that the Palm had fruited annually for some years past. *Cocos australis*, if that be really its name, extends, says Baron Von Mueller, from Brazil to Uruguay and the La Plata States. It is one of the hardiest of all Palms, hardier even than the Date Palm, withstanding unprotected a cold at which Oranges and Lemons are injured or destroyed. It remained perfectly uninjured at Antibes at a temperature of 15° (Naudin).

Cocos australis is a pinnate-leaved species, with elegantly recurved leaves, as may be seen from the figure in Count Kerchove's useful work, *Les Palmiers*, and with strong spines on the leaf-stalks, as are manifest in some specimens before us. The fruits are, as will be seen from our illustration (fig. 124, p. 739), of the size of Hazel-nuts, globular, golden-yellow, with a pulp of a delicious flavour, comparable to that of a fine Pine-apple, and suitable for preserves, or even for making wine. In the centre is a spherical hard stone, which, when cut across, reveals three cavities, each with a single seed. Now, in *Cocos* usually two of the three carpels are suppressed, and one only goes on to maturity.

Other names we have heard applied to this Palm are *C. campestris*, *C. ericopatha* of Drude, and *C. leicopatha* of Berlona. We hope shortly

THE CULTIVATION OF LIQUORICE-ROOT IN THE UNITED STATES.

In consequence of the increasing use of Licorice in America in the preparation of chewing-tobacco, the prospect of the cultivation of the plant in America has occupied the attention of landowners in that country for some time past. Under the title of "The Cultivation of Licorice-root in the United States," Mr. Henry N. Rittenhouse contributed a valuable article on the subject to a recent number of the *American Journal of Pharmacy*. So much valuable information is contained in this paper, that we offer no apology for giving the gist of it for the benefit of our readers. The author points out that Licorice-root (*Glycyrrhiza glabra*) is cultivated, in the true sense of that word, in so few places in the world, and to so small an extent as an article of commerce, as to be hardly worth mentioning, one or two places in England, and a like number in France and Germany, embrace all the localities where actual cultivation is carried on, and the area of land under cultivation varies from a few rods to an acre or two, 5 acres being an exceptionally large field.

The large amount of Licorice imported into America—indeed, the needs of the world in this article are mostly supplied by plants which grow wild without any cultivation whatever. Italy and Spain supply a small percentage of the total amount, probably 5 to 8 per cent.; while Southern Russia, along the line of the Trans-Caucasian Railway, supplies two-thirds of the remainder, and Asia Minor and Syria the other third. The average total amount per annum of all kinds imported into the United States is about 80,000,000 pounds, and the consumption is still increasing.

The Licorice plant grows over an area extending from the shores of the Mediterranean on the south, to Siberia on the north, and from the western shores of Europe, to the plains of Persia and farther India, and from low levels to 1,500 feet above the sea, showing the wide area of land, and the variety of soil and climate over which the plant will grow vigorously. It is hardy, and so tenacious of life, that it is almost impossible to eradicate when once it has established itself.

As found in commerce, Licorice-root is dried and pressed in bales. When freshly dug, it contains on an average 50 to 60 per cent. of moisture. This must first be dried out, which is done by exposure to the air, much as hay is made, requiring frequent turnings and handling to prevent as much as possible, heating, fermenting, and darkening during the drying as well as the wetting by rain or snow, which

may be frequent before the root is dry enough to press for shipment. When nearly dry, and danger from damage from the presence of moisture is passed, it is piled up in large stacks until ready to be pressed. Around these stacks are dug ditches for draining the ground, and after a heavy shower or prolonged period of rain or snow, these ditches will fill with a black water having a very strong taste, and containing a high percentage of the extractive matter of the root; this, of course, detracts from its name, and is itself waste. When sufficiently dry it is pressed in powerful hydraulic presses worked by steam, so as to reduce the bulk to a minimum and to save freight. The bales are bound with iron straps, and sometimes covered with canvas.

Some of the roots as imported are so thick that they indicate a probable growth of, perhaps, twenty years. These very thick pieces are, however, usually rejected as being worthless for making extract, three or four years being the age at which roots are dug up in the plantations about Pontefract, where the best Liquorice-root is grown; after this age it becomes too woody and fibrous to be of much value in making extract.

Of course, a very small proportion of the Liquorice-root of commerce is grown in this country, and in consequence of the expenses attending the digging, drying, curing, pressing, baling, freight, insurance, and other items connected with the produce of Asia Minor and Russia, attention has been directed to the possibility of growing the plant in the United States for the purpose of supplying its own demand. The consumption of the extract in America is now so large and important, especially in the manufacture of chewing tobacco, that it is stated that in case of a European war, a blockade of the Black Sea at the Dardanelles, or the Mediterranean at Gibraltar, the world's supply would be effectually blocked, and the large American industry of tobacco-manufacturing thrown into confusion, as Liquorice has become a more or less important ingredient in most brands of chewing tobacco, and the present generation of chewers has become accustomed to its use. New brands omitting this ingredient might be unseizable.

Considering the great variety of soil and climate in the United States, as well as the cheapness of land and labour, together with the large tracts of land available which are comparatively easy of access for the transportation of the produce, it is estimated that the cultivation of Liquorice would form a profitable industry in America, and would, in time, pay better than either Sugar-cane, Sugar-Beets, Rice, or Cotton, although the industry would not be so large or important as any of these.

Liquorice extract can be made as well or better from fresh root than from the dry, and is so made in the countries that furnish the root, but the duty on it of 5 cents per pound largely restricts its importation, while the root is free.

It is suggested that by introducing the cultivation of Liquorice into America, the extract may be made on similar lines as those now adopted in the manufacture of sugar from cane and Beets, that is, to have large tracts of land devoted exclusively to the growth of the plant, with the factory for making the extract from the fresh root in or near the fields. The present sugar-factory, too, could easily be adapted to the manufacture of the Liquorice extract, the apparatus required being simply suitable crushers or shredding machinery, the diffusion battery and vacuum pans for evaporating. Sugar factories, too, could be utilised when not running on sugar, as the proper time for digging the root is from October to April, and if the root is not needed one year it can be left in the ground until the next, not only without deterioration, but to its increased value and weight. It is not well, however, to allow the root to exceed five years in growth; three or four-year root is the richest in extractive matter. Frost or drought do not injure the root when once well established, though young and tender plants are liable to injury.

After selecting a suitable tract of land, the following is given as the best means of cultivation: "It need only be ploughed once to turn down the

grass and weeds, harrowed, then laid out in furrows about 25 to 30 inches apart, and the beds or cuttings set in the rows 6 or 8 inches apart, and covered by a plough throwing a furrow over the beds from each side, or even cover them 3 or 4 inches with a hoe. This is all. From time to time during the growing season a cultivator should be run between the rows to keep down weeds or grass. The tops at the end of the growing season should be cut off; this could be done with a mowing machine. The second and third year the treatment would be the same. In the fall of the third year the crop would be ready to harvest. The cost of the harvesting would be the most expensive part of the business." As the roots penetrate to a great depth, a good deal of labour is required in digging them up, but it is suggested that this hand-work may be supplanted by some mechanical means of extracting them from the ground.

Mr. Rittenhouse points out that the idea of growing Liquorice in America is not a new one, and that in 1886 several acres were very successfully grown near Sacramento, California, but that its growth was not persevered in. He further says:—"My own experience in growing the plant in the United States has thus far been very moderate in results, owing to causes that might have been prevented, viz., inundations, unsuitable beds for planting, and possibly a want of care or interest or experience on the part of those in charge, to say nothing of the effect of unusually hot and dry weather on the young plants before they had become acclimatised. I have grown the plants in several places in New Jersey, Pennsylvania, Louisiana, and Florida, and still have some growing in the different localities, and believe it to be quite a feasible matter to introduce the industry on a large scale.

In connection with the cultivation of the Liquorice-plant, and the manufacture of Liquorice confectionery at Pontefract, the *Chemist and Druggist* states that at a recent confectioners' dinner at the Holborn Restaurant, a town-councillor of Pontefract, as representing the Liquorice manufacture, stated that the trade had considerably developed during the past few years, and had it not been for this trade Pontefract would have been much less known, and in a much less flourishing condition. Thousands of tons are manufactured annually, and distributed at home and abroad. A large number of work-people are employed, and the money thus circulated contributes materially to the prosperity of the town. A distinct feature to which the trade owes its origin is the great depth of soil in the district, which makes it possible to grow Liquorice, this being the case in only one other part of the country, namely, Essex.

MATTHEW ARNOLD AS A LOVER OF FLOWERS.

Much that is interesting has been written of late regarding the genius and characteristics of this great poet, essayist, and critic, in connection with the recent publication of his letters, which, however, do not give much insight into his life; but I have not discovered in any of these reviews a single reference to what I always deemed—especially after visiting him at his beautiful Surrey residence—his predominating passion, the love of gardening. There can be no question, that Matthew Arnold was intensely fond of flowers. In one of the most valued of his many letters to myself, he says of that exquisite vernal flower, which, rising as if from the grave of winter, seems ever to anticipate—so early is its advent—the coming of spring: "I do not know that I have ever mentioned the Snowdrop in my verses, but I have been planting it round my shrubberies, and I admire it greatly." He had, however, in his classical poem entitled "Tristram and Isolt," sung of his heroine as a "Snowdrop by the sea." I did not fail, subsequently, to remind him of this.

In another of his letters, he says of one of the sweetest and most unobtrusive of flowers, with special reference to a poem I had written upon the subject, "Your poem on the Wood Sorrel shows

very considerable command of thought and expression; but I could wish that you had said more regarding its special self, as I am particularly fond of the flower."

Many incidental allusions to flowers indigenous to Greece are discoverable in his *Merope*, a work which, written after the manner of *Euripides*, has been highly eulogised by Algernon C. Swinburne, a poet of whom Arnold has expressively said, with reference to the terribly diffuse style of his contemporary, "Mr. Swinburne writes a hundred words where one would suffice." The floral passages in this poem are chiefly found in the choruses, many of which are highly suggestive of the scenery of Greece. But Arnold's finest flower-inspirations occur in another and more-impressive poem, his deeply thoughtful and memorable "Thyrsis," written to the memory of a beloved college friend, Arthur H. Clough. Therein, addressing the too-early vanishing cuckoo, he sings:—

Too quick despairer, wherefore wilt thou go?
Soon will the high midsummer pomps come on;
Soon will the Musk Carnations break and swell;
Soon shall we have gold-dusted Snapdragon,
Sweet William with his homely cottage smell,
And Stocks in fragrant blow;
Roses that down the alleys shine afar,
And open, Jasmine-muffled lattices,
And groups under the dreaming garden trees,
And the full moon, and the white evening star."

Matthew Arnold was, of course, an admirer of such splendid flowers as the Carnation, the Begonia, the Lily, and the Rose; but I have an idea that, like his great Teacher, the "High Priest of Nature," he loved much more than these, the humbler beauties of the woods and fields. In "Thyrsis" and the "Scholar Gipsy," which may be regarded as his most characteristic lyrical achievements, the flowers which cling so fondly to his memory, as the alpine *Linaria* adheres to the wall, are the purple *Fritillaries* of the Oxfordshire meadows; the *Orchises*, the *Daffodils*, the poet's *Narcissus*; the *Primroses* gleaming by the hidden brookside; and above all

"Dark Blue-bells drenched with dew of summer eve."

The fair flowerets that gladden the vast solitudes of Nature, those that "die unseen, and waste their sweetness in the desert air," were dearest to his heart. Not of ambition were his songs begotten, whose happiest theme was love. He was himself a child of Nature, and he loved her meekest children best. And hence he could say with his predecessor, William Wordsworth, to whom he was nearest of all his great contemporaries in nature and in life:—

"Thanks to that human heart by which we live,
Thanks to its tenderness, its joys, its fears;
To me the meanest flower that blows can give,
Thoughts that do often lie too deep for tears."

—David R. Williamson.

WINTER CUCUMBERS.

In order to maintain a regular supply of Cucumbers during the interval from the end of November to the end of March, it is necessary that the cultivator should be provided with suitable accommodation in the way of a low-roofed light and air-tight house, supplied with top and bottom-heat, so that a minimum temperature of 60° to 70° can be maintained in all kinds of weather. To do this in very severe weather, it will be necessary and advisable to cover the glass at night with mats; indeed, this practice, on the score of economy, as well as a means of securing a more genial atmospheric temperature in the house, is to be commended during the winter months.

The plants should receive careful attention in the matter of watering, as well as moist air, this last being regulated in accordance with the condition of the weather and the plants, but a humid rather than an arid atmosphere should be maintained. Hence, during mild weather, and consequently slightly heated hot-water pipes, there will be no occasion for syringing the plants, as doing so under the circumstances described, would undoubtedly favour

the growth of mildew. On the other hand, should the nature of the weather be such as to necessitate severe firing to maintain the minimum temperature given above, a slight distribution of moisture in the house in the morning and afternoon, will be necessary to counteract the somewhat parching influence of the highly-heated pipes, and to avoid infesting the plants with red-spider.

When water at the roots is needed, it should have a temperature of about 80°, and afforded in accordance with the requirements of each plant, bearing in mind that too much at one time cannot well make up for a deficiency at another, hence the necessity of knowing when to apply and when to withhold water at the roots, a knowledge only acquired by experience. If the Cucumber-houses are heated by their own boiler, the fires should be banked up by 8.30 or 9 o'clock on bright mornings, by which time sun will have rendered much artificial heat unnecessary. This should be done on bright mornings, even though the thermometer does not register the minimum degree of heat referred to above, for the obvious reason that if the fires had been pushed on till a mid-day temperature be attained, the sun, meanwhile, as well as the fire-heat, would have increased in force, thereby rendering almost immediate ventilation necessary, thus letting out the very thing (heat) upon which labour and fuel have been wasted in getting up in the house, and admitting cold.

The fires should be re-started in the afternoon, as soon as the sun goes off the house, so that by the time the sun-heat has fallen to 65°, the heat from the hot-water pipes will suffice to maintain the proper degree of warmth during the night. In the event of severe frost, a night temperature of 60° will be ample for the time being, but 65° should be the normal degree. To obtain and keep up even this amount of warmth in a house of a moderate size, the supply of hot-water piping must be liberal, and the fuel and stoking good. And with a view to ascertain the degree of heat in the Cucumber-house without letting in a volume of cold air whenever the door is opened for that purpose, the thermometer should be placed in such a position in the house as to enable the degree of heat to be read by the gardener from without, with the assistance of his bull's-eye lantern at night. The above remarks are applicable to all forcing-houses.

Should green or black aphid attack the plants, fumigate with one of Luff's fumigators a couple of evenings in succession when the weather is mild and the plants are damp. This fumigator has a shut-down lid, and two rows of circular holes about half an inch in diameter immediately below it, for the emission of the nicotine fumes. It is supported by three legs sufficiently long to allow of the necessary current of air for slow combustion. Should mildew appear, dust the leaves affected with it with flowers-of-sulphur when damp, and keep a drier atmosphere. The evaporating-troughs on the flow-pipes should be filled with liquid-manure water, unless mildew be present. But should red-spider establish itself on the plants, notwithstanding the application of the antidote, the pipes should be painted with flowers-of-sulphur when the plants and house are dry in the evening, letting the temperature run up to about 83°, so as to fill the house with the sulphurous fume thrown off by the highly-heated pipes, airing the house more freely the two following days, or the plants may be sponged over (both sides of the individual leaves) with soft-soapy water. Crop the plant rather light than heavy, cutting the fruit as soon as they have attained to proper size, and stand them on their ends in saucers containing a little water in a fairly warm room (55° to 60°). Keep all male blossoms picked off the plants, as the necessary complement of fruit for a crop has been secured, and encourage a free though consolidated growth in the plants. Lay a top-dressing of good fibrous loam to the thickness of about 2 inches on the roots once between this date and February, the mould having been placed in the house twenty-four hours before being used, to become slightly warmed. H. W. Ward.

FLORISTS' FLOWERS.

MARGUERITE CARNATIONS.

I READ in the *Gardeners' Chronicle*, at p. 615, "Marguerite Carnations were perfect, and it has never fallen to my lot to see a finer show of bloom in all shades of colour." May I be allowed to remark upon two words used in the above quotation—"perfect," and "all"? Dealing with the last one first, may I venture to ask if yellow and orange colours were represented? So far, I have not observed flowers of these tints, nor, indeed, anything like so many beautiful shades of colour as may be found in a bed of seedlings of our own old-fashioned border Carnations, nor any flaker, bizarrer, or Picotee. I fear the words "all shades of colour" include too much, as does the word "perfect," as applied to Marguerite Carnations. They are yet far from perfect—but this does not detract from such merits as they possess; but these merits are very much obscured when the seed is sown, so as to produce plants in bloom during the months of July or August, as at that season the finest Carnations are in full beauty. In summer the blooms of the Marguerites are extremely fugacious, and the flowers not being very double, pollen is plentiful, and fertilisation takes place as soon as the blooms open,

planted in large 60's, and into 32's about the end of July or early in August. The plants are kept out-of-doors all the time, and are freely syringed and watered. It may be remarked that neither section will produce flowers at the same time, as quite half the number of plants will not show flower-buds, so that the probabilities are this late lot will continue to flower until May and June. When in flower, the plants should be afforded a dry air, and a temperature of about 50° at night, the ventilators being opened daily for several hours. Should aphides appear, fumigate the plants with tobacco. J. Douglas.

[A fairly rich sandy loam suits the Carnation at all seasons; and when making its growth, an occasional pinch of salt strewn on the soil will aid them greatly. Never let the plants get drawn by any of the usual causes, viz., crowding together with other plants, lack of light, or keeping them in the early stages whilst under glass far from the roof of the pit, frame, or greenhouse. Afford good but not excessive drainage; pot firmly, but never use a rammer, and always stand the pots on coal-ashes, or in some other way endeavour to keep worms out of the pots. Ed.]

FORESTRY.

PRICES OF BRITISH-GROWN TIMBER.

THERE can be little doubt from carefully-compiled statistics obtained from almost every part of the country, that the value of home-grown timber has rather decreased than otherwise during the past twenty-five years. This is especially the case with the Scotch and Spruce Fir, and markedly so with the Oak, the latter due in great measure, no doubt, to the substituting of iron for wood in ship and boat-building, and to other minor causes which need not here be noted. Scotch Pine, owing in great part to the amount of wind-fallen trees that has ever since the memorable "Tay-bridge gale" been placed on the market, has, perhaps, more than any other timber, decreased in value, and plenty can now be obtained north of the Tweed at prices varying from 4d. to 6d. per cubic foot. The large acreage of this Pine as well as Spruce in the middle and northern Scottish counties, acts too as a powerful means of keeping the price of the timber at the lowest possible ebb, aided of course by heavy railway or shipping rates, and the amount that has been laid low by our curiously erratic storms of the past few years. Larch being much in demand, and but little grown comparatively speaking, is rather rising than falling off in price, and from 1s. to 1s. 4d. per foot is now frequently obtained for that of fair quality. The Larch disease, too, has acted as a friend of the seller in sending up the price of the timber, but the comparative scarcity and many uses to which it is put, are no doubt the greatest and chief causes why the timber either remains quiescent or rising in value. It is certainly to be regretted that more of the Larch is not planted, especially in Ireland, where the fell disease is [at present] quite unknown, and where thousands of acres of waste land, peculiarly suited for its culture, could be profitably utilised in the growth of the tree. Good Oak timber now fetches readily enough from 1s. 3d. to 2s. per foot, and the demand is brisk; though, in years gone by, when the "wooden walls of old England" were maintained, the price was nearly three times what it is at present for the best trees. The cultivation of Oak, however, pays well enough at present, far better, indeed, than that of most other trees bar the Larch, and it has never, and will not likely become a drug in the market. Sycamore, if large and good finds a ready market at very varying prices, according to locality—from 2s. 6d. down to 1s. 6d. per foot. It is a tree of rapid growth, wonderfully free from disease, and by no means exacting as to the quality of soil in which it is planted. Even hedgerow and field specimens turn out surprisingly good, and only a short time back we cut fully £200 worth on a farm of 150 acres in extent. The largest tree contained 90 feet, and fetched 2s. 6d. per foot.

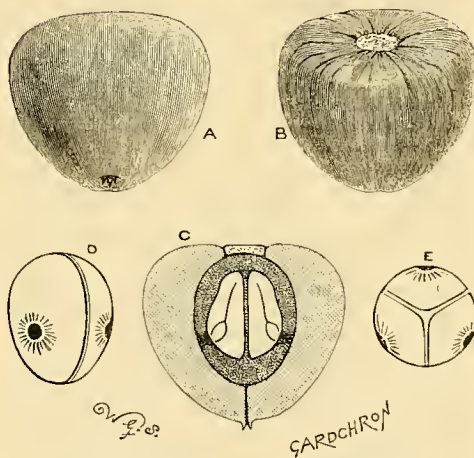

FIG. 124.—COCOS AUSTRALIS. (SEE P. 737.)

causing them to fade the next day. Of course, if seed saving is the main object, that is attained. The best time to sow Marguerite Carnation seed is, I consider, the last week in March or the first in April, and the plants if well managed will produce a wealth of bloom in October, November, and December. I have hundreds of the plants which have afforded cut blooms since early in the month of October, and the plants look as if they would continue in bloom till March or April. I recommend them for the reason that their flowers are the very opposite of what the florist terms perfect, being mostly fringed. To compare with these, there are seedlings raised at the same time of winter-flowering varieties, viz., Uriah Pike (a good seeder), Middle Carl, Miss Joliff, and others of that type of flower. It may be all a matter of taste, but I prefer the seedling Tree Carnations, and it is quite as easy to have these in flower if seed be sown at the same time. My method of raising Carnations from seed is very simple: the seed is sown in flower-pots or pans, which are plunged in bottom-heat of 75°, and in less time than a week the seedlings appear. The seed pots or pans are then placed in a greenhouse near the glass, or in a cold frame if the weather is not unfavourable. When large enough to handle, the plants are pricked an inch apart into shallow boxes, and kept rather close in the cold frame until rooted into the fresh mould, and about the end of May, or early in the following month, they may be

Elm is most difficult timber to deal with, it varying so in price, according to the part of the country where it is offered for sale. We sold a quantity, not especially good, at fully 1s. per foot; but in some parts of Kent and Surrey, *7d.* is nearer the selling price, and it is even difficult to get rid of at that amount. Bat Ash, above almost every other tree, is the one for the speculative planter to go in for in quantity, the ever-increasing demand clearly showing that we have not one tithe of the quantity that is annually required. The best fetches quickly fully 2s per foot, and there is not a stock noisid from one end of the land to the other, unless indeed, under very peculiar circumstances.

We would strongly urge on intending planters the necessity for growing the Ash in quantity, and any dampish loam suits it admirably.

Beech, if grown on chalky or gravelly soils, finds a ready market at from 10*d.* to 1s. per foot, that off the Chiltern hills and chalky reefs of Herts being quickly picked up, even at a trifle over 13*d.* per foot.

"Maiden" Willow cannot be got for love or money, and the demand for cricket-bats will be sure to increase with the Grace memorial.

Birch, Alder, Poplar, and woods of a like kind vary a good deal in value, and around some of the Welsh towns for clog-sole making from 8*d.* to 10*d.* is seldom refused.

Much of the home-grown timber is of very inferior quality, which fact tends directly to keep down prices; but, indeed, it can hardly be expected that the output of woods and plantations that are cultivated mainly for game rearing, shelter, and ornament can be either sufficiently clean or straight to fetch anything like a remunerative price. *A. D. Webster.*

BOOK NOTICE.

SYNOPTICAL FLORA OF NORTH AMERICA.

ONE great object of the late Asa Gray was the accomplishment of a complete Flora of the United States. Many years ago, in conjunction with Dr. Torrey, he published the beginning of such a flora. Five or six editions of a Manual flora of the northern States also passed through the press. In 1878 appeared a volume of the *Synoptical Flora of North America*; in 1884 another similar volume. The publication of these instalments showed clearly that the task was beyond the powers of one man, even though that man was Asa Gray. The States themselves multiplied, collectors became increasingly numerous, and their gatherings proportionately extensive and varied. And so it came to pass that the great and good man who is venerated in this country as he was at home, died when only a fragment of his projected work was done. Now, three years after his death, comes another portion of the work (to be had of Wesley & Son, 28, Essex Street, Strand). It has been compiled from the notes left by Dr. Gray, and by his successor, Dr. Sereno Watson, also deceased, and their work has been continued by the present curator of the Gray Herbarium, Dr. Robinson. Great features of Dr. Gray were his excellent judgment, the perfect clearness, and admirable method of his descriptive work. It redounds highly to the credit of Dr. Robinson that the present instalment, which begins with the Ranunculaceæ and ends with the Frankeniaceæ, presents the same admirable lucidity, terseness, and excellence of arrangement that characterized the portions produced by Dr. Gray. It is a source of satisfaction also to find that in matters of nomenclature Dr. Robinson has followed the plan till lately adopted by almost all descriptive botanists, and has not been led away by the specious arguments of some of his countrymen, who regard nomenclature not merely as a convenient means to an end, but as in itself an end. With the *Genera Plantarum* the *Index Kewensis*, and now, the *Synoptical Flora*, we can but think that the majority of systematists will, in the interests of science, continue to employ the most convenient and the most widely-accepted system rather than adopt others which entail so much confusion and useless synonymy.

WEST INDIES.

PARTIALITY OF CATS TO THE AVOCADO PEAR.

It may be interesting to place on record my experience in Grenada, so far as concerns the fondness cats have for the fruit of the Avocado Pear (*Persea gratissima*). I was puzzled one day to know what to give two kittens which had just previously been presented to me, when it was suggested by one of my men that a piece of Pear would be relished by them. This suggestion I accepted with some amount of reservation, but it was not long before I saw myself that the Avocado Pear was eaten up by them as a dainty morsel. Since this occasion, I have seen the same two kittens, when milk and Pear have been placed before them at the same time, to leave the former and eat the Pear voraciously. This incident appeared to me singular, and worthy of notice in your columns, as it had hitherto been my impression that cats were rather antagonistic to vegetarianism. It may not be generally known at home, that Avocado Pears are always eaten in a raw state with bread-and-batter, or with other things according to taste. *W. E. Broadway, Botanic Garden, Grenada, B.W.I.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

DENDROBIUMS.—For flowering during the late winter and early spring months, few Orchids are more useful or appreciated than Dendrobiums. At the present time, many species and varieties are showing their flower-buds, and some of them, viz., *D. Wardianum*, *D. crassinode*, *D. micans* × *D. Wardiano-japonicum*, and a few others are starting into growth, but that notwithstanding, the cultivator must not be tempted to afford them much water at the root, or subject them to a high temperature, or the growths will grow too rapidly, and prevent the flower-buds coming to perfection. These premature growths generally remain almost stationary for a long time if the plants are kept moderately dry, cool, and in a well-ventilated house. When the flower-buds have reached full development, take the plants, after gradually inuring them to the change, to a warmer house. *D. nobile*, *D. tortile*, *D. aureum*, *D. moniliforme*, *D. signatum*, and the garden crosses, *D. Cassiope* × *D. Aspasia* × *D. Barfordiense* × *D. Ainsworthii* × *D. Dominianum* × *D. splenoidesimum* × *D. endocharis* × *D. Schneiderianum* × *D. Leechianum* × *D. Cybele* × *D. Carysodicus* × *D. melanodiscus* × *D. Juno* ×, &c., not having the propensity to start prematurely into growth when their flower-buds show, may be brought from the cool resting-house into a house somewhat warmer. The Cattleya or intermediate-house forms a suitable place for them till the flower-buds are well advanced, after which remove them to the lightest available position in the East Indian-house. From the present time, and till the flowers open, water should be very sparingly afforded at long intervals of time in sufficient quantity to keep the pseudo-bulbs plump, and induce the slow advance of the buds. The species *D. crepidatum*, *D. cretaceum*, *D. primum*, *D. Boxalli*, *D. transparens*, *D. lituiflorum*, *D. Pierardi*, &c., still at rest, should be kept at rest till the flower-buds show, when more warmth should be afforded them. *D. chrysanthum* is a free-flowering handsome species, which as a basket-plant is much admired for its golden-yellow blossoms. As it is just starting into growth, the rooting material, if it has become in the least degree decayed, should be picked out and replaced with fresh. It succeeds if hung up near the roof in the East Indian-house; and till the young roots have a firm hold of the compost, water should be very sparingly afforded, or the new growths may damp off. When the plant is in active growth, thoroughly water the compost when it has become dry. Keep the plants of *D. Johnsonæ*, *D. speciosissimum*, *D. taurinum*, *D. undulatum*, *D. velutinum*, *D. Amboinense*, *D. Huttoni*, and others that are growing in the warmest house, and water them liberally till the growth is quite mature.

CATTELYAS.—Among those which flower late in the spring and early summer, *C. labiata* Warneri is one of the handsomest, and any plants now starting to grow should be hung up, or elevated on inverted pots so as to be brought close to the roof at the warmer end of the Cattleya-house, affording them water in sufficient quantity to fairly moisten the compost till growth is fully completed. Plants of *C. Warneri* newly imported, on being received will need to be cleaned, dead roots trimmed off, and then placed in pots which will just hold the roots and no more, nearly filling up the pots with crocks, making the plants steady by tying two or three of the pseudo-bulbs to sticks. Do not excite the plants into growth quickly, but place them in the intermediate-house, and surround them with a moist air, and moisten the crocks two or three times a week. When growth has fairly begun, some lumps of peat and sphagnum-moss may be packed firmly around them in the usual manner, and let them be placed with the established specimens in the Cattleya-house, where, with the proper kind of treatment, they will soon become established, and sometimes make stronger growth in one season than plants which have been in the collection for years.

THE KITCHEN GARDEN

By JOHN LAMBERT, Gardener, Fowls Castle, Welshpool.

HORSE RADISH.—Preparations for planting a bed of Horseradish may now be made, and if the demand is large and regular, a bed should be planted every year. Horseradish is one of the most neglected of garden crops, being usually left to take care of itself in some out-of-the-way corner of the kitchen garden. A piece of ground should be selected sufficient to supply the demand, and trenched 2½ to 3 feet deep, if it will allow of this being done; a thick layer of rich manure being laid at the bottom of the trenches, and plenty of manure worked into the upper two spits, leaf-mould being freely used if the land be of a heavy nature. It is important that the bottom spit should be the richest, therefore the original top spit should always be placed at the bottom. The top spit may be left rough. Crowns or nice young thongs about 3 or 4 inches make the best sets, and these should be prepared when dug up from the bed in use. Full instructions were given last spring on the best method of planting Horseradish.

CARROTS AND TURNIPS.—Where early crops of these roots are required, pits should be filled with fermenting materials similar to those suitable for Potatoes. The soil for the Carrots, however, should receive more attention than that used for the Potatoes, or the roots may be disfigured by insects. A light, sandy soil is to be preferred, mixed with soot, lime, and charred earth. It should be passed through a ½-inch screen or sieve to take out clods and stones. The surface of the bed should come within 12 inches of the frame or pit-light when pressed down and finished off ready for the seed being sown. When it has become warmed throughout, sow the seeds in rows 9 inches apart. Good varieties for frame work are Parisian, French, and Sutton's Inimitable Forcing, and Early Nantes Carrots. The Extra Early Milan Turnip is a good variety for frame use, but it is no earlier than the old flat Dutch.

RADISHES.—A pit or some frames with a sufficient number of lights should be prepared, as for Carrots, putting from 3 to 4 inches of soil on the hotbed materials. A pit of three lights will keep up a succession of Radishes for a long time, by sowing one-third of the area at a time, and not letting the tops get crowded. The best manner of sowing Radishes is to take three or four seeds between the fore-finger and thumb and press them into the soil about a quarter of an inch, making the bed level with a piece of board or back of the rake, and patting it evenly all over with a bright spade. Improved French Breakfast is one of the best for early work.

PARSLEY.—The mildness of the weather has caused Parsley to grow considerably of late, and it will be very necessary to cover it up on the approach of sharp frost; also to pull off all of the outside leaves of the plants, a proceeding which will have the effect of giving more light to the young growth. Hoops and mats, or old lights resting on boards, and other contrivances, may be used for protecting the plants. Even a mulching of fresh gathered-up Oak leaves, worked in among the foliage carefully, assists in screening the plants from frost, besides supporting the leaves under plants of snow,

which would otherwise break the leaf-stalks down, and thus cause rotting. The Oak leaves can be kept in place by putting a small quantity of litter along the outside of the beds. The Parsley which is planted in pits and frames should always be left to form a supply in hard weather.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

POT VINES.—Vines that were started in a steady bottom-heat last month should now be showing signs of growth, and a gradual increase of atmospheric heat must be afforded as this advances. Train the canes to the trellis in their permanent positions as soon as the buds have started to grow evenly. The young shoots grow very quickly, and there is a danger of breaking them off if the operation be delayed. Small weakly growths which form at the base of the main shoots may be rubbed off at once. The main buds will also require to be reduced in number when growth is sufficiently advanced that those which are likely to produce the best bunches may be selected. The bottom-heat should range from 70° to 75°, and for this purpose a good heap of stable-litter and leaves must be kept in readiness to be packed round the pots as required. As the roots become additionally active each day, more frequent applications of water will be necessary. Weak liquid-manure may be afforded, but it should always be used at a temperature several degrees higher than that of the house. Continue to syringe the canes at 9 A.M. and 2 P.M. on bright days; but if the weather be dull and frosty, it is better to slightly dew them over only once, at about 11 A.M. No ventilation may be afforded, unless external conditions are very favourable; and the heat in the hot-water pipes should be regulated carefully, so that the day temperature may be about 65°, which may be increased to 70° as the sun strikes the house. Do not over-heat the pipes at night, as this practice tends to greatly weaken the growth; a temperature of 60° will quite suffice for the present.

FIGS IN POTS.—The earliest trees may now be housed, and growth hastened by plunging the pots in a mild hot-bed, and further treated similarly to pot Vines. Syringe the trees slightly once or twice a day, and do not afford a great deal of water at the roots. For the first fortnight, the day temperature should not rise greatly above 55°, but after that time and as growth proceeds, gradually increase it.

PEACHES.—Trees in pots now coming into flower must be kept as near the glass as possible. The trees may be syringed until the first flower opens, but afterwards a drier atmosphere should be maintained. Sudden changes of temperature must be carefully avoided, and a day temperature given of 62° to 65° during mild weather, when air can be admitted with safety, and a fall of 2° or 3° during severe weather. The night temperature may be kept about 60°.

FRUIT TREES IN POTS which are still plunged out-of-doors must be carefully protected from birds, as these have already commenced on the forwardest buds of Cherries and Plums. Dust the trees over when wet with lime and soot, or protect the trees with Strawberry-nets.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

PELARGONIUMS which are being wintered in pits and frames to which no fire-heat can be applied, may be stored away in pots or boxes, or even laid-in by the heels, and will require to be kept as dry as possible. Strict attention must be given to covering them up with dry materials in case of severe frosts. Dry hay or Fern may be put next the glass and laid on thickly, then this should be covered with tarpaulin and well secured to keep all dry. Old plants of scarce varieties that have been laid-in for stock should be potted off, and placed in an earlyinery or other warm-house where they will commence to grow, and produce shoots fit for cuttings. Give store cuttings in boxes or pots plenty of air. If they are on shelves in houses that can be heated, they will require just sufficient water to keep them plump and fresh. Variegated and Ivy-leaved Pelargoniums require less water during the winter than zonal varieties. Sweet-scented varieties, especially Lady Scarborough, require very careful watering, and a pure, dry air. Place them on a wooden shelf, or if they are put on a slate or iron staging, it should be covered with rough sand, that the water may get

easily away. Give abundance of air and a little fire-heat at times in mild weather. If green-fly appear, fumigate the plants at once.

FUCHSIAS.—When cuttings are required of select varieties for bedding purposes, old plants which were lifted from flower-beds in the autumn and stored away in sheds should be potted in good rich soil, well watered, and placed in a warm house, such as an early Peach-house orinery. Thin out the weak shoots, and prune back those remaining to three or four eyes. These will quickly give a good supply of cuttings, which will strike freely under bell-glasses in a gentle bottom-heat.

MISCELLANEOUS BEDDING PLANTS.—Verbenas, Heliotropes, Gazanias, Agatheas, Lobelias, Nierembergias, and other bedding plants of the same class, require a cool airy house and careful watering. Tender plants such as Coleus, Iresine, and Alternantheras must be kept in a warmer temperature. If the stock requires increasing to a great extent, propagating may be commenced at once. Cuttings will strike very freely in a warm, close house at this season. Mignonette and other annuals that are being wintered in pits and frames should have abundance of air given them during fine weather, and they must not be over-watered. Calceolarias in frames require abundance of air during mild weather, and it will be well to cover them up against sharp frosts. If it is thought necessary, cuttings may be put in at once, and may be taken from the tops of those that are growing freely. They will strike readily in a close and shaded frame. Sweet Pea sowings should now be made in 6 inch pots, to be planted out at the end of January should weather permit. A sowing was made here in 12-inch pots in October; they have been kept in a cool house, and are looking strong and well. Dahlias, Cannas, Begonias, Gladioli, and other flower-roots which are stored away in sheds will need to be protected from frost, and they must not be allowed to become over-damp; so far, this has been a season of sudden changes, from heat to cold, but on the whole favourable for outdoor garden operations. Every advantage should be taken of fine days to push on with the planting and re-arranging of all kinds, bearing in mind the weather we had to contend against during the early months of the present year.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

THE GARDENIA.—Plants required to flower in quantity early in the new year should have the old material in which they are plunged removed and renovated with this year's Oak or Beech leaves. A top-dressing of rich loamy soil, and a slight dressing of an approved artificial manure should be applied. The house or pit in which the plants will stand should be made clean, also the plants, paying great attention to the destruction of mealy-bug and brown scale, two very noxious pests infesting Gardenias. The best means to use against them is petroleum, in the proportion of one wine-glassful to three gallons of soap-water, at a temperature of 95°. If the Gardenias are syringed once a month with this mixture it will clean the leaves and free the plants from mealy-bug and brown scale. Of course, during the flowering season this could not be done. A good method of having Gardenia bloom at every season is to plant them out in a pit or house where there are ample means of heating, and the plants should not be pinned, except just to thin the shoots when crowded. At this season they would require plenty of heat, abundance of water at the roots, and syringing twice daily.

WINTER-FLOWERING CARNATIONS.—Cuttings to supply plants to flower early next winter may now be struck in the stove or propagating-pit. Take strong, short shoots, and insert seven or eight in a 3-inch flower-pot, in a compost of sandy loam and peat. Much care must be exercised while in process of striking, to prevent the damping-off of the cuttings; but this can usually be averted by wiping the glass dry on the handlights or *o'choe* night and morning. A few new varieties worth cultivating are Madame E. Bergman, Mrs. Finet, La Villette, Lada, and Primrose Day; the latter has a dwarf habit, resembling Winter Cheer, and yellow flowers. Yellow-flowered varieties of winter-flowering Carnations are scarce, and this is a very acceptable novelty.

BOUVARDIAS, as fast as the plants go out of flower, should be placed in a cooler house, and be

afforded less water at the root. A warm frame would suit them, as they could be enabled to obtain abundant light and air to mature their growth before water is entirely withheld.

CYCLAMENS.—Forward plants now flowering freely should be afforded weak manure-water, such as Clay's, making an occasional change with a weak mixture of soot in rain-water. When the plants are at their best, the air of the house may be kept a little drier and cooler, say 53° by day, to 50° by night, with artificial heat, and a trifling amount of top and bottom ventilation at all times, excepting in very severe weather. The fumigation of the plants is desirable once a month as a preventive of attack of green or black aphid and thrips. Some seedlings may now be ready for potting-off into thumbs. As a potting-mould, use finely-sifted loam, peat, leaf-mould, and sand; pot them with moderate firmness; place on a shelf near the roof, and lightly syringe them twice daily. After potting, afford a light watering to settle the soil about the roots. Examine the plants for aphid, and use a soft brush to dislodge them when found. Those seedlings which are too small to be potted-off, may be pricked-off into other pans to grow stronger; they will form a succession to the earlier-potted ones. I usually find that the last seeds of Cyclamen to germinate bring the best flowers.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

THE TREATMENT OF OLD FRUIT TREES.—If any aged fruit trees are fit to be retained for some years longer, it will be well that something should be done to improve the fruit and the quantity of it. With this intent, top-dressings of well-decayed vegetable refuse, which has been turned once or twice, and quicklime added to it at such times, wood-ashes, and especially charred garden rubbish. These top-dressings should be supplemented by copious applications of liquid-manure from the farmyard or stable, which, now that the trees are at rest, may be used without dilution. The good effects of these dressings will be increased vigour, clean growth, and improvement in the quality of the fruit. In the case of rank-growing barren trees exceptions must of course be made, and instead of affording nutriment, root-pruning should be resorted to, which is best done early in the autumn, but it may be done at any time during the winter in open weather. Root-pruning must be cautiously carried out, and halfway round and under a tree will be sufficient for one year. Begin by opening a trench 4 feet from the stem, and sever the strong tap and main descending roots, but preserving all that are near to the surface. A few wheelbarrow loads of fresh materials will be of great use, placed round the roots in encouraging the growth of small feeding-roots. It is often the case that partial root-pruning has the effect of checking rampant growth and inducing fruitfulness, but it it have not the desired effect the remaining portion should be root-pruned the next season. Trees of inferior kinds, if healthy, should be headed back preparatory to grafting them with scions of better varieties, for which purpose the latter may be taken now and laid in under a north wall, or in some damp cool place. Old Peach and Nectarine trees with cankered branches, or which are unhealthy, will be greatly improved by being cut back to within a foot or so of the stem, carefully shortening the roots, and laying them in maiden loam. The usual result of this kind of treatment is to refurbish the trees with abundance of healthy, fruitful wood, often superior to that of newly-planted young trees. Old Pear and Plum trees on walls crowded with clusters of long spurs, and bearing, perhaps, only a few worthless fruits, should have the spurs freely thinned here and there all over the trees, and about one third be cut back to within an inch or so of the branches. A strong shoot or two will generally spring from the base of each, which, with proper attention paid to stopping once or twice during growth, will develop into new fruit-spurs lying close to the branches. In three or four years, by thus annually taking out some of the remaining spurs, the full benefit of the wall as a shelter for the blossom will be secured, with a corresponding improvement in the fruit in regard to quantity and quality.

THE GLASTONBURY THORN is in full flower and leaf in the Botanic Garden of Trinity College Dublin.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

SALE.

MONDAY, DEC. 23. { Plants, Roses, Hardy Bulbs, &c.
at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—38° 4'.

As our tastes and interests are varied, equally so is the standpoint from which we individually view the Christmas season. With all its inconveniences, the season is by no means an enemy to commerce. During its observance trade is hopelessly disorganised, but the extraordinary impetus every branch experiences in preparation for the festivities more than compensates for this. At Christmas we all seem to gain, and all to lose. If we receive more than usual, we also spend more, and the manifestation of spending power is greater than occurs at any other part of the year. So far, therefore, as we can see, the observance of this festival is not likely to be diminished, though naturally the methods by which it is celebrated will alter slightly with every decade. The noisy, riotous scenes and indulgences that were once characteristic of the season, do not now obtain in the same degree, and we have reason to be thankful that the case is so, and that the money once expended in such a manner is now free to purchase more rational comforts, and time can be given to the pursuit of more reasonable methods of enjoyment.

Looking at Christmas from our own particular standpoint, we find that the resources of horticulture are more and more freely drawn upon. Every class of the public spends more of its money upon plants and flowers. The ancient custom of associating the Mistletoe, the Holly, and other berried plants with Christmas, for many long years has been encouraged by the absence of any other natural material wherewith to decorate our homes or our churches. Of evergreens even, there was not the variety at the commencement of the century that we have now, owing to the introduction to this country of species and varieties of Conifers, peculiarly suitable for Christmas trees, &c. As long as the season has any charm for us, we are not likely to despise the Mistletoe, Holly, and Ivy, which for centuries have been associated with its observance. Indeed, berried plants of all descriptions appeal to us in December with quite irresistible fascination. We continue to welcome these, but our sympathies are not the less able to embrace the abundance of flowers that modern horticulture has made possible to us. The former are now largely supplemented in our decorations by a variety of plants and flowers that

we, by reason of our hot-houses, are enabled to enjoy at a time when formerly they were not procurable. When we think of what has been accomplished, of the advantages we possess that our forefathers knew nothing of, though we see little to boast of, there is plenty of interest—and even to astonish us!

Half a century ago the amount of "glass" in our gardens was small, only the largest of them possessed facilities for the growth and production of exotic plants and flowers, and the forcing of these in December was but little practised, and as little understood. The strides made since then have been rapid and long, the increased facilities for the production of flowers has encouraged the desire for them, and the demand and supply have both increased at a prodigious rate. It is little exaggeration to say that now we cover half our gardens with glass, and we gather some of the choicest of our flowers at Christmastide.

CHRISTMAS PLANTS.

Of flowering plants we now obtain, in December, in succession to Chrysanthemums, four of the best-known in the market, i.e., Heaths, Solanums, Primulas, and Cyclamens. The Heaths, once grown by nurserymen, such as Messrs. Hugh Low & Co., of Clapton, and Messrs. Cutbush & Sons, Highgate, for distribution to gardeners only, have, for a number of years past, been taken in hand by the market growers, and they have treated many of them with remarkable success, placing them upon the market at popular prices and in quantity, similar to the fancy Pelargoniums. None of the Heaths, however, can be said to be exactly Christmas plants; Erica gracilis (the red Heath) is now almost past, being frequently in bloom in October; E. hyemalis and E. h. alba may be seen in the market, but not in great quantity, nor have we seen many plants of it in flower when visiting some of the market nurseries during the past week. What are now to be bought have been specially kept back for this week's sale. E. Wilmoreana, a larger and more showy plant than E. hyemalis, cannot be had soon enough, but comes in nicely during the earlier months of the year.

Mr. Sweet, of Finchley, is known as one of the best Heath-growers for market, and his plants are pictures of successful culture, compact, shapely, and covered with abundance of bloom. Messrs. J. & J. Hayes, Edmonton, Mr. J. Fraser, Messrs. Gregory & Evans, Sidcup, Mr. Ladd, Swanley, Mr. E. Rochford, and others, have grown them largely also. We recently noticed at Messrs. Hugh Low & Co.'s nursery a quantity of E. melanthera, which had been forced into flower, the blooms being white, instead of the light purple they usually are when produced in spring. It is not of much service, however, for such early forcing, and the plant is less popular in spring than it used to be, though Mr. Sweet has been selling plants of E. melanthera with better-coloured flowers. Most of the varieties are pretty and effective plants to put into vases, and obtained through the market they are very cheap, but they are little understood by many who buy them, and they may be frequently seen in restaurants, hotels, and house-windows, with the points of their shoots hanging hopelessly down, languishing for water.

Solanum capsicastrum is essentially a winter plant, and many—almost all—market-growers cultivate them but we have never seen any so fine as those grown by Messrs. J. & J. Hayes, Edmonton. Their plants are remarkable for the small size of the foliage, and the extra large size of the berries. They grow them in thousands, and were amongst the first to cultivate a large number annually from cuttings. Mr. E. Rochford, Cheshunt, raises about 10,000 plants annually. Solanums sell more readily than other plants during the present week and part of next; but, as several growers have remarked to the writer, "Come Boxing-day, and buyers won't look at them."

Primulas are pretty and useful for warm rooms, but are too delicate to be placed in draughts or cold

places at this season. They have long been market plants; but we are inclined to think the trade in them is less than formerly. Messrs. Williams and others are selling very well-grown and pretty plants in several colours.

Cyclamen.—A more popular and a hardier plant is the Cyclamen, especially as the foliage is less liable to injury. There are more annually forced into bloom during the present month than was ever the case, and usually the sale is easy. At Mr. Whiteley's, Hillingdon, there was recently a wonderfully large display of pure white ones; and the St. George's Nursery Co., Hanwell, grow many thousands for market. We noticed some of a very good strain at Messrs. Low's, but of course these are not put upon the market, being all sold to private customers. By the way, if we do not have an opportunity of seeing German Cyclamens in the meantime, there will be plenty in England next year, for we have reason to know that since the letter from Berlin on the subject appeared in these pages, one firm at least has possessed itself of a good quantity of seed from first-rate German collections. As to whether the blooms will be so much better than such a strain as Messrs. Sutton's or Messrs. Williams', our German friends will excuse us being a little sceptical.

Besides these plants, there are Richardias, Poinsettias red and white, white Marguerites about 14 inches high, in 5 inch pot, and literally covered with blossom, and Mignonette. In addition, there is the usual large and varied supply of well-grown foliage plants, Palms, Ferns, Dracenas, Asparagus, Smilax (Myrsiphyllum), &c.

The new race of Cannas will make a valuable and distinct addition to the flowering plants that may be had in bloom during the present month. Messrs. H. Cannell & Sons succeed in obtaining flowers throughout the year, and are able to exhibit them in fair quantity at the present date. Of course, they are unsuitable for market work, but a group of them in flower at this season in our conservatories would be the most lovely and striking addition to zonal Pelargoniums and the like, than we have had for years.

CUT FLOWERS.

Of cut flowers there is much greater variety than one sees in the plants; indeed, we need not lack these, for the market is well supplied. For the purpose of preparing this note, we attended one of the early morning wholesale markets at Covent Garden, and the impression the visit gave is that the last days in the year are now certainly not flowerless ones. Yet, in some instances, at least, the supply in this particular year is not exceptional. For instance, a visit to the large establishment of Mr. George May's, at Upper Teddington, showed that he has practically no Eucharis blooms to cut. Here is the largest and best collection of Eucharis plants we have ever seen, and during the same week last year, Mr. May was marketing scores of dozens of blooms each day. He will have plenty later though, and they promise to be of excellent quality. Abundance of Bouvardia blooms may be seen in the market. The plants are grown much more largely for the supply of cut bloom than to sell as plants; and Roses also are plentiful. Mr. May has a good supply of the latter. That a variety of cut bloom is at hand is proved by the following list, most of which are in the market in considerable quantity:—Chrysanthemums of late sorts, such as L. Caning, Princess Blanche, Princess Victoria, and W. H. Lincoln, a variety which can be had early or late; Liliun lancifolium, L. longiflorum, and L. l. Harrii; Roses, Carnations, Eucharis, Cyclamens, Lapagerias, double Primulas, Azaleas, especially the capital white one, Deutsche Perle; Richardias, Camellias, Taberones, Gardenias, Pancratiums, Freesias, Roman Hyacinths, Talips, Lilies of the Valley, yellow and white Narcissus, and Violets. The Narcissus is imported from France, so also are numbers of Violets, the former may be forced into flower here by this date, but they come very much less kindly. In addition to these, a good supply of Rose buds,

Staphylea colchica, white-flowered Lilac, and yellow Marguerites, may be had from the foreign flower stalls, and a very small quantity of Acacia sprays. There were some excellent Christmas Roses (*Helleborus niger*) at last Tuesday's early market, but less in quantity than one would expect.

A few days since we saw at Mr. Iceton's nursery at Putney Park Lane, an astonishing quantity of Lily of the Valley, ready for cutting. This bloom is the product of new crowns or buds, not retarded ones, and they were very fine, many of the spikes having fifteen good-sized bells upon them. Do what the grower will, however, it is impossible to get much foliage from these early-forced buds, and relatively to this, a batch of retarded buds are useful. The flowers are less fresh-looking, and of weaker quality, but there is plenty of foliage, and this has to be used sparingly when marketing the finer blooms from the new buds. The retarding

varieties were Chrysolora, Yellow Prince, White Pottebakker, and red Duc Van Thol.

From the above will be seen there is ample material for the making of bouquets, button-holes, and the furnishing of ball-rooms. We have not mentioned Orchids, because there are few sold in the wholesale market, and they are always scarce at Christmas; *Cypripedium insigne*, though, may be had in some quantity.

The difference in quantity of the flowers and plants now available at this season, compared with, say, thirty years ago, is not greater than the difference in the prices they realise; some of them sell now for less than one-third of what was given for them then. The public is the gainer, and apparently the growers, by dealing with a large quantity, manage to make them pay well. One of them remarked to us, anent this, that "The growers grumbled then, they only do that now!" P.

alpines, &c., will be held from May 1 to October 15. Temporary exhibitions will also be held from May 1 to 15, June 10 to 15, July 15 to 20, August 15 to 25, and September 22 until October 15.

OUR ALMANACK.—Secretaries of Horticultural Societies and others, are earnestly requested to forward *immediately*, the dates of Show Fixtures and of Meetings of Botanical and Horticultural Societies of any kind for 1896, for insertion in the Almanack, to be published in our issue for January 4.

GARDENERS' ROYAL BENEVOLENT INSTITUTION, CONCERTS AT ALTRINCHAM.—The members of the Altrincham and District Gardeners' Improvement Society have always taken a deep interest in the welfare of the Gardeners' Royal Benevolent Institution and of the Royal Gardeners' Orphan Fund, and the efforts made on behalf of these deserving

FIG. 125.—MILTONIA VEXILLARIA, IN MAJOR JOICEY'S GARDEN, SUNNINGDALE PARK.

system by means of a refrigerator has been practised for many years, and with other plants beside Lilies of the Valley, though the method was inaptly described by the *Times* last week as a totally new departure in horticulture. As a matter of fact, it is fifteen to twenty years since Mr. Iceton, and Mr. Jannock of Dersingham, both of whom were living then at Barnes, together made experiments in this matter, and the system has proved to be a useful one by which to obtain flowers in late autumn. It is only now at the end of December that the produce from crowns so treated can be beaten by early forcing. At Tuesday's market there was some bloom of *Astilbe (Spisæa) japonica* on the stand belonging to Mr. Thos. Rochford, of Broxbourne, which we were informed was from last year's clumps so treated. The reserve was nearly exhausted however.

In addition to the Lilies at Mr. Iceton's were good supplies of Roman Hyacinths and Tulips. The last named take badly to such hard forcing, and always at this date have the appearance that they have been yoked from their natural rest cruelly soon. The

MILTONIA VEXILLARIA.—Our illustration above, fig. 125, represents an unusually fine specimen of a large-flowered type of the species, as it appeared this year in Major Joicey's garden, Sunningdale Park. The plant was then growing in an 8 inch flower-pot, and carried thirty-nine flower-spikes, each of which bore on an average seven blooms. We think, and our readers will doubtless agree with us, that no finer specimen of this beautiful species has been seen under cultivation, and that it reflects much credit on Mr. F. J. THORNE, the gardener at Sunningdale Park.

GHEENT.—A great Chrysanthemum exhibition will be held at Ghent, under the auspices of the Royal Society of Agriculture and Botany, from November 15 to 17, 1896.

NATIONAL SWISS EXHIBITION, 1896.—In connection with the exhibition to be held in Geneva next year, we are informed by Mr. MAAC MICHELI that a permanent exhibition of trees, perennials,

institutions have been supported in a generous manner by the public. The concerts were commenced in 1892, and have been continued annually since. This year it was decided to give two concerts, this special effort being made with the object of establishing a local orphan fund for the purpose of granting immediate relief if occasion required. The attendance on both evenings was very large, every available portion of the large hall of the Literary Institute being occupied. Programmes of more than usual excellence had been prepared for each evening, and the services of several capable artistes retained. The committee were also fortunate in securing the services of the Sale and Ashton Amateur Orchestral Society of forty performers, and the Veronese Mandoline and Guitar Band, whose selections were quite a feature of the entertainments. The amount realised, after paying expenses, was a little over £56, forty guineas of which goes to the Gardeners' Royal Benevolent Institution, and the remainder is retained for the local orphan fund. Since 1892 the amount of £161 has been raised in this way, £105 of which has been sent

to the Royal Gardeners' Orphan Fund—not a bad record for a small country town. Other Gardeners' Improvement Societies please make a note. CHAS. HEWITT, Hon. Sec. and Treasurer.

MEETING OF THE BRUSSELS ORCHIDÉENNE.

—At the last meeting of the Brussels Orchidéenne, on December 8, some fine collections of Cattleyas and Cypripediums from l'Horticulture Internationales were shown. Few persons would have thought, even five years ago, that Cattleyas would ever form a feature at an exhibition held in December. A First-class Diploma of Honour was awarded to M. Linden for a group of eight Cattleyas; also one for Cypripedium \times capartianum with a very large standard, broadly oblong and entirely of a purplish-red colour, abating at the base into blackish-purple. Dr. van Cauwelaert obtained a similar award for Cypripedium \times Allianum. A First-class Diploma of Honour was allotted to M. Warocqué, for a hybrid Cypripedium (C. Lowi \times C. villosum), with a standard like that of the latter parent, unfortunately much bent, and with petals like those of C. Lowi very narrow at the base, bent back, very wide at the tip, and there tinted violet-rose. First-class Certificates of Merit were awarded as follows:—To M. Linden, for Cypripedium \times Leeannum; to M. Warocqué, for C. Curtisi \times C. Lawrenceanum, flowers very large and massive, resembling those of the latter parent with the petals dotted with numerous black warts tinged with red at the tip, the slipper very large; to M. Van Imshoot, for C. callosum \times C. Argus Mœnsis, most resembling the first parent, but with petals spotted somewhat as are those of the other; to M. Madoux (*à l'unanimité*) for Vanda Amesiana, very well-flowered; to M. A. Van Imshoot (*à l'unanimité*), for Odontoglossum crispum; to M. Madoux, for Cattleya Warocqueana and for C. Harrisonæ (*both à l'unanimité*), the latter with two flower-spikes bearing very pale rose-coloured flowers with a white lip bordered with very pale rose and shaded with primrose-yellow round the entrance of the throat. Similar awards were made (*à l'unanimité*) to Mr. H. Knight, for Cattleya maxima Leopoldi, with very large deep red flowers; to M. de Lombaerde (*à l'unanimité*), for Oacidium varicosum Rogersi, very fine, with large, richly-coloured flowers; to M. T. Pauwels (*à l'unanimité*), for Phalænopsis rosea, rare, and with a fine floral raceme; to M. de Moerloose (*à l'unanimité*), for Cattleya Warocqueana; to M. Madoux and to M. Pauwels, each of whom showed a plant of C. Warocqueana, the latter a very curious one with a large straw-coloured lip, faintly bordered with very pale rose, and with a little red spot in the middle. Other First-class Certificates were won as follows:—By M. F. Pauwels, for Phalænopsis Schilleriana, bright rose-coloured; by M. Van Imshoot, for Odontoglossum crispum; by Dr. Capart, for Lælia Gouldiana, deep purplish-red; by Mr. H. Knight, for Cattleya Warocqueana; by M. Van Imshoot, for Lycasta Luciei; by Dr. Capart and M. Madoux, each for Cattleya Warocqueana; and by M. F. Pauwels, for Phalænopsis grandiflora. Second-class Certificates of Merit were awarded to Dr. Van Cauwelaert, for Cypripedium \times Leeannum, with a very large and almost wholly white standard; and two others to M. Madoux, for two more specimens of Cattleya Warocqueana. M. Linden won two First-class Certificates for flowering; one for Cattleya maxima gigantea, the other for Vanda cœrulescens.

THE ROYAL BOTANIC SOCIETY.—A meeting of the Fellows of this society was held in the Museum at the Royal Botanic Gardens, Regent's Park, on Saturday afternoon, 14th inst., Mr. G. R. RYDER presiding. Lady TWEEDMOUTH, Mr. R. HEAP, Mr. P. S. MAYHEW, and Mr. JOHN RUSSELL were elected Fellows. The receipt of the following donations was reported: Specimens of the flora of Havana, presented by Señor J. I. TORREALAS, of Havana; flowering specimens of the Bush Gum (Eucalyptus globulus) and Acacia from Cannes, presented by Miss LEIGHTON. The secretary called the attention of the Fellows to some specimens of the society's unique collection of

economic plants growing in the garden, including Zamia integrifolia, West Indies; Caryota urens, India; Tapioca (Manihot utilisissima), South America; Arrowroot (Maranta arundinacea), West Indies; and Canna edulis, India. There were also on exhibition a number of artificial Orchids and other flowers forwarded by Mrs. EMERY. The specimens, which were exquisitely formed of a composition of wax, were so true to nature, that it was only by a close inspection and comparison with real varieties that any difference could be detected.

THE NATIONAL CHRYSANTHEMUM SOCIETY.

—At the Grand Jubilee Celebration, to be held at the Royal Aquarium, Westminster, on Tuesday and three following days (November 3 to 6) next year, we learn from a preliminary schedule of special Jubilee prizes now issued, that these prizes are offered in addition to those which are usual at the November exhibition, and that these classes will be repeated in the schedules to be issued at the end of the month of March next. Amongst the prizes is an open one for a group of Chrysanthemum plants in pots, to consist of any variety, mingled with foliage plants (the foliage plants not necessarily to be grown by the exhibitor), to be arranged for effect in a circle of 12 feet in diameter. This prize will consist of the Jubilee Medal in gold, and money prizes as well. Another Gold Jubilee Medal and money awards are offered for nine trained specimen Chrysanthemums, incurved reflexed or Japanese, distinct; and a Silver-gilt Jubilee Medal and money prizes for six trained Specimen Pompon Chrysanthemums, distinct. These are likewise open competitions. In the cut-bloom classes, Gold Jubilee Medals and money prizes are offered for sixty Japanese Chrysanthemums, distinct; and for sixty incurved Chrysanthemums, no fewer than thirty-six varieties, and not more than two of any one variety. Good prizes are offered for thirty-six Anemone-flowered Chrysanthemums, one bloom of each, distinct; and twelve Pompon, three blooms of each, distinct; twelve varieties of reflexed Chrysanthemums, three blooms of each; and twelve varieties of Pompon Chrysanthemums, six blooms of each (Anemone Pompons excluded); twenty-four varieties of single Chrysanthemums, twelve large-flowered, and twelve small-flowered, three blooms each of large varieties, and six blooms each of small ones. These are open competitions. There are competitions for growers for market in collections of fruit; special Jubilee prizes, by various nurserymen, for cut blooms; and for collections of vegetables, &c.

HORTICULTURAL CLUB.—The monthly dinner and *conversazione* took place at the Hotel Windsor on Tuesday evening, 17th inst. There was a large attendance of members and visitors. The chair was occupied by Mr. HARRY J. VEITCH, and there were present amongst others, the Rev. W. Wilks, Messrs. Philip Crowley, James Walker, George Monro, A. H. Pearson, George Paol, Peter Kay, H. Selge Leonard, James Webber, J. Ashbee, and Arnold Moss. A very interesting and instructive address was given by Mr. Geo. Monro on "The Fruit Supply of Covent Garden." It was thoroughly practical, and was much appreciated by all present. It also originated a brisk discussion, during which many subjects of great importance were touched upon. A hearty vote of thanks was given to Mr. Monro for his admirable address. Mr. Peter Kay, of Claiqmar, Finchley, sent a basket of very beautiful Alicante and Canon Hall Muscat Grapes; and Mr. Shea also sent a dish of very beautiful samples of Gascoigne Scarlet Apples.

MR. GEORGE SUCH.—American papers record the death of Mr. SUCH, of Amboy, New Jersey, a well-known horticulturist, the fame of whose collections travelled to this side of the Atlantic.

COLOURS OF FLOWERS.—The Scientific Committee of the Royal Horticultural Society is desirous of carrying out some experiments upon the effects of ingredients in the soil upon the colours of flowers. The Secretary will be glad to receive any information about accidental or other results which florists or

other cultivators have met with. Any reference to published accounts of changes of colours in flowers will be thankfully received. Address, Rev. G. HENSLOW, Drayton House, Ealing, W.

MR. C. L. ATKINSON.—The death at Portsmouth, on the 18th ult., of Mr. C. L. ATKINSON, is announced. According to *Garden and Forest*, he for many years had charge of Mr. JOHN L. GARDNER'S estate in Brookline, Massachusetts, and was one of the best known and most skilful gardeners that America has seen. Not only was Mr. ATKINSON a remarkably good gardener in all branches of the profession, but he was a genial, generous, and intelligent man, full of interesting information about gardens and gardening in this country and in his native England, which in conversation he was always willing to impart in a picturesque, and often highly entertaining manner. An honour to the profession, he will be missed and sincerely mourned by his friends and associates in the neighbourhood of Boston.

AYRSHIRE GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—At the monthly meeting of this Association, held in the Carrick Street Hall, Ayr, on Thursday evening, the 5th inst., the Secretary read a paper written by Mr. D. MACKIE, Montgomerie Gardens, Tarbolton, entitled "Climatic Influences in Relation to Practical Gardening." At the conclusion, Mr. MACKIE was accorded a vote of thanks; as was also Mr. M. GANLY, Glendoon, who presided during the evening. The next meeting will take place on January 2, 1896, when Mr. A. H. SCOTT, Cambusdoon Gardens, will read a paper on "Flowering Trees and Shrubs."

"CULTIVATED PLANTS."—In correction of a statement that we made in our issue for December 7, Messrs. WILLIAM BLACKWOOD & SONS, 45, George Street, Edinburgh, desire to call the attention of our readers to the fact that this excellent and most useful book, by Mr. F. W. BURBIDGE, is still in print, and can be obtained through any bookseller.

THE DEVON AND EXETER GARDENERS' ASSOCIATION.—The annual dinner of this body of Devonshire gardeners will be held on Friday, January 3, 1896, at Martin's Castle Hotel, Castle Street, Exeter, at 7 o'clock. In order that proper arrangements may be made for the comfort of those attending, tickets must be taken not later than December 27. ANDREW HOPE, Hon. Secretary.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The monthly meeting of this society was held at 25, Westgate Road, on Tuesday, December 10; Mr. JNO. BULLOCK presided over a good attendance of members. Mr. LAWSON, gr. to W. J. SANDBSON, Esq., Heathdale, Gosforth, exhibited a few well-grown Chrysanthemum blooms; and Mr. LARKER, North Dene, Gateshead, Chrysanthemum and Pelargonium blooms. In the absence of the writer, the Secretary read an excellent paper by Mr. KEELING, Ista of Willywood, Riding Mill, on "Herbaceous and Alpine Plants," which was much appreciated, and favourably criticised in the discussion that followed.

BOTANICAL GARDENS, MOSCOW.—Mr. C. MÜLLER, formerly horticulturist to the Arch-Duke SERGIUS ALEXANDROWITSCH, has been appointed successor to Mr. WOEST, deceased.

PUTNEY, WANDSWORTH AND DISTRICT CHRYSANTHEMUM SOCIETY.—The annual dinner was held on Tuesday evening, 17th inst., at the Railway Hotel, Putney. There was an exceptionally good attendance of members, and the proceedings throughout were enthusiastic and cheery, most of the speeches being full of hope that the society has started upon a period of greater success than it has previously enjoyed. In this respect considerable satisfaction was expressed that the recent show was one of the most successful yet held, but it was unfortunate that the attendance suffered through the inclement character of the weather on the occasion.

NEW LILIES.—In the November number of the *Giornale Botanico Italiano*, are described and figured, by Signor BABONI, two new species of *Lilium* from China. *Lilium chinense* and its variety *atropurpureum* flowered in the Florence Botanic Garden. *L. chinense* has linear spreading leaves about 4 inches long; recurved, orange-coloured flowers about 3 inches across; segments oblong lanceolate, strongly recurved, and marked with purplish spots. *L. Biondi* has also linear leaves, but shorter than in the preceding plant; flowers of the same general character and colour, but rather smaller; segments reflexed, orange, faintly spotted, and with a few warty prominences near the base. Both species come from mountains in the northern part of the province of Suen-si.

CHISLEHURST GARDENERS' ASSOCIATION.—There was a good muster of members on Tues-

days also of *Equisetum*, *Lycopods*, and hardy *Selaginellas*. (Publisher, OCTAVE DOIN, 8, Place de l'Odéon, Paris.) The author deals first with the botanical structure, fertilisation, variation, and hybridisation, and geographical distribution of Ferns, then of the peculiarities of the several species treated of. The second branch of his subject is similarly arranged. There is a full index of names, and the text is plentifully interspersed with small illustrations.—*The Agricultural Annual* and "*Mark Lane Express*" Almanac for 1896. This periodical contains much of interest to those interested in agriculture, as it includes reports of the past year, a calendar of events for the coming one, and many hints on such subjects as Potato blight, cider, butter, &c. Postal information and similar general contents are included, as usual in such publications, amongst which this should take a good place.—*Christmas Numbers*. The Christmas Number of the *Queen* is,

a catalogue of seeds gathered this year, and offered for distribution to immediate applicants.—*Bulletin de la Société Française d'Horticulture de Londres*. This is the record of a flourishing society of French horticulturists who have found the convenience of having a common bond and meeting-place in England. Their meetings are held on the first Saturday in each month at 4, Old Compton Street, and their *Bulletin*, besides chronicling lists of members and other matters relating especially to the society, contains notes on the cultivation of some of the less-understood plants, and suggestions for improving upon old methods of culture.—*Cider*. This monthly journal, "devoted to the interests of cider and perry," is directed and edited by Mr. E. SAMSON. It should do much to increase an already thriving industry by attracting more wide-spread notice to a palatable and wholesome beverage still comparatively neglected in some localities.

FIG. 126.—A DISH OF THE CATILLAC PEAR, GREATLY REDDED.

day, December 10, when Mr. W. CUTHBERTSON, F.R.H.S. (of Messrs. DOBBIE & Co.), gave an interesting and instructive lecture on "Pansies and Violas." The lecture was greatly enhanced by a number of coloured plates and drawings.

GARDEN DIRECTORIES.—The new issues of those very acceptable publications to gardeners, editors of gardening journals, and others connected with horticulture, *The Horticultural Directory and Year Book*, published at 171, Fleet Street, E.C., and *The Garden Annual Almanac and Address Book*, published at 37, Southampton Street, Covent Garden, are now before us. They are, as usual, replete with useful information of a varied kind, including a list of new plants of the year. The portion dealing with gardeners' names and addresses appears to have been carefully brought up to the present date, so far as is possible in books of this magnitude.

PUBLICATIONS RECEIVED.—*Les Fougères de Pleine Terre (Hardy Ferns)*. This book, written by our correspondent, M. H. CORREYON, of Geneva,

as usual, rendered both weighty and bulky by the number and variety of its contents, both literary and pictorial. The *Hobby Home* also issues an excellent Christmas Number, full of interesting and amusing articles and pictures appropriate to the season. *Nature Notes* for December contains, in addition to other papers, a charming article by JOHN D. BATTEN on "Bats."—*Sutton's Amateurs' Guide to Horticulture*. Messrs. SUTTON may be congratulated on substituting photographic reproductions for the glaring and misleading chromo-lithographs once so popular. The photograph blocks of vegetables are beautiful in their rendering of texture and veining.—*Muséum d'Histoire Naturelle*. From this institution comes the *Catalogue des Graines et Plantes Vivantes offertes pendant l'hiver, 1895—1896, aux établissements publics d'instruction*. This is a list of many species, some comparatively little known, save by specialists, and which, as the above words testify, are offered to certain applicants. Such plants as are not hardy in Paris are indicated by an asterisk. From the *Jardin des Plantes*, Montpellier, comes

CATILLAC PEAR.

ONE of the best known and most useful culinary Pears is Catillac, which, when carefully plucked and properly kept, remains in good condition till the spring. Although not particular in regard to soil, the tree does best in rich, fairly deep soil.

The finest espalier-tree I know of, grows in the garden of Mr. Joseph Ham of Budlake Farm, Broadclyst, near Exeter. This same garden, in the early years of the century, was in the possession of the great-grandfather of the present head of the Exeter firm, Mr. Peter Veitch, and it is one of the best fruit-gardens in a district noted for fruit. The Catillac was, twelve years ago, grafted on to a Beurié Rance planted against a stone wall, with a south-western aspect; the Beurié Rance having done badly. The tree has for its size, borne well, and this year it carried from sixty to seventy fruits, which were ultimately reduced to twenty. Five of these, weighing 9½ lb.—the heaviest weighing 2½ lb.—were shown at the fruit show at Exeter,

taking the 1st prize for culinary Pears (fig. 126). It is a remarkable fact that for nine years in succession, this tree has produced the 1st prize dish of Catillac at the Exeter show. Last year the weight of the five fruits shown was 8 lb. 12 oz., and the year before almost the same. *L. ca.*

PLANT PORTRAITS.

ALLAMANDA VIOLACEA, *Revue de l'Horticulture Belge*, December.

ARCTOSTAPHYLOS DIVERSIFOLIA, *Meehans' Monthly*, December.

YUCCA WHIPPLEI, *Garden and Forest*, October 18.

ONION HIGHCLERE TANKARD.

THE Onion Highclere Tankard (fig. 127, on p. 747) is the result of a cross between Ailsa Craig and Pinefield, the latter being the seed-bearing parent; my idea being to combine size and better-keeping qualities, many of the larger varieties of Onion being somewhat deficient in this latter respect. The seed of the Onion mentioned above was sown early in February, and grown on for a time in a little heat, the plants being pricked off into boxes when large enough, hardened off in due course, and planted out-of-doors about the middle of April. Water was given to each plant singly with a spout-can, and the Dutch-hoe used to loosen the soil as soon as possible afterwards; no more water was afforded them, and about the middle of the month of May a mulch of spent Mushroom-dung was applied to check evaporation from the soil. *W. Pope*. [We selected this Onion not only for its intrinsic merit, but also for its symmetrical flagon-like form. Consumers will not consider this matter, but those who like to know "why and how" will feel an interest in speculating as to the why and wherefore of this shape. *Ed*]

HOME CORRESPONDENCE.

A BRITISH FERNERY.—As it is quite impossible, in or near large centres of labour, to get together a decent representative collection of our native Ferns without the aid of artificial means, it follows that a house of some kind is, absolutely, a *sine quâ non*. The form that house shall assume and the best way to go to work to construct it is, perhaps, the next important point, and I think that question has been very carefully and satisfactorily solved by Mr. Chas. T. Drury. Personally, I am under an obligation to him for the details therein applied, although I cannot now bring my own little fernery into a semblance of its more magnificent rival. But that, perhaps, is hardly necessary, as, even in the matter of ferneries, variety is charming. Having, then, fixed upon the most available spot, according to the exigencies of the surroundings, and the capacities of the purse, the next thing to do is to go in search of those lovely ferny forms for which we have lately contracted such an intense desire to possess. There are sure to be plenty of disappointments in store to damp one's ardour, but the quest, nevertheless, and the wholesome exercise, and the sweet fresh air, will do much to compensate one's inability to record a "find." Since addressing my queries to Mr. Drury, I have been

to North Wales and South Dorset. In the former place, I hunted high and low, mountain and moor, river and rock, but I could not find a variety worth recording. The common Polypody (*Polypodium vulgare*) in many places was simply innumerable, but there was no trace of the Welsh one (*P. v. cambricum*). The Parsley Fern (*Allosorus crispus*) disputed with ranker "weeds" the right to occupy whole acres of Snowdon's craggy heights; but never a created form to greet one's gaze. The Hard Fern (*Blechnum Spicant*) was also there, stunted and abnormal, it is true, but that was only due to elevation and exposure, for in the valleys nestling beside some quiet pool, its fertile fronds attained the length of fully 3 feet. In point of numbers then, the normal forms were *ad libitum*, while the varietal ones were, unfortunately, "conspicuous by their absence." And so with some other Ferns—species galore; varieties *non ulla*; i.e., not sufficiently distinct to warrant recognition as such. The ordinary Fern-hunter, then, will have to be content with species; the more-highly developed forms must be sought in other quarters. When, however, the Ferns have been acquired by hook or by crook, they must be either potted up or planted out, and this will be largely dependent upon the construction of the house. If they be transferred to pots, they will require constant supervision. If, on the other hand, they be planted out in a good body of suitable soil, they will not only give infinitely less trouble, but will remain in finer condition over a longer period. As an instance, I may mention *Athyrium f.-f. Elworthii*, which persists, with me, three or four weeks after a duplicate in a pot has died down, and so with the species. But it may be here remarked that deciduous varieties generally seem to have a tendency to live or, more or less, long after their progenitors have gone to rest. *A. f.-f.* gives up its aerial existence about the end of October; *A. f.-f. cristatum* continues for another month; whereas *A. f.-f. plumosum Druryi* persists till Christmas, and so with *Osmunda* and its varieties. The type goes first, then *cristata* follow, while *plumosum* is practically evergreen. Of course, I refer to plants under glass, and I agree with Mr. Drury that the less artificial heat the better. All I aim at is the exclusion of frost, and for this purpose I use, in severe weather, a Wright & Butler's hot-water oil-stove. Thus I am enabled to preserve the fronds of the evergreen species and varieties all through the winter, and they become not only things of beauty, when everything else has failed, but perpetual joys. A neighbour of mine is fond of twitting me about the time and labour I give to British Ferns, when, he says, you can go to Kew and see a far better collection. My reply is, "True; but those are not mine: these are." Possession is better than desire; but somehow or other one is always wanting what one has not got. Moreover, it often happens that the best varieties fetch the highest prices, and are consequently without the reach of those with limited means. That "man wants but little here below" is quite a fallacy—he is always running after "good things;" and Mr. Drury refers me to some good things when he suggests a perusal of his article for August 27, 1892. Mr. Drury may be pleased to learn that the accompanying illustration of his decorative Fern-house occupies a neat little Oak-frame on the wall of my sitting-room, and often inspires me to higher aims. *C. B. Green, Myrtle Road, Acton, W.*

CATTELEYA BOWRINGIANA.—For the information of your correspondents who have written about this species of *Cattleya*, it may be mentioned that recently a plant here produced a spike with twenty-four flowers. I cannot think that there is anything remarkable about this, as seven plants of this species are nearly the total number of our *Cattleya* plants, and the plant in question has been here seven or eight years, and subjected to a temperature considerably above that usually recommended for *Cattleyas*. Years ago I had some experience amongst this genus, and judging from observations made at that time, I believe *C. Bowringiana* to be an easily-cultivated species. It undoubtedly has a good constitution. *Thomas Coomber, The Hendre Gardens.*

LARGE ONIONS.—The fine collection of home-grown Onions exhibited at the Drill Hall on the 10th inst., by Mr. W. Pope, of Highclere Castle Gardens, was one of the best of its kind ever presented from a private garden. There was furnished instructive evidence of the remarkable effects of high culture on these bulbs as compared with what results from ordinary culture. For, in several cases, bulbs of the same variety, but grown under diverse conditions, were shown. The conditions

were, sowing seed in shallow boxes in January, and in gentle warmth under glass, growing the plants on thuly in frames, and when stout and strong, transplanting into well-prepared soil, much more thinly than usual outdoors in April; or sowing seed in shallow drills on soil prepared as usual for Onion, and in the open in the month of March, giving, during the season, such thinning and culture as is common. The transplanted plants mostly escape attacks of the maggot, and being specially thinly planted and robust, usually also suffer less from mildew than plants raised in the ordinary way. As to which method of culture will give the greatest weight of bulbs per rod of ground, there seems to be at present no information. Mr. Bowerman, at Hackwood, who this year grew the heaviest bulbs, grows his transplanted ones every year on the same ground, and finds improvement in weight and substance yearly also. It is worthy of consideration as to whether such splendid bulbs as those shown from Highclere, Hackwood, &c., would not pay to produce as a purely market product. If the public know how superior in texture and flavour they are to any other Onion, imported or otherwise, a great demand for such bulbs would doubtless soon arise. *A. D.* [As products of cultural skill these very large Onions are praiseworthy, and for certain culinary dishes useful, but in general use in the household, they are wasteful to a degree. *Ed*]

THE A. F. BARRON NATIONAL TESTIMONIAL.—I should like to suggest—quite unofficially, of course—that the secretaries or treasurers of the numerous metropolitan and provincial horticultural societies be requested to make some contribution, however small, to the national testimonial now in course of formation for Mr. Barron. It is not so much the amount, as the widely-extended nature of the subscriptions, that is wanted in a case of this kind. Some of us are anxious that it should be really national, as a genial expression of fellow-feeling for one of the most generally respected members of our profession. The act of the Royal Horticultural Society in offering a life-membership to their late garden superintendent, might well be emphasised by the Council making some special grant to this popular testimonial. The Chairman of the Committee is Dr. Masters, F.R.S., the Hon. Treasurer is H. J. Veitch, Esq., F.L.S., and all subscriptions, &c., should be sent to the Hon. Secretary, B. Wynne, Esq., 1 Dane's Inn, Strand, London, W.C. *F. W. Burbidge.*

APPLE NEWTON WONDER.—In answer to Mr. H. Markham's letter in the *Gardeners' Chronicle*, p. 710, respecting Newton Wonder Apple, I wish to say that I was the raiser of the variety, and not Messrs. Pearson & Sons, Chilwell, as stated; and that with regard to its good qualities, it cannot be too highly spoken of. It is an excellent culinary and dessert Apple from the end of the year till June. As a proof of its keeping quality, I have exhibited fruits of the previous year at several shows in the month of July. The tree grows freely, crops well, and is not liable to canker. I have a "flat" of young trees which were grafted three and four years ago which carried a fine crop of fruit this year. The mother tree, now twenty-seven years old, stands in my garden at King's Newton, and, if I remember rightly, it came into bearing in 1876. When Messrs. Pearson became acquainted with the variety they wrote expressing the wish that I would sell the tree; but I declined to do this. Then they inquired if I would sell them fifty trees, which I did; and also gave them a dish of fruit, which they sent or took to the Royal Horticultural Society's meeting at Chiswick, receiving a First-class Certificate on December 13, 1887. *Wm. Taylor, King's Newton, near Derby.*

IMPORTATION OF HORSE RADISH.—I am exceedingly pleased with your remarks on p. 683, respecting the importation of Horseradish, and would very forcibly endorse the remarks that I made at the meeting of the Royal Horticultural Society. The "imported Horseradish" has scarcely any flavour, and may be generally known by its special manner of growth, which is very different from the home-grown roots, which, if properly cultivated, are only one year's growth, while the Dutch is at least two years, sometimes three years old, being grown from what gardeners call "jags," that is, small roots. By this method the sticks are larger, but tough, and almost tasteless. They may be known by the forked rootlets at the bottom of the stick, and their sandy colour. The English produce is cut straight off with the spade, and has no roots at the end of the stick. The sale by the retailers or greengrocers of

the Dutch Horseradish has ruined the trade to a great extent; the public will not use Horseradish because imported roots are generally offered them, and after trying it a few times they "give it up." My advice to lovers of the root is to obtain some of each sort and try the difference, and I am convinced they will not again use other than English roots. The reason the greengrocer prefers to sell the Dutch is very plain; he can buy it at a very low price, and even this is more than it is worth. I often tell my

In June, 1894, I planted some in a very exposed position; after the abnormally severe weather of February last, I fully expected to see them killed, but was agreeably surprised to find them uninjured—whereas the common Laurels a few yards away were severely damaged, and many of them killed. B. Metake is no doubt the hardiest of the species. I find that June is the best time to plant, which should be in well-maured soil, afterwards giving liberal supplies of water. *W. B. G.*

but I have a vivid recollection of what they were fifty years ago, and few indeed of those who had the privilege of nailing those trees can readily forget the appearance of the wall when finished. Under Mr. Dodds, fruit culture was really well done, bush, pyramid, and standard trees were all grown, but the walls were a specialty, and the trees models of neatness. The effect of Mr. Dodds' training on myself was such that, when circumstances placed a wall covered with Morello Cherries under my own care, I made it a point to keep the pruning of the trees entirely in my own hands, and have done so for more than twenty years. The soil in these gardens is a strong loam with a clay bottom, which is unfavourable for the longevity of the trees, as it leads to gumming and canker at the bottom. The Morellos at Scone were certainly at home in the matter of soil, which is fairly strong, as those who had to trench any of it will remember, and in dry weather it was hard stuff to pulverise. *G. Smith, Vice Regal Gardens, Dublin.*

RHODODENDRON CUNNINGHAMI—In a garden in a sheltered part of this village is a bush of this beautiful plant now in full bloom. It has been in this condition all this month, notwithstanding that on three occasions during the last fortnight the thermometer has been down a few degrees below freezing point. The plant is 5 feet high and 6 feet through, and has a truss of six to nine flowers upon nearly every branch. It forms a conspicuous object amongst other shrubs, none of which are in bloom excepting two species of *Chimonanthus*. The only bits of colour near are the scarlet hips of *Rosa rugosa*. The air is highly scented with *Aponogeton* in a neighbouring pool, on the margin of which a strong clump of *Bambusa palmata* is displaying its apple-green broad leaves. *W. T., Bishopsteignton, S. Devon, December 14.*

GAME-COVERT PLANTING—My experience with *Rhododendron ponticum* as a covert-plant teaches me that this rabbit-proof evergreen can be overdone. I have seen it planted thickly for the encouragement of winged game, but in the course of a few years it had grown, and become so dense, that it proved quite the reverse to what was intended. [Why not thin? Ed.] The hybrid *Rhododendrons* I have no experience of for that purpose, but should say these would answer the purpose better, being erect-habited as a rule, less rampant, with more rigid branches, thus allowing the birds to move about freely, and make their escape when molested. I should say that these are alluded to by Mr. Harrison Weir on p. 684. Where suitable soil exists, there is not a more useful and ornamental hardy shrub for covert planting than the *Rhododendron*, but *R. ponticum* should not be too extensively used. Where rabbits are kept down, *Cotoneaster Simonsi* makes an attractive and useful covert-plant, which, when afforded light, grows freely, and is covered in the autumn with scarlet berries, which pheasants eat readily. But this shrub, like so many others, is sometimes destroyed by the rabbits. *Rosa rugosa*, I regret to hear, shares the same fate, which is a pity, as when planted in clumps of moderate size, it would surely be an acquisition. On p. 685 a correspondent asked "H. G. C." if he would give the names of a few plants which he has found to be rabbit-proof, and I hope the latter will be able to do so [see p. 719, Ed.] Now I am writing, I may mention a plant which I have found "rabbit-proof," that is, the common Box; and on a limestone or chalky soil I do not know of a more useful and hardy shrub to plant than Box as a covert plant; its only drawback is its comparatively slow growth. Some years ago I procured a neglected Box edging from an old garden, which, after pulling it to pieces, I planted over a considerable space of wooded ground, mostly Oak. The wood swarmed with rabbits, but to the best of my recollection, not a Box plant was injured by them, and in a year or two the plants had become quite respectable little bushes. I consider this to be the best use to which old overgrown Box edging can be put. Whether the "tree" Box is touched by the rabbits, I do not know. On the same estate, we had one old bush which used to seed freely, young plants coming no on every side. Is not this a very unusual thing? *J. Easter, Nostell Priory Gardens.*

CEPHALOTAXUS DRUPACEA—Referring to the note and illustration of this evergreen shrub at p. 717, I should be glad to know at about what age this plant bears seed. There are several plants in this garden, some of which have been growing in their present sites seventeen years, but as yet show no sign of bearing fruit. I note this plant, like

FIG. 17.—A NEW VARIETY OF ONION, RAISED BY MR. W. POPE, HIGHCLERE GARDENS, NEWBURY. (SEE P. 746.)

customers in the market, "You may as well buy Parsnips and scrape them, as use this imported stuff." *J. M. Mason, Market Gardener, East Greenwich, S.E.*

BAMBUSA METAKE.—Considering the limited number of shrubs that thrive well in London and other large towns, where the atmospheric conditions are so very detrimental to many things, we cannot afford to ignore anything that does thrive well. It has often surprised me that *Bambusa Metake* is not much more extensively planted, unless it is that many people imagine it to be less hardy than it is.

MORELLO CHERRY CULTURE.—In these times for reasons of economy in manual labour there is one department of work that remains pretty nearly impregnable to all innovation, and that is the pruning and nailing of fruit trees. Glancing at what our predecessors in the profession did in this line, and comparing it with that of the present, my impression is that it was better done then than now; and the recent remarks in the *Gardeners' Chronicle* by Messrs. H. W. Ward and D. T. Fish, in reference to the Morello Cherries in Scone Palace Gardens, is a notable example of the truth of my contention. I cannot say in what condition those trees may now be,

many others of a similar type, quickly changes the colour of its leaves from a deep to a pale green when growing in soil too heavy and retentive of moisture, or where chalk abounds. *E. M.* [As male and female flowers grow on different plants, your plants are doubtless all of one gender, hence the absence of seeds. *E. O.*]

THE USE OF DECIDUOUS FLOWERING SHRUBS.—"J.," p. 719, in his concluding remarks on the planting of Apple trees in shrubberies, alludes to a much felt want in the beautifying of so many shrubberies. Too often these are planted abundantly with Laurels, Yaws, and other equally common subjects, many of which might well be dispensed with except in special cases such as forming screens to shut out objectionable buildings or obtain privacy. True Portugal and the Common Laurel in its varieties are suitable shrubs for planting in the partial shade where perhaps nothing else would grow. In the open, however, other genera should be employed in preference. In planting shrubberies, whether it be with flowering plants or with evergreens, there is generally far too much of the "dotting" method practised for the planting to be effective, especially when the plants employed are of small size. How much better a group of, say, six to twelve plants of any species would look as compared with the plan of spreading the same number over fifty lineal yards of a border. Take, for instance, the different varieties of the *Pyrus* family, the *Deutzias*, *Broom*, *Syringa*, *Weigela*, *Almonds*, or even the common *Ribes sanguineum* and others, which, if planted in bold masses, afford a much finer effect than in the other manner. Not only to flowering plants do these remarks apply, but to subjects that are planted for the beauty of their branches or foliage. For instance, the common Dogwood, *Cornus sanguinea*, is most beautiful when seen in a mass of ruddy shoots, and the shrub looks well when growing beside water. *E. M.*

I can endorse all that has been said in these pages of the suitability of varieties of Crab for planting in the garden and pleasure-grounds; and when I have been given a free hand, I have done this for some time past, and the effect has been greatly appreciated by owners of gardens. I should, however, plant the large fruiting varieties, beautiful as they are, in the orchard or kitchen garden, the trees lacking the lightness of habit, and the fruits the brilliancy of colouring of the smaller-growing and fruiting ones. *H. J. MacDonald, Chichester.*

THE ROYAL HORTICULTURAL SOCIETY'S COMMITTEES.—Without going so far as to include myself as one of those gardeners in the provinces who do not read the reports of the London meetings, I can cordially re-echo the purport of "J. S. W.'s" remarks (p. 719). For some years past I have met intelligent and respectable members of the horticultural fraternity who have condemned the idea of London alone being thought the "hub of the universe" as to granting certificates to the varied produce of gardens. These persons were not gardeners alone, but include others eminent in the nursery and allied trades connected with horticulture. Personally, I have watched with interest the general good work done by the Royal Horticultural Society, but seeing that we cannot all reside near London, I do not see why it should not extend its influence outwards all round. These are days of decentralisation in many important matters, why not the Royal Horticultural Society follow suit? Surely there is plenty of organising power in the horticultural world to work out a feasible scheme of local government—if it was only put to the test. Of one thing I feel sure, viz., the Royal Horticultural Society will never gain the support of the main body of country horticulturists until its worth is brought nearer to them in a practical form. Why not have local committees near every large city and town, where long and successful exhibitions are held, giving them power to grant certificates for meritorious specimens, as from the Royal Horticultural Society? In districts where gardens are plentiful, quarterly, or even monthly meetings for a portion of the year, might be held for the same purpose. I might say more, but will refrain—first, because others more competent may perhaps take the matter up; and second, I shall be trespassing on your valuable space. *H. J. C., December 16.*

Your correspondent "J. S. W." in your issue of December 14, opens up an important and interesting subject, when he suggests that something might be done to bring the Royal Horticultural Society "into closer contact with horticulturists all

over the country." That there would be some difficulties to surmount goes without saying, but if there is any way by which the society could establish itself in the hearts of the people in the more distant, but yet important centres in the kingdom, these difficulties would soon disappear, and the connection thus formed would no doubt be the means of strengthening the society in various ways. Your correspondent says "that provincial men have not believed that all the talents were confined to London and neighbourhood," and the committees and local men might well reply "so say we all." It is nevertheless true, that were it not for those men who have not "all the talents," the Royal Horticultural Society would cease to be a factor in the horticultural world, for the "provincial" men rarely attend its meetings, and sad to think, some of them do not even read its reports—or when they do so, they give them but small credit. The horticulturists around London and in the nearer counties keep the fortnightly meetings going for the most part, and are rather entitled to the thanks of their provincial brethren than otherwise while to assert that more scant justice is done to distant fellows or to exhibits coming "from afar" is an insult to the committees, which every member of them will resent. An exhibit from Scotland, for example, will have due allowance made for its long journey. But, granting that things are at present well done, is there no possibility of improving them as "J. S. W." suggests, by having provincial committees who would sit in various centres from time to time, and before whom locally raised, but still it may be most meritorious, plants, flowers, fruits, or vegetables might be brought by persons who had no opportunity of placing them before the regular committees in London? By such an arrangement the Royal Horticultural Society would be brought into closer contact with the district, and I am convinced that many persons would become members when they found some of the society's work to interest themselves in. It is, perhaps, not to be expected that those in the immediate neighbourhood of the society's meetings can exactly measure the feelings of those at distant centres; but, speaking for myself, who was, until recently, located on the other side of the border, I have often, in past years, expressed the hope that the time would come when the Royal Horticultural Society would find itself able, like the Royal Agricultural Society of England, or the Highland Society of Scotland, to make a real royal progress through the kingdom from time to time; or if not that, then to have committees at various centres armed with its power and authority. These committees would, of course, be in direct touch with the London centre, and might—to maintain a closer link with the head—be presided over by a capable member of the central body. A glance at the list of Scottish fellows, or even north of England ones, will impress anyone with the idea that something should be tried to make an improvement. A small committee should, at the annual meeting, be appointed to consider the matter. *Robert Fife, Orpington, Kent.*

DRESDEN.

INTERNATIONAL HORTICULTURAL EXHIBITION AT DRESDEN, MAY, 1896.

The Committee of the Second International Horticultural Exhibition to be held at Dresden from May 2 to 10, 1896 has the great regret to announce the death of both the Honorary Presidents, Mr. Alfred Seibel, Mayor of Dresden, and the First President, Mr. Gustav Krantz, Director of the Royal Gardens of Dresden; Both gentlemen have always shown the highest interest in all matters concerning the exhibition. The present advanced state of the undertaking is in a high degree due to the skill and munificence of the deceased, to whom Saxon horticulturists are greatly indebted. Their memory will be held in honour by all who had the pleasure to be connected with them.

The Honorary Presidency has now been bestowed upon the present Mayor of Dresden, Mr. Boutler, Privy Councillor of Finance, while Mr. Rudolf Seidel, nurseryman of Lunzengast, near Dresden, has been elected first President of the Committee; Mr. Fr. Bouché, Director of the Royal Garden at Dresden, and Mr. L. R. Richter, nurseryman at Striesen, Dresden, are second and third.

The works on the exhibition grounds are proceeding satisfactorily. The beautiful main building is nearly ready, so is the surrounding park, which had to be laid out afresh after the designs of Mr. Bertram, Königl. Gartenbau director at Dresden. The annexes to be erected in addition to the main palace will be commenced in the course of this month, and all will be ready in time for the opening. In general everything has been done to make this Dresden Decennial Exhibition a great success.

NEW INVENTION.

SEASELL'S PATENT ORCHID-BASKET.

FASHION asserts itself in most things in some manner or other, and lately it appears either that the Orchid-grower is getting tired of the old-fashioned Orchid-basket, or that the inventors are determined that he shall try others of a different pattern. Several of these new inventions have been advanced lately, and Seasell's Patent Orchid-Basket has new features which warrant its trial in gardens. The inventors, particularising one important thing in its structure, say "the top of our basket being round and saucer-shaped, the water (which can be supplied by a watering-can or syringe whilst the plant is in position) is carried direct to the centre of the compost, wetting it all thoroughly, and the four top corners being left on, prevent rapid evaporation." Many other advantages are claimed which practical test will no doubt soon decide. The basket is neat and seemingly durable, and so, no doubt, will meet at least some of the requirements of the grower.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

DECEMBER 10.—*Present:* Mr. McLachlan, in the chair; Dr. Müller, Dr. Russell, Mr. Michael, Dr. Bœavia, Rev. W. Wilks, and Rev. G. Henslow, Hon. Secs.

Carnations attacked by Grubs.—With reference to *Dianthus glacialis* destroyed by larvae, brought to the last meeting by Dr. Müller, Mr. McLachlan added to his previous observation that he presumed that they were of the same nature as those brought before the Scientific Committee in 1892. The perfect insect obtained from those grubs was then determined to be *Hylemyia nigrescens*, for many species of black flies infest greenhouses, and it is impossible to distinguish them from the larvae alone; but on one occasion when they were bred they proved to be the species named above.

The Colours of Flowers.—The question was raised whether it would not be possible to carry out some experiments with various substances in the soil to test their effects upon the colours of flowers and fruits. Mr. Wilks remarked upon the effect produced by hoeing in quicklime and soot over the roots of various Apple trees, with the result that a crimson-scarlet hue was imparted to the fruit. With regard to the supposed action, it was a question how far the lime could affect the colour, for if the ammonia was presented in the form of sulphate, it would tend to fix the lime, though the soot itself would certainly be a vehicle for the ammonia. This is a known agent for improving the colour of Balsams, Weigelas, &c.; peat also appears to have a similar effect. Hence the deeper coloration would be due to the enhancing the assimilating powers of the foliage. The case of *Viola calaminaria* was mentioned, a species which absorbed salts of zinc from growing in localities where the carbonate of this metal was abundant; and Dr. Müller alluded to the peculiarity that it did not appear solely as an accidental ingredient in the plant, but that it actually entered into its constitution. Mr. Wilks was good enough to place some Apple trees at the disposal of the committee for experimental purposes, and it is also proposed to use white Hyacinths as soon as the procedure shall have been determined upon by Dr. Müller and Dr. Russell. The committee will be glad to receive information from any correspondent who may have had experience in the changes of colours through the action of the soil in any way.

Cypripedium. Origin of the Slipper.—Dr. Bœavia gave the following possible morphology of the labellum of this Orchid:—"In Canada a wild *Cypripedium* (Selenipedium) acule has a natural slit down the median line on the front of the slipper. This suggests that the slipper may have been originally an open labellum, like that of other Orchids, while the incurving of the edges and their final fusion made a slipper. To-day at the meeting I saw a *Cypripedium* with its slipper open. This may have been an accidental feat; but, supposing this to be so, the fact that the rent occurred down the median line shows a line of cleavage there. Moreover, in several there was a distinct line down the middle, and in some the veins converged towards that line; in others both the veins and median line were obliterated."

EDINBURGH BOTANICAL.

DECEMBER 9.—The monthly meeting was held in the rooms of this society, St. Andrew Square, on the above date, at 8 P.M.; the president, Dr. A. P. AITKEN in the chair. After the conclusion of the private business, consisting of the reports of the council and the election of new members, the first item of public business was the reading of an obituary notice of Professor GEORGE LAWSON, by the assistant-secretary, Mr. J. TERRAS, B.Sc.

The only exhibits were plants from the society's garden, and consisted of *Asystasia scandens*, *Catasetum Christyanum*, *Corynostylis hybanthus*, *Aphelandra chrysops*, *Luculia gratisima*, and others.

A report of the excursion of the Scottish Alpine Botanical Club to Tyndrum last August, was read by Dr. WILLIAM CRAIG, who described the plants found by members of the party. A description was given by Mr. J. H. BURRAGE, B.A. of the male inflorescence of *Nepenthes bicolorata*, with drawings from microscopical sections of the glands.

The curator, Mr. R. LINDSAY, read the report on "Vegetation in the Botanic Garden," and stated the absence of fruits this season was very marked. Mr. R. L. HARROW exhibited the specimens named above, and read a few notes on plants in the plant-houses.

The report of the Meteorological Observations taken at the garden during November, was read by Mr. A. D. RICHARDSON. The maximum of the self-registering protected thermometer was 57.4° on the 11th; minimum 29.9° on the 2nd. Frost occurred on two days. The maximum of the radiation thermometer in the sun was 91.6° on the 10th; minimum on grass, 19.5° on the 2d. Frost on grass occurred on fourteen days. Rain fell on twenty-three days, the total fall being 2.395 inches, and the greatest amount in twenty-four hours, viz., 0.320 inch, fell on the 15th. The mean of the barometer readings at 9 A.M. was 29.717 inches, being 0.113 inch below average for November for five previous years.

COLONIAL NOTES.

NEW SOUTH WALES.

MR. J. H. MAIDEN has published, under the authority of the Colonial Government, a handy little pamphlet on the timbers of New South Wales, and the trees by which they are furnished. It is valuable not only for the practical information it contains, but also as a means of fixing the popular nomenclature, which is very chaotic.

QUEENSLAND.

From the Department of Agriculture, Brisbane, Queensland, comes *Bulletin XII.*, for October, 1895. Its pages deal with Pesticiferous Fungi, by M. C. COOKE, M.A., and Peculiarities of the Queensland Flora, by F. M. BAILEY, F.L.S., both valuable and interesting papers, to which we shall allude hereafter.

JAMAICA.

Mr. Fawcett has issued an interesting report on the work of his department for the year ending March, 1895, and to which we must call further attention later on.

TRADE NOTICE.

THE SAITAMA NURSERY CO.

THE following letter, under date of November 1, 1895, has been received by us from the manager of the Saitama Nursery Co., 26, Nishi-Tateno, Tatinka, Kita-Adachi, Saitama-Ken, Japan:—"I beg to inform you that I have established a company called the Japan Saitama Nursery Co., for purposes of direct exportation to foreign countries of all varieties of plants, seeds, bulbs, and especially Japan Lilies, and if favoured occasionally with your orders, I will esteem myself indebted. The place in which I am now living is the habitat of the Lily in Japan; therefore the species obtainable are much finer than those of any other part of Japan. My own experience as a buyer enables me to purchase the most approved goods as cheaply as any long-established nursery here. I have edited the *Collection of the Lilies of Japan*. I will present you with one volume, and I wish you to send many orders for Lilies!" Our Japanese editor-nurseryman tells us further that he has sent a price-list of the principal species of Liliaceae grown by him, and the prices include packing, boxing, and transportation to the ship. He is decidedly quite up to date.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.;
- 7, England, N.W.; 8, England, S.W. 9, Ireland, N.;
- 10, Ireland, S. * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending December 14, is furnished from the Meteorological Office:—

"The weather during this week continued in a very changeable and stormy condition generally. A good deal of rain fell over the Kingdom, but the fall was comparatively slight in the north-east of England. Thunder and lightning were experienced in different localities on the 12th or 13th.

"The temperature underwent considerable and rapid changes, but the average for the week did not differ materially from the normal value; in most of the northern districts it was slightly below, and in the south a little above the mean. The highest of the maxima were recorded on the 11th, when they ranged from 58° in 'Scotland, W.' to 49° in 'England, N.E.' The lowest of the minima were registered either on the 8th or 11th, and ranged from 20° in 'England, S.' and 23° in 'Ireland, N., Scotland, N., and England, E.' to 29° in 'Scotland, W. and England, N.W.' In the 'Channel Islands' the thermometer did not fall below 40°.

"The rainfall was rather less than the mean in 'Scotland, England, N.E., and the Channel Islands;' in all other districts, however, there was an excess.

"The bright sunshine somewhat exceeded the mean in Ireland, the greater part of Scotland, and the south and east of England; but was just equal to or less than the mean in the other districts. The percentage registered of the possible duration ranged from 29 in 'England, E.' and 27 in 'England, S.' to 12 in 'England, S.W.,' 9 in 'Scotland, N.,' and 7 in 'England, N.W. and the Channel Islands.'"

CULTIVATION OF PLANTS UNDER COLOURED GLASSES.

—The September issue of the *Journal de la Société Nationale d'Horticulture de France* contains a note giving the following as the results of M. ZACHAREWICZ's recent experiments on the cultivation of forced Strawberries under different coloured glasses:—1st. The finest and earliest fruit was raised under ordinary glass. 2nd. Orange glass stimulated the vegetation, but was prejudicial to the quality, size, and earliness of the fruit. 3rd. Violet glass yielded a great deal of fruit, but small, inferior in quality, and not very early. 4th. Red, blue, or green glasses proved detrimental to the vegetation of the plants experimented upon.

A DRAWING OF A MODEL OF A BLENHEIM ORANGE APPLE, which, with four others, received the Banksian Silver Medal at the October meeting of the London Horticultural Society in 1822, was exhibited at the recent Oxford Chrysanthemum and Fruit Show by Miss SWANN, niece to the late Professor WESTWOOD, Walton Manor, Oxford. The drawing was accompanied by the following history of the origin of the Blenheim Orange Apple:—"Mr. G. KEMPSTER, who lived at the end of the last century at Woodstock, when a young man, discovered a plant growing in a crevice in the window-sill. He carefully removed and planted it. In due time it became a tree, and bore Apples, which were at first called Kempster Pippins, and which were so fine and of such excellent flavour that they soon became famous. In 1811, Mr. WHITMAN, gardener to the Duke of MARLBOROUGH, placed some on his Grace's table, and the Duke so highly approved of them that they were thenceforward known as the Blenheim Orange. The original tree was standing in 1826. On September 21, 1822, five Apples were gathered from it weighing from 15 oz. to 21½ oz., and measuring from 12½ to 14½ inches in circumference. They were exhibited at the October meeting of the London Horticultural Society in 1822, and the Banksian Silver Medal was awarded to them. A model was made of the largest of these five Apples, which came into the possession of the late Professor WESTWOOD." *Gardeners' Magazine.*

MARKETS.

COVENT GARDEN, December 19.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

Trade quiet; supplies heavy. Seewdrops, 70s. to 90s.; Hebrons, 75s. to 85s.; Bruces, 45s. to 60s.; Black lands, 30s. to 45s. J. B. Thomas.

SEEDS.

LONDON: December 18.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report that as is usual towards the close of the year business in seeds shrinks just now to a very narrow compass. Quotations all round are, in consequence, without any noteworthy change. For white Clover seed, the tendency of values is downwards. Blue Peas and Haricot Beans are held for former rates. The trade for bird seeds is without any special feature. Some Scarlet Runner Beans are now offering on very tempting terms. Other articles at this holiday season being quite neglected, call for no comment.

FRUITS AND VEGETABLES.

BOROUGH: Dec. 17.—Quotations:—Savoys, 3s. 6d. to 5s. 6d. per tally; Cabbages, 2s. 6d. to 3s. do.; Onions, 2s. 9d. to 3s. 6d. per bag; Horseradish, 1s. to 1s. 3d. per bundle; Apples, 2s. to 6s. per bushel; Chestnuts, 6s. to 9s. per bag.

SPITALFIELDS: Dec. 17.—Savoys, 2s. 6d. to 3s. 6d. per tally; Greens, bunch, 1s. to 1s. 6d. per dozen; Turnips, 1s. to 1s. 6d. per dozen bunches; Cauliflowers, 4s. to 6s. per tally; Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; Scotch Kale, 9d. to 1s. per bushel; Turnip-tops, 1s. to 1s. 3d. do.; Carrots, 2s. to 2s. 6d. per dozen bunches; Turnips, 25s. to 30s. per ton; Carrots, 22s. to 30s. do.; Leeks, 1s. to 1s. 6d. per dozen; Beetroot, 1s. to 1s. 3d. per bushel; Horseradish, 1s. to 1s. 2d. per bundle; Apples, cooking, Deux Ans, 3s. to 3s. 6d. per bushel; Northern Greening, 3s. to 3s. 6d. do.; Wellingtons, 3s. 6d. to 4s. do.; Apples, dessert, Bleheim, 4s. to 4s. 6d. per bushel; King Pippin, 4s. 6d. to 5s. do.

STRATFORD, D.C. 18.—Good supplies, but trade slow. Collards, 1s. to 1s. 6d. per tally; Savoys, 2s. to 3s. 6d. do.; Greens, 6d. to 9d. per bag; do., 1s. to 1s. 3d. per dozen; Cauliflowers, 1s. to 1s. 6d. do.; do., 3s. 6d. to 6s. per tally; Scotch Kale, 6d. to 9d. per sieve; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do., 2s. to 2s. 6d. per sieve; Beetroot, 2s. to 2s. 6d. bag; Horseradish, 1s. 1d. to 1s. 3d. per bundle; Parsley, 1s. to 1s. 6d. per dozen bunches; Turnips, 1s. 3d. to 1s. 6d. per dozen bunches; do., 35s. to 40s. per ton; Carrots, household, 25s. to 32s. do.; do., feeding, 23s. to 28s. do.; Mangels, 13s. to 15s. do.; Swedes, 12s. to 16s. do.; Onions, English, 30s. to 70s. do.; do., Dutch, 2s. 9d. to 3s. per bag; do., Port., 5s. 6d. to 7s. per case; Apples, English, cookers, 2s. 6d. to 4s. per bushel; do., dessert, 2s. 6d. to 4s. per bushel; do., Nova Scotian, 12s. to 14s. per barrel; Pears, English, 2s. 6d. to 3s. 6d. per bushel.

FARRINGTON: Dec. 17.—Quotations:—Savoys, 4s. per tally; Cabbages, 2s. 6d. do.; bunch Greens, 1s. 6d. per dozen bunches; Carrots, 2s. do.; Turnips, 2s. do.; Sprouts, 1s. 6d. per half-bushel; Turnip-tops, 1s. per bushel; Leeks, 1s. 6d. per dozen; Onions, 4s. 6d. per cwt. bag (English); Beetroot, 1s. per dozen; Parsnips, 3s. per sack; Celery, 9s. to 10s. per dozen; Parsley, 1s. 3d. to 1s. 6d. per dozen bunches; Apples, Wellingtons, 4s. 6d. per bushel; Bleheims, 5s. do.; Ribstons, 23s. per barrel; Baldwins, 18s. do.; Newtown Pippins, 25s. do.; Greenings, 15s. do.; Grapes, best English, 1s. per lb.; do., Almeida, 10s. per barrel; Chestnuts, 10s. per bag (best).

POTATOS.

BOROUGH: December 17.—Quotations ranged from 35s. to 80s. per ton.

SPITALFIELDS: December 17.—Quotations:—Sutton's Abundance, 50s. to 60s.; Main Crop Kidneys, 50s. to 70s.; Bruces, 40s. to 60s.; Imperators, 45s. to 55s.; Roses, 50s. to 65s.; Fidler's Colossus, 40s. to 60s. per ton.

STRATFORD, December 17.—Quotations:—Bruces, dark soil, 35s. to 40s. do., light soil, 40s. to 50s.; Reading Giants, 40s. to 50s.; Sutton's Abundance, 50s. to 60s. per ton.

FARRINGTON: December 19.—Quotations:—Maincrop Kidneys, 75s. to 85s.; Jeannie Deans, do.; Laxtons, do.; Abundance, 70s. to 8s.; Imperators, 65s. to 70s.; Bruces, 55s. to 65s.; Magnums, 45s. to 50s. per ton.

LONDON AVERAGES: Dec. 13.—Dunbar Regents, 90s. to 100s.; Snowdrops, 70s. to 90s.; Hebrons, 70s. to 90s.; Sutton's Abundance, 55s. to 65s.; Puritans, 60s. to 55s.; Regents, 60s. to 70s.; Magnums, 40s. to 50s.; Imperators, 40s. to 50s. per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending December 14, and for the corresponding period in the previous year:—1895: Wheat, 24s. 9d.; Barley, 23s. 11d.; Oats, 18s. 11d. 1894: Wheat, 20s. 10d.; Barley, 21s. 6d.; Oats, 14s. 3d.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 80s. to 95s.; do., inferior, 50s. to 70s.; hay, best, 80s. to 90s.; do., inferior, 36s. to 60s.; mixture, 70s. to 89s. 6d.; and straw, 20s. to 42s. per load.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

PERFECTION TOMATO.—A correspondent, "S. J. B.," writes:—"I have two hot-houses, 100 feet by 14 feet, with 5 feet by 3 feet beds down each side, and a path between. I intend to crop these two houses with Tomatos. Please tell me how I am to plant them in the beds (5 feet by 3 feet), so as to obtain the greatest number of plants, yet not to overcrowd, so as to get bad crops? Tomatos to be grown on single-rod system. Ought I not to be able to get five rows in the bed (5 feet by 3 feet)?"

APPLES.—Will some of our correspondents oblige "M. E." with the names of varieties of Apples which bloom late; and also kindly afford him any information concerning the times of flowering of Apple trees on grass and on bare soil; or of methods of retarding the flowering beyond the natural time, by keeping the ground above the roots protected from March to May in some manner from sun-heat?

AZALEA INDICA LEAVES BROWNED: P. & S. We should suppose that the insects (thrips and red-spider) were allowed to infest the plant in great numbers, and then that very heavy fumigation was resorted to, to rid it of them; or that the plant was dipped in over-strong insecticide of some kind. The injury is not likely to destroy the plant, but it will cause the loss of the flower-buds.

BOOKS: W. B. E. & F. Spon, Booksellers, Charing Cross, London, W.C.—H. Orm & Sons, The Tomato, with Up to date Cultural Directions, by W. Iggulden (Published at the office of Journal of Horticulture, 171, Fleet Street, London, E.C.)—Young Gardener—How Plants Grow, Plant Life, Fruit Manual, by Dr. R. Hogg; Manual of Stove and Greenhouse Plants, by B. S. Williams; The Orchid Growers' Manual, by B. S. Williams; Horticultural Buildings, by Fawkes; My Gardener, by H. W. Ward; Artificial Manures; How to Lay Out a Garden, by W. Kemp.

CHISWICK CAROL—What! Chiswick without Barron, And Barron without Chiswick? As well have a doctor Without any physic!

CRICKETS: W. W. C. Sprinkle powdered camphor or carbolic acid in their rune. If you can sink good-sized flowerpots, having a piece of tile or slate over the mouth, and let the bottom of the pot be uppermost and level with the floor of the glass-house you will have a capital trap; and if some kind of odorous bait be placed at the bottom, so much the better. Crickets, having a penchant for exploring holes, will descend by hundreds into these traps, and not being able to get out will perish.

ENGLISH TIMBER TREES: T. D. G. The principal kinds planted are Quercus sessiliflora Q. pedunculata, Fagus sylvatica, Ulmus campestris, U. glabra, U. montana, Carpinus Betulus, Castanea vesca, Acer campestre, A. platanoides, Alnus glutinosa, Betula alba and B. nigra; Fraxinus excelsior, Juglans nigra, J. regia, Populus alba, P. canadensis, P. tremula, Salix alba, and others; Tilia vulgaris, T. americana, and others. Among Conifers, Pinus sylvestris*, P. Laricio*, P. austriaca*, P. Cembra, P. Pinaster*, Abies balsamea*, Tenga canadensis*, Pseudotsuga Douglasii*, Picea excelsa*, Abies pichta, A. grandis, Cryptomeria japonica, Cupressus nookatensis, Juniperus virginiana*, Larix europæa*, Sequoia sempervirens, S. gigantea, Taxodium distichum, Libocedrus decurrens. Those having an asterisk attached are the commonly planted Conifer, but there is no reason why the others should not be generally cultivated, being quick growers and the wood

useful for many purposes. There are numerous species of Pinus which might also be planted with advantage in these islands.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—Mr. Cowles, Newport, U.S.A. The characters agree with a plant in Herb. Kew. from Herb. T. Moore, marked Lomaria gibba, crossed with Blechnum brasiliense, Royal Horticultural Society's Garden, Chiswick, 1876.—L. B. G. Cyrtopodium × Eummannium (Harrisianum × Boxallii.—Wishes to Know. Your specimen of Calanthe, judging by your description, is one of the best.—G. B. 1, Maxillaria rubescens; 2, Croton Weismannii; 3, C. Johannis; 4, Dracaena ferrea; 5, Dracaena regale; 6, Dracaena amabilis.

ORCHID COLLECTING: R. S. Of course, it is beset with dangers of many kinds. We would advise you to read the Orchid Seekers, by Ashmore Rossau and Frederick Boyle; and About Orchids, by F. Boyle, published in 1894 by Chapman & Hall. Both books were reviewed in our issue for January 13, 1894, p. 47. You will find much information about Orchid collecting and collectors at pp. 335, 422, and 487 in the present volume of the Gardeners' Chronicle.

PEACH ROOTS: C. L. C. Very likely the knobs are the result of some injury by a digging-fork or by frequently pulling up the suckers. The knobs are often clusters of buds ready to start into growth when circumstances are favourable.

RETARDING OF LILY OF THE VALLEY ROOTS: Constant Reader and W. G. This is done by large cultivators of the plant, but the exact method we are unacquainted with. The roots are maintained at a low temperature (not frozen) all through the summer and autumn—probably in the so-called cold storage places.

FIG. 128.—STRAWBERRY-LEAF FUNGUS (SPHAERELLA FRAGARIAE).

STRAWBERRY LEAVES DISEASED: L. C. The Strawberry-leaf fungus which may be kept in check by spraying with Bordeaux Mixture.

 Rich Fibrous LOAM, SILVER SAND, excellent LEAF MOULD, C. N. FIBRE, SPHAGNUM MOSS, CHARCOAL, &c. Special cheap through rates to all parts.

EPPS & CO., The Peat Depôt, Ringwood.

WINTER DRESSING.

Guaranteed to clear out Mealy Bug.

Cleanse and prepare your Fruit Trees and Plants, both indoors and out, for a healthy start next season, and destroy Sooty, Bug, Red Spider, American Blight, and the Larvæ of other insects, by using the

XL ALL LIQUID INSECTICIDE WASH (Patent).

A pure Nicotine Preparation (under a new system), from duty-free Tobacco. Absolutely safe, and no fear of injury to the buds. In use goes twice as far as any other Insecticide.
 Per Pint, 2s.; Quart, 3s. 6d.; ½ Gallon, 5s.; 1 Gallon, 10s.

POSITIVE PROOF.

The following is from one of the largest Market Growers round London, having acres covered over with glass-houses:—

MR. THOMAS ROCHEFORD writes,—

"Turnford Hall Nurseries,
 "Near Broxhourn, Herts, Nov. 9, 1895.

"Please send me on 20 gallons of your XL ALL Liquid Insecticide; I consider this is the most effective and cheapest insecticide I have ever used."

To be obtained from all Nurserymen, Seedsmen, Florists, and Sundriesmen; or, direct from—

G. H. RICHARDS, Sole Proprietor, Old Shot Tower Wharf, Commercial Road, Lambeth, London, S.E.

Further Particulars and Testimonials post-free on application.

A SIXPENNY BOTTLE will MAKE a GALLON of DELICIOUS WINE.

Sample Bottle post-free for 9 Stamps.

A LADY writes: "The 6d. bottle of Ginger Wine Essence made several bottles of most delicious wine, far better than what we have paid 2s. a bottle for. It is most suitable for children's parties."

NEWBALL & MASON, NOTTINGHAM.

MASON'S EXTRACT OF HERBS, for making delicious Non-intoxicating Beer. A 6d. bottle makes 8 gallons. Sample bottle, 9 stamps; or a sample of both, post-free, for 15 stamps.

AND SIXPENNY FOR EVERY ADDITIONAL LINE.
 If set across two Columns, the lowest charge will be 20s.
 If set across three Columns the lowest charge will be 30s.
 Page, 2s.; Half Page, 2s. 10s.; Column, 2s.

GARDENERS AND OTHERS WANTING SITUATIONS.
 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

THE GARDENERS' CHRONICLE

("THE TIMES OF HORTICULTURE")

A Weekly Illustrated Journal

(ESTABLISHED 1841)

Among the Correspondents & Contributors to recent Volumes, out of many Hundreds, may be named:—

GARDENER (HEAD).—Age 30; thoroughly experienced in all branches, Large or small place. First-class testimonials.—M., Manor House, Acton, London, W.

GARDENER (HEAD); age 30.—CHAS. HORN seeks situation as above. Over three years General Foreman at Temple House Gardens; previously four years Foreman at Spy Park, Wilts. Excellent references. Strongly recommended by G. Groves (Head Gardener), Temple House Gardens, Great Marlow, Bucks.

GARDENER (HEAD); age 31.—Mr. W. EMERTON, gardener to the Right Hon. Earl Brownlow, Belton, Grantham, can with confidence recommend a thoroughly practical man, conversant with the requirements of good establishment. Has had sixteen years' experience; four years here as Fruit and Kitchen Garden Foreman. Good references from previous places.

GARDENER (HEAD).—Age 30; thoroughly experienced in all branches of gardening. Highest testimonials from present and previous employers. Address—E. ROSS, Belvoir Castle Gardens, Grantham.

GARDENER (HEAD), married, no family.—Gentleman with confidence recommends his late Gardener; life experience in good establishments; thoroughly practical.—G., 2, Southwood Lane, Highgate, N.

GARDENER (HEAD WORKING).—Age 35, married; abstainer. Twenty years' experience in all branches of Gardening. Nearly seven years' good character.—G. G., 72, Livingstone Street, Leicester.

GARDENER (HEAD WORKING).—Life experience in all branches. Good personal character. Wife very good Landress.—R. STEELE, Swiss Cottage, Foot's Cray, Kent.

GARDENER (HEAD WORKING).—Age 33, married, three children; six years in last place. Well up in all branches of his profession. Excellent character.—W. WILKS, 33, Randolph Road, Southall, Middlesex.

GARDENER (HEAD WORKING).—Age 29; life experience in Vines, Melons, Tomatos, Stoves and Greenhouse Plants, Flower and Kitchen Gardens. Excellent references.—A. CHURCH, The Anchor Coffee House, Westbourne, Bournemouth.

GARDENER (HEAD WORKING).—Age 32; thoroughly experienced in Orchids, Stove and Greenhouse Plants, and Flower and Kitchen Garden. Excellent testimonials.—J. BROOKS, Hallow, near Worcester.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 34, married; thoroughly good all-round Man. Eight years Head Gardener to Mr. Lockhart, J.P. and four and a half previously.—J. BATES, Stoudeau Road, Henlow Station, Sheppod, Beds.

GARDENER (SINGLE-HANDED).—Age 25; eleven years' experience in all branches, inside and out.—A. B., Wells Villa, Essex Road, Enfield.

GARDENER; age 30, single.—Mr. A. FRENCH would like to recommend J. Pitts as above. Seven years' experience.—Mr. A. FRENCH, The Gardens, Ford Manor, Lingfield, Surrey.

GARDENER (SECOND, or SINGLE-HANDED).—Age 21, single; good experience in the general routine of Gardening, Inside and Out. Good character.—DOMAN, Thorpa Lea, Egham, Surrey.

GARDENER (SECOND).—Age 26; eleven years' experience in Plant and Fruit growing. Good character.—W. P., 5, Park Villas, London Road, Hackbridge, Surrey.

GARDENER (JOURNEYMAN), age 22, seeks situation Inside or Outside. Five years' experience; leaving through reducing hands.—H. MACLEOD, 13, Barcombe Avenue, Streatham Hill.

GARDENER (UNDER).—Age 22; five years' experience in good gardens. Can be highly recommended.—JOSEPH FLINT, Mr. Lambert, Ody, near Leicester.

To Nurserymen.

PROPAGATOR and GROWER of Plan's and Cut Flowers. Age 40; can raise Ferns in large quantities. Three years' reference.—SOLOMON, 6, Whiteley Cottages, Hillingdon Heath, Uxbridge.

FOREMAN.—Mr. BEALE will be pleased to recommend his Foreman, who has been with him three years, to any Gardener requiring a first-class Fruit, Plant, and Chrysanthemum Grower.—G. SMITH, Sezincot Gardens, Moreton-in-Marsh, Gloucestershire.

FOREMAN.—Age 26; life experience; good references from all places. Mr. STOCKING will be pleased to recommend.—T. GOODALL, The Gardens, Marden Park, Cateham Valley, Surrey.

FOREMAN or JOURNEYMAN.—Age 26; twelve years' experience of Fruit and Plant Cultivation. Three years as First Journeyman in Fruit Banges.—A., 168, Queen's Road, Watford, Herts.

To Nurserymen.

FOREMAN, or PROPAGATOR under GLASS.—Age 37; long experience in Market and Retail Trade, Forcing, and Seed Growing.—W. ROSEBANK, Colliers Wood, Merton, Surrey.

FOREMAN (INSIDE).—Age 26; life experience in Plants and Fruit. Can be well recommended.—Apply, WHEELER, Blackmore End, Knipton, Welwyn, Herts.

TO NURSERYMEN.—Situation wanted as OUTSIDE FOREMAN, thoroughly experienced in all outside stock, well-up in Fruit Trees and Roses.—H. HEDGES, Calthorpe, Bedale, Yorks.

JOURNEYMAN.—Situation wanted by young Man, age 21; Inside or Outside and Out. Not afraid of work. Six years' experience; both preferred.—SAMUEL BARNES, Holleham, Walls, Norfolk.

JOURNEYMAN, Inside.—Age 20; seeks a situation in a good Garden. Six years' experience. Good character. Both preferred.—W. HACKWELL, Bentley Priory Gardens, Stanmore, Middlesex.

MR. MOBSBY, Gardener, Yate House, Chip-ping Sodbury, Gloucester, would be glad to get a situation for a capital young fellow, age 23. Tall and strong; most willing; has served me well two years. General knowledge, but prefers Kitchen Garden.

TO HEAD GARDENERS.—Wanted an inside place in first-class gardens. Five years in present place. Premium, if desired.—W. BURT, Westfield, Ryde.

SEED TRADE.—Elderly Man seeks situation in Seed Shop. Could Manage small Business. Accustomed to Book-keeping, Floral Work, &c.—G. C., 3, Rothes Road, Dorling.

TRAVELLER.—Advertiser desires re-engage-ment, with good Firm. Nineteen years' experience in the North of England and North Wales. Good connection. Well up in Garden and Farm Seeds, Bulbs, Plants, &c.—J. L. CARSWELL, 55, Kempster Street, Lower Broughton, Manchester.

SEED TRADE.—Situation required as WARE-HOUSEMAN, or ASSISTANT SHOPMAN; age 24. Ten years' experience, eight and a half Scotland, one and a half Wholesale London House. Well up in Agricultural Seeds. Excellent reference.—K. R., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

BRICKLAYER seeks permanent situation on Country Estate. Eleven years' London experience. Building, Jobbing, and Sanitary Work.—H. BROOKER, 79, Danbrook Road, South Streatham, Surrey.

FLORIST.—Man, thoroughly experienced in Designs, Bouquets, Wreaths, and all branches. Best London references.—H. H., 5, Bear Street, London, W.C.

REAPING and SOWING are the two most important periods in the life of the farmer, and granting that all circumstances are favourable, he naturally, during the latter period, hopes to get an adequate return for his labour. As he sows, he expects to reap, and unless constant industry has been exercised, the harvest is generally a poor one. So it is with regard to health, if we are not constantly on the watch and destroy the germs of disease as soon as they are discerned, the body becomes weakened, and at last is unable longer to resist the attacks of the enemy. HOLLOWAY'S PILLS destroy even the most minute traces of disease, by purifying the blood and strengthening the system.

NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

Seeds—Their Cost and Quality.

IT IS A FACT all can save 3d. and 4d. in a lb. by having their seeds (of far superior quality and heavier crops) direct from us, the actual growers, on the best spot in the world for producing them, thus getting that which is so lavishly expended to force a sale for the ordinary bought here, there, and everywhere—inferior foreign productions. The secret is to get supplied direct from the actual producers (300 acres). Most practical Catalogue free to coming customers.—H. CANNELL AND SONS, Swanley, Kent.

CUCUMBER SEED.—The Roohford (true to name, as last year), 5s. per 100. Cash with order, to E. J. WICKHAM, Grower, Sutton-Scotney, Hants.

CROTONS.—Beautifully-coloured plants in variety, specially grown and hardened off for House Decoration, in 48-10s., 18s. and 24s. per dozen.—WILLIAM WHITELEY, The Nurseries, Hillingdon Heath, Uxbridge.

HENRY RIDES, SALESMAN, Central Avenue, Covent Garden, W.C. Highest Market Prices. Prompt cash.

FOR ORCHIDS of every description at Reasonable Prices, and efficient men to cultivate them apply to—**W. L. LEWIS AND CO.,** Southgate, London, N. PRICE LIST free.

FRIDAY, JANUARY 3, 1896.

SALE OF ORCHIDS.

By order of Messrs. F. SANDER & Co., St. Albans.

A fine Consignment of

DENDROBIUM NOBILE, from the Dokela Mountains, probably the finest of all the types yet offered. Gathered in the high unexplored mountain of Dokela, far beyond where any plants have been previously gathered. Most distinct-looking plants, found growing with a variety of D. densiflorum; superb varieties. Confidently expected, we believe, these plants will prove richer in new varieties than any other consignment that has ever reached Europe.

ODONTOGLOSSUM ROSSII MAJUS.—This is a Roezlii type now offered, and is unequalled for size, fragrance, and brightness of blossom. It is one of the most attractive of all the winter-blooming Orchids.

ODONTOGLOSSUM CERVANTIANI.—A splendid companion for O. Rossii majus. The plants come from the same locality which before has yielded decorum, roseum, membranaceum, &c.

LELIA ALBIDA, a lovely compact-growing, winter-flowering species, 8 to 10-flowered racemes of fragrant blossoms. The plants are in grand order, and will probably contain Bella, Marianne, Stobartiana, sulphurea, &c.

CYPRIPEDIUM BELLATULUM, the large-flowered deep maroon-spotted form.

CATTLEYA HARRISONI, the finest type procurable. A fine consignment of

DENDROBIUM DENSIFLORUM, almost unequalled as a decorative Dendrobe.

ONCIDIUM UNGUICULATUM, CATTLEYA CITRINA, LELIA AUTUMNALIS ATRO-RUBENS, the true atro-rubens, the dark large-flowered rich-coloured variety. To be SOLD BY AUCTION by

MESSRS. PROTHEROE AND MORRIS at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, January 3, 1896, at half-past 12 o'Clock.

On view morning of Sale, and Catalogues had.

THE LOST CYPRIPEDIUM

IS THE NOBLE AND MAGNIFICENT

CYPRIPEDIUM MASTERSIANUM,

Of which not more than a dozen plants exist in cultivation. We shall offer at

MESSRS. PROTHEROE AND MORRIS', 67 and 68, Cheapside, London, E.C., on

FRIDAY, JANUARY 17, 1896,

5000 PLANTS,

In superb condition, without any Reserve.

F. SANDER & CO., ST. ALBANS.

Tuesday Next—December 31.

Great Sale of 790 cases of Japanese Lilies, comprising:—

34,312	LILIU AURATUM.
430	" RUBRO-VITTATUM.
175	" WITTEL.
8,843	" SPECIOSUM ALBUM.
11,955	" RUBRUM.
960	" MELPOMENE.
800	" LONGIFLORUM.
550	" KRAMERI.
180	" TIGRINUM SPLENDENS.
2,400	NERINE JAPONICA.

Also an Importation direct from Japan consisting of 250 plants of

HEMEROCALLIS AURANTIACA MAJOR.

Collected at great expense, and all in good condition; also 300 AZALEA MOLLIS, 200 CAMELLIAS and A. INDICA from Belgium; a choice assortment of GREENHOUSE PLANTS, FERNS, &c.; 200 Dwarf ROSES, Hardy BORDER PLANTS and BULBS, Hardy PERENNIALS, CARNATIONS, and 200 lots of superlative HYACINTHS, TULIPS, and NARCISSUS.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY NEXT, December 31, at 12 o'Clock.

On view morning of Sale, and Catalogues had.

ABSOLUTE DISPERSAL SALES.

TUESDAY NEXT, DECEMBER 31, at 12.

425,000 FOREST TREES,

At the VRON NURSEY, 3 miles from Gobowen, on the G.W.R., and 5 from Oswestry.

And on THURSDAY, JANUARY 2, at 10.30 a.m.

The GREENHOUSE PLANTS, viz., 2000 Hyacinths and other Bulb Plants; 500 Arum Lilies, 300 Primulas, 300 Azaleas, Camellias, Hydrangeas, and Solanums; 10 Palms, up to 8 feet; 35 Aspidistras, Ficus elastica, &c.; 25 young Vines, 100 Ferns, 300 Geraniums, Fuchsias, &c., 10 months; 7500 Calceolarias, Fuchsias, and other Cuttings; 1500 Geranium Plants, 750 Tomatos, 8 to 12 inches; 8000 Cabbage and Canliflower Plants, 280 Marie Lonise Violets, at—

WHITTINGTON NURSERY,

adjoining G.W.R. and Cambrian Ry. Station, and 2 miles from Oswestry. Sale in Tent at 10.30 a.m.

MESSRS. WHITFIELD AND SON have received instructions from H. Barker, Esq., Trustee in Bankruptcy, to SELL by AUCTION, the above Stock, the property of Mr. B. Porter.

Catalogues and farther information may be had from the Auctioneers, Oswestry.

YORKSHIRE (8649).—Important NURSERY BUSINESS for DISPOSAL, in a fashionable inland watering place. The Property is equal to freehold, and contains an area of about 2½ Acres, with an excellent Dwelling-house, substantially built and well-appointed, also extensive ranges of twenty-nine Greenhouses, Bothy, Workshops, Offices, Stabling, &c. In addition to the Nursery is a large and admirably fitted Seedshop, centrally situate in the town, and which the purchaser would have the option of taking. Arrangements may be made, if desired, for the Stock-in-Trade (which is of an attractive description) to be Sold by Auction, or the purchaser may, if desired, take it by valuation in the usual way.

Further particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

To Nurserymen, Fruit Growers, and Market Gardeners.

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
Dear Sirs,—It affords me much pleasure to inform you the
25 ft. Annular Sail geared Windmill, on 40 feet timbers, work-
ing a set of 3 in. x 9 in. stroke treble pumps, that you fixed
here for Baron Schröder, is giving very great satisfaction,
pumping the water through 4,224 feet of pipe, to a vertical
height of about 80 feet. I must also express my thorough
appreciation of the manner in which the whole of the work
has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schröder.
R. WARNER & Co. have made and erected a similar Mill and
set of Pumps for Lord Northbourne.

DEUTZIA LEMOINEI
(each 5 fr., per dozen 48 fr.), will be sent free to all applicants. GLADIOLUS LEMOINEI and GLADIOLUS NANCEIANUS (1st Prizes at the Paris Universal Exposition, 1889; at the Chicago World's Fair, 1893; Great Gold Medal at the Amsterdam Universal Exposition, 1895), are not subject to disease under the climate of England. Address—
V. LEMOINE & SON, Nancy, France.

WILLIAMS' EARLIEST OF ALL KIDNEY BEAN.

B. S. WILLIAMS & SON'S STERLING NOVELTIES for 1896.

Our own introduction—now offered for the first time.

BEAN, DWARF FRENCH, WILLIAMS' EARLIEST OF ALL (Novelty 1896).

This new variety is the earliest French Bean in cultivation. It can be forced a good deal earlier than any other variety. It is a splendid variety for pot culture as well as for outdoor work. It grows from 18 to 24 inches high, is a strong vigorous grower with a good constitution; the pods are long, broad, and fleshy, and of a green colour. They are very tender when cooked, and of excellent flavour. Specially recommended for very early forcing or for general crop.

Per packet (½ pint), 1s. 6d.

TOMATO, "Warrior" (Novelty 1896).

This magnificent variety is a very free setter and good cropper, producing its fruits in great clusters. The fruit is large, round, and without ribs. The flesh is of a crimson colour, firm, with flavour of the finest quality. As the fruit is exceedingly symmetrical in shape, it will prove very valuable as an exhibition variety. It can be specially recommended either for indoor or outdoor culture. Per packet, 1s. 6d.

NEW GIANT PRIMULA.

PRIMULA SINENSIS FIMBRIATA "MAGNUM BONUM." (Novelty 1896).

This beautiful variety will form an excellent companion to the Giant White Primula, "Snowball," we sent out last year. It was raised by Messrs. J. & J. Hayes, Edmonton. We have every confidence in placing it before our Customers, feeling confident that it will become as popular as our Giant White variety. The plants are very sturdy and compact in habit; the flower stem is strong, and rises well above the strong, robust foliage. The blooms are produced in great profusion, of a gigantic size, beautifully fringed, and the colour is a very beautiful shade of a rich deep red. Per packet, 5s.

ILLUSTRATED SEED CATALOGUE for 1896 is now ready, and will be forwarded, gratis and post-free, to all applicants.

B. S. WILLIAMS AND SON,

SEEDSMEN AND NURSERYMEN TO HER MAJESTY THE QUEEN,

VEITCH'S

GENUINE

FLOWER SEEDS.

PHYSALIS FRANCHETI.

(First-class Certificate R.H.S., October 15, 1895). A novelty of sterling merit, very striking in appearance, producing bright red fruits, 3 inches in length and from 7 to 8 inches in circumference. Very beautiful for Christmas Decoration when cut. Per packet, 2s. 6d.

CAMPANULA PYRAMIDALIS COMPACTA (Syon House Variety).

This variety is quite distinct from the older form, being of dwarfier pyramidal habit, with larger flowers and a deeper blue; very sturdy and free flowering. Per packet, 1s. 6d.

G. F. WILSON'S BLUE PRIMROSES (New).

Very beautiful and distinct. The flowers range from pale lavender to a deep violet. Per packet, 2s. 6d.

TOMATO (ALL THE YEAR ROUND) NEW.

First-class Certificate R.H.S., April 3, 1895. Very superior variety, the fruit being bright red, of a Plum shape, very solid, and of high quality. Very prolific, producing clusters at every joint. Suitable for growing under glass, or in the open ground. Per packet, 2s. 6d.

For full descriptions of the above and other choice Seeds see Catalogue for 1896, forwarded post-free on application.

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 28, 1895.

PRESERVED FLOWERS, GRASSES AND LEAVES FOR WINTER.

BUT few flowers are preserved, because so few present that thickness of petal which enables them to undergo the process of drying and dyeing when necessary. Chief among them is the Helichrysum, a flower that needs but little dyeing, as if cut at the proper season, and carefully dried, it retains a good deal of its clearness of tint. Amateurs who preserve some blooms, and are desirous they should possess a greater brilliance, may employ Judson's dyes, and in the same way give to their dried grasses a decorative value, albeit unnatural. Germany supplies the great bulk of the dried flowers which come into the London markets in autumn.

Acroclonium represents but a small bulk; the petals lack fibre; they are thus of an evanescent character. The same applies to Rhodanthe. The most valued is the pretty Helichrysum vestitum from the Cape, known as the Cape flower. Some say it is not a Helichrysum, but no one disputes its usefulness. The Cape flower comes over in very large bulk, very largely undyed, though a few appear in striking colours; they have proved especially valuable for church decorations. Fairy flowers are made from the silken down taken from some Asclepiad, and reversed by tying closely together the upper portions of the silken hairs, they then form a perfect ball. These are collected by children in certain districts, largely in the northern parts of Canada, and are known as milk-flower balls. They, too, are much employed in church decoration, and for the better-class bouquet work.

The homely Gnaphalium comes to us from France, where they are much grown and employed for wreaths and funeral ceremonies; they are bleached and then gaudily dyed, but few retaining the natural tint of ivory whiteness. A few years ago they were our only dyed flower. Attempts have been made to preserve other flowers, but most of them have proved too fragile to be of permanent service.

Grasses are largely employed, and some of the finer examples of recent introduction are really superb. Many of the most popular grasses come from Germany. Some take the dye without the preliminary of bleaching; some have to be bleached. Many are undyed, retaining their peculiar tints. Agrostis is one but now very little used. The Oat genus supplies many; the higher forms which find a place among our ornamental grasses are not very useful, except in bunches. Of the common Oats some large imported types appear the most useful; a big-eared Oat comes from the northern parts of Italy, and when fully expanded, the husk comes away.

and a greater decorative value is thereby acquired; the Oat takes the dye well. Some of the rich bronzy-dyed heads are very handsome. *Bromus* is perhaps the most largely used generally of any grass, being so pretty and useful, and the Quaking-grass (*Briza*) is always very popular; so are the smaller forms of *Chloris*.

The popular taste goes out to the tall and stately grasses such as the Congo or Nigger-grass, a reed-like type growing in the swamps of the Congo, the flowers in small bunches making up large ball bouquets. The Elephant-grass is in its charming silken appearance one of the appearance of berries[?]; it is very useful for the most attractive in the form of its inflorescence; a tall-growing form with long stems from the Gold Coast, associating well with the preceding. *Eulalia* is also very popular, and is imported from Florida, a beautiful tuft group, in long sprays, eight or nine of these sprays springing at intervals from the stem, and it mixes well with anything dyed or natural. *Erianthus* is another popular grass, which is largely grown in Italy, and has a plumed head like that of the Pampas-grass, many of them as large as the smaller-sized plumes of the Pampas, but to be obtained at a considerably less cost. *Lagurus ovatus*, the Hare's-tail Grass, mostly from Germany, is a pretty one for mixing, but a troublesome grass to store by dealers, for the mice find their way to it, tear the heads to pieces, probably in search of seeds, and build nests for their young with the fluffy portions.

Uniola is one of the most useful of the larger grasses, the heads on long stems, and a mass of spikelets—most useful, whether in its natural tint or coloured. This grass comes from the swamps of the Mississippi river.

But the Pampas-grass commands the largest sale. Messrs. Osman & Co., of Commercial Street, E., get through in a season from 130,000 to 150,000 heads, out of that number dyeing a very large proportion. It is in the greatest demand, which is, perhaps, not surprising when its extremely showy character is considered. Enormous quantities come from different parts of America, largely from St. Louis in the West, and from the North also. A fine companion is found in the Uva-grass, with very handsome feathery plumes on long stems, most valuable for the decoration of halls, and the corners and nooks of large rooms. The plumes come from Brazil.

A magnificent new grass is found in what is termed the "Paradise Plume," a recent introduction, the plume somewhat resembling that of the Pampas, more divided, and of greater length. This is considered the most elegant of all the long grasses which are now imported.

Palm leaves of various kinds, imported in a dried form from Germany, British Honduras, &c., are received perfectly flat and rigid, and so become suitable for forming backgrounds to large bouquets; *Areca*, *Chamædora*, *Latania*, *Cycas*, &c., are the leading forms. The leaves of *Cycas* are hard and durable, but the yellow tint is rendered green by dyeing. *Phoenix* comes over with the leaflets compressed firmly against the main rib; they are opened out, put through a certain process, and curled, and are strikingly handsome. Bulrushes come from many parts of the country, and in different varieties; the main thing is to collect them before they are too far advanced, or the top will burst, and become disfigured.

Sea-weeds are largely employed, and are regarded as among the prettiest agents used in making up decorations. In their natural con-

dition the appearance is somewhat repulsive, and the smell offensive, but when put through a certain process, and dried in various delicate shades, they are most useful. They are dropped into vases, to form the groundwork of bouquets, &c. These plants are collected in various places along the coast of Pennsylvania.

But quite a new development in the utilisation of these dried leaves of Palms, &c., has come to the fore of late, namely in the renewing of these sun-burnt leaves so that they again become a vivid green, and then building them up into stately plants so like to nature as to puzzle casual observers. The leaves are passed through a certain process to render the material supple, they are then ironed, coloured, and fixed to cleverly-imitated trunks, and so a fine specimen *Latania*, *Areca*, *Phoenix*, *Cycas*, &c., is built up in a short time, apparently so full of life and so perfect in health, that it is not surprising that these artistic forms fashioned with singular fidelity to nature are well adapted for ornamental groups, filling unsightly corners, and for furnishing entrance-halls, lobbies, staircases, &c. In hotels and restaurants they prove particularly valuable—they do not fade, are proof against excessive heat and cold, require but little attention, and are supplied either with the leaves permanently fastened to the stem, or so fitted that they can be readily removed for cleaning, for which purpose a damp sponge will be found effectual. In this form the stems are provided with the necessary apertures in which to insert the leaf-stalks. Several very faithful counterparts of *Dracæna australis*, *Thrinax parvifolia*, *Phoenix dactylifera*, *Cycas revoluta*, and others, are on view, and seeing that they can be purchased at a considerably less cost than living plants, it is not to be wondered at they are becoming much in demand. Messrs. Osman & Co. are foremost in introducing novelties, and they are to be complimented upon this latest addition to their extensive display. *R. D.* [The botanical details of some of these plants require investigation. The names given above are mostly trade-names. *ED.*]

NEW OR NOTEWORTHY PLANTS.

LÆLIA × *FINCKENIANA* var. *SCHRODERÆ*,
new nat. hybr. (L. anceps alba × L. albida).

The type specimen which bore some resemblance to *L. anceps Dawsoni*, even to the purple marks on the side-lobes of the lip and the crimson blotch on its front lobe, was illustrated in the *Gardeners' Chronicle*, December 30, 1893, p. 804. The plant more nearly resembles a strong *L. albida* in its growth, and in the form of its labellum, whose side lobes do not clip the column. It bears evident traces of that species, and consequently there is little doubt that the parentage imputed to it is correct. And now a beautiful pure white form, with the exception of a few thin purple lines at the base of the lip, has appeared in the collection of Baron Schroder at The Dell, Egham, and forms a fitting subject to name in compliment to Baroness Schroder, who, like her husband, takes a keen interest in Orchids. *L. × Finckeniæna* var. *Schroderæ* is, in every respect, similar to the original plant, except that it has pure white flowers, and no crimson blotch on the lip. *James O'Brien.*

ORCHID NOTES AND GLEANINGS.

SCUTICARIA STEELII.

For a period of about four weeks we have had this species of Orchid in flower. There are several peculiarities noticeable in the plant not observed in

Orchids generally. It blooms at the dullest time of the year, its fragrance is delicious, and, lastly, the flexible leaves, 3 to 4 feet long, having the thickness of a goose-quill, are singular-looking. Our specimen has two very short flower-scapes, each carrying three flowers of about 3 inches in diameter. The sepals and petals are of an oval form, and of a very fine soft yellow colour, blotched with brownish-purple: the labellum is three-lobed, and of a softer yellow tint than the petals. As the plant shows a few of these splendid flowers every year, we think it is doing well. The plant is fixed to a piece of cork, with sphagnum and peat placed about the roots, and is hanging near the glass. *Scuticaria Steelii* was imported into Europe in 1836 from Brazil and Sarinam. It is a species worth adding to any collection of Orchids. *J. K. B., Utrecht.*

CATTLEYA LABIATA—ALBINO.

Among the tens of thousands of *Cattleya labiata* original type, introduced within the last few years, comparatively few albinos have been seen; indeed, white flowers of any species, of which the typical form is coloured, are rare indeed, and yet we do get an occasional white, one in *C. Mossiæ*, in *C. Trianaei*, in *C. Mendeli*, in *C. Gaskelliana*, even in *C. superbum*, and in *C. Aucklandiæ*, and some other species and sub-species. It is pleasing to see, after all these years of waiting for *C. labiata*, that we have got a superabundance of it, and amongst the lot have come several with white flowers. One of the best that has come under my cognizance is now in flower in the very choice collection of E. S. Ball, Esq., of Earls Court, Bowden (gr., Mr. Alexander Hay). It is a fair-sized flower, with sepals and petals pure white, without a shade of colour, as I examined it with the eyes of a severe scrutinaer. The lip is also white, with the exception of a somewhat irregular lemon-coloured blotch towards the base of the column. The column is also white, and the lobes of the upper portion of the labellum are folded back, showing it fully exposed. The lip is more spoon-shaped than circular, like the typical form in outline, and the whole flower is chaste and beautiful. There are two flowers on the plant springing from the *labiata* typical sheath, and the plant is strong, having five leafy bulbs. It is one from an importation gathered by the collector, who saw it in flower, and labelled it; and a credit it is to him, for it has turned out in every respect according to the description sent home, that variety flowering for the first time in this country.

In this collection also is another albino, having the same purity of sepals and petals, but with the lower extremity of the lip flushed and lined with the softest sheen of pink. This, on the white ground surrounding it, and contrasting with the white segments, makes a beautiful flower, somewhat like the one exhibited by Mr. Meares before the Orchid Committee. This one is dedicated to Mr. Ball's consort, and bears the name of *C. labiata alba Ballæ*. It differs from the white *Cooksoni* in having white round the labellum, *Cooksoni* being solid, beautiful cerise lip, with by far the best formed white sepals and petals of any yet seen. *J. A.*

FLOWERS AS FOOD.

In this country, with abundance of cheap food, we are satisfied with flowers for decoration or ornament to our tables, but in many foreign countries they absolutely serve as food. It is rarely that we find the corolla of a plant serving any other purpose than as a temporary protection for the reproductive organs within. But for a flower to secrete more than half its weight of sugar, and thus become an article of economic value, and even of commerce, is remarkable. Of this, however, we have an instance in the flowers of the *Bassia* of India.

Mere fugitive structures for the most part, their transitory purpose precludes the plant wasting upon them any of its store of reserve materials. In India, the young flowers of the *Banana* are regularly eaten, and in China they are pickled in vinegar. Preserved *Mabica*, or *Mowhara*, flowers constitute an important

article of food to the aboriginal tribes of India. The fleshy snow-white flowers are produced in enormous quantities in March and April. They fall off and cover the ground beneath the trees, and are gathered eagerly by the natives during the flowering season, and eaten either raw or cooked. A single tree will yield many hundred-weight of corollas; these are eaten, as a rule, once or twice a day by the poorer classes of the wild tribes of central India, and in parts of Bombay, Rajpootana, and Bengal. In Moongbay, south of the Ganges, there are about one million *Bassia* trees, so that the yield of flowers there annually cannot be far short of 100,000 tons.

The blossoms of another species, *Bassia longi-*

in Egypt is from a hard conserve of Violets made by pounding the flower, and then boiling them with sugar. This Violet sherbet is of a green colour, and is called "the grand Signior's sherbet." The petals of flowers are much used in Roumania, in flavouring preserves; Violets, Lime flowers, and Rose petals are especially used.

Having regard to their flavour, delicate odours, and agreeable appearance, the variety of confections made there is almost infinite.

The flowers of *Melianthus major* are so full of honey that the natives of the Cape Colony, where the plants grow wild, obtain it for food by shaking the branches, when it falls in a heavy shower.

callis graminea and *fulva*, and *Lilium Thunbergii* when dried, constitute one of the choicest delicacies of the Chinese kitchen. They are used to season dishes, ragouts &c. There is a considerable trade in these Lily flowers at the different Chinese treaty ports, amounting in some instances to 73,000 cwt., as at Chinkiang in 1893. The ports in which the commerce is chiefly carried on are Hankow, Chinkiang, Shanghai, and Wychow. In 1890, 5400 cwt. of these Lily flowers were sent from Hong Kong to Macao. These flowers, plucked shortly before blooming, are grown in many provinces of China; those from Shantung and Honan are especially esteemed. When cooked as a vegetable, they have an agreeable odour and sweet taste. They are much used in the sacrifices offered to ancestors by the Chinese.

The aromatic spice, Cloves, are the dried calyces or flower-buds of *Carophyllus aromaticus*. The petals of the flowers of *Anona senegalensis* are used on the Niger for flavouring dishes. The Turks prepare a cooling drink from the flowers of *Nuphar lutea*.

Another use of flowers is in the form of saffron, the dried stigmas of the *Crocus*, which has been highly prized from a remote period as a condiment. Although not much used here for colouring and flavouring food, it is largely employed in India.

The imports of these were 339 cwt. in the financial year ending March, 1892, valued at £60,272; and in 1894, 317 cwt., value £56,014. The value of the import thus often exceeds £75,000. The stigmas are the only useful product of the flower, the rest being waste, and of these it takes some 70,000 to produce a pound of saffron. Saffron is largely grown in France, Spain, Italy, Germany, and other parts of Europe, and is also produced in some parts of Asia, China, Japan, and Tunis. It is used by "liquorists" and confectioners, and also to colour cheese and butter in Europe. Saffron-cake is a pastry coloured and flavoured with saffron.

The capers used at our tables are the flower-buds of *Capraris spinosa*, employed as a pickle in vinegar, or of *Zygophyllum Fabago*, which latter are occasionally substituted for them. Another substitute is the unripe fruit of the garden *Nasturtium* (*Tropaeolum majus*). About two million pounds of capers are collected annually in the south of Europe. Primroses are excellent in salad. Cowslip flowers fermented with sugar form a domestic wine, and are also used for a balsamic drink, known as "paigle tea." The dried blossoms communicate an aromatic fragrance to home-made wines, resembling Muscatel.

The flowers of Meadow-sweet (*Spiræa Ulmaria*) are also used by wine merchants to improve the flavour of home-made wines. The young calyces of *Dillenia speciosa* are added to curries in India. The flower-buds of *Bombax heptaphyllum* are cooked with salt and pepper, and eaten by the natives of India. The flowers of *Abutilon sculentum*, an edible, as their specific name implies. The flowers of the common Marigold were formerly used in broths and soups, but are now little regarded. *P. L. Simmonds, F.L.S.*

CYPRIPEDIUM WITH PELO-RIATED SEPALS.

PELORIA, or the development in a regular and uniform manner of parts that are usually irregular, is most common in the corolla. In the calyx, or outer whorl of the flower, it is less common. Still, we do not know how better to classify the flower of *Cypripedium insignis* exhibited by Mr. Tate at a recent meeting of the Royal Horticultural Society. The uppermost single sepal, and the lowermost which consists of two in combination, were both characterized by the white tip and the purplish-brown spots that usually characterise the upper sepal only (see fig. 129).

Other flowers on the same plant showed intermediate conditions, and it will be interesting in the future to note whether all the flowers will assume the characteristic coloration and spotting. Should they do so, the gain will be great.

FIG. 129.—CYPRIPEDIUM INSIGNIS; WITH THE UPPER AND LOWER SEPALS SIMILARLY SPOTTED.

fulis, are employed in a similar manner by the natives of Mysore and Malabar, where it abounds; they are either dried and roasted, and then eaten, or binised and boiled to a jelly. The dried small red-pinkish flowers of the *Calligonum polygonoides*, known in India as "phogalli," are eaten by the poorer classes, made into bread, and cooked with ghi (a fluid butter), or eaten separately with salt and condiments. The flowers having fallen off, are swept up from the ground, and used largely as food. The flowers fill the air with a pleasant odour, as of over-ripe Strawberries. On analysis they are found to contain about 46 per cent. of sugar, and 167 of albuminoids.

The Romans had a wine made of Violet flowers, and these flowers are still used in Turkey in the preparation of sherbets. The most esteemed sherbet

The blossoms of the Shaddock are used for flavouring sweetmeats. The calyces or flower-bracts of the Roselle or Indian Sorrel, as they ripen become fleshy, and being of a pleasant acid taste, are made into tarts and jellies in India. Rose-buds are eaten by the ladies of Arabia, boiled in sugar, and made into a preserve.

In China also dried Roses are used as a condiment. At Grasse in France, all the old and stale Violets are disposed of, chiefly to manufacturers of confections, who steam and coat them pretty thickly with flaked sugar, and then sell the confections at a high price as "confections of Violets."

The beautiful bright red flowers of *Quassia amœna* are valued in Jamaica for their stomachic properties infused in wine or water; every part of the tree being bitter. The flowers of species of Lily, *Hamero-*

OUR POULTRY.

BY HARRISON WEIR.

(Copyright.)

(Continued from p. 489.)

THERE are many more varieties of French fowls besides those mentioned, but as table-fowls none superior, and many not so good; most have "a half-bred look" about them, such as the Faverolles, La Bresse, and others. Some of the best are a black breed that I saw at St. Servan some time ago; but these were far excelled by our own Dorking, the old Kent, Sussex, and Surrey breeds. I do not mean those now reared in these counties for market purposes, but those so carefully bred and tended some forty years since, and which may be again reproduced by careful mating and selection and as carefully avoiding any contact or mixture with the Shanghai or Cochin, or what is termed the Bramah; all these are gross feeders, large-boned, and carry more offal than any of the European varieties. And yet for all this, most of the mongrel-bred new breeds generally have a Cochin or Asiatic basis, for the one reason—because they look bigger and heavier, with their large bones, fluffy feathers, and full round abdomen. Still I am hopeful that the general public is being educated, though slowly, as to what is really a good table-fowl. It is, indeed, surprising with what persistency even poultry-keepers cling to the coarse, large, ill-shaped mongrel, in preference to those of almost a perfect symmetry, and of high quality, with an even distribution of flesh and fat on the breast and without an undue quantity of inward, and therefore, as a rule, wasted fat.

In the best Kent, Sussex, and Surrey short, white-legged fowls, of medium weight there is generally great excellence, and the short-legged, sturdy old English game fowl provides the perfection of a moderate-sized bird, fattening evenly, full of flesh of the most delicate flavour, with a fineness of tissue unsurpassed by any other. And of these the white-legged, black-breasted reds are deemed to hold their own against all others. The much-vaunted Indian game, though somewhat larger, is by no means so good, scarcely ever fattening on the breast, having also more abdominal fat, and with heavier and larger bones, besides which they are worse layers than any other breed, with the exception of the Malay. The old English game is again coming well to the front, and that it is rapidly rising in the public estimation is abundantly proved by the very numerous entries at the late Poultry Show held at the Crystal Palace.

Though averse to cross-breeding or cross-bred fowls as a rule—and this for the reason that some of the most noticeable kinds of the pure breeds are so extremely good, this crossing with others must have a tendency to depreciate instead of enhancing those good qualities which they already possess—still, as there exists the craving for crossing which is, I think, most pernicious, and one that is not to be found among the breeders of cattle or sheep when once the true breeds can be got; therefore, it would be well to note some of the many crosses that have been tried with more or less success.

First, there will be considered the king of fowls, the best of table-fowls, the old English white-legged game. Here you start, as nearly as possible, with the perfection of a table-fowl, no part being out of due proportion to the rest. Therefore, if a larger bird is wanted, the undoubted best and most natural cross would be either the Dorking, or the old Kent, Sussex, and Surrey. Here you get size with quality, and as both are active, good rangers and food-seekers, the young will gain much of their living by their own exertions, besides which, this exercise also serves to make them more muscular, hence more fleshy, and even causes them to put on fat, and yet to keep in a healthy condition, unlike those that are cooped and crammed.

Next to this cross is that of the Indian (so-called) game with the Kent, &c., which produces a larger fowl, with a long, and generally a lean breast, the fibre of which is close, short, and somewhat dry, the fat generally being about the belly, with much

internal fat. I have known more than 2½ lb. to be taken out of the inside of fowls of this cross when preparing them for the cook yet they reach the ideas of some as what is a good table-fowl, being of a large size, and nice appearance to the general observer.

VEGETABLE MARROW.

THE Vegetable Marrow, of which we give an illustration (fig. 130, p. 765), was obligingly sent us under the name of Courge Patate by our honoured correspondent M. Charles Naudin, the Director of the Garden of Acclimatization at the Villa Thuret, Antibes. The drawing gives an excellent idea of the size and form of the Marrow. The flesh is yellowish, very firm, and is "very good cooked." The plant is a climber, and produces abundance of fruit. It will, says M. Naudin, succeed in England. We do not find the name in M. de Vilmorin's *Les Plantes Potagères*.

THE LIMES (TILIAS).

THE confusion which has overtaken the nomenclature of nearly all the more popular hardy trees and shrubs is shared to the full extent by the Limes. In the *List of Hardy Trees and Shrubs* issued from Kew in 1894, which, it is hoped, will become the accepted standard of nomenclature for this division of cultivated plants, about twenty species and varieties divide between them some seventy to eighty synonyms, many of which are in current use. In the hope that it may be of some help towards the adoption of a more uniform and correct naming of these trees in English gardens and nurseries, I have, in the following notes, enumerated the species and most of the important varieties in cultivation in Britain, with a description of their more essential and distinctive characters. Whilst the hybrids and intermediate forms which connect several of the species are often puzzling to identify, the leading types, with flowering and fruiting material at hand, are not difficult to distinguish, and these, of course, are the most important in the establishment of a uniform nomenclature.

Tilia is a purely north temperate genus (not represented, however, in North India or Western North America). About fifteen species are known, eleven of which are in cultivation at Kew. Most of them are lofty trees producing a soft, white, and useful timber. They have a tough inner bark from which, in the case of the North European species, ropes and the well-known Bast mats are made. The leaves are alternate, usually more or less cordate in outline, and oblique at the base. They have a somewhat distichous arrangement, and in young trees there is frequently a flat, wall-tree-like arrangement of the branches. The flowers are always of some shade of yellowish white, and fragrant; they are produced on a peduncle which for half its length is united to the mid-rib of a membranous, pale or yellowish-green persistent bract, from the middle of which it appears to spring. In the American species, in *T. argentea* and *T. petiolaris* among the European species, and in *T. Miqueliana* and perhaps other Asiatic species, the stamens are joined to petal-like scales, which are absent in the other species. The fruits are small and nut-like, rarely larger than a small Pea, varying slightly in shape from globose to ovoid.

As ornamental trees in Britain, the European Limes have proved by far the most valuable, being hardier and freer-growing than the American or Asiatic ones; one or two of the best of them, like *dasytyla* (*euchlora*) and *petiolaris*, are not so much planted as they ought to be. They might, from considerations of both beauty and variety, to some extent, at any rate, replace the common Lime in gardens and parks. All the Limes like a fairly rich and moist loam, but they succeed better than many trees do on poor soil, as is shown by those at Kew; in the latter case, however, they are very susceptible to drought, and after a dry summer lose their foliage very early. They are propagated by layers, suckers, and seed, and in the

case of special varieties, by grafts. They are subject to the attacks of various gall-making and other insects, mites, red-spider, &c. There appears to be no practicable means of combating them in the case of large trees, but healthy trees seem to withstand the attacks of most of them without serious injury. A solution of soft-soap and petroleum would probably be effective on specimens small enough for it to be applied. Few trees respond to the pruner's hand more quickly than the Limes. The chief point is to obtain and keep a single erect leader, and as long as the top of the tree is within reach, all rival ones should be stopped. Where the trees show a tendency to develop into too bushy and spreading a form, the side branches should be shortened back, so as to force the tree upwards. With Limes it is easy to do this, and yet retain the natural and informal outline of the tree.

The following is a list of species and chief varieties, with the better-known synonyms:—

EUROPEAN.

- T. cordata*, syn. *T. ulmifolia*, *T. parvifolia*, *T. microphylla*.
T. vulgaris, syn. *T. intermedia*, *T. europæa*.
 " " var. *caucasica*, syn. *T. intermedia* var. *caucasica*.
T. platyphyllos, syn. *T. grandifolia*, *T. cordifolia*, *T. europæa*.
 " " var. *asplenifolia*, syn. *T. laciniata*.
 " " var. *aurantia*, syn. *T. europæa aurea*.
 " " var. *Blechiana*.
 " " var. *obliqua*, syn. *T. Beanmontii*.
 " " var. *oxycarpa*, syn. *T. cordifolia*, var. *oxycarpa*.
 " " var. *tortuosa*.
 " " var. *vitifolia*, syn. *T. vitifolia*.
T. argentea, syn. *T. tomentosa*, *T. alba*.
T. petiolaris, syn. *T. alba pendula*, *T. argentea pendula*, *T. americana pendula*.
T. dasytyla, syn. *T. euchlora*.

AMERICAN.

- T. americana*, syn. *T. canadensis*, *T. glabra*.
T. pubescens, syn. *T. americana* var. *pubescens*.
 " " var. *leptophylla*.
T. heterophylla, syn. *T. americana* var. *heterophylla*.
T. mexicana (not in cultivation).

ASIATIC.

- T. mandachurica*.
T. Miqueliana.
T. cordata (same as European species).
T. Henryana.
T. Oliveriana. } not in cultivation.
T. Tuan.

The three cultivated American species are figured in Sargent's *Silva of North America*, t. 24—7.

EUROPEAN.

T. cordata.—This Lime, which is now admitted to specific rank, is one of the three leading forms which formerly constituted *T. europæa*—a now obsolete name. It may be distinguished from the other two (*T. platyphyllos* and *T. vulgaris*) by the following characters: It is a much smaller tree; its leaves are smaller and glabrous, with the exception of tufts of pubescence in the axils of the nerves on the lower surface; lastly, it flowers later in the season than the other two. It is found wild in Britain, although sparingly; of these three species this has the most northerly habitat, the south of Britain being about the lowest latitude in Europe it naturally reaches, but it is also a native of northern Asia. It is a tree of compact and handsome growth. The leaves are 2 inches or occasionally more in width, and of the same cordate outline as those of *T. vulgaris*. The flowers are like those of the common Lime, except that they are smaller; they are produced in great abundance during July.

T. vulgaris.—This is the common Lime or Linden, and is by far the most abundant of all the species in the gardens and woods of this country. As has already been stated in connection with *T. cordata*, this species was, along with that and *T. platyphyllos*, formerly grouped under *T. europæa*. It is intermediate between the other two in several

respects, viz., in size of leaf, in the degree of pubescence on the leaf, and in the time of flowering. It is well to remember these points of distinction, but in other respects it is so well known that it is needless to describe it. It is a lofty tree in Britain, of somewhat pyramidal shape when young, but round-topped when old. There is one tree in the Arboretum at Kew just over 100 feet high—the tallest tree in the gardens.

T. platyphyllos.—This is the most southern of the three Limes, which need to be united under the comprehensive term of *T. europæa*. Although it is joined to *T. vulgaris* by intermediate forms, probably of hybrid origin, it may, in its typical condition, be recognised (1), by being the first to flower; (2), by its broader and larger leaves; and (3), by

Kew, and the variety is now established under this name in the collection. Its peculiar character is as much marked as ever, some of the branches almost forming loops. It is not, as was at first surmised, due to injury by insects (see report of Scientific Committee, *Gard. Chron.*, 1888, ii., p. 708).

vitifolia.—Leaves of more triangular outline, and with somewhat Vine-like lobing.

T. argentea.—This fine and striking Lime has been in cultivation in Britain since 1767. Loudon, who describes it as *T. alba*, says it is a native of Hungary, and looks upon it as a variety of the Common Lime. But it is at least as distinct as several others now given specific rank. It is not so large a tree as *T. vulgaris*, rarely exceeding 50 feet in height. The leaves are unequally cordate, or almost truncate at

—it differs in its graceful, pendent growth; in its warted, slightly grooved fruits, and in the leaf-stalks being, in proportion to the blades, twice the length of those of *T. argentea*, a character of which the specific name, *petiolaris*, is a sufficient reminder. A native of Eastern Europe.

T. dasytyla.—Although at present but little known in gardens, this is undoubtedly one of the most valuable of all the Limes. It is of graceful habit and vigorous constitution, bearing some resemblance in general aspect to *T. petiolaris*. Its leaves, however, are not silvery beneath, but green on both sides; indeed, the peculiarly lustrous green of its large leaves distinguishes it from all other species. They are heart-shaped, 4 to 7 inches wide, and of leathery texture; the upper surface is glabrous, but beneath, tufts of brownish pubescence occur in the axils of the veins. The bract on the flower-stalk is lanceolate, and the fruits ovoid and downy. This species is likely to prove valuable as a town tree. It is perfectly hardy, and retains its foliage longer than the common Lime, flowering in July. It is a native of the Caucasus, and has been under cultivation over twenty years. A First-class Certificate was awarded it by the Floral Committee of the Royal Horticultural Society in August, 1890. There are trees 30 to 35 feet high in the Kew Arboretum.

AMERICAN.

T. americana.—Although an exceptionally fine tree in North American forests—where, according to Professor Sargent (*Silva*, t. 24, 25) it is 60 to 70 feet, and occasionally 120 to 130 feet high—it has not proved a success in Britain, and cannot be compared in value to the East European species. From these it may be distinguished by its large leaves, which on young trees, at any rate, are often 9 inches or more across. They are slightly and obliquely cordate at the base, and they are glabrous, except in the axils of the veins beneath, which are pubescent. Although this species is not subject to injury by frost, its branches seem very subject to decay, and all the trees I have seen are more or less crooked and flat-topped. The cleanest-grown specimen at Kew is one labelled var. *mississippiensis*; it is, however, worth growing for the striking dimensions of its leaves. The fruits are ovoid, thereby distinguishing it from the two other North American species, which have globose fruits. It was in cultivation at the Chelsea Physic Garden in 1752.

T. pubescens.—Whatever value as an ornamental tree this may have in the United States, it does not succeed well in Britain. It is represented in the collection at Kew by trees 20 feet high, but they have the same unsatisfactory appearance as their near ally, *T. americana*. The following particulars are chiefly taken from the *Silva of North America*, where it is figured at t. 26: It is nowhere a common tree, but is most abundant in South Carolina and Georgia, growing to a height of 30 to 40 feet. The leaves are 2 to 4 inches long (much larger on the small trees at Kew), pubescent on first opening, but afterwards glabrous on the upper surface. The mid-ribs, the peduncles, and the flower-buds are also pubescent. It was introduced into England in 1726. The variety *leptophylla* has larger and thinner leaves.

T. heterophylla.—From the two above-mentioned North American Limes, this is easily distinguished by the silvery-white under-surface of its leaves. Prof. Sargent (*Silva*, t. 27) describes it as a tree 50 to 60 feet high, and says that few North American trees surpass it in the beauty of its foliage. The leaves, which are bright green and smooth above, are 4 to 8 inches long, and the truncate or cordate bases are more markedly oblique than in either *T. americana* or *T. pubescens*. It was introduced in 1811, but is at present a very rare tree in England.

ASIATIC.

There is not much to be said in regard to the Asiatic Limes, as cultivated trees in England. *T. cordata* has already been described among the European species, and the only others in our collections are *T. Miqueliana* and *T. mandhurica*. I have not

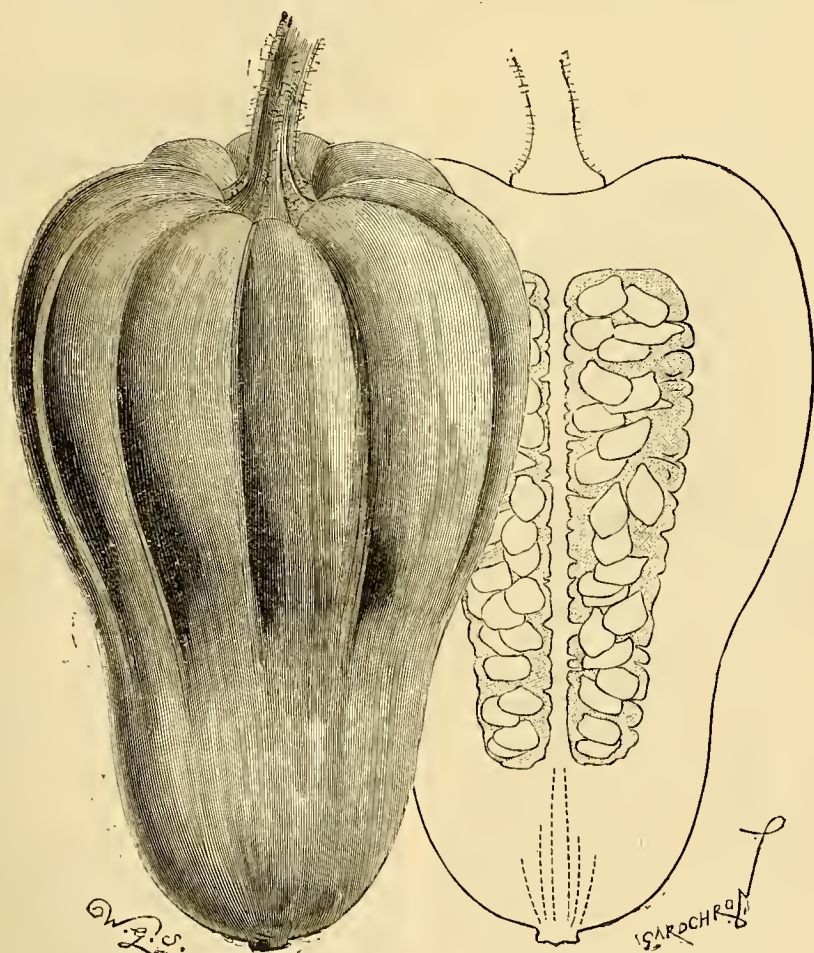

FIG. 130.—THE "PATATE" MARRON: FLESH SOLID, PALE YELLOW. (SEE P. 761.)

its leaves being pubescent usually on the whole of both surfaces, but always on the lower one. There are numerous garden varieties of this species, among which the following are the most distinct:—

asplenifolia.—A tree of very much less vigorous growth than the type, with lacinated, irregularly lobed leaves.

aurantia.—A form distinguished by the rich yellow bark of the young shoots.

Blechiana.—A strong and vigorous tree, with leaves of exceptionally large size.

obliqua.—Has a markedly oblique base of leaf. It is also known as *T. Beaumontii*.

oxycarpa.—With coarsely-toothed leaves and prominently five-ribbed fruits.

tortuosa.—In December, 1885, Mr. G. Swales sent a young Lime with curiously curved and twisted branches to the Scientific Committee of the Royal Horticultural Society. Some grafts were sent to

the base, 3 to 4 inches across, the upper surface dark green and glabrous, the lower one of a beautiful silvery hue, which gives to the tree, especially when a breeze is blowing, a conspicuous appearance. It is of erect, sturdy habit, the fruit being ovate, smooth, and traversed lengthwise by five raised lines.

T. petiolaris.—For many years the identity of this species was very obscure, as may be guessed from the string of synonyms given above. In some respects, notably in the silvery under-surface of the leaf, it resembles *T. argentea*, and it was at one time looked upon as a pendulous variety of that species. In 1884 it was figured in the *Botanical Magazine*, t. 6737, and Sir Joseph Hooker identified it as the imperfectly-described *T. petiolaris* of De Candolle. It is a tree 50 feet or more in height, with rounded leaves, having an obliquely cordate base, and measuring 2 to 4 inches in diameter. From *T. argentea*—the only species with which it is likely to be confounded

seen any living *T. cordata* that has been introduced from North Asia, but judging by the dried specimens in the Kew Herbarium they do not vary from the European forms any more than the latter do among themselves. The most obvious difference is that some of them have leaves with a white under-surface.

T. mandchurica.—A small tree at Kew under this name is 12 feet high with a bushy head. It has thin, cordate, slightly oblique leaves measuring 6 inches across, with sharply pointed, irregular teeth which are either straight or curve slightly outwards. It does not promise to equal any of the European species in beauty, at least in the London district. It is very subject to injury by spring frosts, and the branches have in consequence quite a pollarded appearance. The young bark and buds are at this season covered with a grey-brown tomentum. Professor Sargent, who describes and figures *T. Miqueliana* in the *Forest Flora of Japan*, states that the tree just described is that species, and not *T. mandchurica*. But so far as leaves go, the Kew plant agrees with Maximowicz's specimen of *T. mandchurica* gathered by himself in Amurland, and now preserved at Kew.

T. Miqueliana.—This species is a common forest tree in the northern parts of Japan, and it there attains a height of 100 feet. It is only represented by small seedlings at Kew, and it will be some time before any definite opinion can be given of its probable value in English gardens. Maries collected it in Yezzo, and his specimen is at Kew. From it, it would appear to differ from *T. mandchurica* in the more incurved teeth of the leaves, the greater obliquity of their bases, and the more obvious whiteness of the under-surface. *W. J. Bean, Arboretum, Kew.*

NEW ZEALAND FRUIT CULTIVATION.

IN these days of heavy importations of colonial and foreign fruits, it is a matter of some importance to growers and salesmen at home to realise as nearly as possible what they have to meet from their competitors in other lands; and thus it is that we take advantage of opportunities afforded by the agents of colonies and foreign powers resident in the metropolis to place the desired information on record here. Very often the power to compete possessed by our "outside" friends is over-estimated—as is the case with the colony under consideration—New Zealand. Out there, growers were going to do all sorts of things with all sorts of fruit trade—they have still to begin! In the matter of Apples, all sorts and sizes of fruit were placed on our market, and served to prove an object-lesson of what to avoid planting and sending out as eatable. To-day, old trees are being up-rooted and re-placed by finer varieties, such as are suited to English palates—the same lesson as was so well learnt by our friends in Tasmania and elsewhere. At present, the colony does not even satisfy the cravings of settlers for toothsome fruit—by-and-by they may be able to seek fresh fields with a chance of success.

This year there are 21,400 acres laid down in orchards—an increase of 313 acres on the area so returned in 1894. We may insert here the fact that a great deal of fruit consumed in the colony finds its way from other Australasian colonies and the Pacific Islands. From the North Cape to the Bluff Hill, on the extreme south of the Middle Island, a large variety of fruits is grown, such as Pears, Plums, Quinces, Apricots, Figs, Walnuts, Cherries, Gooseberries, Currants, Strawberries, and Raspberries, and produce large crops. In the Auckland district, Oranges, Lemons, and Limes flourish; many groves are now in bearing condition. The Olive flourishes in the North Island, and bears heavy crops; and the manufacture of oil is gradually becoming an important industry. Vine-growing is also carried on with far more success in many districts; tons of fruit grown under glass are sold in the Auckland markets annually. It is believed by those who know, that the production of wine may soon be entered upon in various localities; raisins, of course, will follow the

development. Auckland has extensive orchards of Apples—some of them half a century old, which produce excellent fruit—returns going up to from £40 to £50 per acre in favourable seasons—that is, when pests are kept under. In Otago orchard-planting is progressing rapidly, all fruits of the temperate zone finding a congenial soil there; railways would play an important part in this development. It may be of interest to note that the manufacture of cider is assuming considerable dimensions; also the drying of fruit, which latter is helped on by the Government in various ways. Jam is being looked after, and if—ah, that "if"—capital were but forthcoming, very much might be done in fruit-preserving for home consumption.

From the material placed at my disposal by the Agent-General, very much more of interest might be given, but space will not permit; enough, however, has been placed on record to show that much may be expected in the not far-distant future from New Zealand fruit-growers. *E. C.*

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

FILBERTS AND COB NUTS.—Nuts form a profitable crop in many parts of the country and well merit attention being bestowed upon the bushes in the matter of pruning, and dressing the land round about them with manure. They succeed admirably when planted in rows midway between the lines of pyramid Apple or other fruits in the orchard proper, but better still, if a piece of land be given up to their cultivation. This should be sheltered from the prevailing strong winds, as the blossoms readily suffer from the frosty winds which are experienced at the time when Nut-bushes are usually in bloom. To secure fine crops of superior Nuts, the bushes should be planted 10 feet apart each way, and trained in much the same manner as a well-balanced Red Currant bush. Supposing the start to be made with a strong-rooted sucker, this should be cut down to about one foot of the ground, and the growths resulting reduced to three of the strongest and best placed. These during the succeeding winter should be shortened to about 3 or 4 inches from the stem. From growths springing from these cut-back shoots a sufficient number of branches will push to afford a selection for the foundation of a bush, and they should be tied to stakes stuck into the soil in a circle, the centre of the bush being kept clear of shoots. These main branches should be cut back annually at the winter's pruning about 12 or 14 inches; a good shoot being selected from each in the summer and trained as leader, and the strong lateral growth slightly shortened. When the desired height is attained, which may be in 6 to 8 feet, all coarse growths should be stopped, and at the winter pruning old bearing wood and strong shoots freely shortened, leaving the small catkin-bearing sprays untouched. It is best to defer the winter-pruning till the female blossoms become visible, thinning and shortening being then carried out with more certainty of securing a crop of nuts. Suckers should be constantly kept down, and a moderate dressing of good manure applied every year, and lightly forked into the surface. Naturally-grown bushes are, of course, much more common than these trained and closely-pruned bushes, and deserve better treatment than usually falls to their lot. In their case a slight thinning of the tops, and the clearing away of suckers, will be beneficial. A liberal dressing of manure as far as the roots extend will certainly lead to further improvement in the size and quality of the nuts. If catkins are scarce when the trees are in blossom, as sometimes happens, a few boughs of common Hazel, on which they are generally abundant, should be cut and placed about the branches for the purpose of fertilisation.

WINTER DRESSING FOR FRUIT TREES.—Now is the right time for dressing fruit trees infested with insects. The old-fashioned remedy of hot-water in which a small lump of soft-soap has been dissolved and petroleum added, is a simple and effective dressing. A wine-glassful of petroleum to each gallon of water will be as strong as it is safe to use it, and the mixture when applied should be at a temperature of 120°. Use a syringe in distributing. Keep it thoroughly mixed whilst using by returning

every other syringe-ful forcibly into the can or pail. For American blight the same mixture is very effectual if well rubbed into the infested parts with a stiff brush.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

LILIUM LONGIFLORUM VAR. HARRISI.—These plants should be kept free from aphid, which are apt to infest them, by an occasional fumigation or dusting of tobacco-powder or snuff, the former being the cleaner and better remedy. The pots being now filled with roots, slightly more warmth may be afforded, and weak manure-water freely applied. These Lilies should be kept pretty close to the roof and not hard-forced, or the flower-buds will become "blind."

LILIUM AURATUM AND L. LANCIFOLIUM.—The bulbs of these species should be potted when received from the nursery, and the pots plunged in coal-ashes or cocoa-nut fibre, and cold frames placed over them. They will not require any water before growth commences.

MARQUERITES.—These plants, if they are now placed in a temperature of 60° by day to 55° by night, will soon afford flowers in quantity useful for cutting. An early vinery would be a suitable place for them if they can be placed where they are not shaded by the Vines. Plants struck in the autumn should be repotted into 48 and 32-sized pots, and will make nice-sized plants for flowering in the spring.

BEGONIAS.—Seed of the tuberous-rooted varieties may now be sown, using for the purpose well-drained shallow-pans in preference to pots. Place these on a shelf in the stove, and when the seedlings appear above ground, use means to prevent their damping off.

FRESIAS.—If these bulbs have been forced hard, flowers will soon appear, and the plants should be gradually given a cooler temperature just previous to the expansion of the first blooms, which will form the right sort of preparation for the removal of the pots to the cool conservatory. Applications of weak manure-water should be afforded, which will help materially to increase the size of the bulbs and improve next year's blossoms. Another batch should be brought into a warm house, choosing the most forward of those in frames. If aphid be present on them, fumigate forthwith with Richards' Compound.

MIGNONETTE.—Seed in quantity may now be sown in 48s, using plenty of mortar-rubble finely broken in the loamy soil, and a handful of horse-droppings to cover the crocks, which should be fairly plentiful. Make the soil very firm, and place the pots when sown and watered in a slightly-warm pit close to the glass.

HINTS ON WORK IN GENERAL.—At this season when the weather is mostly unfavourable for out-of-door operations, an opportunity should be found for preparing for the spring, when nearly every kind of plant requires some sort of special attention, and many re-potting. Where sufficient shedding exists, heaps of loam should be got under cover in readiness for potting *Chrysanthemums*, *Carnations*, &c. If where the heaps are prepared a label be placed in each, indicating the use it is intended for, it will save mistakes being made, and facilitate the operations. Peaty compost may also be prepared for Ferns, stove and greenhouse plants, &c., and all the variety of items required should be got in readiness for use. Plants of all kinds should be thoroughly cleaned in the winter months; and *Begonia* tubers examined, removing from them the old roots and soil, but not to skinning them in so doing. Place the tubers in cocoa-nut fibre in boxes or pans, and store in a dry, frost-proof place. Examine also *Achimenes*, *Caladiums*, *Gloxinias*, and *Hippeastrums*, to ascertain their condition, and should any of the early *Gloxinias* have begun to grow, they should be brought into the light.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

BERRY-BEARING PLANTS.—When planting new shrubberies and borders, or re-arranging old ones, care should be taken to include a good number of berry-bearing plants. They are interesting and bright during the autumn, winter, and spring months, when not taken by the birds, as they often are during severe

weather. This, however, should not discourage an extensive use of such trees. The purple berries of *Mahonia aquifolia* are beautiful during the early winter, when they often resemble clusters of small black Grapes. The plant is one of the most useful for grouping in masses, and its bright golden flowers and reddish-purple foliage are very effective during spring. *Symphoricarpos racemosus* (the Snow-berry tree), with its pretty small pink flowers and large white berries, is useful for planting in the background and under the shade of other trees. It will grow in any soil, and should be well dug about, and the suckers removed, or it will quickly overrun its bounds. There are many beautiful varieties of Hawthorn (*Crataegus*), that are showy when flowering during the early summer, and they have pretty and various coloured berries in autumn. Standard trees of these may be suitably planted as single specimens on lawns and in the back part of shrubberies. *Crataegus pyracantha* var. *crenolata*, or evergreen Thorn, with its clusters of scarlet berries, is useful for planting against pillars, arbours and rains, dwelling-house, or in warm situations it will succeed as a bush plant. Another berry-bearing plant that might be more largely grown is the Sea Buckthorn (*Hippophae rhamnoides*). It is a pretty deciduous shrub, with silvery foliage, and the female plants are usually heavily laden through the winter with yellow berries. The plant is easily propagated by offsets. Plant in the background, as it grows tall. Elders with their various coloured foliage, and scarlet, golden, or purple clusters of fruit are very beautiful when grown in masses or as specimen bushes. Several varieties of Cotoneaster are also good, as *C. microphylla*, *C. buxifolia*, *C. marginata*, and *C. thymifolia*, with fine evergreen foliage and scarlet berries. The Strawberry tree (*Arbutus Unedo*), with its fine foliage and scarlet fruit, grows best in sandy loam and peat. Then there is *Aucuba japonica*, and several varieties of *Pernettya*, also many beautiful varieties of Hollies, all worth planting. The Bilberry, Blueberry, Cranberry, and other varieties of *Vaccinium*, succeed well in peaty soils. The Mistletoe (*Viscum album*) is in great demand at this season for decorative purposes. To propagate the plant, rub the seeds into cracks in the bark of Apple-trees, Thorns, Limes, and Ash. Protect them by a piece of net until the plants grow. In districts where the plant is abundant, the Mistletoe-thrush and other birds feed on the berries, and pass the seeds undigested on to the bark and between the branches of trees.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

ANGRÆCUMS, ETC.—In the East Indian-house, *Angræcum sesquipedale* is fast pushing out its flower-spikes, and these should be examined daily for a small species of yellow thrips which attacks it. Should only a few of these insects be found, it is nevertheless advisable to fumigate the plants at once, and thus to destroy all those that are imperceptible to the naked eye; failing this, a whole year's inflorescence may be disfigured. The pretty *Angræcum pertusum* having flowered, should now be given a short rest, receiving no more water at the root than is sufficient to keep the surface sphagnum moist. *Angræcum pellucidum* is now producing its flower-spikes, and as these have a tendency to push themselves downward into the compost, they should be constantly watched, and assisted over the surface, so as to fall loosely over the sides of the receptacle in which the plant is growing. Should the spikes descend into damp sphagnum-moss, most of them may be lost. This species requires to be kept constantly moist at the root, until its pretty flowers commence to open. Two curious but botanically-interesting Orchids now flowering are *Arachnanthe* (*Vanda*) *Clarkei* and *A. Cathcarti*. They appear to succeed best when trained on upright Teak rafts or cylinders. As both plants have a distinctly pendulous habit when a certain amount of growth is made, they should not be uniformly tied in an upright position, but allowed to droop naturally. Unlike many other species of *Vanda*, the stem of these plants should not be cut down when they become devoid of their lowermost leaves, for if allowed their natural straggling habit of growth, the successful flowering of both plants is assured. At all seasons they require copious waterings from the syringe. *Angræcum Scottianum* succeeds well under similar treatment. It should be fixed to a cylinder of Teak-wood, and its thin stems tied firmly to the rods, so that the small roots may have something substantial to cling to, and when in active growth it is

very important to occasionally examine the plant, carefully tying the scandent growths in an upright position.

BRASSAVOLAS.—*B. grandiflora* and *B. venosa* being both in flower now, their delicious perfume pervades the whole house, especially at night and early morning. These species grow thoroughly well suspended on Teak rafts, the plants being fixed to the wood with their terete leaves in a pendent position.

CATLEYA-HOUSE.—Plants of *Cattleya Percivaliana* are now throwing their flower-spikes, and need a little extra water at the root. Should mild weather continue, this house will well suit their requirements, but in the event of severe frost a few degrees more warmth will be necessary. Plants of *Peristeria elata* whose pseudo-bulbs are fully made up, should be placed in a light position in this house, and be given sufficient water at the root to prevent shrivelling. Other species now at rest, and which require similar treatment at this season, are *Chysis Chelsoni*, *C. bractescens*, *C. Sedeni*, and *C. aurea*, also such Orchids as *Luddemannias*, *Acinetas*, *Gongoras*, *Stanhopeas*, &c.

THE KITCHEN GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

GENERAL WORK.—The weather being too wet to work on the ground without doing harm, sundry other jobs may be attended to. Pea-stakes and Bean-roads may be cut before the sap rises, and they may be trimmed and put in sizes ready for use. Look over those saved from last season, and pick out the best to be fresh pointed. Boxes will need attention, and a regular stock of new ones should be made each year, besides repairing the old ones. Wash all pots, and put them away in a dry shed ready for use, keeping each size in its proper place. The seed-room may be overhauled, throwing away all useless seeds. New home-saved seeds may be put away in their respective drawers, which should be plainly labelled, so that they may be readily found in a busy time. Look up notes respecting crops and seeds, and put them in order, for the new seed lists are now arriving. Ice-houses, if empty, should be thoroughly cleaned out and whitewashed, and left open to sweeten. Tools that were not put in order after the work last winter, should be sharpened and mended, if necessary. Bracken or other material should be cut and put in readiness for the stacks of ice made in the open. We are still using from the outside stack, and the ice-house is not yet opened. Box-edgings that have become old and leggy should be relaid, as nothing gives a garden a more untidy or neglected appearance than badly-kept edgings to walks. If gravel can be obtained on the estate, a stock should be screened now and put ready for future use. The walks may be turned over where the practice is adopted, and if they are fresh gravelled now, a light coat later on in the spring will make all tidy. If tiles, stone, or brick edgings are used, they should be straightened and mended where necessary.

ROOT-HOUSES should be given close attention. Potatoes are, perhaps, the most important of these. Look over the tubers carefully, and remove any suspicious ones as well as as those which are decayed. Room will now be found to spread them out thinly. Onions should be sorted, and any which seem inclined to grow selected for present use. Give plenty of room to all the smaller ones of James' Keeping and other good-keeping varieties. If not yet done, tie up in bundles, or truss if plenty of time on hand, any that may have stalks enough attached. In this shape they can often be accommodated in places better adapted for keeping them. Shallots and Garlic should be cleaned and put safe from frost, ready for spring planting. Carrots, Turnips, and other roots may receive similar attention. Take off all growths, as if these are let grow, the roots are not of good flavour.

FRUITS UNDER GLASS.

By RICHARD PARKER, *Gardener, Goodwood, Chichester.*

MELONS.—In order to cut ripe fruits in April, seed should be sown in the first week in the new year, or slightly earlier. For years past it has been the practice to sow seeds for the earliest crop on Boxing-day, and I have seldom failed to cut a ripe fruit in the first week in April. Two seeds should be placed in 3-inch pots at a distance from the edge of the pots at about half an inch, and half an inch

deep, the soil being sifted loam and leaf-mould, the soil being made moderately firm below the seeds, and less so above them. Sown in this manner, the plants can be repotted or turned out without root-disturbance. It is an advantage to grow the earliest Melon-plants in pairs till they reach 1 foot in height, owing to unavoidable losses by damping, insects, &c. The pots should be clean, dry when used, and well drained. The pots containing the seeds should be plunged in a hotbed having a bottom-heat of 80°, and top-heat of 70°; germination will then take place in few days, and if the soil be fairly moist, no water will be required till the plants appear, and may not then be required. Tepid water should be used when water becomes needed, and it must be carefully afforded through the spout of a small water-can, not wetting the leaves or stem. The plants should not stay many days in the frame, or they will become drawn and weak; but they must be gradually accustomed by affording air to the frame, to a warmth of a pit or house of about 65° or 70° by day, and not less than 60° at night. Stand them on a shelf near the glass. For early work, the plants may be fruited in 10 inch pots, or two plants may be grown in a 12 inch one, but I prefer planting them out on hillocks of turf on a hot-bed. In the meantime these hot-beds should be made up in the house or pit in which the plants will be grown, using stable litter and leaves in this proportion, the first may be one-third and the latter two-thirds, which I have recommended to have in readiness. These should have been turned over and well mixed together two or three times, and then left to ferment for a few days before making the beds. This may be from 3 to 4 feet in width, and built up pretty close to the trellis, so that the plants may be near the roof glass. If the young plants occupy the house whilst the hot-bed is being made, means must be taken to let out the ammonia arising from fermentation, or they may get killed by it; indeed, it is better to have the plants meanwhile in a plant stove or Pine-pit. When forming the hillocks of soil, a late or two should be placed under each, so as not to let the roots get into the hot-bed materials, as this would result in very rank growth. Seed may soon be sown for succession, the treatment of the seed and plants being similar to that given. There must be caution used in the matter of fire-heat to young Melon-plants, or red-spider will soon infest the foliage, causing great injury to the plants.

CUCUMBERS.—Plants which may be in fruit will receive every encouragement to keep them in health, and remembering that much moisture at the roots is almost as injurious to the plants at this season as dryness. The soil should be kept fairly moist, and nothing more. A small quantity of Clay's Fertiliser, or bone-meal, afforded once a week as a surface-dressing, will keep the plants in a better condition than farmyard manure-water. Be careful in regularly removing spent foliage, male blooms, and deformed fruits, and do not allow the plants to carry any more fruit than are really required, and these should be cut before they are fully grown.

TOMATOES.—Young plants in small pots must be kept growing near the glass in a fairly warm house, ventilation being given during mild weather. The plants should not be allowed to become pot-bound, nor be over-potted. Weak liquid-manure may be afforded once or twice a week to bearing plants, and the stems tied to stakes as required. Keep the growth sturdy during dull days, as plants rendered weak in any way seldom give good crops later on. Seed of an early-fruited variety may be sown thinly in pans, and placed on a shelf in a warm-house, pricking off the seedlings when large enough to handle at 2 inches apart, and keeping them close to the glass. It is from this sowing that fruit may be gathered in April. Plants in bearing may be top-dressed with fresh loam and well-decayed manure as the roots extend. Weak manure-water made from sheep's droppings, is also beneficial in assisting the fruit to swell. Continue to ventilate the house during mild weather, affording artificial heat all the same.

SAND-HILL PLANTING.—Mr. RYDBERG (*Contrib. U. S. National Herbarium*, iii. 3, Sept. 14, 1895), has an interesting paper on the sand-hills of Nebraska. The characteristic grasses which bind the sand together are *Calamovilfa longifolia*, *Eragrostis tennisi*, *Redfieldia flexuosa*, and *Mühlenbeckia pungens*. Mr. RYDBERG recommends the planting in suitable situations of *Panicum Banksiana* and *P. ponderosa* var. *scopulorum*.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—36°7'.

A RETROSPECT of the progress of horticulture for the year now at its close is, as usual—

"Of a mingled yarn, good and ill together."

We hope we shall not be thought too optimistic if we say, that putting aside matters of secondary importance, the good has predominated, and horticulture has progressed. It is likely enough that anyone seeing only the routine exhibitions, for instance the endless Chrysanthemum shows, presenting little or no difference one from the other, except in extent, would say that the wheel turned round but did not advance. It is not, indeed, in this direction that experience has taught us to look for progress. The most encouraging signs we see for the advance of horticulture in general, are the steps being taken in our rural districts for the promotion of technical education. We are still a quarter, if not half a century behind other nations in this particular; but, at last, we are moving, and when we do move, we are apt to do so pretty thoroughly. Technical education is understood in various ways in the different counties. In some, it means perfected routine; in others, it means instruction in general principles; whilst in a third category, it implies not only increased skill, but skill directed by judgment begot of knowledge, which should be the highest aim of practical cultivators. Each district has its own requirements, and is influenced by its own local conditions, so that there is no necessity to uphold the one at the expense of the other; suffice it to note, with satisfaction, that in one way or in another, progress is being made, and progress of a kind that is likely to increase in volume rather than otherwise. The large extension of fruit-growing and of market-gardening is also a matter for congratulation in the present depressed state of agriculture.

The garden crops generally have been good this year, the extraordinary cold of February coming too early to inflict much damage; whilst the hot, dry autumn, if there be any thing in well "ripened wood" as offering a forecast for the future, should favour our fruit crops for the following season.

Exhibitions in London and the provinces have been more numerous than ever, but none has presented any novelty or any special feature worthy of comment in a brief retrospect like this.

Of literature pertaining more or less to horticulture, the year has been prolific. It will be sufficient to mention the completion of the

Index Kewensis, the compilation of which is indeed a boon, the appreciation of which will constantly increase as time goes on. KERNER & OLIVER'S *Natural History of Plants* is another book that will be of the utmost value to thoughtful horticulturists. Dr. WEISS, too, has rendered good service by publishing a translation of Dr. SORAUER'S popular *Treatise on the Physiology of Plants for the Use of Gardeners*. This is the nearest approach that has yet been made to LINDLEY'S *Theory and Practice of Horticulture*, the theoretical portion of which latter volume, of course, is long out of date. Professor SARGENT'S monumental work on the *Trees of North America* progresses steadily, and will be of the utmost service to arboriculturists. The numerous hand-lists and other publications issued from Kew are within the means of any ordinary gardener, and should find a place in every garden-library. Of the new edition of PAXTON'S *Calendar*, prepared by the members of the staff of this journal, it does not become us to speak further than to say that it is intended for cottagers, allotment-holders, and occupants of small gardens generally, and has found much favour with the public. The useful monograph of Masdevallis issued under the auspices of the Marquis of LOTHAN by Miss WOOLWARD is approaching completion. Another work which will take its place as a classic is Miss AMHERST'S *History of Gardening*, lately reviewed in our columns.

Forestry has at length been enriched by a scientific treatise of the first order of merit, published by Dr. SCHLICH, with the assistance of some of his colleagues at the Cooper's Hill College. A new and revised edition of our old friend BROWN'S *Forester* has also been published.

The reports of the Epping Forest Commission express in the main the views and feelings of those who have any knowledge of woodland management, and an intelligent love of natural history. They will, we hope, for a time at least, silence the clamour of well-intentioned but ill-informed enthusiasts.

The obituary record is unfortunately long, and includes the names of some of our best-known gardeners, such as WILLIAM THOMSON, THOMAS BAINES, JOHN WILLS, RICHARD GILBERT, T. H. RABONE, PETER GRIEVE, C. F. BAUSE, and others. Among men of science more or less directly connected with horticulture who have been taken from us, mention may be made of PASTEUR, HUXLEY, BABINGTON, BAILLON, BOMMER, BERNARDIN, HELLRIEGEL, RILEY, TRUFFAUT, VESQUE, Professor LAWSON, CLEGHORN, and others.

The discovery by Lord RAYLEIGH and Professor RAMSAY of a new element in the shape of argon does not seem at present to have much connection with practical gardening, but one feature of these epoch-making discoveries is, that the most unexpected results accrue from them; and we may not unreasonably look to future researches into the nature and action of this gas to supply fuller information than we have, at present, on the nutrition of plants, and the part that nitrogen plays in the vegetable kingdom.

As the discovery of argon caused a flutter of excitement among scientific men, so amongst the gardening fraternity consternation was felt at the circumstances attendant on the retirement of Mr. BARRON from Chiswick. Whatever object the Council of the Royal Horticultural Society may have had, they succeeded in wounding the susceptibilities of the gardeners and of their own committees by the ill-advised manner in which, no doubt unwittingly, they carried out their object. The Society has acted handsomely to their late Superintendent, so

that it seems clear that no personal slight was really intended to him. As Mr. BARRON retires with a substantial pension, and has been made a Life-Fellow, there is no necessity to dwell on the personal side of the question. But wholly apart from these personal considerations, there are principles involved in the unfortunate mode of action adopted by the Council which cannot be thrust aside by the somewhat lame apology that has been published on their behalf, principles which involve the honour of the several committees. These several committees have been, as usual, busily engaged during the season, and it behoves them to be more than ever stringent in their awards. Wherever circumstances permit, no definite award should be given till the exhibit has been watched during growth at Chiswick. A remark of Mr. SHEA'S in the pages of our energetic contemporary, the *Gardeners' Magazine*, illustrates the desirability of insisting, wherever it is possible, upon some more thorough test than is possible by the mere comparative inspection of flowers on a board. Mr. SHEA'S statistics show that the great majority of certificated Chrysanthemums never afterwards make their appearance on the exhibition tables; or if they do, that they speedily fail to retain the favour of the growers.

Our exhibitions may be attractive to the public and very seductive to prize-seeking exhibitors, but their main object should be the advance of horticulture—a point not sufficiently considered by the Royal Horticultural Society, and almost ignored by the provincial societies.

Of the future we need not speak now, but it is impossible not to look forward with eager expectancy to the future development of Chiswick as a trial garden and experimental station. At Chiswick we look for processes, at the exhibition table for results. The results may be the more stimulating, but the processes are the more instructive to the gardener.

THE *Journal of Horticulture* for December 5 has an excellent and interesting article on this subject, which shows, among other things, the need of maintaining at Chiswick a "type collection," not only of Grapes, but of fruits and vegetables, which could be referred to in case of dispute or uncertainty. At the same time, a collection of photographs and coloured drawings should find place in the Lindley Library, so that we might have, as botanists have in their herbaria and libraries, some authentic standard of reference. Of course, allowance must always be made for natural variation, as well as for that which is obviously the result of a change in the nutrition of the plant or other conditions. The necessity for this is well exemplified in the following extract from our contemporary:—

"We only attach small, if any, importance to slight variations in shape of berry as a factor in distinctness of variety. A few years ago we called on a large grower of Muscat Grapes for market. He was busy at the moment superintending the forking into half the length of the inside border the heaviest dressing of nitrate of soda we have ever seen or heard of being used. "Just an experiment," he remarked. When the Grapes were nearly ripe we were shown the results. The berries were half as large again as those hanging from the other half of the roof, and the oval shape had practically vanished. To use the expressive phrase of the owner, the nitrate of soda had "blown them out;" those on the other half of the roof (border undressed) were much smaller, and quite oval. This is mentioned as a striking example of variation in which the direct cause was known. We do not advise private gardeners to follow the example mentioned, or they

FIG. 131.—SYNANDROSPADIX VERMITOXICUS (Engler).

might "wear out" their Vines too soon. This market grower is always working on the express system—clearing out some houses and planting others every year; but this cannot be done in private gardens."

The general conclusion at which our contemporary arrives is stated in the following terms:—

"We are decidedly of opinion that the Grapes grown as 'Gros Maroc' and 'Cooper's Black' much too closely resemble each other to be shown as distinct varieties, and consequently an exhibit containing them must be liable to disqualification."

SYNANDROSPADIX VERMITOXICUS, Engler.*—This ornamental and very distinct Aroid flowered recently in the Royal Garden, Kew, and from it our illustration (fig. 131) was made. It is a native of Tucuman, one of the Argentine provinces, and on the first occasion of its flowering in this country, was figured in the *Botanical Magazine* at t. 7242, from a plant cultivated at Kew. In habit and foliage it bears some resemblance to a *Richardia*, but the inflorescence is more like that of *Taccarum Warmingianum* than of any other Aroid known to me. Like the rest of the group to which it belongs, its root-stock is a tuber, which is said to attain a weight of 3 to 4 lb. The leaves are three to four in number, with petioles $1\frac{1}{2}$ to 2 feet long, of a light green, marked with darker green lines, and the blade is bright green, 13 to 14 inches long, by 8 to 11 inches in breadth, cordate-ovate, acute, with wavy margins. The inflorescence is produced with the leaves, on a peduncle 6 to 8 inches long, which is of a light green, with darker green lines; the spathe is about 7 inches long, and 3 to $3\frac{1}{2}$ inches broad, erect, elliptic-oblong, concave, convolute at the apex into a subulate tail-like point; the outside is green, and the inside dull purple-madder, both sides being ornamented with short darker streaks. The lower part of the spadix which bears the female flowers is adnate to the spathe, the rest being free, and covered all round with male flowers; there is no perianth to the flower, but the green ovaries are surrounded by four ovate, obtuse, dull purplish staminodes the stamens of the male flowers are united into a stout, swollen, rose-purple column, surmounted by a small head of blackish-purple anthers. There are several other Aroids in the Argentine Provinces and South Brazil, that are more or less allied to this plant, belonging to the genera *Taccarum* and *Asterostigma*, which are ornamental in character, and well worth the trouble of introducing. A few of them have been under cultivation, but only in a very limited quantity, I believe, and they appear to have soon died out. There ought to be very little difficulty in raising them from seed, but I believe that they require to be cross-fertilised, as, in the few cases known to me, where Aroids with an inflorescence of this character have been self-fertilised, the result has always been a failure. *N. E. Brown.*

OUR ALMANACK.—Secretaries of Horticultural Societies and others, are earnestly requested to forward *immediately*, the dates of Show Fixtures and of Meetings of Botanical and Horticultural Societies of any kind for 1896, for insertion in the Almanack, to be published in our issue for January 4.

CITY OF LONDON COLLEGE, WHITE STREET, MOORFIELDS.—Professor BOULGER, F.L.S., F.G.S., A.S.I., will deliver an introductory course of twelve lectures on "Commercial Botany," on Thursdays, 8 to 9 P.M., commencing Thursday, January 9, 1896. The following subjects will be treated of: The History of our Trade in Vegetable Products—Food Substances—Drugs—Oils and Oil-seeds—Gums, Resins, and Rubbers—Dyes and Tanning Materials—Fibres and Paper Materials—Timber and other Woods—Agricultural Plants—Miscellaneous Vegetable Products.

— During Lent Term, 1896, Professor BOULGER, F.L.S., F.G.S., A.S.I., will also deliver a course of ten lectures on "Forestry" on Thursday evenings, com-

**Synandropadix vermitoxicus*, Engler, Bot. Jahrb., 1883, vol. 4, p. 82.

meencing January 16, at 9 P.M., with special reference to the examinations of the Surveyors' Institution. Practical demonstrations in the country will be given during the spring. Syllabus: Climate and Trees—Land suitable for Arboriculture—The Draining and other preparation of the Land—Nurseries and their Management—Planting Operations—Thinning and Maintenance—Felling and Barking—Timber Measurement—Exploitation and Management of Coppice—The distinctive characters of the various British Timber Trees.

KEW SEED LIST.—In the form of an appendix to the *Bulletin* for 1896, has been published a list of seeds of hardy herbaceous plants, trees and shrubs, available for exchange with other gardens and with regular correspondents. These seeds cannot be had by purchase. The list occupies no fewer than thirty-five 8vo pages of double column.

RARE BOOKS AND THEIR PRICES, with chapters on Pictures, Pottery, Porcelain, and Postage Stamps, by W. ROBERTS. (London: GEORGE REDWAY) Mr. ROBERTS has here enlarged upon and republished in book-form certain of his articles which first appeared in the *Nineteenth Century* and the *Fortnightly Review*. He treats of the present-day mania for collecting, and of the large amounts of money which those able to do so will spend on their favourite hobby. Collecting has its good and its bad sides, and both are here touched on, but the book is chiefly occupied with mention of rare books, articles of porcelain and pottery, and with quaint and true tales of the prices which some of these have fetched at different stages of their career. It is an interesting volume, both to those who find their happiness in pursuing the collecting mania and to others who prefer to watch such enthusiasts with amusement and without joining them in their pursuits.

BERLIN INDUSTRIAL EXHIBITION, 1896.—One of the special features of this exhibition is to be an interesting and instructive department of horticulture. On one of the best-situated positions, near the main building, and between the recreation-ground and the Marine Panorama, will be opened five hectares for the sole purpose of the horticultural section. This portion of the exhibition, which is already partly completed, is being carried out under the direction of the Economy Councillor, Herr L. SEITZ, an acknowledged authority on horticulture. Some eighty firms in Berlin and environs are here represented in a more or less prominent manner. About half of the ground allotted to this group is claimed by the tree plantation exhibitors, and by the landscape gardeners. A splendid park of 1900 metres square has also been skilfully arranged on well-chosen ground, and several prominent gardeners have secured a large and desirable position to utilize for original landscape gardens. A lawn-tennis ground in true English style is also contemplated. Fruit culture of every species will also play an important part in the Berlin gardening industry.

"COTTAGE GARDENING."—Vol. vi. of *Cottage Gardening*, edited by Mr. W. ROBINSON, is now ready. (Publishers, Messrs. CASSELL & Co) It treats of the usual subjects—poultry, window and town gardens, allotments, bees, simple cookery, and housekeeping; and is quite equal to the previous volumes in value and interest.

CUT FLOWERS: ORCHIDS.—M. LUCIEN LINDEN'S energy is remarkable. Not content with the direction of the Horticulture Internationale, and the publications connected therewith, he has established at Moortbeke, near Brussels, *un vaste établissement* for the sale of cut flowers of Orchids. The same enterprising man of business has, in conjunction with M. AUGUSTE DALLEMAGNE, founded at Rambouillet, France, a special establishment for the growth of Orchids.

ANCIENT SOCIETY OF YORK FLORISTS.—The annual dinner was held under auspicious circumstances on the 18th inst., there being about sixty members present. Mr. Alderman McKAY presided, and incidental to the observance of a long toast list,

it was stated that the Society intended to hold an exhibition in York during next year, contemporaneously with the show by the Yorkshire Agricultural Society. On this occasion the National Carnation and Picotee Society will also be represented. The finances of the Society are satisfactory, notwithstanding that unfortunate weather attended the recent exhibition of Chrysanthemums, there being a reserve of £210.

THE ROYAL HORTICULTURAL SOCIETY.—The meetings for 1896 have been arranged to take place as follows:—At the Drill Hall, Westminster, on January 14, February 11, March 10 and 24, April 7 and 21, May 5, June 9 and 23, July 14 and 28, August 11 and 25, September 8, October 13 and 27, November 10 and 24, and December 15. The annual general meeting will be held at the Society's offices, 117, Victoria Street, S.W., in the afternoon of February 11. The Temple Show will take place on May 19, 20, and 21. A great exhibition of British-grown fruit will be held at the Crystal Palace on October 1, 2, and 3.

VEITCH MEMORIAL MEDALS AND PRIZES.—At a meeting of the Trustees held on the 20th inst., Dr. Hogg in the chair, it was resolved to present a Veitch Medal to the following gentlemen, in recognition of their services to scientific horticulture, forestry, and arboriculture—viz, M. Henri L. de Vilmorin, of Paris; Professor Sargent, Director of the Arnold Arboretum, Boston, U.S.A.; Mr. F. W. Barbidge, M.A., Curator of Trinity College Botanic Gardens, Dublin; and Mr. Malcolm Dunn, of the Palace Gardens, Dalkeith. It was also resolved to place at the disposal of the National Rose Society two medals and two prizes of £5 each, one to be competed for at the metropolitan show held at the Crystal Palace, and the other at the northern show to be held at Ulverston; two medals and two prizes of £5 each at the disposal of the National Chrysanthemum Society, to be competed for at the Jubilee exhibition of the Society; and one medal and one prize of £5 to each of the following provincial horticultural societies, Ulster, Dandee, and Derbyshire.

QUANTITY OF WORKED TREES IN AN AMERICAN NURSERY, ETC.—As in many other commercial lines the amount of trade done in some of the United States' nurseries is prodigious, greatly exceeding anything that we can show on this side of the Atlantic, and as illustrating this fact, we take the following remarks from the *National Nurseryman*, a journal circulating amongst growers and dealers, and published at Rochester, N.Y. "The FRANKLIN DAVIS Nursery Co. We have just started into what promises to be a satisfactory fall season. Our sales, both wholesale and retail, are about the same as those of 1894, the same quantity of stock being sold, but at lower prices. We see no difference, however, in cost of production. There seems to be a strong demand for Peach trees and Japan Plums. Prices appear to be lower on everything but Peach; grades under $\frac{3}{4}$ inch in Apples and Pears are exceedingly low, and there is no chance whatever for profit at such figures. We have made pretty heavy plantings in the spring of 1895, trusting that there will be an improvement in the business by the time the stock is marketable. We budded 650,000 Peaches this season, and would have doubled it, but ran short of seed. In 1894 we budded 1,150,000. We planted 500,000 grafts in the spring of 1895, which have done well; and budded 50,000 Pear and 200,000 Apple stocks. From the general outlook, we are fearful that we have planted too much, and we are almost confident that nearly all the growers have done the same thing. There is certainly an over-production, and we do not believe that the 'hard times' are altogether accountable for the low prices. The only man who is making money now is the dealer: he buys at less than cost of production, and is able to get a fair price at retail. We have had a good growing season here, and stock never looked better. We are digging 25,000 to 35,000 trees per day without our tree-plough. It is a little too dry to run it satisfactorily." Our readers

will naturally wonder what a tree's roots look like after being ploughed out of the land. Other reports in the same journal show that the demand for Apples will run the stocks of saleable trees very low by the arrival of spring. From Topeka we learn that the autumn trade is good; a little above the average in volume. Northern and western planters are heavy buyers of Apple trees. Colorado trade gaining heavily on Ben Davis, Gano, Paragon, Arkansas Black or Jonathan. Northern trade still insists on Duchess, Wealthy, Yellow Transparent, Wolf River, &c. Cherry gives slow sale, prices lower." Apparently the demand for Apples is a heavy one in the temperate region throughout the U.S.A. Those growers in Great Britain who have suitable varieties might participate in the trade in Apples, Plums, and Cherries.

A CURIOUS CASE OF NATURAL GRAFTING.—Mr. JOHN CHEESE, of Amersham, furnished lately to the Royal Horticultural Society a photograph and description of a case in which, in spite of the severance of a branch from the main trunk of a Pear, the severed branch produces fruit year after year, communication with the leaves and trunk being carried on by means of a slender twig, which connects the severed portion with the main stem. Mr. CHEESE's account is as follows:—"In 1889, an arm of a Pear tree (Vicar of Winkfield) which did not bear, was severed for grafting. By accident, the old arm was not taken away. Next year as it blossomed, I left it to see what its vitality would come to. It produced and ripened two Pears. As it seemed vigorous, I said 'leave it another year.' It produced ten fruits. I then made a careful examination, and found that a small twig about the size of my little finger had joined itself to the old branch on the top of the wall by friction of wind. It kept on bearing. Last year [it bore] forty-two, this year just under thirty—fed entirely by the twig now almost, or quite, an inch in diameter. The branch has been in perfect vigour; and by the pencil sketch, you will see what the feeder has done. The tree being planted in an orchard, and turned over the wall (one branch) and trained down the other side (garden), makes it rather difficult to give a real idea of it"

From the sketch and photograph, it appears that the only direct communication with the roots or with the old stem, is by means of the inoculating branch. No doubt, as Mr. CHEESE says in another letter, the union was effected prior to the severance of the branch. In any case, so far as the fruiting branch is concerned, the entire supply of water must pass from the root upwards, till it reaches the slender connecting twig, then downwards to reach the fruit-bearing branch, and then more or less horizontally. The quantity of water thus supplied is sufficient to permit of the expansion of leaves, and these in due course manufacture, with the aid of the sun-light, the sugar, starch, and other products required for the maintenance of the branch, and of the fruits produced from it. Such cases are more easy of comprehension, now that we have, to some extent, got rid of the "vulgar errors" connected with the "ascent and descent" so called, of the sap.

SOUTH AFRICA.—A supplement received with an issue of the *Wynberg Times* for November 30 last gives a detailed list of the classes arranged in connection with an exhibition to be held by the Port Elizabeth Agricultural Society in April next. That there is considerable energy at this port in matters agricultural is clear from the fact that the schedule includes as many as 408 classes. Every kind of farm stock, including poultry and pigeons, will be represented, and the same may be said of farm produce, agricultural implements, and South African manufactures.

THE CAPE HERBARIUM is now under the charge of our valued correspondent, Prof. MACOWAN, the colonial botanist. The nucleus of the collection was the herbarium of ZEYHER, or what remained of it at the Cape, for a large proportion was destroyed by fire at Hamburg. The remainder of ZEYHER'S plants came into the possession of Dr. PAPPE, and at

his death they were bought by the Government for £400—a sum very far below their value. Dr. HARVEY made use of the collection for his *Flora Capensis*. After this it was much neglected, till Sir HENRY BARELY paid a surprise visit, and at his instigation steps were taken to preserve the plants in a proper manner. Prof. MACOWAN'S own collections, numbering some 5000 specimens, were added in 1881, and the collection is fairly well housed, except for the risk of fire, which is still great. The value of a herbarium and library to the colonial botanist, and those who apply to him for information on all sorts of topics, is incalculable.

"THE CENTRAL AFRICAN PLANTER."—Among the many encouraging signs of progress, we may note the publication, at Songani, Zomba, of the first number of this journal, which bears out the old adage that there is always something new from Africa. The publication will take for its model the *Ceylon Tropical Agriculturist*. Our fathers, not to mention previous generations, would have been astonished to see such signs of development in a part of Central Africa not known before the time of LIVINGSTONE in 1855. Less than twenty-five years afterwards Coffee planting began, and in 1891 a million Coffee plants were in cultivation. Coffee, indeed, is the principal subject treated of in this journal. Telegraphic communication with Great Britain *via* Cape Town was established at the time the journal went to press. May it be a good omen, and may our energetic planters not forget to occupy some part of their time in making known the resources of the country, and in sending home specimens of its flora and fauna. Who can tell that some now-unheeded plant may not eventually be more commercially valuable than Coffee. The editor is Mr. R. D. HYNDE, F.R.G.S.

THE SURVEYORS' INSTITUTION.—At the ordinary general meeting, held on Monday, December 9, 1895, the President (Mr. DANIEL WATNEY) in the chair, a paper was read by Mr. F. PUNCHARD (Fellow), entitled, "The Working of the Agricultural Holdings Act, 1883." A discussion followed, and was adjourned to the next meeting, and a vote of thanks was unanimously passed to Mr. PUNCHARD for his paper.—The next ordinary general meeting will be held on Monday, January 6, 1896, when the adjourned discussion on the paper read at the last meeting by Mr. F. PUNCHARD (Fellow), entitled, "The Working of the Agricultural Holdings Act, 1883," will be resumed. The chair to be taken at 8 o'clock. Notice is given that the Institution will be closed from Tuesday, 24th inst., to Monday the 30th inst.

THE ROYAL GARDENERS' ORPHAN FUND.—The usual monthly meeting of the committee took place at the Horticultural Club, Hotel Windsor, on the 20th inst., Mr. W. MARSHALL, presiding, there being a large attendance of members. The Secretary, Mr. A. F. BARRON, reported that he had received the sum of £105 15s. 10d. from the trustees of the William Thomson Memorial Fund, the powers as to voting at elections in respect thereof being accepted by them. It was resolved that the sum of £500 should be invested in Canadian 3½ per cent. stock. The following special receipts were announced:—Mr. H. J. JONES, Ryecroft Nursery, Lewisham, visitors to Chrysanthemum-house, £10 12s. 7d.; Scottish Horticultural Association, per Mr. R. W. E. MURRAY, Edinburgh, £5; Mr. H. HERBAT, Stanmore, Kew, £2 11s. 6d.; Mr. G. W. CUMMINS, The Grange Gardens, Carshalton, £2 10s.; Mr. W. R. BLOXHAM, Chesterfield, £2 2s.; The Market Harboro' Horticultural Society, sale of flowers at Chrysanthemum show, per Mr. G. GREEN, secretary, £1 15s.; Mr. R. INGLEBY, Chesterfield, £1 7s. 6d.; Mr. C. GIBSON, Morden Park Gardens, £1 1s. 7d.; Mr. J. MCKECHNE, Holloway, £1 1s.; Messrs. R. W. PROCTOR & SON, nurserymen, Chesterfield, sale of flowers, £1 1s.; The Croydon Chrysanthemum Society, sale of flowers, per Mr. W. B. BECKETT, £1 1s.; Kingdon Gardeners' Association, per Mr. A. DEAN, £1; Mr. W. BATES, Twickenham, 18s. 6d.; Mr. F. MILLER, Northdown, Margate,

18s. 2d.; Mr. T. NEWBOULD, Cragg Royal, Leeds, 17s. 6d.; Mr. A. J. BROWN, Chertsey, 15s. 6d.; Miss Emily ROGER, Farnborough, 13s.; Mr. W. H. DIVERS, The Gardens, Belvoir Castle, 13s. 7d.; Mr. JOHN DAY, Galloway, Garlieston, 12s.; and Messrs. H. CANNELL & SON, Swanley, 10s. It having been announced that at various times during 1896, nine children would cease to be chargeable to the fund, having reached the age of fourteen years, it was resolved that ten children should be elected at the annual general meeting to take place at Anderton's Hotel on February 20 next. The credentials of a number of children were examined and passed. A cheque was ordered to be drawn for the children's allowances for the first quarter of the coming year, amounting to £195, there being sixty children entitled to the benefit of the fund. A hearty vote of thanks was passed to the chairman for his services in that capacity during the year; and Mr. MARSHALL, in acknowledging the vote, thanked the committee for their support and attendances during the year.

THE NATIONAL AMATEUR GARDENERS' ASSOCIATION.—The annual dinner took place at the Guildhall Tavern on the 18th inst., Mr. T. W. SANDERS, the President, in the chair, about eighty persons being present, including several ladies. In proposing success to the association, the chairman said that this was the fifth year of its existence, that he had been associated with it from the first, and was well acquainted with its advantages. It was able to show that it had done good work, and therefore justified its formation. There is an increase in the number of its country members and affiliated societies; both together there are probably from 2000 to 3000 persons connected with the association. The association afforded opportunities for those amateurs interested in gardening to meet together and exhibit their skill as cultivators; and in this way they were instrumental in interesting others. Nothing in the way of an association worked on business principles can be perfect, and there were imperfections in their procedure, but the conductors were always anxious to receive suggestions for perfecting their organisation. One satisfactory feature at their monthly meetings is the collections of flowers, plants, fruits, and vegetables brought to them, and which are closely inspected by the members. Points were awarded to meritorious exhibits, which carried with it a Certificate of Merit; and when a sufficient aggregate of points was reached, a Silver Medal was awarded. Another feature was their *conversazione*, which proved so satisfactory that it will be continued on a larger scale. The President paid a tribute of acknowledgment to his brother-officers and committee, as it was mainly through their exertions they had secured so satisfactory success. The distribution of money-prizes, medals, and certificates then took place, and a succession of speeches, interspersed with music, brought an enjoyable evening to a close. It was announced that at the next monthly meeting on Jan. 7, Mr. R. DEAN will give a lecture on "Hardy Border Primroses."

GARDENERS' ROYAL BENEVOLENT INSTITUTION, ETC.—At the meeting of the Committee of the Wolverhampton Auxiliary of the Gardeners' Royal Benevolent Institution, Mr. G. A. BISHOP, the chairman, handed in his list of subscriptions which he had himself collected in the course of a few weeks, amounting to the handsome sum of £70, including twenty-six annual subscribers of one guinea each. It may be mentioned that besides, Mr. BISHOP, in conjunction with Mr. G. BRADLEY, Werge Hall Gardens, collected within twelve months, £146 for the Wolverhampton Chrysanthemum Society.

SHIRLEY, MILLBROOK, AND FREEMANTLE HORTICULTURAL SOCIETY.—The thirtieth annual general meeting of the above was held at the Shirley Hotel, Southampton, on the 17th inst., the President, A. BARLOW, Esq., presiding. The Secretary read the report and statement of accounts, showing steady

progress of the Society. The entries at the late show numbered 600, an increase on the past, and the balance in favour of the Society was £35. There was a considerable increase in the attendance, and this enabled the committee to make so good a financial report. The adoption of the report and accounts was followed by the re-election of the president, vice-president, and officers, and a ballot for a committee of twelve, for which there were twenty-four nominations. A vote of thanks to the president, the press, and the retiring members of the committee, &c., closed a very successful meeting and year.

SOCIETY OF JERSEY GARDENERS.—At a meeting of this society held on Thursday, Dec. 12, the programme was of an unusual character. Mr. A. FLATTERS, of the Manchester Microscopical Society, gave a microscopical lantern exhibition, being the first of its kind given under the auspices of the Society. These slides numbering 110, illustrated the internal structure of plants, the botanical features of each he pointed out. A number of photographs of horticultural interest, taken by the demonstrator himself upon the island, also formed part of the exhibition. Meetings are held monthly, and the Hon. Secretaries for the coming year are Messrs. E. REEVE and A. SMITH.

PLANTS AND FLOWERS AT TRENTHAM.

A GRAND display of winter-flowering plants is to be found in the houses at this place, the demand being very great. The houses at the present time are a charming sight, hundreds of plants of the brilliant *Poinsettia pulcherrima*, with enormous bracts, are splendidly grown in small pots. Quite as dazzling are the plants of *Euphorbia jacquiniæ*, whose flowering sprays are such as one seldom sees, especially in such small flower-pots as these plants are grown in, namely, small and large 48's. In these the plants maintain their healthy foliage right down to the rim of the pot. Plants of *Salvia* in variety, *Primula*, *Cineraria*, Roman *Hyacinthe*, *Tulips*, *Narcissus*, *Lily of the Valley*, &c., are grown by the thousand, and great quantities of these are now in perfection. Besides these are *Gesneras* in variety.

The Orchid-houses are likewise gay with flowering plants, and in the *Cattleya*-house several hundred blooms of *C. labiata* are expanded; *Dendrobium Phalaenopsis*, *D. Wardianum*, *Laelia anceps*, are there in great quantities. In the *Odontoglossum*-house dozens of sprays of *O. crispum* and *O. Pescatorei* had open flowers, with numbers to follow. Of *Maedevallias* great numbers of fine healthy plants were noted, which could scarcely be excelled for luxuriant growth, many of them in flower, including a grand batch of the pretty *M. tovarensis*.

A houseful of Tree Carnations and Marguerites, the picture of robust health, was remarked with hundreds of expanded flowers, consisting of all the leading varieties. The first-named are invaluable for their fragrant flowers. A grand lot of late-flowering varieties of *Chrysanthemum* are most useful plants at this season, and the plants here are now carrying enormous quantities of blossoms good for cutting, &c. *Rhododendron hybridum*, *Deutzia gracilis*, *Azalea mollis*, and *Lilies*, are extensively forced, and these will follow those already named. The healthiness of the foliage plants show that their cultural requirements are well understood; and plants were noted from small things in thumb-pots upwards to enormous specimens, their uses in the ducal mansion being numerous. The Bamboos are great favourites here, and deservedly so, for their light green, graceful foliage, and their adaptability for decorative purposes in the dwelling. In the

fruit houses good crops of late Grapes were still hanging on the Vines, and splendid fruits of Tomatos. In the early Peach-houses the trees are just on the move, and the early Vines look very promising.

Great improvements have been made by Mr. P. Blair in the pleasure-ground. Many ornamental trees and shrubs have been recently planted—indeed, the place has undergone a great transformation, and is still being improved, so that it will soon match any existing in the country.

The kitchen garden is well stocked with vegetables to meet the large demand made upon its resources. Many fine new buildings have been erected, including one in the village to serve as a lecture hall, with rooms for billiards, the library in connection with which is a very good one, the whole forming a great boon to the inhabitants of the place. The Duchess takes a great interest in the well-being of those employed upon the estate and the villagers, as the Duke of Sutherland does in horticulture. The gardens show careful cultivation and attention to detail in every part, reflecting much credit on the head gardener, Alfred Outram.

JOHN EVELYN.

(Concluded from p. 577.)

EVELYN differed from most of the savants of his day in the dislike to be ranked as an author. The establishment of the Royal Society was a proof that the learned men of the late seventeenth century desired a common meeting-place, where their theories and discoveries could be expounded to men of kindred tastes. The scientist and the antiquary were not regarded with much respect at that period, and their apparent eccentricities were made the butt of much cheap ridicule, and that ridicule, when enshrined in the "catchy" lines of Samuel Butler, had the disagreeable tendency to be accepted by the general public as truth. John Evelyn was too much of a man of the world and of a diplomatist to indulge in the little personal vagaries which at that time, and for a long period afterwards, characterised the student of abstract things. John Evelyn's appearance as an author was not, as we have indicated, the outcome of a perfectly excusable vanity, but a laudable desire that others might profit by his experience. His garden was his great hobby, and he found it so full of pleasure and instruction that he wished others to participate. Botany, like chemistry, was gradually emerging from being a mere art of empiricism, and Evelyn did more than perhaps all his contemporaries together to compel the recognition and acknowledgment of these two sciences.

Evelyn's first publication was issued in 1649, when he was twenty-nine years of age. It was not until nine years after this that the first of his long and valuable series of horticultural publications made its appearance. It is a translation of *Le Jardinier François*, which appeared at Paris in 1651, and ran into six editions in nearly as many years. It was signed by R. D. C. D. W. B. D. N., whatever these initials may or may not mean; the real name and dignity of the author being N. de Bonnefons, *valet de chambre du Roi*. It was "transplanted into English by Philocephos," and published by John Croke at the sign of the Ship in St. Paul's Churchyard in August, 1658. Evelyn was persuaded to make this translation by his friend Thomas Henshaw, to whom the work is dedicated. This book, which Evelyn regarded, and rightly so, as the best treatise then extant on gardening, is an exceedingly interesting work to the literary antiquary. The catalogues of Pears (315 in number), Peaches (37), Apples, Plums, Cherries, and other fruits are exceedingly curious. The book is a duodecimo of 319 pages, with four plates by A. Hertocks; it was an unquestionable success. A second edition appeared in 1669 (with Evelyn's name attached to it for the first time), to which was added "The English Vineyard Vindicated," by John Rose. The third edition appeared in 1672, and others in 1675, 1676, and 1691.

During the interval which elapsed between the first and the second editions of the *French Gardiner*, Evelyn wrote and published his most celebrated work, *Sylva*, "or a discourse of Forest Trees and the Propagation of Timber," to which is annexed *Pomona*, "an appendix concerning fruit-trees in relation to cider, 1664." This was reprinted in 1669, and in 1679, with considerable additions; again in 1705 with still further additions and improvements; and finally in 1725, with other works on gardening—all these were in folio. Dr. Hunter, of York, edited and annotated an edition in quarto in 1776, with a number of beautifully-engraved plates by J. Miller; of this a second edition appeared in 1786, and a fifth in 1825. *Dendrologia*, an abridgement by J. Mitchell, was issued in 1827. A very long article might be written on this most interesting

as I may justify (without immodesty) from the many letters of acknowledgement received from gentlemen of the first quality, and others altogether strangers to me." Evelyn was much disappointed at not receiving the appointment of Inspector of the Royal Forests, but the "mighty man, then in despotic power" conferred it upon another "who had seldom been out of the smoke of London, where, though there was a great deal of timber, there were not many trees."

Evelyn's next book, *Kalendarium Hortense*, or the "Gardeners' Almanack, directing what he is to do monthly throughout the year, and what fruits and flowers are in their prime," was first published in 1664, and in about forty years had run into ten editions. The British Museum copy, 1666, is interesting in having a presentation inscription to Lord Arlington in the author's handwriting. This was not

JOHN EVELYN.

and valuable work. *Sylva* was the outcome of an address delivered at the Royal Society in October, 1662, "upon occasion of certain queries propounded to that illustrious Assembly by the Honourable the Principal Officers and Commissioners of the Navy." The vitality of the work, seeing that it was the standard work on trees for over a century and half, does not need much demonstration. Dr. Hunter tells us that soon after the publication of *Sylva*, which made its appearance under the auspices of the Royal Society, "the spirit for planting increased to a high degree; and there is reason to believe that many of our ships which, in the last war, gave laws to the whole world, were constructed from Oaks planted at that time."

In a letter to Lady Sunderland, dated Deptford, August 4, 1690, Evelyn tells us that *Sylva* was a success "infinitely beyond my expectations," and that it has been "the occasion of propagating many millions of useful timber trees throughout this nation,

the first kalendar of gardening operations published, but it was one of the earliest which embodied the long practical experience of an able writer and close observer. There can be no doubt about the fact that this work had an extraordinary influence on English gardening, which indeed it may be said to have revolutionised. The origin of the book would appear to have been entirely private—a mere note-book of work to be done in each successive month, with no thought of publication. Writing in 1690, Evelyn informed Lady Sunderland that it was written "almost forty years since," so that it more properly belongs to his earlier works, although doubtless it contains the result of his later experiences. At all events, it was an epoch-making book, and a classic in its way.

Nearly thirty years after the *Kalendarium* first appeared, John Evelyn assisted in contributing yet another volume to the art and practice of horticulture. This time the work, *The Compleat Gardener*, was a

translation from the French of J. de la Quintinie, by George London and Henry Wise,* "to which is added his treatise on Orange trees, with the raising of Melons—omitted in the French edition," and translated into English by Evelyn. This publication, which was in folio, with a number of plates, had a long lease of popularity, to which Evelyn's "Address to the Nobility and Gentry" contributed not a little. Evelyn's last work was *Acetaria*, "a discourse on Sallets," which appeared in 1699, and of which a second edition was called for in 1706. Mention may be conveniently made here of a very interesting "letter concerning the damage done to his gardens in the preceding winter," which is published in the *Philosophical Transactions*, vol. iii., p. 28, 1634; and it should not be forgotten that it was in consequence of a recommendation of Evelyn's, in his *Fumifugium*, 1661, which dealt with the inconveniences of the air and smoke of London, that fragrant plants should be grown in nurseries, &c., in the low grounds near the metropolis, that the Lime trees were planted in St. James's Park.

Evelyn himself tells us that he delighted in "a

peculiarity known as heteroecism, or metoecism. During the summer months, examples are frequently to be observed representing various genera, but the majority of heteroecious Uredineæ belong to the genus *Puccinia*, and in this group it is a noteworthy fact that the uredospores and telentospores in all the species described are only to be found on monocotyledons—generally grasses, sedges, or rushes.

A somewhat remarkable exception, however, has fallen under my notice. The species referred to is *Puccinia Bistortæ*, Str. = *Puccinia Bistortæ*, DC., which is classed in Plowright's *Monograph of the British Uredineæ and Ustilagineæ* under *Hemipuccinia*, a group that is supposed to be without æcidiospores. After a long series of experimental cultures and observations during the past three years, the writer is convinced, beyond the slightest doubt, that this species does not only possess æcidiospores, but is heteroecious in character. In December, 1893, a short series of observations were briefly detailed (*Grevillea*, vol. 22, p. 45 to 47), which it is unnecessary here to repeat, beyond remarking that subsequent cultures have fully confirmed previous observations.

in 1895 the plants came up healthy, and remained clear of the fungus throughout the season, and evidently the mycelium also in this case is not perennial.

Germinating æcidiospores were applied to the leaves of *Conopodium denudatum* and *Polygonum Bistorta* on May 1, 1895, but not the slightest result followed on the former, whereas on the *Polygonum* uredospores made an appearance on May 15. During the past spring the fungus was observed to be extremely common in the neighbourhood of Halifax, and a number of plants of *Conopodium denudatum* growing among *Bistorta*, and bearing æcidiospores, were "marked," and for a fortnight were repeatedly visited, but no other spore form appeared on the earthnut, while uredospores showed abundantly on the *Bistorta*:

By means of the uredospores the fungus spreads rapidly, reproducing uredospores in about twelve days. The uredospores are invariably succeeded by telentospores in about the same time; for instance, in the May 1 experiment, the telentospores made an appearance on May 27. Although numerous observations were made on the telentospores during the summer and autumn, in not a single instance was an attempt at germination noticed. During the year, germinating æcidiospores and uredospores were applied to other species of *Polygonum*, including *P. aviculare*, *P. cuspidatum*, and *P. viviparum*, but without any results, although the latter is given as the host in various works. It is intended, however, to continue the experiments during the coming year. The æcidiospores were first found by my friend, Mr. James Needham, at Hebden Bridge, in May, 1893. H. T. Soppitt, Halifax.

THE WEATHER OF 1895.

THE year which is just drawing to a close has been a remarkable one in many ways, and, from a gardener's point of view, may be looked upon in some respects as one of extremes.

January commenced with a cold N.N.W. wind, which continued for some days, but there was not much frost till the 10th, when the temperature fell to 14°. On the 20th it rose to 49° in the shade, but on the 23rd it fell to 10°. There were only three nights in the month that the temperature did not fall below freezing-point, and these were on the 17th, 20th, and 21st. There were about 3.21 inches of rain, including melted snow.

February was a dreadfully cold month, there being only two nights during the whole period that frost was not registered, and these were on the 22nd and 23rd, when the mercury fell to 33° and 34° respectively. The coldest night was on the 5th, when the thermometer fell to 0.5. There was an unusually small amount of rain—0.78 of an inch only—the greater portion of which was melted snow. On three occasions only during fifty years has there been less.

March.—It was not till the 9th of this month that a general thaw set in, but the sun was so bright in the daytime, that by the 13th the ground was in good working condition, so that many of the garden crops were planted by the end of the month. Less than 2½ inches of rain fell, the greatest amount being on the 27th.

April.—The early part of this month was dry, and very suitable for outdoor work, though the nights were cold, but on no occasion did we register more than 6° of frost. Rain was pretty plentiful, during the latter part of the month; so also were slugs, for I never remember seeing such an abundance. The total rainfall was 2.14 inches.

May was a very dry month, rain falling on six occasions, and this only to the extent of .14 of an inch, this being a trifle less than in the dry summer of 1893. There were several hot days on which the thermometer in the shade rose to over 80°. Apple trees were in bloom very early, the first with us expanding on the 6th. The coldest night during the month was on the 10th, when the temperature fell to 31.5°.

June was also a month of unusual drought, and though the nights were cold, the days were warm, as there was no occasion when the maximum did

FIG. 133.—SAYES COURT, JOHN EVELYN'S RESIDENCE, DEPTFORD.

cheerful gaiety; affect and cultivate variety; the universe itself were not beautiful to me without it;" and those most conversant with his writings will readily admit that cheerfulness and gaiety were amongst the most striking characteristics of his nature. His truly was a character "full of sweetness and spirit;" and the whole of the stirring period through which Evelyn lived produced no truer English gentleman.

His portrait, see p. 772, was painted on several occasions. First by Chanterell, in 1626; by Vanderborcht, in 1641; by Robert Walker, in 1648; by Sir Godfrey Kneller, in 1685; and again by Kneller, for Pepys, in 1689. W. Roberts.

A REMARKABLE PUCCINIA.

OF the various parasitic fungi included in the group Uredineæ, few are more singular in their mode of development than those species which have the curious habit of spending part of their existence on one kind of host, and continuing it upon another at one time supposed to belong to a different genus,

The fungus first makes its appearance during the early part of April on *Conopodium denudatum*, and possibly it may have hitherto been confused with *Æcidium Banii*, DC., from which, however, it is clearly distinct, and may be described as follows: *Æcidiospores*; *Pseudoperidia* in small irregular clusters, seated on orange thickening, mostly hypophyllons, on segments and veins of the radical leaves, rarely on the cauline leaves, more elongated on the stems, and petioles nearly flat or shortly cylindrical; mouth narrowly contracted, walls rather thick, margins fragile, breaking up into white oval cellules evenly covered with minute warts 20 to 30µ in diameter. Spores globose, finely verrucose, white, endochrome, with a slight tinge of yellow, 15 to 20µ in diameter. On the radical leaves and petioles of *Conopodium denudatum* April and May.

In the spring of 1894, several plants of *Conopodium denudatum*, abundantly invaded with the *Æcidium*, were grown in pots under glass for the purpose of testing whether the æcidiospores were succeeded by any other spore form. But no further results ensued, and the plants made an appearance in 1895 apparently healthy, and remained free from the fungus, showing that the mycelium is not perennial. In like manner, in 1894, plants of *Polygonum Bistorta*, bearing the telentospores were isolated, and

* It may not be out of place to state here that the present writer contributed to the *Gardeners' Chronicle* of March 19, and May 14, 1892, a paper on "London and Wise, and their Gardening Works."

not exceed 70° in the shade; the hottest days being the 9th and 24th, when 87° was recorded on each date. Only .36 of an inch of rain fell during the month, this being the smallest amount for June registered since 1870.

July, up till the 18th, was dry and warm in the daytime, though the nights were cold. On the 16th the thermometer fell to freezing-point, while on the following day it rose to 29° in the shade, being one of the hottest days in the whole year. Between the 18th and the end of the month rain fell to the extent of 3.50 inches. The hottest night was on the 25th, the minimum being 61°.

August was rainy till the 15th, with warm weather both night and day, after which it became dry and hot, the hottest day being the 22nd, when the thermometer registered 84° in the shade. The amount of rain which fell was 2.42 inches.

September was an unusually dry month, there being only two days on which there was any registered, and these were on the 7th and 11th, the aggregate fall being .73 of an inch, which I think is the least amount for the month since 1865, in which year there was only .02. One of the hottest nights was on the 4th, the minimum being 60°. On ten occasions the maximum reached was over 80° in the shade, the highest being on the 7th, 86°, and on the 25th, 85°; on this latter date 117° was reached in the sun.

October was, in some respects, a peculiar month, for, with the exception of the first, which was very hot and dry, rain fell more or less on every day till the 9th, after which it was beautiful weather till towards the end. The warmest night was on the 6th, when the minimum was 56°; and the coldest was on the 26th, when 18° was registered. Rain fell to the extent of 2.77 inches.

November was a very wet month, rain falling on twenty-one days to the extent of 5.98 inches, which amount has only been exceeded on three occasions within the last sixty years. This is all the more remarkable, for on no occasion was there more than .81 registered, and this was on the 6th. Not once during the year have we had a flood in the river, which runs at the bottom of the garden. The warmest day was on the 17th, when the maximum reached was 62°. On only four occasions did the temperature fall below freezing-point, the coldest night being the 18th, when 25° was reached.

December, so far, has been mild, and with the exception of the 11th, when the temperature fell to 18°, the weather has been fairly mild. On the 15th the maximum was 51°. *H. C. Prinsep, Mid-Sussex.*

BULBS IN WATER.

It is saddening to note in passing through crowded streets or straggling villages how many are the amateur growers who will be disappointed of their expected harvests of Hyacinths and other bulbs to brighten and sweeten the home at this season. The bulbs, the glasses, the water are there in abundance, but the flowers will not be in blossom to welcome our family gatherings of the year, and that is the worst of it, though not quite all. The reason is not far to seek, nor difficult to avoid. Quite the contrary. Here it is. Thousands of bulbs are set in water; and in the light, in a dormant state. I have seen hatches of such perched on window-sills, shelves, and the narrower astragal between the upper and lower sashes. Within the last month or six weeks a very few of these bulbs have made much progress, and not a few of them are already rotten. In others, the tops have run far ahead of the roots, with the inevitable weakening effects.

A few bulbs of great strength of constitution have made a start, at the top and bottom, determined, as it were, to run fair at both ends, and under very unfavourable conditions. But this attempt at reciprocity of growth between root and top, or rather the precedence of root over top-growth, cannot be maintained in the full glare of a sunny window, not even through November or December fogs.

This is a matter not merely of theory, but of

observation on the part of those cultivators who can read the signs of distress shown by the bulbs grown in glasses in our windows, and which are readily interpreted. Under such unnatural conditions, it is no wonder that growth is laggard and the colour of the leaves and flowers poor, as is common in Hyacinths and other bulbs grown in water, whose roots are exposed to the light from the fire. I have observed that the greater the loss of green in the leaves the less ivory-white the roots become. But there are other causes for the lack of verdure and consequently vigour in bulbs in water than the probable diversion of chlorophyll from the leaves and flowers to the roots.

The lack of colour and the sluggish growth often arise, or are greatly aggravated, through the tops being in development ahead of the roots, which is an exact reversal of the proper order in most plants. Bulbs are partial exceptions in having a larger store of food than in other plants. Treated ever so unwisely they make efforts, more or less strong, to grow and unfold their flowers. If, however, top-growth goes ahead of root-growth, the gradual exhaustion of the stored-up supplies causes weakness and comparative failure of the development of leaves and flowers.

But bulbs are often drowned as well as lighted into failure by placing their base into the water instead of keeping it a $\frac{1}{2}$ -inch above the surface. Dormant bulbs of Hyacinths, Narcissus, &c., want nothing till roots have been made, and these the bulbs will emit at the right time. The tops should, during the first stage, be kept dry, and by this simple difference of treatment of the top and bottom of the bulb, the root will start into growth and do fairly well, even in glasses exposed to sunlight.

To have perfect bulbs in glasses, vases, baskets, &c., the bulbs should be kept cool and in the dark for a month at the least, so as to cause root-growth in advance of that of the leaves and flower stems. Having done this, and when the leaf-growth has pushed upwards $1\frac{1}{2}$ to 2 inches, and the roots are freely developing, growth will go on all right without check, if they are brought into the light.

Bulbs not grown in glasses from the first should be covered up with white sphagnum moss, Coco-fibre refuse, leaf-mould, &c., until roots form; then wash them clean, nearly fill the glasses with water, and place the bulbs over it as described above. After this change from moss, or earth, to water is effected, twilight should rule for a time—say, six days—before fully exposing the bulbs to light.

For lack of attention to such apparently minute details of culture, many amateurs have failed with Dutch bulbs, and many ceased to cultivate them, being daunted by their lack of success. As a slight protection against the mild rays of the winter sun, some cultivators make use of coloured glasses. Coloured glass is warmer than clear glass, but the heavily-coloured blues and greens defeat the chief objects of water-culture through hiding up the smaller and more interesting ramifications of the roots. But the subject of glasses, baskets, vases for the culture and display of single bulbs, and bulbs or other plants in groups requires artistic and practical solution—space for the treatment of which is not now available. Every glass and water-stand should have sufficient weight and breadth of base to prevent it being easily overturned, and it ought also to be so well provided with crystal arches, pinnacles, or other ornaments as to afford the necessary support to the roots, leaves, and flower-stems, without ties or supports, the latter being usually as ineffective as they are ugly.

When our Hyacinth-glasses and baskets become more beautiful and varied in design, we shall have not only a great development of the culture and decorative effects of ordinary species of bulbous plants, but of many other plants in water. For many years I have taken every opportunity to study gardening in our great horticultural centres, and during all these years I cannot remember meeting with one record-making illustration of aqua-culture, or its rich, novel, fresh, and charming effects, in the

Centre Avenue, Covent Garden, or in such fine provincial markets as those at Manchester, Liverpool, Birmingham, Glasgow, or Edinburgh. *D. T. F.*

HOME CORRESPONDENCE.

REORGANISING THE ROYAL HORTICULTURAL SOCIETY.—It is at once significant and instructive that there should be simultaneous editorial suggestions on this subject appearing in the leading horticultural papers, and also notes on the same matter from other sources. The obvious inference, therefore, is, that the desire for the reorganisation of the society is a wide-spread and a growing one. As we are yet several weeks from the annual general meeting of the society, the present moment seems to be a peculiarly propitious one for discussing a matter of such vital importance. I confine myself exclusively to that portion which relates to the society's committees, perhaps the most important of any that is likely to be discussed. The evident desire shown to have the operations of these committees widely extended may be regarded as signifying high appreciation of the work performed by those bodies, only it is desired that such work should not be localised in London, but should be diffused throughout the country. That, of course, with the help of the leading provincial societies may be done; but there are difficulties, all the same, to be encountered. As to how it may be done: first, the Council can instruct the Secretary to invite certain of the leading provincial societies to become affiliated to the Royal Horticultural Society. These bodies should not be too numerous, and should be representative of wide districts. Kent might have one, Sussex will find one at Brighton, Hants in Southampton, Wilts in Salisbury, Somerset at Taunton and Bath, Berks at Reading; then going northward, Birmingham, Manchester, Liverpool, Shrewsbury, York, &c., are but some of these bodies that might thus be made county or district representatives. The provincial society affiliated should then be asked to constitute local or branch committees for floral (including Orchids) and fruit and vegetable purposes. These committees should comprise the best horticulturists of the district or county, no one being a member of any two committees, and to these bodies the council of the Royal Horticultural Society should have the power of co-opting, if needed, at least three other members. Probably each branch or local committee should not exceed fifteen in number, including the chairman; whether the members of these branch committees should of necessity be fellows of the Royal Horticultural Society or not is matter for discussion, though, I think, they should be so, to put them on the same footing as are the members of the central committees. These branch committees should have full power to grant awards of merit to such things as they may esteem worthy, not previously taking such an award, and they should be held to be awards of the Royal Horticultural Society. First-class certificates should be granted only by the central committees. All these branch committees should meet once a month at least, in some central place provided by the local society; they should keep full records of their proceedings, and, so far as possible, make descriptive notes of subjects placed before them, which might be embodied in the Society's journal, and issued frequently. This would generally be more readable-matter than is found in many of the long elaborate papers published on subjects already well threshed out in the gardening papers. So far, all seems smooth enough; but now comes the difficulty. How are these branch committees to understand the nature of the standards set up by the central committees? That is indeed a difficult matter. Nothing would so soon tend to devalue the present value of the Society's awards as making them too cheap and abundant. Again, new bodies, not conversant with the experience gained at the Drill Hall and elsewhere in years past, would not know what things put before them had previously been certificated or otherwise, although that is a difficulty that may readily be overcome. So far as objections present themselves, it seems probable that none are insuperable. The policy towards these branch committees must be one of trust, tempered by careful supervision. It would be out of the question for representatives of either the council or the parent committee to attend meetings of these branch bodies except, perhaps, at their original formation. After that they would undoubtedly have to run alone. A much handsomer

certificate than is now given should be furnished, whether as an Award of merit or as a F.C.C., space being left to insert into it the name of the town or society where the award was made. It would hardly be possible to extend the system of granting medals to the provinces as is done at the Drill Hall, as that would be far too costly, and probably at the Drill Hall it would be as well to limit such awards to the ordinary card, and thus avoid appearance of favoritism for London, whilst refusing medals to the country. All the same then, card or medal awards could be made universally. Very unjust are the complaints formulated against the present composition of the Drill Hall Committee. The Council always have allotted many seats to country fellows. On the past year's Fruit Committee I count not fewer than sixteen out of forty who reside long distances from London. If they do not often attend it is purely because of distance, which, of course, means expense, and there are at least ten others who reside at distances varying from six to twenty-five miles from town; were there not a good number of metropolitan and suburban members, it would often be most difficult to make up committees. As it is, the general attendance is most remarkable and creditable. On the Floral Committee about one-third are country members. I mention these facts to show that those much-abused bodies are not quite of such localised formation as some not very good-natured critics seem to imagine. I have propounded these suggestions as affording some ground for discussion. The time for it is most propitious. *A Fellow.*

—The complaints now appearing as to the metropolitan character of the above Society have a certain amount of truth in them, but the question arises—How can it be otherwise? Obviously the Society cannot appoint persons to act as officers who are not Fellows, or even Associates. Doubtless much good might be done by local committees at various centres, if well and judiciously managed; but I fail to see how such an arrangement could be carried out in the present state of affairs. The first step necessary seems to be to get competent men in any neighbourhood to join the Society; and if those who are now complaining would do so, their suggestions would naturally receive more attention, especially if they could become acquainted with the work of the central committees, which could only come about by their attending some of the meetings of the Society. Many of the statements that are now made by persons residing in distant parts of the country would then be found to be without foundation. Another point occurs to me, viz., whether it would not be advisable, on several grounds, for the secretary to visit a few of the leading provincial shows, so as to make himself acquainted with the gardeners and horticulturists generally who frequent them; and in that and other ways get them to take an interest in the work of the Royal Horticultural Society. It is superfluous to say that if the more eminent horticulturists in the kingdom could be induced to join it, much good would result to the profession in general, and in various directions. It occurs to me that if the Gardeners' Royal Benevolent Institution finds it to its advantage to send a deputation occasionally into the country it would pay the Royal Horticultural Society to do so also. But as matters stand at present, probably not one gardener in a hundred knows either the secretary or the assistant-secretary, or would be recognised by them if they were to meet. This cannot be considered a satisfactory state of affairs. A horticultural society should exist for the benefit of horticulture, and derive its chief support from horticulturists. For efficiently carrying out these fundamental purposes and aims, the Royal Horticultural Society should be in touch, either directly or indirectly with the principal gardeners in the kingdom. The recent change at Chiswick, whereby Mr. Barron ceases from taking an active part in the Society's business, is a retrograde step, if considered in the above light, and will cause a severance of the slender connection that has hitherto existed, at least for a time, for he was a man well and wisely known, and deservedly respected by gardeners. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

A HEAVY CROP OF POTATOS.—With reference to Mr. Leith's note on the above in a recent *Gardeners' Chronicle*, p. 684, I would like to say that I believe the advantages of affording space to the Potatoes are very great. Some time ago a friend of mine in the county of Fife drew my attention at the lifting season to the extra quantity and quality of

those roots which grew next the alleys. This seemed proof of the beneficial effects of sun and air on this plant. Take, for example, a row of early Potatoes planted at the foot of a south wall, which, in spite of cold spring weather, are always excellent in crop and quality, and this I have no doubt is mainly attributable to the great amount of sunlight and warmth, and the ample space they enjoy. *Andrew F. Pearson, Rathan.*

CHRYSANTHEMUMS.—I am greatly obliged for your expression of opinion respecting the two varieties of late Chrysanthemums which I sent to the office on the 9th inst. In order to avoid a lengthy communication, I was probably not explicit enough in my note respecting the variety Florence Watson. In order to make it fairly representative, I included the larger bloom from a disbudded plant, and although it looks so distinct, I assure you it is the same variety, the difference being due simply to cultivation. When disbudded to three or four buds, its blooms are excellent for decorative purposes, opening with broad florets slightly incurving, the lemon centre developing to a creamy-white, and as the bloom finishes it gradually assumes a more reflexed form with a slight curling of the florets, sufficient to distinguish it from a bloom in an earlier stage of development. I may add, that the blooms are furnished on stout stalks, requiring no support, which is an advantage. *R. Watson, Gardener, Elkington Hall.*

POTATO CULTURE.—I have this year cultivated Solanum Maglia, Fendleri, Ohrondi, X tile tuberosum, and fifty varieties of S. tuberosum, some from Paragnay and Chili, which M. H. de Vilmorin sent me, with the exception of the three first species, which I received from the Brest Botanic Garden. I quite see how different is the comparison between living plants and herbarium specimens. Certainly, Alph. de Candolle only knew S. Maglia dried or illustrated, as when the development of it is studied concurrently with that of S. tuberosum, it is difficult to see in it the original type of the latter. Mr. Arthur Sutton may be told that to avoid the difficulty of cultivating in the open ground Solanum Maglia, Fendleri, and Ohrondi, difficulties mentioned to me by the head gardener of the Brest Botanic Garden, I have this year grown the tubers of these species in large pots with sandy soil or loam. I obtained plants which flowered well and bore tubers twice as large as those which I had planted. The sides of the pots prevented the rhizomes from wandering too much, consequently the tubers were more developed, and, as is interesting to note, the gathering-in of even the smallest of the tubers was easily done. *E. Roze, Paris.*

OPENING OF THE FLOWER OF CENOTHERA SUAVEOLENS (Desf.).—The opening of flowers is usually accomplished slowly. It is interesting, then, to notice, as forming an exception to this rule, those of *C. suaveolens*, which may be said to open instantaneously; this phenomenon occurs in July, about 8 o'clock in the evening; in August, about 7 o'clock; in September, about 6 or 6.30. The four segments of the calyx begin to separate till they only cohere at their extremities, and suddenly they seem to yield to the pressure of the corolla; they become detached, and spring back sharply on the calyx-tube, and the four petals open rapidly. The stamens appear lightly infected round the style, which bears a cruciform stigma, and shows the pollen already escaped. The phenomenon of this sudden opening, which can easily be noted on the plants in gardens, can be observed on detached branches of the plant, and even on cut flowers or those partially or completely immersed in water. Incisions made in the segments of the calyx at the point of their insertion into the calycinal tube, do not seem to prevent their inflexion, they merely retard it. This is attributable to the hygrometric action of the air, as this is the more rapid in proportion as the heat of the day has been a power, and the cooling process in the evening is more noticeable. This plant being biennial, it is well to obtain, in spring, tufts with the radical leaves in order to obtain blooms in July, the month most favourable for study. *E. Roze, Paris.*

FRUIT AND POTATO GROWING IN BRITISH COLUMBIA.—With reference to your note on the above subject on page 716, December 14, I beg leave to call your attention to the following extract from a letter I have just received from an Englishman who has been a British Columbian resident for the past seven years, but who, with his wife and family, are now on their way home again to the Old Country: "This province seems getting poorer

every day; so much of the apparent well-doing and booming was only paper and ink. The Duncan-Bachelor block has just fallen into the mortgagee's hands; it cost 40,000 dollars, and is now on offer at 15,000 dollars! The Burns block offered at 14,000 dollars; this was the cost of the site alone! A block in Victoria that cost 24,000 dollars is now on offer at 6,000 dollars! In Washington State, U.S.A., adjoining us, they are sending in Potatoes, &c., to the storekeepers (paying freight and duty), and leaving to the storekeepers to remit balance, which is but little, I should think, when our local Potatoes are offered, and cannot be sold at 6 dollars (25s) per ton! Many are leaving the province daily." *Samuel Dobie, Manchester, December 14, 1895.*

RABBIT-PROOF PLANTS.—In addition to those enumerated by your correspondent, the American Raspberry, both the pink and white varieties, may be mentioned. The plants increase rapidly, and are very effective when in bloom. Another plant I have never seen attacked by rabbits is Gaultheria Shallon, a pretty, dwarf, evergreen shrub, very suitable for growing under the shade of trees. It flowers in May and June, and the fruit is much liked by pheasants. To those contemplating planting where rabbits abound, I would recommend the following:—Dogwood, Snowberry, flowering Currants, American Raspberry, and the scarlet-berried Elder (*S. racemosa*), the last a most effective shrub when laden with its beautiful fruit in the autumn; with clumps of Rhododendrons and Gaultheria by the sides of walks and rides. I think sportsmen will find that winged game will frequent the covert formed by these deciduous shrubs in preference to large masses of Rhododendrons, and the birds as well as ground-game are easily dislodged when shooting. Such plants as the common and Portugal Laurel, Berberis (Mahonia), Broom, &c., when established, are seldom injured by rabbits, except in severe weather, but it would be useless to plant them where rabbits are numerous. *George Duncan.*

COLOUR IN APPLES.—Some time since your correspondent, "A. D.," drew attention to fruits of Blenheim Orange Pippin exhibited before the Fruit Committee of the Royal Horticultural Society, which were of an exceptionally high colour; indeed, so much colour had these specimens that "A. D." had doubts of correctness of the name, suggesting Mr. Miles had made a mistake, and that what he showed was really Mère de Ménéage. I believe these are the facts of the case, but as I am writing from memory, I may be in error. I am satisfied Mr. Miles would make no such mistake. He has nearly 200 varieties of Apples, and cipes upon 40 acres of orchard under his charge. For some years past he has been applying sulphate of iron and soot as a top dressing to the land on which the trees are growing, with the object of increasing the amount of colour in the skin of certain varieties. He would, indeed, be a bold man who would say, after inspecting the whole of the trees as I did last September, that Mr. Miles has not succeeded in his endeavour. I never saw Wellington (Damelaw's Seedling) with such high colour as here. There are quite fifty trees of this Apple about twenty-six years old, which afford exceptionally heavy crops of fruit in some seasons; and one tree not dressed with these substances exhibited a marked contrast to the others. King of Pippins, Cox's Orange Pippin, and many others, I have never seen so richly coloured elsewhere. The disputed Blenheim Orange Pippin was quite exceptional too. Scores of trees of this variety are luxuriating—this is the correct word to use, and still they bear annually heavy crops of remarkably fine fruit; and this year the fruits had a more dense colouring than usual. A somewhat close system of pruning is practised, and even the standard trees of Blenheim Orange and Wellington are subjected to this. Mr. Miles is a staunch believer in the free admission of light and air to the inner parts of all the trees, no matter what their shape. *E. Molyneux.*

WEEVILS.—As even a partial remedy for the ravages caused by this pest among Ferns in established collections has a distinct value, I have no doubt some of your readers will be interested in the following results of a number of successful experiments in eradicating the grub without disturbing the plants affected. The weevil, as is only too well known, damages plants in two different ways, during its larval and during its perfect state. In the latter the weevil, as we know, creeps about mainly at night time, and gnaws holes through the fronds, or makes ugly gaps in their edges to such an extent, that where they prevail they completely

destroy the beauty of the plants, and especially of Harts-tongues where such damage is more conspicuous. The remedy at this stage is simply persistent hunting at night, taking the precaution to spread sheets of paper under the plants, so that when they drop, as they are apt to do at the least alarm, they may be seen and destroyed. It is however, in the larval or maggot stage that they do the most harm, as their attacks are then confined to the roots and crowns; and as they are busy during the dormant season as well as in the spring and autumn, the first indication of their presence, often in seed pans as well as with adult plants, is a sudden drooping and falling over of the fronds, which are then found to be quite loose, the whole of the roots and axis of growth being gone, and the plants, of course, destroyed entirely. We have repeatedly found batches of choice seedlings so invaded, that in a week or two the whole of the fronds may be blown away, not a fibre being left to attach them to the soil. Now the difficulty is, that to remove these pests has hitherto involved turning out the plants and thoroughly washing the roots in order to find the marauders, which are often snugly encoined in the heart of the plant—and this, especially in the winter season, is a risky operation, as well as a troublesome one. About a year ago, finding a batch of these larvæ, we kept them under water for several days to see how long immersion was required to drown them; but at the end of nearly a week they were still alive, and we consequently abandoned that idea of drowning them out. Subsequently, however, we plunged an affected pan under water, intending to leave it, if need be, a week or two rather than disturb a specially precious batch of plants, and next morning, after only a night's immersion, we were delighted to find all the maggots on the surface of the soil, perfectly active, it is true, but equally perfectly at our mercy, which was a minus quantity. Repeated trials since then have convinced us that plunging a plant so that water just covers the soil for twenty-four hours suffices to bring them all up in search for air, and thus to clear the pots or pans entirely with a minimum of trouble. *Chas. T. Drury.*

VARIORUM.

A TOBACCO PEST.

For a number of years a disease allied to that which attacks the Potato in this country, has caused great destruction in the seed-beds and plantations of Tobacco in the Dutch East Indies, and particularly in Sumatra. The colonial government commissioned Mr. I. VAN BREDA DE HAAN to investigate the disease, and to devise means of checking its ravages. Mr. DE HAAN discovered the cause of the disease to be a fungus nearly allied to *Phytophthora Solani*. "Nevertheless," says VON ERNEST HALLIER in the *Illustrirt. Garten Zeitung* for November, "according to my researches, this is not the case, this species of fungus not affecting the Tobacco plant at all. The latter has shown, during these investigations of Mr. HALLIER, extraordinary resistance to many bacteria, and that which causes the wet-rot of Potatoes has not the slightest injurious influence on the Tobacco plant. In fact, leaves of the latter cut from the plant remain quite fresh after being kept for four or five weeks in a damp cellar, neither withering nor decaying, not even when the gonidia of *Phytophthora* and the bacteria of the wet-rot are sown over them, the sap of the glandular hairs exerting a poisonous influence on the *Phytophthora* and these bacteria. I then," says Mr. E. Hallier, "carried out more accurate researches into the conserving properties of the leaves of Tobacco, and I am convinced that the living plant possesses extraordinary conserving and disinfecting properties. The uses of Tobacco-smoke and Tobacco-water have been known for a very long period of time for the destruction of plant lice, scale, and other injurious insects, but few persons are acquainted with the uses of the sap of the living plant, of which every gardener should keep a store for use at any season. It is not necessary to give any recipe as is the case in the use of manufactured tobacco; and every intelligent gardener will know in which cases and in which manner fresh Tobacco-

leaves or the sap of the plant should be used. For instance in the carriage of fruit and flowers, a bouquet surrounded by a holder made of fresh leaves of the Tobacco-plant will remain fresh-looking at least ten times as long as when this prudent course is not adopted!

MARKETS.

COVENT GARDEN, December 24.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

Trade quiet; supplies heavy. Snowdrugs, 70s. to 90s.; Hebrons, 75s. to 85s.; Bruces, 45s. to 60s.; Black lands, 30s. to 45s. *J. B. Thomas.*

POTATOS.

LONDON AVERAGES: Dec. 23.—Saxons, 90s. to 100s.; Dunbar Maincrop, 70s. to 90s.; Lincoln Saxons, 70s. to 90s.; Hebrons, 70s. to 80s.; Maincrop, 50s. to 60s.; Sutton's Abundance, 50s. to 70s.; Imperators, 40s. to 50s.; Magnums, 40s. to 50s. per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending December 21, and for the corresponding period last year:—1895: Wheat, 23s. 1d.; Barley, 23s. 8d.; Oats, 13s. 11d. 1894: Wheat, 20s. 8d.; Barley, 21s. 5d.; Oats, 13s. 11d.

SEEDS.

LONDON: December 21.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that the seed market now exhibits quite a holiday appearance, and transactions are few and far between, quotations all round are in consequence purely nominal, and no noteworthy feature whatever has developed itself. Meantime prices generally stand at a very moderate level, and with the opening of the New Year a good trade is hoped for. Niger seed on the spot appears nearly exhausted, and is much wanted. Other articles call for no comment.

FRUITS AND VEGETABLES.

FARRINGTON: Dec. 24.—Quotations:—Cabbages, Col-lard, 2s. 6d. per tally; Savoys, 4s. dc.; Cauliflowers, 6s. dc.; Parsnips, 1s. per score; Turnips, 2s. per dozen bunches; Carrots, do.; Leeks, 2s. do.; Spinach, 1s. 3d. per bushel; Celery, 13s. per dozen rolls; Horseradish, 1s. 2d. per bundle; Apples, Canadian Blenheim, 5s. per bush.; Greenings, 15s. per barrel; Baldwin, 18s.; Newtown Pippin, 18s., do.; Tucker's King, 22s. 6d., do.; Ribstons, do.; English Grapes, 1s. 3d. per pound; Almiria do., 5s. per dozen pounds.

HAY.

Average of prices at the metropolitan markets during the week ending December 23, and for the corresponding week last year:—Clover, best, 80s. to 95s.; do., inferior, 50s. to 70s.; hay, best, 80s. to 90s.; do., inferior, 36s. to 60s.; mixture, 78s. to 87s. 6d.; and straw, 20s. to 42s. per load.

BOOKS: *J. P., E. F. C.* There are no elementary books on forestry worth your studying. Get the newest, viz., *The Manual of Forestry*, in four volumes, by Prof. W. Schlich, published by Bradbury, Agnew & Co., Limited, 8, 9, and 10, Bonverie Street, E.C.—*A. G. M. Baltet's The Art of Grafting and Budding* is published by Mr. W. Robinson, 37, Southampton Street.

FUCHSIAS: *Reader.* The earliest-introduced species was *macrostemma* syn. *coccinea*, 1788; the next *lycoides* in 1796—both from Chili, and many other species in the first half of this century. The introducer of the first was said to be a sailor, whose name is not known.

HOLLY: *A. B.* It will be quite safe to cut the old tree hard back into the old wood. When the roots are bared, as you propose doing, it would be advisable to take out a trench all round the tree at a distance of 5 or 6 feet from the stem, cutting back all roots that go beyond that distance, and filling the trench with fresh soil. The new loam and manure that you top-dress with will also do for filling the trench; or if that is too extravagant, you might mix a good proportion of these materials with the staple. Lift Hollies in April, May, and August.

NAMES OF FRUITS: *J. W.* 1, Hacon's Incomparable; 2, Beauté Diel; 3, Josephine de Malines; 4, Althorp Crassane; 5, Knight's Mosarch; 6, Glout Morceau; 7, Apple Court of Wick.—*F. A. Whitehead.* 2, Claygate Pearmain; 3, Cellini; 4, Yorkshire Beauty; 5, Blenheim Orange; 6, Damelov's Seedling.—*A Southern Subscriber.* Your Apples are not known to us. They are probably some local varieties.—*W. H. Divers.* We do not recognise your Apples—No. 1 looks like Cellini, but is much sweeter than that sort, which of course you have.—*Snowdon.* 1, Golden Noble; 2, Old Golden Pippin; 3, Ribston Pippin; 4, Claygate Pearmain; 6, Wyken Pippin.

NAME OF PLANT: *A. J. C.* *Lælia autumnalis.*

Publishing Office and Office for Advertisements,
41, WELLINGTON STREET, STRAND, W.C.

WANTED by Gentleman's Son, PARTNER-SHIP in small MARKET NURSERY, or succession to same, mainly glass.—ARMITSTEAD, Winmarleigh, Garstang, Lancs.

WANTED, at the Epileptic Colony, Chalfont St. Peter, a GARDENER, experienced in Vegetable and Fruit Cultivation, and in Disposal of Produce, to Manage Garden, to work with and supervise epileptic workmen, and instruct them in Garden Work.—Apply, sending copies of testimonials, to SECRETARY, National Society for Employment of Epileptics, 12, Buckingham Street, Strand, W.C.

WANTED, HORTICULTURAL BUILDER'S MANAGER.—One thoroughly conversant with Conservatory Building and Hot-water Engineering. Competent to wait upon Gentlemen, give advice, and prepare Estimates. Good salary given to a very responsible and experienced man.—Apply, in first instance, by letter, stating experience and salary expected, to W. DUNCAN TUCKER, Conservatory Department, Tottenham.

WANTED, a GARDENER, where Boy and odd MAN are kept. Knowledge of Vines and Peaches required.—Colonel PEDDER, Kilbourne Hall, Derby.

WANTED, OUTSIDE NURSERY HANDS. Must be skilled Knifemen, and have had good general experience. Also Rose-grower and general Outside Propagator, especially of Evergreen Shrubs and Conifers.—Apply, with references and wages required, to SYDNEY S. MARSHALL, Barnham Nursery, Barnham Junction, Sussex.

WANTED, as FOREMAN, in Plant Department, under Glass, a thoroughly capable MAN, who has had experience in large establishments.—Apply, giving references, and stating salary expected, to JNO. COWAN AND CO., Ltd., The Vineyard and Nurseries, Garston, near Liverpool.

WANTED, a MAN, to take charge of the Orchids. Only those thoroughly experienced in them need apply. Wages £1 a week. Botby and vegetables.—F. CHAMBERLAIN, Deepdene Gardens, Dorking, Surrey.

WANTED, TWO WORKING FOREMEN GROWERS, one for Tomatos, Cucumbers, Mushrooms, Roses and Flowers; the other for Fruit, Indoors and Out.—State experience and salary required, to HORTUS, Woodlands, Sunbury.

WANTED, an energetic MAN, not under 30, as WORKING FARM BAILIFF. One who understands routine of Seed Farms preferred.—State age, wages required, and references, to WM. OLIBRAN AND SON, Oldfield Nurseries, Altrincham.

TRAVELLER WANTED immediately for JOHN WATERER & SONS, Limited, Bagshot. Must be a first-class man with good connection amongst gardeners, the trade, and architects. Reply by letter to The Nurseries, giving full details as to experience, references, and terms.

A WELL-EDUCATED YOUTH can be received as APPRENTICE to the Nursery and Seed Trade. Board and residence. Premium.—D. G., *Gardeners' Chronicle's* Office, 41, Wellington Street, Strand, W.C.

WANTED, YOUTH, age 15 to 17, for Gentleman's Gardens in Worcestershire. Must be first-class scholar and strong. One wishing to learn Gardening, Fruit Growing, Forestry, and General Estate work, address with all particulars—H. G., 41, Wellington St., Strand, W.C.

WANTED, an energetic and thoroughly trustworthy MAN as SHOPMAN, of good address, with a knowledge of Cut Flower and Plant Trade preferred, but not absolutely necessary.—Apply, stating age, experience, salary expected, if married or single, to WM. TROUGHTON, Seedsmen, 4, Church Street, Preston, Lancashire.

WANT PLACES.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—
F. SANDER AND CO., St. Albans.

GARDENER (HEAD); age 31.—Mr. W. EMERTON, gardener to the Right Hon. Earl Brownlow, Belton, Grantham, can with confidence recommend a thoroughly practical man, conversant with the requirements of good establishment. Has had sixteen years' experience; four years here as Fruit and Kitchen Garden Foreman. Good references from previous places.

GARDENER (HEAD); age 30.—Mr. WARD, Stoke Edith Gardens, Hereford, would be pleased to recommend T. Stead to any one requiring the services of a good practical Gardener. Has had good experience in all departments.

GARDENER (HEAD); age 28.—Sir ALGERNON OSBORN, Bart., Chicksands Priory, Shifford, Beds, wishes to recommend his Head Gardener, E. Hawes, to any Lady or Gentleman requiring a good practical man. Excellent references.—Address as above.

JOHN FLORENCE, HEAD GARDENER, Hooton Hall, Chester, will be disengaged on January 17, and will be glad to hear of a situation. Thoroughly practical in all departments. Highly recommended.

GARDENER (HEAD WORKING); age 30, married, two children. Can be highly recommended as a hardworking and trustworthy man. Life experience.—W., Messrs. Dollings, Church Lane, Edgware, N.

GARDENER (HEAD WORKING).—Thoroughly experienced in Orchids, Stove and Greenhouse Plants, and Fruit, Flower, and Kitchen Garden. Excellent testimonials.—J. BROOKS, Hallow, near Worcester.

GARDENER (HEAD WORKING), in good private establishment.—Age 36, married, no family. Life experience in good all-round gardening. Four years in present situation; good character. Leaving when suited.—R. F., 41, Wellington Street, Strand, W.C.

GARDENER (HEAD WORKING).—Sixteen years' experience in Growing Vines, Peaches, Stove and Greenhouse Plants, Melons, &c. Highly recommended by last employer.—H. STEDMAN, Church Street, Heathfield, Sussex.

TO NURSERYMEN.—Young man, age 28, requires situation as UNDER PROPAGATOR, or a Hand under Glass. Ten years' experience in the best firms, with good references.—H. F., 41, Wellington Street, Strand, W.C.

TO NURSERYMEN.—Advertiser seeks situation in Market Nursery, age 21. Seven years' experience in Cucumbers, Tomatos, Palms and Ferns, &c.—L. E., Elsie Cottage, New Masthan, Surrey.

MR. RODMAN (Head Gardener), Hardwicke Court, near Gloucester, is desirous of obtaining a situation for a young Man, age 30, as FIRST JOURNEYMAN in first-class garden, under a good Foreman. Six years' experience. Premium if required.—F. HARRIS, Hardwicke, near Gloucester.

CLERK (JUNIOR).—Shorthand and Type-writing, with knowledge of business.—DOBIE AND CO., Rothsay.

CORN and SEED TRADE.—Engagement wanted in above by young man, age 23. Good experience and good references.—J. W., K.lean-re Cottage, High Street, Feltham, Middlesex.

SELECT NOVELTIES IN FLOWER SEEDS for 1896, OFFERED BY HURST & SON, 152, HOUNDSDITCH, LONDON. SEED MERCHANTS.

OUR COMPLETE LIST OF NOVELTIES WILL BE POSTED IN A FEW DAYS.

WALLFLOWER RUBY GEM.

This grand Novelty is certainly the most brilliant and effective variety of single Wallflower hitherto sent out.

The colour is a beautiful clear shade of Ruby-Violet, with a bluish satin-like sheen (quite unlike the old purple Wallflower, which is more dark and dull in colour) and when seen in a mass the effect produced is very striking.

A coloured illustration of this Novelty will be issued with our General Seed Catalogue for 1896.

Large Packets, retail, 1s.; Smaller Packets, retail, 8d.

GRAND NEW CRIMSON

PERPETUAL-FLOWERING CARNATION, URIAH PIKE.

(Grown by Mr. GEORGE MAY, Teddington, from whom we have bought the entire stock of seed grown this year, and now offer the same for the first time.)

Awarded Six First-class Certificates, besides the Silver-Gilt and Silver Medals of the R.H.S. This is undoubtedly the GRANDEST CRIMSON CARNATION ever offered, at the same time the most decided acquisition to the Tree or Perpetual-flowering class that has ever been raised.

Packets of 50 Seeds, retail, 2s. 6d. each; Packets of 25 Seeds, retail, 1s. 6d. each.

SWEET PEA CUPID.

We call special attention to the new dwarf SWEET PEA CUPID, a most unique Novelty of American origin, for which we have been appointed by the Vendors, MESSRS. ATLEE, BURPEE, AND CO., PHILADELPHIA, Sole Agents for the distribution to the Trade in Great Britain, the Australian Colonies, and India.

A brief Description of Cupid (the only dwarf Sweet Pea ever known).—The foliage is very dark green; blossoms pure waxy-white, of unequalled substance, and fully as large as "Emily Henderson." The plant does not grow over 5 inches high, and never more than 12 to 15 inches in diameter.

Packets of 20 Seeds, retail, 1s. each; Half-size Packets of 10 Seeds, retail, 8d. each.

IMPORTANT NOVELTY OF LAST YEAR.

PRIMULA FIMBRIATA RUBRA SUPERBISSIMA.

This grand new Primula may be described as the red counterpart of P. alba magnifica. The fringing of the extra large bold flowers—which are of great substance—is of the same heavy character as in P. alba magnifica, and which distinguishes that variety from all others; whilst the colour is that of the best type of the ordinary "rubra."

Per Packet, retail, 2s. 6d.; Larger size Packets, retail, 3s. 6d.

FOR PRICES TO THE TRADE, SEE OUR NOVELTY LIST.

GREAT REDUCTION IN FRAMES OUR WELL-KNOWN MAKE.

PORTABLE CUCUMBER FRAMES.

These Frames are made of the Best Materials, and can be put together and taken apart in a few minutes by any one.

Table with 3 columns: Size, Price, and Payment. Rows include 1-light (4 ft. by 6 ft.), 2 (8 ft. by 6 ft.), 3 (12 ft. by 6 ft.), 4 (16 ft. by 6 ft.), 5 (20 ft. by 6 ft.), 6 (24 ft. by 6 ft.).

Larger sizes at proportionate prices.

R. HALLIDAY & CO., ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER. London Agent, Mr. H. SKELTON, Seedsman, & Co., 2, Holloway Rd., N.

STOCK SIZES—in inches.
